SWEET'S ENGINEERING CATALOGUE

A Catalogue Filing System
of
Industrial Plant and Engineering
Materials, Equipment and Supplies
Completely Indexed

Sixth Annual Edition

Compiled, Edited and Published Annually by
SWEET'S CATALOGUE SERVICE, INC.
119 West 40th Street, New York

Boston, 114 Federal Street
Philadelphia, 1821 Chestnut Street
Detroit, Penobscot Building

Pittsburgh, Bessemer Building
Cleveland, Citizens Bank Building
St. Louis, Title Guaranty Building

Chicago, Monadnock Block
Minneapolis, Iron Exchange

PLEASE NOTE

This copy of SWEET'S ENGINEERING CATALOGUE

No.....is loaned

by SWEET'S CATALOGUE SERVICE, INC., for reference purposes,
with the understanding that it is to be returned on receipt of
the next annual edition.

All users of SWEET'S CATALOGUE are urged to notify the
publishers of any change of address or of firm name, in order
that the distribution lists may be accurately kept for subsequent
issues.

PREFACE

SWEET'S ENGINEERING CATALOGUE constitutes a Catalogue Filing System of materials, equipment and supplies relating to the practical construction and equipment of all projects of an industrial or engineering nature.

The publishers have spared no effort in this presentation, to secure and present, through documentary information, the characteristics and functions of the various products, together with such standards as fulfil the requirements of both manufacturers and engineers.

The text, drawings and illustrations have been treated with a view to meeting the needs of the user rather than the varied preferences of the individual manufacturer. It has been the aim of the editor to include only essential facts required by the specification writer or prospective purchaser and, so far as possible, irrelevant or merely general information has been eliminated.

To facilitate the constant endeavor of the editor to improve this publication, and to make it render an even more valuable service in the future, it is asked that professional suggestions be freely offered by the users of the book.

EDITOR

1027001

INFORMATION SERVICE

Engineers, engineering contractors and others identified with engineering work are invited to write for information concerning any special class or make of engineering materials or equipment. Detailed information is on file concerning the products of the principal manufacturers of materials of construction, contractors' plant, power plant equipment and allied lines.

Users of "SWEET'S" who notice the omission of the catalogues of firms in whose products they are interested, or who find any of the catalogues herein contained lacking in the specific data required, are requested to advise the publishers of the deficiency. Such co-operation will be an aid to efforts to make subsequent editions increasingly comprehensive.

Address inquiries to our New York office as follows:

SWEET'S CATALOGUE SERVICE, INC.,
119 West 40th Street, New York City

GENERAL INDEX

The General Index is divided into three parts:

PART I. LIST OF MANUFACTURERS CATALOGUED.

PART II. TRADE GROUPS OR CLASSIFIED SECTIONS

PART III. CLASSIFIED LIST OF PRODUCTS, INCLUDING TRADE NAMES.

Part I

MANUFACTURERS

A list of all the firms catalogued in this volume.

A

Acme Ventilator Corp.....302-303
Aeroshade Co.....355
Air Reduction Sales Co.....629
Aladdin Co.....21
Albaugh-Dover Co.....850
Alberene Stone Co.....1134
Alberger Heater Co.....788

Part II

TRADE GROUPS OR CLASSIFIED SECTIONS

This index of trade groups will aid the users of "SWEET's" to readily locate the sections containing similar products. It does not, however, give in detail the products described in the volume. These products are very carefully indexed and given in Part III.

AIR CONDITIONING APPARATUS Including:—Blowers, Fans, Air Washers, etc.....	963-1012	GLASS.....	364-372
BOILERS.....	641-662	GRATES, STOKERS, FURNACES, ARCHES, ETC.....	663-689
BRICK, TILE, LIMESTONE.....	139-150	HARDWARE, WINDOW AND DOOR.....	356-363
BUILDERS IRON SPECIALTIES.....	373-374	HEAT TREATING EQUIPMENT.....	959-962
CEMENT, PORTLAND.....	135-138	HOUSING.....	21-28
CEMENT, REFRACTORY.....	690-696	HYDRAULIC MACHINERY.....	1129-1133
CEMENT, ROOFING.....	288	INDUSTRIAL TRUCKS.....	108-110
CHEMICAL EQUIPMENT AND DRYERS.....	1134-1149	INSULATION—PIPE AND BOILER; COLD STORAGE.....	1021-1030
CHIMNEYS.....	632-639	INSULATION, UNDERGROUND PIPE.....	426-432
CLOCKS.....	1152-1158	KITCHEN EQUIPMENT.....	1171
COAL.....	949	LIGHTNING CONDUCTORS.....	640
COMPRESSORS, AIR.....	781-786	LOCKERS, METAL.....	1159-1169
CONCRETE CONSTRUCTION EQUIPMENT Including:—Mixers, Forms, Chutes, etc.....	93-107	LUBRICATORS.....	588-590
CONCRETE REINFORCEMENT AND ACCESSORIES Including:—Bars, Metal Lath, Steel Lumber, Inserts, etc.....	158-195	LUMBER.....	151-157
CONDENSERS.....	787	METAL HOSE.....	591-592
CONTRACTORS.....	12-20	MUNICIPAL CASTINGS, SEWAGE DISPOSAL, ROAD OILING EQUIPMENT.....	123-128
CONTRACTORS SUPPLIES AND TOOLS.....	29-30	OIL FILTERS AND STORAGE SYSTEMS.....	593-599
COOPERAGE COATING SPRAYS.....	1170	PACKING.....	585-587
CREOSOTED AND TREATED MATERIALS.....	235-236	PAINT, WATERPROOFING, AND WOOD PRE- SERVATIVES.....	196-234
CRUSHERS AND PULVERIZERS.....	941-948	PILES.....	129-134
DOORS.....	322-340	PIPE AND FITTINGS.....	393-425
DRILLING EQUIPMENT.....	31-35	PLUMBING Including:—Closets, Partitions, Fixtures.....	1031-1045
ELECTRICAL EQUIPMENT Including:—Generating, Wires and Cables, Motors, Lamps, Reflectors, Switches, Wiring Devices, Bat- teries, Fuses, Telephones.....	1048-1128	POWER TRANSMISSION EQUIPMENT Including:—Pulleys, Clutches, Couplings, Bearings, Gears, Pinions, Belting and Accessories, Chain Drives.....	818-864
ELEVATING AND CONVEYING APPARATUS Including:—Traveling Cranes, Hoists, Conveyors, Elevators, Ash Handling Equipment, Chutes, Tube Systems.....	865-937	PUMPS AND ACCESSORIES.....	718-780
ENGINEERS.....	12-20	RAILROAD EQUIPMENT AND ACCESSORIES.....	111-122
ENGINEERS SUPPLIES.....	1-11	RECORDING AND INDICATING INSTRUMENTS.....	553-584
ENGINES, STEAM, GAS AND OIL.....	697-711	REFRIGERATING MACHINERY.....	1013-1020
EXCAVATING, HOISTING AND MATERIAL HANDLING EQUIPMENT Including:—Excavators, Cableways, Engines, Derricks, Locomotive Cranes, Buckets, Cables, Ropes.....	41-92	ROOFING.....	272-287
EXPANSION JOINTS, PIPE.....	433-435	SCALES.....	938-940
EXPLOSIVES.....	36-40	SHELVING, METAL.....	1159-1169
FEED WATER HEATERS.....	788-796	SKYLIGHTS.....	289-300
FENCING.....	375-392	SLATE.....	1125
FIRE PROTECTION SYSTEMS.....	1046-1047	STEAM SPECIALTIES.....	506-552
FLOORS AND PAVEMENTS Including:—Composition, Wood, Asphalt, Brick, Granite; Hardeners and Densifiers; Safety Treads and Gratings; Expansion Joints.....	237-271	STEEL PLATE CONSTRUCTION.....	600-615
FOUNDRY EQUIPMENT.....	1150-1151	STEEL SASH.....	341-354
GAS PRODUCERS, GENERATORS AND BURNERS.....	950-958	TANKS AND TOWERS.....	616-628
		TURBINES.....	712-717
		VALVES, SLUICE GATES, VALVE OPERATORS, ETC.....	436-505
		VENTILATORS.....	301-321
		WATER CONDITIONING APPARATUS Including:—Filters, Softeners, Sprays, Towers.....	797-817
		WELDING AND CUTTING APPARATUS.....	629-631
		WINDOW SHADES.....	355

Part III

PRODUCTS

A list of the products catalogued in this volume, arranged alphabetically, followed by the names of the firms manufacturing them.

Products are usually indexed under the main noun (Fire Brick, for example, being indexed as Brick, Fire) except where common usage makes it desirable to have the adjective precede the noun, as, for instance, Gas Producers, Metal Lath, etc.

Trade names (shown in *italics*) follow the firm names listed under the various products except where such trade names would appear simply as an unnecessary repetition of the preceding firm names without giving any additional information.

This index relates to the contents of the book only, and does not include items which might be inferred but are not actually mentioned.

A

Absorption Refrigerating Machines
See Refrigerating and Ice Making Machinery.

Accumulators, Hydraulic
Metalwood Mfg. Co. 1129
Southwark Foundry and Machine Co. 1130-1131
Tippett & Wood. 613

Accumulators, Steam
Worthington Pump and Machinery Corp. 772-777

Acetylene
Air Reduction Sales Co. 629
Airco 629

Acid Eggs
See Eggs, Acid.

Acids, Pickling, Iron and Steel
American Chemical Paint Co. 196
Deoxylyte 196

Agitator Drives
See Drives, Agitator.

Agitators
Blaw-Knox Co. 102-103
Caldwell, W. E., Co., Inc. 618
Corcoran, A. J., Inc. 621
Duriron Castings Co. 1146
Graver Corp. 622
Kalamazoo Tank & Silo Co. 623
New England Tank & Tower Co. 624
Petroleum Iron Works Co. 605-607
Struthers-Wells Co. 608-611
Tippett & Wood. 613
Vogt, Henry, Machine Co. 1017

Agricultural Machinery
Allis-Chalmers Mfg. Co. 1114-1115

Air Compressors
See Compressors, Air or Gas.

Air Conditioning Apparatus
American Blower Co. 964-967
Anthony Co. 957

Air Conditioning Apparatus—Continued.

Atmospheric Conditioning Corp. 1006-1007
Badger, E. B., & Sons Co. 798
Carrier Air Conditioning Co. of America 1005
Carrier Engineering Corp. 1008
Clarage Fan Co. 974-975
Fleisher, W. L., & Co., Inc. 1009
Gordon, Robert, Inc. 978
Hersh & Brother. 1012
Johnson Service Co. 526-527
Massachusetts Blower Co. 982
Parks-Cramer Co. 1010-1011
Spray Engineering Co. 814-815
Star Brass Works. 816
Sturtevant, B. F., Co. 985-1003
Webster 1006-1007

Air Dryers
See Dryers, Air; Air Conditioning Apparatus.

Air Lifts
See Pumps, Air Lift.

Air Sampling Apparatus
Wallace & Tiernan Co., Inc. 817

Air Separation Pulverizers
See Pulverizers, Air Separation.

Air Vents
See Vents, Air.

Air Washers
See Washers, Air.

Alarms, Low Water
See Water Columns, Boiler, Alarm and Safety.

Alidades
Gurley, W. & L. E. 10-11

Alloys, Heat Resistant
See Metal, Heat Resistant.

Altimeters
See Barometers, Aneroid.

Altitude Aneroids
See Barometers, Aneroid.

Ammeters

Bristol Co. 558-559
Brown Instrument Co. 564
General Electric Co. 1050-1084
Westinghouse Electric & Mfg. Co. 1048-1049

Ammonia Economizers
See Refrigerating and Ice Making Machinery.

Ammonia Fittings
See Fittings, Pipe, Ammonia.

Analyzers, Flue Gas
Hoffman, Charles V., Co., Inc. 691
Precision Instrument Co. 562-563

Anchors, Concrete
See Inserts, Concrete.

Anchors, Concrete, Screw
Richmond Screw Anchor Co. 192

Anchors, Guy
Crouse-Hinds Co. 1109

Anchors, Wall, Concrete
See Concrete Reinforcement Devices.

Anemometers
Gurley, W. & L. E. 10-11
Taylor Instrument Companies. 570-571
Tycos 570-571

Aneroids
See Barometers, Aneroid.

Angles, Beams, Channels, Tees, Pressed Steel

(See also Lumber, Pressed Steel)
American Pulley Co. 818
General Fireproofing Co. 174-176
National Pressed Steel Co. 178-179
North Western Expanded Metal Co. 181-183
Truscon Steel Co. 184-186
Youngstown Pressed Steel Co. 188-189
Sharon 188-189

Angles, Rolled Steel
See Structural Steel.

Products are indexed under the noun except where common usage makes it desirable to index under the adjective.

Anthracene Oil

(See also Preservatives, Wood)

Carbolineum Wood Preserving Co.	233
Northeastern Co.	234
Toron	233

Antifreeze Compounds, Concrete

Master Builders Co.	260-261
Sonneborn, L., Sons, Inc.	259
Vitrifyx Co.	262-263
Waterproofing Co. of America.	230
Fermo	259
Hydrite	230
Master Mix	260-261

Antislip Treads

See Treads, Safety.

Arbors

See Ornamental Metal Work; Wire Work; Fencing.

Arches, Boiler—Firebox, Combustion Chamber, Fire Door

(See also Linings, Furnace)

Brady, James A., Foundry Co.	666
Detrick, M. H., Co.	686
McLeod & Henry Co.	693
Sleicher & Drake	683
Washburn & Granger, Inc.	682
Dean	682
Detrick	683; 686
Foot's	693
Steel Mixture	693

Arches, Dutch Oven

See Arches, Boiler.

Armor, Pavement Expansion Joint

Truscon Steel Co.	184-186
-------------------	---------

Arresters, Lightning

General Electric Co.	1050-1084
Westinghouse Electric & Mfg. Co.	1048-1049

Asbestos Wood

See Lumber, Asbestos.

Ash Conveyors

See Conveyors, Ash.

Ash Handling Machinery

See Coal and Ash Handling Machinery; Conveyors; Elevating and Conveying Machinery.

Asphalt

Lehon Co.	280
Standard Oil Co.	256-257
Stanolind	256-257
Specifications	256-257

Asphalt Products

Biegler, E. N., Mfg. Co.	276
Hydrex Felt & Engineering Co.	209
Lehon Co.	280
Standard Asphalt & Refining Co.	255
Standard Oil Co.	256-257
Standard Paint Co.	218-219

Autoclaves

Buffalo Foundry & Machine Co.	1138-1141
Devine, J. P., Co.	1144-1145
Koven, L. O., & Brother	603
Buflokast	1138-1141

Axes, Concrete

Ransome Concrete Machinery Co.	96-99
--------------------------------	-------

Axles, Car or Locomotive

Easton Car & Construction Co.	114-117
-------------------------------	---------

B**Backfillers, Trench**

Byers, John F., Machine Co.	52-53
Pawling & Harnischfeger Co.	46
Waterloo Construction Machinery Co.	101
P & H	46

Backing, Stone

General Fireproofing Co.	206
New Process Chemical Co., Inc.	214
Sandusky Cement Co.	220
Medusa	220
Tri-Bitume	214

Bacteriological Testing Apparatus, Portable

Wallace & Tiernan Co., Inc.	817
-----------------------------	-----

Baffle Walls, Furnace

(See also Arches, Boiler; Cement, Refractory)

Engineer Co.	684-685
Turner	684-685

Bagging Machinery

Gifford-Wood Co.	895
Haiss, George, Mfg. Co., Inc.	901
Specialty Engineering Co.	926-927
G-W	895

Bags, Tamping

Du Pont de Nemours, E. I., & Co., Inc.	40
Hercules Powder Co.	38-39

Bakery Equipment

Van, John, Range Co.	1171
----------------------	------

Balancers

Allis-Chalmers Mfg. Co.	1114-1115
General Electric Co.	1050-1084
Ridgway Dynamo & Engine Co.	706-707

Ball Cocks

See Cocks, Ball.

Ballistic Instruments

Precision Thermometer & Instrument Co.	565
Le Boulenger	565

Balls, Bearing, Steel

SKF Industries, Inc.	848-849
Atlas	848-849

Bar Hangers, Concrete Reinforcement

See Concrete Reinforcement Devices.

Barbed Wire

See Wire, Barbed.

Barges and Scows

Browning, Victor R., & Co.	865
Pittsburgh-Des Moines Steel Co.	625

Barking Drums

See Drums, Barking

Barn Equipment

Fiske, J. W., Iron Works	389
--------------------------	-----

Barometers, Aneroid

Gurley, W. & L. E.	10-11
Taylor Instrument Companies	570-571
Tycos	570-571

Barometers, Mercurial, Index and Recording

Precision Thermometer & Instrument Co.	565
Tagliabue, C. J., Mfg. Co.	568-569
Taylor Instrument Companies	570-571
Tycos	570-571

Barrel Sterilizer

See Sprays, Cooperage Coating

Barrels, Steel

Lyon Metallic Mfg. Co.	1166-1167
------------------------	-----------

Barrels, Steel, Bilged

Petroleum Iron Works Co.	605-607
Gem	605-607

Barrels, Tumbling

Baltimore Cooperage Co.	616
Koven, L. O., & Brother	603
Royersford Foundry & Machine Co.	846-847
Whiting Foundry Equipment Co.	1150-1151

Bars, Curb, Concrete

Concrete Steel Co.	168-169
Truscon Steel Co.	184-186
Havemeyer	168-169

Bars, Merchant, Steel and Puddled Iron

Lackawanna Steel Co.	132-133
Sweet's Steel Co.	122
Youngstown Sheet & Tube Co.	406-407

Bars, Muck, Puddled Iron

Youngstown Sheet & Tube Co.	406-407
-----------------------------	---------

Base Plates, Pillow Block

See Plates, Base, Pillow Block

Base Screeds or Grounds, Metal

North Western Expanded Metal Co.	181-183
Truscon Steel Co.	184-186
Nemco	181-183

Bases, Column, Cast Iron

See Caps and Bases, Column.

Bases, Post

See Caps and Bases, Post

Bases, Ventilator

(See also Ventilators; Sheet Metal Work)

Jordan, Paul R., & Co.	308
Aero-automatic	308

Basins, Wash

See Lavatories

Basins and Covers, Catch

See Catchbasin Inlets

Baths, Oil Tempering

General Electric Co.	1050-1084

Specifications. 224-225

Enclosures, Steel Panel

See Partitions, Metal.

Enclosures, Wire, Stock and Tool Room

See Partitions, Wire; Fencing, Wire or Woven Wire.

Engine and Boiler Trimmings

See Specific Headings.

Engineers, Consulting

Including—Mechanical, Civil, Hydraulic, Chemical, Electrical
Hunt, Robert W., & Co. 18

Engineers, Heating and Ventilating

See Heating and Ventilating Apparatus; Heating Systems.

Engineers, Illuminating

Edison Lamp Works. 1085
Westinghouse Lamp Co. 1120

Engineers, Inspection and Testing

Hunt, Robert W., & Co. 18

Engineers, Structural Steel

See Structural Steel or Iron Work.

Engineers, Timber Treatment

Carbolineum Wood Preserving Co. 233

Engineers or Contractors, Building

See Contractors, General.

Engineers or Contractors, Chimney Construction

See Chimneys.

Engineers or Contractors, Concrete Construction

Barton Spider-Web System. 12-13
Concrete Engineering Co. 170
Concrete Reinforcing and Engineering Co. 171
Concrete Steel Co. 168-169
Ferguson, H. K., Co. 22-23
Foundation Co. 14
Guarantee Construction Co. 15
Industrial Engineering Co. 16-17
Kalman, Paul J., Co. 180
North Western Expanded Metal Co. 181-183
Raymond Concrete Pile Co. 130-131
Rust Engineering Co. 19
Turner Construction Co. 20

- Engineers or Contractors, Concrete Construction—Continued.**
 Waterproofing Co. 229
 Withrow Steel Co. 187
- Engineers or Contractors, Foundation**
 Foundation Co. 14
 MacArthur Concrete Pile & Foundation Co. 129
 Raymond Concrete Pile Co. 130-131
 Rust Engineering Co. 19
 Smith & Brennan Pile Co. 134
- Engineers or Contractors, Power Plant**
 Ferguson, H. K., Co. 22-23
 Foundation Co. 14
 Gordon, Robert, Inc. 978
 Guarantee Construction Co. 15
 Rust Engineering Co. 19
 Turner Construction Co. 20
- Engineers or Contractors, Sewage Disposal**
 Aten Sewage Disposal Co. 126
 New York Sewage Disposal Co. 127
- Engineers or Contractors—Suspension Bridges, Tramways, Cableways, etc.**
 Roebling's, John A., Sons Co. 88-89
- Engineers or Contractors, Temperature Control**
 See Regulators, Temperature.
- Engineers or Contractors, Water Purification**
 See Filters, Water, Gravity or Pressure.
- Engineers or Contractors, Water Supply Systems**
 Layne & Bowler Co. 744-747
 New York Sewage Disposal Co. 127
- Engineers or Contractors, Water Works**
 See Water Supply Systems; Pumps.
- Engineers or Contractors, Waterproofing and Dampproofing**
 (See also Waterproofing)
 Anti-Hydro Waterproofing Co. 197
 General Fireproofing Co. 206
 Hydrolithic Waterproofing Co., Inc. 210
 Permanent Ironite Waterproofing Co. 215
 Waterproofing Co. 229
 Waterproofing Co. of America. 230
- Engines, Corliss**
 See Engines, Steam, Stationary; Engines, Steam, Compound.
- Engines, Diesel**
 National Transit Pump & Machine Co. 760-762
 Nordberg Mfg. Co. 704-705
- Engines, Fire, Portable**
 Foamite Firefoam Co. 1046
- Engines, Gas or Oil**
 See Engines, Internal Combustion.
- Engines, Hoisting**
 See Hoists.

- Excavators, Ladder**
 See Excavators, Drainage or Trench.
- Excavators, Pipe Line**
 See Excavators, Drainage or Trench.
- Excavators, Traction**
 (See also Cranes, Auto)
 Keystone Driller Co. 41
- Exciter Units, Turbo**
 Terry Steam Turbine Co. 715-717
- Exciters**
 General Electric Co. 1050-1084
- Exhaust Heads**
 American Spiral Pipe Works. 416-417
 Burt Mfg. Co. 304-305
 Kieley & Mueller, Inc. 529
 Koven, L. O., & Brother. 603
 Ohio Body and Blower Co. 314-317
 Pittsburgh Valve, Foundry & Construction Co. 484-486
 Sturtevant, B. F., Co. 985-1003
 Wright-Austin Co. 550-552
 Cyclone. 550-552
 Swartwout. 314-317
- Exhausters**
 See Fans, Ventilating or Exhaust; Blowers, Pressure.
- Expanded Metal**
 See Concrete Reinforcement, Expanded Metal or Sheet Metal Mesh; Metal Lath, Expanded.
- Expanders, Gas**
 Worthington Pump and Machinery Corp. 772-777
- Expansion Bolts**
 See Bolts, Expansion.
- Expansion Joint Cement**
 See Cement, Expansion Joint.
- Expansion Joints**
 See Joints, Expansion, Pipe.

Explosives

Atlas Powder Co.	36-37
Du Pont de Nemours, E. I., & Co., Inc.	40
Hercules Powder Co.	38-39

Extinguishers, Fire

Foamite Firefoam Co.	1046
----------------------	------

Extractors, Chemical

Devinc, J. P., Co.	1144-1145
--------------------	-----------

Extractors, Gasoline

Chicago Pneumatic Tool Co.	784-785
----------------------------	---------

Extractors, Grease and Oil

American Steam Gauge & Valve Mfg. Co.	553-557
Bartlett, C. O., & Snow Co.	890
Blackburn-Smith Corp.	799
Boylston Steam Specialty Co.	512-513
Griscom-Russell Co.	789
Kieley & Mueller, Inc.	529

Extractors, Tar

Flinn & Dreffien Co.	950
Smith Gas Engineering Co.	954-955
Struthers-Wells Co.	608-611

F**Fabricated Steel**

See Structural Steel or Iron Work.

Facings—Brake, Clutch, Disk or Block

Cork Insert Co.	827
Russell Mfg. Co.	861
Rusco.	861

Fans, Ceiling, Wall, Desk or Bracket

Newark Cornice & Skylight Works.	313
Western Electric Co.	1119

Fans, Ventilating or Exhaust

(See also Blowers, Pressure)	
American Blower Co.	964-967
Bayley Mfg. Co.	963
Buckeye Blower Co.	968-969
Buffalo Forge Co.	970-971
Carling Turbine Blower Co.	972-973
Clavage Fan Co.	974-975
Coppus Engineering & Equipment Co.	976
General Electric Co.	1050-1084
Green Fuel Economizer Co.	687
Hersh & Brother.	1012
Ilg Electric Ventilating Co.	979-981
Massachusetts Blower Co.	982
Newark Cornice & Skylight Works.	313
Raymond Bros. Impact Pulverizer Co.	943
Skinner Bros. Mfg. Co., Inc.	983
Sprague Electric Works.	1086-1087
Sturtevant, B. F., Co.	985-1003
Wing, L. J., Mfg. Co.	1004
Bi-cal-ky.	1012
Four-Leaf Clover.	313
Massachusetts-Davidson.	982
Plexiform.	963
Scruplex.	1004
Sirocco.	964-967
Ventura.	964-967
Specifications.	985-1003

Fans, Ventilating or Exhaust, Acid Resistant

Duriron Castings Co.	1146
Sturtevant, B. F., Co.	985-1003

Fasteners, Belt

(See also Lacing, Belt, Leather)	
Bristol Co.	862
Crescent Belt Fastener Co.	863
Main Belting Co.	858-859

Fasteners and Adjusters, Casement or Sash

Payson Mfg. Co.	358-361
Signal.	358-361

Faucets

See Cocks and Bibbs.

Feed Water Grease Extractors

See Extractors, Grease and Oil; Filters, Feed Water.

Feed Water Heaters

See Heaters, Feed Water.

Feeder Regulators

See Regulators, Voltage.

Feeders, Chemical, Venturi

See Regulators, Chemical Feed, Venturi.

Feeders, Coal

Bartlett, C. O., & Snow Co.	890
Columbus Conveyor Co.	893
Gifford-Wood Co.	895
Robins Conveying Belt Co.	923
Specialty Engineering Co.	926-927

Feeders, Water

See Regulators, Feed Water.

Felt, Insulating and Sheathing

Lehon Co.	280
Standard Paint Co.	218-219
Union Fibre Co., Inc.	1030
Linofelt.	1030
Ru-ber-oid.	218-219
S P C.	218-219

Fencing, Iron

American Fence Construction Co.	375-377
Anchor Post Iron Works.	380-384
Brook, A. T., Iron Works.	385
Cyclone Fence Co.	386-388
Fiske, J. W., Iron Works.	389
Page Steel and Wire Co.	390-392
Afcco.	375-377

Fencing, Non-climbable

American Fence Construction Co.	375-377
American Steel & Wire Co.	378-379
Anchor Post Iron Works.	380-384
Brook, A. T., Iron Works.	385
Cyclone Fence Co.	386-388

Specifications

- Asphalt. 256-257
Blocks, Paving, Improved Granite. 242-243
Blocks, Wood, Flooring and Paving, Creosoted or Treated. 252-253
Cement, Roofing, Asphalt. 288
Chemicals, Rustproofing. 196
Chimneys, Brick, Radial. 636-637
Conductors, Lightning. 640
Coverings, Pipe and Boiler, Steam or Hot Water. 1026-1028
Enamels—Decorative, Machinery, Piping, Laboratory, etc. 224-225
Fans, Ventilating or Exhaust. 985-1003
Flooring, Asphalt, Mastic. 255; 258
Flooring, Wood Block, Creosoted. 252; 253
Glass, Wire, Corrugated. 368-369
Glass Concrete Construction. 290-291
Hardeners and Densifiers, Cement and Concrete. 224-225; 230; 260-261; 262-263
Heaters, Pipe Coil. 985-1003
Heating Systems, Underground. 429-431
Joints, Expansion, Paving. 271
Lumber, Pine. 154-155
Paint—Brick, Cement, Concrete, Plaster, Stone. 202-203; 204-205
Paint, Metal Protective. 208; 224-225
Paint, Mill White. 204-205; 208
Paint, Oil, Interior and Exterior. 204-205
Pavements, Brick. 248-249
Paving, Improved Granite Block. 242-243
Piles, Concrete. 134
Pipe, Cast Iron. 410-412
Pipe, General. 413-415
Pipe, Steel, Lap or Butt Welded. 406-407
Pipe, Steel, Lock Joint. 413-415
Plaster Bonds, Bituminous. 224-225
Roofing, Built-up, Asphalt, Asbestos, or Tarred. 280
Stucco, Portland Cement. 218-219
Tile, Roofing, Gypsum. 283-285
Washers, Air. 985-1003
Waterproof Cement Coating. 229
Waterproofing, Integral—Mass Concrete or Cement. 218-219; 224-225; 230; 260-261
Waterproofing and Dampproofing Paint and Compounds. 224-225
Windows, Solid Steel, Industrial. 350-351

CHECKING-LIST

COVERING

ENGINEERING CONSTRUCTION

AND

POWER PLANT DESIGN

FOR USE WITH THE
ENGINEERING EDITION OF SWEET'S CATALOGUE

The function of this Checking-List is to serve as a guide and reminder in connection with the preparation of specifications and contracts, and for making estimates.

For convenience it is arranged in two parts: the first, dealing in general with methods of construction, and the second, especially with the design, construction and equipment of steam and hydro-electric power plants.

SYNOPSIS PART I—ENGINEERING CONSTRUCTION

	PAGE		PAGE
1. MATTERS PRELIMINARY TO CON-TRACT.....	2	3. SPECIFICATIONS.....	3
2. CONTRACT.....	2	4. SUBWAYS AND TUNNELS.....	3
6. CONCRETE.....	10	5. ROADS AND PAVEMENTS.....	7

SYNOPSIS PART II—POWER PLANT DESIGN

SEC. I—STEAM PLANTS

	PAGE		PAGE
1. GENERAL CLAUSES.....	13	9. INTERNAL COMBUSTION ENGINES...	33
2. BOILERS AND STACKS.....	14	10. DYNAMOS.....	35
3. GAS PRODUCER EQUIPMENT.....	17	11. ELECTRIC WIRING.....	36
4. STEAMFITTING.....	18	12. SWITCHBOARDS.....	40
5. CENTRAL STATION STEAM HEATING..	28	13. STORAGE BATTERY.....	41
6. POWER PLANT PIPING.....	29	14. REFRIGERATION.....	42
7. STEAM ENGINES.....	30	15. FUEL.....	44
8. TURBINES.....	32	16. LUBRICANTS AND LUBRICATION.....	44
17. ELEVATORS.....	45		

SEC. II—HYDRO-ELECTRIC PLANTS

	PAGE		PAGE
18. DAMS.....	46	22. ELECTRICAL EQUIPMENT OF POWER PLANT.....	52
19. HEAD AND TAIL RACES.....	47	23. SWITCHROOM OF POWER PLANT....	53
20. POWER PLANT BUILDING.....	49	24. TRANSMISSION SYSTEM.....	53
21. MECHANICAL EQUIPMENT OF POWER PLANT.....	50	25. SUB-STATIONS.....	54
26. POWER-TRANSMISSION EQUIPMENT..	55		

PART I—ENGINEERING CONSTRUCTION

1—MATTERS PRELIMINARY TO CONTRACTS

1-1 INVITATION TO BIDDERS

- (a) Authority
 - Official title
 - Address
- (b) Work Required
 - Location
 - General statement of scope of work
 - General method of construction
- (c) Proposal
 - Time and place for delivery
 - Form of proposal
 - Accompanied with certified check
- (d) Bond
 - Required from successful bidder
- (e) Address for Further Information, Drawings, etc.
- (f) Rejection of Bids

1-2 INFORMATION FOR BIDDERS

- (a) General
 - Blanks for bids or proposals
 - Date for opening bids
 - Printed form of bid to be used
 - Blank bidding sheet to be filled in with both words and figures for each item
 - No alterations or restrictions to be made in bidding sheet or specifications
 - Copy of advertisement must be attached to bidding sheet
 - Amount per day added to bids for purposes of comparison
 - Each bidder must sign full name and address given
 - if firm name, names of members must be given
 - if corporation, names of officers
 - When signing for another person power of attorney must be filed
 - Withdrawal of bids
 - Informal bids
 - No recapitulation of work
 - One man interested in two bids cause for their rejection
 - Member of firm not accepted as bondsman for firm
 - Contract signed and bond given in [....] days after notice to successful bidder
 - Bidder present at opening of bids
 - Proposal accompanied by certified check
 - return of check of unsuccessful bidders
 - return of check of successful bidder
 - forfeited if chosen bidder does not commence work on time
 - Bids must be balanced—no prices unnecessarily high or low
 - State organization, facilities and experience for work
 - State credit or means of credit available
 - Proposals in sealed envelope
 - time and place for delivery
 - Bidder to visit site of work before estimating
 - Bidder to give number of days in which he will complete the work
 - Bidder to submit with bid full description of proposed methods of work
 - List of proposed Sub-contractors

Loan of drawings
 deposit to insure their return
 Owner not responsible for information except that given by Engineer
 Provision for submitting a modified form in addition to regular bid

- (b) Conditions of Site
 - Location and accessibility
 - Geographical features
 - Railroad connections
 - Tidewater connections
 - Soundings
 - Borings
 - Test pits
 - Character of rock formation
 - Lines and grades
 - Construction materials available
 - sand and gravel deposits
 - stone
 - timber
 - water supply
 - Difficulty in obtaining labor and materials or delivery of material to property
 - Severity of weather
- (c) Labor Laws
 - State labor laws—working hours defined
 - Rate of wage to be paid on work—for public work
 - Bidders referred to local laws in regard to work
- (d) Approximate Statement of Quantities
 - Basis for comparing bids
 - Bidders to satisfy themselves as to accuracy of approximate quantities
 - Prices not changed by change of quantity
- (e) Samples
 - Of work already completed for inspection by Contractor

1-3 PROPOSAL

Bidder's name and address
 name and address of every member of firm
 if corporation, information desirable
 Agreement to furnish work for price included
 Amount of estimate
 Declaration that bidder is only party interested
 No government official or employee a partner
 Enclosed check for a percentage of bid
 Agreement to give bond
 Liquidated damage, or other damage clause
 Proposal made with full understanding as to nature and quality of work
 Alternate proposals
 Organization of bidder
 Financial information concerning bidder
 Facilities for doing work
 Statement of similar work performed by bidder
 references
 Bidder to have examined site
 Bidder to execute contract within [....] days after notice of award
 forfeiture of deposit in case of neglect
 Schedule of unit prices
 what the prices are to cover

Right to increase or diminish quantities
 Bidders' signatures
 sworn statement before notary
 Sureties' consent
 form
 sworn before notary

2—CONTRACT

2-1 AUTHORITIES

Parties
 Covenants
 Engineer to make explanations and give orders
 provision in case of disability of Engineer
 Engineer to adjust differences
 Engineer to give orders in Contractor's absence

2-2 DRAWINGS

Specifications and drawings a part of contract
 right to amplify drawings
 right to modify drawings
 supplementary drawings
 examination by Contractor
 conditions encountered not indicated on supplementary drawings

2-3 TIME AND ORDER OF DOING WORK

Time is the essence of the agreement
 Work to begin [....] days after letting of contract
 Schedule of progress
 Penalty for non-completion
 Bonus for completion in advance
 Extension of time

- strikes
- stoppage by Engineer
- weather
- other causes

 Extension of time not to release bondsmen
 Conditions of final acceptance
 Right to suspend work

- no claim for damage in consequence of suspension
- damages to Contractor due to suspension of work by owner

2-4 CLAIMS

No claim because actual quantities differ from preliminary statement
 Contract and specifications may be modified by written agreement
 Contractor's claim for damage
 statement filed with Engineer

2-5 EXAMINATION OF WORK

Access to work
 persons or parties included

2-6 SUB-CONTRACTORS

Interference of work under adjacent contracts

2-7 ADDITIONAL WORK OR MATERIALS

2-8 RIGHT OF PROPERTY IN MATERIALS

2-9 EMPLOYEES, ETC.

Competent men to be employed
 Dismissal of workmen
 Compliance with labor laws required

Compliance with local laws and regulations
Payment of employees of Contractor
Bond to indemnify municipalities against paupers, etc.
Work on Sundays, legal holidays, or at night permitted?

2-10 DUTIES OF CONTRACTOR

(a) General

Personal attention given to work
Furnish representative who can act upon special orders
Maintenance of office at the work
Keep plans and specifications on work
Co-operation with other contractors

(b) To Furnish the Following:

Laborers to assist Engineer in setting stakes, sounding, etc.
Laborers to assist Inspector in handling materials
Materials for stakes
Boats for conveyance of Engineers
Scales for weighing materials
Offices for Engineers
Quarters for workmen

(c) Lines and Grades

Preservation of stakes, bench marks and monuments
Advance notice given of need of lines and grades

(d) Rules and Regulations

Study and obey rules and regulations of fire, water, park and police departments with special attention regarding hydrants, steam boilers, explosives, protection of trees and shrubbery
To secure permits and licenses

(e) Sanitary Provisions and Conveniences for Employees

Water supply
Garbage destruction
Sewage disposal
Medical attendance and inspection
Hospital

(f) Records

Furnish bills of lading to Engineer on request
Show time books for work done on force account

2-11 CONTRACTOR'S LIABILITIES

Accidents to persons and property
Examination of abutting property before beginning work
Injury to work by the elements
Insurance against fire
Unforeseen difficulties in performance of work
Preservation and protection of materials and finished work until final acceptance
Verification of borings and soundings
Verification of plans
Checking and verifying of bills of materials furnished by Engineer
Assumption of all liabilities for patent royalties
Payment of demurrage on freight
Disposal of all surplus excavation, old materials, etc., not claimed by owner or abutting property owners
Liability for plant and methods
Providing of means for public travel
Contractor's liabilities not affected by Sub-contractor

Expense caused by strikes, riots, etc.

2-12 MATERIALS TO CONFORM TO SPECIFICATIONS

2-13 MAINTENANCE OF WORK

Definition
Required for stated time
Procedure in case of failure to repair
Maintenance bond or cash deposit
Provision for disturbance of completed work by others than Contractor

2-14 DEFECTIVE WORK AND MATERIALS

2-15 COMPLETION OR ABANDONMENT OF WORK

Cancellation of contract by default
Completion of work after abandonment
Damages for failure to complete on time
Sworn statement required on completion of work
Provision for use of work before completion of contract
Receipted bills, satisfactory liens and other evidences of non-indebtedness for materials and labor to be filed with Engineer
Permission to complete contract not a waiver

2-16 PAYMENT FOR WORK

Partial payments
small percentages retained
method of estimating
Final estimate and payments
Vouchers
Interest on delayed payments
No estoppel
Final payment to terminate liability of owner
Lien laws
Money due Contractor may be retained to meet claims
Prices for extras

2-17 ARBITRATION

Damages for submitting to arbitration
Bond for fulfillment of arbitration

2-18 CHANGE AND INTERPRETATION OF PLANS

Change of plans, grades, etc., may be made by Engineer
Change of plans will not release bondsmen
Quantities may be increased or diminished
Written matter to prevail over printed matter in specifications
Engineer (or Board of Arbitration) to interpret plans and specifications
Omissions not to be used as an excuse for non-performance or extra price
Complete workmanlike job required
Borings and soundings not guaranteed

3-SPECIFICATIONS (General Sections)

3-1 WORK REQUIRED

Limits of contract
Nature and quality of finished work
Rapidly and safety of construction
Work to begin at places designated by Engineer

3-2 DEFINITIONS

Measurements made of actual

lengths, areas and volumes within "neat lines"
Units of measurement as cubic yard, ton, day, rock, earth, etc.
Owner
Chief Engineer
Contractor
Board of Arbitration
Datum of levels
Legal address of Contractor
provision for change
Approved and directed
Contract
Extra and additional work
Unit prices
Materials delivered

3-3 INSPECTION

Duties of Inspector
Work done in Inspector's absence subject to rejection
Contractor to provide facilities for inspection
Contractor to provide laborers to assist Inspectors
Culled material to be removed at once
Contractor to make openings or tear out work for inspection
condition of payment
Acceptance by Inspector not final

4-SUBWAYS AND TUNNELS

4-1 MAINTENANCE OF TRAFFIC, PROTECTION OF PROPERTY, ETC.

(a) Street Maintenance

Access to buildings
Decking of streets
material
quality
surface drainage
Decking of sidewalks
Bridges across open trenches
Maintenance of street intersections
Maintenance of sidewalk crossings

(b) Number and Sizes of Openings of Shafts

Location

(c) Storage of Materials

Location
Amounts

(d) Fire Protection

Access to fire hydrants
Access to fire alarm boxes

(e) Cancelments, Etc.

Procedure in case of necessary cancellation
Procedure in case of necessary disturbance

(f) Maintenance of Street Lighting

(g) Maintenance of Street and Elevated Railway Tracks, Mains, etc.

Notice given to interested parties of start of work
Plans of rearrangement
Reconstruction or relaying
reasonable dispatch
Support of
Protection from injury
Necessary permanent changes of piping, electric conduits and ducts
Payment for new pipes
Payment for excavation outside of net lines
Changes of service connections
Measurement of conduit and duct excavation
Payment for additional necessary construction
Provision for owners of railway to make extensions or improvements

Support of column foundations of elevated roads
 Support and restoration of buildings
 Methods used
 Procedure in case of damage
 Buildings requiring special attention
 Test pits
 Responsibility in case of damage
 Repairs and measures necessary for tenantable conditions of buildings at all times
 Dispatch with which work is done
 Measurement of work done
 Payment for

(h) Maintenance of and Restoration of Pipes, etc.

Protection of
 sewers
 pipes
 ducts
 mains
 conduits
 wires
 cables

4-2 TEMPORARY REMOVAL

Consent of owner
 Approval of Engineer
 Restoration
 Permanent change of location

4-3 BY-PASSING OF PIPES IN CONSTANT USE

Quality of pipe used
 Ventilation in case of gas pipes
 Location of all gates and valves
 Posting drawings in field offices for emergency use

4-4 SEWERS

Change of location
 Claims for damages
 Size of trenches
 freedom from water
 Limit of length of trench opening
 Trenches for manholes and receiving basins
 Foundations
 Testing of grades
 Gutters and passageways kept open
 Under other structures
 Protection of fresh work
 Procedure in freezing weather

(a) Concrete

Profiles and inverted centers for inverts
 protection of invert
 forms, moulds, etc.
 Defective work
 Spur pipes
 how built in
 Risers
 Dimensions
 Ventilation

(b) Pipe Sewers

Vitrified pipe
 Iron pipe
 How laid
 Joining hub and spigot pipes
 Special castings
 Connections
 Ventilation
 Protection of exposed ends of pipes
 Cleanliness of interior of pipes

(c) Manholes

Foundations
 Pipe connections
 Vitrified bricks or granite blocks
 Bluestone
 Use of bats
 Steps or ladders
 Manhole heads and cover
 perforations
 weights

noiseless head and cover for asphalt or wooden block streets
 emergency manholes
 joints
 sealed heads in vault

(d) Catch Basins

Foundations
 Stone flooring
 Headstone and gutter stone
 Grate-bar cast-iron cover
 Cast-iron trap
 Iron steps

(e) Culvert Pipes

Flush tanks
 Waterproofing
 Quality of material
 Flow to be uninterrupted
 Brick or stone inverts
 Brick arches
 Permits for connections
 Cleaning

(f) Backfilling

Material used
 Method of tamping
 Sheeting withdrawn

(g) Payments for

Sewers
 Excavation
 Steel beams and reinforcing rods
 Automatic flush tanks
 Waterproofing
 Cast-iron sewer pipe
 House and drainage connections

(h) Sewers Under Station Platforms

4-5 RESTORATION OF SURFACE

Temporary
 material
 quality
 duration allowed
 Permanent
 area
 type of surface
 quality
 Payment for

4-6 SIDEWALKS

Adjacent to ventilating openings, vault lights, entrances
 Material
 Provisions for other types of pavements
 Measurement
 Curbing
 lines for
 Park surfaces
 trees
 shrubbery
 grass plots

4-7 EXCAVATION

(a) Definitions

Of earth excavation
 Of rock excavation

(b) Dimensions

Width of excavation
 Depth of trenches

(c) Securing of Sides

Sheeting
 Shores
 Walling timbers
 Provision for excess pressure
 Payment for sheeting, etc.

(d) Underpinning of Adjacent Buildings

Definition of underpinning
 Securing other than underpinning
 Payment

(e) Payment for Permanent Sheeting

(f) Timber for Temporary Purposes

Quality
 Workmanship in placing

(g) Vaults of Abutting Property

Disturbance of vaults
 Temporary partitions in case of disturbance of vaults

(h) Blasting

Precautions
 minimum distance from buildings
 type of explosives allowed
 storage of explosives
 state laws

(i) Drainage (Temporary)

Method of pumping
 Discharge piping
 Material in discharge water

(j) Carting

Dumping regulations
 Expeditious removal of material
 Tightness of carts, buckets, etc.

(k) Method of Measurement of Trenches

(l) Changes of Street Grade

Payments for

(m) Cross Sectioning of Rock Encountered

(n) Backfilling

Quality of material
 Method of placing
 around subsurface structures
 Removal of sheeting

(o) Measurements and Payments

Governed by what?
 Allowance for excess excavation outside tunnel lines
 Provision for slips, slides, timbering
 Rates for
 tunneling above mean high water
 tunneling below mean high water
 tunneling in rock
 removal of water

4-8 SHAFTS

(a) General

Location
 Contour of surface
 Proximity to railways or canals
 Character of strata
 Proposed method of making tunnel

(b) Method of Sinking

By hand
 Piling
 Haase's System
 Sinking Drum Method
 Sack-Bour Process
 Pneumatic System
 Honigman System
 Pattberg System
 Cementation Process
 Kind-Chaudron Process
 Hydraulic-Ram Boring Process
 Freezing Process

(c) Uses of Shafts

Extraction of excavated material
 Lowering and raising of workmen
 Ventilation
 down cast
 up cast
 Extraction of water
 Transmission of power from the surface to the underground workings

(d) Cross Section

(e) Lining

Concrete (see Section 6—, Concrete)
 Steel caisson
 double walls filled with concrete
 rivet spacing
 Sandstone
 Corrugated
 Suspended
 Water rings

Exterior caulked
Water tightness
Cribbing
Punch props
Backing deals
Stringing
Sills
Walling
Walling curb
Walling platform
Tubbing
wood
kind
metal
cast iron
wrought iron
brickwork
cement

Alignment boxes
Contraction joints
Limits of excavation
Timbering (see Section 4—12, Timbering and Piling)
Allowable variation in final position of shaft
Floor construction
Roof construction
Opening of shaft
protection by gates
trap door cover
grillage

(f) Drainage

Piping
Method used
Pumps
pulsometers
reciprocating steam pumps
beam engines
sinking pumps
deep well pumps
centrifugal pumps
vertical direct drive

(g) Stairway

Covered
Width
Material
Length

(h) Refilling of Temporary Shafts

Material immediately over tunnel
rock for drainage
careful lowering of material
Distribution to prevent subsequent settling
Refilling around permanent shaft lining
Replacing of drains to prevent leakage into tunnel
Removal of timber

4-9 TUNNELING**(a) Shields**

Type
Design
strength
length of overhang or tail
Provision for safety of workmen
Jacks or rams
pressure used
number
power
locating of operating pumps
Submission of drawings for approval
Platforms
Water trap
Ejectors
Method of starting shield from shaft
Thrust from shield
Cradle for shield
Accuracy required in driving
Blasting ahead of shield
kind of explosive used
size of charge
Support of soft ground ahead of shield
Erection of
Size of enlarged chambers
Track or skids for shield

(b) Plant

Buildings
blacksmith shop
boiler house
carpenter shop
foundry
freight house
ice house
locomotive shop
machine shop
oil house
pattern shop
planing mill
pump house
sand house
store house

(c) Power Plant (see also Part II, Power Plant Design, page 29)

Construction of buildings
location (shaft)
material
fireproof
precautions for extinguishing fires
water supply
duplicate
extinguishers
hose
location of valves

Equipment

boilers
condensers
electrical machinery
lighting
hydraulic machinery
hoists
pumps
air compressors
number
capacity
pressure
for locks
for drills, hammers, etc.

Maintenance provisions

excess capacity for emergency
coal used for heating, etc.
kind
air supply
cooling apparatus for air supply
air supply taken where?
air supply pipes
size
maximum allowable velocity through them
provision for by-pass
pressure regulating valve
quality of pipe
device for deadening noise of escaping air
spare air supply plant
capacity
provision for water supply to boilers
Records of operator
revolutions per minute of compressors
pressures in air receivers, locks, headings, etc.
pressures in hydraulic machinery
instruments used
electrical records

(d) Hoisting Plant

Elevators
Cage
safety
safety catches
bronze bearings
landing dogs
devices to prevent overwinding
Cables
Brakes
Guides
Fastenings
Service cage
Engines
Rope
Pulleys
Skips

Tests of safety devices
before use
at intervals throughout use

(e) Compressed Air Requirements

Quality of air supplied
maximum amount of CO₂ allowed
volume required
Supply taken from where?
Washed
Cooled
Extraction of cylinder oil
Foul air vent pipes from shield
regulating valve
Special means for removal of blasting fumes

(f) Bulkheads

Maximum allowable distance apart
Minimum number in continuous operation
Material
brick
concrete
metal
Piping through
Provision for removal

(g) Air Locks

Minimum number of metal air locks per bulkhead
Strength
to withstand what pressure?
Dimensions
Cross-section
Heating
Ventilation
Operation of doors
Provision for looking through door
Attendance at doors
Regulation of pressure in
Number of locks
Lock tender
Emergency
Material
Inside control of air valves
Fittings for locks
pressure gauge
recording air gauge
location
provision for locking
Who keeps the key?
Maintenance of working conditions

(h) Safety Screens

Where used
Number used
Material
Bracing
Maximum allowable distance from shield

(i) Quarters for Workmen

Light
Heat
Sanitary provisions
Bathing facilities
hot and cold showers
Lockers
Facilities for resting
Facilities for drying clothing
Provisions for supplying of hot drinks

(j) Medical Attendance

Qualified medical and surgical practitioners
hours of duty
substitute in case of absence
Hospital room
attendants
number of
location
hospital locks
number
cots
telephone
air gauge
ventilation
heating
maintenance in a sanitary condition

- compartments for locking doctor in and out
- arrangement for treatment or removal of ill employees
- facilities for treatment or removal of ill employees
- facilities for investigation of physiological effects of compressed air
- collection of records
- employment of help for work under compressed air
- examination
- re-examination in case of absence from work
- sanitary conditions of tunnel
- (k) Runways
 - Width
 - Location
 - shield platform to emergency lock
 - Handrails
 - Steps
 - Ladder to track level
 - Provisions for keeping clean
- (l) Telephone Connection
 - From each lock to power house and office of engineer and main network
 - From heading to power house and main network
- (m) Lighting
 - Temporary equipment
 - maximum spacing of lights in tunnel
 - especial lighting of heading
 - electric lighting
 - candles
 - lanterns
 - insulation
 - current separate from power circuit
 - Permanent equipment
 - system used
 - direct current
 - voltage
 - alternating
 - voltage
 - phase
 - frequency
 - two-wire or three-wire
 - switchboard
 - lamps
 - arc
 - incandescent
 - supports
- (n) Haulage
 - Manual
 - Animal
 - use of animals under compressed air
 - Mechanical
 - type of locomotive used
 - electrical
 - compressed air
 - steam
 - not allowable under compressed air
 - provisions for safety
 - operators
 - cars for tunnel use
 - design
 - tightness
 - brake
 - tracks
 - grade
 - alignment
 - flooring
- (o) Lining
 - Material used
 - concrete
 - masonry
 - cast-iron
 - ordinary or standard weight
 - heavy weight
 - cast steel
 - used where
 - Length of segments

diameter
caulking pockets
caulking
treatment of joints before
caulking
air jet
water jet under high pressure
scraping
method of caulking
use of rust mixture

Details
taper rings
care used in erection
sump segments
spacing
bolts
specifications for
washers
fillets
nuts
grouting hole
leakage around bolts
grommets
metallic lead
hemp with paste of red lead
in boiled linseed oil
Provision for change in method of making joints
Sliding rings
Movable bolting platform

- (p) Screw Piles (Cast Steel)
- Bore segments
 - Plugs
 - material
 - Driving
 - loading
 - Testing
 - Bedding of piles on rock
 - Borings at site during tunnel erection
 - Delivery of sections
 - Screw pile sleeves
 - collar of sleeve
 - Dowels
 - Watertight head of screw pile
 - Concrete within screw pile
 - Measurement
 - Driving machinery
 - Voids outside of tunnel lining
 - grouting
 - drystone packing and grout
 - rubble masonry
 - provision for removing air pressure for test of tunnel
 - manholes in lining
 - Operations to prevent excessive escape of air
 - poling
 - breast boards
 - clay close to interstices
 - materials for packing space between tail of shield and lining
 - deposit of a blanket of clay on the river bed
 - law regulations

4-10 CONCRETE (see Section 6—, Concrete)

4-11 STEEL AND IRON WORK

4-12 TIMBERING AND PILING

Material
quality
Sizing
Fastenings
Water logged timber
treatment
peeling
seasoning
testing
brush treatment
open-tank treatment
cylinder treatment
Cable mat for protection
Treenails
wood
holes for
painting of
how paid for

Character of piles
manner of driving
Concrete piles
where used
Grillage foundation timber
measurement and payment
Hoistway timbering
bolting
bolt specifications
washers
countersinking
Posts
Guides
Splice plates
material
channel shops
minimum length
Splicing joints
method
Additional bracing
Alignment boxes
Ladders
Platforms
Wedging
Blocking
Cord-wood
Legging
Wall plates

4-13 VENTILATION

- (a) Who is Responsible For?
- (b) Location of Shafts or Openings
 - Down cast
 - Up cast
- (c) Method Used
 - Natural
 - Furnace
 - Steam jet
 - Waterfall
 - Mechanical
 - blowers
 - fans
 - motors
- (d) Instruments Used
 - Anemometers
 - Barometers
 - Blowers
 - Centrifugal fans
 - Dry and wet bulb thermometers
 - Fans
 - Hygrometers
 - Pitot tubes
 - Rotary ventilators
 - Steam jet
 - Thermometers
- (e) Standard of Ventilation

4-14 WATERPROOFING

- (a) Materials Used, and Quality
 - Brick mastic
 - Asphalt
 - Coal tar
 - Felt
 - Pitch
- (b) Application
 - Limits of waterproofing
 - At stations
 - Method of joining side walls, roof and floor
 - Finish of surfaces before applying
 - dryness of concrete
 - Quality of labor
 - Methods and care in applying
 - Number of piles used
 - definition of
 - Precautions after laying
 - Procedure in case of leaks
 - Precautions in regard to fire during process of applying

4-15 DRAINAGE

- (a) System Used
 - Floor of tunnel as conduit
 - Wall and arch drains
 - Subdrains
 - Cross drains
 - connections
 - Broken stone

- (b) Sumps
 - Capacity
 - Tightness
- (c) Pumps
 - Capacity
 - Discharge
 - Approval of pattern
 - Duplicate installation for emergency
- (d) Station Drainage
 - Soil pipes
 - Shaft pumps and pump chambers
 - Grades used
 - Quality of drain pipes
 - cast-iron
 - specification
 - size
 - weight
 - joints
 - tests
 - coating
 - inspection
 - valves
 - handholes
 - gratings
 - bends
- (e) Vitrified Drains
 - Definition
 - Size
 - Shape
 - Lengths
 - Joints
 - Curved pipe
 - maximum length
 - Matching
 - Burning and glazing
 - Making joints
 - Measurements

(f) Payment for Drains

4-16 PIPING, CONDUITS, ETC.

- (a) Piping
 - Use
 - water
 - high or low pressure
 - fire mains
 - gas
 - steam
 - air
 - mail tubes
 - Description
 - hub and spigot joints
 - standard dimensions
 - length exclusive of socket
 - outside diameter
 - inside diameter
 - allowable variation in thickness
 - Special castings
 - marking
 - allowable percentage variation in weight
 - quality of iron
 - tests of materials
 - casting of pipes
 - method
 - type of mould
 - length of time allowed to remain in mould
 - vertical casting
 - which end up in casting
 - quality of castings
 - cleaning and inspection
 - coating
 - inspection before coating
 - hydrostatic test
 - weighing
 - power of engineer to inspect
 - report of inspector
 - delivery of castings
 - blocking
 - wedges
 - injury of coating
 - placing of materials inside pipe
 - Laying of pipe
 - method of jointing

- packing
 - jute
 - lead
 - quality
- caulking

- (b) Conduits
 - Who places wiring?
 - Material used
 - quality
 - Tests
 - Bedding
 - Cleaning
 - Watertight joints
 - Bends and offsets
 - Maximum number of bends between outlet boxes
 - Support and protection
 - Lengths (regular)
 - Special lengths
 - Finish and cut ends
 - Single or multiple duct diameter
 - Outlet or pull boxes
 - material
 - jointing
 - covers
 - measurement for payment
 - Closures
 - Paraffined plugs
 - Fish wire
 - left in duct?

- (c) Ducts
 - Form of
 - Location of duct line
 - Dimensions
 - Combining
 - Vitrified ducts
 - quality
 - glazing
 - interior finish
 - holes
 - shape
 - size
 - how laid
 - dowel pins
 - unbleached muslin
 - mandrels
 - rodded
 - Duct manholes
 - Laying of ducts
 - line
 - grade
 - surrounding material
 - mortar
 - on curves
 - Plugging of unused ducts

4-17 GRATINGS, HAND RAILS, VAULT LIGHTS

- (a) Steel Gratings
 - Fan and ventilating chambers
 - At stations
 - Measurement
 - Payment
- (b) Hand Rails
 - Material
 - Finish
 - Fastening
 - Measurement
 - Payment
- (c) Vault Lights
 - Material
 - Where used
 - Setting
 - Joints
 - tightness
 - provision for expansion
 - packing used
 - Non-slipping treads
 - Strength
 - Minimum limit load required
 - Tests
 - expense borne by whom?
 - Measurement
 - Payment

4-18 VENTILATING SHAFTS AND FAN CHAMBERS

- Steel doors
- Ladders
- Stairways
- Landings
- Provision for use as an emergency exit

4-19 PAINTING

- Workmanship
 - weather
 - no painting in wet or freezing weather
 - painting on dry surfaces
 - brushes to be used
- Cleaning
 - scales, grease, dirt, rust, etc.
 - by wire brush
 - by sandblast
 - by pickling
- Number of coats
 - for tunnel or run
 - for stations
- Quality of paint
 - proportions
 - formulae
 - color
 - inspection
 - preparation
 - allowable variation
 - raw linseed oil
 - specifications
 - boiled linseed oil
 - requirements
 - drier
 - turpentine
 - red lead
 - mixing
 - fineness
 - composition
 - lampblack
 - magnesium silicate
 - silica
 - red iron oxide
 - sublimed white lead
 - white zinc
 - rosin
 - fineness
 - drying
 - working quality
 - standard samples
- Shop coat
 - renewal if damaged
- Special treatment
 - treatment of steel bedded in concrete
 - treatment of recesses, which could hold water
 - treatment of surfaces in contact or inaccessible
 - treatment of turned or faced surfaces
- Payments

5-ROADS AND PAVEMENTS

- GENERAL SECTIONS. (See also Section 1—, Matters Preliminary to Contracts, and Section 3—, Specifications)
- Public convenience
 - protection of fire hydrants, driveways, houses, crossings, sidewalks, etc.
 - maintenance of barriers, lights, watchmen, etc.
 - Order and progress of doing work
 - Grade and contour of pavement
 - Preservation of Engineer's stakes
 - Preservation of monuments, etc.
 - Treatment of old material
 - Storage of new material
 - Rebuilding and adjusting street structures
 - catch basins, sewer and water frames and covers, sewer inlets, water pipes and conduits

Care in setting street structures exactly to grade
 Maintenance of clean sidewalks
 Connection with existing pavement and streets
 Curbing to be completed in advance
 Final cleaning up
 No pavement to be laid in poor weather
 engineer judge as to weather conditions
 Rejection of work not in compliance with specifications
 Measurement and payment
 Incidental work at Contractor's expense
 Extra work
 Payment
 Guaranty

5-1 PREPARATION OF SUBGRADES FOR ROADS

(a) Clearing and Grubbing

Treatment of all vegetable growth
 Width of clearing
 Engineer to be notified when complete

(b) Excavating and Embanking

Conformity to lines and grades
 Earth must not be disturbed below sub-grade
 Treatment of soft spots below sub-grade
 Disposal of excess material
 Use of spoil banks
 Appearance of finished surface
 Drainage ditches

(c) Rolling the Roadbed

Type of roller
 Weight of roller
 Duration of rolling
 Method of rolling old roadbed
 Treatment of soft spots
 Treatment of areas inaccessible to roller
 Optional treatment in case of sandy soil

5-2 BROKEN STONE ROAD

(a) Subbase Course (see Section 5-1.)

First, second and third courses
 sizes of stone used
 thickness of each course after rolling

(b) Rolling

Weight and type of roller used
 Method of duration of rolling
 Each course to be true to grade and cross-section tests

(c) Screenings

Care used in spreading
 Excess of screenings to be avoided
 Rolling
 Measurement and payment

(d) Broken Stone

Quality—trap rock, granite, hard limestone, etc.
 Tests for abrasion
 toughness
 Samples furnished to be representative
 Definition of sizes
 dust
 screenings
 Nos. 1, 2, 3 and 4
 tailings
 Crusher plant
 stationary
 portable
 supervision
 Measurement and payment

5-3 CONCRETE PAVEMENT

One or Two Course
 (clauses necessary for two course work enclosed in [....])

(a) Materials

Cement (see Section 6-1a, Cement)
 Coarse aggregate for lower course (see Section 6-1c, Stone)
 Fine aggregation for lower course (see Section 6-1c, Stone)
 [Aggregate for wearing course]
 Use of run of pit gravel
 prohibit or limit its use
 Water (see Section 6-1d, Water)
 Bituminous filler for expansion joints
 quality
 Bituminous material for surface coating
 quality
 Protection plates for expansion joints
 size and character
 Reinforcing metal (see Section 6-7, Reinforcing Steel)
 Gravel or chips for bituminous surfacing

(b) Machinery

Concrete mixer
 type
 approval of Engineer
 Roller
 design
 weight

(c) Earthwork

Excavation
 accurate to lines and grades
 disposal of material
 embankments
 method of placing and compacting
 facing
 Roadbed
 method of preparation before placing concrete
 Shoulders and side roads
 Under drains and lateral drains
 Side forms

(d) Placing Concrete

Thickness of concrete in each course
 Crown given to surface
 Proportions for concrete
 [Proportions of concrete for lower course]
 [Proportion of concrete for upper course]
 Placing of reinforcing materials
 Placing expansion joints
 Mixing and placing concrete (see Section 6-2, Mixing; and Section 6-4, Placing)
 [Placing concrete for lower course]
 [Placing concrete for upper course]
 Finishing the surface
 Beveled edges
 extent
 Curing the concrete
 protection against too rapid drying
 protection against too early traffic
 Placing macadam or gravel shoulders
 Cleaning up

(e) Bituminous Coating

Preparing surface for bituminous coating
 Composition of coating
 specifications
 Initial protection by screenings

5-4 ASPHALT PAVEMENT

(a) Sub-grade (see Section 5-1.)

(b) Foundation

Hydraulic cement concrete (see Section 5-3, Concrete Pavement)

Stone blocks relaid (see Section 5-6, Granite Block Pavement)
 defective areas to be replaced before applying wearing course

(c) Pavement to be Constructed in Two Courses

Base course
 thickness
 Surface course
 thickness

(d) Preparation of Cementing Element

From crude, native, solid asphalts
 From proper distillation of crude asphaltic oils
 Rejection of low grade asphalt
 Refined asphalt
 composition
 properties
 tests
 heat test
 water test
 Use of suitable apparatus for distilling
 Full information of source and character of crude asphalt to be furnished to Engineer

(e) Bitumens Excluded

(f) Softening or Tempering Agent

Properties
 Composition

(g) Sand

Silicious
 Free from organic matter, mica, soft grains, etc.
 Maximum allowable percentage of foreign substances
 Sharp assorted sizes
 Maximum percentage of voids
 Sieve test

(h) Pulverized Stone

Material
 Percentage of various sizes
 Substitution of Portland cement for pulverized stone
 Stone must be dry when used

(i) Asphaltic Paving Cement

Preparation
 Composition
 refined asphalt
 tempering agent
 limiting percentage of ingredients
 Agitation
 Test with standard Dow penetration apparatus
 Viscosity

(j) Wearing Course

Composition
 Mixing
 Sand separately heated
 placed in mixer first
 limiting temperatures on placing
 Pulverized stone heated second
 mixed with sand before adding asphalt cement
 no flame allowed in contact with stone
 temperature limits
 Heating asphalt cement
 temperature limits
 rejection of cement heated above limit
 thermometers
 suitable and accurate
 furnished by Contractor
 Care to accurately weigh and proportion materials charged

(k) Application

Mixing
 type of mixer
 capacity
 approval of design
 temperature limits of mixture at discharge

weighing and measuring devices accurate
 Laying asphalt pavement
 surface of base must be dry and clean
 adjacent surfaces sprinkled to prevent dust
 temperature of air and climatic conditions
 temperature of mixture on unloading
 prevention of heat loss in transportation from mixer to work
 method of placing
 dumped in piles outside of work and raked
 Laying base course
 voids must be completely filled
 average thickness after rolling
 freedom from depressions and irregularities
 joints between hot and cold materials reduced to a minimum
 rolling
 design and weight of rollers
 method of rolling
 testing contour of surface
 templates, straight edges
 maximum allowable deviation
 no hauling over course until surface course is applied
 Laying surface course
 breaks in lower course repaired
 surface must be clean
 painting of exposed surfaces of curbs, manholes, etc., with hot pitch before laying
 removal and replacing of wearing course for inspection
 hand rolling, smoothing irons
 heavy rolling as soon as possible
 method and duration
 contour and grade accurate
 test of grade by template
 maximum allowable deviation from true grade
 Treatment around street R. R. tracks
 sub-grade and pavement foundation under tracks
 special mixture in contact with rails
 tamping of concrete around rail
 treatment of contact
 heating of rails in cool weather before placing asphalt
 use of paving blocks or bricks
 method of setting
 filler

(l) Measurement and Payment

(m) Delivery of Materials

Suitable containers for asphalt
 Container to be labeled
 Each shipment to be kept separate
 Bills of lading accessible to Engineer
 Samples furnished from each carload

5-5 ASPHALT BLOCK PAVEMENT

(a) Sub-grade (see Section 5-1.)

(b) Foundation

Hydraulic concrete
 Broken stone

(c) Asphalt Blocks

Dimensions
 same for blocks on same street
 Defective blocks to be rejected
 Material and composition
 trap rock or limestone
 sand
 pulverized stone
 asphaltic cement
 Manufacture
 materials to be thoroughly mixed
 temperatures of ingredients and mixture
 minimum pressure used

blocks cooled in air or water?
 specific gravity of blocks
 maximum percentage of water absorbed when immersed
 rattler test
 maximum allowable loss in percentage

(d) Laying Blocks

Foundation clean and dry
 Small blocks set on mortar base
 Large blocks set on sand cushion
 Mortar composition wet
 thickness of layer
 leveled by templates
 Blocks set with longest dimension across the street
 set as close together as possible
 Blocks to break joints
 Only whole blocks to be used except at edges of pavement
 Each course laid continuously
 Method of compacting ends of course
 Tamping
 Poorly set blocks replaced
 Test by template or straight edge
 Layer of sand placed on top
 Treatment around R. R. tracks (see Sections 5-4k and 5-6e, Application)
 Street not opened to travel until Engineer allows

5-6 GRANITE BLOCK PAVEMENT

(a) Preparation of Sub-grade (see Section 5-1)

(b) Foundation

Hydraulic cement (see Section 5-3, Concrete Pavement)

(c) Granite Blocks

Quality
 Properties
 No rock outcrop or seamy stone allowed
 Blocks from different quarries kept separate and laid together
 Blocks to be properly culled
 Dimensions
 Test of blocks
 for toughness
 for abrasion

(d) Sand Cushion

Depth after ramming blocks

(e) Application

Setting blocks
 perpendicular to street surface
 length at right angles to street
 method at street intersections
 Ramming
 each block to be rammed
 rammers
 weight
 material
 Filling of joints
 use of gravel
 limiting sizes
 freedom from foreign matter
 mixture with bituminous paving cement
 joints first filled with dry gravel
 heated to defined limits
 paving cement poured thereon
 alternative filled—Portland cement grout
 composition of grout
 mixing
 care and timing of work
 Fitting paving around other structures
 street R. R. tracks
 sub-grade to extend under rail uninterrupted
 mortar for filling
 composition
 arrangement of courses close to rail

Bridge stone crossings
 same material as blocks
 limiting dimensions
 angle of ends
 set in advance of paving blocks

(f) Measurement and Payment

5-7 BRICK PAVEMENT

(a) Sub-grade (see Section 5-1)

(b) Foundation

Hydraulic concrete (see Section 5-3, Concrete Pavement)
 thickness
 surface true to cross-section

(c) Sand Cushion

Depth after rolling
 Quality of sand
 Shaped to specified cross-section
 Template and guide timbers
 Rolling
 hand roller
 weight and diameter
 minimum length of handle
 Cushion not to be disturbed before laying brick

(d) Paving Brick

Dimensions
 Brand
 Shape
 No distorted bricks allowed
 Lugs or raised letters permitted?
 Manufactured especially for paving purposes
 Changes in brand and color allowed?
 Uniform burn
 Color
 Annealed
 Special brick for steep grades
 Free from flaws, cracks, etc.
 Tests
 number of bricks
 rattler test
 allowable average and maximum losses
 water test
 rejected bricks kept separate and labeled conspicuously
 samples submitted to be representative
 delivery of brick
 Inspection
 Storage
 Care used in handling
 Method of transportation from piles to work

(e) Application

Setting brick
 method of arranging courses
 on straight stretches
 on curves
 on street intersections
 beside curbs, tracks, manholes, etc.
 lugs to be laid in one direction
 Rolling and ramming brick
 method pursued
 type and weight of roller
 test of surface after rolling
 use of straight edge and template
 length
 maximum allowable distortion
 Filling joints
 material used
 asphalt filler
 pitch and bituminous cement
 hydraulic cement grout
 method of filling
 type of distributor used
 grout to be kept in constant motion until in place
 bricks to be wet before filling
 treatment of expansion joints
 Travel excluded from pavement

5-8 WOOD BLOCK PAVEMENT

- (a) Sub-grade (see Section 5-1)
- (b) Foundation
 - Portland cement concrete
- (c) Wood Blocks
 - Material
 - One kind only on a job
 - Sizes
 - Only wood from live, sound trees to be used
 - Blocks to have square corners
 - Chamfered blocks for grades
- (d) Preservative
 - Creosote oil
 - composition
 - method of manufacture
 - kinds of oil rejected
 - Treatment
 - kind
 - all parts of block to be impregnated
 - maximum allowable dilution of oil by water during process
 - determination of quantity of oil injected
 - test
 - only seasoned blocks to be treated
- (e) Laying Blocks
 - Foundation clean
 - Use of sand cushion
 - Blocks to be kept wet by sprinkling before laying
 - Layer of mortar
 - blocks set in mortar to be rolled before it has set
 - Method of coursing
 - at street intersections, manholes, tracks, etc.
 - Grain of blocks set perpendicular to base
 - One row parallel to curb
 - Blocks set close together as possible
 - Blocks to be rammed
 - method
 - Finished surface true to grade and cross section
 - Are joints to be filled?
 - material
 - sand
 - bituminous filler
 - specifications
 - Inspection
 - Expansion joints
 - maximum spacing
 - method of construction
 - Street not open to travel until Engineer directs

5-9 BITUMINOUS CONCRETE PAVEMENT

- (a) Sub-grade (see Section 5-1)
- (b) Foundation
 - Old Macadam pavement
 - leveling or dressing down
 - care to prevent undue disturbance of original pavement
 - treatment of newly dug or filled trenches
 - use of hydraulic cement in leveling roadway
 - Old stone or brick pavement
 - use if in good condition
 - if reset, grout to be used for joints
 - treatment of holes or depressions
 - Hydraulic cement foundations (see Section 5-3, Concrete Pavement)
 - Broken stone foundations (see Section 5-2, Broken Stone Road)
 - No travel permitted on foundation until surface is placed

- (c) Bituminous Concrete
 - Composition
 - crushed stone (see Section 5-2c)
 - sand (see Section 5-4g)
 - pulverized stone (see Section 5-4h)
 - substitution of hydraulic cement
 - asphaltic cement
 - percentage, by weight, of ingredients
 - Mixing
 - Placing
 - temperature at unloading mixture
 - spreading
 - Test

5-10 GROUTED PAVEMENT**5-20 GENERAL SPECIFICATIONS FOR EXPERIMENTAL OR UNTRIED PAVEMENTS**

- (a) Contractors Submitting Proposals for Construction of New Pavements Must Submit Specifications
- (b) Special Guaranty
 - Minimum duration of pavement in good condition
 - Contractor to maintain pavement in good condition for specified time at his own expense
 - Engineer or successor the judge as to condition
 - Procedure on failure of Contractor to repair or replace
- (c) Bond Given by Contractor
 - Amount
 - Surety

5-30 HYDRAULIC CEMENT CONCRETE COMBINED CURB AND GUTTER

- (a) Design
 - Made in accordance with plans
 - Provision for variation in cross-section at special places
- (b) Excavation
 - Drainage trench
 - limiting dimensions
 - filling
 - broken stone
 - coarse gravel
 - method of filling
 - drain connected to sewer at suitable intervals
- (c) Concrete (see Section 6—, Concrete; also Section 5-3, Concrete Pavement)
 - Single rich mixture or core with facing
- (d) Application
 - Expansion joints
 - length between joints
 - widths of joint
 - Circular corners at street intersections
 - Corner protection
 - Finishing of surface
 - Forms
 - Protection during work
 - Replacing injured work
- (e) Measurement and Payment

5-40 HYDRAULIC CONCRETE SIDEWALKS

- (a) Design
 - Number of courses
 - Width
 - Distance from outer curbing
- (b) Excavation and Grading
 - Preparation of sub-grade
 - Drainage course
 - broken stone
 - gravel

boiler-room cinders
use preceded by thorough wetting
rolling or ramming
connection to street drains

- (c) Concrete Lower Course (see Section 5-3, Concrete Pavement)
 - Maximum size of crushed stone used
 - Grade
- (d) Surface or Finishing Course
 - Thickness
 - Composition
 - Wet mixture
 - Care to obtain uniform consistency throughout
 - Finishing surface
 - Rounding corners
- (e) Application
 - Forms
 - Expansion joints
 - spacing
 - method of construction
 - transverse joints
 - joints between curb and walk
 - Protection during and immediately following construction
 - Regarding after removal of forms
 - use of rich surface soil
- (f) Defects Repaired for Specified Time by Contractor
- (g) Measurement and Payment

6-CONCRETE**6-1 COMPOSITON**

Give proportions for various classes of work

- (a) Cement
 - Grades
 - specify grades for various classes of work
 - portland
 - natural
 - puzzolan, slag, or tufa
 - silica or sand
 - mixtures
 - conformation of grade to local building ordinances
 - Form of proposal for furnishing cement
 - Brand
 - list of brands used given to Engineer by Contractor
 - brand chosen to have been in use on work of equal importance
 - reputation of Manufacturer
 - requirements in case of use of unknown brand
 - change of brand for work undesirable
 - maximum number of brands allowed on work
 - mixing of brands not allowed
 - color of brands to be uniform
 - brand to receive approval of Engineer
 - well known brand may be approved on short time tests
 - failure of brand to prohibit further use on work
 - Shipment of cement
 - sealing of each package
 - responsibility for damage
 - prevention of substitutions in transit
 - contractor responsible for demurrage
 - box cars not allowed for storage purposes
 - notice sent to Engineer of arrival
 - contractor to provide for unloading, hauling and storage of cement
 - procedure in case of shortage

method of packing and shipping
barrels
bags
stout paper
cloth
bulk canvas
trade-mark on each package
capacity of packages
condition at delivery
treatment of broken barrels or sacks
protection of cement during shipment from rain and moisture
marking of gross weight on packages
maximum allowable percentage for leakage
barrels properly lined
prompt unloading of cars
delay of delivery may prohibit use on work
size of shipment
bills of lading accessible to Engineer

Storing of cement
storehouses
location near work
precautions when located near sea or in a damp place
size
weathertight
protection against moisture and drafts
floors raised from ground
provided with scales for weighing

method of storing
each shipment kept separate
aisles for access of inspectors
system for location of any package
stored so that older cement will be used first
identification marks on each package
disturbance of

storekeepers
competency
keeping of records
minimum allowable amount of accepted cement kept in store
disposition of empty sacks
storage of cement in the open
maximum allowable amount
protection from weather

Tests

sampling of cement for testing
method used, from
carload lots
barrels
bags
storehouse
sample representative of what quantity?
mixing of samples (allowable or not?)
no extension of time granted Contractor due to delay caused by tests
performance by competent persons
re-testing of cement stored beyond a certain time
mill inspection and tests
certificate of manufacture
date of manufacture
tests and analyses
statement that cement is not adulterated
contractor to furnish copies of mill tests
inspection of raw materials and methods of manufacture
tests made in presence of Engineer or representative
contractor to furnish acceptable inspectors
records of inspection at disposal of Engineer

facilities for mill inspection
manufacturer to furnish necessary tools, labor, etc., for inspection
expense included in bid
provision for inspection en route
provision for inspection at delivery
provision for inspection in storage
field inspection and tests
contractor to furnish suitable house
equipment
heating
simple field tests
mortar box tests
laboratory inspection and tests
selection by approval of Engineer
expense borne by whom
protection of samples shipped to laboratory
sample accompanied by manifest giving complete data of same
quantity of sample
marking of sample
time of sending
charges prepaid
identity of maker given or withheld?
visiting of laboratory by interested parties
tests made in accordance with methods suggested by the committee on Uniform Tests of Cement of the American Society of Civil Engineers
records of tests
limits of accuracy desired in per cent

Requirements for use of cement
no cement used on work that has not been accepted by the Engineer
cement that has been exposed to moisture rejected
lumpy cement
rejected or pulverized?
right of Engineer to make extended tests
papers and all rubbish to be removed from cement
unnecessary use and waste of cement
deduction for excess
where finished work contains more than is specified
abandoned concrete (mixed but not placed)
loss in transmission to work
loss by spilling
allowable percentage lost
use of less cement
manufacturer must guarantee recent aeration of cement

Acceptance of cement
requirements
uniformity
fineness
specific gravity
time of setting
tensile strength
constancy of volume
boiling water test
chemical composition
color
microscopic test
tagging of accepted cement
Rejection of cement
removal of rejected cement by Contractor
expense borne by Contractor
time limit
freight on rejected cement
removing work due to defective cement
expense borne by Contractor

caked cement to be rejected
prompt removal of acceptance seal from rejected cement
adulterated cement to be rejected
decision of Engineer to reject cement to be final

Measurement
unit of measure
Payment

(b) Sand

Where obtainable
Coarse
Sharp
Silicious
Maximum percentage of mica, loam, dirt or clay allowed therein
Use of local sands
Fineness
Submission of samples to Engineer
size of samples
name of collector
Measurement
Payment

(c) Stone

Kinds of rock permitted
Gravel
Limestone
Igneous rock
Mixture
Limiting sizes of crushed stone
"Run" of crusher permitted?
Use of local stone
permitted under what conditions?
Submission of samples to Engineer
size of sample
name of collector
Screening
Washing
Use of large stones for rubble concrete or cyclopean masonry
method of placing
Measurement
Payment

(d) Water

Composition
Means for measuring

6-2 MIXING

(a) By Hand

Method used
Size of batches

(b) By Machine

Type of mixer used
Approval of Engineer
Provision for inspection of mixing

(c) Methods of Determining Proportions

Measures used
Mechanical analyses
Allowances for moisture

(d) Details

Cleanliness of ingredients before mixing
Location of mixing apparatus
Retempering
Remixing of concrete compacted in transportation
Mixture used for steep slopes

6-3 TRANSPORTATION FROM MIXER TO WORK

Cars, wagons, buckets, etc.
tightness
approval of design
Rapidity of transportation
Maximum allowable time between mixing and placing

6-4 PLACING

(a) Methods Used

Hand
Chutes
Spouting plants
Buckets

(b) Application

Size of batches
Order used in placing
Thickness of layers
Length of sections
Compacting
"joggled" to expel air
ramming
spading

(c) Details

Imperfections in placing
Maximum drop allowed
Keeping concrete moist after placing length of time
Care used in placing around pipes, ducts, etc.
Time allowed for setting
Finish of surfaces that will set before adjoining concrete is placed

(d) Placing Concrete Under Water

Chutes
Bags
Buckets

(e) Placing Concrete in Compressed Air**(f) Procedure When Placing on**

Rock
cleaning
Earth
ramming
Old concrete
dovetails or grooves
cleaning
wetting
coating of cement or mortar
Cast-iron or steel lining

(g) Precautions During Freezing Weather

Placed on approval of Engineer
Apparatus for heating materials used
Salt hay
Canvas
Tarpaulin
Method for keeping air warm under covering

(h) Precautions in Hot Weather

Covering to prevent rapid drying
Wetting of concrete

(i) Protection of Fresh Concrete from Injury**(j) Expansion Joints****6-5 FORMS AND MOULDS**

Design
Material used
wood
metal
How set
Precautions in placing
Strength to withstand ramming
Tightness
Caulking
Cleaning and wetting
Soaping or oiling to prevent adhesion of concrete
Material to give smooth finish to concrete
Provision for rejection of unsatisfactory forms
Supports for forms
rods
removal
plugging of resulting voids

Removal of forms
Replacing of old forms
Invert forms for tunnels
built for flowing concrete beneath, not screeding
Panels for weepers

6-6 SURFACE FINISH

Rough surface for plastering
Surfacing for waterproofing
Brush coat of grout
Granolithic finish
Surfacing with mortar
Preparation for surfacing
scrubbing
washing with acid
tool dressing

6-7 REINFORCING STEEL

Classes
plain
deformed
cold twisted
Basis of purchase
Manufacture
bessemer
open hearth
no rerolled material
twisting
Chemical properties and tests
maximum allowable percentage of phosphorus
Physical properties and tests
tension tests
modifications in elongation
bend tests
Permissible variations in weight
Finish
Inspection
Rejection
Placing
Fastening
Protection

6-8 GROUT**(a) Time for Grouting****(b) Steel Pipe for**

Where used
Standard weight
Placing

(c) Plant and Equipment for Grouting

Compressors
capacity
pressure used
cooling
gauges
portability
valves and connections
maximum allowable weight
submission of designs
Grouting machines
design
strength
hydraulic pipe and fittings
making connections to piping
sizes
tests

(d) Sand for Grout

Fineness
Storing
Protection from moisture

(e) Mixing and Placing of Grout

Consistency
Freedom from lumps when put in mixer

Continuous feeding of section
Uniform delivery
Grout not be forced long distances
Order of grouting sections
Regrouting and blowing water

(f) Grouting Pads

Number
Material
Strength
Gaskets
Material and workmanship
Setting grouting pads
method
tightness
leaks

(g) Sulphate of Alumina for Waterproofing Grout**6-9 MASS CONCRETE**

Materials
Proportions

6-10 CYCLOPEAN MASONRY

Proportions of concrete used
Placed wet
Method and care in placing
Bonding of stones used
Size and shape of stones
Racking
Trowel work
Expansion joints
Intervals
Type
Cold water paint to prevent adhesion
Facing
Finishing

6-11 CONCRETE BLOCKS

Where used
Cement (see Section 6-1a)
Sand
Aggregates
Methods of manufacture
Unit of measure
Proportions
Mixing
Moulding
Steel rods
Curing
protection
Minimum age before using
Marking
Mortar for joints
Maximum unit load to be placed on blocks
Size and dimensions
Setting blocks
Bonding
Pointing and repointing joints
Care in storage and handling
Protecting and sprinkling
Preliminary tests
Additional tests
Test requirements
Representative sample
Marking of samples
Transverse test
Compression test
Ultimate test
Condemned blocks to be destroyed

7-DAMS

(See Dams under Hydro-Electric Construction in Power Plant Digest, page 46.)

PART II—POWER PLANT DESIGN

1—GENERAL CLAUSES

This section is intended to cover the questions that must be answered in the General Clauses which should accompany every set or section of specifications sent out for bids.

1-1 CONTRACT MEANING OF TERMS USED

- (a) Owner
- (b) Architect
- (c) Purchaser's Representative
- (d) Or Equal Approved

1-2 STANDARD APPARATUS

- (a) Is Standard Apparatus to be Estimated on Even if it Does not Strictly Comply with Specifications?
- (b) How Shall Deviations from Specifications or Plans be Noted by Bidder?
- (c) How Shall Deviations from Specifications or Plans be Controlled?

1-3 CONTRACT BASIS

- (a) On Purchaser's Specification
- (b) On Bidder's Proposal
- (c) On Combination of Above

1-4 DRAWINGS

- (a) Are Any Items not Shown on Drawings Required?
- (b) Are Any Items Required if Shown on Drawings, but not Specified?
- (c) Are Drawings Approximate or Definite?
Scale or figured dimensions have preference?
Centering of electric outlets in panels and ceilings
- (d) Will Copies of Drawings be Given to Bidders?
Time allowed for taking off quantities
Penalty for failure to return in specified time
Keeping clean and free from marks
Supply of copies after award of contract by whom?
Whose property are drawings given to Contractor?
- (e) Measurements on Buildings
Made by whom?

1-5 MATERIALS

- (a) Quality of Materials
- (b) Small Details Required for Complete Finish, if not Specified or Shown, Supplied by Contractor without Extra Charge?
- (c) Completion to Satisfy Reasonable Requirements of Whom?
- (d) Pending Completion Has Purchaser Right to Operate Apparatus or Shall Contractor Control until Acceptance?
- (e) Samples of Materials
- (f) Who Supplies Tools, Derricks, Scaffolding, Hoists, etc.?
- (g) Who Pays Freight Charges?
- (h) Any Penalty on Contractor for Failure to Pay Freight and Other Charges?

1-6 WORKMANSHIP

- (a) Quality of Work Demanded
- (b) Who Condemns Defective Work?

- (c) Are Inspections on Contractor's or Client's Behalf?
- (d) How Shall Contractor Check the Quality of Work?

1-7 LABOR

- (a) Shall Labor be Union Labor?
- (b) Who Decides Which Union if Two Exist in Same Trade?
- (c) Procedure with Intoxicated or Troublesome Workmen

1-8 DELIVERY AND STORAGE

- (a) Where Is Date of Delivery Noted?
- (b) Can Premises be Used for Storage Pending Construction?
- (c) Who Pays for Storage of Material, if Required, at Manufacturer's Plant or Elsewhere Away from Premises?

1-9 WORK OF OTHER CONTRACTORS

- (a) Co-operation
- (b) No Interference with Work of Others
- (c) No Damage to Work of Others

1-10 SUB-CONTRACTORS

- (a) Allowed or Not?
- (b) Names to be Submitted to Whom?
- (c) Names to be Approved by Whom?
- (d) No Relief from Responsibility?

1-11 DAMAGE TO WORK

- (a) Who Takes Risk of Damage After Delivery?
- (b) Who Provides Protection during Construction?
- (c) If It Is Impossible to Prevent Damage, What Notices Must be Sent and to Whom?

1-12 INSURANCE

- (a) Who Supplies Fire Insurance?
- (b) Who Supplies Liability Insurance?
- (c) Who Supplies Boiler Insurance?

1-13 PATENTS

- (a) No Unlawful Use
- (b) Defense of Suits
- (c) Payments of Judgments
- (d) Payments of Royalties

1-14 EXCAVATION AND CUTTING

- (a) Who Does Excavation?
- (b) Who Does Cutting?
- (c) Who Cleans Up?
- (d) Who Carts Away Debris?

1-15 CHANGES

- (a) Changes not Involving Extra Cost to Contractor?
- (b) Changes Involving Extra Cost to Contractor?
- (c) Changes Reducing Cost to Contractor?
How will these be charged for?
Any allowance to be made for omissions?
- (d) How Ordered?

1-16 EXTRA WORK

- (a) Extra Work Subject to Specifications?
- (b) Additions and Omissions (see Section 1-15, Changes)
- (c) How Ordered?
- (d) How Checked?

- (e) Percentage to be Charged above Cost:

What shall "Cost" include?
Any allowance for office expenses, superintendence, tools, insurance, etc.?

- (f) Any Estimates Required?
How detailed?
- (g) In Event of Dispute as to Value, Who Shall Decide?
- (h) Pending Settlement of Dispute What Action Shall be Taken?

1-17 OVERTIME

- (a) Rate for Overtime
- (b) Who Pays for Overtime Work?
- (c) Is Full Cost of Overtime Work to be Paid, or Only Additional Cost?
- (d) Where Overtime Is Necessitated Through Failure of Contractor, Who Pays?
- (e) How Ordered?
- (f) How Checked?

1-18 TESTS AT FACTORY

- (a) Required with What Apparatus?
- (b) Who Makes Test?
Who supplies load?
Who supplies instruments?
- (c) Witnessed by Whom?
- (d) What Expenses of Inspector Are to be Paid by Contractor?
Traveling
Hotel
Inspection charge
- (e) Where Are Test Requirements Detailed?
In section of specification or in contract
- (f) Any Preliminary Test to be Made Before Making Witness Test?
- (g) Is Test at Factory an Acceptance Test?

1-19 TESTS OF BUILDING

- What Tests Will be Made?
- (a) Electric-Wiring Installation
Insulation
Voltage drop under load
- (b) Engines and Turbines
Capacity
Valve setting
Efficiencies at what loads? (Mechanical efficiency and steam consumption per horse-power hour)
Regulation
Noiseless operation and freedom from vibration
For internal-combustion engines and compressors, amount of water used for cooling
Other contract requirements
- (c) Dynamos
Capacity
Efficiencies
Temperature rise
Compounding
Voltage regulation
Commutator
Balance (electrical and mechanical)
Noiseless operation
Other contract requirements
- (d) Refrigeration Machinery
Capacity of machine
Ice-making capacity

Room and box temperature
Water cooling
Efficiencies
Amount of cooling water required
Absence of leaks
Noiseless operation and freedom from vibration
Other contract requirements

(e) Boilers and Producers

Capacity
Quality of steam and gas
Freedom from leaks
Other contract requirements

(f) Piping Systems

Freedom from leaks
Pressure drop (if this is specified)

(g) Storage Battery

Capacity
Absence of buckling
Regulation
Other contract requirements

(h) Heating and Cooling Systems

Freedom from noise
Freedom from water hammer
Freedom from trapped pipes
Circulation
Meeting contract requirements of temperature and humidities
Regulation of temperatures
Absence of leaks
Other contract requirements

1-20 GUARANTEES

(a) Against What Defects?

Design
Workmanship
Material
Delays
Insufficiency

(b) Term of Guarantee

Starts with what date?

(c) Bond Required

For what amount?
Extends until what time?
Character of sureties required

(d) Repair of Defects

Who makes?
Are repairs to be f. o. b. shop, or are repairs to be made on the job?
Time allowed?
Notice sent by whom—client, architect, consulting engineer, contractor, bonding company—and to whom?

(e) In Event of Failure to Make Good Procedure

How will cost of making good be charged?
What charge for supervision of repairs?
Privilege of rejection
Right to recall payments?
Right to use installation and deduct fair value of repair of defects?

1-21 PERMITS AND CERTIFICATES

(a) Who Applies for Permits and Certificates?

From insurance authorities
From State and municipal authorities

(b) Who Pays for Permits, Certificates and Inspections?

1-22 PAYMENTS

(a) Made by Whom?

(b) On Whose Approval, How Evidenced?

(c) First Payment When?

(d) Other Payments When?

(e) Final Payment When?

(f) If Delivery or Final Acceptance Is Delayed on Purchaser's Account, When Will Payments be Made?

2-BOILERS AND STACKS

NOTE: Under this section are grouped matters belonging strictly to the steam-generating plant: Boilers, Setting, Superheaters, Stokers, Fuel Supply and Ash Removal, Oil-Burning and Gas-Burning Equipment, Smoke Stack. Following established custom, Smoke Breeching will be found under the steam-fitting section (No. 4-1 *et seq.*), where also the auxiliaries of the boiler plant appear.

Items marked with an asterisk (*) may be specified or, preferably, left for the boiler maker to specify. They are noted here to call attention to the necessity for definite knowledge and understanding on these points before the contract is placed.

2-1 TYPE OF BOILER

- (a) Horizontal Fire-tube
- (b) Vertical Fire-tube
- (c) Horizontal Water-tube
- (d) Vertical Water-tube
- (e) Enclosed Fire-box Types
 - Marine
 - Sectional
 - Locomotive

2-2 GENERAL DESCRIPTION

- (a) Number
- (b) Horse Power Required
 - Number of sq. ft. heating surface per horse power
 - Even load or varying load?
- (c) Character of Fuel
 - Coal
 - Oil
 - Gas
- (d) Diameter of Shell (Horizontal Fire-tube), Steam Drum (Water-tube)
 - Number of courses
- (e) Number and Length of Tubes
- (f) Diameter of Tubes
- (g) Arrangement of Setting
 - Single or in battery
- (h) Height and Diameter of Stack. (See also Section 2-27, Smoke Stack)

2-3 DIRECTIONS AS TO DELIVERY AND ERECTION

- (a) Who Supplies Boilers, Castings and Trimmings, f. o. b. Cars?
- (b) Who Takes Boilers, etc., from Cars and Erects? Cribbing Furnished by Whom? Horizontal Fire-tube, Water-tube
- (c) Who Sets up Castings?
- (d) Who Does Mason Work?
- (e) Who Makes Smoke Connections?
- (f) Date of Delivery Desired?
- (g) Provision for Expansion in Boilers
- (h) Provision for Expansion in Fronts
- (i) Provision for Expansion in Grates
- (j) Who Furnishes Water for Erection and Test?

2-4 METHOD OF SUPPORT

- (a) By Lugs (Horizontal Fire-tube, Water-tube)

(b) From Beams (Horizontal Fire-tube, Water-tube)

(c) Saddles (Enclosed Fire-box)

2-5 WORKING PRESSURE

- (a) Working Pressure
- (b) How Test Is to Be Applied
- (c) Inspection by Whom?
- (d) Safety Valves Set at What Pressure?

2-6 THICKNESS

- (a) Heads
- (b) Shell or Steam Drum
- (c) Front
- (d) Furnace (Enclosed Fire-box)
- (e) Mud Drum (Water-tube)

2-7 GRATES

- (a) Length
- (b) Width
- (c) Type
 - Stationary, shaking, dumping, horizontal or inclined
- (d) Air Space and Percentage of Air Space
- (e) Height above Floor
- (f) Pitch
- (g) Method of Support
- (h) Furnished by Whom?
- (i) Installed by Whom?
- (j) Weight per Square Foot
- (k) Any Mechanical Stoker?
- (l) Any Fuel Conveyor?

2-8 MANHOLES AND HANDHOLES

- (a) Number
- (b) Size
- (c) Location
- (d) Type of Covers
- (e) Reinforcing of Openings
- (f) Material of Covers
- (g) Gaskets
- (h) Wrench

2-9 STEAM OUTLETS

- (a) Number
- (b) Size
- (c) Construction
 - Flanged or screwed
 - Forged, pressed or cast steel, cast-iron. Standard or extra-heavy
 - Length of nozzle
- (d) Water Separator
 - Construction
 - How connected to steam outlet?

2-10 ANY DOME (HORIZONTAL FIRE-TUBE)

- (a) Diameter
- (b) Height
- (c) Detail

2-11 OTHER OUTLETS

- (a) Water Column, Sizes
- (b) Feed, Sizes
- (c) Blow-off, Sizes
- (d) Surface Blow-off, Sizes
- (e) Safety Plug, Sizes

2-12 OUTLETS IN FRONTS

- (a) Water Column, Sizes
- (b) Feed, Sizes
- (c) Blow-off from Column, Sizes
- (d) Tube Doors, Sizes

- (e) Fire Doors, Sizes
- (f) Ash Doors, Sizes
- (g) Return Flue Door, Sizes
(Horizontal Fire-tube)

2-13 OPENINGS IN SETTINGS

- (a) Manholes
- (b) Steam Pipes
- (c) Clean-out
- (d) Blow-offs
- (e) Water-leg Clean-outs (Enclosed Fire-box)
- (f) Soot Doors (Water-tube)

2-14 ITEMS TO BE FURNISHED

- (a) Water Separator
Type
Size
Allowed makes
- (b) Plates and Rollers for Lugs (Horizontal Fire-tube)
Size and construction
- (c) Internal Feed Pipe
How supported?
Size, diameter and length of pipe
- (d) Fusible Plug
- (e) Water Column
Type
Size
Kind of gage cocks
Kind of gage glass
Allowed makes
High- and low-water alarm
Feed-water level regulator
- (f) Steam Gage
Size
Finish
Pressure range
Allowed makes
Who connects?
Method of support
- (g) Blow-off Cock
Type and size
Allowed makes
- (h) Blow-off Valves
Type and size
Allowed makes
- (i) Feed Valves
Type and sizes
Allowed makes
- (j) Check Valves
Trimnings
Method of support
Allowed makes
- (k) Water-column Valves
Trimnings
Method of support
Allowed makes
- (l) Safety Valve
Type
Trimnings
Method of support
Allowed makes
Discharge carried where?
- (m) Stack Plate (Horizontal Fire-tube)
- (n) Dead Plate
- (o) Arches and Jambs and Rear Arches, Baffle Tiles
- (p) Manhole Frames
- (q) Clean-out Frames and Doors
- (r) Buckstays
Number, length and type
- (s) Tie Rods
Where required?
How fastened?

- (t) Superheater
- (u) Tube Cleaners
Number
Type
Allowed makes
- (v) Special Systems of Draft-control
With or without mechanical draft?
Allowed makes

2-15 MATERIAL

- (a) Shell
- (b) Head
- (c) Tubes
- (d) Fronts
- (e) Rivets
- (f) Braces
- (g) Buckstays
- (h) Furnaces (Internally Fired Boilers)
- (i) Baffle Tiles (Water-tube Boiler)
- (j) Mud Drum (Water-tube Boiler)

2-16 DETAILS OF CONSTRUCTION

- (a) Fronts
Flush, or over-hanging
Full or half front
Double or single tube-doors
Double or single fire-doors
Double or single ash-pit doors
Any return flue
Construction of doors
Any special construction, for shaking or dumping grates or forced draft or mechanical stokers or extended furnace?
- (b) Tubes
Spacing
Beaded or flared ends?
How expanded?
Height of top row of tubes
How are tube holes to be made?
Any specially heavy tubes or stays?
Material and construction of headers, water-tube
Space behind boilers for withdrawing tubes
- (c) Shell and Heads
Convex or concave heads?
Curtain sheet?
How are supports to be fastened?
Scarfig, lap over rivets, assembling of joints
Planing of girth seams of horizontal boilers when plates are over $\frac{5}{8}$ inch thick
Straps
shaping
finish of edges
scarfig
- (d) Seams
Lap or butt joints? If butt joints, triple or quadruple riveted? If lap seams, single or double riveted? Minimum distance allowed between rivet hole and edge of plate
Longitudinal seams
single or double riveted?
- (e) Riveting
Holes punched? Drilled or punched and reamed?
Method should be described
Unfair holes?
Use of drift pin?
Calking
- (f) Bracing
Size and type of braces
Any through braces?
Number of braces
Bracing below tubes of horizontal boilers
- (g) Stays
Minimum diameter

Type of thread and number of threads per inch
Method of fastening to sheets
Material

- (h) Bolts and Studs
Material
Diameter
Allowable stresses

- (i) Standards of Construction
Massachusetts laws?
U. S. naval practice?
What insurance company's requirements to be met?

2-17 SPECIAL NOTES FOR MARINE-TYPE BOILERS OR OTHER INTERNALLY FIRED BOILERS

- (a) Furnaces
Type
wet back
dry back
Number in each boiler
Diameter
Length
Thickness
Material
Method of support
Any special design for stokers?
Diameter opening front head
Diameter opening rear head
- (b) Front Connection
Material
Thickness
Area
Doors
Damper
Covering
Liner
- (c) Back Connection
Material
Thickness
Method of support
Lining
Roofing
Clean-out
Covering
- (d) Covering of Whole Boiler
Covering of heads

2-18 INSURANCE

- (a) Amount of Insurance?
- (b) What Company?
- (c) Any Report Required of Inspection?

2-19 TEST AT WORKS

- (a) Any Tests by Purchaser's Inspector at Works?
- (b) Expenses to be Included?

2-20 SUPERHEATERS

- (a) Location?
- (b) Type
- (c) Material
- (d) Method of Support
- (e) Steam Pressure Carried
- (f) Degree of Superheat Required
- (g) Probable Load Conditions
- (h) Fuel Used
- (i) Capacity
Pounds of steam per hour
Percentage of moisture in original steam
- (j)* Number of Square Feet of Heating Surface
- (k)* Prevention of Burning Out
- (l) Delivery and Erection
Who delivers, erects and connects?

- (m) Cleaning
Means for cleaning outside surface
Means for inspection of inside surface
- (n) Mason Work
Any required?
Done by whom?
Material supplied by whom?
- (o) Allowed Makes

2-21 BOILER SETTING

- (a) See Boilers for Details of Sizes, Conditions of Delivery at Building and on Cribbing, Setting of Castings. Whether Boilers Are Set Single or in Battery and Method of Support; also kind of Grates, Number of Clean-Outs, Number of Manholes, Buckstays, Type of Furnace, etc.
- (b) Materials for
Furnace lining
Combustion chamber
Return flue (if any)
Baffle arches
Front arches and jambs
Bearing walls
Curtain walls
Bridge walls
Top of setting
Top of walls
Ash pit
Floor of combustion chamber
Firing pit
Outside walls
- (c) Workmanship
- (d) Fire and Common Brick
How laid?
header courses where?
In what material are fire bricks to be set?
In what material are common bricks to be set?
Joints how made in fire brick courses?
Joints how made in common brick courses?
- (e) Cap Stones
Length and thickness
How set?
- (f) Special Brick
How supported?
- (g) If Return Flue Is Used
Method of support
Thickness of arch or roof
- (h) Framing for Steam Outlets
Manholes
Blow-off connections
Clean-outs
- (i) Foundations
- (j) Drainage of Boiler Pit
- (k) Waterproofing; Any Iron Pan?
- (l) Plan Elevation and Section

2-22 MECHANICAL STOKERS

- (a) Location of Plant
- (b) Number of Boilers
Type of boilers
- (c) Rated Capacity of Boilers
- (d) Overload Capacity Required
- (e) Fuel Analysis
- (f) Load Conditions
- (g) Type of Stoker
Chain-grate
Inclined-grate
front-feed
side-feed
side-feed self-cleaning

- Underfeed
Shovel stoker
- (h) Motive Power
Apparatus by whom?
Connection by whom?
- (i) Mason Work
By whom?
Details (see Section 2-21, Boiler Setting)
- (j) Forced Draft
Apparatus furnished by whom?
Connections by whom?
Duct work by whom?
Motors, fans and blowers, see Index
Power required to operate fans and blowers, in percentage of rated capacity of boilers
- (k) Natural Draft Obtainable in Furnace
- (l) Supply of Fuel
Any crusher required?
Whence is supply derived?
How controlled?
How weighed?
- (m) Removal of Ash
How discharged from fire?
How removed?
(See also Section 2-23, Coal and Ash Handling)
- (n) Renewal of Parts
- (o) Special Furnace Construction
Is any required?
Space needed, length, width and height
Excavation required
- (p) Foundation
- (q) Guarantees
Life of stoker and refractory arch (if any)
Efficiencies at various capacities
What grade of fuel may be burned?
Maximum percentage of overload?
How long can fire be left inactive (banked)?
Smokelessness up to what rating?
- (r) Allowed Makes

2-23 COAL AND ASH HANDLING

- (a) Storage and Delivery
Kind of material to be handled?
How and where received?
How and where stored?
How and where delivered?
Is storage pile separate from storage for daily use?
Is fuel to be weighed on delivery and ashes on removal?
Is fuel to be weighed as used?
Maximum quantity fuel delivered or ashes removed at one time
How fast must fuel be removed from point of delivery?
Maximum quantity per day
Maximum quantity per hour
- (b) Material and Details of Construction
Kind and weight of material used and details of:
car
track
conveyor
crusher
piping
hopper
scales
- (c) Erection
Who erects apparatus?
Who builds foundation?
Who furnishes steel, wood, or concrete supports?

- Who does wiring?
Who supplies plans?
Who supplies skilled labor?
Who supplies common labor?
- (d) Crusher
Must fuel be crushed?
If so, who supplies and installs crusher?
How will crusher be driven? (See Section 7, Steam Engine; and Section 11-24, Electric Motors)
- (e) Type of Apparatus
Industrial railway (car and track)
Moving conveyor
Chute
Pressure or suction pipe
- (f) Car
Car arranged for dumping?
Car arranged so that one side may be let down?
Car arranged for hoisting?
Car arranged for overhead track?
Capacity of car—dimensions?
How propelled?
- (g) Track
On floor
Flush
Overhead
Switches
Turntables
Scales—recording or indicating
Safety guards
- (h) Conveyors
Type
belt
chain
flight
bucket
spiral
suction or pneumatic
steam exhausters
rotary pressure exhausters
sluicing by water
- (i) Cranes and Hoists
Traveling crane
Jib cranes
Derrick
Self-contained electric
Elevator
Compressed air
(See also Section 20-38, Cranes)
- (j) Hopper or Bunker
Capacity
Dimensions
Gates and spouts
Openings
How supported?
- (k) Scales
Overhead
On floor
On conveyor
Flush
Capacity
Method of cleaning
Method of adjustment
Recording or indicating

2-24 POWDERED OR PULVERIZED COAL

- (a) Unloading Station (see Sections 2-23a and 2-23j).
- (b) Crusher (see Section 2-23d).
- (c) Elevator or Conveyor (see Section 2-23h).
- (d) Drier
Type
Location
Method of firing
- (e) Magnetic Separator
Type

- Location
- Voltage required
- (f) Pulverizer
 - Type
 - Location
 - Foundation
 - Provision for motor on same or other foundation
- (g) Heating Units
 - Boilers or furnaces
 - size
 - number
 - number fires in each
 - Location of units
 - Space in front of and above each fireplace
 (See also Section 2—21b).

2—25 OIL-BURNING EQUIPMENT

- (a) Tank
 - Shape
 - Width, length and height
 - Slope of bottom
 - Manholes
 - Coil in tank
 - length of pipe coil
 - diameter of pipe
 - material of pipe
 - Outlets
 - filtering
 - vent
 - emptying
 - water removal
 - pump suction
 - Tell-tale
 - Painting
 - Foundation
- (b) Method of Feeding
 - Pumps (see Sections 4—18, 4—19 and 4—20, Pumps)
 - Meter
 - size of oil meter
 - by-passing
 - make
- (c) Oil Heater
 - Construction
 - Material
 - Covering
 - Painting
- (d) Burners
 - Make
 - Type
 - Location in furnace
 - Valving
 - regulating valve or cock
 - Where does atomization take place?
 - What provision for cleaning?
 - Any auxiliary burner for hot water heater for house?
- (e) Furnace Construction
 - Any grates to be provided for possible coal burning?
 - Construction of checkerwork
 - Any baffle arches?
 - Where is construction shown?
 - Auxiliary air supply brought in where?

2—26 NATURAL GAS

- (a) Location of Plant
- (b) Pressure at Which Gas Is Delivered
- (c) Kind of Boiler Under Which Gas Is Burned
- (d) Is Gas to be Burned in a Boiler Installation Already Complete or in a New Installation?
- (e) Burners for Natural Gas
 - Type
 - Who erects?
 - Location in furnace
 - Size and location of heater
 - Valving
 - valving of gas supply

- valving of supply from header to burners
- valving of burners for varying load
- will steam or compressed air be used?
- (f) Furnace Construction for Natural Gas
 - Any Dutch oven?
 - Are grates to be provided for possible coal burning? If so, how are they to be protected?
 - Construction of checkerwork
 - Who supplies plans?
- (g) Piping
 - Material
 - Who supplies?
 - Limits of contractor's work
- (h) Guarantee
- (i) Allowable Makes

2—27 SAWDUST AND OTHER LOW-GRADE FUELS

- (a) Quality of Fuel Available
- (b) Character of Fuel
 - B. t. u. dry
 - B. t. u. as received
 - Percentage of moisture
 - Other constituents
- (c) Will Fuel be Dried or Otherwise Treated before Use?
- (d) Method of Conveying Fuel from Storage or Point of Manufacture to Furnace
- (e) How will Combustion be Regulated?
- (f) How will Back Fire be Prevented?
- (g) Will Grates be Supplied?
 - V. bars.
 - Conical hole pin-hole grates
 - Slotted grates
- (h) Will Coal be Used to Aid Combustion?
- (i) Details of Construction
 - Collector
 - Chute or conveyor
 - Measuring or weighing device
- (j) Furnace Construction
 - Dutch oven
 - Special baffling
 - Checkerwork
 - Any auxiliary openings into furnace?
- (k) Natural Draft
- (l) Forced Draft
 - Fan, steam or electric drive?
 - Blower, steam-jet or turbine?
 - Pressure obtained
 - Percentage of steam required at full load
- (m) Ashpit Pressure Necessary

2—28 SMOKE STACK

- (a) Number of Stacks
- (b) Diameter and Height
 - How high will stack project above surroundings?
- (c) Material
- (d) Thickness
- (e) Metal
- (f) Regular Brick
- (g) Fire Brick
- (h) Concrete
- (i) Method of Support
- (j) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?
- (k) Painting

- (l) Clean-out
 - Location
 - Size
 - Detail
 (Items from m to u apply to steel or iron stacks only)
- (m) Lining
 - Method of support
 - Material
 - Carried up how far?
 - Carried down how far below breeching?
 - Thickness of lining
- (n) Riveting
 - Spacing
 - Diameter
- (o) Lap of Sections (If Lap Joint is Used)
 - Length of lap
 - Inside or outside
- (p) Flanged Joints
 - Flange dimensions
 - Bolting
 - Pitch and diameter of bolts
- (q) Base Plate
- (r) Anchoring
 - How anchored?
 - How are anchoring guys kept taut?
 - How is expansion provided for?
- (s) Breeching Entrance
- (t) Protecting Umbrella
- (u) Provision for Re-painting and Inspection
- (v) Ladders
- (w) If of Masonry or Concrete
 - Method of construction
 - Method of making joints
 - Any separate lining?
 - Provision for re-painting and inspection

3—GAS PRODUCER EQUIPMENT

3—1 NUMBER

3—2 TYPE

- (a) Pressure
- (b) Suction
- (c) Pressure and Suction
- (d) Water-gas

3—3 KIND OF FUEL

- (a) Anthracite
- (b) Bituminous
- (c) Lignites
- (d) Oil

3—4 FUEL QUALITIES

- (a) Size
- (b) B. T. U. Per Pound
- (c) Analysis (If so, Bituminous or Lignite)
- (d) Approximate Percentage of Ash
- (e) Approximate Percentage of Sulphur

3—5 CAPACITY REQUIRED

- (a) In Pounds of Coal Gasified per Hour
- (b) B. T. U. Delivered per Hour

3—6 QUALITY OF GAS REQUIRED

- (a) Average B. T. U. (Effective) Heat Value per Cubic Foot
- (b) Minimum B. T. U. (Effective) Heat Value per Cubic Foot
- (c) Allowable Percentages of Hydrogen

(d) Allowable Percentages of Dust

(e) Allowable Percentages of Other Gases, or Impurities

3-7 HEAD ROOM AND SPACE AVAILABLE**3-8 INSTALLATION**

(a) Who Installs and Furnishes Producer, Scrubber and Regulator?

(b) Who Installs and Furnishes Piping?

(c) Who Takes from Cars and Places on Foundations?

(d) Who Installs Gas Holder?

3-9 WHERE IS EQUIPMENT TO BE INSTALLED?**3-10 HOW CAN EQUIPMENT BE GOTTEN INTO PLACE?****3-11 EQUIPMENT INCLUDES:**

(a) Producer

Vaporizer or saturator?

Lining

Charging, interlocking hopper?

Grates?

Blower—hand, motor or engine driven?

Blast regulator?

Cone bottom ash pit or water seal?

Railing, ladder and platform?

Standover pipe (material and where terminated)?

Water supply

where obtained?

where discharged?

how regulated?

Two-way valve

Poke holes and covers

Poke holes and covers

Coal hoist (see Section 2-23, Coal and Ash Handling)

Foundation: How made? Of what material? Any special facing? Supplied by whom?

Painting

Covering

Dimensions

Tools

(b) Scrubber

Stationary

material

dimensions

filling

explosion relief

gas tester

ladder and rail

water supply

where obtained?

where discharged?

how regulated?

temperature and pressure

Rotary

material

how driven?

size

water supply

where discharged?

where obtained?

how regulated?

Foundation: How made? Of what material? Any special facing? Supplied by whom?

(c) Moisture Regulators

Who supplies?

How drained?

Where drained?

(d) Exhaust and Blower

How is discharge pressure regulated?

Any special material for gas handling?

Any special construction for gas handling?

Any by-pass connections?

Foundation

Painting

(e) Piping

Material: Lap-welded, cast-iron spiral riveted, straight riveted

Gas line

Connections between producer and scrubber

Scrubber and engine

Standover pipe

Purge pipe

Engine exhaust

Drip piping

Gage piping

Water, supply and discharge

Drain

Weights of piping required

Will piping be flanged or screwed?

Kind of gaskets to be used

How will joints be made up?

How will piping be supported?

Details of standards

Any insulating covering for gas, water, air or drip piping

Painting

(f) Valves

For standover pipes

For purge pipes

For by-pass on gas lines

For by-pass on exhaust gas line

For water

For steam

(g) Muffler or Heater

Material

Type

Size

Foundation: How made? Of what material? Any special facing? Supplied by whom?

Painting

Covering

If muffler is also a heater, will hot water or steam be generated?

What trimmings and fittings required?

How is water supply regulated?

Relief valve?

Any by-pass?

(h) Limits of Work

Excavation by whom?

Foundation by whom?

How far does gas producer Contractor do piping for gas, exhaust and drip?

Water piping

Air piping

Steam piping

Drain piping

Electric wiring

Any special ventilation required?

What valves are supplied by Contractor?

(i) Gages and Recording Appliances

Gages

number

type

where mounted?

how mounted?

how connected?

Any recording calorimeter?

Any water meters?

Any thermometers?

Any testing burners?

Any gas-analysis apparatus?

(j) Test and Inspections

Factory inspection

expenses by whom?

object of inspection?

(k) Performance Tests

What purpose?

Duration

How carried on?

Who supplies load?

How is load measured?

How is gas quality to be determined?

How is gas quantity to be determined?

Any standard regulations for test?

Who will conduct test?

Who will supply fuel and water?

Who will supply operating labor?

Who makes fuel analysis?

For other matters connected with the installation, operation and use of gas producers see Section 15—, Fuel; Section 2—25, Natural Gas; and Section 2—23, Coal and Ash Handling.

4—STEAMFITTING

The steamfitting section includes such a wide range of apparatus and work that it is the most voluminous in the CHECKING LIST. On account of the magnitude and special character of the items, Boilers (including setting and smokestacks) and Refrigeration, separate sections have been devoted to these contracts (see Sections 2— and 14—), and only their co-ordination with the rest of the steamfitting work is taken up in Section 4—1.

NOTE—It will be noted that several items in this as in other sections of the CHECKING LIST have been starred, or prefaced by an asterisk. These starred items may be specified, or preferably may be left for the Machinery Builder to specify. They are noted here to call attention to the necessity of definite knowledge on these points before placing a contract.

The items to be considered generally in the steamfitting section of an isolated power-plant specification are as follows:

4-1 GENERAL OUTLINE OF THE WORK

(a) Furnishing, Delivering and Erecting of Boilers (see Section 2—1, Type of Boiler)

(b) Steam, Water, Blow-off and Smoke Connections to Boilers

(c) High- and Low-pressure Steam and Drip Connections to Engines, Pumps, Compressors, Hot-water Heaters, Etc.

(d) Blow-off Tank

(e) House-heating System

(f) Refrigerating Plant (see Section 14—, Refrigeration)

(g) Drying Apparatus

(h) Kitchen Apparatus

(i) Injectors

(j) Ejectors

(k) Indirect Heating System

(l) Direct Heating System

(m) Ventilating Equipment, Including

Fresh-air supply

Tempering coils

Air washers and humidifiers

Fans

Heating coils

Vent ducts

Hot-air ducts

Temperature control

Humidifying control

Air cooling by refrigeration

(n) Pumps

(o) Air Compressors
Tanks

(p) Hot-water Heaters

Hot-water tanks

(q) Muffler Tank

(r) Exchanger Tank

(s) Air-separating Tank

- (t) Water Weighers
- (u) Steam Meter
- (v) CO₂ Recorder
- (w) Condensing Apparatus
- (x) Cooling Tower
- (y) Fuel Economizers
- (z) Smoke Breeching
- (aa) Smoke Stack
- (bb) Insulating Covering of Steam, Water, Brine and Ammonia Piping
Insulating covering of smoke breeching
Ducts
Pumps and engine cylinders
Tanks, heaters and traps
Tempering coil castings
Re-heater casing, etc.
Exposed shells or drums of boilers
- (cc) Central Oiling System
- (dd) Railing
- (ee) Wrench Board
- (ff) Gages and Gage Board
- (gg) Automatic, Temperature-regulating System
- (hh) Painting
- (ii) Pump Governors
- (jj) Thermostatic Control of the Hot-water Heating
- (kk) Vacuum Heating System
One-pipe
Two-pipe
Air lines and air valves
- (ll) Radiators
- (mm) Coils
- (nn) Temporary Heat, Including Connection and Disconnection of Radiators
- (oo) Temporary Pumping
- (pp) Labor for Operating the Heating Plant
- (qq) Fuel for Operating the Heating Plant
- (rr) Do Specifications Include Engines, Dynamos, Electric Equipment, Motors, etc.?
- (ss) Description of General Arrangement of Main Piping
- (tt) Auxiliary Main for Emergency Use
- (uu) Does Piping Run Above or Below Floor?
- (vv) Exhaust Steam Will or Will Not be Used for Heating?
- (ww) Exhaust Steam from Pumps Will or Will Not be Collected into a Separate Main, Carrying a Higher Back Pressure than the Engine Main?
- (xx) Relief from Exhaust Pipe Run to What Point?
- (yy) Heating System is Up-Feed or Down-Feed?
- (zz) Return Main Sealed or Dry?
- (aaa) Return Main Connected to Pump Governor and Discharge Where?
- (bbb) Any Exchanger on Return to Cool Returns and Heat Water?
- (ccc) Make-up Water Supplied Where?
- (ddd) Boiler-Feed Pump and Injectors Have Suctions Where?
- (eee) Compressed-Air Piping
- (fff) Cold-Storage Piping
- (ggg) Compressed-Air to be Supplied For dampers of thermostatic control system
Elevator-door operation
Cleaning-out purposes
Manufacturing purposes
Any other purposes?
- (hhh) Blow-off Main Will Run Where?
- (iii) Blow-off Tank Cooled How?

- (jjj) Blow-off Tank Below Sewer Level or Above Sewer Level? If Below, What Kind of Pumps and How Controlled?
- (kkk) Description of the Heating System
- (lll) What Part of Building Indirectly Heated?
- (mmm) What Part of Building Directly Heated?
- (nnn) At What Height and Where Will Registers be Located?
- (ooo) Special Heating of Vestibules
- (ppp) Special Ventilation of
Toilet rooms
Pump room
Engine room
Kitchen, if any
Laundry room
- (qqq) Floor Heights

4-2 SPECIFICATIONS OF MATERIALS AND APPARATUS IN THE STEAMFITTING

(a) Pipe

Where piping is not to be erected under a steamfitting contract, but is to be purchased fabricated only, reference should be made to Sections under General Clauses:—Drawings (1-4), Materials (1-5), Delivery and Storage (1-8), Insurance (1-12), Excavation and Cutting (1-14), Tests at Factory (1-18 and 1-19f), Guarantees (1-20)

State who furnishes and who erects Steam Exhaust, Blow-off and other Valves; Steam and Oil Separators and other auxiliary apparatus; Throttle Valves on Engines, Pumps and Compressors; Companion Flanges for such Valves, Manifolds or Fittings as may be furnished by other contractors; Piping between high- and low-pressure Cylinders and Receivers and Condensers

Also see following Sections: Pipe Supports (4-2-1), Steam Traps (4-2o), Insulating Covering (4-2p), Plates and Collars (4-2q), Feed-Water Heaters (4-21), Blow-off Tank (4-23), Combination Heater, Grease Extractor, etc. (4-24), Back-pressure Valves (4-27), Reducing Valve (4-28), Grease Extractor (4-29), Steam Separators (4-30), Pump Regulators (4-31), Water-weigher or Meter (4-32), Damper Regulators (4-33), Exhaust Heads (4-34), High-pressure Steam Connections (4-40), Drip Piping (4-42), Condensers (4-44), Economizer (4-45), Work by other Contractors (4-53).

Pipe will be used for what purpose?
high-pressure steam over 150 pounds per square inch
medium-pressure steam from 50 to 150 pounds
low-pressure steam up to 50 pounds
condenser steam (below atmospheric pressure)
boiler feed
drips
blow-off
compressed air
air not under pressure
lubricating oil
fuel oil
water
gas
vent
hydraulic

- (b) Materials
Wrought iron, wrought steel, cast-iron, spelterized
black or galvanized or otherwise treated?
Brass
rough or polished?
standard of size?
Copper
standard of size?
- (c) Construction and Weight
Iron and Steel Pipe
seamless
lap weld
butt weld
spiral riveted
merchant pipe
standard weight
extra heavy
double extra heavy
Brass and Copper Pipe
weight per foot
will wrought-iron lap-welded pipe table be used as standard?
- (d) Pressure and Temperature
Steam
high, low, exhaust
saturated or superheated?
superheated to what degree?
Water
pressure and temperature
static and working head
Air, Oil and Gas
pressure
To what pressure shall several kinds of pipe be tested, at mill or after being erected? (See Sections 1-18 and 1-19f, Tests).
- (e) Diameters up to 14 Inches Internal Diameters. Above this, External Diameters?
- (f) Fittings and Flanges
- (g) High-Pressure Mains and Branches to be Made With Standard Weight or Extra Heavy Flanges? Iron, Semi-Steel, Cast Steel, Forged Steel or Malleable Iron?
- (h) Joints How Made? Flanges How Attached?
- (i) Gaskets, What Material and How Made?
Gum, fibre, metallic
Trade names or marks allowed
- (j) Flanges
Standard dimensions of flanges, for standard weight and extra-heavy, are how fixed?
Type of flanges
plain faced?
recessed?
pipes peened over?
screwed?
welded?
Vanstone, Walmanco, Cranelap, Cornellweld, etc.?
Low-pressure mains and connections
flanges used where?
couplings used where?
Small piping
brass unions
malleable-iron unions with brass to iron seats
- (k) Bolts
Square head and hexagon nut
Hexagon head and hexagon nut
Number of bolts to be as per standard of
- (l) Pipe Supports
Types of hangers
Provision for expansion of piping
Any special supports for boiler headers or engine room headers?
Piping to engines on standards or hangers?

Size of pipe for standards and spacing and adjustment
 Supports for risers
 Supports for ducts
 Supports for breeching
 Supports for exhaust to roof
 Supports for coils on side walls

(m) Packing of Valve Stems

Packing of pumps and valves

(n) Valves

Boiler valves
 working pressure
 any automatic self-closing non-return valve?
 angle valves, gate valves
 are these to have a rising stem?
 are they to operate by any special method (hydraulic, compressed air, steam or electric motor?)
 any by-pass in valve?
 safety valves
 pop or lever type, size, one or two, type of seat (see Index)
 check valves
 float valves
 automatic boiler stop valves
 valves for top and bottom of water column
 draw-off valve for bottom of water column
 feed valve on branch from main and at hand height
 blow-off valve
 blow-off cocks
 Gates, globe or angle valves on connections to engines
 valves located below the floor?
 any floor stand?
 Relief valves on hot-water tank and feed line; size, type, pressure at which they are to relieve
 Radiator valves
 angle, corner, gate, self-packing or packless?
 weights of radiator valves. Type of wheels, how finished?
 How are bodies to be finished? Shall valves be supplied with unions for connecting radiator?
 return valves on radiator connections: thermostatic, motor, impulse, check, globe, gate.
 if radiators are concealed in boxings, are valves to have extension stems horizontal or vertical?
 Will graduated supply valves be used? If of adjustable type, by whom adjusted?
 Air valves: size of opening in radiators, type of valve, valves for air line or valves for discharge into room
 Preference valves for insuring supply of exhaust steam to open feed-water heaters
 Stems
 stationary
 rising stem with elongated bonnet
 outside screw and yoke. (O. S. & Y)
 steel, brass, nickel-steel or nickel-bronze mountings?
 Material
 brass; rough, polished or nickel-plated?
 bronze
 all iron
 iron body with brass mounting
 steel, semi-steel, cast-steel, with monel or nickel trimmings
 Pressure and superheat and test pressure
 Screwed or flanged?
 flange drilling

Type and size
 horizontal, vertical or angle?
 size of inlet and outlet
 Allowed makes

(o) Steam Traps

Size of inlet and discharge and pipe area of discharge valve
 Capacity in pounds of water to be handled or in square feet of radiating surface or linear feet of pipe
 Type of trap
 high, medium or low pressure?
 return or non-return?
 intermittent or continuous discharge?
 If direct return, give height above water line of boiler
 If trap discharge is to be raised, does drawing or specification show how much?
 If oil trap, is special provision necessary to discharge steam when pressure is below atmosphere?
 Traps to be by-passed by three-valve by-pass?
 Gauge glass and self-contained by-pass valve?
 Maximum and minimum pressure under which trap is to operate
 Types of traps to be submitted for the various purposes
 Steam piping

(p) Insulating Covering

Steam piping
 Drip piping
 Water piping
 cold water, hot water
 Blow-off piping
 Feed piping
 Fresh-air piping
 High-pressure main flanges
 Low-pressure main flanges
 Flanges on piping above inches in diameter
 Covering of flanges to be moulded or plastered on?
 Feed-water heater
 Muffler tank
 Grease extractor
 Reducing valve
 Back pressure valve
 Pump governor
 Valve bodies
 Fittings to have moulded covering or plastered covering?
 Hot-water tank
 Blow-off tank
 Air-separating tank
 Drip tank
 Smoke connections and up-take from boilers
 Boilers, if not brick-set; if brick-set, top of boilers to be covered
 Boiler dome
 Boiler shells, for water-tube boilers, and vertical boilers
 Engine cylinders
 Pump cylinders
 Compressor cylinders
 Generators of absorption type of refrigerating plant
 Cold-air ducts leading to tempering chambers
 Tempering chambers
 Hot-air ducts leading from tempering chambers to re-heaters
 Re-heater casing
 Ducts from re-heaters to registers
 Fan casings
 Return mains and return risers
 Steam risers, where concealed
 Connections from risers to radiators, where concealed
 Exhaust riser to roof; should this be covered?
 Thickness of pipe covering
 high-pressure pipe over inches

high-pressure pipe under inches
 high-pressure pipe over inches
 high-pressure pipe under inches

Material of covering in each case approved manufacturers
 Covering of auxiliary apparatus and tank, material, thickness and finish
 Shall pipe covering be re-canvased and sewed?
 Painting of covering
 Method of covering smoke connections
 shall this be canvased and painted? Thickness of canvas, color and painting
 Blow-off pipe where exposed to fire, how protected?
 Covering of pumps and other cylinders: How finished? Material of covering and thickness?
 Covering of air ducts, etc.: thickness and finish, color of paint
 Brine-pipe covering: thickness of material, finish, color of paint
 Ice-water pipe covering: thickness of material, finish and painting
 Covering of fittings, moulded, plastered

(q) Plates and Collars

Pipes passing through walls, floors, partitions and ceilings
 Material of collars and thickness
 how finished at the bottom
 how finished at the top
 how supported during construction?
 Are collars to be furnished where risers are boxed?
 Where risers are in chases are collars to extend above floor?
 Filling of collars during construction to prevent filling with concrete
 Plates
 are plates to be screwed to the collars?
 split plates, cast or galvanized-iron, or bronze?
 separate plate for each pipe, or single plates for pipes close together?
 Smoke breeching and ducts; material and thickness of collars for these, where they pass through walls
 Protection of radiator branches in concrete
 Collars for pipe going through roofs. Method of flashing, material and thickness

(r) Painting and Bronzing

What material is to have shop coats?
 What material is to have paint after erection?
 Schedule of colors of paint
 What material is to be bronzed?
 Schedule of bronzing
 Is steel piping to be painted?
 Painting of boiler fronts, pumps, engines, ducts and covering
 Suggested standard schedule of painting follows:
 live-steam pipes, white
 exhaust-steam pipes, yellow
 cold-water pipes, blue
 brine pipes, green
 hot-water pipes, white with red bands
 return pipes, yellow with red bands
 fire-line pipes, red
 sprinkler, black, or white where against white plaster

- (s) Radiators
Material and type
Schedule of sizes, if any, or reference to plans for sizes
Cleaning of radiators before delivery
Are bushings allowed?
Method of joining sections of radiators, with a screw nipple or push nipple?
Radiator legs to be standard height or extra height?
Tapping low enough to drain
If radiators are without legs, specify brackets for hanging on wall
Radiators to be prepared for use with gravity steam, vacuum air-line system, gravity hot water, or mechanical circulation hot water system

- (t) Pipe Coils
Size of pipe
Standard or extra-heavy?
Iron, steel or brass?
Black or galvanized on outside?
Continuous welded or made up with screwed or flanged fittings?
Style of coil? (Oval, zigzag, cylindrical or special)
Details of construction?
Return-bend or header type?
How supported?
Method to determine that iron or steel has been used as specified?
Test?

4-3 STEAM RISERS

- Sizes, Where Shown?
- Anchoring
- Provision for Expansion and Contraction
- How Are Connections to be Taken Off?
- Following Breaks in Walls
- Dripping
- Cleaning Out
- Are Risers Concealed or Exposed?
- Connections from Mains to Risers
How pitched?
How valved?
- Material
- Covering
- Method of Support

4-4 RADIATOR CONNECTIONS

- Over or Under Floor
- Whence will First Story Radiator Connections be Taken
- Direction or Pitch
- Method of Caring for Expansion of Risers
- Sizes of Supply Connections
- Sizes of Return Connections
- Connections Made Into Top or Bottom of Radiators?
- Connections to First Floor Radiators

Following are sizes of standard connections for two-pipe and for single-pipe work

4-5 COIL CONNECTIONS

- Sizes, Where Shown?
- Anchoring
- Provision for Expansion and Contraction
- How Are Connections to be Taken Off?
- Following Breaks in Walls
- Dripping
- Cleaning Out
- Are Coils Concealed or Exposed?

- Connections from Mains to Risers
How pitched?
How valved?
- Where Coils are Under Skylights, Where and How Shall Connections be Run?
- Shall Certain Coils, Such as Those in Sprinkler-Tank Room, Have Direct Connections to Boiler Room?

4-6 TEMPERING COILS

- Number of Square Feet of Heating Surface
- Size of Pipe or Numbers of Cast-Iron Sections
- Divided Into How Many Sections?
- Type of Coil or Stack
- How Is Supply of Steam to be Controlled: Hand-Valved Alone, or Hand-Valved and Automatic?
- Is All or Only Part to be Supplied by Steam From Boilers?
- Is Boiler Steam to be Supplied at Reduced Pressure? If so, What Reducing Valve?
- Is Coil to be By-Passed?
- Where Does Drip Return to? How Trapped?
- Is Steam Supply to be Controlled by Temperature of Entering Air or Temperature of Leaving Air?
- Painting Coils or Stacks
- Painting of Casing
- Casing, Material, Thickness of Metal. Any Removable Sections?
- Is Coil on Inlet or Discharge of Fan
- Covering
- What Means, If Any, Are to be Used to Shut Off Air From Coil When It is Not in Use?
- Support
- Maximum Allowable Friction of Air Passing Through Cast-Iron Blast Heaters or Pipe-Coil Heaters
- Temperature of Air Entering Coils and Desired Temperature of Air Leaving Coils Under Extreme Conditions

4-7 INDIRECT HEATERS AND RE-HEATERS

- Number of Square Feet of Heating Surface
- Size of Pipe or Number of Cast Iron Sections
- Divided Into How Many Sections?
- Type of Stack
- How Is Supply of Steam to be Controlled: Hand Valved Alone, or Hand Valved and Automatic?
- Is All or Only Part to be Supplied by Steam from Boilers?
- Is Boiler Steam to be Supplied at Reduced Pressure? If so, What Reducing Valve?
- Where Does Drip Return to? How Trapped?
- Painting of Coils or Stacks
- Painting of Casing
- Casing, Material, Thickness of Metal. Any Removable Sections?
- Covering
- What Means, If Any, Are to be Used to Shut Off Air from Coil When Not in Use?
- What Means, If Any, to Deflect Air Through or Around Coil?
- With Thermostatic Control. Is Supply of Steam Controlled or

Is Mixture of Cold and Hot Air Controlled?
If latter, who supplies and installs mixing dampers?

(p) Support

4-8 REGISTERS

- Material
- Finish
- Any Special Shapes?
- Any Special Material and Finish for Main Hall Registers? Directors' Room Registers? Other Special Registers? Registers Exposed to Acid Fumes? Toilet Rooms?
- Which Registers Are to be Provided with Adjustable Shutters?
- How Are Shutters to be Operated?
- How Are Sizes to be Ascertained by Bidder from Plans? From List?
- Any Curved Registers?
- Painting
- How Will Registers be Set?
- How Will Joints between Registers and Surroundings be Made Dust-tight?
Co-operation with other trades
- How Will Registers be Connected to Flues?

4-9 TEMPERATURE AND HUMIDITY REGULATIONS

- Scope of Temperance Regulation
Radiators and coils, automatically controlled?
Tempering coils
Indirect stacks
Re-heater stacks
Dampers in fresh-air supply ducts? hot or cold?
Dampers in vent ducts?
Hot water heating?
Refrigerating stacks?
Fan supplying air for cold storage
Refrigerating compressor motor
Humidifying and air-washing apparatus
Control of hot-water tanks
- System of Regulation
Temperature
Humidity
sprays in humidifier automatically operated
dampers in supply ducts automatically operated
dew-point control
- Who Supplies
Pump or compressor
Connecting piping
Thermostats
Automatic valves
Diaphragm valves operated by thermostats
Dampers operated by thermostats or by air from heat-regulating system
- Who Places These Dampers and Valves in Position
- Maintenance of System After Completion
- Thermostats
Location of thermostats
Range of thermostats
Finish of thermostats
- Any Duplicate Apparatus?
- Adjustment and Testing
- Foundation
- Guarantee
- Allowed Makes

4-10 DUCTS AND FLUES

- Material Inside and Outside Building

- (b) Method of Support
- (c) Covering
- (d) Painting of Ducts
- (e) Painting of Covering
- (f) Thickness of Different Size Ducts
- (g) Construction
 - Method of making seams
 - Method of making joints between sections
- (h) Deflectors
 - Material
 - How operated?
 - How adjusted?
 - How secured?
- (i) Doors in Ducts and Flues
 - Material
 - How constructed and size?
 - Number and location. Shown on plans or listed?
- (j) Sizes of Ducts
- (k) Any Special Construction for Acid-impregnated air? Moist air? Avoiding transmission of noise?
- (l) Any Flashing of Ducts or Flues?
- (m) Any Thimbles Required for Passage of Ducts or Flues Through Walls, Etc.
- (n) Any Special Provision for Pipes or Hangers Passing Through Ducts, Etc.

4-11 SMOKE BREECHING

- (a) Material
- (b) Method of Support
- (c) Covering
- (d) Painting
- (e) Painting of Covering
- (f) Thickness of Metal
- (g) Construction
 - Size and pitch of riveting
 - Method of joining sections
 - Method of reinforcing sections
- (h) Clean-outs
 - Size and construction
 - Number and location
- (i) Dampers
 - Number
 - Construction
 - Arrangement for connection to automatic regulator
 - How made tight?
- (j) Plan and Elevation Are Required
- (k) How Connected to Boilers, and How to stack?

4-12 AIR WASHERS AND HUMIDIFIERS

- (a) Capacity and Velocity
 - Maximum cubic feet air per minute
 - Minimum cubic feet air per minute
 - Velocity of air through washer and eliminator
 - What resistance will be added to flow at maximum capacity by complete apparatus?
- (b) Construction Details
 - Materials used in construction of different parts
 - Spray. How obtained, number and kind of nozzles and spacing?
 - Filtering strainers
 - number used
 - mesh of screen
 - area of screen surface
 - Eliminators
 - vertical or horizontal
 - spacing
 - angle of air deflection
 - square feet exposed washing surface
 - method of flooding

- gage of metal
- how cleaned?
- Casing
 - bracing
 - inspection doors
 - number and size
 - construction
- gage of metal
- Tank
 - size
 - height
 - accessories
 - float valve
 - overflow
 - drain valve
 - flanges for pump connections
- gage of metal
- Pumps (see Sections 4-18, 4-19 and 4-20)
- Fans (see Section 4-13)

- (c) Type of Washer
 - Fan discharging through spray or mist chamber and eliminator
 - Fan discharging through body of water and eliminator
 - Fan and washer combined
- (d) Steam and Water Supply
 - Whence received?
 - At what pressure?
 - Where discharged?
 - At what pressures?
 - Who makes piping connections?
 - Who supplies valves?
 - Any automatic flushing device?
- (e) Humidity and Temperature Control
 - How is humidity controlled?
 - by raising or lowering water temperature?
 - by adding moisture to air?
 - Instruments used
 - humidostat
 - hygrostat
 - Accessories
 - angle air-duct thermometer
 - strainers
 - water heaters
 - diaphragm valves
 - air pumps
 - air tanks
 - air lines
 - thermometers
 - steam pressure gage
 - any special device to prevent excessive humidity in event of apparatus getting out of order?
- (f) Foundation
- (g) Covering
- (h) Painting
- (i) Guarantee
- (j) Trimmings

4-13 FANS AND BLOWERS

- (a) Approved Makes
- (b) List of Fans Giving
 - Capacities in cubic feet per minute at maximum and minimum desired speeds at standard pressures for these speeds
 - Maximum speed and minimum speed
 - Types of fans or blowers
 - centrifugal paddle wheel
 - sirocco or multi-vane
 - cone
 - disc
 - positive-pressure rotary blower
 - turbine blower
 - centrifugal blower
 - reciprocating (see Air Compressors)
 - allowed makes
 - Horse power desired of motors, or cylinder sizes of engines
- (c) Speed Control
 - What part of control is to be by

- field regulation and what part by armature resistance?
- Is maximum speed to be obtained with weakened field and no resistance in circuit?

- (d) Motor or Engine Driven
- (e) If Motor Driven
 - Voltage
 - Direct or alternating-current? If latter, single, two- or three-phase, and number of cycles per second? If direct-current, shunt or compound-wound?
 - Is motor to be directly coupled, or mounted on shaft?
 - Is motor to be belted? If so, maximum and minimum speeds of motor? Who supplies belt? Any idler equipment; belt tightener; chain drive? (For further details of Belt see Section 7-23d)
 - Types and makes of controllers any automatic control?
 - If motor is directly coupled or mounted on shaft, is support of motor to be part of fan housing or frame, or is a separate base to be built?
 - Lubrication of motors
 - oil, grease, dry or liquid graphite?
 - Allowable temperature rise of motors under maximum operating conditions
 - Are motors open or enclosed or semi-enclosed type?
 - Approved makes of motors
 - If chain drive is used, allowed make and size
- (f) If Engine Driven
 - Steam pressure
 - Speed control
 - Lubrication
 - Construction
 - Approved makes
- (g) Any Special Fans Required for Acid or Moist Air or Gases?
- (h) Any Shut-off Dampers Required to Close Off Fans When Not Operating
 - *Construction and material of such dampers
 - How controlled?
- (i) Specification and Plans to be Required from Builder Before Approved, Showing Details of Construction, Length of Bearings
- (j) Who Makes Electric Connections?
- (k) Who Makes Steam Connections?
- (l) Material
- (m) Foundation of Fans, Motors, Engines and Controllers: How Made? Of What Material? Any Special Facing? Supplied by Whom? Any noise or vibration? Insulating material?
- (n) Painting
- (o) Covering
- (p) Guarantee

4-14 FOUNDATIONS

- (a) Who Supplies?
- (b) Material
 - Above floor
 - Below floor
- (c) Outside Finish Above Floor, Sides and Corners
- (d) Top Finish, Material and Thickness
- (e) Bolt Drillings
- (f) Painting
- (g) Sheet Piling
- (h) Piling
- (i) Waterproofing
- (j) Shoring

4-15 GAGES

- (a) List Giving
 - Size of face for indicating and timing of chart for recording gage Range of pressures
 - Use (brine, steam, water, air, ammonia, etc.)
 - Locations of separated gages
- (b) Material and Finish
- (c) Method of Support, Including Material of Gage Board and Its Location
- (d) Who Makes Connections?
 - Discharges for blow-off from gages lead where? How controlled?

4-16 RAILINGS

- (a) Size of Pipe for Railings and Number of Pipes in Height
- (b) Any Gates?
- (c) Material and Finish
- (d) Method of Support
- (e) Painting
- (f) Height
- (g) Where Shown

4-17 MATS

- (a) Material
- (b) Length, Width and Thickness
- (c) Approved Makes

4-18 STEAM PUMPS (RECIPROCATING)

- (a) Number of Boiler-feed Pumps, Sizes and Types
- (b) Number of Drain Pumps, Sizes and Types
- (c) Number of House Pumps, Sizes and Types
- (d) Number of Fire Pumps, Sizes and Types
- (e) Number of Elevator Pumps, Sizes and Types
- (f) Number of Oil Pumps, Sizes and Types
- (g) Number of Circulating Pumps, Sizes and Types
- (h) Number of Brine Pumps, Sizes and Types
- (i) Number of Ammonia Pumps, Sizes and Types
- (j) Number of Vacuum Pumps, Sizes and Types
- (k) Number of Air Pumps, Sizes and Types
- (l) Pressures Against Which Pumps Must Work
- (m) Suction Lift
- (n) Sizes
 - Steam cylinders
 - Water, air or oil cylinders
- (o) Types
 - Simplex or duplex
 - Single-cylinder, or compound, or triplex
 - Direct, or crank and fly-wheel type?
 - Triplex driven by steam engine, belted, or directly coupled?
- (p) Inside or Outside Packed Plungers or Piston Pumps?
- (q) Stuffing Boxes, Flanged or Screwed?
- (r) Valves, Exterior or Interior?
 - Material of valves
- (s) Allowable Piston Speeds
- (t) Initial Steam Pressure
- (u) Back Pressure
- (v) Air Chambers. Size and Number and Location of Pet Cocks

- (w) Material of
 - Linings
 - Rods
 - Pistons and plungers
- (x) Lubricators, Types and Sizes
- (y) Foundation: How Made? Of what Material? Any Special Facing? Supplied by Whom? Any Drip Plans? Plans to Be Submitted?
- (z) Painting
- (aa) Governing
- (bb) How Are Governing Devices Lubricated?
- (cc) Covering of Steam Cylinders. Covering of Other Cylinders
- (dd) Pump Packing
- (ee) Allowed Makes

4-19 ELECTRIC PUMPS (TRIPLEX)

- (a) Number of Boiler-feed Pumps, Sizes and Types
- (b) Number of Drain Pumps, Sizes and Types
- (c) Number of House Pumps, Sizes and Types
- (d) Number of Fire Pumps, Sizes and Types
- (e) Number of Elevator Pumps, Sizes and Types
- (f) Number of Oil Pumps, Sizes and Types
- (g) Number of Circulating Pumps, Sizes and Types
- (h) Number of Brine Pumps, Sizes and Types
- (i) Number of Ammonia Pumps, Sizes and Types
- (j) Number of Vacuum Pumps, Sizes and Types
- (k) Number of Air Pumps, Sizes and Types
- (l) Sizes, Diameter and Stroke of Cylinders
- (m) Speeds Allowed
- (n) Pressures Against Which Pumps Must Work
- (o) Suction Lift
- (p) Types, Single or Double-Acting
- (q) Drive
 - Maximum speed and minimum speed
 - Horse power desired of motors
- (r) Speed Control
 - What part of control is to be by field regulation and what part by armature resistance?
 - Is maximum speed to be obtained with weakened field and no resistance in circuit?
- (s) Motor
 - Voltage
 - Direct or alternating-current? If latter, single, two- or three-phase and number of cycles per second? If direct-current, shunt or compound-wound?
 - Is motor to be directly coupled or mounted on shaft?
 - Is motor to be belted? If so, maximum speeds of motor? Who supplies belt? Any idler equipment; belt tightener; chain drive?
 - (For further details of Belt specification see Section 7-23d)
 - Types and makes of controllers
 - Any automatic control? Remote control?
 - If motor is directly coupled or mounted on shaft, is support of motor to be part of pump housing or frame, or is a separate base to be built?

- Lubrication of motors
 - oil, grease, dry or liquid graphite?
- Allowable temperature rise of motors under maximum operating conditions
- Are motors open or enclosed or semi-enclosed types?
- Approved makes of motors

- (t) Conditions with Cross-Head or Trunk Pistons

- (u) Materials
 - Linings
 - Rods
 - Pistons or plungers
 - Valves

- (v) Air Chambers, Size and Number and Location of Pet Cocks

- (w) Relief Valves

- (x) Self-oiling Bearings

- (y) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?

- (z) Painting

- (aa) Guarantee

4-20 CENTRIFUGAL, ROTARY OR TURBINE PUMPS

- (a) Number and Type
 - Horizontal or vertical?
 - If vertical, is pump submerged? Is it supported on feet or between framework?
- (b) Purposes for Which They Are to be Used
- (c) Pressure Against Which Pumps Must Work
 - Vertical discharge lift
 - Is discharge head steady or variable?
- (d) Suction Lift
 - Vertical suction lift
 - Is suction head steady or variable?
- (e) Number of Stages, if More Than One
- (f) Pipe Inlet and Outlet Sizes
 - Direction of suction and discharge openings
- (g) Speeds Allowed
- (h) Material to be Pumped
 - Temperature
 - Capacity in gallons per minute
- (i) If Motor Driven
 - Voltage
 - Direct or alternating-current? If latter, single-, two- or three-phase and number of cycles per second? If direct-current, shunt or compound-wound?
 - Is motor to be directly coupled, or mounted on shaft?
 - Is motor to be belted? If so, maximum and minimum speeds of motor? Who supplies belt? Any idler equipment; belt tightener; chain drive?
 - (For further details of Belt specification see Section 7-23d)
 - Types and makes of controllers.
 - Any automatic control? Remote control?
 - If motor is directly coupled or mounted on shaft, is support of motor to be part of pump housing or frame, or is a separate base to be built?
 - Lubrication of motors
 - oil, grease, dry or liquid graphite?
 - Allowable temperature rise of motors under maximum operating conditions

Are motors open or enclosed or semi-enclosed type?

Approved makes of motors

(j) If Steam Driven (Engine)

Steam pressure

Speed control

Lubrication

Construction (see Sections 7—; and 9—)

Approved makes

(k) Air Chamber? Size and Number and Location of Pet Cocks

(l) Material of

Casing

Impeller

Vanes

Shafts

Suction pipe

(m) Is Foot Valve Included?

(n) Lubrication

(o) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?

(p) Painting

(q) Covering

(r) Guarantee

4—21 FEED-WATER HEATERS

(a) Open or Closed Type?

(b) Capacity in Pounds of Water Per Hour From..... Degrees to..... Degrees

(c) Pressure of Exhaust Steam

(d) Required Feed-Water Temperature

(e) Shall Heater be Arranged to Allow Steam to Pass Through It (Through Heater) or Shall the Heating be Done by Induction (Dead-End Heater)? If Latter, Where Shall Vent be Carried?

(f) Material of Shell or Casing Cast-Iron or Steel

(g) Trimmings, Thermometer, Water Gages

(h) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?

(i) Covering

(j) Painting of Heater

(k) Painting of Covering

(l) Guarantee

(m) Allowed Makes

(n) Size and Location of Steam Inlet and Outlet

(o) Size of Overflow or Drain

(p) If Open Type of Heater

Is governor to control steam to pumps or make-up water?

Is overflow to be float-controlled or sealed?

Is heater to be equipped with grease extractor?

capacity of grease extractor

Are returns from heating system to come back to heater?

Are high-pressure drips to return to heater? If so, how controlled?

Float construction?

Any filtering chamber required? If so, filled with what material?

Whence is suction line for pumps taken and what is its size?

Shape of heater: rectangular or cylindrical?

Is heater to be of metering type?

Is heater to be of softening type?

Is heater to exhaust free to atmosphere or to carry back pressure? If the latter, how much?

Area of heating and lime-catching surface (pan or tray surface) in square feet

Head or pressure of water supply at heater

Time of settlement to be allowed in softening heater

(q) If Closed Type

Is water or steam to pass through coils?

What number of square feet of heating surface per rated horse power is required with:

corrugated copper or brass tubes

smooth copper or brass tubes

Where will drip from heater be carried?

Horizontal or vertical type of heater?

(r) Does Water Require Softening?

(See Section 4—46, Water Softening)

4—22 FEED-WATER FILTER AND GREASE EXTRACTOR

(a) Number and Sizes of Pipe Connections

(b) Simple or Multiple Type?

(c) Material and Details of Construction

(d) Number and Style of Filtering Cartridges

(e) Trimmings

(f) Foundation: How Made? Of What Material?

(g) Covering

(h) Guarantees

(i) Allowed Makes

4—23 BLOW-OFF TANK

(a) Diameter and Length

(b) Built for What Working Pressure? Tested to what pressure?

(c) How Are Contents of Tanks to be Cooled?

If with a coil, length and diameter of pipe

(d) Any Pump Governor?

If so, kind and size

(e) Manholes Where?

(f) Size and Location of

Inlet from boilers

Outlet to sewer or drain pump

Other drain pipes

Vapor pipe

(g) Size of Vapor Pipe

Where valved?

How finished at top?

(h) Check Valves on What Pipes?

(i) Material

(j) Trimmings

(k) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?

(l) Covering

(m) Painting of Tank and Covering

(n) Who Makes Cooling Connections, if Any, to and from Tank?

4—24 COMBINATION HEATER, GREASE EXTRACTOR, MUFFLER TANK, RETURN TANK AND PUMP GOVERNOR

(a) Size, Diameter and Length

(b) Outlets

(c) Open Type Heater

Is governor to control steam to pumps or make-up water?

Is overflow to be float-controlled or water-sealed?

Are returns from heating system to come back to heater tank?

Are high-pressure drips to return to heater tank? If so, how controlled?

Float construction?

Any filtering chamber required? If so, filled with what material?

(d) Pressure of Exhaust Steam

(e) Required Feed-water Temperature Quantity of feed water per hour

(f) Shall Tank Have a Manhole?

(g) Where Shall Drip from Oil-separating Chamber Run?

(h) Vapor Line from Tank to be of What Size?

Vapor line runs where?

(i) What Other Drip Outlets Are Required?

(j) Whence is Suction Line for Boiler Feed Pumps Taken?

What is size of suction pipe?

(k) Material

(l) Trimmings

(m) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?

(n) Covering

(o) Painting of Tank

(p) Painting of Covering

(q) Guarantee

(r) Allowed Makes

4—25 HOT-WATER TANK

(a) Number of Tanks

(b) Diameter and Length

(c) Built for What Working Pressure? Tested to what pressure?

(d) Heating Element to be How Constructed?

Header of return-bend coil?

Brass, copper, iron or other pipe? Diameter of pipe and length of coil?

Where will drip be discharged?

(e) Manholes Where?

(f) Size and Location of

Plumbers' connections

Draw-off connections

Steam and drip connections

How is coil to be connected through head of tank to steam supply?

(g) Thermometer Inserted Where?

Kind of thermometer and range?

(h) How Will Temperature of Water be Regulated and Through What Range?

If automatically, will each tank have a power-operated valve with its own thermostat, or will one thermostat be used for both?

(i) What Pressure of Steam is to be Used for Heating?

(j) Material

(k) Trimmings

(l) Method of Support

(m) Covering

(n) Painting Tank and Covering

4—26 SEPARATE HOT-WATER HEATERS (NOT TANKS)

(a) Number

(b) Diameter and Length

(c) Built for What Working Pressure? Tested to what pressure?

(d) Amount of Heating Surface and Character of Surface

- (e) Allowable Drop of Pressure of Water in Passing Through Heater
- (f) Means of Access to Interior
- (g) Size and Location of Plumbers' connections
Draw-off connections
Steam, drip and vent connections
- (h) How Will Temperature of Water Be Regulated, and Through What Range?
If automatically, will each tank have a power-operated valve with its own thermostat, or will one thermostat be used for both?
- (i) Thermometer Inserted Where?
Kind of thermometer and range?
- (j) What Pressure of Steam is to be Used for Heating?
- (k) Material
- (l) Trimmings
- (m) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?
- (n) Covering
- (o) Painting
- (p) Allowed Makes

4-27 BACK PRESSURE VALVES

- (a) Number and Pipe Sizes
- (b) Horizontal, Vertical or Angle?
- (c) Screwed or Flanged
- (d) Set for What Pressure?
Adjustable?
Remote control?
- (e) Noise
- (f) Covering
- (g) Guarantee
- (h) Allowed Makes
- (i) *Construction

4-28 REDUCING VALVES

- (a) Type
- (b) Number and Location or Uses
- (c) Sizes of Pipe, Inlet and Outlet
- (d) Screwed or Flanged?
- (e) Initial and Final Pressures Required
Saturated or superheated steam?
If reducing valve discharges into closed space, is relief valve to be separate or integral with reducing valve?
- (f) Noiseless Operation
- (g) Leaks
- (h) Method of By-pass, if Any
- (i) Covering
- (j) Guarantee
- (k) Allowed Makes

4-29 GREASE EXTRACTOR. (OIL SEPARATOR)

- (a) Size of Pipe on Which They Are to Go?
- (b) Horizontal or Vertical?
- (c) Drain Discharged Where?
How trapped or sealed?
Any tank required?
Provision for draining separator under vacuum
- (d) Construction
- (e) Trimmings; Any Gage Glass?
- (f) Material
- (g) Covering
- (h) Painting
- (i) Guarantee
- (j) Allowed Makes

4-30 STEAM SEPARATORS

- (a) Pressure for Which Designed?
- (b) Type; Horizontal or Vertical?
- (c) If Receiver Type is Used, Size of Receiver Required
Any gage glass?
- (d) Size of Drip and Where Discharged?
How is drip tapped?
- (e) Material
- (f) Trimmings
- (g) Covering
- (h) Painting
- (i) Guarantee
- (j) Allowed Makes, Types of Each Make to be Stipulated

4-31 PUMP REGULATORS (OR GOVERNOR)

- (a) For What Purpose Required?
House pumps
Boiler-feed pumps, when pumping returns
Vacuum pump
Air compressors
- (b) Type of Regulators
Globe or angle pattern?
- (c) Construction of Floats, if of Float Type
- (d) Adjustment of Regulators, if of Spring Type
- (e) By-passing
- (f) Size of Steam Pipes Which They Control
- (g) For Float Type or Pump Governors
Trimmings
Painting
Covering
Foundation, how made? Of what material? Any special facing? Supplied by whom?
Guarantee
Allowed makes
- (h) For Spring Type
Guarantee
Allowed makes
- (i) Pressures
Steam
Vacuum
Air
Water

4-32 WATER WEIGHER OR METER

- (a) Maximum, Minimum, and Average Quantities of Water to be Measured
- (b) Temperature
- (c) Pressures Under Which Apparatus Must Work
- (d) Size Inlet, Outlet, and Overflow or Drain
- (e) By-passing
- (f) Type
Recording or Indicating
- (g) Where it is to be Located
- (h) Material
- (i) Trimmings
- (j) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?
- (k) Painting
- (l) Covering
- (m) Guarantee
- (n) Allowed Makes
- (o) *Construction

4-33 DAMPER REGULATORS

- (a) Number
- (b) Size of Dampers to be Controlled
- (c) Available Water Pressure
- (d) Regulator to Operate Under What Variations of Pressure?
- (e) Is Regulator to Control Anything But Damper?
- (f) All Chain Pulleys and Erection to be Furnished by Whom?
- (g) Who Makes Water Connections?
- (h) Method of Support
- (i) Guarantee
- (j) Allowed Makes

4-34 EXHAUST HEADS

- (a) Sizes of Pipe to Which They Are to be Attached
- (b) Heads to be Flanged or Screwed?
- (c) Size of Drains
Where is drain discharged?
- (d) Material
- (e) Method of Support
- (f) Guarantee
- (g) Allowed Makes

4-35 OIL CABINETS

- (a) Number of Oil Tanks to be Held
- (b) Capacity of Tanks
- (c) Material
- (d) Trimmings
- (e) Painting
- (f) Allowed Makes

4-36 TRENCH PLATES

- (a) Material
- (b) Method of Support
- (c) Approximate Length and Square Feet of Trench Plates
- (d) Allowable Weight per Section

4-37 TRENCHES

- (a) Material
- (b) Built by Whom?
- (c) Cleaned Out by Whom?
- (d) Sizes Shown Where?
- (e) Depth

4-38 BOILER NUMBERS

- (a) Material
- (b) Who Supplies and Installs These?

