Their use is recommended especially for round-houses, powerhouses, engine rooms and other places where corrosive fumes are generated. They are also recommended for use as closure doors for wood constructed warehouses and the like.

CONSTRUCTION—These doors are made of wood slats 2 in. wide and about $1\frac{1}{8}$ in. thick, fitted together with rule joints, edge to edge, and threaded upon bands of bronze metal running from top to bottom about 18 in. apart. Each band is riveted to the top slat and attached at the bottom to a strong spiral spring anchor of phosphor bronze concealed in the baseboard or bottom bar.

The whole construction is exceptionally heavy and durable, and will stand any amount of hard wear.

OPERATION—The doors are spring counterbalanced and are easily operated by an endless chain attached to gear at end of shaft.

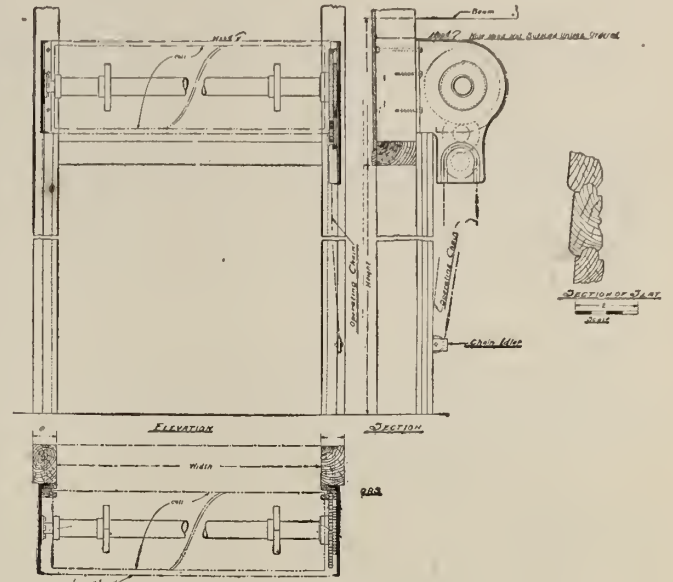

LIGHT OPENINGS—Openings to admit light can be provided in the doors when required, in the shape of wire glass panels. All the light needed can be obtained in this way.

WICKET DOORS—Wicket doors of the sliding and hinged type are provided where required. The swinging wicket doors are hinged to the grooves, the frames of which must be swung back before the large door is raised.

This type has given better satisfaction than any other design applied to wood doors.

INSTALLATION—"Wilson" work can be installed by workmen of ordinary skill.

Drawings, full directions and all necessary parts for fitting are furnished with each shipment. This company, however, prefers to install its own work and then to assume full responsibility.

METAL COVERED DOORS, in Bronze, Copper, Sempermerus, Kalamein, Galvanized Iron and Furniture Steel drawn over white pine and hardwood cores.

Metal Covered Windows and Interior Trim.

Metals Used.

Bronze from Nos. 16 to 26 gauge; copper from 14 to 24 oz. to the sq. ft.; sempermerus, kalamein and galvanized iron, Nos. 22 to 28 gauge; furniture steel, Nos. 12 to 22 gauge.

Underwriters' Kalamein Doors.

The Reliance underwriters' kalamein doors, for elevator shafts, stairways, corridors and partitions, fire escapes and fire tower openings, when installed in accordance with the following specifications and details (Figs. 1, 2 and 3), will procure a minimum insurance rate for the building and contents.

SPECIFICATIONS—Stair and Elevator Doors—Labeled for single doors up to 48 in. wide and in pairs up to 96 in. wide; made with solid panels hung in channel iron or wrought steel frames with 5 by

5-in. surface butts, mortise cylinder locks and $\frac{3}{4}$ -in. throw bolt; stair doors should be made self-closing, either by coil spring or door check, the latter preferable as shown by Fig. 2; combination slide and swing elevator doors shown by Fig. 1.

Fire Escape and Tower Doors—Labeled for the same size openings as stair and elevator doors, and can be constructed to receive wire glass, not exceeding 5 sq. ft.; hung in the same manner as stair doors, shown by Fig. 3.

Corridor and Partition Doors—Constructed to receive 8 sq. ft. of wire glass and bearing the underwriters' label; may be hung to metal covered combination bucks when stair and elevator doors are labeled. This type of construction is also approved by the Labor Department (Fig. 4).

PRICES—Prices furnished on receipt of schedule covering the following data (unless plans and specifications are furnished to the company):

Doors—Size and style of each.

Jambs—Width and thickness required.

Casing—Moulded or flat; stating width, and whether one or both sides of opening.

Lupton Sheet Metal Fireproof Window; Lupton Steel Shelving.

Designing for Unusual Ventilation.

For a number of years DAVID LUPTON'S SONS Co. has specialized in applying sash to difficult ventilating requirements. This practical study has resulted in evolving two forms of sash—namely, Lupton Counterbalanced Sash and Pond Continuous Sash—which give unusually effective ventilation.

Lupton Counterbalanced Sash has the upper and lower sash hung over a single pair of pulleys. This insures equal top and bottom openings as close to the ceiling and floor as possible, and makes it impossible for workers opening the lower sash to neglect the top sash.

Pond Continuous Sash accomplishes two purposes: First, it gives effective weather protection when open; its 20-foot units are connected in long unbroken lines outside of structural work, and the details prevent rain from entering at the top or ends. Second, it gives mass control of ventilation. One man can open more than a thousand square feet in a few moments by hand power, or several thousand if electric motors are used. Pond Continuous Sash was originally designed for sawtooth roofs, but was soon applied to foundry monitors, and to side walls.

The ventilating possibilities of Lupton Counterbalanced Sash and Pond Continuous Sash go much beyond what can be realized with conventional building designs. By planning the buildings so that the sash and the floor layout fit each other, results can be secured which would be impossible otherwise. The effect has been practically to rewrite the science of ventilation as applied to large industrial buildings.

The following principles govern the successful use of these sash:

(1) The balanced top and bottom openings of Lupton Counterbalanced Sash make it for industrial buildings preferable to pivoted or counterweighted sash. The average factory worker does not recognize "stale air," and opens the windows only if the temperature becomes oppressive. In that case only the top or bottom sash is usually touched, though either alone is useless without a wind. By using Lupton Counterbalanced Sash the building may be made wider than usual, with reasonable assurance of fresh air reaching the center

bays. In this way the rental charge is reduced and the sash becomes a profitable investment.

(2) The weatherproof details of Pond Continuous Sash adapt them especially to sawtooth and monitor roofs. Sash that must be shut for every shower are often left shut when they should be open.

(3) In certain industries Pond Continuous Sash is as useful in the side walls as in the roof. Among such are the rubber goods industry, foundries, chemical works, etc., where abundant ventilation is constantly demanded, and where entering rain would cause damage to equipment or to product.

(4) Mass control of sash is especially desirable for large floor areas with many workers or heat-producing processes, since its practical effect is to place control in the hands of a responsible foreman who will attend to it. Instead of scattered workers each opening (or more likely neglecting) a few square feet of sash, one man should be able to open at least a thousand square feet at once.

(5) Where hundreds of workers are employed under a sawtooth or monitor roof, ventilation should be uniform for the entire floor. This is best done by operating Pond Continuous Sash in long lines or groups by electric motors, using Pond Operating Device, motor driven. Thus the air movement over many thousand square feet of floor may be regulated by a single switch; and by suitably locating switches, floor areas of any extent can be controlled from any desired points.

In designing a building to utilize the ventilating capabilities of the sash, the following points in particular must be observed:

(a) Inlet and outlet openings must be properly balanced. Either is useless without the other.

(b) A weak ascending air stream will not drag a long horizontal stream. Very wide sawtooth buildings are defective both in this and in the point just mentioned. Such air as enters from the side escapes before reaching the center if the roof sash be open, or remains stagnant if the sash be closed, as is too often the case.

(c) Where the roof is used, it must be formed to stimulate air movement. The sawtooth roof fails in this, because of the uniform level of its outlets; the conventional monitor roof fails to provide sufficient outlet in the right places, and the peak tends to pocket and chill the air or gases.

The Pond Truss roof avoids all three faults.

(d) Any heat-producing elements (furnaces, ovens, etc.) must be so located as to cause air currents to rise at or near the outlet points. Inlets in the roof must be kept free from heat.

(e) With wide sawtooth roofs, especially where

the workers are crowded or heat is produced, individual openings of sash result in "spotty" outflow, and therefore an irregular distribution of fresh air. The way to get uniform distribution is to operate the roof sash simultaneously in groups by electric motors, and to provide correspondingly uniform inlets in the side walls by means of Pond Continuous Sash suitably located and operated.

(f) For very wide buildings, the sawtooth and conventional monitor should not be used. The only effective way to ventilate the center is by alternate raised outlets and low inlets in the roof. Such a building, embodying the Pond Truss type for outlets and Pond A-frames for inlets, is shown on a page following. This roof gives also much better light distribution than the sawtooth, and is adapted to nearly all classes of industrial buildings. It usually costs less than a sawtooth.

(g) The old conception of stale air rapidly escaping from small outlets is illusory and misleading. Rapid air flow can only result from a considerable difference in pressure. This difference, unless forced draft is used, can only come from a corresponding difference in temperature. The idea of treating a foundry or forge shop as a "chimney" can only be realized in practice by raising the inside temperature to an unbearable extent. The proper way to ventilate such buildings is to use large inlet and outlet areas, so that a slow movement is sufficient, and to locate them so as to produce that movement over the entire floor. For this, a correctly designed roof and correctly placed inlets are just as necessary as correct type and arrangement of sash. The Pond Truss roof was originally designed for foundries and forge shops, and has been found to accomplish its object perfectly.

This company does not design complete buildings or sell designs, but assists engineers and architects in every way to get maximum lighting and ventilating results from the use of Lupton products, maintaining a large engineering department, and adapting each design which is recommended to the individual requirements of the customer's business. No charge is made for this

service, and engineers and architects are invited to use it freely.

Lupton Factory Sash (Patented and Patents Pending).

Has certain features which are deemed fundamental, namely: solid 1-piece rolled steel members, joints which resist corrosion and do not impair effective strength of sash, permanently weathertight ventilators and simple glazing. The members of Lupton Sash are specially rolled to give maximum strength without excessive weight. The muntin joints give maximum strength against wind, and are readily protected by painting. The muntins are fitted into frames and solidly riveted.

Ventilators make a close 2-point contact at all sides; placed one above the other, they are operated by a double arm connection, which closes them tight without slamming.

STANDARD AND STOCK SIZES—For quick delivery all commonly-used sizes of Lupton Factory Sash are

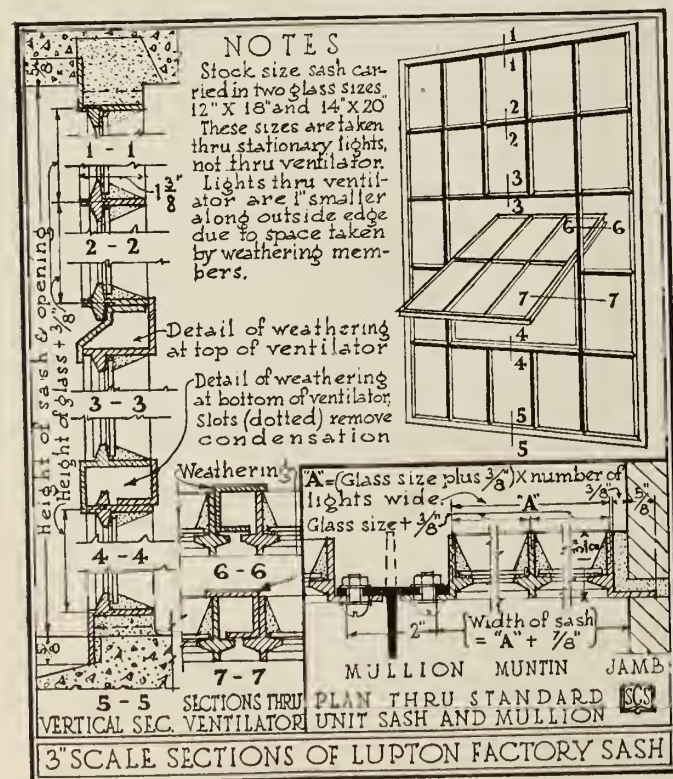

DIAGRAM SHOWING STANDARD AND STOCK SIZES OF LUPTON FACTORY SASH

carried in factory stock in the shape of pre-cut bars ready for assembling. The sizes most in demand are also carried in warehouse stock in various cities, fully assembled. Glass for these "Standard" and "Stock" sizes are 12 by 18 and 14 by 20 in. Angle frame members and T-bar mullions are used.

The diagram on preceding page shows the "Standard" sizes. Those circled are also classed as "Stock" sizes, and are carried in warehouse stock ready for shipment.

Lupton Counterbalanced Sash (Patented and Patents Pending).

Has the upper and lower sash balanced over a pair of pulleys, so that the upper sash descends as the lower sash is raised. Up to 12 ft. in height the windows are 2-sash high. From 12 to 18 ft., 3 sash are used, the

LUPTON COUNTERBALANCED SASH
2-sash and 3-sash high

middle one being stationary. Window units are made up to 6 ft. wide and may be used singly or in multiple. Heads and sill are formed of No. 12-gauge steel. Jambs and mullions are 1-piece rolled steel sections. Sash members are heavy rolled steel sections, oxy-acetylene welded at the joints. No horizontal muntins are used unless specified. Heavy chains and roller bearing pulleys are used. Glazing angle frames are recommended. Wind shields may be added if desired. Sash will be made to bear underwriters' label if desired, at an extra cost.

Lupton Power House Sash (Patented and Patents Pending).

Has the following features:

(1) The mullions and imposts are of unusual width for architectural effect and are formed from No. 12-gauge steel plate.

(2) All the sash are pivoted, except those having curved heads.

(3) All the sash in each wall are usually operated simultaneously by Pond Operating Device. The frames are formed of No. 12-gauge steel plate. The sash members are heavy 1-piece rolled steel sections and are oxy-acetylene welded. All pivoted sash are double weathered.

Sizes are made to suit engineer's specifications.

POWER HOUSE
INSTALLATION

Lupton Counterweighted Sash (Patents Pending).

Each sash is balanced by its own pair of weights. Special weather tightness is assured by having sash run in sheet bronze weathering members attached to the jambs. Sash members are oxy-acetylene welded. Heavy chains and roller bearing pulleys are used. Glazing angle frames and suitable hardware are included.

Pond Continuous Sash (Patented by Clarke P. Pond and Patents Pending).

Used in monitors, side walls, Pond Truss and Pond A-frames, to give weather protected ventilation with mass control. See illustrations under Pond Truss.

Hung under a continuous overhanging angle. At the ends it overlaps rain-excluding stationary panels 2 ft. wide. Its 20-ft. sections are connected by expansion joints, which exclude weather while giving flexibility for faulty alignment of structural work.

All the members are rolled 1-piece sections, and are much heavier than ordinary factory sash. They are welded at all joints, making each section a permanently rigid unit and preventing glass breakage.

Pond Continuous Sash is controlled by Pond Operating Device, which gives exceptional width of opening with minimum applied power. See table.

For factory buildings and power houses, Pond Continuous Sash is made in short lengths to fit window openings, and is operated in lines or groups as desired by Pond Operating Device.

OPENINGS FOR TOP-HUNG SASH CONTROLLED BY POND OPERATING DEVICE

No. 3 sash	3 ft. high	46°	28 in.
No. 4 sash	4 ft. high	47°	38 in.
No. 5 sash	5 ft. high	42°	43 in.
No. 6 sash	6 ft. high	36°	44 in.

Pond Operating Device (Patented by Clarke P. Pond and Patents Pending).

Pond Operating Device is guaranteed to open long lines of sash wider, with less friction and wear, than any other device. It works on the principle of tension transmission, and applies increasing leverage as the sash is raised. It may be used to control any form of sash in long lines; but its advantages are most conspicuous with top hung sash. Power is transmitted by 2 lines of steel rods, connected by chains operating over a sprocket at one end and an idler at the other. These rods actuate the sash arms through compound levers, the increasing leverage being due to the varying angles of the levers and sash arms.

POND OPERATING DEVICE WITH
HAND CHAIN

All hinged connections are bronze bushed.

The sprocket is driven by a worm gear and a hand chain. The worm gear is enclosed and runs in oil, hence has minimum friction and requires no attention.

For long lines of sash, a spiral and counterweight are advised in place of the idler pulley. The varying radius of the spiral balances the varying load of the sash.

Pond Operating Device, motor driven, is recommended for extra long lines, or for simultaneous control of several lines. It uses a 3-phase, 60-cycle alternating current motor, specially designed and furnished by this company.

Pond Truss (Patented by Clarke P. Pond).

For foundries and other industrial buildings, Pond Truss construction allows the use of 1-story buildings of practically unlimited width, with perfect light and ventilation throughout. If the building is of extreme width, two or more Pond Trusses in the roof are

arranged to alternate with Pond A-frames. The latter are lines of A-shaped frames, running the length of the building, on which Pond Continuous Sash are hung. Being located over the low sections between the Pond Trusses, they supply fresh air and light in all weathers.

In industries where certain processes, such as assembling, require unusual skill or many workers, a Pond Truss Roof on a multistory building gives ideal conditions for that work.

The use of Pond Truss is licensed where Lupton products are exclusively used. Its correct use is a matter of experience, and each roof is specially designed. This company should always be consulted before final plans are made.

GENERAL ELECTRIC CO., BUILDING NO. 5, ERIE, PA.

Building is 172 ft. wide, 800 ft. long, with Pond Truss roof, using Pond Continuous Sash, and Lupton Counterbalanced Sash in the side walls. East half has a gallery floor. Building was designed for making steam turbines

Lupton Steel Partition (Patents Pending).

SPECIAL—Lupton Special Steel Partitions consist of units of rolled steel members, set in and supported by heavy plate steel framing.

The units are of standard widths, 2, 4, and 6 ft. center to center of mullions, and 8, 9, 10, 11 or 12 ft. high. Each unit has a base of steel plate 4 ft. high; the upper part is glazed or filled with wire screen.

Mullions are set over and conceal standards secured to floor. Both mullions and head rails are formed of No. 14-gauge steel plate to receive partition units.

All units of like size are interchangeable.

LUPTON SPECIAL STEEL PARTITION

Horizontal section, showing interchangeability of section units, including door section. A door section may be moved, by interchanging it with a standard section

STANDARD—Lupton Standard Steel Partitions are made up of standard Lupton Factory Sash units, with channel instead of angle frame members, and with

mullions of structural steel sections and formed plate. The doors are similarly made up from structural sections, welded to formed plate and welded at the corners. This type of partition is intended for factory and warehouse use, and units have a limited interchangeability.

AMERICAN EVER-READY CO., LONG ISLAND CITY, N. Y.
Lupton Steel Partition and Doors in office

Lupton Steel Tube Doors.

These are made with stiles of seamless rectangular steel tube, welded at the corners. The lower part of the door has a steel panel, and the upper part is filled with glass or a steel panel as desired. These doors are made in all sizes from partition doors up to craneway and locomotive doors, and in many styles suitable for factory or office use.

LUPTON STEEL TUBE DOORS
Horizontal section showing heavy formed steel jambs

Lupton Rolled Steel Skylight (Patented by Joah Brogden)

The construction of Lupton Rolled Steel Skylight prevents breakage of glass, leakage and corrosion. The glass is held between strands of specially saturated fiber, which permits some movement of the glass and eliminates leakage due to drying of putty. All exposed metal parts are non-corroding.

The cap is of copper, and both it and the bar are offset as required for the overlap of the lights.

Condensation is carried by the diagonal strands of fiber into the nearest bar, and drained to the roof by drip holes in the copper curb apron.

LUPTON STEEL SKYLIGHT
Showing skylight bar, stud and copper cap, also method of holding glass

Waldmire Louver (Patented).

Waldmire Louvers are made of No. 22-gauge galvanized Keystone metal. The slats are spaced 6 in. and are 10 ft. long, requiring vertical wood or steel supports on centers of 59½ in.

BOCA SOLID STEEL SIDE WALL SASH.

TOP HUNG and CENTER PIVOTED CONTINUOUS MONITOR SASH with Continuous Mechanical Operator.

BOCA TUBULAR STEEL DOORS and PARTITIONS.

Boca Solid Steel Sash.

Manufactured from heavy, specially rolled solid steel members, $1\frac{1}{4}$ in. in depth. These sash are adapted to all types of construction—industrial buildings, schools, office buildings, etc.—whether of brick, concrete, terra cotta, steel or wood.

PATENTED BOCA LOCK JOINT—Illustrations shown below indicate the rigid construction of this lock joint.

VERTICAL MUNTIN WITH HORIZONTAL MUNTIN PARTIALLY INSERTED

FRONT OR EXTERIOR VIEW OF INTERSECTION OF MUNTINS WHEN COMPLETED

VERTICAL MUNTIN BAR

The metal is not distorted and the surface has a smooth and neat appearance.

This joint produces a rigid sash that does not get out of square.

VENTILATORS—Equipped with specially patented 3-point weathering members.

This 3-point contact is new and has proven its worth as a positive weatherproof and windproof feature.

A special section is supplied at head of ventilator, forming a drip.

GLASS FOR VENTILATORS—Glass must be trimmed $1\frac{1}{8}$ in. at top and sides, and $\frac{3}{4}$ in. at bottom of ventilators.

PUTTY CUSHION—The grooves in the vertical muntin bar afford the best conditions for back puttying the glass. The smooth putty cushion absolutely prevents leakage and protects the glass from the usual breakage.

GLAZING—Four special steel wire glazing clips are supplied for each light of glass. Glass is not included

SASH UNIT OPERATED BY PUSH BAR

unless by special arrangement.

BOCA HINGE—This type of hinge permits a continuous weathering of ventilator, as the upper portion of weathering laps inside the lower.

HARDWARE—A notched push bar with attachment and catch for lower end are regularly supplied with sash. Other devices for operating ventilators, such as spring catch and chain, will be supplied where specified.

CHART OF FENESTRA WAREHOUSE SASH

Fenestra Specifications.

All windows to be of Fenestra solid steel type, as manufactured by the DETROIT STEEL PRODUCTS COMPANY, Detroit, Michigan.

All sash muntin bars to be 1½ in. deep and to be made of rolled solid steel sections. No more than 20% of the cross-sectional area of both muntin bars to be cut out at each intersection of the vertical and horizontal bars.

All ventilators to be hung on external adjustable butts riveted to the vertical bars and the weathering of sash and ventilators.

All ventilators to be provided with a cam handle locking device; those within reach of the floor with notched stay bar and all others with chain and cleat for holding the vent open at any angle.

T-bar mullion shall be used between units where more than one unit of sash is used in an opening.

TRADE-MARK

JOINT—Horizontal and vertical muntin joints have dovetailed miter interlocking the bars, accurately formed by machine dies and assembled with a driving fit.

GLAZING—Each light held by four special spring steel wire glazing clips, each of

which supports the glass at two points. Sufficiently elastic to absorb vibration shocks. Glass must be thoroughly bedded in Truscon steel sash putty and neatly face puttied.

SPRING STEEL WIRE GLAZING CLIP

Type T1 Mullion

Type T2 Mullion

DIMENSIONS MULLION BARS

T1, mullions are used with windows less than 6 ft. 3 in. high
T2, mullions are used with windows from 6 ft. 3 in. to 13 ft. 10 1/2 in. high

STOCK UNITS OF TRUSCON PIVOTED WINDOWS—Pivoted windows are carried in warehouse stock in 30 types, each in 2 glass sizes 12 by 18 in. and 14 by 20 in., meeting practically all building requirements. Their use insures quick shipment, low cost and speedy building.

STANDARD UNITS OF PIVOTED WINDOWS—Large quantities of finished ventilators and machined muntin bars are carried in stock ready to be made up into standard units. These are stocked in 2 glass sizes: 12 by 18 in. and 14 by 20 in. Ventilators are stocked in 3 sizes: 4, 6 and 8 lights. The standard members are assembled to meet particular requirements of each building operation.

DIAGRAM FOR COMPUTING WINDOW DIMENSIONS FROM GLASS SIZES

Width or height dimension of a single window is the same as width or height of window opening. These dimensions may be computed from glass sizes by the following formula:

$$W = n(s + \frac{3}{8} \text{ in.}) + \frac{7}{8} \text{ in.}$$

where n = number of lights

s = size of light; W = width or height of window

For window opening containing more than one unit add together dimensions of units as computed above plus mullion distances.

Continued on next page

STOCK UNITS OF TRUSCON STEEL WINDOWS

Ventilators (indicated by crossed dash lines) are horizontally pivoted 2 ins. above center.

IMPORTANT NOTE—Stock units are made in 2 glass sizes: 12 by 18 in. and 14 by 20 in. The 12-in. width of glass can be used only with 18-in. height of glass; 14-in. width of glass can be used only with 20-in. height of glass. For any one window opening, 12 by 18-in. glass sizes can not be combined with 14 by 20 in.

Other Types of Sash.

The complete line of Truscon Steel Windows includes pivoted windows, continuous sash, counterbalanced sliding sash, steel and glass partitions, steel doors, steel fire windows and special types.

Truscon Continuous Sash.

For monitors and sawtooth roofs. Improved method of support which consists of a continuous bearing, thereby eliminating the old style hinges which only supported the sash at wide intervals. There are no openings above the sash for rain or snow to enter as the contact is absolutely weathertight. This continuous bearing distributes the weight of the sash evenly throughout its length, thus increasing its rigidity and ease of operation. At the end of a run of continuous sash perfect weathering is obtained by the combination of fixed and storm panels. A storm panel is placed behind each end light of the swinging sash, and thus prevents rain or snow from blowing in.

SECTIONS—Formed of solid rolled sections of highest grade steel, being abundantly heavy to stand any strain to which a sash would be subjected. The supporting member which is attached to the building is especially formed of heavy steel, providing accurate bearing and perfect flashing for the sash. The top member of the sash is of a heavy channel section, of which the outside flange bears evenly on the supporting member. The sill member is of special design with a wide projecting flange to insure greatest rigidity in the sash and to provide for the attachment of the operator. Formed with a bent flange to provide a weathertight contact at the sill. The vertical muntins are T sections, and the vertical end members are angle sections, all of ample weight. The storm panel is made of heavy solid members of the same construction as the sash. The connection with the fixed steel panel is weathertight, the swinging sash has a continuous contact weathering, and a drip sill is provided in the storm panel itself, thus giving thorough protection against the severest rains and storms.

As an additional safeguard, occasional stay-clips are rigidly attached to the vertical muntins to prevent displacement of the sash through misuse. JOINTS—The assembling of these members is by means of mortise and tenon joints, accurately punched and fitted. All joints are welded into a solid unit by the oxy-acetylene process to insure a connection of unquestioned strength and weathertightness.

SIZES—Truscon continuous sash are made in stand-

ard heights as shown in the table below. The units are designed for a truss spacing of 20 ft. on centers. The various units, however, can be combined to fit any length of run.

DATA, TRUSCON CONTINUOUS STEEL SASH

Sash number	Height of sash, ft.	Height of opening, ft. in.	Glass size, in.
3	3	2 10 1/2	23 3/4 x 32 3/4
4	4	3 10 1/2	23 3/4 x 44 3/4
5	5	4 10 1/2	23 3/4 x 56 3/4
6	6	5 10 1/2	23 3/4 x 68 3/4

GLAZING—Truscon continuous sash are glazed by means of heavy spring clips as illustrated. Note particularly that these clips are so designed as to give a substantial bearing—approximately 1 in. in width—against the sash as well as the glass. The glass should be bedded in Truscon Sash Putty, and face puttied along the bottom section. No face putty is required at the sides or top.

SASH OPERATOR — Operator is of the tension type, with lever arms, continuous connecting rods and operating station. Toggle arrangement of operating arm gives 60% to 100% additional power.

DATA, SASH OPERATOR

Sash number	Height of sash, ft.	Opening, degrees	Opening, in.
3	3	45	28
4	4	45	37
5	5	42	43
6	6	36	44

Counterbalanced Truscon Steel Windows.

In Truscon sliding windows the lower sash is counterbalanced against the upper. The outside members are especially heavy sections of rolled steel welded at the corners, thus giving the sash exceptional rigidity and ease of operation. Counterbalanced windows are furnished in 2 types: TYPE G—Consisting of 2 sash to a window, one balanced against the other, giving a maximum ventilation of 50%. TYPE H—Consisting of 3 sash, the center third of which is fixed while the upper and lower sash are balanced against each other, giving a maximum ventilation of 66 2/3%.

THE AEROSHADE COMPANY

Ventilating Window Shades

193 Oakland Avenue
WAUKESHA, WIS.

Products.

AEROLUX VENTILATING WINDOW SHADES for factories, offices, stores, schools, public buildings, living porches, sun parlors and sleeping porches.

AEROLUX
VENTILATING WINDOW SHADES
TRADE-MARK

Construction.

All Aerolux Shades are constructed from a splint fabric composed of tough, weather resisting linwood splints which are woven together with a hard twist seine twine. The shades are adjusted by means of cords and pulleys.

Advantages.

Aerolux Shades have these advantages:

They admit a good working light. Exclude the sun's direct rays. Diminish glass intensified heat.

Permit ventilation even when the shade entirely covers the window.

Are durable enough to withstand many years of hard industrial usage with no expensive upkeep or replacements.

A well diffused working light is admitted through the spaces, the splint edges operating as hundreds of miniature reflectors in spreading an indirect light throughout the room. When the windows are opened these spaces also permit ventilation.

Such a system of shading not only raises the standards of workmanship through its provisions for a soft, well diffused and restful working light, but, because the temperature of sun-exposed workshops may be reduced from 10° to 15° and an ample supply of fresh outside air admitted, employees work with greater comfort and production is thereby increased.

There is no sun-ruined merchandise and no time is lost changing mechanical adjustments which are disturbed by great heat variations.

Types.

For factory use the three types of shades most commonly employed are those illustrated.

SINGLE TYPE WITH REGULAR HANGINGS—Equipped to hang at the top and roll up from the bottom. May be used wherever the shades hang far enough away from the windows to clear opened ventilators without interfering with workmen.

SINGLE TYPE WITH TOP DROP—Especially adapted to very wide rooms. Workers close to the windows are protected from sun's heat and glare without cutting off light farther back in the room. The shades will also cover the entire window or roll clear to the top as desired.

DUPLEX TYPE—A type to use where open ventilators extend inside of wall line and where shades must occupy a minimum of room space. Upper section clears ventilator but does not interfere with workers or machines. The two sections operating independently permit any desired lighting effect.

For schools, offices and stores a somewhat finer fabric is used than in factory shading but the lighting and ventilating effects are equally satisfactory.

Service.

Efficient window shading is often more complex than appears on the surface and our service department with several years of industrial shading experience is ready to assist in solving problems.

Duplex Type
AEROLUX VENTILATING WINDOW SHADES

LORD & BURNHAM COMPANY

Manufacturers of Sash Operating Apparatus for Hinged and Pivoted Sash
IRVINGTON-ON-HUDSON, N. Y.

Products.

CONTINUOUS SASH OPERATING APPARATUS in various styles and sizes for Operating Hinged and Pivoted Sash in factories, foundries, car barns, roundhouses, powerhouses, machinshops, steamers, banks, churches, prisons, greenhouses, etc.; TRANSOM OPERATORS for Heavy Transoms in such places as store fronts, hotels, public buildings, etc.

Sash Operating Apparatus.

We make three distinct types of apparatus. There is hardly a sash operating requirement that can not be met satisfactorily by one of them. In cases, however, where unusual conditions make it desirable, we will make such modifications in our standard type as are necessary to meet requirements in the most efficient manner.

Rocker Shaft Apparatus.

For short and medium length runs. Arms are attached to shaft that act directly on sash, through suitable rods. Self-locking at any point. No complicated mechanisms. Easy to erect and simple and easy to operate.

FIG. 1. ROCKER SHAFT APPARATUS

The worm gear mounted in a yoke and collar imparts the rocker motion to the shaft. This motion is transmitted to the sash by means of arms and rods, the arms being attached to the shaft and the rods to the sash by means of small rod hangers

Rack and Pinion Apparatus.

Particularly adapted to long runs of heavy hinged sash. The direct horizontal thrust given to sash, by racks running over the shoulders of the pinions, minimizes the leverage which reduces the torsion. Its simplicity is a strong point in its favor.

FIG. 2. RACK AND PINION APPARATUS

Tension Lever Apparatus.

We advocate the use of this type of apparatus on runs of over 140 ft. in length. It consists of two rods moving in opposite directions, a few inches in front of sash. There is minimum friction and minimum backlash throughout. It is light, yet strong.

FIG. 3. TENSION LEVER APPARATUS

The two tension rods move horizontally in opposite directions a few inches in front of sash. The gear power consists of standard worm gear and sprocket wheels. At other end from gear power is an idle pulley, over which runs chain connecting ends of rod to reverse their motion

Transom Operators.

Adapted to the opening and closing of any transom sash. Consists of 2 miter gears enclosed in metal box. Hub of horizontal gear is threaded and engages with a threaded vertical steel rod, which has a vertical movement as threaded miter gear is turned. Powerful, smooth running and non-sticking. Self-locking at any point. Simple and neat in appearance.

FIG. 4
DETAIL
OF
TRAN-
SOM
OPER-
ATOR

FIG. 5. TRANSOM OPERATOR

By means of suitable arms and rods motion is transmitted from vertical rod to the transom through a rocker shaft in heavier forms of transom operators and directly by bent steel rod in lighter forms

Estimates and Co-operative Service.

On receipt of data giving description of sash and surrounding construction, the designing department will gladly submit sketches, suggestions and estimates for furnishing either standard or specially designed apparatus to exactly meet individual conditions; also estimates for erecting the apparatus.

Catalogue.

Our Catalogue illustrates and describes more fully our types of sash operating apparatus. It will be sent on request.

METALLIC SASH-OPERATOR CO.

23rd and Chestnut Streets
ST. LOUIS, MO.

CHICAGO REPRESENTATIVES: UNIVERSAL STEEL PRODUCTS COMPANY, 939-40 Webster Building

Products.

GEARED SASH OPERATORS.

Adaptability.

A complete line of these devices is manufactured by the company, to control any style or arrangement of solid steel, sheet metal or wood sash.

Co-operative Service.

A fully equipped engineering organization will, without charge, co-operate with engineers, architects, etc., in designing most economical and efficient sash operating equipment for individual or special installation anywhere. Inquiries are solicited. Further information, catalogues and *full sized details* furnished on request.

TENSION SASH OPERATOR, STYLE NO. 9

Designed for heavy top hung or continuous sash, or center pivoted sash in long runs. Construction of gear stations provides that shaft may twist at will without causing a binding action in rack and gear; thrust ball bearings reduce friction; erection costs are minimized by reason of simplicity of design. Made in 2 sizes.

SASH OPERATOR, STYLE NO. 4

For controlling top and bottom pivoted or side hinged sash, 200 ft. of either; shaft supported by roller brackets; power transmitted to gear by endless chain

SASH OPERATOR, STYLE NO. 1

For controlling side pivoted and top or bottom hinged sash, 100 ft. or less, according to weight and position; continuous chain transmission of power from hand to gear; 3 sizes of gears; 2 sizes of connecting arms; wrought shaft brackets, of any length

SASH OPERATOR, STYLE NO. 3

Same as style No. 1, except a hand wheel, bevel gear and $\frac{3}{4}$ -in. rod to transmit power from hand to gear

ESTABLISHED 1875

THE PAYSON MANUFACTURING COMPANY

Manufacturers of Sash Operating Devices and Builders' Hardware

2920 Jackson Boulevard
CHICAGO, ILL.

Products.

SASH OPERATING DEVICES as follows:

Duplex Operator, for heavy transoms.

Ideal Operator, chain control, for pivoted sash.

Superior Operator, hand wheel control, for pivoted sash.

Triumph Operator, hand wheel control, for pivoted sash, monitor type.

Victor Operator, chain wheel control, for vertically pivoted sash.

Monarch Operator, for single vertically pivoted sash.

Reliance Operator, chain or hand wheel control, for top or bottom hinged or heavy pivoted sash.

Peerless Operator, chain control, for top hinged continuous steel sash.

Simplex Transom Lifter, for all types of transoms;

Payson No. 1 Casement Adjuster, for all types of casement sash;

Payson Signal Sash Lock, for double hung windows;

Payson No. 50 Concealed Transom Lifter, for transoms where concealed device is required.

Specifications.

This list of Payson products is selected with the hope that it may be used freely by architects in writing specifications. The list contains standard articles that are guaranteed to give perfect satisfaction.

Torsion Operators.

Detail drawings and cuts are shown of four of the most generally used of the many types of operators we manufacture. So far as general design is involved, one of these four is almost certain to fulfil the requirements of any sash operating problem. The Ideal is used where chain control is required; and chain control is recommended because of its simplicity and ease of erection. The Superior, where a hand wheel must be used. The Triumph, for all monitor work where a hand chain hanging straight down can not be used. The Reliance, for lifting heavy loads and giving maximum ventilation.

X—Height of sash. A—Maximum length of run. B—Maximum distance from power to end of run. C—Standard opening in degrees.

Tension Operators.

Tension devices, Peerless "A" and "B," are fully described in our catalogue, which we would like to send if one is desired. We have worked for a number of years on tension devices to operate long runs of sash, and have finally accomplished two things: that most dangerous of all makeshifts, the counterweight, has been eliminated and we have invented and perfected the only tension device where the leverage power increases as the load increases. If architects want these improvements embodied in tension devices, specify the "Peerless" manufactured by THE PAYSON MANUFACTURING COMPANY.

Service.

Payson sash operating devices are *made to order*, using measurements taken from the plans and checked at the building. Every job is exhaustively studied by Payson engineers, and a drawing showing the scheme thought most satisfactory is prepared and submitted to the architect for approval as to layout and general design. After this approval is obtained, if there is any question as to measurements, drawings are forwarded to the building to be checked. Time is really saved in this way, because the operators can then be erected from the blue print with the certainty that every part will fit the place for which it is intended.

The architect should make liberal use of Payson service, as many times minor construction details make it necessary to change entire layouts, even to altering type of operator. For example, an interference by sway bracing may require change from the Peerless operator to the Reliance or Peerless "B." This should be determined, if possible, before specifications and plans have been sent out for estimates. By consulting with us the architect can be certain that the type of device named in his specification will fulfil all requirements, and often slight changes in construction are suggested which result in lowering cost.

STANDARD DETAIL OF SUPERIOR SASH OPERATOR

THE IDEAL OPERATOR (CHAIN CONTROL) IS NOW WIDELY USED THAN ANY OTHER TYPE OF SASH OPERATING MECHANISM. IT CONSISTS MAINLY OF A WORM & GEAR CONTROL, IS SELF LOCKING AT ALL POINTS - HORIZONTAL SHAPING OF VARYING SIZES FROM $\frac{3}{4}$ " TO $1\frac{1}{2}$ ", ON WHICH ARE CLAMPED DROP FORGED STEEL LEVERS ATTACHED BY CONNECTING RODS AND SASH PLATES TO THE ARM. A LARGE NUMBER OF SIGHTLY VARYING TYPES OF CONTROLS (WORM & GEAR POWER) HAVE BEEN DEVELOPED WHICH ENABLE US TO MEET THE PECULIAR AND VARYING CONDITIONS WHICH ARE CONFRONTED THERE. OFTEN, ON THE SAME JOB, SEVERAL TYPES REQUIRED; THE COMPLEST FORM IS ILLUSTRATED HEREWITH.

Wagner Overhead Trolley Carrier Systems.

For factories, warehouses, storerooms, docks and wherever heavy and bulky goods must be handled.

Send sketch with dimensions and proposed arrangement of track showing radius of curves, etc. A special engineering department is at the service of engineers and contractors. Drawings for proposed installations will be furnished without charge. Special work supplied where standard types shown do not meet requirements.

CARRIERS—Rigid and swivel types. Wheels, gray iron. Bearings, hardened steel rollers. Connecting bars, steel and malleable iron. Eyebolts and pendants, drop forged. Capacities specified below allow a wide margin of safety.

CAPACITIES OF CARRIERS

Number	Track	Capacity lbs.	Bottom of track to bottom of eye, in.	Length over all, in.	Wgt., lbs.
1200	40	1800	7	21¾	16½
1200	40	4000	9¾	48	42
300	15	180	3¾	5¾	3
502	15	500	5½	13	6

MISSISSIPPI WIRE GLASS COMPANY

220 Fifth Avenue
NEW YORK, N. Y.

TELEPHONE:
MADISON SQUARE 9370

BRANCH OFFICES

CHICAGO, ILL., 7 West Madison Street

ST. LOUIS, MO., 4070 North Main Street

Product.

"WIRE GLASS," for Windows and for Vault Lights.
Also best quality Figured Building Glass and Standard Rough and Ribbed Glass for skylights.

Mississippi "Wire Glass."

The MISSISSIPPI WIRE GLASS COMPANY is the original manufacturer of solid "Wire Glass," and its product is universally recognized as the standard wire glass, being the material upon which the Underwriters' standard was based in 1899.

By our process of manufacture, Standard "Wire Glass" is cast solid, and has an average of less imperfections than any "sub-standard" wire glass on the market.

"Wire Glass" is rolled plate glass having a wire netting embedded equidistant from either surface. This process is automatically effected while the glass is in a molten state and, therefore, insures homogeneous and solid "Wire Glass."

The quality of metal and process of manufacturing Standard "Wire Glass" produce the very highest quality, with a tensile strength second to none.

Adaptability.

The object of "Wire Glass" is to afford perfect and constant fire protection at a minimum cost, at the same time admitting and diffusing the light. It is particularly suitable for use in windows, doors, transoms, monitors, skylights and all places where fire or break-age protection is required.

Light Diffusion.

The light may be increased in a room 30 ft. or more deep to from 3 to 15 times its present effect by using Maze, Syenite, Factrolite, Pentecor or Ribbed "Wire Glass," instead of plain glass in the upper sashes.

Conducting Condensation.

"Pentecor," when installed in skylights set at a proper angle, will conduct condensation and prevent dripping.

Advantages.

When employed as above mentioned, "Wire Glass" may be fractured by severe heat or sudden shock, but the wire mesh will hold the shattered pieces in place, preventing their falling and causing serious injury or loss of life. It will also prevent draught and hold a fire within the bounds of its origin.

Underwriters' Requirements, Extract from Rules (1905)

(2) SIZE OF GLASS—(a) The unsupported surface of the glass allowed shall be governed by the severity of exposure and be determined in each case by the Underwriters having jurisdiction, but in no case shall it be more than 48 in. in either dimension or exceed 720 sq. in. (b) The glass to be of such dimensions, after selvage is removed, that the bearing in the groove or rabbet is not to exceed $\frac{1}{8}$ in. less than the full depth called for in rules 6 and 7. (c) The glass to be retained by the structural part of the frame or sash independently of the material which may be used for weatherproof purposes. Only non-inflammable material to be used in setting glass in the sash.

THIS LABEL (PRINTED IN RED) APPEARS ON EVERY PIECE OF THE STANDARD PRODUCT

ASCH BUILDING AND ADJOINING BUILDING, NEW YORK, N. Y.

Typifying efficiency, in modern fireproof construction, of "Wire Glass," as compared to inefficiency of old-style metal shutters with which the Asch Building was equipped.

Note the holes punched in the wire glass windows of the adjoining building by the firemen, to enable them to fight the fire from a point of safety, the wire glass windows forming a fire shield.

Reliability.

Mississippi "Wire Glass," having an indisputable reputation of being a superior product to the sub-standard makes, the company offers no guarantees as an inducement to stimulate sales. Customers know what they are getting when Mississippi "Wire Glass" is specified and installed.

How to Specify.

(Specify outright by name, and be protected.)

"Wire Glass" shall be installed in [specify location] and in all places marked W. G. on plans and elevations.

The "Wire Glass" to have a thickness of at least $\frac{1}{4}$ in. at thinnest point. Wire mesh to be not larger than $\frac{3}{8}$ in., and no wire used for such mesh to be smaller than No. 24 B. and S. gage. Plane of the wire mesh to be practically midway between the two surfaces of the glass.

Selva shall be removed from glass before framing.

[State here type or types of glass to be used and where.]

NOTE—Where the recognized standard and perfected product is required, specifications should call for "Wire Glass," the product of MISSISSIPPI WIRE GLASS COMPANY.

—Width—
POLISHED "WIRE GLASS"
Sizes up to 48 in. wide and 130 in. long
Thicknesses about $\frac{1}{8}$ and $\frac{3}{8}$ in.

Sizes up to 48 in. wide and 130 in. long
Thicknesses $\frac{1}{4}$ and $\frac{3}{8}$ in.

—Width—
FACTROLITE "WIRE GLASS"
Sizes up to 48 in. wide and 130 in. long
Thicknesses $\frac{1}{4}$ and $\frac{3}{8}$ in.

Factrolite for Industrial Buildings.

EFFICIENCY OF FACTROLITE—The MISSISSIPPI WIRE GLASS COMPANY has had practically every kind of glass tested to determine efficiency in light transmission and finds Factrolite to be far ahead of anything else suitable for installation in industrial buildings.

The accompanying report and plotting speak for themselves.

TEST OF FACTROLITE—The tests were made by measuring the distribution of light in two planes perpendicular with each other, with light from an incandescent lamp 3 ft. distant, falling normally upon and passing through the glasses. The relative light intensities are recorded in per cent of the normal (0°—normal—equals 100%.)

REPORT NO. 24558

DISTRIBUTION OF LIGHT TRANSMITTED THROUGH FACTROLITE—INCIDENT LIGHT ON ROUGH SIDE OF GLASS—RELATIVE LIGHT INTENSITIES

Angles	First Plane		Plane Perpendicular to First Plane	
	Right	Left	Right	Left
0 (Normal)	100%		100%	
2½	60.5	86.5	85.2	75.4
5	41.8	51.8	41.0	28.9
7½	24.0	30.6	15.8	13.8
10	9.88	13.3	1.33	9.14
15	1.43	4.45	.39	1.31
20	.101	.81		

Total light transmitted through Factrolite incident light normal on rough side of glass: 84.5%.

ECONOMY OF FACTROLITE—Today, as never before, owners of industrial buildings are coming to realize that the utilization of daylight to its fullest extent by the use of proper glass means the conservation of energy required for artificial lighting, and the maximum production of the employees.

Whereas more heat is required to maintain a given temperature in a building with 80% of its wall area glass than is required for a wall area of 20% glass,

this additional heat is required for only five months of the year, whereas, with the 20% glass area, it is necessary to artificially light the building a large part of the time.

Factrolite breaks up the rays of the sun, diffusing the light and distributing it equally.

INSPECTION INVITED—Before placing a contract for glass, those interested are urged to get a sample of Factrolite and compare it with every other make of glass recommended for industrial buildings.

Without a doubt, they will become convinced that Factrolite offers the maximum of lighting efficiency with the minimum of cost, thus reducing the overhead and cost of maintenance, and increasing the efficiency of manufacturing the commodities.

Tests Made by the Electrical Testing Laboratories Showing Transmission and Illumination.

Test Report No. 28482 rendered to the MISSISSIPPI WIRE GLASS COMPANY on the distribution of illumination through figured sheet glass windows in a model room made by the Electrical Testing Laboratories of New York City.

OBJECT—An investigation to study the distribution of daylight illumination in a room with various types of ¼-in. figured sheet glass used in the window.

TEST ROOM—Model—Representing a room 50 by 100 by 14 ft.

Scale—1 ft. equals 25 ft. (24 by 48 by 7 in.)

Windows—Continuous on one side of room 3 ft. high, sill 4 ft. from floor.

Ceiling and Walls—White glass finish (commercial factory paint.)

Floor—Brown linoleum (having reflection factor of average factory floor.)

TEST STATIONS—Test stations in five lines, as shown.

SOURCE OF LIGHT—Concentrated filament incandescent lamp, representing the sun at 30° from horizon. The intensity of the sun was approximately proportioned to the size of the room.

Sky uniformly bright within \pm 20%.

Light within the room—direct sunlight, 80% ; sky-light, 20%.

RESULT OF TESTS—Transmission of light through glass samples, in per cent of clear, Clear Glass taken as 100%.

Rough wire.....	98%
Syenite	87%
Maze wire.....	82%
Factrolite wire.....	88%
Pentecor wire horizontal.....	90%
Pentecor wire vertical.....	94%
Ribbed vertical.....	96%
Ribbed horizontal.....	99%

Horizontal illumination of working plane, equivalent to 40 in. above floor.

Samples.

Samples of the MISSISSIPPI WIRE GLASS COMPANY's products are filed with the Architects Samples Corporation, New York City.

WIRE GLASS: Aqueduct, Cobweb, Ribbed, Rough, Florentine, Polished.

CORRUGATED WIRE GLASS.

Glass without Wire: Cobweb, Ribbed, Rough, Florentine.

Wire Glass.

PROCESS—Solid wire glass, made by the Pennsylvania continuous process, is formed complete by one pouring and one rolling. It is the only process that makes possible the manufacture of wire glass as thin as $\frac{1}{8}$ in.

APPROVAL—Wire glass, made by the PENNSYLVANIA WIRE GLASS COMPANY, having the distinctive mark (Cabled Strand) is standard under the rules of the National Board of Fire Underwriters.

FIRE PROTECTION—Wire glass is a valuable fire retardant, and therefore a safeguard to human life, and an important factor in the reduction of insurance rates. It is insisted upon by insurance underwriters in all instances where there is any fire hazard.

QUANTITIES AND SAMPLES—Quantities will be listed from drawings furnished this company and approximate estimates provided. Our engineering department offers gratuitous advice on all glass problems.

Requests for samples should be made to the main office in Philadelphia, Pa., where they will be promptly acknowledged.

SPECIFICATIONS—Engineers should always specify "Solid Wire Glass manufactured by the PENNSYLVANIA WIRE GLASS COMPANY," and "to comply with the rules and regulations of the National Board of Fire Underwriters."

Corrugated Wire Glass.

DESCRIPTION—Corrugated wire glass is the new wire glass making possible the most economical and efficient building construction. It gives great diffusion of light and heat rays, reducing to a minimum shadows and glare.

ADVANTAGES—Corrugated wire glass is the best and cheapest form of construction where maximum amount of light is required. It is weatherproof and dustproof; the latter on account of its smooth surface—dirt and germs will not adhere to it. There is practically no up-keep. Buildings in which corrugated wire glass is installed have a modern, up-to-the-minute appearance. Corrugated wire glass is one of the best fire retardants used in building construction.

TRADE-MARK

DAYLIGHT BUILDING—By using corrugated wire glass in roofs and side walls, a daylight building is obtained, without any shadows, glare or objectionable features.

Corrugated wire glass can be used in roofs and side walls alone, or in combination with corrugated iron or corrugated asbestos of equal pitch.

STANDARD SPECIFICATIONS—Materials—All glass marked or shown "C.W.G." on plan, or specified, is to be corrugated wire glass manufactured by the PENNSYLVANIA WIRE GLASS COMPANY, Pennsylvania Building, Philadelphia, Pa.

Provide all the necessary metal cover strips, inner strips, bolts, lead washers, asphalt strips, asphalt paint and any special iron clips or metal strips, and all labor and materials necessary to make a watertight and workmanlike job, satisfactory to the owner or engineer. All materials shall be furnished and installed in accordance with plans and details, and the following specifications:

Method of Laying—Lay glass edge to edge, and allow a space between the sheets of glass as shown on plans. Cover joints with a $2\frac{3}{4}$ -in. asphalt strip, painted on the glass side with asphalt paint, the full length of sheet of glass. Then cover outside with $2\frac{3}{4}$ -in. wide, and inside with $1\frac{1}{2}$ -in. wide, No. 24 gage galvanized iron or other suitable metal strips, full length of glass.

The glass to be hooked to purlin with iron clips as shown, with lead washers, and $\frac{1}{4}$ -in. round head stove bolts. Tighten bolts just snugly. Between the purlins or main fasteners, put in intermediate fasteners (consisting of $\frac{1}{4}$ -in. round head stove bolt with lead washer securely screwed down) every 10 or 12 in.

Roofing—Roofing where shown "C.W.G." to be laid on purlins protected by a 2-in. asphalt strip painted with asphalt paint. Care must be taken to pack purlins with asphalt so that glass lies true and straight. Provide asphalt strips, special cover caps, inner strips, bolts, etc. at joint of cornice and glass, or where glass comes in contact with masonry, as shown on scale details.

Side Walls—Side walls to be constructed in accordance with details, with all necessary parts as shown, to make an air and watertight job. All openings to be filled with Minwax, Arco Sealit or equally elastic cement.

All glass which comes in contact with metal or masonry must be protected with asphalt strips between glass and metal. All metal work to receive one coat of asphalt paint as a priming coat.

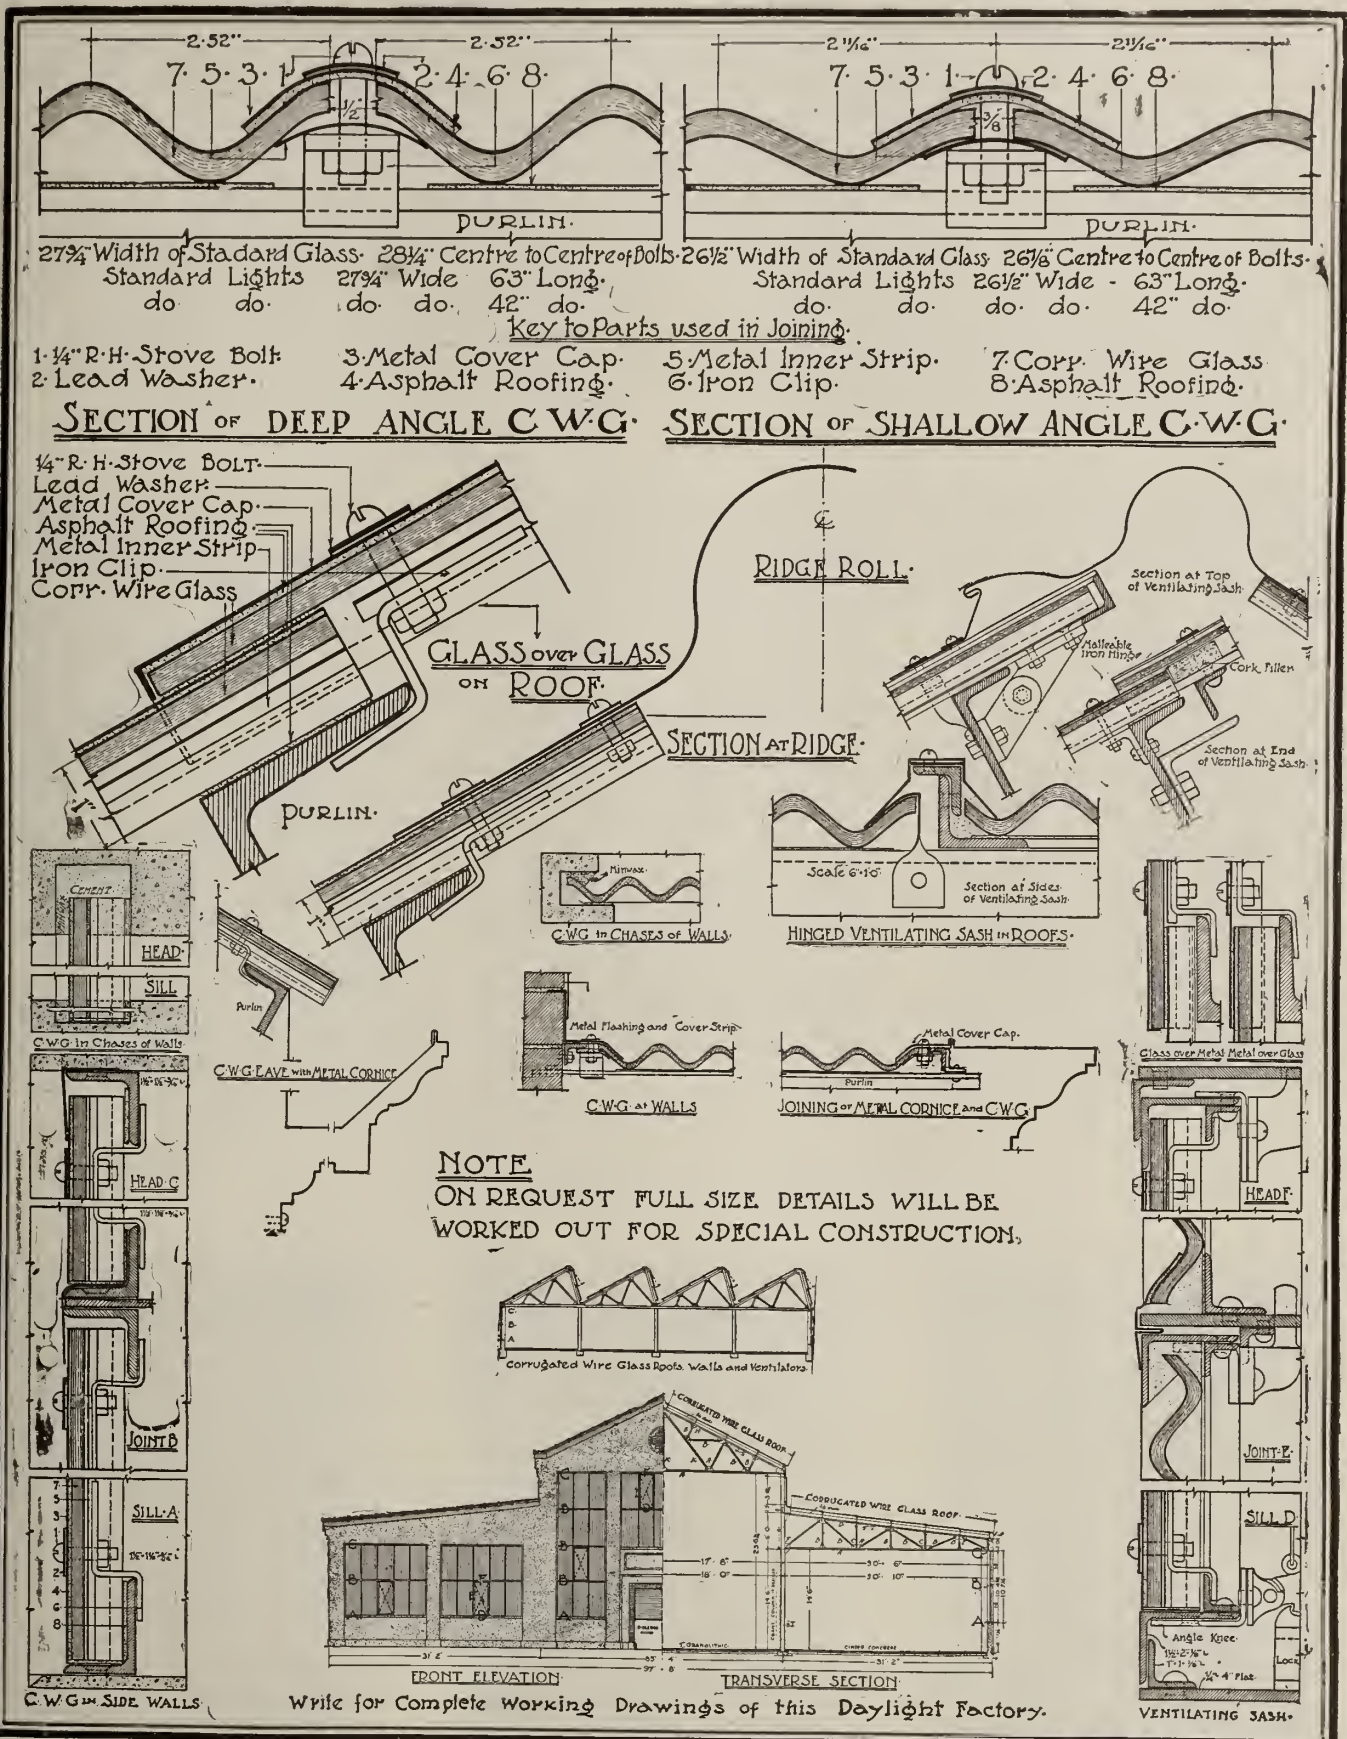

Exterior View—Metal Cover Strip

Interior View—Metal Inner Strip and Iron Clip with Purlin

THE WESTERN GLASS COMPANY

Manufacturers of Figured and Wire Glass

STREATOR, ILL.

Products.

FIGURED GLASS.
WIRE GLASS, Plain and Figured.
ROUGH and RIBBED GLASS.
SHEET PRISM GLASS.
POLISHED WIRE GLASS.

Figured Glass.

This is designed for use in hallways, areas, interior partitions, and similar constructions, where the admission of light without transparency is desired.

Made of the best materials obtainable and moulded in attractive patterns, it adds materially to the decorative effects of such installations.

Its distinctive advantages for this service have given it an established reputation.

DESIGNS—The figured glass is made up in a large number of designs, some of which are illustrated in the accompanying cuts. This glass can be supplied to match any style of architecture and to conform to architect's or builder's requirements.

SIZES AND WEIGHTS—Made in thicknesses of $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ in., with maximum dimensions of 48 by 120 in., and 48 by 132 in.

Rough and Ribbed Glass.

Made in thicknesses of $\frac{1}{8}$, $\frac{3}{16}$, $\frac{1}{4}$, $\frac{3}{8}$ and $\frac{1}{2}$ in., with maximum dimensions of 48 by 120 in. for $\frac{1}{8}$ in. thickness, and 48 by 132 in. for other thicknesses. Especially adapted for heavy service in skylights, partitions and factory windows.

$\frac{3}{4}$ in. thick glass is furnished in rough glass or rough wire glass in cut sizes, not stock sheets.

Solite Glass

Used where the maximum *diffusion* of light, as well as the maximum *amount* of light is required.

Nearly 200,000 sq. ft. of $\frac{1}{4}$ -in. Solite glass was specified and used in the Naval Supply Base Building, Brooklyn, N. Y.

Special samples of Solite glass sent on application.

Wire Glass.

Wire glass can be furnished in any of the regular figured designs or in polished transparent sheets, as desired.

Made in thicknesses of $\frac{1}{4}$, $\frac{3}{8}$ and $\frac{1}{2}$ in., in sizes up to and including 48 in. wide by 132 in. long.

It is made by a single-pour process and the reinforcement is a special wire fabric of our own design, with 3 twists and 5 loops at the vertical strand.

By our method of manufacture, this fabric is incorporated in the sheet of molten glass while it is being rolled.

This makes the finished product better able to stand severe strains and sudden temperature changes.

The wire strand used is so thin that it does not obstruct the light and is scarcely noticeable under ordinary conditions.

FIRE AND ACCIDENT PREVENTION—The main reason for using wire glass is the reduction of the fire and accident hazards.

Properly installed, wire glass furnishes an effective barrier to the spread of flames through exposed windows and other openings.

In this connection our product has stood the severe tests imposed by the Underwriters' Laboratories, Inc.,

MOSS FIGURED GLASS

CARNATION FIGURED GLASS

COMET FIGURED GLASS

and has been fully approved by the Fire Underwriters' Association.

Each sheet bears the identification marks of the Underwriters' Laboratories, Inc.

In windows subject to heavy wind pressures or liable to injury from carelessness or from flying bodies, the installation of wire glass insures against injury to pedestrians from falling glass and against the resulting damage suits.

SIZES—Standard wire glass is made as near as possible to $\frac{5}{16}$ in. thick in accordance with the rules of the Underwriters' Laboratories, Inc., covering standard construction of fireproof windows and skylights.

All kinds of wire glass furnished in the standard $\frac{1}{4}$ and $\frac{3}{8}$ in. thicknesses.

Wire glass is furnished in other thickness as called for by engineering requirements.

Sheet Prism Glass.

Where it is desired to project daylight well back into an interior, our sheet prism glass is an effective glazing medium for producing the maximum lighting efficiency.

Furnished in standard thickness and in sizes up to 50 in. wide and 132 in. long.

PIERRE DUVINAGE

OWEGO FOUNDRY CO., SUCCESSORS

Manufacturer of Spiral Stairs and Cast Iron Work for Buildings

TELEPHONE CONNECTION

OWEGO, TIOGA CO., N. Y.

Products.

DUVINAGE IRON SPIRAL STAIRS, POST CAPS, WALL PLATES, PIER PLATES and BRACKETS, SILL PLATES, WOOD ROOF TRUSS CASTINGS and RODS.

Cast Iron Work, Trussed Girder Rods and Struts, Cast Iron Columns, Bases and Plates, Wheel Guards, Jamb Guards, Saddles or Sills, Shutter Eyes, Cast Iron Clean-out Doors, Trap Pit Covers, Lintels.

Special Castings; Special Cast Iron and Fittings for sewage disposal plants, water works, and powerhouses; Revolving Domes for astronomical observatories.

Machinery Castings.

Duvinage Iron Spiral Stairs (Patented Feb. 13, 1917).

Duvinage spiral stairs have been erected and approved for their simple, durable construction as well as their economy in floor space, in offices, stores, mezzanines, boiler rooms, sewage disposal pumping wells, power plants, gas houses, water towers, etc.

They are made of the best grade of iron; have single 1-in. pipe railing on stairs and around well; and center pipe is 3 or 4 in., according to size and height of stairs.

The regular stock treads of these stairs are made so that they can be used either right- or left-hand (illustration shows right-hand) and 12 or 16 treads to the circle, as tabulated. Modifications in riser heights are affected by height between floors.

ELEVATION AND PLANS OF PIERRE DUVINAGE SPIRAL STAIRS

To provide sufficient headroom under top platform, the risers should not be less than $8\frac{1}{4}$ in. high. By calculating the number of risers required, the relative positions of starting and landing points can be determined, so as to decide whether a right- or left-hand stair would be best suited.

Prices, catalogue and further information on application. In ordering, give diameter, distance between

floors, starting point and position of landings desired.

Products.

FIRE ESCAPES; STAIRS;
COLLAPSIBLE GATES; WOVEN
WIRE WORK.

Ornamental Bronze and
Iron Work and a large and
miscellaneous list of Iron
and Wire Work, including
Machine Guards.

Fire Escapes.

Manufactured in ac-
cordance with the state laws
and local ordinance require-
ments.

When writing for esti-
mates, etc., give sketch, with
elevation of building to
which fire escape is to be at-
tached; distance from fin-
ished floor to finished floor;
thickness and nature of floor
and wall construction; size
and location of all windows
and door openings.

FIRE ESCAPE

Collapsible Gates.

A very valuable protective device manufactured in a variety of designs and sizes to meet any particular purpose and condition. Collapsible gates are being used very widely for the protection of entrances where it is imperative that the passageway and the wall space shall not be obstructed when the gates are open. They are frequently used in connection with the guarding of machines where the collapsible feature permits easy access for repairing and oiling.

Also used to advantage on delivery trucks and wagons.

In writing for prices and designs state purpose in-

COLLAPSIBLE GATE

tended, also size of opening and whether or not an over-
head track can be used and height the track must clear.

Woven Wire Partitions.

Afford a very economical means of subdividing space in industrial plants. In addition to their low cost they have the advantage of simplifying the lighting, heating and ventilating problems, since they permit the unrestricted passage of light, heat and air. They are easily installed, and any space subdivided can be readily diminished or increased according to the existing requirements, simply by the removal or addition of separate panels. They are neat in appearance, strong, require practically no upkeep, and occupy but very little space in themselves. They afford protection and promote cleanliness and orderliness. Used very extensively for tool rooms, stock-rooms, machine rooms, cashier cages, etc.

These partitions are manufactured in either the square mesh or diamond mesh. The square mesh panel is lower in cost than the diamond, due to the fact that the cloth is machinemade. The diamond mesh is hand woven and is usually preferred where considerations of strength, appearance and durability are important.

Standard panels are 4 by 8 ft., No. 10 wire, 1½-in. mesh, and are interchangeable. These partitions are manufactured to suit requirements. Where desired, the base section can be made of sheet metal with sheet metal countertops. Window and door openings can be arranged to swing or slide in direction desired. The framing likewise can be made of either pipe or structural shapes, depending upon the degree of rigidity required, and the conditions existing.

When writing for prices, send sketch showing the general floor layout, giving approximate sizes; also state height finished floor to ceiling, and the nature of the floor, column and ceiling construction, whether concrete, tile, wood or plaster on metal furring.

Woven Wire Fencing of Regular or Non-climbable types, Window Guards, Machinery Guards, Tool Room Enclosures, Wire or Iron Lawn Fences and Gateways, Tennis Court Enclosures, etc.

TRADE-MARK

TYPE NO. 1103 AFCCO WIRE LINK FENCE

Fence 7 ft. high over all, enclosing plant of E. R. Durkee & Co. Entire framework galvanized, and all posts set in concrete footings. Fabric is 2-in. mesh of No. 6 wire

Co-operative Service.

Practically every factory or institution fence presents its own peculiar construction problems. The design and estimating department of this organization is composed of men who have been meeting these problems for years, and to supplement their work, the services of this company's district representatives are available without obligation at many points in the Eastern, Central and Southern States.

The prospective user of fencing is urged to avail himself of this service, or to send for the complete Afcco Factory Fence Catalogue.

Erection.

A large percentage of this company's output of fence is erected by them complete. To take care of this important department a well equipped construction force is maintained, but when erection by this company is not desired, shipments of materials are accompanied with instruction drawings and setting plans, showing proper method of erecting, and insuring mechanical workmanship in every detail.

TYPE NO. 1003 AFCCO WIRE LINK FENCE

Fence 8 ft. high over all enclosing Army Supply Base buildings. This type differs from No. 1103 in that no top rail is used. Posts are galvanized and grouted 12 in. into concrete wall. Fabric is 2-in. mesh of No. 9 wire. For this particular piece of government work the barbed wire overhang was flared out instead of in, the inward flare being the usual procedure

Afcco Factory Fence Features.

END, CORNER AND GATE POSTS—In Afcco fences these posts are made of unusually heavy tubular sections (see Specification data).

DETAIL OF TYPE NO. 1103 WIRE LINK FENCE

Showing method of bracing at ends. Regular stock heights 7 and 8 ft. Other heights up to 10 ft. can be furnished

DETAIL OF AFCCO DOUBLE SWINGING GATES MADE WITH DOUBLE CORNER GUSSET PLATES

Center latch and drop bolt. Adjustable hinges to allow for full swing. Stock widths single gates 3½ ft.; double gates, 10, 12 and 18 ft.

FULL SIZE DETAIL OF ANGLE BAR LINE POST AND ELEVATION SHOWING LINE POST CONSTRUCTION

Note barbed wire arm is integral with post; also hole punched just below bend for pipe rail. This overcomes necessity for using separate parts, such as rail caps and barbed wire arms, assuring greater strength and durability

LINE POSTS—The backbone of any fence is its line posts. For that reason the standard spacing for line posts in Afcco fences is 8 ft.

These line posts are 2 by 2 in. high carbon steel angles, having a wall thickness of $\frac{1}{4}$ in., with integral arm for carrying the barbed wire overhang. For fences with top rail such as type 1103, one leg of the angle is punched for the rail to pass through. Thus all bolted parts or slipover fittings are eliminated, and the framework can not be broken down or dismantled after having been assembled.

DETAILS OF INTEGRAL BARB WIRE ARM ON ANGLE POSTS
Note simplicity and strength

WIRE LINK FABRIC—Afcco wire link is made of galvanized wire, carrying 70 lbs. of spelter per ton, nearly double the quantity used on ordinary galvanized wire. After weaving, this fabric receives a special oil treatment which further increases its rust resisting qualities.

DETAIL "AFCCO" GALVANIZED WIRE LINK STEEL FABRIC, 2-IN. MESH

In widths up to 12 ft. Nos. 9, 6 or 4 gage wire

DETAIL "AFCCO" "VEE" MESH STEEL FABRIC, HORIZONTAL CABLES, 4 IN. APART

In widths up to 8 ft. No. 12½ gage wire

DETAIL "AFCCO" HONEYCOMB FABRIC

In widths up to 6 ft.; 2-in. mesh No. 15 wire, galvanized after making

GALVANIZING—In Afcco fences with galvanized framework the galvanizing is done by the hot dip process *after fabrication*, covering all cut ends, punched holes, etc. No raw metal is left exposed. All bolts used are hot dip galvanized, the threads not being recut, a radical departure from the method in common practice.

POST FOOTINGS—Afcco fences are erected with posts set in concrete. Contrary to common opinion this costs no more than other methods of anchoring posts, insures permanent alignment of the fence, and preserves the steel underground.

Specification Data Afcco Factory Fence.

POSTS—End and corner posts 3-in. outside diameter. Gate posts 4-in. outside diameter wrought pipe with horizontal pipe braces and 2-ply No. 7 galvanized wire truss cables.

Line posts Afcco 1-piece angle, with integral arm, to be spaced 8 ft. apart, set 3 ft. below grade. Galvanized or painted.

TOP RAIL—Tubular $1\frac{3}{8}$ -in. outside diameter wrought pipe. When desired a $1\frac{3}{8}$ -in. rail can be substituted, and line posts spaced 10 ft. instead of 8 ft. apart—8-ft. spacing recommended.

Fences without top rail to have two courses of No. 7 coiled steel supporting wires stretched top and bottom.

GATES—Single or double swinging up to 24 ft., or overhead track sliding types.

Frames of 2-in. T-Section, heavily braced, and corners reinforced with double gusset plates.

FABRIC—Galvanized wire link, triangular mesh, or honeycomb mesh (Afcco wire link 2-in. mesh No. 6 wire recommended for severer services). [Give height and size of mesh.]

Barbed wire overhang 4-point, thick-set galvanized, three or more courses.

GALVANIZING—All posts and their fittings to be hot dip galvanized after fabrication.

Galvanized bolts to be used in assembling. (Threads not recut.)

PAINTING—When galvanizing is not specified for framework, paint 1 shop coat, also 1 field coat before galvanized wire fabric is attached.

ERECTING—Set all posts in concrete footings (ordinarily 3 ft. deep); area for end, corner and gate posts not less than 15 in. in diameter, and for line posts not less than 10 in.

Afco Wrought Iron Fences and Gates.

Illustrations show the 3 leading types of wrought iron fences and gates designed by this company for factory enclosures.

Afco factory fence catalogue showing various other designs, also methods of installation, and containing much valuable information, will be mailed on request.

No. 325 Special Iron Picket Fence.

In connection with simplicity and great strength, this design incorporates low erection cost by virtue of the panels being made in 10-ft., instead of the ordinary 8-ft. lengths. This reduces, by 20%, the number of holes to dig, posts to set and panels to hang.

SPECIFICATIONS—Pickets $\frac{3}{4}$ -, $\frac{7}{8}$ -, or 1-in. square wrought iron. Rails 2 by 2 by $\frac{1}{4}$ -in. angles, or 2 by 1 by $\frac{1}{8}$ -in. channels. Line posts 3-in. I-beam, $5\frac{1}{2}$ -lb. section for heights up to 6 ft.; $7\frac{1}{2}$ -lb. section for greater heights. No back bracing required with these posts. Posts set 18 in. into concrete footings which extend not less than 36 in. below grade. Panels 10 ft. long equipped with heavy center supports.

No. 152 Iron Picket Fence.

Similar in general to design shown on top of page, except that in this fence there are 3 horizontal rails of 2 by $\frac{5}{8}$ -in. solid iron, and the entire work stands on a concrete coping. Line posts enter concrete 12 in.

Angle Picket Railing.

The vertical members in this design are high carbon steel angles instead of solid bars, making a difference of about 25% in weight with a consequent reduction in cost. This reduction in weight makes it practical to rust-proof this type of fence by hot dip galvanizing in panels after fabrication. No painting is then required.

SPECIFICATIONS—Pickets 1 by 1 by $\frac{3}{8}$ -in. angles on 5-in. centers, or $1\frac{1}{4}$ by $1\frac{1}{4}$ by $\frac{3}{8}$ -in. on 6-in. centers. Rails 2 by 2 by $\frac{1}{8}$ -in. angles. Line posts, regular adjustable picket post with back supporting brace and cast iron ground base, or 3-in. standard I-beam section to set in concrete. Panels 8 ft. long equipped with center supports.

Special Gates.

Massive iron gates at the main factory entrance are decidedly attractive. They can be used in connection with wire as well as iron fence without greatly increasing the cost. The view shown herewith is a good example of what can be accomplished.

In this instance massive brick piers were used, ornamented at the top with specially designed lamps. Width of gates 20 ft. Height at center 7 ft. 6 in.

Note ornamental panel effect at center and on each side.

The extreme width of these gates was made necessary owing to the driveway entering at an acute angle.

Many other designs showing factory gate installations can be submitted.

**NO. 325 WROUGHT IRON RAILINGS, 7 FT. HIGH**

Posts are $7\frac{1}{2}$ -lb. I-beam section set in concrete. Pickets $\frac{3}{4}$ in. square, set diagonally. This fence can be furnished in all heights from 4 ft. up to 8 ft.

**NO. 152 IRON PICKET FENCE, 6 FT. HIGH, ENCLOSING PLANT OF THE CROWN MFG. CO., PAWTUCKET, R. I.**

Pickets $\frac{3}{4}$ -in. square, set square. Horizontal rails 2 by $\frac{5}{8}$ -in. solid. Posts are $5\frac{1}{2}$ -lb. I-beam section, ornamented with pineapple heads

**ANGLE PICKET FENCE AND GATES, 6 FT. HIGH, ENCLOSING PECK MEMORIAL HOSPITAL GROUNDS, BROOKLYN, N. Y.**

At a distance of only a few feet this fence has the appearance of an unusually massive solid picket fence

**SPECIALLY DESIGNED WROUGHT IRON FACTORY ENTRANCE GATES, MAIN DRIVEWAY ENTRANCE TO BAER BROTHERS PLANT, STAMFORD, CONN.**

WOVEN WIRE FENCING and STEEL GATES for all purposes.

For Wire Rope, see pages 78-84; for Concrete Reinforcement, see pages 158-63; for Electric Wires and Cables, see pages 1092-1108.

Quality of Wire.

The company makes large quantities of both Open Hearth and Bessemer steel, using both kinds extensively in the manufacture of American fence, with equally good results. The wire used is just right for fence purposes, not too hard nor too soft. It is tough and strong, and can be spliced with ordinary fence tools. When galvanized by our superior process, it makes the best woven wire fence that can be produced.

Quality of Galvanizing.

After being properly cleaned, the wire is passed through a bath of molten zinc or spelter, as it is commonly called. The wire is never passed through the zinc bath more than once, because to pass it through the second time would melt off the first coat of zinc. The terms "double galvanized" and "triple galvanized" are, therefore, entirely misleading, because no double or triple galvanized wire is made. A uniform coating of zinc applied so as to avoid bare and thin spots on the wire is far more desirable than a heavy uneven coating with portions of the wire poorly protected.

After many years devoted to scientific investigation, the AMERICAN STEEL & WIRE COMPANY has been able to determine the proper speed, temperature, etc., that should be used in galvanizing the different sizes of wire, to secure the best results.

Fences and Gates for Industrial Plants, etc.

PARK AND PADDOCK FENCE—A clean and distinctly efficient fence for yards surrounding manufacturing plants, as by virtue of the extreme heights and the strength of the large No. 9 wires made of hard steel, property is thoroughly walled in without the expensive and unclean features of the wooden or brick wall.

Also especially adapted for parks, fair grounds, racetracks, country clubs, golf clubs, tennis courts, zoological gardens, branding pens and stockades.

With the use of a strand of barbed wire at the extreme top, and in some cases with two or more barbed wires arranged horizontally, upon brackets, the largest protection may be obtained. When erected upon our galvanized steel posts it becomes an enduring investment, requiring no attention for repairs nor to guard against fires.

PARK AND PADDOCK

GATES—Especially strong gates with large tubular steel frames and filled with all No. 9-gage Park and Paddock fence fabric. These gates are firmly braced by 2 horizontal and 1 vertical brace. Made in widths of 10, 12 and 14 ft., and in six heights to match Park and Paddock fence.

CONSTRUCTION OF PARK AND Paddock FENCE — (See illustration below.) Fig. 1 is side view of upright or stay wires, showing each stay to be a separate and distinct wire. It also shows the stays as they appear in the fence when upright. Fig. 2 shows action of stays when unusual pressure is brought against the fence. Fig. 3—When pressure is removed, the fence will resume its original position. Figs. 4 and 5 show the tension curve, the pull of expansion and contraction.

PARK AND PADDOCK FENCE
All No. 9 gage wire. Stay wires 6 or 12 ins. apart. Put up in rolls of 20 rods each

DIAMOND LAWN FENCE—This fence is suitable for use around industrial plants, and for similar purposes to those for which the Park and Paddock fence is employed.

The triangular truss used is the strongest form of construction known. The diagonal or cross wires are so interwoven with the horizontal cables that slipping is impossible. This gives the fence exceptional strength and rigidity. At every second cable the cross wires are wrapped around the cable, thus forming a perfect hinge joint. Under a heavy or sudden pressure the fence will act just like a hinge, and when the pres-

American Galvanized Steel Fence Posts.

The American post has 18 years to its credit in actual service in the field throughout the entire country, in all kinds of soil and subject to all sorts of conditions. The following are a few of its advantages:

Sufficient strength; will withstand exposure to atmospheric conditions, fire, lightning, etc. Not lifted by frost; occupies as little space as possible; equal resistance in all directions; readily detached from fence. Easy to set, requiring no special tools; practically indestructible. Can be driven in ordinary soil; easily set in hard earth or pebbly soil by boring 2-in. hole. No staples required; adapted for any style woven wire fence, barbed or smooth wire; light in weight, easily handled; can be moved without injury and reset.

EXTENSION ARMS FOR AMERICAN STEEL POSTS—For use with American galvanized steel fence posts, these arms are made to carry 4 lines of barbed wire. No staples required. The arms are neat, strong and easily attached. They are shipped detached and are fastened to the posts by 2 bolts, thoroughly coated with zinc.

experience thus acquired is offered for the solution of problems.

At New York, and also at the several branches, is maintained a force of men skilled in putting up our fences and in solving construction problems. When a customer prefers to erect a fence, instructions and necessary tools are furnished.

Information Required for Estimates.

Engineering and Erecting Service.

ANCHOR POST IRON WORKS has been called upon, by many industrial corporations and railroads, to design fences to meet a wide variety of conditions. The

In writing for prices or ordering, draw a simple diagram showing length of fence lines; location of gates, corners and ends; width of gate openings, single and double. State whether ground is level or graded.

PLATE NO. E3691. 8600 FEET OF STANDARD ANCHOR POST CHAIN LINK FENCE, ERECTED FOR PETROLEUM IRON WORKS, SHARON, PA.

Height	8 ft.
Posts	Galvanized Anchor posts
Fabric	Chain link woven steel—wire No. 6 gage

Anchor Posts.

Anchor posts are U-bars of high carbon steel and, together with all other parts, are heavily galvanized above and below ground, preventing rust and insuring long service. Posts are driven into the ground and held rigidly erect by two anchor stakes driven through slots clamped to opposite sides of the posts.

Chain Link Woven Steel Fences.

Chain link woven steel is of the best quality galvanized steel wire of No. 9 or No. 6 gage, No. 6 being the size most used. Made in any width up to 10 ft. The mesh is so small it affords no foothold for fence climbers; and as an additional protection 3 or more strands of barbed wire are fastened to inwardly inclined arms attached to the tops of posts.

Fence is furnished with or without top rail of galvanized pipe. Posts and all fence parts are galvanized by hot dip spelter process. Under conditions where protection is of utmost importance, these fences are made 10 ft. in height, and diagonal arms and barbed wire are attached to both front and back of posts; the spread across the top is about 2 ft. The gates are as unclimbable as the fence.

Triangular Mesh Fences.

To meet conditions which do not demand the heavier chain link fence, this company builds an unclimbable fence of moderate cost but of great strength and durability.

The posts are regular Anchor posts, size No. 2, set 8 to 10 ft. apart. Fence is made in heights from 4 ft. up to 8 ft. Triangular mesh fabric is of 2-ply cables, 4 in. apart; the upright wires are 2 in. on centers; No. 12½ wires are used for both. Inclined inward from the post tops are steel arms, on which are stretched two or more strands of barbed wire. Posts, fittings and fabric are thickly galvanized.

Chain Link Gates with Electrically Welded Frames.

Rigidity and strength are the most important characteristics of these gates. Their great strength is secured by joining the top and bottom rails of 2½-in. galvanized pipe, to double uprights of 2-in. channel by means of channel corner plates *electrically welded* to the uprights. The corners so formed are fused together into a single absolutely unbreakable and unbendable piece.

The center lift rod holds the gates at both the top and bottom. The padlock can be reached equally well from either the inside or outside of the gate. The hinges are of extra strong malleable iron and so made that the gate can be swung open 180°, or back parallel to the fence line, a feature which is sometimes of the utmost importance, especially on railroad sidings.

Another exclusive feature of this gate is the method by which the chain link panel is fastened between the channel uprights and stretched up taut by means of hook bolts.

PLATE NO. E3536. CHAIN LINK WOVEN STEEL FENCE

Fabric.....Chain link woven steel—wire No. 6 gage
Line posts.....Galvanized Anchor posts, size No. 3, 2½-in. steel U-bar, set 8 ft. on centers
End and corner posts.....3-in. steel pipe
Gate posts.....4-in. steel pipe

PLATE NO. E4617. ELECTRICALLY WELDED IRON RAILING, ERECTED FOR THE HARTFORD HIGH SCHOOL, HARTFORD, CONN.

Height.....6 ft.
Pickets..... $\frac{3}{4}$ -in. grooved square
Rails..... $\frac{3}{4}$ -in. grooved square double rails
Posts.....3 in. I-beam, set with drive anchors
Panels.....Standard length, 10 ft.; height, 6, 7 or 8 ft.

PLATE NO. E4596. RAILING ERECTED FOR NEW YORK, NEW HAVEN & HARTFORD RAILROAD CO., PAWTUCKET, R. I.

Height.....5 ft.
Pickets..... $\frac{3}{4}$ -in. square
Rails.....2x2 in. channels
Posts.....3-in. I-beams, set in concrete
Panels.....Standard length, 10 ft.
Length.....12,000 ft.

PLATE NO. E4606. ELECTRICALLY WELDED DOUBLE GATES AT THE FACTORY OF THE DURATEX COMPANY, NEWARK, N. J.

Electrically Welded Railings and Gates.

A new and quite revolutionary process in the manufacture of railings and gates has recently been perfected.

ANCHOR POST IRON WORKS has secured the rights of manufacture, and has installed the necessary electrical machinery for the manufacture of railings and gates of every size and weight, from those made of light iron bars of $\frac{1}{2}$ -in. square, up to the very heaviest forms required for any service. By this process, the rails, pickets or other members are welded together at all points of intersection under a heavy electrical current, combined with a mechanical pressure of from 1 to 5 tons exerted at the moment the weld is made. This insures an absolute and unbreakable union of the metal of both the pickets and the rails.

Railings and gates made in this way are remarkably strong and rigid. Each unit, that is, each panel of railing, or each gate, being welded into practically one piece of metal, is free from weak joints or rivets.

Bulletin No. 24 describes this type of railing. A copy will be sent on request.

Iron Gates.

These gates are made to match the railing; the rails and pickets being the same as in the railings.

The gates are hung on strong, malleable iron

PLATE NO. E4531. IRON DOUBLE GATE

hinges; and are equipped with drop bolt in the center, hasp and padlock.

The gate posts are our standard posts No. 100 or No. 200; 3 in. or 4 in. square, respectively.

These posts are usually set in concrete.

PLATE NO. E4460. WROUGHT IRON WINDOW GUARD

In writing for price, give width and height of window openings and state method of fastening preferred

PLATE NO. E3453. WIRE WINDOW GUARD

In ordering, state size of mesh, number of wire, and whether channel or round frame is preferred

PLATE NO. E4487. INTERTRACK RAILROAD FENCE

Intertrack Railroad Fence.

This type of railing has been adopted by some of the principal railroad systems of the country, for fencing between tracks at stations and other exposed points. The posts are made of 3-in. standard I-beam, set in concrete footings. The panels are 10 ft. in length, supported by two very rigid rails of 2 by 2-in. channel. The pickets are $\frac{5}{8}$ or $\frac{3}{4}$ in. round, spaced 8 in. apart, so as to afford protection and strength, at the same time making the panel as light as possible. These panels are fastened to the posts in such a way that they can be quickly and readily removed, so as to facilitate work between the tracks when necessary. The railing shown in the illustration is 4 ft. 6 in. in height but can be made higher if desired.

The gates are very substantially constructed; give a maximum opening of 10 ft.; and are so arranged that they slide on the railing, and do not require a track across the gate opening at grade. They are easy to operate, and will not get out of order. The framing of the gate is made of the same panels as the railing, reinforced with gusset plates as shown in illustration.

A. T. BROOK IRON WORKS

Wire and Iron Fences and Gates

37 Barclay Street
NEW YORK, N. Y.

Products.

FENCE and ENTRANCE GATES for all purposes; NONCLIMBABLE WIRE or WROUGHT IRON FENCES for factories.

Vine and Fruit Tree Arbors and Trellises; Wire Fabrics of every description furnished for Wood Posts.

Special Iron and Wire Partitions for Storage Room and Tool Room; Ornamental Iron Work; Spiral Stairs; Machinery Guards; Office Railings; Window Guards; Cashier's Cages; Gratings; Pipe Railings; Folding Gates; Vault Covers; Weathervanes; Flag-poles, etc.

Facilities.

Over 30 years' experience, and complete equipment, enable this company to promptly furnish and erect products in any part of the country, or products will be furnished complete with full instructions for setting by customers.

Estimates.

Carefully prepared estimates furnished. Diagrams giving dimensions are of great assistance in quoting prices.

Special Designs.

This company will specially design work to suit property and ideas.

Illustrations.

Catalogues or drawings showing fence, gates and other goods of our manufacture mailed on request.

Cyclone Service.

Expert engineers will solve all fencing problems

TRADE-MARK

such as rolling land, steep grades, ravines, switch tracks, etc.

Blue prints showing details of Cyclone fence construction, sent free on request.

Special construction salesman will call, measure property, show samples of fence and photographs of completed jobs.

When desired, expert construction superintendent is furnished at nominal cost to superintend erection of fencing anywhere.

Cyclone Standard Construction.

Specifies full standard weight tubular steel for posts and rail. The outside diameter size, also weight per lineal foot of posts and top rail are specified. Figures are taken from full standard weight schedule adopted by manufacturers. It is recommended that all posts be set in concrete and that Cyclone standard specifications be used to insure maximum satisfactory service.

When Cyclone standard fence construction represents a greater investment than conditions would warrant, a lighter weight post construction is provided to suit any requirement.

CYCLONE CHAIN LINK INVINCIBLE FENCING

Chain Link Invincible Fence—Specifications.

FABRIC—Made in all sizes of wire from No. 4- to No. 14-gauge. Woven in various sizes of mesh, in any height desired.

Top and bottom selvages have *twisted* and *barbed* finish.

POSTS—Full standard weight tubular steel. Line posts set 30 in. in ground; end, gate and corner posts, 36 in. in ground. Line posts spaced not over 10 ft. apart.

End, corner and walk gate posts "O," 3 in. outside diameter, weight 5.79 lbs. per lin. ft. Drive and sliding gate posts "J," 3½ in. outside diameter, weight 7.58 lbs. per lin. ft. Line posts "P," 2½ in. outside diameter, weight 3.65 lbs. per lin. ft.

Note—All weights and dimensions are nominal, and are taken from the full standard weight schedule adopted by manufacturers. The permissible variation in specifications is 5% either way.

When desired, U-bar high carbon steel line posts furnished instead of tubular steel line posts. Up to and including 7-ft. fence, U-bar posts are 2½ in., weight 2.73 lbs. per lin. ft. For 8-ft. fence and over, U-bar posts are 2½ in., weight 3.82 lbs. per lin. ft.

TOP RAIL AND BRACES—Tubular steel, 1½ in. outside diameter, weight 2.27 lbs. per lin. ft. Top rail provided with sliding expansion joint (patent applied for) that allows for expansion and contraction of top rail due to atmospheric changes.

GALVANIZED OR PAINTED—Furnished all heavily galvanized, or with galvanized fabric and painted framework.

POST TOPS—Patented; made of pressed steel arms securely riveted to heavy malleable iron base, and carry three 4-point barbed wires, 12 in. in or out from fence line.

INVINCIBLE POST TOPS (PATENTED)

Chain Link Non-climbable Fence—Specifications.

POSTS—Full standard weight tubular steel. Line posts provided to set 30 in. in ground; end, gate and cor-

CHAIN LINK NON-CLIMBABLE FENCE

ner posts, 36 in. in ground. Posts to be spaced in line of fence not over 10 ft. apart.

End and corner posts "N," also walk gate posts "J," 3 in. outside diameter, weight 5.79 lbs. per lin. ft. Drive and sliding gate posts "J," 3½ in. outside diameter, weight 7.58 lbs. per lin. ft. Line posts "I," 2½ in. outside diameter, weight 3.65 lbs. per lin. ft.

POST TOPS—Patented; made of pressed steel arms securely riveted to heavy malleable iron base, and carry five 4-point barbed wires 9½ in. in and out from fence line.

NON-CLIMBABLE POST TOPS (PATENTED)

Chain Link Safeguard Fence—Specifications.

Especially recommended for schools, playgrounds, athletic grounds, country estates, parks, etc.; also industrial plants of all kinds.

A row of protecting barbs projects above top rail, or fence is furnished with smooth knuckled selvage in place of barbs.

POSTS—Full standard weight tubular steel. Line posts set 30 in. in ground; end, gate and corner posts, 36 in. in ground. Posts spaced in line of fence not over 10 ft. apart.

End, corner and walk gate posts "J," 3 in. outside diameter, weight 5.79 lbs. per lin. ft. Drive and sliding gate posts "J," 3½ in. outside diameter, weight 7.58 lbs. per lin. ft. Line posts "F," 2 in. outside diameter, weight 2.72 lbs. per lin. ft.

CHAIN LINK SAFEGUARD FENCE

Chain Link Reliance No. 1 Fence—Specifications.

FABRIC—Made 6 ft. high of No. 9-gauge heavily galvanized wire woven into a 2-in. mesh. Top and bottom selvages of fabric have a *twisted* and *barbed* finish.

POSTS—End, corner and walk gate posts full standard weight tubular steel 3 in. outside diameter, weight 5.79 lbs. per lin. ft. Swinging drive gate posts, 3½ in. outside diameter, weight 7.58 lbs. per lin. ft.

Line posts of high carbon steel rolled U-shape 2½ in. wide, weight 2.73 lbs. per lin. ft. and spaced 12 ft. apart. Brace posts of tubular steel, 2 in. outside diameter, weight 2.72 lbs. per lin. ft. Braces, 1⅝ in. outside diameter. Post tops, same as used on Invincible fence.

CHAIN LINK RELIANCE NO. 1 FENCE

Gates.

Gates arranged to swing either way, to lock from either side. Where desired, Cyclone roller bearing sliding gates are furnished running on overhead enclosed steel track.

Gates made single or double drive, or walk gates in any height to fit any opening.

Iron Fences.

Iron fencing and iron front entrance gates built and erected for any purpose. Purchasers' taste can be incorporated in attractive designs that will harmonize with any architecture or landscape.

Prices, Information Required, etc.

Prices on complete fence job, including erection or services of construction superintendent, quoted on application.

When writing, send a diagram or blue print of proposed fence lines, giving measurements of each stretch and total measurements. Make an "O" where corner, end or gate posts are to be used. State whether single or double drive gates are wanted, and give opening size.

Quotation on complete job will follow by return mail.

Cyclone (Built-in-sections) Woven Wire Partitions.

Built in standard size sections 4 ft. wide by 8 ft. high.

FRAMES—1-in. channel iron. Fabric No. 10-gauge wire, woven in 1½-in. square mesh. Diamond mesh fabric furnished when desired.

Furnished with either swinging or sliding gates. Handholes or wickets provided where needed. Floor

WOVEN WIRE PARTITIONS

flanges furnished for either wood or concrete floors.

Window Guards.

Frames 1-in. or ¾-in. channel, or ⅜-in. round iron. Fabric No. 10-gauge wire, woven in 1½-in. square mesh. Diamond mesh fabric furnished when desired.

Channel iron frames fit into openings. Round iron frames usually allow ¾ in. on all sides for lap.

DIAMOND MESH FABRIC

SQUARE MESH WINDOW GUARD

Folding Gates.

Built for any width or height. Take up minimum space.

FOLDING GATE

Woven Wire Signs.

Built in any size with heavy channel iron frames. Letters of heavy galvanized sheet steel.

WOVEN WIRE SIGN

Woven Wire Conveyor Belts.

Cyclone flat wire conveyor belts built of ⅜-in. by No. 18-gauge galvanized flat steel wire, woven in 1- and ½-in. mesh.

Cyclone chain link conveyor belts built using all sizes of galvanized steel wire from No. 4- to No. 16-gauge, woven in any size mesh from ¼ to 1½ in.

Flat wire and chain link belts furnished in any length, in standard widths of 18, 24 and 30 in. Special widths to suit requirements.

WIRE CONVEYOR BELT

ESTABLISHED 1858

J. W. FISKE IRON WORKS

Ornamental Iron, Brass, Bronze, Wire and Zinc Work

65-67 Park Place
NEW YORK, N. Y.**Products.**

FISKE CLIMBPROOF CHAIN LINK FENCING and ENTRANCE GATES; MANHOLE FRAMES AND COVERS; CATCHBASINS.

Window Guards, Tool and Stock Room Enclosures, Folding Gates.

Ornamental Lamp Standards, Wrought Iron Railing, Stable Equipment for horses and cattle, Weather-vanes, etc.

Quality.

The quality of Fiske products is best evidenced by installations for government, states, cities and leading commercial organizations.