4-39 INJECTORS AND EJECTORS

- (a) Purpose
- (b) Size of Inlet and Discharge
- (c) Suction and Discharge Pressures
- (d) Steam Pressure
- (e) Location
- (f) Type of Apparatus
Single or double-tube?
- (g) How is Drip Carried Away?
- (h) Material
- (i) Method of Support
- (j) Guarantee
- (k) Allowed Makes

4-40 HIGH-PRESSURE STEAM CONNECTIONS

This section describes high-pressure steam connections. The following matters should be covered:

- (a) Method of Taking Steam from Boilers
- (b) Valving or Main Boiler Connections
Bridge along boiler main

- (c) Connections to Auxiliary Steam Main and Valving of Same
- (d) Construction of Steam Mains Expansion loops and bends
- (e) Installation of Steam Separators
- (f) Installation of Steam Meter
- (g) Connections to Engine Header Expansion bends
- (h) Construction of Engine Header
- (i) Valving of Engine Connections Emergency stop valves
- (j) Dripping of Main and Connections
- (k) Trapping of Drips and Discharging Where?
- (l) Pump Connections from Main and Auxiliary Steam Lines
- (m) Injector Connections to Boilers
- (n) Connections to Other Apparatus Which May be Steam-driven
- (o) Connection to Heating System
- (p) Live Steam for Manufacturing
- (q) Material
- (r) Painting
- (s) Covering
- (t) Method of Support of Piping and Flanges

If a particular method of making joints (Vanstone) is wanted, it should be fully described here.

4-41 EXHAUST STEAM CONNECTIONS

This section describes low-pressure steam connections from engines, pumps, etc., to heating main and to outside air, as well as to other apparatus in which it is to be utilized, and under this heading should be noted:

- (a) Method of Connecting from Engines to Main
- (b) Valving of Connections
- (c) Dripping of Connections
- (d) Connection of Main to Grease Extractor, Heater, or Combination Tank
- (e) By-passing of These Pieces of Apparatus Where Desired
- (f) Connection to Atmospheric Exhaust
- (g) Connection to Heating System
- (h) Connection to Hot-water Heater
- (i) Connection to Driving Apparatus
- (j) Connection to Other Apparatus Using Low-pressure Steam
- (k) The Method of Connecting Pump Exhausts
Whether into the same main as engines, or separate main
- (l) Back Pressure to be Carried on Pump Exhausts
- (m) Is Any Separate Grease Extractor to be Used?
- (n) How Will Exhaust to Outside Air be Run, and How Supported?

In connection with this description, note should be made further as to what size pipe is to be flanged and what screwed, also of suitable specifications for:

- (o) Material. (Spiral riveted, lap-welded, cast-iron, etc.)
- (p) Painting
- (q) Covering
- (r) Method of Support

4-42 DRIP PIPING

Here is described draining of high and low-pressure lines and apparatus:

- (a) Where Shall Steam Drips be Delivered?
- (b) Where Shall Dirty or Greasy Drips be Delivered?
- (c) How Shall Drips be Trapped or Sealed?
- (d) How Shall Following Apparatus be Drained and Where Shall Drain Go?
Steam Separator
Exhaust heads
Exhaust riser to atmosphere
Exhausts from separate engines and separate pumps
Engine cylinders
Connection to throttle valves of engines
Hot water tank or heater coils
Feed water heater overflow (open type)
Feed water drain (closed type)
Blow-off tank
Pump pans
Fly-wheel or dynamo pits
Indirect heating stacks below engine-room level

The following questions should also be covered:

- (e) Material
- (f) Painting
- (g) Covering
- (h) Method of Support
- (i) Location of Drip Piping, Whether Under or Over Floor, Should be Described
Method of protection desired

4-43 HEATING SYSTEM

- (a) In This Section the Kind of Heating System Desired Is to be Described, Whether
Single-pipe, up-feed, with or without air lines
Single-pipe, down-feed, with or without air lines
Two-pipe up or down feed, with or without air lines
Vacuum heating system, single or double-pipe
(For type of Return Valves see Section 4-2n)
Thermostatically controlled or not?
Modulation of heating desired or not?
Hot-water systems, natural or forced circulation?
Vapor systems
- (b) Following Questions Should be Answered:
Who pays royalty, if any is required?
What pressure is to be carried on heating main, and where shall this pressure be measured?
Who furnishes such special apparatus and appliances as may be required by special heating system chosen?
Where shall vacuum pump, air separating tank, vacuum governors, and other special apparatus be located?
Where shall vent be run from air separating tank if any is installed?
Where will reduced pressure live steam be introduced into system?
- (c) Material
- (d) Painting

- (e) Covering
- (f) Method of Support of Mains

4-44 CONDENSERS

- (a) Number
- (b) Type
Surface
Barometric
Evaporative
Jet
Rotary Jet
distance from circulating water inlet to center line of condenser
- (c) Material of
Shell
Tubes
Tube plates
- (d) Capacity
Vacuum required at full rated capacity
Temperature of circulating or injection water
Quantity and kind of water supplied per hour
Number of pounds of steam to be condensed per hour
- (e) Connections
Steam connections by whom?
Water connections by whom?
Electric connections by whom?
Size of steam-supply pipe
Size of water-supply pipe
Size of drain pipe
Whence is water obtained?
Where is water discharged?
- (f) Cooling Surface
Material
Gage of tubes
Square feet of cooling surface
Allowances for expansion and contraction of tubes
- (g) Air and Circulating Pump (see Sections 4-18, 4-19 and 4-20, Pumps and Motors)
- (h) Relief Valve
- (i) Thermometer
- (j) Gages
- (k) What Work of Other Contractors Is Required?
- (l) Cleaning
Inside of tubes
Outside of tubes
- (m) Foundation: How Made? What Material? Any Special Facing? Supplied by Whom?
- (n) Painting
- (o) Covering
- (p) Method of Support
- (q) Allowed Makes
- (r) Re-cooling of Circulating Water
Method of re-cooling
cooling tower
type of cooling tower
spray nozzles
air blast
Location of apparatus
Capacity
quantity of water to be circulated and cooled
required range of cooling
extreme weather conditions
usual weather conditions
mean barometric conditions
Connections
water connections by whom?
power connections by whom?
duct connections by whom?
dampers
Enclosure of tower

Delivery and erection
who delivers and erects?
(For Fans and Blowers see Section 4—13; for Circulating Pumps and Motors see Sections 4—18, 4—19 and 4—20)
Foundation: How made? What material? Any special facing? Supplied by whom?
Painting
Covering
Allowed makes
What work of other contractors is required?

4—45 ECONOMIZER

- (a) Location
- (b) Type
- (c) Method of Support
- (d) Foundation: How Made? What Material? Any Special Facing? Supplied by Whom?
- (e) Steam Pressure Carried
- (f) Height and Diameter of Stack
- (g) Grate Surface in Boilers
- (h) Fuel Used
- (i) Probable Load Conditions
Boiler horse power of plant
- (j) Capacity
Quantity of water circulated per hour
Probable inlet temperature
Required increase in temperature
*Number of square feet of heating surface
- (k) Arrangement of Flue-gas Connections
Connection to and from smoke breeching
Shut-off dampers
Enclosure of economizer
- (l) Water Connections
Size
By whom made?
Material
Relief valve
Discharge from relief valve
Valving
- (m) Mason Work
Any mason work?
Done by whom?
Material supplied by whom?
- (n) Heating Surface
*Material
*Test
- (o) Cleaning
*Method of cleaning outside surface
*Method of cleaning inside surface
*What supplies power?
*Who makes steam, electric, water or air connections?
*Means for removal of soot
*Means for removal of scale
- (p) Details
*Tubes, material, diameter and length
*Headers, material, diameter, and length
*Joints, how made?
*Provision for expansion
*Scrapers; material. How renewed? How operated?
*Blowing-off
- (q) Allowed Makes

4—46 WATER SOFTENING

- (a) Quantity and Quality
Maximum amount of water used in 24 hours
Maximum amount of water used in one hour

Analysis of water
Analysis of water to be purified
Purpose for which water is to be used
boiler, drinking, manufacturing, toilets, chemical processes, dyeing, etc.
Whence is water obtained?
Height in feet above foundations at which water will be delivered to softener
Where is water to be delivered?
Height at which purified water must be delivered to flow by gravity to heater or other point of use
Any settling chamber required?

- (b) Delivery and Erection
Housing for softener if erected outside of power-plant
Who builds foundations?
Who erects apparatus?
Who furnishes steel, wood, or concrete supports?
Who does wiring?
Who does piping?
Who supplies housing?
Who supplies plans for foundations?
Who supplies structure and piping?
Who supplies skilled labor?
Who supplies common labor?
Limits of contractor's work
- (c) Material and Details of Construction
Filter (see Section 4—47)
Heater
Storage tanks
Filtering material
Precipitating material
Other chemicals
Space required
Headroom required
Height of delivery of treated water
Rate of flow in sedimentation tank
Elevation of storage tanks, if elevated
Pumps (see Sections 4—18, 4—19 and 4—20)
Motors
Shafting
Character of electric current available
- (d) Metering
How will chemicals be measured?
How will water be measured?
- (e) Accessories
Thermometers
Water gages
Scales
Filters
Elevated storage tanks

4—47 WATER FILTERS

- (a) General Information
Maximum amount of water required per day of 24 hours
Maximum amount per hour
Source of water supply
General condition of the water
Purposes for which filtered water to be used
Maximum pressure on supply pipe
Size of main supply pipe
Maximum rate of filtration which will be permitted
- (b) Construction Details
Internal diameter of filter shell
material of shell
Total height over all
Thickness of shell
Thickness of heads
Test pressure required
Location of manhole
Form of supports
who builds foundations?
details of foundations

Filtering material
kind
sizes
depth
Strainer system
number of strainers
description of strainers
Exterior of valves and fittings
size of each
materials
description
shall provision be made for by-passing filters?
what are the limits of Filter Contractor's work?
Coagulating apparatus
size
pounds of coagulant contained
description of

- (c) Requirements
Methods of washing
description
time required
pressure and quantity required
where shall water be discharged?
Rate of filtration
net filtering area
capacity 2½ gallons per square foot per minute
- (d) Guarantees
Appearance of filtered water
No excess of coagulant
Maximum resistance of clean filter at 2½ gallons per square foot per minute
Time of shipment of completed filter

4—48 ELEVATED STORAGE TANK

- (a) Capacity in Gallons
- (b) Foundation
How made?
Of what material?
Supplied by whom?
- (c) Tank Construction
Material and thicknesses
Bottom flat or bumped?
Top held cylindrical
Surrounding balcony
- (d) Dimensions of Tank
Diameter
Height
- (e) Roof
Material
Pitch
- (f) Elevation from Foundation to Bottom of Tank
- (g) Tower
Material
Number and size of supports or posts
Pitch of posts
Number of panels
Size and construction of struts
Size and shape of bracing
Anchorage. Size?
- (h) Ladders
Tank. Inside and outside?
From column to balcony or from ground to balcony?
- (i) Piping
Inlet and outlet. Size?
Pipe covering
kind
number plies
Who supplies piping?
- (j) Painting
- (k) What are Limits of Tank Contractor's Work?

4-49 STEAM DURING CONSTRUCTION

- (a) What Temporary Heat Will Be Required and Where?
- (b) How Shall Change be Made for Connection and Disconnection of Radiators?
- (c) What Other Steam Will be Required?
For pumping
For hot water
- (d) Who Will Operate Boilers?
- (e) Who Will Remove Ashes?
- (f) Who Will Keep Piping in Repair?
- (g) Who Will Supply Fuel?
- (h) Who Shall Decide Whether Steam Is to be Kept on All Night or Not?
- (i) What Rate of Wages Shall be Paid for Engineer, Fireman and How Long Will a Regular Day's Work be?

4-50 INSTRUMENTS, TOOLS AND SUPPLIES

What part of the following will be required? Details should accompany list.

- (a) Firing Tools
Length, thickness of handles and tools required
- (b) Ash Cans
- (c) Engine Indicators
- (d) Anemometers
- (e) Flue-gas Thermometers
- (f) Test Gages
- (g) Draft Gage
- (h) Steam-Flow Meter
- (i) CO₂ Recorder
- (j) Recording Low-pressure Steam Gage
- (k) Recording High-pressure Steam Gage
- (l) Oil Filter Capacity
- (m) Tachometers
- (n) Allowed Makes of Each of the Above

4-51 CENTRAL OILING SYSTEM

- (a) What It Is Intended to Perform
What journal systems will be connected to?
Cylinder-oil systems connected to?
What separate cylinder-oil systems are required?
- (b) Limits of This System
Who supplies pump; filter; reservoir; feeds?
Gravity or pressure supply tank?
Filters in basement, engine-room floor, or overhead?
Shall automatic water-separator be furnished?
Steam, motor or air-driven pumps?
Allowed makes
(See also Sections 4-18, 4-19 and 4-20, Pumps)
- (c) Who Supplies Lubricators and Sight Feeds?
Shall force-feed lubricators be used?
Shall lubricators be all metal case?
Shall lubricator sights be on suction side of plungers?
Capacity of lubricators?
Shall oil cups have pipe-feed attachment?
Shall cup sights be removable without disturbing pipe connections?
Size of glass cup bodies?

(d) Where Is Reservoir to be Located?

If pressure tank be used, who furnishes air compressor?
Shall wall float indicator be furnished with gravity tank?

(e) How Are System Parts Cleaned?

*Construction parts to be submitted for approval

(f) Run of Piping and Means of Cleaning

Who furnishes plans?
Who approves plans?
Who supplies and installs piping?

(g) Materials

Shall oil mains on engines be brass, polished and nickel plated, or iron pipe painted?
Shall drip lines be of black steel or galvanized steel pipe?
Shall tanks be of heavy galvanized plate with closely riveted seams, or can they be light galvanized iron with lock-seam joints?

(h) Accessories

Shall the devices be furnished to permit emptying barrels on engine-room floor?
Shall arrangements be provided for taking oil by suction direct from barrels?
Shall heating arrangements be provided so cold cylinder oil can be pumped?
Shall a cooler be provided for cooling journal oil?
Shall draw-off stands be provided for the different oils in gravity or pressure tanks?
Shall the drips of different oils from draw-off stands be kept separated?
Shall draw-off stands have oil and drip lines concealed?
Shall a pedestal and hand wheel with extension to valve below floor be provided for shutting off oil to the two branches to each unit?
Shall journal oil be carried to rocker arms, governor, and other small bearings?

(i) Method of Support

Who furnishes gravity tank support?
Who furnishes raised concrete platform to set basement tanks upon?
Who furnishes pipe hangers?
Who cuts masonry and repairs same?

(j) Allowed Makes

*Square feet of filtering surface
*Capacity of different tanks
*Thickness of plate; riveted or lock-seam work?
*Soldered or caulked joints?

(k) Painting**4-52 FORCED-DRAFT BLOWERS**

- (a) Horse Power of Boilers Required and Rated
- (b) Grate Surface, Size and Openings
- (c) Quality of Fuel to be Burned
- (d) Type and Speed of Blowers
- (e) Steam Pressure or Electric Voltage, etc. (see Section 4-13, Fans and Blowers)
- (f) Possible Location of Blowers
- (g) Whence Is Air to be Drawn?
- (h) Are Blowers to Operate in Conjunction with Damper Regulator?
- (i) Material

- (j) Painting
- (k) Method of Support
- (l) Guarantee
- (m) Allowed Makes

4-53 WORK BY OTHER CONTRACTORS

- (a) What Plumbing Work Is Required by Steamfitter for
Damper regulator
Blow-off tank coils
Drains from pumps
Outlet in sewer for blow-off
- (b) What Electrical Connections Are Needed by Steamfitter?
Motor connections for ventilating fans
pumps
blowers
thermostat alarms
- (c) Mason Work
Cutting of holes
Trench building
Patching
Foundations

5-CENTRAL STATION STEAM HEATING**5-1 LOCATION****5-2 DISTRIBUTION SYSTEM (UNDERGROUND)**

- (a) Mains and Piping. (For other details see Section 4-Steamfitting)

General plan
Survey
Permit to dig up streets
Nature of soil
Depth of mains below street level
Sizes and lengths
Kind of pipe
flanges and couplings
valves
expansion joints
slip type
diaphragm type (packingless)
anchors
distance between anchors and expansion joints
Special fittings
angle and crosses.
oil and water separators
provision for additional connections
provision for measuring condensation
provision for dripping of pipes
traps and by-passes
how shall service connections be made?
sleeves
rollers
painting
tests

(b) Tunnel, Conduit or Trench

Combined conduit and insulator
Height and width
Material of sides
Material of bottom
Material of top
Footings
Gradings
Water of dampproofing
Under drainage
field tile
broken stone
how laid?
Supports for piping
Lighting
Any special cut-off walls where entrance is made into buildings?

(c) Pipe Insulation

Tin-lined kiln dried wood casing
Vitrified tile

Magnesia and asbestos
Asbestos air cell
Asbestos sponge
Cork, sheet or granulated
Hair felt
Waterproofing
Thickness of waterproofing
Insulation of valves, flanges and fittings
Any different insulation in man-holes?

(d) Manholes

Locations
street
valve
expansion joints

Sizes

Material

Covers (single or double) and curbs
material of structure
frames
lettering
provision for lifting
watertightness

Drains

(e) Meters, Traps, Screens, Separators

Supplied by whom?

Sizes

Approved makes and types.

(f) Special Details

Plans supplied by whom?

profiles — measurements — elevations

Inspection supplied by whom?

any special conditions as to supervision or skill of workmen and superintendence?

Tests made by whom?

test conditions

Guarantee

Any promise for protection of or against patent claims?

Liability insurance

Watchman's service

Lights

Protection

Prices for extra work

unit price per foot measurement, over all, including only expansion devices and anchors

unit price for valves set complete in manholes

unit price for street traps complete in manholes

unit price for angle fittings street crosses, etc.

5-3 BUILDING DETAILS**(a) Dimensions**

Height, width and length, and number of stories

(b) Square Feet of Direct Radiating Surface**(c) Square Feet Indirect Radiating Surface****(d) Square Feet Cast-iron Economy****(e) Square Feet Glass****(f) Square Feet Wall****(g) Cubic Contents****(h) Kind of Heating System****(i) Hours of Regular Operation of Building****(j) Where Shall Supply of Steam be Delivered?****(k) Where Shall Condensation be Taken Away?****(l) Will Supply be Metered?****(m) Will Condensation (Returns) be Metered?**

Will condensation be drained into sewer or returned to power house?

(n) Time of Starting and Completion**(o) Any Special Provisions to be Made for Expansion****(p) Permits****(q) Patented Appliances****6-POWER PLANT PIPING**

NOTE: When specifications are to be written for piping for a power plant, it is usual to make this a separate contract and the material may either be purchased separately and a separate erection contract given or the whole contract may be let as one. It seems advisable to make a separate section distinct from the general steamfitting specification.

6-1 CONDITIONS OF SERVICE**(a) Pressures**

High pressure carried
Low pressure carried
Condensing vacuum carried
Water pressure

(b) Steam Characteristics

Percentage of saturation
Superheated
amount of superheat. Maximum, minimum and average

(c) Water

Boiler feed
temperature entering economizer or feed-water heater
temperature entering boilers
Condenser
kind of water
source of supply
available head-tidal variation, etc.
analysis
temperature

6-2 HIGH PRESSURE PIPING**(a) Material**

Steel
Wrought Iron

(b) Weights

What standards of weights shall be used?

Up to what size will internal diameter be used? Above 14 inches outside diameter?

In what sizes will Merchant weight pipe be used?

In what sizes will Standard weight pipe be used?

In what sizes will extra heavy pipe be used?

In what sizes will double extra heavy pipe be used?

Will pipes over 14 inches outside diameter have extra thick walls; and if so, what thicknesses?

Any general requirements as to cracks, blisters, imperfect walls or obstructions to bore

(c) Tests

What hydrostatic pressure will be applied to test these pipes?

6-3 BONDS**(a) Material**

Steel
Wrought iron
Brass
Copper

(b) Design

Shall bonds not used to take up expansion be built to finished dimensions?

Shall bonds used to take up ex-

pansion be built to less than finished dimensions?

Who furnishes drawings?

Any minimum radius compared to diameter of pipe?

What tests are to be applied?

6-4 FLANGES**(a) Above What Diameter Shall Flanges be Used?****(b) What Standard is Used for Dimensions, Bolt Sizes and Number of Holes?****(c) Material**

Cast iron
Semi-steel
Steel

(d) Weights

Standard
Extra heavy
Hydraulic

(e) Type

Vanstone
Welded
Standard

(f) Finish

Rough
Smooth
Raise face or other joint than flat face

6-5 FITTINGS**(a) Cast-iron****(b) Semi-steel****(c) Cast-steel****(d) Weight****(e) Flanged or Screwed?****(f) Any Cast Fittings of Special Design?****(g) Any Welded Nozzles?****6-6 VALVES****(a) Material of Body and Yoke**

Cast-iron
Cast-steel
Bronze
Steam metal

(b) Above What Size Pipe Will Gate Valves be Used?**(c) Gate Valves**

Outside screw and yoke type?

Stationary or rising stem?

Screwed or flanged?

Double-wedged disc or taper seat?

Above what size shall valves be by-passed?

Shall valves be designed for re-packing under full pressure when wide open?

What size hand wheel required?

Any of these valves to be remote control? If so, by what force are they to be controlled, hydraulic or electric?

Stems

steel
bronze
nickel steel
monel metal

Seats

brass
nickel
monel metal

Gaskets

approved makes

(d) Non-return Valves.

Type

globe
angle
gate

Special details

any external or internal dashpot?
any handwheel?

Approved makes?
automatic throttle and emergency
valves

6-7 SUPPORTS

(a) Type

Hangers
roller
pipe
clamp
material
Standards
adjustable saddles
size of pipe support
design of foot

6-8 GASKETS

(a) Approved Makes of Gaskets for
Superheated steam
Saturated steam
Moderate pressure steam

6-9 COVERINGS

(a) Material to be Used and Thickness
With what thickness of canvas
shall covering be finished?
Painting
Banding
Any re-canvassing?

6-10 EXHAUST PIPING

(a) Material

Steel
Wrought iron
Galvanized

(b) Weight

Up to what sizes shall Merchant
weight pipe be used?
Will any of the exhaust piping be
done with galvanized riveted
pipe? If so, what thickness of
pipe?
Any test of this piping required?

6-11 BONDS

(a) Material

Steel
Wrought iron
Brass
Copper

(b) Design

Shall bonds not used to take up ex-
pansion be built to finished di-
mensions?
Shall bonds used to take up expan-
sion be built to less than fin-
ished dimensions?
Who furnishes drawings?
Any minimum radius compared to
diameter of pipe?
What tests are to be applied?

6-12 CAST-IRON PIPING

(a) Will any Cast-Iron Pipe be Used
Between Exhaust Outlet and
Condenser?

(b) Or from Condenser to Pumps,
Etc.?

6-13 FLANGES, COUPLINGS AND UNIONS

Where shall flanges be used?
Where shall couplings be used?
What standard used for dimen-
sions, bolt sizes and number
of holes?

(a) Flanges

Material
cast-iron
cast-steel
For standard weights what flanges
to be used?

How will flanges be secured to
pipe?

Shall flanges have raised spaces for
ring gaskets or will gaskets be
full size?

Shall flanges be finished rough or
machined?

(b) Couplings

Material
Weight

(c) Unions

Material
Weight

6-14 FITTINGS

(a) Material

(b) Weight

(c) Flanged or Screwed

(d) Any Cast Fittings of Special De- sign?

6-15 VALVES

(a) Material of Body and Yoke

Cast-iron
Cast-steel
Bronze
Steam metal

(b) Where Shall Gate Valves be Used?

(c) Where Shall Globe Valves be Used?

(d) Where Shall Angle Valves be Used?

(For details of Gate and Globe
Valves see Section 6-6; of
High Pressure Piping see
Section 6-2)

6-16 SUPPORTS

(a) Type

Hangers
roller
pipe
clamp
material
Standards
adjustable saddles
size of pipe support
design of foot

6-17 GASKETS

(a) Approved Makes of Gaskets for
Superheated steam
Saturated steam
Moderate pressure steam

6-18 COVERING

(a) Material to be Used and Thickness
With what thickness of canvas shall
covering be finished?

Painting
Banding
Any re-canvassing?

6-19 BOILER-FEED PIPING

(a) Material

Wrought iron
Steel
Brass
Copper

(b) Weight

What weight of pipe shall be
used?

(c) Test

To what test shall pipes be sub-
jected?

(d) Shall Pipe Joints be Flanged? Above What Size?

Or, shall coupling be used?

(e) Where Shall Unions be Used?

Shall unions be standard weight or
extra heavy?

(f) Flanges

(Same questions as apply to high-
pressure piping apply to the
flanges for feed line, see Sec-
tion 6-4)

(g) Fittings

(Same questions as apply to high-
pressure piping apply to fittings
for feed line, see Section 6-5)

(h) Valves

(Same questions apply as in high-
pressure work, except that
there will be no non-return
valves, see Section 6-6)

6-20 BLOW-OFF LINE

(a) Material

Wrought iron
Steel
Brass
Copper

(b) Weight

What weights of pipe shall be
used?

(c) Test

To what test shall pipes be sub-
jected?

(d) Shall Pipe Joints be Flanged? Above What Size?

Or, shall coupling be used?

(e) Where Shall Unions be Used?

Shall unions be standard weight or
extra heavy?

(f) Flanges

(Same questions as apply to high-
pressure piping apply here, see
Section 6-4)

(g) Fittings

(Same questions as apply to high-
pressure piping apply here, see
Section 6-5)

(h) Valves

(Same questions as apply to high-
pressure piping apply here, ex-
cept that there will be no non-
return valves, see Section 6-6)
Is asbestos-packed cock to be used
in addition to angle-pattern
blow-off valve? If so, of what
materials shall valves be made?
(For specification digest on Separ-
ators, Condensers, Water Weigh-
er, etc., see Sections, 4-1, et
seq., Steamfitting)

7-STEAM ENGINES

7-1 NUMBER OF ENGINES

7-2 LOCATION OF PLANT

7-3 CHARACTER OF BUILDING

7-4 TYPE

(a) High-speed

(b) Slow-speed

(c) Single-cylinder

(d) Compound

Cross
Tandem

(e) Single-valve

(f) Four-valve

(g) Corliss Type

(h) Poppet Valve

(i) Piston Valve

(j) Pressure Plate and Slide Valve

(k) Telescopic Unbalanced Valve

7-5 SIDE CRANK OR CENTER- CRANK TYPE?

7-6 PURPOSE FOR WHICH ENGINES ARE TO BE USED

7-7 ENGINES TO BE ATTACHED TO
DRIVEN APPARATUS HOW?

- (a) Directly Connected
- (b) Directly Coupled
- (c) Belted
- (d) Coupled to Shaft
- (e) Hand of Engine

7-8 CYLINDER INSIDE DIAMETER
(MINIMUM)

7-9 LENGTH OF STROKE

7-10 SPEED

7-11 STEAM PRESSURE AT ENGINE
THROTTLE

- (a) Number of Degrees Superheat, if Any

7-12 BACK PRESSURE AT ENGINE
EXHAUST

7-13 REQUIRED CAPACITY

- (a) If for Driving Electrical Apparatus, What Is the Kilowatt Capacity of Same?
- (b) If Alternating Current, What is the K. V. A. Capacity and Probable Power Factor?
- (c) If Alternating Current, What is the Cycle?

7-14 REQUIRED OVERLOAD CA-
PACITY AMOUNT AND
PERIOD

7-15 PAINTING

7-16 SPEED REGULATION

- (a) How Measured

7-17 SPEED VARIATION ALLOWED
UNDER SUDDEN VARIA-
TIONS OF LOAD

7-18 SPEED VARIATIONS AL-
LOWED UNDER GRADUAL
VARIATIONS OF LOAD

7-19 FROM WHAT PERCENTAGE
OF FULL LOAD TO WHAT
PERCENTAGE OF FULL
LOAD?

7-20 ANY REQUIREMENT AS TO
VARIATION FROM CON-
STANT ANGULAR VELOC-
ITY DURING EACH REVOLU-
TION? (A. C. WORK)

7-21 NOISE AND VIBRATION

- (a) How Determined?
- (b) Amount Permitted

7-22 TESTS AND INSPECTIONS

- (a) Where Made?
- (b) How Made?
- (c) By Whom?
- (d) Who Pays Expenses of Trips to Factory?
- (e) Any Charge for Inspection?
- (f) Who Pays for Fuel, Oil, and Operating Care During Acceptance Run?
- (g) Who Supplies Load for Test?
- (h) Who Makes Connections?
- (i) What Will be Covered by Test at Shop?
- (j) What Will be Covered by Test After Erection?
Economy guarantees
mechanical efficiency and steam
consumption per horse-power
hour

Regulation
Capacity
Overload capacity
Noise and vibration
Valve adjustment
Steam tightness of pistons
Steam tightness of valves

7-23 MECHANICAL CONNECTIONS
TO DRIVEN APPARATUS

(a) Directly Connected to a Dynamo
(Solid Shaft)

Who will press armature on shaft?
Where will armature be pressed on shaft?
Who furnishes key?
Who furnishes gage for shaft?
Who furnishes dynamo shaft?
If shaft is shipped to generator builder, who pays freight?
Who pays freight to destination on combined shaft and rotor?
Who pays for erection, and who is responsible for damage, if any?

(b) If Directly Coupled to a Dynamo
(Coupled Shaft)

Who furnishes coupling (both halves)?
Who furnishes dynamo shaft?
Will dynamo armature be shipped to engine manufacturer?
Who pays for shipping armature and shaft from engine works to engine room?

(c) Whether Dynamo is Directly Con-
nected or Coupled?

Who furnishes key?
Who furnishes gage for shaft?
Who furnishes sub-base, if any is required?
Who furnishes sole plates, if any are required?
Who furnishes holding-down bolts?
Who furnishes outboard bearing?
Who fits field frame to sub-base of sole plate at job?
Who is to be responsible for mistakes in fitting dynamo parts to engine parts?

(d) If Engine Is Belted to Dynamo or
Shaft

Shall belt be run tight or slack? If tight, how is belt to be kept so?
Diameter and face of driving wheel; diameter and face of driven pulley
maximum horse power to be transmitted
Distance between belt centers
tape-line measurement around pulley
Will drive be with tight side on top or below?
belt forward or back?
Will belt be below floor in any part?
who makes pit?
how will pit be drained?
where will drain discharge?
material of pit?
Any guard rail around belt?
Any guard rail around pit?
How will static electricity be collected from belt?
Who supplies belt?
Who installs belt?
width of belt?
how is joint in belt to be made? endless? If so, made endless at factory, or ends left open and joined at the job?
shall belt manufacturer make allowance for endless lap?
thickness
material
allowed makes

(e) How Is Exciter to be Driven?

7-24 CONSTRUCTION DETAILS

NOTE: Items which are starred (or preceded by an asterisk) may be specified, or, preferably, may be left for the engine builder to specify.

They are noted here to call attention to the necessity of definite knowledge on these points before placing a contract.

(a) Cylinders

Material
Finish of cylinder and head and valve chest
Covering cylinder barrel and head
*Method of support
Blow holes in casting
Provision for re-boring
Draining

(b) Pistons

*Type
*Kind of rings
*How secured to rod?
Steam tightness
Material
If a large piston, will junk-ring be lined with anti-friction metal?

(c) Piston Rod

Material
*Diameter
Packing of stuffing box
metallic or soft packing?
*How connected to cross-head?

(d) Cross-head

*Type
*Method of adjustment
*Method of lubrication
*Length and width of shoes
*Diameter and length of pin

(e) Connecting Rod

*Length
*Cross-sectional area
*Method of securing to cross-head
*Method of securing to crank
*Means of adjustment
Material
Finish, polished, or ground, or rough. If any casting, shall it be filled only or filled and painted?

(f) Crank and Pin

Diameter and length of pin
*Type of crank
*How counter-weighted?
*How balanced?
Material
Finish, polished, or ground, or rough? If any casting, shall it be filled only or filled and painted?

(g) Main Bearings

*Diameter and length
*Oiling System
self-oiling bearing?
*How re-lined?
removable shells
*Adjustments
for alignment?
for wear?
any provision for water-cooling?

(h) Shaft .

*Diameter and length
*Material
Finish, polished, or ground, or rough. If any casting, shall it be filled only or filled and painted?
*Provision for preventing oil from traveling along shaft

(i) Fly-wheel

Number per engine

- *Diameter
- *Weight
- *How secured to shaft?
- *Balance
- *Finish
- *Material

(j) Governing Device

- *Type of governor
- *Detail of construction
- *Method of adjustment for different speeds
- If eccentrics are used, are there to be one or two?
- *Lubrication
- Shields for prevention of spattering of oil
- *Provision for wear

(k) Valves

- *Type
- *Number per engine
- *Means of adjustment
- *Method of control
- Steam tightness
- means of preserving steam tightness
- *Lubrication
- *Range of cut-off
- Material
- Finish
- If superheated steam is to be used, are valves suitable?

(l) Frame

- *Type
- *Material
- *Finish, polished, or ground, or rough. If any casting, shall it be filled only or filled and painted?
- Painting

(m) Foundations

- Dimensions
- Material
- Who builds?
- Who makes drawings?
- Insulation from building
- Who supplies bolts, nuts and anchors, sleeves and template?
- Are bolts, etc., to be shipped before engines?
- Who sets template?
- Who does grouting?
- Is base to be filled?
- Sheet piling
- Piling
- Water-proofing

(n) Excavation

- Who makes?
- Who removes dirt and rubbish?
- Who cleans up after completion?

(o) Throttle Valve

- Type, standard weight or extra heavy? Flanged or screwed?
- if flanged who supplies companion flange?
- Any by-pass?
- Any drip?
- Allowed makes
- Finish

(p) Relief Valves

- Size
- Type
- Allowed makes
- Finish

(q) Cylinder Lubricators

- Types—force-feed, sight-feed, hand-pump
- number of feeds
- reservoir capacity
- method and location of drive
- Size
- Finish
- Allowed makes
- Who erects lubricators?

- Any graphite to be used as lubricant?
- Any special feeding devices?

(r) Engine Lubrication

- Any central system? (see Section 4—51)
- Type
- Size of feeds
- Piping, material and finish
- Size and type of filter
- Size and type of separate storage tank, if any?
- Means for re-circulation
- Any grease cups?
- type and capacity of grease cups
- Oil guards
- Oil drains
- Telescopes, center oilers
- Allowed makes

(s) Engine Indicator

- Any required?
- Supplied by whom?
- Type
- Allowed makes
- Finish
- Any reducing motion?

(t) Indicator Piping

- Material
- Finish
- Diameter
- Three-way or single cock?
- What make of indicator?
- Are angle valves required at both ends of cylinder?

(u) Steam Piping Connections

- Who supplies?
- *Size steam and exhaust
- *Size drip piping
- Who is responsible for cleaning out piping?
- Who is responsible for insuring dry steam?
- Where will exhaust steam be delivered?
- Limits of contractor's work

(v) Receiver and Piping

- Plain or with re-heating coil?
- Any provision in piping for running either side separately?
- Who furnishes supports?
- Who furnishes traps?
- Who furnishes non-conducting covering for receiver and pipe?

(w) Engine Stop

- Steam pressure
- Speed of engine
- Size of steam line
- Method of operation
- mechanical
- electrical
- combined

(x) Erection

- Is complete erection desired?
- If not, who pays for time and services of erector?
- who furnishes cartage?
- who furnishes labor help?
- who furnishes runways into building?
- who furnishes jacks, falls and other tools?
- who furnishes non-conducting covering?

7—25 GENERAL NOTES

- (a) Opening for Delivery of Plant?
- (b) Engineer's Services to Operate Plant
- (c) Location of Engine Room
- (d) Ventilation of Engine Room
- (e) Head Room
- (f) Level of Engines Compared to Drip Tank

8—TURBINES**8—1 TURBINES**

Steam turbines are steam engines; hence the CHECKING-LIST for Engines applies largely to the specification of turbines. Of the preceding sections, these numbers apply directly and may be used: 7—1, 7—2, 7—3, 7—6, 7—7 (see note as to gear drive), 7—10, 7—11, 7—12, 7—13, 7—14, 7—15, 7—16, 7—17, 7—18, 7—19, 7—21, 7—22, 7—23, sub-headings *g, h, j, m, n, o, p, r, u* under 7—24, and 7—25.

Additional matters which should be considered are:

8—2 TYPE

- (a) Single or Multi-stage?
- (b) Impulse or Reaction?
- (c) High-pressure
- (d) Low-pressure
- (e) Mixed Flow

Flow valve and oil separator to be installed?

8—3 ANY STEAM TO BE TAKEN OUT FOR OTHER PURPOSES

- (a) Heating
- (b) Manufacturing
- (c) Pressure Required
- (d) How Is Quantity to Be Compensated for?
- Automatically or hand controlled?
- (e) Quantity Required
- Probable steam requirement curve
- Probable load curve

8—4 ALLOWED MAKES OF TURBINES**8—5 GEARING (WITH IMPULSE TYPE)**

- (a) *Helical Gear
- (b) *Spiral Gear
- (c) *Worm Gear
- (d) *Chain Drive
- (e) *Enclosure of Gear
- (f) *Lubrication of Gear
- (g) Noiseless Operation of Gear
- (h) *Method of Compensating for Wear
- (i) *Material

8—6 CASING

- (a) *Material
- (b) *Joints
- (c) *Bolting
- (d) Absence of Leakage
- (e) *Finish of Inside Faces
- (f) *Finish of Outside Faces
- (g) *Location of Jets
- (h) Number of Jets

8—7 NOZZLES

- (a) *Material
- (b) *Number
- (c) *Type
- (d) *How Controlled?
- (e) *How Supplied with Steam?
- (f) *Method of Support

8—8 EXHAUST OUTLET

- (a) *Type
- (b) Number
- (c) How Controlled?
- (d) Material

- (e) Method of Support
- (f) Finish

8-9 BUCKETS

- (a) *Material
- (b) *Section
- (c) *How Held to Rotor?
- (d) *How Renewed?
- (e) *Clearance
- (f) *Clearance Measurement
- (g) *How Is Leakage Prevented?
- (h) *Finish

8-10 ROTOR

- (a) *Material
- (b) *How Held to Shaft?
- (c) *How Balanced?
- (d) *Diameter
- (e) *Thickness
- (f) *Peripheral Speed
- (g) *How Is Balance Obtained with Unequal Expansion of Rotors in Multi-stage Turbine?
- (h) *How Is Oil Prevented from Traveling Along Shaft from Bearings?

8-11 ACCUMULATOR

(If exhaust-steam turbine is used.)

- (a) Type of Accumulator
- (b) Capacity
 - Average quantity of exhaust steam supplied
 - Minimum quantity of exhaust steam supplied
 - Maximum quantity of exhaust steam supplied
 - Probable load curve of supplying apparatus
 - Probable load curve of exhaust-steam turbine
 - What part of exhaust steam from other apparatus will be available?
- (c) *Dimensions
- (d) *Material
- (e) *Method of Support
- (f) Covering
- (g) Painting
- (h) Foundation
- (i) Who Makes Connections to and from?
- (j) Relief Discharges Where?
- (k) *Make-up Boiler-steam Connection
 - Enters where?
 - Supplied by whom?
 - How controlled?

- (l) Allowed Makes of Accumulators

8-12 OIL SUPPLY: HORIZONTAL TURBINES

- (a) Method of Removing the Dirty Oil and Refilling With Clean Oil?
- (b) Who Furnishes Filtering and Storage Outfit for Turbine?
- (c) Allowed Makes of Outfit

9-INTERNAL COMBUSTION ENGINES

9-1 NUMBER

9-2 LOCATION OF PLANT

9-3 CHARACTER OF BUILDING

9-4 ALLOWED MAKES

9-5 TYPES

- (a) Gas
- (b) Oil
 - Diesel
- (c) Two or Four Cycle
- (d) Horizontal or Vertical
- (e) Suction or Pressure
- (f) Single or Double-acting
- (g) Number of Cylinders

9-6 GAS OR FUEL ON WHICH ENGINE SHALL OPERATE

- (a) Producer
- (b) Natural
- (c) Illuminating
- (d) Gasoline
- (e) Kerosene
- (f) Oil
 - What is chemical analysis and percentage of silt?
- (g) Effective Heat Units in Gas
- (h) Maximum Percentage of Hydrogen
- (i) Maximum Percentage of Impurities

9-7 GENERAL NOTES

- (a) Opening for Delivery of Plant?
- (b) Engineer's Services to Operate Plant
- (c) Location and Dimensions of Engine Room
- (d) Ventilation of Engine Room
- (e) Head Room

9-8 PURPOSE FOR WHICH ENGINES ARE TO BE USED

9-9 ENGINES TO BE ATTACHED TO DRIVEN APPARATUS, HOW?

- (a) Directly Connected
- (b) Directly Coupled
- (c) Belted
- (d) Coupled to Shaft

9-10 CYLINDER INSIDE DIAMETER (MINIMUM)

9-11 LENGTH OF STROKE

9-12 SPEED

9-13 GAS PRESSURE

- (a) Will Engine Create Its Own Suction?
- (b) Will Gas be Delivered under Pressure?

9-14 REQUIRED CAPACITY

9-15 REQUIRED OVERLOAD CAPACITY, AMOUNT AND PERIOD

9-16 PAINTING

9-17 SPEED REGULATION

- (a) How Measured?
 - Percentage to be based on full-load speed of engine
- (b) How is Speed Regulation Obtained at Light Load?
- (c) How is Speed Regulation Obtained at Heavy Load?

9-18 SPEED VARIATION ALLOWED UNDER SUDDEN VARIATIONS OF SPEED

9-19 SPEED VARIATION ALLOWED UNDER GRADUAL VARIATIONS OF SPEED

9-20 FROM WHAT PERCENTAGE OF FULL LOAD TO WHAT PERCENTAGE OF FULL LOAD?

- (a) Percentage to Be Based On Full-load Speed of Engine

9-21 ANY REQUIREMENT AS TO VARIATION FROM CONSTANT ANGULAR VELOCITY DURING EACH REVOLUTION (A. C. WORK)

9-22 NOISE AND VIBRATION

- (a) How Determined
- (b) Amount Permitted

9-23 TESTS AND INSPECTIONS

- (a) Where Made?
- (b) How Made?
- (c) By Whom?
- (d) Who Pays Expenses of Trips to Factory?
- (e) Any Charge for Inspections?
- (f) Who Pays for Fuel, Oil and Operating Care During Acceptance Run?
- (g) Who Supplies Load for Test?
- (h) Who Makes Connections?
- (i) What will be Covered by Test at Shop?
- (j) What will be Covered by Test at Erection?
 - Economy guarantees
 - Regulation
 - Capacity
 - Overload capacity
 - Noise and vibration
 - Valve adjustment

9-24 MECHANICAL CONNECTIONS TO DRIVEN APPARATUS

- (a) If Direct-Connected to a Dynamo (Solid Shaft)
 - Who will press armature on shaft?
 - Where will armature be pressed on shaft?
 - Who furnishes key?
 - Who furnishes gage for shaft?
 - Who furnishes dynamo shaft?
- (b) If Directly Coupled to a Dynamo (Coupled Shaft)
 - Who furnishes coupling? (Both halves)
 - Who furnishes dynamo shaft?
 - Will dynamo armature be shipped to engine manufacturer?
 - Who pays for shipping armature and shaft from engine works to engine room?
- (c) Whether Dynamo is Directly Connected or Coupled
 - Who furnishes key?
 - Who furnishes gage for shaft?
 - Who furnishes sub-base, if any is required?
 - Who furnishes sole plates, if any are required?
 - Who furnishes holding-down bolts?
 - Who furnishes outboard bearing?
 - Who fits field frame to sub-base or sole plate at job?
 - Who is to be responsible for mistakes in fitting dynamo parts to engine parts?

(d) If Engine is Belted to Dynamo or Shaft

- Shall belt be run tight or slack? If slack, how is belt to be kept so?
- Diameter and face of driving wheel; diameter and face of driving pulley
- Maximum horse power to be transmitted
- Distance between belt centers
- tape-line measurement around pulleys
- Will drive be with tight side on top or below?
- belt forward or back?

Will belt be below floor in any part?
 who makes pit?
 how will pit be drained?
 where will drain discharge?
 material of pit?
 Any guard rail around belt?
 Any guard rail around pit?
 How will static electricity be collected from belt?
 Who supplies belt?
 Who installs belt?
 width of belt?
 how is joint in belt to be made?
 endless? If so, made endless at factory, or ends left open and joined at the job?
 shall belt manufacturer make allowance for endless lap?
 thickness
 material
 allowed makes

9-25 CYLINDERS

- (a) *Material
- (b) *Method of Cooling
- (c) *Method of Support
- (d) Blow Holes in Castings
- (e) Lubrication
 Oil, dry or liquid graphite?
- (f) *Clearance
- (g) *Scavenging
- (h) *Location and Number of Igniter Plugs
- (i) Finish of Heads
- (j) Finish of Barrels
- (k) Gaskets or Packing in Cylinder Heads and Manifold Flanges

9-26 PISTON

- (a) *Type
- (b) *How Secured to Rod?
- (c) *Cooling
- (d) Material
- (e) Finish

9-27 PISTON ROD

- (a) *Material
- (b) *Dimensions
- (c) *Packing of Stuffing Box if Double-acting
 Metallic or soft packing?
- (d) *Cooling, if Double-acting
- (e) *How Connected at Each End?

9-28 CROSS-HEAD

- (a) *Type
- (b) *Method of Adjustment
- (c) *Method of Lubrication
- (d) *Area
- (e) *Diameter and Length of Pin

9-29 CONNECTING ROD

- (a) *Length
- (b) *Cross Sectional Area
- (c) *Method of Securing to Cross-head
- (d) *Method of Securing to Crank
- (e) *Means of Adjustment
- (f) Material
- (g) Finish, Polished, or Ground, or Rough. If any Casting, Shall It be Filled Only or Filled and Painted?

9-30 CRANK AND PIN

- (a) Diameter and Length of Pin
- (b) *Type of Crank
- (c) *How Counterweighted?
- (d) *How Balanced?
- (e) Material
- (f) Oiling Device on Crank Pin

- (g) Finish, Polished, or Ground, or Rough

9-31 MAIN BEARINGS

- (a) *Diameter and Length
- (b) *Oiling System
 Self-oiling bearings?
- (c) *How Re-lined?
 Removable shells
- (d) *Adjustment
 For alignment?
 For wear?

9-32 SHAFT

- (a) *Diameter and Length
- (b) *Material
- (c) Finish, Polished, or Ground, or Rough
- (d) *Provision for Preventing Oil From Traveling Along Shaft

9-33 FLY-WHEEL

- (a) *Diameter
- (b) Number per Engine
- (c) *Weight
- (d) *How Secured to Shaft?
- (e) *Balance
- (f) *Finish
- (g) *Material

9-34 GOVERNING DEVICE

- (a) *Type of Governor
- (b) *Detail of Construction
- (c) *Method of Adjustment for Different Speeds
- (d) *Lubrication
- (e) Shields for Prevention of Spattering of Oil
- (f) *Provision for Wear

9-35 FRAME

- (a) *Type
- (b) *Material
- (c) *Finish: Polished, or Ground, or Rough. If any Casting, Shall It be Filled Only or Filled and Painted?
- (d) Painting

9-36 FOUNDATIONS

- (a) Dimensions
- (b) Material
- (c) Who Builds?
- (d) Insulation from Buildings
 Bolts, nuts, and anchors, sleeves
- (e) Template
- (f) Are Bolts, etc., to be Shipped Before Engines?
- (g) Who Sets Template?
- (h) Who Does Grouting?
- (i) Is Base to be Filled?

9-37 EXCAVATION

- (a) Who Makes?
- (b) Who Removes Dirt and Rubbish?
- (c) Who Cleans Up After Completion?

9-38 IGNITION

- (a) Type
- (b) How Many and What Sources of Supply?
- (c) Single or Multiple Igniters in Each Cylinder?
- (d) Ignition Wiring by Whom?
- (e) Sources of Supply by Whom?
- (f) *Is Timing to be Adjustable?
- (g) *Cooling

- (h) *Removal and Renewal
- (i) *Material

9-39 WATER COOLING

- (a) *System
- (b) *Manifold by Whom?
- (c) Who Supplies Valves on Inlet and Outlet?
- (d) *Quantity Needed at What Temperature?
- (e) *Pressure Needed
- (f) Discharge Where?

9-40 VALVES

- (a) *Type
- (b) *How Controlled?
- (c) *Removable Cages
 Any spare valves and cases?
- (d) *How Cooled?
- (e) *Material
- (f) *How Held From Dropping Into Cylinder?
- (g) *Where are Valves Located?

9-41 MIXING DEVICE

- (a) Where Is Mixing Controlled?
- (b) How Is Mixing Controlled?

9-42 CYLINDER AND ENGINE LUBRICATION

- (a) Cylinder Lubricators
 Types
 forced-feed
 number of feeds
 reservoir capacity
 location and method of mechanical drive
 sight-feed
 hand-pump
 Size
 Finish
 Allowed makes
 Who erects lubricators?
 Any graphite to be used?
 Any special feeding devices?
- (b) Engine Lubrication
 Any central system? (See Section 4-51)
 Type
 Size of feeds
 Piping, material and finish
 Size and type of filter
 Size and type of separate storage tank, if any
 Any grease cups?
 type and capacity of grease cups
 Allowed makes

- (c) Means for Re-circulation

9-43 PIPING

- (a) Limits to Which Engine Contractor Goes With
 Gas-supply piping
 Air-supply piping
 Exhaust piping
 provisions for expansion at manifolds
 Water-supply and drip piping
 Oil piping
 Compressed-air piping
 Electric wiring
 Covering of piping and flanges
- (b) Method of Muffling Exhaust

9-44 STARTING EQUIPMENT

- (a) System
- (b) Pressure of Air Required
- (c) Capacity of Air Tanks
 Test for tightness of air tanks
- (d) Relief Valves

- (e) How Will Compressed Air be Supplied?
- (f) Any Automatic Control?
- (g) Any Gages?
- (h) Allowed Makes of Compressors
- (i) Type of Compressors
- (j) How is Compressor Driven?
- (k) Noise and Vibration
- (l) Lubrication
- (m) Method of Support
- (n) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?
- (o) Painting

9-45 PLATFORM AND RAILING

- (a) Material
- (b) Finish

9-46 IF AN OIL ENGINE IS CON-TEMPLATED

- (a) Oil-storage Tank
 - Size
 - Material
 - Location
 - Gravity or suction feed?
 - Fire protection
 - Filling and emptying
 - Vent
 - Painting
- (b) Oil Piping from Tank to Engine
 - Material
 - Valving
 - Pumping
- (c) Ignition
 - Type
 - How many and what sources of supply?
 - Single or multiple igniters in each cylinder?
 - Ignition wiring by whom?
 - *Is timing to be adjustable?
 - *Cooling
 - *Removal and renewal
 - *Material
- (d) No Ignition
- (e) No Gas-supply Piping
- (f) Character and Analysis of Oil to be Used
 - Specific gravity
 - Thermal value
 - Base
 - Percentage of silt

10-DYNAMOS

10-1 NUMBER OF DYNAMOS

10-2 LOCATION OF PLANT

10-3 CHARACTER OF BUILDING

10-4 PURPOSE FOR WHICH DYNAMOS ARE TO BE USED

10-5 TYPE

- (a) Direct-connected
- (b) Direct-coupled
- (c) Belted
- (d) Direct-current. Two or Three-wire
- (e) If Three-wire, Self-contained or Separate Balancing Device
- (f) Alternating-current, Single, Two or Three-phase Star or Delta Connection

10-6 Required Capacity

- (a) Kilowatts for Direct Current
- (b) Kilovolt-Amperes (K. V. A.) for Alternating Current

(c) With Alternating-current, Dynamo Power Factors Should Be Stated

10-7 REQUIRED OVERLOAD CAPACITY

10-8 VOLTAGE

10-9 SPEEDS

10-10 MAXIMUM TEMPERATURE RISES PERMITTED

- (a) Under Full Load
- (b) Under Over-load
- (c) In Commutators
- (d) In Fields
- (e) In Armature Winding
- (f) How Long Under Full Load?
- (g) How Long Under Over-load?
- (h) Will Over-Load Follow Full Load?
- (i) How Will Rises be Measured?

10-11 PAINTING

10-12 ERECTION

- (a) Who Erects Dynamo?

10-13 REGULATION

- (a) Voltage at Over-load
- (b) Voltage at Full Load
- (c) Voltage at Quarter Load
- (d) Voltage at No Load
- (e) Is Compounding to be Variable?
- (f) What Variation Permitted in Line Joining No Load and Full Load (or Over-Load) Voltage?
- (g) How Will Compounding be Measured? After Full Load Run?
- (h) What Drop in Speed is to be Allowed for in Changing from No Load to Over-load?
- (i) What Momentary Variation, Under Sudden Changes of Load, Will be Permitted?
- (j) Will Hand Adjustment be Permitted?

10-14 SPARKLESS OPERATION

10-15 NOISELESS OPERATION

10-16 FLICKERING OF LIGHTS

10-17 ELECTRICAL BALANCE OF WINDING

10-18 WITH THREE-WIRE DIRECT-CURRENT DYNAMOS

- (a) What is Maximum Unbalanced Load
- (b) What Difference in Voltage Between the Two Sides of System Will be Permitted?

10-19 TESTS AND INSPECTION

- (a) Where Made?
- (b) How Made
- (c) By Whom?
- (d) Who Pays Expenses of Trips to Factory?
- (e) Any Charge for Test?
- (f) Who Supplies Load During Test?
- (g) Who Operates Plant?
- (h) What Will be Covered by Test at Shop?
- (i) What Will be Covered by Test After Erection?
 - Efficiency guarantees
 - Regulation
 - Noiselessness
 - Capacity
 - Overload
 - Balance
 - Absence of flickering

10-20 MATERIAL AND CONSTRUCTION

NOTE: These starred items may be specified, or preferably may be left for dynamo builder to specify.

They are noted here to call attention to the necessity of definite knowledge on these points before placing contract.

- (a) Field Frame
 - *Material
 - *Number of poles
 - *Pole clearance
 - (b) Armature
 - *Type of winding
 - *Method of insulation
 - *Method of fastening ends of winding to commutator lugs
 - *Depths of slots
 - *Ventilation
 - (c) Commutator
 - *Material
 - *Insulation
 - *Wearing depth
 - *Number of segments per pole
 - Truing up
 - (d) Brushes
 - Material
 - *Size
 - *Number per pole
 - Maximum current density
 - *Method of support
 - *Adjustment
 - *Connection to brush holder
 - (e) Field Rheostat
 - Who supplies?
 - Type
 - Range of voltage
 - Allowed makes
 - Finish
 - (f) Bearings
 - *Number
 - *Size
 - Self-oiling
 - Who supplies?
 - *Adjustment
 - (g) Pulley (Belted Dynamo Only)
 - Material
 - Diameter and face
 - Method of support
 - *How fastened to shaft?
 - (h) Sub-base
 - Material
 - By whom supplied?
 - *Construction
 - (i) Shaft
 - *Size
 - Protection against oil
 - *Material
- 10-21 MECHANICAL CONNECTIONS TO DRIVING APPARATUS
- (a) If Direct-connected to an Engine (Solid Shaft)
 - Who will press armature on shaft?
 - Where will armature be pressed on shaft?
 - Who furnishes key?
 - Who furnishes gage for shaft?
 - Who furnishes dynamo shaft?
 - (b) If Directly Coupled to an Engine (Coupled Shaft)
 - Who furnishes coupling? (Both halves)
 - Who furnishes dynamo shaft?
 - Will dynamo armature be shipped to engine manufacturer?
 - Who pays for shipping armature and shaft from engine works to engine room?

- (c) Whether Dynamo Is Directly Connected or Coupled
 Who furnishes key?
 Who furnishes gage for shaft?
 Who furnishes sub-base, if any is required?
 Who furnishes sole plates, if any are required?
 Who furnishes holding-down bolts?
 Who furnishes outboard bearing?
 Who fits field frame to sub-base or sole plate at job?
 Who is to be responsible for mistakes in fitting dynamo parts to engine parts?

(d) If Dynamo Is Belted to Engine or Shaft

- How is belt to be kept tight?
 Diameter and face of driving wheel
 Diameter and face of driven pulley
 Distance between belt centers
 tape-line measurement around pulleys
 Will drive be with tight side on top or below?
 belt forward or back?
 Will belt be below in any part?
 who makes pit?
 how will pit be drained?
 where will drain discharge?
 material of pit?
 Any guard rail around belt?
 Any guard rail around pit?
 How will static electricity be collected from belt?
 Who supplies belt?
 Who installs belt?
 width of belt?
 how is joint in belt to be made?
 endless? If so, made endless at factory, or ends left open and joined at the job?
 shall belt manufacturer make allowance for endless lap?
 thickness
 material
 allowed makes

10-22 EXCITERS

(a) Excitation of Fields

- Will fields be self-excited?
 Will there be an exciter integral with dynamo?
 Will exciter be separate?
 If so, will it be motor or engine driven, or driven by belt from main engine? (See Section 10-21d)
 If exciter is motor or engine driven, method of drive? (See Section 7-23d)
 Details of engine or motor
 steam engine (see Section 7-1)
 turbine (see Section 8-1)
 internal combustion engine (see Section 9-1)
 motor (see Section 11-24)

(b) Other Details, see Sections:

10-7, Capacity; 10-8 Voltage; 10-9, Speeds; 10-10, Maximum Temperature Rise Permitted; 10-11, Painting; 10-12, Erection; 10-13 a, b, c and d, Regulation; 10-14, Sparkless Operation; 10-15, Noiseless Operation; 10-19, Tests and Inspection; 10-20, Material and Construction; 10-23, Electrical Connections; 10-24, Foundations; 10-25, Excavations.

10-23 ELECTRICAL CONNECTIONS

- (a) Connections about Dynamo
 (b) Connections from Dynamo to Switchboard
 (c) Lugs for Connections
 (d) Size and Drilling of Lugs
 (e) Switchboard
 (f) Test Connections
 (g) Operation of Test Load

10-24 FOUNDATIONS

- (a) Dimensions
 (b) Material
 (c) Who Builds?
 (d) Insulation from Building
 Bolts, nuts and anchors, sleeves
 (e) Template
 (f) Are Bolts, Etc., to Be Shipped before Dynamos?
 (g) Who Sets Template?
 (h) Who Does Grouting?
 (i) Is Base to be Filled?

10-25 EXCAVATIONS

- (a) Who Makes?
 (b) Who Removes Dirt and Rubbish?
 (c) Who Cleans up after Completion?

11-ELECTRIC WIRING

NOTE: The electrical wiring section of a specification may apply merely to the wiring, or it may, and frequently does, include the electric-power plant, storage batteries, switchboard and panel distributing boards, and lighting fixtures. The advisability of separating these parts or combining them in one contract is a matter of opinion and also a matter of preference and conditions. Unless the work is located at a distance, making it desirable to have one contractor in charge of the whole work, it has been the writer's experience that sub-division results in better control of the work and a lower cost. For this reason the CHECKING-LIST under the heading of Electrical Equipment deals with electric wiring and all matters directly connected therewith, but provides also separate sections on

- (1) Engines
 (2) Dynamos
 (3) Switchboards
 (4) Storage batteries

As to electric fixtures there is no possibility of writing either a general specification or a specification digest. The selection of this work is a matter of taste.

11-1 GENERAL DESCRIPTION OF ELECTRICAL WORK

(a) Work and Materials to be Included in Electrical Contract

- Who furnishes generator units?
 Who furnishes storage-battery equipment?
 Who furnishes switchboard?

(b) Who Makes Wiring Connections Between the Foregoing?

(c) Does Electrical Contractor Furnish Fans, Pumps or Compressors?

(d) Who Makes Connections to and Between Electrical Apparatus Furnished by Other Contractors?

(e) Who furnishes Automatic Electrical Controllers for Pumps, Compressors, Etc.?

(f) Are Power Feeders Required for Use of Tenants?

(g) Is Tenant's Light to be Separately Metered?

Is tenant's power to be separately metered?

- (h) Who Furnishes Distributing Panel Boards?
 (i) Any Emergency or Night Lighting?
 (j) Any Outside Sign or Marquise Lighting?
 (k) Any Special Lighting?
 (l) Are All Outlets Shown on Plans to be Connected?
 (m) Are Any Outlets not Shown to be Provided For?
 (n) Are Any Special Outlets Required for Power, Heater, Irons, Etc.?
 (o) Any Bell and Annunciator System?
 (p) Any Local or Interior Telephone System?
 (q) Any Conduit System for Outside Telephone Service?
 (r) Any Watchman's-Clock System?
 (s) Any Time-clock System?
 (t) Any Fire-alarm System?
 (u) Any Telautograph System?
 (v) Any Carriage-signal System?
 (w) Any Dictagraph System?
 (x) Is Elevator Signal System Connected to Separate Source of Power?
 (y) Are there Any Special Devices, Such as Door-openers, Etc.?

(z) Who Furnishes Electric-light Fixtures?

Who furnishes incandescent, arc, Nernst, Cooper-Hewitt, Moore or tungsten lights?

Who furnishes electric plate-warmers, heaters, irons, etc.?

Who furnishes drop cords?

Who furnishes extension cords and plugs from receptacles and floor outlets for lighting or bell system?

11-2 ELECTRIC SYSTEM TO BE USED

(a) Will Electricity be Supplied from Private Plant or Outside Service?

(b) Electric System Inside of Building

Will same service be used for light and power?

Direct or alternating current?

If alternating, single, two- or three-phase?

Two-wire or three-wire system?

Voltage for lighting

Voltage for power

How far does electrical contractor's work extend as regards connections to service?

(c) Outside Electric Service

Intermediary apparatus, such as transformers, rotary converters or motor generators?

Installed by public service corporation or by owner?

Break-down service required?

Provisions made for metering outside power

Nature of transmission line

Service enters building where?

Direct or alternating current?

Voltage of outside system

Frequency of outside system

11-3 CERTIFICATES AND PERMITS

(a) Fire Underwriters

(b) Municipal Authorities

(c) State Authorities

(d) Who Pays Fees for Inspection, Repairing, Etc.?

(e) What Parts of Work Are to be Covered by Certificates?

Work done by electrician

Work not done by electrician, or apparatus not purchased by him but requiring such certificates

11-4 WIRE

- (a) Material
- (b) Conductors
 - Percentage conductivity
 - Tinning
 - Stranding
- (c) Character and Quality of Insulation
 - Material
 - Percentage of rubber
 - Thickness of rubber or other insulating material
 - Number of braids
- (d) Mechanical Protection
- (e) Tests
 - Mechanical tests
 - Insulation tests
 - Test voltage to be used
 - alternating or direct?
 - Length of time of test
 - Required insulation resistance
 - Who pays for expense of test
 - Who pays for inspector?
 - Who supplies instruments and other test needs and voltage and current?
 - Where shall tests be made?
 - When shall tests be made?
- (f) Size of Wire
 - Where are sizes shown?
 - Where not shown, what rule is to govern?
- (g) Stranding of Wire Required When Larger Than What Size?
- (h) Any Special Wire or Insulation for Electric heating appliance
 - Bell work
 - Portable lights
 - Telephones
 - Storage-battery connections
 - Outside work
 - Rooms with damp air
 - Rooms with acid-impregnated air
 - Rooms with gaseous atmosphere
- (i) Allowed Makes
 - Is manufacturer's certificate required?
- (j) Joints in Wires and Cables
 - Sleeves for conductor, insulation and sheath
 - Taping
 - Insulating compound

11-5 CONDUITS

- (a) Interior Conduits
 - Kind
 - rigid or flexible
 - enamelled iron
 - galvanized iron
 - steel flexible
 - circular loom
 - Size required
 - Limits in use of bent conduit
 - Burrs and sharp edges
 - Water-tightness
 - Protection of conduit and joints in concrete or underground
 - Protection of conduit in acid fumes
 - Threading and making up of joints
 - Plugging of ends during construction
 - Grounding of conduits
 - Support of exposed or boxed-in conduit
 - horizontal
 - vertical
 - Following of ceiling line with exposed conduit
 - How fastened to outlet boxes?
 - Location of runs
 - floor, ceiling, or partition

where indicated? Are plans diagrammatic or designed to show actual runs?

Allowed makes

- (b) Exterior Conduits
 - Kind
 - terra cotta
 - fibre
 - pipe
 - How laid?
 - Joints water-tight
 - Construction details
 - Drainage
 - Manholes
 - size
 - material
 - drainage covers
 - cable racks

11-6 OUTLETS

- (a) How Indicated on Plans?
 - Key to Symbols
- (b) Type
- (c) Material
- (d) Centering
 - Ceilings
 - Wall panels
 - Floors
- (e) Location
 - Receptacles
 - Switch boxes
 - Side brackets
 - Closet lights
- (f) Any Drawings to be Obtained from Architects before Locating Outlets?
- (g) Any Directions to be Obtained from Superintendent?
- (h) Height of Outlets
- (i) Flush with Face of Walls or Ceilings?
- (j) Any Covers for Outlet Boxes?
 - Finish of covers
- (k) Method of Support
 - Where outlets occur under beams
- (l) Floor Outlet Boxes
 - Adjustable for concrete floors
- (m) Any Special Type or Size Outlet Boxes Required?
- (n) Allowed Makes

11-7 CIRCUIT WIRING

- (a) Two or Three-wire?
- (b) Size of Wire
- (c) Number of Wires to be Pulled in a Conduit
- (d) Joints
 - Where allowed?
 - How made?
- (e) Where Exposed
 - How supported?
 - How far apart are supports?
 - How protected in damp or acid air?
 - How protected against mechanical injury?

11-8 DISTRIBUTING PANELS

- (a) Location Indicated Where?
 - Height above floor
- (b) Number of Circuits
 - Any extra circuits to be allowed for?
- (c) Material, Thickness and Finish
 - Panel boards
 - Linings, material and thickness
 - Outside boxes, material and thickness

Flush or surface mounting?
Gutter and no-gutter boxes

- (d) Mains
 - Lugs only
 - Fuses only
 - Switch only
 - Switch and fuses
- (e) Mains and Branches
 - Two or three-wire mains?
 - Two or three-wire branches?
 - Bus-bars form part of mains, or are they connected as a branch from mains? If bus-bars form part of mains, state ampere capacity
 - Support of mains in panel box
 - Are any circuits to be controlled in groups?
- (f) Bus-Bars and Connections to Switches
 - Material
 - Finish
 - Minimum thickness
 - Allowable current density
- (g) Switches on Panels
 - Push, knife or rotary?
 - Double or triple pole?
 - How connected to bus-bars?
 - Are fuses to be between bus-bars and switch, or between switch circuit?
 - Kind of handle for knife switches
 - Finish of pushes for push switches
 - Finish of handles for rotary switches
 - Allowable amperage
 - Are switches to be in same compartment as fuses, or in a separate compartment?
 - Any switches to control groups?
 - Material
 - Allowed makes
 - Are any branch circuits to carry more than 660 watts?
- (h) Fuses
 - Type: cartridge, link or plug?
 - Any extra fuses to be supplied?
 - Who fuses panels to start with?
 - Carrying capacity of fuses
 - Allowed makes
- (i) Trim
 - Material
 - Finish
 - Who supplies?
 - Thickness
 - Design of doors
 - Hardware
 - Diagram holder
- (j) Diagram
 - How are outlets and circuits to be indicated?
 - Material of diagram
 - Support and protection of diagram
 - By whom furnished?
- (k) Special Panels
 - Elevators?
 - Bell system?
 - Sprinkler alarm?
 - Show window?
 - Emergency or night panels?
- (l) Drawings to be Submitted
- (m) Provisions for Metering
- (n) Pull Boxes for Power Tap
 - Material, thickness, and finish
 - Size
 - Cover plate or door
- (o) Allowed Makes

11-9 WALL AND PENDANT SWITCHES

- (a) Types
 - Push, single-pole
 - Push, two-pole
 - Push, three-way or four-way
 - Key operated
 - Snap
 - Pendant
- (b) Finish of Buttons and Plates
- (c) Symbols
- (d) Location and Height
- (e) Use of Gang Switches
 - Plates for gang switches
- (f) Marking of Snap Switches
- (g) Pendant Switches
 - Type
 - Furnished by whom?
 - Length of cord
 - Kind and covering of cord
 - Any extra ones?
- (h) Allowed Makes

11-10 RECEPTACLES

- (a) Types
 - Wall
 - Ceiling
 - Outdoor
 - Electric heating
 - Flush or on face?
- (b) Base
 - Screw
 - Push
- (c) Plugs
 - Finish
 - Length of extension cord required to be furnished, if any
- (d) Plates
 - Finish
 - Size
 - Shape

11-11 PORTABLE LIGHTS

- (a) Number
- (b) How Indicated?
- (c) Construction
 - Kind of plug
 - Handle
 - Guard and holder
 - Kind of socket
- (d) Cord
 - Length
 - Kind
- (e) Allowed Makes

11-12 DROP LIGHTS

- (a) Number
- (b) How indicated?
- (c) Cord
 - Length
 - Kind
- (d) Kind of Socket
- (e) Shade of Holder
- (f) Lamp Guard, if Any
- (g) Pendant Switch
- (h) Any Special Types for
 - Damp places
 - Acid rooms
 - Outdoor work

11-13 SUPPORTS

- (a) For Vertical Conduits
- (b) For Fixtures
- (c) Drop Lights
- (d) Switch Boxes

11-14 PUSH BUTTONS

- (a) Kind
- (b) Finish
 - Special for fire
- (c) Diameter
- (d) Name Plate
- (e) Floor and Table Pushes
- (f) For Remote Control Switches
- (g) Allowed Makes

11-15 BELLS AND BUZZERS

- (a) Type
 - Buzzer or bell
- (b) Diameter of bell
- (c) Finish
- (d) Location Shown Where?
- (e) Bells or Buzzers Required for Which of Following?
 - Entrances
 - Dining rooms
 - Other rooms
 - Elevators
 - Dumb waiters
 - Office calls
 - Fire drill
 - Sprinkler alarms
 - Fire gongs
 - Water tanks, high and low-water
 - Boiler tanks, high and low-water
 - Circuit breaker alarms
 - Engine-room entrance
 - Freight
 - Burglar alarm
 - Elevators to engine room
 - Apartments to servants' quarters
 - Thermostatic alarms
- (f) Mats
- (g) Allowed Makes

11-16 ANNUNCIATORS

- (a) Number
- (b) Location
 - Indicated on plans how?
 - Height
- (c) Type
- (d) Finish
- (e) Support
- (f) Number of drops
 - Any spare drops?
- (g) Annunciators Required for Which of Following?
 - Apartment pushes
 - Elevators supplied by whom?
 - Fire systems
 - Sprinkler system
 - Engine-room from apartments
 - Engine-room from elevators
- (h) Allowed Makes

11-17 MOTOR DYNAMOS

- (a) Number
- (b) Type
 - One armature
 - Two armatures
- (c) Speed
- (d) High and Low-voltage
- (e) Capacity of Dynamo End
- (f) Kind of Current
 - Received
 - Delivered
 - If alternating, single, two- or three-phase and number of cycles?
- (g) Heating Limits
- (h) Method of Support
- (i) Control
 - Switches for motor dynamos

Switches or cut-outs for bell circuits

- (j) Cross Connection
- (k) Painting
- (l) Allowed Makes

For Motors, see Section 11-24; and for Dynamos, see Sections 10-8, 10-9, 10-10, 10-12, 10-14, 10-15, 10-16, 10-17, 10-18, 10-19, 10-20, 10-21 and 10-22.

11-18 BATTERIES

- (a) Number
- (b) Type
- (c) Connection
- (d) Enclosure
- (e) Support
- (f) Allowed Makes

11-19-INTERIOR TELEPHONE SYSTEM

- (a) What is System to Accomplish
- (b) Is System to be Intercommunicating?
- (c) Will System be Independent of, or a Part of Public Telephone System?
- (d) Switchboard
 - Desk or cabinet type?
 - Type of signal
 - Finish
- (e) Outlying Telephone Sets
 - Desk or wall type?
 - Finish
 - Height above floor
 - Is selective signalling desired?
 - Is secret service desired?
- (f) Source of Power
- (g) Wiring
 - Will it be in conduit?
 - Are outlet boxes required?
 - Who will install wiring?
 - Number of wires to each station
 - Metallic circuit or common return?
 - How many conversations must be carried on simultaneously without interference?
 - Will each station be able to call every other station or system?
 - What shall be ultimate capacity of each station and what shall be capacity of main distributing cable?
 - Is main distributing cable to be provided with cross connection strips in all distributing boxes?
 - Is any provision to be made for installing additional stations in future?
 - Is any provision made for secret talking between any stations?
 - Is cable to be lead covered?
 - Will it contain extra battery pairs of larger size than talking pairs?

- (h) Connecting Boxes
 - Size of material
 - Location
- (i) Allowed Makes

11-20 CONDUIT FOR PUBLIC TELEPHONE SERVICE

- (a) Is Service to be Direct or Through an Operating Board?
- (b) Who is to Install Connecting Boxes? Telephone Company?
- (c) What Size Conduits Are Required by Telephone Company?
- (d) Where is Cable to be Run?
- (e) Size of Connecting Boxes?
- (f) Where Does Service Enter?

11-21 FIRE-ALARM SYSTEM

- (a) Type
- (b) Location of Boxes
- (c) Wiring Run How?
- (d) Any Outside Connections?
- (e) Allowed Makes

11-22 WATCHMAN'S CLOCK AND TIME CLOCKS

- (a) Number of Clocks
- (b) Types of Clocks
Type of master clock
clock program
bells connecting board, etc.
- (c) Location of Clocks
- (d) Who Does Wiring?
- (e) How is Wiring to be Run?
- (f) What Size and Kind of Wire?
- (g) Any Duplicate Keys?
- (h) Any Connection to Time-Clock System?
- (i) Source of Power
- (j) Allowed Makes

11-23 ELECTRIC PUMPS

- (a) Number of Boiler-feed Pumps, Sizes and Types
- (b) Number of Drain Pumps, Sizes and Types
- (c) Number of House Pumps, Sizes and Types
- (d) Number of Fire Pumps, Sizes and Types
- (e) Number of Elevator Pumps, Sizes and Types
- (f) Number of Oil Pumps, Sizes and Types
- (g) Number of Circulating Pumps, Sizes and Types
- (h) Number of Brine Pumps, Sizes and Types
- (i) Number of Ammonia Pumps, Sizes and Types
- (j) Number of Vacuum Pumps, Sizes and Types
- (k) Number of Air Pumps, Sizes and Types
- (l) Sizes, Diameter and Stroke of Cylinders
- (m) Speeds Allowed
- (n) Number of Gallons Per Minute to be handled
- (o) Pressure Against Which Pump Must Work
- (p) Suction Lift
- (q) Hot or Cold?
- (r) Types, Single or Double-acting
- (s) Drive
Maximum speed and minimum speed
Horse power desired of motors
- (t) Speed Control
What part of control is to be by field regulation and what part by armature resistance?
Is maximum speed to be obtained with weakened field and no resistance in circuit?
- (u) Motors
Voltage
Direct or alternating-current? If latter, single, two- or three-phase, and number of cycles per second? If direct-current shunt or compound wound?
Is motor to be direct, coupled or mounted on shaft?

Is motor to be belted? If so, maximum and minimum speeds of motor?
Who supplies belt? Any idler equipment? Belt-tightener?
(For further details of Belt see Section 7-23d)
Types and makes of controllers. any automatic control?
If motor is directly coupled or mounted on shaft is support of motor to be part of pump housing or frame, or is separate base to be built?
Lubrication of motors
Allowable temperature rise of motors under maximum operating conditions
Are motors open or enclosed or semi-enclosed types?
Approved makes of motors
Who erects?
Who connects?

(v) Construction with Cross-head or Trunk Pistons

(w) Materials

Linings
Rods
Pistons or plungers
Valves

(x) Air Chambers, Size and Number and Location of Pet Cocks

(y) Relief Valves

(z) Self-oiling Bearings

(aa) Foundations: How Made? Of What Material? Any Special Facing? Supplied by Whom?

(bb) Painting

(cc) Guarantee

11-24 ELECTRIC MOTORS

- (a) Voltage
- (b) Direct or Alternation-current? If latter, Single-, Two- or Three-phase and Number of Cycles per Second? If Direct-current, Shunt or Compound-wound?
- (c) Is Motor to Be Directly Coupled or Mounted on Shaft?
- (d) Is Motor to be Belted? If so, Maximum and Minimum Speeds of Motor? Who Supplies Belt? Any Idler Equipment? Belt Tightener? Quality of Belt
(For further details of Belt see Section 7-23d)
- (e) Types and Makes of Controllers
Any automatic control?
Any remote control?
- (f) If Motor Is Directly Coupled or Mounted on Shaft, Is Support of Motor to be Part of the Housing or Frame, or Is Separate Base to be Built?
- (g) Lubrication of Motors
- (h) Allowable Temperature Rise of Motors under Maximum Operating Conditions
- (i) Are Motors Open or Enclosed or Semi-enclosed Types?
- (j) Approved Makes of Motors
(For other details of Dynamos see Sections 10-7, 10-8, 10-10, 10-11, 10-14, 10-15, 10-19, 10-20, 10-22, 10-24 and 10-25)

11-25 SPECIAL WIRING

- (a) Describe Any Special Work
Such as
Wiring of marquise
Elevator connections
Elevator lighting
Elevator signals

Pump-motor signals
Fan-motor signals
Machine-motor signals
Show-window lighting
Show-case lighting
Office lighting
Dome lighting
Electric heating
Public halls to allow partial lighting
Thermostatic signals
Any tank switch connections?

(b) On All These Cover Following Items

Connection from what point?
Where is connection to be run?
How terminated?
Any enclosure required for switch?
Any fuses required?

11-26 MAINS AND FEEDERS

- (a) Where Shown?
- (b) Two or Three-wire?
- (c) Sizes
- (d) If Sizes Are Not Specified or Shown, What Governs?
- (e) Any Special Mains or Feeders?
Public Lighting
Elevators
Hall lights
Toilet lights
Service quarters
Sign lighting

11-27 PRIVATE PLANT WIRING

- (a) Sizes and Number of Armature Connections, Dynamo to Switchboard
Connections from balancing coil of three-wire dynamos
- (b) Sizes and Number or Series Field, Dynamo to Switchboard
Equalizer connections
- (c) Sizes and Number of Shunt Connections to Switchboard
- (d) How and Where Will These Connections be Run?
- (e) How Protected Against Water?
- (f) Test Connections
Who supplies rheostat to absorb power?
Type of rheostat
Capacity of how long a period?
Electric connections, size and how run?
Operation of rheostats during test
- (g) Storage-battery Connections
Main battery to switchboard
End calls to switchboard
Booster motor to switchboard
Booster dynamo to switchboard
Booster exciter to switchboard
Number and size of each of foregoing
How run?
How protected against fumes?
How supported?
- (h) Where Are Dynamo and Battery Connections Shown?

11-28 ARC LAMPS

- (a) Number
- (b) Type
- (c) Amperage
- (d) Voltage
- (e) Direct or Alternating Current
If a. c., cycles per second
- (f) Method of Support
- (g) Finish
- (h) Numbering for Trimming
- (i) Who Installs?

- (j) Who Connects?
 (k) Type and Kind of Inner Globe
 (l) Type and Kind of Outer Globe
 (m) Type and Kind of Carbons
 (n) Any Cooper-Hewitt Mercury Arcs?
 (o) Any Moore Lights?
 (p) Allowed Makes
- 11—29 **TUNGSTEN, CARBON OR NERNST LAMPS**
- (a) Number
 (b) Who Supplies and Installs?
 (c) Wattage
 (d) Voltage
 (e) Kind of Bulbs
 (f) Finish of Bulbs
 Clear or frosted
 White or colored
 (g) Kind of Base
 (h) Test Requirements
 Who pays for test?
 Kind and duration of test
 Watts per candle power
- 11—30 **FOUNDATIONS**
- (a) Who Supplies?
 (b) Material
 Below floor
 Above floor
 (c) Outside Finish Above Floor, Sides and Corners
 (d) Top Finish, Material and Thickness?
 (f) Sheet Piling
 (g) Piling
 (h) Waterproofing
 (i) Painting
- 11—31 **LIST OF MOTORS**
- 11—32 **LIST OF CLOCKS**
- 11—33 **LIST OF FLOOR HEIGHTS**
- 11—34 **TEMPORARY WIRING**
- (a) Elevators
 (b) Pumps
 (c) Fans
 (d) Machines Used During Construction
 (e) Arc Lighting
 (f) Incandescent Lighting
 Who supplies lights?
 Who replaces lights?
 Who trims arc lamps?
- 12—**SWITCHBOARDS**
- 12—1 **LOCATION**
- 12—2 **MATERIAL**
- 12—3 **THICKNESS**
- 12—4 **HEIGHT**
- 12—5 **LENGTH**
- 12—6 **NUMBER OF PANELS**
- 12—7 **CONSTRUCTION**
- (a) Cornice
 (b) Subbase
 (c) Method of Support
 (d) Method of Bracing
- 12—8 **FOUNDATION (See Index)**
- 12—9 **GRILLE**
- (a) Material
 (b) Location
- (c) Width and Spacing of Mesh
 (d) Doors
- 12—10 **FUNCTIONS OF BOARD**
- (a) Current from What Sources?
 (b) How Distributed?
 (c) Power and Light Distribution
 What part of current is to be metered at switchboard?
 Any apparatus other than electrical apparatus to be mounted on board?
- 12—11 **APPARATUS CONTROLLED**
- (a) Dynamos
 Number and size
 (b) Storage Battery
 Capacity and number of cells
 Number of end cells
 Booster
 (c) Motor Feeders
 (d) Light Feeders
 (e) Street Service
- 12—12 **VOLTAGE**
- 12—13 **CURRENT**
- (a) If Alternating Current, Number of Cycles, Phases and Wires?
 (b) If Direct Current, Whether Two or Three Wire?
- 12—14 **ALLOWED MAKES**
- 12—15 **INSTRUMENTS REQUIRED ON BOARD**
- (a) Ammeters, Indicating and Recording Type
 Allowed makes
 (b) Voltmeters, Indicating and Recording Type
 Allowed makes
 (c) Wattmeters, Indicating and Recording Type
 Allowed makes
 (d) Curve-drawing Instruments
 Allowed makes
 (e) End-cell Switches
 (f) Voltmeter Switches
 (g) Knife Switches
 (h) Oil Switches
 (i) Circuit Breakers
 (j) Enclosed Fuses
 (k) Open Fuses
 (l) Clock
 (m) Ground Detector
 (n) Allowed Makes
- 12—16 **FINISH OF SWITCHBOARD**
- (a) Finish of Instruments
 (b) Finish of Switches and Circuit Breakers
 (c) Bus-bars
 (d) Grille
 (e) Other Exposed Metal Work
 (f) Concealed Metal Work
 (g) Mounting of Instruments
 (h) Finish of Panels
- 12—17 **BUS-BARS**
- (a) Number of Sets
 (b) Number of Bars per Set
 (c) Any Removable Sections?
 (d) Allowable Carrying Capacity
 (e) How Supported?
- (f) Minimum Thickness
 (g) Minimum Spacing
- 12—18 **SWITCHES (CONSTRUCTION)**
- (a) Types
 Single or double break?
 Single or double throw?
 (b) Allowable Carrying Capacity
 Sliding contact
 Cross-sectional area
 (c) How Fused?
 (d) Handles
 (e) Method of Support
 (f) Construction Details
 (g) Name Plates, Front and Rear
 (h) Connection to Bus-Bars
 (i) Connection to Feeders
 (j) Number of Poles
- 12—19 **CIRCUIT BREAKERS (CONSTRUCTION)**
- (a) Types
 Underload
 Overload
 No voltage
 Shunt trip
 Time limit
 Alarm
 Interlocking
 Reverse current
 (b) Construction Details
 (c) Name Plates
 (d) Method of Support
 (e) Connection to Bus-bars
 (f) Connection to Feeders
 (g) Number of Poles
- 12—20 **APPARATUS SUPPLIED BY OTHER CONTRACTORS**
- (a) Rheostats
 (b) Starting Boxes
 (c) End-cell Switches
 (d) Gages
 (e) Lamp Indicators
- 12—21—**LIGHTING OF BOARD**
- (a) Number in Front
 (b) Number in Rear
 (c) How Connected?
 (d) How Controlled?
 (e) How Supported?
 (f) How Shaded?
- 12—22 **GROUND DETECTOR**
- (a) Type
 (b) How Connected?
- 12—23 **GARANTEE OF MATERIAL**
- (a) Instruments
 (b) Circuit Breakers
 (c) Clock
- 12—24 **DYNAMO PANELS**
- (a) Ammeters
 Range of scale
 Number
 Shunts located where?
 (b) Voltmeters
 Range of scale
 Number
 (c) Wattmeters
 Capacity
 Number
 Shunts located where?

- (d) Switch
Single or double-throw?
Number of poles
Capacity
Type
- (e) Circuit Breaker
Number of poles
Type
Capacity
- (f) Rheostats
- (g) Lamp Brackets
Pilot lamps

12-25 TOTALIZING PANEL

- (a) Ammeters (Recording or Indicating)
Range of scale
Number
- (b) Voltmeters (Recording or Indicating)
Range of scale
Number
- (c) Wattmeters (Recording, Indicating or Integrating)
Number
Capacity
- (d) Lamp Brackets
- (e) Ground Detector
- (f) Voltmeter Switch

(With alternating current work there may be transformer, motor-generator, rotary panels, etc., but foregoing will serve as a guide.)

12-26 FEEDER PANELS

- (a) Number of Feeder Panels
- (b) List of Feeders
- (c) Light or Power
- (d) Capacities
- (e) Switches or Circuit Breakers
- (f) Lamp Brackets
- (g) Name Plates
- (h) Double- or Triple-pole Switches
- (i) Single-, Double-, or Triple-pole Circuit Breakers
- (j) How Will Feeders Lead to Switch Lugs?

12-27 STORAGE-BATTERY PANELS

- (a) Booster Control
- (b) Automatic Regulator
- (c) Circuit Breaker
- (d) Special Switching Device for Battery Regulation
- (e) Starting Switches for Motors
- (f) End-cell Switches
- (g) Ammeters
- (h) Voltmeters
- (i) Wattmeters
- (j) Ampere-hour Meter

13-STORAGE BATTERY

13-1 GENERAL INFORMATION

- (a) Location
Where is space provided?
- (b) Purpose
To supply electricity for lighting when battery is not being charged
To supply electricity for lighting when battery is being charged
To supply electricity for elevators and other motors with or without light
To equalize elevator or other motor

fluctuations, receiving and discharging electricity continually

- (c) Whence Will Charging Current be Obtained?
- (d) How Will Battery be Charged?
From outside service?
From dynamos direct?
From dynamo through booster?
- (e) When Will Battery Be Charged?
Is electricity to be drawn from charging source for other purposes at the same time as charging current?
- (f) Allowed Makes

13-2 CAPACITY OF BATTERY

- (a) Capacity for 8 Hours Continuous Discharge at Steady Rate
- (b) Capacity for Momentary Discharge, as in Elevator Work
- (c) Capacity for Three and Five Hours, Continuous Discharge at Steady Rate
- (d) Minimum Number and Dimensions of Plates
- (e) Minimum Number of Cells in Main Battery and in End Cells
- (f) How Will Capacity be Tested?

13-3 BOOSTERS

- (a) Type and Number of Boosters
Constant current
Differential
Shunt wound
Coupled or single shaft or belted
(For details of Belt see Section 7-23d)
Separately excited
- (b) Speed
- (c) Range of Voltage
- (d) Range of Amperes
- (e) Average Charging Current
- (f) Average Discharging Current
- (g) Impressed Current, Direct Current, or Alternating Current? If Latter, Single Phase, Two-phase or Three-phase?
Number of cycles
Impressed voltage
- (h) Allowable Rise in Temperature Under Full Load for 8 Hours and 25 Per Cent Over-load for 2 Hours, also Under Regular Working Conditions
- (i) Noiselessness and Freedom from Vibration
- (j) Sparklessness, Self-oiling
- (k) Foundation: How Made? Of What Material? Any Special Facing? Supplied by Whom?
Bed plate?
- (l) Painting
- (m) Speed-governing Device
- (n) Allowed Makes

3-4 CONTROLLING APPARATUS

- (a) End-cell Switches
Number of switches
Number of points per switch
Who supplies these switches?
Who connects these switches?
Who installs these switches?
Lugs
Where are switches to be delivered?
Capacity in amperes of switches
Any automatic end-cell switches?
- (b) Regulator
Type
Who supplies?
Who installs?

Who connects?
Regulation required
Any details from bidder?

- (c) Rheostats
Number
Who supplies booster-dynamo rheostats?
Who supplies starting rheostat or motor-starting device?
Who supplies exciter-motor rheostats?
- (d) Switches and Switchboard
Who supplies switchboard? (If supplied by battery contractor, see Switchboard Section in CHECKING LIST)
Who supplies starting switches for booster? For exciter?

13-5 JARS OR TANKS

- (a) Number
Any spaces?
- (b) Sediment Space
- (c) Space for Increase in Number of Plates
- (d) Construction of Tanks
Material
Joints
Draining and ventilating of bottoms
Lead lining
Treatment of tanks before lining
Supports for plates
Separators for plates
Covers
- (e) Glass Jars
Supports for plates

13-6 CONNECTION OF PLATES

- (a) Connection of Plates in Each Cell
- (b) Connections from One Cell to Next
- (c) Connections of End Cells
Terminal lugs
- (d) Reinforcing of Terminal Cells and End Cells
- (e) Protection of Bolts

13-7 RACKS AND STRINGERS

- (a) Number of Tiers
- (b) Arrangement of Batteries
- (c) Any Plan Required of Supporting Structure?
Who supplies structure?
Who erects structure?
- (d) Type of Insulators
- (e) Type and Material of Sand Trays
- (f) Who Supplies Sand?
- (g) Numbering of Cells
- (h) Painting
- (i) Foundation

13-8 ELECTROLYTE

- (a) Any Spare Carboys of Acid?
Weight of acid per carboy
- (b) Any Empty Carboys to be Left?
- (c) Hydrometer
- (d) Cell Filler

13-9 CHARGING CURRENT

- (a) Supplied by Whom?
- (b) Supplied for What Period?

13-10 SUNDRIES

- (a) Thermometers
- (b) Portable Voltmeter
Seals of Voltmeter

- (c) List of Instruments and Switches
- (d) Diagram of Connections
- (e) Templates for Drilling by Switch-board Maker

14—REFRIGERATION

As stated in Section 4—1, Refrigeration is broadly a part of the steamfitting specifications, but on account of its importance is here treated separately.

NOTE: Items starred or prefaced by an asterisk may be specified or, preferably, may be left for the machinery builder to specify.

They are noted here to call attention to the necessity of definite knowledge on these points before placing a contract.

14—1 PURPOSE OF PLANT

- (a) Ice Making
- (b) Cold Storage of Food Products
- (c) Water Cooling
- (d) Fur Storage
- (e) Air Drying
- (f) Room Cooling for Manufacturing, Entertainment or Business Purposes
- (g) Manufacturing Processes

14—2 LOCATION OF PLANT AND COOLED SPACES

- (a) Location of Building
- (b) Location of Refrigerating Plant in Building
- (c) Location of Space to be Cooled in Building
- (d) Location of Brine-storage Tank
- (e) Location of Ice-making Tank
- (f) Altitude

14—3 PRODUCTION OF REFRIGERATING GAS

- (a) Ammonia
 - Compression with compressor steam-engine driven
 - Compression with motor drive
 - Compression with gas or oil-engine drive
 - Absorption with generator operated by boiler steam
- (b) Carbonic-acid Machine
- (c) Sulphurous-acid Machine

14—4 TRANSFER OF COOLING EFFECT FROM GAS TO COOLED SPACES

- (a) With Piping Placed in Cooled Space
 - Direct expansion of compressed gas
 - Brine circulation with either of above
- (b) By Cold Air Delivered to Space by Fans
 - Cold air delivered by gravity from bunker space
- (c) Any Tanks for Reserve Cold Storage?

14—5 PLANT

- (a) Number of Units
- (b) Rated Tonnage
 - At what head and suction pressures?

At what condensing-water temperature?

Tonnage in ice melted equivalent? (or stated in b. t. u.)

(c) Work to be Done in Various Parts

- Ice making
- Water cooling
- Brine refrigeration
- Air cooling
- Air drying
- Are these all to be done at one time?

14—6 SPEEDS

- (a) Compressor
 - Engine driving compressor
 - Motor driving compressor
- (b) Pumps
 - Ammonia pumps
 - Brine pumps
 - Water pumps
 - Oil pumps

14—7 ICE MAKING (CAN SYSTEM)

- (a) Amount of Ice per Day
 - When required
 - Storage and delivery into storage
 - Cutting
 - Removal
- (b) Cans
 - Size cans, length, width and height
 - Number
 - Means for removal of cans
 - Ice melting
 - Material
 - Method of support
 - Can filling
- (c) Tanks
 - Length, width and height
 - Material
 - Thickness of metal
 - Bracing
 - Painting
 - Location
 - Outlets
 - Insulation
 - painting of insulation
 - Top and covers of can openings
 - Crane
 - Test of tank
- (d) Coils
 - Size of pipe?
 - Standard or extra heavy?
 - Iron, steel or brass?
 - Black or galvanized on outside?
 - Continuous welded or made up with screwed or flanged fittings?
 - Style of coil? (Oval, zigzag, cylindrical or special)
 - Details of construction?
 - Return-bend or header type?
 - How supported?
 - Method to determine that iron or steel has been used as specified?
 - Test?

14—8 WATER COOLING

- (a) System of Circulation
- (b) Location of Cooler
- (c) Size
- (d) Length of Coil
- (e) Diameter of Pipe
- (f) Material
- (g) Open or Closed Tank
- (h) Filtration
- (i) Insulation of Cooler, Tank and Piping
- (j) Valving

14—9 BRINE CIRCULATION

- (a) Location of Cooling Coils Shown Where?

- (b) How is Brine Cooled?
 - Passing through a Hendrix type cooler
 - Passing through a double-pipe cooler
 - Passing through a submerged shell-and-tube brine cooler
- (c) Balanced or Unbalanced System of Circulations
 - Single or two-pipe system?
- (d) Brine Mains and Risers
 - Material
 - Painting of pipes
 - Insulation
 - Finish
 - Painting of covering
 - Method of support of risers and mains
 - Where are sizes indicated?
 - Strainer
 - Means of cleaning strainer
 - Means of cleaning risers
 - Valving
 - How are connections taken off?
- (e) Thermometer
- (f) Connection to and from Tank
- (g) Connection to and from Pump and Cooler

14—10 GAS PIPING

- (a) Material. (Spiral Riveted, Lap-Welded, Cast-Iron)
- (b) Painting
- (c) Where Are Sizes Indicated?
 - Should contractor specify sizes?
- (d) Valving
 - Type of valves
 - Flanged or screwed
 - Glands
 - Seats
 - Expansion valves
- (e) Allowed Makes
- (f) Joints
 - Method of making joints
 - Type of joints
- (g) Test of Piping
- (h) Insulation
- (i) Method of Support

14—11 AUXILIARY APPARATUS

- (a) Thermometers
 - Brine inlet and outlet of cooler?
 - Brine inlet and outlet of bunker?
 - Inlet and outlet of condenser?
 - Water inlet and outlet of water cooler?
 - Cooled rooms
 - And recording thermometers?
 - Any alarm-ringing thermometers?
 - Range of thermometers in each case
- (b) Psychrometer
- (c) Hydrometer
- (d) Salometer
- (e) Gages
 - Brine
 - Head
 - Back-pressure
 - Steam
 - Allowed makes
- (f) Indicator
 - Allowed makes
- (g) Pressure Regulators
 - Compressors
 - Generator
 - Pumps
 - Allowed makes
- (h) Wrenches
 - Finish of wrenches

- Wrench board
Erection
- (i) Lubricators
Size
Finish
Allowed makes
- (j) Oil and Ammonia Separators
Construction
- 14-12 BRINE**
- (a) Material
Salt or calcium chloride?
Specific gravity
Quantity required?
- 14-13 AMMONIA OR OTHER GAS**
- (a) Who Supplies?
(b) Allowed Makes
(c) Any Spare Quantity?
- 14-14 COOLING SYSTEM BY AIR CIRCULATION**
- (a) Method of Circulating
- (b) Ducts
Sizes
Location shown where?
Thermostatic control of dampers
Method of support
Insulation
Construction
(For other details of Ducts see Section 4-10.)
- (c) Fans (see Section 4-13)
Motors outside cold room?
Thermostatic control?
- (d) Motors (see Sections 11-24 and 26-9)
- (e) Brine Bunker
Number of stacks
Coils
size of pipe
standard or extra heavy?
iron, steel or brass?
black or galvanized on outside?
continuous weld or made up with screwed or flanged fittings?
style of coil? (Oval, zigzag, cylindrical or special)
details of construction?
return-bend or header type?
how supported?
method to determine that iron or steel has been used as specified test?
Location of joints and valves
Drip pans
Draining of pans
Painting
Foundation: How made? Of what material? Any special facing? Supplied by whom?
- (f) Removal of Frost
Method
Details
- (g) Rooms and Boxes
Size
Openings
Shelving
Number of feet of pipes and diameter in coils
Coils. For details of Coils see Section 11-14e or 14-7d)
Drains
Hardware
Insulation of columns or pipes
Lighting
Ventilation
Cleaning facilities
Thermometers
Character of insulation
Finish

Painting
Special fixtures
tracks
hangers
racks
shields

14-15 COMPRESSOR

- (a) Type
Vertical or horizontal
Double or single-acting
Condensing or non-condensing?
Straight-line or duplex
- (b) Number of Cylinders
- (c) Character of Drive
Type of engine
Type of motor

(For details of Engines or Motors see Section 7-1, Engines; Section 9-1, Internal Combustion Engines; Sections 11-23 and 11-24, Motors)

- (d) Foundation
- (e) Painting
- (f) Speeds
Limit of piston speed
- (g) Bore and Stroke of Compressors
Capacity in cubic feet of free air per minute
Air pressure or altitude
- (h) Details of Water Cooling
- (i) Lagging of Cylinder

(For other details of construction of Compressor which it may be advisable to cover in specifications, see Section 7-1, Steam Engines)

- (j) Cross Connection of Suction and Discharge
- (k) Lubrication
Oil, dry or liquid graphite?
- (l) Noiseless Operation
- (m) Valves
Type
Size
Where placed?
*Construction details?

14-16 CONDENSER

- (a) Type
Hendrix
Double-pipe
Atmospheric
Submerged
- (b) Material
- (c) *Square Feet of Cooling Surface
*Diameter and length of pipe
*Standard or extra heavy pipe
- (d) Valving
Number of sections
Series of parallel operation
Flow of water and gas
- (e) Provision for Saving Water
- (f) Draw-off.
- (g) Provision for Cleaning
- (h) With Atmospheric Type
Protection against freeze-up
Sun and wind protection
Damage to neighbors
- (i) With Submerged Type
Overflow and drain
Material and thickness of tank
Construction details
Coils. (For details of Coils see Section 14-7d)
- (j) Number of Condensers
Painting
Method of support
Foundation: How made? Of what material? Any special facing? Supplied by whom?
Test

14-17 COOLERS

- (a) Number
- (b) Type
Hendrix
Double-pipe
Shell-and-tube
- (c) Rated Capacity
With Hendrix type
*diameter
*coil surface
*height and head room required
*valving
With double-pipe
*number of feet of pipe
*diameters of pipe
*material
With shell-and-tube
pipe
diameter
length
cooling surface
tank size
agitation
- (d) Lagging
Painting
Finish, polished, or ground or rough
Insulation
- (e) Valving
- (f) Draining and Purging
- (g) Method of Support
- (h) Foundation
- (i) Test
Working pressure
Test pressure

14-18 Pumps

- (a) Number
- (b) Services and Construction
(For other details of Pumps see Section 4-18, Steamfitting; and Section 11-23, Electric Fitting)
- (c) Insulation of Cold End?
- (d) Governor
- (e) Working Pressure
Static head
- (f) Allowable Piston Speeds

14-19 GENERAL

- (a) Who Makes Steam and Drip Connections?
- (b) Who Makes Electrical Connections?
- (c) Who Makes Plumbing Connections?
- (d) Who Supplies Steam?
- (e) Who Supplies Water?
- (f) Who Supplies Electricity?
- (g) Who Runs Test?

14-20 GENERATORS (ABSORPTION SYSTEM)

- (a) Number
- (b) Capacity
*Coil surface
- (c) Initial Steam Pressure
- (d) Condensed Steam Delivered Where?
How trapped?
Valving?
- (e) Insulation and Lagging
- (f) Painting
- (g) Finish
- (h) Foundations
- (i) Cross Connections
- (j) Connections to Exchanger, Analyzer and Rectifier by Whom?

14-21 OTHER PARTS OF PLANT

- (a) *Analyzer
- (b) *Exchanger
- (c) *Rectifier
 - Whence is cooling water derived?
 - Where is cooling water discharged?
- (d) *Weak-liquor Cooler
- (e) Method of Support
- (f) Painting
- (g) *Valving

14-22 ABSORBERS

- (a) Number
- (b) Capacity
 - *Coil Surface
- (c) Water Connections
- (d) Finish
- (e) Method of Support
- (f) Foundations: How Made? Of What Material? Any Special Facing? Supplied by Whom?

14-23 AMMONIA PUMPS

- (a) Number
- (b) Size
- (c) Speed
- (d) Governing
- (e) Cross Connections
 - (For other details see Section 4-18, Steam Fitting, and Section 11-23, Electric Fitting)

14-24 WATER CIRCULATION

- (a) Where Derived?
- (b) Where Can it be Used?
- (c) Any Re-cooling?
 - Cooling tower
 - Evaporative condenser
- (d) Any Diagram of Connections?
- (e) Size of all Piping

15-FUEL

15-1 LOCATION OF PLANT

15-2 QUANTITY TO BE PURCHASED

15-3 KIND OF COAL

- (a) Anthracite
- (b) Bituminous
- (c) Lignite

15-4 SIZE OF COAL (ANTHRACITE)

- (a) Furnace
 - Egg
 - Stove
 - Chestnut
 - Pea
 - No. 1 Buckwheat
 - No. 2 Buckwheat (Rice)
 - No. 3 Buckwheat (Barley)
 - Dust
 - Yard screenings
- (b) Semi-Bituminous and Bituminous
 - Run-of-mine
 - Screened
 - what size?
- (c) Lignite
 - Run-of-mine
 - Screened
 - what size?
- (d) Crushed at Plant (see Section 2-23d)

15-5 USES OF COAL

- (a) Steam
 - Stationary power plant
 - Locomotive

- (b) Illuminating Gas
- (c) By-product
- (d) Producer Gas
- (e) Cement Manufacture
- (f) Domestic

15-6 DELIVERY REQUIRED

- (a) On Cars
- (b) Alongside Dock
- (c) In Bins
- (d) How Will Delivery be Made?
- (e) Special Regulations Governing Delivery, If Any
- (f) Agreement as to Guarantee of Supply

15-7 TIME OF DELIVERY

- (a) Hours When Delivery Will be Permitted
- (b) What Storage Capacity Is Available at Plant?

15-8 PROPOSAL TO BE IN BY WHAT DATE?

15-9 PROPOSAL TO BE DELIVERED WHERE?

15-10 ANY BOND OR GUARANTEE REQUIRED?

15-11 CONTRACT SHALL BE AWARDED ON WHAT BASIS

- (a) Heat Unit Contents
- (b) Percentage of Ash
- (c) Lowest Price
- (d) Certain Trade Name or Region
- (e) Certain Mine or Mines

15-12 WHAT WEIGHT SHALL GOVERN

- (a) Shall Coal be Purchased by Gross or Net Ton?
- (b) Who Pays for Weighing?

15-13 WHAT PROCEDURE IN EVENT OF FAILURE TO MAKE DELIVERIES

- (a) Who Shall Stand Loss If Any Occurs?

15-14 SAMPLING

- (a) Who Shall Supervise Taking of Samples?
- (b) Where Will Samples be Taken?
- (c) What Size Samples and How Selected?
- (d) Size of Fragments After Pulverizing
- (e) Quartering and Mixing
- (f) Size of Final Sample
- (g) Who Shall Make Test?
- (h) What Type Calorimeter Shall be Used?

15-15 ASH

- (a) White or Red Ash (Anthracite)
- (b) Percentages Allowed By Contract
 - Usual percentages 15 to 18 for Pea Coal and 18 to 29 for Buckwheat
- (c) What Percentage Shall Cause Rejection?
- (d) What Additions or Deductions for Change In Percentage of Ash From Contract?

15-16 SULPHUR

- (a) What Percentage Allowed?

15-17 DUST

- (a) Shall Coal be Screened Before Weighing and Delivery?
- (b) What Provision As to Excessive Amount of Dust?
- (c) How Shall Screening be Done?

15-18 CLINKERING

- (a) Freedom from Clinker

15-19 MOISTURE

- (a) Shall Any Correction be Made in Price for Moisture?

15-20 PRACTICE TESTS

- (a) Shall Any Tests be Made Under Working Conditions?

15-21 VOLATILE MATTER

- (a) Maximum Allowable Percentage

15-22 HEAT UNIT VALUE OF FUEL

- (a) Shall Actual Heat Unit Value As Found By Test be Used to Determine Price per Ton?
- (b) Shall Price per Ton be Raised or Lowered In Direct Proportion to Increase or Decrease In Heat Value?

15-23 WHAT VARIATION SHALL BE PERMITTED IN B. T. U. VALUE?

15-24 OIL FUEL

- (a) Location of Plant
- (b) Quantity Required
- (c) In Tank or Tank Car Load Lots?
- (d) Storage Facilities
- (e) How Shall Oil be Delivered to Furnaces?
 - Pump
 - Hydraulic
 - Air Compressor
- (f) Steam or Compressed Air for Atomizing
- (g) Pressure Available

15-25 CHARACTERISTICS

- (a) Specific Gravity
- (b) Chemical Composition
- (c) B. T. U. per Pound
- (d) Percentage Sulphur

15-26 OIL-BURNING EQUIPMENT (see Section 2-23)

16-LUBRICANTS AND LUBRICATION

16-1 LOCATION OF PLANT

- (a) Quantity of Lubricant Required?
- (b) Delivery?
- (c) Contract to be Awarded on What Basis?
- (d) Price per Gallon?
- (e) Price per Horse Power Hour?

16-2 PURPOSES

- (a) High-Pressure Steam Cylinders
 - 100-250 Pounds
- (b) Low-Pressure Steam Cylinders
- (c) Steam Turbines
- (d) Engine Bearings
- (e) Pins and Rock Shafts
- (f) Motor Bearings
- (g) Gears

- (h) Slides
- (i) Refrigerating Machinery
- (j) Pumps
- (k) Air Compressors
- (l) Producer-gas Engines
- (m) Natural-gas Engines
- (n) Illuminating-gas Engines
- (o) Blast-Furnace-gas Engines
- (p) Fuel-oil Engines (Low Pressure)
- (q) Water Turbines

16-3 STEAM CONDITIONS

- (a) Pressure?
- (b) Superheated or Saturated?
- (c) If Superheated, Degree of Superheat?
- (d) If Saturated, Probable Degree of Moisture?

16-4 REFRIGERATION CONDITIONS

- (a) Head and Back Pressure
- (b) Brine and Ammonia Temperatures

16-5 ENGINE AND PUMP CONDITIONS

- (a) Simple or Compound Cylinder?
- (b) Force or Sight Feed?
- (c) *Piston Speeds
- (d) *Cylinder Dimensions
- (e) *Bearing Construction
- (f) *Bearing Material
- *Valuable information but not essential

16-6 SPECIAL NOTES

- (a) Any Special Causes Tending to Overheating?
- (b) Any Requirements as to Pressure of Oil Delivery?
- (c) Cooling of Lubricant Required?

16-7 KIND OF OIL

- (a) Mineral
- (b) Sperm
- (c) Neatsfoot
- (d) Lard
- (e) Castor
- (f) Tallow

16-8 CHARACTERISTICS OF OILS

- (a) Specific Gravity
- (b) Cold Test
- (c) Flash Test Limits
- (d) Fire Test Limits
- (e) Viscosity at 70 Degrees F.
- (f) Permissible Degree of Acidity?
- (g) Percentage of Acidless Tallow Permissible
- (h) Percentage Insoluble Soap
- (i) Percentage Pure Strained Lard Oil Required
- (j) Oil to be Clear or Dark.

16-9 GRAPHITE

- (a) Any Deflocculated Graphite to be Used?
- (b) Any Flake Graphite to be Used?

16-10 GREASES

- (a) Purposes for Which Greases Are to be Used
- (b) How Will Grease be Fed?
- (c) Any Specially Hot Conditions?
- (d) Any Specially Cold Conditions?
- (e) Any Soapstone to be Used?

- (f) Any Specification of Base of Grease?

- (g) Lard
- (h) Tallow

16-11 LUBRICATING APPARATUS

See Central Oiling System, Section 4-51; also Sections 4-13e, 4-18x, 4-19s, 4-20i, 7-24g, 7-24r, 9-25e, 9-28, 9-31b, 9-42, 11-23z, 11-24g, 14-11i and 14-15k.

17-ELEVATORS**17-1 TYPE OF BUILDING**

- (a) Dimensions
- (b) Number of Stories
- (c) Use

17-2 NUMBER OF ELEVATORS

- (a) Passenger
- (b) Freight
- (c) Sidewalk
- (d) Dumbwaiters
- (e) Escalator

17-3 SHAFT SIZES AND OPENINGS

- (a) Openings on Different Sides
- (b) Automatic or Safety Doors Required?

17-4 TRAVEL

- (a) Number of Stories Each Elevator?
- (b) Any Cars Go to Roof?

17-5 LOADS AND SPEEDS

- (a) Maximum Loading
- (b) Average Loading
- (c) Speed Required?
- At what load?
- the above for each type of car

17-6 MOTIVE POWER AND TYPE

- (a) Electricity
- Voltage
- Kind of current. If alternating current:
- number of cycles
- number of phases
- Traction 1-1
- Traction 2-1
- Duplex tandem, helical worm gear
- Single tandem, helical worm gear
- Duplex tandem worm gear
- Single screw worm gear
- Spur gear
- Belt drive

- (b) Hydraulic
- How is pressure obtained?
- What pressure carried?
- Plunger
- Horizontal multiple sheave
- Vertical cylinder

- (c) Steam
- Pressure carried
- Direct acting (sidewalk lifts)
- Drums

- (d) Compressed Air (Sidewalk Lifts)
- How is pressure obtained?
- What pressure carried?

- (e) Hand Operated (see Section 17-12f)

17-7 CARS

- (a) Design
- Allowed value exclusive of sling
- Any special flooring for passenger cars?
- Any special flooring for freight cars?
- Any removable panels, side or top?

Special construction for sidewalk lifts?

Seat
Mirrors
Dimensions

- (b) Lighting
- How controlled?
- Source and location of supply
- (c) Finish of Cars
- (d) Gates
- (e) Automatic Doors
- (f) Safety Latches
- (g) Telephone from Car to Hall or Engine Room
- (h) Any Temporary Cars During Construction?
- (i) Allowed Makes

17-8 SIGNALS

- (a) Type
- Flash
- Hotel type
- Automatic target reset annunciators
- Magnet drop annunciators
- Allowed makes
- (b) Pushes
- Kind of pushes
- Cases
- Night service
- Signal cut-out in car
- (c) Floor Dials
- Design
- Finish
- Allowed makes
- (d) Sources of Supply
- Any duplicate set?
- Where is signal current delivered?

17-9 HOISTING CABLES

- (a) Number
- (b) Diameter
- (c) Material
- (d) How Secured?
- (e) How Equalized?
- (f) Stretch in Cables Taken Up by Whom?
- (g) Required Safety Factor

17-10 ELECTRIC CABLES

- (a) Number
- (b) Method of Support
- (c) Colors of Covering

17-11 COUNTER WEIGHTING

- (a) Number
- (b) What Proportion of Live Load Is to be Balanced?
- (c) How Are Filling Weights to be Secured?
- (d) Lubrication
- (e) Shoes or Gibs
- (f) With Two Counterweights, How Are Ropes to Bottom Counterweight Protected?
- (g) Sheathing
- (h) Any Chain Counterbalance?
- How secured?
- Any covering?
- Any special construction to avoid noise?
- Any special construction to balance peculiar loading?

17-12 HOISTING MECHANISM

- (a) Traction or Worm Gear Drum (Electric)

- Motors (see Sections 11—24 and 14—14d.)
Driving sheath or drum diameter and width
Driving sheave material
How secured to motor?
Method of braking
How mounted?
Rope grooves
How ropes are led to car and counterweight?
Diameter and length of bearings
Lubrication (with worm gear machines)
Type of gear
Speed reduction ratio
Diameter of worms
Diameter of gear
Diameter of shafts
Materials of worm and gear and shaft
How is thrust taken?
How is thrust bearing adjusted?
Prevention of oil travel along shaft
Method of alignment
Shall motor operate continuously?
- (b) Belt Elevators (Electric)
Belt-shifting mechanism
Length of drive
Diameters of driving and driven pulleys
Motors (see Sections 11—24 and 14—14d.)
- (c) Applying to All Types
Supports
Foundation
Painting
Location of winding mechanism
- (d) Plunger Elevators
Diameter
Material
Thickness of metal
Joining of sections
Construction of ends
Stuffing boxes
construction
packing
gland
Method of boxing
Method of determining alignment
Material of casing
- (e) Hydraulic Cylinder Elevators
Vertical or horizontal cylinder
Location
Diameter of plunger
Ratio of speed increase
Lubrication of nests of sheaves
Diameter of sheaves
- (f) Hand Power
Bearing
single reduction spur gear
double reduction spur gear
Number of hoist wheels
Diameter of hoist wheels
Supports
Painting
Materials
Safety devices
automatic stops
brake
Any provision for possible future power application?
Counterweighting
Rise
Capacity
Size of platform
Construction of platform
Guides and supports
material
erection
Ropes
size
material
method of adjustment
- Pushes and bells
kind
location
- 17—13 SAFETY DEVICES
- (a) Excessive Speed
Safety clutch operating on up motion. (On traction only.)
Safety clutch operating on down motion
Slowing down when speed increases above regular limit
Armature short-circuiting
- (b) Breaking of Cables
Safety clutch (see Section 17—13a), with provision for release
Emergency hand lever, to lock car to guides
Oil bumpers
Spring bumpers
Air lock
- (c) Limits
Hatchway limits
Winding mechanism limits
Protection of motor
No voltage switch
Fuses
Circuit breaker
Emergency switch in car cutting off all current
- (e) Switch to Open if Cables Slacken
- (f) Self-centering Car Operating Switch
- (g) Self-closing Electric Brake
- (h) Door Latches Preventing Starting of Car Until Door Is Closed
- 17—14 OPERATING DEVICES
- (a) Type of Control Switch
- (b) Number of Speed Desired
- (c) Is Acceleration to be at Will or Automatically Controlled?
- (d) In What Space Is Full Acceleration to be Obtained?
- (e) In What Space Is Stop to be Made from Full Speed?
- (f) Allowed Excess of Starting Over Running Current
- (g) Allowed Rise in Temperature of Resistance
- (h) Allowed Carrying Capacity of Copper and Carbon Contracts?
- (i) Is Car to be Operable from Point Near Hoisting Mechanism?
- 17—15 EXTRA PARTS
- (a) Guide Lubricators
- (b) Spare Parts for Controller
- (c) Spare Brushes for Motor
- 17—16 SPECIAL DETAILS
- (a) Who Supplies Overhead Grating?
- (b) Supports for Overhead Work
- (c) Supports for Hoisting Mechanism
- (d) Elevator Pit
- (e) Hoistway
- (f) Doors
- (g) Elevator Room Enclosure
- (h) Covering of Hatchway and Overhead Work
- (i) Painting
- (j) First Supply of Lubricants
- (k) Electricity for Operation
- (l) Permits and Certificates
- (m) Test Weights and Instruments
- 17—17 TEMPORARY ELEVATOR
- (a) Car
- (b) Gate
- (c) Alarm Gong
- (d) Connections
- (e) Operator
- 18—DAMS
- 18—1 SITE ON WHAT RIVER?
- 18—2 LOCATION
- 18—3 DISTANCE FROM RAILROAD STATION
- 18—4 DEPTH OF RIVER AT LOW-WATER LEVEL
- 18—5 DEPTH OF RIVER AT HIGH-WATER LEVEL
- 18—6 MAXIMUM FLOOD IN CUBIC FEET PER SECOND
- 18—7 MATERIAL OF RIVER-BED
- (a) Hard-rock Ledge
- (b) Shale
- (c) Soft Rock
- (d) Hard Pan
- (e) Cemented Gravel
- (f) Boulders
- (g) Clay
- (h) Sand
- (i) Silt
- 18—8 MATERIAL IN RIGHT-HAND BANK (LOOKING DOWN STREAM)
- 18—9 MATERIAL IN LEFT-HAND BANK
- 18—10 WHERE CAN BUILDING MATERIAL BE HAD?
- (a) Gravel
- (b) Crushed Stone
- (c) Stone Quarry
- (d) Coarse, Clean Sand
- (e) Distance in Feet (Haul by Team)
- (f) Distance in Miles (Haul by Railroad)
- 18—11 PROBABLE COST TO DELIVER AT SITE
- (a) Gravel per Cubic Yard
- (b) Crushed Stone per Cubic Yard
- (c) Sand per Cubic Yard
- (d) Cement per Barrel
- (e) Rough Lumber per Thousand Feet
- 18—12 COST OF FUEL
- (a) Coal per Ton
- (b) Wood per Cord
- (c) Oil per Barrel
- 18—13 WAGES OF COMMON LABOR
- 18—14 WAGES OF ROUGH CARPENTER
- 18—15 PRICE PER DAY FOR DOUBLE TEAMS
- 18—16 PROVISION AGAINST FLOOD, ICE, RAINY OR DRY SEASON, WHICH MUST BE TAKEN DURING CONSTRUCTION
- 18—17 PERMITS FOR BUILDING AND STORING MATERIAL
- 18—18 WHO CLEANS UP AND REMOVES DIRT AND RUBBISH?
- 18—19 PROVISION FOR TEMPORARY HOUSING

- 18-20 LOCAL LABOR MARKET
- 18-21 KIND OF COMMUNICATION WITH NEAREST CITY OR TOWN
- 18-22 TIME OF STARTING AND COMPLETION
- 18-23 WHO SUPERVISES THE CONSTRUCTION?
- 18-24 WHO PAYS FOR SUPERVISION?
- 18-25 WHO IS RESPONSIBLE FOR ACCIDENTS?
- 18-26 PENALTY FOR DELAY IN COMPLETION
- 18-27 WHO FURNISHES WORKING DRAWINGS?
- 18-28 SIZE OF DAM
- (a) Height of Crest Above River Bed
 - (b) Length of Crest
 - (c) Width of Crest
 - (d) Length of Base
 - (e) Width of Base
 - (f) Height of Spillway Crest
 - (g) Length of Spillway Crest
- 18-29 WOODEN PILES
- (a) Kind of Wood
 - (b) Chemical Treatment
 - (c) Length of Piles
 - (d) Diameter at Top
 - (e) Diameter at Bottom
 - (f) Bearing Power per Pile
 - (g) Depth to Which Pile Should Go
 - (h) Weight of Driver
- 18-30 CONCRETE PILES
- (a) Mixture of Concrete
 - (b) Nature of Reinforcement
 - (c) Length of Piles
 - (d) Size of Pile at Top
 - (e) Size of Pile at Bottom
 - (f) Bearing Power of Pile
 - (g) Depth to Which Pile Should Go
 - (h) Weight of Driver
- 18-31 COFFER DAMS
- (a) Piling
 - Wood
 - Steel
 - Size
 - Length
 - (b) Planking
 - Size
 - Length
 - Kind of wood
 - (c) Braces
 - (d) Stop-hogs
 - (e) Spikes and Drift-bolts
 - (f) Nature of Filling
- 18-32 EARTH DAM
- (a) Method of Building Dam
 - (b) Material of Dam
 - Stone
 - Gravel
 - Sand
 - Loam
 - Clay
 - (c) Slope of Up and Down Stream Sides
 - (d) Facing of Slopes
 - (e) Where Is Material to be Had?

- (f) Any Piling to be Done?
 - (g) Material for Core
 - (h) Provision for Flash-boards
- 18-33 TIMBER DAM
- (a) Kind of Lumber
 - (b) Chemical Treatment of Lumber
 - (c) Size of Timber
 - (d) Size of Planking
 - (e) Size of Spikes and Drift-bolts
 - (f) Length and Size of Piles
 - (g) Slope of Up and Down Stream Sides
 - (h) Provisions for Flash-boards
 - (i) Nature of Filling
 - (j) Waterproofing
- 18-34 MASONRY DAMS
- (a) Types
 - Gravity
 - Arch
 - (b) Nature of Masonry
 - Concrete
 - Cyclopean
 - Puddle
 - (c) Material
 - Size of stones
 - Character of sand
 - Brand of cement
 - Proportion of mixture
 - (d) Slopes of Up and Down Stream Sides
 - (e) Shape of Apron
 - (f) Facing
 - (g) Waterproofing
 - (h) Provision for Drainage
 - (i) Provision for Flash-boards
- 18-35 REINFORCED - CONCRETE DAMS
- (a) Material
 - Size of stones
 - Character of sand
 - Brand of cement
 - Proportion of mixture
 - (b) Reinforcement
 - Size of rods
 - Spacing of rods
 - Quality of rods
 - (c) Foundations
 - (d) Piers or Buttresses
 - Thickness
 - Spacing
 - (e) Deck
 - Thickness at bottom
 - Thickness at top
 - (f) Slopes of Up and Down Stream Sides
 - (g) Shape of Apron
 - (h) Facing
 - (i) Waterproofing
 - (j) Provision for Drainage
 - (k) Provision for Flash-Boards
- 18-36 STEEL-FRAME DAMS
- (a) Foundations
 - Masonry
 - Piling
 - (b) Piers or Buttresses
 - Dimensions
 - Spacing
 - (c) Bracing
 - Material
 - Spacing

- (d) Deck
 - Material
 - Thickness
 - (e) Slope of Up and Down Stream Sides
 - (f) Shape of Apron
 - (g) Painting
 - (h) Provision for Drainage
 - (i) Provision for Flash-boards.
- 18-37 MOVABLE DAMS
- (a) Types
 - Bear traps
 - Needle dam
 - Chanoine dam
 - Butterfly dam
 - Cylindrical dam
 - Stoney roller dam
 - Movable crests?
 - (b) Foundation
 - (c) Buttresses
 - (d) Material
 - (e) Operating Mechanism
 - (f) Chemical Treatment of Lumber
 - (g) Painting
 - (h) Operating Walkway
 - Material
 - Supports
- 18-38 FLASH-BOARDS
- (a) Material
 - Wood
 - Steel
 - (b) Types
 - Temporary
 - Permanent
 - (c) Height
 - (d) Supports
 - (e) Anchor-bolts
 - (f) Operating Walkway
 - Material
 - Length
 - Width
 - Supports
 - (g) Chemical Treatment of Lumber
- 18-39 FISHWAYS
- (a) Type
 - Cascades
 - Chute
 - (b) Velocity of Water
 - (c) Size
 - Length
 - Width
 - (d) Material
 - Wood
 - Masonry
 - (e) Height of Risers in Cascade
 - (f) Slope of Chute
 - (g) Chemical Treatment of Lumber
- 19-HEAD AND TAIL RACES
- 19-1 LOCATION
- 19-2 NATURE OF SOIL
- 19-3 EXCAVATION
- 19-4 TRANSPORTATION FACILITIES
- 19-5 LABOR SUPPLY
- 19-6 RESPONSIBILITY FOR ACCIDENTS
- 19-7 SUB-CONTRACTORS

- 19—8 REMOVAL OF DIRT
- 19—9 WAGES OF COMMON LABOR
- 19—10 WAGES OF ROUGH CARPENTER
- 19—11 PRICE PER DAY FOR DOUBLE TEAMS
- 19—12 WHO SUPERVISES?
- 19—13 WHO PAYS FOR SUPERVISION?
- 19—14 PERMIT FOR BUILDING AND STORING MATERIAL
- 19—15 PROVISION AGAINST FLOOD, RAINY OR DRY SEASONS DURING CONSTRUCTION
- 19—16 PROVISION FOR TEMPORARY HOUSING
- 19—17 WHERE CAN BUILDING MATERIAL BE HAD?
- (a) Gravel
- (b) Crushed Stone
- (c) Stone Quarry
- (d) Coarse Clean Sand
- (e) Distance
- 19—18 PROBABLE COST TO DELIVER AT SITE
- (a) Gravel per Cubic Yard
- (b) Crushed Stone per Cubic Yard
- (c) Sand per Cubic Yard
- (d) Cement per Barrel
- (e) Rough Lumber per Thousand Feet
- 19—19 NATURE OF SOIL
- (a) Hard Rock Ledge
- (b) Shale
- (c) Soft Rock
- (d) Hard Pan
- (e) Cement Gravel
- (f) Boulders
- (g) Clay
- (h) Sand
- (i) Silt
- 19—20 TUNNELS
- (a) Types
- Pressure
- Non-pressure
- (b) Length
- (c) Pitch
- (d) Size
- Width
- Height
- (e) Method of Construction
- Tunnel form
- Open-trench form
- (f) Lining
- Bottom
- Sides

 - Material

19-30 REINFORCED-CONCRETE PENSTOCKS

- (a) Material, Size and Grade
 - Stone
 - Sand
 - Cement
 - Proportion of mixture
- (b) Thickness of Wall
- (c) Method of Reinforcement
 - Length of roads
 - Size of roads
 - Spacing
- (d) Method of Construction

19-31 SIPHON SYSTEM

- (a) Material
 - Steel
 - Reinforced concrete
 - Wood
- (b) Size
- (c) Elevation of Lower and Upper Ends
- (d) Length
- (e) Supports
- (f) Anchors
- (g) Expansion Joints
- (h) Thickness and Size of Material
 - Walls
 - Reinforcement
 - Bracing
 - Bolts and rivets
- (i) Waterproofing
- (j) Painting
- (k) Vent

19-32 AUTOMATIC QUICK-CLOSING VALVES

- (a) Number for Penstock
- (b) Location
- (c) Method of Operation
- (d) Size
- (e) Material

19-33 STAND PIPES

- (a) Size
- (b) Height
- (c) Material

- (d) Reinforcement
- (e) Anchorage
- (f) Foundation
- (g) Provision for Drainage and Over-flow
- (h) Waterproofing
- (i) Protection Against Frost
- (j) Location
- (k) Provision for Inspection
- (l) Painting

19-34 PENSTOCK-RELIEF VALVES

- (a) Type
- (b) Number
- (c) Capacity of Discharge
- (d) Discharge Pipe
- (e) Connection with Turbine Casing
- (f) Connection with Governor
- (g) Adjustment of Closing Time

19-35 MAIN PENSTOCK VALVES

- (a) Type
 - Butterfly valve
 - Gate valve
 - Sluice gate
 - Cylindrical valve
 - Drum gate
 - Flap gate
- (b) Method of Operation
 - Automatic
 - Non-automatic
 - Local control
 - Distance control
 - Manual
 - Mechanical
 - Electrical
 - Hydraulic
- (c) Size
- (d) Number
- (e) Material
- (f) Location

19-36 TAIL RACE

- (a) Nature of Soil
- (b) Excavation
- (c) Length
- (d) Size
- (e) Slope of Sides
- (f) Lining
- (g) Pitch
- (h) Provision to Cut Off Turbine-discharge Chamber from Tail Race
- (i) Stop-logs
 - Kind of wood

20-POWER PLANT BUILDING

20-1 LOCATION OF BUILDING

20-2 TRANSPORTATION FACILITIES

20-3 NEAREST DELIVERY POINT BY RAIL OR WATER

20-4 PROVISION AGAINST RAINY OR DRY SEASON

20-5 LABOR SUPPLY

20-6 TIME OF STARTING AND COMPLETION

20-7 WHO FURNISHES WORKING DRAWINGS?

20-8 WHO SUPERVISES THE CONSTRUCTION?

20-9 WHO IS RESPONSIBLE FOR ACCIDENTS?

20-10 ANY SUB-CONTRACTING TO BE DONE?

20-11 WHO FURNISHES THE BUILDING MATERIAL?

20-12 WHO REMOVES DIRT AND RUBBISH?

20-13 WHO DOES THE EXCAVATING?

20-14 DISTANCE TO DUMP FOR DIRT AND RUBBISH

20-15 WHO FURNISHES STRUCTURAL STEEL?

20-16 WHO FURNISHES ROOFING, DOORS, WINDOWS, ETC.?

20-17 STATE DAY OF DELIVERY OF MATERIAL

20-18 WAGES OF COMMON LABOR

20-19 WAGES OF BRICKLAYERS

20-20 WAGES OF CARPENTERS

20-21 PRICE PER DAY FOR DOUBLE TEAMS

20-22 SITE OF BUILDING

- (a) Character of Soil
- (b) Who Makes Test of Soil?
- (c) Bearing Power of Soil
- (d) Is Soil to be Reinforced?
- (e) Can Excavated Soil be Used for Building Material?
- (f) Protection Against Ground Water

20-23 PILING

- (a) Number of Piles
- (b) Bearing Power of Piles
- (c) Depth to Which Piling Should Go
- (d) Weight of Driver
- (e) Who Furnishes Piles?
- (f) Who Furnishes Driver?
- (g) Day of Delivery

20-24 SHEET PILING

- (a) Material
 - Wood
 - Steel
- (b) Size
- (c) Length
- (d) Shall Sheet piling be Removed After Work is Completed or Remain in Place?
- (e) Who Furnishes Material?
- (f) Where Delivered?

20-25 WOODEN PILES

- (a) Kind of Wood
- (b) Length of Piles
- (c) Diameter at Top
- (d) Diameter at Bottom
- (e) Chemical Treatment
- (f) Bearing Power per Pile
- (g) Depth to Which Pile Should Go
- (h) Weight of Driver

20-26 CONCRETE PILES

- (a) Mixture of Concrete
- (b) Nature of Reinforcement
- (c) Length of Piles
- (d) Size of Pile at Top
- (e) Size of Pile at Bottom
- (f) Bearing Power per Pile
- (g) Depth to Which Pile Should Go
- (h) Weight of Driver

20-27 FOUNDATIONS

- (a) Who Furnishes Working Drawings?
- (b) Material
 - Stone
 - Sand
 - Cement
- (c) Method of Construction
- (d) Machine or Hand-mixed Concrete
- (e) Who Furnishes Templates for Anchor-bolts?
- (f) Who Furnishes Material for Forms?
- (g) When Shall Forms be Removed?
- (h) Any Waterproofing?
- (i) Who Furnishes Waterproofing?

20-28 WALLS

- (a) Material
- (b) Thickness
- (c) Number and Size of Windows
- (d) Number and Size of Doors
- (e) Columns
- (f) Crane Runway
- (g) Anchor Bolts and Washers
- (h) Who Furnishes Crane Runway?
- (i) Who Erects Columns and Crane Runway?

20-29 STRUCTURAL STEEL

- (a) Character of Steel
- (b) Fiber Stresses
- (c) Workmanship
- (d) Roof Trusses
 - Slope of Roof
 - Number and size
- (e) Columns
 - Number and size
 - Base plates
 - Anchor plates
- (f) Purlins
 - Number and size
 - Method of fastening
- (g) Bracing
 - Method and size
 - Location
- (h) Who Supplies Material?
- (i) Who Erects Material?

20-30 FLOORS

- (a) Material of Floor Proper
- (b) Material and Nature of Floor Finish
- (c) Floor Beams
- (d) Curbing for Openings
- (e) Floor Plates
- (f) Who Furnishes Beams, Curbing and Floor Plates?

20-31 TOILETS

- (a) Number
- (b) Location
- (c) Number and Size of Lockers
- (d) Number of Baths
- (e) Number of Wash Basins
- (f) Number of Sinks
- (g) Number of Seats and Stands
- (h) Material of Equipment
- (i) Material of Partitions and Doors
- (j) Finish of Walls and Floor
- (k) Material and Size of Plumbing
- (l) Provision for Floor Drainage
- (m) Method of Ventilating
- (n) Method of Heating
- (o) Method of Lighting

20-32 STAIRWAYS

- (a) Number
- (b) Location
- (c) Material
- (d) Width
- (e) Length
- (f) Height of Tread
- (g) Width of Tread
- (h) Riser Covered with Anti-slip Material
- (i) Railing
- (j) Painting

20-33 DOORS

- (a) Number
- (b) Size
- (c) Material
 - Wood
 - Iron
 - Wood covered with metal
- (d) Type
 - Swinging
 - Sliding
 - Folding
 - Rolling shutter
- (e) Trimmings
- (f) Automatic Closing Device in Case of Fire
- (g) Who Furnishes Doors?

20-34 WINDOWS

- (a) Number
- (b) Size
- (c) Type
- (d) Material
 - Wood
 - Iron
 - Wood covered with metal
- (e) Glass
 - Plain
 - Wired
 - Ribbed
- (f) Sashes
 - Swinging
 - Sliding
- (g) Who Furnishes Window Frames?
- (h) Who Furnishes Glass?

20-35 VENTILATION

- (a) Method
 - Window
 - Monitors
 - Louvres
 - Ventilators
- (b) Size
- (c) Number
- (d) Regulating Devices
- (e) Location
- (f) Material
- (g) Painting
 - (See also Section 4-1m, Ventilating Equipment)

20-36 HEATING

- (a) System
 - Single-pipe
 - Two-pipe
 - With or without air line
 - Pressure
 - Hot-water
 - Dry-air
 - Vacuum
- (b) Method of Distribution
- (c) Method of Return
- (d) Size of Heating Plant

- (e) Size of Piping
- (f) Size of Ducts
- (g) Material
- (h) Painting
- (i) Covering
- (j) Method of Support
 - (See also Section 4-42, Heating System)

20-37 LIGHTING

- (a) System
 - Direct-current
 - Alternating-current
- (b) Voltage
- (c) Phase
- (d) Frequency
- (e) Two-wire or Three-wire
- (f) Switchboard
- (g) Wiring
- (h) Electrical Protection
- (i) Mechanical Protection
- (j) Lamps
 - Arc
 - Incandescent
- (k) Supports
- (l) Material
 - (For other items see Section 11-1, Electric Wiring)

20-38 CRANES

- (a) Type
 - Hand operated
 - Electrically operated
- (b) Span
- (c) Capacity
- (d) Traveling Speed
- (e) Hoisting Speed
- (f) Material
 - Lattice-girder construction
 - Plate-girder construction
- (g) Who Erects Crane?
- (h) Painting
 - (See also Section 2-23i, Hoists and Cranes)

21-MECHANICAL EQUIPMENT OF POWER PLANT

21-1 NUMBER OF TURBINES OR WHEELS

21-2 LOCATION OF POWER PLANT

21-3 TRANSPORTATION AND UNLOADING FACILITIES

21-4 NEAREST RAILROAD STATION OR LANDING

- (a) Distance from Point of Unloading and Data of Haulage Conditions

21-5 CLASSIFICATION OF TURBINE

- (a) Low Head (Up to 30 Feet)
- (b) Medium Head (From 30 to 200 Feet)
- (c) High Head (Above 200 Feet)

21-6 TYPES OF TURBINES

- (a) Francis Turbine
- (b) Pelton or Impulse Wheel? Horizontal or Vertical Shaft? One or More Runners?

21-7 FOUNDATION FOR TURBINES

- (a) Number

- (b) Material
(c) Dimensions
(d) Who Furnishes Drawings?
(e) Who Builds?
(f) Who Supplies Anchor-bolts, Washers, Nuts, Sleeves and Templates?
(g) Waterproofing
(h) Are Anchor-bolts to be Shipped Before Turbine?
- 21-8 EXCAVATION FOR FOUNDATIONS
(a) Who Makes?
(b) Who Removes Dirt and Rubbish?
(c) Who Cleans Up After Completion?
- 21-9 SIZE OF TURBINE
(a) Horse Power (H. P.)
(b) Speed (R. P. M.)
(c) Head (In Feet)
(d) Volume of Water (Cu. Ft. per Second)
(e) Draft-head
(f) Efficiencies
At half load
At three-quarter load
At normal rated load
At maximum load
- 21-10 REGULATION
Load Changes Speed Changes
(a) 10 per cent — per cent
(b) 25 per cent — per cent
(c) 50 per cent — per cent
(d) 100 per cent — per cent
- 21-11 TIME OF DELIVERY AND OPERATION
- 21-12 PENALTY FOR DELAY IN DELIVERY
- 21-13 PENALTY FOR LACK OF EFFICIENCY
- 21-14 BONUS FOR EARLIER DELIVERY
- 21-15 BONUS FOR HIGHER EFFICIENCY
- 21-16 WHO PAYS FOR PATENT RIGHTS OR INFRINGEMENT?
- 21-17 TURBINE CONSTRUCTION
(a) Casing
Spiral
Cylindrical
Without casing (to be set in the flume or masonry foundation)
(b) Material of Casing
Number of pieces
Number and size of bolts
(c) Size of Inlet (Penstock Connection)
(d) Size and Drilling of Flange
(e) Size of Outlet (Draft Tube Connection)
(f) Anchor Bolts
Number
Size
(g) Finish: Polished, Rough or Painted
- 21-18 RUNNERS
(a) Number
(b) Size
(c) Material
- 21-19 OUTSIDE REGULATION
(a) Gate Rings
Number
- Size
Material
(b) Wicket Gates
Number
Size
Material
(c) Gate Levers
Number
Material
(d) Link Connection Between Gate-Rings and Gate-levers
Number
Material
- 21-20 INSIDE REGULATION
(a) Gate Rings
Number
Size
Material
(b) Wicket Gates
Number
Size
Material
(c) Link Connection Between Wicket Gate and Gate Ring
Number
Material
(d) Pivot Butts for Wicket Gate
Number
Size
Material
- 21-21 DRAFT TUBES
(a) Number of Draft Tubes per Turbine
(b) Draft-head
(c) Size at Top
(d) Size at Bottom
(e) Length
(f) Length of Submerged Bottom
(g) Number of Pieces per Tube
(h) Material
(i) Anchors
Number and size
(j) Anchor Bolts
Number and size
(k) Reinforcement
(l) Painting
- 21-22 IMPULSE WHEELS, CONSTRUCTION
(a) Number of Runners
(b) Size of Runner
(c) Material of Runner
(d) Number of Buckets per Runner
(e) Material of Buckets
(f) Method of Fastening Buckets to Runner
(g) Type of Casing
Material
Number of pieces
Number and size of bolts
(h) Size and Number of Nozzles
(i) Size of Penstock Connection
(j) Method of Regulating Anchor-bolts
Size
Number
(k) Finish: Polished, Rough or Painted
- 21-23 BEARINGS
(a) Number
(b) Size
(c) Type
(d) Location
(e) Number and Size of Bolts
(f) Method of Lubrication
- (g) Provision for Water-cooling
(h) Material of Box
(i) Lining of Box
- 21-24 SHAFT
(a) Material
(b) Size
(c) Finish: Polished or Rough
- 21-25 FLY-WHEEL
(a) Weight
(b) Size
(c) Material
(d) Finish
- 21-26 STUFFING BOXES
(a) Number
(b) Size
(c) Material
(d) Packing
- 21-27 MAIN VALVES
(a) Number per Turbine
(b) Type
(c) Size
(d) Material
(e) Method of Control
(f) Drilling and Size of Flange
- 21-28 GOVERNING DEVICE
(a) Type and Capacity of Governor
(b) Detail of Construction
(c) Method of Drive
Gears
Belt
Chain
(d) Method of Adjusting Speed Regulation
(e) Finish: Polished, Rough or Painted
(f) Type and Capacity of Oil Pump
(g) Capacity of Oil Tank
(h) Oil Pressure Used
- 21-29 CONNECTION BETWEEN GOVERNOR AND RING OR NOZZLE
(a) System
Direct
Indirect
(b) Levers and Links
(c) Piping and Valves
- 21-30 HAND REGULATION
(a) Describe Method
- 21-31 MECHANICAL CONNECTIONS BETWEEN TURBINE AND GENERATOR
(a) Direct-connected
Rigid
Flexible
Insulated
(b) Gears
(c) Belts
(d) Chain
(e) Rope
(f) Who Furnishes Mechanical Connections?
(g) Who Furnishes Key and Gage of Shafts?
(h) Who Pays for Making Connections?
- 21-32 TURBINE INDICATORS
(a) Any Required?
(b) Supplied by Whom?
(c) For Speed

- (d) For Pressure
(e) For Vacuum
(f) Material
(g) Finish
- 21—33 TURBINE LUBRICATION**
- (a) Method
(b) Central System?
Type and capacity
(c) Size and Material of Piping
(d) Type of Valves
(e) Size and Material of Storage Tank
(f) Oil-Circulating Pumps
Number and capacity
(g) Who Supplies Piping?
(h) Who Supplies Central System?
(For additional items see Section 4—51)
- 21—34 ERECTION**
- (a) Who Erects?
(b) Who Pays for Erection?
(c) Who Supervises?
(d) Who Pays for Supervision?
(e) Who Furnishes Common Laborers?
(f) Who Pays for Shipment?
(g) Who Pays for Crating?
(h) Who Protects Machinery Against Damage?
(i) Who Furnishes Laborers and Facilities for Transportation from Railroad to Power Plant?
(j) Who Pays for Transportation?
(k) Weight of Largest Piece
(l) Approximate Dimension of Largest Piece
(m) Who Pays for Grouting?
(n) Who Furnishes Erecting Material?
(o) Is a Traveling Crane in Plant?
Type and capacity
(p) Who Cleans Up After Erection?
(q) Who Pays for Painting After Erection?
- 21—35 TESTS**
- (a) At Shops
Test pressure for all parts subjected to hydrostatic pressure
(b) At Power Plant
When is test to be made?
Who supplies material for test?
Who pays for supervision?
Method of measuring water
- 21—36 SPARE PARTS**
- (a) Runners
(b) Wicket Gates
(c) Gate Levers
(d) Stuffing Boxes and Packing
(e) Lining
(f) Nozzle Tips
(g) Needles
(h) Parts of Governor
- 21—37 WRENCHES**
- (a) Who Furnishes Complete Set of Wrenches?
- 22—ELECTRICAL EQUIPMENT OF POWER PLANT**
- 22—1 NUMBER OF GENERATORS**
- 22—2 LOCATION OF PLANT**
- 22—3 TRANSPORTATION AND UNLOADING FACILITIES**
- 22—4 NEAREST RAILROAD STATION**
- 22—5 PURPOSE FOR WHICH GENERATORS ARE TO BE USED**
- 22—6 FOUNDATIONS**
- (a) Dimensions
(b) Who Furnishes Drawings?
(c) Who Furnishes Foundations?
(d) Who Furnishes Anchor-bolts? Washers and Sleeves?
(e) Are Anchor-bolts to be Shipped Before Generators?
- 22—7 TYPES**
- (a) Direct Current (Two or Three Wire)
(b) Alternating Current
(c) Single, Two or Three Phase
- 22—8 CAPACITY**
- (a) Direct Current in K. W.
(b) Alternating Current in K. V. A.
Power factor
- 22—9 OVERLOAD CAPACITY**
- (a) Duration (in minutes)
- 22—10 VOLTAGE**
- 22—11 REVOLUTION (R. P. M.)**
- 22—12 FREQUENCIES (PER SECOND)**
- 22—13 EFFICIENCY (IN PER CENT.)**
- 22—14 METHOD OF EXCITATION**
- 22—15 REGULATION**
- (a) Voltage at No Load
(b) Voltage at $\frac{1}{4}$ Load
(c) Voltage at $\frac{1}{2}$ Load
(d) Voltage at $\frac{3}{4}$ Load
(e) Voltage at Full Load
(f) Voltage at $1\frac{1}{4}$ Load
(g) Voltage at $1\frac{1}{2}$ Load
- 22—16 WHAT DROP IN SPEED IS TO BE ALLOWED FOR UNDER SUDDEN CHANGE IN LOAD?**
- 22—17 ALTERNATING CURRENT GENERATOR**
- (a) Stationary Armature
Type of frame
Type of core
Windings
Material
Ventilation
- (b) Revolving Field Structure
Number of pole pieces
Type of pole pieces
Field coil
Material
- (c) Collector Rings
Brushes
Brush holders
Material
Adjustment
- (d) Terminal Board
- (e) Provision for Parallel Operation
- 22—18 DIRECT-CURRENT GENERATORS**
- (a) Magneto Frame (Number of Pieces)
(b) Main Poles (Number)
(c) Communicating Poles (Number)
(d) Armature
(e) Armature Coils (Number)
(f) Commutator
(g) Brushes (Number)
(h) Brush-holder
(i) Terminal Board
- 22—19 SOLE-PLATES**
- (a) Number of Pieces
(b) Rails and Carriers
- 22—20 ANCHOR-BOLTS**
- (a) Number
(b) Size
(c) To be Shipped Before Generator?
- 22—21 BEARINGS**
- (a) Number and Size
(b) Type
(c) Method of Lubrication
(d) Material
(e) Provision for Water Cooling
- 22—22 TESTS AND INSPECTION**
- (a) Where Made?
(b) By Whom?
(c) Who Pays Traveling Expenses?
(d) Who Supervises Tests?
(e) Kind of Tests
Capacity
Overload
Regulation
Balance
Noiselessness
Heating
Efficiency
- 22—23 HEATING OF GENERATORS**
- (a) Under Full Load
(b) Under 25 Per Cent. Overload
(c) Under 50 Per Cent. Overload
(Standard rules of the A. I. E. E.)
- 22—24 MECHANICAL CONNECTION BETWEEN GENERATOR AND TURBINE**
- (a) Who Furnishes Connection?
(b) Who Pays for Making Connection?
(For other items see under Section 8—, Turbines)

- 22—25 **GENERATOR LUBRICATION**
(For items see Section 21—33, Turbine Lubrication; also Section 4—51)
- 22—26 **EXCITER**
- (a) Number
 - (b) Capacity
 - (c) Method of Operation
 - Turbine
 - Motor
 - Belt
 - Direct Connected to Main Generator Shaft
 - (d) Voltage
(For other items see Section 22—18, Direct-Current Generators, and Section 10—22, Exciters)
- 22—27 **TIME OF DELIVERY AND OPERATION**
- 22—28 **PENALTY FOR DELAY IN DELIVERY**
- 22—29 **PENALTY FOR LACK OF EFFICIENCY**
- 22—30 **BONUS FOR EARLIER DELIVERY**
- 22—31 **BONUS FOR HIGHER EFFICIENCY**
- 22—32 **WHO PAYS FOR PATENT RIGHTS OR INFRINGEMENT?**
- 22—33 **WHO ERECTS GENERATORS AND EXCITERS?**
- 23—SWITCH ROOM OF POWER PLANT**
- 23—1 **LOCATION OF SWITCH ROOM**
- 23—2 **NUMBER OF FLOORS**
- 23—3 **SIZE OF FLOOR SPACE**
- 23—4 **GENERAL ARRANGEMENT**
- (a) Bus-bars
 - (b) Switches
 - (c) Switchboards and Controlling Benches
 - (d) Protecting Devices
 - (e) Outgoing Lines
 - (f) Stairs
 - (g) Doors
 - (h) Windows
 - (i) Ventilation
 - (j) Lighting
 - (k) Heating
- 23—5 **SWITCHBOARDS**
- (a) Types
 - Direct-current
 - Alternating-current
 - Generator board
 - Controlling board
 - Outgoing feeder board
 - (b) Number of Panels
 - Material
 - Finish
 - (c) Panel Framework
 - (d) Sills
 - (e) Supports
- 23—6 **BUS-BAR SYSTEM**
- (a) Compartments
 - Location
 - Open or closed system
 - Size
 - Material
 - Doors
 - (b) Bus-bars
 - Capacity
 - Dimensions
 - Material
 - Single, or double ring system
 - Length
 - Method of support
 - Distance between bars
 - (c) Insulators
 - Types
 - Size
 - (d) Insulator Pins
 - (e) Disconnecting Switches
- 23—7 **OIL SWITCHES**
- (a) Location
 - (b) General Arrangement
 - (c) Method of Control
 - Local
 - Remote
 - Hand operation
 - Electric operation
 - Pneumatic operation
 - (d) Ratings
 - Ampere
 - Voltage
 - Kilowatt
 - (e) Types
 - Single-phase
 - Double-phase
 - Three-phase
- 23—8 **VOLTMETER**
- 23—9 **AMMETER**
- 23—10 **WATTHOUR METER**
- 23—11 **KILOWATT METER**
- 23—12 **FREQUENCY METER**
- 23—13 **POWER-FACTOR METER**
- 23—14 **GENERATOR SWITCH**
- 23—15 **FIELD SWITCH**
- 23—16 **EQUALIZER SWITCH**
- 23—17 **PILOT SWITCH**
- 23—18 **SECTION SWITCH**
- 23—19 **RHEOSTATS**
- 23—20 **RESISTANCES**
- 23—21 **OVERLOAD COILS**
- 23—22 **FUSES**
- 23—23 **REGULATORS**
- (a) Types
 - Tirrell regulators
 - Feeder regulators
 - Switch or control regulators
 - Induction regulators
 - Single-phase induction regulators
 - Polyphase induction regulators
- 23—24 **RELAYS**
- (a) Types
 - Overload relays
 - Reserve-current relays
 - Reserve-phase relays
 - Underload relays
 - Low-voltage relays
 - Over-voltage relays
- 23—25 **LIGHTNING ARRESTERS**
- (a) Location
 - At power house
 - At sub-station
 - Along transmission lines
 - (b) Multigap
 - (c) Horn
 - (d) Magnetic Blow-out
 - (e) Electrolytic Blow-out
 - Aluminum
 - Liquid electrodes
 - (f) Choke Coils
 - (g) Water Jets
 - (h) Grounded Wire
- 23—26 **WALL OUTLETS**
(For items on Wall Outlets see under Sub-Stations, Sections 25—1 et seq.)
- 24—TRANSMISSION SYSTEM**
- 24—1 **LOCATION**
- 24—2 **NATURE OF SOIL**
- 24—3 **TRANSPORTATION FACILITIES**
- 24—4 **ROUTE OF TRANSMISSION LINES**
- 24—5 **LATITUDE AND CLIMATE**
- 24—6 **ATMOSPHERIC ELECTRIC DISCHARGES**
- 24—7 **CAPACITY OF LINES**
- 24—8 **SINGLE OR DOUBLE CIRCUITS**
- 24—9 **SINGLE OR DOUBLE POLE LINES**
- 24—10 **TOTAL LENGTH OF SYSTEM**
- 24—11 **AVERAGE NUMBER OF POLES PER MILE**
- 24—12 **STEEL TOWERS**
- (a) Types
 - Two-legged
 - Three-legged
 - Four-legged
 - (b) Height
 - (c) Dimensions at Base
 - (d) Foundations
 - (e) Anchors
 - (f) Guy Wires
 - (g) Material
 - (h) Method of Shipment
 - (i) Method of Erection
 - (j) Galvanizing
 - (k) Paint

24—13 WOODEN POLES

- (a) Kind of Wood
- (b) Chemical Treatment
- (c) Size
 - At top
 - At bottom
- (d) Length (Total)
- (e) Length Extended Into Ground
- (f) Height of Insulators Above Ground
- (g) Guy Wires
 - Method of anchorage
- (h) Spacing of Poles
- (i) Number of Poles
- (j) Method of Shipment
- (k) Method of Erection

24—14 REINFORCED-CONCRETE
POLES AND TOWERS

- (a) Length
- (b) Size at Top
- (c) Size at Bottom
- (d) Mixture of Concrete
- (e) Nature of Reinforcement
- (f) Foundation
- (g) Height of Insulator Above Ground
- (h) Guy Wires
 - Method of anchorage
- (i) Spacing of Poles
- (j) Length of Pole Extended Into Ground
- (k) Number of Poles
- (l) Method of Shipment
- (m) Method of Erection

24—15 CROSS ARMS

- (a) Number of Arms per Pole
- (b) Material
 - Wood
 - Steel
- (c) Method of Fastening
- (d) Bolts
- (e) Length of Arms
- (f) Treatment of Wood
- (g) Galvanizing
- (h) Paint

24—16 SYSTEM OF TRANSMISSION

- (a) Direct-current
- (b) Alternating-current
- (c) Two-phase
- (d) Three-phase
- (e) Three-wire Two-phase

24—17 NUMBER OF CIRCUITS

- (a) One Circuit per Line
- (b) Two Circuits per Line

24—18 INSULATORS

- (a) Types
 - Pin insulators
 - Suspension insulators
 - Strain insulators
- (b) Material
- (c) Size

- (d) Number of Insulators
- (e) Insulator Pins
 - Material
 - Number
 - Connecting links
- (f) Number of Pieces per Insulator
- (g) Operating Voltage
- (h) Testing of Voltage

24—19 CONDUCTORS

- (a) Number per Circuit
- (b) Spacing of Conductors
- (c) Capacity
- (d) Size
- (e) Material
 - Copper
 - Aluminum

24—20 CONDUCTOR TIES

- (a) Type
- (b) Size
- (c) Material

24—21 SECTION SWITCHES

- (a) Type
- (b) Size
- (c) Capacity
- (d) Location
- (e) Number
- (f) Method of Operation

25—SUB-STATIONS

25—1 NUMBER OF SUB-STATIONS

25—2 LOCATION

25—3 TRANSPORTATION FACILITIES

25—4 EXCAVATION

24—5 FOUNDATION

25—6 BUILDING

- (a) Size
- (b) Arrangement
- (c) Walls
- (d) Roof
- (e) Floor
- (f) Doors
- (g) Windows
- (h) Heating
- (i) Lighting
- (j) Ventilation

25—7 TRANSFORMERS

- (a) Capacity
- (b) Number per Circuit
- (c) Total Number
- (d) Type
 - Single-phase
 - Two-phase
 - Three-phase
- (e) Method of Cooling
 - Air blast
 - Gravity oil circulation
 - Forced oil circulation

- (f) Connections
 - Single-phase
 - Two-phase
 - Three-phase—delta
 - Three-phase—star
 - Three-phase—T
 - Three-phase—Y
 - Two-phase, three-phase
 - Three-phase—star and delta

25—8 ROTARY CONVERTERS

- (a) Capacity
- (b) Number
- (c) Ratio of Conversion
- (d) Phase
- (e) Voltage
- (f) Starting Device
- (g) Foundation
- (h) Anchor Bolts

25—9 MOTOR GENERATORS

- (a) Capacity
- (b) Number
- (c) Size of Motor
- (d) Size of Generator
- (e) Overload Capacity
- (f) Voltage
- (g) Frequencies
- (h) Heating of Machine under Different Loads
- (i) Foundation
- (j) Anchor-bolts

25—10 FREQUENCY CHANGERS

- (a) Type
 - Horizontal
 - Vertical
- (b) Capacity
 - Size of synchronous motor
 - Size of alternating-current machine
- (c) Size of Exciter
- (d) Operating Performance
- (e) Foundation
- (f) Anchor-bolts

25—11 SWITCHBOARDS

- (a) Type
 - Direct-current
 - Alternating-current
- (b) Number of Panels
- (c) Capacity
 - (For other items see under Section 23—1, Switch Room of Power Plants; also Section 12—1, Switchboards)

25—12 WALL OUTLETS

- (a) Types
- (b) Voltage
- (c) Climate
- (d) Size and Insulation of Conductors
- (e) Wall Brushings
- (f) Wall Insulators
- (g) Terra Cotta Pipes
- (h) Protection Against Rain
- (i) Panels
 - Glass
 - Slate
 - Wood

- (j) Roof Insulators
Size material
Material

26—POWER TRANSMISSION EQUIPMENT

26—1 SHAFTING COUPLINGS AND COLLARS

- (a) Material
- (b) Sizes
- (c) Ends Key-seated for Couplings?
- (d) Couplings
Single face
Compression
keyed
keyless
Jaw clutches
Friction clutches
Flexible
- (e) Anchor Each Length with Collars?
- (f) Set Screws Recessed?
- (g) Alignment Referred to What?
- (h) What is Maximum Speed for Main Shafting?
- (i) Erected by Whom?
- (j) Any Makes of Shafting or Couplings Specified?

26—2 BEARINGS

- (a) Hangers
Drop
Post
- (b) Pillow Blocks
Rigid
B & S
Adjustable
- (c) Special
Slip
Eccentric
Thrust
- (d) Type
Plain
Roller
Ball-bearing
Self-oiling
- (e) Method of Adjustment
- (f) Height
- (g) Number of Bolts in Feet
- (h) How Secured to Supports
Lag screws
Bolts
Clamps
- (i) Method of Oiling
Any drip pans wanted?
- (j) Method of Support
Number of bolts
Number of lag screws
- (k) Are Bearings Secured to Beams, Stringers or Concrete Foundations?
- (l) Stringers (if used)
Material
Size
By whom furnished?
By whom erected?
- (m) What is Maximum Distance Between Bearings?

- (n) What Extra Bearings Necessary Close to Main Pulleys?

- (o) Any Makes of Bearings Specified?
- (p) Any Makes of Ball Bearings Specified?
- (q) Any Makes of Roller Bearings Specified?

26—3 PULLEYS

- (a) Material
Wood
Steel
Iron
Paper
Cork Insert
- (b) Type
Split or solid
Cone face for fixed belts
Flat face for shifting belts
- (c) Sizes for Different Work
- (d) Balance at High Speeds
- (e) Method of Securing to Shafting
Compression?
Keys?
Set-screws?
Or both?
Through clutches, with sleeves with quills or hollow shafts?
- (f) Are Bushings to be Used?
- (g) Any Makes Specified?

26—4 BELTING

- (a) Material
Leather
Rubber
Canvas
Hair
Patent
- (b) Is Belt to be Run Tight or Slack?
If tight, how is it to be kept so?
- (c) Diameter and Face of Driving Wheel
- (d) Diameter and Face of Driven Pulley
- (e) Maximum Horse Power to be Transmitted
- (f) Distance Between Belt Centers
Tape-line measurement around pulley
- (g) Will Drive be with Tight Side on Top or Below?
Belt forward or back?
- (h) Will Belt be Below Floor in Any Part?
Who makes pit?
How will pit be drained?
Where will drain discharge?
Material of pit?
- (i) Any Guard Rail Around Belt?
- (j) Any Guard Rail Around Pit?
- (k) How Will Static Electricity be Collected from Belt?
- (l) Width of Belt?
- (m) How is Joint in Belt to be Made?
Endless? If so, made endless at factory, or ends left open and joined at the job?
Shall belt manufacturer make allowance for endless lap?
- (n) Thickness
- (o) Allowed Makes

- (p) Is Belt to be Exposed to Steam, Acid Fumes, Dampness or Dust?

26—5 GEARS

- (a) Keyed
- (b) Jaw or Friction Clutches on Sleeve, on Quills
- (c) Type
Spur
Bevel
Miter
Worm
Spiral
- (d) Material
Iron
Steel
Bronze
Mortise:
(wood and iron or steel)
- (e) Teeth
Cast
Cut

26—6 SPROCKETS

- (a) Keyed
- (b) Jaw or Friction Clutch
On sleeves
On quills
- (c) Type
Solid or split—name and number of chain
Traction wheels

26—7 COUNTERSHAFTING

- (a) Are Countershafts Supplied with Machine?
- (b) Are Countershafts Supplied by this Contractor?
- (c) Erected by Whom?
- (d) Alignment Referred to What?
- (e) Are Speeds of Countershafts Such as to Require Jack Shafts?

26—8 ROPE DRIVE

- (a) Amount of Power to be Transmitted
- (b) Method of Transmission
- (c) System
Continuous or English
Separate or American
Character of load
- (d) Driving and Driven Sheaves
Diameter
Face
Revolutions per minute
Number of grooves

AMERICAN DRAFTING FURNITURE CO.

22 Railroad Street
ROCHESTER, N. Y.

Products.

Manufacturers of DRAWING TABLES; DRAWING BOARDS; FILING CABINETS; SPECIAL EQUIPMENT for DRAFTING ROOMS in factory, school or office; BLUE PRINTING FRAMES and CARRIAGES.

Blue Printing Machines and Driers.

Knocked Down Tables.

Made in 9 regular sizes of tops (37 by 60 in. to 48 by 96 in.) with various drawer section arrangements to meet all requirements.

Tops of soft white pine, either adjustable or fixed. Bases of solid oak.

KNOCKED DOWN TABLE
Showing adjustable top, parallel rule and filing cabinet

Monroe Drawing Table.

Unquestionably the most popular and widely used drawing table made.

Bases of solid oak, and tops of white pine made in 7 regular sizes, 31 by 42 in. to 43 by 72 in. Height and tilting adjustments.

Absolutely rigid construction throughout.

The addition of the parallel ruler as illustrated, also the use of the swinging drawer attachment where advisable, will materially increase the efficiency of any drawing table.

MONROE DRAWING TABLE
Shown with parallel rule and one drawer only

"Amco" Iron Base Tables.

Made in 6 top sizes 37 to 42 in. wide, 48 to 72 in. long.

Fitted with several styles of interchangeable sectional filing cabinets.

Adjustable for height and from vertical to horizontal.

Two clamps control all adjustments.

"AMCO" IRON BASE TABLES

Sectional Filing Cabinets.

"American" cabinets are carried in stock in 2 styles and 3 sizes. Various drawer arrangements to meet practically any requirements. High grade construction throughout. Paneled ends and backs. Drawer corners dovetailed. Drawer bottoms of 3-ply veneer. Covers at back to prevent drawings from creeping over.

Catalogue gives complete description.

Drawings and prices on special cabinets submitted on receipt of specifications.

STANDARD SECTIONAL FILING CABINET

Drawing and Layout Boards.

Only the best quality white pine and best construction used in "American" boards. Made in 3 styles and any size. Special boards to order.

LAYOUT OR DRAWING BOARD

Blue Printing Frames and Carriages.

Made in 3 styles of frames, in stock sizes from 12 by 16 in. to 36 by 60 in., with several styles of carriages, track, etc.

Specials.

BLUE PRINTING FRAME

This company manufactures considerable special equipment, of both wood and metal, to customers' specifications, and would appreciate an opportunity to quote on requirements.

ECONOMY DRAWING TABLE & MFG. CO.

Drawing Tables and Sectional Filing Cases

ADRIAN, MICH.

Products.

Manufacturers of DRAWING TABLES and SECTIONAL FILING CASES.

Special Furniture in wood or steel for schools, colleges, drafting rooms.

Steel Cabinets.

A complete line of steel cabinets, similar to the wooden designs shown, is now carried in stock.

Catalogue, with full information and illustrations, sent on request.

Specifications for Standard Wood Tables and Cases.

MATERIAL—Drawing boards and tops of tables made of soft white pine; all other exposed parts of standard tables and filing cases, plain oak. Drawers and slides of cherry or other hardwood; drawer bottoms a single panel of 3-ply veneer; and other unexposed parts of light, soft wood. All material air seasoned, kiln dried and kept at an even temperature during manufacture. Material heated before gluing.

CONSTRUCTION—Workmanship is best cabinet work; all joints mortised, tenoned and glued. Drawer sides dovetailed to front and back. Tops fastened to frames, with buttons in slots, allowing expansion and contraction. Frame of tables independent of top, firmly constructed and thoroughly braced.

FINISH—3-coat, dull rubbed. Work is finished in antique; other finishes as ordered.

STANDARD WOOD DRAWING TABLE, STYLE NO. 4, WITH LOOSE INCLINED DRAWING BOARD

MONARCH DRAWING TABLE NO. 102

Upper illustration shows table No. 102 set up; lower illustration shows same table "knocked down" for shipping or moving. An ideal table for field work, where it is necessary to maintain a portable drafting department

STANDARD WOOD DRAWING TABLE, STYLES NOS. 0, 1 AND 2
Showing loose incline drawing board and drawer with sliding tool tray

ECONOMY ADJUSTABLE TOP DRAWING TABLE

Showing adjustable top and parallel ruler attachment. Styles Nos. 30A, 31A and 32A of wood; styles Nos. 60A, 61A and 62A in steel. Top hinged to the rubbing strip at front; equipped with 2 adjustable metal supports at back, with patent locking device for holding top inclined at any angle. A panel is placed over cabinet to protect contents of drawers and forms an extra shelf.

Parallel ruler attachment, for drawing boards 24 to 108 in., operates easily at any angle of board or table; saves draftsman's time and secures more accurate results; and is much more convenient than the T-square method. The attachments can be fitted to drawing board of any size

Standard Filing Cases.

Standard filing cases are made in sectional units and with same care and class of work as the tables. Drawers are dovetailed together, and not doweled or nailed. Drawers work smoothly, and are provided with a 6-in. cover at the top and back to prevent contents from curling and creeping. Sections are held in position in all directions.

STANDARD WOOD SECTIONAL FILING CASE

A 2-section standard case with 4-in. deep drawer in base. Each section has 6 drawers—the most drawer space of any sectional case made. Economy spring covers will double capacity of drawer

HAMILTON MANUFACTURING CO.

Manufacturers of Drafting Room Furniture

TWO RIVERS, WIS.

Products.

OAK and STEEL BLUE PRINT SECTIONAL CABINETS; ADJUSTABLE DRAWING TABLES; DRAWING BOARDS.

Straightedges; T-squares; Parallel Rule Attachments; Artists' Tables; Typewriter Tables, etc.

Blue Print Sectional Cabinets in Wood and Steel.

Built on the unit plan—add as requirements demand. Thoroughly well made of either seasoned oak or cold rolled furniture steel.

Each drawer fitted with label holder, substantial pulls, paper weights and hood.

SIZES—Carried in stock in two sizes. Units lettered from A to O and numbered 32 and 37. No. 32 units have drawers with inside dimensions 32 by 42½ in., outside dimensions 34½ by 45½ in. No. 37 units have drawers with inside dimensions 25 by 37½ in., outside dimensions 27¼ by 40½ in. Special sizes to order.

BLUE PRINT CABINET UNITS

Drawing Tables.

FRY DRAWING TABLE, STYLE C—Hundreds of these tables are in use. Frames made of best quality gray iron.

Tops can be adjusted from a horizontal to a vertical position without stooping or moving from the seat.

Adjustable as to height, and very rigid in any position.

Made in 3 styles, ranging in price from \$15.00 to \$90.00.

FRY DRAWING TABLE, STYLE C

DRAWING TABLE No. 37-D—Large shallow drawer is 37 by 23 by 2 in. inside. Smaller drawer is 10½ by 23 by 3¾ in. inside.

Top is 34 by 60 by 1½ in. thick, with two hard maple cleats on bottom and parallel rule can be attached. Adjustable as to slant.

Height of table, 34 in., but blocks supplied to raise it if desired. Made of oak with pine top. Shipped knocked down.

DRAWING TABLE No. 40-D—Made in several sizes. Adjustable both as to height and slant of top.

Practically any drawer units can be used with it but the "K" units or the "K" and "C" units are especially desirable.

"K" and "C" units are of two sizes, numbered 32 and 37. No. 32 units have drawers 32 by 42½ in. inside; No. 37 units have drawers 25 by 37½ in. inside.

Made of oak and nicely finished. Shipped knocked down.

DRAWING TABLE NO. 37-D

DRAWING TABLE NO. 40-D

Drawing Boards.

This company manufactures six different styles of drawing boards. Made in pine and basswood, in any size, of properly seasoned material.

STYLE D—1½-in. boards with 3 by 1¼-in. maple cleats and oblong washers, staggered.

STYLE D DRAWING BOARD

Facilities and Experience.

The plant is fully equipped with modern labor saving machinery for the manufacture of steel and wood furniture.

About 6,000,000 ft. of lumber are carried in stock to be properly seasoned before going to the dry kilns and tempering sheds.

This company has had over 30 years' experience in making business furniture.

The company has a warehouse at Rahway, N. J., just outside of New York City, so as to insure prompt delivery in the East, as well as in the West.

Special Catalogue.

Special catalogue No. 6 with full details on wood and steel construction furnished on application.

THE PARAGON MACHINE CO.

Manufacturers of Blue Printing Equipment

77 South Avenue
ROCHESTER, N. Y.

Products.

PARAGON BLUE PRINTING MACHINES and EQUIPMENT.

Uses.

Making of blue prints, brown prints, Vandyke negatives, direct black prints, using either sheets cut to size of tracings or continuous rolls of paper.

Paragon Blue Printing Machine.

The printing bed is constructed of polished plate glass $37\frac{1}{2}$ ins. across (the length depending upon the size machine in which it is to be used) bent to a radius of 12 ins., making a complete half cylinder. This is deep enough to accommodate the special blue print arc lamps so that all their light may be used direct without the use of reflectors, and also allowing the lamps to be placed far enough from the printing surface so that the light equalizes perfectly, producing an absolutely uniformly lighted printing surface.

These are all important points, as reflected light means wasted energy and expense and uneven exposure would mean poor prints.

The apron is 2 ins. wider than the rated capacity of the machine, which allows the making of full width prints without difficulty. It is driven from the rear of

PARAGON BLUE PRINTING MACHINE

the semicylindrical glass, giving an action similar in many respects to a band brake, pressing every particle of air from between the tracings and sensitized sheet. This gives the excellent contact for which the Paragon is famous. It is positively guaranteed that there is no machine in existence which can surpass the Paragon on this feature—contact.

As the Paragon now stands it is the fastest in existence, with such a high rate of efficiency as to make

it second to none for low current consumption on a given amount of work.

The drive and speed controlling mechanism are most efficient and also the extreme of simplicity.

There are no belts or chains or other appliances easy to get out of order on the Paragon. The range of speed is ample for all classes of work. A reliable constant speed motor is used. All changes in the speed of the machine are made instantly through a noiseless drive giving any speed from 6 lin. ins. to 20 lin. ft. per minute. This is greatly appreciated by those who desire to make direct black line, sepia or blue line prints.

The drive mechanism is self-contained, being a part of the machine enclosed and guarded so as to comply with the strictest factory regulations.

The Paragon machines are wired complete in the most approved and advanced manner complying with all underwriters' regulations.

The machines, unless otherwise ordered, are furnished with complete equipment which includes in the 42-in. machine, 3 special high power blue printing arc lamps, the $\frac{1}{8}$ h. p. drive motor and a small motor direct connected to the ventilating fan. The 54-in. machines are equipped with 4 arc lamps, the $\frac{1}{8}$ h. p. drive motor and fan motor. Snap switches are provided for the motors and 1 switch for each lamp. These are located on the box directly in front of the operator, so that the use of one or more lamps can be discontinued when making narrow prints. This box also contains the fuse cutouts for the lamps and motors.

CROSS SECTION OF PARAGON BLUE PRINTING MACHINE

Paragon Print Drying Machines.

The construction of the machine consists of a smooth steel heated cylinder, supported on ball bearing journals. It is driven by means of variable speed device directly connected to an electric motor, which allows any desired speed between 0 and 10 ft. per min. No belts or chains are used in driving Paragon equipment.

The heat source for the cylinder may be gas, elec-

tricity or steam, the machine necessarily being constructed for one or the other at the factory.

The machine is so constructed that proper combustion is obtained in the gas heated dryer without the use of a blower.

A canvas apron is carried upon a series of steel rollers so arranged as to bring the apron in tight contact with surface of the steel drying cylinder. This apron is kept taut by a steel roller, the weight of which gives uniform tension regardless of the variation in heat and dampness.

A special device is provided for transferring prints from the bath trays to the dryer. Small prints or prints of any length whatever and of any width up to the rated capacity of the machine are handled with equal ease.

The prints are fed to the apron at one side of the machine and are carried by it into contact with a heated cylinder. The prints are fed from the wash trays to the dryer without the necessity of wringing. The apron holds the paper in direct contact with the heated cylinder until the prints are delivered perfectly dry on the opposite side of the machine. Stripper fingers are provided for automatically running the prints from the heated cylinder and depositing them upon a sorting table which should be provided at the rear of the machine to receive them.

The Paragon print drying machine here described has been built to meet the need of some method of drying various sized prints in separate sheets of any length, without the necessity of hanging them or constructing ovens with racks and lines in them or other makeshift apparatus. This also permits prints to be washed for any desired length of time without interrupting either the printing or drying process.

The area required to hang up the quantity of prints that the Paragon dryer will dry and iron would be so

large as to put it out of the question entirely. The Paragon requires but 8 sq. ft. of floor space.

The 30-in. capacity Paragon print dryer is intended primarily to dry photographic prints and will dry photostat, rectigraph and regular photographic prints perfectly.

CROSS SECTION OF PARAGON DRYING MACHINE

Print Paper Cabinets.

Cabinets are constructed of oak and carefully made and well finished; the partitions are removable so that either cut sheets of paper or continuous rolls can be accommodated.

The cabinet is of great convenience to the operator of the blue printing machine as all sizes and weights of paper are near at hand and quickly accessible.

Cabinet for 42-in. blue printing machine..... \$100.00
Cabinet for 53-in. blue printing machine..... 125.00

Washing Trays and Trimming Tables.

These are constructed entirely of oak except the corners, which are cast iron, and are filled and varnished to withstand severe use. The legs and table tops are removable to facilitate shipping and moving.

DATA, WASHING TRAYS AND TRIMMING TABLES

TRAYS Height, 34 ins.		TABLES	
Inside dimensions	Price	Top dimensions	Price

4'-0"x4'-0"x6"	32.00	5'-0"x7'-0"	50.00
4'-0"x5'-0"x6"	36.00		
5'-0"x5'-0"x6"	40.00		

Installation of Equipment.

A receiving box is furnished with the printer which adds 12 ins. to the length, but eliminates the use of a table, thus allowing the equipment to be used in smaller quarters. The receiving table, however, allows the work to be handled more rapidly.

Send a sketch showing dimensions of blue print room, and a diagram showing the proper layout for equipment will be forwarded.

Further information on the subject will be gladly furnished on request.

Supplies and Equipment.

Every requisite for the draftsman and engineer in field or office. Price and delivery on application.

Surveying and Engineering Instruments.

Berger, Gurley and Buff & Buff levels and transits are carried regularly in stock.

For the last three or four years the emergencies caused by the war have practically eliminated all stocks of such instruments, and this company has been severely taxed to take care of its friends who needed such supplies.

Deliveries along these lines are now rapidly returning to normal and particularly satisfactory service at this time is assured if requirements are stated.

A full line of leveling rods for all purposes, together with all the accessories, such as targets, ribbons, plumb bobs, arrows, measuring chains, etc.

The stock of tapes is also a very full one, and excellent deliveries can be had at all times.

Practically all the well-known makes, such as Chicago Steel Tape, Lucas, Chesterman & Lufkin (in all sizes and divisions), can be delivered at shortest notice.

Inquiries are invited whenever engineers are in need of equipment for either inside or outside work.

Catalogue "B-50."

THE C. F. PEASE COMPANY will be glad to send their catalogue "B-50" to anyone interested.

It may be well to mention here that the present disturbed conditions of the raw material and labor markets make it necessary to declare all prices subject to change without notice. The catalogue is submitted more as a guide to their line and as an aid in defining and specifying orders or inquiries than as a correct indication at all times of prices and discounts.

COMMERCIAL CAMERA COMPANY

Photographic Copying Machines

299 State Street
ROCHESTER, N. Y.

BRANCH OFFICES

CHICAGO, ILL., 19 La Salle Street
PHILADELPHIA, PA., 1102 North American Building

NEW YORK, N. Y., 15 Park Row
WASHINGTON, D. C., Tenth and G Streets, N. W.

Product.

The PHOTOSTAT, a Photographic Copying Machine.

The word "Photostat" is registered as a trademark in the United States Patent Office and throughout the world.

Description.

The Photostat which is manufactured by the Eastman Kodak Company is a combined camera and copying machine.

The copy is made through a prism attached to the front of the lens. The prism reflects the subject through the lens so that the copy reads from left to right as in the original.

The colors of the copy are, however, reversed, black showing white and white showing black. If the original arrangement of black and white is demanded, this can be quickly obtained by making a copy of the first print.

Operation.

The copy is made directly on a roll of sensitized paper. No intermediate glass plate, film or other negative has to be made. By copying directly on the paper the copy is made very quickly and at a low cost. Also the copy is a facsimile of the original, so that there can be no mistake in it.

The print is developed and fixed in the apparatus itself, this part of the process, as well as the focusing and exposing, all being mechanical.

The print is removed from the fixing bath to a tank of circulating water, which washes the print free from chemicals. The print is then dried, between blotters, or on a cheesecloth stretcher, or by passing through a hot roll mangle. The process is a rapid one, the average speed per print being from 1 to 5 minutes.

No expert knowledge of photography is required for the operation of the Photostat as all the processes are mechanical.

Space.

The Photostat when assembled requires a space of at least 10 by 12 ft. This is not to be construed as the overall measurements of the apparatus, but for the convenience of the operator in making exposures, adjusting the apparatus, washing and drying the prints, a space the size mentioned is advisable and recommended.

A PHOTOSTAT IN OPERATION

Stock Sizes.

Model No. 0—Makes a print 8½ by 13 in.

Model No. 1—Makes a print 11½ by 14 in. and smaller.

Model No. 2—Makes a print 14 by 18 in. and smaller.

Model No. 3—Makes a print 18 by 22 in. and smaller.

The dimensions are the sizes of the finished prints. The Photostat is not limited, however, to copying subjects of these dimensions, but will copy any subject however large to these sizes.

Scope of Use.

The Photostat copies at original size, reduces or enlarges.

The Photostat makes rapid, inexpensive and facsimile copies of pencil drawings, ink drawings, tracings, blue prints, maps, sketches, documents, letters, telegrams, specifications, data sheets, tabulations, record cards, pages from books, insurance records, shipping lists, reports, contracts, illustrations for salesmen, patent drawings, production sheets, cuts and drawings for advertising, small tools and illustrations for setting up machines, etc.

Products.

"Buff" TRANSIT and LEVELS.

Theodolites, Tripods, Levelling Rods, Plumb Bobs, Plummet Lamps, Steel Tapes, Range Poles, Marking Pins and Current Meters.

Repairs to Instruments.

"Buff" transits, solidly built to resist blows and falls, have metal generously distributed throughout the construction. At the Jamaica Plain Shops, all makes are repaired with economy and despatch. Injured parts of instruments are duplicated from stock in hand. Telegraph orders can be completed in 24 hours.

Specifications 6¼-inch Buff "Precise" Transit No. 1B.

Graduation, 6¼-in. diameter, with 2 opposite double reading verniers to minutes, placed at either 30° or 90° to line of sight. Two rows of opposite inclined figures 0-360. Graduations silvered and covered by pure crystal plate glass.

Telescope, erecting, is balanced and reverses at either end; 12 in. long, 1¼-in. aperture, with power of 26.5 diameter improved eyepiece, unsurpassed large clear field. Center point is provided on top of telescope to permit of accurate centering from above. Adjustment for vertical plane, and line of collimation correct for all distances. Sensitive level bubble, 6 in. long, with clamp and tangent to telescope. Improved lower and upper spring tangent clamps. Shifting center with ¾-in. adjustment. Spirit levels truly ground by special machine, rated and sensitive. Standards are cloth finished. Long taper centers with broad flanges and of hardest bell-metal and phosphor bronze. Compass needle is 4½ in. long and of accepted form. Compass graduation is silvered and figured with a single row 0-90 on each side of N. and S. Tripod improved, split-leg with wing-nuts, weight 7½ lbs.

Mahogany instrument box is provided with strap, brass lock and hooks; contains plumb bob, pocket magnifier, sunshade, wrench, screwdriver, adjusting pins, etc.

Engineers' Levels.

18-INCH WYE LEVEL—Telescope, 18 in.; 1⅜-in. objective; 36 power; protection to object slide; erecting or inverting eyepiece. Telescope and level tube, cloth finished. Phosphor bronze contact points in wyes for bell-metal collars; hard bell-metal center in socket of phosphor bronze. Line of collimation correct for all distances. Adjusted to finest possible accuracy with sunshade in position and focused on mean distance. Mahogany case with strap and hooks, sunshade, wrench, screwdriver, adjusting pin, etc.

Weight, 10¾ lbs.; tripod, 7 lbs. Price, \$168.00

18-INCH DUMPY LEVEL—36 power. Price, \$134.00.

ESTABLISHED 1845

W. & L. E. GURLEY

Makers of Engineering and Surveying Instruments

TROY, N. Y.

BRANCH: SEATTLE, WASH.

Products.

TRANSITS; LEVELS; PLANE TABLES; ALIDADES.
Also, Compasses; Sketching Cases; "Beaman" Stadia Arc.

Leveling Rods; Stadia Rods; Flagstaffs; Tripods.
Automatic Water Stage Registers; "Price" Hydraulic Current Meters; Hook Gages.

Dealers in Chains, Tapes, Aneroid Barometers, Anemometers, Binoculars, Field Glasses, Drawing Instruments and Materials, Scientific Books, etc.

Manufacture.

From raw material to finished product every detail is of Gurley construction, thus insuring a perfection of manufacture—a precision of operation and adjustment—which has secured for Gurley instruments merited recognition among leaders of the engineering profession. The Gurley has been the accepted *Standard of Quality* for three-quarters of a century, which is evidenced by its close identification with big engineering accomplishments, both past and present.

Guarantee.

All instruments, when purchased directly of this company, are warranted correct in all their parts; and in the event of any original defect appearing after reasonable use, the company agrees to repair or replace with new and perfect instruments, promptly at its own cost, express charges included; or money and express charges paid by purchaser will be refunded.

Prices, Terms and Catalogue.

Prices will be quoted promptly on request.

Terms: Net cash, f. o. b. Troy, N. Y., or Seattle, Wash.; or c. o. d. with privilege of examination, if requested. Safe delivery guaranteed.

Illustrated catalogue describing this company's complete line will be sent to any one free of charge, on request.

General Characteristics of Gurley Transits.

Long compound tapered centers; 4-screw ribbed leveling head; shifting center; radially ribbed and dished limb and plate; horizontal and vertical limbs graduated on *sterling silver*; waterproof flush verniers at 30° to line of sight, reading to 1'; waterproof compass box, with variation arc; sensitive telescope level; superior quality telescope lenses with brilliant illumination, flat field and sharp definition; erecting eyepiece, *platinum* cross wires and stadia wires; telescope reverses either end; center point on top; dust guard. Packed in mahogany box, with plummet, reading glass, etc.

LIMB I—Figured in two rows, the outer row 0 to 360°, the inner row in quadrants 0 to 90°.

LIMB IV—Two rows of opposite inclined figures, 0 to 360°.

Gurley Precise Transits with One Piece Truss Standard.

Designed especially for railroad, bridge, municipal and other work requiring the highest degree of precision.

NO. 8-A, or NO. 27-A PRECISE TRANSIT

	No. 8-A	No. 27-A
Diameter of horizontal limb, in.	6.25	5.65
Length of needle, in.	3.5	3
Length of telescope, in.	11	8
Power of telescope, diameters.	26	20
Length of telescope level, in.	7.2	5
Diameter of vertical limb, in.	5	4.5
Vertical limb reads to.	1'	1'
Tripod with cap.	Split legs	Extension legs
Weight of instrument, lbs.	16	12
Weight of tripod, lbs.	11	10
Shipping weight, 2 boxes, lbs.	75	70

Regularly furnished with Limb IV, but Limb I will be substituted if desired. Vertical arc, instead of full vertical circle with aluminum guard, will be substituted, if desired.

A gradienter will be combined with the clamp and tangent to telescope axis, if desired.

Gurley Light Mountain or Mining Transits.

NO. 28 LIGHT MOUNTAIN OR MINING TRANSIT
The best known transit in America

Horizontal limb, 5.65 in. diameter. Graduated to 30', and figured like Limb I (Limb IV figuring, if desired, at no extra cost). Reading by two opposite double verniers to 1'. Compass needle, 4 in. long. Variation arc. Telescope, 8 in. long. Power 20 diameters. *Platinum* cross wires and stadia wires. Level on telescope, 5 in. long. Vertical arc, 2½ in. radius, graduated to 30' and reading to 1'. Angle-section standards with ample bases.

Extension leg tripod, closing to 36 in., weights 10 lbs. Instrument packed in mahogany box.

Weight of instrument, 11 lbs. Shipping weight, in 2 boxes, about 65 lbs.

If desired, a 4½-in. diameter vertical circle with aluminum guard, will be substituted for the vertical arc.

A granieter will be combined with the clamp and tangent to telescope axis, if desired.

Gurley Plane Table Outfits.

This outfit consists of No. 570 Johnson movement, with split leg tripod, weighing about 10 lbs.; No. 573 drawing board, size 31 by 24 in., with brass screw plate fitted, and with 8 clamp screws and sockets for fastening the paper; flexible canvas case for the drawing board; No. 574 plumbing arm and plummet; and No. 584-C alidade, with 11-in. telescope, inverting eyepiece with diagonal prism, power about 22 diameters, enlarged objective, 1⅜-in. aperture, *platinum* cross wires and stadia wires; detachable striding level; edge graduated vertical arc reading to 1', combined with Beaman stadia arc; clamp and tangent to telescope axis; blade 18 by 3 in., with left-hand edge beveled; circular level, and box compass with 4-in. needle, mounted on blade. Alidade packed in mahogany carrying case.

NO. 576-C PLANE TABLE OUTFIT WITH JOHNSON MOVEMENT
AND NO. 584-C ALIDADE
U. S. Geological Survey Standard

Gurley Engineers
Wye Levels.

The performance record of the Gurley wye level extends over a period of 70 years, and is the best recommendation any instrument could have.

The Gurley level is the standard with which all other levels are compared. It is universally preferred for its accuracy, stability, ease and permanence of adjustment, and long wearing qualities.

NOS. 375, 377 OR 378 ENGINEERS WYE LEVEL

	No. 375	No. 377	No. 378
Length of telescope, in.	22	18	15
Power of telescope, diameters.	42	32	26
Aperture of objective, in.	1⅜	1⅜	1⅜
Least focusing distance, from center of instrument, ft.	12	8¾	8⅓
Length of telescope level, in.	10¼	8¾	8⅓
Weight of instrument, lbs.	14½	13¾	11½
Weight of tripod, with solid round legs, lbs.	10	10	10
Shipping weight, 2 boxes, lbs.	75	65	60

On No. 378, the eyepiece is focused by spiral movement, instead of pinion. The objective slide is without dust guard.

BARTON SPIDER-WEB SYSTEM

Flat Slab Reinforced Concrete Construction

GENERAL OFFICES

Kimball Building

CHICAGO, ILL.

Products and Services.

This company furnishes to engineers complete ENGINEERING SERVICES for any type of Reinforced Concrete Structure, including all bending diagrams and lists of steel required.

It also furnishes under contract, for domestic or foreign delivery, completely fabricated jobs of REINFORCING STEEL either under its own or other designs, except in FLAT SLAB CONSTRUCTION, where the operations are confined to the BARTON SPIDER-WEB SYSTEM.

This service aims to keep the job supplied with the necessary reinforcing steel and the company advises itself as to the progress of the work, so as to anticipate requirements.

The Engineering Department will give advice as to the most economical manner in which to lay out any given job and the field advisory superintendent will make suggestions as to economical field methods to pursue for each particular class of construction.

Patent Protection.

This company operates under the Barton patents and the basic Norcross patents and guarantees protection to clients. Infringers will be prosecuted.

The patents owned by the BARTON SPIDER-WEB SYSTEM are:

United States, No. 1145462, July 6, 1915; No. 1155461, Oct. 5, 1915; No. 1217645, Feb. 27, 1917. French, No. 480920, July 15, 1916. Cuban, No. 3580, Nov. 4, 1916. British, 100457, May 25, 1916. Canada, 179882. Other patents pending.

In flat slab construction a four-way slab of the two general types shown below is designed. One of the features of these patents is the combination of four-way reinforcement in the bottom of slab with two-way reinforcement over supporting columns.

Special Announcement.

This company wishes to announce that by the time this issue comes to the engineers, it will have completed a fabricating shop and warehouse at 35th and Kedzie Streets, Chicago, Ill. This plant will be equipped to make shipments from stock of all classes of reinforcing steel and to handle all types of fabrication. The company will also put on the market a full line of the more practical accessories in its field, announcement of which will be made from time to time.

VIEW OF MAT (TYPE A)

Type "A," (Patented)

Type "B," (Patented)

PLANS AND CROSS SECTIONS BARTON SPIDER-WEB SYSTEM

DIAGRAM OF WORKING LOADS

Diagram gives working loads for column reinforced with both spiral and vertical steel. The two sets of values shown are those required by the Chicago and Cleveland ordinances. The economical stresses in the Chicago ordinance lie between 800 and 1000 lbs. per sq. in. inside of spiral and in the Cleveland ordinance between 1000 and 1200 lbs. per sq. in.

DIAGRAM FOR FLAT CEILINGS

PLANT OF LIBBY, McNEIL & LIBBY, BLUE ISLAND, ILL.

Steel Spiral Sockets.

The socket here illustrated is manufactured by this company in $\frac{1}{2}$ -in., $\frac{5}{8}$ -in., and $\frac{3}{4}$ -in. sizes. They are made of special drawn wire, so coiled that the threads of a standard lag bolt mesh with them. This socket is patented. It is the most economical insert on the market. Its carrying capacity has been thoroughly demonstrated by repeated use and by R. W. Hunt tests. Samples and prices on request. When writing for quotations please state the size and number required.

SOCKET WITH LAG BOLT
IN POSITION

With each socket is furnished a wooden plug, which sets in bored holes in forms and holds socket firmly in position while pouring in concrete

Tables give slab thickness, etc., for average loading and spans, and may be profitably used by any one laying out a flat slab job. These tables are drawn from the Chicago Building Department Ruling and represent conservative design. One table covers the case where drop panels are used around the column head, and the other where the ceiling is flat. The latter is used principally for cold storage warehouses, where insulation is suspended from ceilings.

Inquiries on special cases answered in detail.

THE FOUNDATION COMPANY

Woolworth Building
NEW YORK, N. Y.

CABLE ADDRESS:
"UNDERFOUND"

CHICAGO, Rookery Building
DETROIT, Dime Savings Bank
PITTSBURGH, Fulton Building

BRANCH OFFICES
NEW ORLEANS, Maison Blanche
ATLANTA, Third National Bank
MONTREAL, Bank of Ottawa Building

SEATTLE, L. C. Smith Building
SAN FRANCISCO, Holbrook Building
VANCOUVER, Standard Bank Building

Services.

THE FOUNDATION COMPANY is experienced in the construction of industrial plants, steam and hydro-electric power plants, water supply and sewer systems, and other types of engineering work. The company

specializes in the design and construction of difficult subaqueous work such as deep foundations, bridge piers, mine shafts, etc., involving the use of either pneumatic or open caissons.

UNITED STATES GOVERNMENT CHLORINE PLANT, EDGEWOOD ARSENAL, MD.

This plant was designed to furnish 100 tons of dry chlorine gas per day for the manufacture of various poison gases and oils which were loaded into shells in another part of the reservation. In addition to the process buildings, the plant includes a 20,000-Kv-a generating station, a substation, and a complete water supply system.

Construction was started by THE FOUNDATION COMPANY in April, 1918, and gas was being produced on July 1st. The plant itself was completed in six months, the power house in eight months, and the water works in three months. The entire contract amounted to approximately \$7,000,000.00

180,000-KV-A STEAM TURBINE GENERATING STATION, AMERICAN GAS AND ELECTRIC COMPANY, WINDSOR, W. VA.

Both the substructure and the superstructure of this plant were built by THE FOUNDATION COMPANY from the designs by Messrs. Sargent & Lundy. The present installation consists of 16 water tube boilers and four 30,000-kv-a, 11,000-volt turbine driven alternating current generators

Products and Services.

MILL, POWER PLANT and FACTORY DESIGN and CONSTRUCTION.

This company specializes in construction work of a difficult nature, which requires a maximum of engineering skill in design, and demands high class workmanship in the field.

An engineering department, skilled in difficult design and the proper use of materials, is maintained and is at the service of engineers and architects.

The company undertakes contracts for complete installations, from foundations to equipment, and carries on the work with its own forces and equipment.

This work is done on any form of contract—percentage, fixed fee or lump sum. Entire responsibility is assumed for the designs and workmanship.

For Coal, Ash, and Materials Handling Equipment, Storage Bins and Bunkers, Pneumatic Conveyors, see pages 898-99.

REINFORCED CONCRETE BUILDINGS.

Reinforced Concrete Buildings.

A growing business, and a management studying and planning for new buildings, are inseparable factors. The outcome should be a building that will fit the business.

Duplication is almost unheard of in building operations. The geography of the site, the nature of the product, and the many conditions that surround its manufacture dominate the problem of design and construction. One fact is certain—if the building is to be an asset to the business, it will differ from other buildings. A study of conditions will reveal many shortcomings in the present plant, and kinks in method of manufacture that are peculiar to the business.

Theoretically these problems may be solved by any engineering contractor. But why conduct an experiment of the magnitude of a building operation when a word to INDUSTRIAL ENGINEERING CO. will insure the services of a permanent and experienced organization for the construction of industrial concrete buildings?

Cost.

Of course the cost is a vital consideration to anyone who is contemplating the erection of a new building. The two government storehouses and machineshop, shown on the opposite page, are striking examples of efficiency and low cost. Their combined floor space amounted to 29 acres and their total cost was \$3,100,000.00. They were built under lump sum contracts in war times, when of necessity all building was handicapped and conditions were trying, not the least being the competition for demoralized labor brought on by percentage contracts of enormous magnitude. This cost represents a saving of \$400,000.00 over lowest tenders received in competitive bidding on government

TRADE-MARK

designs. In addition to this INDUSTRIAL ENGINEERING Co. built substantially within their estimates.

Speed.

As an example of what the INDUSTRIAL ENGINEERING Co. has accomplished in the matter of speed, the following is briefly stated:

The Ingersoll-Rand Company asked for 3 months delivery under a heavy penalty and bonus. The nearest competitor asked 5 months. This company guaranteed 11 weeks, and agreed to a \$500.00 per day penalty and bonus clause in the contract.

When the contract was let April 13th, 1917, the plans were not even made. Almost "overnight" these working plans and preliminary estimates of materials were made up. Within 3 days the job was laid out, equipment on the ground, materials being unloaded, and excavators at work. The schedule given below shows how this organization made good, and in spite of labor and material shortages, embargoes and general transportation troubles, earned a substantial bonus and Ingersoll-Rand's satisfaction.

Personal attention and absolute dependability and co-operation of each workman, saved time.

Finish.

Cost is an item of great interest before building, speed is highly desirable after beginning, but finish is a permanent source of satisfaction and profit, remembered when all else is forgotten.

Every ambitious construction company aims for economy and speed of construction. The INDUSTRIAL ENGINEERING Co. gives both, supplemented by high class workmanship, which is a sure indication of its exceptional experience and permanent organization. And owing to its highly specialized and trained organization, it can produce these results as a standard product.

CHART SHOWING PROGRESS OF WORK ON INGERSOLL-RAND CO.'S BUILDING, PHILLIPSBURG, N. J.

The Ingersoll-Rand Co. asked completion of their building in 72 working days, INDUSTRIAL ENGINEERING Co. promised it in 66 working days. They occupied it in 50 working days.

• Black band shows contract time allowance; white bands, actual time of operations; and difference, time saved over guarantee

STOREHOUSE ERECTED UNDER GUARANTEED COST IN WAR TIMES

Contains 12¼ acres of floor space. Saving was \$250,000.00 over lowest bid based on government design

delivered on the work.Complete cement and chemical laboratories at prin-
cipal offices.**Locomotives and Cars.**Car and locomotive inspection service includes in-
spection and testing at point of manufacture of certain
important materials, and supervision of the entire con-
struction of equipment. Careful attention is given to
the quality of material and workmanship, and applica-
tion of safety appliances required by the Interstate Com-
merce Commission. All locomotives are operated and
tested under steam during final inspection before ac-
ceptance.Such thorough inspection assures receipt of cars
and locomotives in accordance with specifications.Complete reports of inspection and tests are furnished
for record.**Miscellaneous Materials and Equipment.**All classes of engineering materials, including cast
iron water and gas pipe, oil pipe, creosoted paving
blocks, relaying rails, etc., are inspected under standard
and thorough methods by competent inspectors. In-
spection and testing of locomotive cranes, pile drivers,
steam shovels, gas engines, pumps, ballast spreaders
and other miscellaneous equipment is given special
attention.**Motive Power Materials.**Wheels, axles, couplers, springs, hose, castings,
journal bearings, and brasses, boiler plates, tubes and
staybolts, and all important locomotive and car materials
are inspected, tested and identified at the manufacturing
plants, where there are facilities for making the proper
inspection and tests promptly, efficiently and economi-
cally. Inspectors engaged only in the inspection of such
materials are assigned to this work.**Rails and Track Materials.**RAILS—Thoroughly experienced and competent rail
inspectors, engaged only in inspection of rails, are sta-
tioned at all rail mills. In consideration of safety alone
rails must be as free from injurious defects as possible;
consequently too much attention can not be given in-
spection of the rail in every phase of manufacture.“Special Inspection” inaugurated by this com-
pany affords a complete progressive inspection of the
steel from time of melting until shipment of finished
rail. Specialized inspectors are assigned to the various
departments of the mill. From data recorded by in-
spectors a complete history and the results of tests of
each heat are furnished clients for permanent record.The large yearly tonnage of rails inspected by this
company has made possible a low standard tonnage rate.TRACK MATERIALS—Tie plates, angle bars, joints,
spikes and bolts can be inspected at the mills with a
result of decreased installation and maintenance charges.
With the advent of heat treated and oil quenched angle
bars, joints, bolts and spikes, an intelligent and practical
inspection has been demanded. The experienced in-
spectors of this company are exceptionally efficient in
securing delivery of proper tie plates, angle bars, joints,
bolts and spikes.**Standard Specifications.**Booklets containing standard specifications of the
American Society for Testing Materials, for construc-
tion materials, for buildings, highway bridges, cement,
etc., and other standard specifications, as well as book-
lets describing engineering and inspection service, will
be promptly furnished upon request of general office
at Chicago.

DESIGN and CONSTRUCTION of Industrial and Power Plants, Tanks, Reservoirs, Mine Shafts, Foundations, Furnaces, Kilns, Ovens, Chimneys and Boiler Settings, Linings for Blast Furnaces, Stoves, Chimneys and Flues; all kinds of work involving the use of REINFORCED CONCRETE and BRICK.

THE RUST ENGINEERING COMPANY offers exceptional service in the design and construction of above classes of work.

Its organization includes the highest grade of engineering talent; insuring designs which give maximum efficiency in operation, and are at the same time economical both in first cost and maintenance. Competent field superintendents are in charge of all construction, and the methods followed insure minimum construction costs. Offices and equipment are maintained at dominating points throughout the United States; and the requisite field force and equipment for the rapid completion of any project, can be placed in the minimum of time and expense, at any location in the United States, Canada and Cuba. The value to the owner of the above service, where large sums of money are tied up in real estate and construction, is too obvious to require comment. Further,

the past success enjoyed by THE RUST ENGINEERING COMPANY in this field of service is a guarantee of practical, not merely theoretical results.

CONSTRUCTION FOR INDUSTRIAL PURPOSES.REINFORCED CONCRETE BUILDINGS, either all con-
crete, or structural concrete combined with brick, tile,
terra cotta or stone.**Slogan.**

"Turner for Concrete."

Experience.

For 17 years the TURNER CONSTRUCTION COMPANY has specialized in reinforced concrete industrial buildings and has handled 751 contracts for 270 different concerns, an excellent percentage of repeat orders. During the war, work directly for the Government amounted to \$45,000,000.00, principally on the Navy and War Office Buildings, Washington, D. C., with 1,885,000 sq. ft. of floor space or 42 acres; the U. S. Navy Fleet Supply Base, Brooklyn, N. Y., with 2,275,000 sq. ft. of floor space, or 52 acres (shown on this page) and U. S. Army Supply Base, Brooklyn, N. Y., with 5,470,000 sq. ft. of floor space, or 125 acres, including the largest piers in New York harbor—said to be the largest building operation in the world. All of reinforced concrete except the piers.

Organization.

The 14 executive officers and responsible department heads have an average of 13.9 years of service with this organization; 39 superintendents, 5.7 years, and 207 foremen, in several different trades, 7.0 years.

Speed.

Turner has never paid a penalty for failure to complete on time.

Winter Weather Work.

Winter weather construction covers 13% of the company's work—all completed on time.

Forms of Contract.

The TURNER CONSTRUCTION COMPANY works under any form of contract—lump sum, cost-plus-fixed fee, or cost-plus-percentage. 49.2% of its business has been on a cost-plus-percentage basis.

Co-operative Service.

The company's engineers will gladly render assistance to architects and engineers in the preparation of estimates or plans. A system of unit costs—based on data obtained from the execution of 751 contracts—enables it to give accurate estimates promptly, even from plans prepared for steel or mill construction.

UNITED STATES NAVY FLEET SUPPLY BASE, BROOKLYN, N. Y.

2 storehouses, 8 stories 700 by 200 ft. (one solid for storage, one with court for manufacturing purposes)

2 warehouses, 1 story 355 by 300 and 355 by 361 ft.

Powerhouse, 3000 h.p., 10 miles of tracks, 2 float bridges

Contract signed March 5, 1918. A total of 2,275,000 sq. ft. of floor space ready for occupancy October 24, 1918—or in 7½ months. Partial occupancy given in about 4 months.

Powerhouse authorized June 22nd, 1918, steam turned on November 12th, or less than 5 months.

THE ALADDIN COMPANY

Manufacturers of Standardized Houses

GENERAL OFFICES
BAY CITY, MICH.

MILLS AND DISTRIBUTING POINTS: MICHIGAN, FLORIDA, LOUISIANA, OREGON

Product.

ALADDIN READI-CUT HOUSES.

Description.

Aladdin houses or the Aladdin Read-cut system of construction are by no means new or impracticable. This method of erecting houses has been in successful operation for the last 12 years.

The two basic principles of the Aladdin system of construction are standardization of parts and substitution of machine for hand labor.

An Aladdin house is identical in construction, designs and sizes of material to the very highest type of frame construction erected anywhere. Only the method differs—method of preparing the materials.

Every piece of material is cut to fit by machinery in the mill, marked and numbered, ready for erection and nailing in place when it reaches its job. This permits standardization of parts, elimination of the usual 18% waste and the substitution of machine for hand labor.

As regularly listed and priced in catalogue, an Aladdin house includes all lumber, millwork, hardware, plaster, paints, nails, etc., above the foundation.

Erection of Houses.

Erection is quick and economical. To ship the complete material in a single car for 1, 2 or 3 houses, and to have it all on the ground at the same time is a tremendous advantage. It eliminates all delay incident to purchase of the many items entering the construction and it insures the quickest possible consummation of the entire project.

Back of each shipment is this company's qualified agreement of sufficient material for the completion of each house.

Types of Buildings.

Standard Aladdin designs from standard materials have been furnished for all of the following types of buildings:

Houses, 1- and 2-story, all sizes and prices; barns, garages, dormitories, guard houses, dining halls, bath-houses, hotels, office buildings, commissaries, store buildings, schools, churches, railway stations, section houses, flag stations, dance halls and pavilions, public rest rooms.

Products.

FERGUSON STANDARD FACTORIES.

Factories complete with Power Plants and Equipment.

Services.

THE H. K. FERGUSON COMPANY designs, builds and equips complete factories, whether of standard or special design. Ferguson standard factory buildings are permanent, well lighted brick-and-steel structures which can be erected in record time at moderate cost, because pre-fabricated steel and other materials are carried in stock or on order.

The systematic methods perfected in standard construction operate also to shorten the time and reduce the cost of special buildings.

PRELIMINARY WORK FREE—Plans and data for Ferguson standard factories are ready and on file. If a special building is indicated, the Ferguson engineers will make estimates and preliminary sketch plans free, without obligation of any kind. These sketch plans will clearly indicate the adaptation of the building to the owner's requirements, and the best way of meeting special conditions.

ENGINEERING CONTRACT—When the preliminary suggestions are approved, the next step is to enter into a Ferguson engineering contract, under which THE H. K. FERGUSON COMPANY furnishes complete plans and specifications.

COMPETITIVE BIDS—Plans and specifications furnished under a Ferguson engineering contract are suitable for the owner to use in securing competitive bids if he so desires.

AWARDING THE JOB—If the building contract is awarded THE H. K. FERGUSON COMPANY at a lump sum price, the builder absorbs the cost of drawings and specifications.

If the building is awarded to THE H. K. FERGUSON COMPANY under some form of commission contract, or to another builder, or does not proceed at once, the owner pays the actual cost of engineers' and draftsmen's time and expenses, plus agreed percentages for overhead and profit.

FORM OF CONTRACT—It is usually desirable to build

TRADE-MARK

standard factory buildings under a lump sum contract, because this method entails less delay and bookkeeping than any form of commission contract.

The Ferguson lump sum and commission contracts are standard forms of proved worth and fairness. The Ferguson participating profit contract is preferred by many owners because it combines the advantages of lump sum and cost plus contracts without the disadvantages of either. Under this form, the owner's cost and the builder's fees are limited,

while all savings are shared by owner and builder.

Any form of Ferguson contract may include a penalty for delay, providing it also includes a bonus for anticipation.

Ferguson Standard Factories.

Some of the types of Ferguson standard factory buildings are shown on the opposite page. They embody the generally accepted features of modern industrial design, and represent the thought and suggestions of the engineers of many of the country's largest and best industrial plants as well as of THE H. K. FERGUSON organization.

They offer the great advantages of quick construction at moderate cost, because, being thoroughly standardized, pre-fabricated steel and other materials can be kept in stock or on order, ready for immediate shipment; yet they are so flexible that they can be expanded laterally or lengthwise or arranged in many different combinations to meet the owner's individual requirements.

Factories Complete with Power Plants and Equipment.

Most of the construction and equipment work in any factory proposition, whether of standard or special design, can be handled by THE H. K. FERGUSON COMPANY'S own men.

There is very little subletting, which means that the owner can hold one organization responsible for his results.

Ferguson men are experienced in good factory construction and equipment and in quick deliveries as well.

THE H. K. FERGUSON COMPANY is organized and equipped to handle any industrial project from start to finish.

INTERIOR OF EXPANDED FERGUSON STANDARD NO. 3

150 ft. wide by 540 ft. long. A typical example of the ease with which Fergusson standard factory buildings can be expanded laterally as well as lengthwise. Compare the superimposed cross section with the basic cross section below. Note the excellent and evenly distributed daylight

Fergusson Standard No. 1.

Light machine shop or warehouse; 60 ft. wide; any length, in multiples of 20 ft.; steel columns and roof beams; continuous steel sash; brick walls below sills; concrete floor; interior downspouts preventing ice-clogged drainage and damage from falling icicles.

Fergusson Standard No. 2.

Machine shop or light foundry; 90 ft. wide; any length in multiples of 20 ft.; duplex sawtooth monitor giving excellent daylight and thorough ventilation without cross-drafts; steel columns and roof beams; center aisle columns can be reinforced for craneway; continuous steel sash; brick walls below sills; concrete floor; interior downspouts.

Fergusson Standard No. 3.

Universal type for light manufacturing and warehouse uses; 100 ft. wide; any length in multiples of 20 ft. with only one column to every 2000 sq. ft. of floor space; duplex sawtooth monitor; steel columns and roof trusses composed of 2 channel irons with 1 in. interval between them, forming a strong and convenient support for shafting; trusses will carry monorail of 2-ton capacity; continuous steel sash or brick pilasters; brick walls below sills; concrete or wood block floor; interior downspouts.

Fergusson Standard No. 4.

Sawtooth building; any width in multiples of 20 ft.; any length in multiples of 30 ft.; excellent daylight and ventilation uniformly distributed; steel columns

and roof trusses; shafting (and monorail if desired) may be suspended from roof trusses; continuous steel sash or brick pilasters in side walls; brick walls below sills; concrete floor; interior downspouts.

MILLIKEN BROTHERS MFG. CO., INC.

Manufacturer of Steel Buildings and Towers

TELEPHONE:
BARCLAY 8860Woolworth Building
NEW YORK, N. Y.CABLE ADDRESS:
"MILLIKBROS, NEW YORK"**Products.**MILLIKEN BUILDINGS (Standardized All-steel);
STEEL TRANSMISSION TOWERS; STEEL RADIO TOWERS;
STEEL POLES.**Guarantee.**

Since 1857 this company has been actively engaged in the manufacture of steel buildings and structural steel. It constructed the famous Singer Tower Building, New York, and many other steel structures in all parts of the world.

Milliken Buildings.

Milliken buildings are special all-steel, permanent fireproof structures, of interest to owners, builders, engineers, architects, etc. They are designed to meet a wide range of industrial service.

The distinctive economy of these buildings comes from their standardization; they are manufactured on a quantity basis, and kept in stock for prompt shipment.

TYPICAL UNIT OF A MILLIKEN BUILDING

Milliken buildings are made under the Standardized Truss Unit System; this consists of a special framework of structural steel members, each of which is alike and interchangeable. This system of construction is of particular advantage when future service is considered—if the owner finds it necessary to remove or dismantle a building, it can be re-assembled in the same form or in an entirely different shape. There is no loss of material.

These buildings are clear span structures, no interior columns. They have been designed for rapid erection with a minimum amount of labor and tools.

Milliken buildings have met with decided favor in all parts of the world. During the war their advantage was quickly recognized, and hundreds were erected for government and industrial use.

These structures are distinctly valuable where one-story buildings are required, whether for single series or group buildings, either in separate units or directly connected.

ADAPTABILITY—Milliken buildings are suitable for a wide variety of industrial purposes, among these being: textile and silk mills; cottonseed storage; cotton bale storage; general storage buildings; cement, tobacco, sugar and other warehouses; petroleum and oil buildings; paint and dye works; grinding mills, sawmills,

etc.; stock houses, and light manufacturing plants of all kinds; dairy and farm buildings; power and boiler plants; machineshops; foundries, garages; hangars, and so on.

ERECTION—Buildings of this type are very simple to erect. A gin pole, hand winch, hoisting rope and a few wrenches are all that is necessary. All connections are bolted, no riveting is required. Bolts are furnished with the material. Erection can be handled readily by local labor, and the unit members are of such size and weight that every piece can be carried easily by two men.

METHOD OF ERECTION

Material is laid out on ground, units bolted together to form roof trusses and columns, and this framework raised into place by a gin pole. Complete instructions for assembling and erecting are always sent to purchasers.

TYPES AND STYLES—Milliken buildings are manufactured in 12 different types. Each type in turn has been developed in 6 styles, and in various lengths. The different combinations give a choice of a wide variety of buildings—it is a "choice of a thousand buildings."

The 12 basic types of buildings are shown on the following page. Such miscellaneous features as large or small doors, single or continuous sash, etc., are practically optional with the purchaser.

BUILDING ERECTED IN SOUDAN

TYPE 4V1 MILLIKEN BUILDING

CATALOGUE—New catalogue No. 10—Choice of a Thousand Buildings—gives complete details, illustrations and price lists of the standard types, styles and sizes of Milliken buildings. Copy free on request.

TYPES OF MILLIKEN BUILDINGS

Made in 2 heights—11 and 21 ft., with either vertical or sloping side walls. Vertical side wall buildings have clear floor widths of 20, 40 and 60 ft. Sloping side walls have floor widths of 27, 47 and 67 ft., respectively, for buildings 11 ft. high; and 34, 54 and 74 ft., for buildings 21 ft. high.

Building lengths are standardized on a basis of 20-ft. panels, making possible any multiple of this length, such as 20, 40, 60, 80 and 100 ft., etc. Structural steel framework is made entirely of standardized truss units. Sloping side wall buildings have standard unit columns. Vertical side wall buildings have vertical channel bar columns. Painting consists of 1 shop coat.

All buildings furnished complete with sash and doors; painted or galvanized corrugated side and end walls and roof; galvanized gutters, leaders, ridge roll, eave flashing, gable flashing, and corner trim, and all necessary clips, bolts and washers for fastening. Foundation anchor bolts also are furnished.

Steel Transmission Towers.

Milliken steel transmission towers are built of open hearth structural steel, galvanized, and have high resiliency and maximum strength. They are constructed in types to meet any transmission line condition, and both for high and low voltage service.

Used throughout the United States.

Radio Towers.

Milliken steel self-supporting radio towers are built of structural steel angle bars, providing ample rigidity against wind pressure and aerial pull. Made in 2 types, one in heights from 66 to 165 ft.; the other in heights of 200, 225, 250 and 300 ft. The towers of the first group are galvanized, while those of the second group can be galvanized or painted, as desired.

Used throughout the United States.

"Pinlock" Poles.

Milliken "Pinlock" poles (patented) are galvanized steel latticed poles, especially suited for the support of single trolley wires or catenary construction, telephone and telegraph lines, electric lights and signs. They have ample strength and require a minimum of ground space.

The "HYDRAULIC SYSTEM" of STANDARDIZED PRESSED STEEL PORTABLE BUILDINGS and STEEL BUILDING MATERIALS is a series of Construction Units which increase the speed and accuracy in erecting steel and concrete structures.

The System includes: Standardized PRESSED STEEL PORTABLE BUILDINGS; PRESSED STEEL FORMS; METAL LATH; REINFORCING BARS: Round, Square and Spiral; Concrete Conveyors.

TRADE-MARK

Hydraulic Standardized PRESSED STEEL Portable Buildings.

For shop restaurants, warehouses, power substations, railway waiting rooms, freight and section houses, garages, farm and dairy buildings, contracting and mining bunk houses, and temporary factories, schools and hospitals.

Design.

Allowable stresses and loading in conformity with standard engineering practice.

TYPE A

TYPE B

TYPE C

TYPE D

TYPE E

TYPE F

TYPE G

TYPE H

TYPES OF STANDARDIZED PRESSED STEEL PORTABLE BUILDINGS

Construction.

Steel trusses with riveted connections. Trusses supported by columns independent of wall plates. Standard solid steel sash. Roof sheets and wall plates of standard pressed steel construction (galvanized or painted).

Types.

Any types shown by cross-sectional sketches.

Sizes.

Length may be any multiple of $2\frac{1}{2}$ ft.

Width may be any multiple of $2\frac{1}{2}$ ft.

Height at eaves, 10 ft. Standard.

Flexibility.

Size and type may be altered after completion—windows and doors inserted or removed.

Portability.

May be dismantled and re-erected in new location with no additional material required.

Delivery.

All parts completely standardized, insuring quick delivery from warehouse stock.

Proof Against the Elements.

No joints open—absolute protection from rain and snow.

Appearance.

Uniform paneling in walls, producing a pleasing effect.

No exposed raw edges.

No protruding rivet heads or bolts.

No unsightly corrugated sheets.

Erection.

Building is easily and quickly erected by unskilled labor without special tools.

Service.

If desired, this company's Service Department will erect these buildings. The Engineering Department of this company is willing to co-operate in the solution of any building problem.

TYPES OF STANDARDIZED PRESSED STEEL PORTABLE BUILDINGS

TRUSCON STEEL COMPANY

(TRUSSED CONCRETE STEEL COMPANY)

Manufacturers of Standard Steel Buildings

YOUNGSTOWN, OHIO

Representatives in principal cities—for list, see page 184

Product.

TRUSCON STANDARD STEEL BUILDINGS, both Portable and Permanent.

For Reinforcing Steel and Metal Lath, see pages 184-86; for Steel Windows, see pages 352-54.

Truscon Standard Steel Buildings.

Truscon standard steel buildings are built of heavy steel standard units, of uniform size, interchangeable, and assembled by means of a simple locking device consisting of a slotted bolt and wedge. This construction furnishes a strong, permanent, fireproof structure that can be rapidly taken down and re-erected when necessary in a new location, without any deterioration to the building itself.

The walls of these buildings are formed of panels, that are interchangeable as they are of uniform width. The walls are of heavy gage steel—rigid and substantial. The windows, also of steel, are welded into the steel panels, affording maximum daylight and ventilation. The steel doors are furnished either single or double, and are equipped with Yale locks and Stanley hinges. The steel roof trusses support steel roof plates, tilelike in appearance and absolutely weatherproof. The building is strongly braced throughout and extremely rigid.

Truscon standard buildings, completely equipped, present a very pleasing appearance, and are ideal where daylighted, fireproof construction is desired and where quick expansion is necessary. They can be furnished in all sizes, and are adapted for use as factories, warehouses, schools, churches, hospitals, garages, dining halls, tool sheds, contractors' houses, etc.

Truscon standard buildings are furnished in any

length; widths up to 100 ft., and of various types (see illustrations). Any height of wall is secured by the two heights of panels and varying curb heights. As panels are interchangeable, any desired arrangement of wall, windows and doors can be obtained.

Buildings can be taken down and re-erected, rearranged, enlarged or reduced as required.

Monitor and Sawtooth Buildings.

The monitor type 3-M is especially adapted for use where additional headroom, light and ventilation are required, such as in foundries, erecting shops, etc. Provision is easily made for traveling crane in central bay.

The sawtooth type is adapted for machine shops and manufacturing generally, assuring maximum lighting and ventilation. Trusses are designed to support 1000 lbs. at any panel point.

Further Information.

For complete information, specifications, etc., write for the Truscon Standard Building Catalogue.

TRUSCON STANDARD BUILDINGS

HAGGARD & MARCUSSEN COMPANY

Manufacturers of Steel Bunks and Berths

1121 West 37th Street
CHICAGO, ILL.

Products.

"TIGER" BOLTLESS STEEL BUNKS; CANTONMENT or HOSPITAL COTS; HOSPITAL RECLINING CHAIRS.

Also, "Tiger" Steel Ship Berths.

"Tiger" Boltless Steel Bunks.

ADAPTABILITY—These indestructible bunks meet every requirement for lumber camps, construction camps, etc., and are designed especially for use in bunk-houses and barracks, hospitals, and sanitariums.

LOCKING DEVICE—These bunks are equipped with a locking device, which is exclusively used in the "Tiger" bunks, dispensing with bolts or loose parts.

The importance of this feature can not be overemphasized, enabling the bunk to be set up in two minutes without tools. Produces a perfectly tight joint which can not work loose.

CONSTRUCTION—Frame is "hard angle" steel. Sleeping surface is diamond shape wire link fabric with high carbon, oil tempered helical springs. The diamond shape of the link distributes tension diagonally and affords elasticity crosswise, dispensing with the need of small helical springs for fastening fabric to side rails, so common when straight link fabrics are used, and which easily become overstretched.

NO. 1585 "TIGER" BOLTLESS DOUBLE DECK BUNK
Height, 57 ins.; floor to first bunk, 14 ins.; to second bunk, 36 ins.; head rail, 7 ins.

Height, 20 ins.; from floor to bed, 14 ins.; head rail, 6 ins.

Hospital Reclining Chair.

Especially suitable for hospital convalescents and tuberculosis sanitariums. Automatic adjustment makes the chair follow every change of posture without requiring a thought. It works on its own standard, taking up little space.

No. 28 has double steel spring seat and adjustable strap support across the back, for comfort. A pair of helical springs at the top keeps the khaki cover drawn snugly.

The construction is such that it is opened or closed by simply pressing the head and foot parts together. To set up the chair requires the insertion of only two small bolts, taking but a minute or two.

Framework and standard are of steel, riveted and well braced, and finished in black enamel *baked on to stay*. The chair folds down flat for crating.

REINFORCED SPRING SEAT
Patent applied for

HOSPITAL RECLINING CHAIR

Cantonment or Hospital Cot.

This is the standard type of cot adopted by the United States Government and installed in the army cantonments all over the country.

The head and foot parts fold under, and the cot is equipped with locking device to prevent it from folding when in use.

The head and foot units are made of $1\frac{5}{16}$ -in. outside diameter tubing, and the spring frame is made of 2 by $1\frac{1}{2}$ by $\frac{1}{8}$ -in. tubing.

NO. 1052 CANTONMENT OR HOSPITAL COT

LOWELL WRENCH CO.

Manufacturers of Reversible Ratchet Wrenches

54 Commercial Street
WORCESTER, MASS.

Products.

REVERSIBLE RATCHET WRENCHES of several styles for constructors, etc.

Uses.

These tools are arranged so that a nut can be turned in either direction without wrench being removed. The saving in labor soon equals their cost.

Tools are guaranteed to give satisfaction in every respect.

Types.

The principal types made and carried in stock are the 1916 Pattern, the Bridge Builders', the Lag-Screw and the Steel Socket Bridge Wrench, and others, with gears and sockets to fit standard bolt heads and nuts.

Special reversible ratchet wrenches, gears or sockets built to order.

1916 Pattern Wrench.

Can be changed into a ratchet drill by removing the cap and replacing the gear by a drill socket. Changed to a right-hand or left-hand motion at pleasure by rotating the knurled nut at the end of the handle.

1916 PATTERN WRENCH

LIST OF WRENCHES

- No. 0. 7-in. lever with any one gear on No. 0 list.
- No. 1. 10-in. lever with any one gear on No. 1 list.
- No. 2. 12-in. lever with any one gear on No. 2 list.
- No. 3. 15-in. lever with any one gear on No. 3 list.
- No. 3½. 18-in. lever with any one gear on No. 3 list.
- No. 4. 18-in. lever with any one gear on No. 4 list.
- No. 4½. 24-in. lever with any one gear on No. 4 list.

LIST OF GEARS

- No. 0. ¼, ⅜, ½ in. square.
- No. 1. ⅝, ⅞, 1 in. square, ⅝, ¾ in. hexagon opening.
- No. 2. ⅞, 1, 1¼ in. square, ¾, 1 in. hexagon opening.
- No. 3. 1, 1¼, 1½ in. square, 1, 1¼, 1½ in. hexagon opening.
- No. 4. 1, 1½, 1¾, 1½ in. square, 1¼, 1½, 1¾ in. hexagon opening.

NOTE—In ordering wrenches state size and shape (square or hexagon) of hole wanted.

Bridge Builders' Wrench.

BRIDGE BUILDERS' WRENCH

LIST OF WRENCHES AND GEARS

- No. 1. Length of handle, 3 ft. Weight, about 11 lbs. Handle will take gears 1, 1½, 1¾ in. square openings; 1¼, 1½, 1¾ in. hexagon openings.
- No. 2. Length of handle, 3 ft. Weight, about 14 lbs. Handle will take gears 1½, 1¾, 1½ in. square openings; 1½, 2, 2½ in. hexagon openings.
- No. 3. Length of handle, 3 ft. Weight, about 23 lbs. Handle will take gears 2, 2¼, 2½ in. square openings; 2, 2¼, 2½, 3 in. hexagon openings.

Lag-Screw Wrench.

Designed for turning coach screws, nuts or bolts,

for street railway builders, telephone, telegraph and electric light companies.

Easily changeable for various sizes by means of the different sockets.

LAG-SCREW WRENCH

LIST OF WRENCHES AND SOCKETS

- No. 1. 12-in. handle, as shown in A.
- No. 1. 12-in. handle, as shown in C. Sockets will turn nuts measuring (smaller outside diameter) ½, ⅝, ⅞, 1, 1¼, 1½, 1¾, 1½ in. square; 1½, 1¾, 1½, 1½ in. hexagon.
- No. 2. 16-in. handle, either style A or C. Style A has 1½-in. hole for bolt to pass through socket. These sockets for nuts (smaller outside diameter) 1, 1½, 1¾, 1½, 1½ in. square; 1½, 1½, 1½, 1½ in. hexagon.
- No. 3. 20-in. handle, either style A or C. Style A has 1½-in. hole for bolt to pass through socket. With sockets to fit nuts (smaller outside diameter) 1, 1½, 1¾, 1½, 1½, 1½ in. square or hexagon.

Special sockets made to order.

Steel Socket Bridge Wrench.

Range of nuts handled by these wrenches is from ⅝ to 3¼ in. bolt diameter, or 1½ to 5 in. smaller outside diameter of nut.

STEEL SOCKET BRIDGE WRENCH

LIST OF WRENCHES AND SOCKETS

- No. 1. Length of handle, 2 ft. Clear hole through socket for 1½-in. bolt. Weight, about 10 lbs. Handle will take sockets with 1, 1½, 1¾, 1½, 1½, 2 in. square or hexagon openings.
- No. 2. Length of handle, 3 ft. Clear hole through socket for 1¾-in. bolt. Weight, about 23 lbs. Handle will take sockets with 2, 2½, 2¾, 2¾, 2½, 3 in. square or hexagon openings.
- No. 3. Length of handle, 3 ft. Clear hole through socket for 2½-in. bolt. Weight, about 50 lbs. Handle will take sockets with 3½, 3¼, 3¾, 4¼, 4½, 5 in. square or hexagon openings.

Please order by size of nut, small diameter, rather than by size of bolt. Odd sizes made to order.

Prices.

All prices on application.

ESTABLISHED 1882

KEYSTONE DRILLER CO.

Manufacturers of Well Drills and Deep Well Pumps

MAIN OFFICE AND FACTORIES
BEAVER FALLS, PA.

NEW YORK, N. Y., 170 Broadway

BRANCH OFFICES
JOPLIN, MO.

CHICAGO, ILL., Monadnock Building

Products.

PORTABLE and TRACTION WELL DRILLING MACHINES for Water Wells, Artesian and Non-flowing; Mineral Prospecting for lead, zinc, copper, coal, fire clay, etc.; Placer Gold Testing in advance of dredging operations; Blast Hole Boring in cement and limestone quarries and heavy excavations; Deep Wells for petroleum or natural gas.

"Downie" DEEP WELL PUMPS.

For Excavators, see page 41.

if required. Sills, beams, derrick are of seasoned fir. Boilers, A.S.M.E. code Non-tractions, to be hauled with horses, made in sizes No. 1 to 5½. These machines are of the double beam type and excel in "spudding" or shallow drilling.

Portable oil rigs, with improved friction tool hoist, sizes No. 27 and No. 32, are offered for deep wells. Have steel sills, babbitted bearings, mounted oil country (locomotive type) boilers on separate truck. Strongest and most efficient construction, maximum portability.

Keystone Drills.

The Keystone traction, self-moving, well drills are made in sizes No. 3 to No. 5½. They are complete, self-contained with motive power on one truck; generally furnished with vertical fire tube boiler and steam engine, but can be equipped with gas or electric motor

PORTABLE DEEP WELL RIG
Sizes No. 27, No. 32 and No. 35

TRACTION STEAM WELL DRILL
Sizes No. 1 to No. 5½

PRINCIPAL SIZES AND STYLES OF KEYSTONE WELL DRILLS

Size, No.	Style	Tool hoist	Power	Size boiler	H. p. of motor or engine	Depth capacity, ft.

35	Non-traction	Friction	Steam	30 h.p.	45	3500

PRINCIPAL SIZES AND STYLES OF KEYSTONE WELL DRILLS (Continued)

Size, No.	Shipping weight with tools, lbs.	Principal uses
1	9000	Shallow water wells, test holes
3	11000	Water wells, test and blast holes
3	14000	Water wells, test holes, blast holes
3	14000	Placer gold testing, water wells, blast holes
3½	11000	Blast holes, water wells, test holes
3½	14000	Blast holes, water wells, test holes
3½	12000	Blast holes, water wells, test holes
4	12000	Water wells, shallow oil wells, test holes
4	15000	Water wells, shallow oil wells, test holes
4½	14000	Water wells, test holes, blast holes
5	14000	Water wells
5	15000	Water wells
5	18000	Water wells, shallow oil wells
5½	18000	Special water wells, mineral test holes
27	26000	Oil wells, separate boiler
32	28000	Oil wells, separate boiler
35	32000	Oil wells, separate boiler

"Downie" Deep Well Pumps.

These pumps are offered for heavy, continuous service in deep water wells, to pump against total head of 50 to 600 ft.; direct steam driven or geared from power; single or double stroke heads and barrels. The type most commonly used is double stroke geared head, direct connected to electric motor with D.S. working barrel and "Downie" conical valves. Efficiency of 85% and maximum capacity with this type. Usable in wells 4½ to 10 in. in diameter with working barrels 2¾ to 8 in. diameter. A 6-in. well will admit a 4-in. double stroke barrel, producing 68 gals. per minute at 35 r.p.m. Catalogue No. 6 in English or Spanish.

May be equipped with safety device for preventing accidental shooting out of piston or rivet set.

"Little Giant" Air Drills.

Of the balanced piston type, and consist of four single acting cylinders arranged in pairs, each pair of

TRADE-MARK

pistons being connected to opposite wrists of a double crank shaft. Pistons of each pair travel in opposite directions at all parts of the stroke, insuring a smooth running machine.

All "Little Giant" drills are made after a standard design, vary-

ing only in size and construction necessary

to adapt them to particular uses; and in reversible and non-reversible types. Range in drilling from 1/4 in. to 2 in. in steel.

"LITTLE GIANT" AIR DRILL

"LITTLE GIANT" DRILLS, REVERSIBLE AND NON-REVERSIBLE

Size	Diam. piston, in.	Length stroke, in.	Free air consumption per min., 80 lbs.	Speed light r. p. m.	Size socket	Drilling capacity, in.	Net wgt., lbs.

91	No. 4 M. T.	2	35	190	50	1 1/2

"Hammer" Self-rotating Hammer Drills.

"Hammer" self-rotating hammer drills are used for mining, shaft sinking, tunneling, drifting, bench work, block holing, breaking boulders, hitch cutting,

quarrying, coal mining, road building, trench work, ore drilling. They are made in two sizes, designated by the symbols A-86 and B-86. The machine can be furnished for either dry or wet work. The change from dry to wet, or vice versa, can be made without any trouble.

These drills are equipped with independent mechanical rotation. The operation of the machine is accomplished by compressed air being first admitted into a rotary motor located in the back head of "Hummer" drills, and, after serving its purpose, is exhausted into the valve chamber of the striking mechanism, where it is utilized again; thus the compressed air performs a double duty without increasing its consumption in any way, and thereby conserving energy.

Motion of the rotary motor is communicated to the drill chuck by suitable transmission, providing "Hummer" drills with independent rotation and its incidental advantages.

This design results in a sturdy, well balanced and compact structure throughout. By locating the rotation motor at the upper end, it is farthest removed from the strains and shocks of the hammer blows at the front end of the drill, and the distribution of the parts is such as to permit each part being made simple and strong and well calculated to stand up under the severe conditions to which the rock drill is ordinarily subjected.

For further information write for Bulletin 345.

A-86 "HUMMER" SELF-ROTATING HAMMER DRILL.
Fastest drilling; easiest to operate; lowest in upkeep

Chicago "Gatling" and "Slogger" Rock Drills.

"GATLING" DRILL—A one-man drill; weighs 145 lbs. and easily drills up to 8 ft. It strikes a very rapid blow—800 per minute on the long stroke—which accounts for its quick drilling capacity.

Write for Bulletin 346.

"SLOGGER" DRILL—Strikes a hard, rapid blow. Made in 4 sizes. Distinctive features are improved valve motion, adjustable shell, positive lubrication, release rotation, bushed front head with taper sleeve and chuck for taking unshanked steels.

C-22 IMPROVED TYPE "GATLING" DRILL
With patented cushion device, mounted on column
Most powerful "one-man" drill on the market

*For connection to ordinary lamp socket. D. C. or A. C. of 60 cycles or less, single-phase, interchangeable.

**Furnished in side spindle style only. Standard windings are for 60 cycles, 110 or 220 volts. Nos. 2, 3 and 4 can be wound for 440 volts.

"Little Giant" Portable Electric Grinders.

For use in foundry, machine and structural shops. Built in 2 sizes for 110-220-600 volts direct current, and 110-220 volts, 2-phase or 3-phase, alternating current. No. 5 BP carries 5 by 3 ³/₄-in. wheel; No. 8 BP carries 6 by 1 ¹/₄-in. wheel.

"Little Giant" Geared Air Hoists.

Great hoisting power; unusually rugged steel construction; economy of air; absolute safety. Simple, valveless air motor operates equally well in either direction and has repeatedly demonstrated its power and air economy advantages. Automatic air brake makes slippage impossible. "Limit" stop device supplies infallible protection against jam-ups from overhoisting. All gears cut from solid stock, accurately machined and case hardened. Lubrication of the "splash" type. Made in 5 capacities from 1 to 10 tons as follows:

"LITTLE GIANT" GEARED AIR HOIST

CAPACITIES AND LIFTING SPEEDS OF "LITTLE GIANT" AIR HOISTS

Products and Services.

ROCK DRILLS and HAMMER DRILLS of many types for use in mines, quarries and on engineering construction; DRILL BIT SHARPENING MACHINES; "AIR LIFT" WELL PUMPS; AIR COMPRESSORS.

Diamond Core Drills for mineral prospecting and test borings, Coal Mining Machines, Forge Hammers, Drill Steel Furnaces, Stone Channeling Machines and Quarrying Machinery.

CONTRACTORS for ENGINEERS TEST BORINGS with Sullivan Diamond Drills, and for Mineral Land Prospecting.

Rock Drills and Hammer Drills.

Sullivan rock drills are available in numerous types for any demand of rock removal. Types include:

Rotator Hammer Drills—Bulletin 1670-F. "DR-6" Water Jet Drifters—Bulletin 1670-H. "Dry" and "Wet" Simple and Self Rotating Air Feed Stoppers—Bulletin 1670-M. "Plug" and "Foot-Hole" Granite Tools—Bulletin 1670-B. Hyspeed and Liteweight Reciprocating Rock Drills—Bulletin 1670-D. Submarine Rock Drills—Bulletin 1670-E. Water Jet Rock Drills—Bulletin 1670-D.

ROTATORS—6 types; average 38 lbs. The hollow piston and air tube rotators are particularly adapted for shaft or open cut drilling, having a capacity of 12- to 15-ft. holes. (They have drilled to 36 ft.) Water tube and "Pneufed" rotators are rapid mine drifters and adaptable for light tunneling. Two types of mounting available. A steam rotator can also be had. All "one-man" drills, powerful and rapid.

SULLIVAN ROTATOR
HAMMER DRILLSULLIVAN TRIPOD
DRILL

SULLIVAN WATER HAMMER DRILL "DX-61"

Made of drop forgings, and tool steel throughout.

For heavier rock drilling, on tripods, quarry bars or gadders, select Hyspeed drills, especially designed and built for quarry and open cut service.

Hitting power, pulling strength, air and repair economy are "Hyspeed" features that mean low drilling cost. Sizes, 2¾, 3, 3¼, 3½ and 4¼ in.

For tunneling and underground drilling in general, requiring a mounting, select "DR-6" or "DX-61" all steel "Water Jet" hammer drills, using 1¼-in. round hollow steel. Holes to 14 ft.

Sullivan Drill Sharpener.

Embodies all the elements necessary for proper care of hammer drill steel. Does its work, both upsetting and swaging, by gradual hammering; does not require injurious temperatures for proper handling of steel. Sharpens both solid and hollow bits and forms shanks accurately and rapidly. Economical of compressed air, which is the motive power; safe and easy to use, and is a substantial, durable machine. Occupies a floor area of 5 by 2½ ft.; is 6 ft. high; weighs 4000 lbs. Write for bulletin 1672C.

SULLIVAN DRILL SHARPENER

SULLIVAN "AIR
LIFT" PUMP**Sullivan "Air Lift" Well Pump.**

Secures more water from the same wells than by any other means; secures cooler water, which means a saving in horsepower in condensing; secures purer and softer water, due to aeration; greater simplicity and reliability (there are no moving parts in the well). Apparatus is always in working order; not affected by sand or mud. Efficiency kept up to original point at all times and after long use; a scattered group of wells can be pumped as readily as one well. Ask for bulletin 1671-D.

Test Boring Service.

The Sullivan Diamond Drill Contract Boring Department, organized in 1884, specializes in testing the proposed sites of bridges, dams, tunnels and docks. The

cores secured show the exact location and character of the bed rock. Work is taken in any part of the United States or Canada, on a price-per-foot or cost-plus-percentage basis. Booklet—16, 113.

Types of Sullivan Compressors.

STEAM DRIVEN—"WC," Tandem Compound Corliss Steam Cylinders—Two-stage air cylinders; capacities 1000 to 3150 ft. Bulletin 1675-U.

"WB-3," Simple Steam—Two-stage air cylinders, straight line; capacities 250 to 950 ft. Bulletin 1675-E.

"WA-6," Simple Steam—Simple air cylinders, straight line; capacities 100 to 400 ft. Bulletin 1675-P.

POWER DRIVEN—"WJ-3," "WN-3," Angle Compound—Belt or direct motor drive; capacities 400 to 1100 ft. Bulletin 1675-S.

"WJ-4," "WN-4," Twin Angle Compound—For direct synchronous motor drive or belt pulley; capacities 900 to 2600 ft. Bulletin 1675-S.

"WH-6," Belted—Two-stage, enclosed frame; capacity 300 ft. Bulletin 1675-R.

"WG-6," Belted—Single-stage, enclosed frame; capacities 50 to 350 ft. Bulletin 1675-R.

"WK-2," Direct Motor Driven—Portable mine car type, single-stage; capacities 100 to 250 ft. Bulletin 1675-I.

"WK-31," Direct Gas Engine Driven—Portable horse truck type, single-stage, for road work, etc.; capacity 150 ft. Bulletin 1675-T.

ANGLE COMPOUND COMPRESSORS, "WJ-3"—Small floor space and foundation cost; flexibility of driving arrangement; power economy, due to accurate balance between vertical and horizontal reciprocating masses, and to unloading apparatus on both high and low pressure members; end rolling "finger" plate valves; large intercooler area and automatic lubrication. Twin units available for larger capacity, provide flexible air supply with maximum power economy, and eliminate peak loads.

TANDEM COMPOUND CORLISS STEAM DRIVEN COMPRESSORS, "WC"—Unite high fuel economy characteristic of the best Corliss engine design with excellent air end efficiency, secured by two-stage air cylinders, ample intercooling area, and close speed and pressure regulation. Tandem design permits important economies in weight, house room and foundations. Five unit sizes: 1000, 1500, 2000, 2500 and 3150 ft.

SULLIVAN BELT DRIVEN SINGLE-STAGE COMPRESSORS, "WG-6"—Provide continuous, reliable air power service. Design is simple,

SULLIVAN DIAMOND DRILL TESTING A BRIDGE SITE ON THE ST. LAWRENCE RIVER

substantial; materials and workmanship of all working parts the best. Automatic, "wafer" type plate air valves; water jacketed cylinder and heads; enclosed frame and splash lubrication. Automatic inlet valve unloader provided to save power.

SULLIVAN "WK-31" PORTABLE, GASOLINE ENGINE DRIVEN AIR COMPRESSORS—Mounted on all-steel trucks, with canopy top for protection. For operating drills for street or highway rock removal. Capacity, 150 cu. ft.; 32 h.p.; weight, 4500 lbs. Two-cylinder vertical compressor operated by gear and pinion from four-cylinder, four-cycle, tractor type gasoline engine, complete with receiver, gasoline tank and radiator, on steel wagon truck. Bulletin 1675-T.

ATLAS BLASTING SUPPLIES and EXPLOSIVES, which include: Chemicals, Blasting Caps, Electric Blasting Caps, Blasting Batteries, Galvanometers, Rheostats, Leading and Connecting Wire, Thawing Kettles, etc.

TRADE-MARK

Dynamite.

ATLAS NITROGLYCERINE DYNAMITE, STRENGTHS 20% to 60%—A high explosive similar to the original dynamite. Exceedingly quick in action, it develops a great disruptive and shattering force, and should be used only where such an effect is desired. It is low freezing and may be used in open work in cold weather without thawing, if charges are fired promptly. Recommended for mud-capping rock, blasting ditches in wet ground, breaking old machinery and castings, etc. An Atlas No. 6 blasting cap or electric blasting cap should be used to detonate this explosive.

ATLAS POWDER

ATLAS EXTRA DYNAMITE, STRENGTHS 20% to 60%—For general blasting in mining, quarrying, railroad construction, road building, Atlas Extra is superior to Atlas nitroglycerine dynamite. Particularly suited to underground work as its fumes are not as objectionable as those given off by nitroglycerine dynamite. It exerts more of a heaving and lifting force, than a rending and shattering one. Atlas Extra is not recommended for very wet work, but is used to best advantage in comparatively dry operations where the material to be blasted is not unusually hard. It is low freezing and will not require thawing except in very severe weather.

ATLAS EXTRA

ATLAS LOW FREEZING GELATIN DYNAMITE, STRENGTHS 30% to 90%—Has all the advantages of ordinary gelatin dynamite, such as being waterproof, absence of objectionable fumes, etc.,

ATLAS GELATIN

and, in addition, does not freeze and become insensitive above 10° Fahr. Unequalled for blasting in mines and tunnels where the temperature is low and ventilation poor. Nothing weaker than a No. 6 blasting cap or electric blasting cap will properly explode it.

ATLAS Low Powder, STRENGTHS 5% to 20%—This is a low grade, granular high explosive which may be said to rank between blasting powder and dynamite. It is made in four grades: RRP, F, FF and FFF. RRP is the lowest grade and is usually put up in paraffined paper bags and packed in wood cases. Will run freely into bore holes and crevices. Other grades packed in cartridges like dynamite. Of great value in open work, such as quarries, railroad cuts, mine strippings, etc., when material to be blasted is comparatively soft and no great amount of water is present. Also used in blasting large stumps. Should be detonated with a primer of nitroglycerine dynamite of not less than 40% strength.

ATLAS RRP

Atlas Permissible Explosives.

A permissible explosive should be used in all gassy or dusty coal mines. When used according to Bureau of Mines' regulations they will not ignite coal dust or gas mixtures. Atlas permissible explosives are made in three kinds and twelve grades to meet the various conditions of coal mining and have all passed the tests demanded by the United States Government Bureau of Mines.

"MINERS FRIEND"—Made in 5 grades: No. 1, No. 2, No. 3, No. 5 and No. 6. It is practically fumeless and is very effective in quarries as well as coal mines, as it can be used without thawing. A No. 6 detonator should be used to fire this explosive.

"VIGORITE"—Particularly effective in wet mines. Is low freezing and does not give off objectionable fumes. Made in 3 grades: No. 1, No. 5 and No. 6. Use a No. 6 blasting cap or electric blasting cap with this explosive.

"COALITE"—Made in 4 grades: No. 1, No. 2D, No. 2MLF and "Coalite" Y. All "Coalites" are strong, slow acting permissibles used at their best in dry mines. They are not water resisting.

COALITE, NO. 1

Atlas Farm Powder.

Especially adapted to agricultural blasting. It is a low freezing dynamite of moderate strength, intended for stump blasting, subsoiling, tree planting and ditching. Practically never requires thawing in weather in which a farmer would ordinarily use it. Requires a No. 6 or stronger detonator.

ATLAS FARM POWDER

U.S. Standard Blasting Machines.

Generates electric current for firing electric blasting caps. Made in five sizes:

No. 2 for stump and boulder blasting, quarrying and mining where it is not necessary to fire more than 10 charges at any one time.

No. 3 will fire 30 electric blasting caps simultaneously. For quarrying, mining and blasting ditches.

No. 4 for use in quarrying and mining. Capacity, 50 copper wire electric blasting caps.

No. 5 for quarry and contracting work where a large number of charges are to be fired at once. Capacity, 100 copper wire electric blasting caps.

No. 6, extra powerful. Will fire 150 copper wire electric blasting caps.

Complete information about blasting machines sent on request.

BLASTING MACHINE

Little Giant Blasting Machine.

A light weight machine especially made for coal mining and other operations where it is not necessary to fire more than one or two charges at a time. It has a capacity of 5 copper wire electric blasting caps and weighs 4½ lbs. It is operated by a removable key or handle which when kept in the possession of the blaster prevents the operation of the machine by any other person. This is an important safety feature.

LITTLE GIANT BLASTING MACHINE

Atlas Electric Blasting Caps.

Detonators containing electric wires embedded in the explosive charge and connected by a platinum bridge of high resistance.

When an electric current is passed through one of these the charge is exploded.

They are made in two strengths, No. 6 and No. 8 and furnished with insulated copper wires of the following lengths: 4, 6, 8, 10, 12, 14, 16 ft. Longer lengths to order.

The No. 6 electric blasting cap contains 1 gram of explosive charge and the No. 8 contains 2 grams.

All Atlas electric blasting caps are packed in pasteboard cartons, enclosed in

BLASTING CAP

heavy wood cases. Cartons contain either 25 or 50 depending on the length of wires. Waterproof electric blasting caps for submarine blasting are furnished in all lengths.

ADVANTAGES OF ELECTRIC BLASTING—It is possible to fire two or more shots exactly together. The shots may be fired at the exact instant desired.

The blaster is in a safe place when he fires the shot. Hang-fires are practically eliminated.

There are no sparks or flame as from a lighted fuse or squib.

It is more reliable in wet work.

Atlas Blasting Powder.

Blasting powder is a slow acting, granular explosive, composed of charcoal, sulphur, sodium nitrate or potassium nitrate (saltpetre).

Two grades are manufactured: "B" blasting powder and "A" blasting powder. "B" blasting powder is usually used in coal mining and for blasting shale, earth and dimension stone. "B" blasting powder is manufactured in 7 granulations: FFFF, the finest, to CCC, the coarsest. The finer granulations are quicker in their

BLACK BLASTING POWDER

action and exert a greater breaking and shattering effect on the material blasted; while the slower granulations have a tendency to lift and heave it out in large lumps. A mixed granulation consisting of FF, FFF and FFFF is used in railroad construction work. Blasting powder does not freeze, but must be kept dry. It is useless when wet and when damp it loses its efficiency. Damp powder when exploded gives off much more smoke than dry powder. Blasting powder is packed and shipped in sheet steel kegs containing 25 lbs.

Atlas Blasting Gelatin.

This gelatin is the most powerful explosive of Atlas manufacture. Comparing it with other explosives it may be said to be 100% in strength.

Like gelatin dynamite, it is water resisting and may remain under water for hours without losing its effectiveness.

It is used in bottoms of "cut holes" in tunnels, and in the bottoms of quarry holes where the rock is exceptionally hard, and in submarine blasting.

Atlas blasting gelatin should be used sparingly at first. Use a minimum rather than a maximum charge. It is so much stronger than all other blasting explosives in common use that an overcharge may do considerable damage.

Blasting gelatin is packed in standard size cartridges and shipped in 50-lb. cases.

Products.

EXPLOSIVES of all kinds and BLASTING SUPPLIES which include: Blasting Machines, Galvanometers, Rheostats, Blasting Caps, Squibs, Victor Delay Electric Igniters, Leading Wire, Connecting Wire, Fuse, Cap Crimpers, Storage Magazines, Thawing Kettles, Blasting Paper, Tamping Bags, etc.

Explosives and Blasting Powders.

NITROGLYCERIN DYNAMITE—Hercules nitroglycerin dynamite is manufactured on both the regular and low freezing formulas in strengths from 15% to 60%.

This dynamite is suitable for work requiring strength and quickness, and gives the best results where a shattering effect is desired. Packed in standard cartridges, 50 lbs. to the case.

NITROGLYCERIN
DYNAMITE

EXTRA (AMMONIA) DYNAMITE—Hercules extra dynamite is made on both the regular and low freezing formulas in strengths from 15% to 60%. The extra grades may be considered as the explosive best adapted for general all around work.

Extra dynamite has the same strength, grade for grade, as nitroglycerin dynamite. It is, however, less expensive, and gives a more heaving than shattering action. It is recommended for mining, quarrying, digging wells, road and railroad construction, clay blasting, mudcapping, and most agricultural work. Packed in standard cartridges, 50 lbs. to the case.

HERCULES GELATIN DYNAMITE—Hercules gelatin dynamite is distinguished by plasticity, high density, imperviousness to water, and freedom from noxious fumes. It is made on the regular formula in strengths from 35% to 75% and the low freezing formula in strengths from 30% to 75%. Hercules gelatin is good for wet work. Its plasticity enables it to be loaded easily and effectively in holes having an upward slant, and the density and plasticity make it extremely well adapted for tight blasting in hard rock. It is packed in standard cartridges, 50 lbs. to the case.

HERCULES GELATIN
DYNAMITE

BLASTING GELATIN—Hercules blasting gelatin is the strongest, quickest, most waterproof and fumeless explosive manufactured for commercial purposes, having a strength of 100%. It is especially adapted for

HERCULES

POWDER
TRADE-
MARK

use in cut holes, hard rock tunnel rounds and submarine blasts in hard rock. Packed in standard cartridges, 50 lbs. to the case.

RED H—Red H Permissible explosives belong to the ammonia nitrate class. The weight for weight strength of Red H powders approximates very closely that of 60% dynamite. On account of their bulkiness, they average about one-third more cartridges of a given size to the case than is found in a similar case of regular dynamite having the same sized cartridges; but each cartridge is equal to a cartridge of 35% dynamite. This makes Red H a very good substitute for the low grades of ammonia and nitroglycerin dynamite.

Red H Nos. 1 and 6 are the quickest in their action; Nos. 2 and 4 are of the intermediate quickness. Nos. 3 and 5 are the slowest and usually best adapted for blasting coal down in good lump form. Nos. 1, 2, 3, and 7 are high freezing; Nos. 4, 5 and 6 are low freezing. Nos. 1 and 2 can be used in a frozen condition, providing the cartridge receiving the blasting cap is loosened up by rolling before it is inserted. Red H is packed in standard cartridges, 50 lbs. to the case.

RED H

XPDITE—Xpdite belongs to the nitroglycerin class of permissibles. While the fumes given off are not always as good as those from Red H, this dynamite will stand water better and is recommended for wet work. Nos. 1 and 2 are the strongest, quickest and best adapted for blasting coal that is desired in a well-broken condition. Nos. 3 and 6 are weakest and the latter is low freezing and gives the best results in blasting thin coal that has been undercut. Packed in standard cartridges, 50 lbs. to the case.

XPDITE

R. R. P.—Hercules R. R. P. belongs to the class known as granular dynamite, often called Judson. R. R. P. is best adapted for use in soft, seamy material, tunnel blasts in hard rock, and heavy blasts where it is necessary to fire them in fairly hard material. Packed in paraffined paper bags containing 12½ lbs. The standard case holds 4 of these bags, making a net weight of 50 lbs.

R. R. P.

"F" POWDERS—The Hercules "F" powders are similar to R. R. P., but contain a small amount of nitroglycerin, which is as follows: F, 10%; FF, 15%; FFF, 20%. (Do not confuse these powders with blasting powder having the "F" granulation markings.) "F" powders are packed in cartridges like ordinary dynamite, 50 lbs. to a case.

"F" POWDERS

BLASTING POWDERS—The Hercules Powder Co. manufactures two high grade blasting powders: "A" blasting (or saltpetre powder), and "B" blasting (or soda powder).

"A" blasting powder is for use in dimension stone, slate and granite quarries.

"B" blasting powder is for use in non-gaseous coal mines, coal stripping, quarry, and construction work. It is manufactured in all sizes of grains, glazed and unglazed. From FFFF, about $\frac{1}{16}$ in. diameter, to CCC, about $\frac{1}{2}$ in. diameter. A special granulation called R. R. is made for large blasts. Packed in kegs containing 25 lbs. net.

BLASTING POWDERS

Hercules Blasting Machines.

An apparatus for generating electric current used in firing electric blasting caps, squibs and igniters; made in 6 sizes with capacity for detonating from 3 to 150 shots in series, as follows:

Size	Capacity, Electric Blasting Caps Copper Wires
Model	3
No. 2	10
No. 3	30
No. 4	50
No. 5	100
No. 6	150

HERCULES BLASTING MACHINES

Electric Blasting Caps.

These are used to detonate charges of high explosives by means of electricity. They are made in two strengths, No. 6 and No. 8. These are connected with insulated copper wires from 4 to 30 ft., or with iron wires from 2 to 8 ft. Packed 25 or 50 to the carton, 10 cartons to the case.

ELECTRIC BLASTING CAP

Electric Squibs.

Hercules electric squibs are similar in appearance to electric blasting caps, except that a paper shell is used instead of copper, and are used to fire charges of blasting powders. The advantages of electric squibs are that more than one shot may be fired at one time, resulting in a saving of both powder and time. Electric squibs are made with 4- to 8-ft. iron wires and 4- to 30-ft. copper wires. Packed 25 and 50 to the carton, 10 cartons to the case.

ELECTRIC SQUIBS

Victor Delay Electric Blasting Caps.

These are made in two delays. Three different periods can be obtained by using regular electric blasting caps in the same circuit. Delay electric blasting caps are made with copper wires 4 to 30 ft. Packed 25 and 50 to the carton, 10 cartons to the case.

VICTOR DELAY ELECTRIC BLASTING CAP

Leading Wire.

Hercules leading wire is an insulated copper wire (No. 14 B. & S. gage) used for connecting electric blasting cap circuits to the blasting machine. It is furnished in coils from 200 to 500 ft.

LEADING WIRE

Connecting Wire.

Hercules connecting wire is used to join the wires of electric blasting caps. It is a high grade insulated copper wire (No. 20 or No. 21 B. & S. gage), and is put up in 1- and 2-lb. spools.

Blasting Caps.

Blasting caps are used to detonate charges of high explosives. As the efficiency of any high explosive depends on the initial shot, this company does not recommend caps smaller than Hercules No. 6. Standard sizes Nos. 6 and 8. Packed 100 in a box, 5 to 100 boxes in a case.

BLASTING CAPS

Miner's Squibs.

Squibs are used for firing charges of blasting powder. "Artificial Straw" and "Rocket" squibs burn with a flame. "Chinese" or "Gas" squibs burn with an ember no flame. Packed 100 to the box, 100 boxes in a case.

MINER'S SQUIBS

Safety Fuse.

The HERCULES POWDER CO. carries all standard brands of fuse. All brands have definite burning speeds, and are packed in coils of 100 ft. Cases contain from 5 to 60 coils.

SAFETY FUSE

Storage Magazines.

The HERCULES POWDER CO. carries a complete line of sidewalk and steel storage magazines.

EXPLOSIVES and BLASTING ACCESSORIES, which include:

Red Cross Extra, Gelatin and Straight Dynamites.

Du Pont Extra, Gelatin and Straight Dynamites; Du Pont Blasting Gelatin; Repauno Gelatin; Low Explosives; Blasting Powders.

BLASTING ACCESSORIES for detonation or deflagration of explosives: Electric Blasting Caps, Blasting Caps, Galvanometers, Rheostats, Thawing Kettles, Blasting Machines, Fuse, Cap Crimpers, Connecting Wire, Leading Wire, Tamping Bags.

For Paints and Varnishes, see pages 204-205.

Quality.

Since 1802, the Du Pont Company has been engaged in the making of explosives. In this century of activity, the company has introduced many new explosives and improved its methods of manufacture. Today its products are recognized as the standard by which other explosives are rated.

The extensive manufacturing, storage and shipping facilities of the Du Pont Company insure ample production and prompt shipments.

The specifying of Du Pont explosives insures highest efficiency and the accomplishment of maximum results with a minimum expenditure for material, time and labor.

Red Cross Straight Dynamite.

This is a quick acting, powerful, water resisting, low freezing explosive especially recommended for open work in hard, tough material where a shattering action is desired, such as breaking boulders and general construction work.

RED CROSS STRAIGHT DYNAMITE

Red Cross Extra Dynamite.

The "extra" dynamites are not so quick nor shattering as "straight" dynamite, but have a more heaving and lifting effect.

Red Cross Extra is suited to soft rock; also hard rock where shattering is unnecessary; and excavating clay, earth and shale. It is a low freezing, all-year-round explosive. The cartridge wrappers should not be slit nor should the charge remain in water very long.

RED CROSS EXTRA DYNAMITE

Du Pont Gelatin.

This brand is a dense, plastic, highly water resisting, low freezing explosive. It is especially recommended for very wet work, under water, and in close work where ventilation is deficient. Du Pont Gelatin gives best results when thoroughly confined, but is not suitable for mudcapping.

Blasting Accessories.

As the largest manufacturers of explosives and with an extensive experience the Du Pont Company is competent to devise and introduce detonation apparatus especially suited to explosives. Insist upon the use of these Du Pont dependable detonating supplies to insure complete detonation.

Blasting Machines.

Several sizes of blasting machines are made having capacities of 1 to 150 No. 6 electric blasting caps fitted with copper wires. The most popular sizes are the pocket size and Nos. 2 and 3.

The pocket size fires from 1 to 3 electric blasting caps. It has a removable handle to prevent firing the charges by anybody other than the shot-firer.

Blasting machines Nos. 2 and 3 fire 10 to 30 copper wire electric blasting caps, and weigh 15 and 25 lbs., respectively. They are thoroughly made and can be relied upon to generate current to fire the number of charges specified. The machines are compact in form, easy to operate and portable.

DU PONT BLASTING MACHINE

Du Pont Electric Blasting Caps.

Nos. 6 and 8 electric blasting caps are made according to specifications determined by long connection with the manufacture and use of explosives. The selection of materials, manufacturing, assembling and inspecting of parts receives the most careful attention to insure a blasting cap capable of causing complete detonation.

Special Information Available for Users of Explosives.

A century of experience as explosives makers has enabled this company to acquire a practical knowledge of explosives.

This company has a series of books and folders containing valuable data concerning the selection of explosives and the best methods to adopt to insure the most satisfactory results. State what is required of explosives and necessary information will be forwarded.

Depth ditching, ft.....	16	16	18

Keystone Excavators.

The Keystone excavator is a light, traction steam shovel for contractors' general use. Three sizes: model 3, 10 tons; model 4, 12 tons; model 6, 15 tons. All have long wheel base, about 10 ft. Two traction speeds, 1½ and 3 miles per hour. Equipped with 4 readily interchangeable buckets—skimmer, dipper, drag-ditcher and clamshell, it can be used on a wide variety of work—road grading, stripping, ditching, backfilling, cellar digging and unloading cars. Has long horizontal crowd—11 ft. and 14 ft. (see table) and powerful thrust. Will lift old macadam, etc., without rooting. Used most for road work and ditching, with skimmer and drag-ditcher. Model 3 has wood sills, 18-h.p. single-cylinder engine, 16-ft. boom, 11-ft. horizontal crowd. Models 3 and 6 are all-steel, have double engines and 18-ft. booms. Model 4 has hydraulic side jacks. Boom swings through half circle. Clamshell attachment gives boom length of 26 ft.; 18-ft. radius; bucket clears 13 ft. above ground. With drag-ditcher attachment bucket reach is 26 ft.

DRAG-DITCHER SCOOP, USED IN DITCHING, BACKFILLING AND CELLAR DIGGING, (MODEL 3)

SKIMMER SCOOP, FOR ROAD GRADING AND GENERAL EXCAVATION (MODEL 4)

DIPPER SCOOP, FOR SIDE HILL DIGGING (MODEL 3)

CLAMSHELL, FOR UNLOADING CARS, DEEP DITCHING, ETC. (MODEL 4)

S. FLORY MFG. CO.

Cableways and Mine and Contractors' Hoisting Engines

BANGOR, PA.

NEW YORK, 95 Liberty Street

PITTSBURGH, First National Bank Building

CHICAGO, Monadnock Block

SALES AGENTS IN PRINCIPAL CITIES OF THE UNITED STATES

Products.

SUSPENSION CABLEWAYS and all Accessories; Improved CONTRACTORS', MINE and other kinds of HOISTING ENGINES: Steam, Electric, Gasoline and Belt.

Also, Slate and Stone Working Machinery: Rubbing Beds, Planers, Saws, Groovers, etc.

Marine Machinery: Marine Railway Engines, Steering Engines, Capstans, Pile Driving Engines, Lighterage, Dredge and Swinging Engines, Dock and Derrick Hoists, Winches, etc.

Flory Suspension Cableways.

Flory cableways are adapted for operating quarries, stripping coal veins, dredging rivers, building concrete walls, locks, dams and bridges, making trenches, sewers and sewage disposal plants, and for general transportation of materials in almost every class of work.

Several hundred cableways, built by this company—both inclined and horizontal types—are in successful

use today, with spans varying from a few hundred feet to 2000 ft. in length and in capacities ranging up to the individual 15-ton load.

Cableways have proved practical and economical up to 2000 ft. in length and 15-ton capacity. The S. FLORY MFG. Co. has been engaged in building and installing these cableways during the past 40 years, and claims to furnish a simple and least expensive outfit, with efficient and satisfactory service.

CO-OPERATIVE SERVICE—Flory cableways are constructed to meet all requirements, and the engineering department is at the disposal of prospective purchasers when such outfits are under consideration.

The Flory cableway catalogue will be sent on request.

REFERENCES—Lists of satisfied users of permanent cableway installations at home and abroad, for quarrying purposes, also temporary cableways for building bridges, dams, sewage plants, etc., sent on application.

FLORY CABLEWAYS INSTALLED BY THE ASBESTOS CORPORATION OF CANADA

View looking over quarry pit toward head towers

Four 800-ton capacity cableways replaced eight of local manufacture and saved two-thirds of the cost of handling one ton of rock

Flory Steam, Electric and Gasoline Hoists.

These apparatus are built to meet every requirement, and are especially adapted for contractors' work, mines and general hoisting purposes. Hoists are made to gage, permitting correct interchangeability of parts. All castings are of selected material and made in the company's plant, metal being properly distributed to protect those parts where greatest strains occur.

DOUBLE CYLINDER, THREE-FRICTION DRUM ENGINE FOR BOOM SWINGING, ETC.

TYPES—Flory hoisting engines are constructed in many types, to cover existing conditions throughout the industrial field, wherever hoisting duties are required to be performed. A few styles may be mentioned.

Stationary; portable; single cylinder, with single or double friction drum; double cylinder—single, double, treble or four-tandem friction drums, single or compound geared, 6-spool erecting, link motion, reversible, non-reversible, swinging, dredging, quarrying or other special type. Flory hoists are built to meet each particular case.

Write for full particulars.

USES—For contracting, mining, pile driving, bridge building, logging, dredging, and any other exceptionally heavy duty, etc.

WERNER BAND FRICTION (PATENTED)—Used exclusively on Flory hoists. It never slips; the friction

without end thrust; distributes strains equally throughout; no counter friction; perfect balance; operated by hand, steam or air.

This band friction transmits its load directly from gear to friction ring on drum, thus eliminating all torsional stress in drum shaft; and it remains "locked" when friction is in or out of contact, causing no strains in bearings or operating mechanism. It consists of a series of levers, double-toggle connected, which actuate rocker shafts (extending through gear and susceptible of motion) to which the bands are coupled. These bands are kept in adjustment by means of turnbuckles.

WERNER PATENTED BAND FRICTION

The method of operation may be either hand or mechanical. If operated by hand a lever is provided in the battery. If mechanical an air or steam

cylinder is mounted on the end of the bearing.

Full particulars sent on application.

CATALOGUE—The hoisting engine catalogue illustrates many types of hoists, giving sizes, capacities, specifications and other useful information desired by the general contractor or engineer.

REFERENCES—Interested persons can be referred to many customers who have during many years used Flory hoists with economy and success.

FLORY SINGLE DRUM, COMPOUND, TWO-SPEED ELECTRIC HOIST

Especially adapted for slopes in mines with variable grades. Equipped with two Werner patent band frictions operated by air and two "Vitabestos" brakes and indicator

SAUERMAN BROS.

Cableway Excavators, Power Scrapers and Fittings

Monadnock Block
CHICAGO, ILL.

Products.

Manufacturers of CABLEWAY EXCAVATORS, POWER SCRAPERS.

Cableway Fittings.

Dragline Cableway Excavators.

USES—The following is a partial list of the classes of work for which Sauerman dragline cableway excavators have been installed:

Excavating sand and gravel from under water and from dry pits.

Loading ballast direct from pits to cars.

Backfilling retaining walls.

Reclaiming ore and coal from stock piles.

Deepening river beds. Building levees and dams. Handling road material. Stripping clay beds and removing overburden.

Removing sand bars, islands and earth dams from rivers. Reservoir construction and cleaning.

FIG. 2. FORWARD DUMP DRAGLINE CABLEWAY EXCAVATOR

DESCRIPTION—The construction and operation of the dragline cableway excavator is as follows:

A bucket and carrier mounted on a slack track cable. This track cable is supported at the power end by a mast or tower, and at outboard end is anchored to the ground or suitable support, so as to form a proper incline for gravity return of the bucket. The track cable is not directly attached to the mast, but to a set of fall blocks at top of the mast, controlled by a lighter cable known as the tension line. The tension line is controlled by rear drum of double drum friction hoist. By letting out or taking in this line, the track cable is lowered or raised. The loading, conveying and dumping of the bucket is accomplished by load line attached to front of bucket and leading through sheave block at top of mast to front drum of hoist.

FIG. 3. DIGGING HARD MATERIAL

FIG. 1. DRAGLINE CABLEWAY AND GRAVEL WASHING PLANT

The operation is simple; the bucket runs back to digging point by gravity, is lowered into pit by letting out tension line, loaded, elevated, conveyed and dumped by taking in load and tension lines alternately. When digging at the mast end and dumping at foot of incline, operation as described above is reversed.

FIG. 4. DELIVERING GRAVEL TO STORAGE PILE

FIG. 5. DRAGLINE CABLEWAY EXCAVATOR DIGGING CLAY AND DUMPING INTO CARS AT LOW END

SIZES—Buckets are built in 6 standard sizes, in capacities of $\frac{1}{3}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, $1\frac{1}{2}$ and 2 cu. yds. Length of spans varies from 200 to 700 ft., the most common length span being from 500 to 600 ft.

Advantages of Sauerman Dragline Cableway Excavators.

Sauerman dragline cableway excavators will dig, elevate, convey the material over a span from 200 to 700 ft. and will dump the material at any point. The four operations, digging, elevating, conveying and dumping, are all performed in a continuous operation without the use of any intermediate machinery, and all operations are under the control of one man. The bucket takes a vertical position in dumping and the discharge is from the front end, which insures a clean and perfect discharge. These excavators will dig equally as well under water as they will in a dry pit.

FIG. 6. EXCAVATING GRAVEL FOR COUNTRY ROADS

SAND AND GRAVEL HANDLING—The cableway is generally installed so as to excavate and deliver all material within its radius direct to screens or bins. After this material has been exhausted the cableway is then

reset at a distance of 500 to 600 ft. from the plant, and a belt or other type of equipment is used to carry the material from the cableway to the screens (Figs. 1, 2 and 4).

The height above the levee and the point at which the material will be dumped from the bucket is under the positive control of the operator. The entire cableway can be moved quickly and easily as the progress of the work requires.

DAM AND RESERVOIR CONSTRUCTION—In dam or reservoir construction a stationary mast or movable tower can be used, depending on local conditions. The mast or tower is located behind the proposed dam. The dam is built up by depositing the material excavated from the proposed basin.

RESERVOIR CLEANING—The same method used in construction of dams and reservoirs is applied to the cleaning of reservoirs, sludge basins and slime basins. Deposit of material in these basins is such that cleaning by ordinary methods is prohibited by expense.

RECLAIMING FROM STORAGE PILES—This cableway is especially efficient in reclaiming old tailings piles, coal storage piles, etc.

USES—For making cuts and fills, rehandling material from storage piles, stripping overburden, and general excavation work.

A cutter edge mounted on runner frame is pivotally and adjustably connected with these hinge plates. This cutter edge, being adjustable and pivoted, is readily adjusted for digging different kinds of soil or other material. When scraper is pulled forward, the runner frame and cutter edge are tilted to digging position automatically.

For light excavation work or rehandling material, the Type "C" scraper is usually employed.

OPERATION—Operated by double drum friction hoist. Front drum operates load cable; rear drum operates “pull back” cable. The load cable generally leads from front drum through a guide block to bridle chains on front of scraper. The “pull back” cable leads from rear drum through guide block to elevated guide block at the far end of the excavation directly back of scraper, and thence to bridle chains on runner frame of scraper.

To operate, scraper is simply pulled back and forth over material to be excavated. To change line of operation, tower can readily be moved on rollers and tail end shifted by moving guide block.

SIZES—The Sauerman power scraper is built in 6 standard sizes, namely, in capacities of $\frac{1}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, $1\frac{1}{2}$ and 2 cu. yds. Other sizes can be built to order as specified. The amount of material handled per hour will depend upon length of haul, speed of engine, capacity of scraper and kind of material. Cost of operation is necessarily low, as the actual operation requires generally only an engineer; or where steam is employed, an engineer and fireman.

Service.

P & H service is as vital and valuable to the man who uses P & H machinery as is the superior construction and design that are a part of every machine made by PAWLING & HARNISCHFEGER CO.

Wearing parts are easy to get at, and a complete stock of repair parts for every P & H machine is always on hand, ready to be shipped; these are important factors to be considered in the purchase of a machine.

BUFFALO HOIST & DERRICK CO.

Manufacturers of Locomotive Cranes and Hoists

129 Erie Street
BUFFALO, N. Y.

NEW YORK OFFICE, 30 Church Street

Products.

LOCOMOTIVE CRANES, STEAM and ELECTRIC HOISTS.
Gasoline Hoists, Derricks, Tractocranes, Horse and
Hand Power Hoisting Machinery, Boom Swingers,
Sheave Blocks, Bull Wheels, Sheaves, Derrick Fittings.
For Clamshell Buckets, see page 72.

Locomotive Cranes.

10-ton, 4-wheel U. S. gauge or 15-in. face tracto-
crane wheels.

Designed for either hoisting operations (using block
and hook or magnet), or for operating a 2-line clam-
shell bucket of the grab bucket type. It will handle a
 $\frac{3}{4}$ -cu. yd. bucket of this type, at a radii of 39 ft. 6 in.
measured from the center of the track. This crane can
also be used for shifting cars as it has ample power to
push or pull a string of 3 or 4 heavily loaded freight cars.

All operations of hoisting, swinging, traveling, rais-
ing and lowering the boom or operating the grab bucket
are performed by power.

The crane has bronze bushed bearings throughout.
All gears and frames are steel casting.

Further information on request.

10-TON 4-WHEEL STANDARD BUFFALO LOCOMOTIVE CRANE
AND 1-CU. YD. BUFFALO STANDARD CLAMSHELL BUCKET
IN USE BY A LARGE BUFFALO STEEL COMPANY

Steam Hoists.

Improved type of engine for use in connection with
general hoisting designed with single, double or triple
drum, with or without boom swinger. Engines are the
modern short stroke type with large steam and exhaust
ports.

Lever is located so operator can handle both
drums without changing his position; foot brakes are
directly under operator.

Cylinders and guides are cast in one piece, being
rigid and strong. Cylinder and crosshead guide bored at
one setting, thereby insuring perfect alignment.

Electric Hoists.

The illustration represents the double drum elec-
tric hoist with the Buffalo latest and most improved
swinger. Hoist is especially designed with single, double
or triple drum and with or without swinger attached.

BROWNHOIST

TRADE-MARK

CAPACITIES—Capacities vary for the different types, and in the table below are given capacities at various radii for one type of crane of each size. Larger and smaller capacities are obtained with different type cranes and different length booms. The cranes can be overloaded anywhere from 15% to 60% of the figures given below before the crane will tip. With outriggers the overload is a still greater percentage of the rated capacity given below.

Brownhoist Locomotive Cranes.

TYPES—These cranes are made in the following sizes: Nos. 1, 3, 4 and 6, and there are several types of each size. They can be operated by steam, electricity or gas engine. The No. 1 and No. 3 sizes are equipped with 4 wheels and the larger sizes are mounted on two M. C. B. standard 4-wheel trucks. Various lengths of booms can be used on the various types.

USES—The cranes can be used for practically all kinds of hoisting work and for handling materials. Some of the uses are handling coal, ore, coke, cinders, gravel, crushed stone, etc., with grab bucket; excavating with dragline or orange peel buckets; driving piles; pulling piling; handling materials with lifting magnet; and with bottom block for handling tubs and miscellaneous loads; and switching cars.

SPEEDS—The cranes are equipped with a pair of high speed engines of large diameter and short stroke. Locomotive crane service requires almost constant starting and stopping of the engines, and the engines on Brownhoist cranes develop full power much quicker than the small diameter engines with longer stroke. Under working conditions the engine speeds run from 100 to 700 r.p.m. On a No. 4 steam crane with fully loaded bucket, the hoisting speed is approximately 200 f.p.m. Hoisting or lowering empty hook on one part line on this crane is about 500 f.p.m. Maximum rotating speed with full load is about 3 to 4 r.p.m. Travel speed with full load on straight level track is approximately 600 f.p.m. Speeds under various conditions will be given on request.

I	7'- 7"	10'	8'- 8"	8'- 8"	10'

For bucket dimensions, see page 65

Traveling Mechanism.

The 4-wheel cranes are supplied with a traveling shaft connected to both axles. On 8-wheel cranes the traveling shaft is connected to one axle on each truck. The shaft is jointed with universal couplings which insure a good mesh of the gears when the crane is traveling on a curve.

The cranes will operate on 60° curves, and also up grades.

Boilers.

The steam cranes are supplied with vertical tube boilers having quick steaming qualities. Each boiler is made to comply with the strictest state boiler laws. The size depends upon the size of crane. Boilers are supplied for coal, coke, wood or oil firing.

CLEARANCE DIAGRAM OF NO. 4 CRANE

Operation.

All cranes are operated and fired by one man. A platform is provided for the operator where he can easily reach all levers and brakes necessary for operation. The platform is elevated so that the operator can have a full view of the work at all times.

Prices.

Prices will be given on the type of crane necessary to fulfill required conditions.

Products.

Manufacturers of LOCOMOTIVE CRANES and their ACCESSORIES, such as BUCKETS, PILE DRIVER LEADS, and STEAM SHOVEL ATTACHMENTS.

Also, Track Pile Drivers and Wreckers.

Standardization of Equipment.

By standardization on the above types of equipment a product unsurpassed for excellence of design, material, workmanship and service has been developed.

The Browning Crane.

The Browning crane is made in various sizes, from 10 to 60 tons. It is self-propelling, carries any length of boom, and revolves in a full circle. All parts are interchangeable. May be equipped with separate rotating engine.

The latest model Browning locomotive crane is a marvel in ease and certainty of operation. All controls are placed directly in front of the operator, where they are at all times under his hand and eye. The operator is so stationed that he always has a clear view of both the bucket and the work. The separate rotating engine means a great saving in time, as it allows three distinct movements at the same time: lifting the bucket, rotating and traveling.

Another leading feature of the Browning crane is the great adaptability. It can be equipped to handle a hook block, an electric lifting magnet, an automatic bucket of any type, a drag scraper bucket, a steam shovel dipper, or a pile driver hammer and leads. All

of these are quickly interchangeable, giving the owner an all-round machine.

Some of the leading mechanical features of the Browning crane, briefly described, are as follows:

The shafting is hammered steel, ground to exact size, no turned journals being used. All bearings are bushed with phosphor bronze instead of babbitt. The track wheels have extra heavy M. C. B. webs and treads. All gears and pinions are of forged steel; those above the rotating base having machine cut teeth. The boom hoist worm wheel is bronze with cut teeth. The worm is open hearth cast steel with finished thread.

All clutches, except the boom hoist, are Browning patent all-steel type. Each working part of the clutches is hardened and ground to size, with ample provision for taking up the wear.

Every part of each Browning crane is tested before it is assembled, and when the crane is completed it is tested again, not only for its capacity, but for overload. The fact that Browning cranes have repeatedly stood up under more than 30% overload tells the story of the care used in designing, building and testing them.

The Browning crane is not limited either by design or manner of operation to any one locality. The Browning crane is in use, not only in the United States and Alaska, but also in Canada, Mexico, Cuba, the Hawaiian Islands, the Philippines, England, France, Spain, Italy, Greece, New Zealand, South America and Russia. The design is so fundamentally sound that it not only stands up under the widely different operating conditions, but is readily understood and economically handled and repaired by the varying types of operators in these countries. The major parts of each crane are interchangeable with every other crane of the same size which this company has built. This shows conclusively that the Browning crane is so designed and built that it is a truly universal crane, and that it is not necessary to build each crane to fit each particular job or country.

FIG. 1. BROWNING LOCOMOTIVE CRANE

THE BROWNING COMPANY is not merely interested in selling cranes, but also in seeing that every buyer gets the best possible service. With each crane is sent a comprehensive book which shows how to best operate the crane for every line of work, so that the utmost volume of work may be done economically. In addition to this the book shows how to order repair parts so that it may be known just what is wanted when the order is received. This helps to ship the part without unnecessary delay, and to give the service to which clients are entitled.

Browning Buckets.

Browning buckets are especially designed by engineers of combined crane and bucket experience for the particular line of work they are to perform, and insure satisfactory performance under the most difficult working conditions. All wearing parts are bronze bushed and carry individual grease cups.

Reeved Type Bucket.

The lightest successful bucket for hard digging. It has great closing power, right up to the point where the jaws come together. Leaves a flat track without lumps or ridges. Can be fitted with steel teeth if required. The sheaves are arranged so that the reeving is adaptable to the material handled—in "loose" digging fewer parts may be used and the speed increased; in "hard" digging the number of parts is increased and greater closing power is attained, insuring capacity loads. The bucket always hangs square (Fig. 3).

Flat Chain Clamshell Bucket.

A quick detachable bucket of splendid digging power. This bucket is similar to the reeved type bucket except in its power mechanism. Instead of securing its closing power direct from the closing cable, the power is transmitted by the large power wheel and flat chains. This design requires but three wraps of the cable around the power wheel, thus permitting the bucket to be quickly unfastened and removed when the crane or derrick is to be used for other purposes (Fig. 4).

Coke Fork.

Handling coke does not permit the use of the ordinary clamshell bucket. This type of bucket crushes the coke to such an extent that the waste prohibits

its use. The Browning coke fork is designed to overcome this condition. Identical with the clamshell bucket in operation and action, the round steel picks, which replace the solid plates, slide into and under the coke with a minimum of breakage. Picks up clean coke only, the dirt and dust falling through the tines.

Originally designed for use at coke ovens and blast furnaces, it has proved equally popular for handling straw, manure and garbage (Fig. 2).

FIG. 2. COKE FORK—OPEN

Wood Grapple.

Designed to solve the problem of handling pulp wood rapidly and economically, it gave such satisfaction that it is now in general use in handling logs, ties and similar material. Similar in principle to a clamshell bucket, the steel scoops are replaced by tough steel tines, correctly shaped to gather and hold the largest load possible. If not required by the material handled, the steel plates with which the tines are fitted (that are so designed as to hold the shorter pieces in the load from twisting and preventing full loads) may be removed (Fig. 5).

Co-operative Service.

The Department of Engineers invites questions on any type of work requiring machinery of this nature. This department will furnish, without charge, trustworthy information, accompanied by photographs when possible. This information, given free, is entirely in the interest of better methods in this field.

Catalogues.

New catalogues of the Browning locomotive cranes and Browning buckets, which graphically show their wide adaptability and economical operation, will be sent free to all who are interested.

THE JOHN F. BYERS MACHINE CO.

Manufacturers of Auto-cranes, Hoisting Machinery and Portable Derricks

270 Sycamore Street
RAVENNA, OHIO

SALES OFFICES IN PRINCIPAL CITIES

Products.

AUTO-CRANES: Steam, Gasoline, Electric, Erection, Grab Bucket, Electric Magnet.

PORTABLE DERRICKS: for special work.

EXCAVATORS: Derrick, Grab Bucket, Drainage, Trench Excavating Machinery.

BUCKETS: Clamshell, Excavating, Grab.

HOISTS: Steam, Gasoline, Electric and Belt.

Ash and Refuse Handling Machinery; Backfillers; Ditching Machines; Car and Wagon Loaders and Unloaders; Pile Drivers; Steam Shovels.

Auto-crane.

A small, compact, high powered steel derrick, or combination locomotive crane, traveling readily on ground to any place it is needed. Light, moderate in price and simple to operate.

Built for travel on road wheels, rail trucks or caterpillars.

Forward and reverse propelling mechanism through spiral steel clutches, by steel roller chain and heavy differential.

Handled by operator instantly by means of conveniently placed levers. One man operates all hoisting drum levers, boom swing and traction.

Rail truck crane built for any gage.

Choice of three kinds of power—steam, gasoline or kerosene, electricity.

Special Features.

Self-propelling; one-man control; spots cars; rehandles materials; hook, skip, magnet, clamshell or orange peel bucket; dragline bucket or steam shovel attachment.

"Tell us the work, and we'll show you an Auto-crane doing similar work."

Guarantee.

One round trip per minute of boom and bucket is guaranteed. This guarantee is conservative and can be easily bettered by a good operator. Byers Auto-crane is guaranteed for one year against defective material and workmanship.

Shipping.

The Auto-crane is shipped set up, ready to work, but with boom and trucks removed. Can be shipped from job to job by rail or travel over streets, as its size comes entirely within railroad and highway clearances.

Catalogue.

Gladly sent on request. Remember, "There's an Auto-crane for your work, too."

Experience and Scope.

INDUSTRIAL WORKS was founded in 1873.

Being pioneer builders of locomotive and wrecking cranes, this company has acquired a fund of practical experience that could come only from having many machines in various kinds of service. "Industrial" cranes of today are the development of this varied experience. Satisfactory service has proved that they are fundamentally correct in design, sturdy in construction, and efficient in operation. In size they range from 2-ton hand operated pillar cranes to wrecking cranes of 160 tons capacity. INDUSTRIAL WORKS has had a good deal of experience building special cranes for special work where no standard machine would fit. This organization is particularly adapted to handle such work.

Locomotive Cranes.

"Industrial" locomotive cranes, steam, gasoline or electrically operated, are made in capacities of from 5 to 60 tons, and with booms from 20 to 125 ft. long. They are mounted on 4-wheel or 8-wheel cars for standard or special gage track, or on boats and gantries.

They are largely employed in railroad operations, bridge building and construction work; in loading and unloading coal, ore, sand, and other bulk material; in handling structural material, machinery and lumber. Being self-propelling, they switch several loaded cars. As used by contractors, they handle forms and concrete material, erect structures, drive piles, and do excavating generally.

These cranes may be used with grab buckets and lifting magnets, or arranged for operating with a dragline bucket, pile driver leads, or a steam shovel dipper arm.

Mechanically, "Industrial" cranes are not excelled. Every crane is made, assembled and tested in the company's extensive shops. All parts of the crane are accessible for easy examination, a large man being able to pass through the machinery part and car to the ground. Absolute interchangeability of parts is assured by the use of jigs and templates at every possible point in the construction. Inconvenient bearings are lubricated through oil pipes. The propelling gears on 8-wheel cars are placed in or out of mesh from the outside of the car body.

The system of clutches and independent drums makes "Industrial" cranes unexcelled for clamshell bucket work. Both drums are independent, and the auxiliary take-up drum for the holding line is entirely automatic in its action, requiring no attention from the

operator. With this drum he can raise the bucket open if desired.

DATA—In general all sizes of locomotive cranes do the same kind of work, the amounts being limited, of course, by their capacities.

The 60-ton capacity cranes are used chiefly for erection purposes; those from 20 to 60 tons for erection work or for handling large quantities of material with a bucket or magnet; cranes from 5 to 20 tons are general purpose machines, being used for all kinds of loading and placing of material.

Locomotive cranes are usually rated according to their maximum capacity at the minimum radius (about 12 ft.).

The following table gives the approximate radius in feet at which various size cranes will handle clamshell buckets full of coal and sand:

	1½-YD. BUCKET				2-YD. BUCKET		
	5-ton	12-ton	15-ton	20-ton	25-ton	30-ton	40-ton
Coal.....	20	25-37	41-46	48-52	49-52	52-54	58-61
Sand.....	18	25-33	36-41	44-48	37-41	42-46	47-51

A 1½-cu. yd. bucket holds approximately 1 ton of coal.

To unload material with a grab bucket from the far end of a modern gondola car, standing on the same track as the crane, requires a 50-ft. boom. In general, the shorter the boom, the easier and faster will be the operation of the crane.

LOCOMOTIVE CRANE AT WORK ON CONSTRUCTION OF LARGE INDUSTRIAL BUILDING

Features of "Industrial" Cranes.

(1) "Industrial" cranes are built complete in our shops.

(2) Each crane is completely assembled and given a full working test before leaving the plant.

(3) Absolute control of all materials used in the construction of product is had through our chemical and physical laboratories.

(4) Heavy duty gears and shafting are heat treated.

(5) Vanadium steel castings are used extensively.

(6) Through bolts with grip nuts, and not stud bolts, are used on all heavy duty parts. Turned bolts are used wherever there is possibility of relative motion.

(7) All gearing is of cast steel or bronze and all except slewing racks and pinions and a few slow moving gears are cut.

(8) All running bearings provided with replaceable bronze bushings. Wearing surfaces of all thrust bearings are separated by bronze washers. There is a bronze collar behind each bevel gear.

(9) Flexible arrangement of auxiliary drum on bucket cranes.

(10) Specially designed clutches, each developed particularly for the work it has to do.

(11) Rollers under the crane are adjustable for wear.

(12) Special trucks built for extra heavy crane duty.

(13) Spur gear propelling mechanism with fewest possible wearing parts.

(14) Heavy rack bolted to car body and efficient brake on rotating motion giving absolute control and obviating the danger of involuntary rotation.

Inquiries.

Inquiries for locomotive cranes should give the following information:

(1) Steam, electric or gasoline operated.

(2) Gage of track, and weight of rails used.

(3) Any unusual clearance conditions.

(4) Maximum load to be lifted.

(5) Radius at which maximum load is to be handled. (Radius is measured from center of rotation of crane to center of gravity of load.)

(6) Maximum radius crane must be capable of maximum load to be handled at that radius and height to which it must be raised.

(7) Nature of work to be done (including propelling service expected) and kind of material to be handled.

(8) Whether a grab bucket or lifting magnet is to be handled and if so, what size.

(9) If magnet is to be handled, whether generating set or plug-in system is to be used.

(10) If electrically operated, state whether current is D. C. or A. C. In either case voltage should be given and if A. C., voltage, phase and cycle.

(11) If electrically operated, whether current will be taken by trolley, plug-in or third rail.

Inquiries for wharf and shipbuilding cranes or other cranes mounted on fixed piers, traveling gantries, traveling piers of the simple raised type, or of portal or semiportal type, etc., should give the following additional information:

(12) Height of revolving crane above rails.

(13) Clearances allowable each side of supporting rails.

(14) Gage and relative levels of the supporting rails for the substructure.

(15) Any special clearances desired under substructure when of the traveling portal or semiportal pier type.

(16) Lowest and highest working positions of hook at maximum and minimum radii.

(17) Fixed or variable radius.

(18) If traveling gantry is desired will revolving crane be fixed upon the same or will it travel along the top?

Products.

ELEVATING and CONVEYING MACHINERY for handling all kinds of materials: Locomotive Cranes; Coal and Ashes Handling Conveyors; Portable Loaders; Belt Conveyors; Slat Conveyors; Link-Belt Roller Chain; Silent Chain Drives; Grab Buckets; Elevator Buckets; Screens; Friction Clutches; Chains and Sprockets; Bucket Carriers; Coal Crushers; Electric Hoists.

Also, Excavating Machinery; Dragline Excavators; Coal Storage Systems for powerhouses, etc.; Coal Tipples, and Coal Washeries; Freight and Package Carriers; Screw Conveyors; Gondola Car Unloaders; Power Transmission Machinery.

Link-Belt Locomotive Crane.

Handles anything: coal, stone, logs, pig iron and structural steel, packages, boxes, etc., weighing from 1 to 25 tons. Can be used as a switch engine capable of pulling 8 standard gondola cars on a straight track. Does the work of from 20 to 40 laborers.

DISTINCTIVE FEATURES—Steel gears and bronze bushings throughout; one-point adjustment on clutches; few parts, every one accessible; large roomy platform for operator, everything handy; exceptionally large factor of safety used; the only crane with foolproof safety device on swinging mechanism.

Reliability, the most desired quality in any locomotive crane, will be found in Link-Belt cranes, coupled with speed and ease of operation.

LINK-BELT LOCOMOTIVE CRANE
Note simplicity and compactness

LINK-BELT TYPE "AE" GRAB BUCKET
For handling abrasive materials such as gravel and sand

LINK-BELT LABOR-SAVING ELEVATORS AND CONVEYORS
Increase production, save labor and promote general efficiency

LINK-BELT WATER INTAKE SCREENS

MALLEABLE IRON ELEVATOR BUCKET

EWART DETACHABLE LINK-BELT

FLINT-RIM SPROCKET WHEEL
For durability

LINK-BELT SILENT CHAIN
For high speed power transmission

ELECTRIC HOIST WITH OPEN TRAILING OPERATOR'S CAGE

LINK-BELT BELT CONVEYOR
For handling all kinds of material

LINK-BELT PORTABLE LOADER
Loads a ton of any loose material a minute

LINK-BELT COAL CRUSHER
For reducing coal to size required for stokers. Made in many types and sizes to meet all requirements.

PECK OVERLAPPING PIVOTED BUCKET CARRIER
For handling coal and ashes, stone, gravel, etc.

OHIO LOCOMOTIVE CRANE CO.

Iron Street
BUCYRUS, OHIO

Products.

LOCOMOTIVE CRANES.

Facilities.

OHIO LOCOMOTIVE CRANE Co. is the only concern in the country today devoting its time and attention exclusively to the manufacture of locomotive cranes.

The company's factory buildings and equipment are modern and its facilities for turning out locomotive cranes are unsurpassed. These cranes are completely built in the company's shops which include grey iron, steel and brass foundries and a large well equipped machineshop.

Adaptability.

Ohio locomotive cranes are constructed in such a manner that possibilities of application to various classes of work are unlimited. Cranes are made in a wide variety of types, and can be operated by steam, electricity, compressed air, oil or gasoline engines, and can be furnished in capacities ranging from 5 to 50 tons.

Ohio cranes are largely employed in industrial plants, railroad operations and construction work.

They can be equipped with a bucket for handling sand, gravel, crushed stone, slag, coal, sugar beets, ore, dirt, etc.; with a generating set and lifting magnet for handling scrap iron, castings, bars, etc.; with a dragline

Shafts are made of forged steel turned to proper size. The boom, sluing and hoisting clutches used are of the cone friction type. The traveling clutch is of the multiple disc friction type, requiring adjustments at very wide intervals and being a very powerful and simple design.

All gears are made of steel, excepting the worm gear on the hoist boom which is made of bronze. All gears have teeth cut from the solid with the exception of the rotating rack and the slow motion propelling gears, and all have machine cut teeth.

Of the castings employed, 90% are open hearth steel, 7% are iron and 3% are bronze.

25-TON CAPACITY, 8-WHEEL CRANE, PENNSYLVANIA STEEL CO., STEELTON, PA.
Equipped with orange peel bucket

bucket for rapid excavation; with a fall block and hook for all general hoisting purposes; with pile driving attachments for driving pile, and can be used as a switching engine.

Construction.

The main base supporting most of the mechanism is one large steel casting, to the sides and rear of which are securely fastened by rivets a structural steel frame supporting the boiler, forming a rigid construction which insures against breakage.

All the bearings used are of the very best quality of bronze. The shaft-shell bearings are of the same size and therefore interchangeable. A feature incorporated in no other make of crane.

20-TON CAPACITY, 8-WHEEL CRANE, WILKOFF IRON & STEEL CO., YOUNGSTOWN, OHIO
Used for handling heavy material about their scrap yards. Equipped with magnet and generator

Catalogues.

It is impossible to give an adequate description of the construction and the scope of utility of the Ohio locomotive crane on this page. The company's own catalogues, giving full particulars, will be gladly furnished on request.

20-TON CAPACITY, 8-WHEEL CRANE, NILES SAND, GRAVEL & ROCK CO., NILES, CAL.
Equipped with oil burner and Hayward bucket for storing and loading crushed rock

Products.

STEAM, ELECTRIC and GASOLINE HOISTS for contractor's work, derrick work, grab bucket work, shafts, coal and freight handling, mines, quarries, dredges and excavators; CABLEWAYS and CABLEWAY EXCAVATORS.

Steel and Wood Derricks and Derrick Fittings, Ballast Unloaders, Ship and Dock Winches, Steering Engines, Towing Engines, Logging Machinery.

Experience.

Since 1873 this company has devoted itself exclusively to the manufacture of hoisting and hauling machinery, and the Lidgerwood machinery of today embodies every improvement in design and construction suggested by this long experience.

This company equips its electric hoists with the types of motor best adapted for the work to be done by the hoist, and is prepared to equip both electric and steam hoists with the latest type of automatic control and safety devices.

Lidgerwood Hoists.

It is the practice of the LIDGERWOOD MANUFACTURING Co. to design the complete machine to operate under the maximum service it is built to perform, and to build every part of the machine to meet the strain of working at its full capacity.

Drums are built of the friction, clutch and fixed types. The friction drums, both cone and band type, have the patented cork inserted friction woods, which greatly increase their holding capacity.

Two types of contractors' hoists are shown: a double drum steam hoist, without boiler for derrick work, and an electric hoist for 3-line derrick operating

ing a grab bucket, the hoist having 3 drums and the Lidgerwood patented swinging gear for operating the bull wheel that swings the derrick.

The steam, electric and gasoline hoists are built in single, double, and triple drum types—the double and triple drum hoists can be fitted with the boom swinging gear. Steam hoists are built in all styles both with and without boilers. Electric hoists are fitted with either direct or alternating current motors. The company has standard hoists built for every ordinary hoisting service required in contracting, building, industrial plants, mast and gaff rigs, warehouse and dock work, pile driving, derrick work, operating grab buckets, excavating and dredging, mining and quarrying.

In addition to the standard sizes and styles, the LIDGERWOOD MANUFACTURING Co. is equipped to build steam hoists of special types up to 1000 h.p. and electric hoists in any size for all hoisting work.

THREE-FRICTION DRUM ELECTRIC HOIST WITH BOOM SWINGING GEAR

In requesting estimate, state what power is to be used—if steam, whether boiler is to be supplied with the hoist, if not, what steam pressure is available at throttle; if electric, give voltage if direct current, and voltage, cycle and phase if alternating. State either the maximum rope pull on single line, or, if block and tackle be used, give maximum load and number of parts of rope to be used, giving a general description of the work to be done.

Lidgerwood Cableways.

Lidgerwood cableway is a hoisting and conveying machine, capable of carrying single loads up to 30 tons over spans of 2000 ft. without intervening supports. They have stationary or traveling towers. They handle loads in slings, plain or automatic dumping skips, and operate clam, orange peel, or scraper buckets for excavating.

Cableways are valuable in constructing dams, bridges, filtration beds, and for open pit mining, quarrying, and excavating over wide areas.

NOVO HOISTING OUTFITS: Reversible or Non-reversible, Single or Double Drum, One or Two Speeds.

Novo Double Platform Elevators.

For Novo Gasoline Engines and Pumping Outfits, see pages 764-65; for Novo Air Compressor Outfits and Saw Rigs, see page 786.

Type DH Hoisting Outfits.

High grade single or double drum hoists can be furnished in practically any combination, reversible or non-reversible, single speed or double speed. Cast iron frame in sections, with heavy I-beam base. All cut gears with wide face and large teeth. Bearings on gear drums and sheaves bronze-bushed. Double cone or V-type wood friction to give greatest possible friction surface; wide brake bands having maximum angle of contact. Equipped with either niggerheads or sheaves, or one of each. Gear guards throughout. Furnished with 8, 10, 12, or 15 h. p. Novo engines of 1200-lb. to 4300-lb. capacities. This DH type

series of hoists in its various combinations is suitable for any hoisting work up to 15 or 20 h.p.

Single Drum Non-reversible Type OH Hoist.

This outfit is suitable for light pile driving and ordinary contractors' hoisting with gravity drop. The cable drum is loose on shaft and is engaged by strong friction clutch for hoisting and by a brake band operated by a foot lever for holding and lowering the load.

FIG. 1465. NOVO TYPE OH SINGLE DRUM NON-REVERSIBLE HOIST

Single Drum Reversible Type T Hoists.

These outfits are suitable for double platform material elevator work and all around general hoisting. They are equipped with friction clutch and large brake controlled by foot lever to hold load when clutch is disengaged.

GRAB BUCKETS and COUNTERWEIGHT HOLDING DRUMS.

A line of Contractors' and Coal Dealers' Machinery including Floating, Portable and Tower Cranes; Steam and Electric Hoists; Mast and Gaff Hoist Fittings and Sheaves; Coal and Ore Hoisting Engines; Coal Car Cable Hauling Engines; Automatic Dumping Coal Cars; Coal and Ash Bins; Coal and Sand Cut-off Valves; Coal and Ash Gates and Chutes; Revolving and Shaker Screens; Tiering Machines; Unloading Towers; Industrial Railways.

For Loaders and Unloaders, see page 901.

TRADE-MARK

most hoisting engines are capable of making two trips per minute; and since these buckets are built in capacities from $\frac{1}{4}$ cu. yd. to 3 cu. yds., it is easily calculable what amount of material per day the Haiss "Contractor" grab bucket can handle. Two hoisting cables control the bucket operations.

DESCRIPTION—All Haiss grab buckets are constructed of heavy plate steel and steel castings. In the "Contractor" bucket, shown here, steel flat-link side chains are used. By rolling up on the hubs of the large closing wheel, these chains provide a 1:4 closing power ratio. The "High-Power" grab bucket, also shown, however, depends on the "block and fall" principle of cable reeving for drawing the two halves of the bowl together. A 1:7 closing power is thus obtained, and gives this particular bucket a powerful penetrating effect. Teeth can be bolted onto the jaws of all Haiss buckets.

The Haiss "High-Power" grab bucket should be used for hard digging, such as clay, ore, and heavy earth excavation when made either above or under water.

Haiss Type "Contractor" Grab Buckets.

USES—Haiss type "Contractor" grab buckets are used for automatic digging from sand and gravel banks, crushed stone piles, and for unloading hard and soft coal, coke, sand, stone, ore, chemicals, etc., from boats and railroad cars. They are also employed for excavating and dredging canals, making railroad embankments and dams, and for other purposes when labor and time can be reduced in construction work.

ADVANTAGES—In the first place, a Haiss "Contractor" grab bucket digs, loads and discharges mechanically; and in the second place, being attached to any type of derrick or crane, the load of material which it has dug may be raised from almost any depth to any reasonable height, and swung or carried to a near or distant point before discharging its load. Under usual working conditions

Holding Drum—This drum controls the holding cable fastened to the top of the grab bucket. It takes the place of an extra drum on a hoisting engine and takes up automatically by means of a counterweight the slack in the holding cable when the closing cable is hoisting the loaded bucket. Full explanation for rigging this drum free on application.

Products.

BLAW BUCKETS for every kind of service in which clamshells can be used with economy; BLAW AUTOMATIC SINGLE ROPE CABLEWAY APPARATUS.

For Blaw Steel Forms, Structural Steel, Plate Work, Knox Water Cooled Appliances, etc., see pages 102-103.

Blaw Single Line Buckets.

A Blaw Single Line bucket, operated with a single hoisting drum, can be hooked on the block of any crane, derrick or other hoist as easily as a sling, requiring no change whatever in the lines or machinery, to make the rig ready for clamshell work. When the bucket work is completed, slip off the closing line yoke and the crane is left free for other service.

The bucket can be reeved direct to operating drum for continuous service either for direct hoist or for operation in the "bight of line."

Blaw Single Line buckets give great closing power, not only economically handling coal, sand and other loose bulk materials, but also are in successful use excavating, cleaning out "skull cracker" pits and handling materials requiring heaviest bucket equipment.

No locks, catches, or other sliding parts to wear and give trouble. A powerful, effective tool built for hard work in use throughout the country in railroad yards, power plants, steel mills, foundries, sand pits, industrial plants, on construction work, etc.

Carried in stock in a great variety of sizes and

TRADE-MARK

weights from $\frac{1}{2}$ yd. (weighing 2000 lbs.) up to high power buckets weighing 11,000 lbs.

Blaw Speedster Buckets.

Designed for rehandling at high speed and with greatest economy, all classes of loose bulk materials such as sand, gravel, cinders, granulated slag, coal, etc. Require one closing line and arranged for either one or two holding lines.

A highly developed lever-arm type clamshell, reeved (internally) with 3-part closing line and automatic bell crank. Lines run absolutely straight from sheave to sheave; are entirely free from "S" bends and effectively guarded from the material in which the bucket is working. These features, together with an improved arrangement for leading rope into head of bucket, accomplish a great saving in wire rope wear.

The Speedster is built of sturdy, substantial, annealed open hearth steel castings and well designed steel forgings. The design accomplishes rigidity at head and scoop-hinge centers by reducing wear of parts to a minimum.

The automatic bell crank accomplishes two things; gives extra power at the beginning of the closing stroke and acts as a shock absorber when bucket is dumping.

Lubrication is provided for at points of motion by means of submerged screw plugs forcing in heavy grease. This is standard practice on all Blaw buckets.

Blaw Power-wheel Buckets.

By an ingenious mounting of the "bull-wheel" above the axis of the main hinge, this company has produced in the Blaw Power-wheel, a light but powerful clamshell bucket especially desirable on light portable derricks, cranes and excavators.

The bucket opens away out, yet the power wheel is well out of the material being handled. An unusually large power wheel is used, giving great closing power to the scoops with consequent enhanced pick-up ability. Equipped with teeth, these buckets are aggressive dig-

BLAW POWER-WHEEL BUCKET UNLOADING ROAD BUILDING MATERIALS FROM CARS

gers. As the bucket closes, the wheel tucks over to one side under the head, thus lowering the headroom clearance. This is an important gain on short boom machines.

For general rehandling of concrete aggregates, coal and other bulk materials, as well as on sewer and trench excavating, the power wheel has exceptional pickup capacity. The most powerful and effective bucket of its weight yet offered to the construction man.

Carried in stock in $\frac{1}{2}$ -, $\frac{3}{4}$ - and 1-yd. sizes for single or 2-part holding-line operation.

Blaw Automatic Single Rope Cableway Carriage.

Either standard carriage type of Blaw automatic single rope type cableways can be readily equipped for clamshell bucket operation by replacing the fall block with a Blaw Single Line bucket with tail sheave. No additional lines or changes in the hoist are needed. The low cost, ease of operation, and wide range of adaptability of this class of apparatus, equipped with an automatic digging and dumping bucket, make it extremely attractive for many types of construction work and

especially for rehandling materials over spans of 100 ft. or more.

The Blaw automatic single rope cableway, operated with a standard single drum non-reversible hoist, handles a Blaw Single Line bucket and forms ideal equipment for digging and transporting materials over long distances and serving storage piles covering large areas.

This company is prepared to equip existing cableways using tubs, skips or dragline buckets with every thing needed for clamshell bucket work.

Blaw Bulldog Buckets.

A powerful lever arm bucket built to handle broken rock, heavy ores, broken slag and similar refractory materials. Reeved internally with a 5-part closing line acting on end of lever arm, giving an extremely powerful closing stroke.

Carried in stock in sizes from $\frac{3}{4}$ to 3 cu. yds. Larger sizes on short notice.

BLAW BULLDOG BUCKET REHANDLING BLAST FURNACE SLAG

Blaw Four-line Buckets.

Built in sizes from 1 to 8 cu. yds. for coal and ore bridges, cranes and other rigs requiring either or both holding and closing line to "fleet through" the bucket. Very low headroom, light in weight, and of the power wheel type. Built in a variety of sizes from 1 cu. yd. up.

Blaw Dredger.

Like the Bulldog, a lever-arm bucket reeved for an extremely powerful closing stroke. Scoop and hinge arrangement designed with especial reference to quick dumping, making bucket more suitable than the Bulldog for handling sticky clay. The scoops have high "water level" capacity and are shaped to dig easily and rapidly. These buckets are used also for handling broken rock, ores, etc.; special attention has been given in the design to protect operating cables from wear and abrasion against materials bucket is handling.

The Blaw Dredger is built throughout in the heaviest and most substantial manner; all castings are open hearth annealed steel designed with special reference to securing rigidity at head hinge and scoop hinge centers. Corner bars are solid forged from soft steel ingots. There are few moving parts in bucket as in all other Blaw buckets; renewable bushings are provided wherever motion occurs.

Stock sizes run from $\frac{3}{4}$ yd. up. Complete specifications on request.

BROWNHOIST GRAB BUCKETS.

Storage Bins; Transfer Tables; Water Closet Shields; Ferroinclave, a combined Reinforcement and Centering for concrete roofs, sides, stairs, bins, floors, etc.

For Locomotive Cranes, Traveling Cranes, Hoists, Bridge Tramways and Trolleys, see pages 48-49; for Suspended Bins, Coal and Ash Handling Machinery, see page 891.

Brownhoist Grab Buckets.

These buckets are made to dig in coal, gravel, sand, crushed stone, cinders, ore, etc., and will excavate in ordinary soil. The excavating bucket is for excavating in stiff materials.

A grab bucket is usually subjected to extremely hard usage on account of the high rate of speed at which it is handled, and therefore the Brownhoist grab bucket has been made very strong in all parts, as will be seen in the illustrations. The bucket is so designed that it does not have to be dropped onto the material with pile hammer force to insure its filling. This results in the least damage to cars, boats, trucks, etc., and also saves wear on the bucket. Another important feature of this bucket is the wide spread of the spades when open, which gives a greater digging power than a bucket of same capacity but with a shorter spread of the spades. The ropes and sheaves are fully protected from the material being handled. The spades can be removed when worn and new ones applied.

FIG. 2. BROWNHOIST SINGLE-ROPE BUCKET

Equipped with trip lever operated by rope leading to ground or crane cab. When lever is tripped, bucket spades open and load is dumped.

BROWNHOIST

TRADE-MARK

Types.

There are the several types of Brownhoist patent grab buckets as shown, and the Contractor's type bucket and the Dragline bucket. There are two types of grab bucket: the two-rope, Fig. 1, and the single-rope, Fig. 2. The single-rope bucket is of similar design and construction to the two-rope, the only difference being in the operating mechanism.

Operation.

The two-rope bucket can be operated on any two-drum machine. The two ropes, the closing and the holding ropes, are so spaced that there is little tendency for the bucket to twist while being hoisted and lowered.

The bucket spade arms are attached to a crosshead which is operated up and down on the inside of the bucket by the closing rope. This opens and closes the spades. To dump the bucket, the holding rope is held fast and the closing rope payed out which permits the spades to open.

FIG. 1. BROWNHOIST STANDARD TWO-ROPE GRAB BUCKET FOR HANDLING COAL, COKE, CRUSHED STONE, CINDERS, ETC.

Bucket made a little heavier for working in ore, limestone and other heavy materials

FIG. 3. BROWNHOIST EXCAVATING BUCKET OF HEAVY CONSTRUCTION

Has greater digging power by reason of being somewhat narrower and having wider spread

Brownhoist Contractor's Type Bucket.

Designed especially for working in sand, gravel, ashes, slag, etc. All bearings fitted with keyed bushings of manganese steel, which withstand the cutting tendency of fine particles of sand, etc. Digging edges are of manganese steel and can be easily removed when worn.

FIG. 6. BROWNHOIST CONTRACTOR'S TYPE BUCKET

FIG. 7. DIAGRAM OF CONTRACTOR'S TYPE BUCKET
Showing dimensions. See table

Brownhoist Dragline Bucket.

A back-dumping bucket. It is operated by two lines, dragline and hoistline.

All standard buckets are equipped with steel cutting edge and two-part teeth. Each tooth is tipped with a manganese steel point. There are three types of points—which one to use depends upon whether the bucket is to work in loose digging, hardpan, or rock. Inquiries must state the class of work.

THE HAYWARD COMPANY

Manufacturers of Orange Peel and Clam Shell Automatic Buckets, Drag Scraper and Electric Motor Buckets

Hudson Terminal Building
NEW YORK, N. Y.

Products.

ORANGE PEEL BUCKETS, CLAM SHELL BUCKETS, DRAG SCRAPER BUCKETS, ELECTRIC MOTOR BUCKETS, HAYWARD COUNTERWEIGHT DRUMS, GRAPPLES.

Skid Excavators, Coal Handling and Dredging Machinery.

Service.

The automatic bucket—originally considered a digging or loading machine—has developed a much wider field and today is also part of the conveying and rehandling systems of foundries, steel mills and power plants.

No single machine has been more generally adopted in the universal effort to handle bulk material more economically by mechanical means.

The succeeding pages merely suggest a few of the many applications of Hayward buckets to construction and industrial problems.

These typical examples may in some instances parallel conditions existing in your plant and hence demonstrate sufficiently the adaptability of Hayward buckets. If not, the Hayward engineers will be glad to co-operate in solving material handling problems most efficiently and economically.

Bulletins on particular classes of work, and recommendations on individual problem will gladly be sent without the request incurring the slightest obligation. Forty years of bucket building experience and ample manufacturing facilities are at your disposal.

No. A-2456. HAYWARD ELECTRIC MOTOR BUCKET
Rehandling fuel in a boiler room from car to bunkers

No. A-904. HAYWARD CLASS "E" CLAM SHELL BUCKET
On a mast and gaff rig, unloading coal from barge and dumping into hopper

HAYWARD ELECTRIC MOTOR BUCKET
In railroad ash pit service

No. A-2648. HAYWARD ORANGE PEEL BUCKET
Excavating material from within a caisson as it is being sunk

No. A-2358. HAYWARD 3-SIDED ORANGE PEEL BUCKET WITH CUT-OFF BLADES
Handling a boulder larger than itself

No. A-1645. HAYWARD CLASS "H" MULTI-POWER CLAM SHELL BUCKET (1½ CU. YDS.)
Working between sheeting 10 ft. apart and digging in sand, loam and gravel

No. C-495. HAYWARD ELECTRIC MOTOR BUCKET (3 CU. YDS.)
Loading broken open hearth slag into cars

No. A-1675. HAYWARD CLAM SHELL BUCKET WITH ORE BOWL
Rehandling contractor's materials. Note the clean, accurate dump

No. C-355. HAYWARD CLAM SHELL BUCKET
Unloading crushed stone from barges

No. A-1927. HAYWARD CLAM SHELL BUCKET WITH ORE BOWL
Fitted with teeth for digging in hard packed sand or other compact materials

No. A-1584. HAYWARD SPECIAL CLAM SHELL BUCKET (2-TON CAPACITY)
Operating on bridge with 180-ft. span, unloading coal

No. A-1839. HAYWARD DRAG SCRAPER BUCKET
Digging in hard-pan. Note the full load cleanly carried

No. A-794. HAYWARD STANDARD ORANGE PEEL BUCKET

A 2-line bucket for general contractors' use. Recommended for dredging, excavating and rehandling bulk materials. Sizes from 2 cu. ft. up

No. A-798. HAYWARD MULTI-POWER ORANGE PEEL BUCKET

An extra heavy digging bucket with a 2-part side chain which gives nearly 60% more penetrating power. Sizes from 2 cu. ft. up

No. A-2595. HAYWARD 3-SIDED ORANGE PEEL BUCKET

Designed primarily to handle blasted rock and other hard and odd-shaped material, but is also an all around digging bucket. Sizes from 21 cu. ft. up

No. A-2503. HAYWARD ROPE REEVED ORANGE PEEL BUCKET

The latest model of the original Hayward bucket. Closing power is varied to suit conditions. Arranged to close by 3, 4, 5, 6 or 7 parts of line and to be operated in the bight of the line or direct. Sizes from 21 cu. ft. up

No. D-939. HAYWARD DWARF ORANGE PEEL BUCKET

A hand-operated miniature of the large orange peel buckets. Will dig inside a 12-in. pipe—the depth only limited by the length of the operating lines. Sizes from 100 cu. in. to 1 cu. ft.

No. A-1943. HAYWARD EXTRA HEAVY 3-SIDED ORANGE PEEL BUCKET WITH CUT-OFF BLADES

The heaviest type (outside of special buckets) of orange peel, made for handling rock and specially reinforced for severe usage

No. A-159-a. HAYWARD GRAPPLES

Made in various styles for handling irregular-shaped bulk material such as logs, stumps, sugar cane, tin scrap, cord wood and similar uneven material

No. A-947. HAYWARD COUNTERWEIGHT DRUM

Takes the place of an additional drum on the engine. Is not connected to hoisting engine so may be placed in any convenient location for leading the holding line to the bucket and the counterweight line to the counterweight. Band brake operated by foot or hand lever

No. A-2565. HAYWARD CLASS "E" CLAM SHELL BUCKET WITH REGULAR BOWL

The light "E" bucket is recommended for handling coal and other light, loose materials; the heavy "E" for dredging. The shape of the bowls allows a gradual yet rapid discharge. Sizes from $\frac{1}{2}$ cu. yd. up.

No. A-719. HAYWARD CLASS "E" CLAM SHELL BUCKET WITH ORE BOWL

In proportion to size, ore bowl buckets carry larger loads and will dig harder materials than regular bowls, owing to their shovellike shape. Sizes from $\frac{1}{2}$ cu. yd. up

No. A-1037. HAYWARD CLASS "H" CLAM SHELL BUCKET

Has 60% more closing power than a Class "E" bucket and thus is slower, but the penetration is much greater and there is less tendency to lift while closing. Sizes from $1\frac{1}{2}$ cu. yds. up

No. A-1323. HAYWARD CLASS "G" CLAM SHELL BUCKET WITH ORE BOWL

A rope reeved bucket. May be operated in bight of the line and practically twice the load handled without increasing size of hoisting engine. Advantageous on cableways, as no headroom is lost. Sizes from $\frac{1}{2}$ cu. yd. up

No. A-1599. HAYWARD SCRAPER CLAM SHELL BUCKET

Recommended for handling iron ore, pumped sand and other densely packed and heavy materials. Fills with but little material under the bucket, gathering its load by a combined digging and scraping movement. Sizes from $2\frac{1}{2}$ cu. yds. up

No. A-2377. HAYWARD ELECTRIC MOTOR CLAM SHELL BUCKET WITH ORE BOWL

Can be hung on a crane or any hoisting apparatus. Bowls are electrically operated with self-contained mechanism. Works within its own height. Digging and discharge under control at every stage. Sizes from $\frac{3}{4}$ cu. yd. up, with A.C. or D.C. motors

No. A-1340. TEETH FOR HAYWARD CLAM SHELL BUCKETS

Made of steel. Recommended for handling some materials in their natural state. Can be attached to all styles and sizes of Hayward clam shell buckets with ore bowls

No. A-1232. HAYWARD DRAG SCRAPER BUCKET

May be operated on almost every type of machine with double drum engine. Can be adjusted to enter material at any angle—and has no rigid bale or bridle in the bucket, hence nothing to break if it lands on side or top. Sizes from $\frac{3}{4}$ cu. yd. up

FOUNDED 1873

POWER WHEEL, HIGH POWER and MULTIPOWER
CLAMSHELL BUCKETS.

For Locomotive Cranes, see pages 54-55.

"Industrial" Power Wheel Bucket.

Owing to the simple and direct application of the opening and closing forces, this bucket is, without exception, the fastest operating bucket on the market today. It is extremely simple in design, which allows great strength, durability and rigidity with a moderate weight. At the same time no other bucket of the power wheel type has greater digging power.

This bucket is recommended for rehandling coal, gravel, sand, sugar beets, etc.

The power wheel type has many inherent advantages over other types of buckets. It may be rapidly attached or detached from the crane operating it. It is remarkably economical of hoisting rope, as one crane hoisting rope is fastened externally to the bucket head and the other hoisting rope winds about the large diameter power wheel and is guarded with roller guards against any possible chafing. The closing chains are round iron close link chains that can be repaired or renewed by any blacksmith.

This bucket is recommended as simple, safe and economical in operation. It will give a maximum of results with a minimum of repairs.

KEYED ILLUSTRATION OF POWER WHEEL BUCKET

SPECIFICATIONS—A—Hardened steel bushings in lower ends of connecting rods. (All wear is concentrated upon easily removable bushings.)

B—Patented steel rope guard extending completely around power wheel to prevent any possible fouling of closing line with consequent loss of time. Guard is made in halves and is large enough to allow spliced thimbles or open socket to pass through it.

C—Large heavy power wheel, bushed.

D—Heavy steel connecting rods, thoroughly braced to maintain proper alignment of bucket parts.

E—Hard alloy steel idler sheave, bushed.

F—Closing line, guarded at every point against chafing.

G—Opening line does not enter bucket.

H—Three roller rope guards about idler sheave.

I—Anchor pin for opening line, may be used with opening cable equipped either with thimble spliced in end or with open socket.

J—Hardened steel bushings in upper ends of connecting rods.

K—Best quality round iron chain, close link "dredge" type.

L—Patented crescent shaped equalizer distributes closing force between the two sides of chain and leads chain into grooves in power wheel hub. These grooves are arranged so chain leads into them with no unnecessary friction and greatly lengthens the service life of chains.

M—Steel shaft bearings. Note shaft is pinned to outside bearings to concentrate all wear on bushings in inner bearings.

N—Rigid braces to hold connecting rods in alignment.

O—Tagline connection that can be shifted to hold bucket at different angles.

P—Heavy cast steel corner brackets.

Q—Plate reinforcements scientifically located.

R—Simple way of fastening rope. Either spliced thimble or babbitted open socket may be used on closing line and either will pass all rope guards except at idler sheave. Rope clamps, not necessary but may be used. Bucket can be attached to or removed from crane ropes in 3 minutes. Only 3 pins need be removed (R, I, and pin in idler sheave E) and ropes are entirely free from bucket.

S—Replaceable hard alloy cast steel cutting edges.

PATENTED "ALL AROUND" ROPE GUARD

PATENTED ARRANGEMENT OF EQUALIZER AND GROOVES FOR THE CHAIN

1 cu. yd.	6'-5"	5'-4"	3'-5"	7'-2"	7'-9"	3000 lbs.
1½ cu. yd.	7'-8"	6'-1"	3'-10"	8'-4"	9'-1"	3900 lbs.
2 cu. yd.	7'-11"	6'-2"	4'-8"	8'-6"	9'-8"	4800 lbs.

“Industrial” High Power Scraper Bucket.

This powerful bucket is of the scraper type and gathers its load by a combined digging and scraping action.