Fiske Climbproof Fencing.

Affords protection to all points at all times. The fence is made of heavily galvanized chain link fabric with galvanized set-in-concrete posts assuring a perfect alignment and a further protection from the weather at the ground line.

Fiske gates are strongly constructed of "T" iron galvanized after making; filling of the gate is also chain link fabric.

The height and size mesh can be made to suit all conditions.

Fiske Erecting Service.

For the protection and convenience of customers, a corps of widely experienced erecting men is maintained to set any kind of fencing, railing, gates, and stock room enclosures at reasonable cost. Entire responsibility is assumed when this work is done under their direction.

Catalogue.

A handsomely illustrated catalogue of Fiske products will be mailed on request.

BRANCHES

CHICAGO, ILL., 29 South La Salle Street
PITTSBURGH, PA., 644 Union Arcade

Products.

PAGE WIRE LINK PROTECTION FABRIC for Outside Fencing, Tennis Courts, Inside Partitions, Window Guards and Conveyor Belting.

WOVEN WIRE FABRICS for Lawn and Garden Fence, Farm Fence, Gates, Reinforced Concrete Construction, General Utility Fabric.

ORNAMENTAL IRON, including Architectural Iron and Fences, Angle Picket Fencing, for factory and institutional enclosures.

Also, Galvanized Wire, Iron and Steel Wire, Rope Wire, Armco Wire, Special Analysis Wire, Barbed Wire, Welding Wire, and all kinds of Wire and Wire Work.

Exclusive Page Features.

All Page wire is produced in Page wire mills. For 30 years Page chemists have been studying the grades of wire suitable for different woven wire fabrics.

By exclusive contract with the American Rolling Mill Company, any wire to be produced from Armco iron must be made by the PAGE STEEL AND WIRE COMPANY. The Page Company is prepared to furnish any of its products in this pure rust resisting material.

Page Wire Link Protection Fences (Standardized).

FABRIC—No. 6 Wire—2-in. meshes, 72 in. high.

No. 9 Wire—2-in. meshes—72 in. high.

Twisted and spiked at top; knuckled at bottom.

When the 2-in. mesh or smaller is used, there is no toe hold obtainable for climbing.

Every foot of this fabric has a twisted barbed top on each link (as illustrated), which is sharpened and affords an effective protection against obtaining a hand hold.

When desired, the fabric can be knuckled over, giving a smooth selvage edge. The bottom edge of the fabric is regularly knuckled unless otherwise specified.

Special construction can be furnished in any heights up to 12 ft., from any sizes of wire from No. 16 to No. 4 and in meshes between $\frac{3}{8}$ in. and 6 in.

Note that nothing but the two above standards will be stocked, and all specials will be subject to delays in delivery and will take advanced costs depending upon the particular order. Standard construction is strongly recommended wherever it can consistently be used.

FINISH—All wires hot galvanized and oil dipped.

Posts, top rails and all fillings can be furnished galvanized by hot process, or painted, or both as required. See details on following page.

Page Economy Protection Fences.

The need for a lighter, but none the less durable, protection fence is met in Page Economy protection fabric. The pickets are of No. 9 wire and the horizontal

PAGE STANDARD WIRE LINK PROTECTION FENCING,
GROUNDS AND PLANT, OLDS MOTOR WORKS,
LANSING, MICH.

PAGE STANDARD WIRE LINK CONSTRUCTION WITH PIPE
POSTS AND TOP RAIL

PAGE WIRE LINK PROTECTION FABRIC

PAGE ECONOMY PROTECTION FABRIC

cables of No. 12½. All wire is Page standard galvanized by the hot spelter process. Two different meshes are used: 1½ and 2½ in. This fabric can be supplied in any height up to 10 ft.

The pickets are deeply crimped and the cable wires tightly twisted with reverse turn between each two pickets, thus giving a firmly locked joint, but allowing the utmost freedom in conforming to unevenness in ground surfaces.

Posts, Extension Arms and Bracing Construction.

The importance of the post and bracing construction for protection fencing can not be impressed too strongly. On it depend the good appearance, efficiency and durability of the fence.

This company's engineers have given the matter of posts and bracing much careful study and experimentation, and the several types of construction here outlined will meet every need.

Posts and barbed wire arm construction are the same for both fabrics and are furnished in the following styles:

PAGE STANDARD CONSTRUCTION—End and corner posts, braced as shown, 2⅞ in. O. D. Gate posts, braced as shown, 4 in. O. D. Line posts, 2⅜ in. O. D. Top rail, 1½ in. O. D.

Note—Experience has shown that any change from these sizes for end, corner and gate posts is not advisable. Therefore none but these sizes will be furnished for our fabric.

There are two options in line posts as follows:

U-bar posts, 1⅞ by 2⅛ in. Angle iron posts, 2 by 2 by ¼ in.

BARBED WIRE EXTENSION ARMS—Page post tops are made by riveting T-iron steel into a heavy base fitting tightly over the top of the post, thus allowing no moisture to get into the post. Eyelets are provided for 3 barbed wires. This construction prevents breakage from all reasonable blows and can be furnished for any of the line posts mentioned above.

We can also furnish our Government type of two-way arms, carrying 5 barbed wires as per illustration.

PLAIN POST TOPS—Post tops are also provided for use without the barbed wire arms. Our general protection fence catalogue gives various types of construction which make use of these plain tops.

Inside Partitions (Thoroughly Standardized).

FRAMES—1 by ½ by ⅛-in. channels, crossbraced with ⅜-in. round bars.

FILLER—Page wire link fabric, No. 10 galvanized wire, 1½-in. mesh. This fabric has a marked superiority over other fillers for partition and guard work, for the reason that the strands being interlocking, it is impossible to make an armhole by the spreading of the meshes.

Wire link fabric also lends itself readily to shaping for curved guards and various special forms.

PANELS—4 by 8 ft., entirely uniform. Each panel is provided with legs which furnish a 3-in. floor clearance. They may be placed in horizontal position above a line of 8-ft. sections to supply a 12-ft. partition (see illustration on preceding page), as all drilling for attaching bolts is standardized and will coincide in either position. When used for added height the floor legs are removed.

Doors—Door panels are complete in themselves and are interchangeable with regular panels. Doors, both swing and sliding, can be hung on either side of partition, to swing or slide in either direction, and can be shifted to the position of any regular panel without

PAGE ECONOMY PROTECTION FENCE WITH ANGLE IRON LINE POSTS

PAGE STANDARD END AND CORNER BRACING CONSTRUCTION

Without fabric, but with all fittings in place. Note turnbuckles for tightening braces.

When placed in concrete foundations this construction offers the most rigid support obtainable

PAGE STANDARD PIPE POST TOP WITH BARBED WIRE ARM

T-iron arm riveted into heavy base which insures against breakage. Top fits over post, not into it, thus allowing no moisture to enter post

PAGE STANDARD TUBULAR POST

Showing concrete base, special non-corrosive bands for fastening fabric, and moisture-proof, non-breakable barbed wire arm with opening for top rail.

Recommended for permanency, durability, strength and neat appearance

PAGE POSTS AND RAIL

From left to right are shown: gate post, end and corner post, line post, top rail, U-bar post and angle post. Sizes given in detailed explanation at the left

PAGE STANDARD WIRE LINK INSIDE PANEL PARTITION
Note self-supporting construction. No light is lost here

PAGE STANDARD GATE WITH ALL FITTINGS AND BRACINGS

This type can be made for almost any size opening. Either swing or slide and double or single

the drilling of a hole or the alteration of a part, and in only a few minutes of time.

BRACING—Adequate bracing is supplied by a continuous flat bar bolted upon the top and running the entire length of the partition. Additional top bracing when necessary, is obtained by the use of a telescoped bar attaching to the ceiling directly above the partition and extending downward to midway of the panel frame at required intervals.

FINISH—Entire material painted black.

NOTE—Particular attention is called to the fact that this construction is *fully standardized* and can therefore be supplied from stock.

Gates.

The chief advantages of Page standard gates are: Tubular frames, $1\frac{9}{16}$ in. O. D., all braces tubular $1\frac{5}{8}$ in. O. D., and all joints acetylene-welded. This construction makes the gate absolutely non-sagging; and more rigid against all strains than can be secured by any other. Frames and attachments are finished to correspond with other materials on the job. Frames filled with standard Page protection fabrics.

Can be opened, closed and locked from either side. Adjustable offset hinges, allowing gate to swing back against fence, and also use of full width of opening. Lock in three places: top, bottom and middle. Automatic gate stops which hold open each gate. Barbed wire protection as shown.

These features are all-year advantages. There will be no trouble from freezing or snow.

Sliding gates can be furnished of any size or with any clearance. Ball bearing rollers with covered track are standard.

Angle Steel Picket Fences.

Angle steel picket fences provide a maximum of durability and strength, with a minimum of upkeep. The cost is not excessive.

It is recommended that none but concrete foundations be used in erecting this fence.

Pickets are of high carbon steel $1\frac{1}{4}$ by $1\frac{1}{4}$ by $\frac{3}{16}$ in., or may be replaced by solid pickets from $\frac{3}{4}$ to $1\frac{1}{4}$ in. in size. When location is such that atmospheric conditions are harmful to iron and steel, the use of Armco iron will be found to increase the life of this fence.

ANGLE IRON PICKET FENCE SHOWING CONCRETE POSTS IN USE

Engineering and Construction Service.

The PAGE STEEL AND WIRE COMPANY maintains a service department which is prepared to design and estimate, and will furnish efficient erecting service at all times. Besides having several groups of service men in various parts of the country, who are highly trained to erect fencing in the most difficult locations, a number of experienced field superintendents are maintained who will go to any part of the country and superintend erection, using labor furnished by the purchaser.

No matter how a job of fencing or inside partitions is erected, a complete set of blue prints is always furnished with the material lists. Proposals are solicited and estimates will be gladly furnished at any time.

WINDOW GUARD MADE FROM CHANNEL IRON AND PAGE WIRE LINK PROTECTION FABRIC

2 in. mesh with No. 9 wire has been used

L. S. GELSER & SON, INC.

Manufacturers of Reinforced Concrete Pipe

FILLMORE, N. Y.

Product.

GELSER REINFORCED CONCRETE SLUICE and BELL END PIPE, for use in sewers, sluices, culverts, etc.

Advantages.

Cost is but one-half that of best cast iron and two-thirds that of best corrugated pipe, while they will withstand all road traffic equally well.

They will not rust like iron pipe or rot like terra cotta, neither will sulphur water, the great enemy of cast iron, have any deleterious effects on them—in fact, they grow stronger with age and are absolutely permanent.

Construction.

Pipe are manufactured by expert concrete workmen, mixing being done thoroughly by machine, the aggregates consisting of the best portland cement procurable, the highest grade of washed sand and gravel and pure spring water, which, altogether, insure a perfect product when properly cured.

Curing is accomplished by keeping pipe under cover protected from all air currents for a period of ten days after moulding, and thoroughly sprinkling three times each day.

Reinforcement.

SLUICE PIPE—Tongue and groove, 2-ft. lengths. Mixture, $2\frac{1}{2}$ parts sand and gravel, 1 part cement. Reinforced with 6 to 9 twisted splice wire hoops to 2-ft. length; gauge, No. 6 to No. 10, according to size.

BELL END PIPE—Mixture, 1 cement, 2 sand, 4 crushed stone, mixed to quaking consistency and thoroughly spaded while being poured into

forms. Made in 4-ft. and 6-ft. lengths. Reinforced with American Steel & Wire Co. triangle mesh.

Guarantee.

This company agrees to furnish pipe, free of charge, in place of any which break during transportation, or for a period of 5 years after being installed.

From the nature of concrete, it is safe to assume that if these pipe will stand for 5 years, they will stand for all time.

State Road Work.

This company specializes in pipe for this class of work and guarantees same to meet specifications of state highway departments.

Shipment.

Sufficient stock of well seasoned pipe is carried at all times to fill orders promptly.

WINNIPEG, MANITOBA, CAN., CANADA LOCK JOINT PIPE, LTD.

Product.

“LOCK-JOINT” CONTINUOUS REINFORCED CONCRETE PIPE, for Sewers, Water Lines, Intake and Discharge Pipes, etc.

The Lock-Joint System for Sewers.

This system provides a continuous reinforced concrete pipe, laid in sections, in which joints between sections are so made as to insure freedom from leakage or obstacles to flow.

The standard design has a circular section cast with a bell and a spigot end, the bell being flush with the outside circumference of pipe.

Sizes range from 24 to 108 ins. in diameter in 4-ft. lengths, and longer lengths when necessary. This company has a large stock of moulds and a force of expert superintendents, and is in a position to furnish pipe anywhere.

DIAGRAM OF SECTION OF PIPE AND LOCK-JOINT

ADVANTAGES—Pipes are made above ground, in a vertical position, resulting in maximum density of the concrete.

Entire exterior and interior surface can be inspected. Joints are on the interior of the pipe and also can be easily inspected.

The “lock-joint” gives the same strength in the joint as in the body of the pipe—therefore no weak spots.

Minimum of trench necessary to be open. Lay the pipe as fast as bottom is reached, then immediately backfill, as soon as pipe is laid.

Pressure Pipe.

This company manufactures and installs reinforced concrete pipe in sizes 8 to 108 ins. diameter for water supply or any purpose where pipes are subject to hydraulic head up to 150 ft.

These pipes are manufactured of a richer mix of concrete. Great care is taken in the mixing of the same.

Individual pipe sections are made in lengths of 6, 8, 10 or 12 ft., to meet specific conditions, 8 ft., however, being a standard length for the larger sizes and 12 ft. for the smaller sizes.

The smaller sizes are made with lead expansion joints. The larger sizes are generally made with copper expansion joints. These joints are made to take care of the expansion and contraction in the pipe line due to temperature changes and settlement.

ADVANTAGES—Reinforced concrete pipes manufactured under methods used by this company are smooth and joints offer no hindrance to flow of water.

There are no offsets or projections to encourage growth in the pipes, with the result that the carrying

LEAD EXPANSION JOINT

COPPER EXPANSION JOINT

capacity of these pipes is as great as, if not greater than, any other type of pipe.

From actual test, “n” in Kutter’s formula has been found to be less than .011. In addition to this, well made reinforced concrete is known to be an extremely permanent material.

54-INCH AND 66-INCH PIPE MANUFACTURED FOR INTERCEPTING SEWER, ALBANY, N. Y.

66-INCH PRESSURE PIPE MADE AT WINNIPEG PLANT FOR GREATER WINNIPEG WATER DISTRICT

A LOCK-JOINT PLANT MAKING 42-INCH PRESSURE PIPE

Subaqueous Pipe.

For powerhouses, water works, sewage plants, etc., made in approximately 20-ft. lengths, with cast iron flanges mounted into each end. Lengths are lowered into place and flanges are bolted together by divers.

Special designs for special cases.

72-INCH SUBAQUEOUS PIPE LAID IN LAKE ERIE

Cost.

Inasmuch as the pipes are, in almost all cases, manufactured on the ground, local price of materials, such as sand, stone, and cement and steel, naturally influences the cost. However, reinforced concrete pipe is, in almost all cases, considerably less expensive than metal pipe.

Estimates, etc.

Plans, specifications and estimates will be furnished to those desiring same, on receipt of information giving heads to be carried, sizes and quantities of pipe, location of work, and prices of sand, stone and cement, delivered along the line, as the pipes are manufactured on the job.

WOOD PIPE including Machine Banded and Continuous Stave; WOOD TANKS.

American Wood Pipe.

An ideal water conveying medium for all ordinary and special requirements.

Most economical in first cost, least expensive in installation, lowest maintenance charge, greatest carrying capacity and best returns from investment.

The staves are made from the best grade of yellow fir which is one of the finest known woods for pipe manufacturing purposes, being very strong to resist the crushing strain under the banding, and a wood that lasts indefinitely when saturated with water.

MACHINE BANDED WOOD PIPE—Machine banded wire wound stave pipe is manufactured in sizes from 2 to 30 in. in diameter and for all heads up to 400 ft., and if desired for special requirements, in sizes up to 14 in. for heads up to 600 ft.

The staves for this class of pipe are machined to accurate segments of the circle and to the true inside and outside radius of the pipe. After assembling the staves into pipe, it is placed in a special winding machine and is wound with heavily galvanized steel pipe winding wire applied under tension and spaced according to the pressure for which the pipe is designed. The ends of the pipe are then machined to form the coupling for connecting the sections of the pipe together. The outside of the finished pipe is coated with an asphaltum

mixture applied hot and then rolled in dry sawdust to protect the coating.

CONTINUOUS STAVE WOOD PIPE—This company contracts for material, and assembles into pipe at the site of the work "continuous stave pipe" in sizes from 2 to 14 ft. in diameter.

The staves for this class of pipe are manufactured from the same class of material as the smaller pipe, and the pipe is banded with round steel bands of proper size, with head, thread, washer and nut. The ends of these bands are connected with a malleable iron shoe to allow the bands to be drawn tight around the pipe, and are spaced according to the pressure under which the pipe is to serve.

CARRYING CAPACITY—Wood pipe has a greater carrying capacity than any other class of material on account of the extremely smooth inner surface. The capacity does not decrease with age, as is the case with metal pipe, and is therefore most economical.

Tanks.

This company manufactures all standard sizes of fir tanks, and also tanks for purposes where special designs are necessary.

Information and Service.

The engineering force of this company will be glad to consult in regard to pipe problems.

For information and prices, address the nearest sales manager.

MACHINE BANDED WOOD PIPE; CONTINUOUS STAVE WOOD PIPE; CREOSOTED WOOD STAVE PIPE; WOOD STEAM PIPE CASING; WOODEN TANKS.

Machine Banded Wood Pipe.

Machine banded wood pipe is carefully manufactured in sizes from 2 to 30 ins. in diameter—in both types, *inserted joint* or *wood sleeve* as required—to withstand pressure due to any head from 50 to 400 ft. The pipe is in convenient lengths, generally from 8 to 20 ft. The joints are carefully milled, insuring a proper fit. The staves are formed with great precision, giving a completed pipe with uniform internal diameter, thus preserving the fullest efficiency. Heavy galvanized wire is wound around the pipe under tension by a specially designed machine, the size of wire and spacing depending on the pressure to which the pipe is to be subjected. The pipe is dipped in a bath of hot preservative and then rolled in sawdust, giving it a coating which is an added protection to both staves and wire.

Continuous Stave Wood Pipe.

Continuous stave wood pipe is used in diameters from 16 ins. up—the largest pipe yet constructed being 168 ins. (14 ft.) inside diameter. The staves are so milled that when assembled they form the size of pipe desired. In building up the pipe, staves of different lengths are laid side by side so that all joints are broken. Each stave is butted against the one immediately preceding, while saw kerfs or slots at the ends receive a thin metal tongue, thus making the construction continuous and doing away with round-about joints of any type in the pipe. The smooth internal walls and the absence of joints in continuous stave wood pipe combine to make the carrying capacity of this pipe considerably greater than that of any other type. The staves are held firmly in place by steel rods or bands, solidly cinched or tightened until every stave is firmly seated. The pressure under which the pipe is to serve determines the diameter of the rods and spacing of the same. Continuous stave wood pipe is used principally for penstocks, gravity supply lines and irrigation projects.

Creosoted Wood Stave Pipe.

Both *machine banded* and *continuous stave*.

Made from selected lumber, treated with pure coal tar creosote oil by a special process. The wood being thoroughly preserved, the pipe will last indefinitely long, as the staves are immune from decay.

Creosoted wood pipe gives entire satisfaction when laid on the ground, in loose, gravelly soil, or in clay. It may be used for intermittent service or under low pressure, as no damage is done when the pipe is not in use or serving under conditions of only partial saturation. These properties of creosoted wood pipe are recognized as distinct advantages in water supply and irrigation work.

They are equally important when creosoted wood pipe is used for drainage or sewerage purposes. For drainage purposes each length of pipe is bored with a certain number of holes to permit the ground water to flow readily into the pipe and be carried away. For outfall sewers, in either salt or fresh water, creosoted wood pipe has demonstrated its special advantages.

Steam Pipe Casing.

Steam pipe casing is extensively used throughout the United States for the insulation of steam pipes radiating from central heating stations, industrial plants and public institutions. The heat energy thus saved has been shown to repay many times the cost of the original investment.

The casing is made of wood staves bound together with galvanized wire and the ends are headed to make a mortise and tenon joint. The outside is covered, like standard wood pipe, with a preservative coating and rolled in sawdust.

Wooden Tanks.

Wooden tanks are furnished for all purposes and the standard sizes are carried in stock. Tanks of special design can be furnished when required.

Inquiries for Pipe.

When asking for prices or information, please be as explicit as possible to avoid misunderstanding, delays and unnecessary correspondence. In order to give a satisfactory reply the following information, or as much of it as is available, should be given:

- (1) Size of pipe.
- (2) Hydraulic head under which it is to serve, either in feet or pounds to the square inch.
- (3) Length of line.
- (4) Rail or water destination.
- (5) Purpose for which pipe is to be used.
- (6) Whether gravity or pumping system.
- (7) Total maximum discharge.

ESTIMATES—For estimates on continuous stave lines, it is necessary that a profile should be received, as the size and spacing of the bands are governed by the head and are different for every considerable change of the same.

PRICE LISTS—Price lists on pipe are not furnished. Owing to constant fluctuations in the prices of raw materials and the difference in requirements on each and every project, satisfaction can be given only by quoting on requirements as they come up.

Co-operation.

An engineering staff is maintained for the convenience of customers.

ESTABLISHED 1869

THE MICHIGAN PIPE CO.

BAY CITY, MICH.

Products.

"MICHIGAN" COMBINATION STEEL and WOOD WATER PIPE; "MICHIGAN" TIN LINED WOOD CASINGS for insulating underground heating pipes.

"Michigan" Combination Steel and Wood Water Pipe.

SCOPE OF USE—Recommended for use in conveying liquids of all kinds in all climates, as follows:

- | | |
|--|---|
| (1) Municipal water supply and distribution systems. | (8) Acids and gases in chemical plants. |
| (2) Mines and railroads. | (9) Pulp in paper mills. |
| (3) Flumes and irrigation systems. | (10) Mineral waters for bottling purposes. |
| (4) Gravity and pressure feed water lines for mills and factories. | (11) Heavy fluids containing grit. |
| (5) Hydro-electric plants. | (12) Ventilating lines and stacks for gas and acid fumes. |
| (6) Liquors in tanneries. | (13) Water and culm in mines. |
| (7) Hot slops from distilleries. | (14) Acidulous and sulphurous water. |

"MICHIGAN" COMBINATION STEEL AND WOOD WATER PIPE
Steel for strength; wood for durability

DESCRIPTION—Made of thoroughly seasoned Canadian white pine and Michigan tamarack staves, machined on the sides forming double tongue and groove for interlocking. Constructed in sections up to 12 ft. in length, spirally banded from end to end under heavy tension with heavy steel banding. Sections, with mortise at one end and tenon at the other, are easily driven together, making an absolutely tight joint. Outside surface covered with thick double coating of special waterproof asphaltum, and rolled in sawdust while hot.

REASONS FOR USING "MICHIGAN" PIPE—

- | | |
|--|---|
| (1) Durability of wood. | (13) Can not burst. |
| (2) Sanitation. | (14) Can be laid in wet trench. |
| (3) 20% more capacity than metal pipe. | (15) Short curved without special fillings. |
| (4) Simplicity in handling. | (16) Low installation and maintenance. |
| (5) Light weight. | (17) 44 years of continued service. |
| (6) Speed in laying. | (18) Easy service connections. |
| (7) Protection against freezing. | (19) Requires no skilled labor. |
| (8) Not affected by electrolysis. | (20) Responsibility of company. |
| (9) Rigid inspection at factory. | |
| (10) Efficient construction. | |
| (11) Great strength. | |
| (12) Asphaltum protection. | |

SIZES—"MICHIGAN" pipe is made in stock sizes up to 48 in. diameter. Larger sizes made to order.

FITTINGS—Special fittings furnished, such as tees, elbows, crosses, branches, etc., also hydrant connections. They are all bored out specially for wood pipe, which insures a safe, tight fit with the wood tenon.

DATA REQUIRED WHEN MAKING INQUIRIES—When requesting quotations, give in detail specifications

of work, such as whether the line is direct pumping or gravity flow, size of pipe, pressure to be maintained, and for what purpose to be used.

"Michigan" Tin Lined Wood Casings for Steam Pipes.

SCOPE OF USE—For insulating underground heating pipes, also extensively used with greatest success for covering pipes conveying return water.

"MICHIGAN" TIN LINED WOOD CASINGS

Lengths up to 8 ft. Strengthened with a No. 6 double galvanized wire. Thickness of shell, 2, 3 and 4 in.; 4-inch shell is the standard and gives the most efficient service

DESCRIPTION—Constructed of thoroughly seasoned Michigan white pine and tamarack, of the solid bored log in the smaller sizes, and in built-up form in the larger sizes. Interior of casing lined with bright tin. Dead air space, from 2 to 3½ in., allowed between wrought iron pipe and covering. Outer surface is coated with a heavy waterproof asphaltum coating, and joint is waterproofed.

Co-operative Service.

This company has a field service department of six professional men.

The engineering department offers a free consulting service in connection with the construction of either direct pumping or gravity water works systems, and in solving problems of handling liquids in any form.

Ideas and estimates on complete installations of central heating plants submitted free of charge. The company is in a position to furnish any part of the equipment.

When laying large lines of pipe, or small lines under difficult circumstances, a field superintendent will be furnished at a nominal charge, who is capable of taking over the entire supervision of the installation of the line.

In the construction of large lines of "Michigan" pipe, the company furnishes free of charge one of its field superintendents to instruct the acting superintendent in charge regarding the laying and handling of "Michigan" pipe.

STANDARD WOOD PIPE COMPANY

Manufacturers of Wood Water Pipe and Steam Pipe Covering
WILLIAMSPORT, PA.

Products and Services.

MACHINE BANDED WOOD STAVE PIPE, SOLID BORED WOOD PIPE and STEAM PIPE COVERING for underground exposed steam and hot water pipe.

Continuous Wood Stave Pipe.

We build pipe for water works systems, power plants, municipalities, mill and manufacturing plants, mining and railroad water supplies, irrigation systems, mine culm, salt water mains, heavy fluids, acids, pulp, brine and sewage disposal, also steam pipe covering.

General.

We are endeavoring to describe our product briefly on this page as much as space will permit. The plates in this issue give descriptions of the various kinds of pipe we make. For full details write for our general catalogue, which gives valuable information concerning wood pipe and steam pipe covering.

Machine Banded Stave Pipe.

The staves are made from white pine lumber, Douglas fir, redwood or cypress. They are dressed and finished to a circle corresponding to the radius at both the inner and outer faces. The staves are double tongued and grooved. Each section in pipe is provided with a tenon and chamber 3 to 4 in. deep depending on the size. The pipe is spirally wound with steel bands or galvanized wire. Gauge and spacing of bands are determined by the pressure and size required. The pipe is rolled in a bath of hot asphaltum pitch and then rolled in sawdust. Machine banded pipe is made from 2 up to 48 in. in diameter. The thickness of wall is 1½ to 3 in. and heavier if desired, depending on the size of the pipe. The illustration, plate No. 16, shows in detail the construction of our wood stave pipe. Letter A, thickness of chamber and tenon; B, steel banding; C and D, thickness of shoulder, also shows tongues and grooves; E protective coating.

PLATE NO. 16. BANDED STAVE PIPE

Solid Bored Pipe.

Made from solid log up to 8 ft. in length bored 1½ to 8 in., inclusive.

Outside turned off to a perfect diameter and reinforced with banding and coated on the outside the same manner as our stave pipe shown on plate No. 16. The description of the solid pipe is illustrated on plate No. 70. Letter A, banded pipe before it is coated; B, pipe completed with coating on.

PLATE NO. 70. BORED PIPE

Square Wood Pipe.

Especially built for tanneries and chemi-

PLATE NO. 32. SQUARE WOOD PIPE

cal works. Made in lengths up to 8 ft. and bored from 1½-in. hole up to 8 in. in diameter and provided with tenon and socket joints, having a steel banding driven around the chamber end to protect the wood from splitting.

Steam Pipe Casing.

The casing we manufacture for covering steam pipe or hot water pipe is made of two grades as illustrated on plates Nos. 44 and 99. Casing on plate No. 44 is made of selected white pine staves 2, 3 and 4 in. thick. Each stave has a double tongue and groove on the same order as our machine banded wood pipe and joined together. It is wound with heavy galvanized wire and then coated with asphaltum pitch on the outside and rolled in sawdust. Plate No. 44 indicates the construction. A shows thickness of wall; B, galvanized wire; and C, protective coating.

PLATE NO. 44. SINGLE LAYER CASING

The other grade of casing manufactured is called double layer, which consists of two thicknesses of lumber as described on plate No. 99. A, inner shell 2 in. thick; B, asphaltum packing; C, dead air space; D, outer shell 1 in. thick; and E protective coating. Either grade of casing is made tin lined and unlined.

PLATE NO. 99. DOUBLE LAYER CASING

Wooden Specials.

In connection with our cast iron specials we make wood connections of any angle for various pressures. They are used in coal mines and chemical plants where iron fittings can not be used. In plate No. 21, A shows complete section of wood pipe; B, section of wood pipe with tenons on each end used in some instances to connect fittings; C, wood tee; and D, wood ell 45°. Boxes for steam pipe casing of any degree are made on the same order with the exception that they are split in two sections and reinforced with iron bolts, forming an adjustable connection made to correspond to the size of the pipe, so it may be put in its place after the casing and the iron pipe are installed.

PLATE NO. 21. WOODEN FITTINGS

A. WYCKOFF & SON CO.

Machinemade Wood Stave Pipe

ELMIRA, N. Y.

BRANCH OFFICE: ATLANTA, GA., H. H. WHITE, 385 Piedmont Avenue

Products.

Manufacturers of WOOD STAVE PIPE (machinemade), for Water Works Systems, Power Plants, Mill and Manufacturing Plants, Mining and Railroad Water Supplies.

For Waterproof Improved Steam Pipe Casing for underground and exposed steam and hot water pipe, see page 432.

Wyckoff Wood Stave Pipe.

Made from selected Canadian pine. All staves are double tongued and grooved, with faces planed, under close inspection. Winding machine so arranged that staves are banded together or wound with a steel band, at desired uniform tension (see illustration). Pipe is rendered *watertight* by tightly squeezing tongues into grooves. Maximum pipe lengths, 12 ft.; shorter sections permit pipe to be laid on curves, without iron fittings.

Advantages.

The Wyckoff machinemade wood pipe has been and is being successfully used for conveying water to municipalities for domestic and fire purposes. For conveying mine water, both hot and cold; for mine culm, tan liquors, mineral spring waters, brine, heavy fluids and pulps in fertilizer works, paper mills or provision factories, and also for conveying diluted sulphuric, nitric, muriatic, acetic and tartaric acids. Its special advantages may be summed up as follows:

Under proper conditions it is as durable as cast iron.

It is more durable than wrought iron or steel.

It is cheaper than either cast iron, steel or wrought iron.

Its carrying capacity at all times is greater than iron or steel.

By continued use its capacity does not decrease, whereas that of iron or steel does decrease yearly.

No skilled labor is needed in laying.

It can be laid with less width of excavation.

Because it is not as readily affected by frost as is either iron or steel it can be laid at less depth.

Prevents electrolysis.

Saves freight.

Is not corroded by the fumes and acids of many fluids.

Is not destroyed by sulphur or other impurities in minerals.

Does not taint water or contaminate fluids carried.

If frozen the elasticity of the wood retards bursting.

Can be laid in the wettest kind of trench.

Special Features in Manufacture.

The wood from which Wyckoff wood stave pipe is made is selected Canadian pine. As the staves are run through the finishing machine, which cuts the double groove and tongue and planes the faces to circular and radial lines, a competent inspector of many years' experience handles every stave just at the time when its defects can best be detected. This inspector culls out about 15% of the timber which comes to the factory and these culls are used for other purposes foreign to wood pipe. The winding machine used for banding the wood staves together is so arranged that the band can be wound at any desired tension, according to the set of the machine, which is regulated for each class of pipe according to diameter and pressures specified. The tension can be made great enough to crush the wood in the large size pipe. During the manufacture of one standard a uniform tension and spacing is absolutely assured.

The chambers and tenons are necessarily cut uniformly by a machine, so that every joint between two pipes must fit as the knives and heads are set alike for each size pipe.

Montezuma Asphalt Coating.

As previously stated, when wood pipe is laid under the proper conditions its life depends upon the life of its steel bands, and the life of these depends upon the absence of corrosion. If this can be prevented of course the steel will last a long time. This company has experi-

TWO ENDS OF WOOD PIPE

a—Montezuma asphalt coating; b—Steel bands, wound solid for high pressure; c—Ends of tenon and shoulder

mented for years to ascertain the best mixture for a protective coating. The qualities required are as follows: it must be durable, hard, tough, perfectly waterproof and strongly adhesive to the metal. It must show no tendency to flow under summer temperature and must not become brittle so as to crack or scale, under freezing temperature.

The origin of Montezuma asphalt is an asphaltic base oil found in the Panuco District of Mexico.

This oil is very rich in asphalt; it is very heavy, having a gravity of from 10° to 11.5° Baumé.

The coating is heated in tanks by steam to a temperature of between 250° and 300° Fahr., and applied to the steel bands as it is being wound around the wood, by running the band through the tank which stands upon the winding machine; this method insures a full and complete coating between the steel and the surface of the wood, thus preventing the moisture which may seep through to the outside of the wood from coming into direct contact with the steel bands.

After winding, the chambers and tenons are cut on the pipe, each being 4 ins. in depth by one-half the total thickness of the shell of the pipe, which is usually 1 7/8 ins. thick. After leaving the finishing machine the pipe is placed on the top of two grooved rollers, set parallel and horizontal, with one-half their diameters submerged in a tank of the hot asphalt, as before described. As these rollers revolve the pipe revolves, and the coating which adheres to the rollers is thus applied to the outside surface of the pipe, covering the bands and wood. After all is applied that the surface will hold, the pipe is rolled on to a table filled with sawdust, the sawdust adheres to the hot coating, and protects it from being knocked off or abraded in shipping or laying. When conditions require, the pipe is re-coated by running it a second time over the rollers and through the sawdust, thus getting a protective coating over the whole surface of the pipe from 1/4 to 3/8 in. thick.

Fittings for Wyckoff Wood Pipe.

WOOD FITTINGS—Wooden crosses, tees and ells are made by properly boring heavy blocks cut from square timbers.

Tension bolts as shown prevent the block from splitting—the number and size of the bolts depending upon the pressure to be resisted. The openings are made of the same dimensions as standard chambers, the connections being effected by using, immediately preceding the fitting, a special section of wood pipe having a tenon on each end. This special section is first driven into the fitting and the combination then handled exactly like a regular section of pipe. Or, if especially desired, the fitting may be provided with regular tenon and chamber in the “run.”

Wood fittings are recommended where the water carries chemicals injurious to iron, or where it is desirable to maintain extreme purity in the liquid conveyed.

They are impractical in large sizes or for highest pressure.

SPECIAL CAST IRON FITTINGS—Special cast iron fittings are most satisfactory for ordinary and general purposes. These are similar to regular cast iron fittings except that the bells are finished to the same dimensions as the chambers of wood pipe of same diameter. This requires a section of wood pipe with tenon on each end as previously described.

On account of the great convenience and universal satisfaction, several manufacturers of valves, fire hydrants, etc., are now furnishing these accessories chambered in the same manner for direct connection to wood pipe.

THREADINGS—Threaded fittings and connections to threaded wrought pipe are provided for by supplying special sections of wood pipe in which a reamed end of proper diameter is substituted for regular chamber or tenon as the case may require. The screw on the threaded nipple cuts the screw in the wood pipe as the junction is made, forming a tight and satisfactory connection. Especially in the smaller sizes this style is very efficient and inexpensive.

A. M. BYERS COMPANY

Genuine Wrought Iron Pipe, Couplings and Nipples; Standard Pipe and Oil Country Tubular Goods

PITTSBURGH, PA.

BOSTON, MASS. CLEVELAND, OHIO BRANCH OFFICES CHICAGO, ILL. DALLAS, TEX. NEW YORK, N. Y.

Products.

GENUINE WROUGHT IRON PIPE. Couplings and Nipples; Oil Well Tubing, Casing, Line Pipe, Drill and Drive Pipe.

Guarantee.

(1) All Byers pipe is guaranteed to be made exclusively from Byers pig iron, refined by hand puddling, rolled into muck bar and finally converted into pipe skelp without the use of scrap in any of the processes of manufacture.

(2) Every individual length of Byers pipe is guaranteed to have passed rigid inspection and testing and to be full weight with a variation of not more than 2½% below card weight.

Properties of Byers Pipe.

- (1) High resistance to corrosion gives a useful life 2 to 10 times greater than that of cheaper pipe.
- (2) Easy cutting, threading and bending.
- (3) The fibrous structure makes it extremely resistant to constant vibration and shocks.
- (4) The excellent welding quality of wrought iron makes the weld of the pipe as strong as the wall at any other point.
- (5) Wrought iron has a rough surface to which protective coatings adhere firmly.

The Installation Cost of Pipe.

When a pipe system fails and has to be replaced, the entire original cost usually has to be defrayed again. While the difference in the cost of Byers pipe and cheaper pipe may be 30% to 40%, the use of Byers pipe adds, on an average, only 5% to the total cost of an industrial piping installation over what the cost would be if the cheapest kind of pipe were used. This small premium buys 100% additional life for the whole pipe system.

Specifications.

Copies of complete specifications for genuine wrought iron pipe will be furnished on request. The following condensed specifications are recommended to insure genuine wrought iron pipe:

- "All pipe shall be (Byers) genuine wrought iron, manufactured exclusively from pig iron refined in a puddling furnace, rolled into muck bar, cut, piled and rerolled into skelp without the use of foreign scrap of any kind.
- "A variation of weight of each length, not exceeding 5% above, and 2½% below full standard weight, is permissible.
- "Galvanized pipe, as to base metal, shall conform to above specifications, and be galvanized by the hot metal process, only prime Western spelter being used. Weight of galvanized coating per square foot of surface covered shall not be less than .20 lbs.
- "Couplings and nipples must be made from same quality iron as pipe.
- "Manufacturer's name or trade-mark, as well as year of manufacture, must be rolled in the pipe every few feet."

Permissible variation in weight is 2½% below and 5% above. Standard pipe furnished with threads and couplings and in random lengths; extra heavy and double extra heavy with plain ends, and in random lengths unless otherwise ordered. Extra heavy and double extra heavy pipe fitted with threads and couplings at an extra charge above regular.

THE NAME AND YEAR IS ROLLED IN EVERY LENGTH OF BYERS PIPE

PEERLESS IRON PIPE EXCHANGE, INC.

Second-hand and New Pipe, New Mill Seconds and Contractors' Equipment

OFFICE, WAREHOUSE AND YARDS

280-288 Jackson Avenue

LONG ISLAND CITY, N. Y.

NEW YORK OFFICE, 302 Broadway

Products.

SECOND-HAND STEEL and IRON PIPE, CASING and BOILER TUBES; NEW PIPE; NEW MILL SECONDS; CONTRACTORS' EQUIPMENT and SUPPLIES.

Line Pipe, Gas and Oil Well Supplies, Couplings.

TRADE-MARK

Used as rollers and for cores in concrete work; also for conduit purposes.

Larger sizes used for culvert purposes, conveying concrete, pile driving, foundation work, etc.

Second-hand Pipe.

Second-hand pipe is extensively used in oil fields and mines, for gas, oil, air and water lines; also for temporary and permanent discharge and exhaust lines, and for culverts. Largely used in all kinds of large and small industrial plants and in all classes of construction work; also in connection with underground and overhead irrigation systems, and for artesian and other well drilling. Suitable for pile driving and foundation work. In fact, can be used for almost any and every practical purpose to which new pipe or mill seconds apply. Sizes carried in stock are from $\frac{3}{8}$ in. to 24 in. in diameter. All second-hand pipe is in "A No. 1" serviceable condition, guaranteed equipped with new thread and couplings. Material saving can be effected by its extensive use.

Casing and Boiler Tubes.

All sizes of casing are carried in stock, suitable for well drilling, etc. Casing, and second-hand boiler tubes, are extensively used in the manufacture of concrete filled columns. Second-hand boiler tubes cleaned and trimmed for re-tubing boilers.

SECOND-HAND PIPE AND NEW MILL SECONDS USED FOR RAILINGS

SECOND-HAND PIPE AND NEW MILL SECONDS USED FOR COLUMNS AND SUPPORTS

New Mill Seconds.

This class of pipe is carried in black and galvanized, in sizes from $\frac{3}{8}$ in. to 12 in. in diameter.

Recommended as most suitable and economical for the following purposes:

All structural and ornamental work, such as area, hand, and bridge railings, fence posts and columns.

Extensively used in the manufacture of racks and stands of all kinds, tool handles, and as integral parts of various kinds of machines, etc.

New Pipe.

All sizes of new pipe are carried in stock—wrought iron and wrought steel, black and galvanized, for water, gas, steam, ammonia, sprinkler systems, etc.

Contractors' Equipment and Supplies.

Second-hand machinery, tools and supplies used in connection with construction work, including boilers, hoisting engines, derricks, concrete mixers, air tanks, etc.

Re-laying rails is a specialty of this company.

List and specification will be gladly mailed on application. Inquiries are solicited. Will gladly quote on, and recommend material most suitable and practical for all requirements.

Buyers of Plants, Equipment, etc.

This Company buys up any quantity of good serviceable used pipe, as well as plants and equipment.

Service.

This Company maintains a large warehouse in Long Island City, N. Y., which is well stocked with all sizes and types of pipe, ready for immediate shipment.

SECOND-HAND PIPE USED FOR DISCHARGE LINE

Modern equipment for cutting and threading of pipe to special specifications.

Shipping Facilities.

In close proximity to the Long Island, Pennsylvania, and all other roads and steamship lines. All orders are immediately filled and shipped.

JOHN SIMMONS CO.

Piping, Mill and Factory Supplies

GENERAL OFFICES

102-110 Centre Street

NEW YORK, N. Y.

Products.

PIPE: Genuine Iron and Steel; Cast Iron Flanged; Cast Iron Water; Cast Iron Soil; Brass and Copper; Lead Lined and Tin Lined; Spiral Riveted.

STEAM TRAPS; AUTOMATIC GRAVITY SCALES.

FITTINGS: Cast Iron, Malleable Iron, Steel and Brass, for steam, water, gas, air and ammonia; Standard, Medium, Extra Heavy and Hydraulic; Simmons Unions.

VALVES: Iron, Steel, Brass, Gate, Globe, Angle and Check; Standard, Medium and Extra Heavy, for steam, water, gas, air and ammonia; Blow-off, Elevator, Radiator, Regulating, Relief, Tank and Vacuum Valves; Foot Valves.

Also, Pressure Tanks; Steam, Hand and Power Pumps; Injectors; Pipe Machines; Vises, Stocks and Dies, Wrenches, Drills, etc.; Expansion, Oil and Storage Tanks; Brass, Lead and Iron Traps; Red Seal Metallic Packing or Gaskets; Pipe Joint Compounds.

Exclusive agency for Wm. Powell Co. line of valves, lubricators, etc., in New York territory.

For Plumbing Supplies, see page 1039.

Pipe.

STEEL AND IRON PIPE, BLACK AND GALVANIZED

"Morehead" Return Steam Trap.

The "Morehead" steam trap removes water of condensation from heating, drying and cooking apparatus and returns the condensation direct to the boiler, regardless of any difference in pressure on the apparatus drained and the boiler, or whether the apparatus is located above or below the water line.

It is admirably adapted for use as a lift pump, and for feeding boilers from open or closed heaters. It handles perfectly water at any temperature. It requires

"MOREHEAD" RETURN STEAM TRAP

no special attention, no cylinder lubrication and very little repacking of glands, or repairs of any kind.

Improved Leinert Automatic Gravity Scales.

A simple, positive, automatic balance for recording liquid weight. This apparatus is not affected by temperature or specific gravity changes.

LEINERT AUTOMATIC GRAVITY SCALES

Drop Forged Steel Fittings and Valves.

The "Simmons" line of drop forged steel fittings has been put on the market in answer to the increased demand for fittings free from flaws or airholes liable to be found in all cast fittings, whether gray iron, malleable or cast steel. Fittings are bored out of solid forgings.

Prices quoted on fittings for all pressures up to 10,000 lbs. per sq. in. Drop forged steel valves for the same service are also offered.

In inquiring for prices please state conditions, and quantity.

DROP FORGED STEEL FITTINGS

Stickie Steam Trap.

The Stickie bucket steam trap is so designed and constructed as to give it the greatest possible efficiency. The construction of the high and low pressure traps are identical except in weight and size of valve openings. No needle point valves. All valves are ball seated and self-grinding.

STICKIE STEAM TRAP

Information.

Circulars containing complete description of JOHN SIMMONS Co. products will be mailed on request. Inquiries will find prompt and welcome attention.

SIMMONS PIPE BENDING WORKS

40 Mechanic Street
NEWARK, N. J.

Products.

PIPE BENDS.
PIPE COILS.
WELDED HEADERS.
VAN STONE JOINTS.
CAST IRON FITTINGS.
VALVES.
STEAM SPECIALTIES.

Pipe Bends.

Made in all shapes and sizes from $\frac{1}{8}$ to 30 in. Full card weight or extra heavy pipe manufactured for the purpose used. Furnished with screwed or Van Stone flanges in cast iron and rolled steel both standard and extra heavy.

16-INCH OUTSIDE DIAMETER PIPE OFFSET

Welded Headers.

Made with any number of welded nozzles in lengths limited only by means of transportation. Light unit construction eliminates leaky joints and lowers shipping and erection costs. Furnished with screwed or Van Stone flanges.

WROUGHT STEEL WELDED HEADERS

Valves and Steam Specialties.

All standard makes furnished ready for installation.

Coils.

Continuous welded construction spiral, basket, zig zag, taper, miter wall and box return bend coils made to specifications in black or galvanized from iron or steel pipe. Also made from seamless steel tubing, brass or copper pipe.

PIPE BENDS AND COILS

Van Stone Joints.

Produced by improved machinery in sizes from 4 to 30 in. with high hub cast iron or rolled steel flanges in standard or extra heavy.

VAN STONE JOINT

Cast Iron Fittings.

Complete line of standard and extra heavy cast iron flanged or screwed fittings. Special fittings made to specifications.

Products.

"YOUNGSTOWN" STEAM, GAS and WATER PIPE: "YOUNGSTOWN" STEEL, $\frac{1}{8}$ -in. up to and including 20-in. outside diameter; "YOUNGSTOWN" STAR BRAND IRON (Genuine Wrought Iron), $\frac{3}{8}$ -in. up to and including 12-in. nominal inside diameter, black and galvanized; EXTRA STRONG and DOUBLE EXTRA STRONG "YOUNGSTOWN" STEEL and "YOUNGSTOWN" STAR BRAND IRON PIPE, which includes:

Line Pipe for oil and gas, fitted with recessed extra heavy taper sockets; Tubing and Drive Pipe; Rotary Drill Pipe; Casing; Screw and Socket and Inserted Joint.

Dry-kiln Pipe; Signal Pipe; Ammonia Pipe; and pipe for various other purposes, such as Pipe Water Lines fitted with flanges, etc.; Asphalted Pipe.

ELECTRICAL CONDUITS, "BUCKEYE" RIGID, Galvanized and Enameled; "REALFLEX" FLEXIBLE STEEL ARMORED CABLES.

Also, Pig Iron; Bessemer and Open Hearth Steel Billets, Slabs and Sheet Bar; Puddled Iron Muck Bar; Double Refined Puddled Iron Sheet Bars; Iron and Steel Plates and Skelp.

Bars and Shapes: Rounds and squares, $\frac{1}{4}$ in. to 2 in.; flats up to $4\frac{1}{2}$ in. wide; angles up to 3 in. wide.

"Youngstown" Sheared Plates, $\frac{3}{16}$ in. to 1 in. thick, maximum width 72 in.

"Youngstown" Iron and Steel Sheets, Black and "New Process" galvanized.

"Youngstown" Iron and Steel Roofing, painted and "New Process" galvanized (corrugated, V-crimp, roll and standing seam).

Barbed Wire, painted and galvanized; Wire Rods; Plain Wire, black and galvanized; Wire Nails, Staples and Hoops; "Youngstown" and "Buckeye" Woven Wire Field Fence.

"Youngstown" Pipe.

Like all of our products, "Youngstown" pipe is made by us straight through from the ore in one plant by one organization. With such manufacturing facilities the utmost in quality and service is assured. Works cover an area of 500 acres, entirely devoted to the manufacture of these products.

Half a million tons of tubular products are made annually. This includes both "Youngstown" steel and "Youngstown" Star Brand genuine old-fashioned hand puddled iron pipe, both of which meet every demand of architect and engineer for high grade tubular products.

"Youngstown" pipe is made with either standard English or standard American threads, as may be ordered.

All couplings furnished with "Youngstown" steel pipe are forged from genuine wrought iron, which insures easier installation and tighter joints than where steel couplings are used.

Marking of Steel Pipe.

"Youngstown" steel pipe is distinguished by the word "Youngstown" in raised letters on every length of pipe. See illustration.

"YOUNGSTOWN" STEEL PIPE

Specifications for "Youngstown" Steel Pipe.

For the convenience of architects and engineers the following specifications for steel pipe are submitted:

MATERIAL—All "Youngstown" steel pipe shall be made of soft weldable steel of uniformly good quality. This steel to be particularly adaptable to the requirements for wrought pipe, and sufficient crop shall be cut from the top of each ingot to secure solid metal in the skelp.

PROPERTIES—The steel from which the pipe is made shall have approximately the following physical properties:

Tensile strength, not less than 50,000 lbs.
Elastic limit, not less than one-half tensile.
Elongation in 8 in., not less than 20%.
Reduction in area, not less than 50%.

TEST SPECIMENS—Test specimens for determining physical properties shall be cut from skelp or finished pipe.

CRUSHING TEST—When required, cross sections cut from any pipe shall stand crushing down until the inside walls are three times the thickness of the wall from each other without showing cracks on the outside of the bend; except that, in the case of butt-welded pipe, any fracture at the weld must give evidence of having been firmly welded.

BEND TEST—When required, a test specimen cut lengthwise from skelp or finished pipe and filed smooth on the edges shall bend through an angle of 180°, with an inner diameter equal to the thickness of the material, without fracture.

HYDROSTATIC TEST—All sizes shall be tested at mill to an internal pressure, as shown in the following table:

$\frac{1}{8}$ to 2 in., butt-weld, 700 lbs.
 $2\frac{1}{2}$ and 3 in., butt-weld, 800 lbs.
Up to 8 in., lap-weld, 1000 lbs.
9 and 10 in., lap-weld, 900 lbs.
11 and 12 in., lap-weld, 800 lbs.

On the 8-in., 10-in. and 12-in. sizes, which have more than one weight as standard, we have shown the test pressure for the heaviest weight.

LENGTHS—Unless otherwise specified, standard pipe will be furnished in random lengths with threads and couplings; extra strong pipe will be furnished plain ends.

THREADING—Pipe and couplings shall be threaded and tapped according to Briggs' Standard. Thread must be a good commercial thread and must not leak under the specified pressure (paragraph 5). The thread must not vary more than one and one-half turns, either way, when tested with a Pratt and Whitney Briggs' Standard Gauge. All burrs at the ends shall be removed.

COUPLINGS—Chamfered or slightly beveled couplings will be furnished on all steam pipe, and shall be of soft puddled

iron, thoroughly welded and free from all blisters, pits or other defects that would break the continuity of the thread.

TOLERANCE—The pipe shall not vary more than 1% either way from being perfectly round and true to the standard outside diameter, and shall not vary more than 5% either way from weight as listed.

TESTS—All tests shall be made at the mill.

"Youngstown" Star Brand Pipe.

Genuine old-fashioned hand puddled iron pipe, guaranteed full weight. We own and control extensive iron ore properties. From properly selected ore we manufacture pig iron. This pig iron is in turn worked by hand in puddle furnaces into *genuine wrought iron*.

This high grade hand puddled iron is then rolled into skelp. The skelp is made into "Youngstown" Star Brand iron pipe. Those who prefer iron pipe to steel will find in "Youngstown" Star Brand an honestly made, full weight product that will meet their every requirement.

MARKING—All of our "Youngstown" Star Brand iron pipe is marked with the word "Youngstown" in raised letters followed by a star. In butt-weld sizes the star is rolled in the iron; in lap-weld sizes it is stencilled on the pipe.

"Buckeye" Conduit and "Realflex" Armored Conductor.

These two materials, which had acquired an enviable reputation as products of the Western Conduit Company, a subsidiary recently dissolved, are now manufactured by us direct in the same plant and by the same organization.

"BUCKEYE" ELECTRICAL CONDUIT—Is made from mild steel tubing produced for this purpose in our own works. It is furnished in two standard finishes—black enamel and electro-galvanized, and in all sizes up to and including 6 in. in diameter. All couplings are forged from genuine wrought iron.

"BUCKEYE" ELECTRICAL CONDUIT

Special attention is given to the finish and threading of this conduit. It is regularly tested and meets the severest specifications, being used extensively on government work.

"REALFLEX" ARMORED CABLE—Contains the highest grade of copper conductors distinguished by different colors and protected by an armor of galvanized steel wire. This wire, which is manufactured specially in our plant, is flattened on the outside and so wound that it gives genuine protection with a degree of flexibility quite unusual. "Realflex" is ratproof and dustproof, works without waste, is installed with rapidity, fits standard connections, and makes a permanently handsome job. Is flexible, and can be fished with such ease that it is used extensively as a substitute for rigid conduit in difficult locations. Manufactured in a number of sizes and can be furnished with or without lead covering beneath the armor.

"REALFLEX" ARMORED CONDUCTOR

"YOUNGSTOWN" STEEL AND "YOUNGSTOWN" STAR BRAND IRON PIPE

8	7.25	8.625	6.875	.875	72.424

The permissible variation in weight is 10% above and 10% below.

The following notes apply to both tables:

Furnished with plain ends and in random lengths, unless otherwise ordered.
Random length of Extra Strong and Double Extra Strong pipe is considered to be 12 to 22 ft.; we to have the privilege, however, of supplying not exceeding 5% of total order in lengths of from 6 to 12 ft.

For pipe fitted with threads and couplings, an extra charge will be made above plain ends.

For cut lengths, an extra charge will be made above random.

For galvanized or coated pipe, an extra charge will be made above black.

Products.

PIPE and FITTINGS.

CLOW GASTEAM RADIATORS.

ULTRA-VIOLET RAY WATER STERILIZERS.

Cast Iron Columns, Bases and Caps.

In Chicago, JAMES B. CLOW & SONS carry a complete line of the following material:

Plumbing Supplies, including Drinking Fountains, Automatic Water Closets, Lavatories, Sinks, etc.

Steam Supplies, including Steel and Wrought Iron Pipe; Cast Iron and Malleable Fittings; Low, Standard and Extra Heavy Valves with Screwed, Flanged, Hub and Spigot Connections—Straightway, Angle, Check, Flap, etc.

Water Works Supplies, including Cast Iron Bell and Spigot-Flanged and Threaded Pipe and Fittings, Lead, Oakum, Tools, etc.

They also manufacture in Chicago Marble Products for all purposes and all brass work for their plumbing business, including Faucets, Bibbs, Traps, Supplies, Showers, etc.

At their Ohio plants, which specialize on making cast iron pipe and fittings, a complete line of Cast Iron Specialties is also produced, including:

Manholes, Lamp Posts, Fountains; Special Castings for Coke Ovens, Filtration Plants, Sugar Refineries, Chemical Companies, Oil Refineries, etc.; Radiators, Boilers; Plumbing Specialties such as Bell Traps, Drum Traps, Gratings, etc.

Steel or Wrought Iron Threaded Pipe.

Can furnish random lengths of steel or wrought iron pipe in all standard sizes, either black or galvanized. Cut lengths to order.

STEEL OR WROUGHT IRON THREADED PIPE

Cast Iron Hub and Spigot Pipe.

Carried in stock in sizes from 3 to 48 in. 12-ft. lengths are regular; shorter lengths will be cut to order. This pipe is made in all classes for all pressures.

CAST IRON HUB AND SPIGOT PIPE

Cast Iron Flanged Pipe.

Made in all sizes from 1¼ to 48 in. and in all classes

CAST IRON FLANGED PIPE

for all pressures. 12-ft. lengths are regular; shorter lengths will be cut to order.

Cast Iron Threaded Pipe.

This pipe is made in all sizes from 1¼ to 16 in., inclusive. It is threaded at both ends the same as steel or wrought iron pipe. 12-ft. lengths are regular.

CAST IRON THREADED PIPE

Cast Iron or Malleable Screwed Fittings.

A very large stock of screwed fittings in both cast iron and malleable iron, black or galvanized, straight and reducing.

CAST IRON AND MALLEABLE FITTINGS

Cast Iron Hub and Spigot Fittings.

Water and gas fittings are carried in stock in all sizes from 3 to 48 in., in straight and reducing sizes. Also cutting-in specials of all kinds.

CAST IRON HUB AND SPIGOT FITTINGS

Cast Iron Flanged Fittings.

A very large stock of flanged cast iron fittings in all standard sizes for low, standard and extra heavy pressures, both straight and reducing.

CAST IRON FLANGED FITTINGS

Cast Iron Threaded Fittings.

A complete line of cast iron threaded fittings for use with our threaded cast iron pipe. In both straight and reducing sizes.

CAST IRON THREADED FITTINGS

Stock of Pipe and Fittings.

All pipe and fittings carried in stock for all pressures. Castings for special purposes made to order.

Clow Gasteam Radiators.

These radiators provide steam heat without the expense of a boiler, piping and chimney, when and where it is wanted. They also eliminate the disagreeable firing of a coal boiler and do away with the coal bin, dust, dirt, ashes and smoke.

Gasteam heating is adaptable to new or old commercial buildings, factories, stores, churches, schools, theaters and residences. In fact it is a practical and efficient heating system for every purpose.

Ten-section Three-column
GASTEAM RADIATOR Sectional View

Description of Gasteam Heating System.

In appearance Clow Gasteam radiators resemble any other cast iron steam radiator. In place of a boiler, however, each radiator is connected to a gas pipe and a Bunsen burner is placed under the radiator, entirely enclosed in a cast iron combustion box. Directly above the burner is the water chamber (see sectional view). An automatic regulator governs the gas supply, guaranteeing the minimum consumption of gas and the maximum heat.

Operation of Gasteam Heating System.

When heat is required in any room, a match is all that is necessary. By turning the gas cock and applying the match, as to an ordinary gaslight, the burner is lighted, the steam is formed in the water chamber and inside of 30 minutes there is a 5-lb. pressure and a good warm room.

Advantages of Gasteam.

- (1) It gives steam heat when and where it is wanted.
- (2) It eliminates the boiler, the chimney, the coal bin, the piping necessary in a central heating system.
- (3) There is no dirt, no ashes, no dust, no smoke, no firing of the furnace, no janitor when Gasteam radiators are used.
- (4) When heat is required it can be had anywhere in the building by simply lighting a match and turning a gas cock—the Gasteam radiator does the rest.
- (5) Gasteam radiators are furnished in several sizes and heights to meet requirements.

Ultra-Violet Ray Sterilizer.

The advantages of sterilization of water by ultra-violet rays, as compared with other methods of water sterilization, are as follows:

(1) Its action is direct and positive, and results in a complete sterilization of the water. It is a system which has an efficiency of 100%, 100% of the time.

(2) The treatment results in absolutely no chemical change in the water treated. It generates no odor, no taste, no heat, nor any physical change in the water treated.

(3) It does away to the utmost possible extent, with the human element. No attention or care is required, except that of starting the lamps.

(4) The apparatus is so simple in its construction that there is nothing about it that requires adjustment or repairs. With the exception of the lamps, which of course, eventually will have to be renewed, the depreciation on the apparatus is practically nothing.

(5) Its initial cost and the cost of operation are only a fraction of those involved in any other system of water sterilization.

(6) Its cost of operation, in electrical energy consumed, is nominal.

TYPE H-2 R.U.V. WATER STERILIZER

CAST IRON BELL and SPIGOT, FLEXIBLE JOINT and FLANGED PIPE and FITTINGS for Water and Gas.

Flexible Joints for Submerged Lines; High Pressure Pipe and Specials for Fire Service; Plain End and Threaded Cast Iron Pipe; Steam Facings; Cast Iron Culverts; Drains, Sewers, Smoke Flues, Keystone Columns, etc.

Foundry Products: Tanks, Sluice Gates, Screw Piles, Coal Chutes and Bunkers, Suction Strainers, and large Special Castings designed or made to purchaser's design.

Cast Iron Water Pipe.

Cast iron pipe has been used for the carrying of water for generations and is today considered the standard pipe for water. Cast iron water lines laid in 1664 are still in service. A cast iron line laid in this country in 1817 was disconnected after 98 years and then only because the demand for water exceeded its capacity.

Specifications for Cast Iron Water Pipe.

Following is an extract from the specifications of the American Water Works Association, adopted as our manufacturing standard for water pipe.

We are equipped to make standard pipe in all regular sizes from 2 to 84 in.

DESCRIPTION OF PIPE

Section 1—The pipe shall be made with hub and spigot joints and shall accurately conform to the dimensions given in Tables Nos. 1 and 2. They shall be straight and shall be true circles in section, with their inner and outer surfaces concentric, and shall be of the specified dimensions in outside diameter. They shall be at least 12 ft. in length, exclusive of socket.

For pipe 4-in. to 12-in. inclusive, one class of special castings shall be furnished, made from Class D pattern. Those having spigot ends shall have outside diameters of spigot ends midway between the two standards of outside diameter as shown by Table No. 1, and shall be tapered back for a distance of 6 in.

For pipe from 14-in. to 24-in. inclusive, two classes of special castings shall be furnished: Class B special castings with Classes A and B pipe, and Class D special castings with Classes C and D pipe. For pipe 30-in. to 60-in. inclusive, four classes of special castings shall be furnished, one for each class of pipe.

ALLOWABLE VARIATION IN THICKNESS

Section 3—For pipe whose standard thickness is less than 1 in., the thickness of metal in the body of the pipe shall not be more than .08 of an inch less than the standard thickness; and for pipe whose standard thickness is 1 in. or more, the variation shall not exceed .10 of an inch, except that for spaces not exceeding 8 in. in length in any direction, variations from the standard thickness of .02 in. in excess of the allowance above given shall be permitted. For special castings of standard patterns a variation of 50% greater than allowed for straight pipe shall be permitted.

ALLOWABLE PERCENTAGE OF VARIATION IN WEIGHT

Section 7—No pipe shall be accepted the weight of which shall be less than the standard weight by more than 5% for pipe 16 in. or less in diameter, and 4% for pipe more than 16 in. in diameter, and no excess above the standard weight of more than the given percentage for the several sizes shall be paid for. The total weight to be paid for shall not exceed for each size and class of pipe received the sum of the standard weights of the same number of pieces of the given size and class by more than 2%.

No special casting shall be accepted the weight of which shall be less than the standard weight by more than 10% for pipe 12 in. or less in diameter, and 8% for larger sizes, except that curves, Y-pieces and breeches pipe may be 12% below the standard weight, and no excess above the standard weight of more than the above percentages for the several sizes will be paid for. These variations apply only to castings made from the standard patterns.

TESTS OF MATERIAL

Section 9—Specimen bars of the metal used, each being 26 in. long by 2 in. wide and 1 in. thick, shall be made without

84	1.72	1633.4	19600	2.22	2104.2	25250	84

The above weights are per length to lay 12 ft., including standard sockets; proportionate allowance to be made for any variation.
NOTE—Table numbers throughout this presentation of pipe and fittings conform to those of general U. S. Catalogue.

charge as often as the engineer may direct; and in default of definite instructions, the contractor shall make and test at least 1 bar from each heat or run of metal. The bars when placed flatwise upon supports 24 in. apart, and loaded in the center, shall support a load of 2,000 lbs. and show a deflection of not less than .30 of an inch before breaking; or if preferred, tensile bars shall be made which will show a breaking point of not less than 20,000 lbs. per sq. in.

COATING
Section 13—Every pipe and special casting shall be coated inside and out with coal tar pitch varnish. The varnish shall be made from coal tar. To this material sufficient oil shall be added to make a smooth coating, tough and tenacious when cold, and not brittle nor with any tendency to scale off.

Each casting shall be heated to a temperature of 300° Fahr. immediately before it is dipped, and shall possess not less than this temperature at the time it is put in vat. The ovens in which the pipe are heated shall be so arranged that all portions of the pipe shall be heated to an even temperature. Each casting shall remain in the bath at least 5 minutes.

HYDROSTATIC TEST
Section 14—When the coating has become hard, the straight pipe shall be subjected to a proof by hydrostatic pressure, and, if required by the engineer, they shall also be subjected to a hammer test under this pressure. The pressure to which the different sizes and classes of pipe shall be subjected are as follows:

	20-inch diam. and larger, pounds per square inch	Less than 20-inch diam., pounds per square inch
Class A Pipe.	150	300
Class B Pipe.	200	300
Class C Pipe.	250	300
Class D Pipe.	300	300

Flanged Pipe.

In recent years, the tightness and strength of the flanged joint have become of value for many special purposes. Flanged pipe is very generally used in power stations and similar buildings, where pipe lines are well supported. The dimensions of flanges, drilling, etc., adopted as standard for all flanged pipe except that for gas, are those recently adopted by the Committee of Manufacturers and the American Society of Mechanical Engineers, and known as the "American 1914 Standard."

NOTE—Flanges drilled to "American 1914 Standard" templates; send template if other drilling is required. Both holes drilled 1/8 in. larger than bolts. All dimensions in inches. Pipe made in 12-ft. lengths and faced 1/4 in. short for gaskets; special short lengths made to order. Above are neat finished weights. Allowance must be made for variation and finish. All weights are approximate

Cast Iron Gas Pipe.

Cast iron gas pipe possesses a power of resistance against corrosion or other factors causing deterioration inherent in the material itself and not dependent solely upon addition of coatings or other artificial aids. The specifications and tables adopted as standard by the American Gas Institute at their eighth annual meeting, held in Richmond, Va., in 1913 have been accepted as standard for gas pipe and specials.

Size of bolts, in.....	¾	¾	¾	¾	¾	¾	1	1	1½	1½	1½	1½	1½	1½	1½

NOTE—All extra heavy fittings and flanges to have a raised surface of ⅛ in. high inside of bolt holes for gaskets. Standard weight fittings and flanges to be plain faced. Bolt holes to be ⅛ in. larger in diameter than bolts. Bolt holes to straddle center line.

Tees and crosses 9 in. and down, reducing on the outlet, use the same dimensions as straight sizes of the larger port. Sizes 10 in. and up, reducing on the outlet, are made in two lengths, depending on the size of the outlet as given in the table of dimensions.

Laterals 3½ in. and down, reducing on the branch, use the same dimensions as straight sizes of the larger port. Sizes 4 in. and up, reducing on the branch, are made in two lengths, depending on the size of the branch as given in the table of dimensions.

The dimensions of reducing flanged fittings are always regulated by the reductions of the outlet or branch. Fittings reducing on the run only, the long body pattern will always be used.

LOCK-BAR STEEL PIPE.

Riveted Steel Pipe; Dredge Pipe; Pontoon Pipe; Shore Pipe; Tanks; Standpipes; Steel Linings; Plate Work; Tube Mills.

Advantages of Lock-bar Steel Pipe.

The relative advantages of different forms of pipe are determined by comparing their carrying capacities, strength, durability, and cost.

Lock-bar pipe has a carrying capacity 10% to 15% greater than riveted steel, and slightly greater than cast iron, because of its smooth interior unobstructed by rivets. It has a strength at the joint of 100%, or equal to the plate itself, as hereinafter shown.

Its durability and relatively small cost have been amply demonstrated by actual use for many years, as is evident by the installations given under "References."

Description of Lock-bar Steel Pipe.

"Lock-bar steel pipe is made by upsetting the edges of the plates and connecting them by a lock-bar in the shape of an H, going over the opposite edges and being forced down over them by hydraulic pressure. This takes the place of the riveting in the longitudinal joints. The circular joints may be made by riveting or otherwise, as for riveted pipe. While double riveting

Before Closing

After Closing

FIG. 1. LOCK-BAR JOINT

develops only about 72% of the strength of the steel plate, the lock-bar actually develops 100%."—*American Civil Engineers Pocket Book*, p. 959.

Strength of Joint.

The lock-bar joint is 100% efficient or equal to

the strength of the plate itself. It is therefore possible to use in many instances lock-bar pipe of a thickness of plate $\frac{1}{16}$ in. less than the thickness required in riveted or welded pipe where the joint efficiency is less than the strength of the plate.

Hydraulic Test on 42-inch Pipe.

On Jan. 2, 1909, official tests were conducted by the Robert W. Hunt Co. for the City of Springfield, Mass., on a 42-in. diameter, $\frac{7}{8}$ -in. plate lock-bar pipe under pressure of 1050 lbs. per sq. in. (Fig. 4). The metal of the plate was stretched over 4 in. in circumference without injury or leakage along the lock-bar joints. Higher pressure was not possible because of blowing out riveted pads at gage and inlet, as shown below. At this pressure, the pipe was actually exceeding by 765 lbs. per sq. in. its normal working pressure.

FIG. 2. HYDRAULIC TEST ON 42-INCH PIPE
Showing riveted pads blown out at gage and inlet; lock-bar joint remaining tight

Carrying Capacity.

By reason of its exceptionally smooth interior, lock-bar pipe has a slightly greater carrying capacity than cast iron pipe, and from 10% to 15% greater carrying capacity than riveted steel pipe, the interior of which is necessarily obstructed at frequent intervals by the projection of rings of rivets.—*See American Civil Engineers Pocket Book*, p. 959; *Fry's Civil Engineers Pocket Book*, pp. 1162-1163.

FIG. 3. NEW WORKS OF EAST JERSEY PIPE COMPANY, PATERSON, N. J.

Sizes.

Lock-bar pipe is made in diameters from 20 to 72 in., inclusive, and thicknesses of plate from 1/16 to 1/2 in., inclusive.

COMPARATIVE CHARTS SHOWING SAFE WORKING PRESSURES FOR RIVETED AND LOCK-BAR PIPES BASED UPON FORMULA $T = \frac{PFD}{2TS}$; T.S.= 55,000 LBS.; F= FACTOR OF SAFETY 4

Lengths.

Standard lengths, except where necessary to fit pipe to plan or profile of line, or where sizes of plates obtainable impose other limitations, are 30-ft. laying lengths, the most economical for handling and transporting.

Joints.

In all sizes above 24 in., where diameter is sufficient to permit inside rivet insertion and calking, patented riveted taper joints (Fig. 5) are employed. For this joint the pipe is made sufficiently tapered to permit insertion of one pipe in the slightly enlarged end of the contiguous pipe, the two pipes being connected in ordinary practice by one row of rivets, after which the joint is calked both inside and outside in a manner similar to the seams of a boiler.

In some instances buttstrap joints (Fig. 6) are employed.

Special attention is called to the new patented high pressure coupling (Fig. 7) and also the modification of this coupling for submarine work (Fig. 8). Lock-bar pipe with plain ends is furnished for use with these couplings, which can be furnished in all sizes 20 to 48 in. in diameter. The lock-bar on the outside of the pipe is cut down and the pipe welded and smoothed a sufficient distance from the end to permit the pipe to fit into the coupling.

Specifications for Lock-bar Pipe.

PLANING AND UP-SETTING—The longitudinal edges of plates shall be planed to proper dimension and edges up-set to a sufficient degree to

FIG. 4 LOCK-BAR STEEL PIPE

form necessary shoulder for engaging lock-bar. The ends of the plates shall be bevel sheared.

CRIMPING AND ROLLING—The longitudinal edges of plates shall be crimped to proper radius, so that when plates are rolled edges entering lock-bar shall not be damaged by rolling. After crimping, plates shall be cold rolled to diameter of cylinder of pipe.

LOCK-BARS—The lock-bars shall be made from a grade of steel and in accordance with certain specifications which experience has shown best designed for this usage.

PRESSING—Plates and lock-bars shall be assembled and clamped together and lock-bars pressed down over up-set edges of the plates by a hydraulic press exerting a pressure of at least 350 tons per lin. ft. of pipe.

FINISHING—After the bars have been pressed, ends of bars shall be trimmed to edge of plate to conform to bevel of edge of plate.

TESTING—Each section of pipe shall be tested in a hydraulic testing machine to at least one and one-half times the working pressure, which pressure shall be maintained until inspection has been made of entire length of lock-bar joint, and any pipe showing any signs of leakage or weakness at any point shall be returned and repressed.

FIG. 8. SUBMARINE PIPE JOINT

General Specifications for All Pipe.

Material used and method of manufacture shall conform to the following detailed specifications, although slight variations from exact specifications may be permitted where, in the judgment of purchaser's inspector, such variations do not affect strength, durability or efficiency.

INSPECTION—All materials entering into manufacture of said pipe and manufacture of pipe itself shall be subject to inspection by purchaser or his duly authorized representative. All steel shall be inspected by purchaser's inspector at mill. Steel plates shall be lifted to a sufficient height or angle to permit proper inspection of both sides, and all plates showing scales, blisters, laminations, burns, or imperfection of any description shall be rejected.

QUALITY OF METAL—Pipe, unless otherwise specified, shall be made of steel plates manufactured by open hearth process which conform to the following requirements:

Tensile Strength—Ultimate tensile strength of steel plates shall be between 55,000 and 65,000 lbs. per sq. in. Form of all test specimens, unless otherwise specified, shall be in accordance with "Standard Specifications for Structural Steel for Bridges" as adopted on August 16, 1909, by American Society for Testing Materials.

Elastic Limit—The elastic limit shall not be less than one-half ultimate tensile strength. The elongation shall not be less than 25% in 8 in. with a reduction in area of not less than 50%.

Rolling—Material shall be rolled true, and billets from which said material is rolled shall be free from seams and cracks. For the purpose of excluding inferior material, there shall be sheared from top of ingot sufficient discard to obtain sound steel.

Punching Test—Specimens for punching test shall be $1\frac{3}{4}$ in. wide, and not less than 10 in. long; a row of not less than 8 holes $\frac{3}{4}$ in. in diameter, spaced $1\frac{1}{4}$ in. between centers, shall be punched while plate is cold, without causing any cracks.

Drifting Test—Specimens for drifting tests shall be 3 in. wide and not less than 5 in. long; not less than 2 holes $\frac{3}{4}$ in. in diameter, spaced 2 in. between centers, and $1\frac{1}{2}$ in. from edges, shall be punched and then enlarged cold by blows from a sledge hammer upon a drifting pin until said holes are at least $1\frac{1}{4}$ in. in diameter, without causing any cracks.

Bending Test—The bending test specimen shall be cut lengthwise and crosswise from sheets, and shall not be less than 6 in. long and 1 in. wide. When cold they shall be bent 180° flat upon themselves without showing any signs of fracture on convex side of bent portion.

Additional Tests—Plates while cold must admit of hammering or scarfing to a fine edge without fracture. Test pieces must stand quenching, forging and other tests to prove fully their temper, soundness, and fitness for use in manufacture of pipe.

Perfect Plates—Plates shall be free from laminations, cinders and any other surface defects. They shall be fully up to required thickness at edges, and any plates which shall be found to be more than 5% short of the required thickness at any point shall be rejected. Not over 5% of plates shall be short of full required thickness at any point. Plates must be rolled flat and sheared as accurately as possible (in no case shall any plates be short of specified dimensions), and must in all respects be in good merchantable condition.

Specimens and Rejections—General qualifications shall be determined from one set of tests from each heat or melt; but any plate which shows defect during the process of punching, bending or riveting shall be rejected notwithstanding previous satisfactory tests of test pieces. Failure of test pieces to conform to specifications shall cause rejection of entire heat or melt from which samples were obtained.

Before proceeding with manufacture of pipe, contractor will prepare and submit to purchaser for his approval shop drawings showing proposed layout.

Punching—Rivet holes shall be punched with sharp clean punches and dies so as to cut holes clean and leave no burr on underside of plates.

SPECIFICATIONS FOR COATING—Material used for coating pipe shall be a specially prepared mineral rubber asphalt mixture.

Pipe section shall be heated in suitable oven to a temperature of not less than hereinafter specified for the bath. Pipe section shall then be dipped vertically in the bath of mineral rubber coating maintained at a temperature of 350° Fahr. or more and of sufficient depth to allow pipe to be entirely submerged, and it shall receive a coating of not less than $\frac{1}{32}$ in. in thickness. Coating must be free from blisters and bubbles; it must strongly adhere to pipe under all circumstances, and must not become soft enough to flow at a temperature of 150° Fahr., nor brittle enough to crack or scale off in freezing temperature. After pipe sections have been removed from bath, they shall be set in a vertical position while cooling.

LOADING—After coating has become sufficiently hard, pipe shall be loaded on suitable cars provided with wood saddles, cut to proper radius for pipe to rest on. All saddles or bolsters, as well as all side stakes on cars which come in contact with pipe, shall be protected with pads of burlap or other suitable material of sufficient thickness to prevent rubbing or chafing of coating. Entire load to be blocked and wired on cars in best possible manner, to prevent, as far as possible, shifting in transit, and injury to coating.

BURLAP WRAPPING—After pipe has been dipped in mineral rubber coating and coating has sufficiently set to prevent flow in subsequent operations, it may, at the purchaser's option, be wrapped with 10-oz. Calcutta burlap or equal, which shall be cut into strips 18 in. wide and applied in accordance with the particular specifications of the EAST JERSEY PIPE COMPANY.

A Few Notable Pipe Lines Made by the East Jersey Pipe Company.

AMERICAN SPIRAL PIPE WORKS

Manufacturers of Lap-welded Steel Pipe, Spiral Riveted Pipe, Steel Pipe Flanges and Hydraulic Supplies

GENERAL OFFICE AND WORKS

CHICAGO, ILL.

EASTERN OFFICE: 50 Church Street, NEW YORK

Products.

LAP-WELDED STEEL PIPE; TAYLOR'S SPIRAL RIVETED PRESSURE PIPE, Galvanized or Asphalted; FORGED STEEL FLANGES; FLANGED FITTINGS; SPECIAL PLATE STEEL FITTINGS; SEAMLESS BOILER NOZZLES; CORRUGATED FURNACES.

Also, Gate, Straightway and Foot Valves; Exhaust Heads; Hydraulic Mining Giants, etc.

Scope of Use.

The products of this company are extensively used for the following purposes:

SPIRAL RIVETED PIPE—For high pressure hydro-electric lines; exhaust steam and condenser piping for various plants; water supply lines, water works systems, pumping mains, distribution work; producer-gas lines, etc.

LAP-WELDED PIPE—For hydro-electric power plants; water supply and intake mains; gas work; shore pipe; dredging pipe; dredging spuds; welded pontoons; large diameter welded drums; tanks; cylinders and shells.

FORGED STEEL FLANGES—For high pressure steam mains, superheated steam, and hydraulic work. Boiler and tank flanges bent to required circle.

Taylor's Spiral Riveted Pipe.

In manufacturing this pipe, a strip of sheet steel is wound into helical shape with one edge overlapping the other for riveting the seam; metal to metal contact at the spiral seam; steel stretched on outer lap slightly offset to insure smoothness on the inside; and riveting is done cold by compression or squeezing under enormous pressure (not by percussion or hammering), thus completely filling rivet holes with slight counter-sink. Hydraulic tests (for bursting pressure) have frequently shown the seam to be strongest part of the pipe.

Pipe comes from machines in a continuous piece and is cut to any desired length. Maximum lengths, galvanized, 20 ft.; asphalted, 40 ft.

FIG. 1. SPIRAL RIVETED PRESSURE PIPE

Forged Steel Flanges.

Being strictly forged steel permits them to be attached securely and rigidly to the pipe by use of power riveters, making an absolutely tight joint, and eliminating the possibility of a leak (Fig. 2).

They are forged from the best grade of steel and can not be cracked or broken in transit or installation. Furnished in either spiral pipe or the A. S. M. E. standard.

Forged Steel Bolted Joints.

For hydraulic purposes. Unbreakable in handling, transportation, or use. Joints allow slight deflection without leakage and take care of all expansion and contraction of pipe. Suitable for highest pressure. By using shorter lengths of pipe, long radius bends are possible (Fig. 3).

FIG. 2. FORGED STEEL FLANGES FOR RIVETED PIPE

FIG. 3. FORGED STEEL BOLTED JOINT

Estimates, or Prices Quoted.

Send us a field or shop sketch, showing layout of line or list of material required, and we will quote special net price and furnish the material cut to exact length with all necessary fittings and specials so immediate installation may be made upon the arrival of the material. Forged steel flanges used throughout. We carry a large stock on hand at all times and are in position to make prompt shipment on all orders. Every length subjected to a hydraulic test of 50% in excess of specified working pressure.

FIG. 4. ASPHALTED PRESSURE PIPE DISCHARGING SAND AND GRAVEL 1¼ MILES FROM SUPPLY
Raising the level of the ground. Using 6,600 ft. of 12-in. No. 12 pipe

Flexible Ball Joints.

Used extensively on submerged pipe lines and on intake mains where pipe follows contour of surface. Deflection of 20° may be had in any direction. Note packing ring which may be tightened, or entire joint re-packed, without affecting clamping ring that prevents joint from pulling apart. Forged steel follower ring, for holding packing and clamping ring (Fig. 5).

FIG. 5. FLEXIBLE BALL JOINT

Pipe Connections and Fittings.

Several styles of connections (flange, welded flange, field riveted, bell and spigot, bolted socket, bolted joint, etc.) are all of forged steel. Particulars of pipe connections and fittings sent on request (Fig. 8).

Lap-welded Steel Pipe.

Made from best quality of open hearth flange steel, having a tensile strength of 55,000 to 65,000 lbs. per sq. in. Welding accomplished by gas fire, giving most reliable and uniform weld.

SIZES OF PIPE—Diameter, 12 to 72 ins.—see tables.

INSTALLATIONS—From complete piping for the largest hydro-electric plant to the shortest nipples required for special work.

FIG. 6. LAP-WELDED STEEL PIPE

12-in. to 72-in. diameters
For water mains, dredging work, etc. Used as high pressure hydro-electric and vacuum exhaust pipe, etc.

We manufacture all intermediate sizes and thicknesses in addition to the above list.

FIG. 8. SPECIAL STEEL PLATE FITTINGS

Corrugated Furnaces.

For internally fired boilers, land and marine types. Every furnace made of highest quality firebox steel in accordance with specifications of U. S. Board of Supervising Inspectors, or U. S. Navy Department or Lloyds. Send for particulars (Fig. 9).

FIG. 9. CORRUGATED FURNACES

Taylor Seamless Forged Steel Boiler Nozzle.

Forged from a single piece of open hearth steel, without a weld. It can not be affected by any possible strain which may arise through the piping system. This seamless nozzle has been proved to be the most reliable and safest connection between boiler drum and a high pressure piping system, and it eliminates all castings, making the boiler wrought steel throughout. Power riveters can be used for attaching the nozzle (Fig. 7).

Products.

STANDARD REINFORCED SPIRAL PIPE, Asphalted and Galvanized; SHEET STEEL PIPE FITTINGS; STEEL FLANGES; RIVET SETS; GATE VALVES.

Hydraulic Supplies and Drop Forgings.

Standard Reinforced Spiral Pipe.

CONSTRUCTION—In the construction of Standard spiral pipe no rivets are employed, thus avoiding interruption to flow, or frictional resistance, by clogging, etc. The interlocking seam is a double lapped connection made in the following manner:

Two strips of steel are cut to required but different widths from long sheets of steel, and the ends are welded together; both strips are fed from large spools into a special machine at one end, rolled to shape and interlocked in such machine, coming out at the other end in shape of an endless pipe; strips are accompanied by a reinforcing band which gives 4 thicknesses of metal at spiral seam, running entire length of pipe. Ample folds on both strips and band prevent leaking, and give large bearing surface or contact at seam.

CONTINUOUS INTERLOCKING SEAM
Smooth inside

Interior of pipe is absolutely smooth—no rivet heads protruding therein to reduce diameter, collect particles and increase friction. Tensile strength and stiffness of steel permit lighter gages to be used, assuring installations more difficult and cheaper than are possible with riveted or any other pipe.

ADVANTAGES—Strength and stiffness are gained by the continuous interlocking seam, giving high collapsible and bursting resistance. Its lightness permits easy handling by common laborers. The elimination of rivets or projections on the inside gives a smooth interior waterway, thereby reducing the frictional resistance. The coating of the pipe and connections after assembling and before shipment insures a complete and thorough protection of metal against corrosion.

USES—For water supply lines, irrigation, dredging, sluicing, reclamation of swamps, brine circulation, paper and pulp mills, exhaust steam, compressed air, blow-pipe, pneumatic conveyors, suction and discharge, filtration piping, pumping and distributing mains, hydraulic mining, phosphate mining, ventilation, dust collecting system, vacuum cleaning system, smokestack, gas, oil and culverts.

USERS—The following are among many:

U. S. Reclamation Service; Halcomb Steel Co.; International Harvester Co.; Inland Steel Co.; Studebaker Co.; Ford Motor Co.; Chalmers Motor Co.; Armour & Co.; Morris & Co.; Butte Superior Copper Co.; Copley Cement Co.; Union Gas & Electric Co.; Anaconda Copper Co.; Eddy Paper Co.; City of Chicago; large gas companies and numerous railroads and other large corporations.

COATING—The life or lasting quality of steel pipe depends in great measure on the character of coating

STANDARD REINFORCED SPIRAL PIPE

material and its application. After removing from pipe all scale or signs of oxidation, spiral pipe is immersed in a bath of bitumite coating, which is kept at a high temperature. All connections, such as flanges, slip sleeves, etc., are invariably attached to pipe before coating. Bitumite coating is best for pipe buried underground or used for conveyance of water. The Western Union Telegraph Co., after exhaustive tests, has decided that the bitumite coating, which is put on by the STANDARD SPIRAL PIPE WORKS, has greater resistance to the action of alkali or other injurious elements, and actually protects steel. Large quantities of pipe have been coated for them. Bitumite coating resists action of acids, alkali and other corrosive or destructive elements found in air, water and soils.

CONNECTIONS—Joining lengths of Standard reinforced spiral pipe is similar to methods used by manufacturers of riveted pipe:

(1) Forged steel flange welded on to ends of pipes and furnished with bolts and gaskets complete, eliminating protrusion of rivet heads on inside of pipe. List price on next page.

(2) A slip sleeve joint—a seamless sleeve welded into one end of pipe; lugs welded on outside at both ends of pipe; one end of pipe slips into the other; pipes drawn together with wires over lugs, making a good joint for ordinary water pressures in flow lines.

(3) BB joint is simple, inexpensive, and very quickly and easily put together; consists of 2 half-round pieces of steel, welded to pipe at ends, and clamped by 2 pieces bolted together.

(4) Steel bolted joints, such as Dayton, Dresser, and others. List price on next page.

Steel Fittings.

Steel fittings of all descriptions including elbows, tees, crosses, laterals, return bends, and offsets, of varying dimensions, both center to face and radius, are now being supplied, made out of Standard reinforced spiral pipe, with flanges to match any fittings made. Can be supplied in much quicker time than special patterns could be made for the castings, and at a lower price.

Rivet Sets.

Manufactured by a hammered and rolled process which produces a set much more uniform in quality than is obtained by the so-called drop forged process or as turned from the bar.

This hammering and rolling removes all undue strain in the steel, and is very much preferred by experienced riveters.

These rivet sets can be supplied finished and cupped ready for use, or unfinished.

Prices quoted on application. Immediate deliveries.

THE M. W. KELLOGG COMPANY
Piping Engineers and Contractors
140 Cedar Street
NEW YORK, N. Y.

BOSTON PHILADELPHIA CHICAGO PITTSBURGH SAN FRANCISCO LOS ANGELES
MONTREAL, TORONTO, WINNIPEG, CAN., CANADIAN KELLOGG CO., LTD.

Products.

WELDED PIPE, FLANGES, TANKS and FITTINGS, KELLOGG IMPROVED VAN STONE JOINT, BENT PIPE and BAROMETRIC INJECTOR CONDENSER.

Also manufacturers of Expansion Joints, Cast Iron Pipe Fittings; Penstocks, Buoys, Seamless Welded Work of all description, Lap-welded Pipe, any diameter and thickness.

For Perforated Radial Brick Chimneys, see pages 636-37.

Services.

THE M. W. KELLOGG COMPANY are piping engineers, who make a specialty of pipe, fittings and flanges of all descriptions for the conveyance and control of high and low pressure steam, water, air, gas and oil. Our Engineering Department is ready to render any assistance in its power in designing the best piping system for any given purpose and location, which will then be made in our factory, and installed complete by our own erecting crews where desired.

Scope.

By our processes, lengths of pipe of any size can be welded together up to the limit set by shipping facilities. We make a specialty of forge welding flanges on wrought iron pipe and seamless steel tubing, any size, thickness or length. Also we can manufacture lap-welded steel pipe 12 ins. and above, of any diameter, thickness and length.

Demand for Welded Pipe.

To meet the increased pressures and temperatures at which gases and liquids for industrial purposes are conducted and controlled, engineers today demand a joint in which pipe and flange shall be one piece.

Kellogg System of Pipe Welding.

Both flanges and pipe are made of a special low carbon steel. The flanges are first shrunk on the pipe, which insures a tight fit between pipe and flange that prevents oxide forming between them. The weld is made in an oil or gas furnace so designed as to give a non-carbonizing or non-reducing heat under accurate control at the welding temperature. The silicate in the

OUTLETS WELDED TO STEEL HEADER
Outlets ranging from 1½ to 12 ins. in diameter

highly heated fire brick furnace also has a tendency to act as a flux and thereby retard the formation of iron oxide until the weld has been completed under the hammer.

Exhaustive tests show a complete weld of the pipe and flange from face of flange to back of fillet. All flanges are machined and drilled, after welding, to insure perfect alignment with the axis of the pipe.

The faces of the flanges can be made with raised seats inside of bolt holes, ground joints, male and female, tongue and groove or bevel face.

This makes an especially good joint for step bearing lines on turbines, high pressure hydraulic lines (where the joint must not only stand high pressure, but also the great strain and shock of waterhammer), receiver pipes on locomotives, marine work, etc.

KELLOGG IMPROVED VAN STONE JOINT

Cost compares favorably with the well-known Van Stone joint.

Welded Nozzles.

The numerous joints in a steam header may be greatly reduced by the welding of outlets directly into the pipe. In superheated steam work the advantages are numerous.

The nozzle may be located at any place and at any angle in the steam main with no increase of run joints.

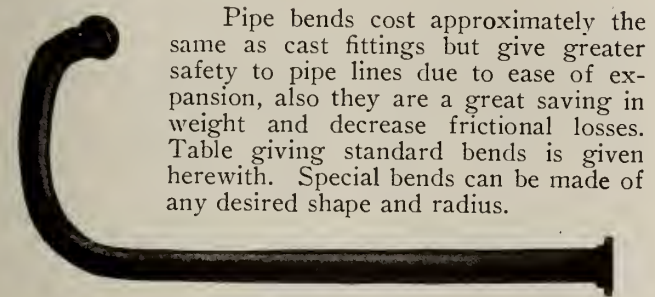

One-half to three-quarters of the run joints can be done away with, and the liability of a blown gasket or a leaky joint done away with to the same extent.

In this way practically all fittings are dispensed with. By cutting V-shaped pieces from the pipe before bending it and then welding the seam by the electric process we can make bends of a very small radius to take the place of a fitting.

Great saving in the cost of erecting and installing pipe lines.

Much less weight has to be borne by walls or trusses, and the cost of flange and fitting coverings is saved.

Pipe Bends.

KELLOGG PIPE BEND

Pipe bends cost approximately the same as cast fittings but give greater safety to pipe lines due to ease of expansion, also they are a great saving in weight and decrease frictional losses. Table giving standard bends is given herewith. Special bends can be made of any desired shape and radius.

Welded Steel Tanks.

We manufacture welded steel tanks for all purposes of any size or description limited to size and shape only by transportation facilities. Joints in welded tanks are not subjected to corrosion nor liable to leak as in riveted joints. Drip pockets, outlets, intakes, gauge bosses, lugs, etc., are all welded to shell. A few of the uses best adapted to this type of tanks are as follows: Storage tanks for oil, water, gasoline, etc., air pressure receivers, blow-off tanks, caissons, brine tanks, cylinders for hydraulic work, steel buoys, etc. Information regarding capacity and dimensions of welded steel separators will be sent on application.

WELDED SEPARATOR

Guarantee of Joints.

Our guarantee for the joint covers anything that the pipe itself will stand. All our welded work is tested to twice the working pressure.

Full dimensions, sketch or blue print should accompany all requests for prices on pipe bends.
Drawings submitted should include dimensions A, B, C, D, H, and O where necessary, and any other variations from dimensions as given in the above table.

Bulkley Barometric Injector Condenser.

As the name indicates, this condenser removes non-condensable vapors by the injector action of the condensing water falling through a contracted throat of special design and dimension. This type of jet condenser can be placed inside or outside of building above the floor level, and can be used to great advantage with engines, high, low and mixed pressure turbines, vacuum pans, evaporators, stills, etc.

ADVANTAGES—Simplicity of operation, as the only moving part is the circulating pump handling cold water; no parts to wear out and thus impair the vacuum; effective in action and handles overloads and sudden fluctuations automatically.

ARRANGEMENT OF BULKLEY INJECTOR CONDENSER

COST OF OPERATION—The consumption of power of the prime mover required to operate this type of jet condenser is 1½% or less, maintaining a vacuum 28 ins., referred to a 30-in. barometer, with injector water at 70° Fahr., and where the source of supply is approximately at the same level as the overflow from the hot well.

Products and Services.

IRON and STEEL GATE VALVES, FITTINGS and FLANGES; PIPE BENDS; WELDED HEADER LINES and FABRICATED PIPE WORK.

INSTALLATION of all classes of PIPING SYSTEMS.

Personal attention and supervision of all work; supplying of special charts showing engineering data on saturated and superheated steam; curves giving sizes for steam headers and boiler connections for 200 h. p. to 10,000 h. p., gage pressures 125 lbs. to 300 lbs., velocities 3,000 ft. to 12,000 ft. per minute.

Welded Headers.

Illustration (Fig. 2) shows a 24-in. header with welded nozzles of extra heavy pipe, instead of flanged tees. Companion flanges are attached by means of National square lap joints. In this header 13 joints are eliminated.

Types of Header Connections.

The most approved methods of connecting boilers to header and of attaching flanges to pipe are illustrated

in Fig. 1. The National square lap joint is recommended; it gives the best gasket surface, a loose or swivel flange and minimum chances for leaks.

Many power plants have leaks in the various pipe connections equivalent to an opening $\frac{3}{16}$ in. in diameter, that, at 175 lbs. pressure, causes a loss of \$578.00 per year, which is about 6% on an investment of \$10,000.00. (See table accompanying.)

APPROXIMATE LOSS FROM STEAM PIPE LEAKS EQUIVALENT TO GIVEN CIRCULAR OPENINGS UNDER AVERAGE CONDITIONS

Basis: Cost of 1 h.p. per year of 300 days and 24 hrs. per day is \$38.40.

PIPING and FITTINGS, including Valves; Flanged Fittings and Flanges; Special Cast Iron and Cast Steel Flanged Fittings; Pipe Bends and Fabricated Piping; Van Stone and Sargol-Weld Pipe Joints, Slip and Copper Expansion Joints; Welded Headers; Steam Separators; Piping Systems; complete, ready for installation or delivered and erected.

Complete PIPING EQUIPMENTS are furnished and installed in power plants of all kinds, such as electric light plants, street railway powerhouses, blast furnaces, steel works and industrial plants of any and every description. The pipe is fabricated in the company's shops and erected with its skilled labor. Complete piping installations are furnished ready for erection, if the owners prefer to install same. Any make of valve, separator, trap or any steam or water specialty, that may be desired, can be supplied.

Piping Equipment.

The installation of piping equipment is made a specialty. The officers of the company give personal attention to the supervision of contract work. Experts are in charge of every contract, which insures correct installations and satisfactory service.

48-INCH LONG RADIUS CAST IRON ELBOW

Construction.

The material manufactured and fabricated is prepared in the company's shops by skilled labor with special machinery and appliances. It is designed for the service required, so that whether it is to be used for hydraulic pressures, superheated steam or exhaust steam, it is made of proper material and sufficient strength to make it absolutely safe.

18-INCH PIPES AND PIPE BENDS WITH WELDED OUTLETS

Pipe Bends.

Modern practice demands that pipe bends should be used when possible. They prevent leakage by allowing for expansion and contraction, reduce friction and loss of pressure. The cost is no more than that of the fittings displaced by their use.

Sargol-Weld Joint.

For high pressure superheated steam lines the Sargol-Weld joint, eliminating the use of gaskets, is the last word.

Write for particulars.

SARGOL-WELD JOINT

Contracts for Piping Installation.

This company is prepared to contract for piping installations at any place in the United States and Canada and for any service, including the highest pressure of superheated steam and hydraulic working pressures up to 5000 lbs.

ROESSING-ERNST COMPANY

Manufacturers of Pipe Coils and Pipe Bends

OFFICE AND WORKS
PITTSBURGH, PA.

Products.

PIPE COILS; PIPE BENDS.

Wide Scope of Use.

ROESSING-ERNST COMPANY manufactures pipe coils and pipe bends of every description for every purpose, from extra strong or double extra strong pipe—black or galvanized; also from brass, copper, aluminum and seamless drawn tubing. The illustrations show a few of the coils and bends most commonly used; but the coiling and bending of pipe and tubing is a distinct specialty. Orders are made in precise accordance with specifications, whether the order is small for a simple coil in common use or whether large for special coils of intricate design.