It is especially efficient in heavy ore, crushed stone, large lump coal, large producer coke, and water packed material, as it is one of the most powerful buckets in use, and shows no tendency to lift while closing. With the addition of hard alloy steel teeth it is available for severe excavating duty and will then operate in heavy clay, hardpan and other difficult materials.

ADVANTAGES—There are many advantages over buckets of the scraper type: (1) In the position of operating ropes and sheaves, as they are kept very high and out of the way of the material. (2) In the great power transmitted to edge of the blades, which increases as bucket is being closed; this brings the greatest crushing strength at the instant of closing and enables it to handle successfully materials impossible for ordinary buckets. (3) In the simple opening and closing mechanism that avoids the usual complicated link work. (4) In the increased speed of operation due to efficient arrangement of the cast steel connecting rods, which in closing force blades together rapidly and in opening pull them quickly to a dumping angle.

Trays are of flange steel with replaceable hard alloy steel shoes for cutting edges. Buckets are designed to concentrate all wear on the replaceable bushings, making renewals an easy and inexpensive matter. Rope sheaves are of hard alloy steel with finished treads and faces and are bronze bushed. A valuable feature is the complete system of rope guards to keep the rope in place and to reduce wear on it to a minimum. At the top of the bucket where the closing line enters, there are roller guards, so that from whatever direction the rope is pulled it can not rub. Special arrangements of holding lines may be provided for use on ore and coal bridges, traveling cranes, etc.

“INDUSTRIAL” HIGH POWER SCRAPER BUCKET						
Capacity	Closed		Width	Open		Approximate weight
	Height	Length		Height	Length	
¾ cu. yd.	7'-0"	6'-0"	3'-3¼"	6'-6"	8'-2¼"	3500 lbs.
1 cu. yd.	7'-10"	6'-0"	4'-2¼"	6'-6"	8'-2¼"	3800 lbs.
1½ cu. yd.	8'-0¾"	6'-0½"	4'-3"	6'-7¼"	8'-7½"	4300 lbs.
2 cu. yd.	8'-6½"	6'-8"	4'-3"	6'-10⅞"	9'-5½"	4700 lbs.

“Industrial” Multi-power Bucket.

This multi-power bucket has been developed from the power wheel type of which the most important advantages have been retained and about one-third greater digging power added.

It is recommended for general service in run-of-mine and lump coal, packed sand and gravel, crushed stone and for emergency light excavating duty. It ranks midway between the other two types in digging power.

The “M-P” bucket is of the rope reeved type, but the hoisting ropes from the crane are not reeved back and forth inside the bucket mechanism. A short piece of rope entirely separate from the crane ropes is used. The bucket can be attached to or detached from the crane in 3 minutes.

Practical men will be attracted by the fact that this bucket operates entirely with wire rope, requiring inside the bucket a short piece which can be readily replaced when necessary.

Other attractions are the large diameter sheaves used, the small compact operating mechanism, the substantial appearance and the great closing power.

All “Industrial” features are maintained as to material, rigid bracing, concentration of wear upon renewable bushings and hard alloy steel renewable cutting edges.

The all around rope guard for the crane rope on the power wheel is a feature of this bucket, although removed to show the operating ropes in illustration below.

“INDUSTRIAL” MULTI-POWER BUCKET

BUFFALO HOIST & DERRICK CO.

Manufacturers of Clamshell Buckets

129 Erie Street
BUFFALO, N. Y.

NEW YORK OFFICE, 30 Church Street

Products.

CLAMSHELL BUCKETS.

For Locomotive Cranes and Hoists, see page 47.

Service.

The Engineering Department of this company will co-operate and place at the client's disposal its experience and service where problems involving a special type of bucket may arise.

Buffalo Buckets.

The Buffalo clamshell bucket is the result of a thorough scientific study by a corps of engineers building buckets for the past 20 years, and its remarkable efficiency is obtained conjointly with this fact and the embodiment of practical contractors' ideas.

These buckets are manufactured in two main types that cover the general needs of the contractor. Other types are also manufactured for special uses.

The Buffalo equalizing arm is the predominating feature in all types of Buffalo buckets. It causes the scoops to travel with uniform speed, thereby increasing

the efficiency of the bucket and insuring a maximum capacity.

STANDARD TYPE—This type bucket is suitable for handling coal, sand, gravel and similar material.

Made in capacities from $\frac{1}{2}$ to 3 cu. yds.

MONARCH TYPE—This type bucket is suitable for handling and digging hard clay, slag, frozen limestone and for all other purposes requiring a powerful heavy digging bucket.

The teeth on this bucket are forged steel and are bolted in place, so that they can be easily removed when not needed.

Made in capacities from $\frac{1}{2}$ to 3 cu. yds.

OTHER TYPES—Buffalo buckets are also made in 4 other types:

Clean-up Type—For use in cars, boats, etc.

Three-line Type—Designed for use on overhead or monorail cranes, where it is not practicable to maintain alignment of bucket by means of a steady carriage.

Four-line Type—Designed to operate on cable or man trolley bridges.

Slag Type—For handling granulated slag.

STANDARD TYPE BUFFALO CLAMSHELL BUCKET
Suitable for handling coal, sand, gravel and similar material

G. L. STUEBNER

Manufacturer of Hoisting Buckets, Dump Cars and Melting Furnaces for
Contractors' Service

TELEPHONE:

Side- and Back-lever Catch for Coal Hoisting

STUEBNER HOISTING BUCKETS

CLASS "B"—Similar to class "A," except that the
sides are straight, of equal width top and bottom.
This bucket is nicely balanced, has double bottom,
strong bail, trunnions, reliable latch; also, weighs and
costs less than class "A." See illustrations of various
types of buckets made by G. L. STUEBNER.

"CONTROLLABLE" CENTRAL DISCHARGE BUCKET—
Used for depositing concrete into smallest as well as
largest forms. Provided with patent pin-controlling
device, to regulate width of discharge opening; and with
powerful levers for controlling quantity of concrete
running out.

"EXCELSIOR" AND "INVINCIBLE" BOTTOM DUMP
BUCKETS—Particularly adapted to handle concrete, mud,
clay, sand, rock, etc. Quick acting, clean, dumping and
labor saving buckets.

THE G. H. WILLIAMS CO.

Manufacturers of Clamshell Buckets and Material Handling Machinery
ERIE, PA.

Products.

WILLIAMS CLAMSHELL BUCKETS, for digging and rehandling purposes.

Description.

The Williams buckets are the result of years of experience and will stand up under the most severe duty. Many different types and improvements are embodied in the present line.

A bucket for every purpose and operated on any type of machine.

Buckets for special purposes built on short notice.

Built entirely of steel and in sizes ranging from $\frac{1}{4}$ to 10 cu. yds. capacity.

Castings are best grade of open hearth steel, properly annealed; corner bars, forged steel; teeth 40 to 50 point carbon steel forgings; lips 40 to 50 point carbon steel except where manganese is used; scoops and plates open hearth steel; bushings phosphor bronze.

No cast iron is used.

Special Features.

The special features of Williams buckets are:

DIGGING ABILITY—The combination of lever (or power arm) and block and tackle principle exert great digging force to the cutting edge of the scoops and insure a full load. *Built to dig, and last while digging.*

LONG LIFE—The triangular construction, the large bearings and massive construction throughout insure long life.

LOW COST OF UPKEEP—Strength of materials employed, the perfect alignment and rigidity and the proper proportioning of its few number of parts.

ECONOMY OF OPERATION—Perfect lubrication, small

number of working parts, and straight leads over large sheaves insure long cable life and speed.

WORKMANSHIP—Is of the best and performed by high grade mechanics. Accurate replacements are insured by the use of the duplicate part system.

ROPE REEVING—A modification of the block and tackle principle which provides straight leads in perfect alignment.

LUBRICATION—All running parts lubricated from center which forces dirt out of bearings at each application.

GUARANTEE—Any parts proving defective will be replaced without charge, f. o. b. factory, on receipt of defective part, prepaid.

Favorite Bucket.

Designed especially for the economical handling of sand, gravel, crushed stone, ore, coal and like bulk material and is the proper weight for effective operation, making it particularly adaptable for use on locomotive cranes, derricks, monorail trolley and like installations.

The reinforced cutting lips are of manganese or high carbon steel plate, and designed to cover the bottom of scoops and to come up past the wearing point on the sides. They are designed to be easily removed in case of excessive wear.

Hercules Bucket.

The most rugged and powerful bucket built, and is replacing orange peel buckets in the handling of the most difficult excavating and dredging work.

Hercules bucket handles hardpan, cemented gravel, clay, boulders, rock and iron ore.

The scoops are formed of one continuous extra heavy plate, bent to shape, and fitted with high carbou

"FAVORITE" REHANDLING BUCKET

CLAMSHELL BUCKET IN OPERATION

HERCULES EXCAVATING BUCKET

steel cutting lips with chamfered cutting edge. Bucket is furnished with steel forged digging teeth.

No. 2 Single Rope Bucket.

Designed especially to operate in connection with hoisting machinery having only one drum available for bucket operation. It can be applied to any type of crane or derrick without added equipment. Practice has proved it to be of great help to general contractors, as it will handle all classes of work and material, and no special skilled or high priced labor is required for its operation.

Standard buckets are designed for handling coal, sand, gravel, etc.; and buckets of special weight for handling iron ore, furnace cinders, crushed stone, and for excavating.

No. 2. SINGLE ROPE BUCKET

No. 3 Single Rope Foundry Buckets.

Built to meet the need of some means of handling sand, coal, etc., in large foundries and plants, and to be operated by crane of ordinary type without special hoisting apparatus, which will leave the crane free for other service when bucket is not in use. This

No. 3. SINGLE ROPE FOUNDRY BUCKET

bucket can be attached or detached from crane hook in a few minutes and is designed for use where distance between crane hook and ground is limited.

A Bucket for Every Purpose and Installation.

For coal, sand, gravel and loose bulk material: Standard, Favorite, Scraper Type and No. 2 Single Rope buckets. For railroad, dredging and bridge contractor or general material handler: Standard X, Hercules and Special Dredging, Deep Water Dredging and No. 2 Single Rope buckets.

For manufacturers and users of overhead cranes, fast plants, monorail cranes and coal and ore bridges: No. 1 Single Rope and the Three and Four Rope buckets. For foundry service: No. 3 Single Rope bucket. For other types of buckets refer to the general catalogue issued by this company.

Standard buckets kept in stock for prompt shipment. Buckets for special purposes built on short notice. Put your bucket problems up to us for solution.

Products.

Manufacturers of PORTABLE CIRCLE SWING BUILDERS' DERRICKS for Hand, Horse or Power; CIRCLE SWING DERRICKS with DOUBLE DRUM WINCH for handling Orange Peel Buckets; STIFF LEGGED DERRICKS, 1 to 10 tons; "A" FRAME, TRIPOD, POLE, TOP POINT and REGULAR SETTER DERRICKS; HORSE and POWER MATERIAL ELEVATORS; WINCHES, CRABS, BLOCKS, and TOWER BOOMS.

Also, Stone and Timber Tongs, Stone Hooks, Lewises, Rope and Cable.

Advantages.

This company's motto is "Satisfaction or no Sale." Derricks shipped on trial to reliable contractors. These derrick are built of best malleable and steel fittings, which make them light, strong and durable.

SASGEN CIRCLE SWING DERRICKS

STANDARD—Equipped with best crucible steel and malleable fittings, including geared winch. Boom can be detached from mast. Operated by hand or power. Drum holds 275 ft. of $\frac{1}{4}$ -in. cable. Capacity 2500 lbs.; weight 350 lbs.; height 8 ft. Boom reach 5 ft. Equipped with 150 ft. steel cable and block.

Price, hand power..... \$81.50
Price, hand and power..... 85.00
Equipped with steel boom, extra..... 4.50

PEERLESS—Self-lubricating bushings, load and boom brake; used by hand, horse or power. Boom instantly removed by loosening one nut. Weight 275 lbs.; capacity 1800 lbs.; height 8 ft. Boom reach 5 ft. Equipped with 125 ft. crucible steel cable and block.

Price, hand power..... \$68.50
Price, hand and power..... 71.50

CHAMPION—Used by hand, horse or power. Folds in two parts and can be transported in touring car. Has self-lubricating bushings, also boom and load brake. Weight 200 lbs.; capacity 1000 lbs.; height 7 ft. 6 in. Boom extends 5 ft. Equipped with 110 ft. steel cable and block.

Price, hand power..... \$54.00
Price, hand and power..... 56.00

SASGEN STIFF LEGGED DERRICK

SASGEN POLE DERRICK

Equipped with winch not geared, 100-ft. cable, hoisting block. Very handy for light work

Cap., lbs.	Length, ft.	Price
1400	16	\$47.00
	18	48.00
	20	49.00

TOP POINT SETTER DERRICK

Equipped with all malleable and steel fittings, including gears. Has sheave frame at top and clamps for fastening extension pole

Cap., lbs.	Length, ft.	Price
3000	18	\$53.00
3000	20	55.00
3000	22	57.00

REGULAR SETTER DERRICK

Equipped with all malleable and steel fittings, including gears. Has sheave frame at top and clamps for fastening extension pole

Cap., lbs.	Length, ft.	Price
4000	18	\$61.00
4000	20	63.00
4000	22	65.00

SASGEN "A" FRAME DERRICK

Practical for setting timbers, girders, columns, etc. Capacity 2500 lbs., with 125 ft. of cable. Price..... \$86.50
Combination pole and "A" frame, price.... 93.50

SASGEN POLE DERRICKS

Used by contractors, stone and iron setters. Equipped with crucible steel top sheave frame, lugs for guy lines, and sheave in back to bring cable to hoisting drum. Bottom sill has rollers. Equipped with 125 ft. crucible steel cable, block, complete for use

Products.

All kinds of WIRE ROPE in the following qualities: Iron, Crucible Cast Steel, Extra Strong Crucible Cast Steel, Plow Steel and Monitor Plow Steel or Tico Special.

A full line of Wire Rope Fittings: Slings, Thimbles, Clips, Clamps, Sockets, Hooks, Turnbuckles, Shackles, Blocks, Sheaves, etc.

For Concrete Reinforcement, see pages 158-63; for Wire Fencing, see pages 378-79; for Electric Wires and Cables, see pages 1092-1108.

Qualities of Wire Rope and Their Uses.

Wire rope is made in the following 5 qualities:

IRON ROPE—The wires are made from the best quality iron, being soft, tough and flexible. They are of low tensile strength, approximately 85,000 lbs. per sq. in. Iron hoisting rope is most generally used for elevator hoisting, where the strength is sufficient. It is almost universally employed for counterweight ropes, except on traction elevators. For traction elevators this company recommends mild steel hoisting rope.

CRUCIBLE CAST STEEL ROPE—This is a medium strength material, tough and pliable, of moderate cost and general utility. Weighs only about half as much as iron for same strength; is harder, and better resists external wear. This rope is applicable to a great variety of uses, among which may be noted mine hoisting, logging, elevators, derricks, hay presses, dredges, cableways, inclined planes, coal hoists, conveyors, ballast unloaders, skip hoists and many other uses.

EXTRA STRONG CRUCIBLE CAST STEEL ROPE—Of higher tensile strength than the crucible steel, and is tough, pliable, a little lighter for the same strength than crucible steel, and about two and one-half times the strength of iron. It has been found particularly useful for oil well drilling and tubing lines. Its other general uses are similar to those of the crucible steel, except that it may be used where loads are somewhat heavier.

PLOW STEEL ROPE—Combines lightness and great strength; is somewhat stiffer than crucible steel and nearly three times as strong. Used particularly for heavy mine hoisting, derricks, inclined planes, dredges, cableways, for heavy logging and similar uses. It is the most economical rope to use where the weight of the rope has to be considered, or where the capacity of the machinery is to be increased without a corresponding increase in sheaves and drums.

MONITOR PLOW STEEL ROPE—This is the highest strength rope made. It is somewhat stiffer in the same diameter than the plow and crucible steel grades, but, strength for strength, it is equally flexible. Very useful where great strength, lightness and abrasive resisting qualities are required.

Transmission, Haulage or Standing Rope.

The coarsest rope, *i. e.*, 6 by 7 construction, a relatively stiff rope with large wires, capable of resisting external wear or abrasion; but it is the least flexible.

TRANSMISSION, HAULAGE OR STANDING ROPE (6x7)

Hoisting Rope.

Composed of 6 strands of 19 wires each, with hemp core. Used for elevators, mine hoisting, derricks, dredges, cableways, inclined planes, coal hoists, conveyors, ballast unloaders, skip hoist, oil well drilling and tubing lines.

HOISTING ROPE (6x19)

Extra Flexible Hoisting Rope.

This rope is composed of 8 strands of 19 wires each, laid around a hemp core. The addition of these 2 strands over the standard hoisting rope increases the flexibility and permits the rope being used over comparatively smaller sheaves and drums.

Adaptable for derricks, steam dredges, coal and ore handling machinery, pile drivers, and also for logging purposes, as well as tubing lines for oil wells.

EXTRA FLEXIBLE STEEL HOISTING ROPE (8 x 19)

Special Flexible Hoisting Rope.

This rope is composed of 6 strands of 37 wires each, laid around a hemp core. This is a very flexible rope, and used largely on cranes and similar machinery where sheaves, of a necessity, are small.

SPECIAL FLEXIBLE STEEL HOISTING ROPE (6 x 37)

Extra Special Flexible Hoisting Rope.

Composed of 6 strands of 61 wires each, with 1 hemp core, and recommended for dredging purposes, for which it is usually made with special wire center.

EXTRA SPECIAL FLEXIBLE HOISTING ROPE (6 x 61)

Flattened Strand Hoisting Ropes.

These ropes compare in flexibility with the standard hoisting rope, but possess about 150% greater wearing surface than the round strand ropes of same diameter, and have been used generally in the same places. (For data see following page.)

Type A (5 x 28)

Type B (6 x 25)

Weight, for Types A and B respectively are the same for all constructions. Standard Plow Steel grade is also furnished if desired.
 *Diameters of drums are the same as for Crucible Cast Steel.

FLATTENED STRAND HAULAGE OR TRANSMISSION ROPE
Type C (5 x 9)

FLATTENED STRAND HAULAGE OR TRANSMISSION ROPE
Type D (6 x 8)

Flattened Strand Haulage or Transmission Ropes.

These ropes are designed to give increased wearing surface above that to be obtained from a round strand rope. Used in logging, coal dock haulage and similar plans.

Tiller or Hand Rope.

Used for starting and stopping elevators, and also for steering lines on yachts and motor boats.

TILLER OR HAND ROPE (6 x 42)

Non-spinning Hoisting Rope.

This type of rope is so constructed that it prevents the rotating of a free load suspended on the end of a single line. It is recommended for "back haul" or single line derricks.

NON-SPINNING HOISTING ROPE (18 x 7)

Steel Clad Hoisting Rope.

Each strand is spirally wound with flat steel strips, which gives considerable wearing surface over the ordinary type. When the flat strips of a steel clad rope have worn through, there still remains the complete hoisting rope with unimpaired strength. Where ropes wear out quickly, this feature is a distinct advantage.

Made in 3 constructions: 6 by 19 wires each; special flexible, 6 strands of 37 wires each; and extra special flexible, 6 strands of 61 wires each.

Galvanized Iron Ship's Rigging or Guy Rope.

In the ship building industry, standard hoisting ropes as shown on the foregoing pages are in general use for handling materials.

The ropes described are used as part of the mechanical equipment of ships, besides being employed for other purposes.

Galvanized iron ship's rigging or guy rope is used for ship's rigging, guys for derricks, smokestacks, and for general standing rope service; it is not designed to run over drums or sheaves.

Construction, 6 strands, 7 or 12 wires to strand, 1 hemp core.

Galvanized Crucible Cast Steel Yacht Rigging or Guy Rope.

Made of crucible cast steel in 2 constructions: 6 strands, 7 wires to strand, 1 hemp core, for ship's or yacht's standing rigging and derrick guys; 6 strands, 19 wires to strand, 1 hemp core, for running rigging and mooring lines.

Sash Cord.

Made "dead soft" unless ordered to the contrary. Used principally for window weights, bell cords, automobile brakes and whistles. $\frac{3}{32}$ -in. diameter galvanized sash cord is used on electric open car curtain fixtures; $\frac{1}{8}$ -in. galvanized sash cord is used on car curtain fixtures.

Tinned High Strength Aeroplane Strand.

For reliable strength, light weight, flexibility, toughness, and elasticity, this strand is unrivaled. May be readily fastened and resists sudden strains and vibration better than a single stay wire.

Round Wire Track Cable and Locked Wire Cable for Aerial Tramways and Cableways.

There have been devised these 2 special cables which present fairly smooth surfaces for wheels to run upon. The better is the locked type, as it presents the smoother external surface.

Flat Rope.

A remarkably strong hoisting rope, used to a great extent by the large mines of the West. It is composed of a number of wire ropes called "flat rope strands" of alternate right and left lay, placed side by side, then secured or sewed together with soft Swedish iron wire, thus forming a complete rope.

FLAT ROPE

Crucible steel—plow steel

WIRE ROPE.

A full line of Wire Rope and Fittings.

For Electrically Welded Wire Fabric, see page 165.

Uses of Wire Ropes.

Wire ropes are made for the following purposes: hoisting, haulage, derricks, cranes, dredges, elevators, power transmission, cableways, tramways, rigging, etc.

Quality and Workmanship.

Long experience in manufacturing wire rope for all purposes, and a thorough knowledge of the exacting requirements due to the various uses to which it is put, warrant the statement that Grey Strand and Excelsior wire ropes are unexcelled for uniformly high tensile strength, torsion and ductility, which insure, beyond security and safety, maximum life of the rope.

Grades of Wire Rope.

We furnish rope of iron, crucible cast steel, extra strong crucible cast steel, plow steel and Grey Strand high grade plow steel, as described hereafter:

IRON ROPE—Soft, tough and pliable, particularly adapted for drum type passenger elevators and similar service where tendency to abrasion is slight and drums are designed to prevent undue bending. The wires, softer than those of steel ropes, will not wear grooves in drums to the same extent.

A higher factor of safety is recommended for elevator service than for general hoisting.

CAST STEEL ROPE—Recommended for general hoisting, such as mine hoists, derricks, coal hoists, cableways, conveyors, freight elevators, etc. This rope, being tough and pliable, will bend over comparatively small sheaves and resist abrasion which tends to result from rapid hoisting. The wire in cast steel rope has nearly twice the strength of that in iron rope and much higher elastic limit.

EXTRA STRONG CAST STEEL ROPE—Occupies an intermediate place between cast steel and plow steel rope. It is used in place of cast steel when desirable to increase factor of safety for given diameter. May be used to advantage for general hoisting, the wire being carefully selected to insure high degree of strength, ductility and toughness.

PLOW STEEL ROPE—Made of wire drawn from especially selected high strength steel, to produce rope of great strength and toughness, capable of resisting severe abrasive tendencies. Can be used in place of cast steel rope to reduce the dead weight of the rope itself, or where it is necessary to use a much stronger rope without increasing its diameter.

Recommended for logging lines, scraper, dredge and wrecking ropes, heavy cranes, ballast unloader ropes, and for all rough uses requiring maximum strength and toughness.

GREY STRAND ROPE—A special rope for special purposes, recommended as the best rope for exceptional service where extreme conditions produce extraordinarily severe and unexpected strains. Made from an extra high grade of steel, and excels all other wires for strength, toughness and uniformity.

Rope with strands of this wire is the latest and most improved product of the selection of metals and drawing wire for rope making.

This rope can be used to advantage in place of standard hoisting rope where extra severe strains and hard conditions of service tend to overtax the latter.

GREY STRAND ROPE

Construction and Adaptability.

TRANSMISSION, HAULAGE OR STANDING ROPE—6 strands, 7 wires to strand, 1 hemp center, recommended for transmission of power, winding, mine and other haulage, oil well drilling and sand lines, and where sheaves and pulleys are of large diameter, and where rope is not liable to reverse bends.

HOISTING ROPE—6 strands, 19 wires to strand, 1 hemp center, recommended for colliery and mine hoisting, elevators, derricks, ballast unloaders, railway switching ropes, dredges, steam shovels, oil well purposes, such as drilling, casing, tubing, dead lines, and where drums, sheaves and pulleys are not undersized for the particular size of rope used.

This construction in the grade of plow steel is used extensively for main line hauling and skidding operations in logging camps.

EXTRA FLEXIBLE HOISTING ROPE—8 strands, 19 wires to the strand, 1 hemp center, is much more flexible than the standard 6 strands, 19 wires, and can be used to advantage where conditions are such that sheaves of smaller diameter must be employed.

SPECIAL FLEXIBLE HOISTING ROPE—6 strands, 37 wires to strand, 1 hemp center, recommended for large electric cranes, on dredges, for cargo falls on steamers, and other purposes where very flexible rope in large diameter is required.

GALVANIZED GUY ROPE—6 strands, 7 wires to strand, 1 hemp center, is better for guys for derricks than hemp rope or rods linked together.

TILLER OR HAND ROPES—Used for steering ropes on river steamers, for hand ropes on elevators, and in any place where a smooth and extremely flexible rope is required. Composed of 252 wires, and made up of a hemp core, around which are twisted 6 ropes, each consisting of 6 strands, 7 wires to strand, enclosing a hemp center.

Products.

CRESCENT WIRE ROPE, standard and special, for all purposes, made of Swedes Iron, Crucible Cast Steel, Mild Plow Steel, Plow Steel and Improved Plow Steel.

CRESCENT HEMP CLAD WIRE ROPE, ROPE ACCESSORIES, and WIRE.

Standard and Special Ropes.

Crescent Standard Ropes are made and kept in stock in sufficient quantity and variety to meet all the needs of average service. Customers can almost invariably secure immediate shipment from stock of ropes exactly suited to their requirements.

Special ropes can be furnished to order for unusual requirements which can not be met properly with standard ropes.

Qualities and Uses of Standard Ropes.

The 5 grades of Crescent Standard Ropes, in the order of increasing strength, are:

SWEDES IRON ROPE—Used exclusively for elevator hoisting.

CRUCIBLE CAST STEEL ROPE—For haulage and hoisting, sand lines, derricks, dredges, cableways, inclined railways, conveying, drilling, pile driving, guying and running rope.

MILD PLOW STEEL ROPE—Serves the same purposes as ropes made of crucible cast steel, and, being stronger, in some cases allows of smaller sizes being used.

PLOW STEEL ROPE—Can be used where greater strength is required without any increase in the rope's diameter. It is employed for heavy hoisting, cableways, skidders, derricks and for long hoists. This company makes a special flexible rope of this material and recommends the smaller sizes for use on electric traveling hoists and the larger sizes for dredges.

IMPROVED PLOW STEEL ROPE—The highest grade rope manufactured. It combines great tensile strength, the highest degree of ductility, and unsurpassed toughness. Applicable for the heaviest haulage, dredging, derricks and sand lines.

CRESCENT WIRE ROPE FOR HAULAGE, ETC.

Hemp Clad Ropes.

These are generally made by spirally binding 5 wire strands with the highest grades of tarred yacht marline. This prevents friction between the strands and affords protection against moisture, acid, water, and foreign matter. The wire is of the same grades as are used in our standard ropes. Hemp clad rope is greatly superior to manila rope, being flexible, as easily handled, three to five times stronger, size for size, and 50% lighter when strengths are equal. There is no swelling when wet, as in the case of manila rope, and ice in winter does not affect it.

Galvanized Rope.

Rope that is to be subjected to severe corrosion, such as salt water or damp sea air, corroding fumes from smokestacks, etc., should be galvanized. It should never be employed for hoisting, for which service, where abrasion is a factor, hemp clad rope is most suitable.

Rope Accessories.

The accessories kept in stock include thimbles, clips, closed and open sockets, shackles, hooks, turnbuckles, etc. They are furnished plain or galvanized and either loose or properly fitted to the ends of ropes. When ordering, state complete details regarding thimbles, splicing, etc.

Catalogue.

The Moon catalogue gives complete details of all types of Crescent wire rope and accessories and contains much interesting and instructive general data for rope users. A copy will be sent on request.

Products and Services.

WIRE ROPE and BARE WIRES; INSULATED WIRES and CABLES.

A full line of WIRE ROPE FITTINGS, such as Hooks, Clamps, Clips, Pulleys, Sheaves, Sockets, Tackle Blocks, Thimbles, Turnbuckles, Slings; Alligator Wrenches, Reels for Hawsers, Riggers' Vise; Track Rollers, etc.

Our Engineering Department specializes in designing and constructing Suspension Bridges, Tramways, Cableways, and installations for the Transmission of Power by Wire Rope.

Uses of Wire Rope and Cables.

Wire rope and cables are made for the following purposes: conveyors, tramways, power transmission, suspension bridges, cableways, elevators, airplanes, for drilling, dredges, steam shovels, rigging, and all hoists and haulages where wire rope can be advantageously used.

Blue Center Steel Rope.

Blue center steel rope is a special rope for special purposes and is recommended as the very best rope for exceptional service where extreme conditions tend to produce extraordinarily severe and unexpected strains.

Wire Rope Slings for Industrial Plant and Construction.

Roebling wire rope slings are the ideal practical equipment for the safe and efficient hoisting of heavy materials in shop and field. They are made from our blue center steel; are compact, light and adjustable, and through equalizing features in certain types the stress of the load lifted is distributed throughout the entire sling. Forgings in tension are eliminated wherever possible. The slings are made in the anchor, bridle

and many special industrial types. Complete information gladly furnished.
Send for Catalogue A-247.

Products.

WIRE ROPE.
Rope Accessories.

General Information.

Standard wire rope is composed of 6 strands and a hemp center, each strand containing 7 wires for haulage and transmission rope, and 19 wires for hoisting rope. Where greater flexibility is required, hoisting ropes are made of 6 strands containing 37 wires to the strand or 8 strands containing 19 wires each. In some cases a wire center is used, but this is not advisable except when absolutely necessary.

The life of a wire rope depends principally upon the speed at which it travels and the diameter of the drums and sheaves over which it works. The larger the diameter of the drums and sheaves, the longer the rope will last. The wear increases with speed, therefore it is better to increase the load, within the safety limit, than to increase the speed.

Working loads are usually calculated at one-fifth of the breaking strain, but it should be understood that this factor of safety is not recommended for all cases, especially in shafts and elevators. Where passengers are to be raised and lowered, the working load should not be more than one-tenth of the breaking strain of the rope.

The strain or weight to be lifted should not be applied to wire rope with a sudden jar or a jerk, as the resultant strain may equal many times the weight to be lifted and the resistance to be overcome. A new rope may be easily broken in this manner. Such sudden strains cause rapid deterioration, if not actual breakage.

The proper lubrication of wire rope has not received the attention that it deserves. A thorough and continuous application of good lubricating oil, of a consistency that will penetrate to the center of the rope and heavy enough to remain as a coating upon the outside, is the ideal lubrication. Wire rope should be coated with grease when not in service, as otherwise the ropes will rust very rapidly.

The diameter of a wire rope is expressed by the diameter of a circle which will enclose it, therefore in using a calliper rule be careful to avoid measuring across two strands side by side. Measure rather from the top of any one strand to the top of the strand directly opposite.

STANDARD LAY WIRE ROPE

LANG LAY WIRE ROPE

Materials.

The strength of the wire from which this company's ropes are made ranges from 85,000 to 280,000 lbs. per sq. in. depending upon the base material from which it is drawn and the treatment to which it is subjected. The wire is carefully selected for its chemical and physical qualities, careful consideration being given to the requirements of each individual case. The breaking strengths are arrived at by actual tests and represent the average of many tests.

Both ends of each coil of wire used in the manufacture of these ropes are carefully tested and it is therefore impossible for inferior wire to get into the product.

Standard Flexible Hoisting Rope.

Standard flexible hoisting rope is composed of 6 strands and a hemp center, each strand containing 19 wires. It is the rope most commonly used for general hoisting purposes and is made from five different materials, namely: Swedish iron, crucible cast steel, extra strong crucible cast steel, plow steel and improved plow steel.

STANDARD FLEXIBLE HOISTING ROPE

BREAKING STRENGTHS FOR STANDARD FLEXIBLE HOISTING ROPE

Diam., in.	Approx. weight per ft., lbs.	Approx. strength in tons of 2,000 lbs.				
		Swedish iron	Crucible cast steel	Extra strong crucible steel	Plow steel	Improved plow steel

1/4	.15	1.5	3.1	3.50	3.80	4.50
3/16	.10	1.1	2.2	2.43	2.65	3.15

Extra Flexible Hoisting Rope.

This rope is used for the same purpose as standard hoisting rope where extra flexibility is necessary. It has 2 more strands and smaller wires than the standard construction of 6 x 19 rope of the same diameter.

The breaking strength of this rope is less than the 6 x 19 construction, but for light loads it gives splendid service owing to its ability to withstand severe bending. When made of extra strong crucible cast steel, extra flexible hoisting rope is intermediate in quality between crucible cast steel and plow steel rope.

EXTRA FLEXIBLE HOISTING ROPE

BREAKING STRENGTHS FOR EXTRA FLEXIBLE HOISTING ROPE

Diam., in.	Approx. weight per ft., lbs.	Approx. strengths in tons of 2000 lbs.			
		Crucible cast steel	Extra strong crucible cast steel	Plow steel	Improved plow steel
1 1/2	3.19	58	66	74	80
1 3/8	2.70	51	57	64	68
1 1/4	2.20	42	47	52	56
1 1/8	1.80	34	38	43	46

3/16	.13	2.75	3.05	3.35	
1/8	.09	1.80	2.02	2.25	

Special Flexible Hoisting Rope.

This rope consisting of 222 wires, smaller than those used in standard hoisting rope, will not stand the same wear and therefore should not be subjected to high speed. Where the bending stresses are severe, it is, however, an economical installation.

SPECIAL FLEXIBLE HOISTING ROPE

BREAKING STRENGTHS FOR SPECIAL FLEXIBLE HOISTING ROPE

Wire Rope Transmission.

Round, endless rope, running between two grooved sheaves, constitutes transmission by wire rope, and may be successfully operated at distances of 50 ft. to several miles. Division into two or more transmissions is necessary in distances greater than 400 ft.

Wire rope of 6 strands of 7 wires each is generally used, though frequently one of 6 strands of 19 wires each is selected. Crucible cast steel has displaced the iron wire rope formerly used for transmission.

On short transmission use the next larger diameter cable than that shown in the table, for satisfactory results; and it is advisable to keep the speed within the limit given in the transmission table. Unnecessary sheaves should be avoided, as each extra sheave adds to the wear of the rope.

For extra friction use larger sheaves or heavier rope of the 6 x 19 construction.

In ordering endless rope be careful to give exact measurements of distance from center to center of shafts and the diameter of terminal sheaves at bottom of grooves.

DALLAS, TEX., A. T. POWELL & Co., Southwestern Life Building
FACTORY, BROOKLYN, N. Y.

Products.

WIRE ROPE; ARMORED WIRE ROPE; FIBERCLAD (Marline Covered) WIRE ROPE; MANILA and SISAL ROPE; MANILA TRANSMISSION ROPE; DRILLING CABLE.

Non-spinning Wire Hoisting Rope, Mining Rope, Wire Transmission Rope.

Waterbury Wire Rope.

Made in grades known as Swedish Iron, Crucible Cast Steel, Extra Strong Cast Steel, Plow Steel and Green Strand Giant Steel, the latter being the highest grade of improved plow steel.

WATERBURY WIRE ROPE

Waterbury Armored Wire Rope (Gore Patent, March 14, 1911).

Made 6 strands, 19 wires, 37 wires or 61 wires to the strand, according to size and conditions of use. Furnished in crucible cast steel, extra strong cast steel, plow steel or Giant improved plow steel stock.

The initial factor of safety is maintained longer in Waterbury armored rope than in any other class of rope. The strands are wound or served with flat wires having convex edges, which wires take the abrasion on the crown strands. This gives a great advantage over rope of ordinary construction, inasmuch as wear on crown strands does not occur until this serving has worn down, and after that period such wire serving becomes packed into the interstices of the rope, making it cylindrical and thus materially increasing the efficiency of the rope.

WATERBURY ARMORED WIRE ROPE

Waterbury Fiberclad Rope.

A wire rope, each strand of which is served with the best grade of tarred Russian hemp marline. The tarred marline affords protection against acid fumes, moisture or foreign matter, such as coal dust and residue. Fiberclad rope is not affected by atmospheric conditions, as in the case of manila or wire rope; is about one-third the diameter of manila rope of the same strength; is flexible and will coil down as readily as manila rope, and will outwear bare wire rope or manila rope under all ordinary working conditions.

WATERBURY FIBERCLAD ROPE

Waterbury Manila and Sisal Ropes (for general use).

Made in the several standard grades of manila and sisal, and may be depended upon to be of the very highest quality in their respective grades.

WATERBURY MANILA AND SISAL ROPE

Waterbury Manila Transmission Rope.

A special rope for power transmission purposes, made from the best selected Cebu manila hemp. Made 4 strands with heart, unless otherwise ordered. The yarns are treated with a special composition, which thoroughly lubricates the strands and individual fibers, making the rope practically waterproof. Especially adapted for rope driving and made as nearly perfect as the best machinery, superior quality of material and workmanship can produce.

WATERBURY MANILA TRANSMISSION ROPE

Waterbury "Drillwell" Manila Drilling Cable.

Made from carefully chosen grades of fiber, graded for toughness and general wearing quality. Drilling cables are 3 ropes laid into 1 (or 9 strands), so formed as to be thoroughly uniform, of correct lay and tension in each of the 3 ropes forming the finished cable. Drill-in cables are referred to as hawser-laid rope, i.e., 3 ropes twisted together, the twist being in opposite direction to the twist of the ropes, usually left hand. The advantages in a properly made hawser-laid rope over other types of rope are greater elasticity or springiness and greater wearing surface.

All Waterbury drilling cables are especially lubricated to prevent internal friction and to keep the fiber from becoming very dry, this preventing disintegration.

WATERBURY "DRILLWELL" MANILA DRILLING CABLE

Waterbury Wire Drilling Cables.

Are generally made left lay, in all standard sizes, 6x19, 6x8, or 6x7 construction. The line includes crucible cast steel stock, extra strong and plow steel stock. Also sand lines, tubing, casing and sucker rod lines, pumping lines, cleaning out cables and steel wire dead lines.

Prices, Handbook, etc.

Ask for prices, samples and the 220-page cloth bound Rope Handbook, containing valuable rope data and describing the complete Waterbury line.

Products and Service.

HEAVY DUTY CONSTRUCTION CONCRETE MIXERS; HEAVY DUTY PAVING MIXERS; DANDIE LIGHT MIXER; MIXER LOADER; HOT MIXERS—Construction and Paver Type.

Rotary Grader; Bar Benders and Cutters.

Koehring Sales and Service Branches, and warehouses in every principal city insure responsible, quick service.

Standardized Concrete.

The Koehring re-mixing action and automatic water measuring tank make it easy to standardize mix for uniformity and consistency.

The re-mixing action is secured by means of the discharge chute pivoted well inside the drum, sloping inward in mixing position, and out through the opening when discharging. Diagonal blades cut through the mixture, carrying it up the drum sides to a point where it spills backward, in a rolling action. Pick-up buckets then carry mixture to the top of drum, spilling it down on the insloping discharge chute in a cascade action which prevents aggregate gathering according to size. From the discharge chute it is hurled back to the diagonal blade on the charging side of the drum for repeated trips through the mixing action.

This re-mixing action is only possible because of the Koehring patent, which pivots the discharge chute inside the drum far enough to return aggregate to the charging side of the drum. Design of pick-up buckets gives fast discharge.

Fast Operation.

High speed operation is secured by automatic actions which permit operator to maintain top capacity operation every minute of the day; and to heavy duty construction which permits continuous high speed operation without breakdowns and delay.

Fast, clean charging is due to high speed elevation of charging skip, which goes to extreme angle by passing between the skip cable sheaves, chuting charge into drum in one swift, clean slide.

Charging skip automatically stops in discharge posi-

tion until released. Size and design of pick-up buckets insure fast discharge of drum during the time the skip with new charge raises to charging position.

Drum.

Drumheads and runways are single castings of special close grained metal. Rounded corners prevent clogging. Flanges are turned true, to secure watertight joint with heavy boiler plate center shell. Double gear drive minimizes vibration, and furnishes reserve drive.

KOEHRING CONCRETE MIXERS

Trunnion Rollers.

Trunnion rollers are fixed to shaft, and shaft revolves in big babbitted bearings easily accessible on frame, and constructed so wear may be taken up. This construction eliminates wobbly drums and preserves perfect alignment of driving mechanism.

Frame and Trucks.

Trucks have 3-point suspension, and with superstructure are built of extra heavy pressed steel members, riveted and gusseted at joints.

Friction Clutch.

Consists of housing with sleeve for gear, in which are front plate and master disc, separated by friction disc. Maple block frictions inserted through opening in disc receive wear on end of grain. Winding drums have bronze bushing with graphite embedded for lubrication.

Power.

Gasoline, steam or electric motor of standard high grade manufacture. Boilers to conform with laws of any state. Surplus power on all sizes.

Equipment.

Low charging platforms, batch or standard hopper, power charging skips, automatic water measuring tank; also on pavers, boom and bucket concrete distributing system, and gravity spouts.

Koehring Pavers.

The fastest paving unit with boom and bucket distribution. Narrow design, giving liberal working room around the mixer. Low center of gravity. Boom swings on arc of 180°. May be had with loading derrick for lifting batch boxes over charging skip. Caterpillar traction or round road wheels. The biggest paver line—5 sizes.

Gravel, cu. ft.	6	6	9	12	18	24

To obtain best results the size of batch should not exceed the quantity as listed in the column under size of mixer. The rating is based on using 1½-in., or larger, crushed rock and full bag batches.

Koehring Hot Mixers.

Koehring hot mixers are combination heating plants and mixers for bituminous road mixtures, sheet asphalt, rock asphalt, mastic floor, and for cement concrete.

Combustion takes place in double burner oil furnace with brick lined chamber, and lined conduit. Heated gases and air are injected into drum by blower. Fuel oil or kerosene may be used.

HOT MIXER

To use as hot mixer, make connection with blower and asphalt tank; to use with concrete cement, disconnect asphalt tank and blower and connect water tank.

Koehring hot mixers are built both in side charging type and paver end charging type.

Dandie Light Mixers.

A light mixer for general work such as culverts, footings, foundations, sidewalks, etc. Double drum drive, single section discharge chute, steel engine house, ball and socket bearings. A strong, dependable light mixer, built in big volume, every part standardized, 4- and 7-cu. ft. capacities, mixed concrete. May be equipped with low charging platform, batch hopper, or power charging skip, automatic water measuring tank and light duty hoist.

DANDIE LIGHT MIXER

Koehring Mixer Loaders.

A belt conveyor, on a portable frame, self-driven by gasoline engine. Hopper bins above belt are adjustable for any size mixer and any proportion of "mix." Striking off materials at top of bins accurately measures materials. Lever opens bottom of bins, allowing materials to drop on belt conveyor, moving 100 ft. per minute, delivering materials into charging skip of mixer. Hopper bins movable along frame to any point. Cuts out all wheeling—delivers materials from any point within 60 ft. of mixer.

TRADE-MARK

The Ransome Engineering Department, composed of engineers, of long and wide experience in construction work, will co-operate with contractors and engineers in the solution of concrete equipment problems, upon receipt of plans, location of material piles and how the aggregate is delivered to the job. This service is free to clients.

RANSOME 21-E PAVER

CAPACITY—21 cu. ft. mixed concrete per batch; 30 cu. ft. unmixed loose material per batch.

EQUIPMENT—Steam engine and boiler, power loader, automatic water tank, 20-ft. distributing boom and bottom dumping bucket or distributing chute with 3-point discharge. Mounted on self-traction trucks or crawling traction

RANSOME STANDARD BUILDING MIXER, SIZE 21-S

CAPACITY—21 cu. ft. mixed concrete per batch; 30 cu. ft. unmixed loose material per batch.

EQUIPMENT—Charging chute, batch hopper, power loader, with or without automatic water tank. On trucks or skids. Steam, electric or gasoline operated, or belt drive

RANSOME STANDARD BUILDING MIXER, SIZE 28-S

CAPACITY—28 cu. ft. mixed concrete per batch; 45 cu. ft. unmixed loose material per batch.

EQUIPMENT—Charging chute, batch hopper, automatic water tank. On skids only. Steam or electric operated or belt drive

RANSOME STANDARD BUILDING MIXER, SIZE 14-S

CAPACITY—14 cu. ft. mixed concrete per batch; 22 cu. ft. unmixed loose material per batch.

EQUIPMENT—Charging chute, batch hopper, power loader with automatic water tank. On trucks or skids. Steam, electric or gasoline operated, or belt drive

IMPROVED RANSOME BANTAM MIXER

On trucks, with gasoline engine, platform and runways.

Made in two sizes, 7-S and 10-S.

7-S CAPACITY—7 cu. ft. mixed concrete per batch; 10 cu. ft. unmixed loose material per batch.

10-S CAPACITY—10 cu. ft. mixed concrete per batch; 14 cu. ft. unmixed loose material per batch.

EQUIPMENT—Both mixers are furnished with charging chute; with or without platform and runways; batch hopper; power loader and with automatic water tank. On trucks or skids. Steam, electric or gasoline operated.

RANSOME 7-E HIGH DRUM PAVER

CAPACITY—7 cu. ft. mixed concrete per batch; 10 cu. ft. unmixed loose material per batch.

EQUIPMENT—Gasoline engine, power loader, automatic water tank, 10 ft. 3-point discharge distributing chute, slope 21°. Mounted on self-traction trucks.

RANSOME CHARGING CHUTE

Guides material into opening of drum. Usually limited to use with wheelbarrows and in connection with platforms and runways.

IMPROVED RANSOME BANTAM MIXER

On trucks, with steam engine, boiler, power loader and with automatic water tank.

RANSOME POWER LOADER

Avoids use of overhead bins, runways, etc. Bucket is loaded directly from wheelbarrows or cars on ground level. Loading time speeded up by compensating sheaves in overhead framework, which increase speed as bucket rises. Ransome automatic water tank is regularly included with power loader.

RANSOME-CANNIFF PNEUMATIC CONCRETE MIXER AND PLACER

Will mix and place concrete in tunnel jobs at 40% of the cost for handwork. Stock sizes handle a batch of 14 cu. ft. of loose aggregates or 10 cu. ft. of mixed concrete. Other sizes made to order. Will successfully convey concrete half a mile. Up to 500 ft., will place 50 batches per hour; to 750 ft. 40 and up to 1000 ft., 28 batches per hour under average conditions.

RANSOME SOLID TOP PORTABLE WOOD-WORKING MILL

Designed and built for contractor's use. Table top is solid casting, machined true on top and sides. Operated by gasoline engine. Saw is mounted on movable arbor and is raised and lowered so that lumber always runs horizontally. A wood turning lathe may be attached. Send for Bulletin 300 for details.

RANSOME HOIST BUCKET

Operates quickly in direct vertical lift and equally well in wooden or steel towers. Automatic discharge at any desired point in tower. No catches or trips.

CAPACITY—8, 12, 18, 27, 36 and 66 cu. ft.

RANSOME CONCRETE CARTS

More economical than wheelbarrows because of greater capacity—6 cu. ft. Handles may be quickly changed to either end. Contour of body facilitates quick, clean dumping. Furnished with or without legs.

RANSOME-CANNIFF PNEUMATIC GROUT MIXER AND PLACER

Designed to mix and place grout under pressure by means of compressed air. Particularly adapted to sealing fissures, closing voids in concrete where absolutely watertight work is essential, etc. Size of batch is 2 sacks of cement and 2 cu. ft. of sand with whatever amount of water is required. Will place on an average of 40 batches per hour under ordinary conditions against a head of 175 ft. or less. 3 types: Standard, adapted to pressure up to 150 lbs.; High Pressure, to 300 lbs.; Extra High Pressure, to 600 lbs.

RANSOME SKIP CARS

These cars dump automatically and return to the loading position by gravity. May be used economically on the larger installations.

CAPACITY—1, 1½, and 2 cu. yds.

RANSOME BIN GATES

Both vertical and bottom type built with radial cut-off. Work easily and positively in all materials. When ordering, specify whether for steel or wooden bins. Made in 2 sizes, 12 by 15 in., and 20 by 20 in.

Ransome Concrete Chutes and Accessories.

The design of Ransome concrete chutes is the result of years of experience and experiments in the handling of concrete. This practical knowledge finds expression in the size and shape of the trough, the slope or angle, and the over-size hopper heads which compensate for the momentary check in flow caused by a change in direction. Standardization and interchangeable unit construction facilitate replacement of parts, dismantling, shipping and setting up of Ransome chutes. The body of the chute is made of No. 14 gage, high carbon steel, insuring rigidity, strength and long service.

RANSOME OPEN WOODEN BOOM IRONS

RANSOME OPEN WOODEN BOOM IRONS—Made of steel and specially designed to take the strains and stresses peculiar to their work. The irons for the 48-ft. 6-by 6-in. open wooden beams are designed for use with the standard open wooden boom plants. The boom irons for the 48-ft. 8-by 8-in. open wooden booms used in connection with counterweight chutes, are made extra heavy.

Closed

Open
RANSOME LINE GATE

RANSOME BOOM CHUTE PLANT

RANSOME LINE GATE—Designed to draw concrete from various points in a continuous line chute by simply pulling a rope. One chute with a hopper head, or a line hopper with flexible drop chutes attached, may be used under the line gates. For exceedingly long drops, 8-ft. lengths of 8-in. diameter chutes are preferable to the shorter lengths of 8-in. flexible drop chutes.

Ransome Swivel Head Chutes, Plain and Trussed.

The simplicity of construction of Ransome chutes is shown by the ease with which the various items may be combined to make various units. To make a 16-ft. swivel head chute, bolt a hopper head on the upper end, and a splash hood with a swivel hook on the lower end of a 16-ft. trough unit. A 32-ft. swivel head chute is made by joining two 16-ft. trough units together and strengthening the joint by bolting a splice plate and attaching a hopper head, splash hood and swivel hook. A 48-ft. swivel head trussed chute is made up by joining three 16-ft. trough units together with two splice plates, and at each joint, bolting through the standard holes in the connecting flanges, one truss strut, and putting in place two truss rods by passing these through standard holes in the flanges. The hopper head, splash hood and swivel hook are then added as before.

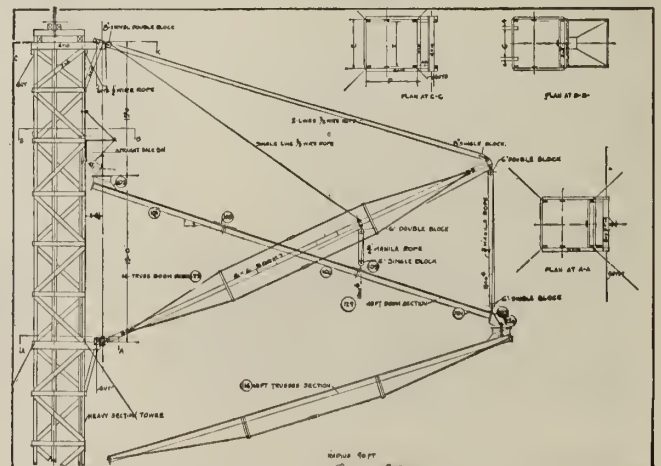

16-ft. Swivel Head Chute

32-ft. Swivel Head Chute

48-ft. Swivel Head Trussed Chute
RANSOME SWIVEL HEAD CHUTES

RANSOME OPEN WOODEN BOOM PLANT

RANSOME SWIVEL JOINT—The view of a complete swivel joint shows the oversize hopper head which takes care of the momentary checking of velocity of flow of the concrete, due to the change in direction, and also the swivel hook located outside the splash hood, which is an advantage, as it does not obstruct the flow of the concrete.

RANSOME CONTINUOUS LINE CHUTE JOINTS

Ransome Continuous Line Chute.

A 32-ft. continuous line chute is made the same as a 32-ft. swivel head chute, except that the hopper head, splash hood and swivel hook are omitted, and a flexible joint is attached at the lower end.

Ransome Counterweight Chutes.

Made in two lengths, 32 ft. and 48 ft. The 32-ft. section will carry a 32-ft. swivel head section and the 48-ft. section is strong enough to carry a 48-ft. swivel head trussed section at its lower end. This means that a Ransome counterweight chute is stronger and naturally heavier than a chute which will carry only the load of concrete within itself.

On practically every job, instances arise where it is advantageous to carry another section of chute on the lower end of the counterweight section.

It will always be an economy to buy a counterweight chute strong enough to do this.

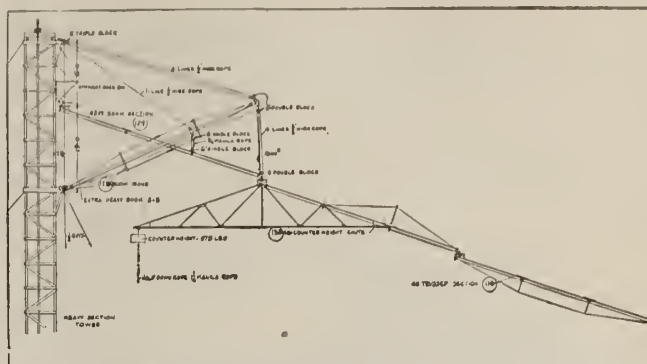

32-ft. Chute

48-ft. Chute

RANSOME COUNTERWEIGHT CHUTES

RANSOME COMBINATION OPEN WOODEN BOOM AND COUNTERWEIGHT CHUTE PLANT

Ransome Swivel Head Boom Chutes.

These chutes are standard equipment and are made in two lengths, 32 ft. and 48 ft. They serve the same purpose as the open wooden boom plants and it is often cheaper to install them; the economy depending upon whether it costs less money to build the tower 15 ft. higher, than it does to purchase open wooden boom irons and build an open wooden boom. It should be borne in mind that in the installation of a swivel head boom chute, the distance from the boom seat end of the chute, when the bin is at its highest point, to the top of the tower, must be at least 30 ft. The boom chutes are double trussed and equipped with liners to insure stiffness. At the upper, or hopper head end of the boom chute, a special swivel bracket is attached.

Also, Contractors' Equipment.

For Scales, see page 940.

Concrete Mixers.

The most important feature in "The Standard" concrete mixer is the patented low charging design which enables the drum to be charged from the low platform that is attached to the machine, and portable with the outfit.

In the new model, no deflector blades or plows are used around the charging opening. Lifting pockets running from end to end provide greater agitation. In fact, a single revolution of the drum causes the bunched contents to rise and fall cataractlike six or seven times.

The large opening in the drum permits the mixing operation to be easily watched; and high grade, uniform concrete is secured without depending on guesswork.

The drums have been shortened as to length and considerably increased in diameter. In these short drums of large diameter, the mixing operation is much simplified and for that reason quicker in action. There is only one mixing zone. The materials are from the start bunched together so that no special means are required to cause end-to-end movements. No separate mixing blades are required. The lifting pockets, reaching from end to end of the drum, set up a vigorous mixing action and the whole mass of the contents, not merely one single mixing zone, rises and falls from six to seven times at each turn of the drum.

The folding platform affords larger space for charging, and enables cement and water to be supplied without interfering with the wheelers. It is folded up for moving, and the complete outfit can be loaded in an ordinary box car without removing any parts.

The result is that poor mixing is impossible and that perfectly mixed concrete can be had in shorter time than ever before. In the thorough blending of materials, the improved drum design of "The Standard" guarantees a grade of concrete that is perfectly mixed and always uniform in quality.

Advantages of Low Charging Mixers.

The low, compact design of "The Standard" avoids the necessity of any kind of mechanical charging device; there is practically nothing to get out of order, and no skilled attendant is neces-

sary. It can be moved rapidly from one point to another, takes up but small space, and the folding platform is always ready for immediate use.

For some classes of concrete work, a mixer equipped with side loader is preferred. This feature is incorporated in a new mixer, complete information on which is contained in Catalogue No. 60 that will be sent on request.

Machines for Street and Road Work.

"The Standard" street paving concrete mixer is mounted on steel truck with steam engine and boiler. Equipped with wide mouth, open end, skip charging hopper; automatic measuring water bucket, and forward and reverse traction. Carefully designed to equalize the weight on four ground wheels. Made throughout of heavy steel construction to meet severe requirements of street work. Front end of charging skip is covered to prevent material from spilling. Unique construction of the open end drum with wide drum chute permits elevating the charging skip to a steep discharge angle.

Complete information in Catalogue No. 60 which will be furnished on request.

ROAD PAVING MIXER WITH DISTRIBUTING SPOUT, STEAM POWER AND TRACTION

LOW CHARGING CONCRETE MIXER WITH FOLDING PLATFORM

WATERLOO CONSTRUCTION MACHINERY COMPANY

Concrete Mixers, Pavers, Hoists, Backfillers and Pumps

CABLE ADDRESS:
"POLYGON"

95 Vinton Street
WATERLOO, IOWA

CODE USED:
Western Union

REPRESENTATIVES IN ALL IMPORTANT CITIES

Products.

WONDER CONCRETE MIXERS; WATERLOO GASOLINE HOISTS; WATERLOO BACKFILLERS; WATERLOO DIAPHRAGM PUMPS.

Wonder Concrete Mixers.

These machines are a distinctive type of mixers with single opening drum, extremely rapid in charging and discharging with very thorough mixing action. Owners everywhere testify that they are the fastest mixers on the market. They are made in four sizes, with capacities of 3, 4, 5 and 7 cu. ft. of mixed concrete in each batch.

WONDER 3 MIXER

AUXILIARY HOISTING EQUIPMENT—Wonders 4, 5 and 7 can be had with either light duty or heavy duty auxiliary hoist built-in over the center of gravity. All the pull is from the center of gravity of the machine.

WONDER 5 MIXER

QUICK CONVERTIBLE—The quick convertible can be had in the Wonders 4, 5 and 7. These machines have an auxiliary frame which swivels on the main frame so they will discharge at either side or at front or rear without moving their trucks. Four bolts are removed and replaced again when the machine is changed to a new position.

Waterloo Hoists.

SINGLE REVERSIBLE DRUM AND ELEVATOR SHEAVE—Equipped with an elevator sheave on the same shaft with drum, and other side of drum has a fixed winch head. Drum may be operated in either direction with sheave stationary; same is true of sheave, or both drum and sheave may be operated together in either direction. Specially adapted for building contractors, and used in operating single or double platform material elevators. A single hand lever, within easy reach of operator, controls reversing operation.

Two crank shaft driving sprockets are furnished and are quickly interchangeable, permitting 2 line speeds and load capacities from one output at practically no expense.

SINGLE DRUM REVERSIBLE HOIST

WATERLOO DOUBLE DRUM HOIST—This hoist has 2 fixed winch heads and is adapted to general hoisting operations requiring two drums. Specially suited to derrick work; one drum for hoisting load, other for raising and lowering boom. Also for industrial plant material. Construction is simple, rigid and of first quality materials with standard equipment, same as single drum hoist.

DOUBLE DRUM HOIST

WATERLOO SINGLE DRUM HOIST—Specially well adapted around industrial plants for single platform material elevators; light and medium pile driving. Equipped with fixed winch head. Mounted on heavy selected timbers, 6 in. by 6 in., bolted together and cross braced with steel plates and bars. The engagement of loose running drum is made by an improved helix thrust, forcing drum laterally along shaft thus engaging friction surface. It is simple, powerful and quick acting.

Waterloo Backfillers.

Waterloo backfillers are made in 2 styles, the Double Quick, which has an auxiliary frame swiveling on the main frame and turning toward the direction of the pull without any assistance from the operator; and the Traction Machine, which is supplied with traction and pulls always in one direction.

TRACTION BACKFILLER

The Double Quick machine is adaptable to any job of hoisting and pulling, and has been used by many contractors for a utility machine on their jobs. The Traction Machine called "Old Indispensable" has proved its indispensability on any kind of construction work.

NON-TRACTION BACKFILLER

Waterloo Diaphragm Pumps.

These pumps are chain driven and the flexible drive prevents all injury to the pump mechanism. The single pump is close coupled and is an exceedingly compact machine. It will deliver 3500 gals. of water per hour. The double pump, however, consists of 2 pumps mounted on the same frame and driven by the same engine either singly or together, delivering 8000 gals. of water per hour. A compensating link keeps the connecting rod working in a vertical position and eliminates side bending on the diaphragm.

BLAW STEEL FORMS for concrete construction of every description.

BLAW FABRICATED STRUCTURAL STEEL: Bridges, Manufacturing Plants, Poles, Transmission Towers, Trusses, etc.

STEEL PLATE WORK and PRESSED and WELDED CONSTRUCTION.

KNOX WATER COOLED FURNACE EQUIPMENT: Buckstays, Doors, Door Frames, Floors, Ports, Reversing Valves, Shields, Skewbacks, Bulkhead Coolers, etc.

For Blaw Buckets and Cableway Carriages, see pages 62-63.

Fabricated Structural Steel and Transmission Towers.

This company turns out a very large annual tonnage of highly fabricated products of all kinds, such as mill buildings, manufacturing plants, aeroplane hangars, crane runways, etc., also transmission towers of which they are one of the largest manufacturers in the United States.

Structural Steel Building
STEEL STRUCTURES DESIGNED AND FABRICATED BY BLAW-KNOX COMPANY

Transmission Tower

TRADE-MARK

Knox Water Cooled Furnace Equipment.

All types of water cooled equipment used around furnaces, particularly of the open hearth type, are included, such as doors, door frames, shields, buckstays, ports, reversing valves, floors, etc.

KNOX COOLED 75-TON OPEN HEARTH FURNACE

Blawforms.

There are Blaw steel forms for every type of concrete construction, from sewers to subways, from sidewalks to skyscrapers. Blawforms—the first steel forms to be used commercially—have been used on every engineering project of note undertaken during the past decade and a half. On the other hand, engineers and contractors are finding Blawforms almost indispensable in the erection of foundations, warehouses, retaining walls, culverts, etc.

There are few types of concrete construction in which Blawforms can not be used with economy.

Submit problems to the Blawforms engineers.

Steel Plate Construction.

BLAW-KNOX COMPANY is one of the largest users of acetylene and electric welding processes. The following is a partial list of articles it is prepared to furnish:

Air receivers; oil and refining agitators; water boshes; annealing and condensing boxes; bulkhead coolers; boiler breechings; flumes; galvanizing kettles; gas containers; creosoting or wood preserving cylinders; digestors; oil filters; melting pots; palm oil melting plants; evaporating and spelter pans; steam jacketed kettles.

Tanks: alkali, brine, chemical or acid, distillate, filter, galvanized, gasoline, lubricating oil, mixing, oil, pressure, settling, compressed air, tar, water.

Traveling Forms.

The economy of Blawforms is apparent in this illustration of a large concrete wall built by Stone & Webster Corporation, at the plant of the Brier Hill Steel Company, Youngstown, Ohio. The wall is approximately 34 ft. high, 18 ft. thick at the bottom, tapering to 10 ft. at the top and is about 1000 ft. long.

TRAVELING FORMS

Alternate blocks are cast in the traveling form in the foreground (which is equipped with swinging bulkheads weighing about 10 tons each), the blocks between being cast in the form shown in the background.

LIGHT WALL FORMS

Light Wall Forms.

Standard panels are 2 ft. square and are keyed together and handled in large units, as illustrated. Panels of other dimensions are furnished, to facilitate adjustment to any dimension.

Culvert Forms.

The rectangularly shaped culvert requires less headroom to get the correct opening to secure proper carrying capacity. As a result this type of culvert is being universally employed.

Blaw adjustable rectangular culvert forms can be used over and over. They make economical concrete culvert construction possible.

Tunnel Forms.

Blaw tunnel forms and tunnel liner plates are adapted to every type of construction.

By their use, the amount of excavating is greatly lessened, the element of danger materially decreased, and maximum working space is assured.

Concrete can be placed either by the pneumatic process or by hand.

Column Moulds.

Blaw column moulds offer many advantages over ordinary moulds, particularly in regard to adjustability, tightness, simplicity, interchangeability, strength and completeness.

Submit column schedules to the Blawforms engineers.

Sewer Forms.

Blaw sewer forms are furnished in all shapes, half round, elliptical, egg shape, circular, etc., and in all sizes, from the very small hand handled sewer forms to the massive collapsible and traveling forms for conduits, aqueducts, etc.

Pipe Moulds.

Although Blawforms for concrete pipe are particularly adapted for use in central manufacturing plants which can be designed to handle the materials and forms to the very best advantage, they are being used to a great extent for manufacturing pipe in the field.

Blawforms are strong, durable and ultimately the most economical.

BLAW-KNOX COMPANY is prepared to furnish all kinds of concrete pipe forms, either of the Blaw patented design or other design, whether cast on end or on side, round, oval or elliptical, standard or special.

Road, Sidewalk and Curb Forms.

The same equipment of Blaw Universal rails can be used on sidewalk, curb, combined curb and

gutter, integral curb and base and road construction of all kinds.

As they are set up by unskilled laborers in a fraction of the time and with a great deal less labor than ordinary forms, Blawforms effect a very great saving in time, labor and money.

Being made of steel, Blawforms will not warp, crack, swell or spring out of shape, nor is it possible to damage the patented slip joint connection in the ordinary course of handling.

Co-operative Service.

BLAW-KNOX COMPANY offers the services of a notable engineering organization of highly trained men and a shop organization equipped with the most modern machinery.

The same engineering thought that designed the forms for the Panama Canal, the Calumet Sag Channel, the New York and Boston Subways, the Catskill and Winnipeg Aqueducts, the sewer systems in the leading cities, etc., is back of every Blawform.

The company's structural engineers will consult with engineers and others at any time.

ROAD, SIDEWALK AND CURB FORMS

METAL FORMS CORPORATION

Metal Forms for Monolithic Concrete Construction

1436-1440 Booth Street
MILWAUKEE, WIS.

Product.

METAFORM INTERLOCKING STEEL FORMS for Monolithic Concrete Construction (Straight Walls, Angular and Circular).

Adaptability.

Metaforms take the place of wood forms on all types of monolithic concrete work—large industrial plants, buildings, residences, walls, etc. Metaform circular equipment is used in the construction of tanks, grain elevators, silos, chimneys, and coal pockets.

Advantages.

Metaforms effect large savings in form costs, speed up construction and turn out better work. As they are permanent equipment and can be used year after year with practically no depreciation, they eliminate the costly wastage that results from the use of wood forms. They reduce labor costs substantially, as a few common laborers can set them up as fast as the pouring proceeds, thus taking several skilled form carpenters off the payroll. Metaform tight joints and smooth surfaces result in smooth, better looking walls.

For circular-walled structures (silos, water tanks, grain elevators, etc.) Metaform adjustable circular equipment offers the only practical construction methods. On this class of work, continuous built-up forms are wholly impractical, while the common substitutes (clumsy slip-forms) are too slow, unwieldy and inflexible to meet the present day necessity for speed and economy.

Description.

Metaforms are built on the interchangeable unit idea. Each individual unit is built of a steel plate, heavily reinforced, and equipped with all necessary interlocking and clamping devices. Each unit is self-contained, there are no clamps, bolts, wedges or other separate parts to be applied. By combining a few of

the fractional and adjustable units to courses of the standard units, the form is made readily adjustable to varying lengths and specifications of concrete walls. Metaform equipment is unapproached in simplicity and versatility.

Metaform circular construction outfits are built on the same principles of standardization, with the added equipment necessary through the peculiar nature of circular work.

Operation.

Erecting Metaform units into a form set-up is almost automatic in its simplicity. The workman takes the units successively off the bottom course (three courses of plate being ordinarily used) and places them in position on the top course, the aligning pins automatically insuring accurate alignment. The two hand clamps with which each unit is equipped are then closed, and the unit becomes an integral part of the form.

Investment Value.

No other equipment that a contractor buys can be considered so permanent as Metaforms. Units which were built fifteen years ago are still in constant use, and are apparently good for an indefinite number of years to come. So highly standardized is Metaform equipment that these old units fit perfectly among the standard units of today.

Metaforms are in use in every state in the Union, and every country in the world. The acceptance of Metaform methods is becoming universal.

Service Department.

All contractors are offered the assistance of this company's Engineering Service Department, in helping to determine the amount of Metaform equipment necessary to do the work most efficiently and economically. Any desired estimates will be furnished without obligation.

STANDARD METAFORM UNIT, SHOWING CLAMPS

ILLUSTRATING METAFORM SET-UP

Many jobs of peculiar nature, such as the construction of sewer manholes, can be executed at a great reduction of cost through the use of standard Metaform equipment specially designed and adapted to the work. Suggestions and plans on such work will be furnished by the Engineering Department without obligation.

Literature.

Metaform equipment and methods are described clearly and graphically in two informative books. One book describes and illustrates the Metaform idea as applied to straight monolithic concrete construction; its companion edition is a valuable handbook on the most efficient and cost saving methods for building concrete silos, grain elevators, water tanks, chimneys, coal pockets, etc. Either or both books will be sent free on request.

CONCRETE DEVICES CORPORATION

Standardized System of Devices for Concrete Reinforcement and the Locking of Forms

280 Broadway
NEW YORK, N. Y.

FACTORY AND WAREHOUSE, 204 Lafayette Street, NEW YORK, N. Y.
EXCLUSIVE U. S. AGENTS FOR THE CONCRETE SPECIALTIES CORPORATION

Products.

DEVICES for PLACING STEEL REINFORCING and the LOCKING of FORMS:

Outside Form Clamps, Steel Bar Locks, Steel Bar Hangers, Steel Bar Spacers, Steel Bar Clips, Washers, Form Ties, Form Spreaders, "C" and "S" Hooks, Beam Saddles, Floor Chairs, Concrete Inserts.

Service.

For assistance in the speedy and accurate solution of special or ordinary problems concerning the placing of steel reinforcing and forms, this corporation maintains a force of engineers who are specialists in this line, and who will take over all such problems, furnish any designs or setting-up plans required, so that workmen may proceed efficiently and with the maximum economy of time, cost and waste of materials.

Advantages.

Contractors, engineers and builders have been quick to realize the value of standardization principles applied to construction and to the building trades. By standardizing the devices used in steel reinforcing and forms, this corporation makes better work possible at a saving of labor, money and materials.

The facts following will demonstrate a few of the many advantages that devices and systems of the CONCRETE DEVICES CORPORATION have over most of the intricate and costly systems now in use:

(1) Rigidity of reinforcement—no movement of the steel while the concrete is being poured. This means 100% adherence to specifications.

(2) Devices made by this corporation can be applied by unskilled as well as skilled labor. Especially under present conditions, this means a vast saving of time and money.

(3) An unskilled workman using this standardized system can set up steel reinforcing or lock forms many times more rapidly than a skilled workman who uses any of the old impractical methods involving nails, twisted wire, etc.

(4) When the concrete is set and the forms removed, the form ties and form clamps, washers and keys can be

used over and over again.

(5) A simple key in the form of a wedge makes the outside form clamps perform a feat never before accomplished in the history of concrete construction. A blow with a hammer is all that is necessary to *tighten and also hold* the forms in place. This is done in *one* operation, rendering the device foolproof and making inspection of forms possible at a glance.

STEEL BAR CLIPS

Made of steel, for round or square bars. Snap on by hand. No tools necessary. Bars can not slip. Put on three times as fast as by any other method, and *cost less*. Can be applied at any intersection.

BAR SPACER

Made of steel wire for round or square bars. Snap on by hand. No tools necessary. Bars can not slip. Put on three times as fast as by any other method, and *cost less*. Can be applied at any intersection.

Form Tie and Washer.

The form tie and washer, being put on the market by this corporation, offer the same dependability of staying steadfastly wherever placed, and the economy of possible installation by unskilled labor. The form ties may be removed by simply sliding the washer away from the wall along the form tie and unhooking the tie from the spreader inside the wall, the washers having left on either side of wall a slight recess which may or may not be pointed with cement, at the discretion of the builder.

Specifications, Samples, Literature and Estimates.

Specifications will be furnished on steel reinforcement and the locking of forms. Samples, catalogue and estimates will be furnished on request.

REPRESENTATIVES IN LEADING CITIES

Products.

SYMONS COLUMN CLAMPS.
Symons Bar-ties and Bar-tie Supports.

Description.

Symons column clamps have been designed to save time in erecting forms for concrete columns, and have so effectively accomplished their purpose that they are now recognized by most of the leading contractors in this country to be one item of their standard equipment.

They are made of mild steel, and are suitable for both square and rectangular columns. Are very quickly applied and removed from a form. One size clamp usually suitable for all the columns in a construction. There are no loose parts to become lost, and the wear and tear are negligible.

The savings derived from their use is so pronounced that the company devised a means for putting them out on rental orders, making shipment from warehouse stock, located in principal cities.

APPLICATION OF SYMONS COLUMN CLAMPS
Showing also tightening wrench

Rental Proposition.

The clamps may be rented on terms that insure or guarantee a saving. All rental contracts contain a 90-day option of purchase, the paid rentals to apply. This rental proposition guarantees satisfactory results even when figured on a rental basis, and with the privilege of purchasing in 90 days, has proved so attractive to contractors, that within the last five years Symons clamps have come into almost universal use and seldom need an introduction in a contractor's office.

Symons clamps made good when form lumber was selling for \$25.00 and \$30.00 per thousand, and carpenters were being paid 50c and 60c per hour. Surely they ought to make good under present conditions.

SIZES AND SPECIFICATIONS OF SYMONS COLUMN CLAMPS

Size of clamp, in.*	Arms (mild steel), in.	Adjustment, in.	Size of columns (square or rectangular) for which clamps are suitable Size is net of concrete, in.
30 x 30	2 x $\frac{5}{8}$ x 30	14	20 x 20 to 9 x 9
36 x 36	2 x $\frac{5}{8}$ x 36	17	25 x 25 to 10 x 10
48 x 48	2½ x $\frac{5}{8}$ x 48	22	36 x 36 to 14 x 14
60 x 60	3 x $\frac{5}{8}$ x 60	24	48 x 48 to 24 x 24
48 x 72	2½ x $\frac{5}{8}$ x 72	24	34 x 58 to 12 x 36
72 x 72	2½ x $\frac{5}{8}$ x 72	30	58 x 58 to 36 x 36

Above specifications are for column forms made of 2-in. boards.

With 1-in. boards 30-in. size is suitable for columns 22 by 22 in. down to 11 by 11 in., etc.

*"Size of clamp" indicates length of clamp arm only. Does not mean size of column for which clamp is suitable.

Sample Clamp.

The SYMONS CLAMP CO. has never employed a road salesman, but in answer to every inquiry, sends prepaid a sample clamp which speaks for itself in more convincing language than a salesman might command in telling about it.

If not acquainted with this popular clamp, send a postcard at once. Procure a sample and a list of over 1000 contractors in this country who will testify as to its worth.

The CLETRAC TANK-TYPE TRACTOR
(formerly the Cleveland Tractor).

Cletrac
TANK-TYPE TRACTOR
TRADE-MARK

Specifications.

Motor: 4-cylinder, 4-in. bore by 5½-in. stroke.
Protected overhead valves. Removable cylinder head.

Horsepower: 12 at draw-bar, 20 at belt pulley.

Length: 96 in.

Width: 50 in.

Height: 52 in.

Weight: 3300 lbs.

Turning circle: 12 ft.

Track: length on ground (each side) 50 in., width 8 in.

Traction surface: about 800 sq. in.

Center to center of tracks: 38 in.

Clearance: 12 in.

Belt pulley: diameter 8 in., face 6 in.

Suspension: 3-point.

CLETRAC TANK TYPE TRACTOR

In Shops, Yards and Plants.

The Cletrac's value in the shop, yard or plant is the result of its great flexibility and wide working range. It is in a class by itself for rough hauling outside the plant, over loose fills, through mud, snow and slush—anywhere in fact that motive power is required. It will pull a load over footing that is impassable by any other means.

At the same time the Cletrac is just as adaptable to work within the plant. Its ease of control, short turning radius and compactness provide a ready and efficient substitute for electric tractors or small industrial railways giving equal or greater power at a reduced cost in first investment, operation and upkeep.

Hundreds of Cletracs are at work in foundries, machinshops, storage yards, warehouses and freight

terminals, hauling heavy machinery, castings, loaded transfer buggies, scrap carts, dump wagons and spotting freight cars. The representative firms using them have cut their haulage costs materially.

CLETRAC HAULING A LOADED CAR

On Contracting and Engineering Jobs.

The Cletrac constitutes a part of the contractor's equipment of first importance because of its ability to do the work of horses or mules better, cheaper and quicker. And when the footing is rough, sandy or muddy the Cletrac replaces trucks which are so easily stalled or mired under adverse conditions.

On the basis of a day's work in moving materials the Cletrac will replace 6 to 8 horses or mules. At the same time it costs nothing when not in use, saving the expense of care and feeding during the days when

CLETRAC HAULING WAGON LOADS OF DIRT

animals would be weatherbound and useless. The savings, therefore, are derived from a greater amount of work per day, more days of work—for the Cletrac is not stopped by mud, sand or snow—and a greatly reduced upkeep and labor expense.

Many contractors have also found the Cletrac invaluable as a means of keeping their "long-haul" motor truck equipment moving at the work end of the journey which is always rough, soft or muddy.

They are also using it with great success for snatch work in excavations or over steep grades.

Road Building and Maintenance.

On road work above all other applications the Cletrac justifies its use in fleets of two to six tractors. It is successfully replacing horses on breaker plows, drags, slip and wheel scrapers, scarifiers and graders and for hauling heavy material and machinery from one place to another along the job.

Because of its broad metal tracks, which reduce the weight per square inch and prevent slipping, the Cletrac can be used over unfinished parts of the roads that horses or trucks could not pull through.

It does as much work with one man in a day as is ordinarily done by three men and three teams. The economies are self-evident—particularly the saving in labor and feed which must be carried as a dead loss when the horses or mules are idle.

Ease of operation, economy and flexibility make the Cletrac equally useful for the maintenance of roads already built. Hundreds are now owned by municipalities, townships and counties for this work.

CLETRAC HAULING A ROAD SCRAPER

In the Lumber Industry.

At almost every turn in the lumber industry the Cletrac is saving time and cutting the cost of production.

Its good work begins in the timber where hundreds of Cletracs are replacing horses and mules in skidding logs to the road or stream. Six to eight animals are replaced on this job and at least 50% more footage can be hauled each day.

Then the Cletrac gets busy loading the trucks or trailers—an easy job because of its simple and positive control. And after that, it speeds up short hauls to the mill, or at the mill itself keeps the stock piles moving; spots freight cars, takes care of any hauling job around the yard and can even be set up to run a saw or dresser if the steam engine is down for repairs.

Because the Cletrac travels on its own broad, metal tracks, it can get through the wood in wet weather and in the winter when other pulling power can not be used.

CLETRAC HAULING LUMBER

In the Oil Fields.

The Cletrac's ability to go almost anywhere and take a good big load along with it is its greatest recommendation to oil men everywhere.

Roads are not essential when you have a Cletrac for it carries and lays down its own broad, metal tracks across country, over rough grounds, up mountain trails or through soft, wet stream beds.

The Cletrac supplies a complete haulage service capable of taking heavy machinery from the railway to the lease and from one job to another by the most direct route.

It is also an excellent auxiliary on any lease, supplying a flexible and economical source of power for pulling rods and tubing and for emergency work at the belt where an average of 20 h.p. is required.

Hundreds of Cletracs are in use throughout the Pennsylvania, Oklahoma, Texas and other oil fields.

CLETRAC USED IN THE OIL FIELDS

Transportation Advisory Service.

The Industrial Sales Department of THE CLEVELAND TRACTOR COMPANY has compiled and is constantly adding to a fund of facts and figures on haulage costs. These are taken from actual performance of the Cletrac under a wide range of conditions.

Shop men, yard managers, lumbermen, oil men and contractors are welcome to any information that can be supplied without cost or obligation. Address the Industrial Sales Department.

THE ELWELL-PARKER ELECTRIC CO.

Electric Industrial Trucks and Tractors

4400 St. Clair Avenue
CLEVELAND, OHIO

OFFICES IN PRINCIPAL CITIES

Products.

ELECTRIC STORAGE BATTERY INDUSTRIAL TRUCKS of the Tractor, Elevating Platform or "Self-loading," Carrier, End Dump, Revolving Crane, Rocking Crane, Straight and Drop Frame Types, for rail or floor.

Applications.

Used inside buildings; in yards or across streets; on inclines, elevators, bridges, or through tunnels at steel, tin plate, paper, cotton, textile and lumber mills; clay working, salt, sugar, chemical, automobile, fertilizer, leather, rubber, glass and power plants; foundries, machineshops; factories; hospitals; shipyards; warehouses, piers, railroad and marine passenger and freight terminals, for quick, economical inter-department transfer of materials. It matters little what the commodities are, electric trucks can be used to handle them at less expense—first cost, maintenance and adaptability to present manufacturing conditions considered.

Operation and Original Features.

Elwell-Parker trucks and tractors steer on all 4 wheels, and are 2- or 4-wheel drive. Edison or lead battery furnishes power to totally enclosed drum type controller and motor. Motor drives through single reduction free coasting worm gear to large diameter solid rubber tired wheels. Battery assembled in a box, may be charged in the truck or removed and charged, or exchanged for one already charged. Battery capacity sufficient for 15 to 20 miles operation, or the average day's work in a factory. Charge from 40-volt DC line in 7 hours at 40 to 60 amperes.

Patent interlocked control is so arranged that truck or tractor can not be started except when operator is standing on pedals or sitting in seat. This control makes a fuse unnecessary. Motor will take entire battery charge. Power may be applied with brakes partially set—important when starting on inclines. When operator steps from truck same will stop within its length.

Speeds 400 to 700 ft. per minute. Carrying capacity of trucks 4000 lbs. Draw bar pull of tractors 6 to 30 tons. Self-loading trucks will pick up 4000 lbs. in 10 seconds. Cranes lift 2000 lbs. at 28 in. over side of truck. Dump trucks with 36 cu. ft. end dump, and 40 cu. ft. side dump bodies. Platform heights range from 11 to 33 in.; lengths from 4 to 11 ft.; widths 2½ to 3½ ft.

Inquiries.

Always state kind and amount of material to be moved per hour, length of haul, percentage and length of inclines, and size and capacity of elevators. Complete catalogue on request.

SOME TYPES OF ELWELL-PARKER ELECTRIC STORAGE BATTERY INDUSTRIAL TRUCKS

BELL LOCOMOTIVE WORKS, INC.

23 Water Street
NEW YORK, N. Y.

Products.

BELL OIL BURNING GEARED STEAM LOCOMOTIVES.
BELL GASOLINE LOCOMOTIVES.

Advantages.

Bell locomotives have the following points of superiority over other types:

Use cheapest fuel: kerosene, fuel oil, distillate or crude oil.

Lowest possible center of gravity with flexible frames permits of high speed over rough track.

Have 50% greater tractive effort than direct connected locomotives of equal weight.

One-man operated.

Accessible, simple and rugged construction.

Can be made with minimum length, width and height clearances.

All parts interchangeable; standardized design.

No smoke or sparks and fire risk eliminated.

More speed than any other locomotive of same class.

Licensed engineer not usually required.

Adaptability.

Bell locomotives are excellently suited for contractors' use; logging; industrial plants; sugar, fruit, hemp and other plantations; brickyards; clay pits; quarries; mining; tunnel and subway work; road building; bridge construction; aqueduct work; dock construction and various special uses.

Bell Oil Burning Steam Locomotives.

This geared type of Bell oil burning locomotive is built in 17 sizes approximating respectively 2 to 20 tons in weight and for any gauge desired.

BELL UNIT ENGINE—Only 15 moving parts. Is geared direct to the axle and runs in oil; has roller bearings and dropped forged parts throughout. It is durable, compact, light, and powerful, and is the most highly developed steam engine made. The complete unit can be removed and replaced in two hours time.

BELL HORIZONTAL BOILER—Made of the best grade firebox steel, with no stays, rivets or seams. It is compact, quick firing, and gives high pressure superheated steam. Tubes are of cold drawn seamless steel.

BURNER—The Bell patented type burner, adapted for kerosene, fuel oil, or heavy petroleum, is most efficient in its use of fuel.

FRAMES—Bar steel and cast frames are designed to secure maximum flexibility, permitting operation on rough, uneven track and roadbed.

Bell Gasoline Locomotives.

The internal combustion, friction driven locomotives are made in 2-, 3-, and 4-ton sizes. Heavy duty Buda motors, with Bosch magneto and thermo-syphon cooling system, are used. Only 36 in. high without cab. Excellently suited for lighter class of contracting, industrial and plantation work.

LOCOMOTIVES to suit the varying needs of Manufacturing Plants, Steel and Iron Mills, Coke Oven Plants, Outside or Inside Mine Haulage, Quarries, Brick Yards, Phosphates or Ore Mines, Contractors, Municipalities; Yard or Terminal Switching; Suburban, Plantation, Logging, Freight, Passenger, or General Main Line Service.

General.

Vulcan locomotives are in successful operation in practically all parts of the world, and are built not only in the standard types available for almost immediate delivery, but also in all the prevailing special designs to meet the needs of any particular service for reasonably quick shipment.

Vulcan locomotives are built to cover a wide range of service, for all practicable gauges of track; to burn all grades of coal, wood or crude oil fuel; cylinders from 5 by 10 in. to 22 by 26 in., and weights in service order vary from 5 tons to approximately 75 tons, exclusive of separate tenders.

CONSTRUCTION—All Vulcan locomotives are built to the duplicate or interchangeable system, so that repeat orders for new locomotives or repairs for engines previously built of similar size or type, can be quickly and correctly supplied.

BOILERS—All boilers are built to conform to the latest American practice, and are tested under water and steam, each engine being given a rigid running test before shipment whenever practicable.

Shipments.

Especially care is given to shipment of locomotives whether for domestic or foreign service. With foreign shipments particular care is taken regarding packing, boxing, etc.

Detailed Information.

Complete information furnished to all prospective purchasers, including prices, specifications, sketches, photographs, and correspondence.

Class C-S 0-4-0 Saddle Tank Locomotive.

Adapted to light contracting, switching and industrial service, for short hauls, sharp curves, etc. All sizes from 5 by 10-in. to 17 by 24-in. cylinders, ranging in weights from 6 to 55 tons working order. Side or saddle water tanks, coal, oil or wood fuel. All practicable gauges.

20-TON CLASS C-S 0-4-0 SADDLE TANK LOCOMOTIVE

Class C-S 0-4-0 Saddle Tank Locomotive.

For heavy contracting, switching and industrial service, built to all practicable gauges of track and to burn coal, wood or oil fuel. Sizes, 6 by 10-in. to 18 by 24-in. cylinders. Weights, 7 to 60 tons working order. Constructive features modified to suit special conditions.

50-TON CLASS C-S 0-4-0 SADDLE TANK LOCOMOTIVE

Class C-S 0-4-0 "Steel Works" Type Locomotive.

For shifting about steel mills, open hearth furnaces, etc., where 24 hours per day service is necessary, under most exacting and limited clearance conditions. Short wheel bases for extremely sharp curves. Sizes from 6 by 10-in. to 19 by 24-in. cylinders, and in weights 8 to 60 tons.

50-TON CLASS C-S 0-4-0 "STEEL WORKS" TYPE LOCOMOTIVE

Class D-S 0-6-0 Plantation Locomotive.

Adapted to light plantation, logging or tramway service, for light rails, steep grades, reasonably sharp curves. Sizes from 6 by 10-in. to 12 by 16-in. cylinders and in weights from 9 to 30 tons. Coal, wood or oil fuel. Steel cabs or canopies.

12-TON CLASS D-S 0-6-0 PLANTATION LOCOMOTIVE

Class D-S 0-6-0 Saddle Tank Locomotive.

Adapted to industrial or general switching service, for steep grades and for moderately long runs where minimum weight per axle is desired. Standard sizes run from 6 by 10-in. to 19 by 24-in. cylinders, and range in weights from 9 to 70 tons. Constructive features modified to suit special conditions.

64-TON CLASS D-S 0-6-0 SADDLE TANK LOCOMOTIVE

Class D-S 0-6-0 Side Tank Locomotive.

Adapted for heavy switching or industrial haulage, for reasonably sharp curves, steep grades, moderately long runs. Sizes run from 12 by 18-in. to 19 by 24-in. cylinders, and range in weights from 33 to 70 tons. Coal, wood or oil fuel. Constructive features modified to suit conditions.

61-TON CLASS D-S 0-6-0 SIDE TANK LOCOMOTIVE

Class I-S 2-4-2 Double Ender Side Tank Locomotive.

Embodies all requirements of speed, power, steady running, distribution of weight, for light rails, and is adapted for running in either direction. Suitable for logging, light terminal or industrial haulage. Sizes from 7 by 12-in. to 19 by 24-in. cylinders, and weights from 12 to 70 tons. Constructive features modified to suit conditions.

31-TON CLASS I-S 2-4-2 DOUBLE ENDER SIDE TANK LOCOMOTIVE

Class M-S 2-6-2 Double Ender Saddle Tank Locomotive.

For light terminal, logging or general haulage, for moderately long runs, fair speeds, reasonably sharp curves, and for running in either direction. Sizes from 8 by 12-in. to 20 by 24-in. cylinders, and in weights from 15 to 75 tons. Saddle or side water tanks. Coal, wood or oil fuel. Constructive features modified to suit conditions.

72-TON CLASS M-S 2-6-2 DOUBLE ENDER SADDLE TANK LOCOMOTIVE

Class C-T 0-4-0-8 Switching Locomotive.

Suitable for light contracting, industrial or switching work in railroad yards and terminals, having short wheel bases and all the weight available for adhesion. Sizes 10 by 16-in. to 19 by 24-in., and weights from 25 to 60 tons, exclusive of tender.

50-TON CLASS C-T 0-4-0-8 SWITCHING LOCOMOTIVE

Class D-T 0-6-0-8 Switching Locomotive.

For heavy shifting service, where maximum power and weight available for adhesion are desired. Suitable for steel works, railroad yards, terminal or heavy contracting work. Sizes range from 10 by 16-in. to 21 by 26-in. cylinders and weights run from 30 to 75 tons, exclusive of tender. Constructive features modified to suit special conditions.

70-TON CLASS D-T 0-6-0-8 SWITCHING LOCOMOTIVE

Class B-T 2-4-0-8 Plantation Locomotive.

Adapted to light general logging, plantation, service for moderately long runs, fairly level track and reasonable curves. Sizes from 8 by 14-in. to 16 by 24-in. cylinders, and ranging in weights exclusive of tender from 14 to 40 tons. Constructive features modified to suit special conditions.

19-TON CLASS B-T 2-4-0-8 PLANTATION LOCOMOTIVE

Class J-T 2-6-0-8 "Mogul" Type Locomotive.

Adapted to heavy freight, logging, plantation or main line service, requiring long runs on good tracks with ordinary grades and curves. Built in all sizes from 10 by 14-in. to 21 by 26-in. cylinders and varying in weights from 16 to 75 tons exclusive of tender.

69-TON CLASS J-T 2-6-0-8 "MOGUL" TYPE LOCOMOTIVE

Class M-T 2-6-2-8 "Prairie" Type Locomotive.

Suitable for heavy freight, logging or main line service, for long runs, fair speeds, undulating track conditions and fairly steep grades. Sizes from 10 by 16-in. to 21 by 26-in. cylinders, weights from 19 to 75 tons exclusive of tender. Constructive features modified to suit special conditions.

59-TON CLASS M-T 2-6-2-8 "PRAIRIE" TYPE LOCOMOTIVE

Class L-T 4-6-0-8 "Ten Wheel" Type Locomotive.

For heavy freight, logging, plantation, passenger and main line service on good tracks, with ordinary curves and grades. Preferable to American type (4-4-0-8) having power and weight under given track conditions. Sizes from 10 by 16-in. to 21 by 26-in. cylinders and in weights from 19 to 75 tons. Constructive features modified to suit conditions.

55-TON CLASS L-T 4-6-0-8 "TEN-WHEEL" TYPE LOCOMOTIVE

Class R-T 2-8-0-8 "Consolidation" Type Locomotive.

For light and heavy freight, logging, plantation and main line service. Combination of power, speed and adaptability for light track conditions for long runs and moderate curves. Sizes from 10 by 16-in. to 21 by 26-in. cylinders and weights from 20 to 80 tons. Constructive features modified to suit special conditions.

55-TON CLASS R-T 2-8-0-8 "CONSOLIDATION" TYPE LOCOMOTIVE

EASTON CAR & CONSTRUCTION COMPANY

32 Church Street
NEW YORK, N. Y.

WORKS: EASTON, PA.

BRANCH OFFICES

ATLANTA BOSTON CHICAGO DETROIT MILWAUKEE PHILADELPHIA PITTSBURGH

Products.

Complete NARROW GAUGE RAILWAY EQUIPMENT, designed and built for mines, plantations, factories, power plants, docks, quarries, etc., which includes:

Steel Cars of every description, Small Locomotives, Permanent and Portable Track, Switches, Crossings, Rails, Turntables, Track Scales, Cast Iron Track, Floor Plates, Wheels and Axles, etc.

Service.

The specialists of this company, with 30 years' experience in this line, will welcome an opportunity to solve transportation problems. Designs of special and standard cars are to be had for the asking. Genuine sincere service is the foundation on which this business has been built.

General Information.

These pages illustrate, as well as the space permits, the wide and complete variety of narrow gauge railway equipment designed and built by this company. Brief description of standard equipment is possible, but there is room for only a few of the typical variations from these standards, and some special types picked at random from among thousands. Full specifications, drawings and additional illustrations will gladly be sent to supplement the data given here.

There are but few different types of industrial railway cars, viz.: platform, V-body dump, rotary dump, end dump, box, gable bottom, hopper bottom, scoop, skip, etc. Each class may be further divided into *standard*, *variation from standard*, and *special*. The so-called *standards* are merely the types most used. *Variations from standard types*, which are made necessary by working conditions, are very common. It is only when the conditions are very unusual indeed that *special* designs are necessary.

A platform car, for example, without being anything but a slight *variation from standard* might be equipped with automatic or link pin couplings, spring draft rigging or rigid bumpers, spring pedestals or springless pedestals, roller bearings or brass bearings, steel platform or wooden platform, with or without brakes, with or without sides, with or without ends, etc.

Since these slight differences in construction are applicable to practically all other standard cars, it will be obvious that: (1) the purchase of a car which varies somewhat from *standard* does not necessarily involve the added first cost which might be expected; and (2) it is absolutely essential on inquiries and orders that this company be furnished with all the details and data obtainable in order that unnecessary correspondence and delay may be avoided.

Because so much of the equipment built by the EASTON CAR & CONSTRUCTION COMPANY is for such widely different conditions, it can readily be seen that the company is peculiarly well fitted to turn out any kind of *special* equipment to buyer's, or its own, drawings and specifications.

Standard Rocker Dump Cars.

Designed for handling all kinds of loose materials.

BODY—Carefully balanced, self-dumping and arranged to dump clear of the wheels.

AUTOMATIC LATCHES—So arranged as to be operated from the sides of the car. A special latch for holding the body in a partially dumped or fully dumped position is supplied on order.

UNDERFRAME—Made of channels, well braced and complete with bumper and link and pin coupling.

WHEELS—Extra heavy single plate type, made of best charcoal iron, thoroughly annealed, with chilled treads, and are hydraulically pressed on steel axles with finished journals.

Standard Easton dustproof roller bearing boxes with flexible yokes are supplied.

VARIATIONS FROM STANDARD—Brakes on 2 or 4 wheels, spring draft rigging with rectangular underframes, spring pedestals, brass bearing boxes and other features incorporated as ordered. See other illustrations on these pages and send for Bulletins No. 2 and No. 3.

NOTE—Capacities level full; weights and dimensions approximate only and not binding on us. End braces on cars of 40 cu. ft. and over.

Standard Coal Charging Cars.

This type of car is designed for charging coal directly from car through fire doors.

BODY—Made of steel plate properly reinforced and to dimensions and height which have been carefully worked out in relation to scientific coal firing.

LATCHES—Automatic and guarded. Hinge of door is coaltight, and offers no obstruction to the fireman's shovel.

Continued on next page

UNDERFRAME—Made of heavy braced steel channels without couplings.

WHEELS—Made of best charcoal iron, thoroughly annealed, with chilled treads, pressed on steel axles of ample diameter with finished journals revolving in Easton standard dustproof roller bearing boxes.

VARIATIONS FROM STANDARD—Such as double doors, end doors, other gauges, flexible wheel base, etc., supplied if required. See other pages and send for Bulletin 16.

Add 5 in. for width over all.

Standard Platform Cars.

This type is a widely used general utility car.

PLATFORM—Made of yellow pine, carried on steel channel underframe thoroughly braced but without coupling.

WHEELS—Extra heavy single plate type with chilled treads, pressed on steel axles with machined journals revolving in Easton dustproof roller bearing boxes.

VARIATIONS FROM STANDARD—Such as couplings, bumpers, sides, ends, partitions, spring draft rigging, spring pedestals, automatic couplers, etc. furnished as ordered. See other pages and Bulletins 1, 6 and 18.

Standard Scoop Cars.

A dump car, the body of which revolves on the underframe and dumps to both ends and to both sides. Usually pushed by hand. Due to its ease of operation and general utility, it is very widely used for sand, ashes, concrete, gravel, coal and other loose materials.

BODY—Made of steel plate strongly braced and reinforced, has an automatic latch and an easily operated turntable.

UNDERFRAME—Made of rolled steel channels securely tied together.

WHEELS—Made of charcoal iron with chilled treads

and are of the self-oiling type, revolving on square axles. Roller-in-the-hub wheels are furnished at a small extra charge.

VARIATIONS FROM STANDARD—In the way of partitions in the body, different shape or size of body, different gauge of track, etc., as ordered. See other pages and send for Bulletin 4.

Standard Turntable.

The best turntable obtainable is the best known means for effecting change of direction in track work where there is no room for switches. This is an axion. The Fig. 94 turntable is the best this company knows how to build.

The table is centered and carried by the machined ball race with its hardened, ground and polished steel balls; and by it alone. This eliminates all the sources of friction and trouble found in all other types of turntables. Both top and bottom are made of heavy reinforced cast iron. The top carries, cast integral in it, a right angle depressed track crossing. The balancing ring and pads are machined. The ball race top and bottom is, of course, also carefully finished. The balls are made of tool steel, hardened, ground and polished. The top is supplied with an automatic latch or stop. Rail supports are supplied cast in the frame.

FIG. 94. STANDARD TURN-TABLE

Standard cast iron, ball bearing turntables with automatic locking device. Large stock on hand

Variations of Standard—In other crossings than those of 90°, double tracks, other gauges, etc., as ordered. See other pages and send for Bulletins 12 and 13.

DATA. STANDARD TURNTABLES

Code word	Diam. of top, in.	Track space, in.	Cap., tons	Standard gauge, in.	Weight, lbs.
Revolvedor	40	41 1/4	3	20	700
Revolving	44	45 1/4	4	24	800
Revolution	48	49 1/4	4	24	1,150
Revotaba	52	53 1/4	6	24	1,275
Revuelto	60	61 1/2	6	24	2,000
Revue	72	73 1/2	7	24	2,000
Revulsarum	84	86 1/2	8	24	3,400

Turntables 44 in. to 84 in. will also fit 21 1/2 in. outside track gauge. Other gauges than standard can be furnished at a slight additional cost.

Standard Portable Track.

Standard portable track is made any gauge, of any weight of rail, mounted on steel ties, complete in 15-ft. sections, 5 steel ties to the section, ready to lay.

Curves and one-way, two-way or three-way switches of any radii, crossings of any angle, ground throws, switchstands, etc., are furnished for complete track layouts.

Drawings to meet any conditions will gladly be furnished, and the track will be shipped complete in sections ready to lay, for rapid bolting up in the field.

VARIATIONS FROM STANDARD—In the way of permanent track, cast iron track, special switch work, etc., supplied, as ordered. See other pages and Bulletins 9, 10, 11 and 12.

FIG. 77. INDUSTRIAL TRACK ON STEEL TIES
Furnished in 15-ft. or 5-meter sections

FIG. 80. PORTABLE SWITCH
Also right- and left-hand switches

FIG. 268. SKIP CAR
Another type of skip built for any purpose and to meet any condition

FIG. 280. SIDE DISCHARGE CAR
With inclined bottom and gate for controlling flow of contents

FIG. 264. PIG IRON CAR
Furnished either with or without sides or ends, with ends and sides removable, or with only one fixed side

FIG. 273. BILLET CAR
For ingots, billets, pig iron, etc.

FIG. 226. HOPPER BOTTOM CAR
Large double truck, with brake and automatic coupler for locomotive traction

FIG. 444. HOPPER BOTTOM CAR
Built with all four sides inclined to insure the contents discharging between the rails

FIG. 277. END DUMP CAR
These all-steel cars are commonly used for mining service

FIG. 430. SPECIAL SIDE DISCHARGE CAR
With inclined bottom. Differs from other types in that a hinged side is substituted for the sliding gate

FIG. 1837. CORE OVEN CAR
4-wheel core oven car of I-beams and channels. For all types of core oven cars, the use of the Easton core oven roller bearing box is recommended

FIG. 414. DOUBLE SIDE DOOR COAL CHARGING CAR

FIG. 1879. STANDARD PLATFORM CAR
Provided with removable sides and ends, and has automatic couplers and spring draft rigging

FIG. 276. CRADLE DUMP CAR
Built to dump side, end or rotary. A large stock of standard sizes is kept on hand

FIG. 249. GABLE BOTTOM CAR
All types built in standard and special designs with and without brakes, smaller sizes being 4-wheel construction; larger sizes double truck, or 8-wheel

FIG. 1886. END DISCHARGE CAR
A special design with inclined bottom, chute and sliding gate

FIG. 266. CORE OVEN CAR
Another type of core oven car with steel channel frame, with grid platform of flat steel bars

FIG. 269. SKIP CAR
All-steel of various designs, built to meet special requirements

FIG. 274. STANDARD PLATFORM CAR
Double truck with wood floor and brake

FIG. 450. DOUBLE END DOOR COAL CHARGING CAR

FIG. 451. CHARGING BOX CAR
Special all-steel cars built from private or special designs and specifications for steel and rolling mills

FIG. 1321. ANNEALING FURNACE CAR
Built in various widths and in practically any length

FIG. 1448. ANNEALING FURNACE CAR
Built in various widths and in practically any length

FIG. 1634. STEEL PLANT CAR
Special all-steel cars built for steel mills and iron foundries in any capacity and gauge. For ingots, bar iron, pipe, etc.

FIG. 283. CREOSOTING CAR
All types

FIG. 147. SUGAR CANE CAR
All-steel car with end walls; used specially for carrying sugar cane

FIG. 1533. PLATFORM CAR
Double truck platform cars built to meet any specific requirements and in any desired size. Both with and without brakes

FIG. 284. TRANSFER CAR
Built in a number of designs. Many of them being underslung, so that the load platform is very close to the ground

FIG. 1542. STANDARD PLATFORM CAR
Same as 1005, except equipped with stake pockets and stakes

FIG. 3530. ROCKER DUMP TRAILER
With extra wide tired wheels for uneven, soft ground; used in connection with tractors

FIG. 974. ROCKER DUMP CAR
Special for locomotive traction. Made in any capacity or design, for any track gauge and either with or without brakes and automatic couplers

FIG. 99. STANDARD PUSH CAR
With wood frame made extra strong but light for quick and easy removal from track

FIG. 403. MINE CAR FOR HEAVY WORK
This type is built in capacities ranging from 12 to 27 cu. ft.

FIG. 184. QUARRY CAR
With automatic end doors. One of many designs

FIG. 135. CROSSING
Any design, angle, gauge, or weight of rail

FIG. 9. RAIL
Rails of any weight. Large stock on hand

FIG. 76. TRACK CURVES
All standard sizes carried in stock

FIG. 2543-B. TURNTABLE
One type of 50-ton capacity turntable with 90° manganese steel standard gauge track crossing

FIG. 176. STANDARD GROUND THROW

FIG. 81. EASTON TWO-WAY SWITCH

FIG. 82. EASTON THREE-WAY SWITCH

FIG. 448. WHEELS AND AXLE
Wheels and axles of any design and for all gauges

FIG. 185. CAST IRON PLATE SWITCH

C. W. HUNT COMPANY, INC.

Manufacturers of Industrial Railways and Coal Handling Machinery

SALES OFFICES

NEW YORK, N. Y.

WORKS AND EXECUTIVE OFFICES: WEST NEW BRIGHTON, N. Y.

Products.

INDUSTRIAL RAILWAY TRACKS, SWITCHES, CARS, SCALES, ELECTRIC MINE and INDUSTRIAL LOCOMOTIVES and STORAGE BATTERY TRUCKS; AUTOMATIC RAILWAYS; CABLE RAILWAYS; CONVEYORS; COAL CRACKERS; SKIP HOISTS; CUT-OFF VALVES or GATES; WEIGHING LARRIES.

Transmission and Hoisting Manila Rope and Rope Couplings, Coal Tubs.

Co-operative Service.

Since every coal handling or railway proposition has specific requirements and conditions to meet, our engineering staff is at the disposal of all parties interested in the above classes of work. It will gladly advise, recommend, or furnish estimates.

Facilities.

Standard parts most in demand are carried in stock. The company's resources, including plant, capital and engineering force, are prepared for prompt action on the largest special requirements. Prompt deliveries are further assured through exceptional shipping facilities—Baltimore & Ohio R. R. tracks on the property and wharf accommodating the lighters of every railroad centering in New York City.

Industrial Railway and Equipment.

TRACKS—Laid on any form of floor or roadbed and can be run across or between standard gage railway tracks without cutting the rail heads, run out on trestles or in tunnels. Made up in sections of 20-ft. length with ties spaced every $24\frac{1}{2}$ in. Rails are furnished either riveted to steel cross ties or having cast tie plates integral with rail or knocked down steel track. Track gage from outside of one rail head to other is $21\frac{1}{2}$ in. (Fig. 2).

FIG. 1. CAST PLATE STRAIGHT TRACK
Sectional view

FIG. 2. ROLLED STEEL AND CAST PLATE CURVES

FIG. 3. LEFT-HAND SWITCH, WITH STAND

FIG. 4. TWO-WAY SWITCH

FIG. 5. RIGHT-HAND SWITCH

Combination of switches are left- or right-hand, 2-way or 3-way, furnished with or without stands. Also, the above can be furnished in cast plate (Fig. 1). Frogs, crossovers and turntables are also manufactured. Any workman of ordinary intelligence can put together a whole system ready for use.

CARS—Bodies of various designs to meet a wide range of use, but all have essentially same truck construction. Axle bearings are either plain or roller bearing. Arrangement of running gear (Fig. 9) facilitates propulsion on short curves. Standard width for clearance of cars is 4 ft. Curve radius, 12 ft.

FIG. 8
ROLLER BEARING

FIG. 9. POSITION OF TRUCK AXLES WHEN ROUNDING A CURVE

FIG. 10. THEORETICAL CONE AND CIRCULAR PATH BY AXLE AND WHEELS IN ROUNDING A CURVE

TRACK SCALES—Made in both iron and wooden frames, especially designed for use with industrial railway, track ends connecting directly with either cast plate track or made-up steel track of railway system.

Both types of scales are provided with a tare beam to balance weight of empty cars so that load beam will give net weight of load. Beams are furnished graduated to pounds or kilograms as desired.

Cast iron type has track rails cast integral with both platform and frame. Platform is 27 in. wide, and clearance distance from center of platform to beam box, when beam is parallel with car track, is 36 in. Where necessary, an extension to base can be fitted to frame, moving beam 4 ft. further or a lesser distance away. Beam box is cast iron, dustproof, and can be made to face in any direction to secure best light on beam. Weights are attached to beam to prevent their being misplaced or lost.

ELECTRIC LOCOMOTIVES FOR INDUSTRIAL AND MINE SERVICE—Narrow gage electric locomotives in connection with industrial railways further reduce cost of handling material. Designed to take full load around 12-ft. radius curves as easily as on straight track.

Various types of locomotives are made to pull loads up to 50 tons.

Standard machine as shown (Fig. 11) is built for any track gage from 18 to 36 in. Minimum curve radius 10 ft. Rated draw bar pull, 800 lbs., at 4 miles per hour; steel wheels slip at 1600 lbs. starting pull. The

operator is protected by sliding top on cab. Over all height from top of rail to top of cab 52 in. Battery capacity ample for full day's work. Battery box easily removable for extra set of cells for 24 hours' service.

FIG. 11. STANDARD ELECTRIC LOCOMOTIVE

Locomotives can be equipped with storage battery for motive power, or current can be taken from overhead trolley or from third rail. Motors and gears are housed to protect them from injury and dust. Speed, variable, from 1 to 10 miles.

Also load carrying motor cars (Fig. 12), 1-ton to 10-ton capacities.

FIG. 12. MOTOR DRIVEN SELF-DUMPING CAR

STORAGE BATTERY TRUCKS—Electric storage battery industrial truck (Fig. 13) is designed for heavy duty in handling freight in and about railway and steamship terminals, manufacturing establishments, warehouses, etc. Its design combines with strength and ruggedness, the maximum of simplicity and

FIG. 13. STORAGE BATTERY TRUCK
Length of car over all..... 108½ in.
Length of platform..... 90 in.
Width of platform..... 48 in.
Height of platform..... 22½ in.
Capacity..... 4,000 lbs.

accessibility. Parts subjected to greatest wear or stress are of steel. It has high grade bronze bushings, seasoned oak platforms, hardened steel pinions, etc. Bearings are of the highest grade such as are in the best automobiles.

Electrical equipment consists of General Electric controllers, Diehl or General Electric motors and either Exide or Edison batteries, and is of ample capacity to perform severest service, day in and day out, without danger of injury. System of electrical control is such that 3 speeds are given in each direction without the use of resistances which are great wastes of energy.

Batteries are hung in a spring suspended basket which absorbs road shocks and reduces to a minimum the danger of broken battery jars. Platform is in 3 sections, hinged so as to give easy access to all parts of truck.

The 2 levers used for steering and speed control are placed in a convenient position for operator and are moved in a vertical plane, simplifying steering. Brakes are the external band type and are placed on the 2 driving wheels. They are positive in action and will hold fully loaded truck on any grade it will climb. The 20-in. wheels with large 3½-in. solid rubber tires insure easy running and permit installation of batteries under platform, and yet height of platform above ground is only 23 in. and road clearance 5½ in. Clear loading space of 48 by 90 in. will carry either a bulky load or a concentrated load up to 4000 lbs.

Also manufactured with longer wheel base and 10-ft. platform for exceptionally heavy and bulky loads. Other designs include tractors (Fig. 15), "motor-in-wheel" drop frame trucks, elevating platform, crane trucks and models equipped with special dump bodies for bulk material (Fig. 14); also a 3-wheel very low truck for use in extremely congested places—the turn-radius being very short.

FIG. 14. DF-60 TRUCK WITH DUMPING BODY

FIG. 15. TRACTOR HAULING EMPTY TRAILERS

Hunt's Automatic Railway.

Designed primarily for transporting coal, sand, rock, cement and similar bulk materials from railway cars or vessels to storage bins where run does not exceed 600 ft. Operation is entirely automatic. Time consumed for round trip of 300 ft., dumping its load and returning, is about 50 seconds. Requires services of only one man—the crane man.

In operation, loaded car is started down an inclined track, and a few feet ahead of discharging point picks up a cross bar which is attached to a cable leading to a weight box. This raises weight box, and when load is discharged from car the reaction due to falling weight returns empty car to loading point.

Two sizes of cars are manufactured: 1-ton and 2-ton capacity. Made of wood, lined with sheet steel.

Cable Railways.

Adapted for handling coal and for carrying heavy material from point to point. Used extensively in conveying coal from barge to storage bins. Standard gage, 21½ in.; curve radius, 12 ft.

Skip Hoists.

Consists of load-carrying bucket, wire hoisting rope, head and leading sheaves, electric single drum hoisting engine with motor, traveling cam control and electrically operated brake, bucket guides, loading pit valve or loading chute, control panel and push button station for operating machine.

FIG. 16. STANDARD SKIP HOIST

Single bucket skip is counterweighted and guides constructed for properly guiding counterweight and bucket. Electric skips with drum type controller and steam hoist friction operated skips of high speed can be furnished if desired. Skip hoists can be operated equally well whether vertical or inclined.

Capacities from 25 to 300 tons per hour.

Overhead Weighing Larries.

Built to meet existing conditions with one way or bifurcated chutes to serve a single or double line of stoker hoppers. Accurate records of coal consumption registered on cards. Manually or electrically operated either from boiler room floor or cab. Capacities ½ ton and up.

FIG. 17. OVER-HEAD WEIGHING LARRY

Conveyors.

The Hunt pivoted bucket conveyor carries bulk material, dry or liquid, noiselessly in any direction without shock, breakage or violence. Three types of conveyors are manufactured: "Standard," with independent buckets, being separately filled; "Continuous," with edges of buckets in contact; "Lip Type," with edges of buckets overlapping—material being spouted into conveyor in constant stream without spill or scatter.

Buckets are suspended on pivots so that gravity keeps them upright whether track be horizontal, vertical or inclined. Conveyor driven by pawls which run smoothly on driving pins on chains. Whole conveyor designed for thorough lubrication of all bearings.

Capacity secured not by speed but by enlarged bucket. Operation entirely automatic. All parts interchangeable. Conveyor will operate on 5 to 10 h.p.

Special automatic machinery is designed for filling each "Standard" type bucket with definite quantity of material. Several fillers can be arranged for measuring and mixing different materials.

FIG. 18. SECTION THROUGH A POWER PLANT EQUIPPED WITH HUNT CONVEYOR

Coal Crackers.

Designed for breaking lump bituminous coal into pieces small enough to feed through automatic stokers. Rolls have hardened steel chisel points that split or crack instead of crushing the lumps. Steel points renewable. Bearings and mechanisms protected from dust. Cracker may be placed below hopper under railway car track, so that coal feeds directly from car into conveyor. Can also be suspended from overhead beams, or be supported from below. Steam or electrically operated.

FIG. 19. COMPLETE COAL CRACKER

Cut-off Valves or Gates.

For controlling flow of coal, broken stone, sand, etc., from storage bins to mechanical stokers, mixers or cars. Installed at side or bottom of bins, or at end of spout. Hand operated by single lever, but power can be applied to larger sizes. Have no sliding parts, but jaws rotate on centers, cutting through material without jamming. Normal tendency of valve is to close automatically by gravity. Almost every requirement may be met with standard types or modifications.

FIG. 20. CUT-OFF VALVES

Fig. 22 shows a low body duplex valve with outside flanges particularly suitable for ash hoppers. If the conditions are unfavorable for the operation of any other type of cut-off valve, these duplex valves will be successful. They are heavily built and are not quickly burned out.

Product.

"PENNSYLVANIA" TANK CARS.

Facilities.

The general offices and works are situated about three miles south of Sharon, Pa., on the Youngstown and Sharon Street Railway. Substantially built structural steel buildings, including power plant, fabricating shops, machineries, painting shops, and storage yards having direct connections with the New York Central, Erie and Pennsylvania Railroads, and the most modern and efficient machinery, enable the company to fabricate and turn out for quick delivery the light and heavy steel plate work which goes into "Pennsylvania" tank cars.

Territory.

"Pennsylvania" tank cars operate in all parts of North America and in many foreign countries, engaged in their big task of transporting raw materials to the manufacturers, and the finished products from the manufacturers to the consumers.

Description.

All materials used in manufacturing "Pennsylvania" tank cars are of the best quality and in accordance with all requirements of the Master Car Builders' Association. The tank is double riveted throughout, and all seams are well calked; it is tested with cold water at a pressure of 60 lbs. per sq. in., and is made absolutely tight in conformity to M. C. B. requirements. All details and appliances on "Pennsylvania" tank cars also conform to M. C. B. specifications and comply with the Federal Safety Appliance and Interstate Commerce Commission Laws.

Capacities and Dimensions.

The standard capacities of tank cars are 6500, 8050 and 10100 gals., though special cars with different capacities can be manufactured to order on receipt of specifications as to the particular product and use covered. The length over striking plates is 35 ft. 6 in. the width over running boards is 9 ft. 5 in. for the 10100-gal. car. Dimensions for the others of course vary slightly according to their capacities.

Adaptability.

"Pennsylvania" tank cars are today serving many industries—hauling various liquids, from acid to wine. Government figures show that about 70% of all tank cars in service are used to transport petroleum and its by-products, and 30% are used for products other than petroleum. To suit the peculiarities of any particular product (such as the prevention of corrosion when certain liquids come in contact with the steel in the tank) "Pennsylvania" tank cars can be insulated with wood or other material when desired.

Uses.

For the carrying of acids, animal oils, ammonia liquor, alcohol, benzol, cottonseed oil, candle grease, caustic potash, caustic soda, corn oil, calcium chloride, coal tar, creosote oil, crude oil, cider, castor oil, edible oils, fish oil, fuel oil, fatty oils, gasoline, glycerine, glucose, illuminating oils, lard, lubricating oils, lard oil, linseed oil, liquid driers, molasses, mineral waters, petroleum products, pitch, paints, road oil, rosin, red oil, silicate of soda, syrup, tallow, toluol, turpentine, tanning extracts, vinegar, wood alcohol, wine, etc.

ONE OF THE 5000 "PENNSYLVANIA" TANK CARS IN THE PENNSYLVANIA TANK LINE

These cars are leased to producers, refiners and marketers of petroleum products. They also carry products in the chemical, mineral and vegetable fields

SWEET'S STEEL COMPANY

Manufacturers of Steel Rails and Appurtenances
MILLS AND GENERAL OFFICES
WILLIAMSPORT, PA.

BRANCH OFFICES
PHILADELPHIA, PA., Land Title Building WILKES-BARRE, PA., Miners Bank Building NEW YORK, N. Y., 2 Rector Street

Products.

LIGHT STEEL TEE RAILS; STEEL TIES and APPURTENANCES.

Also, Light Steel Angles, Flats and Bands; Steel Concrete Reinforcement Bars; Special Agricultural Implement Shapes.

Light Steel Rails and Fastenings.

Standard A. S. C. E. section rails are rolled from high grade stock of *new first quality*, which is required to pass severe chemical and physical tests. These methods insure a thoroughly satisfactory section rail. Under Sweet's construction, a uniform product, made from steel suitable for hard usage, is secured without flaws or defects, due to segregation of various metal compositions.

LENGTHS—Regular standard lengths with splice bar punching, and rolled in accordance with A. S. C. E. specifications. Special lengths, such as 15, 20 or 24 ft., also supplied. Bond drilling when required.

SPLICE BARS—Complete with bolts and nuts for rails of 12, 16, 20, 25, 30, 35 and 40 lbs.

ANGLE BARS—Complete with bolts and nuts for rails of 30, 35, 40, 45, 50, 55 and 60 lbs.

Steel Ties and Fastenings.

Life of steel ties, laid in ballast, is about 20 years and is indefinitely prolonged by immersing ties (when heated to 500° Fahr.) in hot coal tar.

CORRUGATED FEATURE—A double corrugation running the entire length, combined with high carbon steel from which the ties are rolled, gives *much greater rigidity than any other similar section on the market*, with minimum possibility of buckling.

CLIPS AND TEE HEAD BOLTS—Constitute an idea which has stood the test during many years. Clips and tee head bolts are placed opposite each other—a distinct advantage.

LIGHT STEEL RAILS
A.S.C.E. sections, 8, 12, 16, 20, 25, 30, 35, 40, 45, 50 and 60 lbs.

BANNER IRON WORKS

Structural Steel and Cast Iron Work

4560 Shaw Avenue
ST. LOUIS, MO.

Products.

STRUCTURAL, ARCHITECTURAL and ORNAMENTAL STEEL and IRON WORK.

SPECIALTIES: ORNAMENTAL LAMP POSTS and BRACKETS; BELL and SPIGOT and FLANGED PIPE FITTINGS: for gas and water mains; MAN-HOLE FRAMES and COVERS; DRAIN GRATES; GUTTER and SEWER INLETS.

Gray Iron Castings, medium and large; Cast Iron Columns; Reinforcing Steel Bars; Angles, Beams, Channels and Tees.

Bench Mountings for Gas Plants consisting of Self-sealing Mouthpieces, Hydraulic Mains and Buckstays.

Furnace Castings, Grate Bars, Fire and Ash Doors; Door, Window and Wheel Guards; Iron or Steel Stairs; Roof Trusses.

Facilities.

This company's plant consists of a well equipped structural steel shop, ornamental iron and fitting shop, pattern shop, gray iron foundry and machinshop. Direct railroad shipping connections. A large stock of structural steel sections, plates, reinforcing bars and stock manufactured castings are always on hand.

TRADE-MARK

Ornamental Lamp Posts.

The designs shown in the new lamp post catalogue, giving dimensions, weights and list prices of cast iron lighting standards and brackets, are as attractive as any on the market. These designs vary from the comparatively simple to the ornate; from 1-light to 5-light standards suitable for the illumination of streets, boulevards and building entrances to the larger cluster standards for park en-

trances and boulevard intersections. Standards for stone or concrete copings on bridges and viaducts are also illustrated. The range in height will meet every requirement.

These standards and brackets are adaptable for either electric or gas lighting. The test of time has proved the superiority of cast iron for lamp post standards over all other materials.

"Banner Standards" are made of the best grade of gray iron, well finished, and are given one coat of shop paint before shipping. The bases of the posts are arranged with inside flanges or lugs having holes to engage the anchor bolts. A handhole at the base of the

shaft is so placed as to make the nuts of the anchor bolts and the feed wires accessible.

The BANNER IRON WORKS endeavors to keep a quantity of each design on hand so that prompt shipments can be made from stock, and is prepared to submit special designs to conform to any particular requirements. A new special catalogue, illustrating the complete line of designs, is now ready for mailing.

Cast Iron Fittings for Gas and Water Pipe.

The BANNER IRON WORKS has a complete set of patterns for cast iron street main specials made to conform to the requirements of the American Gas Institute. They include bell and spigot, and flanged pipe fittings such as bends, tees, crosses, reducers, sleeves, line drips, etc., in all the usual sizes.

The company is equipped to face and drill flanged fittings to meet any standard or special specifications. Fittings usually required are carried in stock for immediate delivery. Its facilities enable the company to execute large or special orders for this class of material.

ATEN SEWAGE DISPOSAL CO.

TELEPHONE CONNECTION

286 Fifth Avenue
NEW YORK, N. Y.

Products and Services.

ATEN SANITARY SEWAGE DISPOSAL SYSTEMS, adapted to single buildings or groups of buildings unable to connect with city sewers.

The following special parts are required: Combination Form and Reinforcement for Concrete Walls, allowing a reinforced concrete wall to be built without the use of wooden or other auxiliary forms; Cast Iron Manhole Collars and Covers; Metal Tops for Concrete Roof; Automatic Sewage Siphon; Cast Iron Diverting Gate Chamber; Double Porous Disposal Tile; special Y Distributing Branches; special Septic Tank connecting pipes and vents.

Special reports and designs are rendered on sewage disposal problems for buildings, municipalities, factories, etc. Recovery of valuable constituents from manufacturing trade wastes investigated from a chemical and engineering standpoint, and designs and reports submitted for plants where it is necessary to produce efficient results.

Cost estimates will be furnished for systems using Aten materials, and where sufficient data or topographic maps are submitted, details of location and a general layout of the system will be supplied at no cost to the inquirer. When materials are ordered construction specifications are supplied so that complete systems can be installed by inexperienced labor. Materials furnished by this company can also be used in plants designed by other engineers.

Designs.

For smaller systems handling domestic sewage, the design advocated by the ATEN SEWAGE DISPOSAL CO. follows that recommended by leading state boards of health,

ELEVATION SHOWING INSTALLATION OF ATEN SANITARY SEWAGE DISPOSAL SYSTEM AND A FEW ACCESSORIES

ARRANGEMENT OF TANKS AND TILE FIELDS

TRADE-MARK

providing septic tanks for settling and digesting solids, and disposing of the effluent by intermittent filtration through the soil by means of percolating tile lines. No chemicals are used. By installing an Aten system all the sanitary comforts of a modern city building are obtained, and free use can be made of toilets, sinks, bathtubs and similar fixtures.

Catalogue 15, giving description of systems, operation, and other useful information, sent free on request.

Guarantee and Catalogue.

Aten systems are guaranteed, and assurance of their efficient operation is based on ten years of successful experience with them.

NEW YORK SEWAGE DISPOSAL CO.

Sewage Disposal, Drainage and Water Supply Plants

37-39 East 28th Street

NEW YORK, N. Y.

Products and Services.

The DESIGN and CONSTRUCTION of SEWAGE DISPOSAL, DRAINAGE and WATER SUPPLY PLANTS.

Scope of Work.

The NEW YORK SEWAGE DISPOSAL CO. will undertake the entire solution of sewage problems, from analyzing local conditions to building the plant, or will execute any part of the job.

This company is prepared to furnish plans, specifications, reports, special equipment with or without installation, or act in a purely advisory capacity.

Experience.

Sixteen years' experience enables this company to offer the most expert engineering service obtainable for the design and construction of sewage disposal and water supply plants for towns, institutions, country houses, hospitals, camps, etc.

The system employed eliminates all the dangers attending the use of the old-fashioned cesspool, requires very little attention, and is only slightly more expensive.

Description of System.

Following are the 6 salient points that best show the advantages of this company's system:

(1) A sewer connecting the soil pipe at the building with the disposal plant. This is properly designed and laid, care being taken that manholes be placed so that easy access to the sewer can be had in case of changes of alignment.

(2) The settling tank, a tight masonry structure provided with inlet and outlet devices, baffle and weir walls, and other arrangements to insure the sewage being received and held a proper length of time to permit the maximum degree of liquefaction.

The nature and volume of sewage to be treated determines the design of the settling tank. While a simple tank is adequate for a dwelling with from 6 to 30 people, hotels, factories or other large institutions require more special design and construction.

(3) The siphon chamber, another tight masonry structure built in connection with the settling tank. It receives the liquid overflow, and by means of an automatic siphon designed for the purpose, discharges this effluent at periods. The function of the siphon chamber is to produce periodic discharges in order to fill uniformly the tile disposal field beyond, at the same time permitting a period of rest during which the oxidation of the effluent will progress at a uniform rate.

This company has for its exclusive use a siphon which works in a perfect manner, eliminating all the troubles which usually develop with water flushing siphon.

(4) Some form of secondary treatment such as sprinkling beds, contact filters, or sterilization.

The size of the installation, the scope of work it is

to accomplish, and the local soil conditions, are all factors which determine the design of this system for secondary treatment, as well as the type of special devices used.

(5) A special diverting gate, which deflects the siphon discharges into either filter area. Turning a

A TYPICAL SEWAGE DISPOSAL PLANT, SHOWING SECTION OF SIPHON CHAMBER

valve in this gate chamber once a week will accomplish the result, and will permit a period of rest and recovery for the filter last in use.

These gates have openings at the bottom provided with bronze plates which prevent them from rusting and sticking.

(6) A terra cotta fitting made exclusively for this company from its own design. This fitting is set along the distribution lines so that the sewage will flow evenly and uniformly through each line of tile, making a complete distribution over a considerable area, and thus developing the maximum condition of purification.

Procedure.

This company's engineers will visit the property and make a careful study of all local conditions after which a layout will be prepared with stakes and batter boards, indicating the exact location of the plant, cuts necessary, etc. Upon delivery of the special material, a trained foreman arrives and proceeds with the construction of the plant; 3 or 4 skilled workmen are usually sent with the foreman. At all times the work is subject to the inspection and criticism of the architect and the owner. During progress of the job an engineer from the main office visits it to see that all work is being carried out as planned.

Upon completion, the grounds are restored as nearly as possible to their original condition, and the architect and owner each furnished with a map showing the exact location of the plant.

Guarantee and References.

Plants built directly under the supervision of this company's engineers and foremen are guaranteed for design, material and workmanship. A booklet containing the names of over 1000 users will be sent on request.

THE KINNEY MANUFACTURING CO.

Manufacturers of Road Oiling Equipment

3529-3541 Washington Street
BOSTON, MASS.

BRANCH OFFICES

NEW YORK, N. Y. PHILADELPHIA, PA. CHICAGO, ILL. KANSAS CITY, MO. SAN FRANCISCO, CAL.

Products.

ROAD OILING EQUIPMENT: AUTO HEATERS, DISTRIBUTORS and SPRAYERS.

For Friction Clutch Pulleys and Cut-off Couplings, see page 834; for Pumps and Strainers, see pages 742-43.

The Kinney Auto Heater and Distributor.

A machine for heating and spraying by direct pressure all varieties of bituminous materials, hot or cold, for road construction, maintenance or dust laying.

The Kinney auto distributor (Fig. 61) consists of a horizontal steel tank of stated capacity, furnished with the Kinney heating and circulating system and equipped with the Kinney pressure pump, spraying nozzles, valves and controlling levers complete. The outfit is mounted upon a specially designed motor truck chassis. The equipment is furnished in three sizes, 600-, 800- and 1,000-gal. tank capacity. The machine is so constructed that the entire equipment may be removed from the chassis and the truck used for other purposes (Fig. 67).

The heat is derived from kerosene oil burners arranged to convey heated gases through heating tubes placed horizontally through the tank interior similar to the construction of a water tube boiler. Pressure for spraying is supplied by the Kinney pump. The pressure is under direct control of the operator.

The spraying nozzles are adapted to produce a uniform spray in any desired volume (Fig. 61). Both width and volume of spray are under direct control of operator. The spray pipes are provided with spraying hoods to prevent dripping of oil on cross walks. Full and complete description in Bulletin "A" furnished on request.

The Kinney Handy Heater and Sprayer.

This machine (Fig. 144) is specially designed for road or highway repairing and maintenance. It is made

FIG. 67. TANK AND SPRAYING EQUIPMENT REMOVED FROM CHASSIS

Spraying equipment is mounted on separate subframe attached by bolts to frame of chassis. Bolts may be removed and entire oiling outfit lifted off, without detaching parts or disconnecting any piping of tank equipment

in 2 sizes, 300- and 500-gal. tank capacity. The tank is of steel, constructed with welded seams to prevent the possibility of leakage, and is mounted upon a steel truck furnished with steel wheels fitted with broad tires. The machine is equipped with the Kinney pump driven by a gasoline engine. The pump is enclosed in a heating chamber, which prevents the hardening of cooled material and affords the necessary pressure for spraying through flexible metal hose and spraying nozzle. The facilities for heating may be wood, coke, coal or kerosene oil burners. The apparatus is self-loading from heating kettles or tank cars. The Kinney circulating system insures uniform temperature and prevents the coking or burning of material. The machine will heat and spray under pressure all kinds of bituminous material, including the heaviest asphalt or tar products of any desired degree of temperature, and in any required volume of application.

Write for Bulletin "B" giving full particulars and prices.

Products and Services.

MACARTHUR PEDESTAL CONCRETE PILES.

This company contracts to install MacArthur Pedestal Concrete Pile Foundations for buildings and other structures in any part of North America, and also install Pre-moulded Reinforced Concrete Piles and Steel Pipe Concrete Filled Piles where conditions make these types desirable. In fact it is equipped to handle the complete foundations ready for column bases and brick walls.

Co-operative Engineering Services.

This company is prepared to send engineers to any part of the country to investigate conditions and for consultation, at its own expense. On receipt of data on soil conditions and blue prints of any proposed structures, together with loads to be carried, plans for MacArthur Pedestal Pile Foundations suitable for the requirements, with estimates of cost, will be submitted promptly.

MacArthur Pedestal Concrete Piles.

The great carrying capacity of this pile is made possible because of the bulb or spread base, which derives direct bearing power by resting on the firm and compressed subsoil. In addition, no smooth permanent form is left in the ground and greatest possible friction resistance is received on the rough concrete shaft of the pile.

Advantages and Economy.

This company has volumes of proofs that this pile will carry from 50% to 100% greater loads than any other type of pile of the same length and under the same soil conditions. The company can show by actual experience that under many soil conditions, a given load can be carried by fewer and shorter MacArthur Pedestal Piles than would be required with other types.

METHOD OF INSTALLING MACARTHUR PEDESTAL PILES

TYPICAL MACARTHUR PEDESTAL PILE

How MacArthur Pedestal Piles are Made.

Pile-forming apparatus, consisting of a cylindrical core and casing, is driven into the ground under compression, using pile driving methods, until required penetration is obtained. The core is then withdrawn and a charge of concrete dumped to bottom of casing. Core is then placed on this concrete and casing raised to permit formation of pedestal. The core being used as a rammer, being driven down by a steam hammer, compresses the surrounding soil until a large base or pedestal is formed. This pedestal completed, the casing is filled with concrete, and, weight of core and hammer resting on the newly formed pile, the casing is pulled steadily and evenly out of the ground, leaving monolithic column 16 in. in diameter, surmounting the broad spread base of pedestal.

The method is safe, certain, simple and fast. See illustration of the formation.

RAYMOND CAST-IN-PLACE CONCRETE PILES.
RAYMOND PRE-MOULDED CONCRETE PILES.
RAYMOND COMPOSITE (WOOD-CONCRETE) PILES.
PLAIN BEARING and SHEET PILES of CONCRETE.
CONCRETE WORK of a Special Nature.

Slogan.

"A form for every pile; a pile for every purpose."

Raymond Method.

A collapsible steel core, 8 in. in diameter at the point and increasing in diameter at the rate of .4 in. per lin. ft. of length, is incased in a spirally reinforced steel metal shell. The core thus incased is driven to a proper penetration and then is collapsed and withdrawn from

the shell; the shell remaining in the ground and maintaining the resistance encountered during the driving. The shell is then inspected and filled with concrete. This makes a complete Raymond concrete pile.

Concrete Pile Loads.

Usually Raymond concrete piles are driven to carry a working load of 30 tons each. Where it is impossible to secure proper resistance, it is necessary to reduce this to 25 or even 20 tons.

In other cases, loads of 35 and 40 tons are safely carried.

In view of the wide variation in soil conditions, a conference is suggested with the nearest Raymond office, that the site may be investigated and recommendations made.

Spacing.

Raymond concrete piles, of a length not exceeding 30 ft., may be spaced as close as 2 ft. 6 in. on centers and driven as close as 18 in. from center of pile to building wall. When extremely long piles are used, it is necessary to increase this spacing to 3 ft.

Certainty.

The Raymond method of pouring concrete into a spirally reinforced steel shell, and leaving this form in place, follows the accepted method of all good concrete construction. This steel form makes *certain* that underground conditions will not adversely affect the structure of the pile.

Speed Records.

This company always endeavors to make good a promise.

On April 26th, 1917, it promised to place 3600 piles for the United States Government at the Brooklyn Navy Yard by June 10th, or in 46 calendar days; 3800 piles were actually placed by May 26th—30 calendar days after the contract was signed.

On April 19th, 1917, a contract was signed with the Chevrolet Motor Co.; the first pile was driven April 27th, and 1535 piles were completed in 32 driving days.

On August 11th, 1917, this company promised the Austin Company to place 140 piles for a Government contract within 9 days. The contract was completed six hours ahead of schedule.

On April 27, 1915, this company signed a contract with the Crucible Steel Company of Harrison, N. J., for 5533 piles, driving the first pile on the sixth day thereafter and completing the job in 135 working days at the rate of 40 piles per day.

Many other speed records can be shown.

ESSENTIAL STEPS IN THE MAKING OF A RAYMOND CONCRETE PILE

Cost of Raymond Piles.

As Raymond concrete piles are made in place and not sold by the foot, f.o.b. cars, it is impossible to quote prices without knowing the conditions under which the work is to be done, the probable number of piles required, and penetration expected. The spacing of the piles, soil conditions, accessibility to the site, cost of concrete materials and labor are governing factors.

Saving of Raymond Piles.

The Raymond method practically eliminates excavation, sheeting, shoring and pumping, together with the attendant costs in time and labor.

Specifications.

If "Raymond Concrete Piles" are called for, it is of course sufficient; on the other hand, if for any reason it is not advisable to name them specifically, the following will cover:

"The concrete piles shall be of a type specially approved by the architect and shall be placed in the following manner:

"A collapsible steel core, 8 in. in diameter at the small end, increasing .4 in. per lin. ft. of length, shall be incased in a spirally reinforced metal shell and driven to proper penetration. The core shall then be collapsed and withdrawn from the shell, which remains permanently in the ground. Each shell shall be carefully inspected and being found perfect shall thereupon be filled with concrete placed in accordance with good engineering practice."

Concrete in the piles will be composed of 1 part approved portland cement, 3 parts of clean, sharp sand and 5 parts of crushed stone or gravel which will pass a 1½-in. ring.

Special Concrete Work.

This company also designs, manufactures and places pre moulded reinforced concrete bearing piles; concrete sheet piles, both plain and interlocking, and concrete work of a special nature such as difficult foundations, docks, piers, bulkheads, sea walls, retaining walls, ore bins, trestles, and such structures as require a special knowledge of concrete construction.

This company has on its staff, at the service of architects and contractors, experts in the designing and installation of concrete piling for all purposes.

The engineering department will gladly submit recommendations, designs and estimates.

Representative Architects.

LACKAWANNA STEEL SHEET PILING:
Arched-web, Straight-web, Bent-web, Center-flange, Plate and Protected Types.

Structural Steel, Merchant Bars, Plates,
Concrete Reinforcing Bars, Standard and Light Rails.

Co-operation and Service.

Our engineers, and important data collected from over 1200 successful installations for all imaginable purposes, are always at the service of engineers and contractors. The advice of the engineering staff will prove valuable and is gladly given free of charge.

Description.

The Lackawanna steel sheet piling has an integral section; is a rolled bar requiring no fabrication or other assemblage to form the interlock; has no rivets, bolts or parts to loosen or shear off in handling, driving or pulling.

FIG. S-1. LACKAWANNA STEEL SHEET PILING
Showing typical combinations of circular and straight walls and junctions

The interlock consists of similar hooks and guards on both edges of the pile, so shaped that the interlocked joint is flexible through an equal arc of motion on each side of the center plane of the piling section. Hooks engage to resist longitudinal displacement; while the guards overlap and engage outer surface of hooks on

TRADE-MARK

adjacent sections, thus preventing lateral displacement. Between the interlocked members of each joint there are three lines of contact—a double, firm, and close interlock, with a minimum of friction in driving or withdrawing, and a free entry for displaced material to assist in sealing the joint.

Sections are shaped to attain flexibility at joints, for passing around obstructions, forming irregular enclosures, square or circular caissons, etc. Small sections permit change of direction of 16° (other sections, 20°) to either side of piling line. A right angle may be made with six 7-in. and with five of any other interlocked piling sections. Corners and junction members for walls meeting or crossing each other are fabricated by fitting edges of half sections to complete sections as required, and holding same in place by structural steel angles and rivets.

NOTE—The mathematical properties of any of the Lackawanna steel sheet piling sections will be promptly furnished on request.

Circular Structures.

The minimum diameters of circular structures made with *standard* sections of Lackawanna steel sheet piling are shown by the following table:

MINIMUM DIAMETERS

An Even Number of Piles is Required to Permit Interlocking of the Final or Closure Joint

Standard sections	Number of piles required	Deflection angle between piles	Diameter center to center of piling wall	Working diameter inside of piling wall
7" x 1/4"	20	18°	3' 8 1/8"	3' 6"
8 1/2" x 3/8"	20	18°	4' 6 1/8"	4' 3 1/2"
12 3/4" x 3/8"	18	20°	6' 1 1/8"	5' 9"
12 3/4" x 1/2"	18	20°	6' 1 1/8"	5' 9"
14" x 3/8"	18	20°	6' 8 3/8"	6' 4"
15" x 1/2"	18	20°	7' 1 1/8"	6' 9 3/4"

Circular structures having a wide variety of still smaller diameters may be constructed from sections of the straight-web type, of which the web has been *especially bent*.

Bent-web type for circular construction can be furnished to form diameters, as per the following table:

Width of pile	Thickness of web	Diameters of Circular Construction						
		6 piles	8 piles	10 piles	12 piles	14 piles	16 piles	18 piles
12 3/4"	3/8" or 1/2"	2' 3 3/8"	2' 8 1/8"	3' 4 1/8"	4' 1 1/8"	4' 8 1/8"	5' 4 1/8"	6' 1 1/8"
8 1/2"	3/8"	1' 4 3/8"	1' 9 1/8"	2' 3 1/8"	2' 8 1/8"	3' 1 1/8"	3' 7 1/8"	4' 1 1/8"
7"	3/8"	1' 1 3/8"	1' 5 1/8"	1' 10 1/8"	2' 2 3/8"	2' 7 1/8"	2' 11 1/8"	3' 4 1/8"

Strength.

The great tensional strength of the Lackawanna joint is due to the 3 line contact, distribution of the metal in interlocking joint members and their relation to longitudinal axis of piling section.

Competitive tension tests conducted in an entirely disinterested manner and under government supervision were made on five different makes of piling, using on each methods best adapted to bring out the best results. These tests are described in Bulletin No. 108, which will be mailed on request.

Length of Piling.

Usual length of piling is from 50 to 30 ft. or shorter. Longer lengths can be rolled if required, but it is usually desirable, for convenience in handling or shipping, to use a built-up pile, composed of two or more lengths spliced together. In such cases horizontal joints between adjacent piles should be staggered and abutting lengths fastened with splice plates and bolts to form the joint. The use of 65-ft. lengths in a single bar is not uncommon.

Types and Sizes.

The following sections offer at least one type and size to meet economically any sheet pile construction problem:

STRAIGHT-WEB TYPE—Suitable for general work, and especially constructions requiring high tensional and compressive resistance of the pile section, as in self-contained cofferdams made of rectangular or circular filled pockets. The smallest size is much superior to wooden sheeting in sewer and trench work.

CENTER-FLANGE TYPE—For constructions requiring high tensional and compressive strength in connection with a fairly high transverse strength. The center-flange acts as a stiffener, increases the section modulus and furnishes means for attaching transverse ties, braces, etc., needed in special work, and for the mechanical bond of the concrete facing in protected piling.

ARCHED-WEB TYPE—Preferable where transverse strength of the pile is of primary importance, as in

braced or tied constructions. Where the pile is used as a simple, continuous or cantilever beam, the high modulus of the single section per inch of width of pile gives a high moment of resistance to sustain the maximum bending moment produced by the load. A wall of this piling is very thin in proportion to its transverse strength, having no greater thickness over all at the centers of the arches than the over all thickness of the interlocked joints.

No. of section	Size and type of section	Weight per lineal unit of bar		Weight per unit area of wall	
		Per lineal foot in pounds	Per lineal meter in kilograms	Persquare foot in pounds	Persquare meter in kilograms
C-7	7" x 1/4" Straight-web	12.54	18.60	21.5	104.97
G-85	8 1/2" x 3/4" Straight-web	14.698	21.873	20.75	101.314
B-12	12 3/4" x 3/4" Straight-web	37.187	55.36	35	170.90
A-12	12 3/4" x 1/2" Straight-web	42.5	63.25	40	195.32
F-15	15" x 1 1/2" Center-flange	60.	89.29	48.	234.34
E-14	14" x 3/4" Arched-web	40.83	60.76	35	170.90
H-15	15" x 1 1/8" Arched-web	58.12	86.49	46.5	227.02
D-8	8" x 1 1/8" Plate	7.66	11.40	11.5	56.15

PLATE TYPE OF PILING—This piling is cold rolled from steel plate into a type of section designed for use principally where great economy demands a very low weight and cost per square foot of wall—lower than obtainable with the heavier sections of steel sheet piling.

Theory of Watertightness.

Every alternate pile has direct contact of both locks with wales. Intermediate piles acted upon by unbalanced pressures are forced into contact on two lines in each interlock.

Grip for Pulling Lackawanna Steel Sheet Piling.

Consistent with our policy of helping customers after as well as before a sale, we are prepared to loan a pulling grip like that shown. One of these grips will be allotted for a length of time consistent with the work to be done, the customer to pay charges to and from our plant, and cost of repairs.

GRIP FOR PULLING LACKAWANNA STEEL SHEET PILING

SMITH & BRENNAN PILE CO.

Concrete Piles

GENERAL OFFICE AND PLANT

ST. LOUIS, MO.

Products and Services.

REINFORCED, CORRUGATED CONCRETE PILES.
PILE DRIVING.

Description.

The Smith & Brennan corrugated reinforced concrete pile differs from other types in that it is reinforced by six $\frac{5}{8}$ -in. corrugated bars running the full length of the column. No. 9 annealed wire, wound spirally at 3-in. intervals further adds to the rigidity and carrying capacity of the pile. It is circular in section, 18 in. in diameter at the broad end, running parallel down to the last 15 ft. which taper to 8 in. in diameter.

Advantages of the Tapered Pile.

The theory that increased surface area affords increased resistance, and consequently increased load bearing capacity is disproved by records of numerous tests, which show that where the soil is of a uniform, stable character to a practical depth, the tapered pile develops and maintains a greater frictional bearing than the straight pile.

Where the soil is of an unstable nature overlying solid rock or hard pan, the pile depends for its bearing capacity upon contact with this solid matter. But since the soils more frequently encountered are of a more or less stable character, the needed frictional resistance is secured by the increasing density and compactness of the ground, resulting from displacement of the soil by the pile.

The protruding, reinforced ridges on the Smith & Brennan pile further increase its advantages over the smooth pile, and prevent the pile from twisting while driving.

Specifications.

SIZES—18 in. over all at top, last 15 ft. to taper to 8-in. circular section. In figuring the length of proposed pile with the Smith & Brennan pile as a basis, figure 10% shorter pile than any other.

DESIGN—Circular in section with corrugated extensions running full length of the pile. Last 15 ft. to taper.

REINFORCEMENT—Six $\frac{5}{8}$ -in. corrugated bars running full length of the pile. Number 9 annealed spiral wire spaced 3 in.

CONCRETE—Consists of 1 part portland cement, 2 parts clean, sharp sand, $3\frac{1}{4}$ parts clean gravel or crushed limestone, $\frac{1}{4}$ in. to 1 in. in size.

SEASONING—Where possible, it is advisable to have the pile cure at least 30 days.

Co-operative Service.

Smith & Brennan engineers will co-operate with architects and contractors in the solution of difficult concrete piling problems of any nature. Upon the receipt of data as to soil condition on site of proposed structure, and loads to be carried, tentative plans together with applicable suggestions will be submitted.

Products.

ATLAS PORTLAND CEMENT and ATLAS-WHITE PORTLAND CEMENT.

Output.

18,000,000 barrels per year.

Packages.

Atlas Cement is shipped in barrels and in duck or paper bags, and Atlas-White Cement is shipped in barrels and in paper bags inside duck bags. The barrels weigh 400 lbs. gross, or 376 lbs. net. When shipped in bags the gross weight is 95 lbs. per bag; net weight, 94 lbs. per bag; 4 bags to the barrel.

Shipping and Marketing.

Atlas mills and branch offices cover the country and are conveniently situated for quick shipment. Atlas and Atlas-White are stocked by dealers even in remote points.

Atlas Quality.

Atlas Portland Cement meets all tests prescribed by the Standard Specifications for Tests of Portland

TRADE-MARKS

Cement, adopted by the American Society of Civil Engineers and approved by the American Society for Testing Materials, and concurred in by the American Institute of Architects, the American Engineering and Maintenance of Way Association, and the American Concrete Institute; also the specifications of the United States Government.

Atlas-White Quality.

Atlas-White is a true Portland cement of the same uniformity and high quality as Atlas Portland Cement.

It possesses the strength and physical characteristics of Portland cement and passes all standard specifications for this material; and, in addition, is *white* and *non-staining*.

Manufacturing Features.

Atlas Portland Cement and Atlas-White are manufactured from the finest raw materials, under constant expert supervision in every department of the works. Of the very highest quality, they are guaranteed to pass all customary specifications.

NATIONAL CASH REGISTER CO., DAYTON, OHIO
EXPANDED METAL FIREPROOFING Co., Contractors

Uses of Atlas.

Atlas Portland Cement is used in every department of civil engineering construction, such as canals, locks, dams, piers, railroad structures of every description, bridges, highways, industrial plant roadways, etc. Also for the construction of reinforced concrete industrial buildings, power plants, textile mills, grain elevators, cold storage plants, garages, etc.

Quantities of Materials in Concrete.

In estimating the quantities of cement, sand, and broken stone or pebbles in a given volume of concrete, or in estimating the volume of mortar or concrete which can be made from one barrel of cement, the accompanying tables will be found useful. The values given in the tables are computed from results of actual experiments and have been checked with concrete laid in large masses.

VOLUME OF CONCRETE MADE FROM ONE BARREL OF PORTLAND CEMENT *

Based on a barrel of 3.8 cu. ft.

Proportions by parts			Proportions by volume			Volume of mortar in terms of percentage of volume of stone	Average volume of rammed concrete made from one barrel of cement		
							Percentages of voids in broken stone or gravel		
Cement	Sand	Stone	Cement	Sand	Stone	per cent	50%†	45%‡	40%§
			bbl.	cu. ft.	cu. ft.		cu. ft.	cu. ft.	cu. ft.
1	1	2	1	3.8	7.6	75	9.5	9.9	10.3
1	1	3	1	3.8	11.4	51	11.5	12.2	12.8

Uses of Atlas-White.

Atlas-White is used for interior and exterior decorative work; exterior stucco; in mortar for setting marble, tile, brick and stone; facing concrete block; decorative concrete, stone and statuary; terrazzo floors; artistic color effects in conjunction with various colored pigments, exposed color aggregates, etc.; wainscoting for bathroom and kitchen walls, etc.

Atlas Service to Engineers.

Our technical department will co-operate with engineers who are interested in reinforced concrete industrial buildings, furnishing statistics and informa-

tion for the development of designs and economical layouts.

Atlas Publications.

For the benefit of those who desire to make durable improvements and as a guide to those who contemplate new construction, we have published the following books, constituting the "Atlas Cement Library":

- "Concrete in Railroad Construction."
- "Reinforced Concrete in Factory Construction."
- "Industrial Plant Roadways."
- "Industrial Houses of Concrete and Stucco."
- "Guide to Good Stucco."
- "Commercial Garages."

LEHIGH CEMENT — Guaranteed to conform in every respect to the Standard Specifications for Portland Cement as adopted by the American Society for Testing Materials when tested by methods recommended by the American Society of Civil Engineers.

TRADE-MARK

Marketing and Shipping Facilities.

Lehigh mills are located at strategic points from the Atlantic to the Pacific. In principal marketing centers, branch offices have been established for the convenience of our customers.

Lehigh Cement is marketed in cloth or paper bags, or in bulk for domestic trade, and in barrels for export trade. The bags contain 94 lbs. net (4 bags to the barrel), and the export barrel contains 376 lbs. net. These barrels are made in our own cooperage plant and are tongued and grooved to withstand the rough handling necessary in export trade.

Use.

In practically every type of modern construction the use of cement is required. In great engineering works, concrete is an essential material.

The careful selection of the ingredients for concrete is an important factor in the success of the finished

work. The selection of Lehigh Cement is a warranty for the most important material used in concrete.

Perhaps the best guarantee on future promise is past performance. The great New York Connecting Railroad; the Municipal Building, New York; the Girard Point Elevators, the League Island Dry Docks, Philadelphia; the Boston Braves' Ball Park; the Chicago and Northwestern Railway Terminal; the Quay and Sea Walls, Charleston, S. C.; the Galveston Causeway—these are a few of the structures where Lehigh was used.

The most noteworthy conflagrations, quakes and storms have proved the strength and permanence of concrete. Another feature of concrete that recommends its consideration to engineers is its adaptability to every form and class of engineering.

For Engineers' Convenience.

To any engineer writing us on the stationery of his firm and mentioning SWEET'S ENGINEERING CATALOGUE, we will send our celluloid computing scale, giving the amounts of cement, sand and stone required per cubic yard of rammed concrete of different proportions.

Further discussion of items of particular interest to any engineer may be entered into by communication with any of our offices.

'THE NEW YORK CONNECTING RAILROAD'

One of the greatest engineering works of today, made possible through the use of concrete

AMERICAN ENAMELED BRICK & TILE CO.

INCORPORATED 1893

Manufacturers of Enameled and Fire Brick

TELEPHONES:

8787-8788 MURRAY HILL

52 Vanderbilt Avenue
NEW YORK, N. Y.

CABLE ADDRESS:

"AMEREBRICK"

Products.

ENAMELED BRICK, White, Mottled and Standard Colors, in Standard Sizes and Ornamental Shapes.

Fire Brick, Standard 9-in. and 9-in. Series Shapes (as adopted by the Members of the Refractories Manufacturers Association), and Special Shapes.

Fire Clay, packed in bags or in bulk.

Territory.

The business operations of this firm cover North and South America, Europe, Asia and Australia.

Personal Representatives.

For the convenience of our customers in the United States and Canada, we have, in order to keep in closer touch with them, located representatives in all the principal cities to attend personally to inquiries, orders and deliveries.

Dispatch of Shipments.

Factory and office are in constant telephone connection with each other, and we have a local telephone exchange connecting every department of the factory for quick and systematic dispatch of business.

Facilities.

We are the largest manufacturers of this commodity in North and South America.

SHIPPING—Our works, located but an hour's travel from the New York office, are situated so as to enable shipping over two of the largest railroads, viz., the Pennsylvania and the Central of New Jersey, and their connecting lines.

We are also situated on tide water, so that shipments can be made by vessel for the coastwise and export trade.

Capacity.

Our present capacity is 12,000,000 brick per annum, which will be increased as occasioned by the demand.

Stock.

The average stock on hand at our factory is more than 2,000,000 brick, giving a large assortment for immediate delivery.

Illustrations of Stock Designs of Enameled Brick.

Much delay is saved by use of stock designs of moulded brick.

We try to keep a stock of these on hand, in standard colors.

These designs are chosen to reduce manufacturing difficulties and delays to a minimum; to enable composite mouldings to be made up; and to enable prompt filling of orders.

Colors—Bright, Medium or Matt Finish.

In addition to our regular white and standard

colors, such as our sage green, red brown, etc., we have made a specialty of mottles in the following colors:

Gray, brown, black, blue and blue brown, which give a very fine appearance for both interior and exterior work, having a finish more on the type of marble than enameled brick.

If you have in mind, at any time, a particular color, shade or finish of enameled brick for interior or exterior purposes, advise us of your ideas and requirements and we will be pleased to submit samples.

Uniformity of Shade of Enameled Brick.

We guarantee uniformity of shade in all first quality deliveries to the limit of practicability. Colors and effects giving most uniform results are, in order of degree of uniformity, white, mottled gray, mottled brown, mottled black, sage green and red brown. Other colors follow in irregular positions.

We will try on orders of moderate size, or on larger orders, if ample time be given, to match in shade the moulded and stretcher stock, but can not always guarantee to uniformly shade shipments of specials, particularly on rush shipments.

Special Features and Advantages of Our Enameled Brick.

In making our product we follow the English and Scotch systems, working by the soft mud process. This is without question the only process which insures durability and the closest relation of bond obtainable between body and glaze.

Our brick are burnt in but one fire, thus making the chemical change in the body and the glaze simultaneous. We use hard and durable glazes; not soft lead glazes frequently seen on inferior grades of enameled brick and tile.

There has not been a single case during our twenty-six years of business where any peeling or discoloring has been seen or reported.

This is better than any guarantee which we might be asked to give, as it covers a distributed output of over 110,000,000 brick, located all over the United States, Canada, South America and elsewhere, subject to all varieties of climatic conditions.

Cleaning.

Enameled brick are best cleaned with some alkaline solution, such as caustic soda or sodium carbonate. This cleans the enamel and does not affect the cement or lime mortar.

Acids.

Sulphuric, nitric or hydrochloric acids, even in concentrated form, will not affect our glazes; but if used as a wash, even when diluted, they will attack the cement or lime mortar.

The only commercial acids which will attack and destroy our enamel are hydrofluoric and hydrofluosilicic.

DENISON FIREPROOFING CO.

Manufacturers of Load-bearing Tile under License from
American Tile Engineering Co.

MASON CITY, IOWA

OTHER LICENSEES

GOODWIN TILE AND BRICK CO., Des Moines, Iowa

AUGUSTA VITRIFIED SHALE BRICK CO., Augusta, Ga.

Products.

DENISON LOAD-BEARING TILE—Hollow Building Tile, Partition Tile, Floor Tile, Fireproofing Tile, Furring Tile.

License and Patents.

The manufacture of Denison Load-bearing Tile is licensed under the "Wilson System of Bearing Wall Construction" patents, owned by the American Tile Engineering Co., as follows:

United States Patents No. 1171913, February 15, 1916; and No. 1234990, July 31, 1917.

Canadian Patents No. 151165, October 14, 1913; and No. 178744, August 14, 1917.

Other patents pending and allowed.

Advantages of Load-bearing Tile.

(1) All vertical bearing webs are in perfect alignment to carry all load pressures. This gives a wall with the greatest load bearing capacity. (2) This tile produces two or more hollow walls with air spaces between them. It is so designed that it makes the most perfect insulating structural material on the market. (Test: apply blowtorch flame to middle of one face; and after 4 hours, take temperatures in air cells.) (3) Two separate mortar beds, at the top and bottom, lying in the same horizontal plane. (4) Dead air insulates the space between these two horizontal mortar beds in the same manner as the body of the tile is insulated, thus preventing the formation of frost or moisture lines on the inside of the wall. (5) Closed trough in the top of the tile insures against the conduction of moisture through the wall. (6) Works out to the same heights and thick-

nesses as common brick, thus is adaptable to any height of cornice, window ledge, etc., or to any thickness of wall. (7) Because of the discontinuous (or insulated) mortar joint, plaster may be applied direct to the wall without the use of furring. (8) The tile is completely symmetrical, thereby facilitating the laying of it. (9) It is a complete unit, which will stand on its own base in a stable condition when stood on either face or end, thus facilitating piling and handling. (10) Dimension tile of fractional lengths furnished to facilitate the laying of any length wall. (11) Corner tile of this series permit turning inside or outside corners without destroying the insulating efficiency of the wall at this point. (12) Jamb and half jamb tile are furnished for either standard or boxframe openings, which form a weather-proof union with these frames and which maintain the insulating efficiency of the wall.

Specifications.

Specify the use of this tile by including in specifications this reference:

"To be laid according to the standard specifications for Wilson System Bearing Wall Construction." Copies of which may be obtained upon request to any sales agent or licensed manufacturer.

Engineering Service.

Engineering service to engineers and architects, and estimates to contractors, will be furnished without charge, all in accord with conditions stated on such estimates. A portfolio, containing a complete set of detail and working drawings, furnished on request.

THE HOCKING VALLEY FIRE CLAY CO.