Coils made by this company in every conceivable shape, from 1/4-in. to 6-in. pipe, are rendering dependable service in practically every industry carried on in the United States where pipe coils are essential.

Manufacturing Facilities.

The company has complete facilities for making bends and coils from any pipe capable of being so treated, either hot or cold, of steel, wrought iron, seamless drawn tubing, brass, copper, aluminum or any other similar material.

This company is also equipped to make conduit bends of any size, utilizing special machinery for bending and reaming and cutting conduit threads.

The location of the shops in the heart of the Pittsburgh district—the largest pipe producing center in the country—is an especial advantage, because it insures an adequate supply of pipe.

ROESSING-ERNST COMPANY's method of bending entirely eliminates scale from the inside of the pipe and the sections remain true to the original area. Coils requiring pipe longer than mill lengths are made of one continuous length, with the joints welded electrically so as to leave no projections either inside or outside the weld. All kinds of flanges can be attached to bends by any of the approved methods either before or after bending.

All coils and bends are carefully checked for absolutely correct angle and dimensions, avoiding the necessity of forcing pipe into place. Before leaving the shops all work is thoroughly tested to 350 lbs. air pressure submerged in water. If desired, tests are made with any specified hydraulic or line steam pressure.

Special Hydraulic Pipe.

For special service on lines requiring the finest possible grade of materials and workmanship, ROESSING-ERNST COMPANY are prepared to furnish, to specifications, a special hydraulic pipe bored from solid forgings, including threading, making of bends and attaching special flanges for test or working pressures to 10,000 lbs. per sq. in.

2-in. Flat Spiral Coil 14 Ft. 6 In. Outside Diameter for Tank

2-in. Double Cylindrical Coils for Ammonia Condensers

2-in. Cylindrical Condenser Coils

2-in. Special Cooling Coils, for Hearth Jacket Plates

A FEW TYPES OF ROESSING-ERNST PIPE COILS AND THEIR ADAPTABILITY

WALWORTH MANUFACTURING COMPANY

Manufacturers of Fittings and Tools for Steam, Water, Gas and Air;
Specialists in Power Plant Piping

BOSTON, MASS.

For Branch and Sales Offices, see page 494

WESTERN DIVISION
OFFICES, CHICAGO, ILL.
WORKS, KEWANEE, ILL.

Products.

POWER PLANT PIPING COMPLETE, PIPE BENDS and FITTINGS, WALMANCO FLANGES, "GENUINE WALWORTH STILLSON" WRENCHES, "KEWANEE" UNIONS.

Oldest continuous manufacturers in the United States (since 1842) of a complete line of Valves, Fittings and Tools for Steam, Water, Gas and Air.

Originators of the famous "Genuine Walworth Stillson" Wrench and the "Kewanee" Union.

For Valves, see page 494.

Power Plant Piping.

This company will furnish complete piping equipments for power plants of every description for the highest pressures and superheats.

The company's exceptional facilities and extensive experience enables it to produce the very best in power piping.

Those having power piping problems to solve are invited to submit them to the Walworth engineers for a satisfactory solution.

WALMANCO JOINTS—Were the first joints of this type to be put on the market. Many years of actual service under the most severe conditions have shown them to be the best joints for any requirement. Their main advantages are: the pipe is not weakened by threading; the gasket bears on the face of the lap to prevent leaks; the flange swivels on the pipe, has maximum strength and is not subject to torsional strains in attaching.

WROUGHT STEEL HEADERS WITH WELDED-IN NOZZLES AND CAST STEEL HEADERS—For modern requirements of high pressures and temperatures. Steel headers are particularly useful where strength and lightness are desired. Made up with Walmanco flanges.

PIPE BENDS—Bends of all shapes, radii and sizes in steel and wrought iron, made with standard and extra heavy fittings for all purposes.

Table of standard bends sent on request.

STEEL HEADER WITH WELDED-IN NOZZLES

WALMANCO JOINTS

ONE ORDER OF WALWORTH PIPE BENDS

"Kewanee" Unions.

"Kewanee" unions have three parts and five reasons in their favor:

Brass to iron thread connection—no corrosion.

Brass to iron ball joint seat—no gasket required.

Extreme compressed air test under water—no defective fittings.

Solid three-piece construction—no inserted parts.

Easily disconnected—no force required.

Note savings effected through use of these unions: one nipple saved; fewer joints made, thereby reducing possibility of leaks; fewer connections made and labor bills reduced; gaskets eliminated and their cost saved.

The "Kewanee" principle just described is also applied to various products of this company as follows: "Kewanee" flange unions; ells; tees; boiler couplings; service cocks; air pump, air drill, hydraulic and hose unions; circulating boiler fittings; globe, angle, gate and swing check valves.

THE NATIONAL ASBESTOS MFG. CO.

Underground and Exposed Pipe and Stack Insulation

FACTORY AND GENERAL OFFICES

163-193 Henderson Street

JERSEY CITY, N. J.

Products.

PYRO-BESTOS SECTIONAL UNDERGROUND and OVER-HEAD EXPOSED STEAM and HOT WATER PIPE COVERINGS.

Pyro-Bestos Boards and Blocks, either flat or curved, for lining smokestacks, flues, breechings, for either hot blast or hot air, dry kilns, drying ovens, ceilings, etc.; National Brand Asbestos Air Cell Pipe and Boiler Coverings (sectional, blocks, board and plastic); High Temperature Cement.

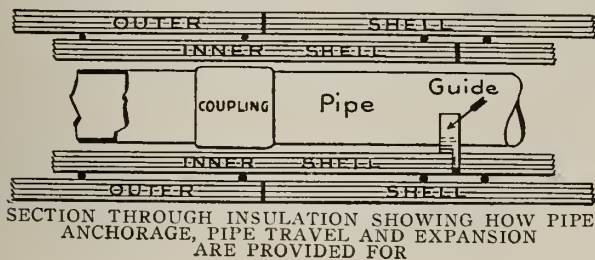

What Pyro-Bestos Is.

Pyro-Bestos is a most economical and efficient sectional waterproofed insulation for either steam or hot water lines in underground trenches, conduits or tunnels, and is the only underground insulation that is permanently and absolutely waterproof in itself. By reason of its great hardness, it will withstand a crushing strain of over 250 lbs. to the inch, and is strong enough to withstand any earth pressure it may be subjected to. In fact it does everything any tile or other conduit can do at very much less cost.

No wooden, brick or concrete trenches, tile or other conduits, or other so-called waterproof protection is necessary. Just lay in trench, fill in with earth—consider the saving.

Underground Pipe Insulation ("National" System).

The "National" system of underground pipe insulation furnishes a permanent, efficient and economical protection, at the same time providing for unhampered pipe travel due to expansion and contraction.

Pyro-Bestos Specifications and Prices.

Write for complete specifications and description. Prices will be quoted on application. State the quantity and sizes needed, as well as the steam pressure.

The service of this company's underground department is at the disposal of interested persons without obligation.

Specifications for special work made up on request.

PIPE GUIDE EQUIPPED WITH BALL BEARINGS

Showing broken joint method with both ends and all longitudinal seams permanently sealed. Pipe guides in position. Wire fastenings every 12 in.

THE RIC-WIL COMPANY

Manufacturers of Heat Insulating Products

CLEVELAND, OHIO

Products.

RIC-WIL UNDERGROUND CONDUIT and RIC-WIL UNDERGROUND PIPE COVERING used in the "RIC-WIL METHOD" of Insulating Underground Steam and Hot Water Pipes.

RIC-WIL
METHOD
TRADE-MARK

The Ric-wil Method.

The RIC-WIL METHOD of insulating underground steam and hot water pipes to prevent heat losses, presenting practical advantages in the utility and ease of construction, appeals to every engineer and large steam user. After the trench is dug and the levels determined, it is usual to begin the RIC-WIL METHOD with a concrete foundation on which the base drain is to be laid. The concrete foundation is of such a character that the levels are easily maintained.

BASE DRAIN—The base drain is both a base for supporting and aligning the conduit, and a drain for carrying away the water which might otherwise accumulate around it. It has, in all cases, ample free drainage area and is made the same length as the conduit, but the joints of base drain and conduit alternate, thus making an interlocking construction which preserves conduit alignment. The joints of the base drain are not sealed, but are left open, and crushed rock or coarse gravel is banked up along each side to act as a filter and keep dirt from entering the base drain and thereby prevent drainage by clogging it up. The base drain is connected at various intervals with a sewer or other free outlet. The base drain is the most important single factor in the success of RIC-WIL METHOD.

CONDUIT—The conduit is sectional, vitrified, salt glazed tile—the upper half being provided with a projecting lip to protect the longitudinal joint—in which is moulded before shipment a pipe covering of high efficiency, same prepared from a highly siliceous natural mineral. The conduit is readily split lengthwise on the job before installing same. RIC-WIL is the only sectional underground pipe covering manufactured where the waterproof casing and insulation are integral.

Generally, further insulation is provided with RIC-WIL filler when a steam pipe or a number of pipes conveying fluids at different temperatures are installed in the same conduit. This loose insulating material is packed around the pipe or pipes to entirely fill the hollow space between same and the insulation which is moulded to the inside of the tile. When properly installed, filler will not settle or shrink and is sufficiently elastic not to interfere with free expansion or contraction of the iron pipes. The insulation around the inside of the tile, together with the filler that is inserted, makes a continuous and efficient insulation.

PIPE SUPPORTS—Are usually placed 12½ ft. apart, entirely enclosed in the conduit, and are of a practical

and strong design, consisting of a malleable iron guide with pockets supporting steel spindles, on which rustproof rollers are free to turn. Guide has a large bearing surface and projecting pins which insure keeping the same in its proper relation to pipes and conduit.

CEMENT—Cement for sealing longitudinal joints of conduit is portland in all cases; the bell joints may be either portland or RIC-WIL Elastic and Waterproof.

INSTALLATION—RIC-WIL METHOD is complete; it is the easiest underground system to install and its durability and efficiency are established.

RIC-WIL COMPLETE

Sizes.

Conduits are made in sizes from 4 to 22 in. inside diameter; sizes up to and including 20 in. carried in stock, larger size made to order only. All sections of conduits are 2 ft. 6 in. long, except the 4-in. and 6-in. sizes which are 2 ft. long.

Base drain made in 3 sizes: small for conduits 4 and 6 in. in diameter; medium for conduits 8 to 14 in. in diameter, inclusive; large for conduits 16 in. and up.

Fittings.

RIC-WIL insulated fittings are carried in stock in all sizes up to and including 14 in. inside diameter of tile in the form of elbows 45° or 90°, reducers or increasers and tee branches. Larger sizes and other shapes made to order.

Shutters.

Specialty designed RIC-WIL shutters are used to close the ends of the conduit when entering buildings, manholes and anchor boxes.

Specification Data.

In preparing subdivision of heating specifications which embraces conduit and insulation, it is recommended that the engineer communicate with this company in regard to:

Sizes of conduit and standard equipment therefor, which will allow installation of certain size pipe combinations required for work contemplated. State conditions under which pipe system is to be operated, whether steam, hot water or oil transmission; and if the former, state pressure and if any superheat is to be carried, and, if so, how much. It would be well to state clearly kind of service for which each pipe is intended and if position of any pipe or pipes is definitely fixed in relation to any other pipes.

With the foregoing information to hand valuable suggestions based on a wide range of observation, contact and experience will be given. Representative will be sent, if desired.

Catalogue.

Complete catalogue which explains the RIC-WIL METHOD will be sent on request.

TYLER UNDERGROUND HEATING SYSTEM

PITTSBURGH, PA.

Products and Services.

Manufacturers and designers of UNDERGROUND HEATING SYSTEMS, including Casing, Piping, Ball Bearing Pipe Supports (for ditch or tunnel floor); Wall Brackets (to hold one, two, three, or four pipes) for tunnel or powerhouse work; Expansion Joints, and Anchors for tunnel or ditch construction.

WATER WEIGHING MACHINES for powerhouse work; CONDENSATION METERS that work on either gravity or vacuum systems; HOT WATER METERS for measuring quantity water and also temperature water; STEAM TRAPS; WATERPROOF MANHOLE COVERS, and INDIRECT HEATERS.

Engineering Service at disposal of clients.

Tyler Underground Heating System.

In designing the Tyler underground heating system the makers went farther than the consideration of first cost, making it secondary to permanency, durability and efficiency. Insulation, expansion and proper anchorage have been provided for as well as numerous other features which will prove extremely interesting to any one considering the installation of a system of this kind.

The advantages are as follows:

PROPER INSULATION—Tyler ditch construction is so thoroughly insulated that heat loss is almost negligible; in fact, if the pipe is buried but 18 in. it will not melt snow on the ground surface.

SINGLE PIPE DITCH CONSTRUCTION
(Patented Oct. 10, 1911)

COMBINATION MULTIPLE PIPE CONDUIT
(Patented Oct. 10, 1911)

The concrete can not crack and no forms are required in placing it

PIPE EXPANSION—The construction of Tyler expansion joints allows the pipe to expand and travel freely and without leakage of steam.

TUNNEL CONSTRUCTION

This construction allows ample room for man to walk and inspect or repair pipe

DOUBLE EXPANSION JOINT

(Patented Oct. 10, 1911, and Oct. 17, 1911)

Joint is made to fasten to ceiling or base and is made either single or double

SINGLE EXPANSION JOINT

(Patented Oct. 10, 1911, and Oct. 17, 1911)

BALL BEARING PIPE SUPPORT
(Patented Oct. 10, 1911)

WALL BRACKET WITH BALL BEARING PIPE SUPPORT

LONGITUDINAL SECTION TYLER UNDERGROUND HEATING SYSTEM

ANCHORS—Anchors are designed so that full size outlets may be taken out of top or sides. Drip pocket outlet is provided.

PIPE MAY BE ROTATED—After the pipe is connected, it may be rotated so as to distribute the corroding effects of the condensation water. This feature adds from 30 to 40 years to the life of the pipe.

TYLER ANCHOR

BRIEF SPECIFICATIONS—A clear ditch shall be prepared, a drain tile laid in bottom and covered with broken stone.

On this as a bed, a reinforced concrete base shall be laid, and pipe rests placed on same, 12 ft. apart. The pipe shall be put in position, connected up, and anchored approximately every 150 ft., alternately with anchors and expansion joints.

Pipe shall then be cased in such a manner as to leave space between pipe and casing, and casing covered with cinder concrete.

Fittings shall be placed in properly reinforced manholes, the expansion joint being made accessible by a double lidded manhole—with gasket on inner lid. Where pipe enters expansion joint and anchor manholes, or enters walls of building, space between casing and pipe is closed by a special collar.

It shall be possible—after pipe is connected up—to easily rotate it every 5 or 6 years and thus distribute the corroding effects of the condensation water.

Casing shall be a hard casing—such as made by the TYLER UNDERGROUND HEATING SYSTEM of Pittsburgh, Pa.

In tunnels, or the interiors of buildings, pipe shall be covered by a special air-cell casing, coming in direct contact with the pipe. The pipe shall be supported by brackets specially constructed.

After underground conduit has been completed, exterior surface shall be waterproofed, when it will be ready for backfilling.

Tyler Indirect Heater.

Used where it is desirable to connect hot water heating plants to available steam mains, without changing hot water system. Steam enters heater near hot water delivery, insuring high efficiency, and a maximum of hot water.

TYLER INDIRECT HEATER
Made in vertical and horizontal type

Tyler Steam Traps.

Simplicity and dependability are the chief characteristics of these traps. Made in three styles: Class "A" for street mains and other low pressures not to exceed 55 lbs.; class "B" for pressures from 60 to 185 lbs.; class "C" for vacuum systems or blast coils not to exceed 60 lbs. pressure.

TYLER STEAM TRAP

Valve will not wire-draw. Intermittent service. Guaranteed not to leak steam. Discharge opening has greater opening than inlet, thus making quick discharge. (Patented Oct. 21, 1913)

Tyler Tilt-Lift-Return Trap.

Will receive water of condensation and boiler feed water at any pressure and return it into a power or heating boiler at temperature of condensation when received. There are no interior parts.

In filling of trap, steam and outlet valve are closed and air relief valve open, giving condensation a non-resisting flow into drum. When filled the drum will tilt, close air relief valve, open steam and outlet valve and discharge contents, momentarily righting itself for the next charge.

TYLER TILT-LIFT-RETURN TRAP
(Patent pending)

Valves of rotary type with full openings. Weight of drum is eliminated from trunnions packing by center connections with counterweight, making movement free and easy

TYLER WEIGHING MACHINE

Built with a weight on end of shaft, so adjusted that the bucket begins to empty as soon as it has received the proper weight of water, the next bucket cutting in just before it starts to dump, allowing every drop of water to be weighed and not a drop more

Tyler Waterproof Manhole Covers.

TYLER WATERPROOF MANHOLE COVER

A. WYCKOFF & SON CO.

Improved Steam Pipe Casing

ELMIRA, N. Y.

BRANCH OFFICE: ATLANTA, GA., H. H. WHITE, 385 Piedmont Avenue

Products.

Manufacturers of WYCKOFF'S IMPROVED STEAM PIPE CASING, for Underground or for Exposed Steam and Hot Water Pipe.

For Wyckoff's Wood Stave Pipe (machine-made), for water works systems, power plants, etc., see pages 400-401.

Wyckoff's Improved Steam Pipe Casing.

Casing is composed of selected and carefully inspected staves of cypress. The 2-in. staves for the inner shell are drawn together by heavy tension into the form of a tube, and firmly bound with galvanized steel wire, wound spirally with extra wrappings at each end. This is effected by bending over about 1 in. of the end of the wire, which is driven into the wood about 2 in. from the end of the casing. The spiral winding is then carried to the end of the casing back over itself and then to the other end of the casing, where it is again wrapped back over itself for about 2 in., and the final end of the wire securely fastened down by means of staples.

The next operation is placing 4 layers, 4 in. wide, of asphaltum packing on each end of the casing. This material is drawn around the casing as tightly as possible, and fastened. It is finished, by putting on the outside another casing of 1-in. cypress jointed staves, which is bound with heavy galvanized steel wire, the same as the inner shell, thus making 2 casings of cypress wood, the inner shell 2 in. thick and the outer shell 1 in. thick, with a $\frac{1}{4}$ -in. dead air space extending the entire length of the casing, between the shells, except the 4 in. on each end. This makes a combination of non-conductive materials which absolutely prevents the radiation of heat.

From our experience it has been found that asphaltum packing will absolutely prevent drain water from getting in between the two shells of cypress.

For underground use, the covering is completely coated on the outside with Montezuma asphalt and then rolled in sawdust, the sawdust acting as a binder, to prevent the coating from being scraped off in transit.

When used overhead, the coating is furnished painted on the outside with black asphaltum paint.

WYCKOFF'S IMPROVED STEAM PIPE CASING

Improvements: cypress used; doubling thickness of inner wood shell; increasing dead air space 50%. Used for high pressure steam lines. Coating omitted to show construction

The covering is made in lengths of from 4 to 12 ft. The lengths are connected by tenon and socket joint and have to be driven together, thus making a water-tight joint.

This improved covering is made to slip on over the pipes while they are being connected up. It can not be opened to apply on pipes already in place.

For opening casing to apply on pipes already in place, see our catalogue No. 40, pages 10 and 11.

For pipes conveying steam, where the pressure is more than 5 lbs., to intensify heat radiation, to keep a more uniformly high temperature in the line, and also more efficiently to protect the pipe, the covering is lined with AAAA charcoal tin.

Where the tin lined covering is used, no matter how high the steam pressure, the extra thickness of the inner cypress shell will positively prevent the danger of collapsing.

Prices.

Prices will be quoted for any size or quantity needed.

In naming size wanted, be sure and make allowance for slipping the covering over the couplings on the pipe to be covered, also state the approximate steam pressure to be carried.

ESTABLISHED 1841

E. B. BADGER & SONS CO.

Manufacturers of Expansion Joints for High and Low Pressure

63-75 Pitts Street
BOSTON, MASS.

SALES OFFICE: NEW YORK, N. Y., 101 Park Avenue

Products.

BADGER SINGLE and SELF-EQUALIZING CORRUGATED COPPER EXPANSION JOINTS.

For Water Cooling Systems and Air Washers, see page 798.

Badger Single Corrugation Expansion Joints.

Badger single corrugation expansion joints are made for connection between turbines and condensers and designed for any special requirements, particularly to take care of vibration and a very slight amount of expansion.

A great many joints of this type have been made in all sizes up to 84 in.

The company has facilities for manufacturing any joint of this type that may be required, whether its shape is round, oval or rectangular.

Badger Self-equalizing Expansion Joints.

The Badger self-equalizing expansion joints are made of seamless copper tubes, of the best quality Lake copper, which is known to be the most ductile metal used in commercial engineering work. They are properly designed and rolled, with deep corrugations; and with the aid of the cast iron or steel equalizing rings, conforming to the shape of the corrugations, they take care of the changes in length in the pipe line, due to temperature changes, in a most efficient and economical manner: first, because they are a one-piece joint and never require packing, and, second, the corrugations are designed and rolled to stand repeated

changes of shape, and to care for a required amount of expansion on each corrugation.

The external equalizing rings equally distribute the expansion over each corrugation, thus eliminating the possibility of a fracture in the copper, due to the fact that one or two corrugations take care of the total amount of expansion. They also give the added strength to the copper to resist pressure.

Self-equalizing expansion joints are made with: 2 corrugations to care for 1-in. expansion; 3 corrugations to care for 1½-in. expansion; 4 corrugations to care for 2-in. expansion.

Special Features of Badger Joints.

Badger expansion joints are:

SIMPLE—There are no complicated parts.

DURABLE—Made of best quality copper.

SAFE—Given a hydraulic test on every joint.

CONVENIENT—Installed as easily as any pipe fitting.

COMPACT—Greatest diameter usually less than flange.

EFFICIENT—They require no packing.

When Ordering Badger Joints.

State (1) size of pipe; (2) whether steam, water, gas or air line; (3) working pressure; (4) length and material of pipe; (5) face to face dimensions; (6) range of temperature; (7) how often heat is turned on or off; (8) whether subject to superheat; (9) outside diameter of flanges, diameter of bolt circle, number of bolts, diameter of bolt hole.

HOWARD GUIDED EXPANSION JOINTS.

Description.

Howard guided expansion joints efficiently eliminate all troubles due to pipe line expansion and contraction. Types for low or high pressure, steam, hot water, gas, oil, chemicals or air; overhead or underground.

TYPE A—Designed with all mechanical weaknesses eliminated and with the following superior features:

Maximum of Traverse—Here the Howard with full 4-, 8-, 12- or 16-in. traverse very often by its greater capacity takes the place of two or more ordinary expansion joints.

Elimination of Strains or Distortions—The Howard excels in preventing these, and all bursting troubles, the cylindrical sleeve being heavily reinforced and heavily bolted to body of joint. Outer connecting flanges are equally strong and insure firm hold on pipe. Steel stops prevent flanges pulling out of sleeve.

Perfect Alignment—The inner sleeve and flange peripheries are accurately machined, holding pipe and slip tube rigidly in line.

Tight Joints Without Attention—The rigidity and accurate machining of inner sleeve and flanges permit no strain on packing and slip tube of Howard bronze will not rust against it. Packing box large, and only a slight tightening of gland nuts, accessible on outside of joint, re-tightens packing. Packing easily reached by unbolting and slipping sleeve back.

TYPE A, EXPANSION JOINT
A—Reinforced sleeve; B—Bronze slip tube; C—Packing followers; D—Gland nuts; E—Body of joint; F-G—Companion flanges; I—Stops; P—Packing

TYPE A, WITH ANCHOR BASE
Base cast as an integral part of body of joint.
Types B & C may also be had with same feature

ROSS HEATER & MFG. CO., INC.

1407 West Avenue
BUFFALO, N. Y.

Products.

ROSS CROSSHEAD GUIDED EXPANSION JOINTS; OIL COOLERS; SURFACE CONDENSERS; EVACTOR JET VACUUM PUMPS; BOILER FEED WATER HEATERS; BRYANT RADIATOR MACHINES.

Also, Hot Water Service, Oil and Sugar Juice Heaters; Gravity and Forced Circulation Heaters for Heating Systems; Air and Water Coolers; Distilling Condensers; Main and Auxiliary Condensers for Marine Service; Evaporators for Marine Service.

Ross Crosshead Guided Expansion Joints.

The Ross Crosshead guided expansion joint was designed to fit the need of a high grade fitting to take care

ROSS CROSSHEAD GUIDED EXPANSION JOINT

of the expansion and contraction in pipe lines due to temperature changes.

The crosshead guide principle used in the steam engine is improved upon to provide a much greater bearing surface and therefore eliminates friction, subject to the slightest variations in the length of pipe, it removes all serious strain on the pipe line and insures absence of warping, and distortion which is so well known to be the result in piping where variations of temperature are constant.

Ross Multi-Pass Oil Cooler.

The Ross Multi-Pass oil cooler is of the straight tube type designed to most effectively transmit heat from the liquid or elastic fluid being cooled to the liquid or elastic fluid used as the cooling medium. Consists of a main shell of cast iron with cast iron water channel, channel cover and bonnet. The tubes are $\frac{3}{4}$ in. outside diameter, pure copper, expanded into a stationary head at one end and into a floating head at the other end.

ROSS MULTI-PASS OIL COOLER

Ross Surface Condenser with Evactor Air Pump.

Ross surface condensers are made with the same care, good materials and liberal rating as all other Ross products.

ROSS SURFACE CONDENSER WITH EVACTOR AIR PUMP

The cooling surface consists of brass or copper tubing so distributed throughout the shell that the entire tube surface is utilized and the highest possible efficiency and results obtained. These surface condensers are made in all sizes for both land and marine service.

The above illustration shows how easily the Evactor air pump can be attached directly to the condenser—eliminating foundations, reducing piping to a minimum, likewise eliminating the possibilities of leakage.

Ross Floating Head Heaters.

The Ross floating head heater is of cast iron construction except the tubes, which are of pure seamless

ROSS FLOATING HEAD HEATER

drawn copper. The life of the cast iron shell is many times longer than when steel plate is used. The copper tubes do not split the way brass tubes do. The tubes are expanded into a stationary tube head at one end and also expanded into floating heads at the other end, eliminating all packing boxes and unequal strains.

The Ross floating head heater is the ideal heater for heating boiler feed water, water for factory use, hot water heating systems, both gravity and forced circulation, domestic supply, swimming pools, etc. It can also be used for heating oil, sugar, juice or any liquid.

Bryant Radiator Machines.

Bryant radiator machines are built for the following operations:

Tapping, boring and facing column, wall, leg, school pin, angular and circular, steam radiator sections; threading right and left radiator nipples; turning push nipples; assembling radiator sections with screw and push nipples; drilling vent openings; testing radiator sections, etc.

Products.

CHAPMAN SOLID WEDGE GATE VALVES, DOUBLE and SINGLE GATE VALVES, CHECK VALVES, DRIP VALVES, HYDRAULIC VALVES, MECHANISMS for OPERATING VALVES by Hand, by Floor Stand, by Hydraulic Lift, by Electric Motor, by Pneumatic Motor and by Pneumatic Cylinder.

Also, Blow-off Valves and Fire Hydrants.

For Sluice Gates, Shear Gates, Tide Flap Valves, Plug Valves, etc., see page 499.

Scope.

Made for a variety of services, including low and high pressure steam, water, gas, oil, ammonia, filtration, sewage, fire protection, hydraulic operations, oil refineries, etc., and listed in the following pages according to types and pressures.

Recommendations.

Some general recommendations as to the use of

CHAPMAN BRONZE VALVES

Pressure	Service	List No.
Low	Water or steam	1 and 4
Medium	Water or steam	4
High	Water or steam	11

CHAPMAN IRON BODY VALVES

Low	Water or steam	(2 to 10 ins., solid wedge) 24
		(2 to 10 ins., double wedge) 59 1/2
		(10 to 84 ins.) 58 1/2
Medium	Water or steam	42
High	Water or steam	42 1/2 and 43

CHAPMAN STEEL GATE VALVES

High	Superheated steam	63 1/2 and 65 1/2

Chapman valves are given below for the convenience of engineers and purchasers when specifying or selecting valves for various purposes.

Facilities and Quality.

This company is the oldest and largest manufacturer of solid wedge gate valves in the United States. The shops are thoroughly equipped with up-to-date machines for rapidly turning out complete and accurately finished products.

Chapman valves and other products are recognized as standard for excellence of design, material and workmanship, and are not excelled in quality, finish or durability.

REGROUNDING SWING BRONZE CHECK VALVES, WITH ROTATING DISK

Fig. 64. (List 20), 150 lbs. working pressure, 350 lbs. test
Fig. 68B; (List 21), 400 lbs. working pressure, 800 lbs. test

Chapman regrinding swing check valves are straightway and have area fully equal to that of connecting pipes. All parts machined to jigs and interchangeable, facilitating repairs. Valve can be reground by removing angle plug and cap. A grinding mixture of oil and fine sand, or oil and ground glass should be applied to seat. Disk can then be revolved on seat until a perfect bearing is formed. Grinding material should then be wiped away to prevent further cutting

List 63½ and 65½, Steel Gate Valves for Superheated Steam.

List 65½, Venturi Type Valves.

STEEL GATE VALVES ESPECIALLY DESIGNED FOR HIGH PRESSURE SUPERHEATED STEAM

Fig. 300. Body and cap cast steel; monel seat rings and spindle; solid monel plug up to and including 6-in. size; sizes above 6 ins. have steel plugs with monel mountings rolled in; cap has condensation or cooling chamber.

Figs. 303, 305 and 304. Strongest design that can be made. Uniform thickness of metal insures even cooling. Seats are parallel. Disks rotating on axis have tendency to clean seats when closing. Body, cap and carrier block of cast steel; seat rings, disks, spindles and spindle seats of monel metal

STEEL VENTURI TYPE GATE VALVES DESIGNED ESPECIALLY FOR HIGH PRESSURE SUPERHEATED STEAM

Construction permits these valves to pass steam practically equal to the full carrying capacity of the pipe. Steam entering converging nozzle on inlet side has a portion of its pressure converted into kinetic energy, steam increasing in velocity, and dropping in temperature and pressure. At high velocity thus developed, it passes through orifice at valve seats. After which it enters diverging nozzle at high velocity, and in its passage converts its kinetic energy into increased pressure, temperature and velocity at which it entered converging nozzle on inlet side of valve.

Chance for leakage reduced on account of reduced area at seats, and valve can be opened quicker. When valve is open, disks and seat rings are protected. Bottom ring of carrier fills aperture in valve, making a continuous pipe line. No steam eddies, therefore increased efficiency in steam flow and long life.

Valves have parallel seats. Disks rotating on axis have tendency to clean seats when closing. Body, cap and carrier ring of cast steel; disks, seat rings, spindle seat of monel metal

Products.

VALVES—Regrinding Globe, Angle, Cross and Check; Extra Heavy Gate; Forged Steel Globe and Angle; Extra Heavy Hydraulic Cast Steel Gate; Crane—Erwood Automatic Double Acting Non-return and Emergency Cut-out.

FITTINGS—Screwed and Flanged, Cast Iron, Malleable Iron, Brass, Cast Steel and Forged Steel.

UNIONS—Ground Joints, Brass to Iron Seats.

UNION FITTINGS—Ground Joints, Brass to Iron Seats.

STRAINER and SEDIMENT SEPARATORS.

JOINTS—Flanged Pipe, Crane Expansion.

HEADERS—Cast Iron, Ferrosteel, Cast Steel.

EXTRA HEAVY STEAM and OIL SEPARATORS.

PIPE SUPPORTS, HANGERS and BRACKETS.

Other Power Plant Specialties: Traps—Cranetilt Steam and Vacuum; Fabricated Pipe and Bends; Valves—Pop Safety, Engine Stop, Exhaust Relief, Stop Check, Water Relief and Safety; Swivel Expansion Joints; Mine Piping; Pump Columns; Flanges; Bolts; Gaskets; Cocks for air lines; Pressure Regulators; Fittings—Screwed and Flanged, Sanitary Drainage, Long Sweep Water; and Plumbing Fixtures.

17,000 articles, including valves and fittings from 1/8 in. to 72 in. Made of brass, cast iron, malleable iron, ferrosteel, cast steel and forged steel. For water pressures up to 6000 lbs., for steam pressures up to 400 lbs., any superheat, and for air pressures up to 2000 lbs.

Regrinding Globe, Angle, Cross, Check Valves.

These valves are made of Crane special brass. They are fitted with our improved non-heating malleable iron wheel and may be repacked when open and under pressure. The body is reinforced by a heavy union ring and when pressure is applied any tendency of the body to stretch is counteracted by this ring and the contact between the body and the ring becomes more intimate as the pressure increases. Made in medium, extra heavy and hydraulic patterns.

NO. 70 GLOBE VALVE

Extra Heavy Gate Valves, Outside Screw and Yoke.

These valves are made of Crane ferrosteel with extra heavy hard metal seats which are screwed to shoulders in body, thereby insuring perfect joints. Seats can be removed at any time it may be necessary to renew them. The gate is made very stiff and is faced with hard metal. The guides in the gates are carefully finished, so as to slide smoothly on ribs in the body, thus

preventing any rattling when the valve is open, or any uneven wear of faces. Stuffing box flange is of malleable iron with a brass follower, giving additional strength and durability at that point. These valves may be packed when open. Tested to 800 lbs. hydraulic pressure per sq. in.

Forged Steel Globe and Angle Valves.

Meet the demand for a thoroughly reliable valve for use with hydraulic presses and extreme high pressure air or gas installations. The body is machined from a solid steel forging. The seat is easily renewable. These valves are recommended for cold water or oil working pressures up to 6000 lbs. hydrostatic. Valves for air or gas are special.

NO. 9-E GATE VALVE

Extra Heavy Hydraulic Cast Steel Gate Valves.

The bodies, bonnets, yokes and discs of these valves are made of Crane cast steel. In sizes above 2 in. the disc is faced with hard metal; size 2 in. has disc in solid hard metal. The construction of the seat and method of screwing it in the body, the strength and finish of the gate and stuffing box are similar to No. 9-E valve. Also they may be packed while under pressure. These valves are recommended for cold water or oil working pressures up to 3000 lbs. hydrostatic, and are tested to 3000 lbs. hydraulic pressure.

NO. 225-H FORGED STEEL VALVE

NO. 205-D GATE VALVE

Unions and Union Fittings.

Made with leakproof brass to iron seat, requiring no gaskets, and may be taken apart readily. The seat is non-corrosive. Unions are made of malleable iron for steam working pressures up to 250 lbs. Union fittings are for 200 lbs. working pressure.

No. 519

No. 591
UNIONS AND UNION FITTINGS

No. 596

Crane-Erwood Automatic Double Acting Non-return and Emergency Cut-out Valve.

The principal duties of the Crane-Erwood valve are boiler protection, header protection, automatic cut in, line protection. These valves are extra heavy, made of ferrosteel with hard metal seats and discs and are recommended for steam working pressures up to 250 lbs. The levers on the outside of the valve are in line with the discs and give a positive indication of their position and the operation of the valve at all times. The valve may be adjusted to close at any desired velocity. Adjustments are made from the outside while the valve is in operation.

NO. 36-E
CRANE-ERWOOD
AUTOMATIC
VALVE

Extra Heavy Hydraulic Malleable Iron Screwed Fittings.

The Crane line of extra heavy hydraulic malleable iron fittings includes all the necessary sizes and shapes for cold water or oil working pressures as follows:

1 in. and smaller.....	2000 lbs. hydrostatic
1¼ to 2 in.....	1500 lbs. hydrostatic
2½ to 4 in.....	1000 lbs. hydrostatic
5 and 6 in.....	800 lbs. hydrostatic
8 in.....	600 lbs. hydrostatic
10 and 12 in.....	500 lbs. hydrostatic

These fittings are tested to hydraulic pressures corresponding to the above working pressures.

NO. 260-H NO. 262-H NO. 264-H NO. 267-H
EXTRA HEAVY HYDRAULIC FITTINGS

Cranetilt Steam Traps.

Designed as non-return, boiler feed, lifting, vacuum or metering traps. They are especially adapted for use on return lines handling condensation under varying pressures, especially where the pressure will vary from a vacuum to high steam pressure. The Cranetilt three-valve trap gives excellent service on returns on apparatus that has a varying pressure while in service or a low initial starting pressure and a high terminal pressure. Buy steam traps by their discharging capacity; not by pipe sizes.

THREE-VALVE TRAP

Strainer and Sediment Separator.

For water working pressures up to 250 pounds. These separators are constructed in a strong and substantial manner and will be found exceptionally valuable for use in connection with steam traps, pumps, injector and ejector suction pipes, feed water lines, etc., by preventing foreign substances from passing through and settling on valve seats and other places that should be kept entirely clear and free from such obstructions.

NO. 990
SEDIMENT
SEPARATOR

Headers.

CRANE Co. has exceptional facilities for making any required design of headers in cast iron, ferrosteel or cast steel, for all pressures and purposes.

WELDED HEADER

Flanged Pipe Joints.

With Crane cast steel or forged steel flanges these flanged joints are highly recommended for use in connection with pipe bends.

THREE STANDARD TYPES FLANGED PIPE JOINTS

Extra Heavy Steam and Oil Separators.

Have large areas and ample baffle surfaces, affording the highest degree of efficiency with the slightest loss in pressure. Their design is based upon the most approved mechanical and scientific principles. This superior line of separators is offered in competition with any steam or oil separating devices on the market.

NO. 014
STEAM AND OIL SEPARATOR

Standard steam separators for steam working pressures up to 125 lbs. Extra heavy steam separators for steam working pressures up to 250 lbs.

Cast steel steam separators for superheated steam working pressures up to 350 lbs. and total temperature of 800° Fahr.

Oil separators for steam working pressures up to 25 lbs.

Crane Expansion Joints.

Are made in brass, copper, cast iron, ferrosteel and cast steel for all pressures and purposes.

Expansion joints with anchor bases reduce the cost of installation.

NO. 49-E EXPANSION JOINT
With anchor base

Pipe Supports, Hangers and Brackets.

Are suitable for pipe lines up to 30 in.

CADMAN INDESTRUCTIBLE BLOW-OFF VALVE; CADMAN GATO PLUG VALVES for Air, Gas, Oil, Water, Steam or Acid under any pressure.

Blow-off Valve.

The Cadman Indestructible Blow-off valve is available at all times for all boilers, including those working under superheated steam up to and including 300 lbs. per sq. in. working pressure. The reversible seats and disks are of monel metal, a metal known to resist the destructive action of dirt, scale, hot acids and alkalis, and boiler compounds. Monel metal is also absolutely impervious to superheated steam.

All cast parts are of air furnace semisteel of heavy construction with a factor of safety of 5, suitable for 300 lbs. per sq. in. Stem of special bronze, with high tensile strength and large proportions. Acme thread of coarse pitch is used, which gives more bearing surface than other types of threads, greater strength, and permits slow operation of valve which prevents water hammer.

A peculiar feature of the seat is a projecting flange held between the body and the base within a recess in the base, which makes it impossible for water to leak past, and expansion and contraction have no effect on it whatever.

The whirlpool inlet port used is obtained by a deflector on one side of the port, which prevents water, dirt and scale striking the valve body with full force when blowing, but causes it to take a course around the periphery of the body, causing the dirt, scale, grit and other heavy substances to go down through the center of the valve without coming in contact with the seating portion.

(Patented)

Cadman Gato Plug Valve.

Cadman Gato plug valve has the straightway features of the gate valve; also, the quick opening advantages of the plug cock, though it is different because it closes tight and stays tight. It has adjustment for wear.

The valve is constructed on the wedge and screw principle, so that when closed the plug is expanded in the shell of the body. The plug is moved by a tee head on stem, which fits loosely in a suitable recess in the plug, and results in a slight lost motion between stem and plug.

This valve is adapted to various conditions of service, and specifications for requirements are invited.

THE FISHER GOVERNOR CO.

Oil Field Specialties

5-11 Linn Street

MARSHALLTOWN, IOWA

Products.

SAFETY and VACUUM VALVES for Oil Stills and Agitators; GASOLINE TRAPS; RELIEF VALVES.

Gas Water Traps.

For Steam Specialties, see pages 522-23.

Fisher Safety and Vacuum Valves.

For use in oil refineries using low pressure stills, to protect shell of still from an excessive amount of pressure or vacuum. Made with heavy cast iron bodies; upper and lower parts of body securely bolted together. Inner valve made of mild bronze, and seats against a perfectly machined cast iron seat; seat ring cast separate from body casting. Both inner valve and seat removable, effecting a saving in upkeep.

Parts of safety valve interchangeable with parts of vacuum valve. Either can be converted into the other by reversing valve on stem, reversing position of cast iron seat ring, and changing leverage.

TYPE NO. 1515S SAFETY VALVE

As regularly fitted, suitable for any pressure up to 20 lbs.

TYPE NO. 1515V VACUUM VALVE
Vacuum valves fitted to handle any vacuum

Fisher Gasoline Traps.

For use where gasoline is manufactured under pressure; also for taking gasoline out of gas lines. Intermittent open bucket types—the only type practical in this field. Vapor loss reduced to a minimum. Liability of freezing greatly lessened.

TYPE NO. 333 FISHER GASOLINE TRAP

All parts extra heavy, being specially constructed for gasoline service. Casting uniform in thickness. Body and cover heavily ribbed to give additional strength.

Fisher Relief Valves.

On weathering tanks as well as in other installations where a relief valve can be used, the Fisher Type 555 has proved superior to relief valves of other constructions.

Like other Fisher specialties is built with high grade cast iron body, with Duromite inner valve and seats. The Duromite insures long life and positive results.

Construction of this valve permits the use of a very long spring, which is compressed by the action of pressure on the diaphragm. This action of diaphragm and spring opens the inner valve and relieves the pressure to desired point.

Adjustment easily secured by releasing lock nut wheel and turning adjustment wheel in either direction. Fisher design of diaphragm rod and valve stem insures constant and perfect alignment, unaffected by adjustment.

TYPE 555 RELIEF VALVE

HOMESTEAD VALVE MANUFACTURING CO.

Manufacturers of Valves and Other Specialties

P. O. Box 1754
PITTSBURGH, PA.

WORKS
HOMESTEAD, PA.

Products.

HOMESTEAD QUARTER-TURN VALVES for various pressures, in Brass, Semisteel Body, All-semisteel and Cast Steel.

HOMESTEAD STRAIGHTWAY VALVES, THREE-WAY VALVES, FOUR-WAY VALVES, ANGLE VALVES.

"HOVALCO" RENEWABLE BLOW-OFF VALVES.

Also, Locomotive Blow-off Valves.

Advantages.

The simple construction gives the following advantages: The Homestead valve can be fully opened or closed with a quarter turn, which is important in times of emergency.

The straight and unobstructed passage through the Homestead valve, when open, makes it particularly suitable for the handling of heavy liquids or for carrying off sediment, as in the case of a blow-off valve.

The patent locking cam releases all pressure on the plug in turning, but locks the plug tight to the seat in the closed position.

The seat is protected from wear when pressure is passing through valves.

Homestead Straightway Valves.

Made in all sizes up to 6 in., and for all pressures up to 5000 lbs. per sq. in.

The Homestead valve is unlike all others, especially globe and gate valves, for the reason that when the pressure passes directly through it, the seat is absolutely protected from wear. The plug is balanced and held in place by the pressure when open, and when closed it is locked in the seat by the patent wedging cam, insuring freedom from friction in seat while plug is turning.

This valve is so constructed that when it is closed the plug at the same time is forced firmly to its seat. This result is secured by means of the traveling cam "A," through which the stem passes. The cam is prevented from turning with the stem by means of the lugs "B," which move vertically in slots. Supposing the valve to be open, the cam will be in the lower part of the chamber in which it is placed, and the plug will be free to be easily moved.

Homestead Three-way Valves.

Suitable for various working pressures for either water, air or steam. Made according to same principle as Homestead straightway valves. It has the internal locking device, which forces the plug tight to seat of valve at both extremes of the arc in which plug turns.

Three arrangements of ports or openings shown can be used.

Valve with the two-port plug, shown in figure D, is used in majority of cases; and if not otherwise specified, is always shipped.

Homestead Semisteel Valves.

Homestead semisteel valves are used extensively on superheated lines. This is particularly true in the oil industry, where valves are used with entire success on vapors superheated to 700° Fahr. Homestead semisteel valves are also used on superheated steam lines in the power plant, where the results are at least equal to those usually obtained from cast steel valves.

"Hovalco" Blow-off Valves.

Exceptionally well constructed. Body is made of semisteel and seat and disk of special composition. Passage is free and unobstructed, and seat or disk can easily be removed, renewed or re-ground.

Once installed, valve should outlast the boiler.

COMBINATION OF "HOVALCO" RENEWABLE BLOW-OFF VALVE AND HOMESTEAD QUARTER TURN VALVE

Designed for use in connection with the Homestead quarter turn valve when a double blow-off valve is required. Combination shown of these two valves is approved and used in many power plants today

JENKINS RUBBER CO.: WORKS AND HEAD OFFICE, ELIZABETH, N. J.

Products.

VALVES in BRASS, IRON BODY and CAST STEEL, for all pressures and purposes; MECHANICAL RUBBER GOODS, including SHEET PACKING, GASKETS, GASKET TUBING, VALVE DISCS, UNION RINGS and the like; PUMP VALVES.

Gauge Cocks, Steam Traps, Compressed Asbestos Jointing and Gaskets.

lbs. working pressure. Sizes 1/8 to 3 in. screwed or flanged.

Jenkins brass swing check valves, standard pattern, are made with globe shaped bodies, adapted for either horizontal or vertical installation; have renewable disc feature same as the horizontal pattern; and are suitable for same working pressures. Sizes 1/8 to 3 in., screwed or flanged.

Jenkins Valves, Standard Pattern.

They represent a distinct type of valve as compared with regrinding, bevel or flat-seated valves. Instead of using a solid metal clapper, they contain a disc holder of brass or other suitable metal, and a removable disc of softer material, preferably Jenkins composition disc. This disc in service presents a slightly yielding surface to the valve seat and is flexible enough to adapt itself to any slight inequalities in the seat, insuring perfect contact. Should the disc be injured, it is only necessary to remove it and replace with a new one, which can be done by any mechanic.

Jenkins valves have full opening. They are made of a special high grade steam metal and contain, besides the Jenkins disc, other features found only in the genuine Jenkins valves.

Jenkins Brass Globe, Angle and Cross Valves.

Screwed or flanged, are regularly furnished with Jenkins No. 119 discs, suitable for 150 lbs. working steam pressure. When specified for cold water, valves are fitted with No. 93 discs, suitable for working water pressure up to 250 lbs. Regular sizes 1/8 to 3 in. Larger sizes in brass made from iron body patterns.

BRASS VALVES, STANDARD PATTERN

BRASS CHECK VALVES, STANDARD PATTERN—Jenkins brass horizontal, angle and vertical check valves correspond to same standard as the standard pattern globe and angle valves. Regularly furnished with Jenkins disc of semihard composition which will soften slightly under the action of hot water as required for boiler feed lines. When specified for cold water, air or gas, a softer and more flexible rubber disc is supplied, usually Jenkins No. 93 composition. Suitable for 150

BRASS CHECK VALVES, STANDARD PATTERN

JENKINS Y VALVES—Besides their extensive use for blow-off service, they are particularly desirable for handling muddy or gritty water. Have renewable seat rings and Jenkins discs; suitable for 150 lbs. working steam pressure, or 250 lbs. working water pressure. Brass valves, sizes 3/8 to 3 in.; iron body valves, 2 to 8 in., inclusive.

JENKINS BRASS WHISTLE VALVES—Quick acting, spring and lever operated valves. A pull of lever opens them and they automatically close by means of spring as soon as lever is released.

Can be used for steam whistles, for hydraulic presses, for emergency stop, for shower baths, etc., wherever a quick opening valve is required. Made in brass with malleable iron levers, from 3/8 to 3 in.

Jenkins Iron Body Valves, Standard Pattern.

These are heavier and stronger than the average iron body valves. They have renewable seat rings and Jenkins discs; and are suitable for same working pressures as the standard pattern brass valves. Globe and angle valves made in sizes 2 to 24 in., inclusive; cross valves up to 8 in. Flanges A. S. M. E. standard dimensions.

Jenkins iron body horizontal, angle, vertical and swing check valves made in sizes 2 to 10 in.; suitable for working pressures up to 150 lbs.

Jenkins All-iron Valves.

These are recommended for service in places where, on account of possible corrosion, no brass mountings of any kind can be employed, as in the handling of solutions of cyanide, saltpetre, caustic potash, and the like.

All-iron globe and angle valves, with screwed bonnets, sizes ½ to 2 in.; with yoke, sizes to 2½ in. and up; horizontal and angle check valves, ½ in. and up.

All-iron gate valves with solid iron double face wedge, with screwed bonnets, sizes ¼, ⅜ and ½ in.; with bolted bonnets, ¾ in. and up.

Iron Body Valves, Extra Heavy Pattern.

The extra heavy pattern iron body globe, angle, cross and Y valves are suitable for 250 lbs. working steam pressure, or 400 lbs. working water pressure. The bodies, yokes and disc holders are high grade cast iron; the spindles are of manganese bronze; the renewable seat rings and discs of durable steam metal composition.

All flanged valves have 1/16-in. raised faces inside of bolt holes, and flange dimensions are in accordance with the American extra heavy standard. When drilling is ordered, it will also be in accordance with the American extra heavy standard, unless otherwise ordered.

Cast Steel Valves.

To meet the requirements of high pressure superheated steam and hydraulic service, JENKINS BROS. manufacture a line of cast steel valves. The globe, angle and cross valves have bodies and bonnets of cast steel; and the spindles, seat rings, discs and disc rings are of monel metal. All connecting flanges are made with 1/16-in. raised faces inside of bolt holes. When ordered with flanges faced and drilled, the bolt holes will always be spot faced unless otherwise specified. Globe, angle, cross and swing check valves in sizes 2 to 12 in., inclusive, suitable for working steam pressure up to 350 lbs., and total temperature of 800° Fahr.

Automatic Equalizing Stop and Check Valves.

These valves are designed to shut off, automatically, the flow of steam from the header to a boiler in case a tube should burst or other internal rupture occur, thereby suddenly reducing the pressure in the boiler. They also serve to equalize the pressure in a battery of boilers and prevent one boiler from working at a lower pressure than the others. As the valves can only be opened by the pressure in the boiler, it is impossible to turn steam accidentally into a boiler which is being cleaned. To prevent chattering, the valve is cushioned by an internal dashpot, made of bronze, which eliminates all danger of sticking through corrosion. The stuffing boxes can be packed when valve is wide open and under full pressure. Each iron body valve is carefully tested to 800 lbs. hydraulic pressure, and is guaranteed for working steam pressures up to 250 lbs. When made with cast steel bodies and bonnets, and monel metal trimmings, they are suitable for 350 lbs. working steam pressure. Sizes 4 to 8 in.

VALVE

Jenkins Gate Valves.

All Jenkins gate valves are of the solid wedge, double face type. The bodies are globe shaped, a design which secures great strength, good proportion and neat appearance. All patterns are made with inside screw, stationary spindle, or outside screw and yoke, rising spindle. The latter are particularly recommended for the higher pressures, as the spindle is more easily lubricated, increasing its durability. The traveling spindle also serves as an indicator, by means of which it can be seen at a glance whether the valve is open or closed. All the valves can be repacked under pressure when wide open, and all parts are renewable and interchangeable. The iron body and cast steel valves in the larger sizes are made with or without by-pass.

Valves can also be furnished with hub ends and square head stem, with spur, bevel or special styles of gearing, with floor stands or indicator posts, and various other operating mechanisms.

STANDARD PATTERN—Brass, sizes ¼ to 3 in. Iron body, sizes 2 to 30 in. For working pressures 125 lbs. steam, 175 lbs. water. All-iron, sizes, ¼ to 30 in.

MEDIUM PRESSURE PATTERN—Brass, sizes ¼ to 3 in. Iron body, sizes 2 to 18 in. For working pressures 175 lbs. steam, 250 lbs. water.

EXTRA HEAVY PATTERN—Brass, sizes ½ to 3 in. Iron body, sizes 1½ to 24 in. For working pressures 250 lbs. steam, 400 lbs. water.

EXTRA HEAVY PATTERN—Cast steel, sizes 1½ to 24 in. For working pressures 350 lbs. steam, and total temperature of 800° Fahr.

Mechanical Rubber Goods.

This company offers engineering requisites which are the result of over 50 years of progressive effort. They are the original manufacturers of rubber composition discs for valves and unvulcanized sheet packing.

Jenkins '96 is a high grade unvulcanized rubber sheeting, suitable for saturated steam joints under high or low pressure, hot water and other fluids.

Jenarco is a vulcanized red rubber sheeting, very tough and pliable, equally suitable for steam, hot or cold water and other joints.

Oiltite sheet packing is specially compounded for joints in lines carrying gasoline, kerosene, crude oil, etc.

SHEET PACKINGS

Approximate weights per sq. yd. 36 in. wide

Thickness	3/32	1/16	3/32	1/8	5/16	3/4
Jenkins '96 regular, lbs.	2 3/4	5 1/2	8 1/4	11	16 1/2	22 1/2
Jenkins '96 brass wire insertion, lbs.		8	10 3/4	13 1/2	19	25
Jenarco, regular, lbs.	2 3/4	5 1/2	8 1/4	11	16 1/2	22 1/2
Jenarco, brass wire insertion, lbs.		8	10 3/4	13 1/2	19	25
Oiltite, regular, lbs.	2 3/4	5 1/4	7 7/8	10 1/2	15 3/4	21

Cut gaskets in any size or shape promptly supplied. If shape is irregular, send drawing or template.

PUMP VALVES—A few of the Jenkins service tested compounds:

- No. 80—for hot water temperature above 180°.
- No. 88—for warm water up to 175 lbs. pressure.
- No. 93—for cold water pressures up to 175 lbs.
- No. 94—for cold water, low pressures.

Any size and compounds promptly supplied. When ordering always give outside diameter, thickness, and size of hole. When in doubt, mention service conditions.

Experience and Facilities.

Extensive operations in the fields of steam power and heating plant erection, plumbing and hydraulic work, carried on for many years prior to the establishment as manufacturers, have given THE KELLY & JONES Co. a thorough knowledge of the wants of the trade. This knowledge is of inestimable value to the company in designing and manufacturing a comprehensive line of brass, iron and steel specialties for steam, gas, water, air and oil.

The company's factories are advantageously located in the heart of the great iron and fuel producing section of the United States, with ideal shipping facilities, and are equipped with the latest and best automatic machinery, much of which has been designed by this company's engineers for various special purposes.

TRADE-MARK

Tests.

In every department, from foundries to finishing shops, none but the highest skilled mechanics are employed under the constant supervision of capable engineers. In addition, the use of the best material insures a perfect product.

All work is subjected to the most thorough inspection and test during the process of manufacture and after completion.

Co-operative Services.

THE KELLY & JONES Co. offers the services of a corps of experienced engineers who will co-operate with engineers, contractors and operators in the solution of difficult power plant equipment problems.

Cast Steel Valves.

Owing to the increased demand for steel valves and to the lack of uniformity and quality in castings purchased from steel foundries making a miscellaneous product, this company has installed its own steel foundry in order to make and maintain a high grade of steel products.

The steel valves are safely recommended under normal conditions. The quality, strength, elasticity, elongation, reduction and bending are in accordance with the strictest specifications.

The seats, or any other wearing surface requiring same, are monel metal, which will not corrode and will contract and expand correspondingly with the steel in the body of the valve.

These cast steel valves are designed for high pressure, saturated and superheated steam lines and extreme hydraulic service.

Outside Screw and Yoke, Wedge Gate

With By-pass

CAST STEEL VALVES, FLANGED

For superheated steam up to 350 lbs. working pressure and a total temperature of 800°

Extra Heavy Cast Steel Straightway Valves, Flanged.

The body, bonnet, yoke and disc of these valves are made of cast steel. In the 2-in. size the disc is solid hard metal; on the sizes above 2 in. the disc is hard metal faced.

The stem of the inside screw non-rising valve is made of brass. The stem in the outside screw and yoke valve is made of rolled steel.

Unless otherwise specified, cast steel flanged valves when ordered faced and drilled are always furnished with spot faced bolt holes. Likewise flanged valves are furnished with male face and companion flanges when ordered with valves are furnished with female face unless otherwise specified.

Tested under 3000 lbs. hydraulic pressure for cold water working pressures up to 3000 lbs.

THE KELLY & JONES Co. designs and manufactures a valve for every purpose and applies a suitable test to each valve, assuring a strong dependable product of correct design.

Any of the cast iron, screwed or flanged valves and fittings shown in this or any other Kelly & Jones catalogue can be furnished in steel or bronze if desired. Blue prints and specifications for special steel casting are solicited.

Iron Body Wedge Pattern Gate Valves.

The iron body wedge pattern gate valves are made in many different designs and for various working pressures.

The guides on the discs and ribs in the body are so constructed as to insure an easy movement of the disc and eliminate all possible danger of the disc coming in contact with the seat, except at the point of closing.

The discs are made of iron, with bronze seat rings.

Standard Iron Body Straightway Valves.

The double disc iron body straightway valve provides, when open, an absolutely unobstructed passage-way for the steam, water, air, or other materials controlled by it.

The faces of the discs and seats being parallel and the principle on which the disc is constructed make it self-adjustable, and at all times insure at least one disc closing, making the valve a positive shut-off. This important operation of the discs is accomplished by means of a wedge bearing between them, which permits of sufficient play in any direction, eliminates all danger of the discs sticking to the seats, and provides for the expansion and contraction strains, shocks or sagging of the pipe line.

The iron body double disc straightway valve is heavy and well designed, and opens by turning to the left. It is made of the very best grades of gray iron and bronze composition, and thoroughly tested before shipment.

The standard pattern is used extensively for hot water washout systems and in water conserving plants.

For wood preserving plants, these valves are furnished with monel stems and trimmings; and the flanged joints are made up with special gaskets. Prices on application.

Standard Saddle Type Straightway Valves.

Can be furnished either black or red japanned, as desired. This saddle style is a very durable and compact valve, and economical, owing to the simplicity of construction. The steel saddle around body of valve holds bonnet securely in place, and can easily be removed, permitting of access to interior. Opens to left and has rising spindle. The solid disc is very narrow and V-shaped at bottom and can, therefore, be seated more readily when dirt or sediment is collected between the seats in the valve.

For 125 lbs. working pressure. All-iron or iron body, brass mounted. When furnished iron body, brass mounted, all parts are iron, except disc, stuffing nut and stem, which are high quality brass. All-iron style recommended very highly, for use in connection with cyanide, creosote, etc.

repacking while under pressure. Yoke and gland nuts are made of high quality bronze. The gland and the opening through bonnet for stem are bronze bushed. Indicators on inside screw, non-rising gate valves are made reversible and can be adjusted to read correctly when valve is fixed in an upside down position.

On valves up to and including 4 in., yoke is cast solid to bonnet. On sizes above 4 in., yoke is bolted to bonnet. The letters "S.V." cast on bonnet identify these valves.

Medium Iron Body Valves.

Made any size from 2 to 12 in., inclusive, both screwed and flanged.

These valves are designed to meet the requirements and increasing demand for a valve suitable for a pressure between standard and extra heavy. They are mechanically correct in every detail. The material used in their construction is of the highest quality, insuring strength where the greatest amount of strain is caused due to the expansion and contraction of the piping.

When it is necessary to use medium valves larger than 6 in., flanged valves are recommended. Valves 8 in. and larger should have a by-pass.

These medium iron body valves can be repacked while under pressure; but in order to do so, the valve must be wide open.

Regularly furnished with $\frac{1}{16}$ in. raised face.

MEDIUM IRON BODY VALVES

For 175 lbs. working pressure with yoke, with or without by-pass
Also furnished in cast steel or bronze at special prices

26	33	2½	29¼	24	1½	7
28	36	2½	32	24	1½	7¼

These drilling templates are in multiples of four, so that fittings may be made to face in any quarter and bolt holes straddle the center line.

Extra Heavy Iron Body Valves.

These extra heavy valves are of the latest and most improved design and are admirably adapted for high pressure power plant service. The body is very heavy and its barrel shape permits of large and free openings.

The extra heavy, hard metal seat in the body has a bridge of improved design to guide the swivel disc. This disc will not rattle even when the valve is partly opened, as the combination of the guide on the disc and the bridge on the seat insures a perfectly tight seating of the disc at all times. Seats are made of a special hard metal to resist wear.

The valve is provided with a disc nut of improved design which facilitates packing while under pressure by opening the valve to the point where the disc nut comes in contact with the lower face of the bonnet flange and forms a joint.

The valve is made with steel stem and malleable iron stuffing box flange with brass follower, giving additional strength and durability to these parts. The over-size wheel gives maximum leverage to the operator in opening or closing the valve.

Designed for steam working pressures up to 250 lbs. Tested to 800 lbs. hydraulic pressure per sq. in. Regularly furnished with $\frac{1}{16}$ in. raised face.

Jenkins Type, Standard Kelly & Jones Valves.

THE KELLY & JONES Co. manufacture a full line of Jenkins type, iron body, globe, angle, cross check and safety valves in both screwed and flanged patterns and in any size from 2 to 12 in., inclusive.

The brass mounted valves are made in sizes 2, 2½ and 3 in. All sizes are furnished with yoke unless otherwise specified. In placing orders it should be stated whether the brass mounted or the yoked pattern is desired. Also whether the valve is to be used for cold water service, as a soft disc is used for this kind of work.

Designed for 125 lbs. working pressure. Can be packed under full steam pressure but valve must be wide open while doing so.

Extra Heavy Automatic Stop Check Valves.

This type valve closes automatically and instantly, cutting out the boiler to which it is connected and in case a tube blows out or a joint in the boiler bursts, the valve will act immediately as a non-return valve and will prevent the back flow of steam from the main.

This valve will also prevent steam from entering or backing into a cold boiler while work is being done, and in this way acts as a safety stop valve. It will open automatically and promptly when the boiler to which it is connected reaches the full pressure in the main. But it will remain closed against a higher pressure in the main—a sure means of detecting a sluggish boiler.

To attain its greatest efficiency, this valve should be placed with wheel up and in such a manner as to allow the boiler pressure to come underneath the disc.

Standard Iron Body Valves.

Made in all sizes from 1 to 3 in., brass mounted, and 2 to 16 in., yoke pattern, screwed or flanged, and for 125 lbs. working pressure.

Made in all styles, globe, angle, cross, check, Y, safety and swing check, and correctly designed, with strength added where the greatest strain is caused. Material used in their construction is of high quality and each valve is carefully inspected and tested to pressure before shipment.

Beckwith Pipe Line Swing Check Valves.

Correct design and substantial construction. All-iron or iron with lead gasket.

Extra Heavy Hydraulic Swing Check Valves.

Made for heavy service, with composition seats. For 800 lbs. water working pressure. Tested to 2000 lbs. hydraulic pressure per square inch.

"Excelsior" High Pressure Brass Valves.

Regrinding "Excelsior" valves are designed to meet the demand for valves suitable for working pressures from 200 to 300 lbs. of live or superheated steam, and are extensively used in modern steam plant construction. The stuffing boxes can be packed while under pressure and valve reground while in position, without disturbing the pipe connections, by making slight adjustments and rotating the stem backward and forward.

Made of the highest grade metal and furnished in globe, angle, cross or check patterns. The outside screw and yoke pattern is recommended for superheated steam. The nickel seat style is so constructed as to permit of easy removal of the seat for renewal purposes.

"EXCELSIOR" HIGH PRESSURE BRASS VALVES

Brass Straightway Valves, Solid Wedge, Gate.

These valves are of the latest improved design, well proportioned and of good weight. They are made special pattern for pressures up to 100 lbs.; standard for 125 lbs.; heavy for 150 lbs.; medium for 175 and 200 lbs.; extra heavy for 250 lbs.; and extra heavy hydraulic for 1000 lbs.

The guides on the discs and the ribs in the bodies of these valves are fitted accurately, insuring a true and easy movement, thus preventing wear of the faces. They also keep the disc from touching the seats in the bodies except at the closing point.

Jenkins Type, Standard Kelly & Jones Brass Valves.

Made of high grade steam metal, correctly designed and carefully machined. Of standard weight and durable construction.

The Y or blow-off brass valve has a full opening very nearly in direct line with the pipe, which practically eliminates resistance to the free flow of steam or liquids. It is specially adapted for handling thick fluids in sugar refineries, paper mills, chemical works, etc.

Indicator Posts.

This post indicates whether the valve in the main is open or shut, and can be used in connection with any make of valve.

The wrench attached to top serves as a lock and prevents tampering with the post when the valve has been opened or closed to the position desired, and provision has been made on this indicator post for sealing.

In ordering indicator posts for the Kelly & Jones make of valves, the only information required is the "A" dimension, or bury of valve. In ordering indicator posts for valves other than Kelly & Jones make, it is important that the following information be received: The size of the valves the posts are to cover, whether the valves open to the right or the left, and the number of turns required to open the valve. Also furnish dimensions for the following: A—bury of valve; B—center of valve to bottom of square; C—center of valve to bottom of post; D—size of square on spindle or top nut.

The indicator is adjustable, and is provided with removable metal frames which carry extra thick glass. The letters are aluminum on a black background.

The price of indicator posts does not include the valves. This indicator post has been especially designed to meet the specifications and requirements of the underwriters.

INDICATOR POST

Unions.

"Norustocta" Union
All parts completely covered with copper electrically applied

Nip Union
No inserted parts. The ring and bottom made of malleable iron, thread end of brass

Brass Seat Union
Round or octagon ends, iron or brass nut

MALLEABLE IRON UNIONS

Sizes, $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, $1\frac{1}{4}$, $1\frac{1}{2}$, 2, $2\frac{1}{2}$, 3, $3\frac{1}{2}$ and 4 in.

Van Stone Joints.

Van Stone joints are made with either round or square shoulder on lap, are absolutely squarable, and require no attention or renewing, excepting an occasional gasket. They are made by rolling over the end of the pipe in front of the flange until at right angles to axis of pipe. The lap is then faced on front and edge, and acts as bearing for gasket in making the joint.

This joint can be used in connection with a flange of a valve or fitting, as well as two pieces of pipe. The flanges act merely as two swiveling collars to hold the pipes together, and permit turning for matching fittings, valve, or other flanges in any position.

Designed for any pressure, and can be furnished male or female.

VAN STONE JOINTS

Pipe Bends.

When submitting specifications for bends, always give the various dimensions indicated on cuts. Prices on application

Standard Cast Iron Flanged Fittings.

CAST IRON STANDARD FLANGED FITTINGS
For 125 lbs. working pressure. Made in all styles and sizes, straight and reducing
Also furnished in cast steel or bronze at special prices

Special Flanged Fittings.

For special purposes flanged fittings are made in different designs and the illustrations show a few patterns designed and made by THE KELLY & JONES CO. They can be furnished as shown or in any other design, for all pressures and temperatures.

In ordering, sketch should be submitted showing design wanted and complete dimensions. Prices on application.

Products.

GATE, CHECK, GLOBE and ANGLE VALVES, for power, heating, fire protection, water supply, plumbing, etc.

Radiator and other Valves, and Fire Hydrants.

Guarantee.

All Kennedy goods are thoroughly tested before leaving the works. Should any defects develop in proper use of goods in the service for which they are manufactured and sold, such goods will be replaced.

Catalogues.

Complete catalogues in either large or pocket size will be sent on application.

Types of Gate Valves.

Bronze valves 3 ins. and smaller, and iron valves 2 ins. and smaller are made with solid wedge disks.

In the larger sizes it is necessary to have a feature of flexibility that will take up and automatically follow slight variations. This is provided by the double disk feature, operated by wedging mechanism.

Outside rising stem and yoke gate valves, for all pressures, and inside stationary stem gate valves, for medium and extra heavy pressures, can be repacked while under pressure and open.

The wedging mechanisms used for operating Kennedy double disk gate valves are the "Cam," "Newtype" and "Lenticular" types.

The "Cam" type is simple—with the least possible number of working parts—and is for light and standard pressures, in sizes 2 to 12 ins. inclusive, for which it is found to give the best service.

The "Newtype" water gate type meets the requirements of water works.

The "Lenticular" type combines the flexible double disk principle with the wedge feature and center spreading control. This type is best for pressures greater than the ordinary, particularly for steam.

FIG. 1
FIG. 2
KENNEDY SOLID WEDGE DISK AND SECTIONAL VIEW OF SOLID WEDGE DISK GATE VALVE

Disk is in one piece, with double taper or wedge shaped faces.

Guided by ribs, cast on inside of body, working on channels in the disk.

A, body; B, cap or bonnet; C, disk; D, stem; E, stuffing box; F, packing nut; H, cast iron hand wheel

"Cam" Type Double Disk Parallel Seat Gate Valves.

These valves have a direct passage, the full size of internal diameter of the pipe, double disks with parallel faces, operated by cams revolving on trunnions fitting into bearings in the disks, a very simple and efficient mechanism.

FIG. 6

FIG. 7
BACKS OF DISKS

FIG. 8

FIG. 9

SECTIONAL VIEWS OF KENNEDY "CAM" TYPE DOUBLE DISK PARALLEL SEAT GATE VALVE

A, body; B, cap or bonnet; C, disk; D, seat ring; E, cams; F, stem nut; G, disk rings

"Newtype" Double Disk Parallel Seat Gate Valves.

Especially efficient for water works purposes. Wedges, of solid bronze, act on both disks equally

and independently of stem; stem always, therefore, being unimpaired and in perfect alignment. Wedging surfaces of wedges are of same angle and interchangeable. Disks can not stick, because bronze stem nut is thicker on one side than on the other; therefore, in opening valve, one disk lifts ahead of the other. Valves operate in any position.

SECTIONAL VIEWS OF SMALLER SIZES "NEWTYP" WATER GATE VALVE

Double wedging mechanism, parallel seats and independent stem nut

DISKS WITH WEDGING MECHANISM OF "NEWTYP" WATER GATE VALVE

"Lenticular" Double Disk Taper Seat Gate Valves.

Only five parts, which are moved by action of the screw—the two disks, lenticular bearing pieces, and the stem nut. The disks are provided with recesses or pockets to admit the shoulders or projections cast on

stem nut and from which the disks are suspended, and on the back of each disk is a projection having its face concaved and fitting the convex faces of the center pieces, thus making a true center bearing.

KENNEDY "LENTICULAR" DOUBLE DISK GATE VALVE

"Standard" Bronze Gate Valves.

Solid wedge disks are used in sizes up to 3 ins., and double disk parallel seats 3½ ins. and larger. Stem is stationary.

Sizes ¼ to 3 ins. are for working pressures up to 150 lbs. water, or 125 lbs. steam; 3½ ins. to 6 ins. for working pressures up to 125 lbs. water, or 100 lbs. steam, and made with bolted bonnet. With or without gland in stuffing box.

"Low Pressure" Gate Valves.

These are iron body, bronze mounted, or all-iron valves with steel stems. Equipped with "Newtype" disks, and are for lighter pressures than the "Standard" line. Those without ribs are tested to 30 lbs. and those for heavier service are more heavily ribbed.

Furnished with flanges of any practicable diameter and drilling.

Stems on inside screw valves are of manganese bronze of at least 50,000 lbs. tensile strength. On outside rising stem and yoke valves they are of steel, unless otherwise specified.

Fig. 48
"LOW PRESSURE" GATE VALVE
Outside rising stem and yoke. 30 lbs. test pressure. Iron, bronze mounted, all-iron

Valves can be furnished to operate with chain instead of hand wheel. Sizes, 14, 16, 18, 20, 24, 30, 36, 42 and 48 ins. Other dimensions on application.

VALVES: IRON, BRONZE and STEEL; STEAM, WATER, AIR, NATURAL GAS, OIL, AMMONIA; ANGLE and GATE; HORIZONTAL and VERTICAL CHECK; for either high, low or medium pressure.

FOOT VALVES; FIRE HYDRANTS.

For Sluice Gates, Shear Gates and Flap Valves, see page 504.

Ludlow Double Gate Straightway Valves.

Internal mechanism of valve consists of stem, two gates and two bevel faced wedges, the wedges being entirely independent of gates (or disks) and working between them, as shown in illustrations (Figs. 70 and 84).

CLOSING AND WEDGING—By action of stem, gates descend parallel with their seats until lower wedge strikes stop (or boss) in bottom of the case, gates and upper wedge continuing downward movement until face of upper wedge comes in contact with face of lower wedge. Face of upper wedge moves across face of lower wedge, exerting pressure on backs of both gates, forcing them apart and squarely against their seats (Figs. 70 and 84).

OPENING—First turn of stem releases upper wedge, thereby releasing both gates from their seats *before they commence to rise*, thus eliminating all grinding and reducing to a minimum the wear on the faces of both gates and seats. *No other valve possesses this advantage.*

CONSTRUCTION—Metal used, both iron and bronze, is of highest grade. Gates can not, under Ludlow construction, be wedged or locked until they are directly opposite valve opening; stem can not bind in wedge; no stripping of thread from stem by canting of gates to either side.

GROUND SEATS—All Ludlow valves have gates ground to their seats, to secure best joints possible.

STANDARD FLANGES AND DRILLING—The diameter and drilling of end flanges on our iron body valves, tested at 1000 lbs. or less, now conform to the "American" Standard effective January 1, 1914.

FIG. 84. STYLE OF GATES AND WEDGES FOR DOUBLE GATE VALVES

A, case; B, cover or bonnet; C, stem or spindle; D, packing plate or stuffing box; E, stuffing box gland or follower; F, stem nut; G, gates; H, gate rings; I, case rings; J, top wedge; K, bottom wedge; L, throat flange bolts; M, stuffing box or follower bolts

FIG. 70. LUDLOW BRONZE MOUNTED DOUBLE GATE VALVE

List No. 4, Double Gate Valves.

For heavy pressures on either side of gate. Used for water, steam, gas, oil, ammonia, etc. Valves tested at 300 lbs. water pressure. Gates are adjustable with center bearings which absolutely prevent gates becoming wedged in case. Although shorter than other

A FEW SAMPLES OF LUDLOW VALVES IN VARIOUS SIZES
Tested to above pressures

List No. 5, Double Gate Valves.

Valves have iron bodies and bronze mountings. Tested at 350 lbs. water pressure. Test *guaranteed*. For extra heavy working pressures either side of gate. All hub valves and all-iron valves have bolted stuffing box. These valves are also made with one end hub and other end spigot, or any other combination desired.

Recommended working pressures not exceeding, steam, 85 lbs.; water, 185 lbs.

SWEET'S CATALOGUE

List No. 5½, Double Gate Valves.

Iron body with bronze mountings and all-iron. A first class steam gate valve made to withstand easily and safely a heavy working pressure up to 250 lbs. Tested at 600 lbs. water pressure. Test *guaranteed*. All parts, both iron and bronze, exceptionally heavy. Stuffing box can be repacked with gates fully open. Made in following styles: With inside screw, outside screw and yoke, bevel or spur gear, with by-pass, with loose flanges, flanges plain or grooved, and with screwed, flanged and hub ends.

Recommended working pressures not exceeding, steam, 250 lbs.; water, 400 lbs.

FIG. 101. Inside Screw Valve. Can be repacked with pressure on

Continued on next page

List No. 30, Double Gate Valves.

For water, steam, oil, natural gas. Similar in style and construction to valves in List No. 5½, except that these valves are made heavier by means of ribs to withstand greater pressure. Iron body with bronze mountings, and all-iron. Tested at 1000 lbs. water pressure. Test *guaranteed*. Can be furnished with Dresser, Custer, Hammon or Dayton couplings.

Recommended working pressures not exceeding, steam, 275 lbs.; water, gas, 500 lbs.

FIG. 221. Screwed End Valve

FIG. 222. Flanged End Valve with Loose Flanges Bolted On

FIG. 223. Flanged End Valve

LIST NO. 30 DOUBLE GATE VALVES
Dimensions same as List No. 5½

List No. 8, Double Gate Valves.

Iron body with bronze mountings and all-iron. These valves have been on the market during many years. Thousands in use in this and other countries.

All parts extremely heavy. Tested at 1500 lbs. water pressure. All bolts are extra large. Stuffing box and follower are triple bolted, and the former is packed with special packing.

For extreme working pressures either side of gate. Recommended for working pressure not exceeding 750 lbs.

FIG. 12. LIST NO. 8 DOUBLE GATE VALVE
6-in. No. 8 valve with loose flanges bolted on

List No. 9, Double Gate Valves.

For hydraulic work, natural gas, oil, etc. Iron body with bronze mountings, and all-iron. Similar in design to valves in List No. 8, but heavier in every way for heavier working pressures. Used extensively on oil and natural gas lines; many still giving satisfaction after 35 years continuous service. Tested at 2000 lbs. water pressure. Gates and seats have ground faces, securing perfectly tight joints.

For extreme working pressures. Recommended for working pressure not exceeding 1200 lbs.

FIG. 14. LIST NO. 9 DOUBLE GATE VALVE
6-in. valve with loose flanges bolted on

is less water on the face of the gates and seats in operation, they work easier under heavy pressure, last longer and require fewer repairs.

The gates are adjustable, with center bearings and can not become stuck in the case. Gates and seats have ground faces, thus insuring watertight and steamtight joints. They work equally well with pressure either side of the gate.

By-passes of any size furnished. Valves made with hub or spigot ends for water, with flanged ends for steam. Tested at 300 lbs. water pressure.

Recommended working pressure not exceeding, steam, 75 lbs.; water, 150 lbs.

FIG. 108. DOUBLE GATE HUB OR BELL END VALVE
With spur gearing

List No. 6, Double Gate Valves.

For heavy working pressures on either side of gate. Iron body with bronze mountings, and all-iron. Designed for water, steam, gas, etc. More of these valves are in use in water works systems than any other valve on the market (Figs. 108 and 184). Superior to all other water works valves, for the reason that there

List No. 1, Single Gate Valves.

Iron body with bronze mountings, and all-iron. For water, gas, etc. Used where double gate valves are unnecessary, and pressure is not excessive. Gate and seat have ground faces, therefore watertight joints are assured. Tested at 200 lbs. water pressure.

Recommended working pressures not exceeding, water, 100 lbs.

List Nos. 2 and 3, Gate Valves.

List No. 2 is single gate and List No. 3 is a double gate valve. Construction and method of wedging single gate valves are same as the double gate valves, except that one gate and one seat only have ground faces. For light working pressure steam, or medium pressure water or gas. Tested at 80 lbs. water pressure. Intended for use where double gate valves are not desirable.

Recommended working pressures not exceeding, steam, 30 lbs.; water, 40 and 50 lbs.

FIG. 104. HUB OR BELL END VALVE Without gearing

																	147 1/8	

List No. 7, Bronze Double Gate Valves.

For steam or water. These valves have been tested at these pressures per square inch: Water pressure, 6 ins. and under, at 300 lbs.; 7 ins. and above, at 250 lbs.

The metal in Ludlow valves is equal to that called for in Government work, and, as to tensile and transverse strength, is superior to that used in other valves.

Valves made to bear a heavy working pressure.

Gates and seats have ground faces, thus insuring steamtight and watertight joints.

All sizes up to 6 ins. inclusive have the screwed stuffing box and follower nut, unless otherwise specified; and all sizes above 6 ins. have the bolted packing gland or follower.

Working pressures recommended should not exceed the following: Steam, 3 ins. and under, 125 lbs., 3 1/2 ins. to 6 ins., 100 lbs., 7 ins. to 12 ins., 75 lbs.; water, 6 ins. and under, 175 lbs., 7 ins. and above, 125 lbs.

FIG. 85 Screwed Cover and Rising Stem 3/8, 1/2, 3/4, 1 in.

FIG. 87 Bolted Cover and Box 2 1/2 to 6 ins.

FIG. 91 Flanged End, with Bolted Cover and Stuffing Box 7 ins. and above

FIG. 21 Sliding Stem and Lock Lever Valve Gate held in any position

LIST NO. 7, BRONZE DOUBLE GATE VALVES

List No. 7 1/2, Extra Heavy Bronze Double Gate Valves.

Recommended working pressures: Water, 6 ins. and under, 400 lbs., and 7 ins. and above, 300 lbs.; steam, 6 ins. and under, 250 lbs., and 7 ins. and above, 200 lbs.

These valves are also made for heavy pressure hydraulic work, working water pressure not to exceed 1000 lbs.

FIG. 153. LIST NO. 7 1/2 EXTRA HEAVY BRONZE DOUBLE GATE VALVE

List No. 10, Bronze Horizontal Swing Check Valves.

Made heavy and substantial, of highest grade of metal, for any desired working pressure. Gate and seat have ground faces.

Every valve is guaranteed. Tested at 300 lbs. water pressure.

Recommended working pressures not exceeding, steam, 100 lbs.; water, 175 lbs.

FIG. 35. SWING CHECK VALVE

List No. 10 1/2, Extra Heavy Bronze Horizontal Swing Check Valves.

Tested at 600 lbs. water pressure. Test guaranteed. Sizes, 1/2 to 4 ins.

Recommended working pressures not exceeding, steam, 250 lbs.; water, 400 lbs.

FIG. 154. EXTRA HEAVY BRONZE HORIZONTAL SWING CHECK VALVE

NOTE—The foregoing valves (Lists 10 and 10½) are not made to compete in price with light and inferior goods, but are made heavy and substantial, and the workmanship is unsurpassed. They are strong, and are not warped out of shape when screwed into a line pipe, as is often the case with inferior goods.

List Nos. 11 and 12, Horizontal Swing Check Valves, Iron Body with Bronze Mountings.

These valves are made with iron bodies, bronze mounted, are heavy and substantial. They are so constructed that bottom of the case is flattened and raised toward the seat, eliminating pockets or receptacles for stones or gravel. Gates in all sizes can be taken out by removing the cover or manhole plate.

Sizes 14 ins. and above are made with by-pass. Tested, 24 ins. and under at 300 lbs. per sq. in. water pressure; 30 ins. and above at 250 lbs. per sq. in. water pressure.

Recommended working pressures: Steam, 24 ins. and under, 75 lbs.; water, 24 ins. and under, 150 lbs.; 30 ins. and above, 125 lbs.

48	105	59½	115¾

List No. 12½, Extra Heavy Horizontal Swing Check Valves.

For use under heavy pressure. Made with iron bodies and are bronze mounted. Similar in construction to the valves in List Nos. 11 and 12, but heavier throughout. All parts extra strong. Tested at 600 lbs. water pressure. Sizes 14 ins. and above made with by-pass; 12 ins. and under made without by-pass.

Recommended working pressures: Steam, 24 ins. and under, 200 lbs.; 30 ins. and above, 125 lbs.; water,

24 ins. and under, 400 lbs., 30 ins. and above, 200 lbs.

For dimension diagram, see List Nos. 11 and 12

List No. 13, Vertical Check Valves.

Iron body, gates faced with solid rubber disks seating against iron plate. Bearings are of bronze. Rubber, of best quality.

Made in two styles: 9 ins. and under, with single gate; sizes above 9 ins. are made with gate plate and a nest of small gates varying in number according to size of valve, also with hand-holes for cleaning purposes.

FIG. 127. VERTICAL CHECK VALVE
Screwed, flanged or hub ends

Tested at 300 lbs. water pressure. Recommended working pressures not exceeding, for water, 150 lbs.

List No. 14, Vertical Foot Valves.

Of similar construction to above vertical check valves. Iron body and iron gate plate. Gates faced with solid rubber. Sizes above 9 ins. have, in addition to nest of small gates, a plate screen or strainer bolted to bottom of valves and made of heavy brass wire, also handholes. Sizes under 9 ins. made with single gate, with basket screen or strainer. Tested

FIG. 128. VERTICAL FOOT VALVE
Screwed end

at 100 lbs. water pressure (Fig. 128). Smaller types, with screen omitted, are adapted for service as vertical check valves. Recommended working pressure not exceeding, for water, 50 lbs. Prices and dimensions sent upon application.

List No. 16, Bronze Hose Valves.

Light and heavy pattern double gate hose valves are intended for use in standpipes in public and office buildings, mills, etc. Single gate hose valves are to be carried on hose carriages for use with hydrants. Double gate patterns, recommended working water pressures, 150 and 125 lbs. Single gate pattern, recommended working water pressure, 100 lbs.

FIG. 71. BRONZE HOSE VALVES With cap and chain

List No. 75, Ludlow Slide Gate Fire Hydrant.

Gate type. A first class non-freezing hydrant, strong, simple in construction, tight under all pressures, with a positive drip that drains hydrant barrel completely. All working parts can be taken out without doing any digging or disturbing hydrant barrel.

CLOSING AND OPENING HYDRANT GATE AND DRIP VALVE—

In closing, gate is moved downward by action of stem through threaded bronze wedge nut in back of gate (Fig. 131), until it strikes the stop at bottom of projection in back of hydrant, when, by action of bronze wedge nut, moving along incline on back of gate, it is forced squarely against its seat without any grinding movement on either rubber gasket, with which gate is faced, or on bronze seat ring, against which it closes, the projections at top and bottom of gate keeping rubber gasket away from seat ring until it is forced squarely against it by action of wedge nut.

The final turn of stem, after gate is closed and wedged, opens drip valve.

In opening hydrant, first turn of stem closes drip valve, after which bronze wedge nut in back of gate is loosened, thus relieving gate from its seat.

GATE LOCKING DEVICE—Consists of 2 lock nuts on stem below gate, which lock gate after it is closed, preventing street from being flooded in case hydrant barrel or standpipe is broken by accident.

Device, fully covered by patent, operates the instant gate is closed and drip is open; and is released immediately upon starting to open hydrant.

DRIP VALVE—Bronze and faced with rubber, drip valve is screwed to lower end of hydrant stem and works in a bronze cup in extreme bottom of hydrant.

FIG. 131. LUDLOW SLIDE GATE FIRE HYDRANT

List No. 75, bronze mounted rubber faced gate. Sectional view showing gate closed and locked and drip valve in extreme bottom of hydrant open

Opens only *after* gate is closed and wedged; and closes *before* gate is released or any water enters barrel.

Fig. 131 shows location of drip valve which prevents freezing of hydrant. Valve does not open until after gate is closed and locked, shutting off water from hydrant barrel; and closes before gate is released from its seat, letting water into hydrant.

List No. 80, Ludlow Fire Hydrant with Balanced Valve.

Compression type. Built strong in every part, remains tight under all pressures, has positive drip and all parts can be removed without digging or disturbing hydrant barrel.

MATERIAL USED— Bronze : seats, sleeve, drip cylinder, drip valve, nozzles; all wearing surfaces are either bronze mounted or rubber faced (Fig. 179).

Other Ludlow Hydrants.

Slide gate flush hydrants; flush hydrants or street washers; slide gate fire hydrant, with water crane attachment; water crane, with automatic drip in main valve, for supplying sprinkling carts; underwriter hydrant, built in accordance with National Board of Fire Underwriters.

FIG. 179. LUDLOW FIRE HYDRANT WITH BALANCED VALVE Showing main valve and drip valve

List No. 29, Automatic Globe Air Valves.

Placed on mains at high points where air accumulates and obstructs flow of water.

When air takes the place of water about float in valve chamber, valve opens permitting air to escape. As water returns, valve is closed (Fig. 146).

FIG. 146. AUTOMATIC GLOBE AIR VALVES

List No. 23, Automatic Lever and Float Air Valves.

With bronze mountings and copper float. Placed on mains at high points where air accumulates and obstructs flow of water. When air takes the place of water about float, B, in valve chamber, float (attached to bronze lever A) drops, thus opening valve, D, allowing air to escape. As water returns it lifts float (relieved of the air pressure), thereby closing valve, D (Figs. 49 and 117).

Oil and Grease Cups, Oil Pumps, Oiling Devices, Injectors and Ejectors, Water Columns and Gages, Gage Cocks, Whistles, Ground Key Work, Low Water Alarms, Fusible Plugs, Unions, Bronze Pipe Fittings.

Motors Accessories: Generator Valves, Carburetor Check Valves, Gasoline Engine Primers, Priming Cups, Gasoline Strainers, Unions, Cocks, etc.

Lubricators for Steam, Gas, Gasoline and Diesel Engine and Compressor Cylinders.

Regrinding Globe, Angle and Cross Valves.

MATERIALS—Body and trimmings of "Valve-bronze"; hand wheel of iron.

PATTERNS—Medium with screw ends for 200 lbs. and "B-H" flange ends for 150 lbs. working steam pressure; extra heavy with screw ends for 300 lbs. and "B-X" flange ends for 250 lbs. working steam pressure. Also furnished in outside screw, bolted or screwed yoke patterns.

FEATURES—Seating surfaces regrindable; all parts renewable; stuffing box repackable under pressure when valve is wide open; flow areas in excess of pipe areas.

"Renewo" Globe, Angle and Cross Valves.

MATERIALS—Seat and disc of "Valve-nickel"; hand wheel of malleable iron; other trimmings and body of "Valve-bronze."

PATTERNS—Medium with screw ends for 200 lbs. and "B-H" flange ends for 150 lbs. working steam pressure; extra heavy with screw ends for 300 lbs. and "B-X" flange ends for 250 lbs. working steam pressure. Also furnished in outside screw, bolted yoke patterns.

FEATURES—Seating surfaces regrindable; all parts renewable, including the nickel seat and disc, making these valves practically indestructible; seating surfaces self-cleansing; stuffing box repackable under pressure when valve is wide open; self-cooling hand wheel; flow areas in excess of pipe areas.

Double Disc Gate Valves.

MATERIALS—Body and trimmings of "Valve-bronze"; hand wheel of iron.

PATTERNS—Medium with screw or flange ends for 150 lbs. working steam pressure.

FEATURES—Ball and socket bearing between the discs provides greatest degree of flexibility in seating engagement; all parts renewable; stuffing box repackable under pressure when valve is wide open; pressure can be taken from either end.

Wedge Disc Gate Valves.

MATERIALS—Body and trimmings of "Valve-bronze"; hand wheel of iron.

PATTERNS—Screwed bonnet, inside screw, or screwed yoke, outside screw; medium pattern with screw ends for 200 lbs. and with "B-H" flanged ends for 150 lbs. working steam pressure; extra heavy with screw ends for 300 lbs. and with "B-X" flange ends for 250 lbs. working steam pressure.

Bolted bonnet, inside screw, or bolted yoke, outside screw; medium pattern with screw or flanged ends for 125 lbs. and extra heavy pattern for 250 lbs. working steam pressure.

FEATURES—Double seated, permitting pressure to be taken from either end; stuffing box repackable under pressure when valve is full open; all parts renewable, including the seats on all sizes with exception of $\frac{1}{4}$ to $\frac{3}{4}$ in., inclusive.

Bolted Yoke Globe, Angle and Cross Valves.

MATERIALS—Body and yoke of "Valve-iron"; bearing parts of "Valve-bronze." Also furnished with cast steel body, bonnet or yoke, and with seat and disc of "Valve-nickel."

PATTERNS—Standard pattern, sizes 2 to 12 in. inclusive, screw or flange ends for 125 lbs. working steam pressure; heavy pattern, sizes 2 to 8 in. inclusive, and with interior by-pass, $\frac{3}{2}$ to 12 in. inclusive, screw or flange ends for 175 lbs. working steam pressure; extra heavy pattern, sizes 2 to 8 in. inclusive, and with interior or exterior by-pass, $\frac{3}{2}$ to 12 in. inclusive, for 250 lbs. working steam pressure.

FEATURES—Seating surfaces regrindable; all parts renewable, including the seat and disc; self-cleansing seating surfaces; stuffing box repackable under pressure when valve is wide open; flow areas in excess of pipe areas.

"Ferrenewo" Globe, Angle and Cross Valves.

MATERIALS—Body of "Valve-iron"; seat and disc of "Valve-nickel"; hand wheel of iron; other trimmings of "Valve-bronze."

PATTERNS—Screw ends only. For 150 lbs. working steam pressure.

FEATURES—Self-cleansing seating surfaces; regrindable seating surfaces; all parts renewable, including the nickel seat and disc; stuffing box re-packable under pressure when valve is wide open; flow areas in excess of pipe areas.

"FERRENEWO" GLOBE VALVE

"Ferrenewo" Horizontal and Angle Check Valves.

MATERIALS—Body of "Valve-iron"; seat and disc of "Valve-nickel"; disc guide and cap of "Valve-bronze."

PATTERNS—Screw ends only. For 150 lbs. working steam pressure.

FEATURES—Disc properly guided at both top and bottom insures perfect seating; seating surfaces regrindable; all parts renewable, including the nickel seat and disc; flow areas in excess of pipe areas.

"FERRENEWO" HORIZONTAL CHECK VALVE

*Heavy valves have 1/8-in. raised face on flange ends, which is included in dimensions.

Bolted Cap Swing Check Valves.

MATERIALS—Body and cap of "Valve-iron"; bearing parts of "Valve-bronze." Also procurable with steel body and cap. Seat and disc may be had of "Valve-nickel."

BOLTED CAP SWING CHECK VALVE

PATTERNS—Heavy pattern for 175 lbs. working steam pressure; extra heavy for 250 lbs. working steam pressure. Screw or flange ends.

FEATURES—Practically straightway flow channel. Two bronze side plugs provided as disc-carrier bearings which are renewable, as are all other parts; seating surfaces regrindable.

"Clip" Gate Valves.

MATERIALS—Body and bonnet of "Valve-iron"; bearing parts of "Valve-bronze."

PATTERNS—Screw or flange ends. Inside screw pattern for 100 lbs. working steam pressure; quick opening pattern, with lever, for 50 lbs. working steam pressure.

FEATURES—Wedge disc, double seated, permitting pressure to be taken from either side; steel clip, surrounding body, facilitates taking apart for cleaning or repairing and adds strength to the body; short face to face dimensions of body; few parts.

"Victor" Gate Valves.

MATERIALS—Body, bonnet or yoke of "Valve-iron"; bearing parts of "Valve-bronze." Can be procured with seat and disc of "Valve-nickel," or body, yoke or bonnet of cast steel.

PATTERNS—Standard pattern, sizes 2 to 8 in. inclusive, for 125 lbs. working steam pressure, and sizes 10 to 24 in. inclusive, for 100 lbs. working steam pressure; medium pattern, sizes 2 to 24 in. inclusive, for 125 lbs. working steam pressure; heavy pattern, sizes 2 to 24 in. inclusive, for 175 lbs. working steam pressure; extra heavy pattern, sizes 1½ to 16 in. inclusive, for 250 lbs. working steam pressure. Furnished with screw ends up to 12 in. only. Flange ends in all sizes. Can be had with by-pass in 5-in. and larger sizes. Made with inside screw stationary stem and outside screw rising stem. Can be procured in sliding stem pattern for quick opening and closing; with angle outlet; stationary stem pattern with indicator to show degree of opening; with gear or hydraulic lift.

OUTSIDE SCREW AND YOKE

INSIDE SCREW STATIONARY STEM

FEATURES—Wedge disc, double seated, permitting pressure to be taken from either end; all parts renewable, including the seats and disc; stuffing box repackable under pressure when valve is wide open.

Balanced Throttle Valves.

MATERIALS—Body and yoke of "Valve-iron"; bearing parts of "Valve-bronze." Can be procured with seat and disc of "Valve-nickel," or body and yoke can be had of cast steel.

PATTERNS—Globe or angle patterns with flange ends only, sizes 4 to 10 in., for 250 lbs. working steam pressure.

FEATURES—Simplicity of construction combined with efficiency make these valves particularly adapted for engine throttling purposes. Interior by-pass facilitates operation; spring seating surfaces accommodate themselves to any slight distortions caused by expansion and contraction; seating surfaces regrindable; all parts renewable, including seat and disc; can be connected with stem pointing vertically upward or horizontally.

BALANCED THROTTLE VALVE

Non-return Boiler Stop Valves.

MATERIALS—Body and yoke of "Valve-iron"; bearing parts of "Valve-bronze." Can be procured with seat and disc of "Valve-nickel," or body and yoke can be had of cast steel.

PATTERNS—Globe or angle patterns with screw or flange ends for 250 lbs. working steam pressure.

FEATURES—Will automatically close and instantly cut out the boiler in battery to which it is connected should the pressure within the boiler suddenly drop below that in the header; permits continued operation of other boilers in battery; will not open until pressure in boiler equals that in header; can be connected with stem pointing vertically upward or horizontally; self-cleansing seating surfaces; seating faces regrindable; all parts renewable, including seat and disc.

Iron Body Straightway Blow-off Valves.

MATERIALS—Body, yoke, disc-guide and stuffing box gland of “Valve-iron”; seat, stem and stem bushings of “Valve-bronze”; iron disc with alloy faces.

PATTERNS—Standard for 125 lbs. and extra heavy for 250 lbs. working steam pressures. Screw or flange ends.

FEATURES—self-cleansing seating surfaces, reversible disc provided with two seating faces; disc face alloy can be renewed when worn; all parts including the seat are renewable.

“Duro” Blow-off Valves.

MATERIALS—Body and yoke of “Valve-iron”; bearing parts of “Valve-bronze.”

PATTERNS—Screw or flange ends for 250 lbs. working steam pressure.

FEATURES—Self-cleansing seating surfaces; disc reversible and pro-

“DURO” BLOW-OFF AND “VICTOR” GATE VALVE COMBINATION

vided with two alloy faces, which can be melted out and new alloy inserted; all parts renewable, including seat.

A combination extensively used is that of the “Duro” with a “Victor” gate valve bolted between it and the boiler.

The gate valve serves as a safety device in event of accident to the blow-off valve and enables repairing of the latter while the boiler is under pressure.

“DURO” BLOW-OFF VALVE

“Vigilant” Safety Water Columns.

MATERIALS—Body and cap of “Valve-iron”; float of seamless copper, and trimmings of “Valve-bronze.”

PATTERNS—Made in various sizes to suit connections for all types of boilers. For 250 lbs. working steam pressure.

FEATURES—Will notify the attendant by automatically blowing a whistle when the water within the boiler approaches the low or high danger limits; aids in keeping the water level within the proper limits, thereby prolonging the life of the boiler and effecting an appreciable saving in fuel; simple in design and exceptionally durable; provided with a sediment chamber to trap scale or dirt, preventing same from being carried to water gage and gage cocks and interfering with their proper operation; only one float used, made of seamless copper and warranted to withstand a pressure greatly in excess of 250 lbs.; all parts renewable.

McNAB & HARLIN MFG. CO.

Manufacturers of Valves and Fittings, Etc.

GENERAL OFFICE
N. E. Corner of John and William Streets
NEW YORK, N. Y.
WORKS AND SUPPLY HOUSE, PATERSON, N. J.

Products.

McNAB & HARLIN VALVES for all pressures and purposes, in Brass, Iron and Cast Steel.

PIPE and DRAINAGE FITTINGS.

BRASS and IRON BODY COCKS, etc.

Also, Wrought Pipe, Malleable Iron Fittings, Seamless Drawn Brass Pipe, Tools, Engine and Boiler Trimmings, Hose Goods and Plumbers' Brass Goods.

Quality of Materials.

The quality of the materials used in the manufacture of McNab & Harlin brass and iron valves and fittings is determined by daily chemical and physical analysis, and these tests furnish invaluable data for the production of a uniform product.

Steam metal, or hard brass, used in the manufacture of these valves, valve seats and disks, has a tensile strength of 33,000 lbs. per sq. in., and is particularly adapted for high pressure and unusually severe service.

Equipment and Facilities.

The installation of modern machinery and efficient methods enable this company to manufacture valves and fittings in the most satisfactory manner and with the least possible delay. A large and complete stock of all staple goods is carried at the factory at Paterson, N. J., insuring prompt shipments of all orders.

McNab & Harlin Patented Improved 1916 Type of Iron Body Gate Valve.

Furnished in sizes 2 to 14 in. inclusive, for 125 lbs. pressure, either inside screw or outside screw and yoke pattern.

For 250 lbs. pressure, outside screw and yoke pattern only.

These valves are of the double disk parallel seat type which has been designed and patented by this company after exhaustive research and experimental work.

Instead of having one central wedge to spread the disks against the seats at time of closing, they have two wedges, which more effectively transmit the lateral pressure exerted on the faces of the disks at the point of closing, thus insuring an absolutely tight valve. The design of the disk is such as to prevent warping or getting out of shape, due to temperature changes; they are equipped with lugs on the side, which operate in guides cast in the body of the valve, eliminating wear on the disks and seats due to friction in the operation of opening and closing, thus insuring a valve of longer life in service.

The disk rings and seat rings of these valves are made of Aterite metal, which is a patented non-corrosive alloy of great strength and density. This metal

TRADE-MARK

is approximately twice as strong as brass or bronze compositions at present used in the manufacture of disk rings and seat rings in gate valves. In addition to this, Aterite is proof against the corrosive action of most of the common acids and alkalis.

Valves equipped with disk rings and seat rings of this metal are particularly adapted for oil refinery work, as Aterite is proof against the corrosive action of sulphur and sulphurous compounds occurring in crude oil. Thousands of these valves are being furnished to different oil refining companies in this country and the valves are giving perfect satisfaction.

A special booklet, giving a detailed and complete description of these valves, as well as all Aterite valves, cocks and fittings, is issued by this company and will be sent on request.

Extra Heavy Iron Body Globe, Angle and Straightway Valves.

Constructed from a new line of patterns for 250 lbs. per sq. in. steam working pressure. Disk and seat rings are made of special hard metal faced true. All these valves are made to open by turning to the left. Wearing parts can be renewed, and seats can be easily and quickly reground. Valves can be packed when open without any escape of flow.

Diameters of flanges, thickness, bolt circle, size and number of bolts, of extra heavy valves and flanged fittings, are the standard adopted by all leading manufacturers on Jan. 1, 1915.

For steam working pressures up to 175 lbs.

Standard Iron Body Brass Mounted Valves.

For steam working pressures up to 125 lbs. Construction is such that they can be packed when open without any escape of flow, a fact that all practical users can appreciate. To do so, the valve must be wide open.

Standard Iron Body Swing Check Valves.

Iron body, brass seat. For steam working pressures up to 125 lbs. So constructed that by removing the bonnet, the disk can be taken out at same time. Thickness of body, metal and flanges correspond with other standard valves for 125 lbs. steam working pressures. Valves made to order with by-pass. Furnished with leather disk, when desired, at special price.

Cast Iron Screwed Fittings.

This line of cast iron standard, medium and extra heavy screwed fittings is complete for 125 lbs., 175 lbs. and 250 lbs. working steam pressure. All fittings tapped to Briggs standard gage and carefully inspected before shipment.

The 175-lb. fittings are especially adapted for oil lines and car heating.

Flanged Fittings.

We have a full line of patterns and up-to-date equipment for the manufacture of standard and extra heavy regular and long sweep flanged fittings, also special patterns for reducing sizes and special shapes used extensively on power plant work.

The dimensions and drilling of all flanged fittings conform with the American Standard adopted Jan. 1, 1915, by Committee on Standardization of Fittings and Valves.

Drainage Fittings.

These fittings are made with a shoulder, the same size inside diameter as the pipe. When the pipe is screwed up to the shoulder, the continuous passage thus formed leaves no opportunity for solid matter to collect and choke the pipe. A large stock enables prompt shipment.

Products.

NELSON VALVES: Gate, Globe and Check in Bronze, Iron and Steel; Cushioned Non-return; Throttle; Large Gate, Electrically and Hydraulically Operated.

Scope.

These valves are made for standard, medium and extra heavy pressures, for saturated and superheated steam, water, air, oil and special service.

There is a Nelson valve for almost every purpose, ranging in sizes from $\frac{1}{4}$ in. to 42 in. The valves illustrated on these pages are a few representative types.

A catalogue of the complete Nelson line will be sent on request.

Nelson Quality.

An exceptionally high quality standard is maintained for Nelson valves. Materials are carefully selected, workmanship is of the skilled character produced by ideal shop conditions, and inspection and test are thorough.

As a result, 20 years' service of Nelson valves has firmly established them in the confidence and favor of engineers and valve users generally. Nelson valves are a *safe valve investment*.

Special Nelson Features.

Nelson valves are designed in accordance with the most advanced and approved engineering practice. They are of heavy construction, with metal distributed to give maximum strength and service. Their lines are carefully determined for clear openings and smooth flow. Each valve must stand test pressures two or three times its rated working pressure.

Nelson bronze valves have liberal weight of metal wherever strength is required. Screwed end valves have wide hexes and taper threads. All bronze valves

are fitted with the new Nelson non-heating hand wheel.

An important feature of Nelson gate valves is the double disk mechanism. This provides a simple flexible gate, insuring easy travel and perfect seating in spite of presence of dirt or possible distortion of valve body. The disks travel freely to their lowest point and then spread into position, eliminating scraping or scoring of seats.

Nelson Bronze Valves.

GATES—Nelson bronze gate valves include standard, medium and extra heavy patterns, screwed and flanged ends. They embody the Nelson double disk principle, insuring a tight valve under any line conditions.

Stems are tough manganese bronze, with generous acme threads. Medium and extra heavy valves are gland packed.

All valves have non-heating hand wheel.

In addition to regular inside screw valves, there are quick opening, rising stem and other patterns.

GLOBES—Nelson bronze globe and angle valves are made in both screwed and union bonnet patterns, screwed and flanged ends. They may be fitted with regrinding or *Nelsonite* renewable fiber disks, or copper disks, all interchangeable on the same stem. They have tapered seats to prevent scoring. Stems are tough manganese bronze.

All valves have non-heating hand wheel.

CHECKS—Nelson bronze check valves include standard swing checks with regrinding or leather disks; extra heavy regrinding swing checks; horizontal globe and angle type cup checks and vertical check valves.

Section
Disks travel freely, steadied by guides, and enter and leave seats without scraping or chattering. Stem makes a "pack" when open" joint when up

Parts
Only 3 parts—2 disks and 1 central wedge. Disks rock into position on the seats automatically, insuring perfect closing

Disk Ring
Disk ring rolled into disk under hydraulic pressure, forming tongue and groove joint which can not be loosened

Nelson Iron Body Valves.

GATES—The Nelson iron gate line offers a valve for practically every condition. There are standard, medium and extra heavy patterns, with inside screw and outside screw and yoke types in each weight, and with screwed and flanged ends. Large, medium and extra heavy valves are also furnished with by-passes.

In addition to these regular types, there are quick opening types, hub end valves; compound thread; motor operated and hydraulically operated gates.

Nelson gate valves are mounted with screwed-in bronze seat rings and rolled-in bronze rings on the disks. The double disk and wedge construction insures positive closing and long satisfactory service. Medium and extra heavy valves have raised faces on end flanges.

Nelson gate valves may be ordered all-iron trimmed for acid and similar service.

GLOBES—Nelson iron globe and angle valves include standard, medium and extra heavy patterns.

The standard valves may be fitted with either regrinding or *Nelsonite* renewable fiber disks, interchangeable on the same stem. The bonnets have through bolts.

Cushioned non-return stop and check valves in globe and angle types are also included among Nelson iron body valves.

Extra heavy Nelson globe valves are made with either cast yoke or Navy type yoke.

CHECKS—Nelson iron body check valves include swing checks in standard and extra heavy pressures, and extra heavy globe and angle cushioned check valves.

The standard swing check valve may be equipped with a leather disk or bronze regrinding disk.

NELSON-ERWOOD—The Nelson-Erwood valve is a combina-

tion swing check and gate valve. The swing check disk is contained within the gate and is adjustable for the desired back pressure. They have numerous applications on exhaust and discharge lines.

Nelson Steel Valves.

GATES—Nelson steel gate valves represent the highest standard in steel valve construction. Close grained annealed castings of exceptionally heavy section are used in their manufacture and the trimmings are of monel metal throughout, adapting them to pressures of 350 lbs. and temperatures of 800°. Various specifications are supplied for different temperatures and working conditions.

They have extra high bonnet and stuffing box, with a long condensing chamber and test cock for packing under pressure. Swing bolts are used on the stuffing box. Cork grips are provided on the hand wheel. Motor operation is frequently furnished on the larger sizes.

GLOBES—Nelson steel globe and angle valves have the same quality and service features as the steel gates. They are distinctly high grade engineering products in the detail of design and in care of manufacture.

They are of heavy construction, monel mounted for superheated steam or composition mounted for other conditions. They are built with either cast yokes or Navy type yokes. Various specifications are supplied for different temperatures and working conditions.

NON-RETURNS—Nelson steel cushioned non-return stop and check valves are similar in construction and types to the steel globes.

They are monel mounted for superheated steam or composition mounted for other conditions. Various specifications are supplied for different temperatures and working conditions.

Success of Nelson Valves.

Nelson valves are giving successful service in the best known power plants throughout the country, and are specified by leading engineers. They are a safe investment where first quality work is desired.

Reference book of Nelson valves giving details, specifications and dimensions will be mailed on request.

VALVES: Accumulator, Aiken Hydraulic Operating, Aiken Stop, Atmospheric Relief, Back Pressure, Blow-off, Butterfly, Check, Chronometer, Crichtlow Hydraulic Operating, Exhaust Relief, Float, Foot, Gate, Globe, Angle and Cross, Hydraulic, Non-return, Plug, Register, Relief, Shock, Stuart Hydraulic Operating, Tanner Hydraulic Operating, Throttle, and Transfer, for high and low pressures, in all sizes, for all services.

VALVE FITTINGS and APPLIANCES.

Specialists in HYDRAULIC PIPING and OPERATING VALVES, and in PIPING SYSTEMS for high pressure superheated steam. PIPE, PIPE BENDS, PIPE FITTINGS and PIPING SUPPLIES.

STEAM SEPARATORS.

Also, Expansion Joints, Swivel Joints, Exhaust Heads, Cocks and Drip Pockets.

Services.

Complete piping contracts executed, designed by experienced engineers, manufactured by skilled workmen under competent supervision, and erected by expert fitters.

The engineering department makes a specialty of unusual conditions, and is prepared to design or estimate

TRADE-MARK

any piping layout or special valves upon receipt of specifications.

Engineers are invited to submit their piping and valve problems, and a satisfactory solution is assured.

Standard Specifications.

Our standard specifications have been adopted by the leading high pressure concerns in the United States, a copy of which will be furnished on request.

Guarantee.

Our trade-mark is on all goods made by us, and we believe in maintaining its reputation. We fully guarantee our goods for the service sold.

Carefully conducted destruction tests of valves and fittings up to 36 in. have been made, and the data secured is an invaluable aid in making new designs.

Gate Valves.

Made in parallel and taper seat types. For exhaust, water, air and gas, the parallel seat type is recommended; while for medium and high pressure steam and hydraulic service, the taper seat type is recommended.

All types and sizes made either outside screw and yoke, or inside screw. Patterns are so arranged that valves can be made all iron or with bronze, monel or special mountings.

MISCELLANEOUS PIPING

CONDENSER PIPING

MISCELLANEOUS PIPING AT CLEVELAND POWER PLANT OF PENNSYLVANIA LINES WEST OF PITTSBURGH

MOTOR OPERATED GATE VALVES—We have applied motor drives to gates for various classes of work, using either direct or alternating current. Gearing for our motor operated gate valve is designed to meet the requirements of strength and compactness. All gear teeth are cut. Motors fitted with metaline bearings which require no oiling or other attention.

Unless otherwise specified, Stuart limit controller is used exclusively for this service, consisting of two automatic circuit breakers, mechanically operated, and incased in a box mounted on the gate yoke and out of reach of the operator, thus making it impossible for him to interfere with their proper functioning.

MISCELLANEOUS PIPING IN BRIDGEPORT PLANT OF REMINGTON ARMS AND AMMUNITION CO.
STONE & WEBSTER ENGINEERING CORP., Engineers

Underwriters' specifications have been met in all our designs.

CYLINDER OPERATED GATE VALVES—Built for any pressure or service. Motive fluid may be water, air or steam. If the fluid is gaseous, as steam or air, placing the cylinder in a horizontal position is recommended. If, however, a vertical position can not be avoided, special attachments to meet conditions will be furnished.

72-INCH CYLINDER OPERATED GATE VALVE

GROUP OF MOTOR OPERATED CAST STEEL VALVES—PART OF AN ORDER FROM THE PUBLIC SERVICE ELECTRIC COMPANY OF NEW JERSEY

ATMOSPHERIC OUTLET GATE VALVE

Valve serves the purpose of a gate valve and a tee. Arrangement reduces depth of basement required for installation of condenser. Valve is of single disc and single seat type. Disc held against seat when valve is closed. Furnished either inside screw or outside screw and yoke. May be equipped with either bevel, spur or special gearing

PIPE BEND

Contains 53 ft. of 14-in. pipe. The three lengths were connected by the Atwood line weld. On account of its size, it could not be shipped by rail. A river barge was used to deliver it to the Alliquippi plant of the Jones & Laughlin Steel Co.

Stuart Two-pressure Operating Valves.

Used extensively by the largest rubber manufacturers for operating heaters and presses with high and low pressure water.

Supply of high pressure water is controlled automatically, and can not be turned on at the wrong time, nor can either the high or low pressure be turned into the waste.

Operation is very simple. Moving lever up or down will raise or lower the press, using low pressure water only. When moulds come against the

STUART TWO-PRESSURE OPERATING VALVE

3/4-in. high pressure; 2-in. low pressure; 2 1/2 in. to cylinder; 2 1/2-in. waste. Lever furnished if so ordered

head of heater, or top of press, high pressure water is automatically turned on to squeeze moulds and low pressure is automatically cut off. After curing process is complete, lever is pulled as far as possible, which shuts off high pressure water and waste water in press.

This valve saves high pressure water; increases output; is foolproof; saves money and annoyance.

Steam Separators.

In these separators, every condition for good separation is met.

The standard horizontal, vertical and angle separators are made with cast iron bodies and wells.

Receiver type separators are made of semisteel bodies and wrought steel wells. They are constructed upon the same general principles as the smaller separators.

The welded receiver type separators have necks welded in by the "interlock" method. This type is guaranteed to be absolutely tight and has proved its reliability under the most severe service.

Iron Body Renewable Disc Valves.

Regular weight, Figs. 38 to 45, are equipped with iron discs, into which asbestos rings are inserted to serve as the faces. The extra heavy pattern valves, Figs. 50 to 53, have iron discs with copper rings to form the faces.

In all these valves the bronze seat rings, as well as the discs, are renewable.

Bronze Renewable Seat Gate Valves.

In these valves the seats are separate rings, made of asbestos, bronze or special metal. These seat rings are held in the body of the valve by retaining rings that screw into the body. This construction makes it simple to renew the seat rings, when they become worn or scored, *without having to remove the valve from the pipe line.*

Cast Steel Gate Valves for High Pressure Superheated Steam.

Cast steel bodies, bonnets and yokes. Split pattern wedges.

Valves 6 in. and smaller have monel metal wedges; larger sizes have cast steel wedges with monel metal faces.

Seat rings are made of monel metal securely fastened so that they can not work loose, with rolled monel metal spindles, and monel metal spindle nuts.

End flanges have 1/8 in. smooth, tool finished raised faces extending the full width inside of the bolt holes. All bolt holes are spot faced.

Yokes are bolted to the bonnets. The bonnet joints are packed with superheated gaskets. To prevent the extreme heat from attacking the packing the bonnets are made with extra long necks.

The stuffing boxes are made with hinged bolts, very deep for asbestos packing.

This company also manufactures a full line of cast steel globe valves.

Iron Body Water Gate Valves with Double Discs and Parallel Seats.

Valves of this design are operated easily, and there is absolutely no danger of the gates becoming wedged so as to prevent their operation.

As the gates are parallel there is an entire absence of friction while they are being forced against the seats in the body.

The stem nut, between the gates, and the stem are both made of solid bronze, preventing rust or corrosion.

One turn of the spindle acts directly on the gate, which has an inclined inner side, thereby releasing the wedge hooks in the locking mechanism and permitting the rocker gate to come away from its seat.

These valves are equipped, if so ordered, either with an electric motor or a hydraulic cylinder for ease of operation.

Bronze Swing Check Valves with Renewable, Rotating Bronze Discs and Regrindable Seats.

A valve of this type is easily reground. By removing the cap, inserting a screwdriver blade into the slot in the disc head, the disc may be rotated on the seat until the damaged surface of the seat is restored to perfect shape. Should the disc become badly worn, it is the work of an instant to substitute a new one by unscrewing the side plugs and removing the interior parts.

Iron Asbestos Packed Cocks, Three-way Pattern.

This type of cock is found extremely useful for controlling the flow through branch lines. It has U-shaped grooves in the body, into which loose asbestos is driven and then vulcanized. There are two designs in this type: one has two openings in the central plug, and the other three openings.

For many years these cocks have been used with unparalleled success for air, ammonia, gas, steam and water.

FIG. 272 Three Openings in Plug
All three ports can be open; any two can be open and the third closed

FIG. 273 Two Openings in Plug
Side port and either line port can be connected; all three ports can be closed

Iron Asbestos Packed Cocks, Groove Packed Pattern.
Instead of having a removable asbestos bushing, cocks of this design are packed with loose asbestos in U-shaped grooves in the body. This packing is done by hand, and afterwards the entire cock is subjected to a special vulcanizing process. This vulcanizing process makes the cock more serviceable and better able to withstand higher pressure and temperature. These cocks give unexcelled service as blow-off valves on boilers where no other type of valve has given satisfaction.

Automatic Stop and Check Valve.

In semisteel for 250 lbs. working pressure, in cast steel for 350 lbs. working pressure and 800° Fahr. temperature.

Design is based primarily on simplicity and ruggedness with full regard to the exacting requirements of the service. The generous length of the piston and cylinder provides an ample dashpot and eliminates the possibility of hammer or chatter of disc.

The piston and disc are of one piece and provide perfect alignment at the only two points where such is required. The absence of a stuffing box prevents any hindrance to free movement of all the reciprocating parts.

The metal thickness of the piston and the dashpot walls is the same; expansion under various temperatures will, therefore, be the same. This, taken in conjunction with the large steam chamber surrounding the outside of the dashpot which insures equal temperatures, prevents the possibility of binding or sticking, which is liable to occur where the dashpot and piston walls are of unequal thickness, or where the outside of the dashpot is in close proximity to the body shell.

THE M. SMOLENSKY MFG. CO.
Manufacturers of Valves
CLEVELAND, OHIO

Products.

SMOLENSKY ROTARY CHECK VALVES;
SUCTION VALVES; POP SAFETY VALVES.

Description.

Smolensky valves are a departure from the generally accepted idea that a check valve, to be efficient, must be bulky and complicated. The standard size rotary flange and rotary screwed check valves are manufactured with 50% less material, and special design valves with 75% less material than ordinary valves. There are but three parts in the small sizes—the housing, the plug and the retaining ring—and two in the larger sizes, no retaining ring being necessary. Plug, which is held in position by ribs cast integral with housing, is cup shaped with closed bottom and ribbed openings on sides. When valve is open the fluid flows through these openings. Quick, accurate and tight closing is secured, because seating edge of valve plug is rounded, while valve seat is a straight bevel.

Rotary Air Line Check Valve.

Constructed entirely of steam brass. Equipped with a spring for an air working pressure of 200 lbs.

PRICES, ROTARY AIR LINE CHECK VALVES

Standard Screwed Rotary Check Valve with Drip Cock.

CONSTRUCTION—Valve housing and valve plug made entirely of steam brass.

WORKING PRESSURES—Water, 150 lbs.; steam, 180 lbs.

PRICES, STANDARD SCREWED ROTARY CHECK VALVES WITH DRIP COCK

Size, in.....	3/8	1/2	3/4	1	1 1/4	1 1/2
Price.....	\$1.74	1.89	2.09	2.75	3.66	4.79

Standard Screwed Rotary Check Valve.

DESCRIPTION—This valve gives perfect service and has greater durability combined with simplicity. It has no screws, nuts, doors or hinges to work loose, nor a ball which would necessitate the removal of the valve to clean.

CONSTRUCTION—Constructed of three pieces: valve housing, valve plug and retaining ring. Valve housing is cast with solid seat and ribs on inside. Valve seat being a finished straight bevel, the ribs hold valve plug in position. Valve plug is made with ribbed openings on side through which fluid flows when valve is open. Seating edge of valve is rounded, fitting in straight bevel valve seat. Retaining ring is of brass, and keeps valve plug in housing.

OPERATION—See standard rotary flanged check valves.

WORKING PRESSURE—Guaranteed for steam, 150 lbs.; for water, 180 lbs.

CATALOGUE—Send for catalogue.

Standard Screwed Rotary Suction Valve.

DESCRIPTION—This is the only valve which does the work of two ordinary pump valves.

It is of the 3-way screw type. Made of bronze.

WORKING PRESSURES—Guaranteed for steam, 150 lbs.; for water, 180 lbs.

STANDARD SCREWED ROTARY SUCTION VALVE

Extra Heavy Rotary Flanged Check Valve.

DESCRIPTION—Designed for use on marine engines and all places where heavy pressure is required.

Its efficiency is not affected by the rolling of ship, because it works perfectly at any angle.

CONSTRUCTION—Attached by single bolts which pass entirely through the housing. The interior construction is the same as all Smolensky rotary check valves.

WORKING PRESSURE—Guaranteed for 500 lbs.

ROTARY FLANGED CHECK VALVE

Extra heavy, special design

Face to face, in.	1	1 1/8	1 3/4	2	2 1/4	2 1/2	2 3/4	3 3/4
Price.....	\$9.25	11.75	16.25	19.75	32.64	44.57	59.75	77.80

Standard Rotary Flanged Check Valve.

CONSTRUCTION—This valve is much shorter from face to face, requiring for construction 50% less material than an ordinary valve of corresponding size. The 6-in. valve is only 8 1/4 in. long in comparison with a usual length of 16 in.

There are but two parts to this valve—valve housing and valve plug. Valve housing, the interior of which has ribs cast integral to hold plug in position, is made of cast iron in cylindrical form, bulging in center. A separate renewable valve seat is also provided. Valve plug is of cast iron, made in skeleton form, with ribbed openings on sides. There is a renewable bronze ring on each end of plug fastened with screws.

OPERATION—Valve plug slides up and down, or back and forth, on the ribs in valve housing as fluid passes through. Valve operates at any angle and can be used for any fluid. It is self-cleaning and self-grinding.

SAVING—There are no doors, hinges, etc., to cause a leakage in this valve. Can be used with perfect satisfaction in vertical or horizontal positions or as foot valves.

WORKING PRESSURES—Guaranteed for steam, 150 lbs.; for water, 180 lbs.

CATALOGUE—Send for catalogue.

STANDARD ROTARY FLANGED CHECK VALVE

Noiseless Rotary Flanged Check Valve.

DESCRIPTION — Specially designed for locations where there must be no noise. A spiral spring is adjusted to valve plug in such manner that there is no unnecessary motion or vibration, thus doing away with “clattering” and “shivering” in pump.

CONSTRUCTION—In manufacturing this valve, 75% less material is used than in the constructing of former types of corresponding sizes. The 6-in. valve is only 4¾ in. from face to face, in comparison with customary length of 16 in.

Valve housing is made in cylindrical form and inner ribs hold valve plug in position. Valve plug is harder material than valve housing, and is made in cup form having ribbed openings on sides through which fluid flows. Retaining ring which holds spring in place is made of bronze.

NOISELESS ROTARY FLANGED CHECK VALVE, SPECIAL DESIGN

Steam bronze. All sizes furnished to order. Length face to face on 6-in. valve, 4¾ in. Other sizes in proportion

SELF-CLEANING—There are no recesses in any Smolensky rotary check valve housings.

Accumulations of lime or other matter can not form, consequently there is no necessity for removing valve frequently for cleaning.

SELF-GRINDING—Smolensky valves are automatically self-grinding, due to the rotary motion of the plug.

OPERATION—Valve plug slides up and down or back and forth on ribs of valve housing.

Made especially for use on centrifugal pumps and there is no clatter nor leak.

PRICES, NOISELESS ROTARY FLANGED CHECK VALVES

Pop Safety Valves.

DESCRIPTION—Only five parts and 40% less material. Can be used at any angle, set at any pressure, and used for any fluid.

CONSTRUCTION—Valve plug seat (4) and support (5) is cast of bronze in one piece, (5) acting as guide and axis for spring seat (6) when valve is closing, support entering countersunk recess in spring seat. Housing (1) is cast with inner ribs to hold valve seat (4) and spring seat (6) in position when valve is in operation.

Pressure nut (2) is cast with shoulder (8) to hold pressure spring. Pressure spring (3) fits into shoulder (8) at top and rests on spring seat disk (6) at bottom. Valve seat (4) and spring seat (6) are separate. Vulcabeston seat (9) is fitted securely to valve housing box after machining, producing a smooth tight connection.

WORKING PRESSURE—Guaranteed from 100 to 200 lbs.

PRICES, POP SAFETY VALVES

Price.....	\$1.82	1.95	2.70	3.56	4.32	6.10	9.47

POP SAFETY VALVE

Globe Valves and Angle Valves.

CONSTRUCTION—Made entirely of steam brass with cast iron hand wheel, screwed ends. Body and disk are made of “hard metal” having almost the hardness of steel. Gives maximum efficiency.

Valve plug (11) is connected to stem (4) by swinging support (9) and held by half split nut (10). Valve nut (2) is fastened to housing (1) by screw threads and stem (4) passes through valve nut, and turns in valve nut on square threads. Cap nut (3) is fastened to valve nut, thus holding packing (8) securely. Hand wheel (5) is held fast to stem by nut and washer (6-7). Seat (11) closes against one flat and one tapered surface, assuring accuracy and tightness. Note manner in which seat is hung by support (9) allowing it to swing as well as rotate, and causing it to gently and automatically find its own seat when closing.

WORKING PRESSURE—Guaranteed working pressure 125 lbs.

VALVES, including Low Pressure, Special, Standard, Medium, Heavy and Extra Heavy; Brass, Special Bronze, Iron Body and Cast Steel; Angle, Check, Swing Check, Cross, Blow-off, By-pass, Gate, Geared, Globe, Hose Gate, Hub End, Hydraulic, Jenkins Type Walworth, Lock Shield, Marine Type, Needle, Quick Opening, Reducing, Regrinding, Relief, Safety, Throttle and Vacuum.

Oldest continuous manufacturers in the United States (since 1842) of a complete line of Valves, Fittings and Tools for Steam, Water, Gas and Air.

Originators of the famous "Genuine Walworth Stillson" Wrench and the "Kewanee" Union.

For Power Piping and Wrenches, see page 425.

Quality of Walworth Valves.

Quality of material, thickness and distribution of metal and general design of Walworth valves, together

with the careful inspections and rigid tests to which they are subjected, insure the purchaser that they are suitable for the pressures specified herein.

They are the culmination of many years of successful valve manufacture and are being used extensively throughout the world.

GOLDEN-ANDERSON VALVE SPECIALTY CO.

Manufacturers of Automatic Valves, Especially Life and Property Insurance Valves

1213 Fulton Building
PITTSBURGH, PA.

Products.

LIFE and PROPERTY INSURANCE VALVES (patented).
AUTOMATIC CUSHIONED CONTROLLING ALTITUDE VALVES.

AUTOMATIC CUSHIONED STEAM PRESSURE REDUCING VALVES.

DOUBLE CUSHIONED QUICK CLOSING EMERGENCY TRIP VALVES.

What Every Boiler Steam Connection Should Have.

Every boiler steam connection should have a Golden-Anderson Life and Property Insurance Valve.

Even when provided with some safety device, the absolute safety of any plant is demonstrated only by a frequent testing of the device.

Golden-Anderson valves can be tested at any minute while in service. They are something to bank on—full confidence may be placed in them.

No Shut-down When a Tube Bursts.

No boiler tube rupture or steam main burst will result in a wrecked plant or total shut-down, if Golden-Anderson valves are used.

Golden-Anderson Life and Property Insurance Valves.

Golden-Anderson valves are the only valves which can be tested at any minute while in service.

They prevent flow of steam from other boilers to one in which a tube has ruptured.

They will cut off all boilers when steam main bursts.

Pressure is equalized between boilers automatically.

No live steam can enter cold boiler, thus protecting workman.

Fitted with double Corliss dashpot, preventing pounding, chattering and spinning. *Heaviest valves made.*

There are 1800 in use in the United States Steel Corporation plants.

LIFE AND PROPERTY INSURANCE VALVES
Angle, Globe or Elbow

Golden-Anderson Patent Automatic Cushioned Controlling Altitude Valves.

For automatically maintaining uniform stage of water in tank, reservoir or standpipes, doing away with the annoyances of freezing. No float fixtures inside or outside of tanks.

THREE WAYS OF CLOSING THESE VALVES—First, automatically by water.

Second, by electricity, if desired.

Third, by hand.

Golden-Anderson Patent Automatic Cushioned Controlling Float Valves.

They carry a constant water level in feed water heaters by perfectly controlling the flow of make-up water. Operated by protected enclosed copper float. Cushioned by both air and water. Operate without hammering, sticking or chattering. No metal-to-metal seats.

Made angle or straight-way.

PATENT AUTOMATIC CUSHIONED CONTROLLING FLOAT VALVES

PATENT AUTOMATIC CUSHIONED CONTROLLING ALTITUDE VALVE

Golden-Anderson Patent Double Cushioned, Quick Closing Emergency Trip Valves.

They can be tripped instantly from distant points by electricity on either open or closed circuits. The only valves that can be arranged to open and reset by electricity from distant points.

Fitted with Corliss dashpot that insures perfect cushioning. Operate without springs or tightfitting parts.

The H. C. Frick Co. have given 150 repeat orders.

DOUBLE CUSHIONED QUICK CLOSING EMERGENCY TRIP VALVE
Sizes to 20 in.

Manufacturers of WILLIAMS BRONZE REGRINDING VALVES; REGRINDING RADIATOR and BLOW-OFF VALVES; HYDRAULIC VALVES; NEEDLE VALVES; REGULATING CHECK, REGRINDING CHECK, REGRINDING SWING CHECK and BALL CHECK VALVES; STEAM STOP COCKS; DOUBLE DISC, WEDGE DISC and IRON BODY GATE VALVES; BRASS and IRON BODY STOP and CHECK VALVES; QUICK OPENING LEVER THROTTLE VALVES; COOKSON STEAM TRAPS.

Also, Angle, Globe, Cross, Air, Hose, Yoke, Heavy and Extra Heavy Valves; Gauge Cocks (Boiler, Steam); Water Gauges; Steam and Oil Separators; Steam Traps; Grease Cups; Oil Cups; Oil Pumps; Steam Engine and Gas Engine Lubricators; Brass Fittings; Iron and Brass Flanges; Expansion, Swing and Swivel Joints; Unions; etc.

Special Goods, of all varieties, made to order from sample, sketch or blue print.

Identification Marks.

The name "Williams" is cast in sunken or raised gothic letters on all valves, traps, separators, etc., while the complete firm name and address (and trade-name if any) are stamped on finished and polished articles in order to identify genuine Williams products from undesirable substitutes.

Facilities and Co-operation.

Modern equipment and long experience enable this company to manufacture practically any product made from brass, bronze, nickel, aluminum, iron or steel, either cast or stamped, including necessary machining operations, assembling, etc.; and the construction of standard goods can be modified to suit local requirements. The plant is operated on a highly economical basis and all quotations are based on an accurate cost system. Write for Catalogue No. 10 which shows complete line.

Advantages of Williams Regrinding Valves.

The use of these durable and efficient regrinding valves (Fig. 107-B) adds to economical operation of any power plant, due chiefly to following advantageous features: (1) Design, simplicity and liberal proportions of valve—smallest area in body is larger than nominal diameter of pipe, permitting no reduction in pressure of steam, water, oil, air or gas. (2) Valves made with screwed or flanged ends for these steam pressures: medium pattern, 200 lbs.; extra heavy, 350 lbs. (3) Made of best quality of metal. (4) Regrinding disc and seat eliminates *all leakage and incidental waste of fuel*. (5) Cheap light valves are always liable to leakage, frequent renewals and waste of fuel, time, labor and patience. (6) Stems made of special bronze composition as hard as steel; are durable, larger in diameter and heavier than other valve stems; will, therefore, not bend or break. When valve is closed and under greatest strain, every thread on stem is utilized, none being idle, thus preventing unequal wear and "stripping." (7) Valve has a steamtight joint at base of stem ("C" when

raised up) and seating against bottom of hub (B); and *when wide open valve can be repacked under full pressure with absolute safety*. (8) Stuffing box packed with special moulded ring packing, not requiring renewal for several years; has drive gland and heavy packing nut, and is readily accessible for repacking. (9) Discs and seats are of bronze, to stand high pressures and temperatures, year after year, without being affected. No extra discs or seats are necessary. In case seat or disc is marred by reason of gritty water or otherwise, regrinding seating surface within a few minutes *without expense or disconnecting pipes* is a simple operation. (10) Note union ring (L), making strong non-corroding connection between hub and body.

FIG. 107-B
INTERIOR VIEW OF
WILLIAMS REGRINDING
VALVE

A, thickness and curve of body. B, all threads utilized, when valve closed. C, when valve wide open (stem) seat forms a tight bearing on bottom of bonnet, preventing steam, etc., from blowing through, and enabling *repacking under pressure* with safety. D, heavy, durable, hexagon packing nut. E, threads on pipe end, conforming to U. S. Briggs standard. F, radial seat, can be reground any number of times. G, showing area of valve in excess of nominal diameter of pipe. H, disc, of hard bronze, can be reground any number of times, is renewable at nominal cost and stands highest temperatures and pressures. I, bronze hexagon lock nut, securing disc to stem. J, long stem, of tough bronze composition, large in diameter and very heavy. K, strong substantial hub—long, to properly support stem; bottom is machined to insure tight joint with seat C while repacking, when valve open wide. L, union ring, screwing over hub and neck of body (threads not exposed), makes steamtight joint. M, special, moulded, asbestos ring packing. N, packing gland follower (in all Williams valves above ½-in. size). O, japanned hand wheel with ball at end of each spoke. P, brass lock nut.

Different Types of Williams Valves.

In addition to the union bonnet ring construction and inside screw stem (Fig. 107) described above, the screwed yoke type (with outside screw stem) has been developed (Fig. 119), in the globe, angle and cross valves; designed for places where fluid may cause

FIG. 119. MEDIUM SCREWED YOKE TYPE			FIG. 397. MEDIUM FLANGED YOKE TYPE		
Screw- ed	Fig.	Flanged	Screw- ed	Fig.	Flanged
Fig. 119	Globe	409	Fig. 393	Globe	396

corrosion of threads on stem or where valve must be inserted in pipe with wheel handle *down*; also, the flanged yoke type (Fig. 397), differing only in manner of securing yoke to valve body, threads (accessible) never being in contact with steam. Both yoke types are built with screwed or flanged ends, in medium and extra heavy patterns.

Other styles of Williams valves are described and illustrated on this and succeeding page.

Williams Regrinding Radiator Valves.

Substantially made of best materials, with female and male and female ends. Illustration (Fig. 122) shows a male union on outlet end to facilitate connection to radiator. Discs and seats are of bronze, easily renewed when worn, by regrinding. Furnished with hardwood wheels or lock shields at same price, and can be repacked under pressure, either wide open or closed.

FIG. 122. ANGLE VALVE
With male union, Globe, Fig. 358; female ends—Angle, Fig. 120 and Globe, Fig. 335

Williams Regrinding Blow-off Valves.

Made of brass in medium and extra heavy pattern; screwed and flanged ends; union bonnet with inside screw stem; liberal areas for blowing off mud, grit and scale. Disc and seat can be reground. Steam working pressures guaranteed—medium, 200 lbs.; extra heavy, 350 lbs.

SCREWED END BLOW-OFF VALVE
Medium, Fig. 243, male and female
Medium, Fig. 272, female ends
Extra heavy, Fig. 621, male and female
Extra heavy, Fig. 289, female ends

Williams Hydraulic Valves.

Made of brass, with screwed ends; for steam working pressures up to 2,000 lbs. Used in rubber factories, cotton and linseed oil mills, on cotton and baling presses, etc. Heavily constructed for any high hydraulic pressures. Disc and stem are of one piece; disc and seat can be reground.

These valves are also furnished in check type.

FIG. 581. GLOBE HYDRAULIC VALVE
Angle, Fig. 592
Cross, Fig. 560

Williams Regulating Check Valves.

Made with screwed or flanged ends, in medium and extra heavy pattern, for working steam pressures of 200 and 350 lbs., respectively. Lift of disc controlled by a threaded stem, giving any degree of opening through valve. Valve quickly reground; union bonnet with inside screw stem. Also furnished in globe pattern, either screwed or flanged ends.

These valves are used on boiler feed lines.

ANGLE CHECK VALVE
Medium, Fig. 454
Extra heavy, Fig. 255

Williams Regrinding Check Valves.

Made with screwed and flanged ends, in medium and extra heavy pattern, for 200 and 350 lbs. working steam pressures, respectively. Small wings cast on bottom of disc insure correct alignment, perfect seating, and tight check. Top-heavy wing guides eliminated.

Recommended for use on boiler feed lines.

FIG. 114. SECTIONAL VIEW OF MEDIUM REGRINDING CHECK VALVE

Screwed Fig. 114
Flanged Fig. 283
Horz. Fig. 283
Angle Fig. 284
Vert. Fig. 285

Williams Regrinding Swing Check Valves.

Made with screwed and flanged ends, in medium and extra heavy pattern, for 200 and 350 lbs. pressure, respectively; designed for steam, water, oil or gas.

Recommended for use on boiler feed lines, steam trap installations, return systems, control of heavy liquids, etc. Can be installed in either horizontal or vertical position.

FIG. 254. SECTIONAL VIEW OF MEDIUM REGRINDING SWING CHECK VALVE

Screwed, Fig. 254
Flanged, Fig. 296

Williams Ball Check Valves.

Made with screwed ends, in medium pattern, for working pressures up to 200 lbs. Made of best steam bronze, and designed for steam and water service. Ball used is round and spherical as possible, is made of a hard, dense, bronze composition, and is guided in its action by cylindrical extensions on inside of cap.

MEDIUM BALL CHECK VALVE

Horz., Fig. 116
Angle, Fig. 439
Vert., Fig. 440

Williams Needle Valves.

Made of steam bronze; medium pattern, with female ends, for controlling gas, gasoline, oil, liquid, air, etc., where close regulation of volume through valve is required. Long, tapering needle point and seat opening, with fine pitch of threads on stem, permit close degree of opening. Steel stems and union ends furnished, when so ordered.

FIG. 606. GLOBE NEEDLE VALVE
Angle, Fig. 607
Cross, Fig. 608

Williams Steam Stop Cocks.

Made of best steam metal, with screwed and flanged ends, in medium pattern, for working pressures up to 200 lbs.

All parts are carefully machined, and keys are ground in by hand to a perfect bearing.

All Williams cocks are guaranteed steamtight.

Keys operate easily, will not stick, bind or leak.

Write for further particulars.

STEAM STOP COCK
Square head; screwed ends,
Medium, Fig. 154; flanged
ends, Medium, Fig. 155

Williams Double Disc Gate Valves.

Made of best bronze composition and heavily built

to stand any excessive strains. Manufactured in two patterns—medium and extra heavy, for 200 and 350 lbs. working pressure, respectively; with screwed and flanged ends.

The construction (shown in Fig. 127) of the double disc mechanism is simple, also flexible, by reason of ball and socket bearing between discs A and B. Discs (tapering) are suspended from stem F. Perfect alignment is secured by means of lugs on either side of disc which travel in a corresponding groove in center line of body; in closing valve, discs automatically drop into position and adjust themselves to same taper of seats. Ball and socket bearing of discs distributes a uniform wedging action to both, causing them to bear tightly to seats, insuring perfect contact at all points. These valves are also furnished with screwed yoke, similar to Fig. 119 shown on a preceding page.

Exterior—Fig. 127—Sectional
MEDIUM DOUBLE DISC GATE
VALVE
Fig. 127 screwed; Fig. 317 flanged

Williams Wedge Disc Gate Valves.

Made with screwed and flanged ends, in medium pattern, for working pressures up to 200 lbs. Stationary, non-rising stem. For steam, water, oil, air or gas.

Construction includes a single brass disc, with its seating surfaces machined and ground to a taper corresponding with angle of valve seats. Disc is held to stationary stem by means of Acme standard thread; is guided by means of lugs cast on either side, similar to double disc type of construction, perfect alignment being thus secured. Operation of valve is entirely frictionless.

MEDIUM WEDGE
DISC GATE VALVE
Hose pattern
Fig. 474 screwed
Fig. 475 flanged

Cino Iron Body Gate Valves.

Made with screwed and flanged ends. Used for steam, water, oil, air or gas.

Guaranteed for working steam pressures up to 100 lbs. Adapted for efficient service in mines, railroad tanks, refineries, paper mills, oil and gas wells, chemical factories, paint or soap factories, distilleries, breweries, water tanks, irrigation purposes, for handling cyanides, acids, etc.

Construction includes two bronze discs having a ball and socket at their center; discs suspended from and held in position by a malleable iron, wedge shaped holder. Wedging action of disc holder, and ball and socket bearing, insure necessary tightness of disc against their seats.

Williams Iron Body Stop and Check Valves.

STOP VALVES—Made of a hard, close grained cast iron having great tensile strength, with flanged yoke and outside bronze screwed stem; brass mounted; screwed and flanged ends. Built in medium pattern for 125 lbs. working steam pressure, also in heavy type for 175 lbs. Threads of stem never come in contact with steam or liquids passing through body. Valves can be repacked under pressure, when wide open; discs easily re-ground. Both patterns are fitted with renewable bronze seat rings.

Williams Cookson Steam Trap.

Increased leverage of valve mechanism makes possible a discharging capacity much larger than that of any other similar trap. Few working parts; no stuffing boxes. Body and cap are of cast iron; strainer and float of copper; disc "J" and seat "K" of monel metal; other parts, of best grade of bronze composition.

FIG. 500. COOKSON STEAM TRAP
For any pressure up to 200 lbs.

Products.

CHAPMAN SLUICE GATES, for hand, hydraulic, electric and pneumatic operation; SHEAR GATES, TIDE FLAP VALVES and MUD VALVES.

Butterfly Valves.

For Chapman Solid Wedge Gate Valves in bronze, semisteel and iron, in all sizes and for all pressures and purposes, and Floor Stands for valves and sluice gates, see pages 436-39.

Chapman Sluice Gates.

Chapman sluice gates are furnished for a variety of services, such as intake gates for penstocks, waste gates for dams, controlling gates for tunnels and canals, inlet and outlet gates for filter plants, sewage disposal plants and reservoirs; distributing gates for reclamation and irrigation projects, etc.

The gates are designed with either circular or rectangular openings. Size of gate denotes the size of clear waterway through the gate.

Gates may be furnished with a standard frame, flanged frame, bell frame or spigot frame. Standard frame type has a wall flange to bolt against the face of the wall, and in addition a short spigot extension around the waterway to be embedded into the concrete. When standard frame type is furnished with top hook wedges, slots must be provided in the wall to permit hook wedges to travel up and down. The short spigot stiffens the frame, assists in carrying the load, and provides a short lining for the waterway. The flanged frame type may be bolted to a flanged pipe or directly

against face of the concrete wall. The spigot frame type is of the same general construction as the standard frame type, but the spigot is much longer and hence provides a superior lining for the waterway.

In the construction of Chapman sluice gates nothing but the best materials are used—cast iron for the gate frame, plug and guides; bronze for the wedges, adjusting screws and lock nuts, also for the faces of the plug and seat. All inside screw gates of standard construction are furnished with a solid bronze spindle and a bronze stem nut. On all gates the plug and seat faces are made of bronze, finished in the most approved manner to form a watertight joint when the gate is closed.

Both outside screw or rising spindle gates and inside screw or non-rising spindle gates are manufactured. The use of the rising spindle type, operated by a floor stand, is recommended, as the rising spindle is a perfect indicator of the position of the plug or gate and the threaded portion can readily be kept clean and properly lubricated.

Sluice gates should be installed so that they will be subject to face pressure, that is, that the pressure will force the plug to its seat on the frame.

Ball bearings are furnished where required or when specified. They are made of the very best materials, the race plates and balls being of tool steel, hardened and ground.

Sluice gates may be operated by hand, hydraulically, electrically or pneumatically. Hand operation is usually employed through the medium of a floor stand; and for electric operation, the motor is usually attached to the floor stand. Hydraulic cylinders may be either attached to the gate frame or mounted on the top of the dam or floor of the gate chamber.

COFFIN VALVE COMPANY

GENERAL OFFICE AND WORKS

NEPONSET, SUBURB OF

BOSTON, MASS.

NEW YORK, N. Y., C. W. BERGEN, 95 Liberty Street

PHILADELPHIA, PA., DE HUFF & HOPKINS, Morris Building

Products.

SLUICE GATES, GATE VALVES, CHECK VALVES, FLAP VALVES, FOOT VALVES, SHEAR SEWER GATES, OPERATING STANDS.

Also, Butterfly Valves, Automatic Sewage Regulators, Fire Hydrants, etc.

Service.

This company furnishes designs and prices for all sizes and types of valves for use in connection with water power plants, water works, sewerage systems, irrigation projects, etc.

Coffin Sluice Gates.

Standard sluice gates are made of cast iron with bronze mountings, and are furnished in all regular sizes, either circular or rectangular. They have either spigot frames to embed in masonry or flange frames to bolt to masonry or to flanged pipe. All gates have bronze seat facings, dovetailed into the frames and disks and scraped to form a watertight joint.

There are two general types of sluice gates:

FIXED WEDGE TYPE—Fig. 81, for light face pressures. These gates have bronze faced fixed wedges at the sides and are furnished with rising or non-rising stem. The most common type of fixed wedge gate is the so-called self-contained gate (Fig. 81) having a non-rising bronze stem and bronze stem nut cast into the disk. Such gates can be supplied with extension stem having operating nut, hand wheel or gate stand at top for operation.

ADJUSTABLE WEDGE TYPE—Figs. 57 and 76, for all pressures. This gate is a more expensive type of gate than the fixed wedge type and has solid bronze adjustable wedges at the sides and backwater guides machined to take tongue of disk. Sluice gates should be installed so that the pressure tends to push the disk against its seat, but where it is impossible to install them in this manner they are supplied with adjustable top hooks and bottom wedges as shown in Fig. 57. Sluice gates should be used where possible with rising stem so that the screw section will be out of water and the stem forms an indicator. These gates can be supplied with a non-rising stem where

necessary, by bolting a solid bronze stem nut to the top of the disk, through which the stem threads.

STEM—Sluice gates are supplied with cold rolled steel or Tobin bronze stems or with a combination stem of steel coupled to a bronze screw section. Long stems are supplied with cast steel couplings, threaded and pinned to stem. Bronze

bushed adjustable stem guides are furnished for every 10 ft. of unsupported stem. Anchor bolts are furnished for gates, stands, stem guides, etc., but are not included in quotations unless desired.

OPERATION—Sluice gates may be operated by hand, by hydraulic cylinder or by electric motor driven stand. Large sluice gates should be operated hydraulically or electrically, as hand operation is very slow on account of the necessary reduction gearing.

ESTIMATES—When requesting quotations on sluice gates, the following data are essential for close and intelligent prices:

- (1) *Type of Gate*—Circular or rectangular, size of opening, rising or non-rising stem.
- (2) *Frame*—Flanged or spigot end.
- (3) *Pressure*—Maximum on center of gate, tending to force gate towards or away from seat.
- (4) *Stem*—Distance from center of gate to base of operating stand.
- (5) *Operation*—Electric, hydraulic or hand.

We include the necessary stems, stem guides, stem couplings, stop collars, etc., but do not include any anchor bolts, unless so requested.

Coffin Operating Stands.

For small sluice gates or gate valves under light loads, plain (without ball bearings) gate stands with or

FIG. 57. COFFIN RECTANGULAR SLUICE GATE
Rising stem; spigot end; adjustable wedges

FIG. 76. COFFIN CIRCULAR SLUICE GATE
Rising stem; adjustable wedges

FIG. 81. CIRCULAR SLUICE GATE
Self-contained type; flange frame

without gearing are furnished. For heavier loads, ball bearing stands are furnished having the necessary gear ratio so that one man can easily operate the gate under full head pressure. Where the load is sufficient, 2-speed stands are furnished to lessen the time of operation. Stands with enclosed gearing furnished where desired. Stands without gears are furnished with hand wheels, and stands with gears are furnished with removable crank handles.

Other Products.

Coffin gate valves furnished in all sizes for steam and water, and arranged for hand, hydraulic or electric operation.

Coffin foot valves furnished in all standard sizes with solid bronze flaps and bronze seats, with or without strainers.

Coffin flap valves, bronze mounted, spigot or flange end, single or double pivot.

Coffin check valves, bronze mounted, single or multiport, flange or hub end.

Coffin shear gates, bronze mounted, spigot or flange end, notched lifting handle with wall loop.

Some Recent Large Installations.

Norfolk Navy Yard Dry Dock—Five 8' x 8' and five 7' x 9' Sluice Gates, operated by oil cylinders.

Philadelphia Navy Yard Dry Dock—Six 8' x 8' Sluice Gates, operated by oil cylinders.

Boston Dry Dock—Six 6' x 8' Sluice Gates, operated by oil cylinders.

Oklahoma City Water Works—Four 9' x 14' electrically operated Sluice Gates.

Utica Gas & Electric Company—Three 66" hydraulically operated Gate Valves.

Connecticut Light & Power Company—Four 8' 6" x 15' 6" electrically operated Sluice Gates.

Southern Power Company—Thirteen electrically driven Hoists, for 18' x 22', 12' x 22' and 10' x 15' concrete head gates.

New Orleans Navigation Canal—Eight 6' x 10' hydraulically operated Sluice Gates, and eight 8' x 8' electrically operated Sluice Gates.

Catskill Aqueduct, N. Y.—30" and 48" Solid Bronze Gate Valves.

U. S. Shipping Board—Electrically operated Sluice Gates and Gate Valves, also Check and Flap Valves for floating dry docks.

COLDWELL-WILCOX COMPANY

Manufacturers of Sluice Gates and Other Water Works Appliances

NEWBURGH, N. Y.

Products.

SQUARE, RECTANGULAR and CIRCULAR SLUICE GATES for all conditions and heads; ROLLER BEARING PEDESTALS and HOISTING STANDARDS.

Also, Modern Sluice Gate Appliances, Electric Hoisting Standards (roller bearing), for either single gate hoists or series.

Plug Drain Valves; Shear and Flap Valves; Screens and Hoists; Flexible Joints.

Experience.

This company is among the oldest designers and manufacturers of sluice gates and water works appliances in America, and is a leader in quality, design and workmanship.

Sluice Gates.

FRAME—Gate frame is cast in one piece, channel shape, for flange connections; flange faces machined to true surface; back flange drilled to bolt direct to masonry, or to special casting or pipe built in the masonry; other flange, bronze mounted, acts as bearing surface of frame and is drilled for guides to be bolted thereto.

GUIDES—Strong, heavy castings, bolted to gate frame. Guides, fitted with stationary bronze wedges (conforming to gate wedges), extend above gate opening.

GATE—Heavy, well-ribbed casting, finished to receive bronze facing to match that on frame. Adjustable bronze wedges, to match those on guides, bring all bearing surfaces in contact at same time and force gate to its seat. When gate moves up, all wedges are immediately released. A hub to which the stem is keyed is on ribbed side of gate (upper part).

STEM—Stem, stationary or rising, is made of cold rolled steel, or bronze; if longer than 24 ft. is required, made in two or more pieces coupled together. Couplings are cross-keyed with taper keys, and keys are drilled at one end to receive cotter pin. Upper part of rising stem is threaded sufficient length to raise gate to full opening; and threaded part is fitted to bronze nut in hoisting standard. The lower part of stationary stem is always bronze and is threaded to engage the bronze nut in gate.

STEM GUIDE BRACKETS—Stems over 15 ft. long are provided with bronze lined adjustable guide brackets, to be set true in line with stem and anchored securely to masonry.

Operation.

Sluice gates are operated by means of roller bearing pedestals. Pedestals are (a) hand wheel, for light sluice gates; (b) geared, for heavy sluice gates, and (c) twin stem, for working two gates with same pedestal.

Compound geared pedestals have two speeds.

They insure (by clutch) either high speed and quick operation, or low speed and great power for starting. Roller bearings (inside pedestal body) reduce friction over 75%.

For further particulars, catalogues will be sent on application.

FLOWER VALVE MANUFACTURING CO.

Manufacturers of Sluice Gates, Valves and Hydrants

120 Parkinson Street
DETROIT, MICH.

Products.

SLUICE GATES, GATE VALVES, FIRE HYDRANTS, SLEEVES.

Indicator Posts, Valve Boxes, Check Valves, Foot Valves, Shear Valves, Drip Valves, Tide Valves.

Trade-names.

"Michigan" and "Flower."

Service.

This company, because of its unusual manufacturing facilities, is able to ship promptly all standard products, and to furnish with a minimum of delay special supplies designed to meet special conditions. Full data will be supplied on request.

Rectangular and Circular Sluice Gates.

RECTANGULAR—The standard rectangular sluice gates are made in a full range of sizes from 8 by 8 in. up to 120 by 120 in. All are fitted with adjustable bronze wedges.

DETAILS OF RECTANGULAR SLUICE GATE

CIRCULAR—Circular sluice gates are similar in construction to the rectangular, and have the same adjustable bronze wedges. They are built in all sizes, from 6 to 120 in.

DETAILS OF CIRCULAR SLUICE GATE

Gate Valves.

Gate valves of all sizes, from 4 in. up and of all types, high and low pressure, hand operated, geared, and electrically or hydraulically operated, are built by this company.

Special designs are furnished to meet any requirements of service.

All types of valves for hydraulic installations, such as check valves, vertical and horizontal, shear valves, and foot valves are also manufactured in all sizes.

GATE VALVE

Fire Hydrants.

"Michigan" hydrants have been standard in many of the large cities for nearly 70 years. They are built with or without frost cases, and in both compression and compound wedge types.

The Michigan compression hydrant with frost case is the most widely used type. Over a half century of use proves its excellence. It can be removed, for inspection and repair, without digging.

Improved Sleeve.

The lead is dovetailed into the sleeve and fitted to the contour of the pipe. No pouring of lead in the trench is necessary and little if any calking, allowing a dry trench, a shallower one, less labor, greater speed, and a considerable saving in lead.

Any standard tapping machine can be used.

IMPROVED SLEEVE

THE LUDLOW VALVE MANUFACTURING CO.

Manufacturers of Sluice Gates

TROY, N. Y.

For Branch Offices and Foreign Agencies, see page 464

Products.

SLUICE GATES, with Bronze Mountings, Rising and Non-rising Stem, for use in connection with FLOOR STANDS or other similar devices; SHEAR GATES; FLAP VALVES.

For Valves for steam, water, gas, oil, and Hydrants, see pages 464-69.

Scope of Use.

The Ludlow sluice gates are designed for use in filtration plants, reservoirs, dams, etc., or places where there is but light or medium pressure. Gates should be so placed that pressure comes on back of gate, forcing same to its seat.

Sluice Gates.

Substantially built and strong in every part, bronze mounted, with bronze gate and seat rings, and with bronze strips on both frame and guide bars. In the non-rising type, threaded stem and stem nut through which stem works are also of bronze.

Gates are constructed with circular, square or rectangular opening, as desired; with flat frame for bolting to wall; with flange neckpiece for bolting to pipe; with hub or spigot neckpiece for calking; or with wall pipe for building into masonry.

DEAN ELECTRIC VALVE CONTROL SYSTEM.

Also, Electric Control for Pumps, Compressors, Machine Tools, etc.

Description.

The Dean Control is a complete electrically operated unit for attaching to new and existing steam and water valves to accomplish closing and opening by power. The whole unit is self-contained and in one casing, consisting of a high torque totally enclosed electric motor, geared to combination worm and planetary reduction gearing together with electrical limit switch.

The whole unit is totally enclosed, steamproof and waterproof, to withstand varying weather conditions, and all electrical operating mechanisms are fully protected against moisture.

Four bolts or studs hold the unit onto the valve yoke. Four sizes of Dean Control units are manufactured capable of operating valves from 4 to 72 in. in diameter at low, standard and high pressures.

Operation.

The projecting slow speed shaft carries the gear which meshes into a similar gear attached to the valve stem and is arranged to run at a suitable slow speed to close the valves at the regular rate of 12-in. per minute.

The electrical limit mechanism may be set to stop the valve instantly when it is properly closed and opened and without jamming.

Lubrication is automatic, the gear casing being partly filled with oil, while the high speed motor and worm shafts are arranged with ball bearings.

DEAN VALVE CONTROL
INSTALLED ON 18-IN.
CAST STEEL VALVE

APPLICATION OF DEAN
CONTROL TO RISING
STEM WATER VALVE

Dean Valve Control Station.

Control is obtained by a small station which opens and closes the valves, and shows by "red" and "green" indicating bullseyes, the actual position of the gate at the two extreme points.

Distant control is obtained from any number of points.

STANDARD DEAN CONTROL
STATION

Used singly or with any number of like equipments for one or more points of control

Adaptability.

The Dean unit may be easily attached to existing valves without shutting down the line. Application to rising stem or outside screw and yoke type necessitates welding two brackets onto the valve yoke to carry the Dean unit or securing a new yoke with the brackets already cast on.

For inside screw or non-rising stem type of valve having gears, a new yoke only is necessary.

All valve manufacturers are prepared to supply complete new parts together with the Dean system necessary for the change over from hand to electrical operation.

Further Information.

For further information on the Dean system write to nearest district office.

Estimates on application.

METHOD OF MOUNTING DEAN ELECTRICAL VALVE CONTROL
ON INSIDE SCREW VALVE

JOHN W. BARTON CO.
Manufacturer of Automatic Steam Traps
Vestry Avenue
CLEVELAND, OHIO

Products.

BARTON EXPANSION AUTOMATIC STEAM TRAPS.

Construction and Operation.

Trap operation is effected by the differences in expansion or contraction between an inner (bronze expansion) sleeve and an outer (steel) casing, due to differences of temperature. The inlet end of the inner sleeve and the corresponding end of the outer casing are rigidly attached to a common fitting, which in turn is connected to the discharge from the system (see illustration). The discharge valve seat forms the free end of the inner sleeve; the floating valve disc and its casing are attached to the free end of the outer casing. As the casing and sleeve are firmly united at one end of the apparatus and are free at the other, movements caused by changes of temperature are entirely independent, one of the other, and will vary with the differences of expansion between them; therefore the seat and valve will approach or recede according to the relative changes in the lengths. Steam entering the inner sleeve causes it to expand and seat against the valve disc sealing the trap. When the steam condenses, the inner sleeve contracts, opens the valve and discharges the condensate. The action of the trap is absolutely positive and automatic. The trap is always water sealed when steam is on the system, and always open when not in use, preventing any accumulation of water. A universal trap for high or low pressure steam, vacuum or gravity systems.

Uses.

Especially adapted for agitators, cookers, dry kilns, dryers, greenhouses, heating systems, kitchen steam tables, laundry machinery, low pressure steam mains, steam hammers, sterilizers, submerged coils, underground tanks, vats, and wherever condensation has to be taken care of.

Advantages of the Barton Trap.

Its simplicity and metal construction throughout. The straight flow and right angle flush valve seat. No intermediate members of expansion such as carbons or liquids or mechanism such as diaphragm, bellow, float, lever, hinge, spring, etc.

Can not blow steam, become airbound, clog up or freeze. Gives continuous discharge of condensate.

AUTOMATIC—When used on a vacuum heating system a vacuum is in between the inner and outer tubes and subjects the outer tube to the temperature of the vacuum. For instance if a vacuum of 15 in. was maintained on the system, the temperature would be 176° Fahr. Should the vacuum become lost for any reason, the vapor discharge of the trap will enter between the two tubes and raise the temperature of the outer tube to 212° —a change of 34°—which causes the outer tube to expand and draw the disc off the

seat, thereby increasing the opening to allow for the loss of the vacuum.

Method of Installing.

Trap is placed in a horizontal position at the lower end of the coil so that the water will flow through the trap. Connect the end of the coil to the opening in the trap marked "inlet." The outlet, (the large opening) may be piped to feed tank, waste outlet, or to a vacuum pump.

Leave valve open and allow steam to blow through the coil pipe until thoroughly cleaned and the trap heated, then close the trap valve until there is no escape of steam. The trap is then set for operation and will require no further attention.

Guarantee.

Guaranteed against defects in workmanship and material during the life of the trap. All worn or defective parts will be replaced free of cost, within two years, upon their presentation.

Products.

"ATLAS" REDUCING VALVES; PUMP GOVERNORS, VACUUM and PRESSURE REGULATORS, BALANCED VALVES, FLOAT VALVES, SWING JOINT FITTINGS and UNIONS.

"VICTOR" HOT WATER REGULATORS and DAMPER REGULATORS.

"Atlas" Fan Engine Regulators; "Victor" Industrial Thermostats and Humidity Regulators.

"Atlas" Reducing Valve, Type A.

In this valve the auxiliary or pilot mechanism is located outside of the valve body, away from the intense heat and easily accessible for inspection, adjustment or replacement, without using any special wrenches or other tools.

For the most severe continuous or dead-end service—and this company does not hesitate to say that (notwithstanding there is also an "Atlas" valve of the

"internal auxiliary" type) the Type A valve is to be preferred wherever space permits its use.

Changes in initial pressure do not affect the reduced pressure; for the valve is seated by the initial pressure, and therefore the higher this pressure the more tightly is the valve seated.

The Type A valve with cast steel bodies and monel metal internal parts is recommended for superheated steam.

"Atlas" Reducing Valve, Type B.

The Type B valve is made from the same patterns as the Type A except that the auxiliary or pilot valve mechanism is contained within the valve.

It is intended for marine or other work where space is too limited for the Type A valve.

A cap that can be locked is provided, to prevent unauthorized changes in adjustment.

Valves for reduced pressures below 5 lbs. are equipped with large diaphragms. Bronze body valves flanged, are furnished at slightly higher list prices. Flanged body valves are faced and drilled extra heavy standard unless ordered otherwise.

“Atlas” Lever Operated Reducing Valve, Type C.

A reducing valve of the double seated, balanced valve type, recommended especially for use on low pressure heating systems, dry kilns, vats, cookers, etc., where from 1 to 15 lbs. reduced pressure is carried.

This valve is not recommended, however, for dead-end service, nor for the service where initial pressure is above 125 lbs. For dead-end service a lever operated valve similar to the illustration, but of the single seated type is recommended.

The body of the Type C lever operated reducing valve is of cast iron, with valve seat, spindle, and all wearing surfaces of Government bronze. Up to 2 in. the bodies have screwed ends; those above that size have flanged ends, drilled as ordered.

“Atlas” Bronze Unions.

Carefully made, each individually ground to make a perfectly tight joint. Can be connected and disconnected any number of times without destroying threads or spoiling joint.

UNION INTERIOR AND EXTERIOR

“Atlas” Pump Governor, Type A.

Aside from certain modifications, the Type A pump governor is constructed like all other “Atlas” Type A valves, and is of the auxiliary operated type, in which a secondary or pilot valve operates the main valve by means of a piston.

The modifications are found in the phosphor bronze diaphragm, to provide sensitive operation and at the same time preclude pump pulsation and waterhammer.

A distinctive feature of this type of “Atlas” pump governor is the limit screw, which can be adjusted to limit the speed of the pump and prevent racing.

Guaranteed for all classes of service because of its excellent record, covering many years, and recommended especially for high pressure discharges, elevator pumps, boiler feed pumps, house pumps, air compressors, ammonia and brine pumps, automatic sprinkler and refrigerating plants and any other service where dependability and long life are essential.

NOTE—Dimensions of Type A governor, over 2 in. in size with flange ends, same as dimensions of Type A reducing valve.

“Atlas” Vacuum Pump Governor, Type C.

The double seated, balanced valve in this governor is held open by the weighted lever, and is closed when the vacuum is great enough to lift the diaphragm attached to the top of the valve stem. Used for regulating pumps for vacuum heating systems and for any other service where it is necessary to maintain a uniform vacuum. Valve body is of cast iron, with valve seat and other wearing surfaces of Government bronze.

“Atlas” Balanced Valves, Type C.

This balanced valve is of the double seated type, with beveled discs, and is extensively used in connection with various automatic controlling devices. Its lever yoke can be swung to, and locked in any position, to facilitate operation by the controlling device.

The list prices given cover the standard pattern as illustrated, which has cast iron body with Government bronze trim, seats, and spindles.

Bronze body valves can be furnished, at special prices.

“Atlas” Float Valve, Auxiliary Operated.

The “Atlas” float valve can be installed on the end of the line directly over or into the tank, or installed in the supply line outside of the tank, and operated by a float in the tank. In either case, the operation of the valve is smooth and positive and guaranteed not to clatter or hammer, and that it will remain droptight under the most severe service.

“Victor” Hot Water Regulator.

Simple, indestructible all-metal construction; so sensitive that it operates the largest steam control valve, at any pressure, with 1° variation in temperature; easily adjusted to act at any temperature up to 400°. These are some of the things that make the Victor a most satisfactory device for regulating the temperature of hot water tanks, instantaneous and flash heaters, etc. It will

“VICTOR” HOT WATER REGULATOR FOR ALL PRESSURES

operate the control valve with either water or air pressure.

Tanks and heaters equipped with the “Victor” operate to full capacity because the control valve stays wide open until the desired temperature is reached.

When ordering, state size of steam supply, maximum steam pressure, and the minimum water or air pressure available for operating the control valve.

The control valve used in connection with regulator is single seated, and the upper end of its stem carries the “saucer” upon which the flexible diaphragm acts.

The diaphragm is made of the very best extra heavy heat resisting rubber, and the valve has a Jenkins composition or steam metal disc. In every feature this valve is extra strong, designed for severe service.

“VICTOR” DIAPHRAGM CONTROL VALVE

“Victor” Diaphragm Control Valve.

This valve is described above in conjunction with the “Victor” hot water regulator.

“Victor” Damper Regulator.

The “Victor” damper regulator is designed to regulate the pressure of steam boilers by automatically adjusting the drafts or damper in the smoke breeching.

It is operated by water pressure, acting upon either side of a double acting piston, which by chains is connected to the dampers or drafts.

The water supply to the regulator is controlled by a diaphragm with a weighted lever, which rises and lowers with variations in boiler pressure, thereby operating the pilot valve which applies the water pressure to either side of the piston.

In the high pressure regulator there is a compensating attachment which holds the damper in a balanced position and moves it as much as needed under ordinary variations in boiler pressure, but opens and closes the damper fully only under extreme variations. Regulators are of three classes: low pressure, for pressures up to 25 lbs.; high pressure, for pressures up to 100 lbs.; and extra high pressure, for pressures up to 200 lbs.

“VICTOR” DAMPER REGULATOR

“Atlas” Swing Joint Fittings.

For steam, water, air or gas up to 200 lbs. working pressure, they make connections that are free to turn or swivel through any part of a circle, and remain at the same time perfectly tight. Made in form of elbows, tees and universal fittings.

Products.

Manufacturers of ASHTON POP SAFETY and RELIEF VALVES; PRESSURE and VACUUM GAUGES; GAUGE TESTERS; ENGINE ROOM GAUGE FRAMES and TABLETS.

Ashton Pop Safety Valves.

The Ashton pop safety valves have been on the market for the past 46 years, and have an established reputation for quality, efficiency and durability. They are made for those who discriminate for dependable service in preference to low first cost. Their principal and special features in design are as follows:

ASHTON LOCKUP POP SAFETY VALVES—In Ashton valves the pop, or blow back, is controlled by a patented hollow screw plug, termed the pop regulator. This projects through the valve body and is located on the back side opposite the outlet, where it is readily accessible for adjustment by means of a wrench, all of which can be done while steam is on the boilers and without taking the valve apart. This obviates the necessity of internal screw rings, which easily clog up and are not handy to operate.

ASHTON KNIFE EDGE LIP WING VALVE—Ashton patented knife edge lip wing is an exclusive form of construction, which insures the most steady and invariable pop, or blow back. The knife edge lip does not extend beyond the seat bushing and thereby increases its lap as the seat wears, which creates a greater pop; but it is made to wear down proportionately to the valve seat, thus maintaining the same relation of inlet to outlet of pop chamber, and requiring the minimum amount of adjustment of the outside pop regulator.

BASE OUTLET CONSTRUCTION—The base outlet construction of Ashton valves makes it possible to take them apart for inspection, cleaning or regrinding without in any way disturbing the outlet pipe, thus saving much time and labor.

CONNECTIONS—Either flanged or screwed inlet and outlet connections may be furnished, and at the same price. No extra charge for special sizes.

SPRINGS—The springs in Ashton valves are of Jessop's best cast steel, and are carefully made by hand and tested in our own factory. When used at the pres-

ures for which they are designed, they will, under ordinary conditions, maintain their strength throughout the life of the valve.

COMPOUND TRIP LEVER—The compound trip lever makes it possible to lift the valve off its seat by hand at all times, being sufficiently powerful to accomplish this regardless of whether there may be pressure on the boiler or not. This lever may also be raised to a vertical position, and held there, as may be desired, to serve as a means for quickly blowing down the boiler pressure.

TESTING CLAMPS—Testing clamps are furnished without extra charge with all Ashton valves. By their use hydrostatic boiler tests can be conducted at any reasonable excess pressure without requiring any change of set pressure adjustment of the safety valve.

MATERIAL—Valve bodies, unless otherwise specified, are of best quality cast iron, levers of malleable iron, and interior working parts of high grade composition.

CAPACITY OF RELIEF—Ashton pop safety valves are regularly made with moderate lift of .10 in., which insures ease of operation, greatest durability and lowest cost of maintenance. They will be furnished, however, with any desired lift and capacity to suit special requirements.

When specified, they are made to conform to the requirements of the new Boiler Code of the American Society of Mechanical Engineers, as well as any state or local regulations.

Styles of Pop Safety Valves.

The No. 20 single and No. 20A duplex style valves are those most commonly used on stationary or marine boiler applications. The No. 17 is specially adapted for use on superheated steam. It has steel body, solid nickel seat, nickel wing valve, and outside spring. Any of these styles are made in sizes from 2 to 6 ins., inclusive, for pressures up to 300 lbs. maximum.

For smaller service requirements, other style valves are made with composition body and in sizes from $\frac{3}{4}$ to 3 ins., inclusive, as follows:

No. 6 style with top open discharge, without lever or lockup.

No. 8 style with top open discharge, with lever and lockup.

NO. 20 VALVE

NO. 20A DUPLEX VALVE

NO. 17 VALVE
For superheat

NO. 9 VALVE

No. 9 style with side pipe outlet, with lever and lockup.

No. 14 style with bottom open discharge, with lever and lockup.

These valves are equally adaptable for use on steam or air; and are for pressures up to 250 lbs., with the exception of the No. 14 style, which is for low pressure service not exceeding 15 lbs., being the style approved by the Massachusetts and Ohio State Board of Boiler Rules for use on boilers not operated by licensed engineers.

For water pressure service, the No. 24 style with composition body in sizes $\frac{3}{4}$ to 3 ins., and the No. 22 style with iron body and extra long spring in sizes 2 to 6 ins. are furnished. Both have top wheel adjustment, and are for pressures up to 300 lbs. For Underwriter service, No. 21 style is approved by the Associated Factory Mutual Insurance Companies for use on Underwriter fire pumps. For high pressure hydraulic service, the No. 25 style with composition body is furnished, or special designs with steel body for any desired size or pressure.

Other style valves are the No. 10 for engine cylinder relief, and the No. 23 for ammonia relief.

The No. 13 improved boiler blow-off valve is made with composition body and designed for long service and ease of operation. The illustration shows the plug cock in its closed position.

The valuable feature is the screw adjustment at bottom, whereby in opening the cock the plug is raised slightly from its seat, turning freely in the case; in closing, the plug is drawn down to its seat, avoiding friction and sticking.

NO. 21 UNDERWRITER RELIEF VALVE

NO. 13 BLOW-OFF VALVE

Ashton Pressure and Vacuum Gauges.

Ashton pressure and vacuum gauges are conscientiously made of the best material. Solid drawn seamless tubes are used. The movements are non-corrosive, having german silver pinions and arbors. Each dial is accurately and separately made to exactly correspond with the spring and movement of the gauge to which it is fitted. The graduations and figures are indented, so that they can be easily read, and will not wear off. The springs are well seasoned to prevent setting.

The No. 51 style pressure gauge is commonly used on stationary boilers; is made in all sizes up to 24-in. diameter dial, and with either iron, brass or nickel-plated case. The No. 52 style, with double spring, is similarly made; but more adapted for locomotive,

marine or water pumping service where there is considerable vibration, or rapid fluctuation in pressure.

Recording pressure gauges with 24-hour charts and graduated for any desired pressure are made in two styles, Nos. 73 and 74, and with brass or nickel-plated

NO. 51 PRESSURE GAUGE

NO. 74 INDICATING AND RECORDING GAUGE

cases. The latter is both registering and recording.

No. 69 is so constructed that an incandescent electric light may be placed behind it, and by means of a glass back the light is directed on to the ground glass dial. This is especially valuable in poorly lighted boiler rooms, or for night operation.

NO. 69 ILLUMINATED DIAL GAUGE

No. 78 is a new design alarm gauge combined with an automatic electric circuit closing attachment, which can be operated to give an electric bell alarm at any desired pressure and at any distance away from the gauge.

NO. 78 IDEAL ALARM GAUGE

Ashton Dead-Weight Gauge Testers.

The Ashton dead-weight gauge testers are made in several styles and capacities up to 1,000 lbs. These furnish the most accurate and reliable method of testing pressure gauges.

Engine Room Gauge Frames and Tablets.

Furnished in slate, marble or wood, and in special designs of various dimensions to suit any required installation.

NO. 79 DEAD-WEIGHT GAUGE TESTER

BOYLSTON STEAM SPECIALTY CO.

CHICAGO, ILL.

Products.

BOYLSTON PRESSURE REGULATING VALVES; BACK PRESSURE, RELIEF, and TANK VALVES; BOYLSTON STEAM TRAPS; BOYLSTON CONDENSATION, PUMP and VACUUM GOVERNORS; AUTOMATIC WATER SPRAYS.
Automatic and Cut-off Valves; Grease and Oil Extractors, Governors and Traps; Water Feeders, Suction Strainers and Strainer Connections.

Boylston High Pressure Pilot Reducing Valve.

The extreme sensitiveness, simplicity of design and great reliability of this valve have won a reputation for it of highest quality. It can be adjusted from as low as 5 lbs. to within nearly the original pressure, and when the adjustment is made the delivery pressure will remain constant irrespective of variations in initial pressure or volume of discharge.

Pressure is regulated by a single diaphragm provided with a direct regulating spring adjustment. The slightest change of reduced pressure on the diaphragm causes it to open or close a small auxiliary valve acting on a piston which engages the main valve. The area of the piston is double that of the main valve, which causes it to respond instantly to slightest variation in pressure.

Notwithstanding this valve has a very wide range of operation, no part is of delicate construction or can be readily displaced. It occupies no more space than a globe valve and can be made, at additional cost, of steel and nickel suitable for superheat steam.

When ordering give pressure desired to reduce from and pressure to reduce to; also service the valve is to perform.

Boylston Improved Pattern Fig. No. 98 Pressure Regulating Valve.

The latest development of the Boylston Fig. 98 pressure regulating valve is shown in sectional view in the accompanying illustration. This valve can be relied upon to meet the conditions of any vacuum, atmospheric or low pressure system of steam heating. It has gone

through nearly 10 years of the century's evolution and its extensive specification by heating engineers at the present time is the best possible evidence of its recognized superior merit.

This valve is suitable for reducing from 125 lbs. boiler pressure on the high side to from 0 to 10 lbs. on the low pressure side, and can be absolutely relied upon to constantly maintain the fixed reduced pressure at which the valve is set on the heating mains. The large diaphragm insures unusual sensitiveness. Long life is secured by the heavy type of construction. The adjustable stop is an exclusive feature and effectually prevents the valve from jumping or pounding.

A characteristic of this valve is that pressure on the heating mains can be regulated or controlled by it at a considerable distance from its location. This is accomplished by running the small ½-in. pipe from the diaphragm chamber to the desired point of operation, which may be as great a distance as 50 ft.

The pressure regulating valve is made in two styles: with increased size outlet and with inlet and outlet of the same size. All castings and parts of these valves are machined by special tools and are interchangeable.

Sizes 1x2 in. made with screwed ends only. Sizes 1½x2½ in. to 2x4 in. made with inlet end screwed, and outlet end flanged. All larger sizes have both ends flanged.

Sizes 1, 1¼, 1½ and 2 in. made only with screwed ends. Size 2½ in. and larger made with flanged ends.

The Boylston Steam Trap.

The present Boylston steam trap is the result of over 30 years' experience in the steam trap business. It combines capacity, durability and positiveness of operation with a design affording easy accessibility to all wearing parts. It is "get-at-able" and quick repairable.

Other features of its construction are the longevity of the seat and disk combined with the ease and cheapness of renewals, which are accomplished by taking the nuts off of two bolts and removing the cap.

As shown in the accompanying phantom view, the Boylston trap employs the open bucket non-collapsible float, dispensing with complicated mechanism such as collapsible floats, counterbalancing weights and multiple levers, simplifying the design and affording a trap of greater capacity.

All castings and parts of Boylston steam traps are accurately machined to templets and are interchangeable. Material used in seat and valve disk, the only wearing parts, is Boylaney metal, the hardest known non-corrosive metal. All other castings are charcoal gun iron.

Boylston steam traps are made in four classes:
Style A, Fig. 214, for pressures ranging from 1 lb. to 30 lbs.
Style AA, Fig. 213 1/2, for pressures ranging from 30 lbs. up to 75 lbs.
Style B, Fig. 213, for pressures ranging from 75 lbs. to 150 lbs.
Style C, Fig. 215, extra heavy pattern for pressures ranging from 150 lbs. to 250 lbs. per sq. in.

Boylston Patent Vacuum Pump Governor.

For regulating the speed of vacuum pumps and controlling the amount of vacuum carried in the heating system. The simplest vacuum pump regulator ever designed, extremely sensitive and positive and reliable in action. This vacuum governor is guaranteed to regulate to within a fraction of an inch of vacuum. Diaphragm mechanism can be turned to any one-quarter of a circle on the valve body bonnet.

FIG. No. 238
BOYLSTON PATENT
VACUUM PUMP
GOVERNOR

Richter Automatic Water Spray.

This water spray is designed for use in the suction pipe of the vacuum pump of a vacuum heating system for condensing the steam so that the required vacuum may be maintained. It is extremely compact and is a cheap and reliable automatic means of doing this work. The nozzle is equally efficient on a small or large volume, and with a constant change of volume the spray adjusts itself automatically to meet the varying requirements. It automatically adjusts itself to any pressure or volume and is positively self-cleaning.

Boylston Junior Regulating Valve.

One of the most compact, sensitive and durable pressure regulating valves on the market. Suitable for reducing pressure of steam, air, gas or water. Renewable and readily replaced. Will work upside down or can be placed in a vertical pipe if necessary. Made in either straight or angle pattern. When ordering, mention whether for steam, air, gas, hot or cold water, also give initial pressure and about pressure desired on outlet or reduced side. Made in two styles: No. 88, single seat, and No. 89, double seat. No. 89 is for steam pressure only and has balanced double seated valve.

Universal Pattern Noiseless Back Pressure Valve.

Boylston universal back pressure valves are noiseless in operation, perfectly tight when closed and have the full area opening of the pipe to which they are connected. A feature is the spring loading mechanism connected with the outside oil dashpot, which insures the valve working perfectly noiseless both in opening and closing. It dispenses with the inside dashpot, which frequently sticks and permits pressure to increase to a dangerous point. Sizes 8 in. and larger are made with double seats, or semibalanced, thus dispensing with the heavy weights required to load a large single seated valve for high back pressures.

Back Pressure Valve.

The original noiseless back pressure valve. Has piston type inner valve which is semibalanced. Operates without injury to seats. Only comparatively small counterweight required to maintain any reasonable back pressure. Valve may be used horizontally or vertically. Has full pipe area through seats, and may be held open permanently.

Combination Back Pressure and Relief Valve.

For use with engine or turbine that is run both condensing and non-condensing. Will hold tight under high vacuum, and may be set to maintain a back pressure. May be used in either horizontal or vertical position, preferably in horizontal. Sizes from 6 to 36 ins.

FIG. 227
COMBINATION BACK PRESSURE AND RELIEF VALVE

Balanced Valve.

Has balanced piston disc, and should be operated by some force applied to lever. Used largely as water inlet valve on feed water heaters. Will handle steam, air, gas, water and other fluids. Sizes up to 1½ ins. have swivel head so that lever may be shifted in any direction. Larger sizes may be so equipped when necessary.

FIG. 212
BALANCED VALVE

Float Valve.

Automatically maintains constant water level in a tank. Has single seated inner valve, and is tight when closed. Disc and seat are renewable. Valve will not stick. No leather cup packing used. No leakage from top of valve to run down over body. Inner valve and cylinder of iron body valves are sherardized and will not rust.

FIG. 214
FLOAT VALVE

Reducing Valves.

Made in two general types—piston and diaphragm. Both may be had in globe and expanded outlet patterns, having screwed ends from ½ to 6 ins., and flanged ends from 2 to 14 ins. Valves Nos. 1, 2 and 3, standard piston type, are constructed for reduction of any initial pressure up to 200 lbs. down to any delivery pressure between 40 lbs. and 1 lb. Valves for air or water and those for greater delivery pressure than 40 lbs. constructed especially for the service.

P & W diaphragm type designed for reduced pressures of 5 lbs. or less. Having rubber diaphragm of large area it is very sensitive, and is used largely on vacuum and low pressure heating systems.

Condensation Receiver and Pump Governor.

Intended to receive the returns from a heating system and serve as automatic governor to a pump returning condensation to boiler. May also be used to maintain constant water level in a tank. Has open cast iron float, and is made in five sizes having capacities to handle from 5,000 to 40,000 sq. ft. of radiation.

FIG. 242
CONDENSATION RECEIVER AND PUMP GOVERNOR

Improved Water Control Valve.

Globe and angle patterns—screwed and flanged ends. For any working pressure up to 200 lbs. Constructed same as float valve, but equipped with straight lever and counterweight. Acts exactly the same as a balanced valve. Having single seat, it is tight when closed. Has renewable composition disc. Inner valve operated entirely by inlet pressure. Adapted for use as float operated water inlet valve on feed water heaters.

FIG. 216
WATER CONTROL VALVE

Steam Trap.

A general service trap. Has double cone shaped balanced valves, operated by high pressure seamless copper float. Will work on any pressure between 0 and 200 lbs. Valves and seats are renewable, and are made of Tobin bronze. Equipment includes self-contained by-pass valve and an air cock. It is tapped so that a gage glass may be attached if wanted.

FIG. 240. STEAM TRAP

Exhaust Relief Valves.

For use on exhaust line of condensing engine. While vacuum is maintained they are closed and are airtight. If for any reason vacuum is lost, they open immediately and allow engine to exhaust into atmosphere. Made in horizontal, vertical and angle patterns, and in sizes from 6 to 48 ins., with standard flanged ends.

Special Valves.

This company has facilities for making special valves for any service and in all sizes, and invites inquiries. Complete line of standard specialties is shown in catalogue No. 9, which will be gladly sent on request.

JULIAN D'ESTE COMPANY

Manufacturer of Engineering Specialties

26 Canal Street
BOSTON, MASS.

NEW YORK, N. Y., 83 Barclay Street

CHICAGO, ILL., 174 North Market Street

Products.

CURTIS ENGINEERING SPECIALTIES, which include:
REGULATORS: Damper, Temperature, Water, Air, Steam and Pump Pressures, Balanced Valve, Steering Engine.

EXPANSION TRAPS; RETURN STEAM TRAPS; BALANCED STEAM TRAPS; BALL COCKS.

Curtis Damper Regulator.

The regulator consists of a gunmetal cylinder, within which is a piston fitted with water packing. The piston rod is connected by a chain to the lever of the damper, on which hangs a weight sufficient to over-haul the piston and open the damper, regardless of any ordinary friction.

When the rising pressure reaches the point of lifting the given load, it permits steam to enter the space over the piston, which slowly pushes it down and closes the damper. Falling pressure at length closes the valve, pressure then passing from top to bottom of the piston, which allows the weight to settle and open the damper.

This regulator is guaranteed to change the damper in either direction on a minimum variation of pressure. It is also a guaranteed fuel saver over the best hand regulation.

Apparatus includes Regulator, Pulleys, Chain, Weights, and Screws.
No. 1 up to 40-in. diameter damper.
No. 2 up to 60-in. diameter damper.
No. 3 up to 72-in. diameter damper.

CURTIS IMPROVED DAMPER REGULATOR

Curtis Temperature Regulator.

Will control any temperature from 0° to 300°. Easily adapted to steam or hot water boilers, or to tanks for heating water for hotels, baths, or restaurants. One degree change of temperature produces sufficient movement to do the work. Power is unlimited.

CURTIS TEMPERATURE REGULATOR

Sizes from 1 to 8 in.

Curtis Water Pressure Regulator.

For pulp and paper mills, hotels, public buildings, and residences.

Warranted to maintain the pressure desired, with perfect uniformity, in spite of any and all fluctuations in the outside pressure.

This regulator obviates the wear and tear caused by water-hammer and high pressure on all plumbing fixtures and fittings.

Steering Engine Regulator for Marine Service.

This regulator prevents racing of the engine, and gives regularly and more quickly the desired speed of change in the rudder from amidships to either extreme port or starboard position. It is also a material aid to the pilot in controlling the ship.

All-bronze; screwed ends.

Sizes, 1/2, 3/4, 1, 1 1/4, 1 1/2 and 2 in.

STEERING ENGINE REGULATOR

Improved Steam Pressure Regulator.

Made entirely of metal; a lock valve and very sensitive. It has no levers, weights, projections, glands or packing. There is no drip or leak of steam or water, and all that passes into it passes through it. Suitable for boiler pressures up to 200 lbs.

IMPROVED STEAM PRESSURE REGULATOR
For sizes, etc., see table below

Improved Pump Pressure Regulator.

For hydraulic and air pressure, an adaptation of the pressure regulator to the peculiar requirements of a pump pressure regulator. Accomplished by connecting the chamber under the diaphragm to the pipe or tank in which the water pressure is to be controlled, so that any change of pressure in the pipe or tank operates on the diaphragm and closes, or opens, the valve placed in the steam pipe of the pump.

IMPROVED PUMP PRESSURE REGULATOR
For sizes, etc., see table below

Curtis Balanced Steam Trap.

For all manufacturers having vacuum pans in use, for those having a large amount of steam and heavy condensation to contend with, this trap is a valuable aid, working, as it does, without starts or stops which occasion jarring and straining. It is made of close grained cast iron, and is amply strong to withstand 200 lbs. pressure. It allows for the removal of both valve and float by taking off cover plate at the side. The trap is fitted for a glass water gage that does away with guess work in maintaining a water seal for the float.

Curtis Return Steam Trap.

Takes the water from the condensing surface, whether the returns are above or below the water level, and returns pure distilled water into the boiler at a temperature always above 212°, and often as high as 275°. It will effect a saving in fuel over any steam pump performing the same service.

RETURN STEAM TRAP

DATA, CURTIS RETURN STEAM TRAP

Trap No.	1	2	3
Ft. of 1-in. pipe trap will drain	4,000 to 5,000	8,000 to 10,000	15,000 to 20,000
Steam pipe, in. . . .	1	1	1½
Inlet pipe, in.	1	1¼	1½
*Outlet pipe, in. . . .	1¼	1½	2

*In all cases, middle pipe is the outlet.

Curtis Expansion Trap.

A practical adaptation of old principles, by means of which the slight difference of temperature between steam and water condensed from it completely controls the valve. When the expansion vessel is in contact with steam it instantly closes the valve, and when water covers it the valve immediately opens and the water discharges, whether at a low or a high pressure of steam.

They are set to deliver at 212°, but can be adjusted to lower or higher temperatures.

U. S. Ball Cock.

Full sized area; valve is balanced; will not hammer even under pulsation of a pump; perfectly noiseless. Renewable seat of bronze metal. Good in any place for high or low pressure.

U. S. BALL COCK, 4-INCH
Sizes ½ to 4 in.

Products.

Specialties for use in connection with the DUNHAM SYSTEM of HEATING, known according to its several adaptable forms as the DUNHAM VACUUM SYSTEM and the DUNHAM RETURN SYSTEM. Both two-pipe systems; and the DUNHAM AIR LINE SYSTEM.

These Specialties are: The Dunham Radiator Trap; Dunham Packless Radiator Valve; Dunham Blast Trap; Dunham Medium Pressure Trap; Dunham Return Trap; Dunham Reducing Pressure Valve; Dunham Oil Separator; Dunham Strainer; Dunham Air Vent; Dunham Vacuum Pump Governor; Dunham Air Line Valve; Thompson Air Line Vacuum Pump.

Dunham Heating Service.

It is three-fold:

Organization;
Service;
Product.

The DUNHAM
HEATING SERVICE

THE COMPANY—The Company, and the organization within it, is strong, the largest engaged exclusively in the manufacture of heating specialties and systems.

SERVICE—This is the Company's strong point. With 35 Branch and Division Offices throughout the United States and Canada, and two complete factories, efficiency service can be rendered. Our Service Departments, with their trained engineers, are at all times ready to co-operate with consulting engineers, architects, and contractors, to furnish special details and information instructive as to the best way of installing and using the Dunham products.

THE DUNHAM PRODUCTS—They are the leaders of their kind, made of the highest grades of suitable materials, by especially trained workmen, in clean, sanitary, well ventilated buildings. They are sold through

the responsible heating trade. Each article will be briefly described.

Dunham Radiator Trap.

The simplicity of the Dunham Radiator Trap is very apparent. It comprises a body, a cover, and thermostatic disc which is secured in the cover. There are no loose parts, no sliding contacts, nothing to gum up, and no guide or pin to obstruct the valve opening. There is a flat valve and seat with liberal valve opening. The position and design of the valve is such that it is self-cleaning. The action of the disc is positive, and the valve seats squarely, like a globe valve, the tightest of all types of valves, and one presenting little opportunity for uneven wear. The body is standardized, also the cover and disc, thus giving the further advantages of interchangeable parts.

The function of the Dunham Radiator Trap is to conserve heat, and thus fuel, by keeping radiation and

FIG. 1. DUNHAM RADIATOR TRAP

pipng at the point of maximum efficiency. To do this the working part of the trap, the Dunham Thermostatic Disc, must be and always is fully exposed to the actual

Continued on next page

conditions within the radiator, and it therefore responds instantly to any change taking place therein, automatically releasing air and water of condensation and closing to prevent waste of unused steam. It not only saves steam but clears the space which should be occupied by steam from air and water—enemies of high efficiency.

This trap was the first of its kind to be a commercial success, and it has maintained its leadership since 1903. It has therefore stood the test of time.

It is made in 5 sizes, and for steam pressures not to exceed 10 lbs. gage.

The No. 1 and No. 2 traps are for use principally on radiators; No. 3 for large radiators, for pipe coils, and dripping piping; No. 4 and No. 5 for large pipe coils, and dripping steam mains. To determine trap capacity for pipe coils reduce actual surface of coil to equivalent square feet of direct cast iron radiation, the unit in which all traps are rated, by multiplying by 1¼.

FIG. 2. DUNHAM NO. 4 AND NO. 5 TRAP

FIG. 3. METHOD OF DRAINING END OF STEAM MAIN IN DUNHAM VACUUM SYSTEM

TABLE A—DUNHAM RADIATOR TRAPS

Size	Pipe connection	Capacity, direct radiation
No. 1	½ in.	100 sq. ft.
No. 2	¾ in.	350 sq. ft.
No. 3	1 in.	450 sq. ft.
No. 4	1 ¼ in.	1500 sq. ft.
No. 5	2 in.	3000 sq. ft.

Nos. 1, 2, and 3 traps made in angle, straightway, right-hand, and left-hand pattern—all made in brass and bronze; Nos. 4 and 5 in angle and straightway pattern only and made of iron.

Dunham Blast Trap.

In design and appearance the No. 6 and No. 7 Dunham Blast Traps are essentially the same as the No. 4 and No. 5 radiator traps, illustrated above. They are designed only for draining blast heating coils. In selecting

capacities be sure and reduce blast coil radiation to equivalent direct radiation by multiplying the actual surface of coil by a factor ranging from 6 to 10, depending upon temperature, velocity and volume of air blown over coils.

FIG. 4. METHOD OF APPLYING DUNHAM BLAST TRAPS

The No. 8 Dunham Blast Trap is intended for handling large quantities of condensation, and is especially adapted for blast coil work. It combines the Dunham

FIG. 5. DUNHAM BLAST TRAP NO. 8

FIG. 6. METHOD OF APPLYING DUNHAM BLAST TRAP NO. 8

TABLE B—DUNHAM BLAST TRAPS

Size	Pipe connection	Capacity, direct radiation	Weight
*No. 6	¾ in.	1500 sq. ft.	12½ lbs.
*No. 7	1 in.	3000 sq. ft.	21 lbs.
No. 8	2 in.	12000 sq. ft.	75 lbs.

*Made in angle and straightway patterns. Made only for pressures up to 10 lbs.

thermostatic principle with the float; it has a double valve and large connections.

Dunham Air Line Valve.

The principle of operation is identical, and design similar, to the Dunham Radiator Trap. Its efficiency is high, and service in connection with air line systems invaluable. Can be furnished with either ⅛-in. or ¼-in. radiator connection. Air piping is required in connection with its use.

FIG. 7. DUNHAM AIR LINE VALVE

Dunham Return Trap.

The Dunham Return Trap is used to separate the air and water discharged into the dry return piping by the Dunham Radiator Traps, to release the air, and to automatically return the water to the boiler without regard to the pressure carried in boiler or system.

It is a simple, positive acting device, with large valve areas, designed especially for high efficiencies at low heating pressures. Its working parts are protected from dust and dirt, and yet are easily accessible without removing any piping connections.

Dunham Packless Radiator Valve.

This is a bona-fide packless radiator valve and not dependent upon springs and packing rings. The Dunham disc

FIG. 8. DUNHAM PACKLESS RADIATOR VALVE

makes this possible. It has a low bonnet and stem and unusual lines, making it attractive in appearance. The valve can be opened or closed in seven-eighths of a turn. It is made only in the angle pattern for use in a top radiator connection. Sizes $\frac{1}{2}$, $\frac{3}{4}$, 1 and $1\frac{1}{4}$ in.

Packless radiator valves are required in all vacuum heating work.

Dunham Reducing Pressure Valve.

This product is so well known and universally accepted that no comment is needed. This valve is made only in standard weight for a pressure range of 125 lbs. down on high side, to 10 lbs. and atmosphere on low side, in straight and expanded outlet patterns.

Dunham Vacuum Pump Governor.

The function of this governor is to control the steam to a steam driven vacuum pump to operate same so as to maintain a certain vacuum in the suction piping. It is used in maintaining a predetermined amount of vacuum in the return piping of a vacuum heating system. Made in all pipe sizes from $\frac{1}{2}$ in. to 2 in., inclusive.

Dunham Medium Pressure Trap, "D" Style.

This embodies the principle so successfully used in the Dunham Radiator Trap, and is just as simple and satisfactory. It is used almost exclusively in hospitals and kitchens for dripping sterilizers and steam cooking apparatus, where steam is used at a pressure not less than 10 lbs. or more than 50 lbs. gage.