Manufacturers of Salt Glazed Brick

NELSONVILLE, OHIO

SALES AGENCIES IN ALL PRINCIPAL CITIES OF UNITED STATES AND CANADA

Products.

ATHENA SALT GLAZED BRICK.
SANITARY FLOOR BRICK.
EVERWEAR PAVING TILE.

Athena Salt Glazed Brick.

SIZE—8 by 2¼ by 3⅞ in.

SHADE NUMBERS, ETC.—Made in beautiful shades of mahogany (105), brown (106), golden (107), buff (108), thoroughly vitrified and salt glazed on both faces and ends, and rich in both color and glaze. All standard shapes carried in stock and special shapes made on order.

INTERIOR USES—For facing entire interior walls or wainscot work wherever sanitary conditions are desired. Principal places: schools, hospitals, gymnasiums, swimming pools, stables, garages; office, factory and warehouse buildings; prisons, power plants, city market houses, acid rooms and vats, fire engine houses, packing plants; subways, passenger and freight depots.

Few Important Jobs (Interior)—

World's Largest Electric Generating Station, United Electric Light & Power Co., 201st Street, New York City (see illustration, opposite column)

Lincoln Park Lion House, Chicago, Ill.

Roseland & Mayfair Pumping Stations, Chicago, Ill.

Twin Market Houses, Pittsburgh, Pa.

Fire Engine Houses, Chicago, New York and Boston

General Chemical Co. Plants (many parts of United States)

Swift & Armour Packing Plants (various places)

Pennsylvania Railroad Stations and Tunnels

Ohio Penitentiary, Columbus, Ohio

Both High and Grade Schools in all principal cities of United States and Canada

EXTERIOR USES—For facing all exterior walls where a beautiful sanitary and permanent wall is desired, as it is not affected by acids or the elements.

Few Important Jobs (Exterior)—

6-story Moose Building in Loop District, Chicago, Ill.

Apartment Buildings in all principal cities

3-story Business Block, Dr. J. E. Pickett, Minersville, Pa.

3-story Business Block, Marvin DeMaine, Pomeroy, Ohio

These brick have been furnished for exterior facing in almost every conceivable class of building

Sanitary Floor Brick.

Size, 8¼ by 4 by 1⅜ in. This product is usually embedded in cement and adapted to practically the same class of floors as those named for our Everwear paving tile, but where the desire is for lighter weight material. Especially desirable in packing house floors, and is being used extensively for such purposes. Only one side is glazed and either side can be turned up as desired.

Few Special Jobs—

Cincinnati Abattoir Co., Cincinnati, Ohio

Detroit Edison Co., Detroit, Mich.

Wm. Davies, Ltd. (Packing Plant), Toronto, Ont.

Swift & Co., Chicago, Ill.

Armour & Co., Chicago, Ill.

Everwear Paving Tile.

Size 10 by 5 by 2¼ in. Extensively used for paving floors of engine and boiler rooms, power and industrial

201ST STREET GENERATING STATION, UNITED ELECTRIC LIGHT & POWER CO., NEW YORK, N. Y.
W. E. McCoy, Engineer F. F. Nesbit & Co., Contractors
650,000 brick used, shades 103 and 102 (interior)

plants; basements of public buildings, schools, warehouses and battery rooms; paving around electric and steam railway passenger and freight depots. Thoroughly vitrified and only one side glazed, and unsurpassed for beauty and wearing qualities. 50% saving over cement floors on original cost, and with many times life of a cement floor.

These tile have been upon the floors of boiler and engine rooms of the New York Life Insurance Building, New York, for 20 years and show scarcely any wear.

Few of Many Concerns Using Same—

Chicago Edison Electric Co., Chicago, Ill.

Cleveland Electric Railway Co., Cleveland, Ohio

Cincinnati Gas & Electric Co., Cincinnati, Ohio

Ford Motor Co., Detroit, Mich.

Aluminum Castings Co., Detroit, Mich.

Hocking Valley Railway Co., Columbus, Ohio

General Qualities of Salt Glazed Material.

All shades of the standard brick and two classes of floor brick are burned to about 2200° Fahr.; thoroughly vitrified and salt glazed; absolutely acidproof; non-absorbent of moisture; will not craze, crack or peel; withstands all the elements of the air besides heavy crushing strain, and always looks fresh and clean.

Samples.

Communicate with this company and the nearest sales agency will be directed to submit samples and prices at once.

Facilities.

With a daily capacity of 50,000 brick, or approximately 15,000,000 annually, and a large and well selected stock for quick shipment, all business is given prompt attention.

BUFF, GRAY ("Blue") and VARIEGATED ("Mixed") INDIANA LIMESTONE (sometimes called "Bedford Stone").

upon industrial structures, is so general that it needs no comment.

Full description and complete architectural specifications will be furnished on application.

Structure and Chemistry.

Indiana Limestone is composed of shells and fragments of shells of microscopic and somewhat larger sizes, cemented together with a film of pure calcium carbonate. It is therefore a homogeneous, massive formation without cleavage planes. It is practically pure carbonate of lime.

Its average chemical analysis follows:

Carbonate of lime.....	97.26%
Silica.....	1.69%
Oxide of iron.....	.49%
Magnesia.....	.37%
Water and loss.....	.19%

Durability.

Indiana Limestone is extremely durable. The oldest known structures built of it show the original tool marks and perfect arrises everywhere. Its great chemical purity, especially the negligible proportion of magnesia, makes it practically inert and therefore but little, if at all, affected by the corrosive gases of city atmosphere. Its wide use for railway stations is "enough said" on this point. It is practically untouched by weather erosion. Inspection of the outcroppings at the quarries, where natural, sharp arrises have been exposed for centuries, proves this.

Strength Plus Softness.

Indiana Limestone is, comparatively, a soft stone. It is nevertheless of a strength for all practical purposes in the same class with granite, which is many times harder and more difficult to work. After quarrying and exposure Indiana Limestone becomes very hard. Its crushing strength in 2-in. cubes is about 15,000 lbs. per sq. in.—many times the strength needed for the heaviest structures.

Engineering Uses.

Indiana Oölitic Limestone has many advantages for the construction of piers, abutments, retaining walls, jetties, etc. It is especially adapted, besides, to sills and lintels in industrial buildings, being strong, inexpensive, easy to get, and quick and economical of labor in handling and setting. The fact that it needs no steel reinforcement in sills and lintels is a still further economy. Its use for decorative trim, so frequently used nowadays

Service Bureau.

We are prepared to discuss fully with any interested engineer the possibilities of Indiana Oölitic Limestone in any operation.

Impartial and practical advice and help of any sort, relating to the uses of Indiana Limestone (including advice as to where it should not be used), samples, photographs of buildings, setting, handling, etc., gladly furnished, gratis, by our Service Bureau at Bedford, Ind.

TWO PLANTS

Products.

VITRIFIED SHALE FACE BRICK, FLOORING and PAVING MATERIALS; CHEMICAL STONEWARE.

Kushequa Face Brick.

The characteristics of Kushequa face bricks are their deep color (specially dark red), great strength and high vitrification. Kushequa face bricks are made in the following types: Kq Paver, Wire-cut, Ox-blood Devonshire, Velours, Saruk, Smyrna and Blackheaders.

KQ PAVER— $2\frac{1}{4}$ by $8\frac{1}{4}$ by $3\frac{7}{8}$ in.; weight $6\frac{1}{8}$ lbs. This brick is repressed, with bevel edges and resembles a small paving block. 2 shades, dark and light. It gives the effect of massive strength and is particularly pleasing in large buildings. In second quality it makes a handsome front at low cost.

WIRE-CUT— $2\frac{1}{4}$ by 8 by $3\frac{3}{4}$ in.; weight 6 lbs. A standard red brick with smooth face and wire-cut sides, in 4 shades. Shade 1, exceptionally dark and strong; Shade 2, a dark red brick of moderate cost; Shade 3, a clear red brick for sidewalks and fronts not requiring dark red; and Shade 4, a light red brick, sufficiently vitrified to withstand wet and frost. Shades 3 and 4 in mixture form our cheapest face bricks.

OX-BLOOD DEVONSHIRE— $2\frac{1}{4}$ by 8 by $3\frac{3}{4}$ in.; weight, $5\frac{3}{4}$ lbs. Very rough texture and a clear, uniform red color. Shade 1, the darkest clear red on the market; Shade 2, a fine deep red; Shade 3, a bright red. The second quality in mixed shades is amply good for any large front and is recommended where price is an object.

SARUK— $2\frac{1}{4}$ by 8 by $3\frac{7}{8}$ in.; weight $5\frac{3}{4}$ lbs. The rough texture and variegated color give this brick an Oriental rug effect. The hues harmoniously blend from deep red through old rose to greenish gray, and

Y HOTEL SHERMAN, CHICAGO, ILL.
 HOLABIRD & ROCHE, Architects
 Faced with 500,000 Kq Pavers

from bronze to tan. To get the best effect, it should be laid with dark mortar joints, not exceeding $\frac{1}{2}$ in., raked. Saruks are choice enough for a parlor mantel, yet cheap enough for a fine hotel front. Second quality Saruks look well in large buildings, especially where "tapestry" effects are desired.

MOSS GARNET—Same as Saruk except less regular texture, and predominance of browns and other dark hues. Touch of gray scum on heads, occasionally on faces, suggests lichen moss.

TEXTURE VENEER BRICKETTES— $2\frac{1}{4}$ by 8 by 2 in., weight $3\frac{1}{4}$ lbs. Texture and rich colors of Moss Garnet. Corner ells show heads to match. Spiked to studding frame or common brick buildings produces beauty and durability of face brick at little over half its cost.

Paving Materials.

This company commenced business in 1904 with the manufacture of paving blocks out of a strongly ferruginous mountain shale highly vitrified by natural gas. The beauty of color and finish of the product created such a demand for building purposes that from 1915, except during the war, the output of the factory has been taken chiefly for face bricks.

LOUIS SEELBACH RESIDENCE, LOUISVILLE, KY.
 McDONALD & DODD, Architects, Louisville, Ky.
 Faced with 80,000 Wire-cut Shade 2

WESTMINSTER PRESBYTERIAN CHURCH, ROCHESTER, N. Y.
Faced with 100,000 Saruk and Ox-blood mixed

The high vitrification of these products makes them acidproof and electric insulating. The paving products comprise:

KUSHEQUA REPPRESSED PAVING BLOCK— $3\frac{1}{2}$ by $8\frac{3}{4}$ by 4 in.; weight, 10 lbs. Tough, durable, impervious and handsome in finish. Guaranteed to lay 40 per sq. yd. street measure.

BRICKETTE— $2\frac{1}{4}$ by 8 by 2 in.; weight, 3 lbs. A dark red, thoroughly vitrified brick, useful for floors where hard wear is desired but unnecessary depth is objectionable. It is beautiful for porch floors and hallways. The Mall or concourse at Staten Island end of New York's Municipal Ferry is paved with Kushequa Brickettes. It is a favorite for packing house floors.

FLOOR BRICK—4 by 8 by $1\frac{3}{4}$ in.; weight, $4\frac{2}{3}$ lbs. Specially made for packing house floors to resist grease, hot water and heavy trucking. One side and two edges smooth; wire-cut back and ends. Durability and lightness are combined.

The second quality is highly vitrified, but shows a fine crack or fire check. Laid with reverse side up, it makes exceptionally good sidewalks. Arrises are straight and true without kiln marks.

Chemical Stoneware.

The acid resisting qualities of our paving materials, such as packing house floor brick, have developed a trade in chemical stoneware which, during the war, absorbed three-fourths of our capacity. This company makes the following:

CHEMICAL RINGS, DIAPHRAGM PATTERN—Cylinders of red vitrified tileware quartered lengthwise by septum or diaphragms, length and diameter equal. Sizes 3 and 6 in. Spiral pattern is made exclusively for B. Mifflin Hood Brick Company of Atlanta, Ga.

CHEMICAL BRICK—For acid condensary towers. Arches and special blocks and shapes made to order. A notice of 45 to 60 days is required.

CHECKERWORK FOR ACID TOWERS—Checkerwork for acid towers is made of our second quality floor brick and Kq. Pavers. See above.

Shipping Facilities.

Daily output 25,000 face brick or paving brick from Plant No. 1 and 20,000 from Plant No. 2.

Independent railroad (Mt. Jewett, Kinzua & Riterville R. R.), connecting direct with Buffalo, Rochester & Pittsburgh Ry., Erie R. R., Pennsylvania R. R., Baltimore & Ohio R. R. and Pittsburgh, Shawmut & Northern R. R., gives short line mileage, speedy car movement, best car supply and minimum embargo trouble.

KUSHEQUA KERAMIC COMPANY

ELISHA K. KANE, LESSEE

Manufacturer of Ox-blood Floor and Roof Tiles
KUSHEQUA, PA.

Products.

KUSHEQUA FLOOR and ROOF TILES.

Ox-blood Tiles.

Ox-blood tiles show superiority in clear, deep red color, high vitrification, even texture and neat finish. No artificial glaze or coloring, the color and substance being uniform throughout.

The material is a stratified mountain shale of uniform composition. It is ground very fine and highly vitrified by natural gas.

Size and Grading.

Ox-blood tiles are made in 3 principal sizes: 1 by 6 by 9 in. (Promenade), $1\frac{1}{8}$ by 9 by 9 in. (Quarry), and 1 by 6 by 6 in. (Quarry).

The Promenade size is graded into 3 qualities: flooring quality (very choice), roofing quality (suitable for floors, excellent for roofs) and seconds (serviceable for roofs or cheap floors). The Quarry sizes, into flooring quality (choice) and seconds (slightly defective).

Color.

Each grade and size is sorted into 3 shades of clear red color: A (dark red), B (deep red) and C (bright red). Oriental tiles, with dark red centers fading toward gray edges, are also made in 6 by 6 in. and 6 by 9 in.

For antique effects, second quality orientals are particularly desirable.

Specials.

A full line of sanitary cove base, quoins, angles, wainscot caps, plinths, coping and other shapes are carried in stock. Also, key quoins, 3 in. and $1\frac{1}{2}$ in., in red or black, and diagonals and fractional tile for course starters. Other special shapes are made to order on reasonable notice. See opposite page.

Uses.

Vitrified tiles are used wherever there is need for a surface which is proof against fire, frost, water, acid, grease and dirt. If, in addition to these requirements, beauty of color and resistance to wear are required, Kushequa ox-blood tiles are best.

Flooring quality is recommended for parlors, halls, dining rooms, restaurants, hospital operating rooms and laboratories. Roofing quality for roof gardens, roofs, porches, promenades, kitchens, laundries, packing houses, engine rooms, bridges, etc. Seconds for cheap roofs, covering for concrete, dye vat linings, acid towers, fertilizer plants.

Facilities.

Monthly output 300,000 tile (150,000 during war) and large stock enables prompt shipment.

Transportation facilities unexcelled, factory connected with Erie R. R., Buffalo, Rochester & Pittsburgh R. R., Pennsylvania R. R. and Baltimore & Ohio R. R.

Direct Sale.

Although represented in principal cities by capable

NATIONAL FIRE PROOFING COMPANY

ORGANIZED 1889

Manufacturers of Hollow Tile

MAIN OFFICE
Fulton Building
PITTSBURGH, PA.

BRANCH OFFICES IN PRINCIPAL CITIES
Twenty-three factories in the United States and one at Hamilton, Ont.

Products and Services.

Manufacturers of DENSE and POROUS HOLLOW TILE for Fireproof Floors, Roofs, Ceilings, Partitions, Wall Furring, Column and Girder Coverings, and for Exterior Walls of all kinds, including barns, silos, and other farm buildings; NATCO LOCK JOINT SEWER TILE and NATCO FACE TILE in various types.

Trade-mark.

Look for the trade-mark "Natco" indelibly stamped on every piece of our product; it is protection against substitution.

Natco Advantages.

Natco hollow tile construction is superior in its moistureproofing, soundproofing, heat preserving (and conversely heat resisting), sanitary qualities, and from the standpoint of economy both initial and final.

Natco Floor Construction.

Floor arches of hollow tile can be set in winter, as the construction dries out in a few days. They are more nearly soundproof than solid construction. Following are illustrations and descriptions of some of the forms in common use. Only typical sections are given. Write for bulletin No. 171, "Natco Standard Fireproofing."

Natco Flat Arches.

The flat arch is the accepted type of standard fire-

FIG. 1. PERSPECTIVE OF STANDARD NATCO FLAT ARCH

proof floor construction, meeting every requirement as to strength, fire protection, architectural appearance and minimum weight.

The Natco hollow tile flat arch construction, as illustrated above, has been developed as the company's standard for this type.

APPROXIMATE WEIGHTS AND SAFE SPANS NATCO FLAT ARCHES
(For designing purposes only)

Depth of arch, in.	Weight, lbs. per sq. ft.	Spans allowable between I-beams arch set flat, ft. in.
6	26	4 0
7	30	4 6
8	32	5 0
9	36	6 0
10	38	6 6
12	44	8 0
14	50	9 0
15	54	9 6
16	55	10 0

The strength of any arch depends as largely upon workmanship as upon materials, therefore the maximum spans given can be used only where experienced workmen are employed and the work is guaranteed by a responsible contractor.

"Combination" System of Long Span Floor Slab.

Used without girders for clear spans up to 25 ft. Rows of tile 12 in. wide between reinforced concrete joists 4 to 6 in. wide monolithic with a concrete top

coat 2 in. thick mixed 1 part cement, 2 parts sand, and 4 parts gravel. Eliminates beam forms and requires one-third to one-half less flat centering, effecting great economy in erection.

FIG. 2. PERSPECTIVE VIEW OF TYPICAL COMBINATION FLOOR
Note economical wood centering used; 2"x8" or 2"x10" under each joist is sufficient

"Natcoflor" System of Fireproof Construction.

An exceptionally light slab of wonderful strength designed to reduce the dead load of fireproof floor construction carried on girders, columns, and footings. A minimum of flat centering required and an all-tile ceiling surface dovetail-scored for plastering a feature.

FIG. 3. PERSPECTIVE VIEW OF TYPICAL "NATCOFLOR"
Note simple method of reinforcing; also economical wood centering, 2"x8" under each joist is sufficient

Natco "Two-way" Floor System (Patented).

A later development of the "Combination" floor designed to carry loads to four sides in place of two, thus enabling designer to cut down thickness of slab and reduce depth of supporting girders. Most economical for bays, the ratio of whose sides does not exceed 1:1½; for long narrow spans "one-way" system is cheaper.

FIG. 4. PERSPECTIVE VIEW OF NATCO "TWO-WAY" FLOOR SYSTEM

Natco Segmental Arch.

Combining great strength with lightness and cheapness. Suitable for warehouses, lofts, factories, sidewalks or wherever a flat ceiling is not required. A flat suspended ceiling may be installed wherever deemed essential, such as used in the New York public schools, and in private houses, stores, etc. The 6-in. tile weighing approximately 27 lbs. per sq. ft. is the standard.

FIG. 5. TYPICAL SPAN OF NATCO SEGMENTAL ARCH

Natco Girder Covering.

Hollow tile beam and girder covering is made in various forms to fit the flanges of all standard steel beams and girders. It is self-supporting except where the width to be covered is more than 12 in.; then the soffit is supported by metal clips.

Note—See Fig. 2 for typical girder covering.

Natco Column Covering.

Steel and cast iron columns should be covered with at least 2 in. of semiporous hollow tile. Natco column covering can be furnished, both circular and square, for almost any type of column and from 2 to 4 in. in thickness. Covering for square columns can be made with rounded corners if necessary.

Natco Hollow Tile Partitions.

Fireproof, soundproof, easily erected, and the standard for stability, especially where called upon to support plumbing fixtures, heavy picture frames, shelving, etc. Stock sizes 2 to 12 in. thick, laying up 1 sq. ft. of wall surface. A reasonable percentage of short lengths also furnished on request.

Natco Face Tile.

For curtain or bearing walls of factories, warehouses, storage buildings, etc., Natco double shell tile in an 8-in. thickness, Natco smooth building tile and Natco XXX Tex tile in 3-, 4-, 6-, 8- and 10-in. thicknesses, with a reasonable percentage of corners, jambs, closures, sills, lintels and half-tile. When laid in a good cement mortar any one of these types produces an exterior surface of attractive finish without the addition of either stucco plaster or paint.

A post card request will bring a copy of the new bulletin No. 174, "Natco Wall Construction."

Natco XXX Hollow Tile.

For wall bearing and curtain wall construction—hard burned tile exposed or to be covered with cement stucco finish.

Natco XXX as compared with regular Natco merely represents added strength. Complete structural efficiency is realized in Natco XXX design in that every square inch of webs and shell is under direct compression when set in walls. Write for Bulletin No. 174, "Natco Wall Construction."

FIG. 6. TYPICAL SHAPES OF NATCO XXX HOLLOW TILE

Natco Lock Joint Sewer Tile.

Triple lock, hermetically sealed. Manufactured from a specially selected, carefully prepared, hard burned clay thoroughly salt glazed.

The recesses of the inner tile are designed to receive projections on each outer tile, which produces a continuous irregular mortar joint for entire length of sewer. The tile also lap 6 to 9 in. horizontally and 3 to 4 in. radially, thus eliminating "through mortar joints." Descriptive catalogue mailed anywhere.

THE HUMPHREY BRICK & TILE CO.

Hollow Terra Cotta Blocks
BROOKVILLE, PA.

Products.

SCORED and SMOOTH HOLLOW TERRA COTTA BLOCKS, 8 by 12 by 12 in. (exclusively during 1920).

Partition Blocks, Hollow Brick and Back-up Blocks will also be manufactured when factory conditions permit.

Facilities.

This plant is located in a section where special advantages for the manufacture of terra cotta blocks, etc., are obtained, such as an abundance of material and water, railroad and shipping facilities and cheap fuel. All motive power in the plant is supplied by gas engines, natural gas being used exclusively for power and fuel, this company operating its own gas wells.

The plant is constructed entirely of terra cotta blocks and is under ownership management, assuring owners' personal attention to all orders.

Due to peculiar trade conditions, this company will devote its entire plant during 1920 to the exclusive manufacture of the 6-chambered 8 by 12 by 12 in. terra cotta wall block both scored and smooth.

Fully 75% of all hollow tile requirements can be met by this block as either an 8-in. or a 12-in. wall can be built with this one size.

This plan of concentrating on one design will naturally result in an increased output and the advantages of purchasing this material from a plant making one run are apparent.

Range of Utility.

The inherent fireproof and dampproof qualities of Humphrey hollow terra cotta blocks extend the scope of their use over a large, growing field. They are eminently adapted for the economical construction of walls, floors, and ceilings for residences, public service, industrial, farm and other buildings, due to the fact that their design facilitates rapid handling and their enduring qualities assure rigid, permanent masonry construction.

Advantages of Hollow Terra Cotta Blocks.

The following advantages are insured by hollow terra cotta construction:

- (1) Absolutely indestructible by fire—due to the process of intense burning resulting in a dense, extremely hard substantial product.
- (2) Low percentage of absorption gives dryness, warmth and insulation to walls exposed to the weather where resistance to moisture, cold and heat are of paramount importance.
- (3) Positive saving in construction as compared with brick or stone.
- (4) Continuous, permanent saving in heating costs.
- (5) The hollow construction minimizes the weight on walls.
- (6) Positive insurance against mice and vermin in walls or other hollow tile construction.
- (7) The use of metal lath is obviated—nothing to rust or corrode.
- (8) The use of wood lath is done away with—nothing to rot or burn.
- (9) No furring strips to give trouble.
- (10) Saves space occupied by furring and lath.
- (11) Being symmetrically accurate in design they facilitate laying.

(12) Each block is a separate unit and will stand on face or end assuring easy, rapid handling and stacking.

(13) Perfect alignment of webs and walls of the block assure maximum load bearing capacity.

(14) Can be made to conform to any architectural treatment, either interior covered or exterior uncovered construction.

Strength Test.

Tests conducted by the United States Government Arsenal at Watertown, Mass., showed Humphrey 6-cell wall blocks to have an ultimate crushing strength of over 111 tons per sq. ft. of 8-in. wall. As this is many times the weight that could be put on any ordinary wall, ample strength of material is assured.

Scored Special 6-Chamber Wall Block.

The increase in the growing application of hollow terra cotta blocks to wall and other construction made many improvements in their design and manufacture necessary.

One of the vital improvements that made the hollow terra cotta block the universal favorite was the scoring of the surface with longitudinal ribs which serve as a bond for stucco, concrete or similar material applied thereto. This feature made possible the use of hard burned block, superior in strength to the soft burned block and more impervious to water which is the reason why hollow terra cotta construction is the dryest of any known masonry construction.

Humphrey scored 6-chamber blocks are recommended for exterior walls, floor arches, back-ups, pillars, or work where a specially strong block is required.

Humphrey Smooth Faced Block.

With these smooth face blocks a wall of either 8-in. or 12-in. thickness for either outside or inside use can be constructed. They are supplied in dark, fire flashed color but if uniform color is desired they can be painted inside or outside as paint will last twice as long as on wood. Their use, in nearly all cases, will cut the cost of even common brickwork in two, besides making a warmer, drier building.

They possess the same qualities of hardness, density and strength as the scored block and they are of precisely the same advantage where special conditions warrant their use.

SPECIAL 6-CHAMBER WALL BLOCK
8 x 12 x 12 in., 36 lbs.

HUMPHREY SMOOTH FACED BLOCK
8 x 12 x 12 in., 38 lbs.

Products.

REDWOOD LUMBER in all grades and sizes.

Character and Qualities of Redwood.

Redwood grows only in California. The trees vary from 150 to 300 ft. in height, and from 3 to 20 ft. in diameter. To this enormous size and close growth are due many of the wonderful qualities of the timber.

The lumber is light; soft, moderately strong; grain fine, even, straight, sometimes curly; annual rings wide in the young timber; summer-wood thin, dark colored, hard, conspicuous; medullary rays numerous, and very obscure; color light to dark red, the thin sapwood nearly white; splits and works easily and polishes well; very durable in contact with the soil.

Uses of Redwood.

Redwood is a superior timber for exterior finish (siding, cornice, window and door frames, porches, columns, doors, sash, etc.), and interior trim; for shingles and shakes of roofs and sides of houses; for pergolas, summerhouses, flower boxes and vases; for special farm uses—such as silo construction—and for hot-bed sash, beehives and incubators; for pattern stock, candy boxes, organ pipes and wine chests, storage battery separators, large clock hands, fireless cookers, for lattice trusses; for tanks, pipes, flumes, culverts, and cesspools; for greenhouse construction; for interior finish wherever great beauty of grain, freedom from knots or blemishes, and immunity from shrinkage or warping is desired in a finish wood; wherever wide paneling from one piece is required; for railroad ties and telegraph poles.

Lasting Qualities of Redwood.

Redwood is in every sense a specialty wood whose proper use presupposes a knowledge of its valuable qualities, chief amongst which, for outdoor uses, is its longevity. The botanical name of Redwood, "Sequoia Sempervirens," meaning "ever living," describes its ability to resist decay under the most severe conditions. It will endure unimpaired for years, under or above ground, without even a protecting coat of paint.

This great durability is probably due in part to the age of the trees and in part to a peculiar preservative which nature has put into the wood.

Resistance to Fire.

Redwood, containing practically no pitch or other resinous substance, is slow to ignite and offers unusual resistance to fire. There has never been any loss from forest fires in Redwood timber. As Redwood absorbs water readily, fire can be quickly extinguished once

it has taken hold. At many places in the great San Francisco fire of 1906 the conflagration was stopped where buildings made of Redwood faced the flames.

Railroad Construction.

For any type of construction that is much exposed to the elements, such as tunnel timbers and lagging, bridges, culverts, water tanks, and railroad ties, where water and earth conspire to produce decay, Redwood is the first choice of those who understand its exceptional qualities. Redwood ties are famous the world over. They are used in England and on the continent of Europe; in India, China, the Philippine Islands; in South Africa, in Mexico, and in South America. These uses of the wood are due to its extraordinary durability, and its comparative freedom from attack by destructive insects, such as the white ant.

Containers of all Kinds.

Redwood is universally used in California for all kinds of tanks, silos, pipe, flumes, culverts and cesspools. Many years ago, Redwood logs bored through the center were used as water mains in various cities, and these are still sound and tight after from 35 to 50 years of service. The water supply of San Francisco is carried through flumes built of Redwood 40 and 50 years ago. California wines are stored in tanks made of Redwood. Mining companies use it in their operations, as it is unaffected by acids. Redwood tanning vats that were built in 1859 are found still in use in San Francisco.

Cost.

Generally speaking, Redwood sells at about the same price as other woods for similar uses.

Facilities.

The Redwood producing sections in California now have direct rail connection, and shipments can be made to any point in the United States or Canada without being transferred.

Redwood is now handled in hundreds of cities and towns throughout the East; but if any one is unable to get it in any particular locality, he can be supplied if he will write to the Association.

Co-operative Service.

The Service Department of the CALIFORNIA REDWOOD ASSOCIATION will furnish literature, samples or any other information about Redwood and its products, and full advice as to its proper use.

Different booklets and pamphlets are issued from time to time, bearing upon the specific applications of the wood.

AMERICAN HARDWOOD MANUFACTURERS ASS'N.

OAK DEPARTMENT

Bank of Commerce and Trust Building
MEMPHIS, TENN.

Products.

OAK TIMBERS, MILL STOCK, LUMBER, DIMENSION, VENEERS.

Kinds of Oak.

White oak and red oak. Commercially there is very little difference except that where great strength and durability are the essential requirements white oak is usually preferred. Normally there is but little variation in price, but when there is a difference it is in favor of white oak.

Scope of Use.

In the United States the growth of oak is widely distributed, but commercial timber is confined principally to the Southern states including Missouri, and to the states east of the Mississippi and north of the Ohio as far north as New York. Oak from time immemorial has been used practically for every purpose for which wood is suitable. Wherever the requirements are for great strength, hardness, durability (and great beauty of restrained and dignified type), oak is appropriate. It has ever been to mankind the symbol of strength, durability, might, dignity and sturdiness, because of the inherent qualities of the wood.

Value to the Engineer.

When wood enters into the engineer's problem oak is an unfailing reliance. Oak is suitable for almost every purpose. It is not recommended above every wood for every purpose, but there is hardly a use for wood in which it will not serve satisfactorily. Oak has been a standard for so long a time that every complete engineers' manual has full mechanical data regarding it.

Mill Construction.

Oak is typically superior when used in mill construction—mill construction being defined as that type of building construction in which the interior framing and floors are of timber; arranged in heavy solid masses, and smooth, flat surfaces, so as to expose the least number of corners, and to avoid concealed spaces which may not be readily reached in case of fire.

Oak has the combination of bending and compression strength, shearing strength and shock resisting ability above any other commercial hardwood. For columns, girders, cross beams and other parts it has continued to demonstrate its practical value ever since the type known as mill construction has been employed.

Factory Flooring.

When flooring is to be subjected to severe wear as is usually the case in the typical manufacturing plant or warehouse, no other wood is so practical as oak. It makes a solid foundation for the fastening of machinery and is sufficiently resilient to absorb some of the strain that must otherwise be carried by the machinery. It withstands the rough usage caused by truck wheels and other severities of factory and warehouse use.

Bridges and Trestles.

Oak is extensively used for bridge and trestle

timbers because of its great shock resisting ability which exceeds that of most other woods. Wood is subjected to no severer strain than in bridges, but the strength of oak meets all the requirements. Its durability adds great value to its use for it reduces the amount of replacements.

Bridge Plank.

Millions of feet of oak are manufactured into bridge plank every year and oak really has no competitor for railroad and turnpike flooring. Oak above all other woods, fills the requirements of this particular use of wood. Almost every kind of strain is placed on bridge plank and because of its strength, toughness, durability and resiliency oak is almost universally preferred.

Switch and Cross Ties.

In the case of switch and cross ties, strength, durability and resistance to decay are the important requirements. No other wood in this or any other country approaches anywhere near oak in the number used. Oak ties are the standard for practically every trunk line in the United States. They are also used extensively in mining and timber railroad operations.

Poles, Cross Arms, Brackets.

Oak is not usually thought of as material for telephone, telegraph, and other wire lines yet the annual use of such in the United States reaches the respectable total of 236,842 ft. Oak is specially qualified for cross arms for electric lines for here strength and durability are particularly needed. Brackets are employed to fasten wires to poles where no cross arms are used. Oak fills this place in larger numbers than all other woods combined.

Ships and Boats.

Before the introduction of armor plate, oak was used almost exclusively in the building of ships and boats. The keels of every great wooden vessel now sailing the ocean are of oak, their ribs and rails are of oak and all those parts that absorb the severe strain and that are not easy of replacement. There has been very little attempt to substitute any other wood in these particular places.

Car Stock.

Oak is peculiarly adapted for car construction purposes. The beams and framing of freight and passenger cars are constantly undergoing strain, carrying heavy weights and subjected to severe jolts. Oak has every quality that makes it ideal in these places. About 25% of all wood used in the construction of cars is oak.

Agricultural Implements.

A purpose for which oak is peculiarly adapted is in agricultural implements. It is readily bent, and will stay bent, and is easily workable. Agricultural implement stock requires peculiar qualities of strength in small strips and here oak excels.

Vehicles.

Oak finds one of its principal uses in vehicle stock. This is another case of where strength and durability are required in small parts and that is why oak is of such value to the manufacturers of vehicles of all kinds.

Mine Timbers.

For props, poles, shafts, ties and planking used in mines, oak is essentially advantageous. The mine timbers undergo severe strain from heavy weights, rough usage and frequently from dampness. Oak resists all of these in an unusual degree and is therefore in great demand by mine operators.

Machine Construction.

Much machinery, particularly the heavier types, require strong wood foundations, supporting rails and strong handles that will not crack or break when subjected to rough usage and severe jar. Oak is exceedingly well adapted for these purposes for it has all the needed strength, toughness and elasticity.

Other Industrial Uses.

Frequently the engineer must decide industrial problems of almost every conceivable nature. It may be of advantage to know that oak reaches its largest

consumption in planing mill products. For furniture it leads all other woods and is nearly half of the entire amount of wood consumed by furniture plants. It leads its nearest competitor by 328,815,422 ft. It is used in making all kinds of fixtures for stores, banks and the like, for cooperage stock, boxes, electrical appliances, dowels, gates, pulleys and conveyors, pumps, wood pipes, playground and amusement park equipment, foundry flasks, machinshop patterns, silos, tanks, stirrups, trees, horns, hames, line rings, trunk frames, and various other articles made from wood.

Supply of Oak.

A consideration which has great weight with users is that the supply of oak is almost inexhaustible. Oak is our most abundant hardwood, and the amount of oak standing in the forests is approximately 40% of all the American hardwoods combined. It is therefore certain that the supply of oak will last indefinitely. This splendid wood will continue to be used, so the users of it may plan as far ahead as they will, with the assurance that when oak is needed it will be available.

Information.

Engineers are invited to write to us for any kind of information on the subject of oak.

GREAT SOUTHERN LUMBER COMPANY

BOGALUSA, LA.

Products.

LUMBER and LUMBER PRODUCTS of extra dense SOUTHERN LONG LEAF PINE (*Pinus Palustris*) from an exceptionally fine stand of virgin timber. Especial facilities for Marine, Railway and Heavy Industrial Material.

Brand.

Every shipment of Bogalusa product is identified by the trade-mark Bogalusa imprinted, wherever practicable, upon the lumber itself. This signifies our guaranty of superior manufacture and accurate and uniform grading.

Uses.

Long leaf pine is widely used for practically all purposes to which any of the so-called soft woods are adapted. Its chief uses are in all portions of frame structures including trim and floors; railway ties, timbers, planking, and car material; bridge timbers; poles; piling; ship timbers and planking; timbers and flooring in "mill construction"; in short, Bogalusa Brand extra dense long leaf pine is pre-eminent in all structural uses, heavy and light.

Facilities.

The plant of the GREAT SOUTHERN LUMBER COMPANY is the largest single sawmill installation in the world, with a capacity of 1,000,000 ft. daily. It is able to care in the promptest and most efficient manner for every requirement from the largest to the smallest.

Standard Specifications.

For the convenience of engineers herewith is appended standard specifications as adopted by the Associated Factory Mutual Insurance Companies, the American Society for Testing Materials, and the Southern Pine Association. Specifications adopted by the American Railway Engineering Association also appear in "The Bogalusa Book." See last paragraph on next page.

Specifications Suggested for a Special Grade of Long Leaf Pine for Use in Mutual Factories*.

In making contracts for beams, columns and plank to be used in "Slow Burning Construction," the following specifications are recommended:

DENSITY—No part of the material shall have a density of less than 30 lbs. per cu. ft. when tested by boring smooth holes 1 in. in diameter and 2 ins. deep in ends of the stick, drying to constant weight at 212° Fahr. and weighing borings and computing density from volume of the hole.

ROSIN—None of the heartwood shall show less than 4% of rosin by weight when borings are taken with a 1-in. bit with a hole 2 ins. deep, dried to constant weight at 212° Fahr. and extracted with benzole, the extracted rosin evaporated until it is not soft or sticky when touched with the finger at 70° Fahr.

HEARTWOOD—Heartwood shall show in all four faces of every stick, and sapwood shall not extend more than 2 ins. from the corner at any place, measured perpendicularly to the corner across the face.

GROWTH RINGS—For timbers 6 by 8 ins., or larger, there must show on the cross section between the third and fourth inch measured radially from the heart center or pith, not less than 6 annual rings of growth, a majority of which shall show at least one-third summer wood, which is the dark portion of the annual rings; but wide ringed material excluded by this

*See "Dry Rot in Factory Timbers," by F. J. Hoxie, 1915; Inspection Department Associated Factory Mutual Insurance Companies, Boston.

BOGALUSA
Trade Mark Reg. U. S. Pat. Office

rule will be acceptable, providing that in the majority of the annual rings the dark ring is hard and in width equal to or greater than the adjacent light colored ring.

For pieces in which the center is not included, there must show on the cross section an average of not less than 6 annual rings of growth, with not less than one-third summer wood. Timbers will be rejected in which there is no sharp contrast in color between the spring wood and summer wood.

DEFECTS—No timber with knots greater than 1 in. in diameter, or rot, or injurious shakes will be accepted.

BRANDING—Long leaf pine sold under this specification shall be branded with the letters "F. M.", the name of the lumber manufacturer, the location of the sawmill from which it comes, and the date of sawing, in letters at least 1 in. high.

Specifications for Southern Yellow Pine Timbers, Adopted by the Southern Pine Association, October, 1915.

The grades of timber are as follows: Select Structural Material, Merchantable Timbers, Square Edge and Sound Timbers, No. 1 Common Timbers.

GENERAL TIMBER SPECIFICATIONS—All timber except No. 1 Common must be free from defects such as injurious ring or round shakes, and through shakes that extend to the surface; unsound and loose knots, and knots in groups that will materially impair strength. Seasoning checks and discolored sap shall not be considered defects in any grade.

KNOTS—Knots shall be classified as round and spike in form and for quality as sound, incased, loose and unsound.

A round knot is oval or circular in form.

A spike knot is one sawn in a lengthwise direction.

A sound knot is one solid across its face, is as hard as the wood which surrounds it, may be either red or black, and fixed by growth or position so that it will retain its place in the piece.

An incased knot is one surrounded in whole or in part by pitch or bark and when grown fast to the piece or fixed by position so that it will retain its place in the piece it shall be considered a sound knot.

A loose knot is one not held firmly in place by growth or position.

An unsound knot is one not as hard as the wood surrounding it, or one having a hole in it.

WANE—Wane is bark on the corner of the piece, or the absence of the corner.

SHAKES—Shakes are cracks appearing on the ends of timbers, either intersecting the annual growth rings or separating the same. They shall be classified as ring or round shakes and through shakes.

A ring or round shake is an opening between the annual rings.

A through shake is one extending from the region of the center to the surface of the piece or extending between two faces.

Shakes not hereintofores described unless known to have extensive penetration shall not be considered a defect under this classification.

SIZES AND LENGTHS—All rough timber, except No. 1 Common, must be full size when green; ¼ in. shall be allowed for each side surfaced.

Standard lengths are multiples of 2 ft., 8 to 20 ft. inclusive. Extra lengths are multiples of 2 ft., 22 ft. and longer. When lineal average is specified, standard of lengths shall be multiples of 1 ft.

GRADES—The grades of timber shall be designated as follows: (1) Select structural material; (2) merchantable timbers; (3) square edge and sound timbers; (4) No. 1 common timbers.

HEART TIMBERS—All timber specifications, except "Merchantable," specifying heart requirements, shall be considered as a special contract.

Rule for Select Structural Material.

(A rule incorporating suggestions by the United States Forest Service. Adopted by the American Society for Testing Materials, August 21, 1915. Copyright, 1915.)

Continued on next page

REQUIREMENTS FOR DENSITY AND RATE OF GROWTH—Shall contain only sound wood and be well manufactured.

Shall conform to the definition of dense southern pine as adopted by the American Society for Testing Materials, August 21, 1915, as follows:

Dense southern yellow pine shall show on either end an average of at least 6 annular rings per in. and at least one-third summer wood, or else the greatest number of rings shall show at least one-third summer wood, all as measured over the third, fourth and fifth inches on a radial line from pith.

Wide ringed material excluded by this rule, will be acceptable, provided the amount of summer wood, as above measured, shall be at least one-half.

The contrast in color between summer wood and spring wood shall be sharp and the summer wood shall be dark in color except in pieces having considerably above the minimum requirements for summer wood.

For the purpose of determining whether any given piece meets the requirements for density and rate of growth, the following rule, suggested by the United States Forest Service, shall be applied. It will be sufficient if either end passes the inspection.

(1) *Pith Present or Accurately Located*—(A) Radial line of 5 ins. present. Apply inspection over third, fourth and fifth ins.

(B) Radial line of 5 ins. not present. (a) Apply inspection to the second inch on 2 by 3 ins., 2 by 4 ins., 2 by 6 ins., 3 by 3 ins., 3 by 4 ins., 4 by 4 ins., or any other dimension material that has less than 16 sq. ins. on the cross section. (b) In the larger material apply inspection to the 3 ins. farthest from the pith.

(2) *Pith Not Present or Can Not Be Accurately Located*—(A) Material over 3 ins. thick, apply inspection to 3 ins. nearest the pith. (B) Dimension material 3 ins. or less in thickness, apply inspection to second inch of the piece nearest the pith.

(3) The radial line chosen shall show a representative number of annual rings of growth and per cent of summer wood.

DEFINITION FOR SOUTHERN YELLOW PINE—This term includes the species of yellow pine growing in the southern states from Virginia to Texas, that is, the pines hereto known as long leaf pine (*Pinus palustris*), short leaf pine (*Pinus echinata*), loblolly pine (*Pinus taeda*), Cuban pine (*Pinus heterophylla*), and pond pine (*Pinus serotina*).

Under this heading two classes of timber are designated: (A) dense southern yellow pine and (B) sound southern yellow pine. It is understood that these two terms are descriptive of quality rather than of botanical species.

(a) *Dense southern yellow pine* shall show on either end an average of at least 6 annular rings per inch and at least one-third summer wood, or else the greater number of the rings shall show at least one-third summer wood, all as measured over the third, fourth and fifth inches on a radial line from the pith. Wide ringed material excluded by this rule will be acceptable, provided that the amount of summer wood as above measured shall be at least one-half.

The contrast in color between summer wood and spring wood shall be sharp and the summer wood shall be dark in color, except in pieces having considerably above the minimum requirement for summer wood.

(b) *Sound southern yellow pine* shall include pieces of southern pine without any ring or summer wood requirement.

RESTRICTIONS ON KNOTS IN BEAMS—Shall not have in Volume 1 sound knots greater in diameter, than one-fourth the width of the face on which they appear—maximum knot 1½ ins. Shall not have in Volume 2 sound knots greater in diameter than one-half the width of the face on which they appear—maximum knot 3 inches.

The aggregate diameter of all knots within the center half of the length of any face shall not exceed the width of that face.

The diameter of a knot on the narrow or horizontal face of a beam is to be taken as its projection on a line perpendicular to the edge of the timber. On a wide or vertical face, the smallest dimension of a knot is to be taken as its diameter.

DIAGRAM OF RESTRICTIONS OF KNOTS IN BEAMS

RESTRICTIONS ON KNOTS IN COLUMNS—Shall not have sound knots greater in diameter than one-third the least width of the column—maximum knot 4 ins.

RESTRICTIONS ON SHAKES AND CHECKS IN BEAMS—Round

or ring shakes shall not occupy, at either end of a timber, more than one-fourth the width of green material, nor more than one-third the width of seasoned material.

Any combination of checks and shakes which would reduce the strength to a greater extent than the allowable round shakes will not be permitted. Shakes shall not show on the faces of either green or seasoned timber.

RESTRICTIONS ON CROSS GRAIN IN BEAMS—Shall not have diagonal grain with slope greater than 1 in 20 in Volume 1.

MERCHANTABLE TIMBERS—May be either dense or sound pine. All merchantable timbers shall be well manufactured and conform to the General Timber Specifications. (See preceding page.)

Sizes under 9 ins. on the largest dimension shall show two-thirds or more heart surface on one of the wide faces; sizes 9 ins. and over on the largest dimension shall show two-thirds or more heart on both of the wide faces. When sticks are square the face showing the most heart shall govern the inspection on sizes under 9 ins. and the two faces showing the most heart shall govern the inspection when 9 ins. and over. Heart showing the full length, even if not two-thirds of the area as above, shall meet the requirement of this quality.

Wane not exceeding one-eighth of the dimension of the face and one-fourth of the length of the piece on one corner, or the equivalent on two or more corners on not to exceed 10% of the pieces, shall be admitted.

SQUARE EDGE AND SOUND TIMBERS—May be either dense or sound pine.

Square edge and sound timbers shall be well manufactured and conform to the General Timber Specifications, admitting sound knots, and shall be free from wane.

No. 1 COMMON TIMBERS—May be either dense or sound pine. Common timbers, rough 4 by 4 ins. and larger, shall not be more than ¼ in. scant at any point when green, and be well manufactured, and may have 1½ ins. wane on one corner one-third the length of the piece, or its equivalent on two or more corners; the wane measured on its face.

Timbers 10 by 10 ins. in size may have 2 ins. wane as above; the larger sizes may have wane as above in proportion to sizes.

The diameter of any one knot shall not exceed 2 ins. in 4 by 4 to 6 by 6 ins.; 2½ ins. in 6 by 8 to 8 by 10 ins.; 3 ins. in 10 by 10 to 10 by 12 ins.; 3½ ins. in 12 by 12 to 12 by 14 ins.; 4 ins. in 14 by 14 to 14 by 16 ins.; 4½ ins. in 16 by 16 to 16 by 18 ins. In sizes not mentioned the diameter of knots admissible will increase or decrease in proportion to the size of the timbers on same basis as above specified.

In determining the size of knots, mean or average diameter shall be taken, or the equivalent of the above in grouped knots at any one point. Shakes one-sixth the length of the piece, small unsound knots and a limited number of pinworm holes, well scattered, are admissible.

Information.

Engineers, and others, are invited to consult the company for any information desired regarding qualities, uses and prompt availability of Bogalusa Brand material. An authoritative booklet, including the above and other specifications as well as tables of working unit stresses, load limits, etc., will be sent gratis on request.

SECTION OF 260-ACRE SAWMILL OPERATION, BOGALUSA, LA.

THE LONG-BELL LUMBER CO.

R. A. Long Building
KANSAS CITY, MO.

Products.

LONGLEAF and SHORLEAF SOUTHERN PINE LUMBER.

OAK LUMBER; OAK FLOORING.

CREOSOTED LUMBER including TIES, POSTS, POLES, PILING and WOOD BLOCKS.

CALIFORNIA WHITE PINE LUMBER including SASH and DOORS, SCREEN DOORS, 3-PLY VENEER and BOX SHOOKS.

Gum Lumber.

Long-Bell
THE MARK ON QUALITY LUMBER
TRADE-MARK

Among its universal uses are posts, girders, joists, flooring, dimension, boards, interior and exterior trim, ceiling, sash and doors, siding, framework, newel posts, sheathing, lath, wood blocks for floors and paving, etc.

Source of Supply and Facilities.

THE LONG-BELL LUMBER CO. operates 13 large, modern sawmill plants. Ten of them manufacture Southern pine: 6 of them are in Louisiana, 2 in Texas, 1 in Mississippi and 1 in Arkansas. There are 2 oak plants: 1 in Arkansas and 1 in Mississippi.

A most complete and up-to-date oak flooring plant is operated at Pine Bluff, Ark.

This company's white pine lumber, etc., are manufactured at Weed, Cal.

THE LONG-BELL LUMBER CO. has an aggregate annual capacity of 620,000,000 ft.

This company is the largest manufacturer of

ONE OF THIRTEEN SAWMILLS OF THE LONG-BELL LUMBER CO.

All Long-Bell mills are equipped with the latest type of lumber making machinery

Southern pine in the United States. Its product is branded with the trade-marked name *Long-Bell*.

The company's exceptional railroad facilities permit shipments with dispatch and immense reserve stocks are constantly on hand. All mills have common rates to all territories.

Scope of Use.

Southern pine is an all-purpose wood unequalled by any other in its wide range of adaptability.

Of all the lumber consumed in America, 36% is Southern pine.

Bulletin No. 99 of the United States Department of Agriculture, "Uses of Commercial Woods of the United States," says of Southern pine: "In a large part of the country it is so universally used that there are few places of importance it does not fill."

Its use ranges from beautiful interior trim and finish to the giant timbers of the heaviest construction.

ILLUSTRATING THE BEAUTY OF THE GRAIN OF SOUTHERN PINE

From an unretouched photograph. Stain or varnish enhances the grain, producing striking effects in interior trim. This wood is equally adaptable to painting and enameling

Advantages of Long-Bell Southern Pine.

United States Government tests show that long-leaf Southern pine has greater breaking, bending, shearing, crushing and tensile strength than any other wood generally used in building construction.

The illustration shown herewith furnishes a striking example of the remarkable bending and tensile strength of longleaf Southern pine. Southern pine is practically unequalled for durability. In the humid climate of the South there are hundreds of structures in a perfect state of repair that were built of Southern pine 100 years ago, and, in not a few instances, 150 years ago.

ILLUSTRATING THE REMARKABLE STRENGTH OF LONGLEAF SOUTHERN PINE

This pine was bent over in a storm by a falling tree. Though its top was pinned to the ground and its trunk twisted, the fibers remained intact

Grades of Southern Pine.

THE LONG-BELL LUMBER Co. specializes on such grades of timber as will meet all requirements for permanence, strength, safety and economy in mill construction work. Particular attention is given to structural timbers and this company is prepared to handle unlimited quantities of stock under the density specifications prescribed by the American Society for Testing Materials, from the largest sizes of posts and girders down to the 3-in. thickness of factory flooring.

For residential and small building construction, THE LONG-BELL LUMBER Co. produces Southern pine in all of the various grades adopted by the Southern Pine Association.

LONG-BELL TIMBERS MADE OF LONG-LEAF SOUTHERN PINE
Can be supplied in lengths up to 60 ft., either creosoted or untreated

Method of Finishing Southern Pine.

Southern pine takes and holds, perfectly, paint, stain, enamel and varnish, and so offers a wide variety of color schemes for architectural uses. Complete instructions for finishing will be sent on request.

Oak Flooring.

This company manufactures the famous Long-Bell forked leaf oak flooring, unsurpassed for beauty, wear and ultimate economy in interior floors. It is even in color and texture, superior as to grade and manufacture.

Creosoted Products.

THE LONG-BELL LUMBER Co. operates its own creosote treating plants and its unexcelled facilities enable it to make large shipments without delay. The exceptional qualities of Southern pine make it especially adaptable to the Long-Bell pressure-vacuum creosoting treatment.

Creosoted Wood Blocks.

Southern pine wood blocks, when creosoted by the Long-Bell process, make an ideal pavement for all industrial plants, barns, stables, garages, loading platforms, railroad shops, warehouses, driveways and streets. Under heavy traffic wood blocks are far more durable

FACTORY FLOOR OF LONG-BELL CREOSOTED WOOD BLOCKS
Long-Bell creosoted wood blocks make a factory floor that will withstand the heaviest use for a lifetime.
They also make an ideal floor for stables, driveways, garages, etc.

than other forms of paving and are sanitary, dustless, noiseless and economical, cutting upkeep to the minimum.

Creosoted Poles and Piling.

Long-Bell poles cut from selected longleaf Southern pine and treated under hydraulic pressure with distilled creosote are not an experiment. Many years of service in the United States and abroad have proved conclusively that poles properly treated with creosote in airtight cylinders, under hydraulic pressure, give far longer life than ordinary poles.

Creosoted Fence Posts.

Thousands of large estates and farms are being fenced yearly with Long-Bell creosoted fence posts, known as "The Post Everlasting." These posts are stronger, more durable and more attractive than any other fence posts ever placed upon the market. They are treated full length and give satisfactory service for a life time. They are branded on one end with the L-B mark.

LONG-BELL CREOSOTED BARN POLES AS USED IN GARAGE CONSTRUCTION

Creosoted Ties and Timber.

Southern pine hewed and sawn ties cut from our own timber and in our own mills and creosoted at Long-Bell creosoting plants are reducing maintenance-of-way costs for many large railways.

Long-Bell creosoted timbers for heavy construction—bridges, trestles, docks—can be supplied up to 60 ft. in length. Because Southern pine is a wood of extraordinary strength and durability, it is universally chosen for piling, trestles, beams, sills, sleepers, columns and joists used in all classes of construction. When creosoted by the hydraulic-pressure-vacuum process, the endurance of Long-Bell Southern pine timbers is limited only by their ability to resist mechanical wear.

California White Pine, Sash and Doors, etc.

THE LONG-BELL LUMBER Co. has long been interested in and has recently acquired the controlling interest of the Weed Lumber Company, Weed, Cal. This plant is well known for the high quality of its California white pine lumber, sash and doors, screen doors, 3-ply veneers and box shooks. THE LONG-BELL LUMBER Co. is now prepared to supply these materials.

Long-Bell Trade-mark.

The products of THE LONG-BELL LUMBER Co. are branded at the mills during the process of manufacture with the trade-marked name, *Long-Bell*, an assurance to the user that he is obtaining the best stock it is possible to make in modern plants and by a strict adherence to the most exacting grading rules.

Literature and Information.

Attractive literature and full information concerning this company's products will be sent to interested persons on request.

Product.

TRIANGLE MESH CONCRETE REINFORCEMENT.

For Wire Rope, see pages 78-84; for Wire Fencing, see pages 378-79; for Electric Wires and Cables, see pages 1092-1108.

Uses.

Triangle mesh reinforcement is used for floor and roof slabs, arch construction, dams and retaining walls, water and culvert pipe, pavements and roadways, river revetment, silos, fireproofing steel framing, bridge floors, reservoirs, sewers, and stucco work.

Description.

Triangle mesh woven wire reinforcement for concrete is made with either solid or stranded longitudinal members, properly spaced by means of diagonal cross wires, so arranged as to form a series of triangles between the longitudinal or tension members; the longitudinal members being spaced 4 in., the cross wires either 4 or 8 in. as desired, providing either a 4-in. or an 8-in. mesh.

The sizes of both longitudinals and cross wires are varied in order to provide the cross-sectional areas of steel required to meet the conditions.

Advantages.

- (1) Provides even distribution of steel.
- (2) Reinforces in every direction.
- (3) Tension or carrying members accurately spaced.
- (4) Low cost of inspection.
- (5) Properly distributes over a large area stresses due to concentrated load.
- (6) Due to cold drawing, higher elastic limits and ultimate strengths with same quality of steel.
- (7) Continuous action from one end of the structure to the other.
- (8) Impossible to leave out or otherwise reduce the necessary steel, if specific style number of fabric or area of steel is specified.
- (9) Perfect mechanical bond.
- (10) Easily handled and stored on the work.
- (11) Minimum cost of installation.
- (12) It is the only design of woven wire fabric in which the cross wires assist the longitudinal or tension members in carrying the load.
- (13) By using stranded longitudinals in the heavy fabrics the necessary strength is furnished, and the finished material is more flexible and therefore more easily handled from the rolls.

TRIANGLE MESH CONCRETE REINFORCEMENT
 Solid longitudinals

Grade of Steel.

High carbon, high tensile strength steel has its advantages over the low carbon, low tensile strength steel, mainly because of the higher allowable working stresses; therefore, a smaller sectional area of steel is required, or, with the same sectional area of steel, an added factor of safety is secured.

The main disadvantage to a high carbon product is the stiff, brittle nature of the material.

By cold drawing a mild steel, the advantages of the high carbon steel are secured with an elimination of the disadvantages.

Triangle mesh reinforcement is manufactured from a cold drawn mild steel having an ultimate tensile strength of from 70,000 to 85,000 lbs. per sq. in.

Higher or lower strengths can be furnished if desired.

TYPES OF FLOOR CONSTRUCTION

Triangle mesh reinforcement can be furnished either plain or galvanized.

Except for special cases, the plain material is preferable, as the adhesion of the concrete is then directly to the steel and not to a coating.

Galvanized material must of necessity cost more; and since nothing is added to the strength of the finished construction, this increased cost is not justified.

Triangle Mesh Wire Reinforced Concrete Pavements and Roadways.

This rapidly increasing form of construction renders the following data and specifications of great value and assistance to consulting engineers, contractors and municipal authorities.

NECESSITY FOR REINFORCING CONCRETE ROADWAYS—It is demonstrated beyond doubt that to make concrete roads proof against heavy motor traffic, weather and time, a fabric of steel must be incorporated in the concrete. Several great states have so ruled.

Reinforced concrete is the future type of roadway construction, since it is obvious that only the most permanent and rigid form of construction will be adopted, and this being the only type that will withstand the constantly growing motor traffic. Many miles of reinforced concrete roads already placed and thoroughly tried have met the test.

ADVANTAGES OF REINFORCING WITH WIRE MESH—The concrete is bound with the strength of the steel so that to the granite nature of the concrete is added the structural steel power of a bridge. The steel fabric keeps the parts of the slab from separating in case cracks are formed, also overcomes the danger of cracking due to spongy soil such as that of Illinois, or where there is improper drainage and otherwise defective foundations; also cracking due to changes of temperature. And finally, the possibility of reduction in the thickness of the concrete slab.

The fabric is so constructed as to give the degree of flexibility demanded where the slab to be reinforced is relatively thin, as in road work.

The indeterminate stresses set up in a concrete road by heat, cold and moisture conditions, as well as the concrete setting, produce contraction and expansion in the concrete, which in time tends to make unsightly and dangerous cracks which may eventually cause disintegration of the concrete and finally the failure of the entire road. There is also always the danger of a sinking subsoil which brings about the same cracks unless proper amount of reinforcing is used.

TRACTOR POWER AND MAINTENANCE COST SAVED BY REINFORCED CONCRETE PAVEMENTS IN AND AROUND INDUSTRIAL PLANTS

Value of this class of construction for distribution of shop materials demonstrated at Santa Fe shops, Topeka, Kans.

It has been proved that a 7-in. reinforced concrete road with the AMERICAN STEEL & WIRE COMPANY'S Triangle Mesh wire reinforcement is stronger and better in every way than an 8-in. road without reinforcing. The cost of 1 in. of additional concrete will pay for the reinforcing required.

RELATIVE COST OF MAINTENANCE OF DIFFERENT KINDS OF ROADS—New York state shows interesting figures of relative costs.

For the period of January, 1915, to December, 1918, the maintenance expense of roads is given as follows:

	Per Mile per Year
284 miles of brick roads.....	\$210.00
2793 miles of bituminous macadam, penetration method	490.00
2451 miles water bound macadam.....	911.00
173 miles gravel macadam.....	843.00
208 miles concrete roads.....	138.00

RELATIVE GASOLINE CONSUMPTION ON VARIOUS KINDS OF ROADS—Actual road tests prove that gasoline

consumption is as much as 50% less per mile as compared with other forms of road.

In co-operation with the White Company, tests were recently made at Cleveland, Ohio, to determine the gasoline consumption of loaded 2-ton motor trucks over various types of roads, with the following results:

	Miles per Gallon
Earth road.....	5.78
Fair gravel road.....	7.19
Good gravel road.....	9.39
Bituminous macadam.....	9.48
Fair brick road.....	9.88
Good brick road.....	11.44
Concrete road.....	11.78

The sinkages in a concrete road that is not reinforced add to the vibration of the car and increase the fuel consumption. The reinforcement holds the surface true as well as binding the body of the concrete with the strength of steel.

COST OF CONCRETE MATERIALS WITH REINFORCING INCLUDED—The enormous increase in the cost of concrete materials within the last few years and the additional strength required for heavy motor car traffic are points in favor of a more extended use of reinforcement.

The following comparative statement of road building cost in Massachusetts compiled by the State Highway Commission shows the fluctuations in the price of concrete and other materials from 1916 to 1919. Concrete shows an increase from \$15.00 to \$24.33 per cu. yd. The price of reinforcing has increased from \$1.50 to \$2.75 a hundred pounds, f. o. b. Pittsburgh:

	1916	1918	1919
Earth excavation, per yard.....	\$0.77	\$1.50	\$1.36
Ledge, per yard.....	2.50	4.50	3.92
Borrow, per yard.....	.82	1.63	1.27
Local broken stone, per yard.....	1.86	2.90	3.05
Trap rock (by rail), per yard.....	2.57	3.60	4.13
Bituminous, application, sq. ft.....	.06	.10	.08
Concrete, 1: 2½: 5, per cu. yd.....	15.00	23.33	24.33
10-in. vitrified pipe, ft.....	.75	1.00	1.10
Catchbasins, each.....	37.00	50.00	62.50

It will readily be seen from these figures that under certain conditions reinforcing may be used without any material increase in the cost of construction through saving of concrete; in fact, its use may result in actual saving besides adding materially to the durability and strength of the slab and providing a factor of safety to guard against unknown demands of future heavy motor car traffic and maximum of service with lowest cost of upkeep.

The use of heavy bars as reinforcing for roads is very unsatisfactory and costly owing to a waste of steel by placing too large an amount in one place. The steel should be distributed as thoroughly as possible throughout the concrete in order to take care of any fine cracks which may form. Triangle Mesh does this in an ideal manner.

Reinforcing the concrete road with Triangle Mesh also makes it possible to place the expansion joints much farther apart. A decided saving and a valuable advantage.

TRIANGLE MESH REINFORCED PAVEMENTS USED EVERYWHERE—Triangle woven wire reinforcement is in use wherever concrete roads are built. Many millions

of yards of this material have been placed in roads North, South, East and West, and its use is increasing enormously. It meets all the requirements of a perfect road reinforcement.

After many years of practical experiments and careful inspection of concrete roads in every part of the country, it is now the positive belief of every good concrete engineer that no concrete road should be built without being properly reinforced with a cold drawn wire fabric.

Many state road engineers in their standard specifications require wire reinforcing in all their concrete roads, and this demand is growing rapidly.

The standard specifications of the American Concrete Institute and the American Society for Testing Materials (the two societies of highest authority on concrete in the world) specify reinforcing and recommend it highly in every concrete road.

REINFORCED CONCRETE ROADWAY, DE KALB, ILL.
A. N. JOHNSON, State Engineer

TESTIMONIAL UNDER EXTREME CONDITIONS—Pavement 12 miles long, U. S. Proving Ground, Aberdeen, Md., has received the traffic of heavy tractors hauling big guns and tons of ammunition and testing materials. *The reinforcement fabric saved the pavement.*

That reinforced concrete is best adapted to meet the growing demands of future traffic is shown by this pavement, than which nothing in the country can show a heavier loading. On account of the unstable subgrade, and of the almost continuous vibration of the ground due to test firing of heavy cannon while the pavements were under construction, the concrete was proportioned 1: 1½: 3 and reinforced with our woven wire fabric. *On one stretch laid on a fill and always carrying the heaviest traffic, the slabs have settled ¼ of a foot without any cracks developing.* This is especially interesting to Illinois where the subsoil is very spongy.

EXTRACTS SHOWING WHY WIRE MESH REINFORCING SHOULD BE USED—From *Specifications of Second National Conference on Concrete Roads*—

Reinforcing: The use of reinforcing in concrete pavements is increasing.

From Report on Joplin, Mo., Roads—

The pavement has been down over a year now and has fulfilled all expectations. There are no cracks, and the surface shows no wear. It is reinforced with Style 27 Triangle Fabric.

*Paper Read by H. S. Van Scoyoc, M. A. S. C. E.,
Chief Engineer, Canadian Highway Commission—*

Station Street, Oakville, was paved in 1914. In about a mile there is only one spot where a crack has developed, and it is known there is a spring there. The work is reinforced and the crack has not opened to any extent. It has required no repairs to date.

Compare above with below, by the same author in the same paper:

Several miles of concrete road were laid in 1911 and 1912 near Winnipeg. It was laid on the natural soil. It developed transverse cracks about every 30 ft. and also a number of longitudinal cracks. The second winter opened up the longitudinal cracks until many of them were more than an inch wide. By another spring some of them looked like gullies. *This road was not reinforced.*

*Discussion before the A. S. C. E., Vol. 39, No. 7.
Sanford E. Thompson, M. A. S. C. E.—*

One of the problems to be considered in concrete pavements is that of contraction and expansion due to temperature changes. Contraction from lowering temperature causes cracks not only in concrete, if not reinforced, but also in brick and stone work.

*An article by A. T. Goldbeck, Engineer of Tests,
U. S. Dept. of Agriculture on "Causes of Cracks in Concrete Pavements"—*

Naturally as friction can best be developed along the length of the road, temperature changes and moisture are promotive of transverse cracks rather than longitudinal cracks.

Sliding of the concrete on the subbase develops frictional resistance of considerable magnitude—when this exceeds the tensile strength of the concrete a crack must form.

Extract from report of B. Woodyard, Chief Engineer of Wood County, West Va.—

The 1916 work will depart from past practice in that the roads will be reinforced. The engineer decided on this change because of a conviction that the addition of reinforcement will lengthen the life of the road and reduce the maintenance cost.

Extract from Bulletin No. 249, U. S. Department of Agriculture, Portland Cement Concrete Pavements by Moorefield and Voshell, Engineers—

Probably the most satisfactory method in point of efficiency for reducing objectionable cracks in concrete pavements is that of employing steel reinforcing. The reinforcing usually consists of woven wire or some similar material.

TYPICAL SPECIFICATIONS—Reinforcing Materials—The reinforcement for concrete pavement shall consist of woven steel

REINFORCED CONCRETE PAVEMENT, CONNERSVILLE, IND.
W. F. RIDPATH, City Engineer
GREENWOOD, CONNOR, BOOTS & GANT, Contractors
585 sq. ft. Triangle Mesh Reinforcement used

RESURFACING WITH REINFORCED CONCRETE, KIRKSVILLE, MO.

The 2-in. bitulithic top was removed and over the 5-in. concrete base (11 years old) was placed 4 in. of new concrete reinforced with Triangle Mesh Reinforcement weighing 45 lbs. per 100 sq. ft.

wire fabric. This material shall be manufactured from steel which shall develop an ultimate tensile strength of not less than 70,000 lbs. per sq. in., and shall bend 180° around one diameter and straighten without fracture; all reinforcement shall be free from excess rust, scale, paint or coating of any character which will tend to prevent its bond with the concrete.

Fabric reinforcement shall weigh not less than —* lbs. per 100 sq. ft.

In no case shall the parallel wires be spaced farther apart than 8 in.

*The State Highway Departments of New York and Pennsylvania require all concrete roads to be reinforced and will not allow the use of any fabric weighing less than 25 lbs. per 100 sq. ft.; however, many other states require not less than 40 or 45 lbs.

Always specify by weight and not by sectional areas.

Placing Reinforcement—The reinforcing fabric shall be placed not less than 2 in. below the finished surface with the main or heavy wires running crosswise of pavement. It shall extend to within 2 in. of all joints and 2 in. of the edges of pavement. Adjacent widths of fabric shall be lapped at least 4 in., and where more than a single length of fabric is required to extend across the pavement, the end laps of these strips shall be at least 12 in.

The weights and other characteristics of the various styles of Triangle Mesh reinforcement are given in the tables on following page.

Machines for Flattening Reinforcement.

The reinforcement is purchased in rolls and flattened on the job. The cost to straighten the fabric by means of these rolls varies from ¼¢ to ½¢ per sq. yd. of pavement. Straightening and cutting on the job, reinforcement is in much better condition than when shipped flat.

LATH.

Berloy Corner Bead, and other Pressed Steel
Products.

Berloy Floor-Cores.

These pressed steel forms supply centering for T-
beam concrete floors in spans up to 30 ft. for live loads
up to 200 lbs.

Berloy Floor-
Cores are made of
Nos. 26- and 22-
gauge steel, in
lengths of 30 and 36
in.; in widths of 20
and 25 in.; and in
depths of 4, 6, 8, 10,
12 and 14 in.

BERLOY FLOOR-CORES

Berloy $\frac{3}{4}$ -in. Ribplex.

This is an expanded metal lath with $\frac{3}{4}$ -in. ribs,
which answers for both centering and reinforcing in flat,
pitched and sawtooth roofs, in walls, ceilings, partitions
and floors.

Ribplex plates are carried in stock in Nos. 24-, 26-
and 28-gauge, in lengths of 4, 5, 6, 7, 8, 9, 10, 11 and 12
ft. Covering width, 24 in. Made of steel or Toncan
metal.

SECTIONS ACROSS PLATE TO SHOW RIBS AND MESH OF
BERLOY $\frac{3}{4}$ -IN. RIBPLEX

Berloy Ferro-Lithic.

These reinforcing plates are made of Nos. 24- and
26-gauge metal.

The dovetail corrugations, $\frac{1}{2}$, $\frac{5}{8}$ or $\frac{3}{4}$ in. deep,
give a firm clinch with plaster or concrete.

Ferro-Lithic is used for roofing, siding, floors,
lining for coal bunkers, etc. It forms a weathertight
job even without concrete.

SECTION ACROSS END OF STANDARD FERRO-LITHIC PLATE,
TO SHOW DETAIL OF PLATE AND CONSTRUCTION

Berloy Multiplex.

These Nos. 16- to 24-gauge steel reinforcing
plates are curved, as shown below, for heavy
floor construction.

Multiplex is extensively used in powder
mills, sugar refineries and other places where a
clean ceiling, free from droppings, is essential.

BERLOY MULTIPLEX REINFORCING PLATE

Berloy Metal Lumber.

This is a system of joists and studs of pressed steel
—a light, strong fireproof construction.

The members are made in many sizes and weights
to conform to requirements, and cut to size from stock
at the factory. Bulletin No. 12 gives complete informa-
tion.

DETAIL OF STANDARD FLOOR CONSTRUCTION

Berloy $\frac{3}{8}$ -in. Ribplex.

For all straight run lathing partitions, outside walls
and ceilings, $\frac{3}{8}$ -in. Ribplex has proven itself the ideal
material to use.

It is an expanded lath with ribs $\frac{3}{8}$ -in. deep on $\frac{3}{8}$ -in.
centers, which give great stiffness. Made in sheets 8 ft.
long; covering width, 24 in.

WICKWIRE SPENCER STEEL CORPORATION

Manufacturers of Electrically Welded Wire for Concrete Reinforcing

WORCESTER, MASS.

BUFFALO, N. Y.

BRANCH OFFICES

NEW YORK, N. Y., 120 Broadway
CHICAGO, ILL., 33 West Austin Avenue

PHILADELPHIA, PA., 410 Commerce Street
SAN FRANCISCO, CAL., 111 Townsend Street

Products.

"CLINTON" ELECTRICALLY WELDED WIRE FABRICS for Reinforcing Concrete.

"Clinton" Woven Wire Lath; "Clinton" Welded Sheathing for interior plastering and stucco work; Wire Cloth, Netting and Perforated Grilles and Metals of all kinds.

For Wire Rope, see page 85.

Electrically Welded Wire Fabric.

SCOPE OF USE—"Clinton" welded fabric is especially adapted for roofs, floors, walls, roads, sidewalks, sewers, reservoirs, levees and all kinds of slab construction.

This material is also used to advantage in all kinds of work involving the covering or protection of steel with concrete, as in buildings, bridges, subways and tunnels.

THE MATERIAL—"Clinton" electrically welded fabric is a wire mesh made up of a series of parallel longitudinal steel wires, spaced certain distances apart and held at intervals by means of transverse wires arranged at right angles to the longitudinal wires, to which they are welded by a patented electrical device. The intersecting wires are actually fused together by electricity, producing thereby an immovable connection between the wires.

This at all times assures a rigid mesh.

"CLINTON" ELECTRIC WELD

In this view the two wires have been cut through at their point of union, revealing a perfectly smooth surface. It is a perfect weld; the two wires are actually fused together.

THE WIRE—"Clinton" electrically welded fabric is fabricated from a special grade of good quality steel wire possessing such strength, elasticity and ductility as to render it especially adapted to structural use. The wire will develop an average ultimate strength of 70,000 to 80,000 lbs., with a maximum, in some cases, of 85,000 lbs. per sq. in.

GALVANIZING—Unless otherwise ordered, "Clinton" electrically welded fabrics are made from wire which has been galvanized before being welded. If galvanizing is not required, these fabrics can be made from plain steel longitudinal wires and galvanized transverse wires.

Reinforced Concrete Slabs.

Because of the unaccountable strength of short span slabs as shown by actual tests, the city of New York, after long consideration of the subject, has finally

adopted an empirical formula to be used in designing slabs of 8-ft. span and less when confined between steel beams. This formula is for the conditions of continuous wire mesh reinforcement, and the designs shown are therefore in accord with the regulations now in force in New York City.

CHICAGO OFFICE, 6 North Michigan Avenue PHILADELPHIA OFFICE, 1619 Chestnut Street

Products.

BRIKLATH or "COMPOSITE METAL LATH," a Brick Covered Metal Lath; a Plastering Base; Monolithic Partition Base; Structural Fireproofing Base; Boiler Insulating Base; Pipe and Electric Cable Fireproofing Base.

Briklath or "Composite Metal Lath."

A mesh of annealed wire, upon which brick clay has been placed under high pressure and baked, so as prac-

A FULL SIZE SECTION FROM A SHEET OF BRIKLATH

tically to enclose the wire. A plastering base that insures a positive bond as well as an ideal key through the openings without loss of material by pushing through.

A self-centering, fireproof lath that may be used wherever metal lath is applicable; that is easy to apply; economical of material and inexpensive in cost.

Standard sheets are 16 ft. 4 in. long by 40 in. wide, and are shipped in rolls containing 6 sq. yds., weighing 55 lbs. Special lengths furnished to order.

Special Uses.

BRIKLATH 2-IN. SOLID PARTITIONS—These are rigid and economical; eliminating the use of angles, channels and studs and producing a solid slab in which the plaster is not weakened at regular intervals by the ordinarily necessary members. The lath is secured to wires drawn drum-tight from ceiling to floor along the center line of the partition and an equal quantity of plaster is assured on each side of the base. These walls are less sound reverberating than hollow walls, less susceptible to settlement cracks than the channel studded solid partitions and are approved by the New York City Building Department for use in fireproof buildings.

FIREPROOFING MILL CONSTRUCTION FRAME BUILDINGS—Posts are wrapped with Briklath and plastered.

The brick firmly baked onto the wire mesh bonds with the cement, holding it securely in place under any degree of heat.

ELEVATOR ENCLOSURES—Briklath 2-in. solid partitions are especially recommended for elevator and hatchway enclosures; not only for their fireproof qualities, but

117	.0955	14 do 12 4	Residence

DETAIL OF FIREPROOF FLOOR CONSTRUCTION

Fireproof Floor of Concrete Reinforced with brick fabric reinforcement

for the advantages they present in the saving of space and in the saving of cost.

SURFACING CONCRETE FOR PLASTERING—Briklath laid in the forms in which concrete is to be placed bonds securely to the concrete, and when the forms have been removed presents a clay surface for the application of finish plaster.

TILE AND CONCRETE FLOORS OVER FRAME CONSTRUCTION—Sheets of Briklath are drawn taut over the top of floor timbers, as shown in details, and stapled down. The required depth of concrete is then placed and finished as desired.

TILE FLOOR ON CINDER CONCRETE ON BRIKLATH

BOILER COVERINGS—Portions of the boiler where insulation is desired are covered with Briklath, securely wired in place, and plastered to the desired thickness with any refractory cement or with magnesia or asbestos plastic compositions, as may be preferred. The perfect bond between the covering and the base insures the permanency of the mass, and the physical characteristics of Briklath results in a mass of dead air cells between the body of the boiler and the covering, which materially increase its insulating properties.

PIPE AND ELECTRIC CABLE CONDUIT FIREPROOFING—For these purposes the lath is cut in strips of convenient width, and is wrapped spirally about the pipe or cable, the lath being securely wired. A 2 to 1 mixture of portland cement is then applied to a thickness of $\frac{5}{8}$ in. This method has been efficiently used by the New York Edison Co., United Electric Light and Power Co. of New York, and the Edison Companies of Brooklyn, Boston and Detroit; also by other large corporations.

BRIKLATH USED AS A BASE FOR CEMENT FIRE PROTECTION ON $2\frac{1}{2}$ -IN. ELECTRIC CABLE

WORKMEN'S HOMES—Briklath effectively solves the problem of durable, practical and sightly homes at low cost.

Briklath is self-furring and may be applied directly to the sheathing, some waterproofing material usually being interposed.

Method of Attaching.

Ordinary forms of metal lath must of necessity be attached to their support around the metal which, rusting away at such points, leaves the stucco slab unsecured and results very soon in cracks and falling stucco. Briklath, on the contrary, is attached by means of staples or tie wires placed diagonally over the little bricklets which serve as permanent anchors in the cement mass, and hold the stucco sheet in place even if the wire should in time disintegrate. This feature alone makes Briklath the best possible base for stucco.

SECTION THROUGH WALL OF FRAME BUILDING

STUCCO EXTERIOR WALL WITHOUT SHEATHING

General Application.

Briklath may be applied, in general, in much the same way as ordinary metal lath. More complete specifications covering specific applications will be forwarded on request.

Engineering.

The CONCRETE STEEL COMPANY maintains experienced and efficient Engineering Departments in its district sales offices for the use of customers. These Engineering Departments would be glad to co-operate in making up designs, estimates and plans on any type of reinforced concrete structure.

Description of Havemeyer Bars: Rounds, Squares, Flats.

Rolled deformed bars with the axes of the projections, forming the mechanical bond, parallel to the axis of the bar; designed to secure at all points constant uniform area of cross section equal to area of cross section of a plain bar of same size. Projections and depressions, being rolled longitudinally, allow all steel to be of value when bar is under tension. No sharp angles tending to start cracks when bar is bent. Full tensile strength of all metal is developed throughout length of bar, equalizing strength at all points. As Havemeyer bars are rolled to same weight and area as plain bars, a strong mechanical bond is obtained with same weight of metal used in rolling a plain bar.

The deformations furnish a mechanical bond more than sufficient to develop strength of bar, as proved by many testing laboratories.

ADVANTAGES OF HAVEMEYER BARS—Bending and handling costs are reduced to a minimum through the following important features: (1) Havemeyer bars bend easily, because metal in longitudinal projections follows bend as readily as metal in body of bar. (2) Both ends

SQUARE BAR

ROUND BAR

FLAT BAR

of a "double bend" lie in same plane without extra work. (3) No abrupt changes in cross section to start cracks. (4) Bars easily wired at intersections, the projections and depressions preventing wire from slipping. (5) Bars easily selected on the work, because readily gaged.

SIZES—Havemeyer bars are rolled at many mills in the various steel centers of the United States. They are carried in stock, ready for prompt shipment, in principal cities, in sizes indicated in the following table:

WEIGHTS AND AREAS, HAVEMEYER SQUARE, ROUND AND FLAT DEFORMED BARS

Size, in.	SQUARE		ROUND		Size, in.	FLAT	
	Area, in.	Weight per ft., lbs.	Area, in.	Weight per ft., lbs.		Area, in.	Weight per ft., lbs.

1 1/8	1.0000	3.400	0.9940	3.379	1 3/4 x 5/8	0.7656	2.600
1 1/4	1.2656	4.303	1.2272	4.173	1 3/4 x 1	0.8750	2.980
1 1/2	1.5625	5.312					

We can furnish 1 3/8-in. and 1 1/2-in. square Havemeyer bars from Pittsburgh Mills. Do not carry them in stock.

NOTE—A size extra of 10¢. applies against 1 x 1/4-in. and 1 1/2 x 5/8-in. flats; all other sizes tabulated take the base price.

Specifications for Steel.

Havemeyer bars can be rolled to any standard specification. Manufacturers' Standard Specifications for concrete reinforcing bars, adopted 1910, are recommended because large tonnages are regularly going through mills on these specifications, and orders complying with them will be shipped in shortest possible time.

Havemeyer Bar Service.

Havemeyer bars can be shipped, cut to special lengths, direct from the mills when mill conditions will permit. Immediate shipments can always be made from large stocks of round and square Havemeyer bars that are carried in warehouses at Youngstown, Camden, Chicago, Birmingham, Boston, Kansas City, St. Louis, Detroit and New York. Stocks are also maintained in other principal cities by agents.

Shop Bending and Fabricating.

The fabricating works are equipped with the most modern machines for bending and fabricating bars accurately and economically. Shop bending is more economical to the contractor than field bending, with no waste, so very low prices can be made.

Fabricated units for girders, beams, columns, etc., ready to drop into form boxes, can be shipped promptly.

Havemeyer Collapsible Spirals.

Made of highest grade rods or wire to size specified, and manufactured in the company's own shops, accurately coiled to proper diameter and correctly spaced, using a rigid spacer, insuring rigidity, strength and uniformity; and unless otherwise ordered, are equipped with two spacers and shipped collapsed, ready to be placed in form. An angle spacer is used, size varying with size and weight of spiral. This type has proven the most economical and satisfactory.

COLLAPSI-
BLE SPIRAL**Havemeyer Easel Chairs.**

Made from high grade spring steel wire. Used in terra cotta or steel tile construction. Standard distance from underside of bar to forms is 1 in. Made double (2 bars) and single (1 bar). Carried in stock.

EASEL CHAIR IN STEEL TILE
No tools required**Hy-chairs.**

Made from pressed steel. Used in flat slab construction for supporting head rods over columns and bent up bars in slab. Maximum size bar, $\frac{3}{4}$ in. Made up on order.

HY-CHAIR
No tools required**Havemeyer Ty-chairs.**

Made from high grade spring steel wire. Used for tying and supporting bars in slab. Standard distance from underside of bar to forms is 1 in. Carried in stock.

TY-CHAIR IN POSITION
No tools required**Havemeyer Bar-ty's.**

Made from high grade spring steel wire. Used for tying bars in walls, bent up bars to supporting rods in slab, tying stirrups to beam bars, fabricating columns, etc. Carried in stock.

No. 2 BAR-TY'S
No tools required**Securo Bar-spacers.**

Made from hoop steel. Locking prongs and legs are self-contained. Used for supporting, spacing and locking bars in the slab. Standard height from underside of bar to form, $\frac{1}{2}$, $\frac{3}{4}$ and 1 in. Made up on order.

BAR SPACERS
No tools required**Havemeyer "Y" Socket Inserts.**

Made from highest grade malleable iron. Has a broad nailing base with 4 nailing holes and made to accommodate bolts with standard threads from $\frac{3}{8}$ to $\frac{3}{4}$ in., both inclusive. Carried in stock.

"Y" SOCKET
INSERT**Dayton Adjustable Inserts.**

Made from highest grade malleable iron, cast in one piece with keyhole slot.

Made in sizes from $\frac{1}{4}$ to $\frac{7}{8}$ in., both inclusive. Carried in stock.

No. 3

No. 5

DAYTON ADJUSTABLE INSERTS

Slotted Inserts.

Made from high grade pressed steel. In standard lengths of 1 ft., 18 in., 2 ft. and 3 ft. to accommodate $\frac{1}{2}$ -, $\frac{5}{8}$ - and $\frac{3}{4}$ -in. bolts. Has 6 nailing holes and closed slot. Carried in stock. $\frac{7}{8}$ -in. bolt special.

SLOTTED INSERT

Havemeyer Beam Saddles and Separators.

Made from sheet steel. Used in beams, girders and lintels, for supporting, spacing and locking the bars. Standard heights from bottom of bar to forms are $1\frac{1}{2}$ and 2 in. Made up on order.

BEAM SADDLE AND SEPARATOR
No tools required**Round and Angle Nose Curb Bars.**

ROUND NOSE— Anchors are flared from the web and bent. Occur every 6 in. and serve as a reinforcement as well as an anchorage. There is no web to weaken or split the concrete, and the bar may be easily bent. Stocked in 8-, 10- and 12-ft. lengths, galvanized.

Showing a Bar Bent

View of Section
ROUND NOSE CURB BAR

ANGLE NOSE— Similar to the round nose curb bar in method of anchorage. Carried in stock in 10-ft. lengths, galvanized.

**Security Wall-ty and Anchor.**

Made from rustproof hoop steel with nailing barb and anchors occurring every 3 in. By prying out the loop of the anchor and inserting the Wall-ty an accurate bond may be secured. Used for brick and terra cotta veneering, tile wainscoting, suspended ceilings, screeds, etc.

Ceco Column Spirals.

Accurately shaped to required diameter by machinery, and held in correct pitch by the new slotted "V" spacer, accurately spacing each wire, preventing distortion, and allowing spirals to be collapsed for shipment and then readily expanded to required diameter. Unless otherwise specified, two spacers furnished with each spiral. Hooping given an extra turn at each end and securely wired in position, so no slipping is possible.

CECO COLUMN SPIRALS

Meyer Removable Steelforms.

Economically adapted for all buildings with long spans. A series of concrete joists is formed, eliminating all concrete useless in resisting stresses, and effecting a great saving in form work through the early removal and speedy re-use possible. No. 16-gauge sheet steel. Shaped exactly by heavy presses, extremely rigid, so maximum re-use is secured.

MEYER REMOVABLE STEELFORM

Rented to contractors, the labor of placing and removing being handled by

MEYER STEELFORMS WITH REINFORCEMENT IN PLACE READY FOR CONCRETING

Contract Department. Furnished in 6-, 8-, 10- and 12-in. depths, in 20-in. widths, and 12- and 15-in. depths in 30-in. widths as well as special widths; and with both single tapered and double tapered end forms—also an economy.

Ceco Round Column Forms.

In standard adjustable sections, all snugly fitted together by tongue and groove joints, and held in place with both flat and tee-iron clamps. All parts completely interchangeable; columns with diameters of 12 to 48 in., of any height, quickly formed. The natural rigidity of heavy gauge sheet steel, with added reinforcement of tongue and groove joint between clamps, makes an absolutely stiff and rigid form. Column section always uniform throughout, and smooth surface a certainty. Used with any type floor construction, special column caps being furnished when necessary. Constant re-use effects great economy.

Contract Department will erect Ceco round column forms in place ready for concrete, guaranteeing complete satisfaction. Or they will be rented to responsible parties without labor of installation.

CECO ROUND COLUMN FORMS

Ceco Service.

The CONCRETE ENGINEERING COMPANY's Contract Department will erect all materials when the quantity is large enough to warrant doing so.

The Engineering Department will prepare complete designs on all types of reinforced concrete construction at a nominal charge. Preliminary estimates of cost, layouts, etc., are a part of the service and incur no obligation.

Shipping Facilities.

Adequate stocks are always maintained in warehouses at Omaha, Chicago and Kansas City. Prompt shipments of any size order made without delay.

Engineering Services.

THE CONCRETE REINFORCING AND ENGINEERING Co. furnish engineering services for reinforced concrete structures of all kinds. This service is co-operative. The cost of this service may be included in our estimate or may be paid for separately on the fee basis.

Co-operative service is offered architects in connection with any work of a preliminary nature. An efficient estimating and engineering department is maintained for service of this character. Suggestions are freely offered regarding type of construction which can be most economically used, and estimates are furnished of comparative cost of various types suggested. Standardization of estimating and designing methods enables this company to offer a very efficient service.

Rivet Grip Bars.

Rivet Grip bars are rolled in sections equivalent to standard square bars.

SHOWING APPLICATION OF RIVET GRIP BARS IN TANK, RESERVOIR OR OTHER WALL CONSTRUCTION

Rivet Grip Fabricated Units.

A compact, rigid unit reinforcement, fabricated in shop strictly according to individual designs; tagged, bundled and shipped ready to place.

Rigidly attached shear members are generally recognized by authorities to have decided advantages over loose bent bars and stirrups wired in place.

Refer to joint committee final report for definite and authoritative statements.

SHOWING METHOD OF ATTACHING SHEAR MEMBERS

APPLICATIONS—Rivet Grip fabricated units are effectively and economically used as beam, girder or joist reinforcements in building and ship construction.

Rivet Grip reinforcement is ideally applicable for wall reinforcement of vaults, tanks, retaining walls, abutments, reservoirs, dry docks, dams, etc.

ADVANTAGES—By using Rivet Grip fabricated units, all errors of field fabrication and placing of reinforcements are eliminated. Field cost of handling is reduced to a minimum.

"STEELCRETE" EXPANDED METAL for reinforcing concrete.

Also, Beam Wrapping; Metal Lath; Channel Furring; Galvanized Metal Corner Bead; Special Meshes for Lockers, Machine Guards, etc.; Rib-mesh Expanded Metal for Lath and for Concrete Reinforcing.

Sectional Area.

A 16-ft. long sheet of expanded metal, for reinforcing concrete, can now be obtained with sectional area of 1.00 sq. in. Heretofore this long length and heavy section has been unobtainable. It will reduce cost of placing reinforcing in concrete. Reinforcing meshes range from sectional area of 1.00 sq. in. down to a light section to be used for temperature stresses.

Scope of Use.

"Steelcrete" mesh, the oldest and most widely used of concrete reinforcement, is adapted for reinforced concrete work such as floor and roof slabs, sewers, conduits, tanks, highway bridges, culverts, retaining walls, etc.

Description.

"Steelcrete" mesh possesses great unit strength and a high elastic limit. It is cold drawn to its mesh shape under enormous speed, being previously covered with oil. This process, together with the use of soft carbon steel, give uniformity of quality and stiffness.

Tensile strength of the open hearth steel used is from 55,000 to 60,000 lbs. It has an elastic limit of not less than one-half its ultimate strength, an elongation of about 25% in 8 in., and cold bending test of 180°. Ultimate strength of finished product is raised to a value of 70,000 to 80,000 lbs. and elastic limit increased by 100%.

Severe loading tends to close the diamonds, giving fabric a ductility unencountered in any other reinforcement of high elastic limit. It causes compression in concrete in the plane of the steel, and thus reinforces the construction against sudden rupture.

Advantages.

As the structure of "Steelcrete" provides a perfect distribution of steel in a horizontal direction, so its stiffness insures a like perfect distribution in vertical direction. There are no waves or warps to be hammered out or to offer an element of weakness.

Due to mesh shape, "Steelcrete" attains a perfect bond in concrete. There is no peeling or scaling of concrete when subjected to heavy loads.

Temperature stresses are guarded against. The form of "Steelcrete" mesh provides positive reinforcement against these known but indeterminate stresses.

"Steelcrete" is cheap to install. It arrives in flat sheets of standard lengths and is easily handled, requiring very little storage room. Bending of "Steel-

crete" in a circular shape or round bend is exceedingly simple.

DECIMAL STANDARDS FOR "STEELCRETE" EXPANDED METAL

Designation of mesh	Size of mesh		Sect. in sq. in. per ft. of width	Wt. per sq. ft. in lbs.	Size of standard sheets

Products.

CORRUGATED BARS; CORR-BAR UNITS; SPIRALS;
CORR-PLATE FLOORS; CORR-MESH, a ribbed expanded
metal.

Corrugated Bars.

All bond is mechanical—it is the entering of cement into irregularities in surface of reinforcing material. In smooth bars, such adhesion as takes place is entering of cement into the microscopic surface pores of the metal. This is very small, particularly in small bars, which are somewhat cold rolled, and in which surface pores are of negligible value for this purpose. Furthermore, when working stress of 16,000 lbs. per sq. in. is developed in steel, diameter has been materially reduced; i.e., material when compared to depth of surface pores.

CORRUGATED ROUNDS (PATENTED)

Corrugated Bars are rolled both round and square in cross section and have ridges or corrugations which effect a positive mechanical bond with concrete. Made of medium, intermediate and hard grade steel.

BOND TESTS—Many bond tests on beams under stress, made at different places, have invariably shown the Corrugated Bar to be superior in a marked degree to all other types of reinforcement.

SIZES—The following standard sizes are carried in stock, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$ and 1 in. round; and $\frac{1}{2}$, 1, $1\frac{1}{8}$ and $1\frac{1}{4}$ in. square.

Column Spirals.

Spirals for columns are shop fabricated, made of cold drawn wire with T-section spacers and furnished in any length, in diameters of 10 to 36 in., pitch 1 to 4 in. A large stock is at all times available for immediate shipment.

SPIRALS
FOR
COLUMNS

Corr-Bar Units.

Insure correct reinforcement in accordance with specifications and save much labor cost because only one piece has to be handled instead of fifteen to twenty. Shop fabricated and self-positioning reinforcement for concrete beams and girders. Each unit, representing the entire reinforcement for beam, anchored rigidly together, is made collapsible for shipment, and is opened on the job and set in the form wherein it positions itself.

CORR-BAR UNITS (PATENTED) READY TO PLACE

Corr-Plate Floors.

A 2-way system of reinforcing that has been determined by the Research Department of this company to be scientifically correct and far more economical than any "umbrella" form of reinforcing for a flat slab concrete floor. This Department's extensive laboratory and field tests have proved that in over 90% of the area of the panel, the lines of principal stress are parallel to sides of panel. Corr-Plate floors satisfy these requirements.

In Corr-Plate floors, a cap about 2 in. thick is used around column to take care of stresses which are much greater there, at the same time saving much concrete. Cap can be underneath the floor or, if wood flooring is used, on top, leaving a perfectly smooth ceiling.

Corr-Plate floors save in total height of structure for given clear story heights. Forms and ease of erection are simpler; lighting and ventilation are better. Large savings are effected in cost of sprinkler, shafting, piping, elevators and other installations.

Corr-Mesh.

Corr-Mesh is an expanded metal with integral stiffening ribs connected by a diamond mesh. It is so expanded that no internal stresses are produced in the metal; it is not necessary to handle it carefully in order to avoid splitting, a condition peculiar to the over-expanded products. A protective coating of paint is applied after expansion.

Ribs obviate necessity of studs for partitions, practically eliminate centering for floor and roof construction, and materially reduce amount of light steel framing required for suspended ceilings.

KINDS—There are 2 kinds of Corr-Mesh; one with $\frac{3}{4}$ -in. ribs and the other with $\frac{5}{8}$ -in. ribs. The former is called " $\frac{3}{4}$ -in. Rib Corr-Mesh," the later " $\frac{5}{8}$ -in. Rib Corr-Mesh."

GAGES—Standard sheets of both kinds are made in Nos. 24, 26 and 28 U. S. gages, painted. Other gages can be furnished if required.

General.

Catalogues, detailed information, etc., sent in response to requests on business letterheads.

EXPORT DEPARTMENT: 395 Broadway, NEW YORK, N. Y.

Products.

SELF-SETERING, an Expanded Metal Reinforcement for Concrete, made up of diamond mesh and stiff ribs so that it acts as both form and reinforcement or as lath and stud; **EXPANDED METAL**, the general purpose Reinforcement for Concrete Work; **TRUSSIT**, a patented Reinforcement for Curtain Walls and Partitions, which entirely eliminates the use of studding.

STEEL-TILE and END-TILE: Steel Forms for T-beam Concrete Floors; light, safe, economical.

GF PEDS; **GF STEEL LUMBER**.

HERRINGBONE RIGID METAL LATH, Painted, Galvanized or made from Armco Iron, universally used because of its stiffness; **KEY EXPANDED METAL LATH**.

Cold Rolled Channels, used as a studding for metal lath partitions, as furring for suspended ceilings, cornices, false beams and ornamental plaster work; **Gen-fire Sheet Steel Lath**—in fact, Metal Lath for every purpose for which it can and should be used; **Corner Bead**, carrying a heavy plaster coat for exposed corners; **Reinforced Concrete Construction**; **Machinery Guards**; **Roof Slab Construction**.

For Waterproofings, Dampproofings and Technical Paints, see page 206.

Self-Sentering.

Self-Sentering is a combined reinforcement and form used extensively for floor and roof construction. It is adaptable for solid and hollow walls, light partitions, etc., making possible a light weight, thin slab, built without expensive formwork, and equal in every way to heavy reinforced concrete.

Roofs of any design and pitch can be built with Self-Sentering, requiring little more than the permanent purlins and trusses for centering, and no solid forms at all.

Self-Sentering is an expanded metal sheet of the most effective form—the diamond mesh, with a series of cold rolled ribs, $\frac{1}{16}$ in. high spaced $3\frac{3}{8}$ in. on centers, which act as stiffeners.

The ribs carry the weight of the concrete till set; the diamond mesh forms a perfect bond for the concrete and with the ribs carries the tension in the slab.

SIZES—Sheets are 29 in. wide and can be furnished in foot lengths varying from 4 to 12 ft. Long

SELF-SETERING

Expanded Metal Reinforcement.

Expanded metal, made by expanding sheets of steel into elongated diamond shape mesh, has greater reinforcing strength, pound for pound, than any other material. It can be cut and expanded to a great variety of sizes adapted for particular classes or sizes of work.

The larger mesh is used for concrete reinforcement in construction of floors, roofs, sidewalks over basements, bridge decks, retaining walls, sewers, conduits, tanks, reservoirs, etc. Smaller mesh widely used in lighter cement work and for railings, window guards, machinery guards, elevator and tool room enclosures.

Style 3-10-176
(3-in. mesh, No. 10-gauge, .176 sq. in. sectional area), illustrated, is the type most commonly used for general work.

Descriptive matter covering complete line of large and small meshes will be mailed on request.

Trussit.

Trussit is an expanded steel reinforcement which is particularly adaptable to the construction of light, fireproof walls and partitions from 1½ to 3 in. thick; also, of solid and hollow walls, curtain walls, elevator enclosures, small individual structures or offices in a larger building, wherever a fireproof, soundproof partition is required.

Trussit eliminates the usual studding, a few temporary braces being required only till the plaster coat on one side is set. Sheets are attached to floor and ceiling with expanded metal angles that render them free from vibration and the danger of cracking.

Trussit is uniformly expanded in both directions. This makes it possible to plaster upon each side exactly alike; and when the wall is set, steel and concrete are so uniformly distributed that expansion or contraction stresses in any direction are met by the Trussit reinforcement.

Stocked in sheets 8, 10 and 12 ft. long; sheets uniformly 19 in. in width. Furnished painted, galvanized or made from Armco (American Ingot) Iron.

24	.83 lb.	.88 lb.

Steel-Tile and End-Tile.

GF Steel-Tile are simply light weight steel forms for concrete floors, designed on the well-known T-beam principle—deep reinforced joists and thin connection slabs of concrete.

One of the advantages of Steel-Tile construction is its substantial reduction in weight. Lazy concrete is reduced to the minimum, saving a good percentage of the load upon girders, columns, foundations and footings, and permitting a lighter construction throughout.

GF Steel-Tile make the old expensive, solid form work unnecessary. Centering along the line of joists, which are 25 in. apart, is sufficient. This closes the only opening and prevents leakage when concrete is poured.

Cost of transporting and handling Steel-Tile is much less than that of terra cotta tile, which involves the same principle of construction, and there is no loss due to breakage. Steel-Tile are adaptable in such structures as schools, hotels, office buildings,

GF STEEL-TILE

department stores, apartments, warehouses, lofts, etc. Wherever long spans are required, GF Steel-Tile construction will be found most economical.

Flat ceilings are easily constructed under Steel-Tile floors. The most dependable method is illustrated. Another is to lay Herringbone lath directly on forms before setting Steel-Tile and pouring concrete. Suspended ceilings are built upon hangers suspended through joists before concrete is poured.

GF END-TILE

CEILING CONSTRUCTION UNDER GF STEEL-TILE, GF CHANNELS AND HERRINGBONE

GF Steel-Tile with End-Tile to match are made of corrugated steel in sizes and weights shown below. A complete Steel-Tile Handbook mailed on request.

GF Peds.

GF Peds are a new GF product, covered by basic spot ground patents, manufactured and sold exclusively by THE GENERAL FIREPROOFING Co. They are used for attaching wood and metal trim to walls and screeds to floors. A Ped consists of a nailing block of wood forced into a circular metal plate. The old-fashioned methods of grounding are eliminated by the use of GF Peds. GF Peds are fastened to walls, floors and beams with a little plaster.

Wall Peds afford a firm foundation for attaching plumbing fixtures, hand rails, telephone boxes, electrical fixtures, and for putting up composition wall or plaster board over masonry walls.

Floor Peds anchor screeds or sleepers to the floor, and eliminate all bracing, wedging and shimming.

Peds not only save a great deal of labor over the old method of laying floors, but also afford more satisfactory results than can possibly be obtained in any other way.

GF PEDS

GF Steel Lumber.

GF Steel Lumber for floor or partitions gives the most economical type of fireproof construction.

GF Steel Lumber is manufactured in a variety of sizes and shapes to meet all conditions. Steel joists are made for all requirements of span and loading, and are cut to exact length and fabricated, when necessary, ready to place in position.

Steel studs are cut exactly and are "pronged" for the attaching of metal lath.

No forms or temporary supports are required and

GF STEEL LUMBER SECTIONS

the light weight of the sections facilitates ready handling and placing in the building.

All GF Steel Lumber sections are manufactured from a special grade of steel, formed cold into sections giving the best possible distribution of the metal. GF Steel Lumber studs or joist sections can be furnished in any desired length up to 100 ft. without splicing. All joist sections formed from two special channel sections, electrically spot-welded together.

For floors in schools, offices, hotels, apartments, residences, and similar structures, GF Steel Lumber gives fire resistive construction that is light in weight and which is erected more quickly and more economically.

GF Steel Lumber construction is absolutely durable and permanent. It is soundproof and verminproof and will not warp, twist or shrink as does wood. Plaster ceilings and walls on GF Steel Lumber and Herringbone rigid metal lath, are absolutely free from cracks as is a cement or terrazzo floor supported by it.

GF Steel Lumber may be supported by bearing walls or by steel or concrete beams.

Joists are placed with speed and accuracy and are covered with Herringbone rigid metal lath which supports 1½ or 2 in. of concrete, in which sleepers for the finish wood floor may be embedded.

Herringbone rigid metal lath attached to the underside of joist section by prongs punched therein, forms the ideal base for a permanent crack-free ceiling.

GF STEEL LUMBER BEAM AND GIRDER CONSTRUCTION

Herringbone Rigid Metal Lath.

The lath that is universally recognized as best wherever metal lath is known. Stiff ribs running full length of sheets and set at an angle of 45° make Herringbone rigid and strong. It is easily handled, quickly put up, and does not sag nor buckle under plasterer's trowel.

Heavy strands connect the ribs and are so flattened that, instead of cutting the plaster, they curl it around, completely enveloping the metal. A perfect key is the

result, and with the lath entirely covered there is no danger of rusting. As a further precaution where salt air or industrial gases are present, Herringbone can be furnished galvanized or made from Armco (American Ingot) Iron.

There is the minimum of waste in erecting Herringbone, for the end laps are short and easily wired; while, on the side, one rib interlocks with the other, making the surface even stronger at the joint than elsewhere.

Style "BB" Herringbone is standard for practically any class of work. Sheets are 20¼ by 96 in.; mesh 7/32 by 1¼ in.; 15 sheets (22½ sq. yds.) to the bundle.

Style "AAA" Herringbone has heavier ribs and strands than Style "BB," which make it a stiffer lath throughout and permit a wider spacing of studs (see table below) or the use of a lighter gauge lath over usual distance between studs. "AAA" Herringbone will be found more satisfactory for ceiling work, and will give uniform satisfaction for partitions, interior and exterior walls.

Sheets are 18 by 96 in.; mesh 3/32 by 1¼ in.; 15 sheets (20 sq. yds.) to the bundle.

HERRINGBONE "BB" EXPANDED METAL LATH (PATENTED)

WORKS

INDIANA HARBOR, IND.

CHICAGO HEIGHTS, ILL.

Products.

OPEN HEARTH STEEL INLAND DEFORMED, PLAIN SQUARE, ROUND and FLAT CONCRETE REINFORCING BARS; RAIL CARBON STEEL INLAND DEFORMED, PLAIN SQUARE, ROUND and FLAT CONCRETE REINFORCING BARS.

Facilities.

Manufacture, from mining of iron ore to finished products, enables this company to guarantee quality, according to standard specifications or special arrangements. Riehle 200,000-lb. testing machine at service of patrons, at both works, for making tests; also complete bending facilities. Rolling capacity, 500 tons per day.

Inland Deformed Bars.

Rolled from open hearth billets, medium or hard grade, and rail carbon steel, rerolled; $\frac{3}{8}$ to $\frac{5}{8}$ in. with single row of stars, and $\frac{3}{4}$ to $1\frac{1}{4}$ in. with double row of stars on each side. Corners rounded to prevent splitting of concrete. The mechanical bond is theoretically correct and ample.

Lengths up to 85 ft. can be furnished without extra charge.

INLAND DEFORMED BARS

Plain Open Hearth Steel Bars.

Open hearth steel square, round and flat bars are furnished in soft, medium (structural grade) or high carbon (hard grade) from new billets. Flats are made in all sizes, squares and rounds as per table herewith. All subject to Manufacturers' Standard Specifications.

Rail Carbon Steel Concrete Reinforcing Bars.

Made in Inland deformed, $\frac{3}{8}$ to 1 in.; plain squares, $\frac{3}{8}$ to 1 in.; rounds, $\frac{3}{8}$ to $1\frac{1}{4}$ in.; flats, all sizes.

Conforming to the Manufacturers' Standard Specifications for hard grade and to the American Society for Testing Materials Specifications.

Elastic limit 50,000 lbs. or over per sq. in. Prices on this material somewhat lower than on open hearth steel bars.

The reheating and rerolling of this material improves its quality—a fact well known.

Manufacturers of Steel Lumber Sections

MASSILLON, OHIO

Products.

STEEL LUMBER SECTIONS consisting of JOISTS and STUDS for Fireproof Building Construction.

Sizes and Capacity.

Special analysis and alloy strips and plates, widths 3-in. to 24-in. (below 8-in., edges sheared)—gauge 1-in. to .065—armor plate.

National steel lumber sections are made from National quality strip steel in lengths up to 100 ft. The process of manufacture is such as to insure uniformity and an ultimate tensile fiber stress exceeding 64,000 lbs. per sq. in.

STEEL JOIST FLOOR CONSTRUCTION
Supported by rolled steel beam and resting on shelf angle

Construction Details.

Nailing blocks and metal lath are secured to top of joists with 12d nails driven into webs of joists.

Bridging is secured to joists in a similar manner.

Metal lath is attached to underside by means of prongs, as illustrated in cuts, or by wiring with No. 18-gauge tie wire through holes punched in flanges of joists, or by means of specially designed clips or fasteners.

STRUCTURAL STEEL COLUMNS AND BEAMS SUPPORTING STEEL JOIST FLOOR PANEL

The concrete fill applied on metal lath for fireproofing purposes can be of 1: 2½: 5 mixture composed of sand, cement and gravel, or a standard cinder concrete fill.

The mixture should be comparatively dry and applied without forms or supports of any kind—the metal lath being amply rigid to carry the weight of the concrete fill.

Where concrete finish is desired as shown in illustration, wood nailing strips are eliminated and concrete fill of 2-in. thickness is applied continuously over joists. The finished surface should be approximately ½ in. thick, of proper mixture and application as employed in standard practice.

STEEL JOIST CONSTRUCTION
• With steel stud hollow partition

Distribution.

National steel lumber sections are marketed through steel fabricators. The result is an opportunity for close co-operation in designing and prompt deliveries.

Handbook.

The National Steel Lumber Handbook gives complete information. Copy may be obtained through local steel fabricators or direct from THE NATIONAL PRESSED STEEL CO.

PAUL J. KALMAN COMPANY

Reinforcing Steel

Merchants National Bank Building
ST. PAUL, MINN.

DISTRICT SALES OFFICES

CHICAGO, ILL.

MILWAUKEE, WIS.

OMAHA, NEBR.

MINNEAPOLIS, MINN.

WAREHOUSES AND SHOPS: CHICAGO, ILL., ST. PAUL AND MINNEAPOLIS, MINN.

Products and Services.

DEFORMED or PLAIN REINFORCING BARS, in Structural, Intermediate or Hard Grade rolled from new billet stock; COLD TWISTED SQUARE REINFORCING BARS; MACHINE MADE COLUMN SPIRALS.

Also Woven Wire Concrete Reinforcement.

Fabricating.

Modern machines afford the most complete facilities for bending and fabricating in the shops, and enable the company to do this work economically and without delay. Column spirals supplied completely fabricated with spacers.

Quality of Materials.

All reinforcement is rolled from the best quality new-billet steel; our years of experience having proved this the best quality for the purpose.

Deliveries.

Large and complete stocks of reinforcing bars, in lengths up to and including 60 ft., are carried in the warehouses at Chicago and the Twin Cities, from which immediate delivery can be made. Where delivery is not so urgent, shipment is made promptly from our mills. A wide reputation has been established for good service and for ability to ship as promised.

Recent Installations.

The structures listed below were all built with re-

inforcing steel furnished by PAUL J. KALMAN COMPANY.

Armour & Co., new Packing Plant, 22 buildings, South St. Paul, Minn.

U. S. Army General Hospital, Chicago, Ill.

St. Paul Public Library, St. Paul, Minn.

Plankinton Arcade Building, Milwaukee, Wis.

Y. M. C. A. Building, Minneapolis, Minn.

Aviation General Warehouse for U. S. Government, Little Rock, Ark.

James S. Kirk & Co., Soap Factory, Chicago, Ill.

Wisconsin-Minnesota Light & Power Co., Reinforced Concrete Dam and Power Plant, Wisconsin, Minn.

Picric Acid Plant for U. S. Government, Grand Rapids, Mich.

Midland Packing Co., Packing Plant, Sioux City, Iowa

Army Supply Base for U. S. Government, New Orleans, La.

Southwestern Milling Co., Kansas City, Kans.

Laclede Gas Light Co., addition for U. S. Government, St. Louis, Mo.

Ford Motor Co., Sales and Assembly Building, Minneapolis, Minn.

Crane & Co., Building C-4 and B-2 Extension, Chicago, Ill.

Cockran-Hill & Co., Packing Plant, Baltimore, Md.

Court Avenue Bridge, Des Moines, Iowa

Armour & Co., Ice Manufacturing Plant, Beef Cooler, Meat Loading Dock, South Omaha, Nebr.

Buildings for Philadelphia Quartz Co., Berkeley, Cal.

Pennsylvania Railroad Co., Northern Central Elevator, Baltimore, Md.

Eastern Michigan Power Co., Junction Dam and Power Plant, Wellston, Mich.

City National Bank Building, Shreveport, La.

Maxwell Motor Sales Corp., Sales and Assembly Building, Minneapolis, Minn.

Railroad Building, St. Paul, Minn.

COURT AVENUE BRIDGE OVER DES MOINES RIVER, DES MOINES, IOWA, SHOWING COMPLETE STRUCTURE

GENERAL OFFICES
407 South Dearborn Street
CHICAGO, ILL.

CODE ADDRESS:
"KNOBURN"

BRANCH OFFICE: BOSTON, MASS.

WORKS: CHICAGO, ILL., JEANNETTE, PA.

Products.

The NEMCO LINE of EXPANDED METAL PRODUCTS includes T-Rib Chanelath and the following Flat or Plastering Laths: Kno-Burn, Eureka, XX Century, Pure Iron, P.O. Special, Diamond Mesh; also these Self-Furring Laths: Corrugated, and Kno-Fur.

ECONO DIAMOND MESH HEAVY EXPANDED METAL for Concrete Reinforcement, Machine Guards, etc.

NEMCO PRESTEEL LUMBER.

Nemco and Econo Sheathing Laths (mesh with waterproof felt backing).

Metal Lath Accessories: Corner Beads, Picture Mould, Base Screed, Base Ground, Tie Wire, Cold Formed Channels.

Nemco Products
TRADE-MARK

Stocks Carried in All Principal Distributing Points; Catalogues and Samples.

Stocks of Nemco Products are carried by selling agents located in all principal cities. Catalogues containing specifications and full details will be furnished on request, also samples. Our Engineering Department will be also glad to co-operate with anyone interested in the most effective and economical use of our products.

T-Rib Chanelath.

A combined form and reinforcement of expanded metal for concrete slabs of moderate spans and loads, such as roofs, floors, walls, tanks, culverts. Chanelath is also much used as a skeleton for solid plastered partitions, and as a plastering lath in suspended ceilings, furred walls, etc. It is furnished in 3 gauges: Nos. 24, 26 and 28.

The T-ribs (the flange of which provides a positive mechanical bond) are 4 in. apart, and $\frac{7}{8}$ in. high. They are connected by expanded metal having a small diamond mesh $\frac{3}{4}$ by $\frac{3}{8}$ in. of the popular Kno-Burn type, with no break in the key at the ribs. The rigidity of Chanelath and the large size of the sheets save time and labor in erection.

T-RIB COVERED COMPLETELY BY CONCRETE

Note knobs of concrete which have passed through mesh protecting underside of T-Rib

T-RIB CHANELATH

There are no projections to catch the trowel

T-RIB CHANELATH
Notice the shaping of the ribs

CURVED CHANELATH

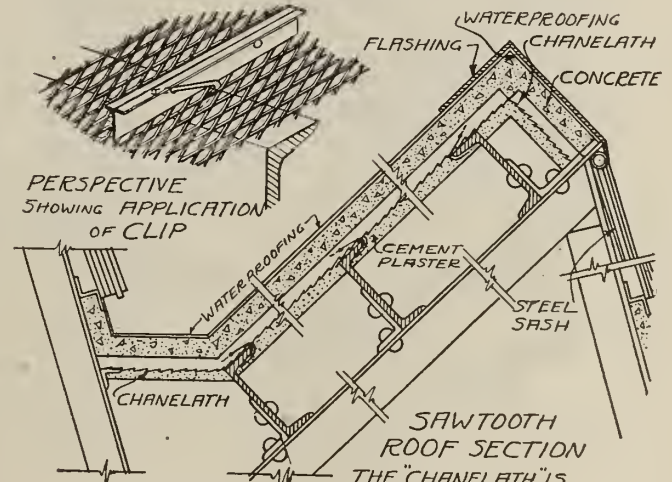

SHOWING CROSS SECTION

SHOWING LONGITUDINAL SECTION OF RIB OF "CHANELATH."

CROSS SECTION AND LONGITUDINAL SECTION OF RIB OF CHANELATH

THE "CHANELATH" IS CLIPPED TO PURLINS AS SHOWN ABOVE. CONCRETE IS POURED ON UPPER SIDE TO REQUIRED THICKNESS. (2" TO 4") THE UNDER SIDE IS PLASTERED WITH $\frac{1}{2}$ " TO $\frac{3}{4}$ " THICK COAT OF PLASTER.

CHANELATH CONSTRUCTION ON SLOPING ROOF

SIZES—Chanelath comes in sheets 4 in. to 4 ft. wide by 4-in. intervals; the 2-ft. size is most popular. Lengths vary from 3 to 12 ft. by 1-ft. intervals. Other lengths can be furnished to order.

T-Rib Chanelath can be furnished flat or curved (rib side out) to a minimum radius of 24 in. Dimensions shown in the cut or the equivalent should be furnished.

"Formless Concrete Construction" contains full information for the use of T-Rib Chanelath, designing tables, erection data, etc. Send for copy.

Specifications for use of Chanelath gladly sent on request.

WEIGHTS AND AREAS OF T-RIB CHANELATH

Size	Weight, painted, per sq. ft., lbs.	Weight, crated, per sq. ft., lbs.	Effective sectional area per ft. of width, sq. in.
28	.56	.70	.152
26	.67	.82	.183
24	.89	1.07	.244

Chanelath is furnished painted only.

DETAILS OF VARIOUS TYPES OF CONSTRUCTION

Econo Expanded Metal.

An economical and highly satisfactory diamond mesh concrete reinforcement for all types of reinforced concrete structures. Econo is expanded from sheets of high grade open hearth mild steel. The process of expansion increases the tensile strength and ductility, rendering high working stresses safe. (New York and Boston building codes permit 20,000 lbs. per sq. in.) The diagonal strands integrally connected at intersections most effectually distribute concentrated loads.

ECONO EXPANDED METAL REINFORCING

The use of this material insures accurate location of reinforcement and perfect bond and the large area placed at one time lowers labor cost. Econo is furnished in a great variety of sizes, cross section areas, and meshes.

The smaller meshes ($\frac{1}{2}$ to $2\frac{1}{4}$ in.) are in demand for machine guards, tool room partitions, etc.

Full details in handbook, "Designing Data," sent on request.

PARTIAL LIST OF STOCK SIZES AND WEIGHTS OF ECONO REINFORCING

*No. Size	Weight per sq. ft., lbs.	Mesh and gauge	Widths, ft.	Lengths, ft.
06-3	.20	3"-16 ga.	3, 4, 6	6, 8 and 12
10-3	.34	3"-12 "	3, 4, 6	6, 8 and 12

10-1½	.34	1½"-16 ga.	3, 4, 6	6, 8 and 12
15-1	.51	1½"-14 "	3, 6	6, 8 and 12
20-1½	.68	1½"-12 "	3, 4, 6	6, 8 and 12
15-¾	.51	¾"-16 ga.	3'-6", 7	6, 8 and 12
23-¾	.85	¾"-12 "	3, 4, 6	6, 8 and 12
20-1½	.68	1½"-18 ga.	3'-6", 4'	8 only
24-½	.82	½"-16 "	4'-8"	8 only

*The number of the size of product may be explained thus, for example: No. 15-3 has .15 sq. in. of steel in each 12 in. of width of the material; mesh is 3 in. wide.

Special sizes made to order

Nemco Presteel Lumber.

Presteel Lumber is a recent addition to the Nemco line. It consists of channel and I-sections of cold rolled steel in 4-, 5-, 6-, 7-, 8-, 9- and 10-in. sizes.

Presteel Lumber is designed to provide a fireproof construction lighter than any other type and at cost very little higher than that of inflammable construction. It is used as framing (joists, studs, etc.) in any type of building. The large illustration gives an excellent idea of the general construction.

Used in connection with other Nemco products, expanded metal lath, Chanelath, etc., it provides a structure that is moderate in cost, fireproof, permanent; the walls and ceilings of this type of building will not streak nor discolor and cracks in the plaster are prevented. Rats and mice, of course, are absolutely stopped by the barriers of steel, either lath or Presteel Lumber.

Construction details have been worked out so simply that untrained workmen with ordinary hand tools can erect Presteel Lumber properly and rapidly. Factory fabrication minimizes cutting or fitting on the job. There are fewer pieces to be handled than in any other construction material.

Presteel Lumber can be erected regardless of weather conditions, as the finished portions of the building need not be installed until after the walls and roof have been completed, thus providing enclosure and protection.

Convenient accessories have been devised, all of which are fully described in the Presteel Manual sent free on request. Full designing and construction information is also furnished in the Manual.

Stocks of Presteel Lumber are carried at convenient distributing and fabricating centers in principal cities throughout the country.

Our own Engineering Department, or the Engineering Departments of fabricators will gladly give information on any point desired.

GENERAL ILLUSTRATION OF FLOOR, WALL AND PARTITION CONSTRUCTION

Expanded Metal Lath.

KNO-BURN—A practical and economical base for stuccoing or interior plastering, etc., also used for protecting concrete columns, fireproofing the enclosures about elevator shafts, beltways, etc., in mill construction. The diamond shaped meshes or openings are $\frac{3}{8}$ by $\frac{3}{4}$ in. with strands $\frac{1}{16}$ in. wide. Furnished in Nos. 24, 25, 26 and 27 gauge. Stock size of sheets 18 by 96 in. Special size 24 by 96 in. can be furnished if desired.

KNO-BURN EXPANDED METAL LATH

STOCK SIZES AND WEIGHTS OF KNO-BURN LATH

Number	Sheets per bundle	Yards per bundle	Weight per yard, lbs.	Weight per bundle, lbs.
27-gauge	9	12	2.3	28
26-gauge	9	12	2.5	30
25-gauge	9	12	3.0	36
24-gauge	9	12	3.4	40.8

Regular size of sheets, 18 x 96 in.
Special size, 24 x 96 in., 16 yds. per bundle, can be furnished.
All gauges furnished painted.

XX CENTURY—An expanded metal lath similar in size and shape of mesh to Kno-Burn but cut from a special copper bearing sheet and protected by a special carbon paint. Recommended for use with patent plasters or for use in damp climates. Furnished in the same sizes and weights as Kno-Burn.

Corrugated Expanded Metal Lath.

A self-furring plastering lath furnished in either the Kno-Burn, XX Century, or Eureka types of mesh.

CORRUGATED EXPANDED METAL LATH

Kno-Fur Expanded Metal Lath.

A self-furring lath and furnished in 2 styles—Kno-Fur Special, having the Eureka mesh and cut from standard steel sheets, and Kno-Fur Regular, having the Kno-Burn mesh but cut from special acid resisting copper bearing sheets.

Service.

Owing to the wide range of detail of these products and the value of the technical experience of the company, it is suggested that engineers and architects avail themselves of the service offered by our corps of engineers that is at all times ready to furnish suggestions, estimates and details.

The following is necessarily only an outline of products and not an attempt to suggest their wide application and extensive use.

Kahn Trussed Bars.

Open hearth steel, concrete beam, girder, floor and arch reinforcement. Unit bars with 45° rigid diagonals formed from flanges on the main body producing 12% to 30% stronger beams than loose stirrups; save steel in design, labor in installation; safe; strong; fireproof and shockproof.

1.563	$1\frac{1}{4}$ " Square	5.41

SQUARE RIB BAR

ROUND RIB BAR

Floretyles and Floredomes.

FLORETYLES—Rows of specially formed steel tiles, separated by reinforced concrete joists, covered with thin layers of concrete, produce strong, deep, light weight, flat ceilings on long spans; require but inexpensive centering and are soundproof. Accuracy of spacing assured by special spacer-chairs. $\frac{3}{8}$ in. Hy-Rib used for ceilings. Furnished in 2 types: (1) ribbed with deep stiffening ribs across top, corrugated sides, rounded corners, corrugated flanges; (2) corrugated with deep corrugations extending completely around tile, with corrugated flanges.

RIBBED STEEL FLORETYLES

Approximate width at base, $20\frac{1}{2}$ in.; standard lengths, 3 and 4 ft.; standard heights, 6, 8, 10 and 12 in.

Corrugated Steel Floretyles—

Approximate width at base, $20\frac{1}{2}$ in.; standard lengths, 2 ft. $4\frac{1}{2}$ in. and 3 ft. 9 in.; standard heights, 6, 8, 10 and 12 in.

CORRUGATED STEEL FLORETYLES

FLOREDOMES—Closed and with reinforcements, on four sides, carrying load in two directions to support.

Hy-Rib.

A reinforcement obtained by shearing and pressing sheet steel, making a unit of lath and stud. The ribs eliminate forms and save studs in concrete and plaster work, reducing cost and simplifying construction, saving labor, time and expense. Used in construction of floors, roofs, walls, sidings, partitions, ceilings, furring, tanks, sewers, culverts, conduits, etc.

SAFE LOADS IN POUNDS PER SQUARE FOOT FOR SLABS REINFORCED WITH HY-RIB

(Safe loads include weight of slab. For safe live loads, deduct weight of slab)

B. M. = $\frac{1}{10} w l^2$ For B. M. equals 1/12 w l² add 20% to loads.

For B. M. equals 1/8 w l² deduct 20% from loads.

1-A HY-RIB LATH

STANDARD RIB LATH

DETROIT AND UNIVERSAL DIAMOND LATH

Truscon Structural Pressed Steel.

A light weight, fire resisting construction consisting of pressed steel beams and studs combined with Hy-Rib metal lath for floors and walls. Ideal for light occupancy buildings such as stores, apartments, hotels, hospitals, institutions, residences, etc. Simple to erect, soundproof, verminproof and economical in cost. Sections furnished in a large variety of shapes, sizes, and gages. Prongs on flanges for attaching Hy-Rib.

I-BEAM
3, 4, 5, 6, 7, 8, 9, 10 and 12 in.CHANNELS
3, 4, 5 and 6 in.CAPS AND SILL PLATES
For studs of 2, 3, 4, 5, and 6 in.H STUD
3, 4, 5 and 6 in.CHANNEL STUD
2, 3, 4, 5 and 6 in.CHANNELS
3/4, 1, 1 1/2 and 2 in.HOLLOW STUD
2, 3 and 4 in.**Truscon Inserts.**

Used in concrete slabs, beams or columns for attaching shaft hangers, fixtures, sprinkler systems, etc. Obviate expensive drilling into concrete in finished building. Built into concrete during process of construction by merely fastening them to wood centering. The concrete thoroughly embeds insert and holds it rigidly in place. Only narrow slot flush with concrete is seen in completed work.

TRUSCON SLOTTED INSERT
Standard lengths, 18, 24, 36 and 60 in.TRUSCON ADJUSTABLE INSERT
1/2, 5/8 and 3/4 in.TRUSCON TAPPED INSERT
1/2, 5/8 and 3/4 in.**Rib Metal.**

A unit reinforcement, equivalent to a large number of separate bars. Provides perfect cross reinforcement against temperature and shrinkage strains.

Truscon Expanded Metal.

All types and weights of diamond mesh reinforcement for concrete roads, floors, walls, roofs, pavements, etc.

TRUSCON EXPANDED METAL

Truscon Wire Mesh.

A superior reinforcement for concrete roads; furnished either in rolls with 18-in. core or in flat sheets cut to length; various weights.

TRUSCON WIRE MESH

Truscon Contraction Joint.

Used in concrete roads to form a plane of weakness for joint. Plates beveled to crown of road and doweled to provide stiffness.

TRUSCON CONTRACTION JOINT

Truscon Armor Plate.

Protects the expansion joints in concrete pavements.

TRUSCON ARMOR PLATE

Truscon Curb Bars and Edge Protectors.

Protects corners of concrete construction. Unit of protecting plate and positive anchorage. Furnished in 2 sizes, either straight or curved.

TRUSCON CURB BAR

PHILADELPHIA OFFICE, 417 Widener Building

Products.

CONCRETE REINFORCING BARS: Witherow Deformed Bars (Patented); Plain Round, Plain Square, Square Twisted Bars.

COLLAPSIBLE SPIRALS.

Engineering Co-operation.

This company maintains a large engineering organization devoted entirely to furnishing assistance to architects, engineers and contractors.

Lump sum quotations are given, including reinforcing bars, Wiscoforms and ceiling materials, together with detailed working drawings, showing location of all Witherow materials in the structure.

Quick Shipments.

Large stocks are constantly on hand ready to ship from warehouses in Pittsburgh and New York.

An efficient traffic department insures speediest possible delivery.

Inquiries are sought and promptly answered.

Fabrication.

The WITHEROW STEEL COMPANY is equipped with the most modern labor and cost saving machinery for bending.

Spirals are shipped fabricated and collapsed.

Witherow Deformed Bars.

Superior points are:

(1) Round corners which prevent cracking of concrete.

WITHEROW DEFORMED BAR

- (2) Uniform cross section.
- (3) Maximum bond.

Plain Round, Square and Square Twisted Bars.

These bars are rolled in sizes from 3/8 to 1 1/4 in., according to standard specifications of the American Society for Testing Materials for concrete reinforcing bars.

THE YOUNGSTOWN PRESSED STEEL COMPANY

Manufacturers of Metal Lath, Expanded Metal and Channels

YOUNGSTOWN, OHIO

Products.

METAL LATH; EXPANDED METAL REINFORCING;
COLD FORMED CHANNELS.

Also, Corner Bead; Prong Lock Studding; Crimped Furring; Pressed Metal Stampings.

Ideal Metal Lath.

The highest grade of metal lath manufactured. Exceedingly rigid, has a wide strand, meets United States Government specifications and affords a firm and solid base for plastering.

Owing to the peculiar formation of the mesh, it does not shear the plaster and is therefore an economical lath to use.

Furnished in steel painted, iron alloy or galvanized, in the following weights and gages:

Gage	Size of sheet	Weight per sq. yd.	Sheets per bundle	Yards per bundle
No. 22	21" x 97"	5.00 lbs.	9	14
No. 24	21" x 97"	4.00 lbs.	9	14
No. 25	21" x 97"	3.50 lbs.	9	14
No. 26	21" x 97"	3.00 lbs.	9	14

IDEAL METAL LATH

Youngstown Metal Lath.

Particularly recommended for exterior stucco work.

A corrugated lath manufactured from the best grade of open hearth sheets.

The transverse corrugation, together with the extra wide strand, makes this material exceedingly rigid.

Furnished in the following weights and gages:

Gage	Size of sheet	Weight per sq. yd.	Sheets per bundle	Yards per bundle
No. 24	21" x 97"	4.00 lbs.	9	14
No. 26	21" x 97"	3.00 lbs.	9	14

YOUNGSTOWN METAL LATH

Mahoning Metal Lath.

Mahoning lath as shown in the illustration has a small mesh. This insures the use of a minimum of plaster and complete embedding of steel in plaster.

The formation of the mesh is perfect and provides an excellent key, every strand becoming thoroughly embedded in the plaster.

Furnished in steel painted, iron alloy or galvanized, in the following weights and gages:

Gage	Size of sheet	Weight per sq. yd.	Sheets per bundle	Yards per bundle
No. 22	21" x 97"	3.40 lbs.	9	14
No. 22½	21" x 97"	3.33 lbs.	9	14
No. 23	21" x 97"	3.10 lbs.	9	14
No. 24	21" x 97"	2.75 lbs.	9	14
No. 25	21" x 97"	2.40 lbs.	9	14
No. 26	21" x 97"	2.10 lbs.	9	14

MAHONING METAL LATH

Sharon Cold Formed Channel.

Formed cold of best quality open hearth steel, producing an exceptionally straight and very rigid channel. Can be bent into the most difficult shapes for furring without the steel fracturing.

Manufactured in the following sizes:

Gage	Size	Weight per 1000 lin. ft.	Size of flange
16	¾"	276 lbs.	¾"
16	⅝"	304 lbs.	⅝"
16	1"	332 lbs.	1"
16	1¼"	381 lbs.	1¼"
16	1½"	456 lbs.	1½"
16	1¾"	539 lbs.	1¾"
18	1¾"	458 lbs.	1½"
16	2"	580 lbs.	2"
16	2"	635 lbs.	1½"

SHARON COLD FORMED CHANNEL

Sharon channels have been accepted by the best architects.

Copy will be furnished of Robert W. Hunt & Company's test on ¾-in. channel for furring and 1-in. channel for carrying bars in suspended ceiling construction.

Stock lengths, 12, 14, 16, 18 and 20 ft.; 22-ft. lengths can be furnished on special orders.

Sharon Perforated Cold Formed Channels.

Perforation 4-in. on centers. A very substantial, as well as economical, hollow metal lath partition can be erected with Sharon perforated channels. Much lower in price than a double row of 3/4-in. channels, and can be erected for half the cost.

Perforations permit the erector to tie metal lath on either side with ease.

Manufactured in the following sizes:

Gage	Size	Weight per 1000 lin. ft.	Size of flange
16	1 1/2"	456 lbs.	3/4"
18	1 7/8"	458 lbs.	1/2"
18	2"	479 lbs.	1/2"
18	2 1/4"	521 lbs.	1/2"
18	2 1/2"	562 lbs.	1/2"
18	3"	626 lbs.	1/2"
18	3 1/2"	729 lbs.	1/2"

SHARON PERFORATED COLD FORMED CHANNELS

For wall and column furrings, thin partitions, carrying bars and furring strips for suspended ceiling.

Stock lengths, 12, 14, 16, 18 and 20 ft.; 22-ft. lengths can be furnished on special orders.

Shipped in bundles of convenient size.

The Youngstown Pressed Steel Company's Expanded Metal.

Expanded metal made by THE YOUNGSTOWN PRESSED STEEL COMPANY is a product of the very highest grade. This material, unlike other expanded metal, is formed at a single operation, without waste, the process lending strength and tenacity to the finished product. Particular attention is called to the "tie" of the diamonds (that part where meshes join one another) as shown in the illustration. In Youngstown expanded metal the "tie" is exceptionally wide, is not "scored"

YOUNGSTOWN EXPANDED METAL

and the material can not be broken at this point. The size of diamond, together with the thicknesses and widths of strands, can be varied to fit the purposes for which the expanded metal is intended.

The table shows the standard, most called for styles and sizes:

Style			Compa-rative gage	Standard sizes	
Diamond	Sectional area	Weight per sq. ft.		Widths	Lengths
3	.059	.20 lbs.	16	3', 5', 6'	6', 8', 10'
3	.082	.28 lbs.	12	3', 5', 6'	6', 8', 10'
3	.115	.39 lbs.	12	3', 5', 6'	6', 8', 10'
3	.130	.44 lbs.	12	3', 5', 6'	6', 8', 10'
3	.147	.50 lbs.	10	3', 5', 6'	6', 8', 10'
3	.162	.55 lbs.	10	3', 5', 6'	6', 8', 10'
3	.179	.61 lbs.	10	3', 4', 5', 6'	6', 8', 10'
3	.251	.85 lbs.	10	3', 5', 6'	6', 8', 10'
3	.274	.93 lbs.	10	3', 4', 5', 6'	6', 8', 10'
3	.324	1.10 lbs.	10	3', 5', 6'	6', 8', 10'
3	.377	1.28 lbs.	10	3', 4', 5', 6'	6', 8', 10'
2 1/4	.089	.30 lbs.	16	5'-4"	6', 8', 10'
2 1/4	.155	.52 lbs.	12	4'-4"	6', 8', 10'
1 1/2	.108	.36 lbs.	16	5'-3"	6', 8', 10'
1 1/2	.179	.61 lbs.	12	3', 4', 5', 5'-3", 6'	6', 8', 10'
1	.084	.29 lbs.	18	3', 6'	6', 8', 10'
1	.162	.55 lbs.	16	5'-3"	6', 8', 10'
1	.206	.70 lbs.	12	5'-3"	6', 8', 10'
1/2	.226	.76 lbs.	18	3'-6"	6', 8'

There are many construction jobs which require expanded metal of a desired sectional area in square inches per lineal foot of width of finished product, or a desired weight per square foot of finished product different from the standard styles above listed.

THE YOUNGSTOWN PRESSED STEEL COMPANY has special facilities for making expanded metal in 3 by 7-in., 2 1/4 by 5-in., 1 1/2 by 3-in., 1 by 2 1/8-in. and 1/2 by 1 3/16-in. meshes in practically any sectional area or weight per square foot desired for some specific purpose. The facilities are such that a minimum amount of delay is caused by such special orders, as mill connections permit the securing of steel, from which this material is expanded, on very short notice. The company will cheerfully cater to the architect's or engineer's desire for a special expanded metal for a special purpose.

Estimates of cost for the finished product will be gladly furnished; the only information necessary is the size of diamond desired, and the sectional area or weight per square foot, or both.

It may be pertinent to say that the steel used in the manufacture of Youngstown expanded metal is a special analysis soft steel of high tensile strength which enables the raw material to be expanded into the desired diamonds or meshes without danger of fracturing the strands, thus giving perfect material of full relative strength.

Youngstown expanded metal is especially adapted for reinforcing floors in buildings or bridges designed to carry heavy loads, and is largely used in reinforcing conduits, tanks, reservoirs, retaining walls, roofs, sidewalks, roads, etc.

THE DONLEY BROTHERS COMPANY

Manufacturers of Concrete Inserts

7337 Aetna Road
CLEVELAND, OHIO

Products.

The DONLEY INSERT for anchorage in concrete ceilings and walls.

Donley Devices and other building specialties of interest to engineers, architects and contractors.

Description.

The Donley insert is a malleable iron casting with 2 diverging roots, capped with flat lugs. Lower part contains a cavity. A slot in the exposed under surface communicates with this cavity. One end of the slot is enlarged to admit a bolt head.

Uses.

The Donley insert is suitable for the support of shafting, trolley and conveyor tracks, sprinkler systems, steam and plumbing pipes, machinery, racks or whatever equipment is to be suspended by bolts.

Its superior quality is recommended to users not merely with view to immediate needs, but they are urged to consider the unforeseen future uses to which the insert installation of any building may be subjected. In calculating the strength of floors to be equipped with inserts, the safe load of the inserts should be added to the estimated floor load.

DONLEY INSERT			
No.....	34	58	12
Size bolt...	$\frac{3}{4}$ "	$\frac{5}{8}$ "	$\frac{1}{2}$ "
Safe load, lbs.....	4900	3300	2300
Height over all.....	6"	5"	4"
Length....	$2\frac{7}{8}$ "	$2\frac{5}{8}$ "	$2\frac{1}{8}$ "
Shipping weight per 100.	185 lbs.	135 lbs.	85 lbs.

Factors of Strength.

In designing the Donley insert, three factors of strength were recognized: (a) strength of the concrete, (b) strength and tenacity of the insert, (c) tensile strength of the bolt. Of these three, the bolt strength is best known. The object in view, therefore, was to produce an insert which would always provide a resistance in proportion to the tensile strength of a steel bolt of appropriate size.

Result of Tests.

To reach this result, a large number of tests were conducted, both of existing inserts and of experimental models. Inserts embedded in cubes of concrete were loaded to failure, and compilation made of the breaking strains and the nature of the failure.

The Donley insert, as finally perfected and shown herewith, withstood a stress in excess of the ultimate strength of the appropriate bolt. Safe loads, noted in

the accompanying table, represent bolt strength subjected to a safety factor of 4.

Analysis for Comparison.

Analysis of the Donley insert is here given and illustrated, which is useful as a basis of judging this in comparison with other concrete inserts:

(1) The section and shape of the top of the socket to overcome bending. (2) The thickness of the side walls, which must resist the bending of the supporting ledges and the tension of the load. (3) The sectional strength of the ledges which engage the bolt head. (4) The sectional area of the leg or legs that support the load. (5) The length of legs; the amount of concrete they make use of. (6) Shape of legs, straight from center of load to the ends. (7) The location of the legs in relation to the load.

NOTE—The tensile strength of steel being three-quarters greater than that of malleable iron, the size of the leg or legs of malleable iron upon which a load is applied should be at least three-quarters larger in sectional area than the steel bolt. The diagrams show the relative sectional areas of the insert and the bolt for which it is made. The sectional area of the Donley insert is two and one-half times as large as the net bolt area.

Complete in Itself.

The Donley insert has the advantage of being complete in itself, in contrast with inserts which have a loop or ring, through which a bar is to be passed for the better engagement of the concrete.

This is an element of economy, but chief claim of the Donley insert for preference is based on superior quality; the insurance that it provides against collapse of overhead fixtures, such as not infrequently occurs where inserts of unascertained strength are used.

Suggested Specifications for Installations.

The Donley inserts No. 12 (or size desired) shall be placed in rows spaced 4 ft. on centers—not to exceed 4 ft. apart in rows. Rows to start 1 ft. from wall or from beams which project below ceiling. They shall be placed on the concrete forms with the insert slot at right angles to the lines of shafting or other equipment to be supported, then nailed securely in position.

KOHLER DIE & SPECIALTY CO.

Concrete Inserts and Metal Specialties

DEKALB, ILL.

Products.

KOHLER THREADED CONCRETE INSERTS: Pressed Steel and Cast.

COLLINGS SLOTTED OR ADJUSTABLE CONCRETE INSERTS.

Kohler Threaded Concrete Inserts.

Combine all the advantages of strength and economy with the greatest possible utility. Used in industrial plants, public buildings, warehouses, elevators, garages, tunnels and docks.

PRESSED STEEL INSERT

Construction of $\frac{3}{8}$ " and $\frac{1}{2}$ " sizes

INSERT WITHOUT SCREW

ADAPTABILITY—The only inserts adapted for use with either wood or steel forms. Afford the safest and most secure method for supporting shafting, sprinkler systems, radiation, machinery, elevator guides and all appliances attached to either the walls, ceilings, floors or columns of concrete structures.

ADVANTAGES—Kohler threaded inserts are the easiest and quickest inserts on the market to set in the forms. No nails or pins required for their use. The screw point, shown clearly in the illustration, does the work. A blow with the hammer and a couple of turns with the hand sets this screw down so that the insert is held securely in a vertical position ready for the concrete to be poured.

The bottoms of these inserts are squared accurately with the thread, as illustrated, so that the inserts must stand upright when the screw is firmly turned down. After work is finished, forms are easily pulled away from the screws which are then quickly removed, leaving the insert free for the threaded bolt.

STEEL INSERT IN FORM, WITH SCREW POINT IN PLACE

Construction of $\frac{5}{8}$ ", $\frac{3}{4}$ " and $\frac{7}{8}$ " sizes

ENLARGED VIEW OF SCREW

CAST INSERT

ECONOMY—These inserts, regularly spaced in the ceilings, floors or walls of reinforced concrete buildings mean a saving of time and heavy expense in attaching or rearranging shafting, piping or other interior equipment. A necessity in concrete construction.

STRENGTH—Careful tests show that both the

pressed steel and cast threaded inserts have an ample margin of safety over the working load of bolts to be used. At the University of Illinois the $\frac{1}{2}$ -in. steel inserts, constructed as shown in the small illustration to the left, supported an average load on five tests of 6070 lbs. Similar tests of $\frac{5}{8}$ -in. cast inserts showed a supporting strength of 9600 lbs.

How SHIPPED—With both the pressed steel and cast threaded inserts the screw points as illustrated are used. These are put in place at the factory so that insert as shipped is ready for use. Notice it is possible to set these inserts in the forms almost instantly and with the same accuracy as driving a nail.

SIZES, WEIGHTS AND PRICES, KOHLER INSERTS

Size bolt	Height	Weight per 100	List price
PRESSED STEEL THREADED INSERTS			
$\frac{3}{8}$ in.	2 $\frac{1}{2}$ in.	8 lbs.	10¢ each
$\frac{1}{2}$ in.	3 in.	13 $\frac{1}{2}$ lbs.	12¢ each
$\frac{5}{8}$ in.	3 $\frac{1}{4}$ in.	42 lbs.	15¢ each
$\frac{3}{4}$ in.	3 $\frac{1}{2}$ in.	50 lbs.	18¢ each

$\frac{3}{4}$ in.	3 $\frac{3}{4}$ in.	85 lbs.	20¢ each

List prices are subject to discount which will be quoted on application.

Collings Adjustable or Slotted Insert.

Made with a corrugated stem that extends up into the compression area of the concrete, the correct place to hang the load; the tapering corrugated base is so shaped that it makes the concrete member stronger. In this insert the fullest strength of the concrete is developed. The greater the load on the Collings insert the tighter the concrete grips and holds.

Note Corrugated Stem and Corrugated Tapering Base

View of Chamber for Bolt

COLLINGS INSERT
(Patented March 26, 1918)

The Collings insert when placed in the form is never in the way of the reinforcing and is so designed that the concrete flows freely around it. There are no sharp corners and with the Collings insert less surface is exposed in the ceiling after the forms are removed than with any other—a very desirable feature.

The Collings insert may be used upside down in the floor for fastening chairs, machinery or permanent fixtures but its greater field is in the ceiling for supporting shaft hangers, sprinkler systems, electric lights, piping and overhead rails. Either the head of the bolt or the nut may be used in the socket. The Collings is the only insert in which the bonding value of the corrugated bar is secured.

SIZES, WEIGHTS AND PRICES, COLLINGS INSERTS

Size bolt	Height	Weight per 100	List price

Products.

RICHMOND SCREW ANCHORS for fastening all styles of screws into masonry or composition materials; "TYSCRU" FORM TIES.

Also, Expansion, Anchor, Form and Centering Bolts; Wall Plugs; Expansion Shields; Concrete Pole Steps, and Concrete Inserts.

Richmond Screw Anchors.

These anchors are made in two types, and can be set before concrete is poured, by affixing to forms; or, later on, by drilling a hole into masonry and setting screw anchor and screw together into it, in portland cement.

SCREW AND DOUBLE COIL ANCHOR

For use in plaster

BOLT AND FLAT COIL ANCHOR

For use in concrete

STRENGTH—Made of steel, a minimum of metal provides a maximum of strength; all stresses are transmitted to surrounding masonry.

Tests show that bolt breaks before anchor loosens.

Placed in concrete it becomes integral with the work, and can not vibrate or loosen without destruction of entire surrounding medium.

Government tests indicate freedom from adhesion for bolts, even in largest sizes, after a lapse of 28 days. Non-adhesion is guaranteed.

Form Tie—"Tyscru" (Patented August 28, 1917).

"Tyscru" is good for a working load of 5000 lbs.

"Tyscru" is a fast form tie, saving more than half the time of any other method.

The TIE that holds forms APART.

"Tyscru" costs less than annealed wire alone required for any operation, and is four times as fast.

"Tyscru" is tie, spreader, and gauge up to 18 in.

"Tyscru" costs less than rods, clamps and spreaders because it is more than twice as fast.

"Tyscru" gives a handy attachment for reinforcing rods holding them firm and true.

"Tyscru" affords a convenient anchorage for succeeding set-ups in wall construction.

"Tyscru" leaves in the walls anchorages at frequent intervals for work benches, shelving, shafting, steam pipes, starting boxes, etc.

TYPICAL USES OF RICHMOND SCREW ANCHORS

Grandstands: Yale Bowl; University of Chicago; University of Michigan; McGill University, etc.

Posts and poles: Removable screws permit stripping vertical forms. N. Y. Barge Canal, Catskill Aqueduct

Mine shafts: Removable screws permit stripping vertical forms; cage guides. Catskill Aqueduct, Vulcan Iron Mines

Railroads: Rails to concrete ties; platform edgings, etc. N. Y. N. H. & H. R.R., B. R. T. R.R., D., L. & W. R.R., etc.

Tunnels: Removable screws permit stripping forms. Overhead transmission. C. P. R. in Mt. Royal tunnel

Docks: Used by N. Y. State Barge Canal, U. S. Army and Navy engineers, Montreal, Philadelphia, New York, Baltimore

Cantilever forms: Walls and dams. The anchor only remains in the work; light to handle, easy to set

SECURITY INSERT COMPANY

Ceiling Sockets for Concrete Work

2 South 15th Street
PHILADELPHIA, PA.

Product.

SECURITY INSERTS, or CEILING SOCKETS, for Concrete Work.

Security Inserts.

The Security insert solves the problem of the hanging of machinery or fixtures to be suspended from ceiling or wall in factories, warehouses and other buildings of concrete construction.

The Security insert was designed by engineers who made a careful study of this problem, and produced a socket overcoming all objectionable features inherent in others. The ease of installation, the absence of any fixed thread, the strength and many other commendable features of this socket, are shown in the illustrations.

INSERT NAILED TO FORM

Features.

The Security insert embodies the following valuable features:

(1) The design, distribution of metal, and anchorage in the concrete enable it to carry a greater load than either bolt or concrete.

(2) It has no fixed thread to become rusty or damaged.

(3) In place of fixed thread a standard steel nut (the strongest thread possible) is placed in the insert when ready to use.

(4) This nut is renewable at any time.

(5) A stud or a bolt may be used, whichever is more convenient for the work.

(6) The Security insert permits play of stud or bolt while hanging machinery or other fixtures; but when washer is slipped into recess, the stud or bolt is held rigidly central.

(7) The Security insert has a large flat base, insuring upright position in the form, to which it is securely nailed, thus avoiding waste of time and lumber.

PHANTOM SHOWING INTERNAL CHAMBER WITH BOLT, NUT AND WASHER IN POSITION

INTRODUCING OR REMOVING NUT

(8) It is desirable to place inserts in all parts of concrete buildings, such as offices, store-rooms, etc., as well as in those portions where machinery is to be installed.

(9) The Security insert is the only insert provided with a means for concealing the hole in wall or ceiling. This may be accomplished by use of a cardboard disk, which fits the washer recess and can be painted to harmonize with surroundings.

(10) There is absolutely nothing to get out of order or deteriorate in the Security.

(11) The Security insert is correct in principle, simple in construction, and so designed as to insure safe, permanent anchorage for anything, from the lightest partition to the heaviest crane.

(12) Once placed, Security inserts are always ready for use.

BOLT AND NUT IN POSITION

Strength.

Security inserts will carry with a factor of safety the safe load of the bolt for which they are designed.

STRENGTH OF BOLTS

Assumed Tensile Strength 60,000 lbs. per Sq. In.

WRIGHT & ALEXANDER COMPANY

Manufacturers of Concrete Inserts

ROCHESTER, N. Y.

Products.

"WRIALCO," a patented CONCRETE INSERT.

Description.

The most practical and reasonably priced hanger yet devised for automatic sprinkler, shafting and general piping work in connection with concrete building construction.

Made of an exceptionally high grade malleable iron and in strength designed to break the bolt throughout the different sizes. Owing to the design of the "Wrialco" insert, its position in the concrete becomes as a wedge, insuring permanency; its removal can only be accomplished by the destruction of the holding concrete. Of the several pulling strength tests made of the "Wrialco" and its use throughout the country, we do not know of an instance where they have been pulled from their concrete anchorage.

Method of Attaching Inserts to the False Work.

We suggest and recommend, that either coated nails or small wood screws be used in the fastening of inserts to the false work, preferably the wood screws. The inserts will then be securely fastened and in a position to use when wanted for anchorage purposes.

Distinctive Features of the "Wrialco" Malleable Concrete Inserts.

- (1) Strength, due to the wedge construction—its complete embedded surface a resisting force against dislodging from the concrete anchorage.
- (2) Compactness.
- (3) Adjustment, horizontal and vertical. Can be made rigid at any point of adjustment desired.
- (4) Adjustment the full length of slot.
- (5) Nailing feature. Nails are driven through the lugs provided on either end into the false work or form at a 45° angle slant. This slant nailing feature serves as a wedge, preventing the insert from lifting up in working the concrete.
- (6) Security of nut in the adjustment chamber.

FIG. 1. CROSS SECTION

Showing arrangement of the adjustment chamber, making it possible to place nut in the chamber or to remove it after insert has been embedded in the concrete.
U. S. Standard or machine bolt nuts may be used

No chance of the nut tilting. An even pulling pressure throughout the entire length of the adjustment slot.

"Wrialco," an insert of exceptional merit, incomparable, the dependable insert for buildings of concrete construction.

Strength.

The Wrialco inserts are made of a high grade malleable iron. They are designed to carry a load fully in keeping with the rated strength of the bolt or nut employed in the different sizes.

MEASUREMENTS AND WEIGHTS

THE STINE SCREW HOLES CO.

Manufacturers of Screw Holes

WATERBURY, CONN.

CABLE ADDRESS: "SCREWHOLES, WATERBURY"—Private Code Used (sent on request)

Products.

SCREW HOLES.

Screw Holes.

The illustration shows a Stine screw hole. It is a brass device used to provide a permanent threaded hole for a screw. It is made, as shown in Figs. 1, 3 and 4, from brass rod, drilled and threaded on the inside so as to receive the screw, and knurled on the outside so as to allow for a certain amount of crushing of the brass when the screw hole is driven into a hard material. This insures proper and solid incorporation in the material where it is used.

It can be used in all cases where an ordinary screw is necessary, as well as in materials where the successful use of such a screw would be impossible. In rubber, cork, wood, fiber and other soft substances, the screw hole may be driven in with a hammer; but in brick, stone, marble, hard rubber, concrete, aluminum and steel, it is necessary to drill a hole slightly smaller than the screw hole before driving in the latter.

Because of their permanent character, screw holes can be used to advantage on such articles as switch boxes, screen doors, etc., where the screws have to be removed and replaced a number of times. A good firm fastening is always assured and the ease with which removal and replacement is accomplished saves valuable time.

Driving Head.

The illustration, Fig. 2, shows the driving head which is screwed into each screw hole before driving for the purpose of making the latter operation easy and quick; and also of preventing damage to the top of the screw hole. As can be seen by illustration 5, the driving head is in such a position that it may be quickly removed after the screw hole is in place.

Sizes.

Screw holes are made to fit the sizes of wood or machine screws listed in the tables given herewith. Each box contains 100 screw holes and one driving head.

Stock Shipment.

A large supply of screw holes is carried in stock from which we are able to make immediate shipments. The fact that the factory has excellent railroad facilities and is only about 100 miles from New York still further facilitates quick deliveries.

Advantages.

(1) They can be used without damage to receiving material. (2) They make possible the standardization of wood or machine screws in all materials. (3) They are made of brass and will not rust under atmospheric or moisture conditions. (4) They save more time value than the holes cost. (5) Special tools are not needed in using them in any material. (6) They can be used in any place a screw can be used. (7) By using screw holes, screws can be used in many places, and in many materials where it is impossible to use screws without them. (8) These are the only ready-made screw holes on the market. (9) No special screws are needed. These screw holes come in different sizes to fit any wood screw or machine screw now in stock. (10) They make the neatest possible job in any material. (11) Smaller and shorter screws can be used with screw holes than can be used without them, this making another saving to their credit.

*Lengths of wood screws vary from $\frac{1}{4}$ in. to 6 in. increasing by $\frac{1}{8}$ in. up to 1 in., and by $\frac{1}{4}$ in. up to 3 in. All screws should enter the screw holes $\frac{1}{4}$ in. to $\frac{1}{2}$ in. The screw holes themselves enter the receiving material over $\frac{3}{4}$ in.
**A screw hole for any size wood or machine screw fits all lengths of that size screw.

AMERICAN CHEMICAL PAINT COMPANY

1118 South Eleventh Street
PHILADELPHIA, PA.

BRANCH OFFICES

NEW YORK, N. Y., 149 Broadway

DETROIT, MICH., 279 East Jefferson Avenue

Products.

Patented Processes, Appliances and Chemicals for Preparing Metals for Painting: LITHOFORM (Patented) for making paint hold to galvanized iron; DEOXIDINE (Patented Process) a Chemical Wash for preparing cold rolled steel for painting; DEOXYLYTE, a Non-rusting Pickle for iron and steel; RUBYLYTE, a Chemical Preparation to take rusting properties out of water.

Paint, for steel and galvanized iron; Paint Preservatives; Rustproofing Processes; Cleaners; Primers, for galvanized iron or steel.

Lithoform (Patented), for Galvanized Iron.

Lithoform means "I make stone," and is a non-metallic material for application to surfaces of galvanized iron, causing paint to adhere firmly thereto. It is a clear, thin, waterylike, non-volatile liquid or solution of certain chemical properties which, when applied, turns the outer surface of galvanized iron into a stony substance resembling pumicestone; the latter is a firm part of the metal and slightly absorbs (like absorbent stone) the first coat of paint, which on drying becomes inseparable from it—a knife is required to detach the paint from galvanized iron treated with Lithoform. The surface formed by Lithoform can be painted and repainted like wood.

CHEMICAL PROPERTIES—Lithoform contains no oil, varnishes, pigments or volatile solvents—it is not a paint. The chemistry of Lithoform and its action on zinc appear in this company's patents, copies of which will be furnished on request.

How APPLIED—By brushing, spraying or dipping. Full directions accompany each shipment. Old paint on galvanized iron must be removed before application.

COVERING CAPACITY—Exceeds that of paint or varnish. When applied with a brush, 1 gal. will cover 1500 to 2000 sq. ft., in less time than is necessary for paint.

GUARANTEE—When applied according to directions, the company guarantees that Lithoform will prevent paint from peeling or scaling off galvanized iron and zinc.

CAUTION—Under no circumstances use Lithoform on any metals except zinc and galvanized iron without first consulting this company.

Deoxidine Patented Process, for Steel.

A positive means of eliminating the development of defects in the finish of steel; it cleans steel and prevents rusting. Causes of rust, such as soldering fluids, non-drying oils, acid runs, hand marks, etc., are removed by this process and prevented from acting under the paint. Gasoline or turpentine has utterly failed to remove the oils; rust still lingers after careful sanding with emery cloth by hand; even the perspiring hands of the sanding operator have left invisible hand marks to show through the painted finish a few weeks later; and, finally, the sand blast, fairly successful in this preparatory course, was expensive to install and troublesome to operate, invariably leaving some grains of sand in the cracks or seams which would get into the paint at a later period.

The Deoxidine patented process now replaces the sand blast.

DESCRIPTION—Deoxidine is a wash, not a paint. This process, composed of ingredients mentioned in the Letters Patent, is a chemical one based on such patents owned by the company—the only process that will clean and prevent rust at same time. It destroys all rust forming substances and even rust itself; removes all traces of oil; produces a surface that slightly absorbs the first coat of paint, causing the latter to adhere firmly to the steel. The process has been on the market for a number of years, proving Deoxidine to be a positive method of preventing defects in the painted finish.

APPLICATION—Deoxidine may be applied by brushing, dipping or spraying, allowing sufficient time for it to act on the surface and then removing it by wiping with a cloth, washing with water or by other means, depending on the nature of the steel being treated.

SPECIFICATION DATA FOR PREPARING STEEL FOR PAINTING BY THE DEOXIDINE PROCESS—Complete directions for processing accompany each shipment.

Hot and Cold Rolled Steel, Interior Steel Finish, Automobile bodies, Structural Steel, etc.—When ready for painting, apply Deoxidine, allow it to act for about 5 minutes, wash off with water, dry with a rag or chamois and allow sufficient time to thoroughly air dry; then paint.

Work Covered With Grease or Heavy Oil—Before treating with Deoxidine remove grease or oil with a suitable solvent such as kerosene, gasoline, soda or lye.

Work Having a Heavy and Thick Covering of Rust—Before treating with Deoxidine remove loose scales of rust with a scratch brush and scrub with Deoxidine and emery cloth. Finally treat with Deoxidine and wash with water in the regular way.

Work That is Not to Be Painted—Treat with Deoxidine and wipe dry with a cloth, omitting the water.

Small Parts—First dip in a tank of Deoxidine; then into a tank of running water, and dry over heat.

GUARANTEE—The Deoxidine process, when used according to directions, is guaranteed to prevent the rusting of steel under the paint.

SHIPMENTS—Sold and shipped generally in barrel lots.

Deoxylyte.

A non-rusting pickle for iron and steel. Can be used cold or hot, in the form of a bath or a wash.

To remove rust with Deoxylyte, apply the Deoxylyte to the rusty work with a brush, allow it to remain on overnight, then wash the work with water.

Rubylyte.

A chemical preparation to take the rusting properties out of water. Recommended for use in hydraulic dies and in water for grinding.

APPLICATION—Use 1 lb. of Rubylyte to 200 gals. of water.

References.