Install at least 4 ft. of connecting piping between the point to be dripped and the trap.

TABLE C—DUNHAM MEDIUM PRESSURE TRAPS, "D" STYLE

Size	Pipe connection	Capacity, water per hour	Weight
No. 13	$\frac{1}{2}$ in.	100 lbs.	4 lbs.
No. 14	$\frac{3}{4}$ in.	200 lbs.	15 lbs.
No. 15	1 in.	400 lbs.	25 lbs.

Always state operating pressure when ordering.

Dunham Air Vent.

This device is for the purpose of venting air from water that is under pressure.

It is particularly adapted to heating work where the vacuum pump is discharging water of condensation directly back to the boiler.

Capacity for 5000 sq. ft. of radiation.

FIG. 9. DUNHAM REDUCING PRESSURE VALVE, STRAIGHT PATTERN

FIG. 10. DUNHAM VACUUM PUMP GOVERNOR

FIG. 11. DUNHAM "D" STYLE MEDIUM PRESSURE TRAP

FIG. 12. DUNHAM AIR VENT

Dunham Oil Separator.

The Dunham Separator made for oil separator service is very efficient.

Where exhaust steam is used for heating purposes the heating efficiency of the steam is materially increased by the use of a good oil separator. In fact, with exhaust steam, the use of an oil separator is imperative in best practice.

The Dunham Separator is made in all sizes from $1\frac{1}{2}$ to 10 in., in horizontal pattern only, with flanged ends.

Dunham Strainer.

A strainer is a necessity in protecting the vacuum pump from dirt and scale which otherwise might get into it and cause considerable damage. The Dunham Strainer with its large brass screen basket for catching and holding the dirt, and easily accessible for cleaning, at once commends itself for this purpose. It is made in all sizes from 2 to 6 in.; the 2-, $2\frac{1}{2}$ - and 3-in. sizes, with either screw or flanged ends; larger sizes flanged ends only.

The Dunham Vacuum System.

Since 1903 the Dunham Vacuum System has been a leader and it still stands at the front, easily maintaining its position because of the remarkable success as well as the high efficiency of the Dunham Radiator Trap and allied Dunham specialties.

Simplicity is the leading note of Dunham design. There is the system of steam mains and piping to supply all radiation, and the return piping to carry away the air and water of condensation. Steam may be supplied direct from boiler plant, or through reducing valve where boiler pressure is too high (over 10 lbs. gage) for direct service, or exhaust steam may be used supplemented by live steam through a reducing valve.

The returns all converge and grade to the suction inlet of a vacuum pump, which may be either steam or motor driven, automatically controlled, and which may also act as a boiler feed pump. Where exhaust steam is used or where boiler pressure exceeds 20 lbs., the discharge from the vacuum pump should go to a freely vented automatic receiver of a boiler feed pump, the vacuum pump not being used directly to feed the boiler.

How to SPECIFY—Specify the Dunham Vacuum System using Dunham Packless Radiator Valves and Dunham Radiator Traps in the supply and return connection to and from each radiator (use hot water type radiation, preferably No. 3, No. 4 or No. 5 Dunham Trap for dripping mains, No. 6, No. 7 or No. 8 Dunham Blast Trap for all blast coils, Dunham Reducing Pressure Valve for reducing steam pressure, or automatically supple-

FIG. 13. DUNHAM OIL SEPARATOR

FIG. 14. DUNHAM STRAINER

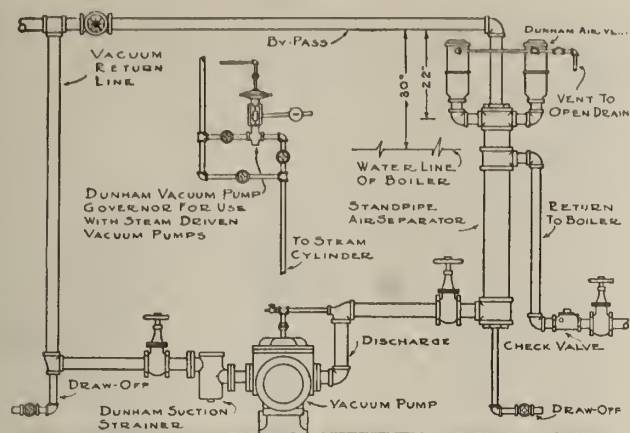

FIG. 16. METHOD OF DISCHARGING DIRECT FROM VACUUM PUMP INTO BOILER

menting exhaust steam, Dunham Oil Separator for removing oil and making exhaust steam suitable for efficient heating, Dunham Strainer for keeping dirt and scale from vacuum pump, Dunham Vacuum Pump Governor for automatically starting and stopping the steam driven vacuum pump to maintain desired amount of vacuum in return piping, and Dunham Air Vent for releasing air from the system; each and all to be installed in accordance with instructions and standard detail drawings to be supplied by the C. A. DUNHAM COMPANY.

FIG. 17. METHOD OF DRIPPING RISE IN STEAM MAIN, DUNHAM VACUUM SYSTEM

The Dunham Return System.

No design for steam heating can be more simple or more easy in operation than this, and coupled with it is the opportunity for high efficiency. Steam is conducted through one system of piping from the boiler to the radiator, where it is retained by Dunham Radiator Traps until it has given off its heat. Then, as water, it passes through the traps, together with the air, and both water and air are conducted through another set of piping back to the Dunham Return Trap, which, independent of the boiler pressure, automatically releases the air out of the system and returns the water to the boiler.

The feature of a positive return under varying steam pressures makes this Dunham System particularly adaptable to apartment houses, small hotels and medium sized commercial buildings, schools and churches. Above all, however, this system makes possible the modernizing of old one-pipe and two-pipe gravity flow systems, materially increasing their efficiency by the introduction of

FIG. 18. BOTTOM SUPPLY CONNECTION TO RADIATOR

FIG. 19. TOP SUPPLY CONNECTION TO RADIATOR

the Dunham Radiator Trap at each radiator, insuring a positive circulation without loss of steam, and permitting the removal of all sputtering, leaking air valves which are such trouble makers in these old heating jobs. During these days when conservation of fuel is of such great importance, this system presents the greatest opportunity for the most efficient and effective use of steam for heating purposes, and therefore will be a fuel saver.

FIG. 20. METHOD OF DRAINING BOTTOM OF STEAM RISER IN AN OVER-HEAD SYSTEM

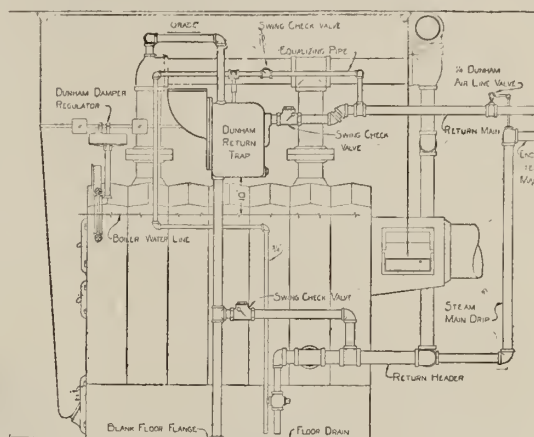

FIG. 21. METHOD OF INSTALLING DUNHAM RETURN TRAP

How to SPECIFY—Specify the Dunham Return System using Dunham Packless Radiator Valves (except in old jobs where inlet connections are at the bottom of radiators) and Dunham Radiator Traps in supply and return connections to and from each radiator, and Dunham Return Trap for releasing air and returning water to the boiler; each and all to be installed in accordance with instructions and standard detail drawings to be supplied by the C. A. DUNHAM COMPANY.

Dunham Air Line System.

This is a one-pipe steam system, using a Dunham Air Line Valve on each radiator in place of the usual sputtering air valve, with a system of air line piping which may discharge the air by gravity, or be attached to a Thompson air line vacuum pump. This system is particularly adaptable in making old one-pipe heating systems more efficient. Easily and cheaply installed, and insures quick removal of air from radiators.

FIG. 22. TYPICAL RADIATOR CONNECTIONS, DUNHAM AIR LINE SYSTEM

Bulletins.

Bulletins with detailed information covering all products, including roughing in dimensions, will be supplied on request.

THE FISHER GOVERNOR CO.

Dependable Power Plant Specialties

5-11 Linn Street

MARSHALLTOWN, IOWA

Products.

PUMP GOVERNORS; AUTOMATIC CHECK and FLOAT VALVES; REDUCING VALVES; PRESSURE REGULATORS; SPRING CONTROLLED DIAPHRAGM REGULATORS; STEAM TRAPS; AUTOMATIC RELIEF, BALANCED LEVER and FLOAT VALVES.

Back Pressure and Atmospheric Relief Valves.
For Oil Field Specialties, see page 443.

Fisher Regular Pump Governors (Patented).

TYPE No. 1—For use on pumps for water works, hydraulic elevators, fire, boiler feed, railroads, mines, air compressors, etc.

They automatically start or stop a pump working under pressure and maintain a uniform pressure on discharge side at all times. Simply constructed, easy to operate, automatic and economical.

Seats and valves made from Fisher special hard phosphor bronze. Particular attention given to construction and testing before shipping.

TYPE No. 2—Special extension cylinder handles pressures of 500 to 1500 lbs. without impairing sensitiveness to variation in discharge.

TYPE No. 3—Maintains guaranteed pressures from 1500 to 10,000 lbs., or capacity of pump.

TYPE No. 4—Maintains constant over-pressure or excess pressure in feed line at all times, regardless of variation in boiler pressure. Durable, because not complex. For use where exacting duty and closest regulation are required.

TYPE No. 5—For use on fuel oil and other low pressure pumps pumping liquids, air or gas. It insures steady flow of oil at burners, controlling pump so as to permit only the slightest variation in pressure. Unequalled for sensitiveness on extremely low pressures. Not recommended for pressures in excess of 40 lbs.

State pump discharge pressure to be maintained and nature of service.

PUMP GOVERNOR
Type No. 3
Hydraulic pressure, 1500 to 10,000 lbs.

Type No. 1 Capacity 10 to 500 lbs.
Type No. 2 Capacity 500 to 1500 lbs.
Type No. 4 Maintains constant excess pressure
Type No. 5 For low pressure pumps
PUMP GOVERNORS

TYPE No. 6—For controlling pumps discharging into open elevated tanks to maintain a certain water level. In addition to gravity or water level control, pump is controlled by discharge pressures, governor being actuated from both sources. Use of float valve and other apparatus for tank control overcome.

TYPE No. 8—Used on all types of steam operated vacuum pumps used with vacuum heating systems, and where a certain number of inches of vacuum must be maintained. Diaphragm and lever mechanism can be swiveled and turned in any direction desired. Also made spring controlled for marine service.

Type No. 6 Gravity
Type No. 8 For vacuum pumps
PUMP GOVERNORS

Fisher Spring Controlled Diaphragm Regulator.

TYPE No. 55—For controlling steam driven pumps operating on closed systems, particularly adapted to low pressure pumps. For fuel oil pumps, when information is given, a specially constructed diaphragm is furnished.

Can be used as pressure reducing valve in any position. If used in vertical line, furnished with pilot guide.

Made globe and angle bodies.

TYPE NO. 55
DIAPHRAGM
REGULATOR

Fisher Float Valves.

TYPE No. 17—Designed to automatically control the flow of fluids into open tanks or reservoirs to maintain a predetermined level. Action of this valve controlled by seamless copper float, directly connected to lever by an adjustable stem.

Made in both angle and globe types. All valves tested. Standard valves suitable for cold water or air pressures ranging up to 200 lbs. If valves are to be used for hot water, steam, oil or other service, information to this effect should accompany order.

TYPE NO. 17
FLOAT VALVE

Fisher Automatic Check and Float Tank Valves.

TYPE No. 15—For use on open and elevated tanks or gravity systems. Construction enables water to be pumped into or drawn from tank through the same pipe.

This combined float and check saves the trouble and expense of a more complicated installation. Fire pressure can be carried on mains with full tank.

TYPE NO. 15
AUTOMATIC
CHECK AND FLOAT
TANK VALVE

Fisher Steam Trap.

TYPE No. 33—Fitted with monel metal valve and non-rust bearings. Has a large capacity, for all services and for all pipe sizes.

Fully accessible in all parts. Intermittent discharge, eliminating wire-drawing of seats. Suitable for any pressure by changing valve and seats. Heavily built throughout. Every trap subjected to heavy and severe hydrostatic test.

Ribbed heavily, insuring strength. Readily covered with asbestos. Two wearing parts only; those easily renewed; economical maintenance.

Reliable design; uniform distribution of metal and strain; contraction and expansion in service will not affect joints.

Area of open hinge bucket is large, giving great pulling power. Possible to use a larger valve than with any other construction.

Fisher Balanced Lever Valves.

TYPE No. 7—Under sole control of lever, outside force operating that lever. It remains unaffected by pressure. Can be used in connection with steam, air, gas, water or other fluids. Especially adapted for feed water heaters, tank feeding, quick opening throttling valves, condensation tanks or hot wells in any situation requiring a lever valve that closes tight when valve seats. Also used as a thermostatic or chronometer governor valve.

TYPE NO. 7
BALANCED LEVER
VALVE

Fisher Reducing Valves.

TYPE No. 10—Responds quickly to sudden draw on service pressure. For use with steam, air, water, gas or oil. Takes initial power plant pressure, and in one reduction attains the lower pressure desired. Never chatters, sticks, nor allows the low pressure to build up.

Being diaphragm and lever actuated type is more sensitive than spring actuated valves.

Made in vertical and inverted types.

TYPE No. 11-A—Suitable for all low pressure and vacuum systems of steam heating. An increased outlet allows for quick expansion of steam after its passage of valve from high pressure side. It is so nearly balanced that lower reducing range is atmospheric pressure or even below.

Made in vertical and inverted types. The large variety of outlet sizes stocked in this valve makes it convenient and economical to the contractor or engineer.

TYPE No. 12—Fisher piston type high pressure reducing valve. Cylinders are provided with a special packed piston, which places this valve in a class by itself. Handles pressures from 50 to 400 lbs. on the reduced side of the valve. Sensitive reduction is guaranteed. Valve can be varied 30 lbs. or more either way from set fixed point. Also stocked in vertical with angle or globe bodies, and with increased outlet bodies, either vertical or inverted.

TYPE NO. 11-A
INCREASED OUTLET
REDUCING VALVE

Fisher Automatic Relief Valves.

TYPE No. 14—Generally recommended for service in main where it is necessary to relieve excess pressure into a branch line; on lines connecting high pressure boilers to low pressure boilers, or any service where a desired pressure is to be maintained and excess pressure above that point relieved.

Absolutely automatic, opening precisely at the working pressure and closing promptly after relieving the excess pressure above the fixed working point.

THE CHAPLIN-FULTON MFG. CO.

Manufacturers of Steam Specialties

28-34 Penn Avenue
PITTSBURGH, PA.

Products.

VIGILANT FEED WATER REGULATOR; FULTON PUMP GOVERNOR; FULTON TANK GOVERNOR; FULTON STEAM REDUCING VALVE; FULTON EJECTOR.

Bingham Gage Cock; Fulton High Pressure or Reducing Regulators, Fulton Low Pressure Regulators, Fulton House Service Regulators; Fulton Duplex Sensitive Gas Governors, Fulton Gas Fuel Boiler Governors, for steam boilers, using natural or artificial gas for fuel; Fulton Gas Relief Valves, for natural gas gasoline plants; Fulton Back, or Check Pressure Regulators, for natural or artificial gas; Fulton Water Regulators.

Vigilant Feed Water Regulator.

OBJECT—Object is to automatically supply to steam boiler exact amount of water that is being converted into steam, thereby maintaining constant water level.

SCOPE—Adaptable to any size or style of boiler, independent or in batteries.

ADVANTAGES—(1) Insures dry steam for engine and better lubrication. (2) Safeguards against accident to boiler from low water. (3) Great economizer of coal, greatest efficiency of boiler when heating surface and steam space are maximum. Steady and constant feeding of boiler allows water to be heated to highest degree. Saving of fuel over hand fed boiler from 6% to 15%. (4) Prevents priming by keeping water level at middle gage. (5) Lessens repairs to boilers from leaky joints due to contraction and expansion of tubes caused by sudden changes of temperature by hand fed boilers. (6) Insures most uniform operation of feed pumps, heaters, etc.

FEATURES—Simplicity in design and construction; all working parts in plain view. No complicated system of levers, floats or diaphragms. Positive in action. Impossible to clog with scale or mud (valves either shut or open). Uses small amount of steam for an instant only when stopping feed. Can be cut out without interrupting feeding of boiler. Regulates feed water within a ¼-in. rise and fall. One man can attend to 40 boilers equipped with regulators.

VIGILANT FEED
WATER REGULATOR

STYLE AND SIZE—Two styles of Vigilant feed water regulators are manufactured: one with a small condenser supplying pure water for use through valves, the other without condenser.

Diameter of chamber, 9½ ins. at flanges. Distance from top of chamber to bottom, 15½ ins.; from side of flanges to end of weighted lever, 23 ins.

Fulton Tank Governor.

Fulton tank governor, placed in steam line to pump, maintains a water level at any desired height with but little variation in tanks, standpipes, reservoirs, water towers, etc., or maintains a pressure in water mains at any desired head. May be used in same manner for pumping oil, acid, or any liquid it is desired to maintain at uniform head.

When forcing liquids through heaters, filters, clarifiers or other obstructions, connection to diaphragm must be made in line or tank in which uniform pressure is to be maintained.

Simple in construction; automatic in action. All valves have cast iron bodies and valves unless otherwise ordered. Valves under 3 ins. have screwed end. In ordering, state fully purpose desired, whether used on steam, gas or water pipes, and whether on pumps or mains. Give pressure of said steam, gas or water, and pressure or head which it is desired to maintain.

FULTON TANK
GOVERNOR
Sizes, 3 ins. and up

Fulton Boiler Feed Pump Governor.

Automatic regulation of pump in accordance with changing boiler requirements is secured by Fulton governor. Fix excess pressure in feed line at 10 lbs., and at 10 lbs. the difference will remain, regardless of how boiler pressure fluctuates. Since boiler pressure is carried on one side of piston and pump pressure on the other, only small difference in pressure between them has to be balanced by governor weight and lever, a marked contrast to the immense springs, etc., often employed.

FULTON BOILER FEED
PUMP GOVERNOR, PISTON
TYPE
Also made with diaphragm

Fulton Steam Reducing Valve.

Valves, 3 ins. and larger, have flanged ends with companion flanges bolted on; are also provided with a trap so that live steam does not come in contact with diaphragm.

Lever is balanced on a knife edged fulcrum and supports valve stem by means of a toggle connection which reduces friction and insures quick response to slightest change of load.

FULTON STEAM
REDUCING VALVE

Fulton Patent Ejector.

Two types. Triple acting jet pump requires one-half the steam other jet pumps require. Will lift 15 ft. and force 30 ft. without loss of efficiency. Working pressure, 80 lbs. Single acting jet pump will lift water 10 ft. and force it 75 ft. with working pressure of 80 lbs.

FULTON PATENT TRIPLE ACTING EJECTOR
Also made in single acting type

WILLIAM S. HAINES & COMPANY

Manufacturers of Steam Heating Specialties

Twelfth and Buttonwood Streets
PHILADELPHIA, PA.

Products.

HAINES VACUUM HEATING SYSTEMS and AUTOMATIC VAPOR SYSTEMS, consisting of Vento Automatic Valves and Traps, Automatic Air Traps, Graduated Supply Valves, Suction Strainers, Safety Valves, Vacuum Pump Governors, Damper Regulators, Low Pressure Gages, and all Specialties used in the systems.

Vacuum Systems of Steam Heating.

This company believes that the engineer and architect are sufficiently familiar with the principle, operation and general piping arrangement of this system to make it unnecessary to detail them here. It is generally conceded that a vacuum system of steam heating, properly installed and equipped, is the most efficient and economical heating system that can be used in connection with large buildings of any description.

Vacuum systems of heating, however, have not always proved successful, due not to any fault in the principle of the system, but almost entirely to poorly constructed automatic valves; in fact, the automatic valve is so important a feature that, regardless of all other perfections, any system of vacuum heating would be a failure without an equipment of positive and reliable automatic valves.

Vento Automatic Valves and Traps.

This company is the sole manufacturer of the Vento automatic valves and traps (four illustrated herewith), in all of which the operating power consists of the Haines specially designed thermostatic tube. This member is not new or untried, as the company has been using it in connection with its automatic valves and traps for 24 years, and during this entire period the principle of the thermostatic tube has not been changed a particle.

CONSTRUCTION—The Vento automatic valves and traps are all constructed on one principle, with some slight difference in design to meet different conditions. In all cases the operating power consists of a specially designed Haines thermostatic tube mounted vertically on a horizontal valve motion. The thermostatic tube has forked or bifurcated ends made to fit a groove in the valve head at one end and a groove in the guide stem at the opposite end. The guide stem is set permanent, so that the movement or travel of the tube is confined to the opposite end in such a way as to automatically open and close the valve. To eliminate friction and remove any possible chance of the valve sticking, the hole in the valve stem is round, whereas the end of the guide stem on which it is mounted is square, which insures a free and perfect movement.

The valve mechanism in all the Vento automatic valves and traps is mounted horizontally. This permits scale and foreign matter to drop clear of the valve and seat at each operation; and as the construction of the thermostatic tube is such as permits a long range of movement, the chances of the valve fouling

with scale or foreign matter is reduced to a minimum.

GUARANTEE—The Vento automatic valves, when used in connection with vacuum or vapor heating systems, are guaranteed absolutely for a period of 5 years; that is, should any of the valve parts become defective through usage during said period, all such will be replaced with new ones free of cost.

VENTO BLAST COIL TRAP

In addition to all classes of blast coil work, it can be used with any class of work employing from 1 to 50 lbs. pressure

VENTO (1911) TYPE RETURN LINE VALVE

Recommended for all coil work and drip points with low pressure heating. Controls extra large valve area

VENTO AIR LINE VALVE

VENTO RETURN LINE VALVE
Recommended for use with cast radiation with low steam, not exceeding 10 lbs.

 WINNIPEG, MAN., 259 Stanley Street

MONTREAL, QUE.

Products and Services.

Manufacturers of THERMOSTATS and Other APPARATUS for the CONTROL of TEMPERATURE and HUMIDITY, including:

Pneumatic Room and Insertion Thermostats and Humidostats.

Electric Room and Insertion Thermostats and Humidostats.

"Sylphon" Metal Diaphragm and Rubber Diaphragm Valves.

Low Pressure, Limited Capacity, Electric Air Compressors.

Low Pressure, Limited Capacity, Hydraulic Air Compressors.

Air and Water Reducing Valves.

Pneumatic Switches or Push Buttons.

ENGINEERS and CONTRACTORS for the CONTROL of TEMPERATURE or HUMIDITY for any purpose and over every range used in manufacturing purposes or buildings, furnishing and installing:

Temperature Controlling Apparatus for any and all kinds of heating and ventilating systems.

Temperature Controlling Apparatus for any industrial process requiring the medium of heat.

Control of Humidity in industrial processes requiring artificial humidity.

Temperature Control of hot water tanks and all liquids.

Control of Temperatures of refrigerating and cold storage plants.

Thermostatic Control of electric motors on automatic refrigerating.

Specific Applications of Temperature Control.

Bake ovens for enamels, japans, etc.

Core drying ovens.

Drying room for paint, varnish, patent leather, etc.

Storage room for tobacco, rubber or similar goods.

Cold storage rooms, fur vaults, etc.

Canning machinery, cookers, exhausters, processors.

Corn and oats drying apparatus.

Fruit drying apparatus.

Johnson Positive Acting Metal Diaphragm Thermostat.

The only thermostat on the market provided with positive snap action for closing and opening the radiator valve quickly, positively and fully, which is necessary with steam heat.

INDICATOR AND CUT-OFF—

It is the only thermostat having an indicator which shows at a glance whether the thermostat has the heat turned on or off. A cut-off is provided for shutting the heat off permanently when desired.

Johnson Graduated Acting Thermostat.

For controlling the temperature of rooms heated by steam, hot blast or hot air furnaces. It controls a mixing damper located at the plenum chamber. The damper, which is furnished, together with the thermostat, etc., is operated by a diaphragm damper motor, connected with the thermostat in such way that the damper blades will automatically assume the correct intermediate position necessary to deliver the right mixture of hot and tempered air to the room and to maintain a constant and proper temperature therein.

Johnson Electric Room Thermostat.

This thermostat is designed and adapted for use in connection with an electric switch, for the control of temperature in electrically heated rooms; for the regulation of temperature in small refrigerators cooled by electrically driven ice machines; for the control of electrically driven centrifugal pumps used for cooling or heating purposes; for the control of motor driven heating, cooling or ventilating fans such as are used in fur vaults, etc.

Johnson Electric Insertion Thermostat.

For insertion in brine systems of electrically driven ice machines, to regulate the temperature of brine by the control of the motor; for insertion through wall of refrigerator, to regulate temperature of cooled space by the control of motor; for regulation of temperature in electrically heated

"SYLPHON" METAL DIAPHRAGM RADIATOR VALVE

POSITIVE THERMOSTAT
Showing inside mechanism

water system or tank, by control of heater; for regulation of temperature in electrically heated compartment, by control of the heater.

ELECTRIC INSERTION THERMOSTAT

Johnson Pneumatic Insertion Thermostat.

Designed to control temperatures within closed air chambers or ducts. The body of thermostat is a dust-proof case containing the two working parts and extending outside the chamber.

This thermostat is made either positive or graduated acting.

APPLICATIONS — Adaptable for use in bake ovens for enamels, japans, etc.; drying rooms for paints, varnishes, patent leather, etc.; storage rooms for tobacco, rubber or similar goods; sterilizers or pasteurizers; cold storage rooms, fur vaults, etc.; refrigerator machine control; humidity control for air washers; flue gas temperature control; hot blast heating plants; combination tempered ventilation and hot blast systems; greenhouses, turkish bath rooms, etc.; tempered ventilation for buildings.

PNEUMATIC INSERTION THERMOSTAT

Johnson Calibrated Thermostat.

This is an especially high grade insertion thermostat for use where it is desired to change frequently the adjustment to operate at different temperatures. It is operated by compressed air at 15 lbs. per sq. in., and used to control temperatures of liquids and air by automatically opening and closing a diaphragm valve or damper. Graduations made to meet requirements, limited to a total range of 60° and to minimum space of 2½°.

CALIBRATED THERMOSTAT
Graduated-acting pneumatic type

Pressure Reducing Valves.

No. 1—This valve will meet the most exacting service requirements. Being small, well proportioned and having a reasonably large range of action, it is especially

suited for small compressed air or hydraulic machinery. When desired, this valve is provided with a cut-out handle which permits high pressure to instantly pass through the valve without reduction.

This valve is tight when closed, will not let pressure creep up on the low pressure side, and allows free passage of air or water without causing appreciable drop in pressure on low pressure side when valve is subjected to sudden and heavy service.

The materials used are the very best considering durability and utility.

No. 2—Larger and heavier than No. 1 valve; has more parts and therefore costs more. Has a more finished adjusting screw provided with black japanned wood palm piece. Also provided with extra catch bowl at the bottom, with drain plug for catching and removing dirt from valve. In all other respects description of No. 1 valve applies to No. 2.

No. 3—A positive shut-off valve, identical in design and construction with No. 2 valve, but built heavier and for larger pipe sizes. Cap screws replace round headed screws on No. 2 valve.

NO. 1 PRESSURE
REDUCING
VALVE
No. 1-A for air
No. 1-W for waterNO. 2 PRESSURE
REDUCING
VALVE
No. 2-A for air
No. 2-W for waterNO. 3 PRESSURE
REDUCING
VALVE
No. 3-A for air
No. 3-W for water

Time Valve Control.

Simple device for automatically and periodically opening and closing a diaphragm valve.

Has many applications, such as periodically flushing of toilets, etc. Being simpler and more powerful in action, it is much superior to float tanks. Eight-day clock valve mechanism operates diaphragm valve on water supply by means of compressed air. Valve may be operated from 1 to 4 times per hour and for periods of 15 seconds to 5 minutes.

ELECTRIC AIR COMPRESSOR FOR OPERATING JOHNSON
THERMOSTATS

RUSSELL B. HOBSON

Condensation Return System

WEST NEW BRIGHTON, N. Y.

NEW YORK OFFICE, 120 Broadway

Products.

The HOLLY GRAVITY CONDENSATION RETURN SYSTEM.

The Holly Gravity Return System.

To pump or trap condensation at 300° to 400° Fahr. and the corresponding pressures without waste of steam or labor of upkeep is a difficult matter except with the Holly gravity return system. This system provides a low dry pocket, pulling the condensation out of every part of the steam piping or apparatus, and throwing it back into the boilers so rapidly that it enters almost at the full boiler temperature.

All full pressure drips are closed up with the boilers to which all condensation and entrained water is made to flow continuously, and steam leakage eliminated.

Being devoid of mechanism it is not subject to be out of order, and remains always at 100% as installed.

The Holly system is applicable also to the drainage of high pressure heating apparatus.

The Holly system is tireless. It is the watch dog of the power plant, and whether there is little or much to

do, it stands ready to perform at its full capacity of many thousand pounds per hour.

This company, while equipping some of the very best types of new power plants, finds a fruitful field in old plants, many of which are being brought up to date by the Holly system.

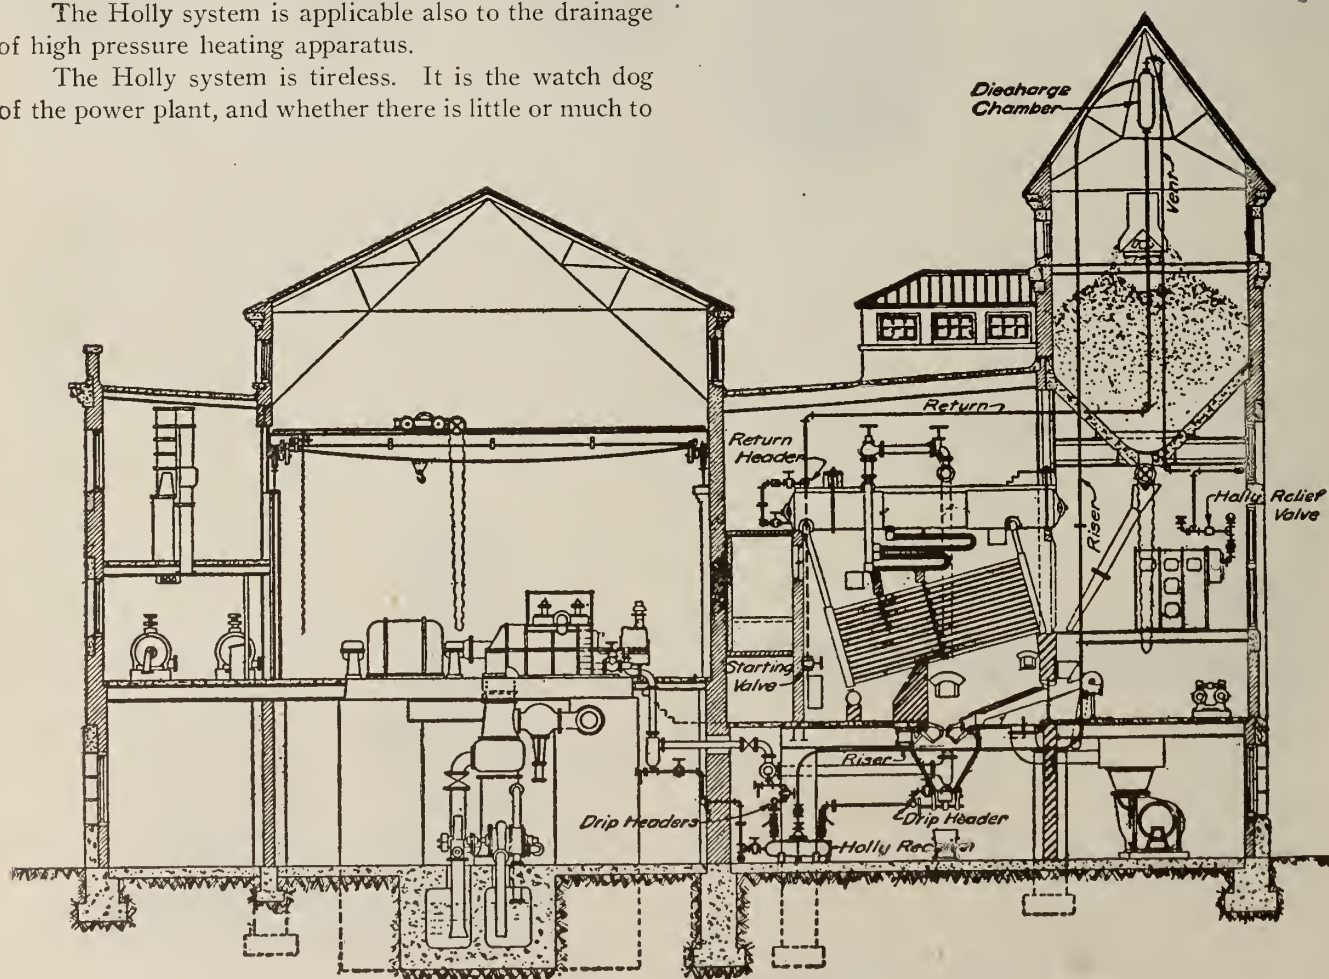

Why not install the Holly system at first, and prevent the possibility of leakage and of loss?

References and Quotations.

Let us furnish references and quotations.

Service.

Upon receipt of order, the working diagram for the steamfitter is prepared, thus insuring the proper attention to detail essential for perfect service.

TYPICAL ELEVATION OF HOLLY GRAVITY RETURN SYSTEM

KIELEY & MUELLER, INC.

Steam, Water, Air and Gas Specialties

34-38 West 13th Street
NEW YORK, N. Y.

AGENTS AND BRANCH OFFICES IN PRINCIPAL CITIES

Products.

KIELEY SPECIALTIES for use in connection with Power, Heating and Plumbing Installations: STEAM PRESSURE REGULATING VALVES of various patterns; BOILER and PUMP GOVERNORS; STEAM TRAPS.

Also, Water, Air and Gas Pressure Regulating Valves, Boiler Stop and Check Valves, Damper Regulators, Water Columns, High Pressure Pilot Regulating Valves, Pilot Automatic Relief Valves for steam, Swivel Automatic Piston Actuated Float Valves for cold water, Altitude and Altitude Relief Valves, Back Pressure and Atmospheric Relief Valves, Automatic Vacuum Water Jet Controllers, Steam Valve and Hot Water Temperature Controllers, Exhaust Heads, Steam Separators, Oil and Grease Extractors, Feed Water Heaters, Air and Grease Traps, Return Steam Traps and Boiler Feeders, Water Feeders, Water Line Traps or Governors, Strainers for Regulating Valves for steam, water, air or gas.

Kieley Specialties and Services.

The superiority of Kieley specialties lies in the construction and design. All material used is of the highest standard; each casting is carefully made and finished; all joints and parts are carefully made with jigs and dies; all parts are interchangeable.

An engineering department is maintained, comprising a staff of competent engineers, selected from all branches of the profession who are familiar with the working details of power and heating plants. The knowledge and experience of these engineers are at the service of engineers and architects; co-operation in working out plans or making suggestions for the solution of difficult problems will be gladly given.

Special 98 Vacuum Pressure Regulating Valves.

These regulating valves are suitable for service where close regulation is required.

They should not be used to reduce against a dead end. For such services the single seated valves should be used.

Initial working pressure is 125 lbs. or less. Delivery or reduced pressure, 10 to 0 lbs. Made in all sizes.

KIELEY SPECIAL 98
VACUUM PRESSURE REGULATING VALVE

Rockaway Pump Governor.

For automatic control of house pumps, elevator pumps, gas, ammonia and brine pumps, water works pumps, fuel oil pumps, air compressors, boiler feed pumps, railroad tank pumps, automatic sprinkler and refrigerating plants, and any other service requiring automatic control of devices operated by steam, air and water.

Will automatically control the speed of pumps from the pressure in the discharge and will maintain the pressure in discharge within a pound or two of what the pump is set to operate at.

Standard weight for 125 lbs. Extra heavy type for 175 lbs. Made in angle and globe patterns; screwed or flanged ends. Sizes: screwed end, brass body, $\frac{3}{8}$ in. to 2 in. inclusive. Screwed end, iron body, 2 in. to 4 in. Flanged end, iron body, 2 in. to 4 in.

KIELEY
ROCKAWAY
PUMP
GOVERNOR

Standard Steam Trap, High and Low Pressure.

Positively non-collapsible floats and unusually large valve openings are provided, secured by Kieley peculiar method of construction, viz:

Floats being suspended and attached at extreme end, close to point at which valve stem is pivoted, afford a leverage sufficiently effective to overcome a higher resisting pressure, and discharging through a larger valve opening against a greater force than has ever been obtained in steam traps of pot or open float construction. Valves are perfectly steamtight and, further, are protected by water seal.

The few wearing parts are of standard gage and are interchangeable; obtained at a minimum of cost; easily and readily placed in position without breaking a single pipe connection. By-pass arrangements are an important feature and a desirable improvement. Made in all sizes from $\frac{3}{4}$ in. to 3 in., and suitable for all pressures and services. Simplicity, accessibility, large capacity, and satisfactory results are assured when Kieley steam traps are used.

KIELEY STANDARD
STEAM TRAP HIGH
AND LOW PRESSURE

KITTS MANUFACTURING CO.

Steam Specialties

1921 West Seneca Street
OSWEGO, N. Y.

Products.

SAFETY FEED WATER REGULATORS; T. C. STEAM TRAPS; REDUCING VALVES; FAN ENGINE REGULATORS; EXCESS PUMP GOVERNORS; HYDRAULIC DAMPER REGULATORS; SINGLE BOILER FEEDER and WATER SUPPLY GOVERNORS.

Also, Vacuum Pressure Reducing Valves, Vacuum Pump Governors, Vacuum Traps, Bucket Steam Traps, Safety Water Columns, Pump Pressure Regulators, Altitude Governors, Low Pressure Boiler Feeders, Air Regulators.

Kitts Safety Feed Water Regulator.

An economical safety device which maintains a constant water level in boilers and effects big savings in coal bills. Simple, durable and absolutely reliable. It insures the greatest possible efficiency, furnishes dry steam to engines and pumps and prevents strain on boilers due to unnatural expansion and contraction because it maintains a constant water level. Furnished with or without the high and low alarm water column.

KITTS SAFETY FEED WATER REGULATOR

Single Boiler Feeder and Water Supply Governor.

No. 1—Used to perfectly control boiler feed pump and water line in a single boiler installation. Valve closes as water rises. The valve and all wearing parts are of bronze or brass, the casting and cover of cast iron.

No. 2—A yoke valve which opens as water rises. Used on tank and pump installations of return systems, such as schoolhouse or hospital work.

No. 3—A yoke valve which closes as water rises. Used on any

water supply system, especially where make-up water is required on a heating system.

Kitts Twentieth Century Steam Trap.

A powerful trap that operates without a float. It saves all the steam. Seats and disks easily renewable. The trap is water sealed at all times and can not blow steam.

TWENTIETH CENTURY STEAM TRAP

Kitts Steam Pressure Regulating Valves.

Adapted for every purpose. In extensive use in some of the largest steam heating plants in the United States.

Kitts Fan Engine Regulator.

Automatically controls the engine used for forced or induced draft, also automatic stoker systems. Built on steel points and very sensitive in operation. For pressures above 125 lbs., a phosphor bronze reinforcement is furnished in addition to the rubber diaphragm.

FAN ENGINE REGULATOR

SPRING TYPE REDUCING VALVE

EXCESS PUMP GOVERNOR

Kitts Excess Pump Governor.

It makes a feed pump deliver a steady, sure supply of feed water, under automatic control, regardless of the variation in steam pressure at the throttle. There is no other pump governor with such a perfect control.

Kitts Improved Hydraulic Damper Regulator.

Will control dampers on a variation of 1-lb. steam pressure. Built for hard service.

A powerful, durable machine.

HYDRAULIC DAMPER REGULATOR

LOCKE REGULATOR CO.

Manufacturers of Steam Appliances
SALEM, MASS.

Products.

"LOCKE" REGULATORS: Hydraulic Damper and Combination Pressure Types; "LOCKE" VALVES: Non-return Stop, Balance, Reducing; "LOCKE" AUTOMATIC ENGINE STOPS of various types; "LOCKE" SPEED LIMITS; "BOARDMAN" FIRE PUMP GOVERNORS.

Also, "Locke" Steam Pressure and Boiler Feed Pump Regulators; "Beats All" Hydraulic Pump Governors; Valves: Auxiliary Electric, By-pass Water Relief, Vacuum Breaker, Differential, Exhaust Relief, Atmospheric Relief, Automatic Safety Shut-off, Renewable Disk Globe, Check, Closed Circuit, etc; Steam Separators; Test and Charging Boards, etc.

IMPROVED "LOCKE" HYDRAULIC DAMPER REGULATOR

Hydraulic regulator actuated by water pressure, admitted through valve to damper operating motor; valve is made to open and close by fluctuation of boiler pressure as it acts under diaphragm, moving weighted lever to which spindle to valve is attached. Cut-off attachment prevents full stroke of damper

"LOCKE" COMBINATION PRESSURE REGULATOR

Indispensable for controlling large valves at slightest variation of pressure.

Especially adapted for: regulating steam to digestors, controlling blower engines for forced draft, sugar refineries, etc.

No amount of resistance caused by dirt or friction will interfere with its close regulation.

Guaranteed to operate within 1/2 lb. variation

"LOCKE" BALANCE VALVE

Sizes: 1, 1 1/4, 1 1/2, 2, 2 1/2, 3, 3 1/2, 4, 5, 6, 7, 8, 10 and 12 ins.

Prices range from \$9.00 to \$286.00

SPEED LIMIT
Driven from main shaft; follows every revolution of engine; if speed be above normal it makes electric contact, shutting off steam from engine

DOUBLE LEVER REDUCING VALVE

Constructed to operate levers and weights for high reduced pressures, or with a single lever for light reduced pressures; inverted diaphragm eliminates stuffing box around valve rod.

State, in ordering, use of valve, initial and reduced pressures.

GLOBE STOP VALVE

Automatic; noiseless. Accomplished by holding valve 1/4-in. from its base, at same time shutting off steam completely. Note valve seat below G

Large Combined Throttle Type
Opened or closed at will, shutting down engine when speed increases above normal

Independent Type
Installed in supply pipe between throttle valve and main steam header

"LOCKE" AUTOMATIC ENGINE STOP VALVES

McDONOUGH AUTOMATIC REGULATOR CO.

Manufacturers of Modern Power Plant Specialties

708 Grand River Avenue
DETROIT, MICH.

Products.

McDONOUGH SYSTEM of CONTROLLING FUEL, AIR and WATER, which includes Damper Regulators, Stoker Regulators, Steam Pressure Recording Gauges, Boiler Feed Regulators, Pump Governors, also other Boiler and Engine Room Appliances.

McDonough System.

Controls automatically all the factors—fuel, air, water—which enter into the generation of steam. Operates without expense or attention, gives perfect regulation and is an immense fuel saver.

Damper Regulators.

McDonough regulator is a result of 26 years' experience in the manufacture and installation of fuel saving devices in steam plants, representing almost every industry where steam is generated.

The most complete and reliable regulator of its kind and an indispensable addition to a steam boiler. In many plants it is equal to an assistant fireman.

CONSTRUCTION—The regulator combines in a single unit a damper and stoker engine or motor speed regulator, a steam pressure gauge, a water gauge, a signal lamp showing open position of dampers and a low steam alarm bell. One regulator controls any num-

ber of boilers, and simultaneously with the closing and opening of the dampers will decrease and increase the speed of stokers, so that the proper amount of coal will be supplied as required.

Regulator can be used for governing gas or fuel oil supply systems. Its action is positive and regulation within $\frac{1}{2}$ lb.

ADVANTAGES—This damper regulator maintains a uniform steam pressure, regulates speed of stoker engines, stoker motors, induced and forced draft engines, gas supply, oil supply, etc.

Boiler Feed Regulators.

This regulator controls automatically the supply of water fed to the boilers. The expansion tube is placed in an inclined position (see installation on opposite page), the upper end of the expansion tube is filled with steam while the lower end is filled with water.

As the water rises or falls in the boiler, it correspondingly rises and falls in the regulator tube, causing it to contract or expand and this motion is

McDONOUGH DAMPER AND STOKER REGULATOR

McDONOUGH BOILER FEED WATER REGULATOR AND FEED VALVE

POINTS OF SUPERIORITY—Valve and cage, easily accessible—easily removable through opening at bottom of valve.

Valve seats being beveled, prevent leakage—hold tight on banked fires—100% efficient in regulation.

Note liberal amount of metal for regrinding—the valve will give excellent service and outlast life of boiler; replace parts are unnecessary.

THERMOSTATIC TUBE STRUCTURE—Tube structure prevents vertical or sidewise buckling.

Lever operates valve from either steam or water end of tube.

Radial slots at either end of tube permit incline of regulator after installation.

ADVANTAGES—Through the operation of McDonough regulator, pressure variation at heavy loads is less, quality of steam is drier, degree of superheat more uniform and greatly increased economy and efficiency is obtained in a boiler plant.

Pump Governors.

DIFFERENTIAL TYPE—The McDonough governor (differential type) is particularly designed for automatic regulation of reciprocating or turbine driven feed water pumps. It maintains any differential pressure desired in the pump discharge pipe over the boiler pressure.

Cap opening in the bottom of governor body for quick and easy removal of valve parts.

McDONOUGH DIFFERENTIAL TYPE PUMP GOVERNOR

Valve and cage of same construction as shown in valve on preceding page.

One adjustment only—by moving weight on lever arm.

Built in every size required.

CONSTANT PRESSURE TYPE—The McDonough governor constant pressure type is especially adapted for service on pumps which operate under excessive and changing steam pressure, while a constant pressure must be maintained in the discharge pipe from pump.

The same valuable features, bevel seat valve and cage, quick access to valve parts are used as in the pump governor, differential type.

Built in every size required.

"McDONOUGH SYSTEM" FOR THE AUTOMATIC REGULATION OF AIR, FUEL AND WATER

MASON REGULATOR CO.

Pressure Regulating Appliances

BOSTON, MASS.

Products.

REDUCING VALVES and PRESSURE REGULATORS for Steam, Water and Air; STEAM PUMP PRESSURE REGULATORS and SPEED GOVERNORS; BALANCED and FLOAT VALVES; HORIZONTAL PRESSURE CONTROLLING DEVICES; HYDRAULIC DAMPER REGULATORS; STRAINERS.

Reducing Valves.

Reduce and maintain an even pressure of steam or air regardless of the variation of the initial pressure or of the volume of steam or air required. Automatically reduce boiler pressure for steam heating systems of all types (vacuum systems included), central heating plants, engines, paper machines, slashers, dye kettles and all situations where it is desirable to use a lower pressure than that on the boiler.

Furnished in the auxiliary operated, lever and other types. All-bronze for initial pressures of 300 lbs., and iron body for pressures up to 180 lbs.

Steam Pump Pressure Regulators.

Designed for fire, boiler feed, air and water works pumps, or any class of pumping machinery where it is necessary to maintain constant pressure. They are placed in the steam supply pipe to the pump, and connected by a 1/4-in. pipe to the discharge system, thereby exactly regulating the amount of steam to the requirements of the pump, and automatically maintaining a uniform discharge pressure regardless of any variation of steam pressure or demand on the pump.

The key style regulator is provided with a dashpot, which positively prevents it from chattering or pounding when sudden changes occur in the discharge pressure. It is fitted with union connections threaded for standard wrought iron pipe. As regularly furnished, it is suitable for steam pressures up to 250 lbs. and discharge pressures between 20 and 140 lbs.

No. 55 regulator has been designed for closed systems, such as are used in supplying domestic service or larger pressure systems for office and factory buildings up to 150 lbs.

Steam Pump Speed Governor.

This governor is to the direct acting steam pump what the ordinary ball governor is to the steam engine. It derives its motion from some reciprocating part of the pump and controls a balanced valve placed in the steam pipe, thereby exactly regulating the amount of steam to the requirements of the pump, and automatically maintaining uniform speed, regardless of any variation of steam or load.

Suitable for controlling either duplex or single acting pumps, as well as flywheel pumps and other classes of pumping machinery.

Steam Vacuum Pump Regulator.

Designed to control steam operated vacuum pumps so as to maintain a uniform vacuum on the system. They are particularly adapted to vacuum systems of steam heating where a steady vacuum is required and an automatic pump control is desirable. The regulator consists of a balanced type of double seated valve connected to a diaphragm operating against the action of the weights, thereby regulating the steam supply to the pumps. Suitable for steam pressures up to 180 lbs. and adjustable for any desired vacuum.

Horizontal Pressure Controlling Device and Belt Shifter.

This device in its various modifications is used for controlling power and electrically driven pumps of all types and classes of service. It can be supplied for vacuums and pressures ranging from 0 to 3,000 lbs. operating in connection with variable speed rheostats, clutches, throwing belts, etc.; cylinder can be either vertical or horizontal, and can be furnished in various diameters and lengths of stroke as may be required.

Hydraulic Damper Regulator.

The design of the compensating device, which is positive in its action, insures the closest possible regulation. The operating cylinder as well as all parts coming in contact with the water are made from high pressure bronze and carefully machined to obtain the greatest durability and sensitive action of the apparatus. The knife edges and fulcrum points of the lever are also of special construction.

HYDRAULIC DAMPER REGULATOR

Suitable for controlling boiler pressures from 1 or 2 to 200 lbs. Piston is operated in both directions by water pressure, permitting use of rod connections to overhead shafting, which is desirable in the larger installations where a number of flue dampers are to be operated in unison.

MONASH-YOUNKER CO.

Manufacturers of High Grade Air Valves and Steam Specialties

CHICAGO, ILL.

NEW YORK, N. Y.

Products.

Manufacturers of HIGH GRADE AIR VALVES and STEAM SPECIALTIES.

Trade-mark.

Trade-mark stands for 30 years of quality and service.

It guarantees to the engineer or architect a reliable article for his client.

Monash No. 6 Four-way Drain Automatic Air Valve.

Made with a hexagon shaped base and has a 5-year guarantee stamped on the shell of the valve.

It is the only valve made with a special air tube, which conducts the air from the radiator to the top of the valve, permitting its escape through the outlet; which also equalizes the air pressure in valve—an all important feature in a perfect working automatic air valve.

It is the only valve that has a four-way drain extending from the body of the valve into the radiator, draining off the water of condensation, preventing flooding of floors and damage to ceilings below.

It is made with a locked shield and has a special key for adjusting, making it foolproof.

We recommend our Monash leakless, packless radiator supply valve in conjunction with the above valve.

How TO SPECIFY—Each radiator to have a Monash No. 6 four-way drain guaranteed automatic steam air valve and a Monash No. 119 leakless, packless radiator supply valve attached.

Monash No. 7 Vacuum Four-way Drain Automatic Air Valve.

Consists of a composition disc, which seats itself over the air outlet end of the valve closing against in-

gress of air, thus creating a perfect vacuum in the radiator, providing the supply valve is leakless and packless and of

a well-known make and is known as Monash, which can be supplied by us. A radiator thus equipped will retain the heat for hours after fire has been banked. This means reduction in fuel bills.

The interior construction of this valve is the same as No. 6, shown on this page.

How TO SPECIFY—Each radiator or coil to have a Monash No. 7 vacuum four-way drain automatic air valve and Monash No. 119 leakless, packless, radiator supply valve attached.

Mo Va Co No. 1 Non-adjustable Syphon Thermo-static Automatic Air Valve.

Sensitive and quick in action. Opens instantly to let out air from steam radiators. Has sealed metal float with volatile liquid. Syphon is removable—an improvement over all others. Base and nipple are all in one cast. No soldered or sweated nipples to come apart.

Passes all air but not steam. No adjusting necessary. Every loop steam hot. Guaranteed to give results.

How TO SPECIFY—Each radiator to have a Monash Mo Va Co No. 1 non-adjustable syphon thermo-static automatic air valve and a Monash No. 119 leakless, packless radiator supply valve attached.

MONASH NO. 6 FOUR-WAY DRAIN AUTOMATIC AIR VALVE.
Patent No. 756,383

MO VA CO NO. 1 NON-ADJUSTABLE SYPHON THERMO-STATIC AUTOMATIC AIR VALVE

Monash No. 2 Liquid Thermostatic Diaphragm Automatic Air Valve for Drip and Air Line Systems.

Can be used with or without pump. Non-adjustable. No air bound radiators, no steam passing into air lines. Rapid and positive in action. Nipple connection to radiator, $\frac{1}{8}$ in. Air line connection, $\frac{1}{4}$ in.

How to SPECIFY—Each radiator or coil to have a Monash No. 2 liquid thermostatic air valve and a Monash No. 119 leakless, packless radiator supply valve attached.

MONASH NO. 2 LIQUID THERMOSTATIC DIAPHRAGM AUTOMATIC AIR VALVE

Monash Valve Holder.

This valve holder prevents valve from being turned or removed from radiator and is especially adapted for use in schools and all classes of public buildings. Illustration shows manner of fastening valve to radiator with Monash valve holder, used only with locked shield valves.

MONASH VALVE HOLDER

MONASH VALVE HOLDER INSTALLED

How to SPECIFY—Each radiator to be equipped with a Monash No. 6 four-way drain air valve and a Monash valve holder to prevent removal of valve from radiator.

Monash No. 9 Hot Water Automatic Air Valve.

On the market 20 years. Is the only *safe* and *reliable* hot water air valve on the market. It will automatically vent a hot water radiator. Requires no attention.

How to SPECIFY—Each radiator to have a Monash No. 9 hot water automatic air valve attached.

MONASH NO. 9 HOT WATER AUTOMATIC AIR VALVE

Mo Va Co No. 3 Non-adjustable Syphon Quick Vent Thermostatic Float Air Valve.

Made especially for quick venting mains, risers, Vento stacks and blast coils. Stops both steam and water. Made with $\frac{1}{4}$ -in. connections.

How to SPECIFY—Attach to each ——— a Monash Mo Va Co No. 3 non-adjustable syphon quick vent thermostatic float air valve.

MO VA CO NO. 3 VALVE

Monash Telwen No. 1 Drip Line Automatic Air Valve.

Used in connection with Monash steam exhauster, Paul or other air line systems of vacuum heating.

The Telwen feature "tells when" valve is properly adjusted, saving time and work due to careless adjustment. Compensating spring seat prevents buckling or bending of expansion member by undue pressure.

The Monash Telwen No. 3 is made identically the same with connections to the radiator $\frac{1}{4}$ in., and $\frac{3}{8}$ in. to air line.

MONASH TELWEN NO. 1 DRIP LINE AUTOMATIC AIR VALVE

How to SPECIFY—Each radiator or coil to have a Monash Telwen No. 1, $\frac{1}{8}$ by $\frac{1}{4}$ in. (or Telwen No. 3) automatic steam air valve attached.

Monash No. 13 Trap.

A small and simple steam trap especially made for use on steam heating coils, heaters, steam jackets or other places where a small amount of condensation is to be removed without waste of steam.

Is perfectly automatic and, when properly adjusted, remains open as long as water escapes, closing when steam strikes expansion post.

Made with $\frac{3}{8}$ -in. connections and not recommended for use on pressure over 80 lbs.

MONASH NO. 13 TRAP

How to SPECIFY—Each steam main to be equipped at proper point with a Monash No. 13 trap, $\frac{3}{8}$ -in. connection.

Monash Telwen No. 7 Automatic Steam Main Vent.

This valve is a large and powerful expansion air vent made for the purpose of relieving steam mains or risers of air as it accumulates, thereby permitting free circulation of steam.

The Telwen feature in the valve enables one to see at a glance whether or not the screw binds. Once ad-

MONASH TELWEN NO. 7 AUTOMATIC STEAM MAIN VENT

justed, this valve will operate on high as well as low pressure.

It is 8 in. long, threaded for either $\frac{1}{2}$ -in. or $\frac{3}{4}$ -in. pipe connection.

How to SPECIFY—The end of each steam main to have a Monash No. 7 Telwen automatic steam main vent attached, $\frac{3}{4}$ -in. connection.

To Specifying Engineers and Architects.
We do not make plans or specifications.
We leave that to the engineers and architects.

Monash No. 40 Thermostatic Return Line Valve.

This valve is *unlike* any other, as it has a by-pass or clean-out feature. Therefore engineers and architects who wish a valve with these features should specify the Monash No. 40 *alone*.

If, however, the above features (by-pass and clean-out) are not required, then specify our No. 50 or Class C-10 thermostatic valves *without* by-pass or clean-out alongside with other well-known thermostatic return line valves.

Thermostatic diaphragm in the No. 40 and No. 50 valve is not attached to cover or body and is always out of steam chamber. It is simply dropped into the valve—an added feature not found in the construction of any other make.

This valve No. 40 is attached to many thousands of radiators and coils in mills, factories and commercial buildings where a perfect circulation of steam is obtained.

Can be installed by any heating contractor or engineer and guaranteed to give perfect results.
Catalogue on request.

MONASH NO. 40 THERMOSTATIC RETURN LINE VALVE

How to SPECIFY—Each radiator or coil to have a Monash No. 40 thermostatic vacuum guaranteed return line valve with clean-out feature and a Monash No. 119 leakless, packless radiator supply valve attached.

DATA, MONASH AIR VALVES

No.	Size, in.	Capacity of direct radiation	Lbs. water per hour
Class C	1½	250	75
No. 50	1½	350	108
No. 40	1½	350	108
No. 42	¾	1500	475
No. 44	1	5000	1566

Monash No. 50 Thermostatic Return Line Valve.

Is identical in construction as the No. 40, with the exception of clean-out feature and may be specified alongside with other well-known thermostatic return line valves. The diaphragm dropped into valve does the work.

How to SPECIFY—Each radiator or coil to have a Monash No. 50 thermostatic vacuum guaranteed return line valve and a Monash No. 119 leakless, packless radiator supply valve attached.

MONASH NO. 50 THERMOSTATIC RETURN LINE VALVE

Monash Class C No. 10 Thermostatic Return Valve for Vacuum, Vapor and Graduated Heating Systems.

Is being used with great success in offices, apartments, hotels, hospitals, schools, banks, churches, clubs, commercial buildings, residences, etc.

3300 of these valves have been giving perfect service in the Continental National Bank Building, Chicago, since the winter of 1914, and not a single replacement of any part or piece of the valve has been required. So say the owners.

The Monash leakless and packless radiator supply valves are recommended for vacuum, vapor or graduated heating systems.

How to SPECIFY—Each radiator or coil to have a Monash Class C No. 10 thermostatic vacuum guaranteed return line valve and a Monash No. 131 graduated radiator supply valve attached.

MONASH CLASS C NO. 10 THERMOSTATIC RETURN VALVE FOR VACUUM, VAPOR AND GRADUATED HEATING SYSTEMS

NORTHERN EQUIPMENT COMPANY

System of Feed Water Control

MAIN OFFICE AND WORKS

115 West 11th Street

ERIE, PA.

BRANCHES IN ALL PRINCIPAL CITIES

Products.

COPEs SYSTEM of FEED WATER CONTROL;
COPEs FEED WATER REGULATORS; COPEs STEAM
PUMP GOVERNORS.

TRADE-MARK

Purpose.

Scientific control of the boiler feed and permanent mechanical performance. The system is a combination of the Copes boiler feed water regulator and the Copes steam pump governor.

Method.

The regulator feeds continuously as long as there is a load on the boiler. On heavy loads it automatically drops the water level so as to increase the steaming capacity. On light loads it automatically raises the water level, and saves the furnace heat which would otherwise be wasted. On steady loads, it maintains a constant water level.

The governor maintains a fixed excess in the feed line above boiler pressure. As the pressure varies, the feed pressure varies correspondingly. The same governor, with a change in connections, will give a fixed constant pressure.

Construction.

A glance at the illustrations shows the simplicity of construction. The regulator—a straight heavy tube, a straight lever, a heavy iron base, and a very rugged balanced valve that is practically frictionless. The governor—a cylinder and piston, a frame, and a balanced valve. Simple. Direct. Positive. No boiling liquids. No adjustments or repairs required after cutting into service. Practically no repairs. Many have been operating daily for over 20 years.

Results.

Gives higher overload capacity. Removes unreliable human element from water control.

Eliminates danger while new employees are being "broken in."

Saves fuel: 4% to 8% or more.

Even distribution of load between boilers.

Smooth rate of feed: more legible steam and water meter charts.

Smaller feed lines and valves.

More even load on feed pump.

Dry steam since the water level can not exceed a predetermined level and because the level is a minimum for greatest loads.

Higher superheat because water is not carried over into superheater tubes.

Where Used.

Wherever power boiler are used.

In 90% of the plants where power is generated for sale at a profit. Copes regulators and governors reduce costs and hence increase profits in those plants.

In 98% of the large modern central steam power plants. In practically every steel mill in the United States. In over 90% of the modern power plants in the anthracite coal field. In every industry where boilers are used. On Heine, Stirling, B&W, Erie City, Rust, Wickes, Manning, Badenhausen, Cahall, Bigelow-Hornsby, Nagle, Edge Moor, Keeler, Springfield, Geary, Ladd, Casey-Hedges, Vogt, Union, and other makes of boilers. On boilers under all conditions of load and climate. On boilers aggregating a total of over 8,000,000 h.p. and varying in size from 50 to 2400 h.p.—mostly over 200 h.p.

COPEs STEAM PUMP
GOVERNOR

The Best Proof.

The fact that there are more Copes regulators in successful daily operation than all other makes combined certainly is proof of the superiority of the Copes system.

Catalogues, etc.

Ask for complete catalogue, specifications, quotations, charts, test data, etc. Give this company all boiler conditions in detail.

Air Temperature Control.

No. 16 REGULATOR—For control of temperature in dry rooms, kilns, warming ovens, varnish rooms, etc.

Self-contained, requires no air or water pressure for operation.

The thermo-static element consists of a pile of thermo-sensitive disks arranged in an open cage, so that a great amount of sensitive surface is exposed to the air to be controlled.

NO. 16 REGULATOR

This regulator having several forms and a great variety of applications, it is important that size of apartment, temperature required, nature of product treated, description of process, pressure of steam, and other facts bearing upon the operation should be fully stated, when ordering.

Ordinarily furnished with spring style of adjustment which may be locked and sealed, or exposed with wheel for manual operation. Bulletin 146.

TYPE OF INSTALLATION IN DRY ROOM, KILN, ETC.

PRICE LIST NO. 16 REGULATOR

Standard Machine, with Low Pressure Valve, Direct or Reversed, and Spring Adjustment, either Open or Sealed

Size, ins.	1/2	3/4	1	1 1/4	1 1/2	2
Price.....	\$60.00	65.00	70.00	75.00	80.00	90.00

Add for lever weight adjustment \$3.00, net.

No. 15 REGULATOR—

For control of atmospheric temperatures where thermostatic bulb must be located some distance from steam valve. Particularly adapted to lumber kilns, smoke houses, textile and leather drying processes, grain and vegetable dryers, etc.

Entirely self-contained, of rugged construction, built for hard wear and long life; no perishable rubber diaphragms; exceedingly sensitive; control within 1° or 2° may be expected.

Adjustment for different temperatures is accomplished by changing the position of the lever weight, which can be locked when proper location is determined. Bulletin 138.

NO. 15 REGULATOR

PRICE LIST NO. 15 REGULATOR

Size of valve, ins. ...	1/2	3/4	1	1 1/4	1 1/2	2	2 1/2
Shipping weight, lbs.	50	50	55	60	65	70	90
Price.....	\$60.00	65.00	70.00	75.00	80.00	90.00	95.00

Size of valve, ins. ...	3	3 1/2	4	5	6	8

Price.....	\$100.00	110.00	120.00	175.00	200.00	250.00

Always specify desired operating temperature, and state fully the purpose for which regulator is to be used.

Valves to 1 1/4 ins. inclusive have bronze bodies, with unions. The 2 to 3 ins. inclusive have iron bodies screwed; larger than 3 ins., iron bodies flanged, with standard drilling. Companion flanges and bolts furnished extra when desired.

Standard flexible tube length, 8 ft.; additional length, 30¢ per ft., net. Reversed valves for control of cooling mediums will be furnished at a slight extra charge.

TYPICAL INSTALLATION NO. 15 REGULATOR IN A LUMBER KILN

No. 11 REGULATOR—Controls temperature of liquids of all kinds under all conditions. Self-contained, requiring no water or other auxiliary operating power. All-metal. Of great durability, guaranteed accurate and positive in action. Very easily installed. Largely used on hot water tanks and heaters, glue heaters, paraffin and grease tanks, etc. Bulletins 129, 138 and 139.

INSTALLATION NO. 11 REGULATOR IN HOT WATER HEATER

PRICE LIST NO. 11 REGULATOR COMPLETE WITH VALVE

Size of valve, in.	1/2	3/4	1	1 1/4	1 1/2	2	2 1/2
Price	\$60.00	65.00	70.00	75.00	80.00	90.00	95.00

Size of valve, in.	3	3 1/2	4	5	6	8
Price	\$100.00	110.00	120.00	175.00	200.00	250.00

Screwed union valves up to 1 1/4 in. inclusive. 2 in., 2 1/2 in. and 3 in., screwed iron body; larger sizes iron body flanged. Standard flexible tube length, 8 ft.; additional length, 30¢ per ft., net. Bulb lengths, 20 to 24 in., requiring 1-in. and 1 1/4-in. tapping.

Liquid Temperature Control.

No. 16 REGULATOR—Same as described in first column of preceding page, but provided with an extension neck, giving a standard length of 19 in. from center of valve to bottom of thermostat cage, which length may be varied on specification. In this shape, the No. 16 regulator is used for control of liquids in open vats, for various processes, where it accomplishes wonderful results.

Bulletin 139 treats particularly of this regulator as applied in the meat packing industry. Also see Bulletin 146.

For prices, see preceding page, under No. 16 regulator.

NO. 16 REGULATOR

SHOWING USE OF NO. 16 REGULATOR IN HAM COOKING TANKS

No. 14B REGULATOR—Exceedingly accurate and reliable. Sensitive to a fraction of a degree. Uses compressed air as motive power.

Used in air conditioning and for cold storage rooms, dry kilns, japanning ovens, varnish rooms, pasteurizers, leather dryers, steam cookers, etc.

All brass construction; polished nickel finish. Dials glass covered.

With this regulator may be used either rubber or all-metal diaphragm mounted valves of direct or reversed type and adapted to the control of steam, gas or liquids under any pressure; also diaphragm motors for the operation of dampers where heated air or gases are to be controlled. Bulletin 132.

NO. 14B REGULATOR

SHOWING METHOD OF INSTALLING NO. 14B REGULATOR

PRICE LIST NO. 14B REGULATOR WITH RUBBER DIAPHRAGM VALVE

Size, in.	1	1 1/4	2	2 1/2	3	4	5	6
Price	\$80.00	85.00	90.00	100.00	105.00	110.00	130.00	160.00

Reversed valves at slight extra charge.

Instantaneous Steam Water Heater.

Thermostatically controlled. For wash sinks, shower baths, etc., in factories, mines, and industrial plants. Absolutely safe against scalding. Bulletin 137.

Mason Condensation Meter.

The operating cost of any steam using product can
only be figured on the condensation basis, whereby
steam condensation losses due to shutdowns using more
steam if wet and less steam if dry are all accurately
accounted for.

The accurate measurement of live steam is impos-
sible except
where density re-
mains constant.

An impor-
tant feature of
this meter is its
ability to meas-
ure vapor to a
maximum pres-
sure of about 5
ozs., which is es-
pecially valuable
in measuring
condensation in
atmospheric or
vapor heating
systems.

A unit out-
fit of Mason con-
densation meter
with Corliss
valve steam
traps is less ex-
pensive than
tilting traps
with stroke coun-
ter (dump in-
dicator).

CLEVELAND, OHIO

Products.

RELIANCE SAFETY WATER COLUMNS.

STEAM TRAPS.

SEAMLESS FLOATS.

FRICTION CLUTCHES.

Also Quick Closing Water Gauges and Lever Gauge Cocks.

Reliance Safety Water Columns.

The Reliance is the original safety alarm water column. It has been the standard for 30 years and meets all codes and laws.

The whistle gives a warning when the water level falls to the lower gauge cock or rises to the upper gauge cock. Reliance columns are made in two styles, the low alarm only and the combined high and low alarm. A Reliance seamless copper float operates each valve. The valves and levers are located above the water line away from sediment and scale which falls to the sediment chamber at the bottom where it can be blown out.

SECTIONAL VIEW OF RELIANCE COMBINED HIGH AND LOW ALARM

RELIANCE ELECTRIC ALARM

A Reliance electric alarm can be used in place of or in addition to the whistle. It can be connected to ring a bell, light a lamp or record on a chart when the water level is too high or too low. It gives a silent alarm for hospitals, hotels or schools.

Reliance Seamless Floats.

Reliance floats are seamless and made by our perfected processes. They are designed to give maximum strength and buoyancy with long life. They are made to fit any special requirements.

RELIANCE SEAMLESS FLOATS

Reliance Steam Traps.

The Reliance trap is operated by a Reliance seamless copper float that causes the valve to discharge in proportion to the inflow. It operates without unnecessary noise or hammering. All parts are easily accessible and free from complication or difficult adjustments.

SECTIONAL VIEW RELIANCE STEAM TRAP

Cleveland Friction Clutch.

The Cleveland clutch and cut-off coupling is an enclosed type with expanding ring. It is readily accessible and easily adjusted. The pulley is not a part of the clutch and can be changed without changing clutch.

STEAM TRAP SARCO; RADIATOR TRAP SARCO; TEMPERATURE REGULATORS for liquids and atmosphere, for drying ovens and manufacturing processes.
Metallic Gaskets.

Advantages of Steam Traps and Radiator Traps Sarco.

There is no simpler form of trap manufactured. There is practically nothing to get out of order; no levers, gages, packing, stuffing boxes or trouble causers. The traps can be adjusted instantly, and this company guarantees that, when adjusted, no live steam will be emitted.

Steam Trap Sarco.

Consists of a steam pipe body which can be screwed on anywhere in a steam main or pipe, occupying very little space and taking the place of an elbow or bend. In this body, a Sarco cartridge is inserted, containing an easily expansible fluid operating a spirally corrugated, hermetically sealed tube, to the lower end of which is attached a piston, which carries the valve head.

The trap requires simply to be put into position and the cartridge unscrewed a few turns. When the steam has heated the cartridge, expanding the fluid and forcing out the piston, the cartridge is gently screwed forward, until the valve head meets the seat, closing off the steam. The adjustment can then be locked and the trap works automatically. As soon as water collects, the liquid contracts and the valve opens; the condensation is then ejected by the pressure behind it, and immediately the steam comes into contact with the cartridge there is an expansion, and the trap closes. The Sarco trap works continuously, thus it requires no large storage capacity such as increases the bulk and the cost of other traps.

List prices	\$7.75	7.75	10.35	12.00	28.50	34.50	48.30	60.00	75.00

Radiator Trap Sarco.

A development of the steam trap Sarco. It uses a spirally corrugated tube of large diameter, which, with the outer case, forms the expansion chamber, containing a volatile liquid. The inside of diaphragm is directly exposed to steam or vapor, insuring quick action. Slight

change of temperature within the trap, due to condensation collecting in same, gives a wide open movement of the valve.

The Sarco is provided with a new valve head, which is a bronze metal ball, freely turning in a socket, insuring a perfect seat and offering a wearing surface many times greater than that of any other type of valve on the market.

The new Sarco radiator trap construction also permits the provision of a strainer of ample surface, ten times the area of the discharge opening of the trap itself. This obviates entirely trouble from clogged or leaking valves.

The trap is a factory adjusted trap and requires merely to be connected to the radiator and to a return exhaust line. It will work perfectly on any degree of vacuum and on any steam pressure up to 20 lbs. per sq. in., without strain and without readjustment.

List prices	\$6.00	6.00	7.50

DETAIL OF RADIATOR TRAP SARCO

Sarco Temperature Regulator.

The Sarco temperature regulators are for controlling the temperature of atmosphere and liquids. They use the same thermostatic principle as the well-known steam trap Sarco, that of expansion and contraction of a sensitive liquid hermetically sealed within the elements. They possess many advantages over thermo regulators at present on the market, in as far as they are compact, simple and wholly self-contained, requiring no exterior operating means, such as compressed air, water or electricity.

This form of construction accounts for the success of the Sarco, as it permits a more accurate and constant regulation, reduces installation expense to the lowest possible point, and eliminates maintenance expense, there being no parts to get out of order.

Sarco regulators are made in three standard types: for room temperature control, for dry kiln work and for tank control, operating on any given temperature between 32° and 300° Fahr. All types can be adjusted by user for any temperature 10° Fahr. above or 10° Fahr. below that for which regulator is calibrated.

Prices on application. Sizes of valves, 1/2 in. to 6 in.

SARCO TEMPERATURE REGULATOR

TEMPLETON MANUFACTURING CO.

Manufacturers of Return, Vacuum and Separating Traps

117 Business Street
HYDE PARK, MASS.

Products.

RETURN STEAM TRAPS; VACUUM TRAPS; SEPARATING TRAPS.

Sterling Return Steam Trap.

More efficiently removes condensation from steam systems than any other trap and automatically returns it to the boilers.

Pumps water at a temperature exceeding 212° Fahr. (a steam pump will not), thus preserves all of the heat above 212°, returning a cubic foot of water for every cubic foot of steam. It operates on 90% less power than a steam pump.

DISTINCTIVE FEATURES—Valves and air vent are opened and closed by a rolling weight which travels from one end to the other of a rocker arm. This eliminates all trunnions and hence trunnion troubles, pounding, sticking and leaking.

The steam valve can be adjusted to open only when the receiving chamber of the trap is full of water. This gives maximum discharge capacity with minimum space, or it can be adjusted to discharge at any height of water.

While the rising and falling of the rocker arm is actuated by a float, this float is counterbalanced by a weight. This enables the use of a patented, very heavy, strong, indestructible, leakproof, seamless Sterling float, as from this counterbalance the full lifting power of the float is obtained regardless of its weight.

A gauge glass discloses constantly the work going on and gives immediate notice when return system is not functioning properly.

The traps are automatic in action and require little attention. There is no friction. They are noiseless, require no cylinder lubrication, will not race or run away, never become steam bound and air binding is an impossibility. All valves are on top of trap, easily accessible for regulation. No packing except in the valve stem, which is easily accessible for re-packing.

The Sterling vacuum trap automatically sprays cold water throughout the casing of the trap when it is

STERLING RETURN STEAM TRAP

*CAPACITIES OF STERLING RETURN TRAPS

51	1	16000	3300	400	5330
52	1½	26000	5300	650	8633
53	1½	34000	7000	850	11300
54	2	42000	8200	1020	14000

*Maximum capacities per hour based on ordinary condensing conditions.

full of steam, condensing the steam and creating a vacuum which pulls condensation from all over the system.

AUTOMATIC OPERATION AS BOILER RETURN—The trap should be placed 4 ft. above the boiler; when it is empty, the vent is open. Either by gravity, or the pressure in the system, or the pressure from another trap acting as a pump, condensation flows into the trap through inlet check valve at bottom of trap. As the trap fills, a large copper float in the trap casing rises. At an adjustable water level, a roller weight on tilting track and connected with the float is carried to the other end of the track, closing the vent and opening steam inlet connecting with boiler pressure. The trap will then return the water directly into the boiler, as the pressure in the trap is equalized with that in the boiler and the water will flow down through outlet check valve into the boiler by gravity. Trap casing is emptied and the float following the water, lowers itself, causing weight to return to other end of track, closing steam inlet and opening vent for another filling and another discharge. Gauge glass shows that receptacle is emptied on each discharge. Trap can then be used as a pump-to-pump condensation from one part of the plant to another and it will operate at about one-tenth the cost of a steam pump.

This company maintains a no-charge service department. Write concerning condensation problems.

Sterling Separating Traps.

The only steam trap wherein it is not necessary to break any pipe connection to get *all* parts out of the casing. One operation removes all parts at once.

The Sterling trap operates at any pressure and is equipped with the Sterling indestructible copper float. All parts are interchangeable.

Ingenious combination of counterbalanced float and vertical valve dropping from its seat overcomes the friction found in all other float traps and the obvious result is greater capacity, with elimination of wire drawing in valve, which with seat is of government metal and always under water seal.

STERLING SEPARATING TRAP

WARREN WEBSTER & COMPANY

Steam Heating Systems, Feed Water Heaters and Steam Specialties

MAIN OFFICE AND WORKS

CAMDEN, N. J.

OFFICES AND REPRESENTATIVES IN PRINCIPAL CITIES OF UNITED STATES AND CANADA

Products.

SPECIALTIES for WEBSTER SYSTEMS of STEAM HEATING, FEED WATER HEATERS, STEAM and OIL SEPARATORS, and EXPANSION JOINTS.

TRADE-MARK

Webster Vacuum System of Steam Heating.

A method of circulating exhaust or low pressure live steam, or a combination of the two with minimum initial or back pressure, and with entire freedom from waterhammer, air pockets, leaky air valves, and all of the other annoyances which are common with ordinary steam heating systems.

A partial vacuum is mechanically created and maintained by means of exhausting apparatus of suitable design and capacity, which may be steam driven or power driven vacuum pumps.

Condensation from each heating unit is discharged through an automatic Webster radiator trap, which permits the escape of air and water and prevents waste of steam.

A positive acting vacuum pump creates a pressure below atmosphere in the return piping and in the radiators, so that when steam is turned into the system it rapidly flows into the lower pressure until each heating unit is completely filled. The automatic radiator traps then close and prevent further passage of steam until it has done its work of heating and has become condensation, which will freely pass through the automatic trap.

The water of condensation and air flow to the lowest point of the system and are discharged by the vacuum pump to a higher level into the Webster air separating tank, from which the air is vented to atmosphere, while the condensation returns to boiler through boiler feed pump or by such means as may be required due to the particular conditions. Described in Bulletin No. B-500.

Webster Modulation System of Steam Heating.

A highly efficient modern type of low pressure steam heating system suitable where live steam only is used for heating, either direct from heating boilers or with steam supply furnished from outside source.

Quick and efficient circulation of steam is obtained by carrying a differential in pressure between the supply and return piping, and atmospheric pressure or slightly below in return piping, and atmospheric pressure or slightly above in the supply piping.

Initial steam pressure is closely controlled by a Webster damper regulator. Condensation is discharged automatically to the boilers or elsewhere through a Webster modulation vent trap which operates without adjustment or attention. The steam is admitted to each radiator through a Webster modulation valve which permits close modulation of room temperature by simple

hand manipulation. Condensation is discharged and air vented from each radiator through a Webster radiator trap which maintains full heating efficiency of radiation and eliminates all annoyances.

Condensation and air from each radiator are carried into Webster modulation vent trap, where the air is automatically vented, permitting the system under favorable boiler conditions to operate for long periods under partial vacuum, or "vapor," but also, due to its flexibility, permitting higher pressures to be carried in severe weather. The system may be modified to suit particular conditions. Described in Bulletin No. B-600.

Webster Heating Systems for Industrial Plants.

Industrial plants, especially those having available exhaust steam from steam driven power units or auxiliaries, present heating problems, the correct solution of which is vital to economy and efficient operation and requires individual engineering attention.

For industrial work, the Webster vacuum system of steam heating is particularly desirable not only for the saving of exhaust steam, which alone makes this system highly profitable, but also the returns are pure water, which with its contained heat can be fed back to the boilers.

Experience in installation of heating systems in thousands of prominent industrial plants, and the wide adaptability of Webster systems, enables this company to meet any industrial requirements.

The remodeling of old heating systems in industrial plants, to avoid the discomforts, inefficiencies and extravagances that exist where the latest methods and devices are not in use, has also been specialized.

So much has been done of this remodeling that very definite guarantees of saving can be made in advance. The Webster system has been applied to old plants on guarantee to pay for itself within two years—a return of 50% on the investment.

Preliminary investigation and advice involves no expense or obligation.

Webster systems for industrial plants are fully described in Bulletin B-501.

Webster Feed Water Heaters.

Thirty-one years of progressive development as the pioneer builders of the "no thoroughfare" type of open-feed water heaters has made this company the recognized leader in this line, and as to be expected, they build many special types and designs desirable to get greatest benefits under any given plant conditions. Webster heaters will heat the water to within 2° to 5° of the temperature of the exhaust steam.

Webster heaters most popular for power plant service only and those especially adapted for heating system requirements are as follows:

Type EB is the standard rectangular pattern for capacity of 300 to 12,000 h.p., combining with the heating function an efficient oil separator, filter and liberal storage capacity. For use in industries where there are intermittent demands for large quantities of hot water, this heater is modified by addition of much larger storage capacity at the bottom. Described in bulletin No. B-102.

Type EBH is exactly the same as the EB, except that the plates are thickened and strengthened for higher back pressures—as, for instance, in a paper mill using higher pressure exhaust steam for drying purposes.

TYPE EB WEBSTER
FEED WATER HEATER

TYPE EF WEBSTER
FEED WATER HEATER

Twin heater units connected to a common exhaust main are recommended for large plants and for those operated continuously. This arrangement avoids piping and control complications and permits one heater to be taken out of service for cleaning while the other remains in use. The twin arrangement also forms an easy method of increasing capacity by the addition of the second heater after the first has become too small for plant needs.

Type EF is for smaller capacities, 50 to 350 h. p., and is similar to Type EB, except that the shell is a one-piece casting and is supported by a framework made from pipe and fittings. Type EG is the same heater modified for power service only. Described in Bulletin No. B-105.

Type ED is of horizontal cylindrical form for 500 to 15,000 h.p. It contains all the essential features of the rectangular types, but has extra large storage capacity for receiving returns from heating or drying system, hot well, etc., and is particularly desirable also where there is less headroom than required for a rectangular heater. Described in Bulletin No. B-104.

TYPE ED WEBSTER FEED WATER HEATER

The preference cut-out type is a further development of our EB, ED, EF and EG types through the substitution of an extra large three-way oil separator, by

means of which all the exhaust steam, not merely that going to the heater, is purified from oil. The heater automatically takes what steam it needs, while the rest passes to heating system or to atmosphere. A cut-out valve between the oil separator and the heater permits isolation of the heater for cleaning, etc., without disturbing the flow of steam through the separator. This type is particularly desirable where part of the engine exhaust goes to the heating system.

Inasmuch as the selection of a feed water heater is a matter of careful judgment, the Webster engineering staff is always ready to co-operate with reliable advice to prospective customers.

Webster Steam Separators.

Webster steam separators deliver dry clean steam. Their use permits smaller piping to carry given quantity and flow of steam, avoids excessive condensation and economy losses and dangers to cylinder heads, and permits sliding surfaces to work with less lubrication. Plain and receiver types are made in all desirable sizes up to 12 in. Described in Bulletin No. B-300.

WEBSTER STEAM SEPARATORS

Webster Oil Separators.

Webster oil separators for purifying exhaust steam are made for horizontal or ascending or descending vertical currents and in sizes up to 24-in. plain and receiver types. The Webster oil separator baffles have been demonstrated to be highly efficient in separation with minimum pressure drop in the flow of steam. Described in Bulletin No. B-400.

WEBSTER OIL SEPARATORS

Webster Expansion Joints.

Webster expansion joints are made in single and double slip siding sleeve types for high and low pressure and with an anchor footing, the use of which avoids strains of pipe sag with their consequent leakage and adjustment annoyances. Types for the higher pressures are provided with limit bolts. Sizes 2 to 24 in.; pressures up to 200 lbs. per sq. in. Described in Bulletin No. B-1100.

VANCE-VETTER COMPANY

Manufacturers of Steam Traps, Separators and Valves

Phipps Building
PITTSBURGH, PA.

Products.

VANCE STEAM TRAPS ; BAUM STEAM and OIL SEPARATORS ; VANCE BLOW-OFF VALVES ; HYDRAULIC OPERATING VALVES.

Vance Steam Trap.

Extra large discharge valve will handle condensation as fast as it can come through inlet pipe. Most traps for pressures of 100 lbs. or over can not get the power to operate a discharge valve larger than about one-sixteenth the area of the inlet.

VALVES OPEN, TRAP DISCHARGING

7	2 or 2 1/2	22	22 5/8	14 1/4

Vance Blow-off Valve.

The double disc arrangement allows the main disc to open and close when there is no flow through the valve.

Can be furnished in angle or straightway, flanged or screwed.

The notable features of this valve are: (1) heavy bronze valve stem; (2) large hand wheel; (3) bronze bushed valve stem guide in bonnet; (4) removable wearing parts which can be replaced at small cost; (5) absolutely tight construction.

VANCE BLOW-OFF VALVE

Baum Steam and Oil Separator.

Baffle plates allow steam, air or gas to pass through in its natural direction and separate all non-elastic matter without reducing the pressure.

BOILER FEED CONTROLLERS; PUMP GOVERNORS and SAFETY COLUMNS.

Stets Boiler Feed Controller, Type B.

DESCRIPTION—A spherical displacement body, filled with water, and counterbalanced to ride one-half submerged; possesses all the power of a closed or buoyancy float of same size, and for the high pressures used in latest steam practice has no chance for failure. The Stets Type B controller design includes such a relation between weight of water filled float and weight of counterweight and lever arms as will cause float to ride at its middle line at all times. Float will not lose its water content by evaporation, because condensed steam which forms in upper steam connection to boiler drips into small pan attached to top.

OPERATION—Controller is connected to boiler at water level. Whenever water in boiler rises, the float must rise with it, otherwise it will gain buoyancy in proportion to rise in water level around it, and will no longer balance counterweight. Leverage and weight of counterweight then become effective to push valve steam downward. When water level in boiler falls the float loses buoyancy and gains weight proportional to the fall, and its impulsive power then becomes effective to pull valve stem upward. As leverage is very great and no stuffing box friction on valve stem to prevent gradual movement, a powerful, positive and fine control of valve movement is secured. The valve opening bears a fixed relation to water level. This is accomplished by no other regulator. Controller also eliminates usual water column.

TYPE B BOILER FEED CONTROLLER

V-PORT VALVE—Valve is of true balanced piston type. One sleeve serves both pistons and has 8 V-ports, 4 at upper and 4 near lower end. By removing jack wheel entire sleeve may be withdrawn without disturbing valve or breaking pipe connections. Valve stem is guided at its extreme ends. These metal guides are in water and consequently lubricated, hence but little friction. There is sufficient inertia in the mass of the float and counterweight to prevent any quick oscillations of water level from adversely affecting valve control.

The result of this design is a rate of feed proportional to boiler water level. This is accomplished with few parts and by powerful and certain means. As all parts are in pressure space the use of a stuffing box is avoided.

Finer control of flow may be obtained with V-port valve than with disc valve. The opening of disc develops a rectangle. As a V-notch weir will measure wide range of flows of water more accurately than a rectangular weir, so will V-port valve control flows far better than a disc valve.

Williams Steam Pump Governor.

This double disc type of governor is of heavy construction to meet the requirements of severe and constant service. The entire absence of weights, cups or pistons permits of very close adjustment, and gives exceptionally smooth operation. The governor is built in either angle or straightway styles of body, with flanged or screwed ends.

PUMP GOVERNOR

High and Low Safety Alarm Water Columns, Stets Type.

Especially designed for central station and other high pressure plants.

Has heavy pressure compensating float which prevents collapse under any operating steam pressure. Single float of large displacement, but one valve for both high and low alarms instead of two light weight floats with doubled likelihood of trouble.

Wright Specialties.

Wright specialties are standard the world over.

"Emergency" steam traps are guaranteed on all steam pressures up to 200 lbs.

"Victor" steam traps operate perfectly in low pressure systems, whether the steam gage registers 0 to 20 lbs.

All Wright products are shipped on trial.

"Cyclone" Exhaust Head.

The Wright "Cyclone" exhaust head prevents the injurious spraying (with the oil and water contained in exhaust steam) of roofs, walls, sidewalks, etc.

The great amount of condensing surface contained in the Wright "Cyclone" exhaust head is a distinct advantage. This is also true of the large passages which permit increased expansion of steam, and of the free outlet which makes this head especially adapted to high speed engines. All back pressure is avoided. Head is made throughout of extra heavy galvanized steel plate, riveted, soldered and thoroughly braced. Drip pipes are made of copper.

The outer shell is heavily coated with a rust resisting paint.

"CYCLONE" EXHAUST HEAD

Cast Iron Exhaust Head.

The Wright-Austin cast iron exhaust head has incorporated in its design all the fundamental principles required for the complete separation of steam from oil and water. The baffles are large in area, affording ample cooling and collecting surface.

Clearance area through the head is several times that of the exhaust pipe. This clear-

WRIGHT-AUSTIN CAST IRON EXHAUST HEAD
Interior view

ance slows the steam down to the point where separation is possible and provides against any back pressure in the head.

The lines of this exhaust head are harmonious and pleasing, combining exhaust head efficiency with good appearance, a requisite in modern plant practice.

Wright Strainer.

For use on steam or water systems, it prevents sand, scale or vegetable substances from entering steam traps, water pipes, boilers, meters, etc. A special strainer for a special purpose. Very effective where the source of boiler feed is from rivers, lakes, etc., a condition subjecting the boiler to impurities, resulting in scale, etc. Installed in pipe lines leading to steam traps, its use eliminates the possibility of foreign matter obstructing the valves, and, in consequence, interfering with satisfactory operation of traps.

Reference to sectional drawing herewith will demonstrate the simple yet positive action of this filter as applied to a hundred or more varying conditions.

A simple blow-off valve, screwed into the opening in plug and opened occasionally, will serve to keep the filter free from accumulated matter. The strainer

tube is of brass and many times larger in area than "inlet." Strainer tube is easily removed by unscrewing plug to which the tube is attached. Satisfactory operation is guaranteed.

Murray Automatic Boiler Feed Regulator and Automatic Pump Governor.

The Murray automatic is the most simple, efficient and dependable boiler feed regulator made. More than 300 of them have been installed in one plant. With regulator in use it is essential that pressure of water in feed line to boiler be uniform. The Murray automatic pump governor never fails to maintain that uniform pressure.

Sizes of Murray regulators are governed by size of feed line to boiler, and are made as follows: 3/4, 1, 1 1/2, 2, 2 1/2, and 3 ins. with screwed ends and 3 ins. with flanged ends. Connection can be made to either top and bottom or side opening.

Special Separators for Special Purposes.

Designed and built to solve problems of separation which can not be handled by standard designs of separators. Write, stating conditions requiring special separators.

SPECIAL SEPARATORS

Austin Live Steam Separators.

Guaranteed to render the highest possible efficiency in the elimination of moisture from steam.

Sizes 12 to 48 ins. are built with close flanges and furnished with stud bolts
Eye bolts placed on all sizes above 12 ins., inclusive.

AMERICAN STEAM GAUGE & VALVE MANUFACTURING CO.

ORIGINAL STEAM GAUGE COMPANY

GENERAL OFFICES AND FACTORY
208-220 Camden Street
BOSTON, MASS.

BRANCH OFFICES

PITTSBURGH, PA., Jenkins Arcade Building
NEW YORK, N. Y., 118 Liberty Street

CHICAGO, ILL., 25-27 South Jefferson Street
ATLANTA, GA., Candler Building

Products.

GAUGES—Steam, Air, Water, Compound Pressure and Vacuum, Ammonia, Hydraulic, Gas, Oil, Automobile, Test, etc., both Index and Recording.

GAUGE BOARDS, to order; GAUGE TESTERS.

VALVES—Pop Safety, Cylinder, Water and Hydraulic Relief, Snifting, etc.

STEAM and GAS ENGINE INDICATORS; STEAM TRAPS; FEED WATER FILTERS; MARINE and LOCOMOTIVE CLOCKS; REVOLUTION COUNTERS.

Also, Steam Whistles, Hydraulagraphs and Trainagraphs.

Experience.

Having been engaged in this line of business over threescore years, operating the largest plant of its kind in the world, this company offers its products for efficient and durable use throughout the industrial field.

American Single Spring Bourdon Pressure and Vacuum Gauge (Patented).

Gauges of this standard type manufactured and installed exclusively by this company until expiration of patent. Graduated to any pressure desired, not exceeding 500 lbs. for either steam or water. Graduations as high as 1000 lbs. furnished to order. Movement is of best non-corrosive metal, and springs are made of solid drawn tube of special mixture. A siphon should be used with each gauge on steam pressure.

Regularly furnished with silver finished brass dial; figures and graduations cut and filled with black

SINGLE BOURDON GAUGE

DOUBLE BOURDON GAUGE

enamel, or, if desired, black dial with silver figures will be furnished. Standard connection is $\frac{1}{4}$ -in. male.

Cock furnished with all gauges up to 500 lbs., sizes 3 in. and larger.

DOUBLE BOURDON PRESSURE GAUGE—For marine and portable work. It possesses rigid qualities, lessening vibration, and sensitiveness. Graduated for either steam or water to any pressure not exceeding 500 lbs.

PRICES, SINGLE BOURDON GAUGES, INCLUDING COCK

Illuminated Dial Gauges.

All American gauges can be made with illuminated dials, for use in darkened or obscure places, if desired.

American Compound Pressure and Vacuum Gauge (Patented).

Graduated by two mercury columns, indicating both pressure and vacuum.

AMERICAN COMBINATION GAUGE—For use in pumping stations to indicate height in feet, and corresponding pounds per square inch of water, in reservoir or standpipe.

WHEN ORDERING—State maximum pressure on which gauge will be used.

3 1/2	10.00	10.18	12.00	12.75

Gauges will be furnished with back connection, when so ordered, without extra charge.

American Ammonia Gauge.

Specially adapted for ice and refrigerating machines.

New construction, tube being bored and turned from solid bar high grade tool steel. No leaky joints to give trouble.

Sizes, 5 to 8 1/2 in.; connection from bottom or back of case.

Send for further details.

American Hydraulic Gauge (Patented).

Used in best railroad shops, sugar refineries and cottonseed oil mills. Made for pressures from 500 to 20,000 lbs. per sq. in. Springs of heavy solid bar steel turned and bored to size. Furnished with back connections when desired.

FIG. 260
AMMONIA GAUGE

FIG. 259
HYDRAULIC GAUGE

American Standard Test Gauge.

An established standard gauge for exhaustive tests of gauges of all types, wherever made. Graduated on an open column of mercury and tested under most severe conditions. Extremely sensitive under all pressures and guaranteed to be absolutely correct.

FIG. 258
STANDARD TEST GAUGE

American House Heater Gauge (Patented).

Bourdon single spring type. Constructed so as to prevent corrosion of the moving parts. Adapted for use in cellars, basements, etc. A siphon should be used with these gauges. Dial plainly marked with large figures.

FIG. 272
HOUSE HEATER GAUGE

American Altitude Gauge.

Indispensable in connection with hot water heaters, for denoting height of water in tank or reservoir.

NOTE—Short red hand is set at point on dial designating necessary height at which water should be kept in tank or reservoir. Long black hand automatically registers actual height of water at all times. Dial marked in feet instead of pounds.

FIG. 270
ALTITUDE GAUGE

American Recording Gauge.

A superior instrument for recording all pressures or vacuum. Features of construction include high grade 7-jewel clock enclosed in inner dustproof case, and improved fountain pen requiring filling only every 30 days. In writing, always state working pressure.

This company also makes ammonia recording gauges (pressure and vacuum); duplex recording gauges, for registering two distinct pressures on one chart; also, gauges fitted with special movements for 1, 12 and 48 hours and 7-day records, etc.

FIG. 287
AMERICAN RECORDING GAUGE

American Marine and Locomotive Clocks.

These 8-day clocks are made with ring hinged to case; fitted with lock and key, and any standard movement desired.

Designed for stationary plants, marine engines, locomotives, etc. Case is similar in style to that used on our standard gauges.

FIG. 282
MARINE AND LOCOMOTIVE CLOCK

American Revolution Counter (Patented).

Operated by either a reciprocating or continuous rotary motion, counting ahead whichever way the shaft revolves. It works equally well on pumps where length of stroke varies, counter-crank being adjusted for shortest stroke. Construction details sent upon application.

These counters are also made fitted in special oblong cases; also in square cases, for use with engines, pumps, grain scales, etc.

FIG. 284
REVOLUTION COUNTER

American Dead Weight Gauge Tester (Patented).

This pump possesses all the advantages of the mercury column; enclosed in much smaller space; and eliminates use of test gauges, their repair and their return to factory for accuracy trials.

All tests are made with dead weights in 5-lb. units, furnished for any desired pressure up to 1,000 lbs.

Designed for testing all types of pressure gauges in railroad shops, mills, factories and other establishments where many gauges are in use. When shipped, pump is filled with a light mineral oil, ready for use. Directions for operating accompany each tester (Fig. 312).

Also made in the hydraulic types, for testing high pressure or hydraulic gauges. Equipped for pressures up to 5,000 and to 25,000 lbs. per sq. in.

FIG. 312. DEAD WEIGHT GAUGE TESTER

American Gauge Boards.

For sets of instruments. Made in various shapes, of black walnut, cherry, mahogany, or plain oak boards; also of slate or marble.

For use in engine rooms of electric plants, steamships, mills, office buildings, mines, water works and factories.

When Ordering Gauges.

(1) State figure number; (2) pressure and size of connection; (3) whether goods are to be iron, brass or nickelplated.

American Pop Safety Valve.

For stationary and marine boilers. Fitted with adjustable blow-down ring. Valves are spring-loaded and relieve automatically at any desired pressure. Adjustment is simple; opening and closing are automatic; and the relief, size for size of valve, is greater than any other valve in existence. Least number of parts to maintain.

Reliability, durability and mechanical superiority have been established during many years. (Figs. 367, 369 and other illustrations).