Extensive lists of steel and iron works; foundries; motor, metal, car, welding, aeroplane, automobile and other industrial corporations; together with various other satisfied users of products of this company will be mailed to architects and other interested persons on request.

ANTI-HYDRO WATERPROOFING CO.

NEW YORK, N. Y.

LABORATORIES, NEWARK, N. J.—Telephone, Market 5069

Products and Services.

"ANTI-HYDRO," a Liquid Compound to be used with portland cement for waterproofing, dampproofing, hardening, and other purposes.

CONSULTING WATERPROOFING ENGINEERS. The consulting engineers are ready at all times to advise concerning difficult waterproofing problems. Correspondence is invited.

Description.

"Anti-Hydro's" function may be expressed as waterproofing cement with cement; that is, filling the voids with a cement solution, which crystallizes at the same time as the cement, integrally forming a hard, insoluble silicate of greater tensile strength, density and activity. It enriches mortars so that cost of troweling, mixing and supervision is reduced to a minimum. In fact, it more than pays its cost in labor saving. It hardens wearing surfaces to a degree that makes them dustless and adamant.

"Anti-Hydro" is a liquid compound, neutral to cement. When added, in certain percentage to the water used in gaging portland cement mixtures in the usual way, it has the effect, without retarding setting, of rendering cement in all kinds of masonry impervious to water, moisture, frost, gas, oils, odors, sugar solutions, alkalis and most acids. It excites and brings into service all the cohesive or colloidal possibilities of portland cements, which in themselves are most efficient waterproofing mediums. There are no alums, hydrate of lime, greases, oils, stearic acid, or decomposable ingredients used; neither are there any iron admixtures—all of which disintegrate concrete in time.

Uses.

Because of its remarkable properties "Anti-Hydro" is used for hardening cement floors, for waterproofing concrete in mass and in surface coating, for dampproofing and for waterproofing mortar in brickwork.

Quantity Required.

For coatings, 1 gal. "Anti-Hydro" for each 80 to 100 sq. ft. 1 in. thick; for mass concrete, 1½ to 2 gals. for each cu. yd.

Specifications.

FLOOR HARDENER—Upon fill shall be laid a 1-in. topping of 1 part portland cement and 2 parts clean sand. This shall be gaged by addition of "Anti-Hydro" to all water used in tempering dry mixture, in proportion of 1 gal. of "Anti-Hydro" to 10 gals. of water. The proper consistency will be obtained if, for each barrel of cement, 1 gal. of "Anti-Hydro" and 10 gals. of water be used.

WATERPROOFING IN MASS—To water used in gaging mixture add 1 gal. of "Anti-Hydro" for every 10 gals. water. Proper consistency will be obtained if, for each barrel cement, 1 gal. "Anti-Hydro" and 10 gals. water be used.

WATERPROOFING IN COATINGS—All interior surfaces of all exterior walls, upper surface of concrete floor slab of basement or cellar, all pits, piers, etc., as shown on plans, shall be water-

TRADE-MARK

proofed by the addition of "Anti-Hydro" Liquid Waterproofing Compound to all water used in tempering dry mixture of 1 part cement and 2 sand, in proportion of 1 gal. "Anti-Hydro" to 10 gals. water.

To assure perfect bond to underlying masonry, all surfaces, before application of waterproofing, shall be thoroughly roughed, cleaned and dampened. Coatings shall be applied not later than 24 hours after surfaces have been prepared. A slush or grout of neat cement, using 1 part "Anti-Hydro" to 3 parts water, is first applied, then followed by a 1 cement: 2 sand mixture.

Floor work shall be 1 in. in thickness, and shall serve the double purpose of a waterproofing agent and dustless wearing surface.

Wall coatings shall be ⅝ in. in thickness from floor level, where they shall be properly coved and bonded to floor, and carried up to at least 1 ft. above grade level.

DAMP-PROOFING—To a mixture of 1 gal. "Anti-Hydro" and 3 gals. water gradually stir about ½ bag of portland cement to a creamy consistency. Apply in 3 coats with a brush or spray.

The first coat is a penetrating one, the mixture for which should be as thick as the brush will carry and well rubbed in, taking particular care to fill all joints and cracks. The second is a further filler. The third is the finish coat, to which any color or effect can be given.

BRICKWORK—Brickwork to be laid in mortar of 1 part portland cement and 2 parts clean sand. This to be gaged or tempered with water having the addition of "Anti-Hydro." in the proportion of 1 gal. "Anti-Hydro" to 10 gals. water. Each course of brick to be carefully grouted, filling all joints with a liquid mixture as above, carrying the same percentage of "Anti-Hydro" to the water used in gaging it, 1 to 10.

STUCCO ON SOLID MASONRY—The stucco shall be applied in 2 coats. The straightening coat shall consist of 1 part portland cement and 3 parts sand. This shall be gaged with a solution of 1 part "Anti-Hydro" to each 10 parts of water. The wall shall first be thoroughly wetted and the straightening coat applied ¾ in. thick. The finish coat shall consist of 1 part portland cement and 2½ parts clean sand, which shall be gaged with the same strength solution of "Anti-Hydro" and water as the straightening coat and applied ¼ in. thick. Surface to be stippled. No lime should be used.

STUCCO ON METAL LATH—The stucco shall be applied in 3 coats. The first and second coats shall consist of 1 part portland cement and 3 parts clean sand, and shall be gaged with a solution of 1 part "Anti-Hydro" to each 10 parts water. The first coat shall be applied ⅞ in. thick and ⅝ in. over the face of the lath. The second coat shall be ¾ in. thick. The finish coat shall consist of 1 part portland cement and 2½ parts clean sand, which shall be gaged with the same strength solution of "Anti-Hydro" as the first and second coats and shall be applied ¼ in. thick. Surface to be stippled. No lime should be used.

ACID RESISTING—Write for special specifications.

Approval.

The superiority of "Anti-Hydro" for waterproofing and concrete hardening is demonstrated by the permanency of work completed as long as sixteen years ago, and by the comparative tests of the United States Bureau of Standards. In these tests, reported in their Technologic Paper No. 3, they designate "Anti-Hydro" as Compound No. 40, and state "It is most impermeable of any of the Mortars."

Shipment.

"Anti-Hydro" is shipped in standard containers of 5, 10, 20 and 30 gals., f. o. b. Newark, N. J.

Products.

Manufacturers of COATINGS, Transparent and Opaque, covering all departments of exterior and interior treatment of surfaces—wood, metal, cement, stucco, brick, plaster.

CEMENT COATINGS, "DRIWAL" (Waterproofing), "BILCHACO" CEMENT FLOOR COATING, "RUSTNAUGHT" (Antirust and Insulator for Structural Steel).

House Paints, Shingle Stains, Roof Paints, "Flexo-Flint Finish," "Rubeffect" (a flat finish varnish), "Artone" (for wall decoration and plaster, wood or metal ceilings), "Flo-rite" (the perfect white enamel).

"Driwal" for Concrete and Brick.

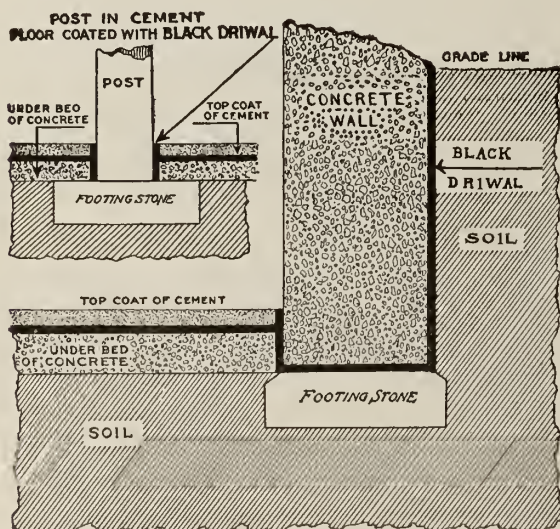

A waterproof and decorative coating for cement, stucco and brick surfaces.

"Driwal" prevents dampness, efflorescence and staining. Made in 14 colors, including greens, browns, reds, yellows and stone colors; white and black; also, transparent.

Driwal will not blister nor peel if properly applied. It penetrates, stains, preserves and waterproofs the texture of the surface; has no disagreeable odor.

Waterproofing for Heavy Pressure.

Black "Driwal" will not become brittle like tar, and may be applied without heating. Made in 3 forms: No. 1, Standard Body; No. 2, Extra Heavy, especially desirable on rough work; and No. 3, Paste, for filling cracks and crevices.

APPLICATION OF "DRIWAL"

Showing where Black "Driwal" should be used in waterproofing cement floors and foundation walls in damp locations, and also proper treatment of posts setting in cement floor

TRADE-MARK

"Bilchaco" Cement Floor Coating.

"Bilchaco" Cement Floor Coating hardens the surface; prevents cement dust, stains and injury from lubricating oils; improves sanitary value and appearance. Suitable for use in office buildings, hos-

pitals, schools, church basements, factories, breweries, packing houses, canneries, garages, laundries, etc.

Made in 6 shades.

BILCHACO

TRADE-MARK

"Rustnaught."

"Rustnaught" is a protective coating for steel, iron and other metals against rust. This coating is made along the lines indicated as best by the results of the investigation of the Cushman Laboratories as to the best protective coatings for structural iron, bridges, etc. It contains ingredients best calculated to act as insulators. It contains no asphaltum nor tar. It will successfully resist sulphuric acid fumes, brine and lubricating oil.

"Rustnaught" is also especially suitable for metal roofs and other metal surfaces exposed to severe weather conditions, as it is an antirust coating of greatest durability.

"Rustnaught" gives protection against rust and electrolysis. It will remain elastic, thus responding to the expansion and contraction of the metal in changing temperatures.

"Rustnaught" is made in 8 appropriate colors and black.

CLINTON METALLIC PAINT CO.

Manufacturers of Paints, Refractory Cements, Roof Cements, Mortar Colors and Cement Colors

HOME OFFICE
CLINTON, N. Y.

Products.

PROTECTIVE PAINT for Metals; REFRACTORY CEMENT; ROOF CEMENT; MORTAR COLORS.
Also, Cement Colors.

orders testify to the extent to which manufacturers have been able to reduce the cost of maintaining refractory structures through the use of "Clinton Super-Heat Cement."

Protective Paints for Metals.

Made in three forms: dry, paste, and ready-mixed.

DRY—"Clinton Metallic Paint," a natural red-brown oxide of iron reduced to the last degree of fineness (99% through 200-mesh).

Analysis of typical sample made at the Massachusetts Institute of Technology, Boston, Mass., October 2, 1919, follows:

Ferric oxide	68.0%	Magnesium carbonate	5.0%
Silica	15.0%	Alumina	2.7%
Calcium phosphate	3.0%	Sulphur	0.25%
Calcium carbonate	5.2%		

One large corporation of national reputation (name on request) has used approximately 150 tons of this dry pigment annually for many years in the manufacture of paint for the protection of its buildings and certain products which it sells.

Full instructions for mixing are gladly furnished.

PASTE—"Clinton Metallic Paste Paint," sometimes called "Clinton Metallic Ground In Oil."

Dry "Clinton Metallic Paint" thoroughly incorporated with pure linseed oil to the consistency of a thin paste; convenient in that it may be readily reduced by stirring in linseed or other suitable paint oil. This should not be confused with paste paint made thick or stiff. Such paste may be made with very little oil, and therefore at low cost. It is difficult to reduce such paste without mechanical mixing.

READY-MIXED—"Clinton Metallic Paint Mixed Ready for Use" contains only "Clinton Metallic Paint," pure, raw linseed oil, and best grade japan dryer. It is the opinion of this company that this is the best protective paint for metals manufactured. 1 gal. covers practically a sq. ft. on metal.

Refractory Cement for Bonding Fire Brick.

A plastic cement used for bonding fire brick, for lining crucibles, and for patching wherever refractory material is required.

Fire clay mortar serves merely as filler to impede the passage of air through the minute openings between the brick. It quickly jars or dusts out, leaving the brick readily susceptible to displacement by vibration and shock. "Clinton Super-Heat" Fire Brick Cement sets hard as rock in a few hours—even before heat is applied. It adheres permanently to the brick, substantially welding them together and seals the wall against infiltration of air.

Constantly increasing sales and numerous repeat

U. S. TRANSPORT LEVIATHAN
Brickwork cemented with "Clinton Super-Heat Cement"

As its part in the Great War, "Clinton Super-Heat" cemented the brickwork of the U. S. Transport Leviathan. It is invaluable in the presence of extreme vibration.

Full information, working sample, and miniature fire brick cemented with "Super-Heat" gladly sent on request. Distributors for this product are in all large cities.

Roof Cement.

"Clinton Silk Fibre Elastic Roof Cement" is made in red, brown, slate, black, green and gray colors.

This is a plastic material designed for bedding slate and tile, for sealing openings around chimneys, etc., and for patching and repairing roofs of every description. It adheres firmly to any surface. It never cracks, it never crumbles, it never lets go. It acts as a perfect and permanent seal against the weather.

"Clinton Silk Fibre Elastic Roof Cement" expands and contracts with changes of temperature. It will not run in the hottest weather.

Mortar Colors.

"Clinton Mortar Colors."

Mortar color is a familiar term to the architect, the dealer in building materials, and the mason contractor. Each knows from experience and observation how greatly the investment of a small sum in coloring material for the mortar enhances the appearance of a brick structure. The business man of today insists that his business be housed in presentable buildings with attractive surroundings. It is generally admitted that a building faced with common red brick with white or gray mortar joints, is unattractive. Such a building with red mortar joints blending with the brick, or with black joints affording contrast, is an ornament to any community in which it may be placed. The cost for coloring material should never exceed \$2.00 per 1000 facing brick and will ordinarily be much less. Good mortar colors are permanent. Unlike paint, they need never be renewed. Like paint, they beautify the structure. Their use is increasing daily, particularly in connection with rough texture brick.

OWNERS OF NATIONAL PAINT WORKS

Manufacturers of Technical Paints

MAIN OFFICE

TELEPHONE CONNECTION

23 Flatbush Avenue
BROOKLYN, N. Y.

WORKS

WILLIAMSPORT, PA.
BROOKLYN, N. Y.**Products.**

TECHNICAL PAINTS for all purposes, including special formula and specification paints.

METAL PRESERVATIVE PAINTS: Bridge and Structural Paints of every kind including No. 31 Imported Red Oxide of Iron; No. 16 Carbon Black; No. 32 Graphite; No. 300 Suspended Red Lead; No. 250 Blue Lead; Lead and Zinc Paints; No. 450 Black Magnetic Oxide of Iron. Also Special Paints for severe and unusual conditions, including Fume Resisting Paints; Dampproof and Sweatproof Paints; Heat Resisting Paints; No. 755 Subway Black for Painting Steel Incased in Concrete.

MILL WHITE or LIGHT REFLECTING PAINTS: "Newlite" for coating walls and ceilings with durable pure white, washable finish. Made in flat, eggshell, semigloss and high gloss.

PAINT for CONCRETE, CEMENT or STUCCO: "Newlite" for interior and Kent Concrete Primer and Kent Concrete Finish for exterior or interior use; CE-Co Cement Floor Paint, a high grade durable floor coating.

Also Brick Paints: CE-Co Brick Paint in all colors; House and Building Paints: CE-Co Prepared House Paint, the highest grade paint for finest work, and N. W. P. Standard Prepared Paint for houses and factory buildings; Marine Paints: N. P. W. Marine Paints; Gas Holder Paints: No. 31 Williamsport Red Gas Holder Paint, Blue Lead, and Lead and Zinc Holder Paints.

Enamels: CE-Co White Enamel for finest work, and Keep White Enamel, both made in eggshell and semigloss, as well as high gloss finishes; Machinery Paints and Enamels: Oilproof Paints and Enamels for engines and machinery, in flat, semigloss and high gloss finishes.

Metal Preservative Paints.

CHEESMAN-ELLIOT Co.'s technical paints for the preservation of steel and iron are known for their uniform reliability as protective coatings. The longest service and best protection for the metal on practically all classes of work can be obtained from the use of No. 31 Red Oxide and No. 16 Carbon Black.

The following specifications provide coatings of lasting qualities and give the most protection:

PRIMING or SHOP COAT—No. 31 Imported Red Oxide or No. 300 Suspended Red Lead.

FINISH or FIELD COATS—No. 16 Carbon Black or, Graphite Paint in color selected or, Lead and Zinc in color selected or, No. 755 Subway Black.

No. 31 Imported Red Oxide Paint.

Made from a specially treated bright oxide of iron as the principal pigment. The principal vehicle is lin-

seed oil, combined with special waterproofing oils and gums on formulas developed by our long experience. It is made for both metal and wood and is particularly recommended for use in industrial plants as well as general iron and steel structures. It is suitable for both priming and finishing coats.

The spreading power of No. 31 is about 650 sq. ft. per gal., 1 coat, on metal.

REFERENCES—No. 31 is on more railroad bridges in the United States than any other iron oxide paint. It is extensively used in large industrial plants, including the American Cyanamid Co.; West Virginia Pulp and Paper Co.; New York and Pennsylvania Co.; Ontario Power Co.; Canadian Niagara Power Co.; Niagara Falls Power Co.; Turners Falls Power Co.; Anaconda Copper Mining Co.; Garfield Smelting Co.; New York Edison Co.; American Locomotive Co.; Eastern Mfg. Co.; Celluloid Co., etc.

Over 12,000 gals. of No. 31 were specified by the Air Nitrates Corporation, with the approval of the government engineers, and used as the shop and field coats on the steel of the U. S. Nitrate Plant No. 2 and the large power house at Muscle Shoals, Ala.

No. 16 Carbon Black Bridge and Structural Steel Paint.

One of the oldest and best known coatings. Composed of high grade pure carbon black with magnetic black oxide of iron and a percentage of inert pigments, combined with pure linseed oil and special driers and binders.

No. 16 dries jet black, with a bright luster. Its spreading power is about 850 sq. ft. per gal., 1 coat. No. 16 over No. 31 withstands tropical conditions better than any other paint.

No. 16 Carbon Black is a well-known bridge paint and is the standard bridge finishing paint of many large railroad companies after more than 25 years' use of it.

Graphite Paints.

Line comprises our No. 32 Natural Color Graphite and a full line of colors, including brown, gray and black. Our graphite paints are the highest quality and are purchased in large quantities by railroads, structural steel fabricators, and manufacturing plants.

No. 625 Galvanized Iron Paint.

No. 625 Galvanized Iron Paint is especially for use on new galvanized iron, and is extremely durable, adhering firmly to the metal. This paint works well under the brush, and will spread about 650 sq. ft. per gal., 1 coat. The special vehicles of No. 625 Galvanized Iron Paint are acidproof, and obtain a firm hold on the smooth, greasy surface of galvanized iron. After applying a coat of No. 625, any of CHEESMAN-ELLIOT Co.'s paints can be used over it without fear of peeling, or No. 625 can be used for the finishing coats.

This paint has been used on galvanized iron pier sheds for many years with entirely satisfactory results.

UNITED STATES ARMY SUPPLY BASE, BROOKLYN, N. Y.

This plant covers an area of 57 acres. The buildings and 4 double deck piers cost \$40,000,000.00 and constituted the largest concrete contract ever executed, the work being done by the Turner Construction Co.
10,500 gals of CHEESMAN-ELLIOTT Co.'s paints, including inside white, were used on this work

No. 250 Sublimed Blue Lead.

Especially suitable for use as a metal preservative against sulphurous fumes and other deleterious gases. Extensively used by copper smelting plants, gas companies, etc. It is very effective as a priming coat in repainting bridges, and other steel structures which, through neglect, have become badly pitted with corrosion. It is also recommended as a shop coat on structural steel to be used in mills and factories when it is desired to have the steel finished with white paints. Its blue gray color facilitates covering by the white paint and blue lead has proved itself to be one of the best preservative paints for metal.

Suspended Red Lead Paint.

We manufacture red lead paint in ready mixed form, with guaranteed qualities of suspension, containing as high as 80% pure red lead. Our No. 300 Suspended Red Lead represents the best that can be made in this class of material.

Light Colored Structural Paints.

Preservative paints in light colors, grays, white and miscellaneous colors.

"NEWLITE" PAINT, FOR LIGHT REFLECTION—Intended for interior use on walls, ceilings, columns, etc., to increase illumination by reflecting light. "Newlite" forms a solid pure white coating with flat, eggshell gloss, semigloss or high gloss surface, as desired. It is washable and extremely durable.

Although "Newlite" is an oil paint, the oils used in "Newlite" do not turn yellow. There is likewise no lead in any form used in "Newlite." Lead has a tendency to turn dark on interior use where it is kept away from good light. The basic pigment of "Newlite" is lithopone, the whitest and one of the best covering pigments known. There is therefore nothing in "Newlite" that is liable to discoloration, which accounts for its remarkable permanence of whiteness, and consequently its efficiency as a light reflector.

"Newlite" has been used in plants with severe conditions, such as sulphite pulp and paper mills, dye and rubber factories, bleacheries, etc., as well as factories with only ordinary conditions, and has universally given satisfactory results.

"Newlite" is suitable for application to concrete, brick, wood, plaster or metal.

Two coats of "Newlite" flat white, or 1 coat of "Newlite" primer and 2 coats of "Newlite" eggshell gloss, "Newlite" semigloss or "Newlite" high gloss, are sufficient to produce a first class pure white finish on any unpainted surface. On surfaces of slight porosity 1 coat of "Newlite" primer and 1 coat of any of the gloss finishes produces satisfactory results.

"Newlite" is also furnished in all colors, or can be readily tinted by the addition of oil colors.

REFERENCES—The Endicott Johnson Co.; American Woolen Co.; Burgess Sulphite Fibre Co.; National Aniline & Chemical Co.; Garner Print Works and Bleachery; Shepherd Electric Crane & Hoist Co.; Stokes Rubber Co.; Henrietta Mills; Norfolk & Western R. R., and others are among users of "Newlite."

Kent Concrete Paint, for Exterior Concrete or Stucco.

Forms a waterproof, frostproof coating of great durability. It is made in practically all colors. Kent concrete paint serves the double purpose of keeping out moisture and beautifying the building with one operation.

The principle of Kent Concrete Paint is a 2-coat combination to resist free lime and the weather. Kent Concrete Primer is neutral to the free lime in concrete and prevents "burning" through. Over the neutral primer is applied the weatherproof Kent Concrete Finish, which is also to a considerable degree neutral to alkalis.

Kent Concrete Paint has been used on many important concrete structures. It covers well and costs no more than common lead and oil paints.

Information Required in Ordering.

When writing this company relative to an order, give all possible information, indicating:

- (1) Character of surface to be painted.
- (2) Number of coats to be used.
- (3) Time to be allowed for drying between coats.
- (4) Whether painted before; is so, condition of old paint.
- (5) Kind of exposure (sun, water, gases, etc.).
- (6) How is paint to be applied (brushed, dipped or sprayed.)

Free Booklets and Color Cards.

Our booklets, "Practical Paint & Painting Specifications," "Technical Paints for Industrial Plants," and "Review of Technical Paints," as well as color cards, will be sent free on request.

DETROIT GRAPHITE COMPANY

Makers of Paints in all Colors for all Purposes

DETROIT, MICH.

BRANCH OFFICES

NEW YORK, N. Y.	CHICAGO, ILL.	BOSTON, MASS.	SPRINGFIELD, MASS.	CLEVELAND, OHIO
BUFFALO, N. Y.	ST. LOUIS, MO.	KANSAS CITY, MO.	SAN FRANCISCO, CAL.	GREENVILLE, S. C.
HOUSTON, TEX.	CHARLOTTE, N. C.	PHILADELPHIA, PA.	CINCINNATI, OHIO	EL PASO, TEX.

Products.

SUPERIOR GRAPHITE PAINT for structural steel and metal surfaces; ANTI-AQUA, a Danpproof Coating for stone, concrete or brick walls and foundations; STA-WHITE, a pure White Oil Paint for industrial interiors.

Degraco-Lite, a White Enamel for interior and exterior; Degraco-Tone, a Flat Washable Finish for interior use on plaster, metal, wood, cement, beaver board, etc.; Degraco Concrete Wall and Floor Paint; Degraco Colors for exterior and interior use.

Superior Graphite Paint.

The base of Superior Graphite Paint is Lake Superior amorphous graphite ore. This ore is a natural combination of graphitic carbon and silica, carrying as well percentages of oxides of aluminum and iron.

Extreme fineness is secured in the preparation of the ore, which is thoroughly ground and mixed with refined and treated linseed oil of highest grade.

Lake Superior graphite ore has a greater affinity for linseed oil than many of the commercial graphites on the market. Proved methods of machine grinding and manufacture make for unusual uniformity of mixture and proper drying qualities. The inert nature of the ore prevents chemical action between pigment and vehicle, and the paint film therefore retains its elasticity and durability over a long period.

Superior Graphite Paint prevents rust action on structural steel, fire escapes, steel window sash, frames and all metal surfaces. Unusual and severe conditions of exposure are met by this paint.

Elasticity to expand and contract with surface on which it is applied prevents cracking and checking of the film.

Large covering capacity, opacity, and ease of application make for initial economy in materials and labor.

Durability (proven in service) results in low ultimate cost.

Superior Graphite Paint has established its reputation as a leader among metal protective paints through service records covering a period of 30 years.

Manufactured in the following colors:

No. 30 Natural	No. 35 Red
No. 32 Brown	No. 36 Stack Black
No. 34 Black	No. 59 Olive Green

Standard packages: barrels, half-barrels, 5-gals. and 1-gal.

NOTE—No. 32 Brown is generally used as a shop coat, No. 30 Natural field coat, and No. 59 Olive Green, final finish coat. This combination of colors facilitates inspection and insures complete coats being applied.

Other colors or combinations desired may be used with equal success.

SPECIFICATION—All scale, dirt and foreign matter shall be removed from structural steel before any painting is done in the shop.

Covered surfaces, surfaces in contact, and surfaces enclosed, of all parts of riveted members, shall receive 1 coat of Superior Graphite Paint No. 32 Brown after pieces are punched and before assembled.

All finished members shall receive 1 complete coat of Superior Graphite No. 32 Brown before taken from shops or exposed to weather. Foundation beams and connections shall receive 1 coat in shop. All bolts used in erection and remaining permanently in structure shall be dipped in Superior Graphite Paint.

All pins and bored pinholes or other planed surfaces shall be coated with white lead and tallow before leaving shop.

All surfaces accessible after erection shall receive 2 coats of Superior Graphite Paint No. 30 Natural and 59 Olive Green, respectively; after being placed in position.

All painting shall be done on dry and preferably warm surfaces.

Paint used shall be Superior Graphite Paint manufactured by DETROIT GRAPHITE COMPANY, Detroit, Mich.

DOUBLE TRACK STRAUSS BASCULE BRIDGE, ST. CHARLES, AIR LINE, ILLINOIS CENTRAL R. R.
260 ft. high. 1750 tons of steel protected with Superior Graphite Paint

All paint shall be delivered to shop and to erection site in unbroken packages, subject to inspection and approval of architect and engineer.

REPAINTING SPECIFICATION—All metal work and other exposed surfaces to be painted shall be thoroughly cleaned with steel brushes, and where necessary all loose scale shall be removed with three cornered steel scrapers and hammer. No paint shall be applied until all dust, mud and grease have been carefully removed, nor shall any paint be applied during wet or foggy weather, or upon a wet surface.

First coat shall be Superior Graphite Paint No. 30 Natural applied as soon as parts are cleaned. Any parts of structure liable to hold moisture shall be cleaned and slushed with this paint.

When first coat has dried sufficiently, a period of at least 1 week being allowed to elapse, second coat shall be applied using Superior Graphite Paint No. 59 Olive Green.

All paint used shall be that manufactured by DETROIT GRAPHITE COMPANY, Detroit, Mich., and shall be delivered in unbroken packages.

Anti-Aqua Dampproof Coating.

Anti-Aqua is a waterproofing and dampproofing paint especially recommended for the following uses:

As a coating on the exterior of stone, brick and concrete foundations to prevent seepage of water.

As a coating on the interior of stone, brick and concrete walls to exclude dampness.

As a coating for the unexposed surfaces of marble, granite or other fine stone used in buildings to prevent seepage and staining.

As a coating between concrete walls and exterior tile or face brick of buildings.

As a plaster bond.

Anti-Aqua is a liquid bituminous paint of ordinary brushing consistency which dries within a few hours and when applied to stone, brick or concrete surfaces, enters into and seals up the pores, and on account of its penetration, the coating can not be destroyed by abrasion during backfilling of foundations.

Two coats of Anti-Aqua may be applied on concrete or brick walls and then followed by a coat of rough plaster. When used in this way, Anti-Aqua acts as a waterproofing paint and at the same time eliminates the use of furring and lathing.

The use of Anti-Aqua as a plaster bond on ceilings is not recommended.

The covering capacity will depend on the porosity

of the surface, but under normal conditions it will be from 80 to 100 sq. ft. per gal.

Anti-Aqua is supplied in the proper consistency for application, but if for any reason thinning is necessary, only special Anti-Aqua thinner should be used. Gasoline, benzine, petroleum solvents, turpentine or its substitutes will not mix with Anti-Aqua and should not be used for thinning this paint.

Sta-White.

Sta-White is a pure white oil paint for industrial interiors with unusual light-reflecting qualities.

TRADE-MARK

It contains no lead, glue or other harmful or easily affected ingredients, bleached oil or pigments, and consequently shows no tendency to turn yellow.

Sta-White will not chip, flake or peel.

It is recommended for interior painting of mills, factories, offices, public buildings, schools, hospitals, theaters, hotels, restaurants, etc.

Sta-White may be used on wood, metal, concrete, plaster, brick, and other surfaces. When, after a period of years, Sta-White becomes soiled, covered with dust or other settlements, the original whiteness and reflecting qualities are easily restored by brushing or washing without injury to the finish.

Sta-White will give maximum service that is expected of highest grade interior whites, both as to light reflecting qualities and durability.

Sta-White is made in high gloss enamel finish, although semigloss and flat finishes are also furnished.

AMERICAN HARD RUBBER CO. BUILDING

Painted with Sta-White. Note how the high gloss finish reflects the light

SPECIFICATIONS FOR CONCRETE, BRICK, PLASTER, WOOD OR METAL—The surfaces shall be dry, and free from dust or loosely attached matter such as old paint, rust, scale, etc. All oil spots shall first receive a coat of shellac.

The first or priming coat shall be Sta-White Primer applied with a full brush.

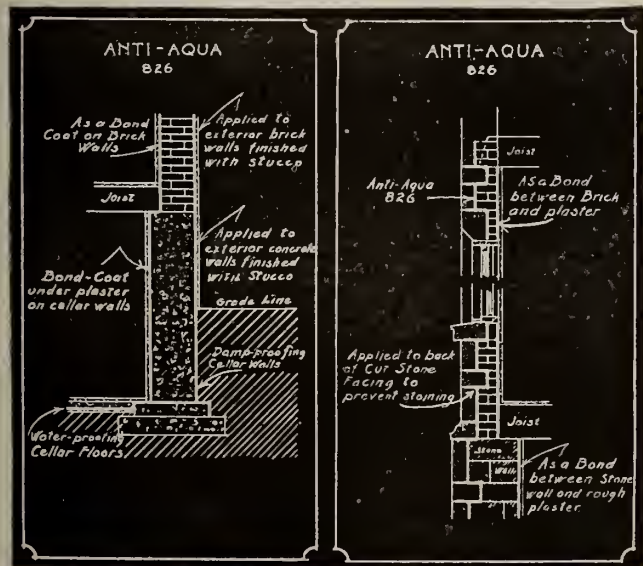

The final coat shall be Sta-White Gloss (semigloss or flat as desired) brushed in the manner varnish is applied, i.e., flowed on rather than brushed out. Care should be taken to see that the paint does not sag.

Drying Time—At least 48 hours shall be allowed between coats.

Thinning—For brick, concrete, plaster or wood surfaces, Sta-White Primer may be thinned with turpentine or turpentine substitute (petroleum spirits), not to exceed 1 qt. to 1 gal. of paint.

For steel, the primer shall be thinned with not to exceed 1 pt. to 1 gal. Sta-White Gloss (semigloss or flat) shall not be thinned under any circumstances.

All paint used shall be that manufactured by the DETROIT GRAPHITE COMPANY, Detroit, Mich., and shall be delivered in unbroken packages. All work shall be subject to inspection and approval of the architect or engineer.

Products.

DU-LITE (Mill White), ANTIOXIDE (Rust-inhibitive), OXIDE PAINT, CONCRETE PAINT, FLOOR & DECK PAINT, TOWN & COUNTRY PAINT, ELASTIC WALL PRIMER.

Flat Wall Paints, Machinery Enamels, Acid Resisting Black Paint, Graphite Paint, Smokestack Paint.

Also a complete line of Paints and Varnishes for all types of construction.

For Explosives, see page 40.

Quality.

The all important factor in the manufacture of the above products is the maintenance of a quality standard, attained through the use of highest grade raw materials, scientifically formulated and tested, and incorporated by modern machinery. The result of this careful formulation and production speaks for itself in the durability of the products, their covering or hiding power and the perfect protection they afford to the various types of material to which they are applied.

Service.

The Du Pont Architectural Service Bureau, Paint and Varnish Division, has been of valuable assistance to architects and engineers in solving difficult paint problems, through detailed advices, information, literature, color cards and specifications. This service is entirely unobligative, and performs a necessary function in bringing to a successful conclusion any project where paints and varnishes are used.

Du-Lite (Mill White).

An intensely white, solid covering paint for factory, mill, hospital and public building interiors. This is an oil paint, with non-poisonous pigments, greatly superior to calcimine or cold water paints, both from the standpoints of appearance and durability. Du-Lite may be used on wood, metal, concrete or brick surfaces equally well, producing a tough, elastic finish that will not chip or flake off. It retains its color exceptionally well, and is not affected by steam or fumes.

FINISH—Supplied in flat, eggshell or gloss finish.

COVERING CAPACITY—Will cover approximately 500 sq. ft. per gal., 1 coat.

SPECIFICATIONS

For Cement, Concrete, Brick and Plaster—All surfaces when thoroughly dry, shall be wire brushed to remove loose particles of cement, and then dusted. Cement and plaster should age for at least 30 days before painting.

First Coat: Du Pont Elastic Wall Primer.

Second Coat: Du Pont Du-Lite Flat.

Third Coat: Du Pont Du-Lite Gloss, Eggshell or Flat.

TRADE-MARK

For Wood and Wall board—Surfaces shall be reasonably smooth, dry and free from grease and dirt. Knots and sappy places in wood shall be shellacked before painting, and all nail holes puttied after first coat.

First Coat: Du Pont Du-Lite Flat, reduced to priming consistency with equal parts of pure raw linseed oil and pure spirits

of turpentine.

Second Coat: Du Pont Du-Lite Flat of package consistency.

Third Coat: Du Pont Du-Lite Gloss, Eggshell or Flat.

Structural Steel and All Other Metal Work Primed or Unprimed (Exception: Galvanized iron)—Wire brush metal surfaces to remove rust, scale or loose particles. Remove oil or grease with turpentine or benzine.

First Coat: Du Pont Ferro-Keep Gray.

Second Coat: Du Pont Du-Lite Flat.

Third Coat: Du Pont Du-Lite Gloss, Eggshell or Flat.

Galvanized Iron—Surface shall be thoroughly clean; oil and grease to be removed with turpentine or benzine. New galvanized iron shall be washed with a solution of 8-oz. copper sulphate to gal. of water. Allow to dry 4 hours before painting. Where galvanized surfaces have weathered for a month or longer this treatment is not necessary.

First Coat: Du Pont Galvanized Iron Primer.

Second Coat: Du Pont Du-Lite Flat.

Third Coat: Du Pont Du-Lite Gloss, Eggshell or Flat.

Antioxide (Rust-Inhibitive).

The highest grade of rust-inhibitive paint, made with a varnishlike vehicle which prevents moisture from attacking the metal and causing rust. It curbs progressive oxidation where it has begun and withstands acid fumes and conditions to an unusual degree.

COLORS—Supplied in red, bronze, green, maroon and black.

COVERING CAPACITY—Will cover approximately 750 sq. ft. per gal., 1 coat.

SPECIFICATIONS

Structural Metals for Buildings, Bridges, Fire Escapes, Tanks, Fences, Railings, etc.—All steel work shall be thoroughly freed of mill scale, rust, dirt and grease, by cleaning with wire brushes, scrapers, benzine, etc.

Priming Coat: After cleaning, the work shall not be allowed to stand, but shall immediately be given a priming coat of Antioxide Red. All abrasions of the priming coat due to handling in shipment and in erection shall be carefully recoated, and let stand 4 days before applying second coat.

Field Coats: After erection, the metal work shall

be given 2 field coats of Antoxide. Each coat shall be allowed to stand until perfectly dry, at least 4 days before subsequent coats are supplied.

Ferro-Keep.

An excellent metal protective paint-prepared with special rust inhibitive pigments. Dries with a full oil gloss.

COLORS—Supplied in black, green, red and gray.

COVERING CAPACITY—Will cover approximately 600 sq. ft. per gal., 1 coat.

SPECIFICATIONS

See Antoxide.

Oxide Paint.

A good covering, durable paint for exterior use, on outbuildings, fences, roofs, and similar work. May be used on wood or metal surfaces.

COLOR—Supplied in bright red only.

COVERING CAPACITY—Will cover approximately 500 sq. ft. per gal., 1 coat.

SPECIFICATIONS

Coats—1 or 2 coats in accordance with surface conditions.

Concrete Paint.

A protective and decorative coating for cement, concrete, stucco, plaster and brick surfaces, interior or exterior. It preserves the texture and individuality of concrete and its composition includes a special vehicle unaffected by lime or alkalis.

COVERING CAPACITY—Will cover approximately 300 to 350 sq. ft. per gal., 1 coat.

SPECIFICATIONS

Concrete should age for at least 30 days before painting. When thoroughly dry, wire brush to remove loose particles of cement and then dust.

First Coat: Harrisons Concrete Paint thinned with 20% pure raw linseed oil and 5% turpentine.

Second Coat: Harrisons Concrete Paint of package consistency.

Floor & Deck Paint.

For interior and exterior wood and concrete floors. Makes a tough and elastic coating and one that is impervious to moisture. Prevents the gradual wearing away and "dusting" of concrete floors, due to abrasion or heavy traffic.

When treating concrete floors a coat of Du Pont Concrete Floor First Coater is applied as a foundation over which the Du Pont Floor & Deck Paint is applied.

COLORS—Supplied in spruce, dark spruce, buff, light stone, dark stone, dust color, brownstone, maroon and light brown.

COVERING CAPACITY—Will cover approximately 275 sq. ft. per gal., 2 coats.

SPECIFICATIONS

All floor surfaces shall be dry, clean, free from grease and dirt, and reasonably smooth.

Concrete surfaces should age for at least 30 days

before painting. Wire brush to remove scale or loose particles.

Wood Floors—**First Coat**: Du Pont Floor & Deck Paint thinned at the rate of 1 pt. of pure turpentine to 1 gal. of paint.

Second Coat: Du Pont Floor & Deck Paint of package consistency.

Concrete Floors—**First Coat**: Du Pont Concrete Floor First Coater.

Second Coat: Du Pont Floor & Deck Paint of package consistency.

Third Coat: Du Pont Floor & Deck Paint of package consistency.

Concrete Floor First Coater.

A product of varnishlike consistency for the treatment of concrete floors before painting. Stops the suction and prevents lime and alkali from affecting subsequent coatings.

COVERING CAPACITY—Will cover approximately 400 sq. ft. per gal., 1 coat.

SPECIFICATIONS

See Floor & Deck Paint.

Elastic Wall Primer.

A sealing coat for concrete, cement, brick or plaster surfaces. Stops suction and is not affected by lime or alkalis. Forms a perfect foundation for all paint coatings when used on surfaces mentioned.

COVERING CAPACITY—Will cover approximately 300 sq. ft. per gal., 1 coat.

SPECIFICATIONS

See Du Pont Du-Lite.

Harrisons Town & Country Paint.

The highest grade of prepared paint, for all general exterior woodwork wherever a coating of exceptional durability is required.

One hundred and twenty-five years of paint making experience is back of this product, together with every facility to maintain its quality and uniformity.

COLORS—Supplied in 30 shades, black and whites.

COVERING CAPACITY—Will cover approximately 350 to 400 sq. ft. per gal., 2 coats.

SPECIFICATIONS

All surfaces shall be dry, clean and smooth. Grease and stains to be removed with benzine.

Putty all nail holes and surface imperfections after priming coat.

COATS—**Priming Coat**: For close grained, non-absorbent woods, thin with equal parts pure raw linseed oil and pure turpentine. For soft woods, like white pine or poplar, thin with 3 parts pure raw linseed oil and 1 part pure turpentine. For hard or yellow pine, cypress, Norway pine and other resinous woods, thin with 1 part raw linseed oil and 3 parts pure turpentine.

Second Coat: Thin with 2 parts pure raw linseed oil and 1 part pure turpentine.

Third Coat: Thin each gallon of paint with from 1 pt. to 1 qt. of raw linseed oil, depending on surface conditions and color used.

Products.

INTEGRAL WATERPROOFING, PASTE and POWDER; TROWEL COATING; FOUNDATION BRUSH COATING; MOP COATING; WATERPROOFING FELT; SATURATED FABRIC; ACIDPROOFING; COLORLESS WATERPROOFING; CEMENT and MASONRY COATINGS; FLOOR HARDENER; FLOOR PRIMER; FLOOR ENAMEL; DAMPPROOFING COATING; STAINPROOF STONE BACKING; MASTIC CEMENT; STEEL COATING; PROTECTIVE COATING (for steel); GALVANIZED IRON COATING; WOOD PRESERVATIVE.

Bonding Compound, GF No. 400.

For Metal Lath Reinforcement, see pages 174-76.

Service.

A Waterproofing Service Department is maintained, in which are practical engineers who have had wide experience on waterproofing jobs. Their time is devoted to studying actual conditions and recommending the right method along with the most suitable material for the job.

This department will give complete specifications if informed regarding nature of the work.

GF No. 10 Integral Waterproofing Paste.

A smooth white paste mixed with the gauging water for concrete and cement. It effectively lines all pores, rendering the mass permanently watertight. The small quantity required, and ease of using GF No. 10 make it an effective and inexpensive waterproofing.

USES—For waterproofing concrete foundations, floors, tanks, silos, etc., as an integral part of the mix; for waterproof coating when mixed with cement plaster; for waterproofing stucco exteriors over masonry, metal lath, hollow tile, etc.

GF No. 11 Integral Waterproofing Powder.

For the same work as GF No. 10 Paste. The only difference is the form and method of application.

GF No. 15 Trowel Coating and No. 16 Foundation Brush Coating.

The former a thick pastelike compound, the latter a heavy bitumen which can be swabbed on with a brush.

USES—For dampproofing substructures on the outer surface before refilling with soil.

GF No. 17 Mop Coating, GF No. 18 Waterproofing Felt and GF No. 21 Saturated Fabric.

For membrane waterproofing courses.

USES—Nos. 17 and 18 used for waterproofing basements, floors, roofs, etc.; Nos. 17 and 21, for swimming pools, steel and concrete bridge decks, etc.

GF No. 99 Acidproofing.

A thin transparent liquid which effectively resists dilute acids and acid gases.

GF No. 100 Colorless Waterproofing for Exteriors.

A permanent pore-filling liquid, which in no way changes appearance of walls but waterproofs them.

USES—For waterproofing exterior walls of brick,

stone or stucco; for copings, parapets, cornices; for cisterns, water tanks and pools.

GF No. 101 Cement and Masonry Coating.

For uses similar to GF No. 100, except that it imparts a lasting color to the surface. Furnished in colors—white, old ivory, buff, Bedford gray, Portland gray, concrete gray, tile red and brownstone.

GF No. 145 Floor Hardener.

A concentrated liquid for hardening and dustproofing concrete floors, both new and old. Also used to prevent streaking and staining on the face of granite and limestone. Proof against water, oil and dilute acids. Especially suitable for factories, warehouses, etc.

GF No. 155 Floor Enamel.

A decorative, protective coating for concrete floors, extremely long in vehicle, thereby insuring deeper penetration and greater wearing surface. Consequently, while not giving as dense a color, makes a better dustproofing. With No. 155 no priming coat is required. Supplied in red, brown, gray, green and colorless. Especially suitable for office buildings, hospitals, hotels and public buildings.

GF No. 200 Dampproofing Coating.

A heavy bitumen which is applied cold to rough brick or masonry walls. The strong "tack" aids in bonding the plaster; also forms an insulator.

USES—As a dampproofing on walls to which plaster is applied directly, or over lath and furring.

GF No. 220 Stainproof Stone Backing.

Applied on the back and joint surfaces of limestone, marble, etc., before erection to prevent staining and efflorescence.

GF No. 250 Mastic Cement.

A thick cementlike waterproofing for concrete roofs and pointing up joints, window and door casings, etc. In black and colors.

GF No. 300 and No. 325 Structural Steel Coatings.

For structural steel, either permanently exposed or to be incased in masonry or concrete.

GF No. 350 Galvanized Iron Coating.

A thin, transparent compound in liquid form. One coat applied with a brush to any galvanized surface will neutralize and cover up the oily film, preparing the surface for ordinary oil or graphite paint. GF No. 101, in colors, can be used over this priming coat.

GF No. 550 Wood Preservative.

Makes wood impervious to water; protects it from rotting due to dampness; prevents formation of fungi, and discourages wood-boring insects. Applied by brush, spray or immersion. Nut brown color, leaves no film.

Handbook.

The Waterproofing Handbook containing complete specifications furnished on request.

CINCINNATI, OHIO, First National Bank Building

CHICAGO, ILL., City Hall Square Building
BOSTON, MASS., Winthrop Building
ST. LOUIS, MO., Railway Exchange Building
DALLAS, TEX., Slaughter Building

Products.

GOHEEN'S PRODUCTS include Protective Coatings for iron and steel; Interior and Exterior Wood Paints, Enamels; Dampproofings and Waterproofings for concrete and masonry surfaces; Concrete Floor Paints and Hardeners; Canvas Waterproofings, Wood Floor Preservatives and Shingle Stains.

Goheen's Highway Red.

A chemically combined red lead paint. This product has been developed to overcome the faults of the commonly used mixture of red lead and oil on iron and steel. Can be used as a shop coat or field coat. Does not harden or settle in the package.

Covering capacity is 800 sq. ft. per gal. Two coats properly applied will give absolute protection from 7 to 10 years.

Co-operation.

Our Engineers are always glad to correspond and co-operate with the trade. Our Engineers' Handbook, color cards and folders will be furnished on request.

Goheen's Carbonizing Coating.

An inhibitive and protective coating for iron and steel. Wearing qualities unexcelled. Recommended for use on all structural steel work, bridges, steel tipples, gas holders, standpipes, etc.

Covering capacity, 1000 sq. ft. per gal.

Has protected Inter-City Viaduct, Kansas City, for 14 years and good for several years more.

Goheen's Concrewaltum.

A paint for dampproofing and beautifying masonry surfaces. Prevents efflorescence and the staining of the walls. To be used where positive and permanent results are desired.

Made in all colors.

Covering capacity, 400 sq. ft. per gal.

Goheen's Galvanum.

The only paint that adheres permanently to galvanized iron. Can be applied without treating galvanized iron with an acid wash. Dries firm and hard, producing a film which is impervious to acids and to various alkalis found in water. Will not crack when subjected to heat or cold.

Covering capacity, 600 sq. ft. per gal. for light colors, and 800 sq. ft. per gal. for dark colors.

Goheen's Old Honesty.

Where the highest grade paint for exterior and interior wood surfaces is desired, Goheen's Old Honesty is recommended. This product is a combination of lead, zinc and linseed oil.

Made in all colors.

It has a covering capacity of 600 to 700 sq. ft. per gal. under normal conditions.

Other Products.

GOHEEN'S ASBESTOS ORE PAINT—A fire retardant and wood preservative coating for wooden tipples, trestles, fences, shaft houses, etc. Made in reds, browns, greens, black and special colors. Covers 400 sq. ft. per gal.

GOHEEN'S ROCKOTE—For hardening concrete floors. Converts granulating, dusting concrete floors into hard, flintlike surfaces.

GOHEEN'S HYDROLITE—A concentrated liquid for waterproofing concrete. Readily miscible with the gauging water. Can be thrown directly into the mixer—no skill required. One gal. waterproofs 1 cu. yd. of mass concrete. Costs less than any other good waterproofing on the market.

GOHEEN'S FLAT WALL FINISH—A sanitary washable flat paint which dries with a rich velvet effect. Covers 600 sq. ft. per gal. Hides in one coat.

GOHEEN'S PUBLIC SERVICE WHITE—A high grade mill white for factories, public buildings, schools, hospitals, dairies, etc. Increases lighting efficiency. Retains its gloss and whiteness indefinitely.

GOHEEN'S ENAMELETTE—A white enamel that stays white. Absolutely sanitary. Can be washed without harm. Equal to highest grades of imported enamels and more economical.

GOHEEN'S ROOF CEMENT—An asbestos fiber cement for renewing old composition, tin, paper, felt and wood roofs. Made in liquid and paste form.

GOHEEN'S SPECIAL ACID AND HEAT RESISTING PAINT—Resists combined effect of chemical fumes, heat and steam on exterior exposure. Ideal for smokestacks. For interior conditions, use Goheen's Oxidized Carbon Cement R No. 1.

ESTABLISHED 1852

HAMPDEN PAINT & CHEMICAL CO.

SPRINGFIELD, MASS.

BOSTON, MASS.

BRANCH OFFICES

NEW YORK, N. Y.

Address all correspondence to main office

Products.

- "HAMPDEN" MILL WHITE, for mill and factory walls and ceilings.
- "HAMPDEN" STRUCTURAL PAINT, for the protection of structural iron and steel.
- "HAMPDEN" CEMENT FLOOR COATING.
- "HAMPDEN" CONCRETE FLOOR HARDENER, for concrete floors.
- "HAMPDEN" PIPE ENAMEL, for hot and cold interior piping systems.
- "Hampden" Interior Flat Finish, for hospitals, offices and public buildings; "Hampden" Mill Enamel, for interior mill trim; "Regal" Wall Coating, a cold water paint; "Hampden" Exterior Concrete Coatings, for exterior brick and concrete surfaces; "Rubercoat" Elastic Carbon Paint, for waterproofing roofs, and all walls below grade; "Hampden" Varnishes, for all classes of work—exterior and interior; "Hampden" Ready Mixed Paint, for exterior work; "Hampden" Permanent Green, for all exterior work; "Almandine" Reds, for exterior use.

"Hampden" Mill White.

This paint is particularly adapted for brightening interiors of mills, factories and industrial plants, and may be applied to walls and ceilings of wood, brick and concrete. Possesses great light reflecting qualities. It will not chip or scale, is permanent and washable, and is supplied in 3 finishes.

MILL WHITE GLOSS—For use in rooms free from moisture. Insures permanent high gloss. Exceptional ease of spread and covering capacity.

MILL WHITE EGGSHELL—A pleasing finish between that of flat and gloss. Great covering capacity, and opaqueness combined with ease of spread.

MILL WHITE FLAT—For interior use where moisture and steamy conditions exist. A permanent, velvety finish, pleasing to the eye.

SPECIFICATION DATA

For New Surfaces—Surfaces must be dry and free of all loose particles. All knots and sappy places in woodwork should be coated with shellac of good body.

For Old Surfaces—Surfaces must be dry, and cleaned of loose particles.

Previous applications of whitewash or similar coatings removed and surface left clean.

Grease and oil stains removed and surface coated with shellac.

First Coat—Concrete, brickwork, and plastered surfaces given 1 coat "Hampden" Concrete Primer brushed well into pores. Allow at least 24 hours for drying.

Unpainted galvanized surfaces given 1 coat "Hampden" Galvanized Iron Primer. Woodwork given 1 coat "Hampden" Mill White Flat. Allow at least 48 hours for drying.

Second Coat—1 coat "Hampden" Mill White Flat. Allow at least 48 hours for drying.

Third Coat—1 coat "Hampden" Mill White—Flat, Egg-shell or Gloss, as desired.

All paints, when necessary, to be made workable by addition of "Hampden" Mill White Thinners in proportion not greater than 10%.

"Hampden" paints may be obtained from HAMPDEN PAINT & CHEMICAL Co., Springfield, Mass., or authorized agents.

TRADE-MARK

NOTE—The second coat of "Hampden" Mill White Flat may be omitted for 2-coat work; it is not advised, unless surface has been previously painted and old paint is in good condition.

CONSERVATIVE COVERING CAPACITY,
OVER PRIMED SURFACES—On wood, 50 sq. yds. per gal.; on brick and concrete, 30 sq.

yds. per gal.

"Hampden" Cement Floor Coating.

This is a sanitary finishing paint for cement floors in hospitals, schools, office buildings, halls, etc. It hardens the surface and prevents cement dust, thus lengthening the life of even the best concrete floors. Easily kept clean. It is oilproof, therefore very valuable for use in garages, factories and engine rooms. Not intended for wet basement floors.

"Hampden" Concrete Floor Hardener.

For hardening, waterproofing, and dustproofing concrete floors. Chemically transforms the concrete—colorless.

"Hampden" Structural Paint.

This paint forms a permanent coating to protect structural iron and steel, and is a most efficient rust inhibitor. Made in 5 colors, and in special shades when quantity warrants.

SPECIFICATION DATA

Shop Work—All metal surfaces must be thoroughly scraped and cleaned of all rust, mill scale, dirt, and dust. All grease removed, and surfaces dusted. Apply 1 heavy coat "Hampden" Structural Gray No. 502; thinned, if necessary, by addition of pure turpentine in proportion not greater than 10%. All surfaces inaccessible when assembled to receive 2 coats before assembling.

Erection—After erection, all rust spots and places where paint is off to be thoroughly cleaned. All edges, rivets, nuts and bolt heads to receive an extra coating of above paint. Dip all bolts before placing.

Finishing—2 coats "Hampden" Structural Paint (of shade selected). Allow from 3 to 5 days' drying time for previous coat. Nothing but strictly pure settled linseed oil shall be used in reducing, and in proportion not greater than 15%.

"Hampden" paints may be obtained from HAMPDEN PAINT & CHEMICAL Co., Springfield, Mass., or authorized agents.

"Hampden" Pipe Enamel.

These enamels are adapted for hot and cold interior piping, and form permanent coatings for the preservation of metal pipe. Made in shades adopted by the American Society of Mechanical Engineers.

Packages.

Paints packed in 1-bbl., ½-bbl., 5-gal. and 1-gal. containers. When packed in barrels, same are equipped with mechanical agitators.

Publications.

Bulletins and pamphlets covering the different paints will be sent on request. A book of specifications for painting is offered with the idea that it may prove of assistance to the busy architect and engineer, and may be had on application.

HYDREX-"SANIFLOR" DEADENING FELT
HYDREX-"NOVENTO" WATERPROOF SHEATHING PAPER

HYDREX WATERPROOFED BURLAP
HYDREX PRESERVATIVE PAINT
HYDREX-"BIKOTA" SHEATHING PAPER
HYDREX WATERPROOF CLOTH
HYDREX WATERPROOF CANVAS
HYDREX-"PLUVINOX" READY ROOFING

Hydrex Expansion Joint (strips); Technical, Roofing and Asphalt Paints; Cold Storage Insulation, Damp Course, Asphalts, Cloth-backed Case Lining, etc.

Hydrex Waterproofing Felt ("The Membrane Method").

This well-known waterproofing felt is an absolutely impervious leatherlike sheet, first saturated and then given a *glazed coating* on both surfaces. Used in two or more layers with hot Hydrex Compound (as the conditions may require) for waterproofing foundations, tunnels, subways, reservoirs, swimming pools, dry docks, fortifications, battery room floors, etc.

SPECIFICATIONS.—For general waterproofing work, specify 4 layers of the felt, cemented together with hot Hydrex Compound (*The Membrane Method of Waterproofing*), which has been successfully used in the most difficult water pressure work throughout the world.

For waterproofing upper floors in mills, warehouses, etc., specify 2 layers of Hydrex Felt "*Penna. Special*" grade, cemented together with hot Hydrex Compound.

Detailed specifications, suited to particular needs and conditions, will be promptly supplied, on request. As engineers and experts in structural waterproofing, this company will furnish estimates, plans and specifications for waterproofing any kind of construction.

Hydrex-"Saniflor" Sound Deadenening Felt (Insulation).

A thick, soft felt *coated* on both surfaces so as to hermetically seal in the felt and render it non-absorbent, clean, sanitary and absolutely verminproof. Moths, mice and other vermin will *not* and can *not* eat the coating, because gnawing causes the teeth to stick. The well-known sound deadening quality of Hydrex-"SANIFLOR," together with its verminproof features, makes it unequalled for use in hospitals, residences, apartment houses, schools, etc.

Also widely used under machinery to prevent vibration and as a warmth giving, blanketlike lining under clapboards and roofs, and for cold storage, ice-houses and refrigerator car insulation.

Hydrex-"SANIFLOR" is put up in rolls 36 ins. wide, containing 300 sq. ft.

TRADE-MARK
Reg. U. S. Pat. Off.

Hydrex Primer and Hydrex (Bitumen) Compound.

Used for coating walls, floors, electrical work, etc. Hydrex Compound is a standard for junction boxes, mastic acid resisting floors, etc.

SPECIFICATIONS.—When surfaces are dry, brush on a thorough coating of Hydrex Waterproofing Primer, and when dry, mop over it a heavy coating of hot Hydrex Compound.

Hydrex Dampproofing and Preservative Paint.

A heavy bodied black paint for dampproofing the interior or exterior surfaces of walls, and also for hollow terra cotta tile walls to be stuccoed. It excels in *acid resisting qualities*, especially against sulphuric acid, and is therefore standard for use in electric storage boxes and battery rooms, for coating walls and all exposed metal.

This paint forms a heavy, tenacious, impervious coating to which plaster and stucco tightly bond. For the best results, 2 coats should be used. Covering capacity, 1 gal. for about 100 sq. ft. of brick surface.

Hydrex-"Novento" Waterproof Sheathing Paper.

An extra heavy *felt paper*, first waterproofed through and through and then given a *glazed coating* on both sides. *Is further improved by a coating of powdered soapstone* on the weather side, the soapstone being a great water repellant and preservative. Used under clapboards, slate, tile, stucco, tin, etc., the gray or soapstoned surface is turned outward towards the weather; under floors, the soapstone surface is turned upward.

Hydrex-"NOVENTO" contains no *coal tar or acids* to corrode tin, nails or other metal. Being alkali resisting, it is largely used under stucco. Made in 1-ply, 2-ply, 3-ply. Put up in rolls of 500 sq. ft.

Hydrex-"Bikota" Waterproof Sheathing Paper.

A low priced, waterproof sheathing paper, coated on both sides, but *not* saturated. Widely used under floors and parquet flooring. Made in 1-ply, 2-ply, 3-ply. Put up in rolls of 500 sq. ft.

Hydrex Waterproof Canvas.

A heavy, strong canvas, impregnated and coated with an elastic waterproof compound. Used on porch roofs, boat decks, piazza floors, etc., where there is considerable walking. Shipped in rolls 29 ins. wide, containing 216 sq. ft.

Hydrex Burlap, "New York Subway Brand."

A saturated and coated burlap accepted and used for waterproofing New York Subways. Put up in rolls of 400 sq. ft.

Hydrex Waterproof Cloth.

A waterproofed woven fabric used for waterproofing in connection with (hot) Hydrex Compound. Shipped in rolls 36 ins. wide, containing 500 sq. ft.

Hydrex-"Pluvinox" Ready Roofing.

A high grade, smooth surfaced, durable roofing. Made in 1-ply, 2-ply, 3-ply. Rolls contain 216 sq. ft.

THE HYDROLITHIC WATERPROOFING CO., INC.

Engineers and Contractors for Waterproofing

TELEPHONES:
GREELEY 2264, 2265

1328 Broadway
NEW YORK, N. Y.

Services and Products.

Engineers and Specialists for WINSLOW'S HYDROLITHIC SYSTEM OF WATERPROOFING.

HYDRO-CRETE, a Protective Concrete.

This company takes and executes contracts for the WATERPROOFING of all kinds of SUBSTRUCTURES, such as Subways, Tunnels, Reservoirs, Vaults, Swimming Pools, Boiler Rooms, Cellars, etc., giving a guarantee against any percolation, whether structures are of concrete, brick or stone.

Winslow's Hydrolithic System.

All work is executed in the well-known Winslow's hydrolithic system, using either hydrolithic cement or hydrolite as the conditions may require. Hydrolithic coatings contain all the good points of a first class true Portland cement mortar, with the addition of their water repellent and waterproofing qualities.

APPLICATION—Hydrolithic waterproofing is applied on the interior of exterior walls and floor forming one monolithic shell, and the adhesive qualities are such that it will withstand any water pressure, and will last just as long as the structures waterproofed will last. Hy-

HYDROLITHIC

TRADE-MARK

Before applying Waterproofing

After being Waterproofed

42ND STREET (NEW YORK) STATION, QUEENSBORO SUBWAY

hydrolithic waterproof coatings, $\frac{5}{8}$ in. thick on brick, have withstood a laboratory test of 1200 lbs. per sq. in.; and actual successful work has been done 162 ft. below grade, representing a hydrostatic pressure of over 70 lbs. per sq. in.

ADVANTAGES—The advantages of Winslow's hydrolithic system over the old membranous method are many: Repairs of any defects can be made easily, as the work is always in sight; it gains floor space, taken up in the membranous method of protecting brick walls, not necessary under the hydrolithic system; the waterproof coat constitutes the finish of the walls and floors, and, being impervious, is absolutely sanitary. Hydrolithic coatings are perfectly bonded to waterproofed structures, forming a part of such and thereby add strength to walls, and especially to floors.

RECORD—Winslow's hydrolithic system has been used for more than 20 years; has stood the test of time, and the company can truly say there is nothing superior to it on the market to-day.

ESTIMATES—If architects will write their requirements, specifications and estimates will be gladly furnished, no matter how large or small the job may be.

Hydro-Crete.

A concrete especially adapted in the construction of bank vaults, producing the highest degree of protection against fire, water, intense heat, riots and burglary.

Hydro-Crete received the indorsement of experts after thorough tests had been made, representing as near as possible actual conditions of destruction by fire, drilling, cutting and smashing.

REFERENCES—Hydro-Crete has been used lately in the construction of the following bank vaults:

Products.

METAL PROTECTIVE and PRESERVATIVE PAINTS: RED LEAD LUTE, METALCOTE, GRAPHITE PAINT, GALVANIZED IRON PRIMER, MACHINE FILLER; SEALER COAT; OILPROOF MACHINE FINISHING PAINT.

DYEHOUSE ENAMELS.

MILL WHITE PAINT: Primer, Flat and Gloss.

Also other Metal Protective Paints; Carbon Paint; "High Standard" Liquid Paint, for interior or exterior use; Aluminum Paint; Mellotone, a flat oil, interior paint; Mello-Gloss, an interior gloss paint; Enamels; Stains; "Little Blue Flag" Varnishes.

Scope of Use.

These paints are made ready for use, and are adapted for structural and manufacturing purposes as follows:

Steel structures, bridges, railway equipment, public works of all kinds, metal roofs, metal covered buildings, factory buildings—exterior and interior—electric light, telephone and railway requirements; pipes, water, oil and gas tanks, machinery, viaducts, elevators, smokestacks, subways, ornamental ironwork.

Metal Protective Paints.

RED LEAD LUTE—A special treatment of red lead and linseed oil in combination with inert materials of durability and binding power. It is far superior to ordinary hand mixed red lead as a preservative paint for foundation coats on structural iron and steel.

Ordinary red lead and oil mixed by hand must be used immediately. With Red Lead Lute there is no waste. Lute has been known to remain in suspension in the container over 3 years. Every drop in the bucket will be taken up by the brush, leaving no sediment whatever.

METALCOTE—Used over Red Lead Lute or for all coats. Dries quickly with a good gloss without tack. Best possible protection against all sorts of injurious gases and moisture.

GRAPHITE PAINT—Selected graphite in combination with a binder that insures adhesion and durability.

GALVANIZED IRON PRIMER—Adheres to galvanized iron and presents a suitable surface for recoating.

Machinery Paints.

MACHINE FILLER—For painting and filling iron castings and machinery of all kinds. Does not crack or check and sands readily to a smooth surface.

SEALER COAT—A gloss varnish paint used over sanded out machine filler to seal the pores and prepare the surface for the finishing coat.

TRADE-MARK

OILPROOF MACHINE FINISHING PAINT—Made in light, medium and dark gray shades and black. When used over sealer coat, dries with a beautiful semigloss finish.

MACHINERY FINISHING PAINT—A high grade flat finish for fine machinery.

Dyehouse, Rubber Factory and Chemical Plant Paints.

Designed to meet the severe conditions prevalent in dyehouses, rubber factories, and chemical plants. They are acid and fume resisting, are not affected by moisture, and do not turn yellow. They work easily under the brush, cover solid in 1 coat, and produce an elastic durable surface. Dry in 24 to 36 hours, according to the conditions. Furnished in brushing consistency, and may be thinned with benzine for spraying, if desired. It is not recommended that the Dyehouse Enamel White be sprayed on.

Lowe Brothers Mill White.

Mill White is a paint excelling in ease of working, spreading capacity, hiding power and durability. Made from pigments and liquids best adapted to the purpose with most careful attention to each detail of manufacture. May be used on wood, brick, concrete, plaster, steel ceilings, wallboard, or any other surface ordinarily fit to be painted, and in each case gives excellent results. Because of its superior hiding power, very few coats are necessary to cover blackest walls. Its easy working properties greatly lessen cost of applying.

MILL WHITE PRIMER—Designed only for first coat work where 2 or more coats are used. It is an oil paint that works freely under the brush. Covers 600 to 700 sq. ft. per gal., 1 coat, depending upon nature of surface. Adheres firmly to surface and puts it in proper condition for receiving finishing coats of Gloss or Flat.

MILL WHITE FLAT—Produces a beautiful, soft, velvety finish. Very easily applied with a good wall brush. Will cover from 600 to 700 sq. ft. per gal., 1 coat, depending upon condition of surface. Like all flat paints it has a tendency to settle; but it may be stirred up with ordinary effort, as it does not harden in can.

MILL WHITE GLOSS—A paint of high class, full body, excellent working properties and great serviceability. Covers from 400 to 500 sq. ft. per gal., 1 coat, depending upon condition of surface. This paint, on account of its great light reflecting properties, is a most satisfactory mill finish. To secure best results where surface is dirty, an undercoating of Mill White Primer is recommended.

Special Requirements.

Special finishes are made up for individual concerns to perform a particular service, as practical experience and up-to-date laboratories enable THE LOWE BROTHERS COMPANY to handle most difficult requirements.

MINWAX WATERPROOFING SYSTEM;
DAMP-PROOFING; CONCRETE FLOOR FINISH;
BRICK and CEMENT COATING; PROTECTIVE METAL COATINGS.

Also Expansion Joint Cement and Artistic Wood Finishes.

Minwax Waterproofing System.

For foundations, pits, basements, trenches, retaining walls, bridge floors, subways, and all sub-level purposes.

This is a membraneous system, using two plies or layers of Minwax saturated cloth laid in and cemented with Minwax hard waterproofing—the resultant blanket being made up of two layers of cloth and three swabbings of waterproofing.

MINWAX SATURATED CLOTH—A heavy, strong, elastic cotton fabric completely saturated with a highly refined natural asphalt. This complete saturation not only protects each fiber of the cotton from moisture, but also prevents the lateral transfer of moisture through the laminations of the waterproof blanket by capillary action.

MINWAX HARD WATERPROOFING—This waterproofing, with which the cloth is both saturated and applied, is a naturally occurring asphalt refined with the sole object of producing a material absolutely stable both chemically and physically—a material possessing maximum ductility, which will be extremely tough at all working temperatures without being brittle, and which shows a minimum susceptibility to temperature changes. Therefore, a structure waterproofed by the Minwax system is one which is enveloped in a rubbery skin over $\frac{1}{8}$ in. thick, of great strength, which will not rot or deteriorate, and which will exclude water permanently regardless of the pressure encountered.

The cotton cloth system is the standard type of membraneous waterproofing, and the Minwax system is pioneer of all cloth systems and the only one with a proven record of satisfactory service.

Complete specifications furnished on request.

Minwax Protective Metal Coatings.

No. 500 BLACK—For metals exposed to heat. Minwax No. 500 black is intended for such heat exposures as stacks, boiler fronts, steam coils and steam piping—and it successfully resists temperatures up to 800° Fahr. without running or physical alteration.

Being a natural hydrocarbon with no pigments whatever, it dries entirely by evaporation into a tough, elastic coating with a smooth black, non-cracking enamel-

like surface. Its covering capacity is about 400 sq. ft. of smooth metal per gal.

No. 700 BLACK—For smoke exposures.

Train sheds, roundhouses and similar exposures, where the corrosive action of steam and smoke will be encountered, are the field of application for Minwax No. 700 Black. It dries by evaporation into a tough, tenacious, elastic film that is acidproof, alkaliproof, fumeproof and, of course, moistureproof. It resists all temperature changes without physical alteration, cracking, peeling or blistering. No pigment coating can be applied over Minwax No. 700 Black. Two-coat treatment is always recommended—its cost being little more than that of one ordinary oil paint coat. Covering capacity is about 400 sq. ft. per gal., first coat, and 500 sq. ft. per gal., second coat.

No. 150 BLACK—For exposed interior metal surfaces, Minwax No. 150 Black meets conditions where metals are not in direct sunlight, but are exposed to air, moisture, fumes, smoke, etc.—as in tunnels, factories, shops, mills, foundries and boiler plants. It forms a tough, elastic, non-cracking, impervious coating with the maximum of protection. Covering capacity is about 450 sq. ft. of smooth metal per gal.

No. 100 RED—A shop coat for iron or steel. This Minwax coating bonds firmly without peeling or blistering to any metal. The color is a bright Flemish tile red, of extreme permanency, produced by imported ferric oxide in a reinforced oil vehicle. Covering capacity is about 350 sq. ft. per gal., on metal.

No. 100 BLACK—A field coat for embedded iron or steel. Minwax No. 100 Black is a pure asphaltic hydrocarbon coating produced from a natural asphaltic mineral wax. It is designed as a protective coating, over Minwax No. 100 Red, for metal that is to be embedded in concrete or masonry. It is chemically inert, is acidproof and alkaliproof, dries by evaporation, is absolutely stable, and gives a tacky surface that bonds perfectly with the priming coat and also with the surrounding masonry or concrete. Minwax No. 100 Red and Black, in combination, give as perfect protection against corrosion as modern science can produce. The covering capacity of Minwax No. 100 Black is about 450 sq. ft.

Specifications on any of the above sent on request.

MORENE PRODUCTS CO., INC.

Manufacturers of Cement in Liquid Form and Waterproofing Specialties

245-247 West 28th Street
NEW YORK, N. Y.

Products.

LIKWID CEMENT for Finishing Exterior and Interior Surfaces; MORENE PETROFLUID for Waterproofing Structures subject to water pressure; MORENE KEMISOL for Waterproofing Surfaces above ground.

Morene Likwid Sement.

Especially adapted for application on structural steel and galvanized iron in all factories, industrial plants, gas works, reservoirs, tanks, etc.

Can be applied on live steam pipes.

Morene Likwid Sement is portland cement in liquid form, produced by chemical process, carrying sand and asbestos in suspension, retaining the natural set, hardening and curing features of the original portland cement base. Is immune from injury by the elements.

Morene Likwid Sement is shipped ready for use. It should be used within 30 days from date of shipment.

The base color is white cement. It is applied with a brush in any color and texture on stone, brick, concrete or plastered surfaces. Any smooth, stipple or stucco effect can be produced.

Rough concrete or brick walls first given a surface application of Morene Kemisol (applied with a compressed air spray) and a heavy coat of Morene Likwid Sement will be absolutely waterproof and have a reasonably smooth appearance as the smaller voids and imperfections will be filled.

SPECIAL FEATURES—(1) Morene Likwid Sement is a perfect waterproof cement surface, will not scale, and fine hair checks will not appear as in ordinary cement plaster.

(2) It can be applied without injury when subjected to hot sun or wind and after being applied an hour, ordinary showers will not mar the surface.

(3) Will adhere and bond to painted surfaces. Old defective stone, brick and cement walls can be safely refinished.

(4) Morene Likwid Sement applied over brown coat cement plaster makes it unnecessary to apply the usual finish or dash coat plaster and to paint same for decorative color effect.

(5) It will also adhere to wood and metal, thus enabling wooden or metal cornices to be finished to match the adjacent stucco or stone work.

Morene Kemisol.

The scientific, practical and economical perfection of a colorless waterproofing and preservative for stone, brick, concrete and cement surfaces above ground.

APPLICATION—Use 1 gal. of Morene Kemisol for 10 to 15 sq. yds. Surface to be treated must be dry and absorptive to obtain proper results. If the structural material is covered with paint, grease or other foreign matter preventing direct contact, same must be removed before applying the waterproofing.

Morene Kemisol should be applied with a compressed air spray (orchard spray); a large brush will do. Every square inch of exposed surface must be treated. Crevices, cracks, voids and all low places must be thoroughly saturated.

Apply freely, not less than two applications, second

to follow immediately after first is absorbed, not over 10 minutes intervening. Once dry and set, no more can be absorbed. Any material remaining on the surface is useless. Smooth cut stone or pressed brick surfaces should be wiped off with cheese cloth before last application has thoroughly dried.

All dangerous crevices and voids on buildings must be pointed up with Morene Plastik Sement after being treated with Morene Kemisol to insure a watertight job.

SPECIAL FEATURES—(1) Morene Kemisol is a chemical solution, water base, ready for use.

(2) Is efficient only on absorptive surfaces.

(3) Leaves no coat, fills no pores, but makes the material itself non-absorptive.

(4) Is a preservative for stone, brick and cement; prevents discoloration and stains.

(5) Applied to the surface, prevents efflorescence or alkali from appearing on walls.

CAUTION—This material is ready for use. Do not dilute. In cold weather it will thicken. If too heavy, warm to about 100° Fahr. It should not be used at a temperature lower than 50° Fahr.

Morene Petrofluid.

An underground waterproofing material for basements, tunnels, tanks and reservoirs, or any concrete or brick construction to resist water pressure; to be used as an integral mixture in cement plaster or floor topping—prevents absorption and percolation, and will resist constant and severe water pressure.

APPLICATION—Surface to be plastered must be properly prepared to secure a perfect bond.

If the surface is smooth or has been painted, roughen by chipping about 70% of the surface. Dry parts of the wall must be thoroughly wetted with water or given a brush coat of equal parts of Morene Petrofluid and water before plastering to avoid quick drying of plaster and assuring a perfect bond.

For average conditions, mix 1 part cement and 2 parts fine sharp sand in the usual manner. Add 1 gal. of Morene Petrofluid to each bag of cement, then add sufficient water to make proper consistency. Apply and finish same as ordinary cement plaster.

For troweling or floating surface, use equal parts of Morene Petrofluid and water.

Estimate for this work: 1 bag of cement and 2 bags sand will plaster 6 to 7 sq. yds. $\frac{1}{2}$ in. thick. Minimum thickness of plaster should be $\frac{1}{2}$ in.

Where severe water pressure exists, increase the quantity of Morene Petrofluid about 50% or $1\frac{1}{2}$ gals. to each sack of cement. Also increase the thickness of plaster somewhat.

CAUTION—This material is ready for use. In cold weather it will thicken; if too heavy, warm to about 100° Fahr. Should not be used at a temperature lower than 50° Fahr.

Technical Service Department.

This company maintains a Technical Service Department. Experts are at your service for the solution of any problems pertaining to waterproofing, and to the conservation or protection of buildings.

NEW PROCESS CHEMICAL CO., INC.

Waterproofing and Acid Resisting Paints and Cements

39 Cortlandt Street

NEW YORK, N. Y.

Products.

PAINTS: Waterproofing; Acid Resisting; Anticorrosive; Insulating; Concrete; Marine.

CEMENTS: Waterproofing; Acid Resisting; Flashing; Seam; Elastic; Roof; Vault Light; Insulating.

Also Liquid Waterproof Glue.

INTRODUCED 1907

TRADE-MARK
Reg. U. S. Pat. Off.

XXX Nupro Cement (Maroon and Black), Elastic, Adhesive, Water and Acidproof.

Applied while hot with a trowel. For waterproofing structures. Will adhere to brick, concrete, steel, wood, tin, iron, slate, glass or felt. Retains its elasticity; will withstand vibration and climatic changes.

Especially adapted for waterproofing foundation walls; for lining steel, wood or concrete tanks; for coating exposed brick walls; for filling cracks and stopping leaks in concrete roofs, foundations, tanks, etc.; for waterproofing steel joints where they go through concrete; for coating steel girders lying in wet or damp places for prevention of electrolysis and corrosion; for uniting old and new concrete, making a perfect watertight joint; for tile and slate roof repairing; for vault lights; for waterproofing interstices of steel structures, etc.

COVERING CAPACITY—1 lb. XXX Nupro Cement covers 2 sq. ft. $\frac{1}{16}$ in. thick.

NOTE—Used on the Queensboro and Manhattan bridges in New York City for waterproofing expansion joints. In service since 1916, still qualifying.

X Nupro Cement (Maroon in Color).

X Nupro Cement is an especially high grade of flashing for dormer windows, skylights, chimneys, repairing leaks in tin roofs, etc.

It is ready for use. Adheres to wet or dry surfaces and forms a leatherlike impregnable coat that always remains elastic and adhesive and will not become brittle, peel off, crack due to vibration, nor is it affected by climatic changes.

COVERING CAPACITY—1 lb. covers 4 sq. ft. when applied as a flashing.

Nupro Solution and Enamel—Elastic and Adhesive, Anti-corrosive Coating for All Kinds of Tanks.

Nupro Solution is a primer to be used in steel or concrete water tanks or containers that are to hold cold acid solutions, alcohol or vinegars, after which a coating of Nupro Enamel, $\frac{1}{16}$ of an in. thick is applied.

100 lbs. of Nupro Enamel will coat 200 sq. ft. $\frac{1}{16}$ in. thick.

COVERING CAPACITY—1 gal. of Nupro Solution covers 400 sq. ft. of surface.

"Tri-Bitume" (Registered).

"Tri-Bitume" is a composition of bitumen mixed with non-oxidizing oils, is elastic, adhesive, waterproof and insulating.

For waterproofing foundation walls below grade, dampproofing walls above the grade level and staining limestone, granite and marble.

Manufactured in several consistencies.

NOTE—Nupro "Tri-Bitume" was used for waterproofing concrete car floats and barges built by the United States Navy and War Departments.

TRADE MARK
TRI-BITUME

"Tri-Bitume" No. 11 (Primer).

A primer to be used in conjunction with "Tri-Bitume" No. 22 and No. 33 as a first coat where structures are to receive 2 or more coats. Its purpose is penetration and to seal all pores.

COVERING CAPACITY—1 gal. covers 100 sq. ft.

Dampproofing Walls above Grade (Interior).

"Tri-Bitume" No. 22, a black, heavy, elastic, waterproof material that remains tacky, makes a perfect bond between plaster and main wall, eliminates furring and lathing.

COVERING CAPACITY—1 gal. covers 80 sq. ft.

Dampproofing Walls below Grade (Exterior).

"Tri-Bitume" No. 33, a heavy, semiplastic, water-repellent, elastic coating, is applied with a stiff brush or trowel to the outside of foundation walls, after the same have received a coating of "Tri-Bitume" primer No. 11. (Backfill should not be placed until after the coating has dried for at least 48 hours.)

COVERING CAPACITY—1 gal. "Tri-Bitume" No. 33 will cover 40 sq. ft.

Stainproofing Marble, Limestone, Granite, etc.

Apply 1 coat of "Tri-Bitume" No. 11 before stone is to be laid and 1 coat of "Tri-Bitume" No. 22 not more than 24 hours before the stone is laid. The above treatment will eliminate mortar stains and efflorescence.

Nupro Acid Resisting Paint No. 44 (Maroon, Black, Gray and Green).

For factories, foundries and industrial plants. Not being affected by acid fumes or gases, it is especially adapted for coating all steel or iron structural work in industrial plants, foundries, etc., for the prevention of disintegration due to corrosion caused by gases, acid fumes and climatic conditions. Possesses a proper degree of expansion and contraction, and will not crack, chip or peel off.

Maroon is recommended as a first coat.

COVERING CAPACITY—1 gal. covers about 400 sq. ft. of surface.

PERMANENT IRONITE WATERPROOFING CO.

Engineers and Contractors for Waterproofing

518 Peoples Gas Building
CHICAGO, ILL.

BRANCH OFFICES

PITTSBURGH, PA., 813-14 Union Bank Building
KANSAS CITY, MO., 232 Lathrop Building
ST. PAUL, MINN., Pioneer Building

MILWAUKEE, WIS., First National Bank Building
HOUSTON, TEX., 204 Beatty Building
FT. WORTH, TEX., 117 South Jennings Avenue

Products.

IRONITE WATERPROOFING; IRONITE CEMENT FLOOR HARDENER; IRONITE OILPROOFING.

Ironite Waterproofing.

Made in the form of a very fine metallic powder. It is mixed with water, and on application to a porous masonry surface will penetrate where moisture will.

The Ironite oxidizes and expands, becoming an integral part of the material to which it is applied, both strengthening and waterproofing same.

Ironite is an insulator against electricity, steam, heat and cold. It is non-magnetic, prevents electrolysis, and withstands a high degree of heat. Tests have proved it to withstand higher degrees of heat than concrete, steel and fire brick. Protects against the action of gases, fats, oils, brines, syrups, etc.

WHERE USED—Ironite is used on subways, basements, scale pits, coaling stations, powerhouses, cinder pits, tanks, tunnels, etc.; also on porous building products, such as brick, concrete and stone, applied on wet or dry surfaces.

APPLICATION—It is applied either to the interior or exterior surfaces of walls or floors, as conditions require.

By applying to the interior surfaces no outside excavation is necessary, consequently old work can be waterproofed as readily as new construction. Further, for inside treatment, the most opportune time can be selected to treat the surfaces, no interior lining wall being

required to hold the waterproofing in place; consequently, in case of fractures in the structure, repairs can be easily made.

PRESSURE—Ironite waterproofing is guaranteed to prevent leaks, providing structure stands where pressure does not exceed 4320 lbs. per sq. ft.

FINISHING OF WALLS—Walls may be plastered or decorated after waterproofing has been applied.

LIFE—Ironite will last as long as the structure to which it is applied, and in most instances lengthens the life of the structure.

SPECIFICATIONS—Specify that all surfaces to be treated shall be taken care of by the Ironite method, by the PERMANENT IRONITE WATERPROOFING CO.

Detailed specifications furnished on request.

Ironite Cement Floor Hardener.

A metallic hardener, used as an added aggregate, which, when mixed with cement, expands to such an extent as to close the pores in the cement finish. The result is a solid floor with a wearing surface of maximum density, adding strength to the concrete.

Specifications and information furnished on request.

Ironite Oilproofing.

This material is applied similar to the Ironite waterproofing, and will make the concrete both waterproof and oilproof. The Ironite method has been used for over 2 years to treat the inside surface of concrete oil storage tanks in various sections of the country, and has been used for different kinds of oil products.

BASEMENT AND SUB-BASEMENT OF PENNSYLVANIA FREIGHT TERMINAL, CHICAGO, ILL.
Waterproofed from the inside with Ironite method

THE SHERWIN-WILLIAMS CO.

Paints, Varnishes, Enamels, Stains, Wood Preservatives

CLEVELAND, OHIO

FACTORIES

CLEVELAND

CHICAGO

NEWARK

MONTREAL

LONDON, ENGLAND

SALES OFFICES AND WAREHOUSES IN PRINCIPAL CITIES

Products.

Manufacturers of a complete line of PAINTS; VARNISHES; ENAMELS; STAINS; ROOF CEMENTS; WOOD PRESERVATIVES; CONCRETE and CEMENT HARDENERS; WATERPROOFING COMPOUNDS.

Facilities and Quality of Products.

To meet the paint requirements of mine owners and operators, THE SHERWIN-WILLIAMS Co. has thoroughly investigated the conditions surrounding the industry and as a result has developed a line of materials particularly adapted to meet the severe and widely differing destructive influences to which such paints are subjected.

Sherwin-Williams' facilities for producing just the right product for each specific purpose are unequalled in the paint and varnish field. The sources of supply of many of the most important raw materials are controlled by THE SHERWIN-WILLIAMS Co., who operate 5 factories for the production of paints and varnishes—tin can factory, box factory, mines and smelters, and other essential raw material producing units.

Each product is designed for the particular use specified and will economically and effectively produce the best results.

S-W Mine, Mill and Factory Colors.

Sherwin-Williams Mine, Mill and Factory Colors are recommended for decorating and preserving exterior surfaces where a durable oil paint is required at moderate cost.

Used largely where operators desire to maintain standard uniform colors at various plants, employees' houses, etc. (see plant standardization plan on next page).

S-W Metalastic (Liquid).

Metalastic is a combination of carbon black, graphite and specially treated pure linseed oil, producing a film that is very elastic and durable. The drying is so regulated by special dryers that it is an ideal paint for shop coats on structural steel. It is also recommended as a fabricating coat. Furnished in four colors—black, brown, green and dark gray—ready for use.

Put up in 1-qt., 1-gal. and 5-gal. cans, also barrels.

S-W Non-corrodible, Acid Resisting Paint.

A splendid antirust paint with graphite for its pigment base. It will be found very durable and economical for metal surfaces. It is a scientifically prepared coating for use on metal surfaces subjected to the action of gases, acids or their fumes, salt water, ammonia, and other disintegrating agents. Especially adapted for use

on smelters or buildings adjacent, which are subjected to sulphuric acid fumes, and similarly exposed locations.

Put up in 1-gal. pails, 5-gal. square tin cans and barrels.

S-W Galvanized Iron Primer.

Prepared ready for use. This is a paint for priming or first coating galvanized iron and sheet metal surfaces; metal sash and trim, cornices, finials, leaders and in fact any galvanized iron surface. [It is a perfect undercoating and can be successfully applied to galvanized iron and sheet metal surfaces.] It is made especially for high class work and subsequent coats of S-W Metal Protective and Oil Paints must be applied not longer than 4 days later. Made in gray only.

Put up in 1-qt., 1-gal. round cans, 5-gal. square cans and barrels.

S-W Roof and Bridge Paint.

An economical paint for roofs, bridges, barns, fences, etc., of metal or rough lumber.

S-W Carbon Paint, Red Diamond Brand.

Absolutely the best chemically inert carbon metal protective paint possible to manufacture. Produces a homogeneous film which insures maximum protection.

S-W Salamander Smoke-stack Black.

Especially made for boilers, smokestacks and surfaces subjected to great heat. Elastic and very durable.

S-W Gas Engine Enamels.

Especially adapted for finishing machinery, engines, and all metal work, etc., where a rich gloss elastic finish is desired. Does not become brittle nor mar easily.

S-W Graphite Pipe Joint and Gasket Compound.

A practical advantageous material indicated by its name. It makes a perfectly tight joint with less labor and cost than red lead and other materials, and in addition allows the various fittings on which it has been used to be uncoupled without the loss or breakage characteristic of red lead, cement or rust-set joints. Does not become hard in the package.

S-W Lustral Enamels.

Designed particularly for use on wood and metal surfaces, where an elastic high gloss enamel finish is desired. Constructed to withstand severe usage to a maximum degree. Made in a number of attractive shades.

S-W Eggshell Mill White.

(Undercoat and finishing).

For use on building interiors, etc. The intense whiteness makes it particularly adaptable for use in dark corners for reproducing refractory light. It will be found an invaluable agent for efficient lighting in building interiors.

Put up in 1-gal. and 5-gal. containers, also in barrels.

S-W Ajax Insulating Varnishes and Compounds.

In Ajax insulating materials THE SHERWIN-WILLIAMS Co. offers a complete line of insulating varnishes, both air drying and baking compounds, acid resisting paints, spirit varnishes, etc. The same care that is used in the manufacture of the entire line of Sherwin-Williams paint and varnishes is used in the production of insulating materials. The raw materials are selected with the greatest of care by experts in this line and are combined in a way that only long experience, careful research and a full knowledge of the business can teach.

Every batch is carefully tested in THE SHERWIN-WILLIAMS Co.'s well equipped laboratories (before shipment is made) for heat resistance, oilproof and moistureproof qualities, as well as dielectric strength.

This painstaking care that is used both in the manufacturing as well as the testing of S-W insulating materials, assures a product that at all times will meet the exacting requirements of users of electrical equipment of all kinds.

S-W Preservative Shingle Stain.

An exceptional line of shingle stains made on a creosote basis for use on shingle roofs and all shingle parts. Is also well adapted for stables and outbuildings, as it is an excellent wood preservative, as well as a strong disinfectant.

S-W Ebonol.

An economical black elastic paint for use on paper, composition, felt and canvas roofing and on exterior equipment of any sort where an economical paint is desired. Can be used on tin roofing, as it absolutely contains no acids harmful to the metal. Is also adapted for use on rain water tanks, standard pipe, sluice boxes, water troughs, gutters, copings, fences, etc.

Ebonol has excellent covering capacity, works well under the brush and will stand outdoor exposure.

S-W Elastic Roof Cement.

Without doubt the most durable and economical roof cement on the market today. For use in repairing all leaky roofs, can either be used for patching or can be spread over the entire roof, making practically a new roof at a very small cost. Cracks and holes in brick, stone, concrete, chimneys and other exposed surfaces can be sealed up with comparatively little trouble by using this material. It is made on a pine tar basis with long asbestos fiber as its pigment, which makes it fireproof.

S-W Elastic Roof Cement will remain plastic in all temperatures, will not run in the hot summer sun or crack in freezing temperatures.

Put up ready for use in 1-, 5-, 25- and 100-lb. containers and barrels.

100 sq. ft. of roofing will require from 25 to 50 lbs.

S-W Carbolic-Oil (A Wood Preservative.)

Carbolic-Oil is a pure anthracene oil derived from the distillation of pure coal tar, or in other words, the heaviest oil produced from the distillation of coal tar and what is known as a high boiling point oil. The distinction between an anthracene and creosote oil is that the latter distills at a low temperature, consequently is lighter in gravity, more volatile, and generally recognized as not being efficient for the types of work for which Carbolic-Oil is recommended.

Particularly recommended for use on poles, shaft timbers, trestles, flumes, tipples, air shafts, sheds, etc.

Carbolic-Oil can be sprayed, dipped or brushed and where possible, dipping is preferable, heating the material about 200° Fahr. It is always preferable to heat a wood preservative before applying, as this greatly assists the impregnation of the wood.

S-W Concrete and Cement Hardener.

An effective preparation for hardening and waterproofing cement. The value of using a preparation for hardening and waterproofing cement can not be overestimated. Cement, the same as all other materials, is subject to wear and decay from the elements unless properly protected. By filling up the open pores or voids with S-W concrete and cement hardener, the cement may be greatly strengthened or hardened, thus giving it much better wearing properties. The elements have no effect on S-W Concrete and Cement Hardener, as, after the pores of the cement are filled with this material, the cement becomes permanently and thoroughly waterproof.

S-W Petriloid.

An excellent waterproof, alkaliproof, acidproof and dampresisting glossy black composition, used for hermetically sealing concrete and stone surfaces against the detrimental agents mentioned.

S-W Plant Standardization Plan.

THE SHERWIN-WILLIAMS Co. has a plant standardization plan of special interest to mine operators (see sample below). Complete information of this plan, together with a system worked out for general use will be submitted on request.

STANDARDIZATION CHART OF PAINTS AND VARNISHES LEHIGH & WILKES-BARRE COAL COMPANY WILKES-BARRE, PA.				
NUMBER	COLOR	USE	HOW USED	PER GALLON COVERING CAPACITY
52 Semi-Flat Black No. 52		Breaker and Hoisting Engines, Fan Engines, Compressors and Pumps, Interior Only.	One coat over filler	400-500 sq. ft. one coat
67 Semi-Flat Black No. 67		Fan Draft Engines, Conveyor Fan Housing, Chain Hoist and Shop Engines, Hot Water Heaters, Hoisting Engines, Inside Pumps, Exterior and Interior	One coat over filler	400-500 sq. ft. one coat
84 Intermediate Coat No. 84		Plates chipped down to filler	One or more coats as needed	400-500 sq. ft.

STANDARDIZATION CHART

Special Paints.

It is of course impossible to describe the entire line of Sherwin-Williams products in these columns—only a small percentage being mentioned here. However, this company makes a special paint for every surface and is prepared to furnish at once and in any quantity just the right product for any purpose. THE SHERWIN-WILLIAMS Co. will be glad to solve specifically any paint problem.

IMPERVITE CEMENT WATERPROOFING COMPOUND.

Also, Ru-ber-oid and SPC Roofings, Shingles, Felts, Papers, Deck Cloth; P&B Technical Paints, Liquid Insulating Materials and Asphalt Specialties.

Advantages of Impervite Waterproofing.

A $\frac{3}{4}$ -in. facing of Impervite mortar, plastered on the inside of a structure according to Specification A, by THE STANDARD PAINT COMPANY or under its supervision, is guaranteed to make and maintain the job watertight.

Due to the efficiency of Impervite, a *leaner* mortar than ever before specified may be used. This eliminates cracking.

Impervite differs from other waterproofing compounds, because it contains no calcium stearate or other soap. Unlike soap compounds it does not reduce the strength or delay the set, therefore larger amounts can be used and greater safety attained, although even for equal weights, it is guaranteed to be twice as efficient as any soap compound. See Test G.

Impervite is a white paste having a paraffin base, emulsified so as to be mixable with water. The value of paraffin has long been known, and Impervite now adapts it to concrete. Impervite is shipped in 25-lb. and 100-lb. cans and 450-lb. barrels.

Impervite mortar is permanent. It will resist brine, hot water, steam, fuel oil and other oils; distillates, acid fumes and most chemicals.

As compared to a membrane of tar and felt, the Impervite system is applied to the inside and does not require any protecting wall or double floor construction. This saves in excavation, construction, and useful space.

The experts of this company discuss cost and design with clients and maintain an effective co-operation with the job. Apply for a Question Blank, fill out, and receive suggestions.

Tests.

A—SAN FRANCISCO EXPOSITION—As the result of comparative tests, Impervite received the Gold Medal, highest award.

B—PERMEABILITY TEST—Impervite mortar, $\frac{3}{4}$ in. thick, has been tested to 150 lbs. pressure per sq. in. without any percolation taking place.

Note—(A very efficient permeameter designed by this company will be loaned.)

C—BONDING TEST—Impervite facing bonded to old concrete shows an adhesion of 290 lbs. per sq. in., equal to about 600-ft. head of water.

D—"ENGINEERING RECORD"—See Oct. 10, 1914, for description of an Impervite job withstanding 200-ft. head.

E—U. S. BUREAU OF STANDARDS—Technologic Paper No. 18 reports that compound No. 11 was the only one warranting further investigation. (No. 11 is Impervite.)

F—U. S. DEPARTMENT OF AGRICULTURE

Remarks on Design.

FLOORS—It is important that floors be reinforced strongly enough to resist the upward pressure of the ground water. This is $62\frac{1}{2}$ lbs. per sq. ft. of floor for each 1 ft. of head. Clay or rock foundation does *not* permanently reduce this. A floor 20 by 50 ft. subject to 5-ft. head has a total upward pressure of 312,500 lbs. Determine the maximum head of water before starting construction. Special data on request.

All floors should have some reinforcement to prevent cracking due to temperature stresses and the shrinkage of concrete on setting. A safe rule for small floors subject to not over 2-ft. head of water is a 5-in. base of 1:2:4 concrete, reinforced with $\frac{3}{8}$ -in. deformed steel bars, 1 in. from top of floor and spaced 1 ft. apart in both directions across floor.

Protect floor from cracking by heat of boilers or ashes. Domestic furnaces should rest on a layer of plain brick, extending out 4 ft. in front. Large boilers should rest on 2 in. of sand, covered with brick and extending out 8 ft. in front.

WALLS—To prevent shrinkage cracks in concrete walls, use 0.5% of reinforcing steel in horizontal direction: that is for every 100 sq. in. cross section of wall, use $\frac{1}{2}$ sq. in. of horizontal steel. For example, a wall 10 in. thick and 10 ft. high has a cross section of 1200 sq. in. and requires 6 sq. in. of horizontal steel. This may be secured by 6 rods 1 in. square, or better by 24 rods $\frac{1}{2}$ in. square.

A plain circular or straight wall is less likely to crack than one with offsets. Strengthen corners by bending the reinforcement around and using extra bars and fillets.

Ask for this company's suggestions on expansion joints.

For Safety, Use Specification A.

Specification A has been compiled at the urgent request of engineers desiring a high safety factor. It is original and contains the most advanced practice.

Without interfering with the strength of the mortar, it takes more compound than competitors are able to use and gives 12 times the security. See Tests F and G. It specially avoids rich mortars which might crack. The total cost of labor, cement, sand and compound for a waterproof facing is 20¢. to 50¢. per sq. ft., the cost of compound being 2¢. to 6¢. *Therefore if the extra safety is worth 4¢. a sq. ft., use Specification A.*

Abridged Specification A.

Walls and floors, where indicated on plans and specifications, are to be waterproofed with Impervite Cement Mortar, according to Specification A of THE STANDARD PAINT COMPANY, New York, N. Y., whose instructions shall be secured by contractor before starting work. No substitution will be permitted.

Specification A—1:3 Mortar Facing.

ESTIMATING—For 100 sq. ft. of surface, 1 in. thick, figure 3 bags of cement, 9 cu. ft. of sand and 36 lbs. of Impervite.

MIXING—Mix equal parts of Impervite and water and take a 12-qt. pail of this solution for each bag of cement. Use 1 bag cement to 3 cu. ft. sand. Mix on a tight floor until the mortar is perfectly uniform.

MATERIALS—Cement shall be approved brand, but sand is of greater importance, as it is impossible to secure results with sand which is dirty or too fine. Sand must be washed free from loam or clay. It must have a large proportion of coarse grains, and on test must equal Standard Ottawa Sand.

WORKMANSHIP—The work shall be done by experienced cement masons or sidewalk finishers, not by lime plasterers. Go over finished job with a light hammer; cut out any hollow place, roughen well, apply grout and replaster. Any cavity or scratch indicates faulty workmanship.

ROUGHENING—The roughness left by board forms is not sufficient for perfect bonding. Chip new concrete every 1 to 1½ in. immediately after removing forms, as part of the concreting contract; the waterproofing may be done later (a convenient tool is a T shape 3-lb. hammer with 4-in. points). Chip old concrete and wash with 1 part muriatic acid to 5 parts water (mixed in a wooden pail) and flush off thoroughly. Deeply rake joints of new brick; old brick should have entire surface removed with an axe. On new floors remove dirt and chalky material; thoroughly chip old or smooth floors.

BONDING—Wet down at intervals or soak for 24 hours so as to saturate the surface with water and prevent too quick drying of the mortar, which would make it weak. Then brush a grout of cement and water on to a small portion and follow within 10 minutes with mortar, for if the grout dries it is worse than useless. (The grout penetrates the fine pores where mortar is too stiff to enter.)

PLASTERING—Wall facings shall be ¾ in. thick in 2 coats. Floor facings 1 in. in 1 coat. Walls are plastered first; floors last.

Prevent mortar from sagging. Allow to harden 1 to 2 hours, then work with wooden float to compact thoroughly and remove holes. This is most important. Scratch lightly with ½-in. wire mesh. Apply finish coat, stopping 6 in. above floor. Allow to harden, then float again with great care and trowel smooth. (The use of dry cement in finishing is prohibited.) Apply floor, sweeping 6 in. up wall in a rounded cove; float and trowel.

When joining to any facing that has stood 12 hours or more, break off the edge to expose a clean fresh surface, and brush on a cement grout.

After getting first set, cover floor for 1 week with moist sand or water 1 in. deep. If room is heated, keep walls covered for 1 week with wet burlaps.

PUMPING—Dig a hole or sump 3 ft. below floor level and keep this pumped dry night and day until the mortar has set sufficiently to withstand the pressure of water. (Instructions for closing sump sent on request.)

NOTE—For oilproofing, acidproofing, or if necessary to combat running water, get special directions.

Specification B—1:2 Mortar Facing.

ESTIMATING—For 100 sq. ft. of surface 1 in. thick, figure 8 lbs. Impervite, 4 bags cement and 8 cu. ft. sand.

MIXING—Use 1 bag cement to 2 bags clean, coarse sand. Mix equal parts Impervite and water and take ½ gal. of this solution to each bag of cement.

Specification C—Mass Concrete.

ESTIMATING—For each cubic yard of concrete, figure roughly, on small jobs, ½ yd. of sand, 1 yd. of stone and cement as follows: (7 bags for 1:1½:3), (6 bags for 1:2:4), (5 bags for 1:2½:5), (4 bags for 1:3:6). For each bag of cement, take 1 lb. of Impervite (1 pt., dipperful). On special work more may be used.

MIXING—Impervite gives a smooth flowing mixture with a reduced amount of water; this results in stronger concrete. Throw right into the mixer, giving fully 1 to 2 minutes in the machine.

CONCRETING—Spade well to the face of the work. Work continuously if possible; but if stops at night are necessary, roughen the surface with a rake. Before starting again, pour a 2-in. bonding layer of 1:3 waterproof mortar without stone.

NOTE—Under ideal conditions, concrete can be made waterproof without any compound. Under practical conditions, it is easy to slip up on any of the following details:

(1) Rigid and watertight formwork. (2) Well graded aggregates that run uniform from day to day. (3) Uniform proportioning and adequate mixing of every batch. (4) Preventing the use of an excess of water. (5) Depositing the concrete without segregation in chutes or forms. (6) Conscientious spading. (7) Either continuous night or day work, or very careful attention to the bonding planes. (8) Preventing the infiltration of water, before concrete is hard. (9) Curing to prevent freezing, or too rapid drying.

The addition of Impervite is very useful, but even a 3-ft. thickness of mass concrete is not as safe as a ¾-in. Impervite mortar facing according to Specification A.

Specification D—1:4 Non-cracking Stucco.

ESTIMATING—For 100 sq. ft. of surface 1 in. thick, figure 2½ bags cement, 10 cu. ft. sand and 10 lbs. of White Impervite. (1-in. stucco is twice as strong as ¾-in.) Hair is unnecessary. Lime (whether hydrated on the job or at the mill) will not be permitted, as it contracts on drying, thereby increasing the tendency of stucco to crack.

MIXING—Measure and mix carefully to get uniform color. To each bag of cement, use 4 cu. ft. clean, coarse sand, measured in a frame 4 ft. by 2 ft. by 6 in. high. Mix equal parts Impervite and water, and take 1 gal. of this solution for each bag of cement.

APPLICATION—Saturate tile or masonry walls with water before stuccoing. The painting of tile is *not* recommended. Keep stucco from drying till at least 1 week old; cover with tarpaulins or spray frequently. To prevent diagonal cracks at the corners of door and window openings, place an extra strip of expanded metal 1 ft. square.

NOTE—The pamphlet, "Inside Facts about Stucco," will be sent on request. This was the first literature showing that rich mortar is the main cause of hair cracking. Impervite is recommended by leading architects and manufacturers of tile, lath and cement. For valuable data on Impervite stucco, see Technologic Paper No. 70 of the U. S. Bureau of Standards.

An old client reports, "The Impervite stucco is the best job in the county; not a hair crack in the whole structure."

Testimonials.

MCDONALD & JOSLIN, BOSTON, MASS.—"We have had a great deal of trouble with waterproofing different basements and elevator pits, and it seems a godsend to find something so simple and satisfactory as Impervite."

RUBBER REGENERATING CO., NAUGATUCK, CONN.—"We used Impervite in a pit with 9-ft head to fight against. This water was strong with dilute acid. A ¾-in. facing of Impervite mortar was placed on the walls and a 1-in. facing on the floor and, since then, this pit has been absolutely dry."

BELL BROTHERS MUSIC CO., TOPEKA, KANS.—"We tried everything that was mentioned in order to overcome water seeping through the wall. We are now using the room for pianos and there is no sign of dampness."

THE SANDUSKY CEMENT CO.

Manufacturers of Concrete Waterproofing and Waterproofed Cement
CLEVELAND, OHIO

BAY BRIDGE, OHIO

• FACTORIES
SYRACUSE, IND.

DIXON, ILL.

YORK, PA.

Products.

MEDUSA WATERPROOFING, in either Paste or Powder form—the original *integral* concrete waterproofing.

MEDUSA PORTLAND CEMENTS: Gray and White Portland Cements; Waterproofed Gray and Waterproofed White Portland Cements.

Also, Medusa Stone Backing.

Medusa Waterproofing.

MEDUSA PASTE—A white emulsion which can be dissolved in the gauging water for mortar or concrete. Especially recommended for machine mixed concrete.

The correct quantity to be used is 1 gal. to a barrel of portland cement.

MEDUSA POWDER—A water-repellent compound of fatty acids chemically combined with lime, to be mixed with dry cement before sand and water are added.

From 1½% to 2% of weight of cement (6 to 8 lbs. to 1 bbl. cement) is the right quantity to be used.

DESCRIPTION OF MEDUSA WATERPROOFING—The paste is identical with the powder in resulting composition, and is as everlasting as the concrete itself. It forms in concrete a water-repellent compound, thoroughly and effectually rendering the mass impermeable.

Ordinary concrete consists of from 20% to 40% of microscopic pores or capillary tubes, thus making it a porous material. Medusa Waterproofing possesses the characteristic of forming a thin film, capable, when properly supported, of holding back, by surface tension and its own cohesion, the layer of water to which it is exposed.

ADVANTAGES—It causes concrete work to dry off immediately after a rain, avoiding the unsightly dark appearance which water-soaked concrete retains for hours.

It makes concrete basement walls, tanks, cisterns, mortar and all concrete work positively waterproof and dampproof.

It does not affect the color, strength, or setting of concrete work and prevents the white efflorescence which renders cement work unsightly. It also minimizes the formation of shrinkage cracks.

Being sealed within the pores of the concrete, and not being subject to depreciation, the waterproofing effect is permanent.

It adds very little to the cost of the concrete and needs no renewal.

USES—Medusa will give positive watertight and dampproof results in the construction of concrete reservoirs, water towers and tanks, bathing pools, tunnels, disposal plants, pumping stations, elevator pits, stucco, basement walls and floors, cisterns, cement blocks, etc.

SPECIFICATIONS—Specify "According to manufacturers' directions." Write for specification booklet.

Medusa Portland Cements.

DESCRIPTION—Medusa Waterproofed Cements are

slow setting and quick hardening, remarkably uniform and especially noted for their fineness and strength. They constitute the regular white and gray brands waterproofed, ready for use, with Medusa Waterproofing. Highly recommended for basement walls and floors, swimming pools, reservoirs, elevator pits, and in a multitude of other uses where resistance to water percolation is required.

OUTPUT—Annual production, 3,000,000 bbls.

QUALITY—Medusa Portland Cements are guaranteed to pass standard and United States Government specifications. Every carload is tested before being shipped. A record of laboratory tests will be furnished on request.

SPECIFICATIONS—Specify "According to manufacturers' specifications." Write for specification booklet.

MEDUSA WHITE PORTLAND CEMENT—Especially suited for exterior or interior work, stucco work, and all kinds of construction where a beautiful white color is desired. Unexcelled for stucco, concrete bridges, floors, building trim and ornamentation.

MEDUSA GRAY PORTLAND CEMENT—Best suited for concrete work in which a white finish is not required. It is used extensively in roads and farm, factory and general industrial construction.

MEDUSA WATERPROOFED WHITE PORTLAND CEMENT—Consists of Medusa Waterproofing ground with Medusa White Portland Cement in the process of manufacture, insuring a thorough mixture in exactly the right proportions. It is the most reliable waterproofed cement manufactured.

Makes mortar or concrete absolutely waterproof, preventing the slightest penetration of moisture or dampness. It prevents discoloration of concrete blocks or stucco after heavy rains, and does not affect strength, setting or hardening qualities of concrete.

Intended for use the same as ordinary portland cement. Also used in stucco or exterior plaster. Its use prevents corrosion of metal lath, which may occur if cement plaster allows moisture to penetrate.

Concrete blocks are now being used in the construction of a great variety of buildings, in many of which waterproofing is absolutely necessary. Concrete blocks faced with Medusa Waterproofed White Portland Cement will be absolutely proof against water and moisture and permit plastering directly on blocks, thus saving expense of furring and lathing.

MEDUSA WATERPROOFED GRAY PORTLAND CEMENT—A standard portland cement containing the correct amount of Medusa Waterproofing ground in during the process of manufacture, thereby saving mixing changes and preventing errors in mixing. Medusa Waterproofed Cement should be used wherever waterproof and damp-proof concrete is required.

LITERATURE—Literature describing any of the above furnished on request.

Inventors and manufacturers of
STEEL PROTECTIVE PAINTS; DAMPPROOF-
ING and WATERPROOFING PAINTS and
COMPOUNDS.

Also, Decorative Paints for all pur-
poses; Insulating Paint; Machinery En-
amel; Smokestack Paint; Roofing Paint; Cement Floor
Coatings; Enamels; Mortar, Cement and Plaster Colors.

A thoroughly equipped chemical laboratory is main-
tained by us and the services of the chemists are at the
disposal of clients who desire paints for special condi-
tions. Correspondence and personal inquiries are in-
vited on technical paint and waterproofing problems.

"R. I. W." Tockolith (Patented).

A Portland cement paint, gray in color, used only
as a priming coat on iron, steel or other metal. Must
be painted over as soon as practicable, and in any event
not more than 4 to 6 months after application. Can be
made specially to withstand longer exposure where con-
ditions demand it. A finishing coat must always be ap-
plied according to the character of the finished surface
required and the nature of the service expected.

An unexcelled combination for preventing chemical
or electrolytic corrosion is "R. I. W." Tockolith for the
priming coat and "R. I. W." Damp Resisting Paint for
the finishing coat. Approximate covering capacity (1
coat) per gal., 500 to 700 sq. ft.

No. 137 "R. I. W." (Red).

For interior or exterior use. Resists acid fumes.
Endures the excessive heat and moisture in the tropics.
A remarkable preservative of wood and metal under
adverse conditions in chemical works where acid fumes
prevail; on roofs, gutters, tanks, shutters, fire escapes
and structures constantly exposed to the weather.

Should be used as a finishing coat over a priming
coat of "R. I. W." Tockolith. Approximate covering
capacity (1 coat) per gal., 400 to 600 sq. ft.

No. 110 "R. I. W." Damp Resisting Paint.

Black or maroon, waterproof, specially adapted for
painting steelwork in factories or laboratories where
paint is not subjected to atmospheric conditions, but
must resist severe corroding agencies such as the fumes
of acids or alkalis.

Used as a finishing coat on structural grillage work
which is to be embedded in masonry, also on railroad
bridge floors and column footings, sprinkler pipes, poles
and pipes buried in the ground. Adheres perfectly to
concrete. Positive protection against electrolytic cor-
rosion, having an insulating value of over 800 volts per
millimeter. Usually applied over "R. I. W." Tockolith,
but 2 coats may be used without primer, if desired.
Approximate covering capacity (1 coat) per gal., 250 to
400 sq. ft.

**No. 112 "R. I. W." Damp Resisting Paint.**

Similar to No. 110 "R. I. W.," but
has the additional advantage of resisting
the influence of the elements during erec-
tion of steel. Also used on brine and
condenser pipes, and interior iron and
wood work subjected to moisture, alkalis,

acids, or electrolytic action.

Has an insulating value of over 550 volts per milli-
meter. Approximate covering capacity (1 coat) per
gal., 300 to 500 sq. ft.

"R. I. W." Battleship Gray.

Designed primarily for United States Navy and
still in use by them. Endures excessive heat and mois-
ture in the tropics.

Particularly adapted for molasses tanks, fire
escapes, and other steel or metal structures. Used by
many sugar centrales as a finishing coat over a priming
coat of "R. I. W." Tockolith, as it does not attract
and intensify heat on metal structures as is the case
with black or dark colored paints. Does not turn white,
streak, or lose its gloss near sea water.

Should be used as a finishing coat over a priming
coat of "R. I. W." Tockolith. Approximate covering
capacity (1 coat) per gal., 500 to 600 sq. ft.

"R. I. W." Self-Healing Bridge Cement.

A black, viscous, non-hardening material which
maintains a homogeneous, unbroken membrane coating
under normal conditions. Remains elastic at low tem-
peratures. Will not run in summer. Free from the de-
fects of tar, pitch or asphalt compounds that contain sul-
phur, which chemically attacks and destroys adjoining
layers of paper, burlap and other materials. Approxi-
mate covering capacity (1 coat) per gal., 20 to 40 sq. ft.

"R. I. W." Toxement (Patented).

A dry powder to be mixed with neat Portland ce-
ment on the job or, in very large operations, with clinker
at the mill. "R. I. W." Toxement fulfills the require-
ments of an integral waterproofing compound, because,
owing to its colloidal nature, it lubricates the mass, pro-
duces a denser body, and makes Portland cement con-
struction waterproof.

No. 421 "R. I. W." Acidproof Toxement (Patented).

A special grade of "R. I. W." Toxement, which,
when mixed with Portland cement, will produce a con-
crete that will withstand the action of 50% sulphuric
acid. An ideal material for concrete floors and walls
in chemical plants.

Used in conjunction with "R. I. W." Acidproof
Filler to protect concrete storage tanks against the action
of acids and oils.

many users have against the ordinary prepared paint; and in working out the Elastikote problem it was discovered that, in the practical application of Elastikote, certain new and unusual protective features were developed.

In its wide adaptability, Elastikote, applied to wood, metal, iron or steel, brick, stone, cement, etc., is probably the only paint that possesses the necessary elasticity, toughness, adhesive qualities and extreme weather resisting qualities necessary to conform to the various conditions met with in treating the several surfaces mentioned, and from which dependable results can be obtained.

In the manufacture of Elastikote a certain percentage of a specially prepared natural hardened gum is incorporated by a process of our own. This gum, scientifically fused and blended with the usual paint pigments finely ground, and the resulting combination thoroughly mixed with pure linseed oil and dryers, forms the basis of Elastikote, to which is added only the purest and most durable tinting colors.

Although Elastikote is made in light colors, such as white, buff, fawn, etc., its greatest elasticity is obtained in the darker positive colors, such as the greens, reds, browns, maroon colors, etc., for the reason these darker shades carry a higher percentage of the gum base, which so greatly adds to the flexibility and durability of Elastikote.

Elastikote comes ready to apply. It is a full, heavy bodied paint, stays well in suspension and will thoroughly cover more surface than any prepared or hand mixed paint. Two coats are recommended.

Toco Graphite.

A full bodied graphite paint of the greatest durability and wear resisting qualities. It will follow the expansion and contraction of metal perfectly without scaling or cracking and is particularly adapted for coating structural steel to be incased in concrete. In this dampproofing and alkali resisting feature, Toco Graphite is superior to other graphites, which renders it especially desirable for bridge and railroad work.

Toco Graphite dries with a tough, glossy, dark steel gray finish and will stand up under the most severe test.

While ordinary metallic paints are not claimed to cover more than 300 to 400 sq. ft. under favorable conditions, Toco Graphite will cover from 600 to 700 and as high as 1000 sq. ft. to the gal. Two coats are recommended.

Cement Coatings.

Long experience in dealing with the problem of waterproofing and painting cement and concrete surfaces qualifies us to place at our customers' disposal the following products of proved reliability:

Cementkote, for cement, brick, stone or concrete walls above ground; Floorkote, for concrete and cement floors.

English Structural Steel Paint.

There are certain classes of work requiring the highest grade of ferric oxide paint. English Structural Paint is made specifically for exposed metal surfaces, such as iron and steel construction work, bridges, railway and tramway maintenance; gas, electric and water plants; towers, tanks; telegraph, telephone and trolley poles.

The protection of metal against rust, corrosion, and electrolysis is a waterproofing problem and its solution can only be accomplished by the use of a continuous, impervious insulation that will protect it from contact with moisture. Corrosion can not exist without oxygen, which is supplied by water. Rust is steel or iron chemically changed by the presence of moisture.

To properly protect exposed metallic surfaces requires a paint film which is, first, impervious; second, elastic; and third, one having a pigment base that is inert, finely ground, and at the same time powerfully adhesive. English Structural Paint is the result of years of practical tests. The combination of pigments and vehicles used in its make-up has proved to be of very great durability.

English Structural Paint is made in the usual standard colors: maroon, English oxide red, green, brown, lead color, and black; is full bodied, and ready for the brush. Two coats are recommended.

Elastikote.

A high standard protective and preservative paint made in strong positive colors, black and white, designed for general use on all exterior surfaces exposed to severe weather-wear, requiring solid, substantial, durable paint protection.

Elastikote is the result of thirty years' experience and scientific research to overcome certain prejudices

All concrete or cement work is permeated with a fine network or system of capillaries, which absorb and distribute moisture to all its parts. These ducts or capillaries can not be filled during the curative stage of the concrete without materially interfering with the chemical action of the cement, as these conduits are necessary to introduce the moisture so essential during the curative stages.

Nothing therefore should be used in mixing mortar that will fill these capillaries, but they should be left open until the chemical action of the cement has taken place, thoroughly set and hardened, also dried out and seasoned for several months. The surface is then ready to paint. Walls should be painted and dampproofed with 2 coats of Cementkote applied according to directions.

CEMENTKOTE—A preservative and decorative paint for exterior dampproofing of cement, brick or stone walls above ground. Cementkote dries with a flat finish.

Covering capacity 150 to 200 sq. ft. to gal., 2 coats.

FLOORKOTE—A durable, wear resisting coating for cement floors. Dries with a full gloss.

Cement floors should be painted with Floorkote, which not only fills and finishes the surface in a beautiful glossy tilelike effect but also prevents staining, grinding and dusting that is sure to follow the use of unpainted concrete floors.

Covering capacity 200 to 250 sq. ft. to gal., 2 coats.

Floorkote is superior to ordinary floor paint for wood floors as well.

Tropical Waterproofing Paint.

All concrete, cement, brick and porous stone foundation walls should be thoroughly waterproofed on the exterior side before filling in the earth between the foundation and the unexcavated ground. Tropical Waterproofing Paint has proved itself to be a foundation proofing of the highest order. It is a tenacious black which is easily and readily applied, covering about 65 sq. ft. to the gal., 2 coats.

Tropical Waterproofing Paint produces a continuous film which has sufficient elasticity to remain intact regardless of the expansion and contraction of the surface to which it is applied.

Tropical Waterproofing Paint prevents water seeping through the walls of concrete cisterns, swimming pools, elevators, elevator pits, water troughs, etc.

Tropical Waterproofing Paint prevents metal lath from rusting, and should be used on all artificial stone and concrete work, marble, etc., to prevent mortar stains.

Tropolite.

In this product this company has developed the greatest heat resisting paint known. It dries with a black, glossy enamel finish and is unaffected by heat that will break down the best graphites, boiler and front end paints on the market. Tropolite will stand from 700° to 800°, which is 200° higher than any other known paint coating will stand. Two coats are recommended.

Tropical Rubber Paint.

A black roof and metal paint that is tough and elastic. For general use. Dries with a brilliant black gloss finish. Two coats are recommended.

Tocoseal.

An asbestos cement plastic roofing. This product is manufactured from genuine asbestos fiber, combined with mineral gum. It comes in the form of a soft, pliable paste and is applied to new or old roofs with an ordinary oblong shaped smoothing trowel. It sets up in 2 or 3

days and gradually hardens into a rough rubbery coating, that is waterproof, fire resistant and extremely durable. Tocoseal puts a new roof on a building, without removing the old one, at a moderate cost, and will last longer than several coats of the most expensive paint. Consult the company on any roofing problem and be helped.

Tropical Finest Outside Gloss White.

Made originally for private use only. This product is the last word in exterior white paint. It is of unusual whiteness, magnificent body, and will outwear and outlast any other white paint made. Two coats are recommended.

Toco Mill White.

A high grade, durable, solid body white paint for factories, textile mills, warerooms, where lighting and cleanliness are essential features. Made in both gloss and dull finish. Toco Mill White is durable and washable; will not scale or check off, and holds its color to a remarkable degree.

Tocotone.

A durable, non-absorbent, washable interior flat paint. Tocotone can be used upon all plaster surfaces—rough, smooth, sand finished or pebbled; also upon composition wall board, metal ceilings, wood trim, and upon burlap and other cloth wall coverings, and, in fact, it is suitable for any interior wall surfaces. Two coats are recommended.

B. and P. Enamel.

For plaster, cement, wood or metal. This special line of interior enamels has been produced to fit the peculiar and exacting requirements of breweries, packing houses and bakeries, where the interior finish of these buildings must withstand condensation of steam, fumes and odors, or for condensers, ammonia pipes, hop jackets, boiling or storage tanks and where the interiors must be kept scrupulously clean for washing.

This enamel does not absorb moisture, because when applied it produces a porcelainlike, hard and durable film. Sulphate or carbonate of lead is not used in this product. Many government laws and regulations restrict the use of lead in paints used where food products are manufactured or handled.

B. and P. Special Enamel is sanitary, decorative, and free from detrimental volatile odors. It is damp-proof, therefore, no mildew, mold, dry rot, decay or dampness can exist, preventing the breeding or growth of fungi or germs.

Recommended for the protection and decoration of walls and ceilings in killing rooms, butter and sausage rooms, refrigerators, coolers, engine rooms, the outside of aging tanks, offices and showrooms.

Covering capacity on concrete or plaster 200 to 250 sq. ft. per gal., 2 coats.

Tropical Boiler Seal.

A plastic insulating cement for boiler settings. It eliminates the suction of cold air through the cracks, crevices and pores of the brick, thus preventing cooling of the boiler shell and furnace gases. An accurate, unprejudiced test shows an increase of CO₂ from 9% to 11½% by its use.

Architectural Varnishes.

In addition, this company manufactures a line of highest grade architectural varnishes to meet every possible requirement.

Products.

TRUSCON PRODUCTS, which include DAMPPROOFINGS, WATERPROOFINGS, FLOOR HARDENERS, TECHNICAL PAINTS and COMPOUNDS, WOOD PRESERVATIVES.

Truscon Waterproofing Paste, Concentrated.

Integral waterproofing compound, in paste form for concrete and cement mortar, mixes perfectly with water and diffuses readily through the mix, giving uniformly dependable results.

For foundations, dams, tunnels, reservoirs, tanks, and floors where absolute waterproofness is essential.

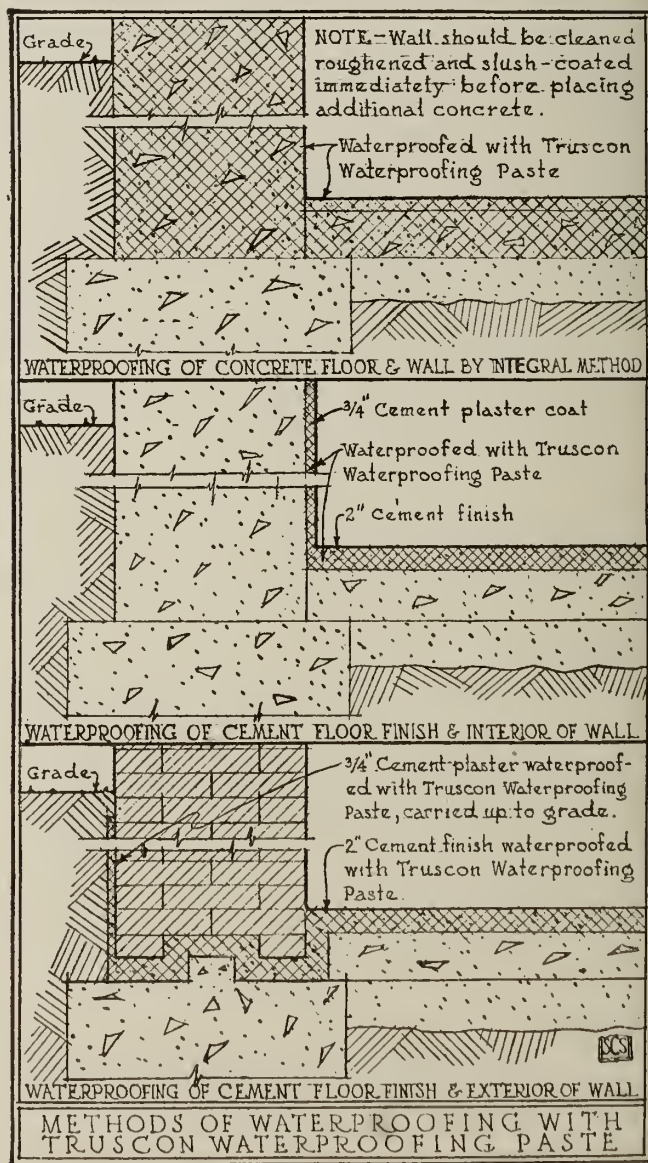

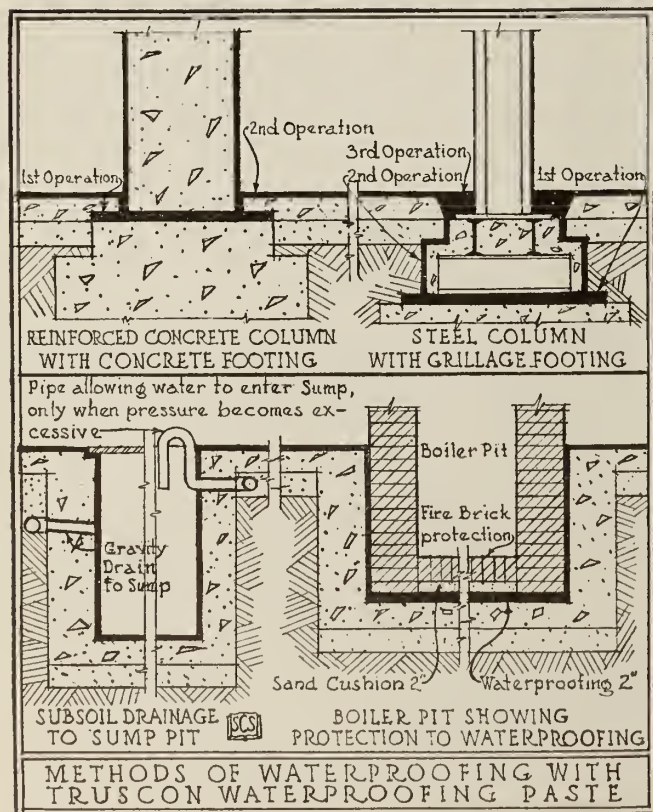

SPECIFICATIONS—Mass Concrete—The dry mix of cement, sand and stone (1:2:4) to be tempered with water containing Truscon Waterproofing Paste in the proportion of one part of Truscon Waterproofing Paste, Concentrated, to every 36 parts of water as per manufacturer's directions. All concrete to be placed in one continuous operation, each pouring to be thoroughly spaded to insure uniform density.

Waterproof Plaster Coat Applied to Concrete or General

Masonry—The dry mixture of cement and sand in the proportions of one to two (1:2) by volume to be tempered to required consistency with a mixture of one part of Truscon Waterproofing Paste, Concentrated, and eighteen parts of water as per manufacturer's complete directions. Before applying waterproofing plaster coat, chip to thoroughly roughen up masonry and clean thoroughly to obtain a satisfactory bond.

Further treatment of such surfaces as directed by manufacturer.

Truscon Stonetex.

A specialized liquid cement coating for damp-proofing, protecting and beautifying exposed stucco, concrete and masonry surfaces of all kinds. Applied with a brush like any paint. Seals pores and hair checks, prevents absorption and penetration of moisture, and gives a handsome stonelike appearance to the coated surface. Especially formulated to meet the exact physical and chemical requirements of exposed walls.

SPECIFICATIONS—The surface to be coated must be absolutely dry. Surface must be freed from dirt and loose particles that would interfere with a perfect bond. Apply Truscon Stonetex in two (2) coats; the second coat to be applied seventy-two (72) hours after the first.

For full information and color card, see Truscon Stonetex Booklet, furnished free on request.

Truscon Plaster Bond.

A special bituminous coating for dampproofing all exposed walls. Its use provides a continuous damp-proofing element in all such walls, and perfectly insulates the interior from any evidence of dampness. On application to the surface, it is partially absorbed into the pores, thoroughly sealing them and establishing a most inseparable bond. Also furnishes a bond for plaster, and eliminates the necessity for furring or lathing.

SPECIFICATIONS—Truscon Plaster Bond shall be applied with a brush to a clean dry surface. Very porous places should be retouched the following day to insure an even, uniform coating. Special care should be taken to make the coating of Truscon Plaster Bond perfectly continuous over entire surface. Should be used only on vertical surfaces. Plaster shall not be applied until twenty-four (24) hours after surface has been coated.

Free booklet on request.

Truscon Industrial Enamel.

An economical, durable, sanitary enamel manufactured especially for coating interiors of factories and industrial plants. Possesses many of the qualities of enamels selling at much higher prices. It gives a high enamel finish resembling porcelain, utilizing and diffusing all available light and bringing the brightness of daylight within the four walls. It insures the utilization of all light in the interior by reflecting it directly upon the machinery and parts of the plant where it is most needed.

SPECIFICATIONS—Undercoatings—(a) The wall shall first be coated with one (1) coat of Truscon Industrial Flat, which shall be well rubbed into the pores to insure proper penetration and bond and lightly smoothed off to a uniform even coat.

(b) After the first coat of Truscon Industrial Flat has been given at least forty-eight (48) hours to dry and harden, a second coat shall be carefully applied to provide an even, uniform foundation for the application of the enamel coating.

Enamel Coatings—After the second coat of Truscon Industrial Flat has become thoroughly hard and dry, the surface shall be finished with a uniform coating of Truscon Industrial Enamel.

Truscon Floor Enamel.

This product produces a tough, hard, elastic and reasonably durable finish on cement floors. Affords a perfect and attractive enamel finish that prevents dusting and granulation of floor surfaces. Protects floor from stain due to absorption of oils, greases and other foreign matter. It is applied with a brush, and should only be used on floors subjected to light traffic, such as office buildings, garages, hospitals, engine rooms, etc.

SPECIFICATIONS—Surface shall be absolutely dry and thoroughly cleaned. Truscon Floor Enamel shall be applied in two (2) coats; forty-eight (48) hours should be allowed between application of the first and second coats. The finishing coat shall be allowed to dry forty-eight (48) hours before being subjected to any use.

For floors laid directly upon the ground a coat of Truscon Floor Primer is required before the coating of Floor Enamel.

For full details and color card, see Truscon Floor Enamel Booklet, furnished free on request.

Truscon Bar-Ox "Inhibitive" Coating.

A protective coating for structural steel bridges and all exposed iron and steel surfaces. Formulated in strict accordance with the electrolytic theory of corrosion. This product forms an absolutely impenetrable film that completely excludes the moisture necessary for the beginning of corrosion.

SPECIFICATIONS—All steel shall receive a thorough coat of Truscon Bar-Ox "Inhibitive" Red, well brushed on.

All surfaces to be riveted in the shop shall receive two (2) thorough coats of Bar-Ox "Inhibitive" Red before assembling.

All surfaces to be riveted on the field shall receive two (2) thorough coats of Bar-Ox "Inhibitive" Green, in addition to the priming coat, before leaving the shop.

After erection, all abrasions shall be touched up with Bar-Ox "Inhibitive" Red.

The entire structure shall then receive a second coat of Truscon Bar-Ox "Inhibitive" Black or Green.

No painting shall be done in wet weather, and no paint applied to a wet or damp surface.

Free booklet sent on request.

Truscon Agatex.

Chemically transforms a soft, dusting cement floor to a hard, dense, impenetrable surface without changing its color or appearance. Actually enters into chemical reaction with the constituents of the cement and forms entirely new compounds, that are hard, enduring and resistive to wear. Affords three indispensable factory requirements—dustproof, wearproof and sanitary floors.

SPECIFICATIONS—All cement floors shall be given three (3) liberal treatments of Truscon Agatex as manufactured and recommended by THE TRUSCON LABORATORIES, Detroit, Mich.

Condition of the Surface—The floor shall be free from all dust, dirt, and oil, or other foreign matter that would retard the penetration and absorption of the Agatex into the pores of the surface.

Application—The product as supplied shall be diluted with water in the following proportions, and applied in liberal saturating coats with a long handled brush.

For the first application—Use one (1) part Truscon Agatex and two (2) parts water.

For the second application—Use one (1) part of Truscon Agatex and one (1) part of water.

For the third application—Use two (2) parts Truscon Agatex and one (1) part of water.

An interval of twenty-four (24) hours shall be allowed between coats.

One (1) gal. of Truscon Agatex will cover approximately 100 sq. ft. for three (3) applications, depending on the porosity of the surface.

Truscon Wood Floor Preservative.

Formulated to meet the heavy demand for a product capable of protecting wood floors, both from the wear of traffic and from rotting and decaying. It is a translucent liquid of a rather yellowish tinge. Applied with a wide brush, it dries overnight without materially changing the physical appearance of the treated surface. A floor treated with this product sheds water and can be easily kept clean and sanitary. Slivering and splintering are effectively and permanently prevented.

Covering capacity 400 sq. ft. per gal. 1 coat on close grained wood and 300 sq. ft. on open grained wood.

Truscon Fibrotex.

A plastic compound made of gums and asbestos. Has about the consistency of putty, but is much stronger because of the asbestos. Has valuable application for the repairing, mending and patching of tin, shingle and slate roofs, and is also excellent for re-covering composition roofs. Is also valuable for sealing cracks, pointing up around chimneys, packing about pipes, and mending skylights.

UNIVERSAL COLD WATER PAINT CO.

TELEPHONE:
WEST 1933

30 North La Salle Street
CHICAGO, ILL.

FACTORY, 2011-13 West Lake Street, CHICAGO, ILL.

Products and Services.

UNIVERSAL COLD WATER PAINT for industrial interiors.

Contracts for application of paint taken within 500 miles of Chicago.

Universal Cold Water Paint.

A mill white (i.e. a dull white paint) that is sprayed, or can be brushed on. The most economical paint on the market for application to interiors of mills, factories, etc. Reflecting and diffusing the light perfectly—unlike whitewash or ordinary glossy paint, it presents absolutely no glare.

It will not blister, crack, peel or drop off; due to the *secret formula* and superior facilities for proper mixing, will hold fast longer than any other cold water paint. Equally applicable to wood, cement or brick. Other colors may be had by mixing. And it costs only 12¢ per 100 sq. ft.

CLEANLINESS—Clean, healthful, "Universalized" buildings help keep the air germ-free. Recently a large candy manufacturer saved his shops from being closed by the state factory inspector by hurriedly "Universalizing" them.

SAFETY AND EFFICIENCY—Too strong lights in shops where there are dangerous machines or spots cause many accidents. *Fifteen states* already have factory lighting codes which have brought about greatly improved and increased production, a reduction in the number of accidents, greater efficiency in workers and their outputs and better working conditions.

FIRE RETARDANT—Regularly listed by the Underwriters Laboratories, Inc., as a fire retardant.

ECONOMY—Pleasant and soft to the eyes, increasing efficiency among employees. Saves three-fourths of the light bill. Reflects sunlight so well that in many cases, except on very dark days artificial light may be completely displaced. Before one large manufacturer

TRADE-MARK

applied Universal Cold Water Paint he was obliged to use electricity from 4:30 P.M. to 5:30 P.M.; now, except on unusually dark days he uses Universal reflected daylight only.

GUARANTEE—The UNIVERSAL COLD WATER PAINT Co. absolutely guarantees that when used in normal shop conditions,

properly mixed and sprayed according to printed instructions, it will *never blister nor crack*. The only reason it will ever have to be renewed is because in from two to four years, depending on the amount of smoke, dust and soot, it will, like anything else, get dirty.

Cost.

Cheaper to buy, cheaper to apply and covers more space than any other cold water paint.

COST OF MATERIAL—One 375-lb. barrel of dry powder, when mixed, will cover about 12,500 sq. ft. In 3-barrel lots and over, the price is 4¢ per lb. Due to added overhead in furnishing spray outfit in 2-barrel lots, the cost is 5¢ per lb.; and 1 single barrel costs 6¢ per lb.

COST OF APPLICATION—Sprayed on; no brushes required. Spraying outfit is furnished free of charge. One barrel of the powdered paint makes 2 barrels of liquid. Inexperienced help can apply it, and 2 men in 1 day can cover 20,000 sq. ft. with 2 coats, which would require 20 men with brushes. The spray does better, more even work, leaves no streaks and gets into the corners and cracks that the brush can not possibly reach.

How Shipped.

In dry powder form in barrels of about 375 lbs., ready to mix. Spraying outfit will be shipped, packed complete, ready for use with full directions enclosed. Return in its original case. Outfit may be retained for \$25.00. Write for particulars.

Products.

"BAY STATE" STEEL PROTECTIVE COATING, a Metal Protective Paint; "BAY STATE" BRICK and CEMENT COATING, a Dampproofing Paint for brick, cement and plaster surfaces above grade; WAHCOLITE and DIXIELITE, Factory Whites.

"Bay State" Steel Protective Coating.

This metal preservative is the result of years of research and of many practical and laboratory tests. Made from the purest pigments, it has proved, under actual severe exposure, a most effective rust inhibitive. It is adhesive, moisture-proof and a resistant of acid fumes, such as are encountered in the atmosphere of railroad and manufacturing districts.

TESTS—All pigments used in this product have been thoroughly tested out on the Atlantic City and Washington Test Fences, where they were exposed for several years, and withstood the severest conditions.

APPLICATION—"Bay State" Steel Protective Coating is recommended for use on structural metal in buildings, bridges, subways, elevated railway structures, smokestacks, tanks, etc.

Its use should be preceded by a thorough cleaning of the surfaces to be protected, sand blasting being the most desirable method; in lieu of which method wire brushes and scrapers should be used. All scale, grease and rust spots should be thoroughly removed.

COVERING CAPACITY—About 400 sq. ft. per gal., 1 coat.

COLORS—"Bay State" Steel Protective Coating is prepared in 4 standard colors: rich brick red, dark green, dove gray and coal black.

Note—For permanence where acid fumes are encountered the coal black and dove gray are to be preferred.

PACKAGES AND PRICES—Packed in the following quantities: 5-gal. can, 1/2 barrel and barrel. Quotations on application.

SAMPLES, ETC.—Further details regarding "Bay State" Steel Protective Coating, together with samples for experimental purposes or inspection, sent promptly on request.

Please send for Color Card No. 20.

"Bay State" Brick and Cement Coating.

An effective dampproofing coating for above grade. It waterproofs the surface and, being manufactured in

THE BAY STATE
TRADE-MARK
(Reg. U. S. Pat. Off.)

various colors, beautifies the structure without destroying the distinctive feature of the cement, as it dries dead flat and has the same appearance as cement. For interior decoration it dries with that soft, velvety finish similar to that obtained in water colors, but will resist the action of gases, alkalis or water.

This coating is composed of carefully selected pigments, carried in volatile liquids, which evaporate upon application, and when applied to concrete cement, brick or plaster, incorporates itself as a part of the material.

Contains no lead, glue, casein or water.

Made in white and colors.

APPLICATION AND COVERING CAPACITY—"Bay State" Brick and Cement Coating should be applied with a wide, stiff, bristle brush, keeping the brush full and flowing it out. In extreme cases where absorption is very great and 2 coats are necessary, the first coat may be thinned with pure spirit turpentine, not over 1 pt. to 1 gal. of "Bay State" Cement Coating Special Thinner. Under no circumstances use benzine or oil in thinning. Allow 24 hours between coats. If tinting is desired, use only oil colors thinned with turpentine.

On brick or concrete, hard finish, use 1 gal. to cover not over 18 sq. yds.; on brick, concrete or stucco, tough, or porous, use 1 gal. to cover not over 15 sq. yds.

COMPARATIVE COST—"Bay State" Brick and Cement Coating costs less per gallon than lead and oil paint. While it covers slightly less surface in area, 1 coat covers better than 2, and frequently better than 3, coats of lead and oil or other paints, showing a reduction in cost of material, with a great saving of labor and time.

PACKAGES—Packed in the following quantities: 1-gal. can, 5-gal. can, 1/2 barrel and barrel.

SAMPLES, ETC.—Samples of "Bay State" Brick and Cement Coating sent on request.

Please write for Color Card and Booklet 21.

Wahcolite and Dixielite.

Wahcolite and Dixielite are factory whites especially designed for the walls and ceilings of factories, mills and warehouses.

These whites are used by the largest mills in this country, with a remarkable saving in lighting bills and a great increase in labor efficiency.

Made in flat, semi-flat and gloss finish. These enamels, made on an oil and varnish base, are easily washed and kept clean.

Samples on application.

WAILES DOVE—HERMISTON CORPORATION

FORMERLY AMERICAN BITUMASTIC ENAMELS COMPANY

Manufacturers of Protective Paints and Coatings

17 Battery Place
NEW YORK, N. Y.

BRANCH OFFICES

PHILADELPHIA, PA., 322 South Delaware Avenue

CLEVELAND, OHIO, Rockefeller Building

WORKS, GARWOOD, N. J.

Products.

BITUMASTIC and HERMASTIC SOLUTIONS and ENAMELS—Protective Coatings for iron, steel and concrete exposed to atmospheric moisture, electrolysis, acids, acid fumes, sewage, brine, gases, alkalis, etc., buried in the ground or submerged in fresh, salt, or mine water.

Description of Bitumastic and Hermastic Compositions.

These compositions are of a bituminous base, so treated in manufacture as to eliminate all useless and harmful substances. Being free from those ingredients which limit the life and usefulness of ordinary coal-tar and asphaltum compounds, they possess exceptional physical properties—i. e., toughness, tenacity and pliability. These properties they retain throughout a far broader range of temperature and under more severe mechanical distortion and abrasion than have generally been considered to be within the scope of a bituminous composition.

BITUMASTIC SOLUTION—A heavy, black, bituminous paint of superior preservative properties and mechanical strength. It dries quickly, forming a tough, elastic coating. Under conditions of moderate severity where ordinary paints last but a short time, the solution gives exceptional protection for long periods.

It is used against acid fumes, sewage, brine, water, gases, alkalis, moisture, electrolysis, etc. In industrial plants it is used to paint structural steel, boiler fronts, smokestacks, coal bunkers, brine systems, tanks, pipe lines, sheet iron and steel, and for other similar purposes. In the engineering and construction field its applications will suggest themselves to the engineer.

Method of Application—The surfaces to be coated must be thoroughly clean and free from rust, scale, paint, oil and moisture. Bitumastic and Hermastic Coatings should not be applied to wet, frosty or greasy surfaces.

On metal, two coats are customary, the second following the first after an interval of 12 to 24 hours. On wood, three coats are recommended.

Covering Capacity—Properly applied, is as follows: On steel, 1 coat, 1 gal. to 200 to 250 sq. ft.; 2 coats, 150 sq. ft. On cast iron, covering capacity is a trifle less; on concrete surfaces, approximately 100 sq. ft. to the gal.

Put up in 1-gal., 2-gal., and 5-gal. cans and in 50-gal. barrels, and is suitable for use on any surface to which paint may be applied.

HERMASTIC ENAMEL—A durable, protective coating to be used under the most severe corrosive conditions where lasting protection and ultimate economy are of the first importance. It is applied hot over a coat of priming solution, to such thickness as may be desired (usually $\frac{1}{16}$ in.), and forms a black coating which hardens immediately, ready for service.

This coating is exceptionally ductile, strongly adhesive and impervious to moisture, chemical fumes, sulphurous gases, salt water, salt atmosphere, most acids and other corrosive agents. As its insulating capacity is

high it is an effective protection against electrolysis. The resistance of this coating to mechanical injury from distortion and abrasion under service conditions is exceptional and marks a distinct and noteworthy advance in the art.

Adaptability and Method of Application—Hermastic Enamel is particularly recommended for the following: internal and external surfaces of steel pipe lines, and other parts of drainage systems; tanks of every description, coal bunkers, ventilating fans and blowers which must handle moist air and acid fumes; conveyors, penstocks, trash racks and other steel items of hydraulic plant; cooling towers, bridges and other steel structures exposed to salt air and spray or other especially corrosive conditions; sheet steel buildings, chemical installations, sheet steel piling, and many other uses too numerous to be listed here but familiar to every engineer, architect and industrial executive. The coating is sanitary, tasteless and odorless and may safely be used as a lining for tanks to contain drinking water.

Hermastic Enamel may be applied in the field or at the point of fabrication, as may be preferable and consistent with best results, either by dipping, brushing or pouring, as may be required by the specific exigencies of the work in hand. When the dipping process is used the priming coat may be dispensed with, provided the surfaces to be coated can be heated before dipping to a temperature of 350° to 400° Fahr. This is the prevailing practice when steel pipe lines are coated at a shop where a dipping tank and a heating furnace are available.

The enamel is shipped in solid form in drums, barrels or blocks. It is heated to between 350° and 400° Fahr. and applied while in a molten state, after the primer has dried to a tacky consistency. It sets immediately, and when applied about $\frac{1}{16}$ in. thick covers approximately 2 sq. ft. per pound. Full instructions for application will be supplied upon request. Whenever necessary, the manufacturers are prepared to supply expert instruction and supervision over the application of these coatings, or, under special conditions where the best interest of the purchaser will be served thereby, to do the work on a contract basis with their own workmen.

SPECIFICATIONS—The form of specification for Bitumastic and Hermastic products is dependent upon the nature of the work and the exposure to which surfaces are subjected. A thoroughly protective specification to meet any given condition will be furnished on application.

Ultimate Economy of Hermastic Coating.

The chief item in the maintenance cost of steel structures is the cleaning and preparation of the surfaces for repainting. After the application of Hermastic Enamel this expense is saved, for this coating will outlast many coats of the ordinary protective paints.

It is this saving of the cost of continual repainting that makes Hermastic Enamel the protective coating of ultimate economy.

THE WATERPROOFING COMPANY

Engineers and Contractors for Waterproofing

345 East 33rd Street
NEW YORK, N. Y.

BRANCH OFFICES

BOSTON, MASS., 65 Albany Street

PITTSBURGH, PA.

Product and Services.

Manufacturers of "Cow Bay" WATER-PROOF CEMENT.

Engineers and Contractors for WATER-PROOFING, making a specialty of CEMENT WATER-PROOFING. This company contracts for the waterproofing of basements, subways, reservoirs, vaults, tunnels, swimming pools, etc., guaranteeing a positive and permanent waterproofing for all kinds of masonry construction.

Also Designers of and Contractors for REINFORCED CONCRETE CONSTRUCTION, which includes OIL STORAGE TANKS.

Specialists in OILPROOFING CONCRETE TANKS for the storage of fuel oil.

"Cow Bay" Waterproof Cement.

ADVANTAGES—Ease and economy with which repairs may be made.

No extra supporting walls are required; they are left with a neat finish; no furring and plastering necessary. No additional floor finish is necessary.

"Cow Bay" waterproof cement, when set, is as hard as the best portland cement mortar, and may be placed beneath grillages and column bases without danger of settlement—eliminating the metal pans used with tar and felt waterproofing.

EXPERIENCE—"Cow Bay" waterproof cement is beyond the experimental stage, having been employed since 1900. During the past 15 years this company has waterproofed a majority of the important buildings in New York, Boston and Pittsburgh.

SPECIFICATIONS—Material—All interior surfaces of all exterior walls, and upper surface of concrete floor slab throughout basement (or subbasement), elevator pits, machinery foundations, trenches, etc., as shown on plans, shall be waterproofed with "Cow Bay" Waterproof Cement.

Workmanship—All surfaces, before application of waterproof coating, shall be thoroughly chipped or cleaned, and coating applied not later than 24 hours after surface has been prepared. A perfect bond must at all points be secured with underlying masonry.

Wall coating shall be 5/8-in. thickness, applied in 2 coats, thoroughly floated and troweled to a smooth and even finish, free from imperfections. Floor work shall be 1-in. thickness, and to serve the double purpose of a waterproofing agent

TRADE-MARK
Reg. U. S.
Patent Office

and wearing surface. Floor coating shall be floated and finished as described for wall coating.

Guarantee—Waterproofing contractor shall furnish written guarantee that his work will be waterproof; that during a period of 5 years after completion of the waterproofing, he will promptly repair any leaks appearing through same which are not due to causes beyond his control.

A FEW IMPORTANT WATERPROOFING CONTRACTS—Building, location, and name of architect:

Singer Building, New York, N. Y., Ernest Flagg

Products and Services.

HYDRITE LIQUID WATERPROOFING.
HYDRITE LIQUID CONCRETE FLOOR

HARDENER.

HYDRITE METALLIC CONCRETE FLOOR HARDENER.
HYDRITE ANTI-FREEZING COMPOUND.
Hydrite Liquid Dampproofing.
Hydrite Liquid Oilproofing.

A Service and Contracting Department is maintained, composed of practical engineers in all waterproofing problems. Contracts are executed in all parts of the United States.

Hydrite Liquid Waterproofing for Concrete.

An opaque, neutral liquid, forming a chemical combination, filling all voids. Does not affect the strength or change the color of concrete.

SPECIFICATIONS FOR INTEGRAL WATERPROOFING OF CONCRETE—Hydrite Waterproofing Compound shall be used according to manufacturer's directions.

Use 1 part best quality portland cement, 2 parts clean sharp sand and 4 parts uniformly graded stone from $\frac{1}{2}$ to $1\frac{1}{2}$ in. To each cubic yard of dry mixed materials add 1 gal. of Hydrite Waterproofing placed in gauging water. Where excessive water pressure is encountered, add $\frac{1}{2}$ gal. Hydrite per cu. yd. to each additional 10 lbs. of hydrostatic pressure.

SPECIFICATIONS FOR WATERPROOF CEMENT COATING—Use 1 part best quality portland cement and 2 parts clean, sharp sand, dry mixed. Add 1 gal. of Hydrite mixed with the gauging water to each 10 cu. ft. of cement plaster. All surfaces where cement is to be applied shall be thoroughly cleaned, roughened and moistened. When this has been done, apply two $\frac{1}{4}$ -in. coats of the waterproof cement plaster, first coat to be left rough.

Waterproof Grouting Under Pressure.

For basements, tunnels, pits, emplacements, etc., where excessive water pressure is encountered in present structures.

We have specialized in this class of work for the past 10 years. This process is employed exclusively by us and from an engineering standpoint is the only permanent one. The surfaces are made lastingly watertight and moistureproof through the forcing of waterproof cement grout by means of bleeders to the exterior or pressure side of the walls, using suitable machinery to accomplish this result. Data is solicited on the most difficult problems.

Hydrite Liquid Concrete Floor Hardener.

SPECIFICATIONS FOR FINISHED CONCRETE FLOORS—Hydrite Liquid Floor Hardener, as manufactured by THE WATERPROOFING CO. OF AMERICA, shall be used in the following manner: Thoroughly clean floor of all dust, dirt and oil. Float on evenly Hydrite Hardener with long handled brush, allowing surface to absorb all the material it will take. When first application has thoroughly dried, a second application to be applied in similar manner, allowing from 4 to 6 hours for drying after each application.

"Hydrite"

TRADE-MARK

1 gal. Hydrite Hardener will cover approximately 100 sq. ft. in two coats.

SPECIFICATIONS FOR USE INTEGRALLY IN TOP FINISH—For 1-in. topping on fill, use 1 part portland cement, 2 parts clean, sharp sand and 1 gal.

Hydrite Liquid Hardener for each 100 sq. ft. of surface. Add Hydrite to gauging water. Use same proportion for less thicknesses of topping.

Hydrite Metallic Concrete Floor Hardener.

Consists of evenly ground mineral substance which, when incorporated in the concrete, will prevent dusting and disintegration. Furthermore, will seal the pores and prevent discoloration, making the surface very dense and wearproof.

SPECIFICATION FOR APPLICATION, RED OR GRAY—After floating of topping and before troweling, add dry mixture of 1 part Hydrite Metallic Hardener by weight carefully mixed to a uniform color, and to be not less than 20 lbs. of Hydrite Hardener and 20 lbs. of portland cement for each 100 sq. ft. of surface. This mixture to be sprinkled evenly over surfaces.

The dry mixture of cement and Hydrite Floor Hardener shall be well floated to form a perfect combination and troweled. The surface shall receive a second troweling when it has set sufficiently to finish smoothly.

Hydrite Anti-Freezing Compound.

A liquid which is added to the gauging water at the rate of 1 gal. to each cu. yd. of concrete. This material is guaranteed not to reduce the strength of the concrete.

Co-operative Service.

Circulars descriptive of the products above mentioned with details of their application furnished upon request

References.

Contracts have been successfully executed for the following companies, for the most of whom a number of commissions have been performed:

Marshall Field & Co., Chicago, Ill.

BARRETT CARBOSOTA — *Grade-One Liquid Creosote Oil* for Preserving Wood.

Description.

A standardized, pure coal-tar distillate, from which all objectionable properties of crude creosote oil have been completely eliminated.

Coal-tar creosote has been the universally recognized standard wood preservative for over fifty years. There is no authentic record of the failure of creosote, properly applied, to protect wood from decay. First used in Europe, the recognition of its value in America is indicated by a normal consumption of 100,000,000 gals. per annum.

Advantages and Superiority.

Carbosota is superior to commercial coal-tar creosote for non-pressure treatments, because:

It is liquid; free from water; practically non-volatile; does not evaporate or leach from the wood; has high specific gravity. It has low viscosity, and being liquid, penetrates readily and deeply into the wood.

It has increased antiseptic and decay-preventing qualities, and imparts a pleasing, dark brown color to the wood. It is a clean, uniform, standardized oil.

Carbosota conforms strictly to the *established standard* for non-pressure treatments as represented by specifications issued by the U. S. Shipping Board Emergency Fleet Corporation and the U. S. Railroad Administration.

Methods of Application.

Timbers, whether used in buildings or exterior structures, which will be exposed to conditions favorable to the development of decay, should be protected by preservative treatment. Specifications should include detailed requirements as to method of treatment and grade of creosote oil; specific instructions as to procedure and equipment, and provision for inspection.

Carbosota can be readily injected into many species of seasoned wood by the open tank process or applied by surface treatments. Green lumber or timber can not be effectively creosoted by non-pressure processes. It should be air-dry.

TRADE-MARK

OPEN TANK PROCESS—Consists of the impregnation of structural wood with refined coal-tar creosote oil (Carbosota Creosote Oil) by immersion in two baths—first in a hot bath, the oil being at 150° to 200° Fahr., and following this by a cold bath with the oil at atmospheric temperature. Where but one tank is available; the hot oil is allowed to cool and the wood is kept submerged. However,

time is saved by using two tanks, one kept hot and the other cold. Advantage is taken of the vacuum formed within the wood, due to the differences in temperature, and a good penetration is thus obtained. The duration of the two baths will depend upon the dimensions of the timbers, and the maximum advantage is derived when the time is sufficient to bring the temperature of the wood to that of the bath.

Special detail data relative to quantity of Carbosota required for various species and treatment obtainable by addressing nearest office.

SURFACE TREATMENTS—Surface applications of preservative at all points of contact of timbers, such as mortises, tenons and bearings, or where it is the dual purpose of retarding decay as well as decorative painting, may be applied (a) by brush treatment, that is, application of two or more coats of Carbosota with a broad wire-bound brush; (b) by spraying, which is often preferable because of rapidity with which large areas may be covered; (c) by dipping, that is, complete immersion for short periods of entire stick in heated Carbosota.

Sufficient intervals of time should elapse between treatments to permit of thorough drying of previous application. It is advisable in surface treatments that Carbosota Creosote Oil should be maintained at a temperature of about 150° Fahr. Cold oil may be used during favorable weather, but to obtain best results the oil should be heated. One gallon of Carbosota will cover approximately 150 to 200 sq. ft. of surface.

OPEN TANK PROCESS

Two wooden tanks lined with galvanized sheet iron, soldered at joints, one for "hot treatment," the other for "cold treatment"

Products.

CONSERVO WOOD PRESERVATIVE for preserving ties, timbers, pilings, planks, bridges, boats, posts, poles, sills, sleepers, etc., from wet and dry rot, insects and worms.

Also, Dampproofing; Insulating and Deadenening Quilt; Creosote Shingle Stains; Waterproof Brick and Cement Stains.

Description of Conservo Wood Preservative.

Conservo is a carbolineum compound of high-boiling coal tar distillate, non-volatile, insoluble, non-viscous, and antiseptic. Its tone on wood is rich butternut brown.

Advantages.

Conservo is a scientific product made to cover the three cardinal principles of wood preservation, i. e.:

- (1) Penetrating power—to get into the wood.
- (2) Permanence—to stay in the wood.
- (3) Sterilizing power—to destroy the bacteria that cause decay.

Penetration.

No preservative can preserve the wood unless it penetrates; and Conservo is so limpid that its penetrating power is unique. The heavier carbolineums are from twice to five times as viscous (viscosity is that "cold molasses" quality that prevents most wood preservatives from penetrating) as Conservo.

Permanence.

It not only goes more quickly and deeply into the wood than more viscous products but, when it gets in, it stays in, because it is insoluble and non-volatile. It will not dissolve out nor evaporate out. Heavy preservatives can not penetrate and are washed off the surface by the first rains.

Sterilizing.

Decay is caused by bacteria in the wood.

Conservo has always carried the proper percentage—7% to 10%—of phenols or tar acids to sterilize the wood and poison this bacteria. The phenols also combine with the lignin of the wood and increase the penetrating power. This is of special value for unseasoned wood. These phenols in Conservo form permanent asphaltic bases in the wood, that make the preservative results lasting.

Non-inflammable.

Conservo is non-inflammable and, as it gives off a cooling vapor under flame, it actually makes the wood less inflammable after drying than untreated wood.

Application.

Conservo is so limpid, and has such great penetrating power, that it can be effectively applied without heating. At normal temperatures this quality is of great importance where heating arrangements are not feasible, but heat should always be used, if possible, because it increases the limpidity, and helps to expel moisture from the wood.

Conservo can be applied by any method preferred. The most common methods are:

Brush coating, like paint, with a wide flat brush or a mop brush for speed, or with a spraying machine.

Dipping, using tanks of appropriate size for the lumber to be dipped.

Soaking, using tank equipment for either cold or alternate hot and cold soaking, as in the open tank vacuum method.

Temperature for hot treatment, from about 170° Fahr. for seasoned timber, to about 225° Fahr. for unseasoned timber.

The length of treatment depends upon the condition and character of the timber; seasoned and porous woods requiring a shorter treatment than unseasoned or dense woods.

Cost.

The cost of treating depends upon the method selected, the character and condition of the wood, and the economy of handling, which includes wages, waste, etc.