American Pop Safety Valve, Models E and G.

Made of cast iron, semisteel or cast steel.

Constructed with both open and incased spring and with straight or compound drop levers, as ordered. Incased spring prevents contact of spring with steam. Spindle passes through bottom of spring case, which acts as a guide, and, by reason of small diameter of spindle, friction is eliminated.

LIFTING LEVERS—Leverage of long vertical arm is compounded by short connecting link, which becomes a toggle (as long arm approaches horizontal position) and acts with further leverage upon spindle through top horizontal lever.

Model E, Enclosed Spring Model G, Outside Spring
POP SAFETY VALVE, MODELS E AND G

Designed for working pressures up to 300 lbs., with test pressure of 450 lbs. Adapted for all styles of horizontal and vertical tubular boilers as well as all sectional and water tube boilers

American Marine Pop Safety Valves.

For merchant marine. Internal construction is similar to that of American pop safety valves, Models E and G.

These valves comply with rules and regulations of United States Board of Supervising Inspectors of Steam Vessels; also, English Board of Trade and French Lloyds' Inspection Bureaus.

FIG. 379. Duplex
DUPLEX IMPROVED MARINE POP SAFETY VALVES

FIG. 385. Twin

Types—Made in several styles as follows:

- (1) With straight lever.
- (2) With drop lever.
- (3) Duplex (two halves in one casing having one common opening).
- (4) Twin (two stationary valves mounted on a common "Y" base).
- (5) With outside spring (Fig. 374).

American Cylinder Relief Valve.

Designed for use on steam cylinders, feed pumps, fire pumps, jackets, valve chests, condensers, auxiliary exhausts, etc. Sizes, ½ to 4 ins.

Made inlet, if desired. Flanged ends to order.

FIG. 389
CYLINDER
RELIEF VALVE

American Water Relief Valve.

Made of iron, brass mounted. For pumps, either steam, rotary or plunger.

Valves are accepted by Inspection Department of Associated Factory Mutual Fire Insurance Companies for use on standard underwriter fire pumps. Used by manufacturers of underwriter pumps.

Fig. 405 shows an all-brass valve, of similar design, made in small sizes for small pumps.

Their capacity for relief, size for size, is guaranteed to be far greater than any other valve (Figs. 399, 404 and 405).

FIG. 410

FIG. 411

AMERICAN WATER RELIEF VALVES

Standard type, all-bronze. For use on tanks, pipe lines, etc. For pressures not exceeding 250 lbs.

American Thompson Improved Indicator.

Indicator shows graphically the exact conditions of pressure within cylinder, indicating adjustments in valve gear which may be required to insure economical operations and prolong life of engine.

SPECIAL ADVANTAGES—The indicator shows (1) pressure acting on piston; (2) drop in pressure between boiler and cylinder; (3) exact horsepower developed; (4) exact consumption of water; (5) waste of coal; (6) leaking piston and valve; (7) improperly set valve; (8) power demanded by full load; (9) power wasted at low load; (10) cost of running idle; (11) loss resulting from improper piping from boiler to engine and exhaust; and (12) like results in gas and ammonia work.

DRUMS—Made in sizes 1½ and 2 in.

REDUCING WHEEL ATTACHMENT—Wheel, made of aluminum, brass and steel, is to reduce accurately the motion of an engine crosshead to that required for a paper drum of an indicator.

ELECTRICAL ATTACHMENT—It consists of instruments furnished in pairs in a box, fitted with push button and two dry batteries.

Used in making tests of plants having two or more engines.

FIG. 477

AMERICAN THOMPSON IMPROVED INDICATORS

American Ideal Steam Trap.

It has been on the market over 10 years. Operates on pressures up to 295 lbs. Has a patented valve leverage

that permits use of heaviest floats (to withstand heaviest working pressures) ever put into steam traps. Float is seamless copper.

Valve is water sealed and can not leak steam.

Lifting capacity, 2 ft. of water for each pound pressure at trap. Valve discharges against any back pressure less than pressure in trap.

MODEL "C" TRAP
Showing seamless float (made any size), valve, etc.

IDEAL FLOAT VALVE
Adapted for any service. Float same as used in steam trap. Water level regulated by changing angle of float at "K"

* Table based on condensation ratio of 9 oz. per lin. ft. per hour. Allowance should be made for conditions causing a higher ratio, always selecting trap of sufficient size to care for maximum amount that may come to it at any time.

American H₂O Grease Extracting Feed Water Filter.

Designed for the efficient removal from feed water of grease which, after slight boiling, adheres in the form of "slugs" to boiler shell and flues.

This filter has a filtering surface many times greater than area of the feed water pipes, and occupies small space.

OPERATION—Under double filtration, filtering cages are covered with two layers of "Turkish toweling," which cloths are to be changed as often as conditions require. Temporary cleaning, however, may be effected by applying a reverse current of steam and drawing off the oil and grease while filter is in service.

Further particulars sent on request.

BRISTOL'S RECORDING PRESSURE, VACUUM, DRAFT and COMBINATION GAUGES; LIQUID LEVEL GAUGES; RECORDING THERMOMETERS; RECORDING PSYCHROMETERS; INDICATING and RECORDING ELECTRIC PYROMETERS; THERMOSTATS; TEMPERATURE CONTROLLERS; RECORDING VOLTMETERS, AMMETERS and WATTMETERS; RECORDING MILLIVOLTMETERS; RECORDING SHUNT AMMETERS; FREQUENCY METERS; ELECTRICAL and MECHANICAL TIME RECORDERS; RECORDING TACHOMETERS; COUNTERS.

Bristol-Durand Radii Averaging Instruments.

For Belt Lacing, Safety Set Screws, etc., see page 862.

Bristol's Recording Pressure and Vacuum Gauges.

For securing continuous night and day records of pressure or vacuum, for steam, air, gas and liquids. Charts furnished to read in pounds, ounces, inches, feet, metric or any desired units; for ranges from full vacuum to 12,000 lbs. per sq. in.

The construction of these instruments is extremely simple. On instruments for high ranges, the pen arms are attached directly to the pressure tubes without employing gears, levers or other multiplying devices. The original form Model 11 case affords space for a long length of pen-arm with small angle of deflection to cover entire scale. Many instruments of this model have been in continuous service for 15 years without even being repaired.

Round form models can be furnished at somewhat lower prices than the original form.

Bristol's Recording Liquid Level Gauges.

For use where it is necessary or desirable to locate recording instruments at a higher or a lower level than the liquid to be measured.

Especially valuable for automatically and continuously recording the depth or level of water or other liquids in tanks, water towers, reservoirs, etc.

Differing from float gauges, these instruments are independent of freezing temperatures.

RECORDING LIQUID LEVEL GAUGE

RECORDING GAUGE
Original form—Model 11

RECORDING GAUGE

TRADE-MARK
BRISTOL'S

REG. U. S. PAT. OFFICE

Bristol's Long Distance Transmitting and Recording System.

For transmitting electrically, over distances of many miles, records of pressure,

liquid level, temperature, mechanical motions, etc.

The needs of such an equipment are numerous in connection with water works,

central heating stations, hydro-electric plants, gas distribution systems, irrigation projects, etc.

Bristol's Recording Thermometers.

For all commercial ranges of temperatures from 60° below zero to 800° Fahr.

Equipment furnished with plain sensitive bulb for use in dry kilns, etc. The bulb is located where the temperature is to be measured, and connected with flexible leads to the recorder, which may be placed in the most convenient location. Patented automatic compensators furnished when needed to insure accurate results.

Also furnished with bulbs having union and screw connections for recording temperatures of water or other liquids in closed spaces under pressure, such as boiler feed water, superheated steam, milk pasteurizers, etc.

RECORDING THERMOMETER
Model 311

RECORDING THERMOMETER
Moistureproof—Model 140

Bristol's Recording Wet and Dry Bulb Thermometers or Psychrometers.

For determining the degree of humidity or moisture in the atmosphere.

Two independent thermometers are mounted in one case and register on the same chart.

Equipped with a motor and fan, which keeps a good circulation of air over the bulbs. Also equipped with patented device for producing a continuous flow of water through wick to keep it moist.

RECORDING
PSYCHROMETER

Bristol's Indicating and Recording Electric Pyrometers.

For ranges up to 3000° Fahr. The internal type cold end compensator exclusively applied to Bristol's pyrometers is one of the most radical improvements in thermo-electric pyrometry. High resistance Model 319 is especially suited for use in connection with furnaces for hardening high speed steel, also brick and pottery kilns and furnaces. Pyrometer may be installed a long distance

INDICATING PYROMETER
High resistance Model 319

PORTABLE INDICATING PYROMETER

from the furnace if desired. Portable instruments can be furnished, suitable for general checking both in shop and laboratory.

Combination units of Bristol's pyrometers are ex-

COMBINATION UNIT OF ELECTRIC PYROMETERS

tensively used, indicating instrument being located at the furnace to guide the operator, and recording instrument located in superintendent's office.

Bristol's Temperature Controllers.

For automatically controlling temperatures of ovens and furnaces heated by oil, gas or electricity. Models 176, 276 and 376 are used for temperatures up to 800° Fahr.; Model 473 for higher temperatures.

Bristol's Recording Electric Meters.

Bristol's recording voltmeters for all commercial ranges of D. C. and A. C. It is important to maintain uniform voltage for operating electric lights and for many other purposes. Records obtained with Bristol voltmeters show whether desired results are secured.

THERMOSTAT

RECORDING VOLTMETER
Switchboard—Model 510

FIG. 573. RECORDING AMMETER
Portable—Model 612

Bristol's recording ammeters, furnished in switchboard or portable type, provide continuous records of current on generator and feeder panels, for motor and transformer tests and to provide records of customers' current consumption.

Bristol's strip type recording wattmeter, portable model, designed for use on both polyphase and single phase alternating current. Convenient and practical for carrying about to points where it is desired to obtain records of consumption of electrical energy.

Bristol's recording millivoltmeters, equipped with high grade pivot jewel bearing movements, are extensively used for recording very minute potentials which are involved in electrolysis investigations.

Bristol's Operation Recorders.

For recording occurrence and duration of mechanical movements and machine operations.

This strip type electric time recorder is designed to record 20 different operations on one chart. There are thousands of uses for this operation recorder in manufacturing plants. Easy to install.

Bristol's Recording Tachometers.

For recording speed of shafting, machines, engines, etc. Furnished in pneumatic type or electric for either A. C. or D. C. Simple in construction. Particularly suitable for use with paper machines and for use in connection with blowing engines at blast furnace plants.

FOXBORO INDICATING and RECORDING GAUGES for pressure and vacuum; INDICATING and RECORDING THERMOMETERS; AUTOMATIC TEMPERATURE CONTROLLERS; INDICATING and RECORDING ELECTRIC PYROMETERS; DIFFERENTIAL PRESSURE RECORDERS; FLOW METERS for gas and liquids; INDICATING and RECORDING LIQUID LEVEL GAUGES; RECORDING PSYCHROMETERS; RADIAL PLANIMETERS; REVOLUTION COUNTERS; CO₂ RECORDERS for flue-gas analysis; GAUGE BOARDS.

Mechanical and Electric Time Recorders, Clocks, Indicating and Recording Tachometers, Siphon and Mercury Gauges, Air-speed Indicators, Airplane Thermometers.

Foxboro Gauges.

RECORDING—For steam, gas, water, air, oil, ammonia, brine, anything under vacuum or pressure; any range from full vacuum up to 20,000 lbs.; any unit of measurement: inches water, ounces, pounds, feet, metric units, etc. New inverted type does away with blotted records and dirty pen arms. All gauges are equipped with patented chart holder; micrometer adjustment pen arm; automatic release pen lifter. All cases round form and dusttight.

Two-pen recording gauges furnished to record two separate pressures on one chart. Bulletin BA-98-1.

INDICATING — All movements are absolutely *non-corrosive* and independent of the case. Perfect alignment of working parts insures accuracy.

Ammonia gauges and hydraulic gauges for pressures over 1000 lbs. have nickel steel screwed tubes. Positively will not set or leak. Bulletin BA-95-1.

Foxboro Thermometers.

RECORDING — Depend upon expansion of liquids, gas and the vapor tension of volatile liquids for their action. Impossible to deteriorate with age.

No mercury used—effect of atmospheric conditions is thus eliminated. Connecting tube can be 300 ft. long and accurate results guaranteed. The actuating movement is our improved helical tube movement. *No multiplying devices are used.*

RECORDING GAUGE
Sizes 8, 10 and 12 in. Any finish desired

Sizes 2 to 24 in. Range, from full vacuum to 20,000 lbs. per sq. in.

RECORDING THERMOMETER
Sizes 8, 10 and 12 in. From — 60° to + 1000° Fahr., or corresponding ranges in Centigrade or Reaumur

FOXBORO
TRADE MARK

Charts either even scale or increasing scale as desired. Bulbs made to suit any kind of application. Special lead and acid resisting bulbs are made for the chemical industry.

Two-pen and three-pen recording thermometers, to record on one chart 2 or 3 separate temperatures, can be supplied. Bulletin No. BA-104-1.

INDICATING—Designed to eliminate excessive breakage. An instrument easy to read and of the long distance type as well as stem type. No mercury—the same principle applies as in the recording thermometer. Bulletin BA-104-1.

Foxboro Recording Psychrometers.

Same principle as in the recording thermometers but with 2 pens, one to record the dry bulb and the other the wet bulb temperatures.

Furnished in 2 distinct types: self-contained (as illustrated), and long distance.

Special table furnished with each instrument makes determination of humidity very easy. Bulletin BA-103-1.

Foxboro Automatic Temperature Controllers.

Improved type motor valves operated by vacuum or pressure; automatically close if air system fails; overheating prevented. Controllers operate 1, 2 or 3 valves on one system. Can be equipped with clock for time control. Built in combination with recording thermometer. Bulletin No. BA-112.

INDICATING THERMOMETER
From — 25° to + 1000° Fahr., or corresponding degrees Centigrade or Reaumur

RECORDING PSYCHROMETER

AUTOMATIC TEMPERATURE CONTROLLER

From — 60° to + 800° Fahr. Operate valves up to 12 in.; graduated scales. Set index hand at desired point and regulator automatically controls temperature at that degree

Foxboro Electric Pyrometers.

Indicating and recording types. Stationary or portable. For any heat treatment of any metal. All fire bars and thermo-couples are *interchangeable*. Send for Bulletin BA-108.

INDICATING PYROMETER

RECORDING PYROMETER
OR "TAPALOG"

Records automatically 1 to 6 separate temperatures on 1 chart. Up to 3000° Fahr. for use with base metal or platinum rhodium thermo-couples

Foxboro Liquid Level Gauges.

Both indicating and recording types.

Primarily designed for recording varying levels of rivers, reservoirs, canals, forebays, tail races, etc.; but have been widely adopted for sewer work, weir measurements, specific gravity recorders, and paper mills use them to record the height of stuff in Jordan stuff chests, etc.

Are not affected by ice formation; can be used on liquids other than water; guaranteed for accuracy and will be sent on trial. Complete list in Bulletin No. BA-82.

LIQUID LEVEL GAUGE

Foxboro Differential Pressure Recorders and Orifice Meters for Gas.

The difference between two existing pressures can be accurately recorded by these instruments. Float type. Can not blow mercury.

Used extensively in connection with orifice plates, Pitot tubes and Venturi throats for measuring the flow of gases and liquids under pressure.

Complete orifice meters for measuring the flow of gases and liquids are supplied. A complete meter consists of a differential recorder, static pressure recording gauge, special flange union and orifice plate as shown. The

DIFFERENTIAL
RECORDING GAUGE

Guaranteed to give satisfactory results under pressures from 0 to 4-in. head of water and up to any desired differential pressure, and under static pressure up to 1000 lbs. per sq. in.

instruments are mounted on angle iron frame, with all necessary pipe fittings.

These meters are adaptable to many kinds of service. Complete data in Bulletin No. BA-113.

ORIFICE PLATE AND FLANGES

Foxboro Improved Radial Planimeters.

For averaging any kind of records on circular charts.

A very convenient instrument. Gives mean ordinate in linear inches.

Made for us by Amsler & Son, Switzerland. Complete information and instructions for use will be found in Bulletin BA-101.

RADIAL PLANIMETER

Foxboro Revolution Counters.

For either right or left, rotary or reciprocating motions. Equipped with easily operated device for resetting to zero.

Can be built with capacity of 99,999,999. Round type furnished in sizes, 6, 8½, 10 and 12 in. Send for Bulletin BA-95.

REVOLUTION COUNTER
Round type**Foxboro CO₂ Recorder.**

Used for flue-gas analysis. Compact and rugged in construction. Simple, sure and accurate in operation. No rubber tubing to deteriorate. This is strictly a commercial machine and not a delicate laboratory instrument.

A neat dotted line on the chart shows amount of CO₂ in flue gas at a glance, affording ready means for observing the efficiency of firing. Send for Bulletin BA-114.

CO₂ RECORDER**Foxboro Gauge Boards.**

This company is prepared to design and build to order neat attractive gauge boards for any combination of Foxboro instruments.

Complete proposals will be submitted on receipt of specifications.

How to Specify.

Specify Foxboro recording and indicating instruments. Our Engineering Department is at your service.

PRECISION INSTRUMENT COMPANY

Manufacturers of Recording and Indicating Instruments for Power and Gas Plants

FACTORY AND MAIN OFFICE

21 Halsey Street

NEWARK, N. J.

BRANCH OFFICE, DETROIT, MICH.

Products.

AUTOMATIC CO₂ RECORDERS; INDICATING and RECORDING GAUGES for vacuum and pressure, with scales in inches, pounds and millimeters of water, mercury and kerosene; COMBINED RECORDING and INDICATING GAUGES; HAND ORSATS or FLUE GAS ANALYZERS; SPECIFIC GRAVITY RECORDERS; RECORDING GAS CALORIMETERS; GAS COLLECTORS; COAL CALORIMETERS; MICRO-METER GAUGES; LABORATORY GLASSWARE.

Also, SO₂ Recorders, Wet Gas Test Meters, Pitot Tubes.

CO₂ Recorder.

Automatically analyzes the flue gases and records on a 24-hour or 60-day chart. True orsat in principle. Reagent used is potassium hydroxide. Simple in construction; accurate to .5 of 1% CO₂. Standard range, 0 to 20% CO₂. Also supplied in 0 to 10% for producer gas; 0 to 50% for blast furnaces and lime and cement kilns; 65 to 100% for soda ash manufacturers.

CO₂ RECORDER

Precision Gauges.

Precision 5-in-1 gauges to indicate the drafts in boiler where Cox or Harrington stokers are installed, enabling the fireman to read pressure and drafts at every part of the boiler. Dead beat construction under Precision patents.

Precision 4-in-1 gauges for use in installations where an economizer is installed. Same general construction as 5-in-1 gauge.

Precision 3-in-1 gauges for use with stokers with forced draft; and are installed to enable the operating man to see at a glance the three vital points of draft in a boiler. Can also be supplied in recording 24-hour type.

3-in-1 5-in-1
PRECISION DRAFT GAUGES

Precision 2-in-1 gauges for use in natural draft boilers, showing the draft in the combustion chamber and the last pass or any other points of draft desired.

PRECISION 2-IN-1 DRAFT GAUGE

The above named gauges supplied in ranges from 1 in. vacuum or pressure to 10 in. pressure to meet the requirements of the installation.

Precision single indicating gauges for indicating vacuums or pressures. Rugged in construction, and of well-known Precision dead beat type.

Supplied in inches, pounds and millimeters of water, mercury or kerosene.

Precision 60-day tape gauges, supplied in ranges from 2 in. vacuum to any desired pressure, are of dead beat construction, and used to record drafts at the boiler or steam pressures.

Precision 24-hour recording gauges guaranteed accurate. Dead beat construction. Ranges 1 in. to 500 lbs. vacuum and pressure.

In feet head for liquid levels.

For coke oven use, can be supplied in millimeters of kerosene.

PRECISION SINGLE GAUGE

PRECISION
60-DAY TAPE
GAUGE

PRECISION 24-
HOUR RECORD-
ING GAUGE

Precision Recording Calorimeters.

Precision recording calorimeters for recording on a 60-day chart the British thermal units of artificial, natural or producer gas. Automatically compensates for variations in temperature, specific gravity and pressure. Accurate and reliable.

Simple in construction, and gives permanent record.

Precision Specific Gravity Recorders.

Precision specific gravity recorders automatically record the specific gravity of gases; and are applicable for natural gas, producer gas, artificial gas, and in the oil and gasoline fields. They are accurate, simple and reliable.

PRECISION RECORDING CALORIMETER

PRECISION SPECIFIC GRAVITY RECORDER

Precision Standard Orsats.

Orsats in 1, 2, 3, 4 tubes. Burettes graduated for 50 cc or 100 cc. All metal and glass construction. Analyze for CO_2 , CO , O , H .

Orsats for other readings can be supplied to your specifications.

Combined Recording and Indicating Gauges.

Give the indication at a glance, and also the permanent record of the condition on a 60-day tape chart. Made for either vacuum or pressure, direct reading or differential, and can be supplied with a re-winding device for the used chart if desired. Case is of all-metal construction, black enamel. Bronze front can be furnished at extra cost.

When ordering give range desired, as these gauges are made with diaphragm construction for the low ranges and Bourbon tube type for the higher ranges.

PRECISION 100 CC STANDARD ORSAT

PRECISION COMBINED RECORDING AND INDICATING GAUGE

Gas Collectors.

Enable the engineer to make a complete analysis of the gas and accurately check up the efficiency of the boiler.

The improved type consists of a substantial galvanized iron tank with piping arranged for constantly drawing a sample of gas from the flue.

This instrument was especially designed for small power plants.

PRECISION GAS COLLECTOR

Coal Calorimeters.

A simple and reliable patented instrument for determining the heating value of coal.

This company has been identified with the manufacture and sale of coal calorimeters for several years, and the subject is now receiving the special attention it deserves, for within the last few years coal buyers have begun to realize the financial advantage of buying coal on a heating value basis from tests of the coal offered for sale.

PRECISION COAL CALORIMETER

Double Micrometer Level Gauges.

These instruments combine rapid and accurate calibration with low maintenance and the minimum chance of breakage. Absolutely no strain is placed upon the glass in these gauges. The connection between glass and metal is through a simple seal.

If it is desired for portable purposes, make a fixed joint by inserting the proper mixture in the seal cups, screw in the nipple, and it is accomplished.

PRECISION DOUBLE MICROMETER LEVEL GAUGE

Chemical Glassware.

The PRECISION INSTRUMENT COMPANY will make to specifications chemical glassware or supply standard articles.

Products.

PYROMETERS; THERMOMETERS; GAUGES; TACHOMETERS and other SCIENTIFIC INSTRUMENTS.

Pyrometers.

HIGH RESISTANCE INDICATING TYPE—For measuring temperatures from 300° to 3000° Fahr. or equivalent Cent.

Operates on thermoelectric principle. Entirely unaffected by temperature changes along wire connecting thermocouple to instrument.

Also designed to automatically control or regulate temperatures of electric, gas or oil furnaces.

HIGH RESISTANCE RECORDING TYPE—Keeps a continuous record, day and night, of temperatures. Eliminates guesswork. Gives executive a check on plant operation.

CONTINUOUS RECORDING TYPE—Makes a continuous record of temperatures over a 2 months' period. It requires only the winding of 8-day clock mechanism once a week. Made in types to record the temperature of 1, 2, 4, 6, 8 or 10 thermocouples in different colors on one chart.

PORTABLE TYPE—Made in both high and low resistance types. Height, 7 in., width, 7 in., depth, 4½ in., weight only 6½ lbs.

HIGH RESISTANCE INDICATING PYROMETER

RECORDING PYROMETER

CONTINUOUS RECORDING PYROMETER

PORTABLE PYROMETER

Recording Thermometers.

For measuring temperatures up to 800° Fahr. Operates on the principle of expansion of gas or liquid with change of temperature. Tubing can be 100 ft. long. Readings are unaffected by atmospheric changes in temperature along tubing or at instrument. Makes a clear, accurate chart.

RECORDING THERMOMETER

Recording Pressure Gauge.

For recording all ranges of vacuum and pressure from a few ounces of water to 3000 lbs. Operate through expansion or contraction of a helical hollow spring for high pressure and a series of diaphragms for lower pressures and vacuums. Positive and accurate.

RECORDING PRESSURE GAUGE

TIME AND OPERATION RECORDER

Time and Operation Recorder.

Extensively used for recording the time of operation of machinery, switches, valves, pumps and for recording the reversals of glass melting tanks, open hearth furnaces and annealing furnaces. Also for recording the time of starting and stopping of paper machines and other devices.

Other Brown Instruments.

Ammeters; draft gauges, electrical tachometers, mercurial tachometers; mercury gauges; milli-ammeters; milli-voltmeters; recording gauges; temperature controllers; mercurial thermometers; vacuum gauges; voltmeters; differential gauges.

BROWN ELECTRIC TACHOMETER

BROWN DRAFT GAUGE

BROWN MERCURIAL THERMOMETER INDUSTRIAL TYPE

PRECISION THERMOMETER & INSTRUMENT CO.

1434 Brandywine Street
PHILADELPHIA, PA.

Products.

THERMOMETERS for Laboratory, Factory and Power Plants; HYDROMETERS; HYGROMETERS; BAROMETERS; AUTOMATIC REGULATORS; METEOROLOGICAL INSTRUMENTS; VACUUM GAGES; PRECISION INSTRUMENT WORK—special and experimental.

Automatic Regulators.

Electrical for heavy duty.

Barometers (Government Standard).

Mercurial standard U. S. W. B. type.

Hydrometers.

Plain and combination standard grades only, with individually calibrated hand written scales.

Hygrometers (Government Standard).

Wet and dry bulb hygrometers for the accurate determination of relative humidity.

Vacuum Gages.

Full column mercurial gages with trap.

Calender Micrometers.

Indicating and recording, for use on calendering machines to indicate the thickness of paper, linoleums, etc.

Ballistic Instruments (Government Standard).

"Precision" LeBoulange chronograph of improved design, as adopted in 1917 by U. S. Government and the largest powder manufacturers. Complete units furnished.

Low Temperature Thermometers.

Special chemical thermometers reading to—100 C. filled with toluol, and to—200 C. filled with pentane.

Thermometers (Navy Standard).

Navy Department, Bureau of Steam Engineering standard type thermometers.

Thermometers (Government Standard).

INDICATING THERMOMETERS: "Crescent" and "Reform."

RECORDING THERMOMETERS: "Columbia" and "Schaeffer."

TACHOMETERS: Hand and Stationary.

COUNTERS: Indicating and Recording.

OPERATION RECORDERS.

CALORIMETERS: "Carpenter's" Separating and Throttling Steam.

Gauge Boards and Complete Equipment.

Gauges.

A complete line of pressure, vacuum and draft gauges for all purposes. Constructed on most approved principles with the best of material and workmanship.

Catalogue S-C 1.

GAUGE

Recording Gauges.

For accurately recording all pressure, vacuum or draft "Columbia" and "Schaeffer" recording gauges will meet the most exacting requirements.

The "Columbia" is furnished with 8-in. or 12-in. charts making one revolution in 24 hours, 7 days, or other time periods.

The diameter of the "Schaeffer" chart is approximately $7\frac{1}{2}$ ins.

Equipped with "Day and Night" border charts, removable and adjustable recording pen arm, non-corrosive and non-spilling glass pens, etc.

Catalogue S-C 100.

STANDARD THERMOMETER COMPANY

65 Shirley Street
BOSTON, MASS.

Products.

STANDARD METALLIC THERMOMETERS.
STANDARD THERMOSTATS.

Thermometers.

This company manufactures types of standard thermometers to meet the various demands of a wide range of uses. The highest degree of accuracy and sensitiveness has been achieved through 25 years of experience building products which are thoroughly tested and leave the factory with a full guarantee to give satisfaction.

Standard Recording Thermometers are designed and made for every condition demanding a permanent temperature record, and especially adaptable for industrial installations, such as dry kilns, japan and bake ovens, refrigerating and cold storage plants and greenhouses.

No. 200 is for use in public buildings, factory rooms, hospitals, offices, clubs or homes. No. 200 recording thermometers are furnished in attractive oxydized copper or black enamel cases and with daily or weekly charts providing for temperature ranges of from 0° to 500° Fahr.

While extremely sensitive to changes, these instruments are practically indestructible, a feature of importance when they are to give service in kilns, brick ovens, etc., where the hazard of damage would ordinarily be great.

No. 200. STANDARD RECORDING THERMOMETER

Mechanical Thermometers.

No. 42—For installation in sugar boilers, vacuum pans, japan and bake ovens, kilns, water and oil tanks, retorts, steam and hot water lines, etc. This type furnished also in Reamur or Centigrade scale.

No. 43—Same type as No. 42, but has vertical extension.

No. 34—Has 6-in. dial and protecting brass shell over the extension, perforated over the lamina, which increases the sensitiveness of the instrument. No. 34 is especially designed for service where dry heats are maintained, and has a range of from 0° to 400° Fahr.

EXTENSIONS—A threaded extension, either horizontal or vertical is furnished with instruments to be used in kilns, retorts, etc., with which temperatures from below 50° to above 500° Fahr. can be accurately recorded. The length of an extension is measured from the end of the screw thread to the end of the lamina cover, and is the portion of the thermometer extending into receptacle.

VERTICAL EXTENSION

No. 34. SHOWING EXTENSION

No. 42. WITH EXTENSION

ADVERTISING THERMOMETERS—For households, offices and public buildings.

No. 85 "Standard"—Has full revolution movement and 9-in. dial. Is very easy to read and provides a conspicuous place for the advertiser's message on dial. An advertising medium of the highest grade. Furnished in copper, oxidized copper, black, or nickel finish.

No. 197 "Amesbury"—Is similar to No. 85, except that a 90° arc dial is used, thereby providing greater space for advertising on dial. Advertisement printed in as many colors as required.

No. 138S, Desk Type Thermometer—A 3-in. thermometer set in highly polished pressed steel base. Is very desirable for use on desk, table, or mantel. As a premium or advertising medium it is unexcelled. Advertisement carried on either the dial or front of the base.

No. 85 THERMOMETER

"AMESBURY" SPECIAL NO. 197

DESK TYPE "AMESBURY"

Thermostats.

STYLE B—For the control of motors and regulation of steam and heat of furnaces, vulcanizers, boilers, etc., this instrument can be furnished with extensions up to 24 in. though the 4 in. is the regular length.

TEMPERATURE RANGES

B-1 0° to 200° Fahr.
B-2 50° to 250° Fahr.

B-3 100° to 300° Fahr.
B-4 200° to 400° Fahr.

GREENHOUSE THERMOSTATS—No. GH3—High temperature and low temperature contact hands set at desired points by stud through glass.

No. GH4—Similar to No. GH3, but set stud is under glass. Lock prevents tampering and case is hermetically sealed.

GREENHOUSE THERMOSTAT

Shipping.

Each instrument is packed in a separate mailing case and its safe arrival is guaranteed.

INDICATING, RECORDING and CONTROLLING INSTRUMENTS:

Automatic Temperature, Pressure, Time, Vacuum, Liquid Level, Condensate, Time-temperature and Time-pressure Controllers; Mercurial Barometers; Humidity Indicating Instruments; Hydrometers; Hygrophants; Oil Testing Instruments; Pyrometers; Recorders; Recording Gages and Thermometers; Thermometers: Indicating, Recording and Registering; Vacuum Gages, etc.

Automatic Controllers.

Roesch-designed, of both air-operated and self-operating types, for purposes enumerated below.

APPLICATION—All TAG Controllers are supplied with variations of features, according to nature of the industry and specific local conditions.

Therefore, they can be advantageously employed in practically every industry where the factor of uniform control of temperature, pressures, etc., is essential for economy, efficiency and the guaranteed quality of the products.

Temperature Controllers.

For use at from -40° to 900° Fahr., or equivalent; of both air-operated and self-operating types. (Refer to opposite page concerning the self-operated type.)

"PERFECT" TYPE AIR-OPERATED TEMPERATURE CONTROLLER

DIAPHRAGM MOTOR VALVE
Replaces hand valve and is operated by controller

P. & W. LEVEL AND CONDENSATE CONTROLLER

Pressure Controllers.

For maintaining uniform pressures within the limits of as little as 1/25-in. water column, and as high as 400 lbs. per sq. in.; of both air-operated and self-operating types. (Refer to opposite page concerning the self-operated type.)

TRADE-MARK

Liquid Level Controllers.

For either open or closed tanks at any elevation, and for holding any kind of liquid.

Condensate Controllers.

For effectively discharging any volume of condensate under practically any conditions.

Time Controllers.

For automatically shutting off the heating or cooling supply entirely, at the end of any time period for which the controller is set.

Vacuum Controllers.

For vacuums as slight as 1/25-in. water column and up to 30-in. mercury column.

Thermometers.

TAG industrial mercurial thermometers for all industrial requirements where accuracy is a factor of importance, with scale limits from 60° Fahr. below zero to 1000° above or equivalent; in a variety of forms and sizes.

Provided with various features to best suit the particular requirement of usage.

Also other industrial thermometers of less refinement, in a great variety of styles.

Miscellaneous thermometers of all types and forms for every purpose.

TAG INDUS-TRIAL THER-MOMETER
Straight form

Recording Thermometers.

For temperature from 60° Fahr. below zero to 800° above, or equivalent; of self-contained and long distance forms, in various sizes and patterns. Arranged with numerous special connections and other features for, in each case, recording the temperature with the highest degree of accuracy.

RECORDING THERMOMETER

Oil Testing Instruments.

For determining the specific gravity, flash and fire point, boiling point, melting point, freezing point, viscosity, etc., of oil, fat, wax, grease, etc. Hydrometers of various ranges and forms; jars, tubes, bottles and glasses for test purposes; oil thieves and samples; water indicators; special thermometers; gage and want-age rods; centrifuges; stills; separatory funnels, etc.

Self-operating Controllers for Temperature and for Pressure.

These TAG controllers can be applied to practically any apparatus where control of temperature or pressure is desired within the ranges of 90° to 290° Fahr. and 2 to 70 lbs., in either a vertical or horizontal position.

ECONOMY—They need no compressed air for their operation, being entirely self-contained and self-operating. There are no levers, air valves or lines, etc., to look after.

Bear in mind that these controllers are just the same in perfection of operation, accuracy and reliability as this company's well-known air-operated "Simplex," "Perfect," and "Faultless" controllers.

The improvement consists of the simplicity of operation, and the practical elimination of any upkeep expense.

SIMPLICITY—They are so simple in principle and operation that an ordinary workman can obtain quick and highly satisfactory results. The charts reproduced below graphically illustrate the efficiency of TAG automatic control vs. hand regulation of the steam inlet valve.

RUGGED RELIABILITY—All of the parts are heavy, strong, durable, practically unbreakable—nothing that can give out—nothing delicate, no weak link in the sturdy chain. Absolutely unaffected by vibration.

FOOLPROOF—The most ignorant operator can not harm them, except wilfully, as there are no delicate adjustments or parts.

EASILY INSTALLED—The complete and explicit instructions that are sent with each controller will readily enable any careful pipefitter to easily install them.

TAG SELF-OPERATING PRESSURE CONTROLLER

Bulletin.

For further details, ask for Bulletin SC-388.

Guarantee and Co-operative Service.

All TAG products are guaranteed. Literature, blue prints and further information sent on request.

Submit your problems to this company's nearest sales engineer. No obligation incurred for such co-operation.

FIG. 1

FIG. 2

ILLUSTRATING THE EFFICIENCY OF TAG AUTOMATIC CONTROL VS. HAND REGULATION OF STEAM INLET VALVE

Records of the temperature of the size maintained in a slasher under identical operating conditions, the temperature desired being 200° Fahr. Fig. 1 shows the irregularity and fluctuations produced by the most careful hand control, and Fig. 2 the uniformity produced by a TAG Automatic Temperature Controller

TAYLOR INSTRUMENT COMPANIES

Manufacturers of Industrial Thermometers, Regulators and Pyrometers

ROCHESTER, N. Y.

BRANCHES

NEW YORK BOSTON CHICAGO WASHINGTON ST. LOUIS PHILADELPHIA TORONTO

Products.

AUTOMATIC TEMPERATURE REGULATORS.

THERMOMETERS: Recording; Index Tycos Thermometers for any industrial application; Engraved Stem.

GAUGES: Recording, Mercury Column, Vacuum, and Absolute Pressure; Draft; Air Blast; Gas Pressure.

TEMPERATURE CONTROLS; ANEROID and RECORDING BAROMETERS; HYGROMETERS; AIRMETERS and ANEMOMETERS; HYDROMETERS; PYROMETERS.

Also, Brine and Cold Storage, and Melting Tank Thermometers.

FIG. 1. TYCOS AUTOMATIC TEMPERATURE REGULATOR

For closed or open hot water tanks, for hot water house heaters, combined hot water tanks and heaters, plating baths, potash tanks, dye vats, vulcanizers, retorts, etc.

Furnished for operation with water or air pressure

FIG. 2. DUBL-DUTY TYPE TEMPERATURE REGULATOR

Furnished with flexible capillary tubing.

Case of regulator can be mounted at considerable distance from apparatus under control.

Controls temperature with bulb K-1 and discharges water of condensation from heater or coils with bulb K. Operates with compressed air

FIG. 3. TYCOS TEMPERATURE CONTROL, ELECTRIC CONTACT TYPE

For automatically controlling temperature of electrically heated apparatus, especially within limits of 40° below zero to 1000° above zero Fahr.

FIG. 4. Indicating

TYCOS THERMOMETERS, CAPILLARY FORM

Can be supplied with any range of temperature within the limits of 40° below zero to 1000° above zero Fahr.

Fig. 5 has pen arm equipped with patent seal, which prevents adjustment by unauthorized persons. Chart is of practical dimensions with uniform scaling as wide as on so-called 12-in. charts

FIG. 5. Recording

TYCOS THERMOMETERS, CAPILLARY FORM

FIG. 6. TYCOS PRESSURE AND VACUUM RECORDING GAUGE

Built with same case, clock movement, size chart, sealing device, etc., as used with Tyco's recording thermometers, thus where mounted together, the two instruments harmonize

FIG. 7. TYCOS TRAVELING RECORDING THERMOMETER

Adapted to taking temperatures in pasteurizers. Every fluctuation of temperature that occurs in the product is recorded on revolving chart in the case, giving a continuous temperature record for every stage of the pasteurization process

FIG. 8. TYCOS RE-RECORDING THERMOMETER, SELF-CONTAINED FORM

Specially adapted for recording indoor air temperatures.

Bulb or sensitive member inside of case. Sides of case well perforated to allow free circulation of air, making instrument sensitive

FIG. 9. TYCOS BI-RECORD RECORDING THERMOMETER

For obtaining temperature drop on brine, ammonia and hot water circulating systems.

2 pens, 2 flexible tubes and 2 bulbs. The 2 systems operate independently and a continuous record of the temperature to which bulbs are subjected is provided

FIG. 10. Right Side Angle Form

FIG. 11. Separable Socket Connection

FIG. 12. Union Connection, Pipe Threaded Hub Form

TYCOS ANGLE AND STRAIGHT STEM THERMOMETERS

Furnished in straight or variable angle stem and with vertical, inclined or reclining face forms. Made in 3 scale-case sizes for 7-, 9- and 12-in. scale lengths. Intermediate and high range scales for superheated steam are in 12-in. case only. Flue gas thermometers made with 12-in. case and scale range of 210° to 950° Fahr. with 30-in. stem. Made with separable socket connection and union threaded hub connection as illustrated

FIG. 13. ARMORED TYCOS HY-ENGRAVED STEM THERMOMETER

Products.

THWING THERMO-ELECTRIC, RADIATION, and RESISTANCE PYROMETERS, INDICATING and SINGLE and MULTIPLE RECORDING SYSTEMS for measuring all temperatures between -250° to 3000° Cent. (-420° to 5500° Fahr.).

Thwing Multiple Recording System.

A Thwing multiple-record indicating and recording pyrometer system is a real necessity wherever heat conditions are to be measured or controlled.

The recorder in the office keeps the conditions at every heat source constantly under the manager's observation, warns of irregularities, checks inexperienced men, detects the shirkers and gives *permanent* records. These records afford the best possible means of determining and duplicating the ideal time and heat relation for perfect product, minimum fuel consumption and for maximum plant capacity, through completion of the process in the shortest possible time. The Thwing multiple system of recording produces 1 to 12 records on a single chart and thereby avoids the extra expense of additional instruments, charts, etc.

The indicators at the heat sources enable attendants to keep their fires right at all times to avoid losses from overheating or underheating.

WALL PATTERN INDICATOR

6-RECORD RECORDER

Thwing pyrometers are made in the following types:

TYPE "A" (THERMO-ELECTRIC)—For temperatures from 100° Cent. (200° Fahr.) to 1600° Cent. (2900° Fahr.).

Operation is based upon measurement of the electric current generated by insertion of the "hot end" of a thermo-couple into the temperature to be measured.

The thermo-couple is made of base metal or platinum, with outer protection of fused quartz, porcelain, clay, iron, etc., as conditions require, and when installed as directed will give continuously accurate results with very low expense for renewals.

TYPE "B" (RADIATION)—For temperatures from 500° Cent. (925° Fahr.) to 3000° Cent. (5500° Fahr.).

This is the quickest acting pyrometer made and is accurate to the highest temperatures. No part enters the fire nor does the operator have to get uncomfortably close to the heat. The construction is simple, practical and very durable; and as no focusing, leveling or reference to tables are required, readings can be taken in rapid succession.

Made for both portable and stationary use and particularly desirable for reading temperatures in furnaces, ovens, kilns, fire pits and within moving molten metal and other material.

TYPE "C" (RESISTANCE)—For temperatures from -250° Cent. (-420° Fahr.) to 200° Cent. (400° Fahr.) and in special cases up to 425° Cent. (800° Fahr.).

This instrument is based upon measurement of the resistance to an electric current passing through a bulb of fine wire located at the point of temperature measurement. The resistance type is most used for measuring low temperature where the cold ends of a thermo-couple can not easily be kept at constant temperature.

Engineering Service.

Wide experience and records of performance in about every imaginable temperature measurement peculiarly fit this company to offer correct advice. Gladly and *without charge* special reports will be rendered and desirable arrangements for difficult conditions suggested.

Literature.

Literature with detailed description of any type of Thwing instrument and giving valuable hints on pyrometer selection and use will be sent free on request.

PORTABLE RADIATION PYROMETER

THERMO-COUPLES

UEHLING INSTRUMENT COMPANY

Power Plant Economy Apparatus

2016 Empire Building
NEW YORK, N. Y.

Products.

Manufacturers of RECORDING INSTRUMENTS, which include Uehling CO₂ Recording Equipment; Combined CO₂ and Temperature Recorders; Combined Barometer and Vacuum Recorders; Absolute Pressure Indicators; Pressure and Vacuum Recorders.

Also, Hand CO₂ Machines, Pyrometers, Waste Meters, Differential Pressure Recorders, Draft Recorders and Indicators, Revolution Recorders, etc.

Uehling CO₂ Recording Equipment.

Uehling CO₂ recording equipment provides the simplest means for keeping continuous check on the fuel wasted up the chimney. It is made up in the single and multiple form for one boiler or a battery. With each unit is included a recorder which can be located in the office of the chief engineer or superintendent, and an auxiliary CO₂ indicator which can be located at the boiler front for the fireman's guidance, by means of which he can be held responsible for

CO₂ RECORD (Reduced)

CO₂ RECORDER

TRADE-MARK

BOILER FRONT INDICATOR

ABSOLUTE PRESSURE INDICATOR

Uehling Recording Instruments.

The distinctive features of Uehling recording instruments are simplicity, accuracy and reliability. They are based on the hydrostatic principle, by the application of which all springs, levers and joint movements are avoided.

In addition to these important advantages, the hydrostatic principle permits of making

the scale open between the limits where the readings are important and narrow where they are unimportant, or eliminating that part of the scale altogether which is of no use, thus utilizing the whole width of the chart for important readings.

The foregoing principles are illustrated by the drawings of Uehling vacuum recorder and Uehling pressure recorder reproduced herewith.

UEHLING VACUUM RECORDER

Combined Barometer and Vacuum Recorder.

For power plants, particular attention is drawn to the Uehling combined barometer and vacuum recorder which puts a record of both the barometric pressure and vacuum on the same chart. The distance between the two records, therefore, always represents the absolute back pressure. This recorder is most accurate and is meeting with much favor as applied to condensing plants.

UEHLING PRESSURE RECORDER

the record produced and thus for the fuel wasted up the chimney. The continuous and uninterrupted record is made on an 8-in. circular chart or on a rectilinear chart if desirable.

Absolute Pressure Indicator.

The fact that the accuracy of all vacuum measuring devices is affected by any change in barometric pressure led to the development of the Uehling absolute pressure indicator, which measures the absolute pressure in any chamber and is entirely independent of any change in atmospheric pressure. Mercury is used as the indicating medium.

Special Instruments.

This company also has a department for designing and developing special instruments for special purposes.

BAILEY METER COMPANY

2019 East 46th Street
CLEVELAND, OHIO

Products.

FLUID METERS: Recording and Integrating the Flow, Pressure and Temperature of High and Low Pressure Steam, Exhaust Steam, Feed and Service Water, Brine, Compressed Air, Natural, Coke Oven and Illuminating Gas.

BOILER METERS: Recording and Integrating Steam Flow, also Recording Air Flow, Flue Gas Temperature, Stoker Speed, Steam Temperature, etc., and Indicating Firebox Draft.

V-NOTCH WEIR METERS.

Also Recording Instruments.

All manufactured under the trade-name "Bailey."

Bailey Fluid Meters.

Bailey meters use a thin plate monel metal orifice placed between a pair of existing flanges in the pipe line and can be inserted the same as a gasket without any changes whatever in existing piping, except to drill and tap the pipe on each side of the flange for connections to the meter.

The Bailey orifice serves the same purpose as a Venturi tube, but can be installed much easier and is more accurate for measuring steam, water, air or gases. The pressure loss is too small to be noticed. The orifice does not change due to wear or scale.

A variable area bell sealed in mercury gives a high degree of accuracy at low rates of flow, and produces a record on a 12-in. uniformly graduated 24-hour chart reading directly in thousand pounds per hour, or other desired units. This bell also has ample power to accurately move an integrator without the use of any cams or other troublesome mechanism and gives totals directly in pounds, gallons, cubic feet, etc.

The capacity of the meter is readily changed by exchanging orifices. The meter can be used for portable work or permanently piped to two or more orifices in different steam or water lines and switched from one to another by merely changing valves.

Bailey Boiler Meter.

This meter records steam flow, air flow and flue gas temperature. It may also be supplemented with firebox draft indicator, wind box pressure recorder, steam flow integrator or other useful supplemental recorded or indicated results essential to the operation of the furnace or stoker.

The Bailey boiler meter not only checks the work of the fireman but helps him to know whether he is obtaining maximum efficiency and desired capacity at all times, and shows him what changes should be made to correct any faulty condition promptly.

STEAM FLOW—The same type of mechanism previously described is used to record the rate of steam output from the boiler. This usually reads in per cent of boiler rating, but may read in horsepower or thousand pounds of steam.

An integrator reading direct in thousand-pound units may be supplied and the actual evaporation of

each boiler, or of each fireman obtained if accurate means for weighing coal are in use.

AIR FLOW—Air is a fuel just as much as coal and a certain evaporation per pound of air should be secured. The air flow part of this meter is adjusted, after practical tests, to read the same as the steam flow so long as the proper amount of air is being used for best efficiency. Too much air causes the air flow reading to exceed the steam flow. Deficiency of air, which also causes loss in efficiency, is shown by a lower reading than the steam flow.

When the steam flow and air flow read the same it indicates that the fuel bed is in perfect condition, and the flue gas analysis shows highest CO_2 desirable with minimum loss due to CO . When the fire is maintained in this condition any reasonable capacity may be obtained from the boiler by increasing or decreasing the rate of air supply.

FLUE GAS TEMPERATURE—Dirty tubes and poor baffles are often the cause of more loss of heat in the average power plant than is the improper supply of air. With the flue gas temperature recorded on the same chart with the rate of steam and air flow, the effect of the rate of steaming and the air excess can be eliminated and the heat absorbing efficiency of the boiler directly determined.

The Bailey flue gas temperature recorder is different in that it gives a true average temperature of all gases leaving the boiler, even where 24 ft. wide; it may be heated to 1200° Fahr. without damage and is free from sources of error common to most recorders.

BAILEY BOILER METER, TYPE D26, CLASS 56

Bailey Weir Meter.

Records flow of water or other liquids through V-notch or rectangular weirs on uniformly graduated chart without the use of cams or other complicated mechanism.

This meter is equipped with integrator reading directly in pounds and gallons. For feed water, hot well discharge, etc., at or near atmospheric pressure. It can be provided with temperature recorder.

BAILEY WEIR METER, TYPE F2

Some Types of Bailey Meters.

TYPE C2, CLASS 2 FLUID METER—Records rate of flow of steam, water, air or gas on the outer $2\frac{1}{4}$ -in. section of a 12-in. chart; integrates total flow; and records pressure on the inner 2-in. section of same chart.

TYPE C2, CLASS 24—Same as Type C2, Class 2, but includes temperature recorder in addition to rate of flow and pressure.

TYPE C6, CLASS 1 FLUID METER—Records rate of flow of steam, water, air or gas with $4\frac{1}{4}$ -in. pen motion on a 12-in. chart and integrates total flow.

TYPE C9, CLASS 1 FLUID METER—Records rate of flow of low pressure gas (by-product, coke oven, illuminating, etc.) or air with $4\frac{1}{4}$ -in. pen motion on a 12-in. chart.

TYPE C10, CLASS 3 FLUID METER—Records rate of flow of low pressure gas or air with $4\frac{1}{4}$ -in. pen motion

BAILEY FLUID METER, TYPE C2, CLASS 2

BAILEY FLUID METER, TYPE C10, CLASS 3

on a 12-in. chart and integrates total flow reading directly in cubic feet. It also records pressure on the same chart.

TYPE D21, CLASS 56 BOILER METER—Records steam flow and air flow on outer $2\frac{1}{4}$ -in. section of 12-in. chart; records flue gas temperature on inner 2-in. section of same chart and indicates firebox draft.

TYPE D22, CLASS 356—Same as D21, Class 56, except it has integrator giving total steam output in thousand pounds, and records wind box draft on inner section of chart.

TYPE D25, CLASS 36 BOILER METER—Records steam flow, air flow and wind box draft with $4\frac{1}{4}$ -in. pen motion on a 12-in. chart; also indicates firebox draft.

TYPE D26, CLASS 56 BOILER METER—Records steam flow, air flow and flue gas temperature all on 12-in. chart with $4\frac{1}{4}$ -in. pen motion; also integrates total steam flow in thousand pounds and indicates firebox draft. (Shown on preceding page.)

OTHER TYPES—Many other types of meters are made and several other classes (representing supplemental recorders or indicators) may be furnished.

Niagara and American Water Meters.

The American meter and the Niagara meter are of the disk type and differ only in their outer cases.

The Niagara meter has the outer casing made of a fine grade of cast iron, carefully galvanized. When a meter is frozen, one-half of the outer case usually breaks, thus relieving the inner and more expensive parts from injurious strain.

The American meter has the main outer casing made of bronze with either a galvanized iron base or

5/8-INCH WATER METER, SECTIONAL VIEW

ROUND READING REGISTER

a bronze base. The galvanized iron base reduces the cost of the meter and also increases its rigidity.

The works are carefully made on the interchangeable plan from bronze composition, hard brass, hard rubber, and nickel bronze; they are protected by an internal strainer. The measuring chamber is of large capacity, and is fitted with a strong reinforced hard rubber measuring disk. All submerged bearings are protected against sand and sediment.

The meters may have either round reading or straight reading registers indicating cubic feet, gallons or liters at buyer's option.

GROSS PRICE LIST NIAGARA AND AMERICAN WATER METERS

Size of meter, in.	Greatest proper cap., U. S. gals. per min.	Niagara Meter only with all-galv. iron outside case	American Meter only with bronze main case and galv. iron base	American Meter only with all-bronze outside case	Brass couplings per pair extra	Approx. Weight, meter and couplings boxed, lbs.

2	75	48.00	54.00	60.00	3.00	40
2 1/2	100	64.00	72.00	80.00*	4.00	60
3	160	96.00	108.00	120.00*	6.00	100
	240	140.00	157.50	175.00	8.75	150
	315	192.00	216.00	240.00	Flanges no charge.	200

† In these sizes, quarter bent couplings may be furnished at the following prices per pair: 1/2-in., \$1.50; 3/4-in., \$2.00; 1-in., \$3.00.
* 1 1/2-in. and 2-in. all-bronze case meters may be furnished with internal standard pipe threads when specially ordered.

Niagara Oil Meters.

Niagara oil meters are used to measure fuel oil, lubricating oil, gasoline and oils of all kinds. They will operate by pump or gravity pressure of 1 lb. or more per sq. in. and with oil of any temperature.

OIL AND HOT WATER METER

STRAIGHT READING REGISTER

The register is all-metal straight reading type indicating U. S. gallons, imperial gallons or liters. Each meter is tested and adjusted to measure within 1% of absolute accuracy at its rated capacity.

GROSS PRICE LIST NIAGARA OIL METERS

Size of meter	*Capacity for continuous rates of flow per hour, U. S. gals.	†Size and kind of pipe connections	List prices
A	6 to 300	1/2-in unions	\$20.00
B	10 to 500	1/2-or 3/4-in. unions	20.00
C	30 to 1000	3/4-or 1-in. unions	30.00
DV	60 to 2000	1- or 1 1/4-in. unions	44.00
EV	90 to 3000	1 1/4-or 1 1/2-in. unions	60.00
FV	120 to 4000	1 1/2-in unions	80.00
F	175 to 6000	1 1/2-or 2-in. unions	120.00
G	250 to 9000	2- or 2 1/2-in. unions	160.00
G	250 to 9000	3-in flanges	200.00

For all sizes of Niagara oil meters with large vertical dial add to these list prices \$20.00.

* These minimum quantities are the smallest rates of flow which the meters should be expected to measure accurately. The maximum quantities are the highest rates of flow for continuous operation without undue wear. Meters used only occasionally may be safely operated on flows twice the maximum quantities.

†The size of meter required is not determined by the size of pipe on which it is to be set, but by the flow to be measured. To facilitate setting on different sizes of pipes each meter may be furnished with either of the two sizes of openings and connections listed.

Niagara Hot Water Meters.

The Niagara hot water meter is similar in design to the Niagara oil meter, but has works of special construction to run in water of any temperature up to 250° Fahr.

GROSS PRICE LIST NIAGARA HOT WATER METERS

Size of meter	Capacity according to h.p. of boilers	†Size and kind of pipe connections	List prices
B	8 to 20 h.p.	1/2-or 3/4-in. unions	\$20.00
C	10 to 40 h.p.	3/4-or 1-in. unions	30.00
D	25 to 90 h.p.	1- or 1 1/4-in. unions	44.00
EV	40 to 150 h.p.	1 1/4-or 1 1/2-in. unions	60.00
E	50 to 200 h.p.	1 1/2-or 2-in. unions	80.00
F	80 to 325 h.p.	1 1/2-or 2 1/2-in. unions	120.00
G	150 to 600 h.p.	2- or 2 1/2-in. unions	160.00
G	150 to 600 h.p.	3-in. flanges	200.00
Battery 2-3 in.	300 to 1200 h.p.	4- or 6-in. internal threads	450.00

For all sizes of Niagara hot water meters with large vertical dial add to these list prices \$20.00.

†The size of meter required is not determined by the size of pipe on which it is to be set, but by the flow to be measured. To facilitate setting on different sizes of pipes each meter may be furnished with either of the two sizes of openings and connections listed.

Manufactured by the Venturi Department: VENTURI METERS for liquids, gases, steam, etc.; VENTURI RATE of FLOW CONTROLLERS.

Venturi Chemical Feed Regulators; Loss of Head Gauges; Water Level Recorders, etc.

Other Instruments: Barometric Type Mercury Manometer for testing work; Type Q S Register for air and gas; Effluent Controllers and Gauges for filtration plants, etc.

Venturi Meter Tube.

A Venturi Meter Tube is placed in a pipe line in the same manner as ordinary pipe. From the inlet to the throat the interior diameter gradually decreases and then gradually increases again to the full diameter at the outlet. The unrestricted passageway thus formed permits high differential pressure between inlet and throat with minimum friction loss. Annular pressure chambers are provided at inlet and throat. The throat is lined with bronze. Connection to the indicating, recording or registering instrument is simply made by two small pipes from the inlet and throat chambers.

Type M Register-Indicator-Recorder.

This machine has the advantage of unusual ruggedness and extreme accuracy.

The Type M furnishes three distinct kinds of information: it indicates momentary rate of flow through the meter tube; permanently records this rate upon a large circular chart; gives the total quantity on a circular counter dial. Each register is graduated for the particular meter tube with which it is to be used.

For cold and hot water and other liquids, high pressure gases, steam, etc. Universally employed for main water supply lines, boiler feed, hot water heating systems, and many other important kinds of service.

TYPE M REGISTER-INDICATOR-RECORDER

Type M Indicator-Recorder.

The lower dial is 10 in. in diameter and indicates the rate of flow (pounds per hour, gallons per minute, etc.) through the Venturi Meter Tube. The upper dial records this rate continuously on a large circular chart. The interior mechanism is simply and positively actuated through large cast iron floats, resting on mercury columns, and rack and spur gearing.

The total quantity may be obtained by tracing the charts with a special planimeter manufactured by BUILDERS IRON FOUNDRY.

The Type M Indicator-Recorder may be used for the same kinds of service as the Type M Register and is also frequently employed for temporary installations at various points where it is desired to study the consumption or output through certain main pipe lines, or the efficiency of operation of important plant units.

TYPE M INDICATOR-RECORDER

Bulletins.

Bulletins describing the Venturi for hot and cold water, sewage, brine chemical solutions, oil, gas, air or steam sent on request.

SIMPLEX VALVE AND METER COMPANY

112 North Broad Street

PHILADELPHIA, PA.

Products.

SIMPLEX DEVICES for the Measurement and Control of Water, as follows:

Meter Registers for use with Venturi Tubes, Pitot Tubes, and Orifices; Meters for Measurement of Boiler Feed Water; Rate of Flow Controllers, Direct Acting and Indirect Types, for Mechanical, Slow Sand and Pressure Filters; Loss of Head and Rate of Flow Gages, Indicating, Recording and Combined Types, which do not require copper floats and their float pipes.

Also, Elevation Gages, Indicating and Recording Types; "Head and Fall" or Water Level Recording Gages, for Water Wheel Plants; Portable Pitot Chart Recorders for Water Waste and Pump Slippage Determination; Manometers for use with Venturi and Pitot Tubes; Automatic Air Valves; Combined Air and Vacuum Poppet Valves for Large Mains; Mercury Altitude Regulating Attachment for Hydraulic Gate Valves; Altitude Valves, Mercury or Float Operated, which prevent waterhammer; Chemical Feeding Devices, for both Low Head and Pressure Service.

Simplex Meter Register.

DESCRIPTION—Simplex meters, actuated by Venturi and Pitot tubes are adapted to filter plants, water works, pumping stations, powerhouses, gravity mains, sewage disposal plants and industrial plants. They lend themselves to the measurement of flow through gravity mains, and may be located in gate houses, pits or chambers, requiring only the removal of the chart and winding of the clock once a week. They are ornamental in appearance, and are equally suitable for placing in a pumping station or powerhouse, where they may be required to measure the flow from usual types of reciprocating and centrifugal pumps. The same register may be used with any size Venturi tube, from a 1-in. boiler feed installation up to a steel or concrete conduit of large size.

In places where glass domes can not be used without too much danger of breakage metal covers are recommended. These are also applicable for replacing glass domes on the present meter registers.

SIMPLEX METER REGISTER,
UPPER PART

ters when required, and they are furnished at a small additional cost.

CONSTRUCTION AND OPERATION—The Simplex meter is the most logical answer to date to the problem of flow measurement. Its construction involves a minimum number of parts which are almost frictionless in operation.

A bell shaped float rests in a cylinder containing mercury. A pipe connected with the full section of the Venturi tube transmits pressure to the cylinder and around and above the float. Pressure is carried from the throat to another pipe, located beneath the bell and thence through the mercury. The float rests on the mercury and its movement is guided by hard rubber bearings located on a guide rod in the axis of the float.

The interior of the float is accurately shaped to such a curve that its resultant total downward vertical movement (when subjected to the difference in pressure due to flow through Venturi tube) is always proportional to the quantity of fluid passing through the tube.

The travel of the float is also recorded without the necessity of cams, gears or other intricate devices.

The simplicity of this construction is such that the movement of the float is transmitted to the indicating, recording and registering mechanism with minimum friction loss. One dial indicates the rate of flow; another shows the total quantity discharged and a rectangular chart produces a permanent record of both rate and quantity.

The high degree of accuracy of Simplex meters at low velocities permits the use of Venturi tubes with large throats. This is of vital importance for many reasons, particularly as the loss of head due to friction through the Venturi tube varies directly as the fourth power of the diameter ratio.

CONNECTIONS BETWEEN VENTURI TUBE AND SIMPLEX METER

Simplex Portable Pitot Chart Recorder.

This company has a department which specializes in the investigation of flow in existing water mains and uses for its work the Simplex Pitot tube, Manometer and Portable Chart Recorder.

Investigation can be made of the flow into an entire city or in a small distribution system.

The Portable Recorder and Rod shown by the illustration is in use by a considerable number of water departments, water corporations and industrial plants, who use it as a *universal meter*. It requires only that a corporation cock tap be made in an existing main and the rod, the manometer and recorder moved to the site.

A traverse of the pipe is first made to determine the relation between the mean velocity through the main and at the center. With this data in hand the total flow is readily computed from the chart record taken from the recorder.

The construction of the device embodies the same float principle as is used in the Simplex meter and the apparatus is capable of measuring flows between $\frac{1}{2}$ ft. and 10 ft. per second.

SIMPLEX PORTABLE PITOT
CHART RECORDER

Universal Portable Meter.

The instrument described as Portable Pitot Chart Recorder is readily adapted to use with Venturi tubes that are in place in a feed line.

Because of the ability to use this device with Venturi tubes, orifices between flanges, or with a Pitot tube that may be inserted in a main when in service, it fills a need long felt.

Simplex Rate Controller, Type "B."

The controller consists of a double disk balanced valve and a Venturi tube.

The water enters the Venturi tube and discharges into the valve body between the disks and their seat rings, and thence into the effluent main. The valve stem is carried upward through a stuffing box in the top cover and ends in a flexible connection attached to the short end of a lever mounted on knife edges. The long end of the lever supports an adjustable counterweight. The lower end of the valve stem is shouldered to receive supporting plates for a rubber diaphragm, and its bottom projection rides in a guide in the bottom cover.

By this construction the valve body has two compartments; that above the diaphragm through which the water flows in its way out under the valve disks, with comparatively low velocity, and the portion underneath

the diaphragm, through which no water flows, but which is joined by a pipe connection to the throat of the Venturi tube.

SIMPLEX RATE CONTROLLER

Showing method of operation of valves, diaphragm and counterweight

OPERATION—The upper and lower surfaces of the diaphragm receive water pressures of different values, the lower or Venturi tube throat pressure being delivered to the underside. This arrangement places a considerable load on the diaphragm, and thus tends to close or throttle the valve. In the operation of the controller, this closing tendency is resisted by the opposite pull on the valve stem, due to the counterweight on the long arm of the lever.

For a given rate of discharge through the throat of the Venturi tube and the body of the controller, there must be a certain difference in pressure on the two sides of diaphragm, and consequently a definite diaphragm load. As a result the valve will be self-throttled, until for any given position of the counterweight the pull on the valve stem due to it is exactly balanced by the differential pressure being delivered to the diaphragm.

Simplex Loss of Head and Rate of Flow Gage.

In the Simplex devices for indicating and recording loss of head in filters and the rate of flow through them, use is made of hollow inverted hard rubber floats resting in mercury.

Guide pintles which are fastened in the float lightly touch the hard rubber incased pressure pipe or a hard rubber liner in the cylinder. Raw water presses downward on the float and effluent water upward on the interior with the result that the float moves into the mercury in proportion to the loss of head. In the rate gage, use is made of the Venturi tube that is put on the Simplex rate controller and the pressure from the main section of the tube is transmitted to the outside of the float and from the throat to the interior of the float. This float is suitably shaped so that its movement is proportional to the flow.

SIMPLEX LOSS OF HEAD AND RATE
OF FLOW GAGE

UNION WATER METER COMPANY

Manufacturers of Water Meters and Specialties

WORCESTER, MASS.

Products.

WATER METERS, COMPOUND PRESSURE VALVES, PRESSURE REGULATORS.

Experience.

For over 50 years the UNION WATER METER COMPANY has manufactured products of determined value, embodying sound, simple, sensible features with a superiority that the test of time has demonstrated. It is the constant endeavor of this company to maintain and increase the reputation that its goods have so long enjoyed.

King Disc Meters.

In designing the King disc meter of the positive measuring, self-draining type for house service, strength, simplicity, durability and accuracy under varying conditions, have been the aim. Conscientious attention has been paid to the details of correct proportioning, the convenient arrangement of parts and thoroughness of manufacture.

KING DISC METER, MODEL B

The best materials obtainable are used throughout. All internal moving parts are accessible for inspection without removing the meter from the service pipe.

The vertical meter is actuated by the same mechanical principles but provides for vertical connections.

DIAL READING REGISTER DIRECT READING REGISTER

Body—Bronze.

WORKING PARTS—Bronze, monel metal and hard rubber.

Disc—Hard rubber, three part type, reinforced by steel; rubber controller roll on disc spindle prevents

galvanic action and insures perfect contact with intermediate crank.

MEASURING CHAMBER—Hard bronze. Consists of three parts, ring, upper and lower heads, and has unusually large capacity, resulting in a low rate of piston travel and consequent reduction of wear, thereby increasing the life and sensitiveness of the meter.

INLET SCREEN—Directly covering inlet, of perforated copper, tinned, and is easily removable.

THE INTERMEDIATE—Has three hard rubber spur gears and cut monel metal pinions.

REGISTER—Circular or straight reading.

REGISTER CASE—Bronze. Glass is secured by brass ring.

DATA, MODEL B

Size, in.	Safe maximum delivery per min.		Dimensions			Net weight, lbs.
	Cu. ft.	U. S. gals.	Length, in.	Width, in.	Height, in.	
$\frac{5}{8}$	2 66	20	8	$5\frac{1}{2}$	$6\frac{3}{4}$	$7\frac{1}{2}$
$\frac{3}{4}$	4 66	35	9	$6\frac{1}{4}$	$7\frac{3}{4}$	$9\frac{3}{4}$
1	8	60	$10\frac{3}{4}$	7	$8\frac{3}{8}$	14

Nilo Velocity Meters.

Nilo velocity meters are built for severe service requiring large volumes of water, with minimum loss of head, such as railroad standpipes, elevators, and supply mains.

SECTIONAL VIEW OF NILO VELOCITY METER

Body—Iron.

WORKING PARTS—Bronze, monel metal and hard rubber.

PISTON—Hard rubber; has two sections united by a bronze shaft, the upper half having right-hand, the lower half left-hand helical vanes which are incased

DATA, NILO VELOCITY METERS

Size, in.	Safe maximum delivery per min.		Dimensions			Net weight, lbs.
	Cu. ft.	U. S. gals.	Length, in.	Width, in.	Height, in.	
2	33.4	250	$15\frac{1}{4}$	$9\frac{1}{2}$	$13\frac{3}{4}$	76
3	93	700	22	$14\frac{1}{2}$	9	265
4	133.5	1000	24	$14\frac{1}{2}$	$20\frac{1}{2}$	295
6	294	2200	26	17	$24\frac{3}{4}$	450
8	534	4000	33	$22\frac{1}{2}$	28	950

in an outer shell, removing all possibility of breakage of veins. The water enters the piston from above and below preventing thrust.

DEFLECTOR PLATE—Between the two sections of piston; insures discharge of equal volumes of water from upper and lower halves.

INTERMEDIATE GEARING—Three reinforced hard rubber spur gears.

BEARINGS—All bearings are of ample proportions and are bushed with hard rubber.

Nilo Compound Meters.

This device combines the efficiency and accuracy of the Nilo velocity meter for large volumes of water and of the King disc meter for small streams, by means of a double differential controlling or compounding valve of the vertical type.

The upper and lower valves of hard rubber, reinforced with bronze, are connected by a central vertical bronze shaft having guides bushed with hard rubber, and are ground at one time to a perfect bearing with hard bronze seats which insures ease of action, efficient control and accurate registration on all flows.

The proportion of the upper or larger valve is so finely adjusted to that of the lower valve that the necessity of additional weight and consequent wear is reduced to a minimum.

The combined area of the two valves is more than twice that of the pipe for which the meter is built.

SECTIONAL VIEW OF NILO COMPOUND METERS

The controlling or compounding valve is closed on small streams, all water passing through by-pass and King disc meter. When the volume increases to the range of accuracy of the Nilo meter the controlling valve opens and the water passes through both meters. The combined reading of the two meters is the total amount of water drawn. In no case is any water measured twice.

DATA, NILO COMPOUND METERS

Size, in.	Safe maximum delivery per min.		Dimensions			Net weight, lbs.
	Cu. ft.	U. S. gals.	Length, in.	Width, in.	Height, in.

8 x 2	525	3900	61 3/4	30	31 3/4	1730

Union Compounding Valves.

Union compounding valves are identical with those used on Nilo compound meters and may be attached to any type meter 2 by 8 in. by tapping by-pass to King disc meter in the inlet of the large meter and the outlet of the valve. This insures accurate registration

on services where flow is at times lower than the range of accuracy of the large meter already in service.

Union compounding valves are furnished with flanges to any specifications necessitated by flanges of the meter in service.

Officials and engineers of some of the largest water works in the country have made exhaustive tests of these valves in actual service and have found an increase in

SECTIONAL VIEW OF UNION COMPOUNDING VALVE

revenue, quickly offsetting the installation costs, and removing the necessity of discarding serviceable meters perfectly satisfactory on larger flows.

BODY—Iron.
WORKING PARTS—Bronze and hard rubber.

DATA, UNION COMPOUNDING VALVES

Size, in.	Safe maximum delivery per min. Cu. ft. U. S. gals.	Dimensions			Net weight, lbs.

Union Water Pressure Regulators.

The operating valve has iron body with bronze lining and bronze stem, giving all advantages of a bronze valve at a reduction of the cost.

The stem is carefully ground to a perfect bearing with bronze lining insuring extreme sensitiveness and long life.

UNION WATER PRESSURE REGULATOR

Union water pressure regulators are absolutely automatic in their action, depending in no way on springs which in time become crystallized and set.

The size of regulator to be used is determined by its proposed location, initial pressure, reduction desired and pressure to be maintained.

Sizes, 4, 6, 8, 10, 12 and 16 in.

Yarway-Lea V-Notch Meter.

Measures liquids accurately while they are flowing and records their volume or weight. 98½% accurate, even under wide fluctuations of temperature.

A Yarway meter keeps the plant in a state of continuous test. Faulty firing methods are shown up at

YARWAY-LEA V-NOTCH METER

WATER FLOWING THROUGH V-NOTCH

once. Serious trouble is forecasted so quickly that accidents may often be prevented and repairs made before a shutdown is necessary.

Measures continuously without interrupting or retarding any process.

More than 1500 Yarway-Lea meters in use in all parts of the world for measuring "water rate" in turbine plants, boiler feed water, make-up water, blow-down and heating system returns.

Hundreds of Yarway-Lea meters are being used in connection with feed water heaters.

Meter and recorder may be set on a different level from the measuring tank, either a floor above or below or at another part of the same floor near a common instrument board.

Hundreds more Yarway-Lea meters are being used to record the flow of water for municipal and irrigation systems, and also to measure and record the flow of liquids in manufacturing processes where definite quantity of liquid has to be measured while it flows.

Measuring without interrupting or retarding the work not only increases production but lowers manufacturing costs.

Write for Bulletin L-40, which will describe advantages, mechanism parts, and tanks.

Different sizes of notches used to regulate flow through meter.

YARWAY-LEA RECORDER

DIFFERENT SIZES OF NOTCHES USED TO REGULATE FLOW THROUGH METER

Yarway Seatless Blow-off Valve (formerly the Simplex).

Are leakless, because they are seatless. Nothing to cut or clog. Full, free opening through the valve. Note position of plunger when port is open and closed.

Packing is protected from action of the blow-off and is automatically compressed when the valve is closed. Many Yarway seatless blow-off valves have been in constant service 7 and 8 years without being repacked. Gradual opening—no danger of waterhammer.

Yarway seatless blow-off valves are made both angle and straightway, screw or flange, extra heavy throughout and are finished with all-iron, bronze mounted, or all-bronze body—for land or marine service. The standard blow-off valve in thousands of large plants in the United States and Canada.

YARWAY SEATLESS BLOW-OFF VALVES

In closing valve, shoulder "S" on plunger "V" engages loose follower gland "F," compressing packing "P" above and below the port, making an absolutely tight valve.

STRAIGHTWAY TYPE YARWAY SEATLESS BLOW-OFF VALVE

Yarway Adjustable Spray Head (C. C. Thomas Patents).

A simple, unique, efficient spray head for use on cooling ponds, or wherever a liquid needs to be cooled rapidly.

Adjustable to any rate of flow or pressure, to varying atmospheric and temperature conditions.

Can be flushed out by operating levers from shore.

Many ponds have been equipped with Yarway spray heads in the United States and other countries.

YARWAY ADJUSTABLE SPRAY HEAD

Yarway Boiler Skimmer.

A successful device for the removal of scale-forming matter from the water in the boilers.

It is based on the thermal principle of circulation in heated water.

Leading plants are securing greatly increased steaming power from boilers equipped with the Yarway automatic skimmer.

Fifteen tons of solid matter removed from 7 boilers in one large plant in one year.

Bulletin S-1201A gives full information and may be had for the asking.

YARWAY BOILER SKIMMER

Yarway Hydraulic Valve (Caskey Patents).

A short lever, quick acting, easily operated valve, designed for high pressure work from 500 to 5000 lbs. per sq. in. The greater the pressure the tighter the valve. Can be repacked. Thousands in use in many industries.

Yarway Pipe Joint Clamp (formerly the Simplex).

For permanently stopping leaks in pipe lines. Quickly and easily attached, even in out of the way places. A power, coal and money saver. The standard in thousands of plants.

Yarway Air Compressor Unloader (Richards Patents).

A power saver for the motor driven air compressor. Simple, automatic, cool running and long wearing. Hundreds in successful service for years.

Bulletins and Information.

All Yarway specialties are described at length in different folders and bulletins which will be sent for the asking.

PNEUMERCATOR COMPANY, INC.

EUROPE: KELVIN, BOTTOMLEY & BAIRD, GLASGOW SCOTLAND

Product.

PNEUMERCATOR GAUGES for indicating the depth, weight, volume or specific gravity of any liquid or semi-liquid, fluid enough to seek its own level.

Principle of Operation.

The operation of all models of Pneumercator gauges is based on the maintenance of a true hydrostatic balance between the head of liquid to be measured and a column of mercury or other indicating medium, the pressure being transmitted by air confined in a small connecting tube between the liquid and the gauge.

Construction.

(1) A balance chamber located in the liquid to be measured. (2) A mercury or other gauge or gauges, located wherever readings may most conveniently be taken. (3) A hand pump or other source of compressed air. (4) A control valve attached to the gauge, and connected by small piping to the balance chamber and to the source of compressed air.

Advantages.

A Pneumercator gauge installed in any tank will provide a perpetual inventory of the liquid stored in the tank—an accurate check on liquid put in or withdrawn from the tank. The gauge will operate with equal accuracy on tanks open to the atmosphere or under pressure or vacuum. The accuracy is not affected by changes in temperature of the liquid in the tank, or the temperature

through the pipe line connecting the tank to the indicating portion of the apparatus.

There are no floats, diaphragms or delicate mechanism of any kind to stick or get out of order.

Applications.

Can be applied on fuel oil tanks, acid tanks, molasses tanks, gasoline tanks, chemical storage tanks, stills, evaporators, automatic sprinkler tanks, automobile tank trucks, reservoirs, standpipes, flumes, tail races, dams, water works, tide fluctuations, etc.

Trade-mark.

The coined word, "Pneumercator" is our registered trade-mark and is attached to all instruments sold by us, our representatives, or licensees under our patents throughout the world.

Information and Prices.

As each Pneumercator gauge has to be made up for the specific purpose for which it is to be used, in order to advise and quote intelligently, it is necessary to have the following information:

Dimensions of tank (or tanks). Distance from tank to indicating portion of the instrument. Nature and specific gravity of the liquid to be measured.

Prices and full information will be promptly furnished on request.

COMPONENT PARTS OF MODEL S.T.I. PNEUMERCATOR GAUGE, SHOWING BALANCE CHAMBER, AIR PUMP, ETC.

For sprinkler service, ballast and feed water tanks, reservoirs, standpipes, open or pressure tanks, etc.

CRANE PACKING COMPANY

Manufacturers of "John Crane" Flexible Metallic Packings

MAIN OFFICE AND WORKS

1813 Cuyler Avenue
CHICAGO, ILL.

BRANCHES

NEW YORK, N. Y., 1547 Park Row Building

HOUSTON, TEX., 416 Scanlan Building

CANADIAN OFFICE AND FACTORY: WINDSOR, CAN., FLEXIBLE METALLIC PACKING CO., LTD.

DISTRIBUTERS IN ALL THE PRINCIPAL CITIES

Products.

"JOHN CRANE" FLEXIBLE METALLIC PACKING for Steam Engines, Steam Pumps, Turbines, Valves, Expansion Joints and Traps; a Flexible Metallic Packing for Steam, Air, Ammonia, Water, Oils and Acids; SPECIAL PACKINGS for Superheated Steam and Hot Oil, suitable for high temperatures and heavy pressures.

FLEXIBLE METALLIC GASKETS, Lead and Copper, Plain or Corrugated, for use on Pipe Lines, Manholes, Handholes, Flange Fittings, Flange Unions, Ice Machines, Pumps, Filters, Steam Traps, Tanks, Lamps, Autoclaves and Extractors.

CONDENSER TUBE PACKINGS, All-metallic, for packing Surface Condensers, Heaters and Evaporators.

"John Crane" Flexible Metallic Packing.

Made of thin sheets of the smoothest babbitt foil, wound spirally, thoroughly impregnated with nature's pure graphite and oil. Made in sizes from $\frac{1}{16}$ in. up to $1\frac{1}{2}$ in. in coils 10 ft. long, coiled into a handy spiral. It is flexible, compressible and, by view of these babbitt sheets wrapped spirally, impervious to any pressure. It will not disintegrate or deteriorate, being entirely of metal construction.

USES—Composed of all metal materials, it easily withstands the highest temperatures and the heaviest pressures and, as babbitt in an engine journal, friction is reduced to the very minimum when applied to the stuffing boxes, whether service is steam, air, ammonia, water, oil, acid or any other vapor or liquid.

Engineers are using it very extensively on hand valves, header valves, expansion joints, traps, Corliss valve stems and piston rods. Manufacturers of engines, pumps, air compressors and motors are standardizing because of its long life and permanency and its tendency to polish the rods and shafts, rather than score them.

SPECIAL PACKING—The Engineering Department of the CRANE PACKING COMPANY has been very successful in developing special packings for high temper-

TRADE-MARK

atures and heavy pressures and special liquors. They will be glad to co-operate with any manufacturer or user of packing on any special packing problem.

"John Crane" Flexible Metallic Gaskets.

These asbestos copper-jacketed gaskets, as well as the lead and copper, corrugated and plain, are being used in power plants for industrial and manufacturing purposes. Standard gaskets of all kinds in stock.

Condenser Tube Packing.

Condenser tubes packed with "John Crane" flexible metallic rings are absolutely tight and remain tight many years. Electrolytic action ceases when "John Crane" metal bonds the tube to the tube sheet. They are easier to install than any fiber or candle wicking. The metal never hardens or dries up and a perfect vacuum is always maintained.

"JOHN CRANE" RING FORM

How to Order "John Crane."

Furnished in coils 10 ft. in length, in all sizes from $\frac{1}{16}$ in. to $1\frac{1}{2}$ in. Illustration shows "John Crane" in this form. In ordering coils, state number and size.

In ordering "John Crane" in ring form or sets, give diameter of rod, diameter of box and depth; also give temperature and pressure.

In ordering gaskets, send sample or templet and describe service to which gaskets will be exposed.

"JOHN CRANE" SPIRAL COIL

DURABLA MANUFACTURING COMPANY

Compressed Asbestos Sheet, Gaskets, Rod Packing and Gauge Glass

114 Liberty Street
NEW YORK, N. Y.

BRANCH OFFICES

CHICAGO, ILL., 337 West Madison Street
PHILADELPHIA, PA., 1428 Callowhill Street

PITTSBURGH, PA., 108 Smithfield Street
DALLAS, TEX., 416 Commerce Street

Products.

DURABLA COMPRESSED ASBESTOS SHEET; DURABLA GASKETS; DURABLA U. S. A. HIGH PRESSURE GAUGE GLASSES; DURABLA SEMIMETALLIC ROD PACKING; DURABLA VALVE DISCS.

Durabla Compressed Asbestos Sheet.

Durabla compressed asbestos sheet is a guaranteed product, a *standard for all gasket work*.

Durabla gaskets make tight joints on steam, water, air, oil, ammonia and acids at all temperatures and pressures. Joints packed with Durabla can be broken without injury to gaskets.

Durabla gives uninterrupted service. It eliminates

DURABLA ASBESTOS SHEET
Registered trade-mark all over the sheet

the necessity of carrying in stock various packings for different purposes.

Vibration or condensation does not affect Durabla. It will not burn out, blow out or pulp at the joints, and requires no following up.

Durabla sheets can be rolled and unrolled; never dries out or opens up. It does not deteriorate.

Durabla is manufactured in standard thicknesses of $\frac{1}{64}$, $\frac{1}{32}$, $\frac{1}{16}$, $\frac{3}{32}$ and $\frac{1}{8}$ in. and in sheet sizes of 36 by 144 in. and 48 by 144 in.

Durabla Rod Packing.

Durabla rod packing is a semimetallic packing, one of the patented features of which is the metal wearing surface which comes in contact with the rod. This feature prevents damage to the rod or to the packing when excessive pressure is caused by the gland being "pulled up" too tight.

DURABLA SEMIMETALLIC ROD PACKING

Durabla rod packing is made in 12-ft. lengths in sizes of $\frac{1}{16}$ in. from $\frac{3}{8}$ in. upwards and in spiral form only.

Durabla rod packing is flexible, which permits cutting rings of any size.

Excellent service is being given by Durabla rod packing on steam hammers, hot and cold distillates, chemicals, oil and water.

Durabla U. S. A. High Pressure Gauge Glasses.

Durabla U. S. A. high pressure glass tests as follows:

TEMPERATURE—Not affected after 18 two-minute submersions in oil at 380° Fahr., then in water at 40° Fahr.

EROSION—No trace of erosion, and perfectly clear after live steam at 100 lbs. pressure had passed through the glass for 96 hours.

TENSILE STRENGTH—Remained unbroken under hydraulic pressure of over 2000 lbs. per sq. in. for 2 minutes.

SERVICE—Under continuous operating conditions with pressure of 225 lbs., performance equaled in every respect the best service ever obtained by any foreign glass.

DURABLA U.S.A. METALLIC GAUGE GLASS
Durabla U.S.A. is etched on every glass

All sizes have fused ends.

Standard lengths always in stock. Any length furnished.

Durabla Gaskets.

Durabla standard and extra heavy gaskets $\frac{1}{16}$ in. thick are carried in stock in all sizes.

DURABLA GASKETS
Look for trade-mark on every gasket

Orders for gaskets in all shapes and thicknesses promptly filled.

Durabla Valve Discs.

Durabla discs are made for high pressures and superheated steam.

DURABLA VALVE DISC
Durabla stamped on every disc

Durabla discs will not chip or crack. They are not affected by any fluid, and have the strength and durability required by modern conditions.

GOETZE GASKET & PACKING CO.

10 Allen Avenue
NEW BRUNSWICK, N. J.

Products.

Manufacturers of "GOETZE" No. 2 ELASTIC and "GOETZE" No. 1 PLAIN CORRUGATED GASKETS; "GOETZE" VALVE DISCS, "GOETZERIT" SHEET PACKING and GASKETS.

"Goetze" Triumph Single and Double Jacket Gaskets, "Goetze" Devo Gaskets, "Goetze" Metallic Packing and Special Gaskets for Every Purpose.

"Goetze" No. 2 (Elastic).

Made from heavy copper, steel, monel and various other metals with closely twisted asbestos cord held in the corrugations as shown in illustration. It forms a cushion which takes care of contraction and expansion in pipe lines. The "comeback" in this gasket is so great that even where the piping is out of alignment and the flanges not equidistant the gasket will hold the joint firmly tight and give excellent service when used again.

"GOETZE" NO. 2 ELASTIC GASKET

"Goetze" No. 1.

A corrugated metal gasket without asbestos inlay and is recommended for flanges with smooth surfaces. Made of various metals to meet the particular conditions, and, as they are not of the flimsy type, the corrugations are deep giving elasticity to the gasket.

"GOETZE" NO. 1 GASKET

"Goetze" Valve Gaskets or Discs.

For valves of Jenkins, Crane and similar type and are made of copper or other metal and asbestos. They

furnish a cushion for the valve seats which will yield just enough to make a tight joint, but will not crumble or deteriorate or injure the valve seats in the slightest degree.

Their increasing use is proof enough of their excellence, for engineers who find their valve troubles eliminated by "Goetze" discs naturally praise them.

"GOETZE" VALVE GASKET

"Goetzerit" Sheets and Gaskets.

"Goetzerit" is a red asbestos sheet packing for flanged joints—for engineers who prefer to cut their own gaskets from the sheet rather than to use a metallic gasket or metal-asbestos combination. "Goetzerit" is easily the best sheet packing for such use, because it is made from pure prime asbestos fiber, compressed under an exceedingly high pressure and impregnated with a substance which makes it proof against the action of superheated or saturated steam. It does not squeeze out into the pipe openings. It does not blow out, even at the highest pressures now used. Specify "Goetzerit" for steam, air, ammonia, acids, oil, petroleum, etc.

TRADE-MARK

Sizes and Uses.

"Goetze" gaskets are made in any size desired from $\frac{1}{4}$ in. up to 15 ft. in diameter and larger, of various metals and combinations, for high and low pressures, superheated or saturated steam, gas and chemical lines.

For use on the following:

Acid lines	Locomotives
Aeroplane motors	Manholes
Air and ammonia compressors	Oil engines
Benzol and toluol stills	Pumps
Boiler domes	Steam chests
Boilers, stationary	Steam hammers
Boilers, marine	Steam shovels
Chemical lines	Steam traps
Coke oven by-product plants	Steam and gas engines
Condensed water lines	Stills and tanks
Cylinder heads	Submarines
Diesel engines	Superheaters
Distilleries	Tractors
Economizers	Unions
Flanged joints	Valve bonnets
Handholes	Water tube boilers
Heaters

Fusible Plugs; Radiator Valves.

Sight Feed Lubricators.

Detroit lubricators are made in a sufficient variety of styles to properly lubricate the valves and cylinders of all types of steam engines, steam pumps, air compressors, etc. Scientifically designed, each for its purpose; afford efficient and constant lubrication; all parts made of proper metal and replaceable at a small cost.

Cored heating passage filled with steam at all times lubricator is in operation, maintaining oil at even temperature, keeping it in a thoroughly liquid condition and permitting no fluctuation in rate of feed. Lubricator is well fitted for feeding heavy oils.

Force Feed Oilers.

For mechanical lubrication of gas, oil, gasoline, and steam engines, air compressors, machine tools, etc. Composed of one or more pumping units, one unit to each feed. Entire mechanism is contained in tank or reservoir and easily accessible for cleaning or inspection. Oiler driven by some moving part of the engine or machine which also automatically controls the speed at which it is driven. Made in large variety of ways and with different drives, etc., for different service requirements.

In addition to one or two lubricating compartments Detroit oilers can be made with a separate compartment

Showing filler opening and screen

FOUR-FEED MODEL "JT" FORCE FEED OILER WITH GRAVITY
DISCHARGE FUEL PUMP
Rear view showing lubricating feeds, fuel feeds and overflow

for handling fuel—pumping it from an underground storage tank or other safe place into the fuel compartment from which point it is either forced or flows by gravity to the engine cylinder.

Glass Body Oil Cups.

For use on machinery and bearings of all kinds. Made in both cast and pressed brass, in all sizes with sight feed; sight and set feed; sight feed, set feed and stop feed features, as specified. Particularly adaptable to service where use of mechanical oilers is unnecessary. Construction insures oilers standing up under heavy service at all times. A very desirable feature is a patented slide fitted over oil filler opening which automatically closes when released, preventing dirt or other foreign substances from getting into oil.

Manufacturers of Automatic Force Feed Lubricators

109 Duane Street
NEW YORK, N. Y.

TELEPHONE CONNECTION

Products.

ROCHESTER AUTOMATIC LUBRICATORS.

Application.

For the lubrication of the cylinders of all types of steam engines and pumps as well as air and ammonia compressors.

Construction.

Working parts are made of steel, and all bearings case hardened.

The mechanism of the Rochester automatic lubricator is compactly centered in a steel pump block, the principal working parts being enclosed and protected from dirt, grit, etc.

This block with all the mechanism can be almost instantly detached and removed, giving easy access to all the working parts for cleaning, repairing, etc., without disturbing the bowl or reservoir attached to the engine.

Driving Mechanism.

The clutch drive, while positively noiseless, is absolutely positive.

Notwithstanding the fact that the drive is a clutch drive, there is a regulating device whereby can be induced more or less lost motion of the actuating arm.

The clutch drive Rochester is especially adapted for use on high speed engines, having been used with great success on an engine running at 800 r.p.m.

Ratchet drive lubricators can be furnished if desired, the list prices being the same as for the clutch drive model.

Regulation.

Each feed regulated independently. Not affected by temperature, pressure or vacuum.

Improved Vacuum and Check Valves.

One of these check valves is furnished with each feed of every Rochester lubricator.

Special steel check valves and nipples, for use on ammonia cylinders, will be substituted if so specified on the order.

IMPROVED VACUUM AND CHECK VALVE

Sizes.

Made in all sizes from 1/2 pt. to 2 gals., and with any number of feeds from 1 to 8.

All sizes fully nickelplated.

Also made with 2 compartments, for use where different kinds of oil are used in the different cylinders of the same machine, as in the case of air compressors, ice machines, etc.

ROCHESTER AUTOMATIC LUBRICATOR
2-pint, single feed

DETROIT, MICH.

BRANCH OFFICES

NEW YORK, N. Y.

WASHINGTON, D. C.

CHICAGO, ILL.

Products.

FORCE FEED LUBRICATORS and "McKIM" COPPER-ASBESTOS GASKETS.

McCord Force Feed Lubricators.

The McCord force feed lubricator is made in from 1 to 14 feeds, and has a separate pump for each feed. Each pump has individual adjustment. It has constant sight feeds, which show exactly how much oil is being pumped to each bearing, and the flow can be adjusted from one drop to a full stream per stroke.

It is positive and automatic in action and operates in perfect synchronism with the engine or pump it is lubricating. It is not affected by viscosity of oil, variations in steam pressure or length of feed line.

ADVANTAGES—In addition to its standard features, such as positive sight feeds without pressure, separate pumps capable of individual adjustment for each feed, forced delivery of oil against pressure up to 1,000 lbs., etc., it has special advantages not found in any other device, as follows:

Internal mechanism—all working parts immersed in oil; auxiliary hand crank for accelerating feed; drop forged operating lever; reversible end bearing, so that lubricator can be driven from right or left hand end; heating chamber; plug for draining reservoir. (See catalogue for details.)

McCORD FORCE FEED LUBRICATOR
Class B, 2 feeds

CAPACITIES AND PRICES

Capacity	Feeds	List	Capacity	Feeds	List

BOSTON, MASS., 84 Battery March Street
PITTSBURGH, PA., Union Bank Building

Products.

AMERICAN FLEXIBLE METAL HOSE and TUBING.

Description.

American Metal Hose is made in a number of different patterns. Heavy service hose is the interlocking construction shown in illustration below. Hose of this type is made from a continuous strip of bronze or galvanized steel which is first profiled into the desired shape and then wound spirally over itself; a packing of asbestos cord fed into place between the metal surfaces making the hose pressure-tight.

Scope of Use.

American Metal Hose is used in a wide variety of services. While extensively employed in the lighter classes of work, its wonderful efficiency and economy are most impressively demonstrated in the heavy duties such as conveying steam, oils, oil products, etc.

Oil Hose.

American Metal Hose for Oil, (BD15 Steel), is the cheapest and most satisfactory oil hose in the market. Oils and grease have no effect on it. It can be used under highest pressures, has the flexibility of rubber hose and under ordinary working conditions will last for years. American Metal Oil Hose is used in every conceivable connection in the general handling of oils. The U. S. Navy Department purchase from this company thousands of feet of it annually for this service.

UNLOADING TANK CAR WITH AMERICAN METAL HOSE
FITTED WITH SPECIAL ELBOW UNLOADING COUPLING

Steam Hose.

American Metal Hose for Steam, (BD15 Bronze), is the same as the steel oil hose except for the difference

in the metal. It is free from all the weaknesses that limit the use of steam hose made wholly or in part of rubber, and can be counted on to render long and satisfactory service. It is used generally for the conveying of steam, both as a hose and also on machines in place of iron pipes and swing joints.

SHORT SECTION 2-IN. BD15 BRONZE STEAM HOSE WITH
HEATPROOF COUPLINGS ATTACHED

Gasoline Hose.

American Metal Special Gasoline Hose is a combination of flexible metal tubing and gasoline resisting rubber. It is light, strong, tight, durable and very flexible; has the approval of the National Board of Fire Underwriters. Adapted to use with pumps or wagons.

10-FT. LENGTH SPECIAL GASOLINE HOSE WITH COUPLINGS

Couplings.

Couplings are attached to the outside of metal hose, and the benefit of the full opening of the hose is always maintained. All couplings, unless otherwise specified, have standard iron pipe threads corresponding to the inside diameter of the hose to which they are attached.

Catalogue.

Catalogue and price list covering all the various types of metal hose and tubing made by this company, mailed on application.

Products.

PENFLEX FLEXIBLE METAL HOSE for all purposes and pressures up to 1500 lbs. per sq. in.

PENFLEX AUTOMATIC BARREL FILLER.

Penflex Metal Hose.

CONSTRUCTION—Consists of a continuous length of special bronze or galvanized steel tape rolled in spiral so that the edges interlock, forming the four-wall construction shown in the illustration. As the tape is rolled, a groove is formed, containing an especially prepared asbestos packing, remaining fully protected from internal or external wear.

ADVANTAGES—Not injured by oil or heat. Does not kink, stretch, swell, rot or corrode. 30% lighter than rubber. Leakproof and flexible. Will last 10 times longer than rubber. Will convey steam, oil, hot tar, paint, water, acids, etc.

SECTION OF PENFLEX METALLIC TUBING

USES—*Blowing Boiler Tubes*—Used in most of the power plants for the past 15 years. An all-metal hose covered on one end with asbestos packing to facilitate handling. The $\frac{3}{4}$ -in. or 1-in. copper No. 2 furnished with reinforced coupling is recommended.

For Turbine Tube Cleaners—Made from specially prepared steel strip, electrogalvanized. Consists of inner and outer section of tubing. Constructed to overcome vibration of turbine cleaner. Owing to small diameter, it allows cleaner to move freely through the tubes.

Hot Air for Carburetor—Made of the best steel packed with asbestos thread, very flexible and easily attached. Used extensively by automobile manufacturers throughout the country. Made in all sizes up to $2\frac{1}{2}$ in. inside diameter.

For Automobile Tire Filling—Made in $\frac{3}{16}$ -in. (inside diameter) galvanized steel covered with wire lacing. Very flexible and will not kink. Not susceptible to oil usually found on the garage floor. Stands pressure up to 150 lbs.

Vacuum Cleaner Hose—With the use of this hose there is 30% less weight to lift and pull around, and 50% less resistance, as it is twice as flexible as rubber. Will not kink. As there is not any inner tube to blister and peel off, it will not clog or collapse. Made in sizes from $\frac{3}{4}$ in. to $1\frac{3}{4}$ in. Any special fittings desired can be furnished.

TRADE-MARK

For Marine Salvage Work—Hose specially constructed; made of tough specially hardened copper. Interlocked section renders it strong and capable of withstanding hours of steaming at high pressure.

For Oil Tanks, Cars, Wagons, Steamers, and Barges—Here Penflex will last for years as the action of the oil preserves it. Special light weight copper hose is made for use here. Its flexibility is improved by the action of liquids passing through it. In general use by oil companies, paint and varnish makers and oil refiners.

FOR UNLOADING TANK STEAMERS AND BARGES

For Gasoline Measuring Pumps—This combination interlocking joint hose with specially designed covering to protect the hose and car is the best flexible connection to a gasoline filling pump because it is perfectly tight, and being of metal is unaffected by the action of gasoline like rubber hose. With metal hose, clean gasoline can always be delivered.

OTHER USES—Penflex metal hose is used for spreading hot asphalt over highways, for exhaust connections for engine test hose, for gas stoves, irons, hot plates, radiators, air drills, for electric wire armoring, etc.

Is in daily use on over fifty railroads for such work as washout hose, hydrostatic testing, steaming coaches, sprinkling coal, etc.

Penflex Automatic Barrel Filler.

Years of experience in handling barrel fillers have enabled this company to put on the market an automatic barrel filler which is an improvement on anything heretofore used for this purpose. Guaranteed to be perfect in material and workmanship, and to operate on all liquids, hot or cold.

Co-operative Service.

Our various branch offices will be glad to supply information as to how Penflex will be adapted to your requirements. State purpose for which the hose is intended; working and test pressures required; for wet or superheated steam; inside diameter and length; style of couplings wanted on each end; kind of metal wanted.

THE BURT MANUFACTURING CO.

Manufacturers of Oil Filters

601 High Street
AKRON, OHIO

Products.

“BURT” OIL FILTERING SYSTEM; CROSS OIL FILTERS; RESERVOIRS; OIL PUMPS.

Also, American Oil Filter for use with gas or gaso- line engines; Gary Oil Filter; Double Unit Oil Filter for two kinds of oil; Warden Oil Filter for any kind of filtering material.

For “Burt” Ventilators and Exhaust Heads, see pages 304-305.

“Burt” Oil Filtering System.

In the system illustrated in Fig. 1D, the oil is fed to the different bearings by gravity from the overhead oil reservoir. After passing through the bear- ings, it is piped to the oil filter or filters in the basement, and after being purified it is again pumped to the reservoir, making the process

FIG. 1D. “BURT” OIL FILTERING SYSTEM
Usual method of installing gravity outlining system

automatic and requiring only very slight attention. The “Burt” oil filtering system can be constructed and put into operation by any engineer. This company will furnish the oil filters, oil reservoirs and the oil pump.

The Cross Oil Filter.

INTRODUCTION—The larger portion of lubricating oil is not consumed by the machinery, but passes through the bearings, drips away and is lost, except in cases where special provision has been made for gathering the waste oil by means of drip pans or buckets placed under the bearings. This waste oil frequently amounts to from 50% to 90% of the whole quantity used; but if gathered and caused to pass through one of the Burt filters, all dirt, grit and other impurities will be elimi- nated, and the waste oil can then be used over again on the finest machinery with perfect safety.

It is well known that a flowing oil, fed freely, will reduce friction to a lower point than a heavier oil fed slowly. It is true economy to have all the oil passages of liberal size, so as to provide free and copious lubri-

cation. Where a filter is employed, free flowing oil may be used with minimum waste, and a resulting extension in the life of the machinery.

The most important part of an oiling system is the filter. The Cross oil filter is recommended for filtering engine and common machinery oils. The Nos. 1R, 2R, and 3R sizes are made as shown in Fig. 1D; No. 4R and larger sizes are illustrated in Fig. 4R (without connection for oiling system). Very little steam (exhaust) is required, and if the filter is kept in a warm place it will not be necessary to make steam connections. The object of using heat is to increase speed and capacity of filter.

OPERATION—Waste oil is poured into chamber A (Fig. 4R). It then passes into chamber B, through layer of waste, which collects all the heavier impurities. Thence it passes through perforated bottom of chamber B, downward in direction shown by arrows into tube C, and from there to filter plate D, where increased weight of water has a tendency to keep oil back in tube C. However, pressure of oil in chamber B forces it down and it spreads out across underside of plate D in a *very thin film* which constantly changes surface and grows thinner as it travels from center to outer edge of plate, thus exposing every particle of waste oil to action of water. Oil then flows over and under plates 1D and 2D, going through same process in each case. When oil leaves filter plate 2D it is in a finely divided state of separation and thoroughly mixed with water, which washes it out, and, from which all the remaining impurities are separated by gravity and settle in chamber E, whence they can be removed through cock No. 3. From plate 2D, oil again filters through stratum of filtering material F, and from there it rises to chamber G, the reservoir containing the purified oil. It is then drawn off as required from cock No. 1.

In some cases the Cross filter will need to be cleaned only once in three or four months, while in others it

must be done about once a month. Filtering waste in chamber B can be instantly removed without interference with pure oil supply.

Practically no attention is required after filter is started, and first cost is the only expense, excepting a few cents per year for waste.

“STYLE A”—Recommended where lubricating oil is used in very large quantities and where, in the interest of economy, pipe connections are made by means of gate valves so that the filtered oil can be pumped to any part of the plant desired.

The “Style A” filter is used by some of the largest power plants in the world, and is so constructed that it can be used with or without an oiling system.

Filter can be used with or without water.

“STYLE B”—In many power plants water becomes mixed with waste lubricating oil, and considerable difficulty is often experienced in filtering this mixture. “Style B” filter is recommended for this problem, and is guaranteed to separate water automatically from waste oil and at the same time to clean the oil so that it can be used over and over again.

The “Style B” filter will also take condensed water and oil from oil separators and exhaust heads and successfully separate the oil from the water and filter the oil perfectly, so that the reclaimed cylinder oil will make an excellent lubricant for pumps and other machinery, but is not recommended for re-use in the cylinders of steam engines.

Reservoirs for Oiling System.

These reservoirs are furnished by THE BURT MANUFACTURING CO. for use with their oil filters. They are made of galvanized iron (same quality as used in the oil filters), fitted with inlet and outlet pipes, overflow pipe, cover, and oil gage. Each tank is handsomely decorated in gold to correspond with filters.

Strictly net, f. o. b. Akron, Ohio.
At prices quoted any size inlet and outlet pipes will be furnished.
If desired, steam coil pipes can be furnished at slight extra expense.

Special reservoirs of any size or shape, and of any gage iron desired, made to order. Prices and blue prints on compartment oil tanks on application.

Oil Pump for Oiling System.

This duplex oil pump is especially designed for use in connection with oiling systems. Working parts are all easy of access, and are made to gage. Rods are put in on the separate principle, and are fastened at the center by a special device which permits of one rod being easily removed without disturbing the other.

This pump is economical in the consumption of steam, can be started at any point of the stroke, and consequently there is no danger of its being on dead center. The valve arrangement is especially adapted for a continuous service.

With each pump is included a lubricator, all necessary air and drain cocks, wrenches, etc. Every pump is tested at factory and guaranteed.

FIG. 8E. "BURT" OIL PUMP FOR USE IN OILING SYSTEM

DATA, DUPLEX OIL PUMP

No.	Size, io.	Proper strokes per min. of one piston, varying with kind of work and pressure	Gallons delivered per min. by both pistons at stated number of strokes	Steam, in.	Exhaust, in.	Suction, in.	Discharge, in.	Price

Strictly net, f. o. b. Akron, Ohio.

Thirty Days' Trial.

THE BURT MANUFACTURING Co. will send one or more oil filters to any responsible house on 30 days' trial, subject to approval in every respect. If it is found, upon trial, that they do not reduce lubricating oil bills at least 50%, or that the filters fail to meet every claim made for them, they may be returned and this company will pay freight charges both ways.

Guarantee.

THE BURT MANUFACTURING Co. expressly agrees to repair or replace, free of charge, any oil filter, exhaust head or ventilator, sold by them, which shall at any time be found to have been defective in workmanship or material.

References.

A comprehensive list of satisfied users of Burt filters will gladly be sent on request.

Gasoline and Oil Storage Systems

FORT WAYNE, IND.

CANADIAN PLANT, TORONTO, ONT., S. F. BOWSER COMPANY, LIMITED

Branch and Sales Offices in All Principal Cities of the United States and Foreign Countries

Products.

COMPLETE SYSTEMS for the STORAGE and CONTROL of OILS and GASOLINE; HAND and POWER DRIVEN SELF-MEASURING GASOLINE and OIL PUMPS; OIL and GASOLINE STORAGE TANKS; OIL FILTERING and CIRCULATING SYSTEMS, DRY CLEANERS' NAPHTHA STORAGE and DISTRIBUTING SYSTEMS.

Also, Cutting Oil Reclaiming Systems, Filling Station Equipment, Fuel Oil Systems, Self-measuring Kerosene Pumps, Tanks for Underground Storage, Paint Oil Storage and Handling Systems, Railway Oil Storage, Reclaiming Systems for Oil, Rubber Cement Tanks and Pumps, Wheel Tanks for Lubricating Oil and Gasoline.

Gasoline and Oil Pumps, Tanks and Storage Systems.

PUMPS—Pumps measure accurately quantities of 5 gals. down to 1 pt. at a stroke, intermediate quantities as desired. Designed for direct connection on tanks or to tanks installed at

BOWSER

TRADE-MARK

a distance, inside building or underground. Handle all oils that can be pumped.

TANKS—Rectangular or cylindrical, of galvanized steel; for installation inside buildings or underground; storage capacities from 65 gals. up. Specifications and quotations on large tanks, furnished on request. This company has a modern tank department, especially equipped for turning out this class of work; and builds tanks of exceptional quality.

SYSTEMS—Complete systems, designed and built for receiving, checking, storing, measuring, distributing, and recording oils of all kinds for all purposes.

FIGURE 41—Capacity, gallon, half-gallon, quart or pint; handles gasoline, lubricating or non-lubricating oils; standard with discharge register, lock, etc.; may be equipped with filter, meter and other accessories.

FIGURE 103—Capacity, 1 gal. or less; quick return type; standard with meter, discharge register, filter, lock; best and most rapid gallon gasoline pump manufactured.

FIGURE 106—Same capacity and type as Figure 103, except without filter, for lubricating oil.

FIGURE 101—Capacity, 5 gals. or less; quick return type; standard with meter, filter, discharge register, lock, hose draining attachment, hose and nozzle. Especially suited where large capacity is required.

FIGURE 105—Same capacity and type as Fig. 101, except without filter, for lubricating oil.

FIGURE 64—Battery lubricating oil outfit; one or more units as required; quart measuring pump; tanks, capacity 120 gals. and larger. Illustration shows it equipped with barrel cradle, track, dash and hoist for emptying barrels.

FIGURE 154—Portable outfit for lubricating oils. Quart measuring pump. Capacity 65 gals.

FIGURE 121—Portable outfit for gasoline. Gallon measuring pump. Capacity 50 gals.; equipped with discharge register, lock, hose, hose nozzle, hose drainer, etc.

FIGURE 109—Battery outfit for paints, lubricating and other oils; one or more units; equipped with gallon measuring pump with discharge register, computer, lock, etc. Tanks, capacity 120 gals. and larger.

FIGURE 115—Battery outfit for paints, lubricating and other oils; gallon measuring pump; basement tanks of 120 gals. capacity and larger.

RECTANGULAR GALVANIZED TANK

CYLINDRICAL GALVANIZED TANK

Naphtha Storage and Distributing Systems for Dry Cleaners.

"Standard" or "Premier" styles. Tanks installed underground, as many as necessary, of any desired capacity; cone bottom for settling naphtha. Pumps discharge naphtha as desired to washers, still, washer to washer, back to tanks, etc.

Power Pumps.

Plunger type, for operation by belt or direct motor connection; varying styles and capacities to meet existing conditions and requirements.

POWER PUMP FOR
DIRECT CONNECTION
TO MOTOR

Oil Filtering and Circulating Systems.

The system is automatic in operation. Oil is fed in continuous streams to bearing, collected, carried to the filter, cleaned, returned to overhead gravity tank and fed again to bearings. This gives a continuous round of clean oil. For reciprocating engines or similar machinery, horizontal steam turbines and other types. Also filters to take care of oil in batches only.

Engineering Service.

Assistance in planning and designing new oil houses, to include oil storage and distributing systems, oil handling equipment for buildings already constructed. Complete survey of present conditions made and recommendations given as to probable savings complete oil handling systems will effect.

This service is furnished to all manufacturing industries, mines, mills, shops, power plants, railroads, garages, filling stations, office buildings, or wherever oils are used.

Bulletins.

Bulletins illustrating and describing in detail the construction and operation of equipment, furnished on request.

OIL FILTERING AND CIRCULATING SYSTEM

SALESMEN EVERYWHERE

Products.

MEASURING and NON-MEASURING PUMPS for Lubricating Oils and Compounds, Gasoline, Naphtha, Light Paint, Paint Oils and similar products both volatile and non-volatile.

OIL HOUSE EQUIPMENT for mills, mines, factories or railroads.

LIGHT and HEAVY METAL RIVETED and WELDED TANKS, Cylindrical and Rectangular, made from Black or Galvanized Steel for underground or above ground storage of liquids, or for vacuum pressure.

Guarantee.

All Wayne equipment is guaranteed for 2 years.

Wayne products are indorsed by leading engineers and engineering architects. They are adopted as the standard of practice by the foremost of railroads and manufacturers of the United States, and conform to the measure of safety prescribed by the National Board of Fire Underwriters.

Departmental Storage Systems, Stationary and Portable.

For storing lubricating oils in powerhouses, machine departments in mills, factories, mines, railroad

shops, etc., and for portable delivery of oils direct to machines. This Wayne equipment eliminates scored bearings and similar trouble, by protecting oil from dust, dirt and all foreign matter, which is liable to get into oils when stored in less efficient containers.

This Wayne equipment pays for itself because of its protective and labor saving features.

Tanks are built of high grade tank steel; all openings reinforced, insuring long service. Joints are spot-welded; seams flushed with solder inside and out; pump materials are carefully selected, and all Wayne materials are guaranteed the best of their kind for the service required.

Factory Equipment for Distribution from Central Supply.

For distribution of paints, paint oils, the mixing of oils and liquid products, Wayne system of central storage, with distribution to various floors of the factory, is an ideal installation, from the standpoints of labor saving, oil saving, fire protection and elimination of unauthorized use.

The central storage battery of tanks is arranged below floor level, and allows easy filling from original containers; provides adequate supply on hand at all times; pumps accurately measure and, if desired, record all dispensing on the various floors. Return pipes are part of the equipment.

Preliminary investigations and drawings for installations to suit any plant layout will be made on request.

LUBRICATING
OIL PUMP

For storage of lubricating oils in engine rooms or departments where a limited supply is in constant use. Of galvanized tank steel with roll top, which can be locked. When top is closed entrance of dust and dirt is largely prevented, keeping oil clean. Pump delivers exact measured quantities.

DEPARTMENTAL
OIL STORAGE
SYSTEM

Made portable by mounting on disk roller bearing castors. Tank of high grade galvanized tank steel. Seams flushed with solder inside and out. Reinforced openings. Drip pan provided with cover and extension tube which extends to discharge nozzle. Discharge nozzle of non-drip type.

PORTABLE WHEEL
TANK

Especially desirable in machine and other shops where a regular supply of oil or other fluid is required. Equipped with pump which delivers 1 qt. at a stroke, while the delivery of lesser quantities is governed by accurately placed stops.

CENTRAL STORAGE SYSTEM

For several grades of lubricating or other oils. Made in sectional units that can be added to as the needs require, width only being changed as length and height of tanks are uniform. Barrels are handled by convenient methods and completely drained. Pump delivers exact measure. Containers practically fireproof.

Light and Heavy Metal Storage Tanks, Black or Galvanized Steel.

Open hearth steel ranging from $\frac{3}{16}$ to $\frac{5}{8}$ in. in thickness is used for these tanks. Capacities are indicated under the illustrations. Any other reasonable specifications can be supplied.

Rigid inspection of all plates eliminates defects. Rivet holes are accurately spaced with punch press; plates are carefully rolled to true circles and accurate alignment of courses; laps conform to radius of cylindrical courses. Tanks tested with air pressure 50% greater than liquid pressure exerted on tanks.

BLACK STEEL STORAGE TANK
Capacities, 100 to 15,000 gals.

RECTANGULAR STORAGE TANK
Capacities, 100 to 10,000 gals.

Pressure and Vacuum Tanks, Riveted or Welded Type.

Riveted joints are in accordance to the specifications submitted or to such designs as are recommended by insurance or municipal requirements, or to code of A.S.M.E.

For welded tanks a weld is employed that is equal to the best riveted joint and is even as strong as the solid plate.

Subjected to a hydrostatic test of one and one-half times the allowable working pressure before leaving the factory.

Gasoline Dispensing Equipment for Public and Private Garages and Service Stations.

These systems are built to deliver exact measured quantities of gasoline from 1 qt. to 5 gals. at a stroke. Tanks can be buried outside at convenient locations or distances from the pump, while the pump may be located inside the garage or service station or at the curb as may be desired.

All pumps are heavily constructed of suitable materials and are weatherproof. They include such fea-

tures as the Wayne patented housing that minimizes space, and other carefully thought out details of construction that insure absolute service and satisfaction to the user.

Various bulletins on the different types are issued and the company is ready to help engineers in selecting the exact type for a certain purpose.

Oil Filters, Types No. CF and No. PF.

Type CF Wayne oil filter provides many exclusive features for clarifying and purifying lubricating oil, so that it may be used over and over again.

It is a scientific fact that properly filtered used oil possesses all the physical properties of new oil.

Type CF is rectangular; saves space; has small outside dimensions in relation to its rating per hour; it both precipitates and filters, the two processes removing every foreign substance heavier than the oil, and every foreign substance too light to precipitate, which is suspended in the oil.

Precipitation is effected by producing as near a state of rest as possible when the oil is in the trays. A very valuable feature.

The filter medium of special cloth, which can not fold or gather, stands vertically so that sediment works toward the bottom, and receives a constant, uniform pressure, insuring perfect filtration throughout. Construction allows ease of cleaning, with no danger of sediment falling into oil.

Type PF Wayne filter is a portable for plants not requiring a continuous system or to supplement a main oil filtering system. Has all of the advantageous features of the CF filter, with less capacity.

All Wayne oil filters combine careful construction with simplicity. Complicated appurtenances are omitted; maximum efficiency is obtained.

TYPE CF OIL FILTER

Catalogue.

The complete catalogue SI of this company illustrates and describes the Wayne line and should be in the library of every engineer. Gladly sent on request.

DOVER BOILER WORKS

Steel Plate Construction

SALES OFFICE
50 Church Street
NEW YORK, N. Y.

WORKS:
DOVER, N. J.

Products and Services.

RIVETED OR WELDED STEEL PLATE CONSTRUCTION which includes: Storage Tanks for liquids, compressed air, vacuum and heating; Stacks, Flues, Penstocks, Riveted Pipe, Flumes, Chutes, Hoppers, and all kinds of Riveted Steel and Iron Equipment.

Builders, Engineers and Contractors.

Facilities.

The plant of the DOVER BOILER WORKS is located at Dover, N. J., only 40 miles from New York, and is modern, efficient and completely equipped for turning out the work in which this company specializes.

Engineering Service.

A corps of engineers of long and successful experience in designing and constructing steel plate equipment, is maintained at the New York office of this company.

It is the work of these experts to check carefully all plans submitted and to furnish specifications, estimates and designs that meet requirements to the fullest degree. If plans submitted to this department do not seem best adapted, changes and improvements will be suggested.

This work can best be done from blue prints furnished by customers. When necessary, however, designs for equipment will be submitted, based on rough sketches by engineers or plant superintendents.

Materials.

Dover products are made of mild open hearth steel, usually referred to as soft steel. The tensile strength is from 55,000 to 65,000 lbs., and the shearing value 45,000 to 50,000 lbs. These materials are exceedingly homogeneous, invariably uniform in thickness and texture, and free from flaws and defects.

Tanks and Stacks.

LAYING OUT—The plates, heads and shapes used are laid out and all holes located on the flat, by expert layers-out, all of whom have been especially trained. Nothing is left to chance and the work assembles with surprising and gratifying exactness.

PUNCHING—All material is heavily center punched and then punched by expert punch operators.

ROLLING OR BENDING—All rolling and bending are done cold, so as not to set up heat strains in the material. Our powerful rolls will handle material up to 1-in. thickness. Cold bending is done on a 200-ton hydraulic press.

FLANGING—Standard or special flanged work is handled with ease by the flanging department, while hydraulic flanging machine and large heating furnaces enable the turning out of large work of first quality at a low cost.

RIVETING—Wherever possible, the work is riveted up on hydraulic riveters. Pressures from 50 tons to 100 tons are used, depending on the size of work. This form of riveting is the best the art affords.

CALKING—After riveting, tanks are calked with pneumatic calking machines, by skilled operators, using round nosed calking tools.

TESTING—Before painting, all tanks are tested with water for tightness. A pressure equal to one and one-half times the working pressure for the test is used and tanks are made tight at that pressure before shipment.

INSPECTION—At completion all work is thoroughly checked for accuracy, inspected as to workmanship, painted with a good quality paint usually graphite and loaded on cars on our tracks.

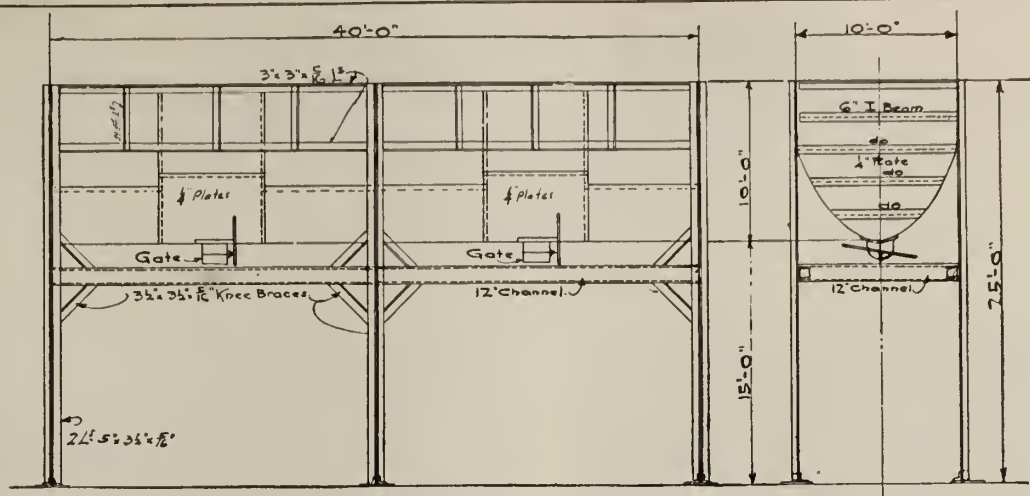

Every precaution is taken to give customers just what they expect to get.

FARRAR & TREFTS, INC.

Steel Tanks, Boilers and Grey Iron Castings

Illinois and Perry Streets
BUFFALO, N. Y.

TANK AND BOILER SHOP

FOUNDRY AND MACHINESHOP

Products.

Fabricators of STEEL PLATE WORK, manufacturers of CHEMICAL APPARATUS and producers of CASTINGS.

Steel Plate Work:

Boilers, Stacks, Tanks and other Welded or Riveted Steel Plate Construction.

Chemical Apparatus:

Dryers, Stills, Evaporators, Kettles, Filter Presses, Vats, Mixers, Jacketed Tanks for steam, oil or water.

Castings:

Grey Iron, Semisteel, Acid Resistant and Municipal; Grate Bars.

Miscellaneous:

Patterns, Forgings, Blacksmithing, Machine Work, Electric or Acetylene Welding.

Service.

The Laboratory and the Engineering Departments have complete control of the operations and processes throughout the entire organization.

These two departments have at their disposal a vast

amount of valuable data which will be useful in determining exact requirements and plans.

The Plant.

The boiler and tank shop, and the foundry and machinshop are equipped with modern machinery that has proved most efficient for the execution of any work entrusted to this company. The new foundry, erected during 1917, and enlarged in 1919, has a daily capacity of 200 tons of castings. Single castings, up to 50 tons each can be poured in this foundry.

The Organization.

The executives have had many years of experience in this business, and the knowledge gained through the production of chemical apparatus and castings, and the fabrication of steel plate work insures satisfactory results to their clients.

The engineering force is made up of experienced and technically trained men.

A skilled metallurgist, in charge of the laboratory, has direct supervision of the foundry.

All operations throughout the entire plant are directed by competent superintendents.

Dry Kilns: all kinds.

Dryers: all kinds.

Filters: all kinds.

Furnaces: Annealing, Melting, Oil and Tar Melting, Producer-gas Burning, Rivet.

Heads: for Boilers, Exhaust, Kitchen Range Boilers.

Heaters: Feed Water, Glue, Gravel.

Kettles: Mixing, Soda and Potash, Steam Jacketed, Sugar, Tar, Wax.

Kilns: Baking, China, Glass.

Milk Machinery.

Mixers: all kinds.

Ovens: Bread, Core, Enameling, Proofing.

Oyster Apparatus.

Paint Machinery.

Pans: Annealing, Drip, Gravel, Revolving.

Pasteurizers.

Pipe: Hydraulic, Riveted.

Pots: Melting, all kinds.

Receivers: for Air.

Reclaimers.

Sand Blast Machines.

Separators: Steam.

Sinks: Factory, Wrought Steel, etc.

Standpipes.

Sterilizers: all kinds.

Tanks: For Acid, Air, Automobile, Blow-off, Brine, Creosoting, Closet Tanks, Expansion, Factory, Fuel Oil, Gas, Gasoline, Grain, High Pressure, Hot Water, Melting, Mixing, Oil, Plumbers', Pneumatic, Septic, Sewage Disposal, Soda Water, Tempering, Varnish, Water Supply.

Trays: all kinds.

Tubs: all kinds.

Vulcanizers: all kinds.

Washers: Can, Vegetable, etc.

Services.

This firm makes a specialty of the design and manufacture of machines and apparatus of all kinds for engineers and manufacturers. The partial list of products included herewith gives some idea of the variety of work which may be furnished to order.

The desired apparatus may be manufactured from the following metals: sheet iron, copper, bronze, brass, lead, block tin, zinc, monel metal, aluminum, etc.

Estimates will be furnished from specifications and drawings, or, if preferred, this firm's engineers will submit plans of work desired, on consultation as to requirements.

PLANT OF L. O. KOVEN & BROTHER, JERSEY CITY, N. J.

LOVE BROTHERS INCORPORATED

Founders and Machinists

AURORA, ILL.

Products.

GRAY IRON CASTINGS.
BRASS and BRONZE CASTINGS.
SPECIAL MACHINERY.

LOVE BROTHERS INCORPORATED are now manufacturing complete for engineering companies a wide range of products of which the following are typical:

Reversing mechanism for open hearth furnaces;
heating furnaces, soaking pits, etc.
Water cooled ports for such furnaces.
Water cooler frames, etc., for furnace work.
Steam and water valves.
Filter presses.
Metallurgical furnaces.
Gas producers.
Chemical castings and chemical apparatus.
Special alloyed irons.
Conveying machinery.
Sugar machinery.
Marine work.

History of the Business.

LOVE BROTHERS INCORPORATED have operated foundries and machinestops at Aurora for many years.

The business was originated by the men who at the present time manage the company. Their personal experience as moulders, then as overseers of a small foundry, and later as the managers of a rapidly developing business, insures that practical point of view which is essential to the successful development of every business.

The administrative ability which today characterizes the management of this corporation has grown with its opportunities and kept pace with its development.

The management is well aware that the future must see a constant increase in efficiency, and the necessary measures have been taken to insure success in this regard.

The financial strength of the company has constantly increased, and its responsibility is unquestioned.

Location of Works.

The foundries and machinestops of LOVE BROTHERS INCORPORATED are situated at Aurora, Ill., thirty-seven miles west of Chicago, a railroad center unrivalled for its facilities in supplying the necessary raw materials, and affording the promptest and most extensive shipping facilities. It is perhaps no exaggeration to say that no better location for a business of this kind could be found in the United States. Labor conditions have uniformly been good and the available skilled labor is of a stable and satisfactory character. The city of Aurora is constantly growing. Its manufactures are thoroughly well established. The location so near Chi-

cago insures the best opportunity for obtaining all necessary supplies.

Manufacturing Facilities.

The company operates gray iron foundries, brass foundry, and necessary machinestops.

The foundries are adapted to all classes of work, and the foundry experience and metallurgical knowledge which are peculiarly the characteristics of the company, offer the fullest measure of protection to customers as to quality of the work produced. Castings can be handled up to 10 tons.

The machinestops are equipped to handle the maximum size of castings which the foundries can produce. Planers, boring mills, drills and lathes are all modern, well kept up, and capable of turning out accurate work.

Manufacturing Policy.

LOVE BROTHERS INCORPORATED have long been known as a first class jobbing foundry and machinestop.

Of late years their business has rapidly developed in the manufacture of complete machines and apparatus for engineering customers. This resulted in a declared policy on the part of LOVE BROTHERS INCORPORATED whereby the facilities of the company have been to a very large extent devoted to this particular class of work.

Results of this Policy.

LOVE BROTHERS INCORPORATED have thus firmly established themselves in the business of acting as the manufacturing end of engineering concerns and in certain lines of custom work, and are constantly improving their practice, due to the development of the engineering specialties whose needs they serve.

The work is completely manufactured, fully assembled, tested where necessary, and put in condition for permanent installation.

The customers are accorded every facility to examine the progress of the work and, in the experience of the company, have expressed themselves as fully satisfied with the way in which these complete lines of manufacture have been turned out for them.

It is the natural result of such a history, such experience, and such facilities that further developments along these lines should constitute the future work which the company will undertake.

Correspondence with those who are desirous of making use of the company's facilities is solicited, and personal visits to the plant are welcomed. A New York office is maintained by the company and systematic attention is given by a competent sales staff to the needs of customers wherever located.

THE PETROLEUM IRON WORKS COMPANY

(OF OHIO)

Steel Plate Construction

SHARON, PA.

DISTRICT SALES OFFICES

NEW YORK, N. Y., 50 Church Street
HOUSTON, TEX., 1110 Carter Building

ST. LOUIS, MO., 712 Third National Bank Building
SAN FRANCISCO, CAL., 503 Market Street

Products.

All classes of LIGHT and HEAVY STEEL PLATE CONSTRUCTION for the oil, gas, chemical, iron and steel, municipal, water works, railway and allied engineering industries, including:

Tanks for every purpose—Oil storage, large and small; acid storage; water; turpentine storage; molasses; grain; tar; asphalt; hydro-pneumatic; pressure; filter; car; bleaching; distillate; benzol; drip; gasoline, naphtha, benzine, lubricating oils and all classes of petroleum products; malt; alkali, caustic soda; brine; sand; compressed air storage; evaporating; cooling; settling; mixing; gaging, etc.

Oil Refinery Equipment—"Leman" counter current condensers; condenser boxes; agitators; stills of all descriptions.

"Gem" Bilged Steel Barrels; "Presteel" Drums; Standpipes; Water Towers; Smokestacks, Guyed and Self-supporting; Penstocks; Flumes; Riveted Steel Pipe; Galvanizing Kettles; Hot Metal Ladles; Annealing Boxes, Condenser Boxes; Pulp Digesters; Creosoting Cylinders; Coal and Ash Storage Bins; Ore Storage Bins, etc.

Also, Breechings for boilers; Buckets, scrap and dredge; Lime Kilns; Coaling Towers.

Offices and Works.

The general offices and works are situated about three miles south of Sharon, Pa., on the Youngstown and Sharon Street Railway, and consist of modern, substantially built structural steel buildings, including fabricating shops, power plant, machinshops, warehouses, storage yards, etc., equipped with the most modern and most efficient machinery necessary for the fabri-

TRADE-MARK

cation of all classes of light and heavy steel plate work. The plan and general layout of buildings and manufacturing equipment is such that all P. I. W. products are efficiently, accurately and quickly fabricated.

The manufacturing equipment also includes complete welding apparatus, enabling us to furnish welded work when desired.

Shipping Facilities.

The works have direct connections with the New York Central, Erie, and Pennsylvania Railroad systems.

The present yard trackage for handling inbound and outbound freight is about three miles in length and affords ample space for car storage, and ideal facilities for making shipments, thereby eliminating car shortage and delays occurring where there is but one railroad connection, making possible prompt delivery to points in practically every direction.

The closeness of the plant to the heart of the iron and steel district insures excellent service in obtaining raw materials and other commodities used in the fabrication of P. I. W. products.

Inspections and Tests.

During the process of manufacture inspections and tests, varying in accordance with the character of the work in hand, are applied. These are sufficiently rigid to more than meet the local field conditions to which the finished product will be subjected.

Engineering Service.

Technically trained men with many years of practical experience comprise the engineering, sales, and

55,000-BARREL OIL STORAGE TANK, 114 FT. 6 $\frac{3}{4}$ INS. DIAMETER BY 30 FT. 4 $\frac{1}{2}$ INS. HIGH

A standard size tank for oil storage and carried in stock for immediate shipment. We have designed, fabricated and erected oil storage tanks from 5 ft. to 120 ft. diameter and 5 ft. to 45 ft. high with capacities from 25 to 64,000 barrels

THE TEXAS COMPANY'S REFINERY, PORT ARTHUR, TEX. (Continuous with view on opposite page)

The above view shows a wide range of steel plate products, many of which have been fabricated and erected by THE PETROLEUM IRON WORKS COMPANY. While this company has not fabricated and erected all of the steel plate work shown in this illustration, it has fabricated and erected approximately 65 stills; 21 condenser boxes of various sizes and capacities; 18 agitators; 81 storage tanks of various sizes, from a few hundred

operating organizations. These men are prepared to design and fabricate all classes of light and heavy steel plate construction, either from rough sketches, where it is necessary to supply all detailed drawings used in manufacturing and erecting, or from working drawings furnished by customer. The thoroughness and accuracy of this engineering service is indicated by the fact that independent erecting forces experience no trouble in constructing or assembling P. I. W. products in the field, and that P. I. W. products are efficient and durable in service.

To facilitate erection, special working drawings and erecting plans that are intelligible and comprehensive are furnished, enabling any steel construction engineer or contractor to erect P. I. W. products as readily and satisfactorily as when P. I. W. field forces are employed.

Field of Activity.

THE PETROLEUM IRON WORKS COMPANY has sold and erected its products in practically every oil field of importance in the world. This company was one of the first manufacturers of oil storage tanks, and other steel plate construction used in the petroleum industry, to enter foreign fields, and is therefore not only prepared to contract for steel plate work in the United States, but in any part of the world.

In addition to the wide scope of P. I. W. activity in the oil fields, this company has designed, fabricated and erected hundreds of other steel plate products for use in various industrial fields as evident from the list of products. P. I. W. field of service covers many classes of engineering projects such as water works, hydro-electric and other power plants, railway, iron and

steel, and practically every industry where steel plate construction is necessary.

"It is P. I. W. Service and P. I. W. Service is World Wide."

"GEM" BILGED STEEL BARREL

Showing the 6 outward hoop formations rolled into the frame of barrel.
Made only in 55-gal. capacity—black or galvanized

"PRESTEEL" DRUM

Conforming to all Interstate Commerce Commission's requirements for shipping containers. Capacities, 15, 30, 50, 55 and 110 gals.

Inquiries.

When writing for quotations, detailed information, as well as drawings and information relative to local conditions, as the haul from the nearest railroad station or siding, topography and other general field conditions of the district, accommodations for boarding erecting forces, etc., will assist in the prompt and accurate preparation of estimates.

The importance of giving complete data is self-evident. If inquiries are accompanied with detailed information, the company will be enabled to intelligently and quickly quote on requirements.

GROUP OF SMOKESTACKS

Fabricated and erected for the Youngstown Sheet & Tube Co., Youngstown, Ohio

PENSTOCKS

Fabricated for the Washington Water and Power Company and erected at Long Lake, near Spokane, Wash. These penstocks are 300 ft. long and convey water power from the highest spillway dam in the world—227 ft. high

THE TEXAS COMPANY'S REFINERY, PORT ARTHUR, TEX. (Continuous with view on opposite page)
barrels up to and including those of 55,000-barrel capacity; 30 filter tanks; 4 dump tanks; 2 receiving tanks; 26 filling tanks; 5 separator tanks; 22 exchanger tanks; 16 steam drums; 11 grease tanks, some steam jacketed; acid tanks, kettles, and many other steel plate products. This refinery is one of the largest in the world

BATTERY OF PARAFFIN STILLS
Built for the Texas Company, Port Arthur, Tex.

BATTERY OF CONDENSER BOXES
In course of construction for the Texas Company, Port Arthur, Tex.

FOUR SINGLE, THREE DOUBLE AND THREE TRIPLE COMPARTMENT CYLINDRICAL, HORIZONTAL OIL STORAGE TANKS ON STRUCTURAL STEEL SUPPORTS

BATTERY OF 18 AGITATORS
Built for the Texas Company, Port Arthur, Tex. This is one of the largest installations of its kind yet to be erected

Illustrations.

On this and the two preceding pages are illustrated examples of steel plate work fabricated and erected by this company. They partially show the wide range of activity in many fields. The sizes and capacities of these products are not indicative of manufacturing ability or capacity, they being limited only by operating conditions of the field in which the products are to be used.

EIGHT ALUMINUM ORE BINS, 34 FT. DIAMETER BY 70 FT. HIGH
Aluminum Company of America, Massena, N. Y.

2000-TON ACID TANK
45 ft. $5\frac{3}{4}$ in. diameter by 26 ft. $7\frac{7}{8}$ in. high
One of 6 erected for the General Chemical Co., East St. Louis, Ill., Marcus Hook, Pa., Nichols, Cal., and Bayonne, N. J. We have built other acid storage tanks up to 2000 tons capacity

STRUTHERS-WELLS COMPANY

Riveted and Welded Steel Plate Construction

WARREN, PA.

NEW YORK SALES OFFICE: 50 Church Street

VIEW OF MAIN OFFICE AND WORKS

Products.

RIVETED and WELDED STEEL and IRON PLATE CONSTRUCTION of every description, with various STRUCTURAL SHAPES, FINISHED CASTINGS and FORGINGS, including Riveted and Welded Pipe; Steel Tanks (Rectangular, Circular or Oval) for storage, pressure and vacuum; Coolers; Retorts; Dryers; Jacketed Kettles for cooking, boiling and evaporating; Evaporating Pans; Cylinders for brick hardening and creosoting purposes; Stills; Heaters.

Steam Regenerators; Incinerators; Extractors; Steam Headers; Stacks; Penstocks; Exhaust Piping; Standpipes; Flumes; Condensers; Steel Plate Equipment for refining sugar and oil; for the manufacture of paper, soap, chemicals, rubber, paints, acids, powder; for use in the distillation of wood in the production of turpentine, wood alcohol and their by-products; Horizontal Tubular Boilers.

The Plant.

The workshops of this company cover seven acres and consist of a plate shop, flange and forge shop, pattern shop, foundry and machinshop; a complete unit under one ownership and management, fully equipped with most modern tools and appliances.

PLATE SHOP—Comprises seven sections or bays. Work starts where the steel plates are first unloaded and moves steadily in one direction to completion of product. No back-tracking; shears and punches, flange presses, bending rolls, riveters, calking and testing apparatus, etc., are so placed that each operation is performed in consecutive order. Entire floor space served by electric traveling cranes that move all work quickly.

WELDING DEPARTMENT—Occupies one entire section of plate shop, 24 by 446 ft. Oxy-acetylene welding and electric welding are both used for welding plates up to 1 in. in thickness.

NUMBER OF STEEL HEATERS AND TANKS

Connected with cast iron return bends and pipes; units separated and supported by cast iron stands, all resting on steel foundation (not illustrated). Connections are rigidly bolted joints, requiring absolute accuracy of workmanship. Length of outfit, about 45 ft.

JACKETED TANK

Welded seams in both inside and outside shells, with cast iron cover bolted on; stirring arms on inside; complete driving apparatus outside; a product of foundry, machine and plate shops

Knocked Down Work.

Knocked down fabricated material for plate construction (when too large to ship intact) furnished; working drawings supplied for guidance of erecting gangs; such material is assembled in shop before shipment, to insure accurate dimensions and to minimize work in the field. Knocked down material for export will be properly wired for ocean transportation, and nested to reduce space.

Work of Special Design for Particular Purposes.

Estimates on intricate or simple work promptly furnished. Drawings and specifications of special design for any particular purpose should be forwarded to our nearest office, in order to obtain an estimate or special report from the Engineering Department.

Responsibility Centralized.

All operations connected with Struthers-Wells serv-

ice are carried on under one roof and one responsibility, without outside assistance. Absolute secrecy is assured, as the plant contains its own Engineering Department, drafting rooms and all necessary shops. Every operation in each job is executed by our own men under our guidance and control. Full responsibility for the complete work is accepted.

EVAPORATING PAN

Steam jacket extends over entire bottom; inner and outer bottom plates are staybolted together; jacket tested to any working pressure required. Length, 16 ft.; width, 8 ft.

CHARCOAL COOLER

Used in wood alcohol and turpentine industries where destructive distillation process is employed. Made in any desired length, with airtight doors at one or both ends

RIVETED PIPE SPECIAL

Construction of this character requires expert laying out and careful workmanship in order that dimensions may be accurately maintained

BRICK HARDENING CYLINDER

Diameter, 78 ins.; length, 75 ft.; removable heads at each end; cylinder loaded for shipment on 2 cars. Built in varying lengths up to 120 ft. and for any working pressure required. This cylinder was subjected to a cold water pressure test of 225 lbs. per sq. in.

FIRE STILL

For refining petroleum. Heads of still are flat, braced on inside to withstand required pressure; dished heads also furnished. Note pressed steel detachable lugs. Diameter, 10 ft.; length, 30 ft.

AN OVEN RETORT

Used in manufacture of wood alcohol and turpentine by the destructive distillation process. Built in any length desired, usually 26 to 56 ft.; width 6 ft., 3 ins.; height, 8 ft., 4 ins. Airtight doors on one or both ends. Installed in batteries set in brickwork, like setting of steam boilers

CARLOAD OF RIVETED PIPE

Diameter, 24 ins. Built in sections 30 ft. long, with bolting flanges at each end

FOUR PRESSURE TANKS

Diameter of each tank, 5 ft.; length, 35 ft.; made for storage of oxygen under 300 lbs. pressure per sq. in.; tested under 450 lbs. pressure per sq. in.; designed with ample factor of safety. Note high grade riveted work

FOUR CYLINDRICAL TANKS

Tanks (for mixed character of work) of special design and construction from the Struthers-Wells shops; diameter of each, 9 ft.; length, 17 ft.; tested under 25 lbs. pressure. Note special castings for manhole openings, connections between tanks, inlet and outlet piping, steel supporting structure, etc.

Oxy-acetylene and Electric Welding.

By use of these welding processes, a number of pieces can be welded into one homogeneous whole which expands and contracts equally throughout, giving an absolutely and permanently tight job, a perfect seamless joint. Buckling, opening of seams and shearing of rivets are eliminated.

ADVANTAGES—Welded seams are vastly superior to riveted seams, (1) in tanks holding air and gas under pressure; (2) in tanks for storage of oil, gasoline and other fluids of a volatile nature; (3) evaporation, therefore, reduced to a minimum; (4) welded seams are a safeguard against fire; and (5) this process permits use of steel plate exclusively in complicated construction formerly requiring plates, forgings and castings, with expensive dies and patterns.

OXY-ACETYLENE WELDED TANK

Diameter, 6 ft.; length, 25 ft.; welded seams; working pressure, 50 lbs.; tested under a pressure of 75 lbs. per sq. in.—a permanently tight tank

TRANSFORMER TANKS WITH ELECTRICALLY WELDED SEAMS

In service, these tanks contain a special oil in which the transformer is submerged. The temperature frequently runs up to 150°, making the oil difficult to hold. Welded seams properly made are absolutely and permanently tight in such service. Note that all rivets in lugs at tops of tanks are above oil level

The welded tank is rapidly supplanting the riveted tank in many requirements of plate construction, especially in those cases referred to in preceding paragraph. Plates (1 in. thick) for any kind of work can be successfully welded by means of the process followed in the Welding Department; and the experience of this company during a period of ten years is a sufficient warrant for efficient welding operations.

TANK

Diameter, 10 ft.; height, 10 ft. Shell in one plate, and bottom in one plate. Welded seams throughout

WELDED TANK WITH
PRESSED STEEL COMBI-
NATION BOTTOM AND
BASE

ELLIPTICAL SHAPED TANK

Special construction, 8 ft. wide, 15 ft. long, 11 ft. high. Tested under 30 lbs. pressure. All seams welded

A PAIR OF ROTARY DRYERS WITH SCRAPER ATTACHMENTS

Steel Storage Tanks.

Materials for storage tanks of all sizes and of any thickness of steel plates are fabricated and furnished to meet all requirements. Designs are made in accordance with character and weight of contents, with proper weight of plates and type of riveting, to give sufficient factor of safety at all heights. All parts are assembled in shop to verify accuracy of holes and other preliminary work; each piece is then plainly marked for guidance of erecting gang; material is painted, small parts boxed and entire tank is shipped knocked down. Blue prints are supplied to men in the field to facilitate erection.

PLAN AND ELEVATION OF STEEL STORAGE TANK WITH GLOBE-SHAPED ROOF

Engineering Service.

Those having jobs involving steel plate construction will find the co-operation of this efficient organization very valuable.

Difficult, intricate and apparently baffling problems in steel plate construction are solved here daily, and this accumulated experience is at the disposal of those having such problems.

If customers' ideas are fully developed, they can depend on our ability to interpret them intelligently, or, the Engineering Department will develop customers' ideas, putting them into practical shape, and the shop will fabricate the work. No job too large or difficult; none too small to receive best attention.

RECTANGULAR TANK

Width, 17 ft.; length, 22 ft.; height, 15 ft.; with welded seams, braced inside and outside for pressure and vacuum

TWO TANKS

Each 8 ft. diameter by 8 ft. high, with vertical mixing apparatus and driving gears. Tanks similar to these in construction, some of them jacketed for steam and others equipped with steam coils, are used in the manufacture of paints, in the compounding of oils and greases, in powder works, soap factories, sugar refineries, and many other lines of business

JACKETED KETTLES

Of varied shapes, both welded and riveted construction. Used for cooking, boiling and evaporating

STEACY-SCHMIDT MFG. CO.

Manufacturers of Lime Kilns and Complete Hydrating Plants
Queen Street, Hay Street, Arch Street, Mill Road and Pennsylvania Railroad
YORK, PA.

CABLE ADDRESS: "BROOMELL,"—Codes used: A. B. C. 5th Edition and Western Union

Products.

KEYSTONE LIME KILNS, COMPLETE LIME and HYDRATING PLANTS, and EQUIPMENT for ELDRED PROCESS for Lime Burning.

Also, Belgian and other type Kilns for the extraction of carbonic dioxide gas; Bag Filters, Stacks, Tanks, Castings, Turntables and Special Machinery from engineers' designs.

For Sugar Machinery, see page 1149.

Keystone Lime Kilns.

The Keystone kiln, the result of the best kiln practice, is an all-steel brick lined kiln built of very heavy steel boiler plate, beams, angles, etc., to give the strongest possible construction. May be fitted to burn either coal, wood, gas or oil as fuel.

Repeated requests have been made to this company to design the Keystone kiln so as to use a mechanical

conveyor of lime from the bottom of the cooling cone to crusher or bins instead of trucking the lime away.

This result has been accomplished by setting the furnaces at right angles to drawing shears.

Keystone kilns will in the future be furnished in this way when *specially* ordered.

GAS PRODUCER KILNS—We are prepared to furnish Keystone kiln installations, and Keystone kiln gas-fired lime kiln installations complete.

FORCED OR INDUCED DRAFT—If either forced or induced draft is desired for increased production over natural draft, this company is prepared to furnish such equipment.

CAPACITY—The capacity of lime kilns and the cost of burning are dependent on a large number of variables—the nature and quality of the rock, the kind and quality of fuel used, together with the management and skill of the burners—so that it is impossible to predict the exact amount that can be obtained from a given kiln. However, under average conditions, with a standard kiln burning coal or wood, 9 to 14 tons may be produced per day; if forced or induced draft is used these figures are exceeded. With

producer gas or oil for fuel this capacity is from 14 to 25 tons per day.

SPECIFICATIONS—Diameter of shell outside, 11 ft. Diameter of brick lining inside, 6 ft. 6 in. Total height of kiln, 47 ft. 10 in. Shipping weight, about 42,500 lbs.

Improved Keystone Kiln.

Test installations for this company's new type kiln, the Improved Keystone, have been concluded. Catalogues and claims can be had on application.

Eldred System.

The company is prepared to install Keystone lime kilns using coal as a fuel with the Eldred process. This patented process insures a very substantial output on an economical installation.

Lime Hydrating Plants.

The company is prepared to furnish complete lime and hydrating plants, either from specifications or from their own designs.

TIPPETT & WOOD

Designers, Manufacturers and Erectors of Steel Plate Construction

166 Howard Street
PHILLIPSBURG, N. J.

BRANCH OFFICE, Royal Building, cor. William and Fulton Streets, NEW YORK, N. Y.

Products.

STANDPIPES, WATER TOWERS and STEEL TANKS of every description and for all purposes.

Tanks: Acid, Brine, Car, Coal Tar, Creosoting, Crude Oil, Cyanide, Elevated, Filter, Fuel Oil, Galvanizing, Gasoline, Jacketed, Molasses, Pressure, Refined Oil, Soap, Storage, etc.; Smokestacks, Breechings, Flues, Flumes, Penstocks, Riveted Pipe, Cylinders, Boilers, Condensers, Ladles, Hoppers, Troughs, Pans, Dryers, Receivers, Bins, Supports, Trestles, Accumulators, Agitators, Buckets, Cable Towers, Caissons, Clarifiers, Cylinders, Desiccators, Drums, Gas Holders, Hearth Jackets, Jacketed Kettles, Railway Water and Coaling Stations, Stills, Turntables, Water Jackets, Accessories for Water Towers and Standpipes and all kinds of Plate Steel Work and Structural Steel Construction requiring unusual fabrication.

Quick Shipments.

We carry a large stock of steel plates of several

thicknesses from which we make tanks of a large range of diameters. For special requirements, permit us to make slight substitutions from our stock, and fabrication will proceed immediately. We are equipped and prepared for orders requiring concentration of effort resulting in unusually prompt completion of the work.

Facilities.

Our fifty years of experience are your benefit and assurance of proper attention and construction. Our shops, which are large and equipped with the most modern machinery, have expanded steadily during this time. We are constantly extending and installing new machinery and new methods. No work is too large for us. Send us inquiries stating when material is required. Our engineers are at all times at your service. A catalogue giving information on standpipes and water towers will be mailed on request.

STANDARD WATER TOWER

STANDPIPE FOR CONNECTICUT AGRICULTURAL COLLEGE
Diameter, 25 ft.; height, 80 ft.

ASSEMBLING SHOP

WALSH'S HOLYOKE STEAM BOILER WORKS

Steel Plate Construction

Riverside
HOLYOKE, MASS.

BRANCH OFFICE AND WORKS, DRUMMONDVILLE, QUEBEC, CAN.

Products.

All classes of LIGHT and HEAVY STEEL PLATE CONSTRUCTION, including Riveted and Welded Tanks of every description for water storage, compressed air, acid, filters, rosin, size, heaters, blow-off, receiving, oil, caustic soda, brine, molasses, fuel oil and tar.

Diffusers, Digestors, Incinerators, Barking Drums. Penstocks, Riveted Steel Pipe, Surge Pipes, Wheel Cases and Draft Tubes.

Smokestacks; Flues, Rotary Bleach Boilers, Standpipes, Kiers, Flumes, Expansion Joints for pipe lines, etc.

Fabricated Plates of every description.

Structural Steel for construction, bridges, etc.

Services.

The practical experience of this company in designing, constructing and erecting is at the service of prospective customers.

The engineering department of this organization will assist in the solution of all steel plate construction problems. As satisfactory a solution is assured, as has been accomplished for many others.

Facilities.

A corps of skilled and experienced mechanics, modern shop tools and portable field equipment insure prompt and satisfactory execution of all contracts.

STANDPIPE ERECTED FOR CITY OF CHICOPEE, MASS.

Steel Pressure and Storage Tanks

East Market Street and Case Avenue
AKRON, OHIO

Products.

STEEL TANKS for Pneumatic Water Supply, Hot Water Storage, Gasoline, Fuel Oil, Kerosene, Naphtha, etc.; AIR RECEIVERS.

Jacketed Tanks.

For Vulcanizers and Devulcanizers, see page 1136.

Pneumatic Water Supply Tanks.

Recommended and guaranteed for a safe daily working pressure of 75 lbs. Materials and workmanship are the best. Rivets are closely spaced and are hydraulically driven.

Heads are flanged and dished under hydraulic pressure of 300 tons in formers which are accurately machined. Water gauge openings are tapped automatically by a special machine. Openings for pipe connection are properly reinforced, using forged steel flanges on sizes $1\frac{1}{4}$ in. in diameter and larger.

Thoroughly inspected during construction, and upon completion are subjected to a hydrostatic test pressure of 50% in excess of the safe daily working pressure. Absolutely airtight.

Price lists furnished on application.

PNEUMATIC WATER SUPPLY TANKS

Extra Heavy Hot Water Storage Tanks.

Made with or without coils. Standard coils are made of four pipes connected with three return bends. They are securely fastened to the tank and properly braced. Can be equipped with special coils if desired.

Price lists furnished on application.

EXTRA HEAVY HOT WATER STORAGE TANK FOR 100 LBS. PRESSURE

Extra Heavy Gasoline Storage Tanks.

Constructed according to specifications of the National Board of Fire Underwriters, and, if desired, will be furnished with underwriters' label attached at no additional charge. Suitable for the storage of gas, fuel oil, kerosene, gasoline, naphtha, etc.

An absolutely tight joint is assured under all conditions, all rivets being closely spaced and driven hot under hydraulic pressure. All seams are lap jointed, single riveted, properly laid up and calked metal to metal without composition filler.

On tanks under 15,000-gal. capacity, heads are dished to the true radius of the diameter of the tank,

one head being riveted in convex and one concave, which materially reinforces the tank.

Material is the best open hearth steel, and workmanship is subject to the most critical inspection.

Standard sizes of oil and gasoline storage tanks are carried in stock.

Price lists furnished on application.

EXTRA HEAVY GASOLINE STORAGE TANK
Capacity, 84 gals. to 25,000 gals.

High Pressure Tanks.

The tank in accompanying illustration is designed for 500 lbs. working pressure. Shell plates are $1\frac{1}{2}$ in. thick. Rivets are $1\frac{5}{16}$ in. in diameter, with longitudinal seams butt joint, quadruple staggered riveted with inside and outside covering strap.

We are specialists in high pressure tank construction, and our plant is hydraulically equipped throughout, enabling us to fabricate material $1\frac{1}{2}$ in. in thickness.

STEEL STORAGE AND PRESSURE TANK

Air Receivers.

The construction of these air receivers and the selection of materials both receive the utmost care. Tested to 50% in excess of guaranteed safe working pressure. Rivets are hydraulically driven. Heads are flanged and dished to true radius of diameter of shell. Openings are reinforced with forged steel flanges.

Horizontal receivers with manhead have both heads riveted in convex. Manhead is always placed in head near drain opening, unless otherwise specified.

Vertical receivers with manheads have bottom head concave and manhead is located in shell on line with outlet near bottom, unless otherwise specified.

Standard air receivers have longitudinal seams lap joint, double staggered riveted; circular seams, single riveted.

Price list furnished on application.

Prices of special air receivers, for any working pressure desired, also quoted on application.

AIR RECEIVER

W. E. CALDWELL CO., INC.

Manufacturers of Tanks and Tank Towers

2240 Brook Street
LOUISVILLE, KY.

Products.

WOOD, STEEL and GALVANIZED IRON TANKS; TANK FOUNDATIONS; TUBULAR, ANGLE or CHANNEL COLUMN and WOOD TOWERS; FRICTION CLUTCHES and PULLEYS.

Steel Stacks, Standpipes, Tank Agitators; Water Supply Systems; Gearing and General Power Transmission Machinery.

Industrial Tanks.

Tanks for industrial and special purposes, in wood or steel—round, rectangular, elliptical, or any shape.

WOOD—This company specializes in cypress, as it is the best wood for tanks for most purposes. It has great durability, minimum shrinking and swelling and does not give taste or color to drinking water.

Fir, yellow pine, white pine, white cedar and poplar are also used.

Specifications—Lumber is thoroughly dried, without loose or unsound knots, splits, shake, peck or wormholes or other defects. All heart on inside, sound sap on outside only, not to exceed one-half the thickness.

Thickness: 2 in. for 10,000 gals. and smaller; 2½ in. up to 20,000 gals.; 3 in. for larger sizes. Finished thicknesses are 1¾, 2¼ and 2¾ in., respectively.

Standard Inside Diameter: Every 6 in. from 3 ft. to 9 ft., every foot to 16 ft., and every 2 ft. above 16 ft.

Standard Inside Depth: 1 ft. 5 in.; 2 ft.; 2 ft. 5 in.; 3 ft.; 3 ft. 5 in.; 4 ft.; 4 ft. 5 in.; 5 ft.; 5 ft. 5 in.; 6 ft.; 6 ft. 5 in.; 7 ft. 5 in.; 9 ft. 5 in.; 11 ft. 5 in.; 13 ft. 5 in.; 15 ft. 4 in.; 17 ft. 4 in.; 19 ft. 4 in.; 21 ft. 4 in.; 23 ft. 4 in.

Workmanship: Staves dressed both sides. Edges machine jointed to proper bevel. Bottom dressed on top side only. Machine jointed straight and square and well doweled.

WOOD TANKS

Hoops: Round hoops of wrought iron (not steel) with malleable iron draw lugs; sizes and spacing to give a safety factor of 4 to 1.

STEEL—Thin galvanized tanks are recommended only in small sizes and for intermittent or temporary use.

Heavy steel tanks made in any shape or size.

Specifications—The standard diameters and depths are in even feet. The standard thicknesses are ⅛ in. up to and including 10 ft.; ⅜ in. up to 16 ft.; ¼ in. up to 24 ft., and ⅝ in. above 24 ft.

These can be furnished set up, in the smaller sizes, or knocked down, all punched, fitted and bent to shape with the necessary rivets.

Tank Foundations.

Plans for foundations on the ground will be furnished. Designs of, and prices on, foundations for special conditions will be submitted on receipt of a sketch with the necessary rivets.

Tank Towers.

TUBULAR COLUMN—Classes O to G built with tubular steel columns and struts, in heights of 15 ft. and every 12-ft. interval above to 100 ft.

ANGLE COLUMN—Classes CC to LL built with steel angles for columns and struts, in heights of 12 ft. and every 10-ft. interval above to 102 ft.

LATTICED COLUMN—Classes LD to LH built with latticed steel channel columns and struts (bridge construction), in heights of 20 ft. and every 5 ft. above to any height.

Note—Above types of towers are for flat bottom tanks (see table) and are furnished with either a steel or wood foundation for the tank at the top.

HEMISPHERICAL ALL-STEEL TANKS AND TOWERS—Made with latticed columns and struts in all capacities and heights.

TANK AND TOWER.
STUDEBAKER BROS.
MFG. CO.,

*Hemispherical bottom steel tanks and towers are regularly made in capacities from 10,000 gals. up. Any of the above towers can be made to suit special conditions.

Caldwell Friction Clutch.

The basic principle of this clutch is identical with that of the standard automobile service brake; a flexible band lined with Rabestos and tightened with a single lever. There are only eleven parts. One screw adjusts it, shortening or lengthening the band which gives equal pressure everywhere around the friction ring.

CALDWELL
FRICTION CLUTCH
PULLEY

CHATTANOOGA BOILER & TANK CO.

CHATTANOOGA, TENN.

Products.

TANKS for all General and Special Purposes:

For the manufacture and storage of Sulphuric, Nitric and Mixed Acids.

For manufacture and storage of Benzol and Toluol.

Creosote Tanks.

Grain Tanks.

Ice Tanks.

Rendering Tanks.

Oil and Gasoline Tanks.

Cottonseed Storage Tanks.

Bleaching Tanks.

Kier Tanks.

Silicate Soda Tanks.

Alum Manufacturers' Tanks.

Soap Stock, Rosin and Brine Tanks.

Molasses Tanks.

Barium Process Tanks.

Tanks for manufacture and storage of Green Gum or Wood Turpentine.

Water Tanks, Towers and Standpipes; Gas Holders.

Co-operation and Service.

This company makes a specialty of tankage design and construction, and has spent and is spending much money and time on mechanical and chemical investigation.

Experience places it in a position to offer valuable advice on tanks required for all general purposes.

In the consulting department is one of the country's

most capable and successful chemical engineers, who can be consulted for special propositions.

With this service and an up-to-date shop, the company gives more value, from beginning to end, than is obtainable elsewhere.

With an immense stock of materials, quick shipments, together with other advantages, are guaranteed.

Acid Tanks.

The various steps in acid processes can not be handled with the same material. Any material from steel to lead lined tanks is furnished. Also, cooler frames of steel, or shipped complete with lead coils and lining.

Acid work is a very important subject, and the plant is specially equipped to render the latest and best practice.

Towers, Tanks and Standpipes.

The consulting department will advise whether towers and tanks, or standpipes, are the most economical for condition presented.

Gas Holders.

Will supply gas holders for any gas which can be handled by means of a holder.

For which purpose we have constructed tanks covering a wide range in capacities.

Estimates, etc.

Information and estimates will be furnished on request.

TANK OF PROC-TER & GAMBLE, HAMILTON, ONT.
Capacities, 50,000 and 100,000 gals.
Heights, 100 and 50 ft. to bottom

STEEL STACK, UNITED VERDE COPPER CO., JEROME, ARIZ.
Diameter, 31 ft.; height, 400 ft.

MOLASSES TANKS, GREAT WESTERN SUGAR CO., GERING, NEBR.
Diameter, 35 ft.; height, 23 ft.

150,000-GAL. CONICAL BOTTOM TANKS, CHICAGO & NORTH WESTERN RY., CHICAGO TERMINAL

Information Required in Making Quotations on Elevated Water Tanks.

- (1) Capacity of tank required in gallons.
- (2) Height of tower, which should be given to the lowest point of bottom of tank above top of foundations.
- (3) If tank is used for sprinkler service, state whether stock company or mutual.
- (4) Which, if any, of the following accessories manufacturer is to furnish: riser pipe, frost casing, overflow, indicator, pressure gage tank heater, heater house, foot elbow, gate valve, float valve. Not one of these accessories is included in quotations except when expressly so stated.

ESTABLISHED 1865

A. J. CORCORAN, INC.

Manufacturers of Tanks, Towers, Pumps and Windmills

OFFICE

766 Jersey Avenue

JERSEY CITY, N. J.

WORKS: JERSEY CITY, N. J., Jersey Avenue and 13th Street—Telephone, Montgomery 238

Products.

Manufacturers of "CORCORAN" TANKS which include: Ink and Blacking Tanks; Tanks for Acids and Chemicals; Rectangular and Oval Tanks; Frostproof Tanks; Sprinkler Tanks; Developing Tanks; Dye Tubs; Vats; Tumbling Barrels; Drums; Tanks for Special Purposes.

Machinery made and fitted in tanks, including Manhole and Handhole Frames and Covers to order.

Agitators for Wooden Tanks; Windmills; Towers; Pumps.

Experience and Prestige.

Fifty years of practical experience in the manufacture and erection of tanks and windmills have made this house an authority on the essentials that tanks and windmills should possess for general utility.

Acid Tanks.

A. J. CORCORAN, INC., were pioneers in constructing acid tanks and are among the leaders in this important industry. Tanks of this kind are made of extra heavy

6-, 8- and 10-in. yellow pine, dressed so as to resist the corrosive influences of acids and other chemicals. They have replaced lead lined tanks, because they last longer and cost less.

The Corcoran factory is equipped for making all types of acid tanks, and special tools and fittings have been installed for making rectangular acid tanks in the best manner and by the most improved methods.

Advantages.

All Corcoran tanks are warranted to be absolutely watertight; and while the initial cost may be slightly higher than numerous unknown tanks, they are always cheaper in the end.

Corcoran tanks are indorsed by the New York Building and Fire Departments, Fire Insurance Exchange and the Associated Factory Mutual Fire Insurance Companies.

STEEL TANKS and GENERAL STEEL PLATE CONSTRUCTION.
OIL REFINING EQUIPMENT, including Stills, Condenser Boxes, Agitators, Filters, Bleacher Tanks, Rundown Tanks, Storage Tanks, etc.
For Water Softening, Purifying, Sterilizing, Filtering and Heating Apparatus see page 802.

GRAVER QUALITY STEEL TANKS

Facilities.

Since 1857 the GRAVER CORPORATION has given high class designing and construction service to the largest users of steel storage and steel plate work in the United States.
It completely equips oil refineries, gas plants, water works, mines, railroads, and builds a line of tanks of standard size for every storage purpose.
Standard Riveted and Welded Tanks, Horizontal and Vertical.
Very few buyers of steel storage realize that they probably could find in the Graver storage yard a standard tank that would meet their requirements as fully as the specially constructed tank they had in mind. This would mean not only a material saving in the first cost of the tank, but also quicker delivery than could be effected if the tank had been constructed according to their own specifications.

The storage yard is one of the features of Graver service which enables the organization to give to customers prompt shipment and to provide them with tanks to meet their requirements, without the delay always incident to special construction.

ECONOMY—Most important economies in tank manufacture have been effected by GRAVER CORPORATION. The immense business and intelligent standardization of sizes and specifications permit reasonable prices to be quoted on tanks singly or in lots. Other sizes of tanks than the standardized line will be made to order.
Location in the heart of the Chicago industrial district makes it possible to place at the disposal of customers unexcelled railroad facilities for quick shipment at moderate rates.

Oil Refining Equipment.

The same high standard of construction which characterizes other Graver products is maintained in the manufacture of Graver stills, condenser boxes, agitators, filters, bleacher tanks, rundown tanks and storage tanks.

Whether the need is for tanks of only a few hundred gallons' capacity or for complete equipment for the largest refinery, asphalt plant, acid plant, grain elevator, packing house, creosote plant or chemical plant, it will pay to get a Graver estimate. Address nearest office for information and prices.

ORGANIZED 1867

INCORPORATED 1889

KALAMAZOO TANK & SILO CO.

KALAMAZOO, MICH.

Products.

WOOD TANKS for all purposes, including Storage Tanks, Railroad Tanks, Manufacturing Tanks, Paper and Pulp Mill Tanks, Blow Pits, etc.; STEEL TOWERS; TANNERS' DRUMS, VAT TRUCKS.

Special Tanks, Wood Vats, Agitators, Vinegar Generators, Frostproofing for Pipes.

Services.

This company maintains a staff of engineers whose experiences in the manufacture of tanks and tank structures cover a period of many years. They have acquired valuable information for the solution of all tank problems, which they will gladly furnish to prospective buyers.

Kalamazoo Wood Tanks.

For 50 years the KALAMAZOO TANK & SILO CO. have manufactured wood tanks of the best grade of lumber and workmanship. Their plant is equipped with the latest machinery for the manufacture of wood tanks.

ROUND WOOD TANKS—Tank staves accurately sawed and jointed on true and radial lines, with proper regard for diameter of tank. The crozing at bottom of stave is cut circular with proper regard to stave when set in position and assures same to be completely filled by tank bottom when staves are driven up. Outside surfaces of staves finished convex, giving full bearing to hoop over entire face of stave. Tanks furnished with correct number of round steel hoops and malleable iron lugs for tightening.

Size of tank determines hoopage, and factor of safety allowed to make ample allowance for pressure of water, and swelling of staves.

RECTANGULAR WOOD TANKS—Carefully machined and jointed in workmanlike manner. Built in any size required, with or without partitions, false bottoms, etc. The vertical rodding runs through the lumber and tops of rods are countersunk and covered with rounded piece of maple wood, giving smooth and finished top. Shipped knocked down, all pieces match marked for easy assembly, or shipped set up if convenient or required.

GRAVITY WOOD TANKS—Furnished with or without steel towers and are suitable for supply or sprinkler systems. They can be furnished complete with pitched or flat roof, ladders, indicator and float. Built to requirements of National Board of Fire Underwriters and local authorities.

Products.

WOOD TANKS; STEEL TOWERS; AGITATOR DRIVES, with or without stirrers.

Also, Wood Vats, Dye Tubs, special Tanks for any purpose, and special Mixing Machines.

TRADE-MARK

Pressure Tanks.

Wood pressure tanks are designed and tested for 50 lbs. pressure per sq. in.

PRESSURE TANKS

Round Tanks.

Round tanks up to 100,000 gals. capacity, built of 1½-, 2-, 3- or 4-in. stock.

Cypress, redwood, Douglas fir, white pine, yellow pine or oak can be furnished.

ROUND TANK

Settling Tanks.

Cone bottom settling tanks, used by paper and board mills, can be furnished in capacities from 1000 to 35,000 gals., with either wood or steel supports.

SETTLING TANK

Rectangular Tanks.

Rectangular tanks are built in desired sizes of 1½- to 4-in. stock.

Rectangular compartment tanks are furnished with dovetailed grooving on inside to provide anchorage for lining with cement.

RECTANGULAR TANK

COMPARTMENT TANK

Pickling Tanks.

Pickling tanks are designed especially for handling wire in coils.

PICKLING TANKS

SPECIAL MIXING TANK WITH STEEL SPIRAL STIRRERS

Tanks and Towers.

Sprinkler tanks and steel towers are furnished and installed to meet insurance requirements.

Tanks can be furnished of cypress, redwood, yellow pine or Douglas fir.

Products and Services.

Engineers, manufacturers and erectors of ELEVATED STEEL TANKS and STORAGE TANKS of all types for industrial, municipal and railway service; REFINERY CONDENSERS; OIL STILLs.

Also, Standpipes, Smokestacks, Steel Pipe Lines, Coal Bins, Barges, Dredges, Coaling Stations, Wireless Towers, Steel Structures and General Plate Work.

Elevated Steel Tanks.

This company has made a specialty for many years of the manufacture of elevated steel tanks. It is the most satisfactory means of supplying water to a sprinkler system, and in connection with private or municipal water works, it furnishes a reliable, long lived, watertight structure of simple lines and pleasing appearance.

ELEVATED STEEL TANK, EAST YORK, PA., AMERICAN CHAIN CO. Capacity, 100,000 gals., height, 100 ft.

ERECTED AT THREE RIVERS, QUE. Capacity 50,000 gals., height, 149 ft. Capacity 120,000 gals., height, 100 ft.

Railway Locomotive Service.

Engineers who build for the future have adopted as their standard this permanent all-steel, fire-proof construction.

The peculiar requirements of the railway water tank are met by the large diameter mud drum and antifreeze design.

This company has special designs which are most satisfactory and economical.

Co-operative Service.

This company maintains an expert engineering and contracting staff. If the problems of design are complicated a wire or letter to the nearest office will bring a competent man before you without expense or obligation.

Upon receipt of inquiry, the engineering department will gladly prepare plans and prepare estimates and submit quotations with no obligation on the part of the prospective purchaser.

It is recommended that specifications of tanks be given in accordance with standard dimensions.

Write the nearest sales office for catalogue.

RIVERSIDE BOILER WORKS, INC.

Manufacturers of Steel Tanks

CAMBRIDGE, MASS.

PACIFIC COAST OFFICE, 461 Market Street, SAN FRANCISCO, CAL.

NEW YORK OFFICE, 48 East 41st Street

Products.

BLACK and GALVANIZED STEEL TANKS.

RECTANGULAR TANKS of different sizes for water, oil and other storage.

Also, Air and Gasoline Tanks; Ship, Expansion and Pressure Tanks; Range Boilers; Welded Headers.

Special Riveted and Brazed Construction.

The strongest, tightest and safest tank construction today is the "Riverside" riveted and brazed construction. The riveted and brazed seam is a specialty with this company and is used on all possible work.

Tanks.

The tanks listed can be made up from sheets regularly carried in stock. Tappings placed in any location desired.

Manholes and handholes are extra and furnished on request. Net prices f. o. b. Boston will be quoted promptly.

Sizes range from 5 to 2260 gals. capacity, with diameters ranging from 6 to 48 ins., inclusive, suitable for all purposes where working pressures do not exceed 300 lbs. per sq. in.

Rectangular or odd shaped tanks, riveted or welded, black or galvanized, from $\frac{3}{8}$ to $\frac{1}{4}$ in. thickness, inclusive, are made to order.

Galvanizing.

Tanks are galvanized inside and out by the hot-dip process.

Heads.

Regularly furnished with one convex and one concave. Welded tanks can be made up with both heads convex or concave, if desired.

Estimates.

The 32 years' experience of the company is of value. State the problem and the tank will be designed and quotations submitted promptly.

On receipt of inquiry, quotations on square and rectangular storage tanks, or any tanks of special dimensions, will be furnished.

Table.

The table is to be used in specifying "Riverside" steel tanks, and represents the best tank practice for purposes stated.

DIMENSIONS—First figures shown are inside diameters; second figures show lengths on shell.

Facilities.

A well equipped and up-to-date plant guarantees the prompt construction of steel tank work of riveted, riveted and brazed, and welded construction, the oxy-acetylene method being employed.

STORAGE TANKS FOR HOT WATER, FUEL OIL, GASOLINE, ETC.

AIR REDUCTION SALES COMPANY

Manufacturers of Airco Oxygen, Acetylene, and Welding and Cutting Apparatus

GENERAL OFFICES

120 Broadway

NEW YORK, N.Y.

DISTRICT OFFICES AND DISTRIBUTING STATIONS THROUGHOUT THE UNITED STATES

Products.

OXYGEN; ACETYLENE; WELDING and CUTTING APPARATUS and SUPPLIES; ACETYLENE GENERATORS.

Carbide, Nitrogen.

Airco Engineering Service.

The AIR REDUCTION SALES COMPANY maintains a corps of specialists on oxy-acetylene welding and cutting. These experts are employed to assist in solving oxy-acetylene welding or cutting problems or in training welders in the art.

Airco Oxygen.

Airco Oxygen is of a uniform high quality. It is shipped to users from Airco plants and distributing stations located at important centers. There is a distributing station conveniently near every Airco user. Each plant is equipped with sufficient capacity, as to cylinders, to take care of the user's requirements on short notice. Airco oxygen cylinders are of two sizes—containing approximately 110 cu. ft. and 220 cu. ft. of Airco oxygen.

Airco Acetylene.

Airco acetylene is manufactured from calcium carbide at the Airco acetylene plants located throughout the United States. Airco acetylene cylinders are of a special design which insures maximum safety and fulfils all the requirements of the Interstate Commerce Commission and the various Safety Councils.

Airco acetylene cylinder policy represents the greatest economy to the user. The same excellent methods prevail in the distribution of Airco acetylene as for Airco oxygen.

Airco "A" Welding Torch.

The Airco "A" welding torch is designed for welding material from $\frac{1}{32}$ in. thick to the thickest

AIRCO "A" WELDING TORCH

TRADE-MARK

metal practical to weld with the oxy-acetylene process. The torch is furnished in lengths of 16, 20, 26 or 34 in., with 45°, 67½°, or 90° angle head, and 10 sizes of welding tips. The standard length, 20 in., weighs only 31 oz.

Airco "B" Welding Torch. (Sheet Metal Torch.)

The Airco "B" welding torch is manufactured to meet the demand for a light, well balanced, substantially built torch for use in manufacturing plants where the same operation is done day in and day out and where the thickness of material does not exceed approximately $\frac{1}{4}$ in.

The torch is furnished with 3 angles of head, namely: 45°, 75° and 90°; and weighs only 15 oz. It is furnished with five interchangeable tips designed for use in welding metal from $\frac{1}{32}$ in. to approximately $\frac{1}{4}$ in.

Airco "C" Welding Torch. (Lead Welding Torch.)

The Airco "C" welding torch is manufactured to meet the demand for a torch with a hot, concentrated flame for delicate operations, such as very light sheet metal, dental and jewelry work. The torch is furnished with 4 interchangeable tips for welding material from $\frac{1}{32}$ in. to approximately $\frac{1}{8}$ in. and weighs only 13 oz.

AIRCO "C" WELDING TORCH

Airco "D" Cutting Torches.

Airco cutting torches are designed along the same principles as the Airco welding torches. The "D" torch is furnished with three angles of head, namely: 67½°, 90° and 180° and with six interchangeable tips for use in cutting material up to the maximum cut capable of being made with the oxy-acetylene flame. The torch weighs 47 oz. with tips and hose connections attached.

AIRCO "D" CUTTING TORCH

Airco Carbon Burning Torch.

This torch is used for removing carbon from the cylinders of internal combustion motors. It is simply and strongly constructed and will more than pay for itself in a very short time, by the saving made over the usual costs of removing carbon from motor cylinders. The torch is very popular in garage and automobile repair plants.

AIRCO CARBON BURNING TORCH

Airco Acetylene Generators.

Airco acetylene generators are manufactured to meet the demand of large users of acetylene who desire to obtain a constant supply of acetylene generated on their own premises. Airco acetylene generators are manufactured in sizes ranging from a capacity of 25 cu. ft. of acetylene per hour to 300 cu. ft. per hour. Every effort has been made in the design and construction to make the generators foolproof by means of interlocking levers and other simple safety devices.

ELECTRIC ARC CUTTING AND WELDING CO.

222 Halsey Street
NEWARK, N. J.

Products and Services.

STANDARD PORTABLE ALTERNATING CURRENT WELDER; WELDING ACCESSORIES: Welding and Cutting Electrodes, Welding Handles, Welding Operators' and Inspectors' Masks and Shields, Aprons, Gloves and all other Welding Supplies.

WELDING SCHOOL and SHOP for Training Men to meet all around welding problems.

Description and Notable Features of Welder.

The standard portable A. C. Welder is a special transformer which delivers the arc voltage of the necessary characteristics at the terminals of the apparatus, and is made to meet any A.C. primary power supply voltage or frequency. The complete apparatus weighs 265 pounds, is equipped with two handles and will operate in any position.

STANDARD A.C. WELDER SHOWING TYPE 17 MASK AND TYPE A WELDING HANDLE

A—flux diverter which gives the small increments of current to give exact conditions of heat.

B—secondary taps, either side may be grounded. These give the larger increments to current for heat conditions.

Brass plates under each tap designates kind of work to be done. Light work, slag coated electrode, flux coated electrode, bare wire, light work, medium work, heavy work, cutting.

C—primary connections, taps for 10% below normal.

D—handles for carrying welder. E—ventilator. F—lamp socket for light grinder. G—oak case

SHORT, CLOSE ARC—It is definitely known that a short, close arc must be held to obtain a good weld. The standard A. C. Welder holds a close arc through its automatic regulation of current and voltage, which is obtained not by reducing voltage but by inherent qualities of the machine, thus maintaining a high penetrative quality.

HEAT AND TEMPERATURE OF ARC—For sound metallurgical rea-

WELDED BOILER TUBE SHOWING PERFECT FUSION OF METAL

sons the fusing of metal to be welded should be done with an agent that is extremely local and extremely hot. This is exactly the result obtained with the standard A.C. Welder. Large gradations of current are obtained by various plugs on the front of the machine, the finer adjustments by moving the flux diverter up or down. Watts or heat is held constant.

OVER ALL EFFICIENCY—This is best represented by the kilowatt hours per pound of metal deposited. In the case of standard A.C. Welder this is 1½ kw. to 2 kw. hours per lb. of metal deposited as against 8 kw. to 25 kw. hours on other type welders.

SPEED—Alternating current provides a faster speed than any system with a polarity electrode. In tests where voltage and current conditions were similar the alternating current system was 20% to 30% faster than any other system in the deposition of metal.

POWER FACTOR—This is the ratio of kilovolt-amperes asked for to kilowatt used. Our power factor in welding runs from 35% to 65%, a fair average being 50%; while the power factor in cutting runs from 65% to 90%, a fair average on heavy cutting being 80%. Our demand for the heaviest sort of welding is 5 kw., and the demand for the heaviest cutting is 50 kw.

Summary of Advantages.

(1) Low first cost. (2) 1 kwh. per pound of metal, which is less power consumption than any other machine. (3) Cost of maintenance, none. (4) Inherent short arc insures reliability of weld. Constant heat is automatically held at arc. (5) Speed in welding is greater than any other machine. (6) Portable, weighs 265 pounds. (7) Low comparative cost of installation. (8) Power factor equal to, or better than, any induction motor generator set. (9) Uses any type of electrode. (10) Absolutely weatherproof, permitting work outdoors in any weather.

Accessories.

HANDLES—Welding handles are made of manganese bronze. Grip is of bakelite delecto, self-aligning spring. Electrode released by squeeze of hand.

MASK and SHIELDS—Made of especially light weight, reinforced material complete with glasses. Designed to protect operator's eyes and to shield all parts of head from burns and falling objects. Mask is generally used by welder, shield by inspector or observer.

WILSON WELDER & METALS CO., INC.

Welding Apparatus and Metals

2 Rector Street
NEW YORK, N. Y.

Products and Service.

WILSON PLASTIC-ARC WELDER and PLASTIC-ARC CERTIFIED WELDING METALS.

Welding of every description done by the Wilson Plastic-Arc welding system.

Wilson Plastic-Arc Welding System.

This system employs a flat, compound wound, 35-volt, direct current generator, in connection with a panel containing an automatic control mechanism. This combination gives 18 to 22 volts at the arc, the rest of the power being used in the line and in the automatic power regulation. The advantage of the low voltage is that it prohibits the operator from making a long arc between the electrode and the work, which slags the metal deposit. If the arc is lengthened it is weakened and must be brought back to a proper distance to make the weld, thus limiting the operator.

Low voltage insures better penetration of the original metal by the concentrated arc than with a longer diffused arc of higher voltage.

Proper welding is accomplished by fusing the parent and new metal with a uniform welding heat. The heat is kept constant by the Wilson automatic control mechanism mounted on the panelboard, an exclusive feature of the Plastic-Arc system.

Plastic-Arc outfits are built in one-, two- and four-arc units, and four operators can draw energy from the same generator, each using a different heat as required on different metals without interference. A separate panel is required for each operator. The Plastic-Arc will weld practically any metal: copper, brass, aluminum, and cast iron.

Damage on 20 German vessels consisting of 118 major breaks which would have necessitated the renewal of 70 cast iron cylinders, some as large as 9 ft. in diameter, were repaired with the Plastic-Arc system. The saving to the United States government amounted to \$20,000,000.00 and twelve months of time, during which time ships transported over 500,000 troops overseas.

Plastic-Arc "Certified" Welding Metals.

There are 8 grades of Plastic-Arc "Certified" Welding Metals and each can be depended upon, being guaranteed to give satisfactory results when employed upon the type of work it is designed for.

GRADE NO. 6—For work where ductility and high tensile strength is required.

Plastic-Arc
TRADE-MARK

ONE-ARC, DYNAMOTOR TYPE,
PORTABLE OUTFIT

WELDING REPAIR ON STEAM ENGINE

A steam engine broken practically into two parts welded and put into service by Plastic-Arc System

*GRADE 8—Useful for building up worn places where high tensile strength is not required.

GRADE 9—For use on all cast steel parts requiring high strength in the weld.

GRADE 17—For filling in blowholes in steel and gray iron castings and all work where parts are not subjected to undue strains and tensile strength is not an important factor.

GRADE 20—Bronze alloy for all brass, copper and bronze work.

GRADE 30—Standard diameter, $\frac{1}{8}$ in. An exceptionally easy and fast flowing electrode which lays flat where deposited; of medium tensile strength; specially designed for welding thin cast iron.

GRADE 31—High tensile strength and conductivity with very smooth flowing, specially designed for overhead welding with deep penetration. The $\frac{1}{8}$ -in. size particularly recommended for boiler flue work.

GRADE 33—Exceptionally smooth flowing qualities. Designed for overhead welding.

To give the best results, the arc-welding system should employ both the welder and welding metals manufactured by the WILSON WELDER & METALS CO., INC.

Commercial Welding.

This company solicits commercial welding of any description.

Catalogue.

The system and its uses are fully described in an 80-page manual and catalogue, number 5, copies of which will be supplied on request.

TRADE-MARK

AMERICAN CHIMNEY CONSTRUCTION CO.

(Not Incorporated)

SUCCESSORS TO FRED HILLESHEIM CHIMNEY CONSTRUCTION CO.

Radial and Common Brick Chimneys

TELEPHONES:

FRANKLIN 2594, 2595

118 North La Salle Street

CHICAGO, ILL.

BRANCH OFFICE: CLEVELAND, OHIO, 505 Superior Building

Products and Services.

Designers and Builders of PERFORATED RADIAL and COMMON BRICK CHIMNEYS with Foundations and Flues, of all sizes and for all purposes; FURNACES and KILNS; COAL SAVING and SMOKE ABATEMENT DEVICES.

OLD CHIMNEYS EXTENDED, REPAIRED, STRAIGHTENED and POINTED while in operation; REPORTS and RECOMMENDATIONS on condition of old chimneys; STEEL STACKS LINED.

Facilities.

The AMERICAN CHIMNEY CONSTRUCTION Co., through its 25 years of experience, is in a position to give expert advice as to the proper size and shape of any kind of chimney for any purpose, as well as to make, through its efficient engineers, recommendations regarding boiler layouts, size, shape and design of furnaces, coal to be used, temperatures, gases generated, geographical location and any other conditions affecting the determination of the most economical and efficient sizes of furnaces and chimneys needed.

Perforated Radial Chimneys.

The perforated radial blocks are made only from the purest materials selected for high refractory powers and high crushing strength. Special attention is given in the brickyards to making the proper mix of clays in the right proportion to produce a radial brick chimney which will resist contraction and expansion of heat strains to a great extent, as well as strains from weight and wind. All the radial blocks are formed to suit the circular and radial lines of each part of the chimney, so that they can be laid with thin, even joints and produce a regular, smooth surface.

PERFORATED RADIAL BLOCKS

Common Brick Chimneys.

The AMERICAN CHIMNEY CONSTRUCTION Co. also builds round common brick chimneys of inside diameter from 3 ft. 6 in. and up. These chimneys are just as good looking and durable as the radial chimneys; they have been in use for many years and have given universally good results and satisfaction.

Data Required for Chimney Designs and Estimates.

In general, state conditions and result desired; the Engineering Department will promptly give the correct, efficient and economical size of chimney and furnaces and will make recommendations, not from theoretical tables but from 25 years of practical experience; they will give data from users of their chimneys, collected from actual working conditions in American installations in all parts of the world.

Also, give all possible information regarding place, transportation, dimensions of chimney required, boiler horsepower, probable temperatures, etc. State nature of soil where chimney will be erected. Give local prices for necessary building material.

In accordance with the above information, designs and lowest estimates of the chimney needed will be submitted.

Chimney Repairing.

Old chimneys can be extended without any interruption to the plant.

Send a plan of the old chimney, or the height, inside diameter, width at base and wall thickness. The Engineering Department will furnish design and figure on extending the same.

This company repairs, straightens and points old chimneys while in operation. They inspect old chimneys and make reports and recommendations on their condition, etc.

Furnaces and Kilns.

This company designs and constructs kilns and furnaces. It makes a specialty of building kilns of all kinds.

Miscellaneous Fuel and Smoke Equipment.

Steel stacks, etc., lined. Devices for smoke abatement and fuel saving with high or low pressure boilers furnished or installed complete.

CLEVELAND, OHIO, 919 American Trust Building
BOSTON, MASS., 141 Milk Street

Products.

PERFORATED RADIAL BRICK CHIMNEYS; COMMON BRICK CHIMNEYS.

Ornamental Chimneys for boiler operation, smelter plants, chemical plant (acid gases), crematories, incinerators (high temperature).

Perforated Radial Brick Chimneys.

The AMERICAN CHIMNEY CORPORATION constructs their chimneys of special bricks which are perforated and are shaped to the circular and radial lines of the chimney, producing, when in place, smooth and true inner and outer surfaces.

The perforations in the brick permit a thorough burning.

In the wall they form insulating dead air spaces which reduce radiation, resulting in fuel economy.

The mortar extends into the perforations, thoroughly bonding the bricks together and adding greatly to the stability of the chimney.

Steel bands are provided for in the wall as safeguards against cracking.

Joints are broken in every course, horizontally and vertically.

Chimneys are built from inside without scaffolding, greatly reducing the cost and time of erection.

Common Brick Chimneys.

This company is prepared to erect chimneys of common brick, round, square or octagonal, to suit special architectural requirements.

Estimates.

When asking for information or estimates, kindly advise on the following points:

(1) Intended use of chimney (boiler furnace, smelter, chemical plant, incinerator).

(2) Height above foundation and diameter or boiler horsepower or number and dimensions of boilers.

(3) If a bid is desired on foundation, give character of soil.

(4) Does chimney stand independent of building? If it is a part of the building, state for what height.

(5) Give hauling distance from purchaser's railroad siding or nearest railroad freight yard.

(6) If possible, give approximate prices of building materials and wage scale of local common labor.

(7) Color of bricks desired.

VANCOUVER, B. C.

Products and Services.

Designers and Builders of PERFORATED RADIAL BRICK CHIMNEYS, with FOUNDATIONS and FLUES, of all sizes, for boilers, furnaces, crematories and ovens; CHIMNEYS for smelters, hotels and office buildings; ACIDPROOF CHIMNEYS for paint works and chemical plants; HIGH TEMPERATURE CHIMNEYS for garbage destructors and incinerators; KILNS, BOILER SETTINGS, etc.

Specifications, plans, designs and data furnished free on request.

The ALPHONS CUSTODIS CHIMNEY CONSTRUCTION Co., through its forty years of experience, is equipped to give expert advice as to the size and shape of any kind of a chimney, for any purpose, as well as make recommendations through its engineers regarding boiler layouts, size, shape and design of flues.

The boilers, the coal used, temperatures, gases generated, geographical location and many other conditions affect the determination of the most economical and efficient size of a chimney. State conditions and the results desired, and the engineers of this company will promptly give the correct, efficient and economical size of chimney, and will make recommendations, not from theoretical tables, but from over forty years' experience and unpublished data collected from actual working conditions of our chimneys all over the world.

The fact that over 7000 Custodis radial brick chimneys are now in successful operation is conclusive proof of their efficiency, permanency and economy.

Description.

The perforated radial blocks are made only from the purest clays, selected for high refractory powers and high crushing strength. Special attention is given in the brickyards to making the proper mix of clays in the right proportion to produce a radial brick chimney which will resist heat strains, as well as strains from weight and wind.

All the radial blocks are formed to suit the circular and radial lines of each part of the chimney, so that they can be laid with thin, even joints and produce a regular smooth surface.

PERFORATED RADIAL BLOCKS

Manufactured in sizes and shapes suitable for all chimney diameters

The blocks are larger than common bricks, making the number of mortar joints in a radial brick chimney one-third of those in a common brick chimney of the same size.

Moulded with vertical perforations, as shown in the illustration, the radial blocks are most thoroughly

and uniformly burned, increasing, to a marked degree, their density and strength. The

perforations form a dead air space around the chimney, insulating the hot column of rising gases on the inside from sudden changes of temperature of the outer air, resulting in a maximum draft under all conditions.

Flues and Kilns.

This company designs and constructs flues and furnaces. It makes a specialty of building kilns of all kinds. Steel stacks, etc., lined.

Remodeling and Repairing.

Old chimneys can be heightened without any interruption to the plant.

Send the height, inside diameter, width at base and wall thickness, or a plan of the old chimney. The engineering department will furnish design, and figure on heightening it. Old brick chimneys can be removed without danger. We repair, straighten and point them while in operation, if necessary. We inspect old chimneys and make reports and recommendations on their condition.

Information Required.

When requesting estimates, please give the following information:
Name of place where chimney is to be erected.
On what railroad siding is same located.
Distance from siding delivery to chimney site.
Is chimney to be used for boiler drafts or other purposes.
Give probable temperatures of the flue gases.
If for boiler draft, what is total horsepower.
Kind of fuel or coal to be used.
Amount consumed per horsepower or total per hour.
Dimensions of chimney required—diameter; height.
Is arrangement for overhead or underground flue.
Give dimensions and shape of flue opening desired in chimney.
Give height of same above or below foundation top.
What is nature of soil where chimney will stand.
What is estimated safe load per square foot.
What depth of excavation is necessary to reach good soil.
What is latest date allowed for erection of chimney.
Sketch showing arrangement of building, boiler and chimney.
Local prices—red brick, lime, cement and sand.

Products.

Engineers and builders of RADIAL BRICK and CONCRETE CHIMNEYS.

Also Concrete Tanks and Towers for all industrial purposes.

Services.

THE HEINE CHIMNEY CO. have a skilled and experienced organization for the designing and construction of chimneys, tanks and towers. As a result of close application for many years in radial brick and concrete construction, our engineers are in a position to render a most valuable consulting service to engineers who are intending to build either chimneys, tanks or towers. A vast accumulation of data in our possession, and which is not available elsewhere, is at the disposal of our engineers for their use in determining the most efficient type and size of chimney required to meet any existing conditions.

Heine Radial Brick Chimneys.

Heine radial brick chimneys are built with perforated radial brick, manufactured from clays specially selected for high refractory qualities and crushing strength.

Heine Concrete Chimneys.

Heine concrete chimneys are constructed with all steel outer and inner forms, covered by patents, assuring a true and concentric chimney with uni-

form taper. They are built with a wet mixture and reinforced with steel bars and triangular wire mesh as manufactured by American Steel & Wire Company.

Information Required for Preparation of Estimates.

Name of party and place of erection.

Distance from railroad track to chimney site.

Will chimney be built in the open or within a building?

Is chimney to be used for boiler drafts or other purposes?

State probable temperature of the flue gases.

Give number and total horsepower of boilers.

Give number of flue openings.

Give approximate distance from grade to bottom of flue opening; whether chimney is arranged for overhead or underground flue.

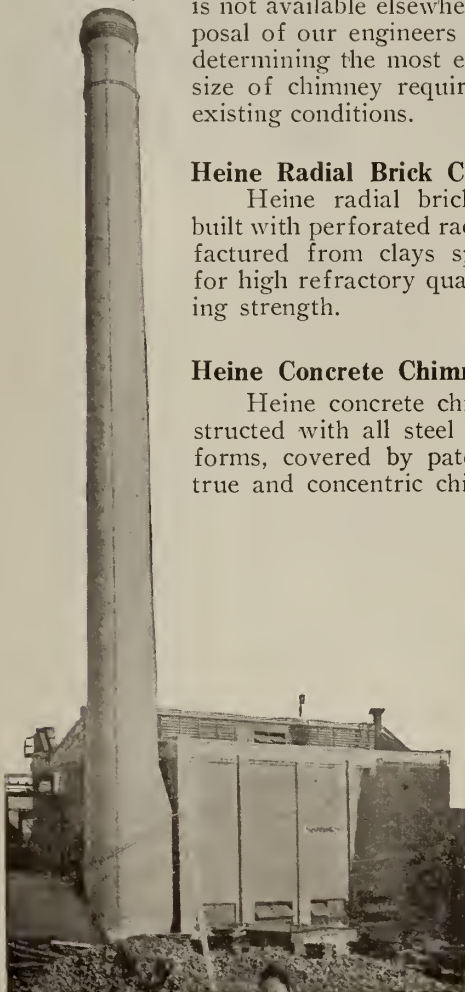

Height and diameter of chimney.

Present local prices for the following delivered at job:

Cement, lime, sand, stone or gravel, and common brick.

PERFORATED RADIAL BRICK CHIMNEYS.

For Welded Pipe, Flanges, Tanks, Fittings and Seamless Welded Work of all descriptions, see pages 420-21.

Service.

THE M. W. KELLOGG COMPANY has erected some of the finest chimneys in the United States during the last sixteen years, and is ready to share the results of that experience with engineers and architects who are engaged in problems where chimney construction is required. This company's engineers will be glad to advise on types, sizes, shapes, etc., of chimneys for any condition that may arise.

Kellogg Perforated Radial Brick Chimneys.

No artificially produced material for the construction of the modern factory chimney compares with refractory clay. This raw material is put through a variety of scientific treatments by skilled hands and especially designed machines before it comes from the kilns in the form of perforated radial brick ready for shipment, and for use in chimney construction.

Each brick is formed to occupy a certain position in the circular and radial lines of the chimney, as shown by the drawing on this page, and is sound ringing, hard, well burned and free from checks.

Bricks are made to conform closely with the circular and radial lines of the shaft and are weatherproof and acidproof.

Total amount of perforations does not exceed one-fourth of the cross area of the brick, which are tested to a crushing strength of not less than 6000 lbs. per sq. in.

The perforations in the radial bricks form a dead air space about the core of the chimney. This has a marked effect in reducing amount of fuel used, in preventing sudden changes of temperature within the chimney, and in reducing radiation. Thus a uniformly maximum draft is maintained in any kind of weather.

A trained superintendent of construction, familiar with all the details of the plans and specifications of the chimney, accompanies each shipment of radial brick, to supervise unloading and stacking in the order of their use. Throughout the entire construction the bricks of each tier reach their final place under his direction.

An expert mortar man supervises the preparation and use of all of the mortar. The tensile strength of the chimney, its ability to withstand heat and cold and to defy all sorts of weather from without and all sorts of gases from within, depend largely upon this mortar. Each brick is laid in so full a bed of mortar that the latter enters the perforations of the brick from 1 in. to 1½ ins. The joints are struck both inside and out.

METHOD OF USING M. W. KELLOGG'S PERFORATED RADIAL
BRICK IN CHIMNEY CONSTRUCTION

struction carry forward the erection of the chimney from start to finish, insuring careful construction and the proper grading and matching of brick throughout.

Standard Specifications for Perforated Radial Brick Chimneys.

SCOPE—The work included under this contract is to consist of all labor and material necessary for the erection complete of one radial brick chimney in accordance with this specification, which shall become a part of the contract. The proposal shall include all scaffolding, cartage, unloading of material and removal of rubbish necessary to leave the chimney in a first class condition ready for operation.

DELIVERY—The chimney will be built at.....
located on the.....
railroad.

Material may be unloaded on owner's siding, which is within.....of the chimney site.

SPACE—Sufficient storage room for chimney contractor's materials will be provided adjacent to chimney as well as unobstructed access from transportation delivery to the site of chimney for delivery and removal of materials and tools. At least one side of chimney will be left free and open by the owners for hoisting and working space until the chimney is completed.

WATER—The owners will provide the chimney contractor with necessary water within 50 ft. of the site of the chimney free of expense to the chimney contractor. From this point the chimney contractor will make his own hose connections, if required.

WORKMANSHIP AND MATERIALS—All workmanship and materials shall be first class.

The chimney contractor shall furnish a competent foreman under whose supervision the chimney will be built. Chimney must be built in a thorough, complete and workmanlike manner.