Prices and estimates furnished on request.

Covering Capacity.

BRUSH COATING—1 gal. covers about 100 sq. ft. of rough sawed lumber, 2 coats; 1 gal. covers about 200 sq. ft. of rough hewn lumber, 2 coats; 1 gal. covers about 250 sq. ft. of dressed lumber, 2 coats.

The amount varies somewhat, according to the character and condition of the wood; but these are safe and conservative figures.

DIPPING—About the same as brush coating, if the Conservo is drained back into the dipping tank to prevent waste.

SOAKING—The covering capacity varies so greatly for both methods of soaking, owing to differences in wood, heating, length of immersion, etc., that it is impossible to give exact figures; but simple soaking for a short time will take about twice as much as dipping; the vacuum process, from 4 to 12 cu. ft. per gal.; and, by the expensive impregnation pressure process, the wood can be made to take up 2 or 3 gals. per cu. ft.

Products and Services.

PROTEXOL WOOD PRESERVATIVE.

TORON WOOD PRESERVER.

NEOSOTE PRESERVATIVE.

TECHNICAL WOOD PRESERVATIVES.

Shingle Oils and Stains, Black Preservative Varnishes for wood and iron, Detergent and Soluble Disinfectants, Weed Killers, Crude Carbolic Acids, Waterproofing Pitches, etc.

Also a complete line of American and English Creosote and Anthracene Oils according to chemical specifications.

Complete Treating Equipment for brush, spray or open tank creosote treatments of timber.

Services include Chemical Analyses, Researches, Experimental Work, Design and Layout, Estimates for Covering Capacity on submitted timber schedules and all matter pertaining to Consulting Practice on the subject of Timber Preservation.

Wood Preservatives—Technical Description.

PROTEXOL—A non-volatile, heavy oil, derived from the highest boiling distillate of coal tar. Its constituents belong to the anthracene group, the permanent anti-septic properties of which are generally acknowledged. After filtration and refining, the oil is chemically treated to improve its character and to increase its efficiency. It readily penetrates wood, imparting a durable nut brown color, and is highly toxic.

TORON—A straight run anthracene oil distillate to meet the chemical standard for what is known as the carbolineum type of oil.

NEOSOTE—A mixture of the lighter anthracene oils obtained in redistilling to produce Protexol wood preservative and heavy creosote oils. A pure coal tar product run to a uniform standard. Liquid at all temperatures.

Trade-names.

The adoption of the American trade-mark Protexol for the highest grade wood preservative is a recognition by this company of changed conditions resulting from the war.

The discontinuance of *selling* Avenarius Carbolineum accentuates the belief that an American product can be *manufactured* to the old established standard of excellence more economically in America.

The erection of works at Kenilworth, N. J., to produce as primary products a complete line of wood pre-

TRADE-MARK

servatives aimed at economical production and distribution. This has enabled the maintenance of the old standard of quality for Protexol without practically any advance in price.

Quality is the 40-year old standard.

Other Products.

In addition to the wood preservatives the Protexol Products include disinfectants, both soluble and detergent for all purposes. Black preservative varnishes for wood and iron, weed killers, crude carbolic acids, etc.

Specifications.

See former editions of SWEET'S CATALOGUES.

These are designed especially to meet the requirements of each case and include a consideration of the conditions to be met and the kind and quality of timber to be used.

Cost estimates will be prepared when schedule of timber is submitted.

Literature.

A list or all available bulletins and circulars will be sent on request. Each is written to answer definite questions.

Inspection Invited.

The only test on the value of a wood preservative is time. References are available in town or country, factory or residence, where a personal inspection will demonstrate the wood preserving value of Protexol—the standard wood preservative for surface treatments.

Products.

LETTENY WOOD PRESERVATIVE (Carbolineum).

Anthracene Oil and Dead Oil of Coal Tar (to specifications).

TRADE-MARK

Record.

Letteny has an unequalled record of more than 50 years of efficient treatment of timber.

Description of Letteny.

Letteny is a liquid compound manufactured from by-products of wholly bituminous coal tar. Guaranteed to contain at least 99.5% pure coal tar oil. Distills only at high temperatures and contains no light volatile matter.

Guaranteed to be well within standard specifications for carbolineum and similar wood preserving oils.

Letteny penetrates the wood and remains there permanently. It is not soluble in water and will not wash out.

Permanent color is dark red brown.

Specifications.

Have the wood, before treating, as well seasoned as possible. Posts, poles, ties, piles, etc., should have all bark removed before being treated.

If there is any accumulation of dirt or other foreign matter on the timber, it shall be scraped off with a wire brush before the preservative is applied.

BRUSH TREATMENT—When the wood is dry, thoroughly apply Letteny Wood Preservative with a broad, flat, stiff bristle brush, by two applications; the second after the first has been absorbed. Apply the preservative at a temperature of from 175° to 210° Fahr.

OPEN TANK TREATMENT—After cutting and fitting, all lumber shall be completely immersed for 20 minutes in a tank containing Letteny Wood Preservative, which must be maintained at a temperature of from 175° to 210° Fahr.

SPRAYING TREATMENT—This treatment shall consist of one heavy spraying with Letteny Wood Preservative, heated to a temperature of approximately 175° Fahr. Surfaces must be thoroughly covered, and treatment given to the refusal point whenever spraying seasoning checks, joints and contact surfaces.

Covering Capacity for Good Practice.

ON ROUGH LUMBER—

2 brush coats	} 100 sq. ft. per gal.
20 minute dip	
Sprayed	
1 brush coat	150 sq. ft. per gal.

ON DRESSED LUMBER—

2 brush coats	} 150 sq. ft. per gal.
20 minute dip	
Sprayed	
1 brush coat	300 sq. ft. per gal.

NOTE—Correspondence is solicited for details of treatment and handling of lumber in open tank.

Packages.

Letteny Wood Preservative is put up *ready for use* in the following size packages: 50-gal. barrels, drums, ½ barrels, and in 5-gal. and 10-gal. cans.

Prices.

Delivered prices to all freight stations furnished promptly on application.

Products.

The world's largest producers of CREOSOTED MATERIALS, including Creosoted Cross Ties, Structural Timbers, Paving Blocks, Piling, Poles, Cross Arms, Fence Posts, Water Tanks, Silos, Lumber, etc.

Facilities.

A responsible organization with an established reputation, now supplying the treated tie requirements of over 30,000 miles of railroad; furnishing creosoted materials to the United States Government, states, counties and municipalities, and giving special service to the demands of construction engineers, traction lines, telegraph and telephone companies, factories, farmers and builders generally. A record of 3,500,000,000 bd. ft. forest products treated since 1904; annual capacity now 350,000,000 bd. ft.; ample storage capacity for season-

ing under approved scientific methods; fullest opportunity for plant inspection.

Lowry Process.

A pressure and vacuum process for the efficient and economical treatment of wood, patented in the United States and Canada, insuring maximum penetration and distribution through structural cells with final retention (according to specifications) of minimum quantity of creosote oil consistent with proper preservative effect; a system affording accurate gauging and recording of results.

Creosote Oil.

Oil used is best obtainable grade of pure coal tar creosote oil, conforming to specifications of American Railway Engineering Association and American Wood Preservers' Association. Analyses furnished.

BROWN COMPANY

FOUNDED 1852

FORMERLY BERLIN MILLS CO., AND BURGESS SULPHITE FIBRE CO.

Manufacturers of Kyanized Lumber, Pulp, Paper and Chemicals
PORTLAND, ME.

NEW YORK OFFICE, Woolworth Building

CHICAGO OFFICE, 110 South Dearborn Street

WORKS AT BERLIN MILLS, N. H.

Products.

KYANIZED LUMBER, PULP, PAPER and CHEMICALS:

Timber; Cedar Shingles; Manufactured Lumber, Doors, Window Frames, Mouldings, Posts, Columns; Sheathing and Novelty Siding, Clapboards, Laths and Gutters; Flooring of all kinds; Spruce, Pine and Fir Lumber.

Kyanized Lumber, preserved by treatment in the company's own Kyanizing plant; Sheathing and Roofing Papers, Wrapping Papers; Fibre Tubes; Bleached and Unbleached Sulphite; The "Nibroc" Line, including Kraft and Bond Papers.

Waxo.

The BROWN COMPANY'S "Nibroc" Kraft is now furnished, when desired, with a special waterproofing treatment and is branded "Waxo." In this form it is both tough and highly resistant to moisture, forming an excellent protecting cover for shipments of high grade mechanical and engineering products and for all goods which need extra protection from the elements.

Kyanizing.

Decay follows the growth of fungi in structural timbers exposed to moisture. Kyanizing preserves the wood by preventing the development of fungi. The strength of the wood is not affected, nor its color changed. Kyanized timber is less combustible than natural timber, shows a clean surface and will take paint. By careful kyanizing, salts are formed within the wood which are insoluble and so remain as a permanent protection. Every stick of timber which the

BROWN COMPANY kyanizes is branded with the company's name and date of treatment. A generation of success with kyanizing gives further weight to the company's guarantee.

"Bermico" Brand, Sheathing Paper.

In connection with its extensive timber and pulp interests, the company is in a position to apply to each of its paper specialties the materials best suited to that particular service.

BERMICO
TRADE-MARK

"Bermico" sheathing paper is a case in point. It is made from fibre—pure, clean, long, rosin sized fibre, and has absolutely no filler.

It is therefore a permanent and dependable building material; tough and resistant to wear and tear. Being correctly made, from the right materials, it can be depended upon to give the longest service.

Range of Products.

The company's output includes a wide range of manufactures which can not be adequately presented here; but in general these comprise the products and by-products resulting from forestry operations. The forest products are applied in a manner to conserve the natural values, merchantable timber being used as such, and pulpwood utilized in both the sulphite and sulphate processes to obtain the best possible types of pulp and paper. White pine, too rare now for reckless use, is made up into window frames; small wood is used in box shooks. Certain fibres of exceptional strength are reserved for use in a new line of fibre pipes and conduits; and important industrial chemicals are derived from the mill waste.

Catalogue.

The company's principal products are covered by special catalogues or sample books, which are gladly mailed on request.

SUCCESSORS TO MAS-OLEUM FLOOR MFG. CO.

Manufacturers of Mas-Oleum Mastic and Almada Cork Composition Floors

TELEPHONE:
HUMBOLDT 135

2734 North Rockwell Street
CHICAGO, ILL.

Products and Services.

MAS-OLEUM (Mastic Linoleum) SANITARY FLOORING and COVE BASE: Fiber Mastic Floor Covering, Composition Flooring, Rubber Flooring and Asphalt Mastic Flooring.

ALMADA CORK COMPOSITION FLOORING.

Contracts for Installation executed anywhere in the United States.

For Roofing, Waterproofing and Paint, see page 276.

Mas-Oleum Flooring.

DESCRIPTION—Mas-Oleum (mastic linoleum) is an asphalt mastic linoleum, a combination of hydrocarbons with mineral caoutchouc and asbestos fiber, to which has been added color pigments, and then sufficiently fluxed with mineral oil, permitting its use on weak and unsupported floors, where a heavy material would be prohibited.

Mas-Oleum can be nailed, sawed or drilled like wood. It contains no sand, slag cement or sawdust and is fireproof, waterproof and dustless.

ADVANTAGES—Mas-Oleum mastic is easily applied by trowel over a smooth surface and furnishes a sanitary, resilient, dust resisting and waterproof topping.

It is non-slippery and not affected by ordinary acids.

It bonds readily to the subfloor and becomes a permanent part of the building, thus differing from unsanitary and more expensive floor coverings.

It is laid without seams and joints, and a cove base can be extended up on the wall to any height desired, forming a hermetically sealed and perfectly sanitary floor.

Mas-Oleum mastic floors can be easily cleaned, being absolutely waterproof.

APPLICATION—Mas-Oleum is laid directly on any floor surface—wood, concrete, steel, tile, brick, asphalt or fabric surfaces.

It is laid in 5 or more thin coats trowelled or rolled and the 5 coats when completed should be $\frac{1}{8}$ in. in thickness. The first or primer coat is followed by 3 or more filler or body coats, with a finishing coat trowelled hard, which may be waxed, if desired.

Any ordinary workman, by following printed instructions furnished, can lay Mas-Oleum.

SCOPE OF USE—For hospitals, churches, theaters, schools, warehouses, factories, dairies, hotels, comfort stations, jails, club houses, sanitariums, railroad stations, silos, bridges, tunnels, subways, track elevations, etc., on either floors, walls or ceilings, interior or exterior.

Also corridors and hallways, stair treads, landings, manual training rooms, gymnasiums, playrooms, toilets, locker rooms, damp basement floors, laundries, side-walks, porches, etc.

ECONOMY—Mas-Oleum is the cheapest permanent floor covering offered today; costs less than battleship linoleum, composition, and, in many cases, less than wood flooring.

GUARANTEE—This company guarantees every Mas-Oleum floor laid by them for a period of 2 years and

will repair, without charge, any and all defects due to defective material or imperfect workmanship. Surety bond furnished when desired.

SPECIFICATIONS—*Over Cement or Metal Surfaces*—A cement subfloor or metal surface shall be provided by others. The cement surface shall be equal in construction to what is generally termed a sidewalk finish laid perfectly true and level. Either shall be recessed $\frac{1}{8}$ in. from finished floor level and be thoroughly dry before the mastic material is applied.

Over Wood Surfaces—Mas-Oleum Composition Scratch Coat should be used. First apply metal lath or wire mesh securely over the wood boards, then install Mas-Oleum Composition Scratch Coat at least $\frac{3}{8}$ in. in thickness and allow this to set hard. Mas-Oleum mastic should then be applied. The total thickness of Mas-Oleum mastic floors with composition foundation over wood shall be $\frac{1}{2}$ in.

Over Stair Treads—A smooth surface shall be provided by others, recessed $\frac{1}{8}$ in. from finished floor line. Suitable nosing shall also be furnished by others, same to extend $\frac{1}{8}$ in. above floor level.

MAS-OLEUM FLOOR, Y. M. C. A. NORTH SIDE BOYS' CLUB, CHICAGO

Almada Cork Composition Flooring.

DESCRIPTION—Almada cork composition flooring is a sanitary, seamless, fireproof, lightweight composition for floors, base, stair treads, etc.

All ingredients are scientifically compounded so as to insure a fireproof, non-slippery, non-dusting and sanitary floor suitable for the varied types of floor service.

COLOR—Generally red is used, owing to its permanency, although black, green, yellow, and natural can be had. Where color effect is desired a varied number of color schemes can be installed, such as borders in a different color than the field.

INSTALLATION—The E. N. BIEGLER MFG. CO. contracts to execute work anywhere in the United States and is also in position to furnish Almada composition with complete instructions for the mixing and installation of the same, so that it can be laid by local plasterers or cement finishers if desired. This is a special advantage for small areas.

Co-operative Service and References.

Mas-Oleum and Almada floors have been used in hundreds of buildings successfully. Names of engineers, architects and contractors, also list of buildings in which Mas-Oleum floors and Almada cork composition floors have been used will be furnished on request. Also circulars describing the features of the two different floors will be furnished on request, including specifications and samples.

CARTER BLOXONEND FLOORING CO.

SALES OFFICES

KANSAS CITY, MO., 1303 R. A. Long Building—Telephone, Main 1177
 CHICAGO, ILL., 332 South Michigan Avenue—Telephone, Harrison 6491
 CLEVELAND, OHIO, 406 Electric Building—Telephone, Main 961
 NEW YORK, N. Y., 501 Fifth Avenue—Telephone, Murray Hill 558

MILL: KENSETT, ARK.

Product.

BLOXONEND FLOORING, a Wood Block Flooring.

Uses.

A high grade, heavy service floor for factories, warehouses, shipping rooms, loading platforms, shops, freight houses, baggage, mail and express rooms, railroad stations, baggage, mail and express cars, assembly rooms, industrial schools, elevator and scale platforms, and all surfaces subjected to trucking (hand or power), or concentrated footwear.

Advantages.

Durability. Resilience. Smoothness. Adds to volume and efficiency of production. Absorbs vibration. Insulates. Warm. Quiet. Comfortable. Smooth but not slippery. Firm, safe foothold. A soft bed for tools or materials dropped. Advantages of good block pavement, with greater smoothness and adaptability of best matched flooring to building work, whether steel, concrete or wood structure, new or old.

Construction.

Built up in flooring sections (Fig. 1). (Should not be confused with loose paving blocks.) Blocks of selected Southern pine, on end, are dovetailed to horizontal baseboards, presenting end of grain to wear, forming flooring sections which are finished to uniform height and grooved in the sides for heavy splines (slip tongues). Splines are used to break joints, giving support to end joints and keeping flooring sections in alignment.

Size.

After exhaustive experiments and practical use, Bloxonend is made in one standard size, 2-in. blocks on base made from 1 in., making sections finish $2\frac{9}{16}$ in. thick by $3\frac{1}{2}$ -in. face, in lengths up to 8 ft. Not made in specified lengths.

Application.

(1) OVER CONCRETE, STANDARD (FIG. 2)—Laid at right angles on and nailed to beveled sleepers bedded in slab or laid over slab and filled flush. 2- by 4-in. sleepers at $15\frac{3}{4}$ -in. centers are standard. Size of sleepers can be increased and centers reduced for extra heavy or exposed service or other special conditions. Advice for such special conditions furnished on receipt of details.

(2) OVER CONCRETE, ALTERNATE (FIG. 3)—Over neat concrete slab or old concrete floors grouted smooth, Bloxonend may be laid at right angles on flat strips not bedded. Strips should practically cover slab except for slight air space between. 1- by 6-in. strips (SIS) are standard for this type. Nail through strips with nail of size and length to snub on concrete and clinch under strips, forming whole into a floating floor or mat. This type is desirable only for strictly dry locations and occupations, and particularly where height or weight of sleepers and fill are objectionable.

(3) OVER WOOD STRUCTURE—Over joists or open sleepers Bloxonend should be laid on

substantial subfloor of proper thickness to furnish firm level support, according to spans and loads contemplated, allowing for Bloxonend itself tensile strength of a good inch floor. Where structural conditions admit and service requires, subfloor laid diagonally at not less than 45° to supports (or better 60° or 75°) and Bloxonend at right angles to supports will preserve maximum strength and stiffness of both.

(4) NAILING—Bloxonend may be toe-nailed through base before inserting splines, blind nailed in groove or nailed through splines after same are inserted, according to location and use of floor. Nails will vary in gauge and length with location and method of nailing. More detailed instructions for laying specific jobs will be furnished on application.

Treatment.

Bloxonend can be treated before shipment where specified. Treatment is essential for exposed use and desirable in other places where the nature of occupation does not make it objectionable and maximum life is essential.

Information.

List of installations of interest and details desired furnished on request. In writing for prices and other information, advise areas to be covered, use of floors and nature of construction.

CHENEY & COMPANY, INC.

Sole Owners and Manufacturers of Troegerlith Composition Flooring

TELEPHONE:
CHELSEA 4253

134 West 18th Street
NEW YORK, N. Y.

Products.

TROEGERLITH COMPOSITION, a Plastic Tile for Flooring, Base, Stair Treads, Risers.
Pollo Oil for care of Troegerlith.

Troegerlith Flooring.

Troegerlith Composition is a magnesium-oxy-chloride cement, consisting mainly of commercial magnesite, long fiber asbestos, mineral colors, and magnesium chloride.

All materials are standard, thoroughly tested and mixed with the utmost care and precision.

The finished floor is warm, resilient, fireproof and sanitary, of strength and durability.

Troegerlith absolutely will not dust; it does not contain either portland cement, sand or lime products.

AN ACTUAL PHOTOGRAPH OF AN OLD WOODEN FLOOR, UPON WHICH TROEGERLITH COMPOSITION IS BEING LAID

It depicts all of the unsanitary features of the wooden floor, and also how easily all are eradicated. The Troegerlith floor is most attractive in appearance, and absolutely sanitary. Note the special treatment of base and corners. Fireproof, germproof, waterproof. The new floor is as resilient and easy of tread as the old, and far more serviceable.

Installation.

Troegerlith is laid in plastic form and finished by troweling to a perfectly smooth, close grained, even surface without seams, cracks or joints, in one, two or more layers (minimum thickness $\frac{1}{2}$ in.) depending upon the type and condition of foundation and the service to which the floor will be subjected.

This material bonds firmly to new or old wood, cement or steel foundation. It is quickly and easily installed and the floor may be used in 24 hours after completion.

Metal reinforcement, if required for any special condition or purpose, may be used with perfect result.

HEAVY DUTY TROEGERLITH COMPOSITION FLOORING INSTALLED IN WAREHOUSE OVER ROUGH CONCRETE UNDERFLOORS

Adaptability.

Troegerlith floors are giving eminently satisfactory service through entire buildings; are appropriate for all classes of buildings and are especially suitable where a clean, dustless and warm flooring of pleasing appearance is desired, such as in banks, offices, hotels, schools, dormitories, hospitals, apartment houses, and industrial buildings.

This material is an important factor, and is extensively used in factory construction, being especially and scientifically built to give the maximum service to fill all requirements of the heavy duty prevailing in this type of construction.

Guarantee.

CHENEY & COMPANY, INC., squarely and fully guarantee its products against defects of material and workmanship.

References.

Performance has proved the superior quality and durability of Troegerlith floors.

List of installations will be furnished on request. Write for Catalogue S-6.

Service.

CHENEY & COMPANY, INC., have offices and warehouses in many of the larger cities, where complete organizations are ready to render prompt and efficient service to engineer, builder and owner.

All installations of Troegerlith are made under the direct supervision of the local office. This service insures perfect work at a minimum cost.

GENERAL KOMPOLITE CO.

Composition Floors and Wainscots, Mastic Floors, Plastic Floor Compounds
Calciners and Grinders of Magnesite

TELEPHONE:

HUNTERS POINT 5361, 5362

325-327 Borden Avenue

LONG ISLAND CITY N. Y.

Products.

"KOMPOLITE," a Monoplastic, Sanitary, Seamless Composition Floor and Wainscot.

"MASTOLITH," a Mastic, Plastic Flooring.

"Kompolite."

"Kompolite" is a magnesium asbestos composition made in many attractive colors. It is sanitary, seamless, fireproof, sound deadening, water repelling, easy under foot, germproof and dustproof. For heavy service and hard wear. Applied in plastic form on concrete, wood or iron, in new or old buildings.

It is light in weight, so that it can be used on weak structures where heavier material can not be employed. It is in daily use in places where wood, cement, asphalt, concrete, slate, marble, etc., have not been satisfactory.

Fifteen years of successful application and millions of feet of it in daily satisfactory use attest to the value of "Kompolite."

It has proved wonderfully durable under the most severe conditions. A floor now in use nearly 12 years, over which loads of 2 to 4 tons are drawn and sharp shod horses are driven, shows hardly any sign of wear. Another floor, over which 60,000 to 80,000 people have passed each day, has been in uninterrupted use for over 8 years.

Nearly 250,000 ft. of "Kompolite" have been installed in a public institution and after almost 6 years of use not a single foot was removed, repaired or relaid because of defective or unsatisfactory material or workmanship. After 2 years of test and service and in comparison with many other composition floors, "Kompolite" was accepted by the architects of the Grand Central Terminal, New York, and is the only composition floor laid in that great railroad station.

After careful, scientific test and numerous experiments by the Bureau of Standards, Washington, "Kompolite" was installed in many of the United States Post Offices, Government Printing Offices, the Capitol of the United States and other public buildings.

"Kompolite" has been laid in fine residences, tenements, hotels, restaurants, factories, stores, railroad stations, hospitals, schools, churches, office and loft

buildings, theaters, clubs, etc. In all it has been satisfactory.

Every foot is guaranteed by a contract which has never been questioned and has always been carried out to the satisfaction of architect, contractor or owner.

"Kompolite" is specified by leading architects, indorsed by noted contractors, and approved by property owners as the solution of many floor troubles.

Being calciners and grinders of magnesite this company can guarantee the quality of the most important materials used in every composition floor installation.

"Mastolith."

"Mastolith" is a plastic, seamless surface made from mineral gum with vulcanized oil and asbestos fiber. It has the advantages of light grade battleship linoleum without any of its disadvantages.

It is furnished in a medium red, chocolate brown and dark gray, laid $\frac{1}{8}$ in. to $\frac{3}{16}$ in. thick. It sets rapidly and may be used for foot traffic within 24 hours.

"Mastolith" is waterproof and is not affected by foot usage or trucks in warehouses.

It deadens noise and is agreeable to the tread.

It is absolutely sanitary and non-absorbent.

It will not crack or loosen from the underflooring.

It can be repaired perfectly with little trouble.

It retains its elasticity and always presents an attractive appearance.

"Mastolith," used as a covering, bonds excellently to concrete or wood floors, either old or new, concrete roofs, porches, walks, stair treads, or is used to protect concrete floors from dusting or from wear.

It forms an ideal floor for schools, churches, hospitals, asylums, jails, and for theaters, restaurants and all public or private buildings.

References.

"Kompolite" and "Mastolith" have been subjected to most severe tests in practical use. References will be given to architects, engineers, or contractors to prove that "Kompolite" and "Mastolith" are the most reliable and, quality considered, the most moderate priced monoplastic floors and wainscots now made.

THE HASTINGS PAVEMENT COMPANY

TELEPHONE:
BROAD 1496

25 Broad Street
NEW YORK, N. Y.

WORKS
HASTINGS-ON-HUDSON, N. Y.

Products.

COMPRESSED ASPHALT FLOORING and PAVING BLOCKS, and TILES.

Asphalt Blocks.

A scientifically manufactured material for the wearing surface of streets and roads, and of piers, warehouses, loading platforms, factory floors, bridges, driveways, courtyards, etc.

Manufactured at a large permanent plant; shipped in block form ready to lay; and always obtainable in any quantity for extension and repairs.

COMPOSITION—A properly proportioned mixture of natural asphalt, crushed rock and limestone dust is heated to 300° Fahr., and shaped into uniform blocks under a pressure of 6000 lbs. per sq. in.

SIZE AND WEIGHT—The blocks are 5 in. wide, 12 in. long and 2 and 2½ in. deep, and weigh respectively 11 and 13½ lbs. A square foot of 2 in. block weighs 26 lbs. The "Eightfour" blocks are 8 in. long, 4 in. wide and 1¼ in. deep, and weigh 3½ lbs. A square foot of 1¼ in. "Eightfour" weighs 15½ lbs. The specific gravity of asphalt block is 2.40. Blocks of other thicknesses can be made to meet special conditions.

ADVANTAGES—Asphalt blocks are pleasing in appearance; smooth, noiseless, dustless, warm and easy under foot; sanitary, because non-absorbent; and next to granite, the most durable. They present a gritty, non-slippery, non-skiddable surface, and are easily taken up and relaid. They are non-expansive, odorless and free from exudations; and are not affected by standing loads, extremes of temperature, or by automobile oils. They are reasonable in cost, and are made to suit any climate and traffic conditions.

METHOD OF LAYING—Upon the surface of the concrete foundation there is spread a bed of portland cement mortar ½ in. thick, which is struck to a true and even surface. Upon this bed the blocks are immediately laid, with close joints and uniform top surface, the joints being broken 4 in. After being laid, the blocks are given a light coat of sharp, fine sand, well broomed into the joints. Traffic is permitted in 4 or 5 days.

"Eightfour" Blocks.

The "Eightfour" asphalt flooring block is designed especially to meet those conditions in which weight and thickness of flooring must be at a minimum consistent with durability under heavy traffic. They are laid in the same manner as the large blocks, except that the joints are grouted.

For roofs subject to traffic an "Eightfour" is manufactured 1 in. in thickness, which weighs 12½ lbs. per sq. ft.

Asphalt Tiles.

A wearing surface especially designed for cemetery and park walks, sidewalks, and other surfaces, subject to foot traffic.

Products.

IMPROVED GRANITE PAVING BLOCKS and GRANITE CURBING.

Services.

Expert engineering consultation and advice furnished *gratis*, where this material is under consideration.

Specification Data.

Specification data adapted from the standard specifications of the American Society of Municipal Improvements.

NEW GRANITE PAVING BLOCKS—Paving blocks shall be of medium grained granite, showing an even distribution of constituent materials; of uniform quality, structure and texture; without seams, scales or disintegration; free from an excess of mica or feldspar, and equal in every respect to the sample in the office of the engineer.

Improved Granite Paving Blocks used with cement concrete base where extreme durability is desired, and heavy traffic encountered.

5-INCH STANDARD BLOCK—8 to 12 in. long, $3\frac{1}{2}$ to $4\frac{1}{2}$ in. wide, $4\frac{3}{4}$ to $5\frac{1}{4}$ in. deep. To be laid either with sand cushion or with mortar cushion on concrete base. The most durable pavement in existence today.

RESURFACING BLOCKS—7 to 11 in. long, $3\frac{3}{4}$ to $4\frac{1}{4}$ in. wide, $3\frac{1}{2}$ to 4 in. deep. For use generally as a replacement block in cases where wood block or brick is worn out; and to be used on original concrete base which was under the wood block or brick, saving expense of new concrete base.

4-INCH GRANITE BLOCK—7 to 11 in. long, 4 to $4\frac{1}{2}$ in. wide, 4 to $4\frac{1}{2}$ in. deep. To be used preferably with 1 to 3 or 4 dry mortar cushion, on concrete base.

6-INCH GRANITE BLOCK—8 to 12 in. long, $3\frac{1}{2}$ to $4\frac{1}{2}$ in. wide, 6 to 7 in. deep.

CUTTING AND DRESSING—Blocks shall be so dressed that face will be approximately rectangular in shape, and ends and sides sufficiently smooth to permit blocks to be laid with joints not exceeding $\frac{1}{2}$ in. in width at top, and for 1 in. downward therefrom, and not exceeding 1 in. in width at any other part of joint. Top surface of block shall be so cut that there will be no depressions measuring more than $\frac{3}{8}$ in. from a straight-edge laid in any direction on top and parallel to the general surface thereof.

NOTE—Above blocks are cut under standard schedules by agreement with the Granite Paving Block Cutters, and cost less money than special cut blocks. Used generally with cement grout or bituminous mastic joint.

Tests.

For heavy traffic, the granite shall have a toughness of not less than 9 and a "French Co-efficient of Wear" of not less than 11. For medium traffic, the granite may have a toughness of not less than 7 and a "French Co-efficient of Wear" of not less than 8 if a cement grout filler is used.

Tests shall be made by methods described in Bulletin No. 44, United States Department of Agriculture, Office of Public Roads.

The average of 3 tests shall be used for determining toughness and the average of 6 tests for determining the "French Co-efficient of Wear."

Test certificates and samples and name of quarry producing same shall be filed with the engineer.

Construction Specifications.

After properly excavating and compacting the subgrade and constructing thereon a proper concrete base conforming to the American Society of Municipal Improvements' specifications for same, upon the concrete base so constructed shall be spread:

CUSHION COURSE—A layer, averaging 1 in. in depth, of clean, coarse, dry sand, free from all gravel exceeding $\frac{1}{4}$ in. in size; or, substituting for the dry sand cushion course, 1 part of cement, 4 parts of sand, by volume, mixed dry. Care shall be taken that this mortar cushion shall not be laid too far in advance of the laying of blocks, and that it shall not become wet and set up before ramming and grouting of the paving is accomplished.

LAYING BLOCKS—Upon this sand, or sand and mortar, cushion, blocks shall be laid in courses of uniform width at right angles to line of street, and in a straight line from curb to curb, except in special cases, when they shall be laid at such an angle as may be directed by the engineer. Blocks shall be laid as closely as possible, each block touching adjoining one on sides and ends, and in courses of uniform width. Care shall be taken that blocks are laid flush and true to the finished surface of roadway. All blocks shall be broken with a lap of at least 3 in. Blocks shall not be laid more than 25 ft. in advance of the ramming.

RAMMING—After blocks are laid, they shall be rammed to a solid bearing, joints shall be adjusted, and all unsatisfactory blocks shall be taken out with tongs and all low blocks shall be raised by adding to the bed. The whole pavement shall then be rammed to an even and true surface. Pinch bars shall not be used except by special permission of engineer, and no sand shall be placed in joint except when mixed with joint filler specified hereafter.

The best practice, in the matter of ramming, is to use one rammer to each two pavers, or, at the most, three pavers; and these rammersmen shall be men skilled in their craft and of proper previous experience.

JOINT FILLER—*Cement Grout Filler*—After pavement has been brought to a uniform surface, portland cement grout shall be "poured" into joints until it appears on surface. Grout shall be broomed or scraped into the joints if necessary to fill same and operation shall be repeated as grout settles and before initial set has taken place, until joints are thoroughly filled flush with surface of blocks. Immediately after this the entire pavement shall be broomed to a smooth surface. Blocks shall be wetted immediately before applying grout, except when bituminous mastic filler is used.

Cement grout shall be composed of 1 part portland cement and 1 part clean, sharp sand. Cement and sand shall be thoroughly mixed dry, and only enough clean fresh water shall be added to make a grout which will flow to bottom of joints.

Grout shall be machine mixed in a batch mixer approved

CROSS SECTION SHOWING IMPROVED GRANITE BLOCK AND CURB CONSTRUCTION

by engineer, and shall be applied to joints before ingredients have separated. Particular attention is called to the importance of ascertaining the proportional amount of water to be used with the mixture of different kinds of cement and sand to give best results; and when the most advantageous proportions have been ascertained, these shall be used.

After grouting is completed, and sufficient time for hardening has elapsed so that a coating of sand will not absorb moisture from cement mixture, $\frac{1}{2}$ in. of sand shall be spread over whole surface and shall be kept damp until street is opened for traffic.

After grouting is completed, street shall be kept closed and no carting or traffic allowed on any part of the grouted pavement until at least 7 days have elapsed.

Should the bond between blocks become broken before work is accepted, such defective work shall be relaid and again barricaded, as previously described.

If paving blocks are dirty, or have a film of oil, the grout will not obtain a proper hold on sides and difficulty will be experienced through their letting go. When grout once "lets go," no further sustaining power can be expected from it, and the only possible repair is a complete replacement with new grout in joints.

Around web and flanges of street railway tracks much better results are obtained by allowing the grout to fill in against rail, care being taken to add more grout as shrinkage in setting takes place; through this method a toothing bond being accomplished with the rail area grouting at each joint between different blocks abutting on rail.

Tar Pitch Filler—Joint filler used shall be paving pitch, hereafter described, thoroughly mixed with as much hot, dry sand, as pitch will carry, but in no case shall volume of sand exceed volume of pitch. Sand shall be fine and clean, and all of it shall pass a 20-mesh screen. It shall be heated to a temperature of not less than 300° Fahr. nor more than 400° Fahr. and shall be between these limits when mixed with paving pitch.

Paving pitch shall be heated in kettles properly equipped with an approved thermometer, which shall register temperature of pitch.

Mixture shall be flushed on surface of blocks and pushed into the joints with suitable tools, refushing or repouring if necessary, until the joints remain permanently filled flush with surface of pavement. As little as possible of the mixture shall be left on the surface.

The tar pitch shall comply with the following requirements:

(a) It shall have a specific gravity between 1.23 and 1.33 at 60° Fahr.

(b) It shall have a melting point between 115° and 135° Fahr. determined by the cube method in water.

(c) It shall contain not less than 20%, nor more than 35%, of free carbon insoluble in hot benzol or chloroform.

(d) It shall contain not more than $\frac{1}{2}\%$ of inorganic matter.

(e) It shall be free from water.

(f) It shall have a ductility of not less than 60 cm. at 77° Fahr.

The tar pitch shall be used on the work at a temperature of not less than 250° Fahr. and shall at no time be heated above 325° Fahr.

It shall be delivered where directed by the engineer in time to allow for examination and analysis.

In applying filler, care shall be taken that pavers are closely followed by filler gang, and in no case shall paving be left overnight, or when work is stopped, without filling of joints being completed. In case of rain stopping the filler gang before its work is finished, joints shall be protected by use of tarpaulins, or other means, to keep out water. Under no circumstances shall filler be poured into wet joints.

Asphalt Filler—Joint filler used shall be asphalt cement, hereafter described, thoroughly mixed with as much hot, dry sand as cement will carry, but in no case shall the volume of sand exceed volume of cement. Sand shall be fine and clean, and all of it shall pass a 20-mesh screen. It shall be heated to a temperature of not less than 300° Fahr. nor more than 400° Fahr. and shall be between these limits when mixed with cement.

The asphalt cement shall be heated in kettles properly equipped with an approved thermometer, which shall register the temperature of cement.

Mixture shall be flushed on surface of blocks and pushed into joints with suitable tools, refushing or repouring if necessary, so that joints remain permanently filled flush with surface of the pavement. As little as possible of mixture shall be left on surface.

The asphalt paving cement shall be obtained by distillation of an asphaltic petroleum at a temperature not exceeding 700° Fahr. and shall comply with following requirements:

(a) It shall be homogeneous,

(b) Melting point shall not be less than 130° Fahr. nor more than 145° Fahr.

(c) Solubility in carbon tetrachloride shall not be less than 98 $\frac{1}{2}\%$.

(d) Penetration at 77° Fahr. shall not be less than 60 nor more than 100, the penetration test being made with No. 2 needle for 5 seconds under a load of 100 g. and the penetration at 100° Fahr. shall not exceed three times its penetration at 77° Fahr., the condition of time and load being as above established. The contractor, before beginning work, shall obtain, from engineer, a statement in writing as to the penetration desired for any particular contract and a variation of not greater than 10 points either way from this penetration will be permitted.

(e) Ductility at 77° Fahr. shall not be less than 40 cm., the rate of elongation being 5 cm. per minute.

(f) It shall not lose more than 3% by volatilization when maintained at a temperature of 325° Fahr. for 5 hours, nor shall the penetration of the residue, after such heating, be less than one-half the original penetration.

Asphalt filler shall be used on work at a temperature of not less than 275° Fahr. and shall at no time be heated above 350° Fahr.

It shall be delivered where directed by the engineer in time to allow for examination and analysis.

In applying filler, care shall be taken that pavers are closely followed by filler gang, and in no case shall paving be left overnight, or when work is stopped, without the filling of joints being completed. In case rain stops filler gang before its work is finished, joints shall be protected by tarpaulins, or other means, so as to keep out water. Under no circumstances shall filler be poured into wet joints.

Expansion Joint Strips.

These are sometimes used against street curbing, extending from the top of the finished grade to the bottom of the concrete base, if one is used. This in a great measure eliminates any vibration which might occur through the curb and granolithic walks communicating to the building adjacent. Joint strips are absolutely unnecessary transversely in the roadway.

Grooving on Hillsides.

Where the cement grout is used on hillsides and steep inclines, in order to provide a toehold for horses, the grout in the joint is sometimes raked out for about $\frac{1}{2}$ in. in depth, with a tool resembling an ordinary poker, or by stiff brooming. But owing to the fact that ordinarily no difficulty is experienced in this manner until about five years after it is constructed, it is better practice, although a little more expensive, to wait until such times as difficulty is experienced, and then with a tool similar to a pean hammer, or else with compressed air tools, cut channels at each joint, making the proper grooving for toehold for horses. In this manner a much better riding surface is obtained than if the joints are raked out or broomed out at the start.

Track Blocks.

It often becomes necessary to pave against tee rails, street railway construction. In this case a special block is cut, taking the place of the flange on the grooved girder rail, to receive the flange of the car wheel.

Protection in Freezing Weather.

Protection in cases where work has to be done in freezing weather can be best accomplished by the use of fine sawdust, preferably pine, as oak or chestnut would be apt to stain the pavement temporarily, leaving a very disagreeable looking piece of work, but otherwise not harming it in any way. It will be found that a thin layer of sawdust is a very efficient protection against severe cold. This material is light, easily handled and spreads readily over the surface of the pavement, and if necessary can be covered against rain by rolling out tarred felt over the top.

IMPERIAL FLOOR COMPANY, INC.

Sanitary Fireproof Flooring

ROCHESTER, N. Y.

Products.

Manufacturers of IMPERIAL SANITARY FIREPROOF FLOORING, which can be applied to Iron, Concrete, or Old or New Wood Floors; IMPERIAL SANITARY KITCHEN TABLES.

Imperial Flooring.

Imperial sanitary flooring is a non-porous composition material applied in plastic form over iron, concrete, or old or new wood floors.

CHARACTERISTICS—Imperial sanitary flooring differs from others of a similar nature in that it contains no sand, which is almost invariably used as a filler in other flooring material because of its cheapness. Sand materials have a tendency to crack and disintegrate after short usage, and also increase weight to the prohibitory point in many cases, whereas Imperial flooring is light and durable and can be applied to any floor. Sawdust is another cheap material commonly used, which does not form a part of Imperial flooring.

DURABILITY—Owing to its elasticity, Imperial flooring will outwear floors of the character of tile, terrazzo, etc.; does not disintegrate, chip or crack, or loosen from its foundation, and improves with use.

APPLICATION—Imperial sanitary flooring can be applied to any floor so as to produce a smooth but not slippery surface, with base or wainscoting perfectly sealed to floor as shown in illustration. Can be laid any thickness from $\frac{3}{8}$ to $\frac{1}{2}$ in. and hardens for use in 48 hours. If necessary to open floor for any purpose it can be readily and neatly repaired at nominal cost.

SANITARY—Being laid in a plastic state, the floor becomes one solid sheet with neither crack nor crevice for the accumulation of grease, dirt or moisture, and can be thoroughly cleansed with water without injury to floor or foundation.

WATERPROOF, FIREPROOF—Floors covered with Imperial sanitary flooring are absolutely waterproof, and fire can not reach wood covered with this material.

ELASTICITY—Owing to its great elasticity Imperial sanitary flooring is noiseless, and pleasant to the tread; never producing the fatigue experienced from cement, stone or other hard floors, and is not cold to the feet.

COLORS—Imperial sanitary flooring is made in many colors, and makes a very artistic appearance when laid with border. Especially recommended for public dining rooms, hospitals, schools, churches, auditoriums, amusement halls, corridors, bathrooms, lavatories, kitchens, restaurants, stores, banks, police stations, powerhouses, etc.

SAMPLES AND ESTIMATES—Samples of Imperial sanitary flooring gladly furnished at all times.

Send brief description of foundation, area and nature of space to be covered, and definite estimate of cost of material installed or material ready for laying will be supplied.

Sanitary Kitchen Tables.

Sanitary kitchen tables are made with composition tops that possess the following desirable features: Easy to keep clean; can be used as bread board; germproof; will not crack from heat; not injured by hot dishes; resemble marble, and are not expensive. Size of top, 24 by 42 in. Frame of natural maple or white enamel finish. Price, \$10.00.

Products and Services.

KREOLITE WOOD BLOCK FLOORS and
PAVEMENTS.

This company maintains a corps of expert superintendents who are sent out to instruct purchasers how to properly install Kreolite wood block floors, or to supervise the construction; or, if preferred, they can arrange to have the floor installed.

Use.

Kreolite wood block floors are used in factories, machinshops, warerooms, loading platforms, annealing rooms, foundries, pickling rooms, dye rooms, glass factories, paper mills, rubber tire plants, garages and stables.

General Description of Kreolite Wood Blocks.

Manufactured in various designs to meet special conditions. They are rectangular in shape, surfaced on two sides and one end to a uniform size, 3 to 4 in. in width and from 2 to 4 in. in depth depending on the severity of service. All blocks are furnished of the same width and depth for any one job.

MATERIAL—All blocks are manufactured from carefully selected Southern long leaf yellow pine, thoroughly air seasoned and free from bark, loose or rotten knots or other injurious defects.

TREATMENT—All blocks for interior floors are treated in air-tight cylinders by the Kreolite pressure and vacuum process, as much Kreolite creosote oil being forced by hydraulic pressure into the timber as it is possible to inject under safe temperatures and pressures, but in no case leaving less than 6 lbs. of oil per cu. ft. of timber.

Blocks that are to be used for exterior purposes, such as driveways, loading platforms and court pavements, or that are subjected to much moisture, are treated by the Kreolite "two-stage" process which consists of a second application of hot Kreolite oil injected to insure a more thorough waterproofing of the blocks.

A pure grade of Kreolite creosote oil is used.

CONSPICUOUS FEATURES—In the average machine-shop or iron working plant where sharp heavy castings are handled or where trucking is done, Kreolite wood blocks will outwear any other type of floor except iron plates. United States Government experts rank wood blocks just slightly below granite blocks in point of durability. The dropping of iron castings or the constant passing of heavy trucks on Kreolite wood blocks has the

Kreolite Wood Block Floors
"They outlast the factory"
TRADE-MARK

tendency to further compress the fibers, making the blocks tougher and harder.

After a Kreolite wood block floor is once laid there will be no expense for re-

pairs for many years to come. As the blocks are not ground by wear, there is no dust to get into the bearings of valuable machinery. They are non-conductors of heat and very easy on the workmen's feet.

Specifications for Installing Kreolite Block Floors.

The following method of laying Kreolite blocks is recommended for the average floor. Special specifications will be gladly furnished for unusual conditions.

CONCRETE FOUNDATIONS—(Concrete foundations are recommended to be used wherever practicable). The minimum thickness of concrete base shall be not less than 4 in. and shall increase in thickness, depending upon load the floor is designed to carry. Under extremely heavy loads and impact where settling of the subgrade is liable to occur, reinforcements shall be placed to distribute the load. The concrete base shall be composed of 1 part portland cement, 3 parts sand and 6 parts stone or gravel, or hard, clean cinders. The top of the concrete foundation shall be brought to a true, smooth and even surface exactly the depth of the block below top of finished floor.

PITCH CUSHION—After the concrete has thoroughly dried out, it shall be given a thin and even coating of Kreolite bituminous cement about $\frac{1}{8}$ in. in thickness, which shall be allowed to harden before laying of the blocks.

ALTERNATE DRY MORTAR CEMENT—If the concrete is not finished smooth or level enough to permit the block to be laid directly thereon, it shall be brought to a true and even surface with dry cement mortar, mixed 1 part portland cement and 4 parts sand. This should be mixed dry and well sprinkled with water just before the blocks are laid.

MANNER OF LAYING—The blocks shall then be laid tightly together, with grain vertical directly upon the cushion as prepared, with their length at right angle to line of traffic, care being taken to break joints by at least 2 in. After every 4 rows of blocks shall have been laid in place, the courses shall be lined up and driven together as tightly as possible by means of a 2 by 4 plank laid alongside the outside edge of the blocks. The blocks in each separate row shall also be tightened lengthwise by forcing them together from the end with a lever, pick or other instrument. When the dry mortar cushion has been used the blocks shall be rolled or tamped until they are brought to a smooth surface immediately after laying.

APPLICATION OF FILLER—After the blocks have been laid in place and brought to as true and level a surface as possible, the joints between the blocks shall be filled with Kreolite bituminous filler, applied hot. The filler should be applied by flushing over the surface of the floor, using a rubber-edged squeegee to force it into the joints. Care must be taken to see that the filler penetrates the full depth of the blocks and that the joints are completely filled at the time of application. Dry sand shall then be swept over the floor, completely covering the blocks, same to be left there until the blocks are well set.

EXPANSION JOINTS—Against walls on all sides of the floor, as well as around all columns and other obstructions, there shall be laid a bituminous expansion joint 1 in. in width.

Solution of Various Floor Problems.

Hundreds of metal working concerns, textile mills, paper mills and various other plants now have Kreolite wood block floors, which are withstanding service under varying conditions. The fact that 85% of these concerns are sending in repeat orders, is the best evidence that their managers and factory engineers regard Kreolite floors as a good investment.

"MARBLELOID" FIREPROOF PLASTIC FLOORING, a Magnesite Composition for Floors, Coved Sanitary Base, Wainscot, Trim, Treads, etc.

"MARBLELOID" MAGNESITE STUCCO, a Magnesite Cement Stucco and Plaster for exterior and interior work.

"Tredlite," a distinctive Cork Composition Tiling, for the unusual floor.

Physical Characteristics, Properties and Advantages of Marbleloid Flooring.

Marbleloid is a sanitary, standardized, permanent, light weight, fireproof and resilient composition. It is installed in a plastic state, $\frac{1}{2}$ in. thick, and sets in a few hours into a seamless, tough, elastic body, presenting a fine grained, smooth surface.

The fact that it is jointless, remarkably free from a tendency to crack and practically non-absorbent gives it unusual sanitary value. It is easily kept clean; it is quiet to the tread; it is non-dusting, offering high resistance to abrasion; it is not slippery; it is waterproof. Owing to its elasticity, it is not fatiguing; it is a non-conductor of heat, and therefore, never cold; it has great crushing and structural strength and does not contract nor expand to any appreciable degree.

Marbleloid adheres firmly to wood, concrete or iron, and may be installed over old flooring, base or wainscot, as well as upon new construction. It is made in all colors, offering possibilities in the working out of any desired color scheme. Only inert mineral colors are used.

ADAPTABILITY—Over 8000 Marbleloid installations of large area have been made in the most varied types of flooring service. Marbleloid is being installed in almost every type of building. Because of the advantages enumerated above it is used to a very large extent in offices, institutions, schools, public buildings, churches, restaurants, clubs, hotels, theaters, libraries, banks, industrial plants, residences, apartment houses, laboratories, stores, garages, and in railroad cars and railroad stations and steamships. Approximately 2,000,000 sq. ft. of Marbleloid are annually installed in the United States and Canada.

PHYSICAL TESTS—Marbleloid weighs approximately 3 lbs. to the sq. ft.; it has a very low percentage of absorption; its compressive strength is over 6000 lbs. per sq. in.; it has a tensile strength of from 800 lbs. to 900 lbs. per sq. in. It has great resistance to abrasion and will stand under light trucking.

Marbleloid has been tested and approved by the Bureau of Buildings, Borough of Manhattan, New York City, as *fireproof material*. Copies of this report and other physical tests made by Prof. Woolson at Columbia University may be had on request.

*Indicates warehouse

MARBLELOID INSTALLED THROUGHOUT OFFICE OF
AMERICAN PULLEY COMPANY, PHILADELPHIA, PA.
HEACOCK & HOKANSON, Architects

MARBLELOID SERVICE—THE MARBLELOID COMPANY maintains thoroughly trained and skilled workmen at the principal building centers of the country, and is, therefore, unusually well equipped to perform work in any section with its usual high standard of excellence.

Owing to the fact that installations are unsuccessful when made by local cement masons, inexperienced in the handling of material of this nature, Marbleloid flooring is not sold in bulk. *All work installed by the Marbleloid organization is rigidly guaranteed.*

Before actually beginning the installation of the Marbleloid material, a preliminary inspection is made by an engineer thoroughly familiar with all phases of building construction.

At the plant and in the field, Marbleloid facilities are such that the company is always prepared to handle all work, no matter how large, with the utmost dispatch and efficiency.

In order to maintain the superior merit of its product, THE MARBLELOID COMPANY has in its employ a graduate chemist who has specialized in this line for the past seventeen years. The laboratory is constantly engaged in research work and all raw materials entering into the Marbleloid composition are carefully tested or analyzed, assuring a standardized product.

MARBLELOID SPECIFICATIONS—Before drawing up specifications covering the use of Marbleloid, the company suggests that engineers or architects secure a copy of this company's Standard Specification Sheet, giving detailed drawings showing construction of sanitary base, iron stair tread construction, etc. This Specification Sheet contains foundation requirements and other data that is essential for securing satisfactory results.

RELATIVE LOW COST—Marbleloid is a permanent flooring which requires no unusual or expensive foundation. It may be put into service 24 hours after it has been installed. It may be used just as readily over wood flooring (finished or under) as it can be over concrete fill or finished cement floor. Thus in alteration work, both the time and expense of the preparation of a special foundation may be eliminated. In the large areas it costs but a trifle more than the best grade hardwood or linoleum and will outwear many applications of the latter.

The price of Marbleloid flooring, sanitary coved base, wainscoting, stair work, etc., varies, naturally, with the area involved, nature of the foundation (wood, concrete, or iron) and location. The price of Marbleloid, unlike that of other flooring materials has increased but from 10% to 15% since 1916. With crews of Marbleloid mechanics in the various building centers of the country, economy and efficiency are assured.

Upon receipt of data giving information regarding nature of foundation, the area of floor and wainscot, lineal extent of sanitary base, treads, etc., a definite proposal for the work completely installed will be furnished.

GUARANTEE—THE MARBLELOID COMPANY rigidly guarantees the quality of its material and all work performed by its workmen, and will repair, free of charge, all defects due to the use of improper materials or workmanship.

SAMPLES, ETC.—Samples and color card, together with full literature including booklet, Standard Specification, etc., will be gladly mailed on request.

Marbeloid Magnesite Stucco.

Marbleloid magnesite stucco is an oxy-chloride cement stucco, which presents numerous advantages over the portland cement product, chief among which are the following:

Marbleloid magnesite stucco, because of its elasticity, high tensile strength (750 lb. per sq. in.) and the fact that it does not depend wholly upon a key for a bond, will neither crack, warp, nor come loose from the foundation over which it is applied. It is light in weight, considerably lighter than portland cement stuccos.

This material is absolutely fireproof. It can be applied successfully in freezing weather, no water being employed in preparation. Due to a slight expansion when setting, an absolutely tight joint is formed against all trim, coping, etc., thus obviating all possibility of dampness penetrating behind the material, causing it to loosen from the foundation over which it is applied, a serious objection in portland cement stucco.

Marbleloid magnesite stucco is furnished in three parts—undercoat, topcoat, and dash.

Due to the fact that mineral colors can be incorporated in the top coat, as well as variegated aggregates used in the dash, most pleasing and artistic effects can be secured. Not only can this material be used for exterior work but highly decorative schemes can be worked out with it as an interior finish.

Not only is Marbleloid magnesite stucco filling a long felt want in providing a durable, attractive and economical finish in new construction, but it is also being used extensively in the renovation and remodelling of old structures.

This company is prepared to furnish complete and explicit directions for the application of Marbleloid magnesite stucco, insuring absolutely satisfactory results upon the part of local plastering or stucco contractors. Samples, booklets, detailed specifications, outlining foundation requirements, will be furnished on request.

NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION

CLEVELAND, OHIO

MEMBER ASSOCIATIONS

EASTERN PAVING BRICK MANUFACTURERS ASSOCIATION, Lincoln Building, Philadelphia, Pa.
ILLINOIS PAVING BRICK MANUFACTURERS ASSOCIATION, Chamber of Commerce Building, Chicago, Ill.
INDIANA PAVING BRICK MANUFACTURERS ASSOCIATION, Fidelity Trust Building, Indianapolis, Ind.

OHIO PAVING BRICK MANUFACTURERS ASSOCIATION, Hartman Building, Columbus, Ohio
SOUTHERN PAVING BRICK MANUFACTURERS ASSOCIATION, Volunteer Building, Chattanooga, Tenn.
WESTERN PAVING BRICK MANUFACTURERS ASSOCIATION, Dwight Building, Kansas City, Mo.

Products.

VITRIFIED PAVING BRICK (or BLOCK, as they are sometimes called).

Uses.

Vitrified paving brick are used for paving city streets and country highways, alleys, driveways, walks and sidewalks, railway tracks, railway station platforms, factory floors, areas and drives about manufacturing plants, barn floors, stock feeding platforms. Adapted for paving anywhere that extreme resistance to wear and tear are essential or where imperviousness to moisture, acids, etc., is necessary.

They are also frequently and successfully used in the construction of sewers, conduits, buildings such as factories, garages, dwellings, warehouses, foundations for structures of all kinds, tanks, silos, and similar structures.

Paving brick may be used for all the purposes enumerated. For uses other than paving, off-grades—those that are not entirely suitable for paving by reason of being a little out of shape or perhaps too regular in shape, owing to extremes of the burning process—may be specified with entire satisfaction.

Only Number One pavers should be specified for paving purposes.

Paving Specifications.

The NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION and its Member Associations will furnish paving specifications on request.

These specifications may be followed in factory floor, driveway and area paving or under other comparable conditions.

A BRICK PAVED COUNTRY HIGHWAY

Sizes.

The standard paving product of the NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION is a plain wire-cut, square edged brick 3 by 4 by 8½ in. in size. Thirty-six are required to lay a square yard when laid to the 3-in. depth; 48 when laid to the 4-in. depth. They weigh approximately 4 tons per thousand. Other sizes special.

Many manufacturers of paving brick also make vitrified brick 2½ by 4 by 8½ in. in size for sewer and building construction.

THE RENKERT BUILDING, CANTON, OHIO, FACED WITH VITRIFIED PAVING BRICK

Specifications are available as follows:

STANDARD SPECIFICATIONS

Base—Rolled stone, slag or gravel.

Concrete.

Worn macadam, gravel, and slag pavements (utilized).

Worn concrete pavements (utilized).

Natural soil foundation.

Bedding—Sand, stone screenings or granulated slag.

Brick—3 by 4 by 8½ in. plain wire-cut, square edged, without lugs.

Filler—Asphalt.

ALTERNATIVE SPECIFICATIONS

Bedding—Cement—sand.

Filler—Sand, combined tar and asphalt, cement grout.

Brick—3 by 4 by 8½ in., square edged with lugs.

Specifications also can be furnished for the Green Concrete Foundation Type of pavement.

SPECIFICATIONS FOR STANDARD VITRIFIED PAVING BRICK

Section 1. Description—All brick shall be the Number One grade of standard vitrified paving brick. They shall be wire-cut, without lugs, and shall have square edges.

Section 2. Size—The size of standard vitrified paving brick shall be three (3) by four (4) by eight and one-half (8½) inches.

Section 3. Variations in Size—Vitrified paving brick shall not vary from the standard dimensions more than one-half (½) inch in length or more than one-eighth (⅛) inch in width and depth.

Section 4. Quality—Vitrified paving brick shall be evenly burned, thoroughly annealed, and uniform in texture. They shall be hard and tough. They shall show a uniform fracture when broken, free from marked laminations.

Section 5. Shape—The wearing face of the brick when laid shall be reasonably straight.

Section 6. Test—Brick shall not lose their weight more than twenty-four (24) per cent. when tested in the standard rattler and in accordance with the Standard Specifications for Paving Brick, of the American Society for Testing Materials, Serial Designation C 7-15.

Section 7. Samples—Samples for testing shall be chosen according to the Standard Specifications for Paving Brick of the American Society for Testing Materials, Serial Designation C 7-15.

Section 8. Brands—The contractor shall name the brands of standard vitrified paving brick, with the prices respectively, upon which he submits bids.

Section 9. Factory Inspection—When shipments of brick to any one project, or the combined shipments to separate projects under the jurisdiction of the engineer, are sufficient to make it economical, then the brick may be inspected and tested at the place of manufacture.

Merits.

Vitrified brick pavements are known as "Taxpayers' Value" pavements on account of their unequalled wearing qualities, low repair and maintenance cost, extreme durability under the severest use and their long-run economy. The buyer is protected by the following guarantee of vitrified paving brick used in paving.

Guaranty of Paving Brick.

The members of the NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION guarantee their product against defects in material and manufacture. Each brick in street or highway surface gives assurance of long and worthy service because each brick is a guaranteed service unit, complete and finished before it is laid.

Prices.

A list of manufacturers will be furnished on request from whom prices may be obtained.

Co-operative Service.

The office of the Association is always ready to consult with engineers concerning "Taxpayers' Value" paving brick and its uses and will be glad to furnish all

detailed information within its power, literature, list of manufacturers, and in general to be as helpful as possible.

THE OHIO WOOD PRESERVING COMPANY

Manufacturers of Wood Block Floors

1053 Century Building
PITTSBURGH, PA.

PLANTS: ORRVILLE, OHIO; BROADFORD JUNCTION, PA.; REED CITY, MICH.

Products.

CENTURY CREOSOTED WOOD BLOCK FLOORS.

Also, Creosoted Wood Paving Blocks, Creosoted Ties, Lumber, Timbers, Piling, Poles and Posts.

Century Wood Block Floors.

Century wood block floors are manufactured from dense, air seasoned long leaf yellow pine.

The blocks are accurately cut to uniform size, thoroughly seasoned and treated with creosote by a special process and under high pressure, to meet conditions existing in factories and shops. This treatment absolutely prevents decay and renders the blocks impervious to water.

The blocks are laid with the grain of the wood vertical so that the pressure and blows of heavy traffic come on the ends of the grain of the wood. Hard use has no effect other than to compact and "iron out" the ends of the wood fibers and make the floor smoother and more resistant to wear.

The blocks are laid on a concrete base, which is first coated with pitch or on which is spread a thin mortar cushion. Being uniform in size, Century blocks can and should be laid as tightly together as possible, the joints between the blocks being filled with hot pitch.

Uses.

Century block floors are manufactured especially

TRADE-MARK

for use in machinshops, foundries, metal working plants, automobile factories, railroad shops, pickling rooms, warehouses, stables, and other industrial plants where wearing quality, elasticity, sanitation and economy are prime requisites; also for loading platforms, driveways, courtyards and bridges.

Advantages.

Century block floors withstand the hardest and most severe traffic and actually improve with use.

They are smooth, making trucking easy; and having no "wearing surface" to grind off, do not wear away into ruts and holes. Furthermore, there is no splintering or abrasion under hard use, so no dust is formed to damage machinery.

They are comfortable to stand on, as they absorb vibration, are non-conductors of heat and sound, and are resilient—not hard, unyielding and cold.

Blocks require practically no attention after installation. They will last for years under constant use; while sections can easily be removed and replaced for repairs or installation of machinery whenever required. See illustration below.

Specifications.

The size, type and treatment of blocks and the method of installing floors differ with conditions under which they are used. Complete specifications sent on request.

Products.

KREODONE INTERIOR WOOD BLOCK FLOORS.

Creosoted Ties, Poles, Posts, Piling and Lumber of All Kinds.

Reilly's Improved Creosote Oil; Reilly's Wood Preservative Oil ("R. W. P. O.").

Wood Block Floors.

Kreodone interior wood block floors are superior to all other types of floor construction where durability and low cost of upkeep are the requisite factors. Best for machineshops, foundries, metal and woodworking plants, bakeries, paper and textile mills, automobile plants, rolling mills, breweries, barns, loading platforms, warehouses, railroad shops of all kinds, round-houses, freight depots, platforms, driveways, etc.

No other floor will withstand such heavy service nor last as long without requiring repairs. And no other floor can be so quickly and easily repaired.

CONSTRUCTION—Kreodone interior wood block floors consist of blocks of the best long leaf yellow pine, thoroughly seasoned and then impregnated with Kreodone Oil. The blocks are perfectly rectangular, 3 in. deep parallel to the grain, 4 in. wide, and from 5 to 10 in. long.

These blocks are laid on a suitable foundation which is first covered with a cushion of sand or pitch. The grain of the blocks is laid vertical to the surface of the floor and the blocks are laid close together, breaking joints between courses.

ADVANTAGES—The heaviest traffic has never been known to wear out or produce ruts in a Kreodone interior wood block floor. Hard service makes the floor stronger and more compact.

It forms a perfect trucking surface, as there is no give or traction wave such as plank floors produce; the floor can not dust and crumble like concrete; it can not disintegrate under the action of water, steam, acids and oils like composition floors; and it can not form ruts and humps like asphalt.

The blocks are all of the same height, hence the surface is smooth and even.

It is warm, non-slippery, easy under foot, dustless, free from noise and glare, resilient and free from vibration. The remarkable resiliency of the floor reduces the damage to tools and castings that may fall upon it.

As Kreodone Oil can never leave the wood, these Kreodone blocks are permanently proofed against water and decay.

In cases where sections of the floor have to be taken up to install alterations, the individual blocks are simply lifted out and then put back in place when the work is finished, leaving a floor that is as perfect and even as before they were removed.

COST—Prices furnished on application to any of the above sales offices. Figured in years of service and cost of upkeep, Kreodone interior wood block floors are more economical than any other type of floor yet discovered.

SPECIFICATIONS—Where specially severe or unusual conditions are to be met, the engineering department will gladly prepare specifications. Printed specifications for laying a Kreodone interior wood block floor will be sent on request.

The life of a Kreodone Interior Wood Block Floor depends primarily upon the preservative used. The oils must be free from volatile elements and adulterants of either coal tar or petroleum products. Kreodone Oil is the highest grade pure creosote oil on the market. It has no equal.

KREODONE OIL SPECIFICATIONS—Oil shall be wholly an *unadulterated* distillate of coal tar. No material of any kind, such as liquid tar, petroleum, or other products, shall be added to or mixed with it. Its specific gravity at 38° C. shall be not less than 1.09 and not more than 1.12.

It shall conform to the following distilling points: Up to 200° C., not more than 2% shall distill; up to 210° C., not less than 3% and not more than 5%; up to 235° C., not less than 10% and not more than 20%; up to 315° C., not less than 30% and not more than 40%.

Residue at 355° must be a crystalline solid, and shall not be in the least sticky; and when a small portion of it is placed on white filter paper and warmed, oil spot produced, when viewed by transmitted light, shall appear of a dark amber color. Specific gravity of residue shall not be less than 1.15.

Coke test applied to oil, according to N.E.L.A. method, shall show not more than 1½% coke.

Specific gravity of distillate between 235° C. and 315° C. at 38° C. shall be not less than 1.04 and the unsulphonated residue of this fraction shall not exceed 2½%. Also, a distillate shall be taken from oil between 300° C. and 360° C., inclusive, and the unsulphonated residue of this fraction shall not exceed 3½%.

TRADE-MARK

Creolignum Floors.

Creolignum is a trade-name designed to represent, first, the finest quality of creosoted yellow pine blocks, manufactured to meet the special conditions of each floor; and, secondly, an engineering service which is the result of wide and complete experience of different problems of floor construction. Poor quality of material can not be overcome; nevertheless, the highest quality of material may fail if poorly designed or ignorantly installed.

Creolignum floors are especially designed for machineshops, warehouses, shipping rooms, roundhouses, freight platforms, etc.; also for dairies and stables.

Creolignum floors are primarily for heavy duty and long service. They are especially designed for each situation.

Creolignum floors, in addition to their great durability, represent the greatest comfort to workmen and are ideal for trucking over.

Inquiries should state as exactly as possible the conditions and service required.

Material.

Long leaf yellow pine has become established as the most suitable and durable wood for heavy service floors. Its close grained structure and strength joined to the fact that it readily accepts a thorough treatment of creosote makes it an ideal material.

Short leaf yellow pine takes treatment even better than long leaf, but is somewhat lower in strength. Under lighter conditions of service, however, it is equally as satisfactory as long leaf and is somewhat lower in price.

Dense Southern yellow pine has become established as the most suitable and durable wood for heavy service floors. It has great strength and this, combined with the readiness with which it accepts treatment, makes it an ideal material.

The Southern Yellow Pine Association in conjunction with the American Society for Testing Materials have adopted density specifications rather than any other, in order to overcome the usual difficulty of inspection through confusion of species.

Creosote Oil.

Creosote oil, more properly called tar oil, is a by-product of the destructive distillation of coal tar, which

in turn is a residuum from the manufacture of coke and gas. There are several grades of creosote in use, ranging from the water gas tars to the pure distillate oils, and much controversy as to the proper oil to

use in treatment has arisen. As good a rule to follow as any is to use the cheapest and most available creosote, which can be guaranteed to do the work required with the treatment suitable for the purposes. It would be obviously unsound to preserve a timber against decay for 30 years when its mechanical life might be only 15, and equally so to preserve wood under fairly dry and uniform conditions in the same manner as that which would be subjected to very stringent conditions.

Treatment.

The recognized method of treatment of interior wood block floors is by "The Rueping Process" which thoroughly impregnates the blocks with creosote, and thereby insures complete preservation and at the same time leaves the wood free from excess oil, which might bleed and render the floor unusable.

Manufacture.

It is essential that blocks be cut properly. This requires good machinery and great care, as the blocks must be uniform in size, or trouble will result.

Determining Factors.

Entering into the highest quality of wood block flooring are:

- (1) Best lumber suitable for the purpose.
- (2) The best creosote available and suitable for the purpose.
- (3) Correct manufacture.
- (4) Correct size of blocks for service required.
- (5) Proper treatment to preserve against decay under prevailing conditions.

To gain the above factors, absolute efficiency and integrity of manufacture are required.

Service and Maintenance.

A correctly designed and properly installed wood block floor will last for years—practically no maintenance is required. The elasticity of the blocks is of the greatest advantage to the workmen, and their freedom from dust and insulating qualities make them an ideal floor.

Adaptability of Specifications.

The following specifications are scientifically and economically sound and will cover by far the majority of conditions in factories and warehouses. Special cases may arise, as, for instance, the conditions present in the pickling rooms of large steel plants, where moisture is at all times present on the floor; here a block of heavier

treatment is required and the installation calls for special methods.

Specifications for Floor in Heated Building Not Exposed to Weather or to Water Liquids.

MATERIAL—Blocks shall be THE SOUTHERN WOOD PRESERVING Co.'s Creolignum Blocks manufactured from first quality dense Southern yellow pine, thoroughly seasoned, containing at least an average of 6 rings to the inch, measured radially across the grain. The blocks shall be cut uniformly with sharp saws and shall vary not more than $\frac{1}{8}$ in. in width and $\frac{1}{16}$ in. in depth.

DIMENSIONS—Blocks shall be 3 or 4 in. in width. Average 8 in. long and 3 in. in depth (depth varies with service required).

TREATMENT—Blocks shall be creosoted by the following process (Rueping):

Blocks shall be placed in an airtight treating cylinder and subjected to an air pressure of from 40 to 80 lbs. per sq. in., depending on the condition of the wood. Preservative at a temperature of not less than 160° Fahr. shall then be introduced into the cylinder and additional oil pumped in until the cylinder is completely filled with the preservative and from 100 to 180 lbs. to the sq. in. is recorded in the gages. This pressure shall be maintained until the blocks are thoroughly impregnated with from 12 to 16 lbs. of creosote oil per cu. ft. of wood, after which the pressure shall be released, the cylinder drained and the excess oil removed from the blocks.

CREOSOTE OIL—Shall be completely liquid at 38° C. and not more than 3% of water-free oil. Shall be insoluble in chloroform or hot benzol. Specific gravity at 38° C. shall not be less than 1.05 nor more than 1.14. When distilled as described in Bulletin 96 of the A. R. E. & M. W. Assn., distillate shall not exceed the following:

To 200° C.....	no distillate
To 210° C.....	less than 5%
To 235° C.....	not more than 25%
To 315° C.....	not more than 50%

The oil shall not contain more than 2% of water.

Specifications for Laying Blocks on Concrete Base Coated with Pitch.

PITCH COAT—The smooth concrete foundation shall receive a hot mopped coat of pitch just prior to laying the blocks. This coat of pitch shall be thick enough to overcome all irregularities in the surface of the concrete and to give a smooth, even surface on which to lay the blocks. In case the surface of this coat of pitch is not smooth, it shall be ironed with hot smoothing irons such as asphalt pavers use.

PLACING BLOCKS—Blocks shall be carefully laid with the grain of the wood vertical in straight parallel courses at right angles to the length of the room or building, the blocks being laid with close, tight joints. The joints shall be broken by a lap of at least two (2) in. Nothing but whole blocks shall be used, except in starting or closing a course, and in no case shall less than one-third of a block be used in starting a course.

EXPANSION JOINTS—Expansion joints shall be provided along the walls of the building or room and around all pillars, machinery foundations, manhole frames and pit walls. The expansion joints shall be made by placing three-quarter ($\frac{3}{4}$) in. boards or strips on edge against the walls or foundations before the blocks are laid. The blocks shall be laid lightly against the strips.

After the blocks have been bedded by rolling or tamping, and the joints between the blocks have been filled, as hereinafter specified, the strips shall be removed and the spaces filled to within three-quarter ($\frac{3}{4}$) in. of the surface of the floor with hot coal tar pitch.

TAMPING OR ROLLING—Blocks shall be rolled or tamped until they are firmly bedded and brought to a smooth surface on the grade of the finished floor.

SAND COVERING—After the joints have been filled, the surface of the floor shall be covered with clean sand which will pass a ten- (10) mesh sieve. The sand shall be left on the floor for a few days until the joints are filled flush with the surface of the floor and any surplus sand shall then be removed.

Alternative Specifications—Cement Mortar Cushion.

LAYING BLOCKS—Upon the concrete foundation, prepared as heretofore specified, shall be spread a layer of dry mortar, approximately one-half ($\frac{1}{2}$) in. in thickness, composed of one (1) part portland cement and four (4) parts sand thoroughly mixed without the addition of water. The dry mixture of sand and cement shall be struck to a true surface parallel to the grade of the finished floor. The thickness of the mortar cushion shall be such that, when the blocks are set and properly bedded by tamping or rolling, their top surface will conform to the grade of the finished floor.

NOTE—A sand cushion may be used in place of the mixture of sand and cement, but it is not recommended.

PLACING BLOCKS—After the mortar bed has been spread and struck, it shall be dampened by using a sprinkling can, immediately before the blocks are laid. The blocks shall then be carefully laid with the grain of the wood vertical in straight parallel courses at right angles to the length of the room or building, the blocks being laid with close, tight joints. The joints shall be broken by a lap of at least two (2) in. Nothing but whole blocks shall be used, except in starting or closing a course, and in no case shall less than one-third of a block be used in starting a course.

EXPANSION JOINTS—Expansion joints shall be provided along the walls of the building or room and around all pillars, machinery foundations, manhole frames and pit walls. The expansion joints shall be made by placing three-quarter ($\frac{3}{4}$) in. boards or strips on edge against the walls or foundations before the blocks are laid. The blocks shall be laid lightly against the strips. After the blocks have been bedded by rolling or tamping, and the joints between the blocks have been filled, as hereinafter specified, the strips shall be removed and the spaces filled to within three-quarter ($\frac{3}{4}$) in. of the surface of the floor with hot coal tar pitch.

TAMPING OR ROLLING—Before the mortar cushion has started to set, the blocks shall be rolled or tamped until they are firmly bedded and brought to a smooth surface on the grade of the finished floor.

SAND COVERING—After the joints have been filled, the surface of the floor shall be covered with clean sand which will pass a ten- (10) mesh sieve. The sand shall be left on the floor for a few days until the joints are filled flush with the surface of the floor and any surplus sand shall then be removed.

NOTE—The direction of the courses of the blocks at right angles to the length of the building or room contemplates that the direction of the heaviest trucking or traffic will be parallel to the length of the room or building. If otherwise, the blocks should be laid in courses at right angles to the direction of the heaviest traffic.

SPECIAL SERVICE FLOORING CORPORATION

Composition, Asphalt, Mastic, Non-slip and Industrial Floors

Grand Central Terminal
NEW YORK, N. Y.

BRANCH OFFICES IN ALL PRINCIPAL CITIES
FACTORY, MAMARONECK, N. Y.
CANADIAN OFFICE, MONTREAL, P. Q., 332 Bleury Street

Products and Services.

SPECIAL SERVICE MAGNESITE COMPOSITION FLOORING.

SPECIAL SERVICE ASPHALT FLOORING.

SPECIAL SERVICE MASTIC FLOORING.

SPECIAL SERVICE SOLRY 100% NON-SLIP FLOORING.

Special Service Colored Cement Flooring, Special Service Concrete Hardener.

FLOORING ENGINEERS and CONTRACTORS.

Special Service Floors.

Sanitary, durable, dustproof, resilient, fireproof, verminproof and germproof; they are sound deadening, quickly installed, and never become slippery even when wet.

Designed to meet the various service requirements. The entire floor problem is assumed by the corporation, one of whose engineers interviews the architect to ascertain what may be particularly required of the new floors; after these specific data shall have been obtained, the flooring materials will be manufactured at the company's factory expressly for the special service to which the new floor is to be subjected. The best materials and treatments are used to take care of the individual floor in question, the traffic to be met, etc. Complete specifications furnished.

ADAPTABILITY—Special service floors can be laid over wood, concrete or steel and are extensively used in industrial buildings, public buildings, hospitals, schools, residences and naval vessels.

INSTALLATION—Floors are installed by the experienced mechanics of this corporation anywhere in the United States and Canada. These materials can be used over all kinds of construction and are suitable for floor, base, wainscot and stair work, in both new construction and in existing buildings.

The formulæ and methods of installations are based on 11 years' actual experience in various installations of special service floors in all kinds of buildings in all parts of the country, the results of different formulæ and methods being carefully noted in all cases. This policy, therefore, will assure the proper floor for each particular requirement.

Special Service Magnesite Composition Flooring.

Special service magnesite composition flooring is generally laid $\frac{1}{2}$ in. thick over wood, concrete, or steel. It is not affected by changes of temperature or humidity; is fireproof; does not dust; having the quality of springiness, it does not tire a person who stands on it; is smooth, sanitary and adapted for use where the absence of dust is necessary. Made in all colors.

Special Service Solry 100% Non-slip Flooring.

Special Service Solry 100% non-slip floor is a travel surface for floors, ramps, stairways, landings, etc., that will not wear smooth or slippery, will be wear resisting and is of sanitary construction. The material is fireproof, acidproof, waterproof, resilient, and installed in all colors. The non-slippery qualities are permanently maintained by distribution of an abrasive

material through the entire thickness of the material so it can never wear slippery.

Special Service Asphalt Flooring.

Is laid usually from $\frac{5}{8}$ to $1\frac{1}{2}$ in. thick over wood, concrete or steel and is guaranteed not to creep. Has been successfully used in factories, recreation roofs and other places where a floor or decking is required to be extremely resilient, waterproof and durable.

Special Service Mastic Flooring.

It is installed by cold process and is built up in 4 layers. Is very resilient and presents a pleasing appearance; is flashproof and a good thermal and electric insulator; is usually installed over concrete, composition, steel, or wood, in brown, black, red and green.

Special Flooring for Special Conditions.

Special floors are installed by this corporation in acid plants, pickling rooms, coal bunkers, battery storage rooms, and under difficult conditions.

Manufacture of Products.

Raw materials, magnesite, asphalt, color, and all other ingredients of the very highest grade and test, are carefully selected; analyzed by means of chemical tests conducted by the company's chemical engineers at time of purchase, before manufacture and before shipment.

Supervision.

Corps of skilled mechanics, located in the principal industrial centers of the United States and trained 11 years, work under the direction of the company's president, insuring uniformly successful installations. These men have had long experience in floor operations under all conditions in all parts of North America.

Estimates, Specifications, Samples, etc.

Gladly supplied on application.

Guarantee.

All products installed by the corporation are guaranteed by it against all defects of materials and workmanship.

Quick Shipments.

Large stocks of raw materials are kept at all times at the main factory, also at the principal agencies, facilitating shipment of materials.

References.

This corporation has installed work for many of the leading architects and engineers in the United States and Canada, and for the U. S. Government. Names will be gladly given on request.

Some prominent industrial installations are:

Aeolian Company	New York Central R. R. Co.
American Can Company	New York Edison Company
American Everready Company	New York Telephone Company
Brooklyn Rapid Transit Co.	National Screw and Tack Company
Bordens Condensed Milk Company	Proctor and Gamble Company

STANDARD ASPHALT & REFINING COMPANY

Producers of Mineral Rubber Asphalts

208 South La Salle Street
CHICAGO, ILL.

Products.

SARCO MINERAL RUBBER MASTIC and FLUX for asphalt mastic floors, platforms, driveways, etc.

Sarco Mineral Rubber No. 6 Waterproofing; Fabric and Expansion Joint for Waterproofing. Other Sarco Mineral Rubber Asphalt Products: Asphalt Filler, Roof Cement, Pipe Coating, Refrigerator Compound, A. P. (acidproof) Tank Lining, Cork Cement, Battery Seal, Insulation (Thermal and Electric); Protective Coatings for metal, concrete and masonry.

Quality and Services.

All Sarco mineral rubber asphalts are 99.5% pure, unvaryingly uniform, completely waterproof and non-absorbent, odorless and tasteless, and highly resistant to acids and alkalis. They are insensible to extreme, quick changing temperatures, due to a difference of more than 200° Fahr. between melting and brittle points.

The information and advice this company is prepared to furnish, for the use of asphalt for any purpose, represent the most advanced technical knowledge and years of practical experience in refining and using asphalts. Service in this respect comprehends the preparation of plans and specifications. Besides producing the materials, the company operates an Engineering-Contracting Department for performing contract work.

Adaptability and Advantages of Sarco Mineral Rubber Floor.

On account of its resilient, flexible nature it is adapted to any kind of traffic, absorbing all shocks without "grinding" or "dusting." It remains permanently "alive," as the materials do not deteriorate with age. The floor is non-absorbent and contains no joints to accumulate filth. It is easily cleaned by flushing.

It is a scientific combination of abrasion resisting materials (sand and gravel of the proper size and quality) and Sarco mineral rubber mastic and Sarco mineral rubber flux. Being in a plastic state when laid, it can be easily moulded to conform to drainage requirements and fitted closely against walls, pillars and even

continued as a lining for drains and gutters. It is rubbed to a smooth surface, making a desirable, sanitary and waterproof floor. Because of sanitary, quiet, non-dusting qualities it is very desirable for schools, hospitals and sanitariums. On account of excellent wear resisting qualities it is used very extensively

in freight and passenger stations, baggage rooms, machineshops, factories, industrial plants, warehouses, docks, alleys, driveways, packing plants and canning factories.

Specifications for Sarco Mineral Rubber Asphalt Floor Over Concrete.

Foundation shall be clean, dry, smooth and finished true to grade.

Floor shall be laid with Sarco Mineral Rubber Mastic and Sarco Mineral Rubber Flux, as produced by the STANDARD ASPHALT & REFINING COMPANY of Chicago, Ill.

Mastic shall be composed of very fine mineral matter, well graded and saturated with Sarco Asphalt during the process of manufacture. Sarco Flux shall be 99.5% pure asphalt, of a tough, rubbery, quality. Its consistency or degree of hardness shall be suitable for the character of traffic to which the floor is subjected.

Mineral aggregate used in the floor shall be clean, washed torpedo gravel, limestone or granite screenings of well graded sizes from 1/4 in. to fine particles.

Mastic blocks shall be broken into pieces, mixed with a proper amount of Sarco Flux, and cooked to a thin liquid. To this mixture shall then be added a proper amount of dry and heated mineral aggregate, and the mixture agitated with stirring rods to insure all particles being thoroughly coated. During removal of mixture from kettle it shall be agitated by iron stirring rods.

The mixture when deposited on the foundation shall be spread to proper thickness with wooden spreaders and floats. Thickness of floor shall be controlled by strips of the proper height.

Floors 1 in. in thickness shall be laid in one course. Floors 1 1/4 in. and 1 1/2 in. thick may be laid in one or two courses as conditions warrant.

In making joints, hot mastic shall be laid over the cold edge of the joint and allowed to remain until the same is heated and softened. Surplus material shall then be removed and joints made perfectly tight and compact by sufficient rubbing. Finished surface shall be sprinkled with fine sand and rubbed with sufficient pressure to eliminate all voids. If a light color surface is desired, floors shall be dusted with portland cement, to give uniform light color.

STANOLIND PAVING ASPHALT.
STANDARD PAVING FILLER.
ROOFING ASPHALTS.
SATURATING ASPHALTS.
BRIQUETTING ASPHALTS.
FLUXING ASPHALTUMS.
ASPHALTIC ROAD OILS.
NON-ASPHALTIC ROAD OILS.

Stanolind Paving Asphalts.

GRADE "A"—For heavy traffic sheet asphalt pavements.

GRADE "B"—For sheet asphalt and asphaltic concrete pavements.

GRADE "C"—For asphalt macadam pavements (penetration method).

GRADE "D"—For surface treatment of roads and pavements.

CONSISTENCY—The range of consistency of grades "A," "B," "C" and "D" are ample to cover conditions in work for which they are recommended.

DESCRIPTION—Stanolind paving asphalts are refined from asphaltic petroleum by distillation and steam agitation, by an improved method in one of the largest, if not the largest, and most perfect refinery in the world.

All asphalts come out of the ground, some through crevices or cracks or openings in the earth's surface, or through pipes driven into the earth, and at different degrees of consistency.

It is readily seen that it is important that it should be properly refined and as free from impurities and as near pure bitumen as it is possible to make it.

Its purity in bitumen fixes its value, the main properties being cementing power, ductility, stability, and small loss in volatilization when put to use.

Stanolind paving asphalt has all of the necessary qualities required of a bituminous cement; in fact, it has a greater cementing strength than most of the asphalts on the market, and in its different consistencies gives perfect results in the widest climatic changes over the extensive territory in which it has been used.

Standard Paving Filler.

Stanolind paving filler for brick and granite block pavements.

Briquetting Asphalts.

Stanolind briquetting asphalt is used in the manufacture of briquetting coal; it is absolutely a perfect cement and gives forth no odor when burning.

Roofing Asphalts.

Parolite—soft, medium and hard.
Stanolite—semihard, soft and hard.
Stanolind Saturating Asphalt.
Petroleum Tailings.
Fluxing Asphaltums.

The grades and consistencies of same have ample range to fill all the requirements of the manufacturers of ready made roofing and asphalt shingles.

Fluxing Asphaltum.

Grade 6S for use in tempering paving and roofing asphalts.

Asphaltic Road Oils.

Furnished in grades Nos. 3, 4, 5 and 6.

No. 3 being the lightest, containing not less than 30% asphalt.

No. 6 being the heaviest, containing not less than 60% asphalt at 100 penetration.

No. 3 is recommended for laying and as a dust preventive.

No. 4 and No. 5 are recommended for dust preventive, and waterproofing earth, macadam and gravel roads.

No. 6 is recommended for second or third treatments.

Non-asphaltic Road Oils.

For dust laying purposes on brick roads, bridle paths, park walks, tennis courts, etc.

Use of Asphalt.

In planning for the use of asphaltic cement, we would suggest to engineers and architects that when drawing specifications, they use the following:

Specifications for Asphalt for Asphaltic Cement to be Used in Sheet Asphalt and Asphaltic Concrete.

By the careful distillation of petroleum with steam agitation at a temperature not exceeding 700° Fahr. until the resulting residue has a consistency not harder than 30 penetration, the specific gravity of which shall at 77° Fahr. be not less than 1.0.

(a) The solid residue so obtained shall be soluble in carbon tetrachloride to the extent of 98½%.

(b) If the solubility in carbon tetrachloride of the solid residue is less than 99%, the bitumen shall yield upon ignition not more than 15% of fixed carbon; if the solubility is 99% or more, the bitumen shall yield upon ignition not more than 18% of fixed carbon.

(c) When 50 grams of the material are heated for 5 hours at a temperature of 325° Fahr. in a tin box 2 $\frac{1}{8}$ in. in diameter by 1 $\frac{3}{8}$ in. deep, after the manner officially prescribed, it shall lose not over 5% by weight, nor shall the penetration after such heating be less than one-half the original penetration.

(d) When the refined asphalt is brought to a penetration of 50 by the use of the flux with which it is to be combined in making the asphaltic cement, or by heating at a temperature below 500° Fahr., it shall have a ductility of not less than 100 centimeters, test to be made at the rate of 60 centimeters per minute.

(e) The asphaltic cement shall show a cementing value of .25 of a kilogrammeter at 5° C. when tested at a penetration ranging from 50 to 70; test to be made as described on page 796, Vol. 6, Journal of Industrial and Engineering Chemistry.

(f) Asphaltic cement shall have a ductility of not less than 5 centimeters when tested at 5° C., test to be made at the rate of $\frac{1}{4}$ centimeter per minute.

The penetration of the asphalt used shall range between 40 and 65 and shall be within 5 points of such penetration as is deemed best for the particular work for which the specifications are drawn.

Our recommendations for repair work are from 35 to 45 penetration; for sheet asphalt on medium traffic streets, from 50 to 60 penetration, and for asphaltic concrete on medium traffic streets, from 55 to 65 penetration, when Stanolind paving asphalt is used.

Specifications for Asphaltic Cement to be Used in Asphalt Macadam Pavements (Penetration Method).

(a) The asphaltic cement shall have a specific gravity at 77° Fahr. of not less than 1.0.

(b) The bitumen of the asphaltic cement shall be soluble in carbon tetrachloride to the extent of at least 98 $\frac{1}{2}$ %.

(c) The fixed carbon of the asphaltic cement shall be not less than 8% nor more than 16%.

(d) The melting or softening point of the asphaltic cement shall be not less than 100° Fahr. nor more than 135° Fahr.

(e) The asphaltic cement shall have a penetration of from 80 to 150, which shall be varied within these limits to adapt it to the particular asphalt used, and to conditions of the streets.

(f) When 50 grams of the asphaltic cement of the consistency used in the paving mixture are heated for 5 hours at a temperature of 325° Fahr. in a tin box 2 $\frac{3}{8}$ in. in diameter by 1 $\frac{3}{8}$ in. deep, there must not be volatilized more than 3% of the bitumen, nor shall the penetration after such heating be less than one-half the original penetration.

(g) A briquette of the asphaltic cement of a consistency equivalent to 80 penetration shall have a ductility of at least 100 centimeters, tests made at the rate of 60 centimeters per minute.

(h) The asphaltic cement shall show a cementing value of 0.15 kilogrammeters at 5° C. according to method of test described in Journal of Industrial and Engineering Chemistry, page 796, Vol. 6. Test for cementing value to be made at a penetration ranging from 90 to 110.

(i) Asphaltic cement shall have a ductility of not less than 5 centimeters when tested at 5° C., test to be made at the rate of $\frac{1}{4}$ centimeter per minute.

We recommend the penetration for Stanolind paving asphalt to be used on medium traffic (penetration work) at from 100 to 120.

Specifications for Asphaltic Cement for Surface Treatments on Brick, Concrete, Water Bonded Macadam or Gravel Roads, or Cinder Drives.

SPECIFIC GRAVITY—The specific gravity of the asphaltic cement at 77° Fahr. shall not be less than unity.

LOSS BY VOLATILIZATION—When 50 grams of the asphaltic

cement are heated in a cylindrical vessel (tin box) 2 $\frac{1}{8}$ in. in diameter by 1 $\frac{3}{8}$ in. deep at a temperature of 325° Fahr. for 5 hours, the loss in weight shall not be greater than 5%, nor shall the penetration at 77° Fahr. after heating be less than one-half the original penetration.

PENETRATION—The asphaltic cement shall have a penetration of from 175 to 225 when tested for 5 seconds at 77° Fahr. with a No. 2 needle weighted with 100 grams. Its penetration at 32° Fahr., when tested for one minute with a No. 2 needle under a weight of 200 grams, shall not be less than 20.

FIXED CARBON—The asphaltic cement shall not yield more than 16% of fixed carbon when a 1-gram sample in a platinum crucible 35 millimeters by 35 millimeters is heated for 7 minutes in the full flame of a No. 4 Meker burner, according to the method recommended by the American Society for Testing Materials for the determination of fixed carbon in coal.

FLASH POINT—It shall have a flash point of not less than 350° Fahr.

PARAFFIN SCALE—It shall not contain more than 1.5% of paraffin scale by the Holde method.

DUCTILITY—It shall have a ductility of 77° Fahr. of not less than 100 centimeters when a Dow mould is pulled at the rate of 60 centimeters per minute.

SOLUBLE IN CARBON TETRACHLORIDE—The asphaltic cement shall be soluble in chemically pure carbon tetrachloride to the extent of at least 98 $\frac{1}{2}$ %.

SOLUBLE IN CARBON BISULPHIDE—The asphaltic cement shall be soluble in chemically pure carbon bisulphide to the extent of at least 99%.

VISCOSITY—It shall have a viscosity at 32° Fahr. of not less than 0.55 gram; the viscosity of the asphaltic cement, by the terms of this specification, shall mean the number of grams of asphaltic cement that will in 4 hours be forced through a circular orifice 1 centimeter in diameter by a pressure equal to that exerted by a column of mercury 150 centimeters high. The asphaltic cement during this test shall be contained in an iron cylinder 42 millimeters in diameter, and 100 millimeters high, and the thickness of the plate through which the orifice is made shall not be more than 2 millimeters.

RESIDUE—When 20 cubic centimeters of naphtha solution, obtained by treating 1 gram of the asphaltic cement with 100 cubic centimeters of cold naphtha, and filtering, is evaporated, the residue shall be adhesive, not merely oily.

The penetration we recommend for this class of work in most cases is from 190 to 210.

Booklet of Specifications.

In connection with asphaltic cement in different kinds of pavements, we have published a Stanolind paving asphalt booklet that gives complete specifications for the different kinds of pavements in which asphalt is used, and also the different surface treatments in which asphalts are used, the specifications covering a wide range of treating pavements of all the different kinds, as well as recommendations on paving fillers, expansion joints, etc. The booklet also contains useful tables and general information in regard to asphalts and paving construction. This booklet will be furnished free on request.

Shipments of Asphalt.

The asphalt products are shipped in bulk, tank cars, and also in iron drums. The softer asphalts are shipped in specially heavy, double headed, tightly sealed drums.

Co-operative Service.

Special and prompt attention is given to all requests and inquiries for information regarding the various uses of our asphaltic products.

THOMAS MOULDING BRICK CO.

Fiber Mastic Floor Covering
1206 Chamber of Commerce Building
CHICAGO, ILL.

REPRESENTED BY AGENCIES IN CITIES THROUGHOUT THE UNITED STATES

Product and Service.

T-M-B FLOORING: Fiber Mastic Floor Covering, Mastic Linoleum Floor Covering, Composition Flooring, Rubber Flooring.

Mastic Material sold and Floors installed anywhere.

T-M-B Flooring.

A tough, resilient covering and wearing surface for cement floors. T-M-B flooring is an artificial rubber floor covering built up to a thickness of $\frac{3}{16}$ in. by applying thin coats in plastic form. The finished floor covering is perfectly bonded to and forms an integral part of the underlying floor and is a continuous sheet of rubber-like texture without seams, joints or cracks, and having a soft, resilient, non-slippery tread.

Adaptability.

T-M-B flooring is well suited to use for light manufacturing and warehouse purposes, throughout schools, hospitals, institutions, office buildings, spaces used for gymnasiums, drill halls, toilets, locker rooms, comfort stations, etc.

WORK SPACES—For either entire workrooms or patches in front of workstands and benches. Does away with foot weariness. Eliminates necessity of the dangers of movable platforms for bench and vise hands. Largely increases the efficiency of any workman continuously on his feet.

ELECTRICAL INSULATION—For electric power plants and substations; wherever electric currents are present.

CHEMICAL PROOFING—For laboratories, plating rooms, etc.

STAIRWAYS—For all treads and landings. Gives safety (non-slipperiness) and quiet.

OUTDOOR USE—For porches, terraces, recreation roofs, etc.

AREAS TO BE AVOIDED—T-M-B flooring is *not suited* to use in garages, kitchens, packing houses or any space where the floors are subjected to the continued action of oil, grease, fats, gasoline or other hydrocarbon solvents, such as would affect rubber. It is also inadvisable to install T-M-B flooring for trucking purposes where loads are excessive or where motor tractors are used.

Advantages of T-M-B Flooring.

- (1) Warm, easy and non-slippery under foot.
- (2) Quiet and noiseless.
- (3) Dustless.
- (4) Waterproof and non-absorbent.
- (5) Very durable.
- (6) Easily and cheaply repaired. Can be maintained indefinitely in perfect condition.
- (7) Pleasing in appearance. Colors: green, red, brown and black.
- (8) Sanitary.
- (9) Chemically inert.
- (10) Non-conductor of electricity.
- (11) Will not crack, wrinkle, crawl or come loose from the underlying floor.
- (12) Economical in both first cost and maintenance.

Specification Data, Abbreviated.

T-M-B Flooring, where shown on plans or called for by the specifications, to be furnished and installed by or under supervision of THOMAS MOULDING BRICK Co., of Chicago, Ill.

SUBFLOOR OR BASE REQUIREMENTS—As T-M-B Flooring is not a structural material, but a tough, resilient covering and wearing surface, subfloor should be trowel finished cement, metal or magnesite composition with smooth level surface, sufficiently hard and strong to stand, without failure, the usage to which the finished T-M-B floor will be subjected. Grade to be $\frac{1}{8}$ in. below finished floor level.

COVED BASE—Finished cement, magnesite or metal. Not over 6 in. high.

STAIR TREADS, LANDINGS AND PLATFORMS—Finished cement, magnesite or metal, and provided with metal nosings so set that a $\frac{3}{16}$ -in. thickness T-M-B Flooring applied to tread or platform will finish flush with top of nosing.

GENERAL CONDITIONS—All subfloors to be delivered bone dry, broom clean and free from grease and paint.

Estimates, Co-operative Service and Guarantee.

This company will be pleased to furnish estimates or bids to supply all necessary labor and material to install T-M-B flooring anywhere.

Full detailed specifications, descriptive booklet, references and samples sent on request.

The THOMAS MOULDING BRICK Co. stand squarely back of their products in every way and assure satisfaction by all installations of T-M-B flooring applied by themselves or their authorized agents.

L. SONNEBORN SONS, INC.

Manufacturers of Concrete Floor Hardeners and Technical Paints

262 Pearl Street
NEW YORK, N. Y.

FACTORY: AVONDALE, N. J.

Products.

LAPIDOLITH, the Liquid Hardener for concrete floors and Waterproofers for concrete and stucco walls.

CEMCOAT, a Wall and Floor Coating for concrete and other building materials.

FERMO, an Integral Liquid Chemical for the acceleration of the setting, and for prevention of freezing of concrete mixtures.

LIGNOPHOL, a Preservative for wooden floors.

Hydrocide, for dampproofing foundations and walls; Structural Steel Paints.

Lapidolith.

Lapidolith is an inorganic liquid chemical which renders new concrete floors hard, dustproof, wearproof and watertight. When applied to old concrete floors, Lapidolith will prevent further dusting and disintegration.

LAPIDOLITH
TRADE MARK

Advantages of Lapidolith.

Prevents dusting and wear of floors. This chemical permeates the concrete and renders it as hard as granite.

Lapidolized floors take on a fine surface finish under service and can be easily washed and swept.

Lapidolith prevents the formation of concrete dust, thus saving expensive repairs to machinery, injury to merchandise, etc.

The labor cost of applying Lapidolith is negligible. Only unskilled labor is required, and an average man should be able to cover from 10,000 to 15,000 sq. ft. per day with one application.

Covering Capacity of Lapidolith.

According to porosity, 1 gal. will cover about 70 to 100 sq. ft.

Directions for application furnished in each case.

Lapidolith Specifications for Concrete Floors.

Harden and dustproof all concrete floors with Lapidolith, manufactured by L. SONNEBORN SONS, INC., New York, as per their directions and under their supervision.

Service Work for Lapidolith.

This company itself is prepared to apply Lapidolith under the supervision of a service engineer on areas of 20,000 sq. ft. and over. In New York City and wherever it has branch offices or representatives, or in

localities where its service crew happens to be working, it is able to undertake service work involving smaller areas.

Some Present Users of Lapidolith.

Aluminum Company of America	General Chemical Company
American Woolen Company	B. F. Goodrich Company
American Writing Paper Company	Johns Hopkins University Buildings
Armstrong Cork Company	National Lamp Works
Bethlehem Steel Company	Nordyke & Marmon Company
Canadian Fairbanks-Morse Co.	A. G. Spalding & Bros. Mfg. Co.
Carnegie Steel Company	Three In One Oil Company
Chalmers Knitting Company	U. S. Navy Department
Chevrolet Motor Car Co.	U. S. Steel Corporation
Continental Can Company	Washburn-Crosby Company

Cemcoat for Interior and Exterior Use.

Cemcoat is an ideal, enamellike wall and floor coating, in white and colors. Absolutely free from all poisonous ingredients.

Cemcoat
TRADE-MARK

It forms an even, light reflecting, non-porous surface, which affords no lodgment for dust and can not be injured by soap and water, or even water applied with a hose.

Fermo.

Fermo will:

- (1) Accelerate the setting of concrete.
- (2) Prevent concrete from freezing at low temperatures.
- (3) Densify concrete and reduce its permeability.
- (4) Produce a smooth, workable concrete mass which is much more easily troweled than ordinary cement.

Lignophol, the Preservative of Wooden Floors.

New floors will be protected from splintering and decay; old floors will be revived and their life prolonged.

Lignopholed floors last longer, are dustless, smooth and sanitary.

Further Information.

The following printed matter will be sent on request: Booklet, "Concrete and Lapidolith," and Scientific Test Reports.

Booklet, "Why Lapidolize?"

Specification booklet covering Lapidolith, also Cemcoat, Hydrocide Fermo, Lignophol and other Sonneborn products.

Samples, flask of Lapidolith and hardened block of concrete.

Master Builders Method

TRADE-MARKS

Registered United States
Patent Office

If rock or grit is used in addition to sand, specify as follows, instead of above: 1 part tested portland cement; 1 part crushed rock or grit (not over $\frac{3}{8}$ in. in size), free of dust; 1 part clean, coarse, gritty sand.

MEASURING VOLUMES—These proportions shall be accurately measured by volume, in suitable size boxes. No counting by shovels, or measuring by wheelbarrows or other approximation will be permitted. To determine proper proportions, 1 bag of cement shall equal 1 cu. ft. of sand or grit.

ADDITION OF WATER—Mix thoroughly dry until uniform in color, showing no streaks or patches of the constituents; if mixed by hand, topping aggregate shall be turned over dry three times. Add sufficient water to saturate mixture and mix thoroughly again. Topping shall at no time be made sloppy.

APPLICATION OF TOPPING—Lay and straightedge the topping to a true and even surface; float the surface well with wooden floats to close all voids and hollows.

WEARPROOF FINISH—A dry mixture of 1 part Master Builders Concrete Hardner to 1 part tested portland cement (by weight), mixed to an even color, shall be sprinkled evenly over surface. Not less than 20 lbs. of Master Builders Concrete Hardner and 20 lbs. of portland cement shall be distributed in this manner over each 100 sq. ft. This shall be floated in thoroughly and troweled. A second troweling shall be given surface when it has set sufficiently to finish hard and smooth.

Under no circumstances shall the wearproof finish be applied when there is any surplus water on the floated surface.

SAFEGUARDING THE FLOOR—After topping has set up, contractor shall cover it with a uniform layer of soft wood sawdust, shavings, or other suitable covering. This covering must not be applied until experiment shows surface hard enough to prevent covering from scratching or injuring the finish. Surface shall be kept wet for at least 5 days. Floors, if protected as above, will be ready for light traffic in 1 week, and for heavy traffic in 3 weeks, under favorable weather conditions.

EXCEPTIONS—The foregoing "Standard Specification" is the standard method of procedure for the average building. The 20 lbs. of Master Builders Concrete Hardner recommended per 100 sq. ft. will give a surface which will withstand any average service. However, there are some cases where the quantities should be varied. These exceptions follow:

In buildings where floors are subjected only to light foot traffic, specify 15 lbs. of Master Builders Concrete Hardner to every 100 sq. ft. for the wearproof finish. For floors, piers and loading platforms, etc., which receive extremely heavy wear, specify 25 lbs. of Master Builders Concrete Hardner to every 100 sq. ft. for the wearproof finish. For railroad repair shops, forge shops, etc., specify 30 lbs. of Master Builders Concrete Hardner to every 100 sq. ft. for the wearproof finish.

Description and Advantages of Master Builders Method.

Ordinary concrete floors dust and wear into ruts and holes. The reason for this is their porous structure and lack of proper wearing aggregate. Master Builders Method is a formula for building concrete floor surfaces according to definite, standardized principles which eliminate the defects of ordinary concrete floor construction and produce wearproof, dustproof and waterproof concrete floors.

To accomplish this result, Master Builders Method employs Master Builders Concrete Hardner, a perfectly graded, scientifically treated metallic aggregate, which, when added to the sand and cement when the topping of the floor is installed, eliminates all pores and supplies a hard wearing, permanent, non-abrasive element that withstands the wear and tear under which ordinary concrete floors break down and wear out.

Master Builders Method is the original and standard method for producing concrete floors that will not dust or absorb moisture and that will resist the hardest kind of wear. Over 30,000 users have more than 100,000,000 sq. ft. of surface in use to date.

Master Builders "Standard Specification."

Recommended for making wearproof, dustproof and waterproof concrete floors in every type of building.

Wherever practicable, topping to be laid before base has set.

PROPORTIONS OF TOPPING—Topping (thickness at least full $\frac{3}{4}$ in.) shall consist of the following proportions: 1 part tested portland cement; 2 parts coarse, gritty, clean sand.

BIG FOUR RAILWAY SHOPS, BEACH GROVE, IND.
75,000 sq. ft. Masters Builders Method concrete floors laid in 1912

Master Builders Red or Black Concrete Hardner.

Either of these colors may be obtained, combined with the hardening elements found in the regular Hardner, and are particularly desirable to use where the decorative fitness of the floor is as important as its wearing qualities.

Master Builders Saniseal.

On concrete floors, already laid and not giving satisfactory service, or where it is impossible or impracticable to use a metallic hardener in laying the floor, Saniseal is the ideal material to use. It combines with the lime in the cement, forming a new crystal that is exceedingly hard and wear resisting. It changes the soft, porous surface to a flintlike hardness.

Saniseal is easy to use. No complicated dilutions or applications necessary. Except where a floor is exceptionally porous, 1 gal. of Saniseal will cover approximately 100 sq. ft. Does the work overnight in most cases.

Master Mix.

Master Mix gives the answer to five vital questions in concrete construction:

(1) How to accelerate the final set of the cement, without weakening its tensile strength. (2) How to produce ideal troweling conditions. (3) How to create at low cost a dense, hard surface that will not dust. (4) How to secure waterproof concrete. (5) How to prevent concrete from freezing at ordinary low temperatures.

The scientific explanation of how Master Mix settles these "how" problems requires more space than is available here, but its accomplishments can be touched upon in sufficient detail to show the amazing possibilities and opportunities in this preparation.

Master Mix accelerates the final set of the cement from 2 to 4 hours; increases the tensile strength 71% in the first 24 hours and from 5% to 10% permanently; produces a "fatty" condition of the cement that makes it 100% easier to trowel; hydrates from 40% to 50% more cement than water, thus producing a dense, hard surface that will not dust or crumble; prevents concrete and stucco from freezing at ordinary low temperatures; renders concrete waterproof, through giving it sufficient density to prevent water seeping through.

Every claim made for Master Mix is amply borne out by years of actual use in all types of buildings and

millions of square feet laid in the most important building operations in the country.

Contractors have long been waiting for a material that would produce ideal conditions and results without having to follow complicated instructions. Here it is in Master Mix.

Master Mix Specifications.

FOR ACCELERATING SET OF CEMENT AND HARDENING CONCRETE FLOORS—1-in. topping is recommended, proportioned 2 parts clean, fairly coarse, sharp sand and 1 part fresh tested portland cement. Mix thoroughly dry. Add Master Mix to gauging water gradually in proportion of 1 gal. Master Mix for every barrel of cement used. Pour, float and trowel cement in usual manner. A second troweling when surface is sufficiently set will produce a hard smooth finish. Protect surface from injury and keep it wet until surface is hard. For this purpose use a layer of soft wood sawdust, properly wet down.

FOR WATERPROOFING BRICK MASONRY—Mortar in which bricks are laid should be 1 part cement and 2 parts sand. Mortar to be tempered with water to which has been added Master Mix in proportion of 1 gal. waterproofing to 10 gals. of water. Carefully grout each course of bricks, taking care that all joints are filled with mortar.

FOR WATERPROOFING CONCRETE AND CEMENT MIXTURES—To waterproof 1-2-4 mass concrete add $\frac{3}{4}$ gal. of Master Mix to gauging water to each barrel of cement. To waterproof 1-2-5 mass concrete add 1 gal. of Master Mix gauging water to each barrel of cement.

Concrete walls, floors, etc., can be made waterproof by the application of a cement coat into which Master Mix has been introduced. A mixture of 1 part cement to 2 parts sand should be made and tempered with water and Master Mix in the proportion of 1 gal. of Master Mix to 18 gals. of water.

FOR WATERPROOFING STUCCO—Stucco shall be applied in 2 coats. The straightening coat shall consist of 1 part portland cement and 3 parts sand. This shall be gauged with a solution of 1 part Master Mix to each 18 parts of water.

Wall shall first be thoroughly wetted and the straightening coat applied $\frac{3}{4}$ in. thick. Finish coat shall consist of 1 part portland cement and $2\frac{1}{2}$ parts clean sand, which shall be gauged with the same strength solution of Master Mix and water as the straightening coat and applied $\frac{1}{4}$ in. thick.

TO MAKE MASONRY IMPERVIOUS TO MOISTURE—To a mixture of 1 gal. Master Mix and 3 gals. water gradually stir about $\frac{1}{2}$ bag of portland cement to a creamy consistency. Apply in 3 coats, with a brush or spray.

First coat is a penetrating one, mixture for which should be as thick as the brush will carry, and well embedded, taking particular care to fill all joints and cracks. The second is a further filler. The third is the finish coat to which any color or effect can be given. Above coating also acts as a cold water paint.

TO PREVENT CONCRETE FROM FREEZING—Use the following proportions to hydrate the mixture at indicated temperatures. Add Master Mix to gauging water. Temperature 32°, 1 part Master Mix, 20 parts gauging water; temperature 25°, 1 part Master Mix, 15 parts gauging water; temperature 18°, 1 part Master Mix, 10 parts gauging water; temperature 13°, 2 parts Master Mix, 10 parts gauging water.

Master Mix

THE VITRIFYX COMPANY

Manufacturers of Concrete Hardener, Portland Cements, Hydrolithic and Colored, and Cement Chemicals.

Chamber of Commerce Building, 133 West Washington Street

TELEPHONE:
MAIN 1065

CHICAGO, ILL.

Products.

VITRIFYX, a Liquid Chemical Concrete Hardener for surface application.

VITRIFYX INTEGRAL, a Liquid Chemical Concrete Hardener for incorporating into the cement mix.

Improved Hydrolithic Cement for Integral Waterproofing; Colored Portland Cements for top finish work of Floors and Walls.

Vitrifyx.

DESCRIPTION—Vitrifyx is a liquid chemical concrete hardener which makes concrete as hard as granite; it makes surfaces proof against acid, dust, oil, water and wear. As effective on old as on new concrete floors, walls or stucco. This material hardens and preserves concrete floors permanently, to withstand the heaviest trucking, foot traffic, etc., and prevents all sanding and dusting. Many floors, considered worthless, have been made serviceable by applying Vitrifyx at a total cost of less than one-tenth the expense for installing a new floor topping.

ADVANTAGES—Absolutely no upkeep cost involved, as results are guaranteed to be permanent. The application of this product actually changes the nature of the concrete by acting chemically on the concrete's elements, producing a new component, practically wear-proof. By acting principally on the weakest part of any concrete floor, namely, the cement matrix, Vitrifyx imparts strength where it is most needed, and really makes the surfaces undergoing treatment 100% serviceable, as compared to the practice of adding or substituting metal, granite, or other hard substances in the usual cement and sand topping, which obviously does not harden the cement used, the latter remaining unchanged and comparatively soft.

Satisfactory results insured, because it is only necessary to flow the material over the surface to be treated—Vitrifyx will do the rest.

How to Use—New concrete floors may be treated with Vitrifyx before the skin coat on the surface is badly abraded, thereby preserving the original finish. Vitrifyx may, however, be used successfully on any concrete floor, provided part of topping is still left.

Vitrifyx is not mixed into the concrete before the concrete is laid, but is applied after the concrete has set and dried. The only requirement for a perfect job is that the work to be treated be of ordinarily good construction, properly finished.

COST—Depends on the area to be treated, and the conditions that the treated work must endure. The cost for all labor and all material varies from 2¢ to 5¢ per sq. ft.

TRADE-MARK
(Reg. U. S. Pat. Off.)

TERRITORY—No point too distant. The sun never sets on Vitrifyx-treated buildings.

HOW TO SPECIFY—All concrete floors, stair treads, landings, etc., throughout the building, shall be treated with Vitrifyx, as manufactured by THE VITRIFYX COMPANY, Chamber of Commerce Building, Chicago, in strict accordance with their instructions to render these concrete surfaces [state what is desired—i.e., dustproof; wearproof against heavy trucking; wearproof against foot traffic; acidproof; oilproof; water-

proof, etc.]

Detailed information promptly furnished regarding suitability of this product for any special work.

Vitrifyx Integral.

Vitrifyx Integral, a colorless liquid chemical, is much more than a hardener and waterproofer. It produces vital and permanently beneficial effects on the cement. It is composed of no ingredients at all detrimental, and contains no alum, acid, greases, oils or hydrate of lime.

MAKES A HARD, DENSE, DUSTLESS SURFACE—Vitrifix Integral accelerates the hydration of the cement and provides the necessary amount of dampness to insure perfect curing of the concrete. It permits the cement mortar to be mixed with less water and still be easier to trowel and finish, thus enabling the finisher to produce a harder and denser surface that will eliminate any danger of the cement setting in suspension and insures a dustless and waterproof floor.

MAKES PERFECT TROWELING CONDITIONS—The mortar develops a firmer texture through the expulsion of superfluous water, and stiffens to proper consistency to work most advantageously. In consequence, a much greater surface can be finished per day, and that perfectly dense and smooth.

ACCELERATES FINAL SET OF CEMENT AND INCREASES TENSILE STRENGTH—Final set of cement is accelerated from 2 to 4 hours. At the same time, the tensile strength is greatly increased. Vitrifix Integral produces these results by raising the temperature of the water, effecting more complete hydration of the cement and the rapid evaporation of uncombined surplus water.

RENDERS CONCRETE WATERPROOF—The densest concrete obtainable is effected through the increased hydration produced by Vitrifix Integral. The concrete is thus made lastingly waterproof. As an effectual waterproofing Vitrifix Integral is unsurpassed.

HINDERS FREEZING OF CONCRETE—Vitrifix Integral makes it possible to pour concrete work at much lower than customary temperatures, without providing additional protection. The freezing point is lowered and the set quickened, producing a perfect surface.

SPECIFICATIONS—*For Accelerating Set of Cement and Hardening Concrete Floors*—A 1-in. topping is recommended proportioned 2 parts clean, fairly coarse, sharp sand and 1 part fresh tested portland cement. Mix thoroughly dry. To 10 gals. of gauging water, add 1 gal. Vitrifix Integral for every barrel of cement used. Use this solution to hydrate the mixture. Pour, float and trowel the cement in the usual manner. A second troweling when surface is sufficiently set will produce a hard, smooth finish.

Protect surface from injury and keep it wet until surface is hard. For this purpose use a layer of soft wood sawdust, properly wet down.

For Waterproofing Brick Masonry—The mortar in which the bricks are laid should be of 1 part cement and 2 parts sand. The mortar is to be tempered with water to which has been added Vitrifix Integral in the proportion of 1 gal. waterproofing to 10 gals. of water.

Carefully grout each course of bricks, taking care that all joints are well filled with mortar.

For Waterproofing Concrete and Cement Mixtures—To waterproof 1-2-4 mass concrete add $\frac{3}{4}$ gal. of Vitrifix Integral to gauging water to each barrel of cement.

To waterproof 1-2-5 mass concrete add 1 gal. of Vitrifix Integral to gauging water to each barrel of cement.

Concrete walls, floors, etc., can be made waterproof by the application of a cement coat into which Vitrifix Integral has been introduced. A mixture of 1 part cement to 2 parts sand should be made and tempered with water and Vitrifix Integral in the proportion of 1 gal. of Vitrifix Integral to 18 gals. of water.

For Waterproofing Stucco—The stucco shall be applied in 2 coats. The straightening coat shall consist of 1 part portland cement and 3 parts sand. This shall be gauged with a solution of 1 part Vitrifix Integral to each 18 parts of water. The wall shall first be thoroughly wetted and the straightening coat applied $\frac{3}{4}$ in. thick. The finish coat shall consist of 1 part portland cement and $2\frac{1}{2}$ parts clean sand which shall be gauged with the same strength solution of Vitrifix Integral and water as the straightening coat and applied $\frac{1}{4}$ in. thick.

To Make Masonry Impervious to Moisture, etc.—To a mixture of 1 gal. Vitrifix Integral and 3 gals. water gradually stir about $\frac{1}{2}$ bag of portland cement to a creamy consistency. Apply in 3 coats, with a brush or spray.

The first coat is a penetrating one, the mixture for which should be as thick as the brush will carry, and well rubbed in, taking particular care to fill all joints and cracks. The second

STEWART-WARNER SPEEDOMETER CORPORATION, CHICAGO
Floors in these buildings treated with Vitrifix Integral

is a further filler. The third is the finish coat, to which any color or effect can be given.

The above coating also acts as a cold water paint.

To Prevent Concrete from Freezing—Use the following proportions to hydrate the mixture at indicated temperatures when aggregate and water are heated. Add Vitrifix Integral to gauging water.

TEMPERATURE	PARTS OF VITRIFIX INTEGRAL	PARTS GAUGING WATER
32°	1	20
25°	1	15
18°	1	10
13°	2	10

IRVING IRON WORKS COMPANY

Manufacturers of Grating Flooring and Safety Steps

TELEPHONE:
HUNTERS POINT, 3342

Dutchkills Creek and Third Street
LONG ISLAND CITY, CITY OF NEW YORK

Products.

Sole manufacturers of "IRVING SUBWAY" GRATING-FLOORING.

Also, of "Sunway," "Reticuline," "Eggcrate" and other forms of Grating, Grating-Flooring, and Grating-Flooring Accessories; Irving "Safstep" Stair and Ladder Steps; Irving Walkways; Metal Accessories for mining, power, pumping and industrial plants.

Trade-marks.

The trade-marks "Subway," "Sunway" and "Reticuline," as registered in the United States Patent Office, are the exclusive property of this company, and can not legally be used in connection with any other grating or grating-flooring product made by any other company.

Construction.

"Irving Subway" consists of a series of light steel bars placed on edge, between each pair of which a reticuline bar is placed and firmly riveted in position. The finished section is a light but inflexible panel embodying the well-known truss principle of construction, by which a load applied at any point is at once distributed over a wide area. Maximum strength is thus secured with the minimum weight of material. When riveted up, each section of "Irving Subway" is, in all essentials, a solid unit, in which there is, and can be, no looseness, no play, no rattling.

Types.

There are two standard types of "Irving Subway" as illustrated below, differing in appearance and in price, but not in strength or general merit. The rated load capacity is the same for both Type "G" and Type "E." Choice between them in any case is to be determined by the factor of size of mesh.

Exclusive Advantages.

Maximum strength per unit of weight; minimum weight per unit of load and span; uniform distribution

ABSOLUTELY NON-SLIPPING ALWAYS

of load by truss construction; minimum deflection per unit of load and span; maximum lighting and ventilation area (80% of panel area); absolutely non-slipping surface; can not become loose and rattly; oil or grease, ice or snow, age or wear does not impair its non-slipping qualities; mini-

mum lodgment for dirt or solid objects; small size of individual openings (mesh) prevents passage of tools, etc.; wheels or rib-hooped barrels can be rolled over it in any direction without going through; its light weight permits minimum weight and cost of the supporting structure; safe, comfortable and noiseless to walk or work upon; safe to work under because nothing large or heavy can fall through it; openings for pipes, columns, etc., can be cut out without seriously impairing the strength of the panel; easily fitted into corners or formed in irregular shapes without impairment of strength; easily mounted or attached to any type of construction by means of specially devised fasteners—no drilling, no tapping, no bolts nor screws needed.

"IRVING SUBWAY" GRATING INSTALLED IN AN ENGINE ROOM

Applications.

Floors, walkways, and galleries in power plants; boiler room floors in oil-fired plants; pump platforms; coverings for turbine pits, pipe trenches, and drainage sumps; floors for mine cages, freight elevators, elevator pent houses, shaft houses; floors and platforms around tanks or vats; charging floors; floors of gas plants and retort houses; a substitute for water cooled plates, affording maximum area; armoring of concrete surfaces; stair and ladder steps, etc.

As a removable mat over a floor in laboratories or other places where sand or plaster might fall or be ground under foot and be tracked about, it offers peculiar advantages.

Catalogue.

Catalogue No. 2A17, sent on request, gives complete description, load rating, sizes, spans, weights and all other data, together with a list of representative users, reports of tests, and details of various applications.

AMERICAN ABRASIVE METALS CO.

Manufacturers of Antislip Treads

TELEPHONE:
CORTLANDT 7444, 7445

Hudson Terminal Building, 50 Church Street
NEW YORK, N. Y.

Products.

FERALUN and VULCALUN ANTISLIP TREADS.

Feralun.

Feralun is non-porous metal with abrasive grit embedded in the wearing surface to provide an approved durable and effective antislip tread.

This grit, embedded at the time of casting, projects slightly and bites, so that slipping is prevented, and in hardness is excelled only by the diamond. Being firmly held by the metal partly surrounding each grain the abrasive grit gives to Feralun its extreme durability.

FERALUN ANTISLIP TREAD

Note the antislip nosing and absence of grooves parallel to it

Feralun treads are more durable than treads having lead, cement or asphalt as the body. They do not deteriorate through corrosion, as they do not have a steel base.

Vulcalun.

A mixture of rubber and abrasive grit vulcanized to a steel reinforcing plate contained entirely within a pure rubber base.

Its outstanding advantages are: (1) High dielectric strength showing no leakage up to 7500 volts and flash over not occurring until 20,000 volts. It is therefore desirable for walkway surfaces around switchboards, etc. (2) Light weight—about $3\frac{1}{2}$ lbs. per sq. ft., making it desirable for elevator car floors, automobile running boards, car steps, etc. (3) Does not corrode and therefore can be used on marble and elsewhere. Is not absorbent and does not disintegrate nor discolor. (4) Is not brittle and therefore does not shatter when struck. (5) Is obtainable in any size sheets up to 48 by 24 in.

VULCALUN WALKWAY SURFACE

STYLE "O" FERALUN ONE-PIECE ANTISLIP TREAD, REQUIRING NO SUBTREAD

APPROVED CONCRETE STEP CONSTRUCTION, WITH STYLE "A" FERALUN INSERT 6 IN. WIDE

APPROVED METHOD OF REPAIRING WORN STEPS

Antislip Stair Treads.

Feralun and Vulcalun antislip stair treads are fireproof and slipproof, lasting much longer than iron, steel, slate or marble. They have no dangerous, slippery nosing edge or heel catching grooves. A plain or hatched abrasive surface, with the antislip element carried down over the nosing, makes these stair treads unequaled as a preventive of stair accidents.

Style "A" (Lipped)

Style "B" (Rounded)

Style "C" (Ornamental)
FERALUN TREAD NOSINGS

Sizes and Designs of Feralun.

Made in any form in which it is possible to cast metal. Styles "A" and "B" are $\frac{5}{16}$ in. thick. Other designs are made $\frac{3}{8}$ in. thick, but are generally $\frac{1}{2}$ in. or $\frac{5}{8}$ in. thick.

Feralun Approved Coalhole Cover.

The Feralun cover conforms to the new requirements in New York City, and is being rapidly adopted as standard by other municipalities.

Open

Closed

FERALUN SAFETY COALHOLE COVER

Other Forms.

Floor plates, door saddles, trench covers, drainage gratings, and other walkway surfaces, where steel and cast iron have proved unsatisfactory and dangerous by becoming slippery, are made of Feralun and Vulcalun. Slippery sidewalks, ramps and vault lights are made slipproof by Feralun strips, crosses or buttons.

Awards and Approval.

Feralun antislip treads are approved without qualifications as a fire safe and antislip tread by the Underwriters' Laboratories, Inc.

Products.

MASON SAFETY TREAD (lead or carborundum filled); MASON BLACK DIAMOND SAFETY TREAD; MASON SAFETY TREAD and CORK COMPOSITION; STANWOOD TREAD; STANWOOD-MASON TREAD; STANWOOD STEP; KARBOLITH FLOORING.

Mason Safety Sidewalk or Vault Lights, Mason Safety Coalhole and Ash Lift Covers, Mason Non-slip Ladder Shoes.

Uses of Mason Safety Treads.

These are adaptable to all of the many situations, inside and outside of a building, where the surface with which the foot comes in contact is liable to become slippery.

Manufacturing concerns and others employing labor should equip the stairs of mills, factories and other buildings with Mason safety treads; thresholds of doors and elevators, elevator floors, fire door thresholds, inclined passageways, vestibules, floors around engines or machinery, and elsewhere where there is likelihood of grease or oil deposits. This practice has been observed in many hundred instances.

They are adaptable to granite, marble, slate, cement, iron or wood; to old, partly worn or new surfaces; to straight or curved lines; and can be installed in a building already completed or during the course of construction.

Insurance.

Accident insurance companies expect and demand reasonable endeavor on the policy holder's part toward making the plant safe.

The Accident and Liability Department of the Aetna Life Insurance Co., in their book "Safeguards," refers to Mason safety tread as the proper device for dangerous stairs.

The AMERICAN MASON SAFETY TREAD CO. knows of no case where damages have been claimed for injuries from slipping that has been lost to the defendant when Mason safety treads have been used as a preventive, and the company has a long record of such cases decided in the defendants' favor.

90% of the safety treads in use are Mason make. Mason safety treads have been used constantly for many years.

Description of Mason Safety Treads.

Metal surfaces devised to provide an absolutely sure footing, to prevent accidents caused by slipping. Not superficial safety surfaces, but of a protective quality coextensive with the life of the tread, and continuously effective during the wearing down process.

Types of Mason Safety Treads.

Made in various types and in standard sizes as follows:

LEAD OR CARBORUNDUM FILLED MASON SAFETY TREAD—Made of rolled steel or extruded hard brass of

substantial thickness ($\frac{1}{4}$ in.) with alternate dovetailed and U-shaped grooves. The dovetailed grooves are filled either with lead or a mixture containing a large proportion of carborundum and other abrasive substances as is desired, and in combination with the open U-shaped grooves produce a surface, the continuous supports of which wear evenly, that can be readily swept or washed out, and whose slip resisting parts remain intact during the entire life of the tread.

With this tread there can be no filling of open grooves from mushrooming or creeping lead, no jagged edges for the retention of filth or germs and no abrasive top dressing to wear off, leaving a polished, dangerous, slip inviting surface.

The efficiency always equals the life in the lead or in the carborundum filled treads.

MASON SAFETY TREAD
Lead or carborundum filled

Standard Sizes—Steel Base: Width, $2\frac{1}{2}$, $3\frac{3}{4}$, 4, $4\frac{3}{4}$ and 6 ins. flat; 3 ins. with nosing or overhang and square back and $3\frac{1}{2}$ ins. with nosing and beveled back. These sizes in combination (with the exception of the 3-in. width with nosing having a square back) will produce any desired width. Cut to order with necessary countersunk holes and with anchors when used in connection with cement.

Hard Brass Base: Width, 2, $2\frac{1}{4}$, $2\frac{1}{2}$, $2\frac{3}{4}$, 3, $3\frac{1}{2}$, 4, and 6 ins. flat; with nosings similar to that of steel base in widths of $2\frac{1}{8}$ and $3\frac{1}{2}$ ins. and with deep nosings in widths of 2 and $2\frac{3}{4}$ ins. See details on following page.

MASON BLACK DIAMOND SAFETY TREAD—A non-slip tread with a deformed surface for the catching of foreign substances and with open end grooves for drainage. The non-slip, diamond shaped units are of an abrasive mixture, containing a large proportion of carborundum, surrounded by a frame of metal on edge, assuring durability. Particularly useful for door thresholds and elevator sills, on account of beveled edges and generally trim appearance. Furnished in brass or steel.

MASON BLACK DIAMOND SAFETY TREAD

Brass Nosings.

For use in connection with flat strips on Mason safety tread (Figs. 15 and 16). They have also been used in connection with cork composition. Brass nosing (Fig. 20) has a deeper top flange and is used for tile, concrete, Karbolith or other composition treads.

Dentil Nosings.

Furnished in the combination Mason tread and nosing (Fig. 26) the safety tread being welded to a steel plate, or as in Fig. 27, where a carborundum cement filling is firmly secured to a base plate.

The construction of this nosing prevents the foot slipping forward over the extreme edge of the nosing, and sidewise as well, for which anchors are attached as shown in detail below. Both types are especially suited for use with concrete, asphalt, or composition filling.

DETAILS OF MASON SAFETY TREADS
(Lead or Carborundum Filled)

Mason Safety Tread and Cork Composition.

A combination suited to many interior conditions, particularly to long inclines and corridors. The cork composition is especially tough and springy and has long life under constant traffic.

Strips of cork composition are alternated with strips of lead or carborundum filled Mason safety tread as shown in details on preceding page.

COMBINATION MATS—Mason safety treads and cork composition in movable sections. These are particularly adaptable to floors under revolving doors receiving a concentrated traffic which show wear quickly. This is particularly unsightly when the doors are removed during the summer.

The sections of these combination mats are interchangeable so that the wear may be equally distributed. Alternate strips are fastened to a heavy backing and the mats are fastened in place by screws.

Repairing Worn Stairs.

Badly worn stairs are brought to a finished condition by the use of Karbolith filling which forms a bed for Mason safety tread and cork composition. The width of the safety tread is determined by the worn condition of the step. The 3-in. piece with square back is made expressly for this condition.

All evidence of repair is concealed by the use of hard brass nosings (Fig. 16) which may be of hard brass "copper" or rustproof steel.

REPAIRING WORN STAIRS

Stanwood Tread.

Very strong, and suitable for hard service where cleanliness and safety are important on stairways to engine rooms, areaways and similar conditions. These were originally designed for cars.

STANWOOD TREAD

Made up of a number of thin strips ($\frac{1}{2}$ and $\frac{7}{8}$ in.) high carbon steel, bent so that when assembled they form a series of openings in the surface of the tread. These strips are assembled and interlocked so that movement is impossible.

Frames, of rolled steel, are provided with a ledge to carry the strips, and rods pass through the frame and steel strips firmly tying them together. Additional straight strips of steel run lengthwise with the tread for extra support and sagging is impossible.

Stanwood-Mason Tread.

The regular Stanwood tread with a strip of Mason safety tread along the front edge.

STANWOOD-MASON TREAD

Stanwood Step and Tread.

Toe guards are secured to tie rods and riveted to hangers. Hangers are of pressed steel and made in four styles of top suitable for various attachments.

Surface of tread is $\frac{3}{8}$ in. above upper edge of frame and beveled slightly, producing a non-slipping edge.

Made single, double, triple, quadruple or any other style, to order in any size and shape desired.

STANWOOD-MASON TREAD
Double step type

Karbolith Flooring.

A composition with a base largely of magnesium that produces a hard, durable surface, proof against rats, fires and germs. It is impervious to heat, cold and dampness and will not chip, crack, tear loose nor disintegrate. It can be laid over cement, iron or wood, and binds firmly to the base.

UNIVERSAL SAFETY TREAD; UNIVERSAL SAFETY LADDER STEP; UNIVERSAL ANTI-SLIP METAL TREAD.

Universal Safety Tread.

USES—It may be used on wood, iron, concrete or stone; on stairs and inclines in all kinds of buildings; on car-steps and ladders.

CONSTRUCTION—The baseplate is of steel or brass, punched to receive the lead inserts, which are firmly interlocked. By this construction a continuous non-slip wearing surface of lead is presented, reinforced by the steel teeth to insure durability. The baseplate can be extended to form a nosing of any depth required, and the tread made in any widths up to 12 in. in one section.

RUBBER ALUMINUM TREADS—This Universal Tread is also manufactured with hard aluminum baseplate and rubber inserts, especially suitable for hotel stairs, car steps and vestibules, elevator platforms, and automobile step plates.

NAVAL WORK—The baseplate can be furnished of special *alloy-coated* or *galvanized* iron to resist the action of salt water; or of *brass* if desired, thereby rendering the tread *rust-proof*.

ANCHORS—In concrete work special anchors for attaching the treads are furnished.

Universal Safety Ladder Step.

USES—This step is designed for all types of vessels wherever an all-metal, *self-supporting* safety tread step is required; as well as for industrial purposes, engine room and powerhouse stairs, etc.

CONSTRUCTION—It is made of Universal Safety Tread plate, galvanized if desired, and stamped from one piece. The front and back edges are flanged down for the purpose of developing great rigidity, and are braced on the inside by iron straps riveted thereto. The ends are folded over, forming a double thickness of metal, through which holes are punched for the bolts that attach the steps to the supporting framework.

This step combines four essential features: non-slip efficiency, strength, light weight and rustproof advantages.

Universal Anti-slip Metal Tread.

USES—This tread is designed for exceptionally severe wear, as on stairs in subways, sidewalks, etc.

CONSTRUCTION—It is made of *Alundum* grains, held to the metal base by a binder of lead composition. These abrasive grains give it the highest efficiency as a non-slip surface; and on account of the extraordinary hardness of the mineral, permanence and durability are assured. It can be made with *flat* or *corrugated* surface.

ADVANTAGES—The surface presents *no steel whatever* to become slippery, as the steel baseplate is merely used as a stiffener for the abrasive material. In process of manufacture the tread is lead-coated on all sides, which renders it absolutely *rustproof*, equal in all respects to a galvanized product.

UNIVERSAL SAFETY TREAD BEFORE AND AFTER LEAD IS ROLLED IN

UNIVERSAL SAFETY LADDER STEP

CAREY ELASTITE EXPANSION JOINT.

Also, Carey Flexible Cement Roofing, Asphalt Slate Shingles, Pipe Covering, Waterproofing and Asbestos Products.

Adaptability.

The Carey Elastite expansion joint is installed in all classes of street paving, and in any construction work where provision must be made for the expansion of materials: (1) In brick pavements, used longitudinally between gutter or curb and paving; (2) in wood block and granite block streets, concrete roads, cement sidewalk construction, it is laid down both longitudinally and transversely; (3) its application is universal in concrete bridges, walls, piers, viaducts, reservoirs, dams, etc.

Description.

It consists of a heavy body of special asphalt compound "sandwiched" between two layers of a special grade asphalt-saturated wool felt, the whole being firmly bonded together by the Carey combining process.

Thickness is uniform. Compound is evenly distributed between outside wool felts from top to bottom and end to end. Its melting point is high, and the material readily responds to any expansion.

Features.

Carey Elastite expansion joints provide for all temperature changes. They do not melt or ooze out in hot weather, retain their elasticity in the coldest weather, and keep cracks filled watertight when paving surface is contracted.

They take up all expansion stresses; prevent buckling and cracking of paving surface; absorb longitudinal and transverse stresses in cement sidewalks, and insure absolute perfection

and uniformity in every joint, from surface of pavement to base.

They make a better job than a poured joint.

They cost less to install and nothing to maintain.

They save labor and material; no tar or kettle gang, or spacing strips are required.

They save time, being installed by same man who lays pavement.

SPECIAL FEATURES—The asphalt used in joint meets the following requirements:

Melting point.....	250°F
Penetration (100 grams weight No. 2 needle, 5 seconds).....	38
Solubility in carbon bi-sulphide.....	100%
Solubility in carbon tetrachloride.....	99.6%
Solubility in carbon 74° naphtha.....	67%

Form.

Joints are sectional in form, or, when desired, are furnished cut to crown. They extend through entire thickness of pavement (perpendicular to its surface).

Width and Location.

Where joint is 1 in. thick or less, filler is provided in single thickness; if joint is over 1 in. thick, filler consists of several layers of equal thickness, a single layer in any case not exceeding 1 in. in thickness.

In concrete pavements (Fig. 2), transverse joints are not less than $\frac{1}{4}$ in. nor more than $\frac{3}{8}$ to $\frac{3}{4}$ in. in width, and are placed across pavement (perpendicular to center line), not more than 30 to 35 ft. apart; and longitudinal joint (between curb and pavement) is not less than $\frac{1}{4}$ in. wide, nor more than $\frac{1}{2}$ to 1 in. in width.

Thickness and depth of joint in all cases made to correspond with required dimensions shown on engineers' plans or specifications.

References.

List of engineers and contractors who have installed Carey Elastite expansion joints, throughout the United States, sent on request.

FACTORY, FERNWOOD, PA.

Products.

"IDEAL EXPANSION JOINT."

"IDEAL" SEWER JOINT COMPOUND.

"Ideal Expansion Joint."

DESCRIPTION AND USES—The "Ideal Expansion Joint" is a premoulded strip of asphalt, especially designed to take care of the expansion in brick, wood block, granite block and concrete paving, and also to act as a protection against expansion in concrete foundations, walls, etc. The strips are made in standard lengths of 5 ft., having the width and thickness according to requirements of specifications.

Special lengths and shapes are made to meet any particular type of construction.

ADVANTAGES—(1) The use of the "Ideal Expansion Joint" insures a perfect expansion joint, as there is no chance of foreign matter getting into space which should be completely taken up by "joint filler."

(2) It is easy to install, and saves the investment in heating equipment, pouring pots, wooden strips and labor required when the pouring method is followed.

(3) The joint is laid as the paving progresses, and there is nothing to require going back over the work to fill joints after grouting of paving has been finished.

(4) It makes a cleaner and better job than the old method and effects a saving in the cost of the work.

SPECIFICATIONS—The material used in the expansion joint shall be an asphalt which will pass the following tests:

Specific gravity.....1.025 Penetration 32° Fahr.....15
Bit. sol. 76° Naphtha.....64% Penetration 77° Fahr.....25
Bit. sol. car. disulphide...99.8% Penetration 115° Fahr.....45
Melting point 250° Fahr. Ductility 2 cm.

REFERENCES—This product has been approved for use by numerous city engineers, state highway departments and officials of the U. S. Government.

Samples and further information will be submitted on request.

"Ideal" Sewer Joint Compound.

DESCRIPTION—A specially prepared bituminous compound, having a specific gravity of 1.45, a melting point of 200° Fahr. and becoming liquid at a temperature of approximately 400° Fahr.

Compound to provide a perfectly tight joint in sewer construction, thereby reducing the leakage and infiltration, and destruction by roots, which is sometimes a very serious problem to be considered.

APPLICATION—The compound is melted and poured into joint space at 400° Fahr. in the same manner that a lead joint would be poured except that the "snake" should be coated with oil to prevent the compound from sticking. Joint space must first be calked with a light packing of jute or oakum.

As the material has a certain flexibility it is possible to make joint outside of trench and lay pipes in double lengths. The presence of water in trench will not destroy sticking qualities of the compound.

ADVANTAGES—Reduces leakage from joints to a minimum and allows severe tests to be readily met. Material is easily handled, is inexpensive, and dependable.

REFERENCES—This material has been used and approved by leading sanitary engineers and also by U. S. Government officials.

Products and Services.

"FEDERAL" REINFORCED CEMENT ROOF SLABS.

Our sales department, together with our engineering department, will assist engineers in effecting the most economical distribution of structural steel for carrying "Federal" cement slabs.

"Federal" Reinforced Cement Slabs for Flat and Pitched Roofs.

Impervious to severest elements. Not affected by heat, cold, fire or water; strengthen with time. Laid directly on steel purlins, making a fireproof construction. All pitched tile joints interlock and overlap. Require no painting, repairing, or other maintenance. Where flat slabs and composition covering are used, the joints are buttet.

"FEDERAL" SLAB DATA FOR STANDARD PITCHED ROOFS

Covers 24 by 48 in.	Purlin spacing, 4 ft. 0 in.
Over all length, 52 in.	Least allowable slope, 1/5 pitch
12½ tile per square (100 sq. ft.)	Safe carrying load, 100 lbs. per sq. ft.
16 lbs. weight per sq. ft.	Breaking load, 300 lbs. per sq. ft.
Thickness, 1⅞ in.	
Wire reinforcement	

Cost.

"Federal" slabs make the best and cheapest roof on the market, because they are indestructible and everlasting; no expense for maintenance; cut the rates if fire insurance is carried; save steel in the building frame; eliminate wood sheathing, also repairs and renewals.

"FEDERAL" INTERLOCKING SLAB

FACTORY WHERE "FEDERAL" REINFORCED SLABS ARE MADE

Two main buildings, each 100 by 600 ft. "Federal" slabs cover roofs. "Federal" glass slab light factories. Strictly fireproof; no fire insurance required or carried

Manufacturers of Roofing, Waterproofing, Technical Paints, Oils, Paving and Insulating Compounds

TELEPHONE:

HUMBOLDT 135

2734 North Rockwell Street
CHICAGO, ILL.

Products and Services.

ROOFINGS: BUILT-UP ASPHALT, BUILT-UP ASBESTOS, BUILT-UP TAR and GRAVEL (BARRETT SPECIFICATION), BUILT-UP PLASTIC; BIEGLER'S ASPHALT PREPARED ROOFING; PROMENADE TILE and MASTIC FINISH.

High grade WATERPROOFING MATERIALS for basements, subbasements, tunnels, reservoirs, subways, bridges, sidewalks, floors, cisterns, pits, silos and roofs; TECHNICAL PAINTS for steel and metal; JAP-O-LENE PAINT OIL; INDUSTRIAL WHITE.

Acidproof and Alkaliproof Paints, Asphalt Paints; Insulating Compounds; Paving, Rock Mastic Floors, Asphalt Products and Metallic Floor Hardener; full line of Enamels; Insulating Varnish.

Contracts for high class ROOFING or MEMBRANE WATERPROOFING executed anywhere in the United States.

For Mas-Oleum (Mastic Linoleum) and Almada Cork Composition Floors, see page 237.

Roofing.

The roof for a building is one of the most important branches of construction. In the selection of the proper roofing, the construction of the building ought to be taken into consideration, and while the materials to be used are of importance, the installation of the work is equally important.

It has been the business of the E. N. BIEGLER MFG. Co. for the past twenty years to install the proper roof, and by this experience it is able and pleased to recommend specifications according to work. The contracting department will furnish estimate on work in this line anywhere in the United States.

Built-up Tar and Gravel Roofing.

Barrett Specification 20-year Guaranty Bond roofs are executed by E. N. BIEGLER MFG. Co.

Built-up Asphalt Roofing.

Especially adapted for manufacturing plants, warehouses, etc., for either flat or steep surfaces. This roofing is built up at the building, usually consisting of three plies or more of asphalt saturated felt cemented together with hot asphalt and finished with hot asphalt, or if desired, gravel or slag embedded as a wearing surface or trowelled mastic finish.

Built-up Asbestos Roofing.

Installed the same as the built-up asphalt roofing. Gives the added feature of fire resistance, and is especially suitable on foundries or buildings subjected to flying sparks or extensive heat. Manufactured from rock minerals it gives greater durability.

Built-up Plastic Roofing.

Biegler's Ever-Tite plastic cement can be trowelled over any old or new roof surface. Put up in packages ready for use. Also practical for repairing old felt, composition and metal roofs.

Biegler's Asphalt Prepared Roofing.

Put up in rolls containing 108 sq. ft. ready to lay. Practical for steep work only.

TRADE-MARK

Promenade Tile and Mastic Finish.

Where roof is desired for recreation purposes or traffic, the company recommends, in addition to one of the above roofs, laying promenade tile or mastic finish.

Biegler's Reinforced Membraneous Waterproof Construction.

Where there is considerable water pressure to contend with, this construction is recommended. To secure best results each job should be executed according to existing conditions, and, therefore, this company prefers having clients advise nature of work to be waterproofed, stating water pressure, etc. Recommendation and method of construction will then be submitted.

Duro-Carbo Paint.

A durable, carbon metal preservative paint of high quality made with pure linseed oil and suitable dryers which prevent corrosion, and when properly applied protects all metals to which a metal surface is generally subjected. It should be used on all structural steel work, bridge and truss work, viaducts, fire escapes, metal lath, tanks, boilers, etc.

Jap-O-Lene Paint Oil.

Composed of China wood oil chemically treated, high grade gum, linseed oil, and reduced to consistency of a paint oil with volatile spirits (naphtha or turpentine). Jap-O-Lene can be used in any kind of paint material, either dry, ground in oil or japan, with or without addition of linseed oil. If linseed oil is to be used, raw oil in proportion suitable for the work in hand is recommended.

Industrial White.

A white coating for interior walls in factories, hospitals or public buildings where a sanitary finish is desired. Can be had in either flat, eggshell or high gloss, the latter being a high class enamel.

Co-operative Service.

ROBERTSON PROCESS METAL: Flat, Corrugated, Beaded and Mansard Sheets and Bars for Roofing and Siding, Flashings, Ridge Caps, Louvers, Gutters, Downspouts, Ventilators, Skylights and Lath.

ROBERTSON PROCESS GYPSUM: Poured-in-place Roofs and Floors; Pre-cast Roof Slabs.

ROBERTSON PROCESS ASPHALT: Built-up Roofing, Roll Roofing, Slate Surfaced Roofing, Slate Surfaced Shingles, Protective Coatings, Paving Expansion Joints, Plastic Cements, Saturation Compounds, Insulation Compounds, Mineral Rubber Battery Sealing Compounds.

ROBERTSON PROCESS SPECIALTIES: Road Fabric (welded) Curb Reinforcement, and Wallbrite, an interior paint.

Robertson Process Metal.

A metal building material which is fully protected from the most severe weather conditions, smoke, gases, fumes, condensation and salt sea air, by means of three impervious coatings—(1) asphalt, (2) asbestos, (3) waterproofing. It is made in sheets and bars for use in industrial buildings on roofing, siding, downspouts, gutters, general building trim, skylights and ventilators.

Robertson Process Metal is low in first cost and involves no maintenance or depreciation charges. It is a metal that *does not rust*, *needs no painting* and is at the same time fire resisting.

ROBERTSON PROCESS—The body or core is special annealed steel which has been thoroughly cleansed so as to be free from grease, moisture, oxide and every other surface impurity. The metal is heated to a uniform and definite temperature and, while hot, thoroughly cleaned, and, with a receptive surface, is immersed in a bath of special asphaltic compound. The asphalt is in turn protected by a tough, opaque and insulating covering of asphalt saturated pure asbestos felt, which completely covers every surface of the metal and is applied while the asphalt is hot. The asphalt coat provides permanent pro-

TRADE-MARK

tection to the metal against corrosive influences of moisture and fumes and the asbestos protects the asphalt from mechanical abrasion and prevents evaporation and carbonization of the natural, life-preserving asphalt.

Finally, the asbestos itself is protected from the softening action of moisture by a new and original process of waterproofing which

imparts to the asbestos a tough, smooth, repellant surface. This waterproofing treatment also provides power of resistance to mechanical abrasion, permitting the sheets to be handled freely in shipment and erection without damage to the protective coating.

FORMS, COLOR AND SIZES—Robertson Process Metal is made in a variety of standard forms and sizes which good practice has demonstrated to be the most useful, economical and attractive. It is made in corrugated, beaded and mansard roofing and siding sheets as well as in flat sheets. It is also made in various forms for building purposes, such as ridge caps, downspouts, gutters, flashing, louvers, etc. Robertson Process Metal forms an important part of Robertson ventilators and Robertson skylights, both of which are more fully described below.

Robertson Process Metal is supplied in black and red. Sizes and weights will be given upon application. All necessary materials needed in fastening, such as nails, rivets, hooks, straps, bolts, etc., can be supplied.

ADVANTAGES—Robertson Process Metal is both light and strong. It weighs practically the same per square foot as corrugated iron and at all times retains the strength of the original metal, since it suffers no loss of efficiency by corrosion or other forms of deterioration.

It is corrosionproof and rustproof. It has stood every test on all kinds of industrial buildings and is used and endorsed by engineers throughout the country. The fact that it is immune to the corroding action of gases, acid and alkali fumes, all weather conditions and even salt sea air, makes it exceptionally well suited to permanent building construction.

Robertson Process Metal has insulating qualities that greatly reduce the tendency toward condensation of mois-

ROBERTSON
PROCESS
METAL CORRUGATED SHEET

ROBERTSON
PROCESS OF
METAL PROTECTION

ROBERTSON PROCESS METAL RIDGE CAP

ROBERTSON
PROCESS MANSARD SHEET

ture. Buildings in which it is used are, therefore, drier, easier to heat in winter and remain cooler and more comfortable in summer.

The light weight, strength and permanency of Robertson Process Metal render construction as a whole less costly by comparison with other building material. Furthermore, first cost is the total cost. There is no upkeep, no repairs. Robertson Process Metal *does not need painting*.

Robertson Ventilator.

This Robertson product is built completely of Robertson Process Metal and it will, therefore, withstand the most severe gases, fumes, smoke, etc., from the inside and all weather conditions from the outside. All upkeep expense is saved. It does not need painting and can not get out of order.

The Robertson ventilator is a stationary type of ventilator, designed to provide the greatest development of air current under all conditions. It does not rely upon mechanical adjustment or moving parts which are not permanently operative and can not continue to function efficiently. It gives an exceptionally large, definite and reliable exhaust capacity under the most adverse conditions.

Robertson ventilator is made in a variety of sizes with special bases to meet all requirements. Complete information sent upon request.

ROBERTSON
PROCESS METAL
VENTILATOR

Robertson Skylight.

Robertson skylight is a patent type of skylight construction, the long life of which is due to the use of Robertson Process Metal and Robertson Process Asphalt. It is a form of skylight construction that can not corrode or rust and *does not require painting*. The danger from broken glass through corrosion and deflection of supporting bars and the expense of such breakage are entirely eliminated. All of the defects of ordinary skylight construction can be avoided by the use of this Robertson product.

CROSS SECTION OF ROBERTSON PROCESS METAL SKYLIGHT
CONSTRUCTION

The bar, condensation gutter and cap are made of Robertson Process Metal. It is readily apparent that skylight construction made of metal, so fully protected, will have many years added to its life. It is equally apparent that much upkeep expense will be saved during that time.

Robertson Process Asphalt is used for the skylight

cushion and fillers. This special asphalt provides a non-absorbent, resilient, permanent, and insulating bed for the glass. It positively keeps the glass from contact with hard substances and prevents all destructive strain.

A special bulletin covering this Robertson product will be sent upon request. This bulletin contains complete description with cross sections, installation illustrations, and complete specifications.

Robertson Process Gypsum for Roof Construction.

This Robertson product represents a noteworthy contribution to the building of roofs for commercial structures and the more substantial type of industrial building. Robertson Process Gypsum consists of a

PRE-CAST TYPE OF ROBERTSON GYPSUM ROOF CONSTRUCTION

scientific reinforcement of an improved gypsum composition. Robertson gypsum roofs are built in both the poured-in-place and pre-cast form—a process by which roof construction has been both strengthened and lightened at the same time. Robertson Process permits of strength computation just as accurate as that of steel girders or truss construction; yet its weight has been reduced to the point that great savings can be made in the construction of foundation and superstructure.

Both the poured-in-place process and the pre-cast process have been technically illustrated and described in separate Robertson bulletins. Since these processes represent such noteworthy contributions to better roof construction they should be in the hands of engineers, architects, plant executives and officials, contractors and builders. Although containing technical descriptions and illustrations, they are of value to anyone interested in roof or building construction.

Robertson Process Gypsum for Floor Construction.

For the floor construction of commercial building, Robertson Process Gypsum provides maximum strength with minimum weight. It is a type of floor construction which makes possible great savings in both foundation and superstructure. The Robertson Process Gypsum floor is a poured-in-place monolithic type of construction. Robertson Process Gypsum is more than fireproof. It possesses a degree of non-conductivity of heat that will successfully protect the incased structural steel work from injury under the most severe conditions of fire that can possibly obtain in the building. It does not expand or contract under high temperatures, and thus prevents serious injury both during the progress of a severe fire

CONSTRUCTION DETAILS OF ROBERTSON POURED-IN-PLACE
GYPSUM ROOF

and under subsequent application of a stream of water at high pressure.

There are many other good qualities of Robertson Process Gypsum, all of which are fully described and illustrated in a special bulletin, which will be sent free upon request.

Robertson Process Built-up Roofing.

This product was developed to meet the demand for a high grade permanent waterproofing for use on Robertson Process Gypsum roofs. It is composed of 2 or 3 plies of tough woven felt, specially manufactured for this purpose, which retains the asphalt waterproofing compound to a greater degree than any other type of felt.

This felt is thoroughly saturated with a special asphalt compound which renders it permanently water repellent and immune to attack of acid or alkali fumes.

Asphalt is the waterproofer, and over this roof proper is placed a heavy ply of saturated asbestos felt, which, being opaque, inert, and not subject to injury through exposure to acids and alkali fumes, permanently protects the underlying layers.

The asbestos shield is further protected by a super-treatment of Robertson Roof Coating, which gives a gritty, hard and resilient wearing surface, capable of withstanding extremes of exposure.

This type of built-up roofing is equally suitable for the covering of ordinary wooden roofs and is the logical waterproofing for the flat roof of fireproof buildings. Special literature regarding this product will be sent upon request.

Robertson Process Roll Roofing.

This is another economical product especially adapted for use on buildings of light construction where a low first cost is desired. It has as a base a heavy thoroughly waterproofed felt, especially treated with a pure asphaltic saturant which binds itself together into a wonderfully tough mass. Both sides of the felt then receive a coating of Robertson Process asphalt cement.

Robertson Process roll roofing is put up in rolls of one and two squares, each roll containing sufficient galvanized roofing nails and liquid lap cement for proper applications together with complete instructions for laying.

Robertson Process Slate Surfaced Roll Roofing.

This product possesses all of the good qualities of Robertson Process roll roofing and, in addition, has em-

bedded into its outer surface a heavy coating of crushed, natural slate.

Its constituents and process of manufacture render it absolutely waterproof and fire resisting to a very high degree. It is made in two colors, green and red, and put up in rolls containing sufficient material to cover 100 sq. ft. of finished roof area.

The Robertson Process of Protective Coating.

The Robertson Process of protective coating has been developed by long and thorough experimental work and its reliability proved by extensive practical service under the exact condition that each product is intended to withstand. Roofing presents one problem, sidewall coating another, structural steel another, smokestacks another, etc.

The Robertson Process involves the use of pure asphalts, refined under improved methods. The universally recognized qualities of asphalts to resist the action of acids, alkalis and natural elements are, by this process of refinement, made available for protective coating to a most efficient and practical degree.

Following is a list of these products, complete descriptions of which will be gladly furnished upon application:

Robertson Structural Steel Coating, Robertson Structural Coating, Robertson Stack Coating, Robertson Acid Resisting Coating, Robertson Rubber Coat for Roofs, Robertson Rubber Coat for Siding, Robertson Cement Fiber, Robertson Semi-Cement Fiber, Robertson Process Wallbrite.

Robertson Policy.

In order to insure the proper use of Robertson Process building materials we have at times found it necessary to undertake the erection of the material where competent workmen are not available. We are equally as well prepared to contract for the construction of Robertson Process Gypsum roofs and floors in either poured-in-place or pre-cast form. On this type of work responsibility for the completed roofs or floors is assumed.

A corps of engineers is maintained, which is at all times prepared to assist manufacturers, builders, and contractors, architects and plant officials. With offices in all important cities in the United States, as well as in Canada and other foreign countries, prompt and adequate service can be given. Many special bulletins have been published covering the various Robertson products. These bulletins as well as a general book entitled "Robertson Process Metal Gypsum Asphalt" will be gladly sent upon request.

Asphalt is admittedly superior to tar as roofing material, softening at a much higher melt point.

KANSAS CITY TERMINAL RE-ROOFED WITH MULE-HIDE ASPHALT BUILT-UP ROOFING

SPECIFICATIONS—On Wooden Roof Deck—First, a dry course of red rosin sized paper should be laid in order to prevent drip into the building from the first mopping. If a 4-ply roof is desired, apply 2 layers of Mule-Hide Asphalt Felt, weighing 15 lbs. per 100 sq. ft., lapped 17 in., mopping between courses with hot asphalt so that felt does not touch felt. Use about 30 lbs. of Lehon's Waterproofing Asphalt for each mopping. Felt should be thoroughly rolled and pressed into hot asphalt so as to be quite flat. Top course to be 2-ply Mule-Hide Cap Sheet, weighing 40 lbs. per 100 sq. ft. Cement well between laps, roll down securely and mop entire surface with hot asphalt in smooth, uniform, workmanlike manner. All flashings, gutters, and valleys to be reinforced with an extra thickness of cap felt.

Where a 5-ply roofing is desired, use 3 layers of asphalt felt, lap 22 in., otherwise to be laid as above.

Over Concrete, Pyrobar, or Gypsum—When applied over concrete, pyrobar, or gypsum, omit dry course. First thoroughly brush and clean surface of roof deck, then apply a brush coat of Mule-Hide Primer to penetrate pores of roof deck surface and secure a good bond. When dry, mop with hot Lehon's Waterproofing Asphalt and roll in asphalt felt as specified over wooden roof deck. Lap 17 in. for 4-ply and 22 in. for 5-ply.

Waterproof Building Papers.

Furnished in 3 different weights. Each put up in rolls containing 500 sq. ft.

SEALSKIN WATERPROOF PAPER—Width, 36 in.; weight, 40 to 45 lbs.

BLACK-BEAR WATERPROOF PAPER—Width, 32 or 36 in.; weight, 30 to 35 lbs.

Concrete Waterproofing Membranes.

Mule-Hide cotton membranes and Mule-Hide saturated burlap. Used extensively to reinforce concrete waterproofing on important engineering undertakings, such as tunnels, subways, bridges, reservoirs, etc.

TRADE-MARK
Registered

Damp-Tite Waterproofing Compound.

For dampproofing basements, foundation walls, etc. In 5- or 10-gal. jacketed cans and barrels. May be applied cold to the outside of foundation walls.

Asphalt Paints and Cements.

MULE-HIDE LAP CEMENT and ROOF COATING—For re-coating felt or composition roofing. Furnished in pint, 1-, 5-, and 10-gal. cans; also in barrels.

STAY-LASTIC METAL PAINT—Suitable for use on exposed metal work. Furnished in 1-, 5-, and 10-gal. jacketed cans; also barrel lots.

STAY-TITE FLEXIBLE ASBESTOS CEMENT—An asbestos fiber cement. For flashing around skylights, etc. In 10-, 50-, and 100-lb. pails; also in barrel lots.

Mastic Flooring Materials.

Details on application.

Lehon's Waterproofing Asphalt.

Furnished in metal drums weighing 500 lbs.

Expansion Joints for Concrete Pavements.

Mushroom type. Particulars on application.

House Lining.

An excellent protection in cold climates, also suitable as roofing on temporary buildings.

Put up in rolls containing 200 sq. ft., without nails or cement; 36 in. wide; weight, 50 lbs. If desired, this material can be furnished in rolls containing 108 sq. ft. with nails and cement included; weight 30 lbs.

Porch Deck Canvas.

Put up in rolls containing 108 sq. ft., complete with galvanized roofing nails and cement; 36 in. wide; weight, 25 lbs. per square.

Insulating Paper.

A waterproof insulating paper used in refrigerators, coolers, butcher boxes, refrigerator cars, etc.

In widths up to and including 112 in., in weights of 70, 80, 90, 110, 125, and 160 lbs. per 1000 sq. ft.

Waterproof Insulating Fabric.

Represents the latest and most efficient form of waterproof insulating. Furnished in rolls containing approximately 100 lin. yds., 35 in. wide; weighs approximately 100 lbs. per 100 lin. yds.

Roll Roofings (Smooth Surface).

MULE-HIDE ROLL ROOFING—Made 32 in. wide, in rolls containing 108 sq. ft. 1-ply weighs 40 lbs., 2-ply 50 lbs., 3-ply 60 lbs.

MULE-HIDE SLATE-KOTE ROLL ROOFING—Surfaced with either red or gray-green crushed slate, 32 in. wide, put up in rolls containing 108 sq. ft. In two weights: 85 lbs.; extra heavy 110 lbs.

Asphalt Shingles.

Individual or four-in-one style, in permanent Slate-Kote colors, red or gray-green.

SECURITY WIDE-WELD ASPHALT ROOFING.
INDUSTRIAL PAINTS.

Security Wide-Weld Asphalt Roofing.

A heavy, built-up, mineral surfaced asphalt roofing made in 4 surfaces, with a patented 6-in. joint that can not leak, which welds the whole roof into one piece and covers all nail heads with the full thickness of the roofing.

Surfaces.

Sea gravel, red or green crushed slate, fine feldspar rock.

Construction.

Security roofing is built up of pure mineral asphalt and special high grade, long fibered asphalt saturated wool felt, with the best grade of perfectly embedded mineral surfacing. Not a particle of coal tar or pitch enters into the composition of any of the roofings.

How the Patented Cement Weld is Made.

The illustration shows the patented 6-in. cement

TRADE-MARK

welded joint, covering the nail heads and making a continuous one-piece waterproof roof.

A—Lap construction of lower sheet of roofing.

B—Upper sheet of roofing.

A1—Bottom layer of saturated felt in lower sheet, 36 in. wide and extending 4 in. beyond other layers.

A2—Full thickness of 2 layers of saturated felt and 2 of heavy mineral asphalt, 32 in. wide, extending 2 in. beyond the mineral surfacing; and covered with fine tissue paper to prevent sticking in the roll. The nails are driven through this full thickness of the roofing as shown.

A3—The mineral surfaced portion of sheet A, 30 in. wide, and the full thickness of the complete sheet of roofing.

C—The completed joint appearance, showing the continuous one-piece, leakproof feature.

Laying Specifications.

The welded joint, as above described, is made with a thick layer of hard asphalt cement, into which the upper sheet is firmly pressed.

In cold weather, warm the rolls before unrolling them.

Always unroll the roofing and lay flat on roof for a short time before applying, to prevent wrinkles and buckling.

On concrete roofs, a priming layer (National Asphalt Primer) should be applied before laying.

Proper and adequate flashings must be built around chimneys and skylights to insure a satisfactory roof.

Specification sheets for engineers and architects mailed on request.

Industrial Paints.

This company owns and operates the Natroco Paint & Varnish Works and is prepared to supply all industrial paint requirements.

An excellent line of protective paints, concrete paints, and waterproofing specialties are manufactured at these works. This company also makes Natroco Factory White, the best factory white it is possible to produce.

Special literature and information furnished upon request.

6-INCH CEMENT WELD

THE STARK ROLLING MILL CO.

Manufacturers of Toncan Metal Rust and Corrosion Resisting Sheets,
Roofing, Siding and Accessories

MILLS AND MAIN OFFICE

CANTON, OHIO

Products.

TONCAN METAL BLACK and GALVANIZED RUST and CORROSION RESISTING SHEETS, used extensively for Roofing, Siding, Cornice, Eaves Trough, Conductor Pipe, Lath, Shingles, Window Frames, Blower Systems, Ventilators, Skylights, Reinforcing, Tanks, Refrigerators, Expanded Metal Lath, Culverts and all other purposes where durable sheet metal is needed.

Description.

Toncan Metal is a rust and corrosion resisting sheet metal made from iron ore. Its reputation for thorough durability and efficiency is firmly established. For more detailed information, send for and read "Corrosion—The Cause—The Effect—The Remedy."

Sources of Supply.

Jobbers and tinnerns everywhere sell Toncan Metal sheets and products.

Specification Data.

Complete data necessary for specifying and estimating Toncan Metal will gladly be mailed on request. Our sheet metal book gives convenient tables for use in specifying Toncan Metal for siding and for roofing—corrugated, V-crimp and pressed standing seam; also bundling weights, standard sizes and gauges, comparative weights of roofing materials, etc. Send for it.

Dimensions of Toncan Metal Corrugated Sheets.

2½-IN. CORRUGATIONS

Width, 26 or 27½ in. Lays 24 in. center to center.

All gauges 10 and lighter.

Lengths, 5, 6, 7, 8, 9, 10, 11 and 12 ft.

2-IN. CORRUGATIONS

Width, 26 in. Lays 24 in. center to center.

All gauges 18 and lighter.

Lengths, 5, 6, 7, 8, 9, 10, 11 and 12 ft.

1¼-IN. CORRUGATIONS

Width, 25 in. Lays 24 in. center to center.

All gauges 20 and lighter.

Lengths, 5, 6, 7, 8, 9, 10, 11 and 12 ft.

Also made with ⅝-in. and 3-in. corrugations.

Note—26 gauge Black and 28 Galvanized are lightest Toncan Metal sheets made.

TONCAN METAL CORRUGATED SHEETS
Painted or galvanized.
Suitable for roofing and siding

STANDING SEAM ROOFING

Painted or galvanized. Suitable for sloping roofs. Covering width, 24 in. Lengths, 5, 6, 7, 8, 9, 10 or 12 ft. Gauges, 20 or lighter

ROLL ROOFING

Painted or galvanized. Suitable for slightly sloping roofs. Covering width, 24 in. Each roll lays 100 sq. ft. on the building

Expanded Metal Lath.

Toncan Metal Expanded Metal Lath should always be used where the construction is subject to excessive moisture or other corrosive conditions. Its use as

backing for all exterior stucco is an extra assurance of permanence.

Manufacturers and erectors of PYROBAR REINFORCED GYPSUM ROOF TILE (made of Structolite), for Roof Decks.

Engineering Service.

An Engineering and Construction Department is maintained for the purpose of assisting engineers and architects in designs and estimates, and it is desirous of submitting erection bids on Pyrobar roof tile. The UNITED STATES GYPSUM CO. maintains possibly the largest and most skilled organization for the erection of this kind of work.

Sixteen producing mills, located at advantageous points, assure prompt delivery of any quantity.

Pyrobar Reinforced Gypsum Roof Tile.

Pyrobar gypsum roof tile are made of Structolite, a specially prepared, hard, dense gypsum, reinforced with steel and designed to carry the full required roof load. These tile are manufactured in two general types: long span (either hollow or channel sections), and 30-in. type (solid and hollow).

All types are machine moulded, assuring true and even faces and straight edges.

The tile are laid directly on steel purlins or trusses and the joints are filled with gypsum grout which bonds the tile, forming a gypsum surface, to which any type of roof covering can be immediately applied, after the tile are set in place.

ADVANTAGES—Strength—Pyrobar roof tile are designed to carry 50 lbs. live load per sq. ft., uniformly distributed, with a factor of safety of 4.

Fireproof—Gypsum is acknowledged to be one of the best fire resisting materials known. Gypsum will not support combustion, and has no appreciable contraction nor expansion; consequently it will not warp, buckle nor spall under severe fire.

Minimizes Condensation—Superior heat insulation is a salient feature of Pyrobar tile. Tests give the following values of B.t.u.'s transmitted per sq. ft. per degree Fahrenheit difference in temperature, per hour, for various roof deck materials:

	B.t.u.
1½-in. solid cement tile.....	0.990
3-in. solid concrete slab (1-2-4).....	0.750
2-in. yellow pine plank.....	0.385
3-in. solid Pyrobar roof tile.....	0.250
4-in. hollow Pyrobar roof tile.....	0.200

This proves that less heat is transmitted through gypsum than any of the other materials. This is the reason why the undersurface of Pyrobar roof deck remains at practically the same temperature as the air of the interior of the building regardless of changes of ex-

STEEL FRAME READY FOR
PYROBAR

PYROBAR APPLIED TO
STEEL

ternal temperature. Under these conditions no "sweating" or "dripping" can occur and condensation of moisture is minimized.

Heat Saving—The superior heat insulation value shows a decided saving compared both in tons of fuel used for heating purposes and first cost of heating plant.

Light Weight—Pyrobar tile are 50% lighter than concrete per square foot of surface for equal thicknesses, thereby affording a material saving in steel framing and, consequently, in steel columns.

Adaptable—Suited to any form of roof design, flat or peaked, and easily cut and fitted. Any form of roof covering, built up or composition, may be directly applied. Nailing strips are entirely eliminated. By use of extra thick nailing deck, for the "channel" type, and extra dense material for the 30-in. type, slate, baked clay, Ludowici and similar roof coverings are nailed directly to the tile.

Quickly Erected—The large light weight units are very quickly installed during any weather conditions, including freezing temperature. Their erection does not interfere with plant operations going on below.

Light Diffusive—The undersurface of the roof is white, uniformly smooth and light reflecting, assisting in the solution of the lighting problem.

Permanency—The permanency of Pyrobar gypsum tile has been established through many years of use. The tile are not affected by the chemical action of smoke or the deteriorating action of sulphuric acid fumes; thus maintenance cost is eliminated.

PYROBAR LONG SPAN TILE
Spanning from purlin to purlin

Long Span Gypsum Roof Tile.

The "channel" type tile are made in lengths from 4 to 10 ft. The table below gives design dimensions and weights of the various lengths.

LONG SPAN "CHANNEL" TYPE GYPSUM ROOF TILE

DETAIL LONG SPAN "CHANNEL" TYPE GYPSUM ROOF TILE

Special long span lap joint tile, similar to the "channel" type, are manufactured for general roofing construction and reroofing purposes, and are designed to take care of conditions where the purlins are not always in alignment. This condition often exists where Pyrobar tile are to replace clay tile, concrete or wood roof.

DETAIL LONG SPAN "CHANNEL" TYPE WITH LAP JOINT SPANS FROM FOUR TO TEN FEET

Safe live load, 50 lbs. per sq. ft.; factor of safety, 4

Span in ft.	4	5	6	7	8	9	10
Depth, "D" in.	5	5	5	6	6	7	8
Weight, lbs. per sq. ft.	16.5	16.5	16.5	18.5	18.5	20.5	25

In general, all tile on one continuous roof deck to be of depth required for maximum span.

The "hollow" type are manufactured in the same lengths as the "channel" type up to 8 ft.; the hollow type, however, provides a flat and better light reflecting ceiling, with maximum insulation.

LONG SPAN "HOLLOW" TYPE ROOF TILE

DETAIL LONG SPAN "HOLLOW" TYPE ROOF TILE SPANS FROM FOUR TO EIGHT FEET

Safe dead load, 50 lbs. per sq. ft.; factor of safety, 4

Span in ft.	4	5	6	7	8
Depth, "D" in.	6	6	6	6	6
Wt., lbs. per sq. ft.	25	25	25	25	25

NOTE—Purlin table for long span channel or hollow type tile and construction details are shown at head of following column.

30-Inch Type Pyrobar Roof Tile.

The hollow and solid types are designed to withstand the same loads. Their surface measurements are 12 by 30 in., with thickness of 3 in. for the solid tile and 4 in. for the hollow or cored tile. They are especially adaptable for curved and other intricate roof designs and are easily cut to fit any requirements. The tile are

placed on T-iron purlins spaced 30½ in. on centers, their weight being 16 lbs. per sq. ft.

Curbs or walls on the monitor or sawtooth sash are built of 3- or 4-in. solid Pyrobar tile; the end walls of monitors and sawteeth are similarly built—the roof covering being extended to cover curbs and end walls.

Where it is necessary to build up roof for drainage purposes, a "drainage fill" is supplied, which is a combination of gypsum and cinders or wood chips that sets within 30 minutes after being placed, permitting application of roof covering without delay.

Pyrofill Monolithic Gypsum Roof Deck.

This is an economical form of poured-in-place construction. Formwork is provided the same as required for concrete slab; steel cables are laid across the purlins and securely fastened. The principles in its design are the same mathematically as that of a suspension bridge, and its strength can be calculated with the same accuracy. A transverse steel rod is laid across the cables at the center of each span, so as to secure uniform deflection. This type of roof is made of Pyrofill, a specially calcined gypsum mixed before shipment with a definite proportion of wood shavings.

Pyrofill requires only addition of water to make it the required consistency. It is poured on the reinforcing and leveled off to the specified thickness of slab.

PYROFILL FOR ROOFS

Specifications for Pyrofill Monolithic Gypsum Roof Deck.

Unless otherwise noted, all roof slabs shall be constructed of poured gypsum, using the system of the UNITED STATES GYPSUM Co. known as Pyrofill Monolithic Gypsum Roof. The contractor shall provide necessary forms, reinforcing cables, Pyrofill and all labor required.

All cantilever construction, such as eaves, etc., shall be properly reinforced and anchored to the adjoining slab. All curb walls, ends of monitors, etc., shall be constructed of 3- or 4-in. Pyrobar Gypsum Tile, neatly laid up in gypsum mortar.

Specifications for Pyrobar Long Span Roof Tile.

(1) All roofs as shown on plans, unless otherwise noted,

CONSTRUCTION DETAILS SHOWING TYPICAL DESIGNS OF PYROBAR GYPSUM ROOF TILE

shall be constructed of Pyrobar Long Span Reinforced Roof Tile [specify whether "Channel" Type, Lap Joint or "Hollow" Type shall be used], manufactured by the UNITED STATES GYPSUM Co. The tile shall be placed directly upon [steel or wood] roof framing without mortar and with sides close together. All "routing joints" of the tile shall be filled with gypsum grout, composed of 1 part unfibered gypsum cement plaster and 3 parts of clean, sharp sand.

(2) Curbs under monitor or sawtooth sash, also the end walls of monitors or sawteeth, shall be constructed of 3- or 4-in. solid Pyrobar Tile set in gypsum cement mortar, joints to be well bedded and struck.

(3) Where it is desired to nail roof coverings directly to the roof deck, the above specifications should read: "to be constructed of Pyrobar Long Span Reinforced Gypsum Roof Tile, ["Channel" Type] [Lap-Joint] with extra thick nailing deck."

(4) Cut nails or barbed slater's nails shall be used to fasten roof covering, and nails shall have at least 1½-in. penetration into gypsum nailing tile.

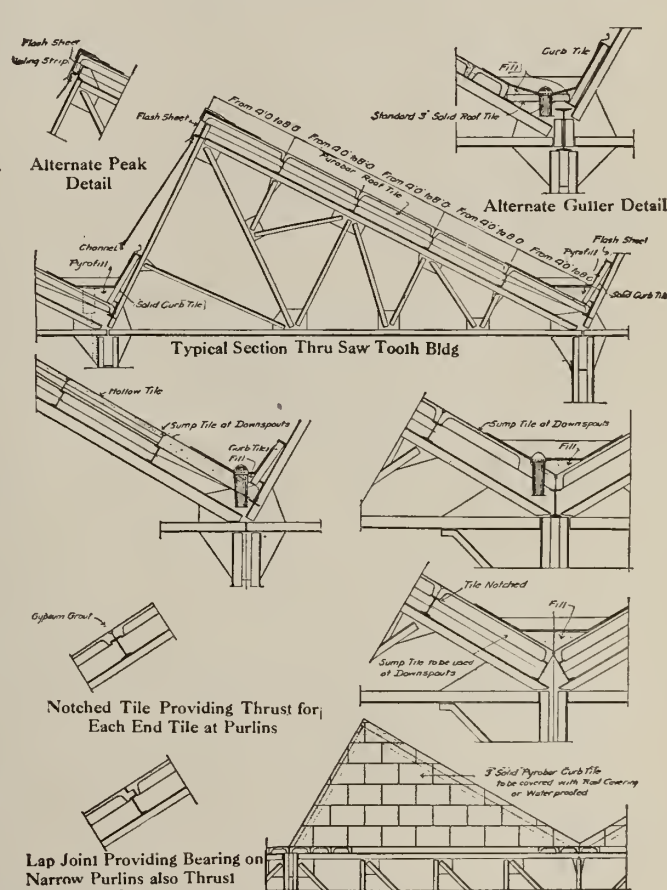

Specifications for Pyrobar 30-inch Roof Tile.

(1) All roofs as shown on plans, unless otherwise noted, shall be constructed of [30-in. solid or hollow] Pyrobar Reinforced Gypsum Roof Tile, manufactured by the UNITED STATES GYPSUM Co. The tile shall be laid close together on "T" irons without mortar, but the space at and above the flange of the "T's" and the grouting joints of the tile shall be filled with grout composed of 1 part of gypsum cement plaster and 3 parts clean, sharp sand.

(2) Curbs under monitor or sawtooth sash, also the end walls of monitors and sawteeth, shall be constructed of 3- or 4-in. Solid Pyrobar Tile set in gypsum cement mortar, joints to be well bedded and struck.

(3) Where it is desired to nail roof covering directly to the roof deck, specification above should read: "to be constructed of 3- by 12- by 30-in. Pyrobar Reinforced Extra Dense Nailing Roof Tile."

(4) Cut nails or barbed slater's nails shall be used to fasten roof covering, and nails shall have at least 1½-in. penetration into gypsum nailing tile.

UNITED STATES CEMENT TILE COMPANY

Farmers Bank Building
PITTSBURGH, PA.

WORKS:
NEW CASTLE, PA.

Product.

REINFORCED CEMENT ROOFING TILE.

"Flatlock" Cement Tile.

"Flatlock" reinforced cement roofing tile is adaptable to any kind of roof construction, whether flat or pitched. It provides a fireproof concrete base for the application of a built-up or composition roofing, affording the maximum strength with the minimum use of steel, making a durable and absolutely safe construction.

Salient Features of "Flatlock."

(1) A side elevation of the tile, shows it tapering from end to end, with an offset recess at its thicker end of a depth corresponding to the thin end of the tile, whereby a flush upper surface is obtained and a 4-in. end lap; also a depending hook that engages with the purlin, in this manner developing the novel and simple flat lock joint over each purlin, whereby the individual courses of tile are safely anchored.

(2) With this type of tile, channel purlins are used throughout, with a consequent saving of steel.

(3) Purlin spaces can be varied to accommodate the length of roof slope.

(4) The overhang at the eaves is not dependent on a cut-out recess which weakens the tile at that point.

(5) The simple and efficient manner of supporting flashing tile in any position.

(6) The ability to nail the waterproofing at overlapping joints on steep surfaces.

The above features provide a highly efficient, eco-

nomical and safely anchored fireproof base made absolutely weathertight and waterproof by the application of a built-up or composition roofing.

Composition.

Flatlock tile is made of portland cement and clean coarse aggregate. It is suitably reinforced, the reinforcing being thoroughly embedded and protected.

The tile is manufactured in a modernly equipped factory, by experienced men, under expert supervision. The materials are accurately proportioned, thoroughly mixed and rammed into place, forming a homogeneous and dense mass. The results obtained closely resemble those secured by laboratory methods, insuring a uniform product.

The top surface is free from any oil or other substance detrimental to the successful application of waterproofing. The bottom presents a pleasing, smooth and light surface.

Roof Design.

Flatlock tile is laid directly on channel purlins. If desired, I-beams can be used.

Standard spacing is 5 ft. back to back of purlins, which allows for 4-in. end lap.

Spaces can be stretched not exceeding 5 ft. 2 in. to compensate for variations in the length of roof.

Special tile is furnished for short courses, where stretched spaces will not suffice. See detail No. 4.

All eave purlins must be raised 1 1/4 in. above top line of other purlins.

"FLATLOCK" TILE ROOF CONSTRUCTION

Erection.

Flatlock tile is erected by this company's own experienced erection crews.

The open spaces at overlapping joints are afterwards pointed with a lean cement mix, the abutting sides are thoroughly pointed with elastic cement, leaving the entire roof surface ready for the application of waterproofing.

Load Test.

Flatlock tile is guaranteed to carry a uniformly distributed load of 100 lbs. per sq. ft. over a span of 5 ft.

Service.

The engineers connected with the UNITED STATES CEMENT TILE COMPANY have had long experience in the

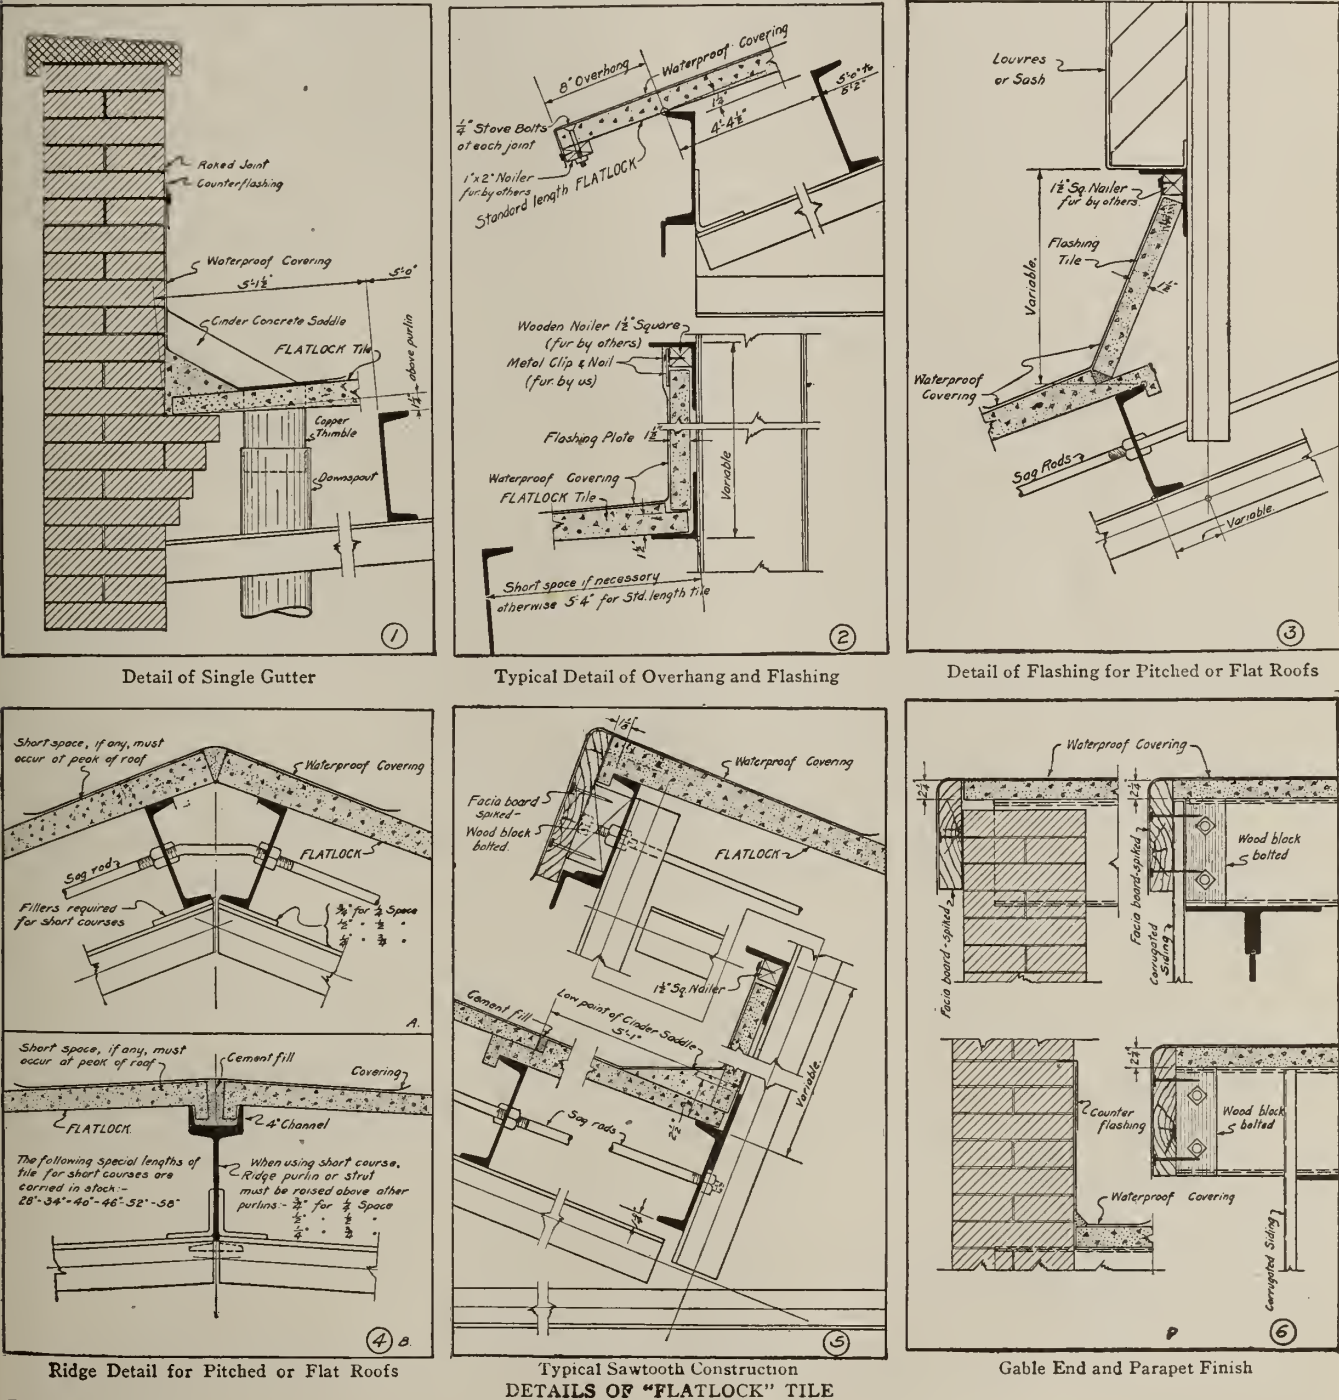

cement roofing tile industry and their services, without charge, are at the disposal of patrons.

Prices.

When furnished plans, the company will be pleased to make estimates for roofs erected and guaranteed.

ESTATE OF J. G. HETZEL

CHAS. E. HETZEL, PROPRIETOR

Manufacturers of Roofing Cement and Paints

CABLE ADDRESS:

"HETZEL, NEWARK"

67 Maine Street

NEWARK, N. J.

Products.

HETZEL'S ELASTIC RUBBER ROOF CEMENT for all kinds of roofs, glass skylights, coping stones, etc.

HETZEL'S ASBESTOS PLASTIC COMPOUND for spreading over old roofs.

HETZEL'S "R. O. P." CEMENT COATING.

HETZEL'S PIPE JOINT COMPOUND.

HETZEL'S DAMP RESISTING PAINT for brick walls.

Hetzel's Asphalt Paints; Hetzel's Asbestos-Roof-Kote, a liquid asbestos roof paint; Hetzel's "Rub-on" Roofing Paint; Hetzel's Enamel Paints (black and green) for boiler fronts and steam pipes; and Hetzel's Acidproof Paint for metal work, ammonia tanks and gas tanks.

Hetzel's Rubber Roof Cement.

Hetzel's rubber roof cement, which has been in general use throughout the United States and Europe for many years, is especially valuable for covering and repairing all holes, cracked joints, breaks, or leaks in roofs of all kinds. It is also used for pointing around chimneys, skylights, and dormer windows; for repairing coping stones, gutters, wood and stone work which require to be made watertight; and for laying and bedding slate and tile roofs.

Supplied in the following colors: brown, gray, black, green and red. It is also made to order to suit every purpose, and is the only slaters', tanners' and tile roofers' cement.

Hetzel's rubber roof cement is equally well adapted for use on slate, tin, asbestos, glass, wood and metal roofs; is permanent; does not run or loosen from joints or cracks, and is not affected by any extreme of temperature or climatic changes. It does not harden, but preserves its complete elasticity even when exposed to extreme heat, cold, dryness or humidity.

Hetzel's Asbestos Plastic Compound.

A specially prepared compound for spreading over old wood, tin, iron, or felt roofing; for repairing leaky chimneys; for waterproofing walls below and above grade, etc. Applied with a plasterer's trowel.

Hetzel's "R. O. P." Cement Coating.

A specially prepared material for stucco, brick and concrete surfaces.

Impervious to moisture, and positively unaffected by any of the alkalis in cement and brick materials.

As a cement floor coating, it dries hard and is proof against oil, grease or water.

Made in 8 different colors.

Pipe Joint Compound (Red, Gray and Black).

This compound adheres to metal, and is used for joints of gas, steam, water, and air pipes. It will not harden, and prevents joints from rusting. It will make absolutely tight joints, which can be disconnected at any time, without injury to fittings.

TRADE-MARK

Hetzel's Damp Resisting Paint.

A compound black paint for dampproofing foundations and walls above and below grade. When applied to inner side of exterior walls, forms a good damp-proof surface for direct application of plaster, rendering plaster stainproof, and saving cost of furring and lathing.

Specifications for the Use of Hetzel's Elastic Rubber Roof Cement.

All nailholes and joints between the slates shall be sealed with Hetzel's Elastic Rubber Roof Cement as manufactured by the ESTATE of J. G. HETZEL, Newark, N. J., in such quantities as to hold the slates in position should they break, or the nails rust away. (Fig. 1.)

FIG. 1. For Slate Roofs

FIG. 2. For Spanish and Flat Tile Roofs

The joints of all tiles shall be sealed with Hetzel's Elastic Rubber Roof Cement as manufactured by the ESTATE of J. G. HETZEL, Newark, N. J. To prevent leaking, the hip and ridge rolls shall be sealed in a like manner. (Fig. 2.)

FIG. 3. For Pointing up Cap Flashings

All cap flashings shall be carefully pointed up with Hetzel's Elastic Rubber Roof Cement as manufactured by the ESTATE of J. G. HETZEL, Newark, N. J. (Fig. 3.)

FIG. 4. For Tile and Stone Copings
APPLICATIONS OF HETZEL'S ELASTIC RUBBER ROOF CEMENT

The joints of all copings shall be set and sealed with Hetzel's Elastic Rubber Roof Cement as manufactured by the ESTATE of J. G. HETZEL, Newark, N. J. (Fig. 4.)

NATIONAL VENTILATING COMPANY

Manufacturers of Puttyless Skylights

GENERAL OFFICE AND FACTORY

337-339 East 26th Street
NEW YORK, N. Y.

TELEPHONE:

MADISON SQUARE, 387-388

Products.

MULTI-UNIT PUTTYLESS SKYLIGHTS.

Also, Side Lights, Operating Sash, and National Ventilating Devices.

Adaptability.

Skylights for railway terminals, power stations, machinestops, factories, foundries, libraries, museums, art galleries, and all other buildings whereon permanent watertight skylights of large area are required.

Advantages and Distinctive Features.

Referring to illustration, the bar and upper lights are supported in a fixed manner by the purlin thereunder; while the lower bar, supporting the lower lights, is secured by the same purlin in a loose manner, permitting it to expand freely.

This construction, being repeated at each purlin, permits movement, all in same direction, due to expansion, contraction, or vibration (along the slope of the skylight) of the cap, glass and bar of each unit or tier of glass, independently of every other unit or tier.

Along the longitudinal line of the skylight the steel frame of the building and the entire length of the glass are each taken as separate units, and the difference, nearly 100%, in the expansion and contraction of these materials (glass and steel) is likewise thoroughly taken care of by the copper spreader clips shown in transverse section at supporting bar. These spreader clips are placed over each cap bolt, spaced about 12 in. along each skylight bar, and incidentally they serve also to better secure in place the copper bolts for holding the caps.

The cap is strong and yet resilient. Its upper half is of an inverted "U" shape, which provides strength and rigidity; while the lower half, especially at the lower extremities, is resilient, so as to conform thoroughly, when secured in position, to the surface of the glass.

All gutters and parts that are non-accessible, without removing the glass, are of non-corrosive material. The entire top of the bar is covered with 8-oz. copper, the same being applied while the last coat of bar-paint is still wet; and a flexible bearing for the glass is formed, which adjusts itself to any warps or irregularities of the glass along its bearing line.

The company is equipped to cover the bottom of the bar also. Both the top and bottom bar covers

are made by special dies and both fit the bar snugly.

No packing or filling substance of any kind is required, and no material is used other than glass and metal.

Installations.

The Pennsylvania Railroad Co. adopted this construction for its new New York City Passenger Station, on which building 83,000 sq. ft. of skylight were installed, embracing every known variety of construction.

The Central Railroad of New Jersey also adopted this system for its new Terminal at Jersey City, where 116,000 sq. ft. were installed.

The New York Central Railroad Co. has this construction on its Grand Central Terminal at 42nd Street, and on Powerhouses and Passenger Stations at various points.

Installations have been made on a number of large buildings in the United States Navy Yard at Washington, D. C., and Norfolk, Va.

A large number of industrial plants have also adopted this system as it has been found the most economical and satisfactory.

The Standard Arcade at 50 Broadway, New York, N. Y., has a curved roof skylight of this construction, which is a splendid example of its peculiar adaptability to any condition.

3 Way-Luxfer Simplex Sidewalk, Vault Lights and Floor Lights.

Prism Glass, Flush Watertite Sidewalk Doors, Coalhole Covers, Vent Doors, Sidewalk Grating, and other Cast Iron Paving and Sidewalk Specialties.

3 Way-Luxfer Simplex Skylights.

ADAPTABILITY AND ADVANTAGES—Skylights of this construction, made with $6\frac{1}{8}$ -in. square glasses, are ideal for large surface installations, such as depot train sheds, light wells and floor lights. The large light area, great strength, economy of installation, absence of upkeep cost, freedom from fire risk, and their everlastingness, combined with the neat appearance of glass and concrete surface on both sides, make Simplex skylights all that can be desired.

Once installed, the Simplex skylight needs almost no attention and no repairs except in case of extraordinary accidents. It requires no protecting screen, needs no transverse supporting beams, and withstands all kinds of weather without leaking.

CONSTRUCTION—First is made a grid of steel, in itself capable of supporting a big load. We punch $1\frac{1}{2}$ -in. I-bars every $7\frac{1}{2}$ in., and through these holes are forced $\frac{3}{8}$ -in. reinforcing rods.

This grid is then embedded in concrete. With the grid in the forms, each mould for the glass is carefully centered in each square of the grid. A special mix of concrete is then filled in till all the steel is covered but the heads of bars.

When constructed on the job, or for complete slab, this same construction is followed, but all the concrete is poured at one time, with the glasses in place.

Reground Cement Used—Nothing but reground cement is employed, 95% of which must pass through a 200-mesh screen.

Coarse ordinary cement *never all gets wet clear through*. So in concrete there is always a certain per cent of "raw" cement. Successive rains, melting snows, etc., penetrate the concrete, wet this raw cement and chemical action begins—expanding and causing great pressure on the surface. That is the reason that reinforced concrete walks always buckle up and not down.

But the very fine grain of the reground cement is wet clear through, in the first mix, so that there can be no after crystallization; hence no undue expansion, causing surface cracking and shaling of glass in skylights. And because of its added density this concrete is naturally waterproof, although, if desired, waterproofing can be added.

Lazalite Glass Only Employed—The space for glass is $6\frac{1}{8}$ in. square, surrounded with concrete $1\frac{3}{8}$ in. width. The glass is pressed to exact size, $6\frac{1}{8}$ in. square, and tempered and annealed just like the side-

SIMPLEX SKYLIGHT OVER SWITCHBOARD IN CALUMET EXCHANGE, CHICAGO TELEPHONE CO.

Ideal construction—great strength, large daylight area. One of two gable skylights on this building which have never leaked or given any trouble

GRID REINFORCING STEEL

LAZALITE LENS

walk glass. This large glass will resist any ordinary blow, and can be walked on with perfect safety.

The famous Lazalite glass contains no manganese, so does not turn pink or purple under action of the elements. And every piece is absolutely perfect, free from hidden stresses and strains because each is tested under the polariscope before it leaves the factory, and is guaranteed by the manufacturer.

After perfect lenses are selected, the edges are covered with a plastic coating to provide a cushion to

take up the pressure of the heat expansion of the glass and concrete.

Finishing the Skylight—Most installations are of the gable or "dog house" type. Flat installations are discouraged except where raised on coping. The difference of expansion between the solid roof and the skylight makes it almost impossible to keep the joint waterproof; while if the skylight is raised on its own coping, it is easy to provide for the variation and make the joints absolutely tight.

The preformed slabs are set and glazed on the job.

No Cross Beams Required—Cross beams are not necessary for the support of Simplex skylights. The longitudinal I-bars buried in concrete and laced together make such a strong construction that it will carry many times the load any snow storm might put on it. Send for our Engineer's Test Report on Strength.

The Joints—As the preformed slabs are set in place a "U" formed metal expansion joint is inserted between every two slabs. The flanges rest on the edge of the preformed part of the slab and so are buried on the top dressing. When the top is "set" the space is filled with Tyte-Lite calking compound. When complete slabs are supplied they are made with a groove to take the expansion joint.

SPECIFICATIONS—Skylights, where shown on plans to be reinforced concrete type with no exposed metal, using 1½-in. channel flats with ¾-in. reinforcing rods at right angles to channel flats. It shall have a tested carrying capacity of not less than 250 lbs. per sq. ft. on a 5-ft. clear span, supported on two ends only, figuring on a factor of safety of 4.

Glass to be Lazalite quality, as manufactured by the Jeanette Glass Company, guaranteed by the manufacturers to be free of manganese and without stresses and strains, each piece having stood polariscope test.

Side walls to have a plastic malleable coating to form a cushion protection for expansion. Glass to be of replaceable type, so as to permit of any replacement without defacing the surface of concrete.

All glass to be 6½ in. square, spaced on not more than 7½-in. centers.

Cement must be reground to the extent of permitting 95% to pass through a 200-mesh sieve.

Calk all joints around and between prismatic skylights with Tyte-Lite.

Work to be set by manufacturers' own experienced workmen.

All as furnished by AMERICAN 3 WAY-LUXFER PRISM CO., or other approved equal.

3 Way-Luxfer Simplex Skylight Slabs.

Complete skylight slabs ready for slipping into place and calking joints supplied for small installations.

Replaceable Lens.

The glass in the original installation is made with a bead and so shaped that if a glass becomes broken from any cause it can be easily replaced without chipping the concrete. By using our new replaceable lens, which is made slightly smaller, a new glass is simply slipped into the old opening and the space filled with clear cement and plastic coating.

Tyte-Lite.

Tyte-Lite is a compound made especially for waterproofing joints in skylights. Jobs several years old calked with Tyte-Lite upon investigation by us have been found in perfect condition.

Sold in any quantity. Write for further information.

Typical Drawings and Details.

Our skylight construction experts have prepared several drawings of different forms of skylights.

Upon receipt of information regarding skylight installations considered, these complete working drawings will be furnished together with details.

AGENCIES IN ALL PRINCIPAL CITIES

Products.

"ANTI-PLUVIUS" FIREPROOF, PUTTYLESS SKYLIGHTS—trade-marked and patented.

"STRAIGHT PUSH" and "LOVELL" SASH OPERATORS—patented; also WORM and GEAR SASH OPERATORS.
"Drouvé" Ship Skylight and Hatch Lifting Device.

Service.

A skilled estimating department will give every assistance in preparing specifications.

Detail drawings of different types and conditions will be forwarded on request, if engineers will indicate approximately their ideas.

Catalogues, prices, preliminary estimates or any co-operation will be gladly and promptly furnished.

"Anti-Pluvius" Puttyless Skylights.

Skylights are used in industrial buildings of all kinds; in sawtooth, flat or pitched roofs, and made in all types whether flat, single or double pitched, or hipped.

ADVANTAGES—A type that will satisfy the most exacting requirements of stiffness under wind and snow loads, of perfect watertightness, of freedom from condensation drip and of endurance against corrosion.

Strength of materials and of the structure are ideal; will support the weight of a man or men without danger to glass. Proper provision is made for easy cleaning of glass. Frames are flexible and full allow-

ances are made for contraction and expansion, vibration and wind pressures. Construction permits of easy removal of glass by any man about the place.

It is adaptable to all types of roofs: wood, metal, brick, tile or concrete, galvanized iron or asbestos.

Can be put up by anybody, anywhere.

Lights of glass are independent, and do not come in contact with each other, nor do they touch the channels. Skylight frames are shipped with or without glass. No sweating of steel members from chill caused by cold glass.

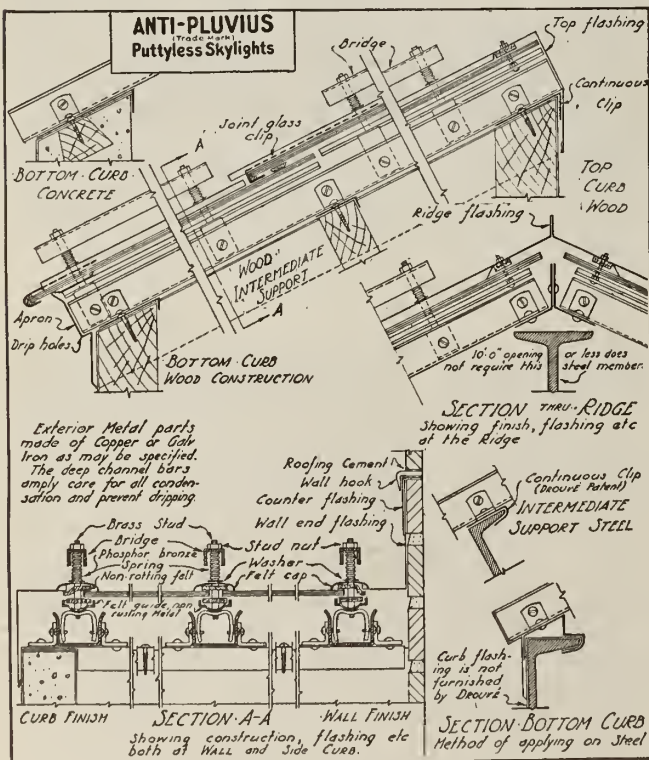

GLASS—Can be rough, hammered or ribbed, plain or wired, of any kind or thickness.

PAINTING—Steel channels or skylight frame have one shop coat of metal protective paint. Galvanized portions are unpainted unless requested.

SHIPMENTS—Shipped knocked down. Any person of ordinary intelligence can erect them (see assembling details).

The company will install these skylights anywhere, if desired.

INFORMATION REQUIRED FOR ESTIMATING—State type of skylight required, give size or sizes and number wanted. State trimmings desired. These cover outside exposed portions of skylight and include cap and flashings (not roofer's curb flashings) and may be of copper, or galvanized iron. Specify kind of glass (see "Glass").

DETAILS OF SINGLE OR DOUBLE PITCH TYPE GENERAL SKYLIGHT CONSTRUCTION

Scale 1/4 inch = 1 foot

"Straight-Push" Sash Operator.

Designed to operate all types and makes of sash in monitors, skylights and side walls of buildings. Designed to withstand all manhandling and unexpected conditions.

Guide rolls mounted on brass pins to prevent rusting. All working parts have brass-to-iron connections. The sweep of levers is level.

Leverage force applied is uniform throughout length of line, insuring equal opening and closing of all sash.

ERECTION—Erecting crews are maintained by the company to handle any job, anywhere, or any workman can install from erection instructions.

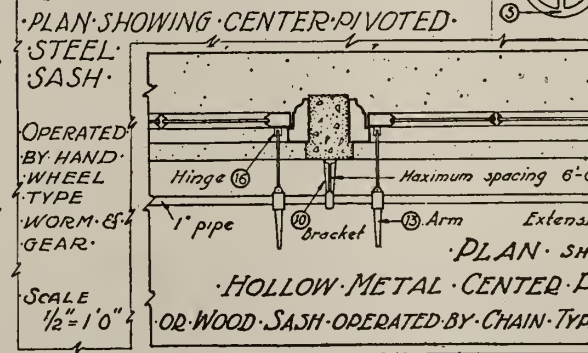

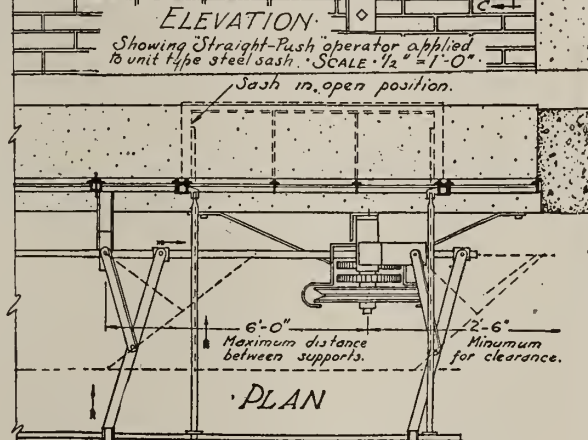

"Improved Lovell Dreadnought" Sash Operator.

This design, with its sweeping movement, gives large openings to heavy top hung sash. All parts made extra heavy, with phosphor bronze working joints.

Worm and Gear Operators.

Practically all types of standard worm and gear devices supplied as desired for operating lines of ventilating sash in side walls, pitched roofs, sawtooth roofs and monitors, and for pivoted or hinged sash.

Details of standard worm and gear operating devices forwarded on application and, when sufficient information is given, recommendations will be made as to efficient and economical procedure.

ESTABLISHED 30 YEARS

HUGH R. BURNS, PRES. JOHN A. MERCIER, VICE-PRES. CHAS. R. WOOLENSACK, SECY-TREAS. CHRIS. YAUCH, SUPT.

THE HOWIE COMPANY, INC.

Manufacturers of Skylights

TELEPHONE:
GLENDALE 271370-374 Fourth Avenue
DETROIT, MICH.**Products.****PEERLESS SKYLIGHTS.**

Fireproof Windows, Tin Clad and Kalamein Doors, approved by Underwriter's Laboratories, Inc.; Copper and Bronze Doors, Architectural Sheet Metal Work, Ventilating Systems; Slate, Tin, Tile and Composition Roofing; General Sheet Metal Work, Barber's Genuine Trinidad Lake Built-up Asphalt Roofing, Barrett's 20-year Bond Specification Roofing; Jobbers in Slate, Tile and Roofing Supplies.

Peerless Skylight, Sawtooth and Marquise Constructions.

These are designed to provide a weatherproof and dustproof skylight construction and one that can be guaranteed against any and all possible glass breakage due to vibration; through expansion and contraction due to temperature changes, and from vibration of structure caused by machinery shafting fastened to roof trusses.

BARS, CUSHION, CAP STRIP and CONDENSATION GUTTER—Supporting bars are of special rolled steel bars, $\frac{3}{4}$ by $1\frac{3}{4}$ -in. T-section with upturned flanges. The glass is laid directly on these flanges in small panes, 24 by 24-in. size, overlapping each other 2 in. with a $\frac{1}{4}$ by $\frac{3}{4}$ -in. Genasco Asphalt strip laid between, thus forming a cross condensation gutter. A special Genasco Asphalt strip is laid along edge of glass and against side of bar. A sheet metal spring bearing cap is provided for a covering of T-bar and packing strips. This cap is but 23 in. long and is provided with a heavy brass cotter pin through center of cap. Cotter pin engages a slot provided in bar in such manner as to insure a tight springlike fitting to glass and packing strips; each light of glass being held in place independent of every other light by means of this cap and cotter pin, and thus left wholly free to move whenever affected by either expansion or vibration.

GLASS, OVERLAPPING, FLEXIBLE CROSS JOINT—The standard $\frac{1}{4}$ -in. wire glass is used in lights 24 by 24 in. in size, necessitating the offsetting of T-bars every 22 in., thus providing a horizontal flexible cross joint throughout the construction.

EXPANSION CASTINGS—Provisions for the expansion of the bar is provided by the upturned flanges of the bar engaging the special casting flanges, which castings are fastened to curb, ridge and intermediate purlins, as required, to suit the construction of the building. The curb castings are provided with weep holes.

CONTINUOUS CURB GUTTER—The sheet metal curb flashing is turned up $\frac{3}{4}$ in. on the inside directly back of curb casting; this necessitates the bar being offset at curb end, thus providing a continuous curb gutter $1\frac{1}{4}$ in. deep by 3 in. wide, guarding against the possibility of a leaky frozen-up curb. The metal ridge is bolted to bar with a $\frac{1}{4}$ by $1\frac{1}{4}$ -in. brass bolt.

SHEET METAL TRIMMINGS—The only sheet metal used in this construction is the cap curb and ridge, which can be of galvanized iron, lead coated metal or copper.

STANDARD CONSTRUCTION—The above is a standard construction and is carried in stock, thus facilitating quick shipment upon receipt of order.

COST AND MAINTENANCE—Peerless skylights cost no more than ordinary skylights and last from 4 to 5 times as long without additional cost of maintenance.

SUMMARY—The Peerless skylight is designed to meet all requirements and is the last word in skylight, marquise and sawtooth construction. It is absolutely proof against water, snow and dust; and will last as long as the building with no glass breakage possible, excepting by accident.

Details.

The following details illustrate the practical use of Peerless skylights, sawtooth and marquise construction.

Other details required to meet any other conditions evident in various building construction will be made and submitted for approval.

Specifications for Peerless Skylight and Marquise.

INTENT—This specification together with the accompanying drawings and details is intended to provide for all labor and material required for the completion and erection of all skylights as shown or mentioned.

WORK BY OTHERS—All steel framing, wood curbs, nailing strips, gutters and roof flashings, shall be provided for under another contract, unless otherwise specified.

WORK REQUIRED—Provide and install all skylights as shown or indicated on drawings. All skylights shall be "Peerless" skylight construction as manufactured by THE HOWIE COMPANY, INC., Detroit, Mich., complete as shown by their standard details, and adapted to the construction of the building.

All sheet metal trimming shall be of No. 24-gauge galvanized iron or 16-oz. cold rolled copper.

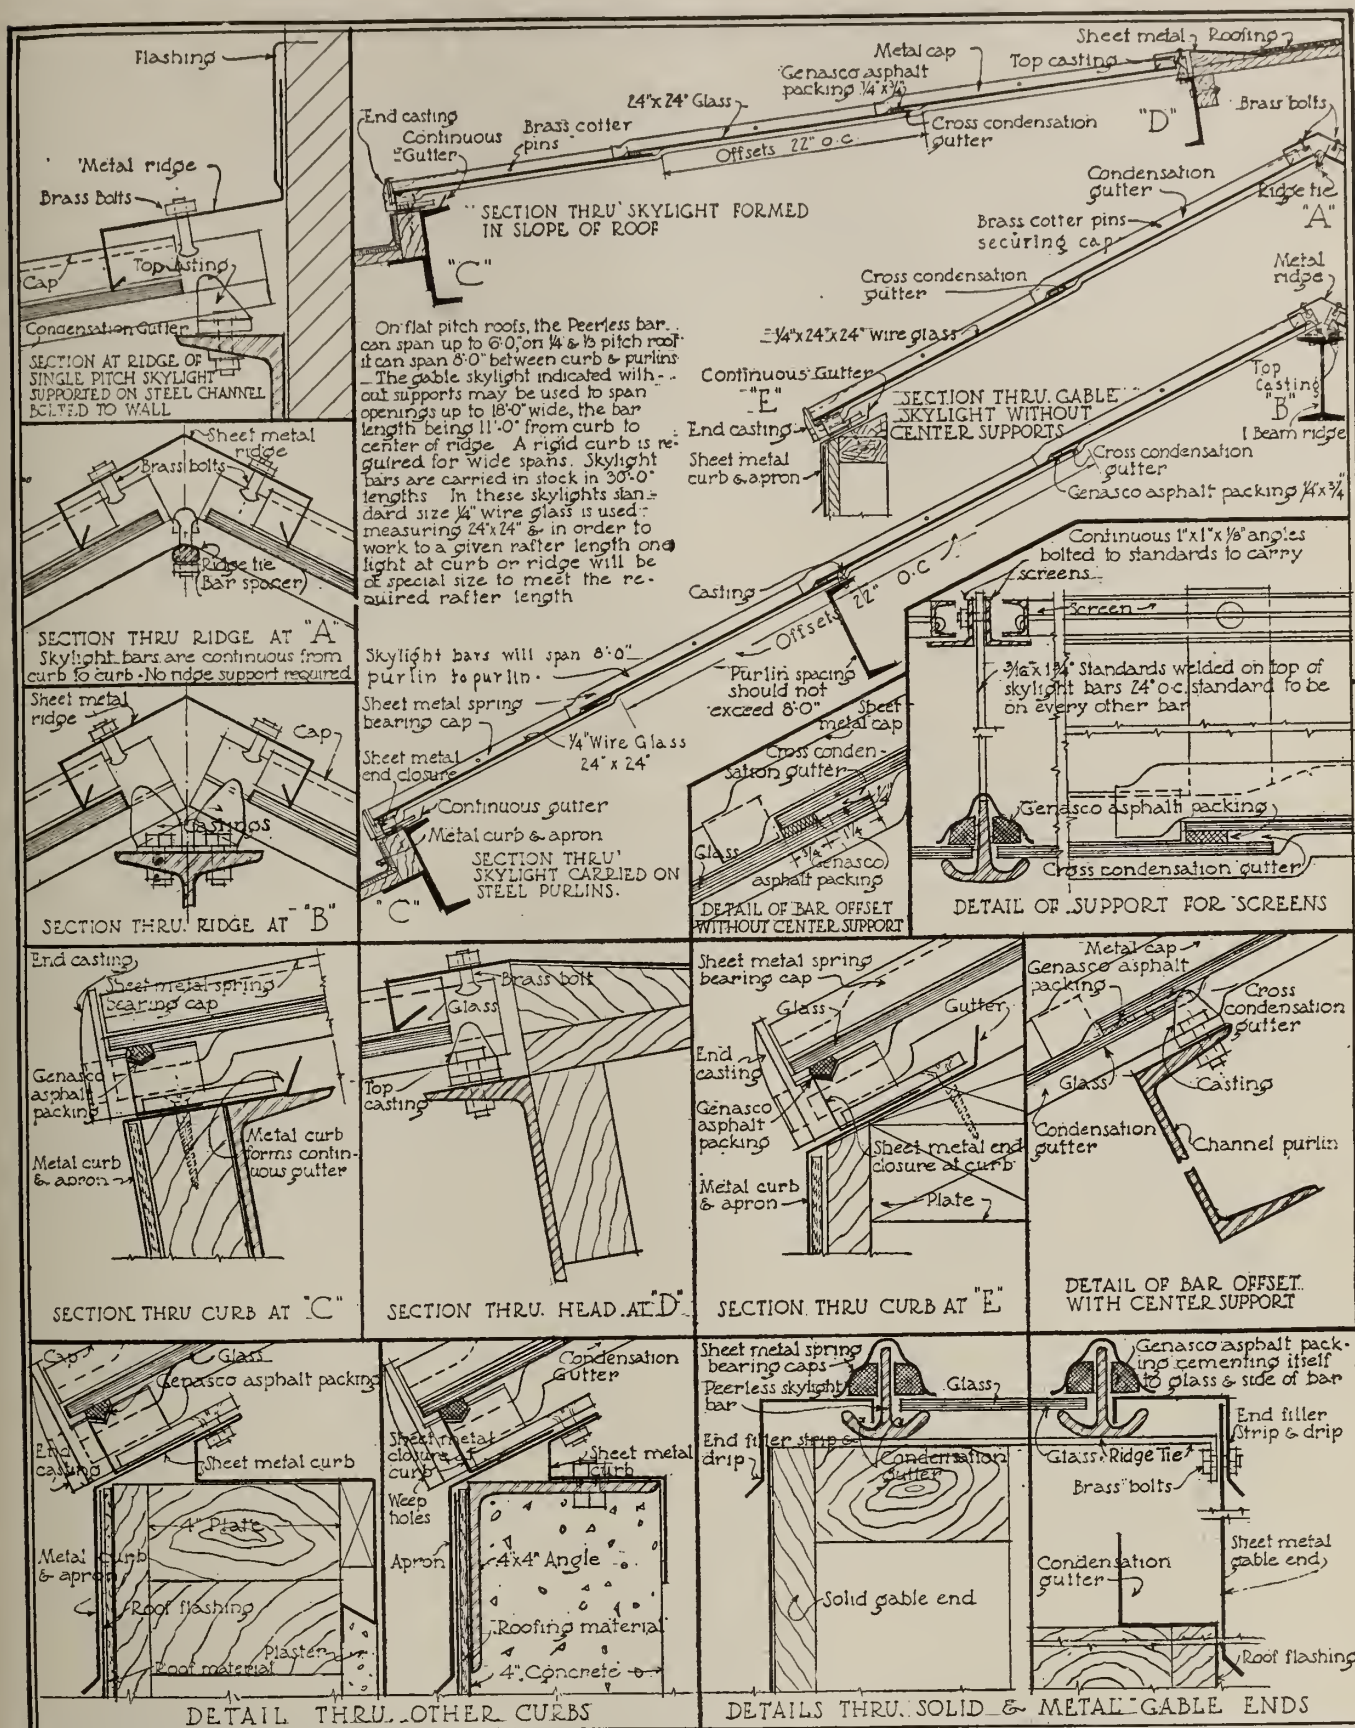

GLAZING—All skylights to be glazed with best quality $\frac{1}{4}$ -in. rough wire glass, not to exceed 24 in. in width. All glass to be left whole and clean at completion of the work.

PAINTING—All metal work in connection with skylight, except copper, shall be painted; also paint all skylight bars with 1 good coat of approved paint.

GUARANTEE—This contractor is to furnish a written guarantee for 5 years.

MARQUISE—The marquise shall be constructed of Peerless skylight bars with necessary end castings, brass nut flashing, etc., in accordance with THE HOWIE COMPANY, INC., construction.

LONG ISLAND CITY, N. Y.

BRANCH OFFICE: BRIDGEPORT, CONN., WM. V. DEE, Vice-president and General Sales Manager

Products.

PUTTYLESS STEEL SKYLIGHTS.

CAST IRON ROOF DRAINS.

Sheet Metal Skylights, Turrets and Louvers;
Architectural Sheet Metal Work of every description;
Metal, Tile and Slate Roofing.

Services and Estimates.

This company's estimating and drafting department is at the disposal of engineers, architects and owners. Estimates, suggestions, specifications and plans for its products will be gladly given on request. A large force of experienced men is employed, who have been carefully trained to erect the company's products. When material only is supplied, complete instructions and drawings are furnished.

Facilities.

This company's factory is situated in Long Island City, near the Long Island Railroad and the Brooklyn Eastern District Terminal. This gives a direct shipping to any point in the world, either by railroad or water.

Jeter's Puttyless Skylights.

SPECIAL FEATURES—The sash bar of Jeter's patented puttyless steel skylight is composed of a lower channel, over which is placed a special moulded glass rest, secured to the bottom channel by means of wrought iron stirrups and tap bolts.

TYPICAL DETAILS OF JETER PUTTYLESS STEEL SKYLIGHTS

Scale: 1 in. = 1 ft.

The glass rest is held in position by a brass bolt, which is of sufficient length to engage and secure the metal cap that covers the edges of the glass.

On the special moulded glass rest, a cushion of heavy saturated asbestos is provided, running entirely across the glass rest. After the glass is laid in place, a saturated asbestos sealing strip is provided, which is securely held in place by the metal cap. This feature insures against any dust or moisture getting under the glass and in to the sash bars or gutters.

A special moulded section is used as a continuous bottom support for the glass. This section also contains a pocket, on which is placed a strip of saturated asbestos upon which the glass rests. Connections at intervals of about 20½ in. are provided in the continuous bottom members, which receive and secure the bars. This method of asbestos cushioning device makes the skylight waterproof and dustproof and, being of a soft indestructible material, reduces the cracking of the glass to a minimum.

ADAPTABILITY—Jeter's patented system of putty-less steel glazing is adaptable for use in railroad terminals, museums, schools, hospitals, factories, machine-shops, etc.

The very simplicity of construction enables any mechanic to readily erect this system.

SPECIFICATIONS—All skylights shall be of rolled steel, of a type to allow for free expansion and contraction and made tight without use of paint, cement or putty.

Sash bar shall be composed of a special U-channel 2 in. wide and 1¾ in. deep, made of high carbon steel ¼ in. in thickness.

A special moulded glass rest made of No. 16 gage steel shall be provided. This glass rest shall be formed in the shape of a trough and shall be supported on wrought iron stirrups which will be tap-bolted through the walls of the special U-bar.

A heavy non-absorbent asbestos cushion shall be placed over the glass rest. Cushion and glass rest shall be securely fastened to the wrought iron stirrup by means of brass or copper machine screw.

A special continuous moulded member shall be provided at eaves of skylights. Between this member and the glass shall be placed a non-absorbent asbestos cushion and same drawn up tight under glass by means of bolts at bar centers.

After glass is set in place, provide a metal spring cap 1¾ in. out to out of flanges. This cap shall be underlined with a sealing strip of non-absorbent asbestos material, held in position by being punched and strung over the cap bolts. Edges of sealing strip shall not protrude beyond edges of cap. Securely fasten cap by means of a brass nut.

All skylights to be glazed with ¼-in. ribbed wire glass.

All caps, combing and trim shall be of (specify copper, zinc, or galvanized iron).

After fabrication and before assembling the sash bars, all parts shall be thoroughly coated with an application of bitumastic solution (or specify hot galvanizing).

Jeter's Improved Cast Iron Roof Drains.

These drains are decidedly superior to the troublesome old style drains and are offered at about the same cost as the latter.

They are adapted for use with interior leaders on slag, gravel or promenade tile roofs, with either concrete or wood construction.

They are substantially constructed of cast iron, insuring service for the life of the building.

No extra metal flashing is required, as the roof material is flashed directly to the drain and clamped

down in place by flashing rim, which also forms gravel or tile stop.

Being incorporated in concrete roof slab or fastened to wood construction eliminates any chance of shrinkage or separation between roofing material and drain, and proof against leakage is assured.

Their simplicity, few parts, ease of installation, durability and economy make them ideal drains.

For Slag or Gravel Roofs

For Promenade Tile Roofs

VAILE & YOUNG

Puttyless Skylights, Portable Steel Buildings, Sheet and Plate Metal Construction

Ridgely and Bush Streets
BALTIMORE, MD.

Products.

Manufacturers of SHEET and PLATE METAL CONSTRUCTION; STRUCTURAL STEEL WORK; PUTTYLESS METAL SKYLIGHTS; PORTABLE STEEL BUILDINGS.

Tanks, Hoppers, Blast Pipes and Breechings; Bronze and Copper Covered Doors and Windows.

Patent Metallic Puttyless Skylight.

The VAILE & YOUNG patent metallic puttyless skylight is made of galvanized sheet metal or copper, the bars being constructed with two open tubular gutters and a tubular strengthening rib inserted between these, all well riveted together.

In spans less than 4 ft., the strengthening rib is omitted; and in spans over 8 ft., where additional strength is required, steel strengthening cores are inserted as shown.

Tubular condensation gutters are provided on inside of skylight at eaves. These conduct condensation to outlet holes at junction of eaves and bar gutters.

Bars are capped on outside with V-shaped caps, in each side of which is inserted a strip of heavy sheet lead; this is pressed closely to the glass, the cap being held firmly in place by heavy copper cleats, making the skylight absolutely watertight.

The readiness with which broken glass can be replaced is apparent, it being only necessary to loosen the copper cleats and remove the cap.

DETAILS OF PITCHED SKYLIGHT CONSTRUCTION

Sheet and Plate Metal Construction.

SCOPE OF OPERATIONS—The activities of this organization extend over every field embracing the design, construction and installation of sheet and plate metal work.

Contracts executed by VAILE & YOUNG include substantially every form in which sheet and plate metal can be constructed.

FACILITIES—This company, with new modern equipment and daylight factories, is prepared to handle special problems in sheet and plate metal construction

of every character, including structural steel, for mills, factory, and other equipment. Limit about $\frac{3}{8}$ in.; heavier in special lines.

Prompt execution of all contracts is assured as the method and factory equipment are strictly up-to-date. Nearly 100% increase in available floor space. All on one floor, assuring minimum cost for handling material.

SHEET METAL PIPING, BENDS, ANGLES, FLANGED JOINTS, ETC.

SHEET METAL PAN

SHEET METAL GEAR GUARD

"Kerber System" Portable Steel Buildings (Patents Pending).

VAILE & YOUNG are the sole manufacturers of the "Kerber System" of portable steel buildings, which are original, unique and simple in construction.

Buildings are rigid, substantial, sanitary, fireproof and portable. They are constructed entirely of standard sections formed of heavy galvanized steel sheets. The sections are interchangeable, thus enabling the purchaser to select any desired arrangement of doors, windows, etc. The portable feature is such that the buildings can be erected by any one.

Partitions, ceiling and lining of suitable material may be installed, without alteration, at any time after the buildings are erected, and when lined, an air space or cell is formed between the lining and outer wall which insures comfort and eliminates dampness.

Any desired heating arrangement may be used.

The purposes for which the "Kerber System" is adapted are numerous, as has been shown by practical tests. They can be dismantled at any time without damage to the various sections, thus insuring re-erection

without repairs or employment of skilled labor.

The sections are formed so that they can be nested, and are packed in substantial crates, thus reducing to a minimum the possibility of damage in transit.

PRICES—Prices will be quoted for deliveries to any point, f. o. b. Baltimore or destination, or including erection.

Co-operative Service.

The personnel of this company is composed of experts in sheet metal and steel plate construction, thoroughly conversant with the best practice in all branches of this line, and prompt and satisfactory service is guaranteed.

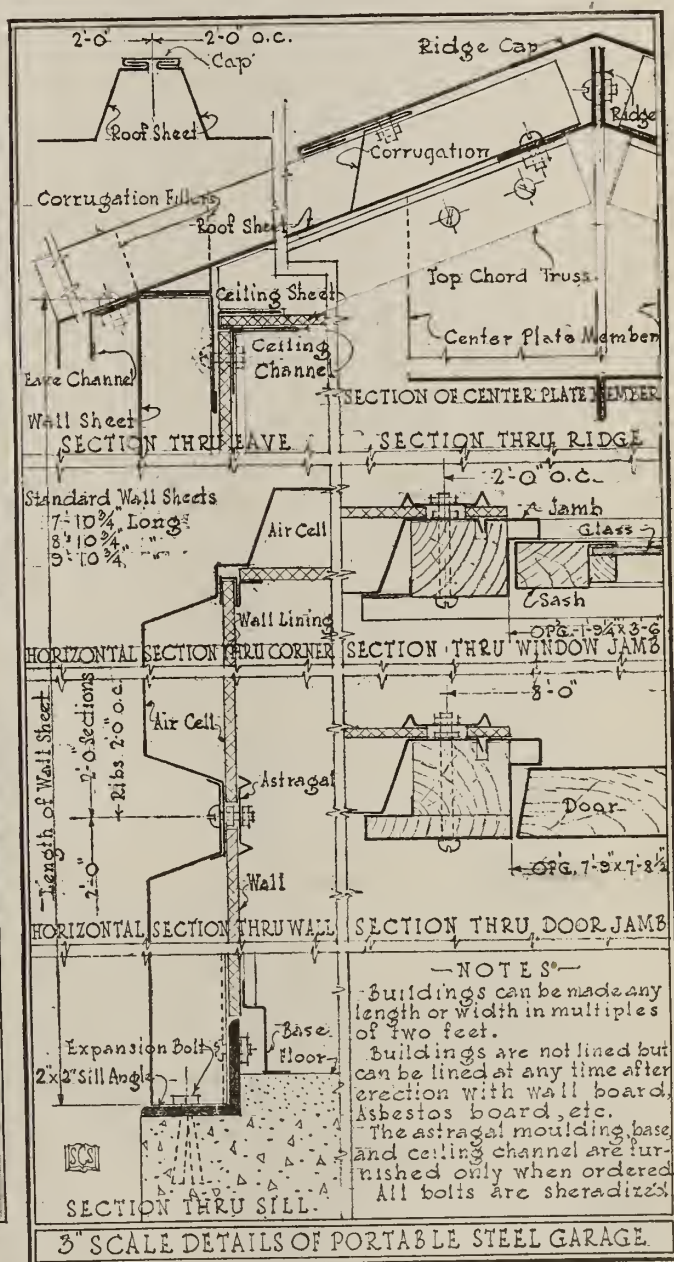

The drafting department will gladly co-operate in planning and offering suggestions for any special problem involving sheet and plate metal construction in any part of the country.

PORTABLE STEEL INDUSTRIAL BUILDING

PORTABLE STEEL GARAGE

ESTABLISHED 1873

E. VAN NOORDEN & COMPANY

Skylights and Ventilators

TELEPHONE:

100 Magazine Street, near Massachusetts Avenue
BOSTON, MASS.

Products.

Manufacturers of "ANCHOR-BAR" ROLLED STEEL, PUTTYLESS SKYLIGHTS; GALVANIZED STEEL OR COPPER VENTILATORS.

Also, Sheet Steel and Copper Skylights of every type, Sheet Steel or Copper Windows, Kalamein Doors.

TRADE-MARK

Rolled Steel, Puttyless Skylights, "Anchor-Bar" Type (Patent No. 931638).

The opportunity of suggesting framework for any type of glazed roof is solicited, and saving in steel framework is assured.

The Van Noorden rolled steel puttyless skylight is designed for large skylight areas. Fewer purlins or steel supports are required than for any other skylight.

The structural parts of rolled steel and trim of sheet metal (generally copper) form an unsurpassed combination for strength and weather protection.

BAR—A tee and angle combination. Angle member serves as condensation gutter. Glass rests loosely on cushion of pure wool felt.

CURB—Continuous steel reinforcement at the base. The thrust of skylight bars is directly against this member, which must hold while the curb holds.

FEATURES—The combination of steel frame of bars, base and ridge form a self-supporting steel structure upon which the glass is loosely embedded after which the exposed sheet metal portions (generally copper) are applied. Caps secured with brass bolts.

EXPANSION AND CONTRACTION—Amplly provided for. Sheet metal parts are independent of rolled steel parts. Glass sets loosely on the cushion of wool felt.

ACCESSIBILITY FOR REPAINTING — Rolled steel members are readily accessible; sheet metal portions (preferably of copper), are impervious to weather conditions.

SECTION THROUGH CURB, "ANCHOR-BAR" SKYLIGHT

SECTION OF BAR IN "ANCHOR-BAR" SKYLIGHT

ADAPTABILITY—Wherever overhead light is desired. Inquiries should state over all length of outside of curb, bar length, pitch of skylight (5 ins. to the foot, or more) and distance between intermediate purlins.

"ANCHOR TRUSS BAR" (Patent No. 1140909)—Used where bar length is more than 11 ft. unless intermediate purlins are provided. Truss bars are self-supporting for a bar length up to 15 ft. The saving effected in the steel frame support is far greater than the excess cost of truss bar construction. Details on application.

"Storm King" Rotary Ventilator.

Consists of a stationary barrel surmounted by a sensitive ball bearing, flare shaped head that is always in correct position to the wind. Insures free exhaust; hinged damper, weatherstripped at top, permits full capacity when open and completely seals mouth of ventilator and prevents back action of snow, etc., when closed. Gutters provided at sides of damper.

Damper operated by chain, through tubular spindle, which can not foul braces or supports.

"STORM KING" ROTARY BALL BEARING VENTILATOR

A—revolving head; B—fixed barrel; C—base; D—gravity damper (open position); F—side gutter insuring tightness of damper; H—reinforcing channel

"Simplex" Ventilator with "Suretite" Damper.

Consists of stationary barrel and head with sliding damper. When closed, damper completely seals the top of shaft insuring absolute weather tightness. Damper is of double cone form. With damper open, lower cone accelerates up-draft in shaft and prevents back-draft. With damper closed, upper cone sheds filtration of fine snow. Damper can be locked in various positions.

"SIMPLEX" VENTILATOR WITH "SURETITE" SLIDING DAMPER

A—head; B—barrel; C—base; D—weather shield; E—"Suretite" gravity sliding damper (closed); F—damper (open); G—operating arm; H—chain lock (locking damper in open position); J—telescopic damper guide; K—gutter (for condensation)

CHICAGO, ILL.

BRANCH OFFICES IN ALL PRINCIPAL CITIES

Product.

AREX ORIGINAL SIPHONAGE ROOF VENTILATOR.
Arin Antidraft Window Ventilators.

Arex Siphonage Roof Ventilator.

The Arex ventilator assures, by natural means, constant, positive, uniform ventilation for any kind of building—mills, factories, foundries, warehouses, power plants, train sheds, etc. Foul air, warm air, fumes, gases, vapors, steam and smoke are quickly and completely removed.

DESCRIPTION—

Passing wind plays upon the siphons so as to accelerate the outflow of foul air from interior of building, but it permits none of the outside wind to enter the ventilator. Every opening an outlet.

Of galvanized iron, ingot or Toncan metal, cold rolled copper or any other special metal in any size or gauge. Brass bolts connecting the frustum to the siphons permit installation in two halves and facilitate painting inside and outside after installation.

ADVANTAGES—Down-drafts impossible; constant, positive ventilation assured; 300% greater air exhaust obtained; half the number of ventilators required. No cost for maintenance or operation; every joint securely riveted; no solder used; no movable parts; the whole

is one strong, solid piece. Approved by leading and most prominent architects and engineers in the country; also by government officials.

TYPICAL STANDARD INSTALLATIONS OF AREX ORIGINAL SIPHONAGE VENTILATORS

ACME VENTILATOR CORPORATION

399 Atlantic Avenue
BOSTON, MASS.

Products.

ACME AUTOMATIC ROTARY VENTILATOR (United States Patent No. 1202842; Dominion of Canada Patent No. 189715).

AIRROUT AUTOMATIC BALL BEARING VENTILATOR. (Patent applied for.)

Acme Automatic Rotary Ventilator.

ADVANTAGES—No corrosion; no squeaks; no oil used; no down-drafts; absolutely weatherproof.

DESCRIPTION—Made of galvanized steel, Toncan iron, and copper. Painted standard or acidproof. Most simple, stable, and durable automatic rotary ventilator known to be in use.

CONSTRUCTION—Point—Ventilator revolves on case-hardened steel point against cast iron center, a method considered practical and satisfactory as the result of more than ten years' experience.

Air Congestors—Cause greater suction by actual scientific tests than any other known ventilator on the market.

gestors. Larger sizes are bound with $\frac{3}{16}$ -in. wire to increase the strength and stability.

Sail—Made of heavy gauge material and braced to add to its stability.

Bases—Can be furnished when required. In such cases, detailed specifications should accompany order. When questions as to position and construction are involved, the engineering department is ready to assist with an expert service based upon more than twenty years' experience in solving ventilator problems.

OPERATION—Cone is always kept pointed to the wind which passes through large outer openings of the air congestors (one on either side of cone), the constant pressure forcing the air through the smaller inside openings at higher velocity, thus the slightest movement of air outside automatically creates a strong and constant suction that draws air within the building upward through the ventilator pipe and out the exhaust opening. The outer rim of the storm guard—extending beyond and being separated from rim of the cone by space shown in Plate B—serves both as protection against weather and to increase suction power.

Plate A

Ballast—Causes equal pressure on sides of rod so that ventilator rotates to the slightest breeze.

Brass Bushing and Rod Protector—The friction part of the rod passing through the iron ring is protected by a brass bushing. Rod between point and bushing is protected by metal casing, making friction part proof again dust and dirt.

Storm Guard—Adds stability, makes ventilator weatherproof, and increases pulling force of air con-

GEO. H. LINCOLN CO. BUILDING, SOUTH BOSTON, MASS.

CARTER'S INK CO. BUILDING, CAMBRIDGE, MASS.

MERRIMAC MANUFACTURING CO., LOWELL, MASS.

SPECIFICATIONS—Should read as follows:

Acme automatic rotary ventilator, in. diameter, to exhaust cu. ft. per hour with a wind velocity of 6½ miles per hour.

NOTE—Insert number of cubic feet according to size and as given in table below:

DATA, ACME AUTOMATIC ROTARY VENTILATORS

Size, in.	Cap., cu.ft. per hour	Galvanized Iron Ventilators			Copper Ventilators		
		Gauge of metal	Weight, lbs.	Price	Weight of metal, oz.	Weight, lbs.	Price
4	5600	26	5	\$12.00	16	5½	\$18.25
6	12169	26	10	16.00	16	11	25.40
8	22418	26	16½	20.00	16	18	32.50
10	35028	26	29½	24.00	16	32	39.70
12	50441	26	40	29.00	16	44	47.75
14	68656	26	58	36.00	16 and 18	63	62.30
16	89673	26	73	45.00	16 and 18	80	75.00
18	113493	24	109	60.00	18	120	99.40
20	140115	22 and 24	140	72.00	18	154	115.75
22	175143	22	175	88.00	20	192	143.00
24	201765	22	217	112.00	20	238	172.00
30	314464	20	450	280.00	22	490	394.00

NOTE—The above exhaust capacities should be compared with other ventilators. These tests were made with actual outdoor working conditions, and are not the result of laboratory tests. Velocity of wind at time of tests, 6½ miles per hour. Temperature inside, 68°; outside, 50°. With higher temperature inside building and lower temperature outside, capacities would be greatly increased.

USES—Exhausts—Smoke, steam, gases, and fumes.

Drafts—For chimney to create suction and over-draft.

Industrial and Public Buildings, Theaters, etc.—For lifting foul air, heavy gases, fumes, and smoke. The use of Acme ventilators greatly increases efficiency of labor.

COMPETITIVE TESTS—All representations made by this corporation are based on actual facts. An Acme ventilator will be placed in competitive tests with any known ventilator and a sample will be sent for trial, also an engineer to demonstrate.

Actual tests show the Acme with a 35% higher efficiency than any other known ventilator.

Consult the Engineering Department for any information and suggestions.

PARTIAL LIST OF USERS OF THIS COMPANY'S VENTILATORS:

Amoskeag Mfg. Co., Manchester, N. H.; Broadway Iron Foundry Co., Cambridge, Mass.; W. H. McElwain & Co., Merrimac, N. H.; Winchester Laundry, Winchester and Lowell, Mass.; Boston Woven Hose and Rubber Co., Cambridge Mass.; Home Bleach and Dye Works, Pawtucket, R. Airout Automatic Ball Bearing Ventilator.

ADVANTAGES—Patented, ball bearing race; dust-proof and weatherproof attachments.

MATERIAL—Rust resisting galvanized iron and copper construction. Ventilator revolves on patented ball bearing attachment with metal casing to protect all parts from dirt and condensation, making it absolutely dust-proof.

BALL BEARING—Patented ball bearing attachment fastened to revolving head of ventilator and fitted over end of machined, cold rolled steel rod, insuring free and easy rotation.

STEEL ROD—Steel rod machined on top to receive ball bearing attachment, guided through ring on bottom of revolving part of ventilator, extended down and through ring fastened to stationary part of ventilator, secured and held permanent by locknuts.

BRASS BUSHING AND ROD PROTECTION—Friction part of rod passing through iron ring is protected by brass bushing, and rod between bearing and bushing is protected by metal casing, making rod and bearing proof against dust, condensation, and corrosion.

BALLAST—Counterweights placed on back of ventilator to insure proper balance, so that head will rotate to slightest breeze.

DAMPER—Damper is of the butterfly type, weighted and placed in main pipe of ventilator, eliminating pulleys and chains, which when out of order interfere with the mechanical operation.

STORM GUARD—Adds stability and greatly increases pulling force.

SAIL—Made of heavy gauge material and braced to add to its stability, keeping ventilator in proper position in relation to wind.

AIROUT VENTILATOR

SPECIFICATIONS should read as follows:

Airout automatic ventilator, in. diameter, to exhaust cu. ft. per minute with a wind velocity of 5 miles per hour; all ventilators to be equipped with storm guard, ball bearings, rod and bearing protector, and butterfly damper in barrel of ventilator.

THE BURT MANUFACTURING CO.

Manufacturers of Ventilators and Exhaust Heads

601 High Street
AKRON, OHIO

Products.

"BURT" VENTILATORS: Double Damper, Fan, Sliding Cone Damper, and Ball Bearing Revolving; "BURT" EXHAUST HEADS.
For Oil Filters, see pages 593-95.

"Burt" Ventilators.

By means of "Burt" ventilators, impure air, hot air, smoke, steam and gas are taken out of buildings automatically and without any operating expense. The "Burt" glass-top ventilator constitutes both a skylight and a ventilator.

Whether ventilator is closed or open, the air shaft remains always unobstructed. Manufactured in any size required. Regular patterns are built throughout of galvanized iron, of suitable weight for each size. May be made with a metal top instead of a glass top, when required, either type of which may be mounted on top of a skylight or on the ridge of a roof.

FIG. 1A. "BURT" GLASS-TOP VENTILATOR
Sectional view

FIG. 2A. "BURT" METAL-TOP VENTILATOR
Sectional view

"BURT" DOUBLE DAMPER VENTILATOR (Patented)—Designed especially for weave sheds. It is being adopted by two-thirds of the new textile mills now being erected in the Eastern States.

When condensation is very severe, lower damper acts as a drip pan and collects moisture, and later this evaporates. Lower drip pan is placed below bottom damper as a safety device. In case lower damper should overflow, this collects all surplus water. The condensation trough in the air shaft collects a great deal of moisture and passes this to outside of ventilator.

FIG. 3F. "BURT" DOUBLE DAMPER VENTILATOR
Open

"BURT" FAN VENTILATOR—This ventilator will remove quickly and at a slight expense excessive fumes and odors in blacksmith shops, foundries, rubber factories, laundries, etc. Adapted for the most difficult conditions and will be found much more economical than the average blower system and just as effective.

Fan, operated either by pulley or by motor, at a speed of 350 to 400 revolutions per minute (requiring from $\frac{1}{4}$ to $\frac{1}{2}$ h.p.) will remove 10 times more air in a given length of time than the average stationary ventilator. Fully equipped with ball bearings.

In case of fire, the fusible links will break, causing damper to drop and shut off draft. Manufactured in 8 sizes; namely, 30, 36, 40, 48, 54, 60, 66, and 72 in.

FIG. 4D. "BURT" FAN VENTILATOR
Sectional view

"BURT" SLIDING CONE DAMPER VENTILATOR—A strictly high grade cone damper, which automatically closes in case of fire. The raising and lowering device (patent applied for) is simple in construction, positive in action, and guaranteed not to stick or bind (Fig. 5B). Made with metal tops, and with or without fusible links.

"BURT" BALL BEARING REVOLVING VENTILATOR—Fully equipped with high grade ball bearings and guaranteed not to stick or bind. Owing to its peculiar construction, all the air currents are allowed to pass directly through the ventilator. (Fig. 6R.) Every ventilator is fully erected and tested before shipment.

FIG. 5B. "BURT" SLIDING CONE DAMPER VENTILATOR
Showing cone damper open

FIG. 6R. "BURT" BALL BEARING REVOLVING VENTILATOR
Sectional view

DIRECTIONS FOR ORDERING—In ordering bases always furnish sketch showing pitch of roof, and location of ventilators whether on ridge or slope, and round or square.

Ventilator bases are charged for extra, for which figures will be quoted on receipt of specifications. All bases equipped with dampers without extra charge.

Prices on ventilators made of copper, Toncan, American ingot iron, or any other material desired will be furnished on application.

Prices f. o. b. Akron, Ohio, and include sliding sleeve damper. Ventilator bases are charged for extra, for which prices will be quoted on receipt of specifications. Operating rope or chain not furnished.

GUARANTEE—This company expressly agrees to replace, free of charge, any of its ventilators which shall at any time be found to have been defective in workmanship or material.

Co-OPERATIVE SERVICE—The engineering department of this organization will gladly and expeditiously co-operate with engineers, architects, contractors and others, in the selection of proper types and sizes of ventilators, to suit particular conditions and requirements. Blue prints of all types will be furnished on application.

"Burt" Exhaust Head.

Attached to the exhaust pipe, this device prevents oil and wet steam from escaping, to drench and disfigure the building and rot the roof. Prevents condensed steam from falling on side-walks, which in winter forms ice under foot. After cylinder oil has been removed, the water employed in steam system may be repeatedly used.

FIG. 7A. "BURT" EXHAUST HEAD Sectional view

CONSTRUCTION—The "Burt" exhaust head is constructed with perpendicular sides, giving a large inside area, and providing abundant room for the expansion of the steam. With plenty of room for expansion, there is no back pressure; and as the area of the steam chamber is not lessened by useless stuffing, it is virtually increased. There are no baffle plates, no diaphragm nor scrap metal. This means the avoidance of friction, and increases the life of the apparatus.

The "Burt" exhaust head is equipped with malleable iron bases and drips (galvanized). Seams and attachments are watertight; the head can not overload or blow up if proper size is ordered.

STANDARD EXHAUST HEADS—Designed for the utilization of centrifugal force for separating water and oil from exhaust steam. Due to the cone shape of the head, the incoming steam is given a whirling motion at the top of the head, and the water and oil strike the sides, flow down the drip outlet at the bottom, and thus do not come in contact with the incoming steam.

FIG. 8F. STANDARD EXHAUST HEAD Sectional view

LARGE EXHAUST HEADS—Where an exhaust head is used in connection with a rolling mill engine or hoisting engine, or where the exhaust is extremely severe, the individual conditions require special treatment. Large exhaust heads furnished any size desired and manufactured from any weight of iron specified. Quotations will be forwarded on receipt of information as to the horsepower of the engine and whether or not same is overloaded and the exhaust is severe.

AUTO UTILITIES MANUFACTURING COMPANY

Manufacturers of Building and Car Ventilators

5 North La Salle Street
CHICAGO, ILL.

Products.

PEERLESS EXHAUST VENTILATORS for buildings, factories, steam and electric railway cars.

Description.

This ventilator differs entirely from any other type of exhaust ventilator. It is square in design with 4 V-shaped faces or sides. The outer openings are at the four corners, the inner outlet directly back of the V in the wind resisting face. The slightest air currents striking the V-shaped faces are forced over the corner opening at a greatly increased velocity, thus creating the vacuum.

The inner construction consists of 4 cylindrical parts with flat edges extending outward into the V of the face. These flat edges absolutely prevent down-draft and make positive a continuous exhaust, whether the wind passes over or through the corner openings. The collar extends up into the ventilator, creating a perfect drain and making the ventilator absolutely stormproof.

PEERLESS
VENTILATOR

PLAN SECTION THROUGH PEERLESS VENTILATOR

Indorsements.

No installation of Peerless ventilators has ever failed; they succeed where the round and rotary types can not.

The Bureau of Yards and Docks of the Navy Department for a considerable time took over our entire output for the proper ventilation of the great barracks buildings, where pure air is so vitally essential to the proper housing of thousands of men. As a result, the large camps at Great Lakes, Ill., Paris Island, S. C., Hampton Roads, Va., Philadelphia, Pa., Bay Ridge, Brooklyn, N. Y., Charleston, S. C., and dozens of smaller camps were all ventilated with Peerless ventilators.

The Peerless has the indorsement of the State Factory Inspection Department of Illinois, and of the Chicago Board of Health.

More than 60,000 are in use as smokejacks on stove heated street cars throughout the United States.

The Pullman Co. has used Peerless ventilators on every sleeping car built since November, 1914. Adopted as standard by them, because it gave greater pull than anything they could find and did not *back up or show an intake*.

A few other indorsers of Peerless ventilators are: Fulton Iron Works of St. Louis; Crane Co., Western Foundries Co., Western Packing Co., Jos. T. Ryerson & Son, all of Chicago; Studebaker Corporation at South Bend, Ind.; Advance Rumely Co., La Porte, Ind.

Construction.

The Peerless ventilator is built of the best grade galvanized steel, Ingot or Toncan metals and copper. No solder is used in the essential parts of its construction; all parts are double seamed or riveted; it has no movable parts, no top bands or any other parts to rust, give way, or blow off.

Advantages.

The Peerless is substantially built, and therefore long-lived.

It sells at a legitimate price and delivers full value for the money.

Its exhaust capacity can be relied upon; the user takes no chance of failure.

Its merit is the result of its design. A flat surface will give greater resistance to the wind than a round one.

The Peerless ventilator works in all kinds of weather.

TYPICAL INSTALLATION OF PEERLESS VENTILATORS ON FACTORY WITH MONITOR ROOF

GLOBE VENTILATOR COMPANY

205 River Street
TROY, N. Y.

Products.

Sole manufacturer of "GLOBE" DOME TOP SUCTION VENTILATORS; "GLOBE" CHIMNEY CAPS and "GLOBE" VENTILATED RIDGING.

Barn Birdproof Ventilators; Special "Globe" Car Ventilators and "Globe" Lamp Jacks.

Uses.

"GLOBE" VENTILATORS—Especially adapted for removing excessive heat and foul air from churches, schoolhouses and public buildings; for exhausting steam, smoke and gases from mills, foundries and factories; and for expelling impure air, moisture and odors from barns and stables—in fact, they meet every requirement of ventilators.

CHIMNEY CAPS—Prevent downward currents in chimneys and increase drafts in sluggish flues.

"GLOBE" VENTILATED RIDGING—For use on buildings where it is not desired to break the skyline by placing ventilators.

"GLOBE" VENTILATED RIDGING

Description of "Globe" Ventilators.

The "Globe" ventilator is made in all materials, of the proper gages to give lasting service; it is strongly braced with extra heavy steel bands, and is riveted, making an exceptionally strong ventilator, which is efficient under all conditions.

Glass top ventilators possess all the qualities of the metal top ventilators, and are designed to secure the greatest degree of ventilation and the largest area of light.

AEROPLANE ROTARY VENTILATORS;
AEROBOOST COMMON FOCUS VENTILATORS;
AEROPULL STORM BAND VENTILATORS; AERO-AUTOMATIC
BASES; AERO-AUTOMATIC FRESH AIR INTAKES.

Wall Boxes; Ventilating Systems Complete; Auto-
matic Regulating Bases; Siphonage, Roof Barn, Toilet,
Schoolhouse, Car, Dampened, Glass Top, and Revolving
Ventilators.

The "Aero" Line.

There are three types of successful roof ventila-
tors—the rotary, ejector or siphonage, and storm band.
The "Aero" line presents the highest development in
each type. It does not exploit any fantastic ideas, but
harnesses each proven principle of air movement to
take fullest advantage of that principle.

Aeroplane Rotary Ventilators.

A *top balanced* rotary ventilator, free swinging,
perfectly balanced with a weight, well braced with steel
flats set edgewise, reinforced with riveted steel seg-
ments, seamed and riveted throughout.

The *main bearing* at the top is of a special bronze on
steel one-ball type, which is non-corrosive, is practically
frictionless and has no setting tendency. Absolutely re-
liable under all conditions and requires no attention. It
never sticks.

In operation it swings around, responding to wind
direction, always keeping the mouth away from the
wind. The wind blowing past the mouth creates a
vacuum there, exerting a tremendous sucking action.

Four *special shaped planes* keep the mouth exactly
away from the wind and from this accurate adjustment
Aeroplane ventilators get their remarkable efficiency.
Sensitive to the lowest air movement.

AEROPLANE ROTARY VENTILATOR

The "Aero" Line Aerobost Common Focus Ventilators.

A highly efficient stationary ventilator.
Triple siphonage, or triple ejector type

The three strata
of ejector tubes are
so focused as to give
a boosting action to
the exhausting foul
air at every point in
the same direction
that it is moving,
boosting it without
causing eddies or
whirls to impede its
rapid flow.

AEROBOOST COMMON FOCUS VENTILATOR

Aeropull Storm Band Ventilators.

A stationary
type, well designed
and well put up.

Its unequaled
free exhaust area and gen-
erous dimensions eliminate
the choking down tendency
of poorly designed storm
band ventilators.

AEROPULL STORM BAND VENTILATOR

Aero-automatic Bases.

A base that can be used
with any ventilator, giving
automatic regulation to the
flow of air out the flue. Is
noiseless; needs no oiling or
attention of any kind. Is
well made and durable.
Keeps heat from being
sucked out of building when
ventilation conditions are too
favorable.

AERO-AUTOMATIC BASE

Aero-automatic Fresh Air Intakes.

Furnishes and controls a
steady and unvarying stream
of pure air, the diffusion
chamber giving the correct
volume and velocity to carry it up into
the warm air stratum at the ceiling.
For wall installation.

AERO-AUTOMATIC FRESH AIR INTAKE

KAIN & AUNGER COMPANY

Manufacturers of Rotary Ventilators

1364-1368 East 34th Street
CLEVELAND, OHIO

Product.

SI-FO VENTILATOR.

Description.

The Si-Fo ventilator is of the rotary type, with the siphonic feature perfected and embodied in the design and construction which gives it *power to eject more air than any other ventilator made.* (Note official test.)

It is constructed in a neat and durable manner, of sufficiently strong material and bracing to withstand long and continuous operation. It is made of rust resisting galvanized sheet metal or cold rolled copper. The revolving part of the ventilator is supported by a phosphor bronze bearing resting on a steel shaft. It is practically noiseless in operation and is guaranteed to operate at all times and under all conditions.

Operation.

As the wind strikes the cylindrical cone it is deflected outwardly to the larger or front end of the funnel. As the funnel tapers around the inner chamber, the outlet is contracted, which causes the air to leave at a greater velocity than that at which it entered. This produces siphonic action at the open end of the inner chamber and naturally exhausts air from the vertical chamber.

To further increase the velocity of the air for obtaining greater siphonic action, a plurality of openings is provided in the walls of the inner chamber. These openings are covered by inclined pockets having open front ends and closed rear ends.

As the air enters these pockets it is directed through the openings into the inner chamber near the open end, and this produces increased velocity of the air at the

discharge end of the inner chamber. The openings are made tapering and larger toward the discharge end to deliver a greater volume of air nearer the open end and thereby create siphonic action. The cylindrical form of this ventilator precludes the possibility of dead air pockets, which exist in the square or rectangular design of ventilators.

Results of Test.

This test was conducted by F. H. Vose, Professor of Mechanical Engineering, Case School of Applied Science, Cleveland, Ohio.

The Si-Fo ventilator used was 12-in. in diameter. Readings were taken of the wind velocity over the roof, and of the air velocity through the ventilator—readings being taken continuously for one hour. During this time the

- Average wind velocity was 4.28 miles per hour
- Maximum wind velocity was 5.6 miles per hour
- Minimum wind velocity was 2.24 miles per hour
- Air discharged by ventilator averaged 465 cu. ft. per min.
- Diameter of ventilator pipe at point of measurement was 12 in.
- Area of pipe at point of measurement being .7854 sq. ft.
- Average velocity of air through ventilator at point of measurement was 592.5 ft. per min.
- Distance from roof to lowest point of exhaust opening was 5 ft. 10 in.

At the same wind velocity, the Si-Fo ventilator has a greater velocity through the ventilator and moves more cubic feet of air per minute per square inch of area opening, than any other ventilator on the market.

PRICES, AND CUBIC FEET PER MINUTE BASED ON WIND VELOCITY OF 5 MILES PER HOUR

Testimonial.

CLEVELAND, OHIO, November 13, 1918.

GENTLEMEN :

Last June you installed on our foundry five of your 16-in. Si-Fo ventilators, and on our furnace room two of your 18-in., and after almost five months continual use of same, we are pleased to advise you that the Si-Fo is without question the most efficient ventilator we have ever had installed, and we believe the most scientifically constructed ventilator on the market today.

The two 18-in. Si-Fo ventilators on our furnace room keep the room clear from all fumes and smoke at all times regardless of the kind of metal we are melting, while the five 16-in. on the foundry draw all the smoke and fumes out as fast as they rise from the metal we are pouring.

We take great pleasure in recommending the Si-Fo ventilator to any one contemplating installing ventilators.

Very truly yours,

THE AETNA BRASS MANUFACTURING CO.
Chas. Miles, President.

AGENCIES IN ALL PRINCIPAL CITIES

Products.

“K-S-V’s” (KERNCHEN SIPHONAGE VENTILATORS), with or without dampers. Fuse Link Dampers for same when desired.

“K-S-V” (Kernchen Siphonage Ventilator).

For any type of building or enclosure, railway and street cars; chimneys, defective drafts, etc.

“K-S-V” (Kernchen Siphonage Ventilator) does the work of three others. Save this cost.

The correct siphon is the most powerful pulling force known to gravity science. It not only exhausts, it terrifically pulls.

The siphons harness the most delicate air currents, compressing and compelling them to co-act in mightily increasing the upward movement of air through the ventilator, and consequently increasing the pull.

CONSTRUCTION—Simplicity of construction and absence of any mechanism whatever are extra features of the K-S-V (Kernchen Siphonage Ventilator). It has over 200% free area or outlet. Nothing choking or hindering. Friction at minimum, exhaust at maximum.

The eduction pipe is of cylindrical form throughout. The upper end of the pipe is provided with several V-shaped slits or openings, each opening covered with a siphon, tapered inwardly toward the top and rising above the level of the pipe. A jacket of conical shape envelops these siphons, whereby other siphons are formed, greatly increasing the terrific pulling power of the ventilator. In addition, two hoods are put over the jacket near its mouth, augmenting considerably the pulling force and preventing rain, hail, sleet or snow from going through, thus being absolutely stormproof. There is no band of iron around the two top hoods interfering with the exhaust or outlet area. (See illustration of ventilator.)

The ventilator is in one piece and stationary—no mechanism, nothing revolving or rotating—always silently doing its work. Nothing to wear out. No cost for maintenance. A rotary ventilator requires a certain amount of wind energy to swing it around

before it gets ready to ventilate. The “K-S-V” uses this same wind energy to ventilate.

The damper is equally as simple as the ventilator and is made in one piece. It has no sliding sleeves or mechanism.

CAUTION—Beware of imitations and infringements. Protect yourself by specifying as follows: “K-S-V’s (Kernchen Siphonage Ventilators), manufactured by KERNCHEN COMPANY, McCormick Building, Chicago, Ill.,” and see that KERNCHEN COMPANY brass tags are on ventilators.

Official Tests.

Note in the following two indisputable official tests (which are signed by eminent authorities) the absolute proof of capacity and terrific pulling power. Compare the Case School of Applied Science Official Test (which was made on the roof of a building) with the Armour Institute Official Test (which was conducted in a laboratory), for scientific corroboration and verification of each other, and of our statements regarding the actual powerful pull of “K-S-V’s.”

We challenge all to furnish such signed, Institutes of Technology Official Tests.

Ventilation of Industrial Buildings.

Pivoted sash, sawtooth or monitor roofs, with hinged or pivoted windows, do not ventilate and are useful for light only. Wind pressure, direction, and angle govern

“K-S-V’S” INSTALLED ON THIS MONITOR OR LANTERN ROOF WITH PIVOTED SASH

window ventilation and produce contrary results. Instead of providing ventilation, they have generally an exactly opposite effect, for the outside air, entering a building through such openings, blows down or back the foul air, smoke, fumes, etc., which, instead, should be pulled out.

Louvers also have proved to be nothing but complete intakes, driving the foul air, fumes, steam, smoke, etc., down to the floor.

Greater Results with Less Cost.

“K-S-V’s” (Kernchen Siphonage Ventilators) are far cheaper than other makes since less than half the number or size are required to exhaust the same amount of air. Even then the inferior types, with their larger number or greater size, will not give results equal to the “K-S-V’s” (Kernchen Siphonage Ventilators) when the outside air currents are low.

This saving in the number or size of ventilators involves an added saving in installation.

And so, while the initial cost of the “K-S-V” (Kernchen Siphonage Ventilator) may be higher than some others from a diameter standpoint, this is much more than offset by its surpassing exhaust.

Above sizes are kept in stock and prices are f.o.b. our five factories: east, central, north and west. Prices on other and larger sizes, and other metals, supplied on application. When ordering, specify if damper is desired.

Special Ventilation Service.

The KERNCHEN COMPANY specializes in ventilation and its engineers are always available, gratis.

Particular attention given to difficult or unusual problems involving great heat as well as temperatures below the freezing point; steam conditions; elimination of condensation, moisture, fumes, gases or smudge, foul or vitiated air, in every type of building or room.

Booklet—“It Pulls.”

A postal will bring our latest illustrated booklet,

52 “K-S-V’S” INSTALLED ON THIS SAWTOOTH ROOF WITH PIVOTED SASH

entitled “It Pulls,” containing complete information concerning the “K-S-V’s” (Kernchen Siphonage Ventilators).

Testimonials.

The following letters, selected from many received from industrial houses of national and international reputation, convey a limited idea of the way that we and our “K-S-V’s” (Kernchen Siphonage Ventilators) are completely curing vexing and costly conditions of foul air, steam, smudge, condensation, moisture, gas, smoke, fumes, dust, etc., giving absolute satisfaction, in many cases after large fans and other types of ventilators have failed to give adequate relief:

AMERICAN CAR AND FOUNDRY CO., CHICAGO—“The Kernchen Siphonage Ventilator has proved very satisfactory. It is installed above our blacksmith shop and it pulls the bad air out.”

PACKARD MOTOR CAR CO., DETROIT—“Kernchen Siphonage Ventilators are handling the ventilating of the third floor of our Heat Treat Department and our Truck Blacksmith Shop very well indeed.”

NEW YORK, CHICAGO & ST. LOUIS RAILROAD CO. (“NICKEL PLATE”), CLEVELAND, OHIO—“The ventilators are working very satisfactorily.”

GENERAL RAILWAY SIGNAL COMPANY, ROCHESTER, N. Y.—“The operation of this ventilator is entirely satisfactory and we are considering the use of several more in the near future.”

HENRY DISSTON & SONS, PHILADELPHIA, PA.—“The Ventilators have been installed and are giving satisfaction.”

THE THOMPSON & NORRIS CO., BROOKVILLE, IND.—“During the months previous to the extreme cold weather, the Kernchen Ventilators absolutely prevented any dripping and condensation in our Machine and Store Room where we were formerly bothered very much, although we had four 36” fans and two ordinary ventilators.

“It was such a positive pleasure to go into this room after your ventilators were installed and find the floor and ceiling dry, whereas both used to be covered with moisture, that we wondered if such would be the case when the extreme cold weather set in.

“The extreme cold weather has been encountered and we have found your ventilators to be just as effective, and our Machine and Store Room has been kept absolutely free from steam, condensation and dripping.”

FRAZER PAINT CO., DETROIT—“The summer of 1916 will pass into weather history on account of the long, torrid spell in the Middle West. Factories and furnaces were forced to suspend operations on account of the heat or materially curtail productions.

“Detroit was no exception as a sufferer from the heat and our factory of metal sash construction became so hot that the men could not stand it and we were confronted with a shutdown at the time of the greatest rush of business in our experience.

“But instead, we installed K-S-V’s (Kernchen Siphonage Ventilators) according to the layout proposed by your man, and they saved the day for us.

“Not only did they cause a refreshing current of air by withdrawing the hot, bad air, but they reduced the temperature of the working rooms several degrees.

“We did not shut down, but, instead, had an output beyond the usual.

“When our factory was built in 1915, we had intended to install K-S-V’s, but the architect provided others and the contract had been let before we noticed it and we did not insist. Under stress, they proved entirely inadequate.

“We regard the K-S-V in a class by itself.”

MOYER MANUFACTURING COMPANY

Ventilators and Ventilating Systems

MONTEVIDEO, MINN.

Products.

Manufacturers of MOYER VAC VENTILATORS for every type of building.

Also Moyer Vac Ventilating Systems for industrial plants, slaughter houses, laundries, creameries and barns.

Efficiency of Moyer Vac Ventilators.

The Moyer Vac ventilator head shows on repeated tests a velocity of air in the flue equalling 85% of the velocity of the wind outside of the building, blowing from any direction.

The Moyer Vac is absolutely watertight in any storm. The series of openings around the top band let the rain flow off from the top cone. The rain follows the inside of the band and runs off in a solid sheet from the points of the inside of the deflector vanes.

Workmanship.

The Moyer Vac ventilator heads are made in a modern shop, using only the highest type of material, and with this company's patented knocked down construction, assembled on the job with stove bolts, a most rigid construction results.

Freight Saving.

The Moyer Vac patented knocked down construction makes possible the shipping of 10 Moyer Vac ventilator heads in less than one-half the cubic space taken by 1 ventilator head of equal size crated as is usual for shipment. Completely erected ventilator heads of standard construction allow but 10 ventilators to be shipped in a standard 40-ft box car. With the Moyer Vac patented knocked down construction regularly shipped in this same size car, 420 Moyer Vac ventilators give a loading weight well above the necessary minimum for a car of this capacity and taking low export rate.

The freight classification on standard crated ventilators is two times first class rate, while Moyer Vac ventilators, knocked down and nested, are shipped at second

TRADE-MARK

class rate. This saving in freight is often the determining factor in the cost laid down on the job of Moyer Vac ventilator heads.

Where large sizes of ventilators are specified, the saving in the cost of erecting Moyer Vac ventilators in place on the roof is quite pronounced, as they can be hoisted into place and assembled in position without tackle.

NEWARK CORNICE & SKYLIGHT WORKS

Rotary Ventilators and Sheet Metal Work

9-15 Seventeenth Avenue
NEWARK, N. J.

Products.

"FOUR-LEAF CLOVER" ROTARY VENTILATORS;
"FOUR-LEAF CLOVER" FANS; SHEET METAL and
KALAMEIN WORK.

"Four-Leaf Clover" Rotary Ventilator.

The operating feature of the "Four-Leaf Clover" rotary ventilator consists of a ball bearing rotary cap (wind propelled or power driven) with spiral propeller blades riveted on top and spiral exhaust blades on the bottom of the rotary cap. The principle employed in the design of the spiral propeller vanes and exhaust blades insures effective operation and a positive and continuous pull and discharge of air from below; it will exhaust under any and all conditions. In cases of ventilating low buildings or in courts where there is a downward movement of the wind it will exhaust air where other types reverse and take in air.

MATERIALS AND SIZES—Made of heavy galvanized iron or copper, according to specifications. The cap is firmly supported on strap iron framework, hot galvanized after fabrication, brass or copper framework being used for copper ventilators. Noiseless in action, revolving on ball bearings, no oil being required.

TEST OF CAPACITIES—A test sheet compiled by the mechanical laboratory, Pratt Institute, Brooklyn, N. Y., giving the discharging capacity, furnished on application.

"Four-Leaf Clover" Exhaust Fan.

Especially adapted for theaters, halls, buildings and mines. Gives greater exhaust with less power consumption.

On account of its outward flat circular surface, it eliminates all outside resistance, giving a positive exhaust.

The "Four-Leaf Clover" exhaust fan can be used single or double, direct or indirect driven, installed horizontally or perpendicularly.

View of Fan Under Cap

"FOUR-LEAF CLOVER" ROTARY
VENTILATOR

"FOUR-LEAF CLOVER"
EXHAUST FAN

"Four-Leaf Clover" Ceiling Fan.

Illustration shows ceiling fan blades for circulating air in theaters, hotels, restaurants, and offices.

The blades are made of thin sheet metal, suitably decorated and equipped with standard castings, so as to be interchangeable with the blades of any of the standard types of fan motors.

The action of this fan is the reverse of that of ordinary paddle designs. Instead of blowing down the hot air from the upper portion of the room on the heads of the occupants, causing disagreeable draughts, chilling of food, annoyance from smoke, etc., cool air from the lower part of the room is drawn up and distributed horizontally along the plane of the blades.

"FOUR-LEAF CLOVER" CEILING FAN

Sheet Metal and Kalamein Work.

This organization is equipped to manufacture high grade sheet metal and kalamein work of all descriptions. The highest standards of workmanship and the best known methods of construction are in use. The grade of work solicited demands the employment of highly skilled workers with a shop and the necessary machinery and tools to produce the best and most satisfactory results.

The illustration shows a typical specimen of the kalamein work supplied by the NEWARK CORNICE & SKYLIGHT WORKS.

SWARTWOUT ROTARY BALL BEARING VENTILATORS; SWARTWOUT HYDROMATIC STEAM TRAP; SWARTWOUT STEAM, OIL and AIR SEPARATORS; SWARTWOUT CAST IRON EXHAUST HEADS; SWARTWOUT HYDROMATIC WATER LEVEL CONTROL VALVE; SWARTWOUT AIR TRAPS; SWARTWOUT ALL SERVICE FEED WATER HEATERS. Swartwout Steel Core Ovens; Swartwout Gas-Oil Burners.

Swartwout Rotary Ball Bearing Ventilators.

Effective ventilation can be secured only by effective ventilators. "A hole in the roof is not ventilation." The Swartwout actively compels the flow of air. Because of large ball bearing and ample vane, the Swartwout always faces away from the wind. The free power of the breeze as it passes the mouth of the ventilator creates an active and continual suction which pulls out a steady flow of used air from below.

Responding to every change in wind direction, the entire area of the mouth is always efficient. The flow of air, regulated by chain operated dampers, takes only one right angle turn.

The Swartwout ventilator is built of special rust resisting, galvanized metal (or copper on specification) of ample gauge over a framework of sturdy angle iron, galvanized after forming on template and punching. It is suspended on a skeleton of steel channels and angle iron and revolves on large size non-corrosive, frictionless bronze bearings and hard composition balls, placed centrally in a dust-proof housing.

When specified, a full size wired glass top may be substituted for the sloping metal top, affording a combination

TRADE-MARK Registered in U. S. Pat. Off.

ventilator and self-cleaning skylight. Accurate directions for mounting are supplied on each ventilator.

SKYLIGHT TYPE—The illustrations show the Swartwout "Air-Light" ventilator with sloping (self-cleaning) glass top.

Note that no position of ventilator or damper can obstruct the passage of light into the room below.

One view also illustrates the type of base recommended and shows both ventilator and base as built in copper, which is furnished when specified.

AIR REQUIREMENTS—In large buildings the number of cubic feet of air required for each person in an hour is as follows:

In workshops and barracks, 3000; office rooms, 1800; schools, 2400; hospitals, 3600; churches, theaters, 2000; dining rooms, 1800; toilet and bathrooms, 2400.

Collars two gauges heavier than top. All ventilators are supplied with chain through ventilator with swivel at end. Additional chain furnished at nominal cost. In ordering, only dimension A is required.

*CAPACITY—Figures shown here taken from actual anemometer readings of a ventilator in service under actual conditions (not a laboratory test). The wind velocity was 5 miles per hour, or about one-half average wind velocity of United States, as shown by official government reports. Conditions of test were: Temperature, outside, 30°; inside, 60°. Average wind velocity, 440 ft. per minute, or 5 miles per hour.

SPECIFICATIONS—All ventilators to be of the rotary ball bearing type, glass top [metal top] of galvanized [copper] rust resisting metal, all interior members of angle iron, galvanized after forming and punching. The ventilators to turn sensitively on accurately machined bronze bearings, employing bell metal balls, and counterweighted on outside. The ventilators to be equipped with outside louver dampers to throw accumulated dirt outside of building, louvers to be operated from within by rustproof chains over brass pulleys. Gauge of metal* to be THE OHIO BODY AND BLOWER COMPANY, Cleveland, Ohio, standard, as furnished in Swartwout rotary ball bearing ventilators at regular prices. Top of collar and bottom of hood to be stiffened with galvanized angle iron rings.

* (If desired, give standard gauge for each size, as shown on preceding page.)

ANY OR ALL OF FOLLOWING FEATURES MAILED FREE—Ventilation Data Card—A quick reference for the drafting room and specification man, printed on heavy card 8½ by 11 in. Contains requirement tables, complete base and ventilator specifications, anemometer test figures, capacity tables, etc. Fits letter size file.

"The Gospel of Fresh Air"—A 24-page handbook giving facts on the fresh air needs of every industry, together with capacity tables and specifications.

Specification Index Cards—Containing specifications, dimensions and list prices. 3 by 5 in. and 4 by 6 in.

Swartwout Steam Separators.

Centrifugal force is a certain and powerful separator, and, as applied in Swartwout separators, does not interfere with the pressure or straight through flow of the steam. The steam is given a whirling motion by the helix, and centrifugal force throws the heavy particles of water and oil to the walls of the separator, whence they flow into the large chamber below.

Built in any size for any pressures, Swartwout steam separators give 99% effective separation, and produce commercially dry steam without causing appreciable back pressure.

The illustrations show the types most frequently required.

PRICES, STEAM SEPARATORS

SWARTWOUT VERTICAL DOWN-CURRENT OIL SEPARATOR (Patented)

Discounts on application. Catalogues on request. Prices do not include water gauge, drip valve, nipple and companion flanges and bolts. These can be furnished at additional cost when requested. Unless ordered otherwise bolt holes of flanges will straddle vertical center line.

Swartwout Air Separators.

Air tools, such as hammers, chippers, drills and hoists, must be supplied with air that is as nearly dry as possible. Water in the air lines will cause trouble by knocking, etc.; while in cold weather the lines may be damaged by water freezing.

The Swartwout helico-centrifugal horizontal air separators will remove all condensation from the air. The air has a straight, unobstructed passage through the separator. There are no baffle plates or angles to reduce the pressure.

The "corkscrew" helix imparts a whirling motion to the air, and the centrifugal force thus set up throws all particles of water to the outside walls of the chamber, where they run down and are collected and drawn off by a Swartwout hydromatic trap. Nothing but dry air leaves the chamber. This application of the centrifugal principle, a natural law, is patented in Swartwout air separators.

Swartwout Hydromatic Trap.

The illustration shows the trap just before discharge.

The rising water fills the bucket, causing left side of bucket to drop to post below. The lever action of the hinged bucket on the pull rod opens the discharge valve wide. Steam pressure empties the bucket and buoyancy then lifts the bucket, closing the valve.

The perfect water seal within the bucket prevents steam from passing over, a patented feature exclusive with this trap. The bucket is hinged on the inside. Scale or sediment in the trap body can not clog the hinge, as the swirl of water thoroughly cleans it at each discharge.

The presence of only two moving parts reduces wear to a minimum. Valve and seat (reversible) are of monel metal. In the higher pressures the valve is double ended. The action of the valve being intermittent, removes all chance of wire-drawing.

The design, construction and materials are such that the Hydromatic can be used at all pressures up to 250 lbs., merely by substituting interchangeable valves and seats.

The Hydromatic is guaranteed to perform up to rated capacity and against defective material or workmanship.

For complete information to be filed, write for Trap Bulletin No. 207 and Steam Specialty Catalogue No. 117 containing full specifications, drawings, installation diagrams of separators, exhaust heads, etc.

SWARTWOUT HYDRAMATIC TRAP
(Patented)

CAPACITIES, WEIGHTS AND PRICES, HYDRAMATIC TRAPS

Size in.	Lin. ft. of 1-in. pipe	Sq. ft. of radiation	Lbs. of water per hour	Weight, lbs.	Price
1/2	9000	3000	1000	35	\$18.00
3/4	15300	5100	1700	60	22.00
1	18000	6000	2000	90	28.00
1 1/4	40500	13500	4500	120	35.00
1 1/2	50400	16800	5600	170	50.00
2	70650	23550	7850	250	70.00
3	124200	41400	13800	435	150.00

All sizes can be fitted with valves and seats suitable for pressures from 0 to 250 lbs. When ordering state the highest operating pressure. If no pressure is specified, traps will be fitted with 150-lb. valves.

Swartwout Air Traps.

Swartwout air traps (patented) are indispensable on air lines supplying pneumatic hoists.

A Swartwout air trap placed at the lowest part of the air line and primed with water will positively collect all condensate and discharge it without loss of pressure. There can be no loss of air, as the bucket float is always buoyant, and after each discharge automatically closes the valve and water seals it.

No sediment can hinder the action of the hinge, as it is washed clean of all sediment by the swirl of the water at each discharge. The valve and seat are of

monel metal and will wear indefinitely. By a simple change of these the trap will work under any pressure up to 250 lbs.

Each trap is fully guaranteed as to material, workmanship and operation.

See steam traps for specifications and prices.

Swartwout Hydromatic Water Level Control Valve.

Maintains a constant water level in open heaters, tanks, vats, reservoirs, etc.

The controlling valve is opened or closed by its pilot valve controlled by its float. There is no mechanical connection between the pilot valve and the main inlet. This allows the pilot valve to be placed in any convenient position. The float, rising or falling with the water, opens or shuts the pilot valve, which in turn causes the water to flow through or back up in the auxiliary pipe running from the main valve to the pilot valve. This opens or shuts the hydromatic valve that controls the main inlet.

SWARTWOUT
HYDRAMATIC
WATER LEVEL
CONTROL VALVE
(Patented)

The water level can not vary more than 1 1/2 in., as that is the full movement of the float between the wide open and closed positions. In actual practice it is usually less than 1 in.

The pilot valve is of extra heavy, solid brass construction, guaranteed against defects in material or workmanship. There are no leather washers or packed joints. The seat is ground in and may be easily reseated when worn. The float is of the indestructible seamless copper type, making a strictly high grade proposition throughout.

PROPER INSTALLATION OF THE SWARTWOUT VERTICAL STEAM SEPARATOR, HORIZONTAL OIL SEPARATOR, STEAM TRAP, WATER LEVEL CONTROL VALVE AND CAST IRON EXHAUST HEAD

Drip from separator should be carried full size to trap, and drip from exhaust head full size to catchbasin or sewer

Swartwout Cast Iron Exhaust Heads.

The helico-centrifugal principle is also employed in the Swartwout cast iron exhaust head. The whirling motion given the steam throws the heavy water particles to the walls of chamber "B," where they flow out through drip pipe "C." The result is positive separation without back pressure.

Swartwout cast iron exhaust heads will last a lifetime, and are light in weight and ornamental from the architectural viewpoint.

SWARTWOUT CAST IRON EXHAUST HEAD (Patented)

PRICES, CAST IRON EXHAUST HEADS

Size exhaust pipe, in.	List price	Size exhaust pipe, in.	List price	Size exhaust pipe, in.	List price

Discounts on application. Catalogue on request.

NOTE—Sizes 5 in. and smaller are tapped; larger sizes are flanged. Bolt holes of flanges are drilled to straddle center line of drip outlet on sizes 6 in. and larger. Companion flanges and bolts furnished at extra cost when requested.

Drip pipe should be carried full size to catchbasin or sewer.

Swartwout All Service Feed Water Heaters.

Designed by a man who has devoted his life to the study and designing of open feed water heaters, the Swartwout feed water heater is the result of a lifetime of specialized endeavor.

It has a higher standard of efficiency and economy than ever before attained in a feed water heater. It has many features never before thought possible.

The steam enters the heater through a Swartwout Helix oil separator (patented) which imparts a whirling motion to the steam, throwing all oil and condensate against the walls of the separator, where they collect and run down to the trap and thence to the waste pipe. After purification of the steam it enters the body of the heater, where it is deflected downward, passing through and under the trays, completely filling the chamber.

The steam opening into the heating chamber is provided with a cut-out valve of the floating ball type. This valve is opened and closed from the opposite side of the heater. The overflow is also provided with a cut-out valve which, together with the main steam cut-out valve, enables the operator to cut the heater out of service at any time for cleaning or inspection without stopping the engine or in any way interfering with the plant.

The fresh water is controlled by a balanced valve, actuated by means of a self-draining float, which keeps the water at the proper level at all times.

Any excess of water entering the heater, from drips, condensate or leaky valves, will cause the water level to rise to the overflow box, overflow to the trap and thence to the waste pipe.

The Swartwout feed water heater is peculiarly adapted to the present conditions of continuous plant expansion. It is built like a sectional bookcase and sections can be added from time to time as the power plant grows. It is not necessary to buy a heater that is too big now, to take care of any possible growth. Neither is it necessary to scrap the heater every time a new boiler is bought.

Write today for a detailed description of the heater which "grows with your plant." It is mighty interesting reading.

Manufacturers of Roof Ventilators

TELEPHONE:
RANDOLPH 2378

Marquette Building
CHICAGO, ILL.

Product.

PYRAMID ROOF VENTILATOR.

Adaptability.

The Pyramid is a siphon ventilator especially adapted to all structures where humans are housed or gather, such as factories and commercial buildings, state or county institutions, churches, halls, or schools. Barns also should be ventilated with Pyramid ventilators.

Description and Advantages.

The Pyramid ventilator will exhaust the maximum quantity of foul or warm air, smoke fumes, gases or vapor from within and makes down-drafts from without impossible. Condensation from steam is exhausted the same as air. The ventilator is so constructed as to make it proof against snow, ice or rain collecting or adhering to any part. Screens prevent the nesting of birds.

It is free from rough edges and flat, exposed surfaces. No solder is used except where necessary to close up airholes.

It is extremely artistic in appearance and entirely fireproof.

The Pyramid ventilator contains no movable parts to rattle and groan; it is absolutely silent. No upkeep is necessary. First cost is last cost.

Construction.

The Pyramid ventilator is made by skilled workmen in a union shop, and pure ingot or Toncan metal is the only material used, except when made of copper. No Pyramid ventilators are made of the cheaper metal known as galvanized steel. They are not intended as temporary makeshifts, but are built to last a lifetime.

Two distinctive and scientific features of Pyramid ventilator are the inner deflector and four openings, two

PYRAMID VENTILATOR
Patented Feb. 11, 1919

on each side of the siphon. These relieve pressure in case of a storm, and whichever way the wind may blow—down, up, either side, or corner—it forms an intense suction inside of the ventilator.

The deflector answers two purposes: first, prevents down-drafts; second, will discharge condensation from steam in a similar manner to which the foul air is discharged. No condensation of steam can leak back through the stem of the ventilator.

A Notable Test.

The following test was made of two ventilators installed on the same building at Great Lakes, Ill. It was conducted by Prof. A. H. Anderson, under the direction of Mr. G. F. Gebhardt, Mechanical Engineer of Armour Institute, a recognized authority.

In the test, Specimen "A" was a well-known ventilator, not a Pyramid. Specimen "B" was the regular Pyramid ventilator.

Diameter at base of ventilator, 18 in.; area, 1.8 sq. ft. Temperature inside and outside, 70°.

Wind, ft. per min.	Wind, miles per hr.	Air vel. in ventilator, ft. per min. (due to aspiration)	Ratio ventilator vel. to wind vel.	Air vel. added to allow for 50° temp. diff.	Total air vel., ft. per min.	Cu. ft. per hr.
A 700	7.91	232	33%	247	479	51,730
B 740	8.36	267	36%	247	514	55,512
A 420	4.74	184	44%	247	431	46,548
B 590	6.66	253	43%	247	500	54,000

SIMULTANEOUS TEST—Air velocity in ventilator, feet per minute, due to aspiration:

A	122.0
B	142.5

Wind velocity not determined in the simultaneous test. Temperature, 70°.

This column computed from an assumed temperature difference of 50°.

ROYAL VENTILATOR COMPANY

412 Locust Street
PHILADELPHIA, PA.

Products.

Manufacturers of "ROYAL" VENTILATORS of Galvanized Steel, Pure Iron, Copper, etc.

Glass Top Ventilators; Rectangular and Square Ventilators with fire retarding dampers; Smoke Jack and Combination Ventilators; Insectproof and Bird-proof Ventilators.

Double Cone Ventilators.

The double cone is designed to withdraw smoke, fumes, and impure air without any resistance being offered to the outward flow. The lower cone is placed directly in the center of ascending air, which, upon striking it, is deflected directly upward and outward. There are no obstructions. Only an upward draft is obtained. The "Royal" ventilates continuously, regardless of wind or temperature conditions. The tapered frustums force outside air currents over top and down sides, providing a constant strong upward draft.

Construction.

If the construction of the "Royal" ventilator is examined critically, the "Royal" will be specified.

The double cone has two thicknesses of metal, doubling the life of the ventilator. Every known mechanical improvement is embodied in the "Royal"; all sections are built with lapped seams, giving three thicknesses of metal at joints; all edges are wired for rigidity and weather resistance; all bracing is accomplished with malleable iron stays, so arranged as not to impede passage of air. Absolutely weatherproof.

The "Royal" is especially adapted for foundries and chemical plants.

Specification.

F. O. SCHOEDINGER

Manufacturer of Rotary Suction Ventilators

COLUMBUS, OHIO

Products.

SCHOEDINGER'S ROTARY SUCTION BALL BEARING VENTILATORS.

"Columbus" Stationary Ventilators, Puttyless Skylights, Underwriter's Tin Clad Fire Doors.

Also sole manufacturer of Schoedinger's Universal Lock Joint Metal Ceilings and Kinnear and Gager's Quad Lock Metal Ceilings.

Description.

Schoedinger's rotary suction ventilator is rigidly constructed from galvanized steel, ingot iron, Toncan metal or copper, supported by an adequate framework of rust resisting steel and malleable iron. It is equipped with high grade, high speed hardened steel ball bearings, which are immersed in heavy acid resisting lubricant, fully weatherproofed and easily accessible.

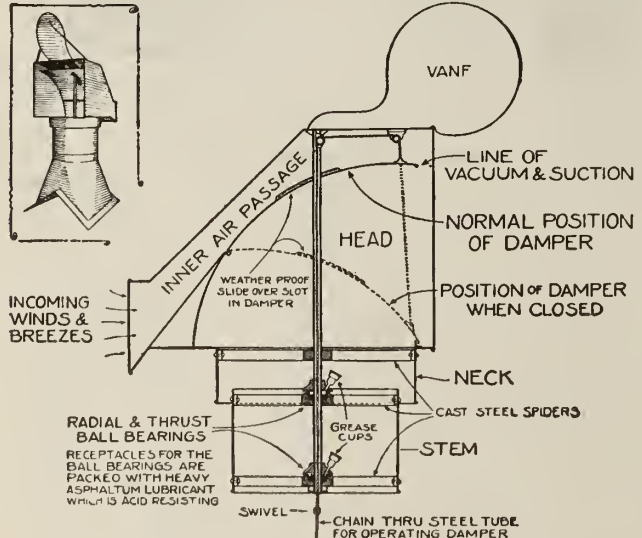

Operation.

Schoedinger's rotary suction ventilator contains the inner air passage through which the passing winds and breezes blow with accelerated force, unhampered by conflicting cross currents, causing a pronounced vacuum in the head of the ventilator. The head of the ventilator is much larger than the stem, allowing the rising foul air to spread out along the horizontal line of the diaphragm, where it is caught by the suction of the swiftly moving air currents discharging from the passage above and carried out.

The diaphragm consists of one smooth, curved galvanized sheet, which greatly assists in the free passage of the air, especially at low wind velocities.

The ample vane always holds the mouth of the ventilator away from the wind, making same proof against weather, rain, storm and down-drafts.

As no mechanical power is used, no operating expense results.

(PATENT PENDING)

SECTION SHOWING NEW DAMPER IN THE HEAD OF SCHOEDINGER'S ROTARY SUCTION VENTILATOR

SCHOEDINGER'S ROTARY SUCTION VENTILATOR (Patent pending)

Product.

AUTOFORCE VENTILATOR.
For Heating and Ventilating Apparatus, see pages 985-1003.

Patents.

This company holds the following patents in connection with ventilators: 634215 Oct. 3, 1899; 697125 Apr. 8, 1902; 702581 June 17, 1902.

Uses.

Autoforce ventilators are of special value in factories, foundries, theaters, hotels, churches, schools, residences, stables, garages, mills, tanneries, kitchens, etc.

Description and Advantages.

The Autoforce ventilator is superior to any other natural ventilator as it effectively utilizes the force of the wind to create a suction, which suction always pulls inside air through ventilator to the outside. Ventilators are built of galvanized iron, but can also be furnished of Toncan metal or of copper. Butterfly dampers with a fusible link designed to meet fire insurance requirements can be furnished as an extra. All ventilators have eyes riveted to sides, so that guy wires furnished by others may be readily attached.

If Autoforce air pumps are used, fewer of them will be required to perform the work than with other types of ventilators.

AUTOFORCE VENTILATOR

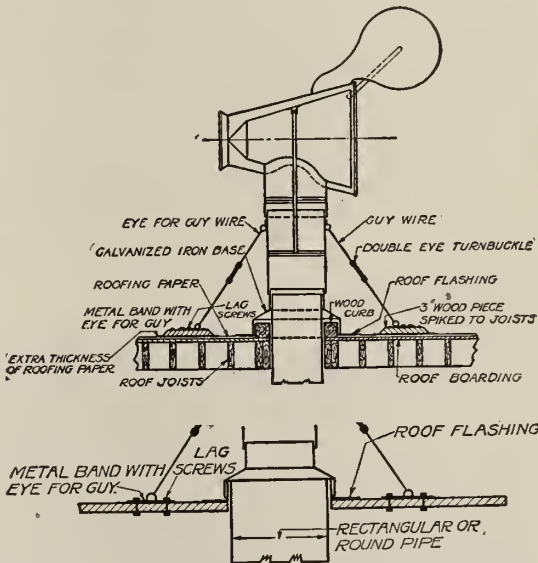

Specifications.

Specifications should read as follows:

The natural draft ventilation shall be... No...Autoforce, made by the B. F. STURTEVANT COMPANY, each ventilator to remove....cu. ft. air per hour.

Installation.

Erect plumb and firm, and guy in four directions with double galvanized iron wires, taking up the slack in each with a double eye turnbuckle.

DIMENSION DIAGRAM

Air entering at A is spread out by nose of inner cone X; since the ring of air emerges at increased speed, it tends to decrease pressure in front of exit YY; suction thus created draws air up connecting flue C; tailpiece M keeps pump at all times headed to wind, so that continuous satisfactory operation is secured.

Note that operation is on same successful principle as the steam injector or Hancock inspirator.

Products.

STEEL CLAD ALIGNUM FIRE DOORS.
All-Alignum Fireproof Doors.

Description of Alignum and Its Advantages.

Alignum is manufactured from fireproof mineral components, principally of asbestos, amalgamated under hydraulic pressure.

It is strong, yet resilient. It is an insulator of heat and sound; is not subject to decay; does not swell, shrink, warp, nor check, and is not friable.

There is no deteriorating action between aliumin and steel, nor is there any corrosion of steel surfaces bonded to aliumin in process of manufacture, not even when exposed to high humidity for long periods.

Alignment has been approved by the Department of Buildings of New York and the Underwriters' Laboratories, Inc.

Alignum Fire Doors.

Alignum fire doors are lighter than 3-ply tin clad doors. Alignum has a tensile strength of about 1300 lbs. per sq. in. For greater strength, it is reinforced with wire mesh.

ANGLE TYPE FIRE WALL DOOR—Shown in illustration to left and is labelled by the Underwriters' Laboratories, Inc. for all types of openings up to 120 sq. ft. of area. It is particularly well adapted for use in fire walls, elevator shafts and other openings where heavy traffic is likely to occur, on account of its great strength and durability.

PANEL TYPE FIRE WALL DOOR—Shown in illustration below and is labelled by the Underwriters' Laboratories, Inc. for all types of openings up to 80 sq. ft. of area. This door is strongly recommended for use in all stairways, penthouses, and other openings of this type in industrial buildings.

FINISH—Unless otherwise specified, doors will be furnished with one shop coat of paint.

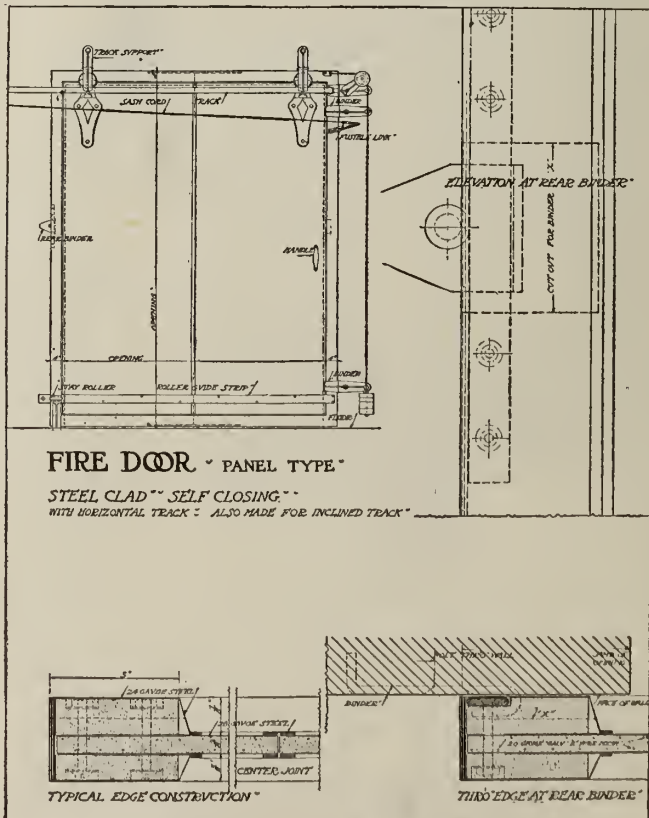

HARDWARE—Any standard hardware for 3-ply tin clad fire doors can be applied to Alignum fire doors.

Exhibition of Samples.

Samples of Alignum fire doors are on exhibition with the Architects' Sample Corporation, 101 Park Avenue, New York, N. Y., and at the Laboratories of Investigating Committee of Architects and Engineers, Plainfield, N. J.

CORNELL IRON WORKS

Manufacturers of Rolling Steel Shutters and Doors

TELEPHONES:

CHELSEA { 1423, 1424
550

26th Street and 11th Avenue
NEW YORK, N. Y.

Products.

ROLLING STEEL SHUTTERS and DOORS, Hand Chain and Motor Operated, for residences, office buildings, garages, wharves and piers, warehouses, elevator shafts, store fronts and buildings of all kinds.

Description.

Material consists of deep, corrugated, strong and stiff continuous sheets of flexible open hearth steel. Edges reinforced with malleable shields to take up wear in the side guides. Construction of steel throughout. Send for catalogue.

Operation.

There are three typical methods of operation:

SELF-COILING TYPE—Standard for openings up to 8 ft. wide. Push up and pull down by hand. The quickest acting construction possible.

HAND CHAIN AND GEARING TYPE—Standard for openings of over 100 sq. ft. Shaft revolved by endless hand chain acting through single or compound gears.

AUTOMATIC CLOSING TYPE—Controlled by fusible link melting at 150° Fahr.

SPECIAL CASES—Motor, worm and bevel gear drive are also used in special cases.

Advantages.

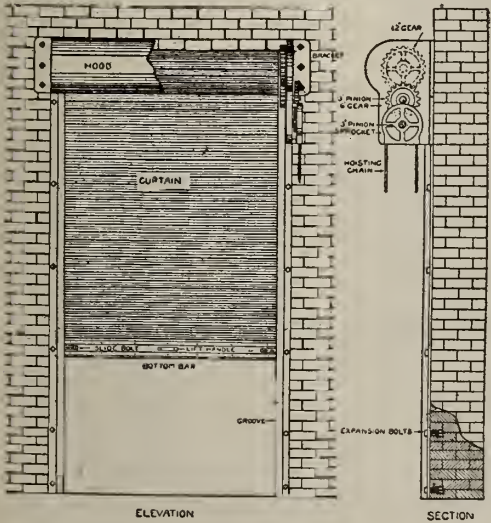

Cornell doors present to smoke and flame a continuous-sheet of deep corrugated steel. By use of a special die the rigidity of the sheets is increased

about 26 times; all parts are reached by the painter's brush, no points or slats to invite corrosion. Repairs, due to accidents, can be made with great convenience. Installations of 40 years and more speak for the wearing qualities of shutters made by this company.

GEO. W. JOHNSON MFG. CO.

Manufacturers of Standard Underwriters' Labeled Automatic Fire Doors

1210-1212 South Eighth Street
ST. LOUIS, MO.

209-211 West 17th Street
KANSAS CITY, MO.

Products.

STEEL ROLLING DOORS and SHUTTERS; COUNTER-BALANCED TRUCKOVER ELEVATOR DOORS.

Also, Automatic Tin Clad Sliding Fire Doors, Tin Clad Hinged Fire Doors and Shutters, Dufold Doors, Boiler Plate Doors and Shutters, Wood Rolling Partitions, Iron Stairs and Fire Escapes.

Steel Coil Doors.

Steel coil doors provide protection for openings of any size; occupy the minimum amount of space and have a smooth finished appearance from either side of the wall.

The Johnson doors are made of flexible corrugated steel, galvanized. The corrugations are short and deep, giving the maximum resistive power against wind pressure.

No. 100, PUSH UP—Spring counterbalanced, operated by hand. For nominal openings.

No. 100A—Spring counterbalanced, automatic closing. For nominal openings.

No. 110, CHAIN HOIST—Spring counterbalanced, operated by means of endless chain. For large openings. This type is fitted with roller bearings when desired.

NO. 110 STEEL COIL DOOR INSTALLED ON TRACK OPENING

SPECIAL FEATURES—The Johnson automatic attachments with two fuse links, one placed at the ceiling line, are superior to the old style attachments with link only at the opening.

Experience has demonstrated that ceiling link released doors where fire occurred, and in many cases the link at the opening was still intact when fire was extinguished.

Elevator Truckover Doors.

The most practical freight elevator door on the market. Serves the purpose of a fire door and elevator safety gate combined, cutting off draft at each floor.

The patented trucking bar is pivoted and conforms to location of elevator platform. If same is below sill level, this bar automatically adjusts itself to the proper angle, giving a smooth surface for trucks, even with small wheels, to pass over without jar or damage to contents.

Another important feature is the interlocking guides, which prevent danger of heavily loaded trucks striking door from room side when closed and forcing same out of guides. Such accidents have occurred when doors were equipped with only plain guides, resulting in contents of truck falling into shaft.

Doors are substantially made and are durable. No weights or springs are required, as one door counterbalances the other with simple and perfect mechanical operation.

Doors work easily, and can be equipped with safety attachments.

Write for more particulars and details.

Penco Expanded Metal Lath; Sheet Lath; Metal Studs; Metal Corner Bead; Metal Ceilings; Metal Siding; Metal Shingles and Roofing; Metal Culverts and Flumes; Metal Buildings; Kornerite, a plaster base for internal angles; Metal Ship Partitions and Bulkheads; Metal Deck Plates and Treads; Stair Risers; Metal Boxes.

TRADE-MARK

It is perfectly rigid. It will hold "limit to capacity" loads without buckling or warping. All fancy trimmings or extra unnecessary parts are eliminated.

Simplicity of construction allows it to be easily adjusted or expanded indefinitely at a most reasonable cost.

Penco shelving will fit any space, and can be used for open shelving, or equipped with back panels. Can be made with partitions and fronts for enclosed shelving purposes, or bins.

Prompt shipment from Boston.

Penco Hollow Metal Doors.

Formed of steel or genuine Hampton metal.

Designed to serve under the most exacting conditions. Simplicity of construction is the foremost consideration, next to quality. Installation of a Penco door is simplified by the elimination of all unnecessary units.

Penco Hollow Metal Windows.

Formed of galvanized steel or genuine Hampton metal.

Officially approved by the National Board of Fire Underwriters.

Guaranteed architecturally correct. In design, mechanical perfection, workmanship and quality, they represent the best that over 50 years of service can make them, with these exclusive features:

No screws, bolts or fasteners are exposed to the weather.

Installation or repair of any one part does not necessitate removal of the entire window, or any part of it, for each member is independent.

These utilitarian features of Penco hollow metal windows recommend them where eventual economy is desired.

Made double hung, pivoted, or any standard or special types to fit any size opening.

Penco Metal Shelving.

Formed in all standard and special sizes from Nos. 14 to 20 gage special annealed sheets.

Co-operative Service and Catalogue.

A special department, under the supervision of a construction expert, is maintained for the purpose of figuring requirements or drafting suggestions, in consultation with engineers.

Products.

STEEL ROLLING DOORS and SHUTTERS; WOOD ROLLING DOORS and PARTITIONS; BIFOLDING DOORS; VERTICAL SLIDING SECTIONAL DOORS; SLIDING FIRE DOORS.

Kinnear Construction.

In Kinnear steel rolling doors and shutters, the curtains are made of open hearth interlocking steel slats, with malleable iron endlocks. Curtain is coiled upon barrel journalled in cast iron brackets, and travels in steel guides at the sides; it is counterbalanced by helical springs, enclosed in barrel. A steel galvanized hood encloses the coil and protects it from the weather.

Wood rolling doors and partitions are made of hard pine, cypress, oak or birch, with ribbons of phosphor bronze.

Folding and vertical sliding doors are constructed either in wood or steel, or wood frame covered with steel.

Fire Protection.

Steel rolling doors and shutters are valuable fire retardants for the protection of openings in fire walls, vertical shafts and exterior window and door exposures.

Special fire door types bearing the names of "Akbar," "Acme," "Atlas" and "Superior" are constructed under the supervision of the Underwriters' Laboratories, Inc., and are inspected and labeled by their representative at the factory.

Installation of Rolling Doors.

Two forms of installation are generally used in mounting steel rolling doors and shutters:

FIRST—On face of wall; the coil brackets are placed above the bottom of lintel and the guides at the sides of the opening.

SECOND—Mounted in the opening; the coil and brackets are placed under the lintel and the guides on the jambs.

ERECTING—Any good mechanic can erect our material.

Blue prints and instructions accompany every shipment showing application and method of erection.

Installation of Folding and Sliding Doors.

These are mounted upon face of wall, either interior or exterior.

Operation.

Three methods of operation are employed:

MANUAL—By means of handle in bottom of curtain.

MECHANICAL—By means of endless chain, sprocket and gear; or crank, shafting and gear.

POWER—By means of electric motors.

Co-operative Service.

The following pages illustrate but a few of the many constructions we are prepared to furnish.

Catalogues Nos. 51, 52 and 53, showing complete line, furnished on application.

We are constantly making improvements, having a department devoted exclusively to developments and designing. Special designs submitted to cover unusual conditions.

BUTLER BROS., CHICAGO, ILL.

Kinnear steel rolling doors on shipping platforms. Compactness of doors admits of placing openings in close arrangement, making practically the entire side of building available to teams, which greatly facilitates handling of merchandise

CURTIS PUBLISHING CO., PHILADELPHIA, PA.

Interlocking Steel Slat No. 2

Fitted with alternate endlocks. It is $1\frac{13}{16}$ ins. wide on centers, depth of crown, $\frac{9}{16}$ in. Made in gages Nos. 24, 22, 20, 18 and 16. Especially adaptable to shutters equipped with mechanical operating device

Interlocking Steel Slat No. 5

Fitted with alternate endlocks; $1\frac{1}{2}$ ins. wide on centers, depth of crown, $\frac{1}{2}$ in. Made in gages Nos. 22, 20 and 18. Especially designed for doors and shutters manually operated by handle in bottom bar. When in perpendicular arrangement, shoulders are brought into rigid alignment

CONCAVE AND CONVEX SIDES OF INTERLOCKING STEEL SLATS

Kinnear steel rolling doors and shutters are composed of slats illustrated above. Concave and convex sides, and method of interlocking are shown. Note that either side of the interlocking joints sheds water. Malleable endlocks reinforce edges and prevent longitudinal separation. They also provide an excellent wearing surface in the guides

PROJECTIONS (Schedule Below)

Above are indicated the salient dimensions of the more ordinary construction of usual sizes of Kinnear steel rolling shutters. View to the left shows shutter placed on face of wall; central view shows shutter placed between jambs, and that to the right shows curtain with concealed coil. The following dimensions are for shutters of height and width indicated

Width 3' 0" to 6' 0"						Width 6' 0" to 10' 0"					Width 10' 0" to 15' 0"					Width 15' 0" to 20' 0"

Schedule is for No. 2 slats. Sizes above division line apply to shutters operated by handle in bottom of curtain. Those below division line apply to shutters operated by endless chain or crank and bevel gear. Dimension "P" applies only to face of wall constructions. Dimensions "W" and "D" only to "between jamb" constructions. Dimension "A" applies only to chain hoist side of hoist operated shutters placed between jambs. Dimension "B" should always be at least 8 ins. wider than width of door opening for moderate sized shutters, and for very large shutters 10 or 12 ins. and more if possible. We do not recommend manually operated construction for curtains of larger area than approximately 100 sq. ft.; chain hoist should be used on larger sizes. Wherever desirable, automatic device may be combined with manually operated construction. Regarding any further details and unusual sizes or special constructions, direct correspondence is suggested.

FORD ASSEMBLY PLANT, CAMBRIDGE, MASS.

MILWAUKEE ELECTRIC RAILWAY & LIGHT CO., COLD SPRINGS, WIS.

Fire Doors and Shutters.

Constructed under the supervision of the Underwriter's Laboratories, Inc., and labeled.

IMPORTANT FEATURES—Kinnear fire doors and shutters are specially designed for fire protection. Details of construction have been carefully developed.

The following are some of the more important features:

(1) An auxiliary or inner hood is automatically dropped and closes the space between the barrel and outer hood, thereby preventing the passage of flame over the barrel.

(2) Special endlocks closing the concaved ends of slats and preventing the passage of flame around the edge of the curtain.

(3) Fusible washers employed in the construction of grooves which melt and allow the members composing the grooves to expand without cramping.

(4) Non-corrodible metal used for bearings and contact points of the automatic release.

(5) Single line contact bearings in releasing levers.

(6) Provision made for expansion of parts for all temperatures up to 2000° Fahr.

(7) Disposition of fusible links, insuring prompt closing.

(8) The enclosure of automatic release, protecting it from the weather.

SPECIAL EQUIPMENT—THE KINNEAR MANUFACTURING Co. is prepared to furnish governors controlling the speed of curtain in automatic closure.

CATALOGUES—General Catalogue No. 51 and the special Fire Door Catalogue No. 53 illustrate many additional types and their applications. These doors are designed to obtain easy operation in normal service, and are easily opened and reset by a single person after automatic closure.

SUPERIOR NO. 1

Single shutter for exterior windows; opening not to exceed 10 ft. wide by 10 ft. high. Mounted on face of wall. Normally open; automatically closed. Equipped with governor, controlling speed of the descending curtain

AKBAR NO. 3

For elevator shafts; opening not to exceed 80 sq. ft. in area. Installed on face of wall. Manually operated by means of handle; automatically closed

ACME NO. 4

Double doors for fire walls; opening not to exceed 80 sq. ft. in area. Doors mounted in opening. Manually operated by means of handle; automatically closed

ACME NO. 8

Single shutter for exterior window openings, not exceeding 10 ft. wide by 10 ft. high. Grooves mounted between jambs; coil concealed above head of window. Normally open; automatically closed. Equipped with governor, controlling speed of the descending curtain

AKBAR NO. 7

Double doors for fire walls; opening not to exceed 80 sq. ft. in area. Mounted on face of wall. Mechanically operated by means of crank; automatically closed

ATLAS NO. 3

Single door mounted on interior face of exterior wall; opening not exceeding 10 ft. wide by 10 ft. high. Operated mechanically by means of endless chain, sprocket and gear; not equipped with automatic closing device

"Ajax" Door for Openings in Fire Walls.

Approved for openings not exceeding 80 sq. ft. in area, double doors required.

DESCRIPTION—This door is composed of interlocking cellular sections $2\frac{1}{2}$ ins. thick, assembled on steel frame.

Filled with non-combustible material which does not produce smoke or gas when highly heated.

Mounted on track. Overlaps the opening sides and top.

All of the hardware on the door is attached, except hangers, and holes are provided for these.

Manually operated by means of handle, and automatically closed by weight released by fusible links.

"AJAX" SLIDING DOOR EQUIPPED WITH AUTOMATIC CLOSING DEVICE

Akbar No. 8 Doors.

Double doors mounted in an opening not exceeding 80 sq. ft. in area. Normally open; automatically closed by releasing device actuated by a fusible link. Escape-governor forms part of the standard equipment and controls the speed of the descending curtain. Mechanical means of opening are provided, consisting of crank, shaft and gear, which are not disengaged during automatic closure.

AKBAR NO. 8

Counterbalanced Doors.

Single door for elevator shafts; not exceeding 80 sq. ft. in area. Installed on face of wall inside of shaft.

Manually operated and automatically closed.

The sections are constructed of heavy angle and plate frames, connected at the corner by malleable iron gussets.

The covering is sheet steel, ribbed surface.

COUNTERBALANCED DOOR

UNDERWRITERS' LABELS

CROSS SECTION SHOWING END ELEVATION OF BUILDING WITH DOOR EQUIPMENT

VERTICAL LONGITUDINAL SECTION

Crane Opening Doors.

The above illustration shows a typical crane opening and the best arrangement of door equipment. It consists of three steel rolling doors, separated by hinged post with grooved edges for the curtains to travel in. At the crane girders a different post design is used, the groove section extending to the sill with a panel closing the space above the girder. The posts are arranged to lock and unlock automatically.

The operating mechanism is situated on a platform supported by the lower cords of the roof trusses. The doors and posts are operated by separate power units, which are similar except for the posts, where a drum is provided for winding the lifting cable.

Each unit comprises a motor; limit switches, controlling the travel of the doors or posts; an automatic magnetic brake and automatic cut-out, both controlled by the limit switches; and reduction gear enclosed in cast iron box, gear running in oil bath. Gears are steel, with cut teeth. All bearings are fitted with grease cups.

The reduction gear box is arranged to combine power and manual operation. Its peculiar design and construction permit employment of either method without shifting clutches; it is only necessary to throw the electric switch, or pull the endless chain; the manual operation is intended for emergency.

Electric operation controlled from any convenient point, preferably accessible from the ground floor.

MECHANISM, PLAN AND ELEVATION CRANE OPENING DOOR

VERTICAL SLIDING SECTIONAL DOOR

Composed of two or more sections consisting of trussed frame covered with corrugated iron, hung independently with chains, connected with counterbalance weights. Operated by endless chain

SANTA FE FREIGHT SHED, LOS ANGELES, CAL.
Equipped with Kinnear vertical sliding doors. Interior view showing three positions of the door

Kinnear Bifolding Door, Type No. 1.

Door comprises two sections hinged together and supported at center by radial arms pivotally connected to wall brackets. Chains are attached at the bottom which communicate with the counterbalance weight. The bottom of door is fitted with rollers, which travel in guides attached to wall, and transmit the thrust.

BIFOLDING DOOR, TYPE NO. 1

NORFOLK & WESTERN FREIGHT HOUSE, NORFOLK, VA.
Installation of Kinnear bifolding door, type No. 1

Clearance "D," 6". Clearance "E," 18". Clearance "F," 10".
Example—Required "C" for door 12 ft. wide by 10 ft. high. See intersection of column 12 and line 10, the dimension is 3'0". This may be reduced by cutting out the floor under counterweight, permitting it to extend below floor level.
Where clearances at top and sides are not available for regular equipment, it is advisable to request information, accompanying the same with details of openings. We will be pleased to furnish drawings showing special attachments applicable to the conditions.
Clearances for types Nos. 2 and 3 sent on application.

PENNSYLVANIA FREIGHT HOUSE, CAMBRIDGE, OHIO
Installation of Kinnear bifolding door, type No. 1

Kinnear Bifolding Doors, Type No. 2.

Especially designed for large openings. Operates with ease and rapidity.

It is unnecessary to "break" door by hand, as is generally done in other types of folding doors; operations of unlocking, "breaking" and raising are accomplished by means of endless chain.

A reversal of these functions occurs when door is closed. In opening, lower section moves upward a distance approximately 18 ins., when hooks on lower section engage reciprocal members on upper section; door then folds radially to a point above opening.

DIMENSIONS—The schedule gives the clearances "C" and "K" for different size openings, using standard construction. The dimension "C" can be reduced either by using different size counterweights or by permitting the counterweights to extend below the floor level.

ADAPTABILITY—Suitable for depots, freight houses, docks, warehouses and shops.

Especially well adapted to situations which necessitate providing for lighting the interior.

MATERIAL AND CONSTRUCTION—Doors are constructed of wood, flat or corrugated steel. When specified, they are pierced by lights of plain or wire glass fixed in wood or metal frames. The hardware and

K	7'-1 $\frac{1}{2}$ "	7'-8"	8'-3"	8'-10"	9'-5"	9'-11 $\frac{1}{2}$ "	10'-6 $\frac{1}{2}$ "	11'-1 $\frac{1}{2}$ "	11'-8"	12'-3"	12'-10"

INTERIOR VIEWS SHOWING KINNEAR BIFOLDING DOORS, TYPE NO. 2, IN CLOSED AND OPEN POSITIONS

framing members are properly proportioned to the size of doors and have ample strength to prevent excessive deflection of the sections when doors are raised.

The structural design and liberal use of material give both strength and durability.

OPERATION—Doors are counterbalanced by weights. Operated by mechanism consisting of endless chain and reduction gear. They operate with ease and rapidity.

Types Nos. 2 and 3 are self-breaking and self-locking.

Bifolding Door, Type No. 3.

Designed for large openings. Made in two sections. In operating, the lower section raises to half the height of the opening. The door then breaks and both sections move simultaneously, the lower edges vertically and the upper edges horizontally on suspended tracks, to a position above the opening as shown by phantom lines.

Experience and Co-operative Service.

The standards of construction of "Wilson" products have been progressively developed during a period of nearly 40 years of manufacturing experience. This fact, together with the high records of service which can be shown for "Wilson" doors and shutters, offers effective assurance of their superiority.

While it is hoped that the data provided herewith will effectually assist in the full study of any door and window problem, and in making all necessary provisions for installation of the specified products, the experience and mass of scientific data in possession of this company are also gladly put at the disposal of users of this book.

"Wilson" Steel Rolling Doors and Shutters.

CLASSES OF SERVICE—"Wilson" steel rolling doors and shutters are designed to meet two classes of service: First, as an effective closure of openings against weather and intrusion.

Second, as approved underwriters' fire doors.

Closure Doors—The doors and shutters made for the closure of openings are strong and durable and have proved to be excellent fire retardants. They retain their shape under intense heat and will not warp or twist.

When made red hot they will still prove a perfect barrier to flames.

Fire Doors—The doors and shutters made for protection against fire (fire doors) are similar in construction to the closure doors above described.

They are automatic in operation and are designed to meet all of the requirements of, and are indorsed and labeled by, the National Board of Fire Underwriters, Inc.

OPERATION—All doors are counterbalanced by either helical or flat springs so selected as to balance the door in all positions.

(1) *Spring Balanced or Self-coiling*—Operated by means of handles located at bottom of door, suitable for fire doors and closure doors not exceeding 80 sq. ft. in area.

(2) *Gear Operation*—Operated by means of chain and sprocket, bevel or worm gear actuated by either hand chain or crank from either the inside or outside or both.

(3) *Power Operation*—Operated by electric motors fitted with suitable reduction gears and electric brakes. Alternate hand operating chain to be used in cases of emergency. Operation controlled by means of a drum-type controller located at a convenient point, or by means of push buttons located at any convenient point with the aid of electric or mechanical limit switches, which automatically make or break the power circuits. Doors may be operated independently, simultaneously or in groups.

STEEL ROLLING CURTAINS—Steel rolling curtains for closing the openings are furnished in one of four of the following types, depending upon the area of

Little 4

No. 2 with Fire Stop

Style Big 4

Big 4 with Safety Attached

TYPES OF INTERLOCKING SLAT STEEL ROLLING DOORS

opening and class of service to which the doors are to be put.

INTERLOCKING SLAT TYPE, STYLE LITTLE No. 4—Designed to secure maximum strength with a minimum depth of corrugation.

The design eliminates all sharp bends which would prove detrimental in the process of manufacture and to its durability.

Each square foot of assembled slats contains approximately 2 sq. ft. of steel, the metal so formed as to offer greatest resistance to wind pressure and to distortion when subjected to high temperatures.

Recommended for closure doors not over 12 ft. wide, made from No. 22 and No. 20 gauge stock.

When used for fire doors, see underwriters' size limitations.

INTERLOCKING SLAT TYPE, STYLE No. 2—For large openings and especially for fire doors.

Labelled by the National Board of Fire Underwriters, Inc., for closing openings in vertical shafts, room partitions and fire walls.

They are manufactured from stock No. 20, No. 18 and No. 16 gauge.

When used for fire doors, see underwriters' size limitation.

INTERLOCKING SLAT TYPE, STYLE BIG 4—Similar in design to the Little 4 type, having the advantage of a greater depth of corrugation, which materially increases its rigidity, placing it in a class by itself, when fitted with safety attachment for resisting wind pressure.

This construction is adapted to all classes of closures, manufactured from No. 22, No. 20, No. 18 and No. 16 gauge cold rolled stock, especially for openings up to 30 ft. wide.

Pilasters of the rolling or hinged type for openings over 25 ft. wide are preferred where conditions will permit.

GEARING—Of the cast iron type, so designed as to be accessible at all times for repair or lubrication. Journals are of cold rolled shaft; all gears 4 pitch.

Designs for special operation where worm and bevel gears are required will be supplied upon application. Ball bearings will be supplied when conditions justify them.

HOODS—Hoods are constructed of No. 24 gauge galvanized sheets with as few joints as possible, reinforced where necessary with steel angles. Hoods are optional where doors are placed on the inside of openings. They

are not furnished unless specified. Flashings should be provided by sheet metal contractor where hoods are exposed to the weather.

GUIDES, ANCHOR DEVICES, BOLTS, ETC.—All necessary guides, anchor, devices, bolts, etc., are furnished with each installation. Complete lintel, jamb and sill details should accompany each order.

LOCKING DEVICES—Locking devices are furnished in any one of the three methods of locking as shown in the illustration. The type desired should be specified.

WICKET DOORS—Hinged wicket doors, maximum size 2 by 5 ft., may be placed in any closure door at the side.

The doors are so designed that the wicket with its frame must be swung back out of the way before raising the large door.

INSTALLATION—"Wilson" work can be installed by workmen of ordinary skill in the various building trades. Drawings, full directions and all necessary parts for fitting are furnished with each shipment. This company, however, prefers to install its own work and then to assume full responsibility.

OFFICIAL INDORSEMENT—"Wilson" rolling steel fire doors are indorsed and labeled by the National Board of Fire Underwriters, Inc., for the following services:

Openings in Fire Walls—For openings not exceeding 80 sq. ft.; doors on both sides of wall; doors mounted on face of wall, only; construction, "Wilson" Interlocking Slat, No. 2, No. 16 gauge. Arrangement No. 1.

Openings in Vertical Shafts (Stairway and Elevator Openings)—For openings not exceeding 8 ft. by 10 ft.; construction, "Wilson" Interlocking Slat, No. 2, No. 20 gauge. Arrangement No. 1.

Door Openings in Corridor and Room Partitions—Openings not exceeding 8 ft. wide by 10 ft. high; construction, "Wilson" Interlocking Slat No. 2, No. 20 gauge. Arrangement No. 1.

Exterior Openings—Openings not to exceed 10 ft. in width and 10 ft. in height; construction, "Wilson" Galvanized Interlocking Slat Little No. 4, No. 22 gauge. Operation may be either self-coiling, chain gear or bevel gear. Arrangement No. 1.

"Wilson" Sliding Swing Doors.

DESCRIPTION—These doors are made fireproof or not, as required.

The method of operation is entirely new, very simple and durable. The door can be raised or lowered with very little effort, with great rapidity and smoothness.

The advantages gained by the use of these doors are economy of space and a practically unlimited strength of construction. The construction is either tin clad or glazed.

This design lends itself admirably to the installation of wickets.

When applied to the exterior of openings, the raised door serves as a weather protector.

OPERATION—These doors can be operated direct by hand, by chain or bevel gear (with operation on inside or outside of opening or both), and motor driven gear.

INSTALLATION—"Wilson" work can be installed

by workmen of ordinary skill in the various building trades.

Drawings, full directions and all necessary parts for fitting are furnished with each shipment. This company, however, prefers to install its own work and then to assume full responsibility.