TIME OF COMPLETION—The chimney contractor shall state in bid the guaranteed number of working days in which he will finish the chimney after receipt of signed contract and approved drawings.

FOUNDATION—Proper foundation will be built by the owner from plans and specifications to be furnished by the chimney contractor, who will, upon completion, give in writing his approval of the foundation as being sufficient to sustain the chimney and fulfil the guarantee.

Note—In case, however, it is desired to have chimney contractor build the foundation, the following may be used:

The chimney contractor shall furnish a concrete foundation of proper depth and spread to safely sustain the chimney. The foundation shall be not loaded to more than.....tons per sq. ft., which is the safe bearing value as determined for this work.

Excavating shall be done by contractor for foundation.

The concrete shall be composed of cement, sand, stone or gravel in the proportion of 1 part cement to 2½ parts sand and 5 parts of stone or gravel. It shall be deposited in the forms in layers not to exceed 6 in. in thickness and thoroughly rammed into place. Concrete shall be a wet mixture.

DESIGN—The design of the chimney shall conform to the following dimensions as shown on drawing attached:

Height above top of foundation.....ft.....ins.

Minimum internal diameter.....ft.....ins.

The wall of the column shall have one straight and true batter from top to bottom. The wall thickness and section lengths to be as shown on drawing. In case the contractor's standard wall thickness should not be exactly as shown, a variation of 3% will be allowed in either direction.

BASE—If chimney is to be built with base and column construction, use the following:

The base of the chimney shall be built [here fill in shape of base] in shape.....ft. high, of the dimensions shown on drawing, of straight, hard, well burned, well shaped common building brick laid in full bed of cement lime mortar as herein specified.

Note—If round for the entire height, specify as follows:

The chimney shall be built of perforated radial brick for the entire height, as hereinafter specified.

RADIAL BRICK—All radial brick shall be best quality, moulded from refractory clay, sound ringing, hard, well burned, well shaped, of reasonably even color and free from checks; made to closely conform with the circular and radial lines of the shaft, and shall be weatherproof and acidproof. They shall have a water absorption of not less than 5% nor more than 12% of their dry weight after immersion for a period of 24 hours; and shall have a crushing strength of not less than 6000 lbs. per sq. in. The total amount of perforations shall not exceed one-fourth of the cross area of the brick. One cu. ft. of radial brickwork shall weigh not less than 120 lbs. The outside faces of the brick shall be of regular size, so that the general appearance of the brickwork will be neat and uniform.

LINING—The chimney shall have an expansion lining built of perforated radial fire brick 4¼ ins. thick.....ft. high from a point 2 ft. below the bottom of the flue opening. The lining prevents flue gases from coming in contact with the solid masonry of which the shell is built, and shall be separated from same by an air space of not less than 2 ins.

The lining shall be built after the chimney is finished, and exceptional care must be taken to keep the air space clear and free of loose mortar and other dirt.

Rack out the shell of the chimney approximately 2 ins. above lining, to form a ledge for the purpose of diverting the falling soot when the chimney is in operation.

MORTAR—All brickwork shall be laid in cement lime mortar, as hereinafter specified, with courses level and with full joints throughout. Face brickwork and backing to be laid up at the same time with joints of reasonably even thickness, not exceeding ½ in. The mortar to be used in the chimney shall consist of 1 part Portland cement, 2 parts fresh burnt limp lime mortar and 5 parts clean, sharp sand. The cement to be added to the sand and lime mortar as the mortar is required, and no mortar having taken an initial set is to be used. The cement must not be added until the lime is cool. The sand shall be clean and sharp, free from loam, vegetable matter and large pebbles. If necessary, it must be both screened and washed.

BOND—All common brickwork shall have every fourth course a header course.

Radial brickwork shall be bonded every three courses.

BREACHING OPENING—One opening shall be provided in chimney. The opening to be lined on the reveals with refractory material. The masonry above the opening to be supported by heavy I-beams set on steel plates, with air spaces at each end for expansion. Under these I-beams a flat masonry arch shall be built to properly protect the beams from the effect of the gases. The flue opening shall be reinforced laterally by heavy tie rods and plates over the top and at the bottom.

Three-eighths by 3-in. steel bands to be placed in the masonry above and below opening.

The opening shall be.....wide by.....high, the bottom of which shall be approximately.....above foundation.

REINFORCING RINGS—The chimney contractor shall place in the brickwork at every change in wall thickness steel bands ¾ in. thick by 3 ins. wide.

If the contractor should furnish perforated radial brick having corrugated sides, these bands may be omitted.

HEAD—The head of the chimney shall be neatly corbeled out and fitted with a heavy annular retaining ring set in full bed of cement mortar.

CLEAN-OUT DOOR—Provide and place in base of chimney where directed by owner a cast iron clean-out door and frame properly hinged and fitted with latch. Said door to be approximately 24 ins. wide by 36 ins. high.

LADDER—Build on the interior of the chimney a ladder to consist of ¾-in. galvanized iron rungs, spaced approximately 15 ins. center to center and securely anchored to the masonry from top to bottom. These ladder irons to be in the shape of a "U" with hooked ends.

LIGHTNING CONDUCTOR—The lightning conductor is to consist of.....copper points, ¾ in. in diameter by 8 ft. long, with 1½-in. platinum tips. The points to be anchored to the top of the column and extend from the bottom of the corbeling upward. The lower ends of the points to be connected by a loop of copper cable encircling the chimney. From this loop there is to be 1½-in. 7-strand No. 10 Stubbs' wire gauge copper cable, carried down the side of the chimney and connected to copper ground plate of the 3-winged type as best for the proper distribution of charge. The points to be securely fastened to the top of the chimney and the cable to be anchored every 7 ft. in height with brass anchors, so designed that they will support the weight of the cable. The ground plate shall be buried by the contractor for the foundation when it is built.

LETTERING (WHEN DESIRED)—Work into the column on [one or two] sides as directed the letters [here insert the desired legend] to be made in permanently colored kiln burnt brick. Letters to be true to size and shape and to be in a true vertical line.

TRIMMINGS (IF ANY)—All necessary stone or terra cotta shown on drawing will be furnished without charge by the building contractor to the chimney contractor, who will set same. No one piece should weigh over 200 lbs.

INSURANCE—The chimney contractor shall carry at his own expense, during the entire period of construction, liability insurance, insuring the men in his employ and the public in general, in case of damage due to accidents.

GUARANTEE—The chimney contractor shall guarantee the chimney for a period of 5 years from date of completion. The guarantee shall cover any defects that may arise within this period due to faulty design, construction, material, weather, and the products of combustion up to 800° Fahr.; and shall further guarantee to make good at his own expense all defects that may arise from any of the above conditions within the specified period.

The chimney shall be designed for a wind velocity of not less than 100 miles per hour.

NOTE—The chimney shall be built according to THE M. W. KELLOGG COMPANY [or equal] system of construction.

The insertion of this clause would be greatly appreciated on account of the advertising value to us on future work.

Products and Services.

Specialists for 35 years in the design and construction of PERFORATED RADIAL BRICK CHIMNEYS and accessory structural members, including Foundations, Boiler Setting and Brick Furnaces.

Manufacturers of PERFORATED RADIAL BRICK.

Also, Grain Elevators, Tanks and Silos.

Rush work a specialty. Material always ready for immediate shipment from the factory.

Heinicke Radial Bricks and Chimneys.

Heinicke chimneys are constructed of specially formed perforated bricks manufactured by Heinicke themselves. These bricks are shaped to the circular and radial lines of the chimney, producing, when in place, smooth and true inner and outer surfaces.

They are hard burned, regular in shape, sound ringing, and weatherproof and acidproof.

All Heinicke radial bricks are produced from selected, chemically tested and carefully proportioned refractory fire clay and shale.

The perforations permit of thorough burning of the bricks, assuring a product which is highly resistant to acids, heat, weather and other deteriorating influences.

The brick plant is run as a part of this business and not as a separate enterprise. It is the only brick plant in the United States which makes a specialty of radial bricks. Radial bricks are produced by other brick makers simply as a side line in connection with their regular business. Such concerns can not be expected to give the care and attention to the manufacture of radials as will be exerted by the chimney builder himself.

The Heinicke bricks are superior to the brick ordinarily used and are made by this company to maintain a high standard of excellency.

Since we manufacture the brick and erect the chimneys in our own organization, full responsibility is assumed for results without question or argument. There can be no division of responsibility.

The experience and organization of H. R. Heinicke should be worth something to you.

Heinicke chimneys are bonded in every direction at all courses. This with the concealed reinforcement employed enables us to absolutely guarantee the chimneys against cracking, except from unusual cause or abuse.

The H. R. HEINICKE, INC. has successfully erected thousands of chimneys both in the old world and in the new. As specialists in the engineering and designing of chimneys, their experience is available to engineers and contractors.

Features of Design and Workmanship.

(A) The perforations in radial bricks form insulating dead air spaces in the wall of the chimney, which reduce radiation and prevent sudden temperature changes within the chimney, resulting in a considerable saving in fuel. The mortar slightly extends into the perforations, forming an anchorage that adds greatly to the stability of the chimney.

(B) Concealed steel bands are used in reinforcing the chimney; these add materially to the strength of the stack in resisting stresses due to expansion, and insure safety against cracking.

SECTIONAL DETAIL
OF CHIMNEY, SHOW-
ING HEINICKE BOND

HEINICKE CHIMNEY SERVING
A SMELTER
Height, 460 ft.; clear diameter at
top, 8 ft. Built 1889

(C) The Heinicke system of bonding provides for the breaking of joints between courses, so that no vertical joint is higher than one brick. Every course is thoroughly bonded through the use of bricks varying in length from 4 to 10 in. (See sectional detail.) This method of bonding gives greater compressive strength and resistance to lateral stresses than other systems; the increase in strength over the common bond amounting to about 300%.

(D) The erection of the chimney is done from the inside, thus doing away with outside scaffolding and eliminating accompanying dangers to workmen as well as unnecessary cost.

Estimates.

In writing for information or estimates, please advise on the following points:

(1) Distance from nearest railroad siding or team track.

(2) Intended use of chimney (boilers, furnaces, incinerators, smelters).

(3) Height and diameter, or boiler horsepower, or type, number and dimensions of boilers.

(4) Kind of fuel to be used.

(5) Character of soil for foundation.

(6) Approximate price of cement, lime, sand, gravel, crushed stone and common hard brick, delivered at the chimney site.

PERFORATED RADIAL BRICK
and REINFORCED CONCRETE
CHIMNEYS, with FOUNDATIONS
and FLUES, for powerhouses,
furnaces, factories, smelters and ovens.

Acidproof Chimneys for chemical
plants.

For Reinforced Concrete, Brick and
General Construction, see page 19.

Service.

The design and construction of tall
chimneys call for special care and special
methods. Nothing in the line of large con-
struction calls for greater exactitude. It is
an art in itself; and efficiency, combined
with safety and economy, is assured only
where the work is managed by highly spe-
cialized engineers.

THE RUST ENGINEERING COMPANY
possesses every facility for the successful
design and construction of tall chimneys.
With offices located at convenient points
throughout the United States, with com-
plete construction plants immediately avail-
able, with office and field forces ready to
act on instant notice, this company is pre-
pared to undertake the design and construc-
tion of chimneys any place in the United
States, Canada and Cuba.

The design is prepared by expert chim-
ney engineers. Efficient and economical
proportions are determined through a rigid
mathematical investigation which takes into
consideration the fuel, method of firing,
boiler layout, outside temperature, elevation
and geographical location.

Construction is in charge of trained
field superintendents; and in consequence,
the finished chimney is in strict conformity
with the plans and specifications.

The wide experience of THE RUST EN-
GINEERING COMPANY in chimney design and
construction, together with the consistent
use of first grade materials, insures results
that are practical and uniformly satisfac-
tory.

ARROW CONDUCTOR & MANUFACTURING CO.

Lightning Conductors

1536 West Adams Street
CHICAGO, ILL.

Products and Services.

Manufacturers and contractors for LIGHTNING CONDUCTORS for chimneys, towers and all types of high and exposed buildings.

Electrical Grounding Terminals.

Chimney Banding and Repairing.

Steeple Jacks furnished for hazardous work.

Specification.

For the convenience of architects and engineers, a brief specification is given for a safe and lasting system of lightning protection for power plant chimneys, as is specified by architects and engineers.

POINTS—Preferably multiple reinforced type made of special high heat resisting copper bronze, main center point 6 in. long, $1\frac{1}{2}$ in. at base, tapering to $\frac{1}{2}$ in., then sudden sharp point. Five small points with reinforced tips 3 in. by $\frac{1}{8}$ in. set at angle of 45° at base of large point. Main and small points to be sleeved with shell of pure platinum $\frac{1}{500}$ in. thick. Point mounted on solid copper bar $\frac{3}{4}$ in. in diameter. Round "V" bends between points and circuit cable conductor.

CABLE CONDUCTOR—At least two cable down conductors after forming a cable circuit with round "V" bends, to be 99% pure copper, 300,000 C.M. cross section with all cable joints interwoven.

LEAD ARMOR—To protect the system against acids and gases emitted through top of stack, all parts of system from platinum to 25 ft. below top of stack to be covered with chemically pure lead $\frac{1}{8}$ in. thick with all joints lead burned.

GROUND TERMINALS—Two pure perforated copper ground reservoirs, 24 by 4 in., with No. 19 B. & S. gage wall metal, 4-in. bronze conical cap, tube center, and filled with pea size charcoal, should be attached to each cable.

FASTENERS—Heavy copper bronze, 2-bolt type anchors, lead coated in the armor zone, of the Arrow pegged anchor type, to be built in as the masonry progresses, 5 ft. apart vertically and 18 in. horizontally.

LIGHTNING INDICATOR AND TEST GAGE—An efficient instrument incased in aluminum with a regulating attachment on the face, so that it can be used for testing the system, should be attached to one of the cables without cutting the cable conductor.

PROTECTION PIPES—To prevent theft, brass pipes 8 ft. above ground level and 1 ft. below, properly anchored to wall with heavy brass anchors.

GUARANTEE—The contractor to guarantee a structure equipped with this system against damage by lightning for a period of

10 years and assume liability for accidents and damages during installation.

Official Approval.

The Arrow patented system embodies all of the preceding qualities and more. Approved and labeled by the National Board of Fire Underwriters and their Laboratories.

Installations and Co-operative Service.

Installed on United States and Canadian Government stacks, on municipal and industrial structures everywhere. Prominent state, city and corporation stacks in nearly every State in the United States and Canada equipped with the Arrow system.

A complete specification, blue print and other valuable information mailed free on request.

BADENHAUSEN STATIONARY and MARINE WATER TUBE BOILERS.

Scotch Marine Boilers, Simplex Superheaters.

For Steam Engines, see page 697.

Badenhausen Stationary and Marine Water Tube Boilers.

ADVANTAGES—The Badenhausen water tube boiler in all its forms was designed and perfected by John P. Badenhausen, M.M.E., whose expert knowledge and thorough experience in economical and efficient steam production enabled him to build a boiler having positive, continuous and unrestricted circulation, thereby making possible daily high efficiency and instantaneous and long-continued overloads without heat waste or boiler injury. To make a good boiler better, he added the ability to deliver at the boiler outlet steam guaranteed to be dry and superheated to an average of not less than 10° Fahr. thus eliminating wet and dirty steam troubles and removing the necessity for installing superheaters unless high degrees are desired.

CONSTRUCTION—The principle of perfect circulation is shown in Fig. 1. The boiler construction is shown in Fig. 2. Note that curved tubes connect drums to form an unrestricted path of equal area throughout. In the tubes connecting drum 3 and drum 4 the steam is dried and superheated. When high degrees of superheat are desired, Simplex superheaters are installed as shown in Fig. 2.

Figs. 1 and 2 show the 4-drum design of the Badenhausen boiler. Fig. 3, the preheater design. It is also built in double ended form. The dimensions and horsepower per unit vary to meet various steam requirements.

FIG. 1. BADENHAUSEN WATER TUBE BOILER, STANDARD 4-DRUM DESIGN

Arranged for hand firing. Glass ring superimposed thereon has been proven to be proper shape of vessel for perfect generation of steam. Note how clearly boiler coincides with glass ring showing that "The Best and Soundest Circulation Theory is Carried Out Practically"; that, regardless of intensity of heat applied to heating surfaces, no part of Badenhausen water tube boiler is left dry to the action of fire

FIG. 2. BADENHAUSEN WATER TUBE BOILER READY FOR BRICK WORK

To be equipped for both coal and oil firing. Note strong steel frame-work, also Simplex superheaters

Units are built up to 6000 h.p. each. Whether stoker or hand fired with bituminous or anthracite coals, whether using oil or natural gas, lignite or bagasse; wood working offal or any kind of waste heat, whether in land or marine service, the best furnace design is assured to meet the varying conditions.

The Badenhausen water tube boiler is supported independent of brickwork and is adequately flexible; thereby insuring long boiler life. All parts of boiler, superheaters, baffles, etc., are easily accessible and inexpensively kept in first class condition.

The design, construction and operation conform to the requirements of the boiler code of the A.S.M.E. and of both land and marine inspection requirements of reputable inspection and insurance companies.

Write for catalogues.

FIG. 3. BADENHAUSEN HIGH EFFICIENCY PREHEATER TYPE BOILER

Equipped with stoker for soft coal firing. In this 6-drum type, exit gas temperatures are extremely low, and the usual daily efficiency is 85%

JAMES BEGGS & CO.

Manufacturer of Worthington Water Tube Boilers

OFFICE AND SALESROOM

42 Warren Street
NEW YORK, N. Y.

WORKS: SOUTH NORWALK, CONN.

Products.

WORTHINGTON WATER TUBE BOILERS, built in units from 50 to 600 h.p., A.S.M.E. Code.

For Grates and Steam Blowers, see page 663.

Beggs Worthington Water Tube Boiler.

The Beggs Worthington water tube boiler is of the sectional type with steam and mud drums, headers and steel or iron tubes. The construction is clearly shown in the illustration. The circulation is from the steam drum through the downtake tubes to the lower headers, front and rear, through the tubes over the grates to the upper headers, front and rear, and thence through the connecting tubes to the steam drum again.

Points of Superiority.

FACILITY OF DELIVERY—By reason of its sectional character this boiler can be delivered in places wholly inaccessible to other desirable boilers. A boiler of 200 h.p. can be passed through an ordinary window or side-walk opening.

SETTING—The Worthington boiler is entirely enclosed in a steel casing provided with the necessary doors to make the interior accessible for cleaning and repairs. The casing is lined with non-conducting material which reduces the heat radiated to almost nothing.

COMPACTNESS—As a result of doing away with the brick setting and of grouping the tubes in the firebox, a large aggregate of heating surface is concentrated in a small space. The boiler, therefore, has a greater capacity per cubic foot of space than many other boilers in the market.

CIRCULATION—Short tubes and headers produce rapid and positive circulations, which is recognized as the best method of preventing deposits of scale or sediment.

The tubes of the Beggs Worthington boiler will be cleaner than those of many other boilers, evaporating a like quantity of the same water per square foot.

DRY STEAM—Each section has its own independent outlet discharging into the steam drum against a baffle. As a result of the separation obtained going around this baffle, priming is avoided and dry steam obtained.

HEATING SURFACE—All tubes are in the fire and are exposed to the radiant heat of the fire; every square inch is therefore employed as active heating surface.

GRATE SURFACE—The grate extends under the entire heating surface, giving an exceedingly liberal proportion of grate surface to heating surface.

OVERLOAD CAPACITY—As a result of the ample grate surface and the large amount of active heating surface, the Worthington boiler is able to respond quickly to any sudden overload demands.

BAFFLE REPAIRS—As there are no baffles in the Worthington boiler, the expense resulting from baffles falling down, together with the increased coal consumption resulting from the short circuiting of the gases, is entirely avoided.

CLEANING—Openings are provided front and rear between the upper and lower header sections for the insertion of a steam nozzle between the vertical rows of tubes, for the purpose of blowing the soot and dust from the outside of the tubes.

Adaptability for Stokers and Grates.

The standard sizes are adapted to fit all types of stokers and grates, particularly the McClave improved cut-off and dumping, also shaking grates. Special designs and settings can be made to fit any unusual requirements of space, stokers or grates.

THE BROWNELL COMPANY

Manufacturers of Boilers, Engines and Feed Water Heaters

DAYTON, OHIO

SALES REPRESENTATIVES IN ALL SECTIONS OF THE COUNTRY

Products.

BOILERS: Horizontal Return Tubular, Locomotive Type Portable, Scotch, Vertical Tubular, Firebox Heating, Oil Country.

ENGINES: Automatic, Throttling, Fan, Variable Speed Duplex, Oil Country Drilling.

Feed Water Heaters: Open and Closed Types.

Brownell Boilers.

Material used is of the best quality—plate being open hearth steel, and tubes being A.S.M.E. standard, of best quality of American manufacture. Workmanship is the best and according to the latest known practice.

Brownell boilers are built to pass the most rigid inspection requirements. The company is prepared to build boilers according to the A.S.M.E. Code, or laws of the different states and municipalities.

Types of Boilers.

HORIZONTAL RETURN TUBULAR BOILERS—Designed with a factor of safety of 5; the longitudinal seams being butt jointed and double, triple, or quadruple riveted, according to the size and pressure carried. Where possible, rivets are driven by hydraulic pressure. Built in sizes from 15 to 250 h.p. for working pressures from 100 to 150 lbs., and for lower pressures for heating purposes. For details, refer to Bulletin B-1.

HORIZONTAL RETURN TUBULAR
BOILER, WITH BOX TYPE
STEEL CASING

BOX TYPE STEEL CASING—Steel casings entirely surround brickwork and thereby eliminate losses due to imperfections in brickwork, decrease radiation losses and insure maximum draft. It is, without doubt, the most satisfactory type of boiler setting. For other types of steel casings, see Bulletin B-4.

FIREBOX HEATING BOILERS—Smokeless firebox boilers are built with a down-draft furnace to meet the most rigid smoke ordinances. The down-draft furnace not only eliminates the smoke but increases the efficiency of the boiler.

Firebox boilers are built without down-draft furnace for use where no smoke ordinance is in effect.

Firebox heating boilers are suitable for heating all large public buildings, churches, schools, office buildings, factories, etc. Detailed information in Bulletin B-6.

SMOKELESS FIREBOX HEATING BOILER

Brownell Side Crank Steam Engines.

The engines are well built throughout, only the best material being used in the construction. They are designed for severe and continuous service.

Types of Engines.

HIGH SPEED AUTOMATIC ENGINES—Built in either open or closed type. The automatic governor is of the inertia flywheel type, guaranteed to regulate the speed of engine within 2% from friction to full load. All enclosed automatic engines are furnished with quarter box main bearing. Open type automatic engines furnished in either angle or quarter box type main bearing when shaft is 6 in. in diameter, or less. On engines where shaft is over 6 in. in diameter, main bearing is always quarter box type. Further information in Bulletins E-1 and E-2.

HIGH SPEED AUTOMATIC ENGINE

FAN ENGINES—Built in either open or closed type. Provided with hand adjustable *variable cut-off* device, when desired. Fan engines always have quarter box main bearings. Furnished with shaft extended for direct connection to fan or arranged for coupling to fan shaft. Additional information in Bulletin E-5.

OPEN TYPE FAN ENGINE

VARIABLE SPEED DUPLEX ENGINES—Especially designed for paper mill drive, giving long, dependable service, simple operation and perfect speed control. All variable speed engines have quarter box main bearings. A special speed limiting device prevents overspeeding. A special riding cut-off valve has been designed for use with these engines, in order to secure exceptional steam economy. Bulletin E-4 gives further information.

Products.

CONNELLY WATER TUBE STEAM BOILERS.

Design of Boilers.

The Connelly water tube boilers are built in two general designs: one being the 4-drum type for units up to about 1500 h.p., equipped with stokers on one side only; the other being a 7-drum type for units from 1000 to 4000 h.p., equipped with stokers on two sides. Pressure parts are designed and built to conform with A.S.M.E. boiler code.

These two general designs are each made in a number of classes to meet the conditions of available space and can be fired with coal, gas, oil, waste heat, or blast furnace gases.

Advantages.

(1) Designed so as to be capable of manufacture in units up to 4000 h.p.

(2) Simple in design and has no flat surfaces.

(3) Free from complications of hundreds of joints; no handholes at end of tubes.

(4) Has no staybolted surfaces.

(5) Boiler contains a large amount of water in proportion to its size.

(6) Boiler has a large amount of steam liberating surface, and also large steam space.

(7) All stress due to expansion and contraction is provided for (both water drums being suspended).

(8) Boiler tubes are so spaced that any tube can be removed without removing any other tube.

(9) Boiler is designed so as to get the greatest horsepower in the smallest cubical space.

(10) All baffling is simple, and easy to replace or re-adjust.

(11) Boiler has free and unrestricted circulation, owing to the same tube area between drums in the path of water circulation.

(12) The large volume of water, liberal steam space, abundant steam liberating surface, and unrestricted circulation, mean high efficiency, large overload capacity, and minimum repair expense, or loss of tubes.

(13) Water is fed into rear upper drum, so that coldest water meets the coldest gases. This means low temperature of gases entering stack.

(14) Every pressure part of boiler is made of high quality steel (no cast iron used).

(15) Boiler is so designed that it will deliver not only commercially dry steam, but will deliver superheated steam.

(16) Entire boiler is swung from a steel frame (independent of brickwork) so as to provide against undue stresses on the brick setting.

Shop Facilities.

The plant occupies a site of 6 acres on the main line of the New York, Chicago & St. Louis R. R. The

CROSS SECTION, CONNELLY BOILER EQUIPPED WITH UNDER-FEED STOKER OF TAYLOR TYPE

main building is 140 ft. wide, divided into 3 bays (40 ft. on each side and 60 ft. in center). Each side bay is equipped with a 10-ton electric overhead traveling crane, and the center aisle is equipped with a 25-ton electric traveling crane. All cranes operate full length of building.

Riveting plant consists of a 15-ft. gap hydraulic riveter, exerting a maximum pressure of 150 tons. This machine is served by an overhead hydraulic crane of 25-ton capacity. Riveter stake is equipped with a special type top, by which it is possible to rivet heads of drums or boilers into the shell under hydraulic pressure. Another hydraulic riveter, 10 ft. 6-in. gap, with a capacity of 80 tons pressure on the rivet is also installed.

A modern plate planer with a capacity of 22 ft. cut on 1½-in. metal at one setting is used for planing edges of all heavy shell plates and butt straps.

The plant is well equipped with modern drills for cutting rivet and tube holes.

Flanging department has a 500-ton hydraulic press of the 4-post type, also a 150-ton Universal type hydraulic press, capacity up to 160-in. heads, and a modern spinning machine for flanging flat heads up to 108-in. diameter.

In addition there is also a complete line of punches, shears, rolls, a complete pneumatic equipment, and all modern tools for producing highest quality of work.

A modern tube bending machine is installed and tubes for any boiler can be furnished within a few hours after notice to ship.

WATER TUBE BOILERS; SUPERHEATERS.
Steel Stacks, Housings, Flues, etc.

Facilities.

Two complete plants, at St. Louis, Mo. and Phoenixville, Pa. The HEINE SAFETY BOILER CO. has been building boilers since 1882 and is fitted by long experience to provide steam boiler equipment. A special branch of the Heine engineering department handles applications for special purposes, such as the utilization of waste heat.

Heine Standard (Longitudinal) Boilers for Land Service.

These boilers are built with drums from 30- to 48-in. diameter and from 12 to 18 ft. long. In every particular they conform with the requirements of the A. S. M. E. Boiler Code, this being the most advanced standard for boiler construction. The Heine standard boiler consists of three main parts.

DRUM—Three sheets with riveted heads at each end; reinforcements for manholes, steam outlets and other openings; inside main drum is a mud drum, acting as feed water purifier. Deflection plate near front throws down water that may be entrained with the steam.

WATERLEGS—Formed of two plates, called tube sheets, and handhole sheet, joined, except at top, by a butt strap. Stayed to withstand internal pressure by hollow staybolts screwed into tapped holes of the two sheets. Waterlegs riveted to drum at throat openings.

TUBES—Extend between the two waterlegs and expanded into tube sheets by roller expanders. Ends are slightly flared to increase holding power.

Heine Superheater.

Placed alongside of drum of standard boiler, toward front and just above last passage of gases. May be

single and placed only on one side; or in two parts, one on each side of boiler, according to boiler sizes.

Temperature is automatically controlled by varying the flow of hot gases over the superheater tubes, damper at the outlet being opened or closed by a thermostatic device keeping superheat within 5° Fahr. of the desired temperature.

Heine Cross Drum Boiler for Land Service.

The Heine cross drum boilers have the general advantages of the standard (longitudinal drum) type, and in addition the headers, tubes and drum can be packed in minimum space for shipment.

The large combustion chamber gives ample space for the gases to mix and burn. The design—two simple headers, plain cylindrical drum, and straight tubes—is ideal for free circulation and for high efficiency.

Heine Marine Water Tube Boiler.

These boilers are made with either longitudinal or cross drums. For marine service, however, the cross drum type is recommended. Several hundred thousand horsepower of cross drum boilers have been built for the U. S. Emergency Fleet Corporation alone.

For low and medium superheat temperature Heine marine boilers are fitted with superheaters of the "waste heat" type placed in the base of uptake. For higher temperature, superheater elements are built up of tubes passing through main bank of tubes, just below middle baffle.

References and Literature.

The best references for Heine boilers are the hundreds of installations in central stations, office and public buildings, and industrial plants.

The treatises, "Boiler Logic," and "Marine Boiler Logic," describe Heine construction in detail, for land and sea installation respectively. Copies are available for those interested in modern boiler design or operation.

ERIE CITY VERTICAL and HORIZONTAL WATER TUBE BOILERS, IMPROVED "ECONOMIC" RETURN TUBULAR BOILERS, HORIZONTAL RETURN TUBULAR STATIONARY BOILERS.

ERIE CITY "LENTZ" ENGINES.

ERIE CITY SHAKING GRATES.

Also, "Counter Current" Feed Water Heaters, Tanks and Steel Plate Construction.

Erie City Vertical Water Tube Boiler.

This boiler comprises two horizontal drums—one placed directly above the other—connected by a series of tubes, the combination being supported by heavy frame of steel beams. A wall of masonry surrounds boiler, and a frontal extension thereof, lined with fire brick and faced with metal front, forms the furnace.

DRUMS—Upper drum (the larger) carries body of water to the center of the drum, 10 and 12 ins. of water being above the top row of tubes, and has at each end a steam storage compartment (patented), unequaled for production of dry steam. Lower drum is supported by tubes connected to upper drum. Each drum has a man-hole, giving ready access for installation and inspection.

TUBES—Curved to facilitate expansion and contraction. Spaces between different banks of tubes permit a man to enter. Each tube enters drum radial with center. Tubes readily cleaned by either air or hydraulic tube cleaner.

MATERIAL—Drum-shell plates, of best open hearth homogeneous flange steel. Tubes, of mild steel, are hot rolled and seamless. Rivets, of mild steel, conform to standard specifications.

GENERAL CONSTRUCTION—Shell plates are rolled to true circle; longitudinal seams, double butt-strapped; edges of plates, bevel planed; end of lap strip, scarfed on special milling machine; seams, calked inside and outside of shell; tubes so spaced as to leave ample alignment of metal; heads of drums, of same material as shell; steam and water openings in drums are reinforced with pressed steel nozzles, and flanges are thoroughly riveted and calked.

FURNACE—Its location at front of boiler permits construction of arched roof of fire brick over fire—an anterior combustion chamber for the gradual liberation of gases and proper admixture of air through grate area, preliminary to the perfect utilization of products of combustion when in

contact with tubes. Ample grate surface, for various forms and grades of fuel.

STEEL CASING—To prevent entrance of uncontrolled air to furnace. Built with lining of 9-in. fire brick, and a dead air space between brick wall and metal casing (patented).

CIRCULATION—Each tube, individually, is an independent steam producer, in nearly vertical position between both drums, without cross-over connecting pipes or any other restriction whatsoever, insuring rapid circulation. Water level is at center of upper drum, affording largest disengaging surface; ample depth of water over ends of tubes; water level steady; "spouting" eliminated—all these being signs of a scientifically designed boiler.

BLOW-OFF—Two blow-off openings are provided on bottom of lower drum.

CLEANING—Two access doors located directly under horizontal supporting beams, and a third near floor line at side of setting, for cleaning and inspection purposes, removal of tubes when necessary, etc. A steam blower with pipe is furnished with each boiler.

ERIE CITY VERTICAL WATER TUBE BOILER

SECTIONAL VIEW OF UPPER DRUM
Showing steam compartments (patented)

FEED INLET—Feed water, entering lower drum, is distributed through a double discharge and taken up through front bank of tubes, then down through tubes in middle and rear bank to lower drum, thence upward again in similar manner.

DRY STEAM—Steam disengaging surface in upper drum is very large and steam outlet pipe (located near top of drum) permits *steam only* to enter the main, in a dry state.

Erie City Horizontal Water Tube Boiler.

The ERIE CITY IRON WORKS has been building this type of boiler for many years, and recently placed on the market a new style horizontal water tube boiler in which is eliminated, as far as possible, the weak points incidental to this particular type of boiler.

A description of this boiler will be gladly furnished on application.

Erie City Horizontal Tubular Stationary Boiler.

Shell plates and heads made of open hearth homogeneous boiler steel. Shell up to 18 ft. long built in two courses; over 18 ft. long in two or three courses.

HORIZONTAL TUBULAR BOILER

Rivets driven by machinery. No steam dome. Boiler equipped with full arch front; and tested under water pressure 50% above proposed working pressure.

Erie City "Economic" Return Tubular Boiler.

Shell and heads made of open hearth homogeneous steel; tubes and rivets, of mild steel. Boiler is self-contained, occupies small space and is a rapid steamer. No stay-bolted water sides to fill with mud and burn out, or flat crown sheets to be exposed by low water and cause explosions and loss of life.

Front and sides of furnace are lined with 9 ins. of fire brick, with air space on outside wall next to steel casing.

"ECONOMIC" RETURN TUBULAR BOILER

Regularly built for 100 lbs. working pressure, and for higher pressures on order

SECTIONAL VIEW OF "ECONOMIC" BOILER
Protected by patents

Erie City Shaking Grates.

Grates properly proportioned for majority of fuels used under steam boilers. Note bearing blocks in side bars and how held in place. Blocks and keys carefully fitted together.

Worn bearing readily replaced, instead of renewing entire horizontal side bar. Individual bars designed to prevent loss of fuel through grates to ash pit while in shaking position. Note normal position and shaking movement.

SECTIONAL VIEWS OF GRATES

Erie City "Lentz" Engines.

Under the American rights secured, this company is now manufacturing the "Lentz" engine—a reciprocating engine designed for the use of superheated steam (at high pressures) and proved by experience, since 1899, to be the *most economical* prime mover that can be used. Now used in almost every line of manufacture.

"LENTZ" ENGINE

SPECIAL FEATURES—Steam regulation is accomplished by varying a cut-off through a shaft governor and straight-shot eccentric instead of by throttling. Cylinders and beds made simple and compound, condensing or non-condensing, to meet conditions. Valves are of double seated poppet type, and are each actuated by a cam working on a roller running at side of engine. No elastic packing throughout engine, special cast iron rings being used in stuffing boxes, etc.

Full particulars sent on application.

SCOTCH BOILERS; VERTICAL TUBULAR BOILERS; HORIZONTAL RETURN TUBULAR BOILERS; SHAKING GRATES; STEEL PLATE CONSTRUCTION.

Engineering Services.

The engineering department of this organization offers its services to those having boiler, grate and steel plate construction problems to solve.

The experts in this department have at their disposal the knowledge and accumulation of valuable data of many years of successful boiler, grate and steel plate construction, and co-operation with these experts insures the most efficient and the most economical solution for any particular requirement, without obligation.

Designs, recommendations and estimates will be submitted promptly upon receipt of the necessary information regarding conditions.

Brady Scotch Boilers.

Of the many types of boilers which have been used in marine service, none has attained the degree of all around efficiency shown by a well designed standard Scotch marine boiler.

For stationary practice, the Scotch boiler is equally satisfactory. Its extremely small radiation loss due to the internal furnaces, its strength, economy, ability to stand hard service and the absence of troublesome brick setting appeal strongly to many engineers.

BRADY SCOTCH BOILER

GENERAL DESIGN—The Brady Scotch boiler combines the advantages of internal firing and self-contained construction, while overcoming all possible objections by providing positive, rapid circulation without a special pump or other device.

In the Brady Scotch boiler, positive rapid circulation is obtained by placing just below the front neck an annular ring or plate extending around the inside of the shell, with an opening in the bottom (see illustrations). This circulation overcomes the great difficulty in Scotch marine and dry back boilers, which ordinarily are not quick steamers because water remains cold at the bottom.

Unequal expansion is impossible in the Brady Scotch boiler, because the water circulates from the bottom of the shell along a definite path.

INTERNAL FURNACES—No brickwork is necessary with the Brady Scotch boiler, as furnaces are internally fired. Radiation losses are practically eliminated and there is the highest efficiency of transmission of heat to water.

The efficiency of transmission with the internally fired boiler is higher than with the brick furnace, because the furnace of the former and all products of combustion are entirely surrounded by water heating surfaces, and the efficiency of combustion is not reduced by air leakage.

Cost of installation is also reduced with the Brady Scotch boiler, as there is no brickwork. The boiler is self-contained and ready for use as soon as piping and smoke flue connections are made.

COMPLIANCE WITH OFFICIAL REQUIREMENTS—Brady Scotch boilers are built in compliance with the requirements of the A.S.M.E. Code, the Massachusetts Board of Boiler Rules, the laws of other states, British Board of Trade, Lloyds Registry and the various Canadian provinces.

Vertical Tubular Boilers.

MANNING TYPE—Perfectly adapted to all requirements of the highest pressures and the largest units, because no plate subject to tensile strain comes in contact with the fire.

It is the best boiler for turbines on account of its ability to furnish steam superheated 25° to 50°. Amount

of superheat may be increased by lowering the water line or by using longer tubes.

It is well suited for any locality regardless of water conditions when made with the multiple plan of cleaning handholes, which give access to every part of the crown sheet. Additional facilities are provided for cleaning and inspection.

The economical evaporative performance is remarkable. All radiant heat from fuel bed is absorbed directly by water heating surface, distribution of furnace gases over heating surface is practically uniform, there are no losses due to the infiltration of air in the setting and stand-by losses are comparatively small, occupying less ground space per h.p. than other types.

OTHER TYPES—Straight shell and tapered course types of vertical tubular boilers also built.

Detailed information on request.

MANNING VERTICAL TUBULAR BOILER

Horizontal Return Tubular Boilers.

Constructed in a most approved manner in full accordance with the rigid requirements of the A.S.M.E. code and the Massachusetts Board of Boiler Rules, the highest standard of efficiency being maintained.

Standard settings can be provided with stationary or shaking grates and where increased efficiency and compactness are desired, standard steel casings can be provided for these settings.

Designed with liberal proportions of heating surface, steam space and grate area. They are safe, most economical in fuel consumption, simple in design, cost less per horsepower than other types, require less repairs, and, when necessary, repairs are more easily made and less expensive.

Made in units up to 350 h.p.

HORIZONTAL RETURN TUBULAR BOILER

Special Boilers.

Special boilers of any size built for all conditions of service.

The engineering department offers its services for the most satisfactory solution of all boiler problems.

Macdonald Shaking Grates.

These grates perform all the proper functions of a shaking grate. Following are several of the reasons why they are the best shaking grates on the market:

They have unrestricted air passages and foolproof

locking device. Fuel can not be wasted by shaking. Powerful leverage provided for shaking and breaking up small clinkers.

They may be repaired or renewed at small expense by replacing top sections only.

Detachable top sections may be changed to give any desired air opening or spacing of grate.

Proper distribution of metal gives the greatest strength possible in proportion to the weight of the material.

When shaken, the maximum irregularity or depth of vibration is given without opening a wide space between sections. A flat grate locked in position so that the surface can not be left uneven or with points projecting into the fire.

Gives more perfect combustion, saves fuel and increases the capacity of the boiler.

Further information on request.

MACDONALD SHAKING GRATE

View with side supporting bar removed and operating lever thrown down

Steel Plate Construction.

Steel plate construction of every description for all industries, fabricated from this company's own designs or in accordance with purchaser's specifications.

The company's plant is the most efficient and best equipped steel plate construction plant in the East, and has exceptional shipping facilities.

The engineering department's services (see preceding page) are at the disposal of those having steel plate construction problems to solve.

WATER TUBE BOILERS; RETURN TUBULAR BOILERS.
Built to A. S. M. E. Rules.

Standard Keeler Water Tube Boiler.

The arrangement of furnace, tubes, headers and drums is correct, accessible and compact. The superior efficiency of the Keeler boiler rests upon correct proportions of heating and grate surface for the character of fuel to be burned, ample height of furnace, superior arrangement of baffle walls and perfect circulation.

Every portion of the heating surface is accessible for both external and internal inspection, making it impossible for soot or scale to accumulate undetected.

Wrought steel is used for every part of the boiler under pressure. This is the first requirement of reliability.

All tubes are straight. Boilers with bent tubes are accepted only as a compromise. Bent tubes are harder to keep clean and the interior can not be inspected. In the standard type all tubes are 4 in. in diameter and 16 or 18 ft. long. This is a standard carried in stock by dealers everywhere. A 4-in. tube is stiffer than a 3½-in. tube in the ratio of 1.52 or 1.04 (their section moduli); 3½-in. tubes sag and leak at the headers, 4-in. tubes do not.

The Keeler boiler is provided with vertical baffles. These support the tubes instead of being a dead weight. Vertical baffles insure a more perfect distribution of gases, need no repairs and do not collect soot.

The wrapper sheet in the header is flanged, and the header sheet straight. A wrapper, being small, can be flanged at one operation; while to flange a header it is necessary to heat it several times. This has a tendency to crystallize the metal and cause internal strains.

The Keeler boiler has its steam outlet at the center of a horizontal drum. This is out of the way of the violent agitation at the front header and insures dry steam.

The distance between the center line of tubes and underside of drum in Keeler boilers is 10¾ in. in front and 26½ in. to 28½ in. in rear. This large space between the drum and tubes gives ample room for expansion and contraction, without throwing strains on the throat connection. It also affords space for superheaters and facility for inspection of all parts of the drum.

Keeler boiler has a substantial and workmanlike flush front. This means there is no projection for

the fireman to come in contact with in coaling the boiler or cleaning the tubes.

The method of supporting the boiler meets the requirements of the most exacting specifications.

In the Keeler boiler the blow-off is in the bottom wrapper sheet of the rear header. The design is such that there are no obstructions of any kind; the dirt and sediment are drawn from boiler by gravity.

The rear header of the Keeler boiler is covered with a steel casing, supported by structural steel frame. This keeps the cold air away from the header.

Unless otherwise specified, solid staybolts are used, with test holes drilled in each end. Where hollow staybolts are used a certain amount of cold air is admitted into the boiler setting. Hollow staybolts must be plugged. These plugs are seldom kept in place and have to be frequently replaced, which is an expense.

STANDARD WATER TUBE BOILER
Built in units from 75 to 1,000 h.p.

WATER TUBE BOILER, UNITED STATES
BUREAU OF STANDARDS, WASHINGTON, D. C.

TWELVE 410 H. P. KEELER WATER TUBE BOILERS, ISTHMIUS
OF PANAMA
Built for the United States Government

The Keeler boiler is cleaned from the side of the setting with a steam blower, through a small opening over each row of tubes.

Keeler Cross Drum Boiler.

The Keeler cross drum boiler is a modification of the standard design only in the length and location of the drum and the method of connecting it to the headers.

This type was designed to meet the demand for a high pressure water tube boiler that could be installed in office buildings, school-houses, churches, apartment houses, hotels, and in boiler rooms generally where ceiling height is limited, or where boilers must be introduced through narrow passageways or restricted openings. This type is in use in many of the new public schools in Philadelphia, in the Sheffield Scientific School, New Haven, Conn., and is used by the United States Government. This boiler is shipped knocked down, and will appeal especially to architects and heating and ventilating engineers as a logical water tube boiler for their requirements.

CROSS DRUM BOILER
Built in units from 60 to 600 h. p. Especially adapted for schools, etc., where there is lack of headroom

Keeler Tubular Boiler.

The Keeler tubular boiler embodies all this organization has learned of boiler building in 55 years. Every boiler which leaves the shop is regarded as a pledge of good faith.

The Keeler full flush front is of heavy, substantial design. All doors have a deep flange or roll. This feature prevents warping or cracking of edges and gives the front a rich and handsome appearance. Fire doors are of an extra heavy deep pattern, with a liberal space between the door and the perforated liner which preserves both castings. Fire doors close against inclined seats, so that they never stand away from the front. There is provision for expansion above the fire doors, which absolutely prevents cracks in the front at the corners of the openings under all ordinary conditions of service. All doors and seats are carefully fitted to a close bearing, and all fronts are assembled complete before shipment. The top of the front is finished with a handsome cornice.

RETURN TUBULAR BOILER
Built in units from 40 to 300 h. p.

The chief difference in the same type of boiler is the time and attention given to details. That is why one boiler costs more than another, where specifications are practically the same. If a cheaply constructed tubular boiler is bought it may have to be removed in a short time. Do not run the risk of having to charge off as a total loss the money spent for freight, hauling, labor, brick setting and erecting the stack. A cheap, carelessly constructed boiler entails the same expense for freight, installation and other requirements as the most reliable boiler that can be built.

Material and Workmanship.

All Keeler boilers are guaranteed to pass the inspection of any established boiler insurance and inspection company for the pressure specified.

References.

Fifty-five years of boiler building without a shut down or an explosion is the reputation gained by this company. Following is a partial list of users of Keeler boilers :

PAGE TWIN WATER TUBE SECTIONAL BOILER.
(Patents pending.)

Elimination of Soot.

Soot $\frac{1}{4}$ in. thick will stop as much heat as 1 in. of asbestos. This is one of the most surprising facts ever discovered in connection with steam engineering. The importance of frequent cleaning can not be emphasized too strongly. A boiler frequently cleaned produces higher efficiency and a saving of coal. Soot and ash retard heat absorption, choke the tubes, a poor draft results, and coal bills continue to increase.

The Page boiler is equipped with an oscillating soot blower—all sections blown in one minute, not a door to open.

General Description.

The Page sectional water tube boilers are so designed that all heating surface is directly exposed to radiation. It is not a total area of heating surface that determines efficiency of boiler, but cross-sectional area with respect to flow of heat passages. These are split up vertically and horizontally; flues of small diameter are more efficient, due to more frequent contact from tube to tube. The section tubes are straight and short and so clustered over the gases that in a limited cubical space a large effective heating surface is accumulated, whereby great steaming capacity is condensed in a space remarkably contracted, yet perfect in utilizing fuel to best advantage. The alternate crossing of sections acts as a vertical and horizontal baffle in center

of boiler, which causes gases to expand to outer ends of the tubes' surface. On each side of boiler, at top, special baffles are provided for as gases pass in through main tubes; these baffles control gases and cause them to pass beneath steam and water drum. Accomplishes the same in a one-pass as other type boilers do in three-pass. By actual pyrometer readings, a most uniform baffling of gases is accomplished.

Expansion.

The advantages of the sectional tube boiler are considered of the highest type, due to each section being free to expand independent of other sections, each having a complete circuit of water circulation. Each section has a separate water feed from upper drum, and contains a separate intake to steam drum. Therefore, a boiler containing 30 sections has 30 water feeds coming into the sections and 30 deliveries coming into steam and water drum. These separated tubes coming in result in a most efficient and strong steaming boiler.

A positive and efficient circulation insures that all portions of pressure parts will be at approximately the same temperature, and in this way strains resulting from unequal temperatures are avoided. In a properly designed water tube boiler, steam may be raised from a cold boiler to 200 lbs. working pressure in less than $\frac{1}{2}$ hour.

The lack of accessibility in most boilers further leads to difficulties where repairs are required. In design and construction, the Page water tube boiler provides every convenience for inspection and cleaning.

Hand Fired

Stoker Fired

PAGE TWIN WATER TUBE SECTIONAL BOILERS

Quick Cleaning.

A feature is the water circulation passing above mud drums. Sediment formation may be blown out as desired. It is not necessary to remove header plates when washing out. After a constant service on high pressure for a number of years, these boilers have been found to be almost free from sediment and scale.

Enclosure.

Entirely enclosed in an airtight steel casing. An arrangement of doors makes every part of the interior construction readily accessible for cleaning and repairs.

The steel casing being lined with asbestos non-conducting material and fire brick of a tough and durable texture, so effectively prevents radiation that when a boiler is running at its rated capacity the hand may be put on any part of the casing without discomfort.

Efficiency.

The efficiency and airtightness of this type of enclosure is a marked improvement over cumbersome, leaky and weighty brick settings. Brick settings also encroach on valuable space and are a continual source of annoyance through deterioration. Efficiency on these boilers frequently runs from 72% to 75%.

Compactness.

Compactness, a feature of this boiler, is due not alone to elimination of brick walls as an enclosure, but to the peculiar cross tube system which distinguishes it from all others of sectional type. Capacity in horse-

power per cubic foot of space is greater than is afforded by any other boiler on the market.

Gases extend under entire heating surface. Combustion chamber is of proper height to permit use of any kind of fuel. Proportion of grate surface to heating surface is liberal. Rated horsepower is easily developed with 13 lbs. of good coal per square foot of grate per hour. Baffling of gases is arranged to suit conditions.

Cost.

The cost varies with size of boiler, the pressure carried, location of boiler, and special requirements.

Marine Boilers.

The Page sectional water tube boiler is equally efficient and adapted to marine service. Design and construction are such that the weight per horsepower is less than in any other type of boiler; larger capacity can be placed per cubic or square foot; and the large combustion area beneath boiler is greater.

Utilization of Waste Heat.

Page boilers in actual service as waste heat boilers have shown an evaporation of from 15% to 20% more than other types of boilers. Manipulation of baffles can be so arranged as to control velocity of gases to suit conditions. The oscillating soot cleaners are most reliable and are a part of the equipment.

Refer to Kroupp Forge Works, Chicago, in regard to the efficiency and easy manner in which they can run double the capacity out of each unit.

BOILERS: Horizontal Tubular, Locomotive and Vertical; STEEL PLATE CONSTRUCTION.

Horizontal Tubular Boilers.

For over 75 years we have built boilers of this type to the complete satisfaction of our customers. Until the Rogers Locomotive Works were absorbed by the American Locomotive Co. and closed down on account of their disadvantageous location away from railroad facilities, this shop was chiefly occupied in building locomotive boilers for the famous Rogers locomotive. Their characteristics are too well known to require mention here.

H. R. T. Boilers are so simple and prove so satisfactory, the fact is often lost sight of that only the very best materials to be had and intelligently directed skill must enter into their manufacture.

An indifferent job of boiler making is probably the most undesirable thing on earth. This fact is vividly recalled and too late to be remedied when a catastrophe occurs through its being blown up. The success of the Smith boilers is due largely to the fact that the makers have never been guilty of an indifferent job. All boilers are built to A. S. M. E. standard specifications

strictly; and are easily adapted to the use of any fuel, including bagasse.

Vertical Boilers.

Though not so generally used as the horizontal tubular type, there are conditions which often make the vertical boiler preferable. The Smith vertical boiler may be described as a Super-Manning. The illustration on the opposite page shows how accessible this boiler is for cleaning and inspection. This feature of accessibility eliminates the one big disadvantage from which vertical boilers have suffered. The conical firebox permits large grate area, with stronger yet lighter superstructure of boiler. Distribution of air is equalized by having from 4 to 8 large sliding doors. Actual tests show from 50° to 100° superheat. The boilers are made in units from 100 to 500 h.p.; and for pressures from 125 to 200 lbs.

Steel Plate Construction.

This organization is equipped to handle steel plate construction in all its forms. Steam boxes of all descriptions, vulcanizers, kiers, tanks, stacks, digesters, riveted pipe, are made as part of the regular line or to specifications. The shop is well equipped to handle this class of work rapidly and economically. Its location is most favorable, being within 15 miles of the

UNIFLOW BOILERS of the Improved Return Tubular Type.

Service.

It is the policy of the UNIFLOW BOILER COMPANY, INC., to assume the entire responsibility of steam boiler plant installation in all parts of the country.

Boiler plants of any size can be quickly erected, and without affecting the operation of the plant.

The Uniflow organization consists of a group of steam boiler specialists who endeavor to give the customer the boiler best adapted to conditions.

Construction.

The Uniflow boiler is constructed in accordance with the Uniflow design, fully patented in the United States, Canada and foreign countries.

The material used in the construction of the Uniflow boiler is carefully selected, and guaranteed to be reliable and durable for the work for which it is designed.

The Uniflow boiler is also constructed in accordance with the requirements of the A. S. M. E. Boiler Code, or the Massachusetts Code, and can be made conforming to other established state or municipal boiler laws.

TUBES—Arranged on a hexagonal plan, in vertical rows, which provides a film of water $1\frac{1}{4}$ in. in thickness to pass up between tubes in the three tube banks. The downward circulation occurs in the circulation spaces between the tube banks.

STEAM OUTLET—The improved Uniflow dry pipe projects through rear head of boiler. This dry pipe is placed high in steam space of boiler. With the improved dry pipe, steam is taken from steam space throughout length of boiler, with the result that there is no surging or priming.

FEED INLETS—Are so placed on front head of boiler that feed water is distributed equally to both sides of boiler and discharges downward into circulation paths provided in tube layout.

Incoming feed water does not interfere with discharge of steam into steam space.

SMOKE BOX EXTENSION—Made of a separate steel plate ring, fastened to front head of boiler instead of shell being extended forward, permitting the breeching connection to stack to be taken out vertically or at any angle that suits conditions.

The Uniflow Setting.

The Uniflow furnace setting fulfills all the requirements of correct furnace construction. By the introduction of air through bridge wall that is not preheated, smokeless combustion and complete secondary ignition of gases from the fuel result. By the use of inverted arch extended from bridge wall toward rear of boiler, the gases impinge against shell with a scouring action, making that portion of the shell, which has previously been insulated with a film of dust, a part of the most effective heating surface of the boiler.

The whole of the brickwork is so assembled as to prevent the internal expansion disturbing it. The red brick is retained as the structural element of the setting, leaving the fire brick to function as the heat insulation alone.

The Uniflow boiler is suspended from I-beams, supported on the red brickwork of setting.

Special Features.

The patented Uniflow tube layout divides the water currents and produces a rapid and positive circulation resulting in: high efficiency—economy of operation; rapid steaming—ability to absorb heat; delivery of dry steam—no priming; large steam disengaging area; great overload capacity without overheating; minimum travel of entrained steam; reduction of the amount of incrustation; even temperatures, overcoming expansion strains.

Compactness: 50% more heating surface than in ordinary boiler, economy in floor space and height, less cost of settings.

Uniflow furnace: complete and smokeless combustion and minimum radiation losses and upkeep cost.

Durability: simplicity of construction.

Accessibility for cleaning, internally and externally.

Ease of installation and operation. Low maintenance cost and long life.

Guarantee.

Every installation of the Uniflow boiler is made under the guarantee of 71% to 74% efficiency, 50% overload capacity, delivery of commercially dry steam at all times, and smokeless combustion of bituminous coal.

PLANT OF THE UNION IRON WORKS

Water Tube Boilers.

Over thirty years' experience in high pressure steam boiler building has produced the Union water tube boiler. There are more distinctive features in its design which make for continued efficiency, high overload capacity, safety, and minimum cost of operation and maintenance than any other water tube boiler. Among these advantages may be mentioned the following:

The patented corrugated flange connection from drums to headers eliminates distortion of tubes and leaky headers. There are no restricted areas, thus free circulation is assured, and internal strains are relieved in the boilers.

The patented purifier in the drums takes out practically all of the impurities in the feed water before it comes in contact with the heating surfaces. Settling chamber is out of range of the fire and path of circulating steam making element. Fitted with separate reinforced blow-off connection.

The horizontal drums provide ample steam and water space and steam liberating surface. Large area of connection from drums to header allows unrestricted circulation. This insures dry steam and large water storage capacity, permitting high overload.

The shape of the handhole permits each steel plate to be withdrawn through the hole it covers. No ground joints are used, and plates are easily kept tight. The yoke is of novel design, readily and quickly removed.

The tube spacing and purifier permit keeping the boiler clean while in operation. These features reduce the labor for cleaning, and the time lost while boiler is out of service. There is both higher operating efficiency and greater overload capacity than in any other boiler on the market.

The headers are made in integral halves in one heat and operation. The water space is of unusual depth and the headers have at no point two thicknesses of plate or rivets in the fire.

We have never had a broken staybolt in the Union water tube boiler. The water contents of these boilers is exceptionally large and practically the same as for return tubular boilers of the same horsepower rating. Regular pitch of staybolts, and additional blow-off at bottom of the headers.

The greater inclination of the tubes promotes more rapid circulation. They are vertically staggered to expose the maximum area to the heat. The horizontal spacing in rows is to permit inspection and proper cleaning of the fire side of the boiler. It also furnishes ample room for the passage of gases. All tubes are straight, of the same length and standard diameter.

The standard vertical baffles permit the installation of any regular superheater, as well as mechanical soot blowers. Horizontal baffles, however, may be fitted, as tube spacing is arranged for them. Products of com-

UNION WATER TUBE BOILER

bustion pass through ample spaces between tubes and baffles, making at least three passes and then are discharged through the uptake areas of large capacity.

The workmanship is guaranteed to be the very best that can be done by a well trained organization, with modern facilities.

All boilers are inspected and put to hydrostatic and steam tests, and passed only when found to be absolutely tight under the highest allowable working pressures, in compliance with boiler laws and insurance company requirements.

Horizontal Return Tubular Boilers.

The Union horizontal return tubular boilers are of standard designs and have the highest reputation for quality of material and workmanship. This line is complete in various types and sizes. A large stock is usually kept on hand for prompt shipment.

THE WALSH & WEIDNER BOILER CO.

CHATTANOOGA, TENN.

Products.

STEEL BOILER CASINGS; HORIZONTAL RETURN TUBULAR BOILERS; HORIZONTAL WATER TUBE BOILERS; SUGAR CRYSTALLIZER; STORAGE TANKS, STRUCTURAL STEEL and all classes of STEEL PLATE CONSTRUCTION.

Also, Vertical Water Tube Boilers, Pressure Tanks, Steel Riveted Piping, Acid Tanks, Oil Tanks, and Packing House Tanks.

Facilities.

The plant is located in the heart of the Southern iron and steel territory where material can be purchased to advantage, where the best of skilled mechanics are available and where favorable freight rates prevail.

This company has one of the largest shops in the country for doing all classes of boiler and plate iron work, and is in a position to handle jobs of almost any size.

The shop is well equipped with the most modern machinery, and an efficient corps of engineers capable of designing and preparing plans for all classes of work in this line is employed.

The company is especially well prepared to build special plate ironwork, tanks and structural work required in industrial plants.

A large, experienced erection force is prepared to erect material in any part of the country.

A large stock of materials is always carried on hand, and prices will be quoted for prompt shipment from stock.

Catalogues covering the line will be gladly furnished on application.

Special Horizontal Return Tubular Boilers with Steel Casing Setting.

This company makes a specialty of high grade horizontal return tubular boilers and usually furnishes the improved drop combustion chamber steel casing setting with them.

This setting costs about the same as a brick setting and decreases the coal consumption from 10% to 25%. They are built for any number of boilers in a battery and arranged for any special type of furnace.

Vogt Water Tube Boilers.

The exacting requirements of the modern power plant are satisfied by Vogt water tube boilers.

Continuous high economy is obtained, due to the design of the boilers and the arrangement of the furnaces for the proper combustion of the fuel.

Low cost of maintenance is secured by the elimination of numerous handholes at ends of tubes and by the accessibility for cleaning and inspection; also by the flexibility of construction, effected by the method of suspension which allows for the freedom of expansion and contraction.

High grade workmanship and material are embodied with the most advanced boiler practice, which complies with the new A. S. M. E. Boiler Code.

Vogt Sectional Steel Boiler Casings.

The necessity that more perfect combustion be obtained has made the elimination of the excess air, which leaks through brick boiler settings, one of the most important features of boiler setting design.

The Vogt steel casing for return tubular and water tube boilers constitutes a decided step towards securing this more perfect combustion, as it avoids all leaks common to brick settings.

A considerable saving in the cost of maintenance and in the elimination of expensive delays is effected, since the brick lining of the steel casing (being tightly sealed) is not subject to the usual expansion and contraction.

Excess air means wasted fuel. Stopping the leaks reduces the coal consumption. Coal saved is dollars saved, which is a direct return upon the investment.

VOGT STANDARD HORIZONTAL WATER TUBE BOILER

SECTIONAL STEEL INCASED HORIZONTAL RETURN TUBULAR BOILER

C. J. WALTON & SON

Boilers, Tank and Plate Work

1221 West Main Street
LOUISVILLE, KY.

Products.

RETURN TUBULAR and WATER TUBE BOILERS;
STEEL CASINGS.

Also, Scotch Marine Boilers, Stacks, Tanks, Shaking Grates, General Plate Work, etc.

Experience.

During the 80 years that the firm of C. J. WALTON & SON has manufactured steam boilers, the highest standards of construction, material and workmanship have been constantly maintained. Throughout the entire manufacturing career of this company, the most modern methods and the newest mechanical equipment have always been sought and utilized for the improvement of its products.

Scope of Work.

While specializing in return tubular boilers, C. J. WALTON & SON also build boilers with riveted flues, internally fired Scotch marine boilers, vertical boilers with full length and submerged tubes and vertical water tube boilers.

The scope of work also includes plate and sheet iron work and the manufacture of shaking and standard flat grates.

Return Tubular Boilers.

These boilers, with ranges from 30 to 250 h.p., may be supported by wall brackets, or I-beam and column supports. The latter is recommended for larger sizes.

Boilers can be furnished with full flush, three-quarters or half fronts, and fronts arranged to receive any type of stoker.

Grates of the flat type or shaking grates can be furnished.

BOILER SHOWING INDEPENDENT SUPPORTS

TRIMMINGS—The trimmings consist of pop safety, blow-off check and globe valves, water gage with gage cocks, steam gage and siphon, in addition to the regular setting fixtures.

Water Tube Boilers.

The Walton water tube boiler is of the vertical type with straight tubes, large steam space and built in sizes of 200 to 400 h.p.

Steel Casing.

Steel casing for enclosing the boiler is furnished instead of standard brick casing which often cracks, admitting cold air.

Riveted steel plates made with straight sides or rounded bottom, insure airtight construction. The casing is lined with fire brick to protect it against the action of hot gases.

WICKES VERTICAL WATER TUBE BOILERS and
HORIZONTAL RETURN TUBULAR BOILERS.

Wickes Vertical Water Tube Boilers.

Designed and built in accordance with the A. S. M.
E. Boiler Code.

Steel Cased Setting Increases Efficiency

Great Height of Steam Room
Insures Dry Steam

Man Stands Erect Cleaning

DISTINCTIVE FEATURES WICKES VERTICAL WATER TUBE
BOILER

Built of homogeneous metal. No cast metal of any
kind used.

All tubes perfectly straight.

Very highest class workmanship known to the art
put upon these boilers.

No special parts used. Material can be furnished
and boiler repaired by local boiler maker.

SWEET'S CATALOGUE

Baffle tile is heavy, rabbetted, tongued and grooved
and can not be misplaced.

Easiest boiler to open, wash or turbine and close
on the market. Hence, can be operating the maximum
number of hours per year.

Accessible mud drum located at the lowest point
of the boiler.

Gases have a very long travel; entirely surround
and scrub heating surface from entrance to release.

There are no passages in setting not filled with
heating surface. No opportunity exists for gases to
short-circuit heating surface.

Precipitation of soot and impurities in water are
taken advantage of by gravity to the fullest possible
extent.

Steel cased settings stop air leaks and so increase
efficiency.

Great height of steam outlet from water level,
coupled with liberal steam storage capacity, results in
absolutely dry steam being delivered by this boiler.

BULLETINS—Ask for educational, technical bul-
letins, illustrated with Wickes vertical water tube
boilers. The titles of these bulletins, for free distribu-
tion while they last, are:

Products.

BEGGS MCCLAVE IMPROVED DUMPING, SHAKING and CUT-OFF GRATE; STEAM BLOWERS.

For Boilers, see page 642.

Beggs McClave Improved Dumping, Shaking and Cut-off Grates.

This improved grate combines in one grate the ability to burn all kinds of coal from bituminous run-of-mine to the smallest size of anthracite. The grate has three distinct motions: first, the cut-off, where a slice of ash is removed from the bottom of the fuel bed; second, the dumping where the entire contents of one or more sections is dumped in the ash pit; third, the shaking where the fuel bed is agitated, permitting the fine ash only to fall into the ash pit. The grate surface is divided into sections and any one of these motions may be imparted to any section without disturbing the other sections.

SECTION OF FIREBOX

BOILER FRONT

GRATE SHOWING FRONT SECTION DUMPING, REAR SECTION FIRING POSITION

GRATE SHOWING SHAKING POSITION

ANTHRACITE FUEL—Anthracite coals require that fuel bed shall be disturbed as little as possible. With the Beggs McClave improved grate, the combustion is maintained with the minimum amount of agitation. As the layer of ash under the hot coal accumulates, a slice approximately 3 in. thick is removed by means of the cut-off motion of the grate, leaving a thin bed of hot coals, the ideal condition for the fire.

BITUMINOUS FUEL—Bituminous coal tends to slag and cake, thereby cutting off the draft through the fuel bed. Continuous agitation is required to keep the fire broken up. Beggs McClave improved grate is admirably adapted for this, as the shaking motion agitates the fuel bed permitting only the fine ash to drop into the ash pit.

DIRECTIONS FOR ORDERING—(1) Give the exact width between side walls of furnace at the level of grate.

(2) Give length of lines AA and BB.

(3) State whether the dead plate has a lip (or rabbet) on its inner edge to carry front end of grate frame. The lip (or rabbet) for the Beggs McClave improved grate should be $2\frac{1}{4}$ -in. projection, $2\frac{1}{8}$ -in. depth.

(4) Give measurements, A, B, C and D.

Ring Blowers.

For furnishing forced draft to burn the smallest grades of coal or to help over the peak, a ring blower installed in the ash pit is most economical and efficient. It is easily installed and requires no adjustments or repairs. It does not depreciate when not in use. A large volume of air is obtained by the use of a small amount of steam. Clinkering is prevented as a result of the softening effect of the steam.

THE AUTOMATIC FURNACE CO.

DAYTON, OHIO

Products.

MODEL AUTOMATIC SMOKELESS FURNACE; MODEL CHICAGO CHAIN GRATE; MODEL ACME STEAM ENGINE.

Co-operative Service.

This company will gladly co-operate with consulting engineers, architects, owners, managers, operatives, and all who have to do with steam power, heat or light plants and will gladly furnish such detailed information as may be desired to determine the practicability of any proposed installation.

Model Automatic Smokeless Furnace.

The Model Automatic smokeless furnace is so designated because it is an improved form of the side-feed type and embodies greater utility than any other make or type.

The devices for getting rid of the ash have been so designed and perfected that the furnace keeps the fire clean all the time.

There is therefore no "defect," as the clinker and other coarse refuse, as well as fine ash, are constantly and automatically discharged in the ash pit underneath the grate, and a clean, live fire is maintained at all times, even when low grade slack is used.

The Model Automatic is operated on natural draft and is not only superior in constant, efficient self-cleaning and smoke prevention, but is also designed to, and does, give effective protection. When repairs are necessary, renewal of any part can be made readily without disturbing other parts.

The principal parts of the furnace are not exposed to damage and will last a lifetime. The grates are in pairs, one piece of each being stationary and the other movable. They are set in, but not fastened, the upper end resting against the bed plate of the coal magazine and the lower end resting on the grate bearer, which, with the sectional clinker grinder, forms the longitudinal center of the grate surface.

Illustrations show the narrow surface of each grate that is exposed to the heat and the broad surface on which the air acts and cools as the air is drawn from the ash pit up between the grates into the fire bed.

10,000 H.P. PLANT, WITH COAL AND ASH HANDLING MACHINERY

CROSS SECTION THROUGH MODEL AUTOMATIC FURNACE SHOWING SINGLE AND DOUBLE ARCH CONSTRUCTION

The coaling process is made the more effective by reason of the automatic cleaning keeping the air spaces always free of ash, clinker, and other choking refuse, thus avoiding sticking or sliding and maintaining an even fire bed. Each pair of grates can be renewed separately and each section of the bar that grinds up and discharges the clinker and coarse refuse can be renewed separately and, if necessary, without putting the furnace out of commission or seriously interfering with its operation.

That part of the magazine bed plate, against which the upper end of the grate bars rest and over which the coal is fed onto the grates, is covered with feed plate angles made in short sections held to place by a single bolt, so that renewal, if necessary, can be made quickly and only the section damaged need be disturbed. Air for combustion of the volatile gas is heated before it enters the fire chamber and so admitted as to avoid overheating of the fire arch, arch plates and other parts, and insures instantaneous, complete combustion.

MOVABLE AND STATIONARY GRATE BARS
Separately and in pairs as they are set in the furnace

DRAFT—The Model Automatic furnace operates with either natural or induced draft.

The stronger the draft, the more coal can be burned per square foot of grate and the harder the boiler can be crowded. There are Model Automatic furnaces under stacks 175 ft. high with ample area where 500 h. p. boilers have been repeatedly crowded to 1500 h. p. for days at a time and maintained a clear stack, and there are no cinders to trouble the neighbors, as is ex-

Continued on next page

LONGITUDINAL SECTION THROUGH CENTER OF FURNACE

perienced with furnaces that are operated with forced draft.

AUTOMATIC REGULATION—A combination draft and fuel feed regulator can be applied, so that the rate of fuel feed, air supply and combustion correspond to the steam requirements.

ADAPTABILITY—The Model Automatic can successfully handle and burn with superior economy any known bituminous coal mined in this country or in any foreign fields, can be adapted to any make or form of boiler, and to almost any conditions of boiler room or fuel or duty requirements.

The stronger the Model Automatic furnace is crowded, the higher the temperature and the greater the volume of white heat, but no smoke, and this holds true whatever district coal is used.

No other mechanically operated furnace lends itself more advantageously to economic use of mechanical coal or ash handling. The clinker and other coarse refuse is broken up, so the ash is in suitable condition for any desirable method or system for ash handling.

REPAIRS—The construction and arrangement of the Model Automatic furnace provides for a maximum self-protection to all parts subject to damage by heat or wear, and there is therefore a minimum cost for maintenance. The fuel saving is sufficient to pay for the necessary repairs and also to give a large return on the cost of furnace.

This company does not sell furnaces to secure repair orders, but will furnish repair parts that are right, at a slight advance over cost of material and labor involved.

OPERATOR—A small steam engine or electric motor is furnished with each furnace, battery, or row of furnaces and fitted to a set of double worm gears, thus

GRATE BEARER AND CLINKER BAR WITH ONE SECTION REMOVED

giving ample power with use of little steam, and the exhaust is utilized in connection with our steam shower beneath the clinker bar and grates.

Mechanisms for operating both the stoking and cleaning arrangements are on the outside of the front, not exposed to the heat of the fire. Each part can be disconnected and connected up again without stopping engine or motor. Motion of clinker grinder can be varied to suit amount of refuse in the coal by simply pulling out a single pin and replacing it in desired position, to keep the fire clear of refuse and not waste combustible in the ash.

Coal can be supplied to coal magazines by hand with shovel or by gravity from above the magazines or through chutes from an overhead bin.

Chain Grate.

This company also manufactures the Model Chicago chain grate. It is of rugged, heavy construction and is designed to stand the trying service of boiler room equipment. Detailed description will be gladly sent on request.

Model Acme Steam Engine.

USES—There are now thousands of Acme engines in operation, driving mechanical stokers, generators, core drills, air compressors and similar units, and owing to their rugged construction, simple and durable design, they have no equal for such service, operating as they do with the minimum amount of attention.

MODEL ACME STEAM ENGINE

DESCRIPTION—Engine is of the single acting, two-cylinder type. Designed to operate under a steam pressure from 80 to 200 lbs. and a speed of 150 to 600 r. p. m. A pair of vertical cylinders are placed above an enclosed crank case which serves as a rigid foundation for the engine as well as a reservoir for the oil used in the automatic splash system of lubrication.

It is provided with generous sized ports for quick inlet and exhaust of steam. Valve is a one-piece casting ground to fit an accurately bored chamber, the latter piece also serving as a cylinder head. Automatic relief valves are provided in the top of the cylinder head to insure quick release of any water which may collect in the cylinders, thereby eliminating any chance of damage from this source.

Engines are equipped with either a flyball governor with speed ranger attachment, or with an automatic governor located in the flywheel. For some classes of work, one type of governor is more satisfactory than the other, but both are of the best design, workmanship and material.

All bearings of this engine are of ample size and are continuously lubricated by a positive splash system contained in the crank case.

ESTABLISHED 1900

THE JAMES A. BRADY FOUNDRY CO.

Stokers, Ash Conveyors, Flat Arches, Coal Scales and Heavy Castings
45th Street and Western Boulevard
CHICAGO, ILL.

Products.

Manufacturers of TRAVELING GRATE STOKERS, STEAM JET ASH CONVEYORS, FLAT ARCHES, AUTOMATIC COAL SCALES, and HEAVY CASTINGS.

Traveling Grate Stoker.

The Harrington stoker constitutes an automatic mechanism designed for firing bituminous coal and lignite and more particularly coals containing high ash. It embodies an endless chain grate which carries coal into furnace in an even bed whose depth is regulated by height of the fuel gate at rear of the coal hopper. The coal bed is undisturbed during its entire consumption.

A series of small self-cleaning grate clips, placed over cast iron bars, make up the grate surface. Clips are arranged with an air space between them and are free from any strains whatsoever, thereby insuring their long life. If for any reason it is found necessary to replace a clip, the operation can be performed from the front of the stoker, in less than two minutes time. The fuel bed is carried on heavy semisteel driving links with rollers supported on tracks; therefore little power is consumed in its operation and all unevenness of grate surface is entirely eliminated.

For low grade fuels or high rates of combustion, forced draft is employed. The big feature in the Brady stoker is the special zone draft regulation which consists of an arrangement of four draft chambers located underneath the grate and transversely to it. Into these chambers forced or natural draft, in any relative proportions, or any pressure, is admitted by manually controlled means, from front of stoker. Complete regulation of drafts in one chamber is entirely independent of that in any other, giving the operator extreme flexibility of control of combustion on any portion of grate surface. Through this efficient method of operation, one man can

HARRINGTON TRAVELING GRATE STOKER INSTALLATION
With dual driving system—motor and engine

take care of as many as 10 stokers where the gravity overhead coal feed system is employed.

Steam Jet Ash Conveyor.

The Brady conveyor consists of a pipe line of extremely hard wear resisting pipe and specially designed fittings, cast from Brady metal—a special mixture of iron. Through this pipe line ashes are conveyed by suction of air at high velocity, created by steam jets located between ash intakes and point of discharge. Usually pipe line is carried out of doors to an elevated ash tank under which a car or wagon can haul off ashes expelled from swinging spout. Manufactured in the 8-in. diameter size only; capacities of from 1 to 8 tons per hour.

Flat Arches.

The Brady flat arch is used not only for ignition purposes in stoker settings but for furnace roofs of all kinds.

It is so constructed in any size that all side thrust is eliminated and therefore tighter settings are insured without the use of heavy buckstays.

BRADY FLAT ARCH, ASSEMBLED
Showing rows of tile, racks, etc.

Coal Scale.

The Reliance scale operates on a new principle which makes it possible, with a careful adjustment, to weigh coal continuously to within 1% of the actual weight, as long as the coal is delivered to it. Each scale is furnished with an automatic counter.

Heavy Castings.

THE JAMES A. BRADY FOUNDRY Co. also do a job casting business, with plant facilities capable of turning out 100 tons of iron or semisteel castings per day and single castings weighing up to 35 tons.

Co-operative Service.

THE JAMES A. BRADY FOUNDRY Co. maintain an engineering department which will furnish any information required, and submit drawings and proposals covering costs and guarantee of capacity. They will gladly call at any plant and suggest a layout.

Products.

GRATE BARS, SHAKING and DUMPING GRATES.

Description.

The bars are constructed on the clip and truss plan, having two trusses lengthwise; and the clips are bridged across these trusses, each clip forming a double brace with the trusses. No other design can give such a uniform strength to the entire bar. It has no weak spots to warp or buckle. The illustrations will explain clearly the general construction of the grates.

The trusses and clips are beveled from the top side to the underside as follows: The trusses on top side are $\frac{7}{8}$ in. tapering to $\frac{3}{8}$ in. at underside. The clips are $\frac{3}{8}$ in. at face (top) of the bar and beveled to $\frac{3}{16}$ in. at underside. The distance between the clips on the face of the bar is $\frac{3}{8}$ in. and on underside is $\frac{9}{16}$ in.

The bevel has three special advantages: First, all ash that passes through the face of the bar must drop directly through to the ash pit. Second, the openings being nearly twice as large at the underside as on the face side, it admits nearly double the volume of air than if the lines between the clips were parallel. Third, there is no friction on the air (draft) until it has reached the extreme top edge of the openings, or face of the bar, thus unbroken currents pass up through unobstructed air spaces, the result of which is too obvious to need explaining. This design is practically equal to a forced draft, as the large volume of air gathered through the larger air spaces at the underside of the grate can not escape except through the top side, at which point it is evenly distributed through the fuel. The bars rest in the frame on chilled axles, which are proof against wear.

The shaking device is strong, simple, and effective. The equalizing bar slides onto the trunnions of the arms, which run down from the ends of the bars, and are secured by cotter pins; while a wrought iron rod 1 in. in diameter connects the equalizing bar with the shaking and dumping arm on the front of the boiler. This arm locks into a lug which is secured to the front of the boiler by cap screws, and is fitted with a cast steel link which drops into a slot and locks the bars level.

The bars can be shaken as vigorously or gently as may be desired, according to the condition of the fire, having a motion of 4 ins. up and down without opening the spaces between the bars any farther than when the grate is locked level. No unburnt fuel can drop through it. The "filing movement" of the bars (owing to the fact that they set in the frame eccentrically) cuts the ash entirely off the bottom of the fire, making it possible to maintain the free circulation of air through the fire.

When it is desired to dump the residue of the fire, the shaking lever is pressed downward until the bars are thrown to such an angle that the entire contents of the firebox drop through between the openings, which are then about 4 ins. wide, into the ash pit. There are, of course, clinkers which, under certain conditions, no shaking grate can dump; but if the conditions of the firebox, bridge wall, combustion chamber, and grates are such as they should be, heavy clinkers may be avoided, for there is no other grate that will handle clinkers as effectively as the Cyclone.

CYCLONE GRATE BAR IN FIREBOX

Material.

It is a common fallacy that any kind of iron is good enough for grate bars, but the very opposite is the case. These grates are made from a mixture of iron which has been found from years of tests and experiments to be best suited for the purpose. We use this grade only. Grates are therefore of uniform quality, and many sets have shown no evidence of burning after 4 years of continual firing 24 hours a day.

It admits 68% of the available air.

It can not waste fuel when shaken, as the openings between the bars are no greater when shaken than when locked level.

When the bars are thrown to dumping position the residue of the fire drops directly into the ash pit, clear of all working parts of the grate.

Points of Superiority.

It locks level; can not get out of adjustment. Damage by accident or careless handling has been fully provided against.

It will burn any kind of fuel; the bar furnished is best suited to the fuel which is cheapest, or most desirable, in any locality.

The bars are so braced and trussed that warping is a practical impossibility. There are no points or fingers to burn off.

The filing movement, when shaken, cuts the ash off without disturbing the fire. Cleans ashes from unburnt fuel without waste.

Evaporation—more water per pound of coal. The heavy smoke is consumed, therefore more perfect combustion is obtained.

Every detail in the construction and equipment of the Cyclone shaking and dumping grate has been studied with the view of conserving the three essential features of simplicity, durability and economy of fuel.

CYCLONE ROUND GRATE

CYCLONE ROUND GRATE BAR IN A DUMPING POSITION

KELLY FOUNDRY & MACHINE CO.

Manufacturers of Furnace Grates, Boiler Fronts and Power Plant Equipment
GOSHEN, IND.

Products.

ROCKING, DUMPING and STATIONARY FURNACE GRATES; BOILER FRONTS and ACCESSORIES.

Also, Cast Iron Power Plant Equipment.

TRADE-MARK

SUPERIOR FEATURES—The Kelly idea is to make the grates fit the conditions under which they are to work, and the utmost in fuel economy is attained by making the grates with air opening best suited to the fuel used.

The ventilated center bearing bar is a feature not possessed by other grates. The air enters from either side below the grate surface, and passes through the openings on the surface. These openings are shown in plate No. 18.

A steady, even fire can be maintained by rocking the grates and keeping the air space open. Grates have a flat surface, and therefore operate with greater effect in disturbing and breaking up the fuel bed. Grates can be cleaned by shifting the fire and dumping one section at a time.

No fingers to burn off; will burn any kind of fuel, and burn it up clean; need no alterations in a regular furnace to install. Actual tests have proved that they will save from 5% to 25% in fuel.

STYLE A. PLATE NO. 16

Side bearing bar removed, giving a clear view of simple mechanical arrangement for rocking and dumping. Each section operated independently.

Rocking and Dumping Grates (Style B).

In this style the large dumping grate, at the rear of the furnace, operates independently in disposing of the residue of combustion at the rear of the furnace, where it accumulates next to the bridge wall.

STYLE B. PLATE NO. 22

Full dumping position with 18-in. rear dump

Rocking and Dumping Grates (Style A).

CONSTRUCTION—The Kelly grates offer least resistance to the passage of air, and at the same time support the fuel; movable, for the sifting of ashes and dumping of clinkers, and operated easily and effectively; free from cumbersome or complicated parts and attachments, and adaptable to the various fuels and furnace conditions.

Material used has the greatest heat resisting qualities. Grates are made in uniform pattern, will expand and contract evenly, and are not liable to warp. Entire framework is held together by pins, connecting the ends of the side and center bearing bars with the ends of the tie bars.

INSTALLATION—The Kelly grates may be installed where any ordinary stationary grate has been used, without changing supports; sets on regular standard front and rear angle grate rests. Drilling required in boiler front for shaking attachment is 1-in. holes.

STYLE A. PLATE NO. 18

Standard installation

OPERATION—The rocking motion is confined to a certain limit, by a simple locking device, eliminating the possibility of wasting fuel or dumping the grates in the rocking operation; by releasing the lock pin, the grates may be dumped and thoroughly cleaned without opening the fire doors.

STYLE B. PLATE NO. 23

Rocking motion with rear dump grates locked in level position. With use of lock pin in shaker stand each section of grate can be locked in level position. 18-in. rear dump

STYLE B. PLATE NO. 15

Grate surface 5 ft. long by 5 ft. wide. One side bearing bar removed from normal position to give view of mechanical arrangement of rocking and dumping operation. The shaking attachment is made at right- and left-hand sides. Each section requires two levers to operate

STYLE B. PLATE NO. 13

Front sections of grate surface are operated independently from double capacity rear dumping grates, giving fireman every advantage for perfect control of fires. The dumping operation is accomplished by removing lock pin from shaker stand. 12-in. rear dump

Sizes, Styles A and B.

Standard sizes run in even feet and half feet in both width and depth, and are carried in stock. Grates are furnished for any size area and any number of sections wide on receipt of order, at no extra price per square foot.

"Kelly Improved" Grates, Stationary.

The air opening is continuous from one side of the furnace to the other, admitting 10% more air than any other grate. No dead surface. An equal volume of air to every square inch of the surface.

THE "KELLY IMPROVED" GRATE

Standard width 6 ins., any length. Air openings $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ in.

SWEET'S CATALOGUE

The side, or support bar, does not come to the fire surface, but is 1 in. below it. This allows a draft circulation above the side bar, which keeps it cool and protects the strength of grate from the direct action of the heat, therefore it can not sag nor warp.

SECTION "KELLY IMPROVED" GRATE

Boiler Fronts and Trimmings.

Design, style and sizes of the Kelly boiler fronts and trimmings have been established for years and conform to the average power plant equipment. Many patterns have accumulated and special work can be furnished on short notice. Pattern and machine shops are well equipped to handle work from blue print or sketch.

Complete setting consists of front proper, fitted with flue, fire and ash doors, baffle plates fitted to fire doors, dead plate and liners, rear grate rest and grates, rear arch rest and arch bars, buckstays and diamond washers, soot door and frame, breeching frame and damper. Front accurately fitted and lettered.

STYLES AND SIZES—Ten different regular styles: Full arch and half arch fronts; Dutch oven fronts; smoke extension fronts; full and half creamery fronts.

Sizes: 30-in. to 84-in.

STANDARD NO. 1 BOILER FRONT

MARION FOUNDRY CORPORATION

Manufacturers of Shaking Grates

Marion National Bank Building
MARION, IND.

Product.

The CLEAR-CUT SHAKING GRATE.

Description.

The Clear-cut grate has four positions :

Level.

Ash sifting.

Semi-dumping or medium dumping.

Full dumping.

The illustrations herewith show these four positions.

TWO-SECTION GRATE IN LEVEL POSITION

Grates are held level by the latch

TWO-SECTION GRATE IN ASH SIFTING POSITION

Without throwing the latch the grates can rock forward and back to level without appreciable widening of the air openings

TWO-SECTION GRATE IN SEMI-DUMPING OR MEDIUM DUMPING POSITION

Latch is thrown back when this action is used. There is a 2-in. dumping clearance along the full length of the rocking bars. Clinkers too large to fall through this 2-in. opening may slide into the valleys between bars and are then cut up and pushed through by the knife edge fingers of the rocking grates. Locked shafts help to make this crushing action possible

TWO-SECTION GRATE IN FULL DUMPING POSITION

Lever stop is removed from fulcrum post to obtain this full dumping action, which gives a 5-in. dumping clearance along the full length of the rocking bars

Marion Bagasse Grates, Power Plant Specialties, Coal and Coke Handling Machinery, and Oil Well Machinery.

Introduction.

Inefficiency in a steam plant is very often attributed to the kind and grade of coal used, when upon investigation and tests it is found that improper method of firing is the direct cause. Frequently but little attention is paid to what actually takes place within the fire

box. In burning bituminous coal, great care is necessary if good results are to be obtained.

Composition of Coal.

ANALYSIS—The principal components are fixed carbon, volatile matter, sulphur, ash and moisture. The volatile matter is the gases and vapors that are liberated from the fresh coal, consisting of hydrogen and hydrocarbons and is the part which causes the most difficulty in securing perfect combustion. The hydrogen and lighter hydrocarbons burn off almost immediately if given sufficient oxygen. The tars and heavy gases are slow burning and require a longer time; therefore a longer combustion chamber must be provided so that combustion will be complete by the time the tubes are reached. After the volatile matter has been driven off,

MARION HAND FIRED STOKER

the fixed carbon remains which burns without flame and will vary from a red color at about 800° Fahr. to a white heat, depending upon the rate of combustion.

The principal elements of combustion are hydrogen and carbon from the fuel and oxygen from the air. If burned with sufficient air the carbon forms carbon dioxide (CO_2), and if insufficient air is furnished, carbon monoxide (CO) is formed, which is a combustible gas. As the hydrogen burns, it combines with the combustion agent oxygen and forms water.

When combustion is thorough, the CO_2 formed should be about 14% of the flue gas, and this indicates that there is little CO , or combustible gas, escaping up the stack.

ENERGY OF COAL—There is enough energy in 1 lb. of coal if it could be utilized, to lift a 200-ton locomotive 54 ft. high, or 1 ton over a mile high. A lump of coal as large as an average apple, if all converted into useful energy, will drive a 3000-ton ship 1 mile through the water.

The average modern power plant of 1,000 to 2,000 h. p. loses 26% of all of the heat of the coal in the hot chimney gases; only 3% is being actually used in manufacturing.

Marion Hand Fired Stokers.

No one type of grate and no one method of firing will successfully burn all kinds of coal under all conditions, and consequently the grates used and the method of firing must be adapted to the kind of coal, the type of furnace and the load condition.

There are three methods of hand firing, viz.—coking, spreading and alternate and of all these the coking method is the most economical for bituminous coal. In this method the coal is placed at the front of the grates, where the volatile gases are distilled off gradually and the fuel then worked backward until the fixed carbon is finally burned by the time the fuel has reached the back end of the grates.

It may be seen that as the volatile gases are burned off, the remaining fuel as it approaches the back part of the grate is practically coke, and thus the name coking. By this method the heat units ordinarily obtained from the use of coke would be utilized, plus all the heat obtained from the burning volatile gases not found in coke due to their being burned off in the coke ovens.

All ash and clinker remaining are removed at intervals by dropping into the ash pit. This method requires a special grate or stoker.

The Marion hand stoker is designed to burn bituminous coal containing a high percentage of heavy, slow burning, volatile matter, which distills rapidly at low furnace temperature. The peculiar method of stoking will keep a clean, uniform, practically smokeless fire.

MARION HAND FIRED STOKER

OPERATION—The grates are stoked until the first coal introduced has worked clear back on the grates.

Then fresh coal is thrown on the coking plate at the front of the grate. The volatile matter is distilled off and passes over the fire where it mixes with the hot air and burns completely before reaching the tubes.

The firing door should be opened slightly for a brief period after firing, to furnish more oxygen for the burning gases. The long interlocking teeth of each grate bar extend back of the axis of rotation of the preceding bar so that the forward movement causes each rocking unit to take fuel from the preceding unit and carry the fuel forward to the following bar, giving a positive continuous forward movement to the fuel. The shape of the teeth is such that in all positions of stoking there is a uniform opening between the teeth, thus conserving fuel, and the design of the grate bars is such that they will not warp or get out of shape.

Marion Interlocking Grates.

A smooth, even surface is obtained when the Marion interlocking grate is at rest. When in operation, the bed of clinker and ash is effectually broken up by the rocking, fore and aft, of the projecting interlocking fingers, which serve to keep air spaces open, so no large clinkers can form or stick fast to grate bars.

With each successive upward tilt of the rockers, clinker and ash is thus stirred up and slides down into openings and is crushed through with the return movement of the grate.

The centering and locking device makes it impossible to unlock operating handle from socket until grates are brought to a dead level, when handle can be removed with ease. This device removes all objections to an interlocking grate, for there is no danger of burning the projecting fingers if handle is always removed.

Practically all the power applied to the operating lever is exercised in breaking the clinker. The leverage is about 30 to 1.

LEVELING DEVICE AND SAFETY LOCK

GRATE BAR

MARION INTERLOCKING GRATE
Weight, about 75 lbs. per sq. ft.

Marion Scottdale Grates.

With the Marion Scottdale grate, the fireman can brighten up the fire and sift out the ash, by lifting the top latch of fulcrum bracket and rocking the grates through a limited arc without increasing any opening of grate. He can remove the clinker by lifting the latch attached to bottom of fulcrum bracket and allowing grates to open up as necessary.

Two-section, Showing Various Parts

One Section in Ash Shifting Position, and the Other Section in Clinker Dumping Position

MARION SCOTSDALE GRATE

SPREADING METHOD OF FIRING—With the use of this method, the whole fuel bed has to be covered with fresh fuel at each firing, and made perfectly level.

The key to successful firing by this method is to fire thin and often, avoiding piling fresh coal on high places. In this way the flame soon cuts through the fresh fuel, and there is no coking.

If all fine ash is removed by shaking the grates slightly, large lumps of coal broken up, the ash pit kept clean, and care exercised in firing thin and often, there will be less smoke and a cleaner fire maintained. A little water in ash pit will make the clinker porous. No hooks or slice bars should be used.

MARION SCOTSDALE BAR—The design is such as to give the highest percentage of air space without sacrificing strength of individual fingers. The double rib

UNDERSIDE OF MARION SCOTSDALE BAR
Furnished in $\frac{3}{8}$ -, $\frac{1}{2}$ -, $\frac{5}{8}$ - and $\frac{3}{4}$ -in. meshes

construction is very strong, and can not warp. This design makes possible the use of deep fingers in proportion to their short length.

Keystone Non-interlocking Rocking Grates.

The efficiency of furnace and capacity of boiler will be increased greatly by the proper use and care of rocking grates. A much greater load can thus be carried, and a much easier job afforded for the fireman.

The Keystone grates are made in two styles—the Rocking, and the Rocking and Dumping. Both are of the non-interlocking type. It is not necessary to operate the grates very vigorously or very often to remove the ash and keep a clean fire. The fire should not be stirred with a slice bar or hook, as this makes a clinker.

Marion Non-interlocking Rocker Grates.

Coals that form a large, soft clinker need a dumping grate. Grates that must give an extremely high rate of combustion need to have a large percentage of air opening and be able to keep an absolutely clean surface free from ash and clinker and to remove same easily.

The Marion rocker grate is both serviceable and substantial, built with much more attention to detail than is ordinarily found in grates of this type. Latch locking device insures a level grate when not in operation. Can be fitted to any boiler setting without disturbing furnace brickwork. Steel trunnions are used.

The same arrangement for preventing dislocation of any rocking bar is used in this grate as in the Marion Scottdale grate. Each pair of frames consists of one with removable bearings and the other having bearings cast solid with frame.

Marion Soot Blowers for Water Tube Boilers.

MARION ROTARY SOOT BLOWERS—The Marion rotary soot blower is a single jet type blower and delivers a small volume of steam at high velocity through the flues, driving out all loose ash and soot.

The steam nozzle contains a number of steam ports having different angles. These ports are opened one at a time. The whole nozzle is rotated upon its axis, which allows each port to successively direct a steam jet against a fixed section of the flue area. The nozzle is made of a special mixture of cast iron which stands the high temperature.

MARION ROTARY SOOT BLOWER

MARION PLANET SOOT BLOWERS—They are designed for all types of water tube boilers, including vertical, horizontal and marine. These blowers have the internally welded nozzle, which forms an integral part of the blowing element. The nozzles are so spaced as to clean the entire tube surface. The blowers are operated by a special hand wheel control, which gives the blowers a steady rotating movement.

PLANET BLOWER

They can be used at all times, regardless of load conditions.

No piece of equipment will save so much coal as a good system for keeping the boiler tubes clean. An efficient soot blower will often save as much coal as the feed water heater. One is as indispensable as the other in the up-to-date plant. To obtain the maximum efficiency from any boiler, the flues should be blown free of

MARION PLANET SYSTEM WITH
WATER TUBE BOILER AND
SUPERHEATER

soot every few hours. When the soot and ash first collect on the tubes, it is loose and fluffy and very easily removed by a blast of steam. However, if allowed to remain for a comparatively long time, the heat will fuse it into a hard clinker which is stuck to the tubes and can be removed only by means of a tool. It is possible to save from 5% to 10% by keeping the soot removed from the tubes, which will pay for the equipment in a very short time. Soot and fine ashes are practically equal to asbestos, as far as heat insulation is concerned.

The body of the Marion Planet steam soot blower is a large, substantial casting through which the distributor passes. This body is placed in the brick wall and thoroughly anchored.

The yoke, which is fastened to the body, holds the steam connections in position and keeps them in alignment with the distributor.

The large sprocket contains the stuffing box and is screwed to the outside end of the distributor, making a rigid unit.

The turned nipple is well packed in the stuffing box, making the whole thoroughly steamtight.

OPERATION—The mechanical soot blower is a permanent installation and each unit cleans a certain section of the tubes. These blowers are so placed that the tubes are thoroughly cleaned in each pass; enough units are used on the boiler to thoroughly clean all the tubes and headers. If the boiler has a superheater, a unit will be so placed as to clean this also.

The jets of steam blow the soot off the tubes, part

MARION PLANET SOOT
BLOWER APPLIED TO

of it passing out with the flue gases and the heavier matter settling in the combustion chamber, from which it can be removed from time to time.

Scottdale Crushers.

Scottdale crushers are made in sizes to crush bituminous, semi-anthracite and bone coals and give a product from $\frac{3}{4}$ to $4\frac{1}{2}$ in. To accomplish this, adjustment for various sizes of product, one roll is made floating or adjustable and is driven by special long-tooth gears, to insure proper meshing of teeth when roll is set for fine or coarse crushing.

The rolls are made of white iron with deep, chilled face and teeth, and are mounted on large steel shafts, key seated to fit closely over feather key in shaft. The hubs of the outside sections of the rolls bear against the end bearings and hold the sections in place on the shaft. All rolls are carefully designed with a high factor of safety and are fully guaranteed for material and workmanship.

FILES ENGINEERING COMPANY, INC.

Manufacturers of Files Stokers

PROVIDENCE, R. I.

SALES OFFICES AT ALL IMPORTANT CENTERS

Product.

FILES HAND STOKER (Patented April 29, 1919).

Structure.

The Files hand stoker is a device constructed strictly upon the principle of correct metal distribution. The side and center bearing bars that support the stoker are perforated and channelled, which insures perfect circulation of air around them, even when against side walls. Rapid radiation keeps the bars from warping. The heavy head of the cleaning plate swings up in toward the bridge wall, crushing, as between two jaws, every particle of clinker thereon and dumping all refuse into the ash pit.

When the plant conditions warrant it a mechanical coal feed may be installed, making a saving of labor equivalent to mechanical stokers.

Function.

Fresh coal fed periodically to the front of furnace just inside doors is subjected to a coking action; the volatile gases distilled by this action are consumed in their passage over the incandescent fuel bed. The fuel, freed of these gases, is then carried gradually forward toward dump plates by action of hand operated stoking bars, giving up in its passage down the inclined grate all of its heat value. The last remaining heat value is extracted on the dump plates. The result is perfect combustion; no carbon in ashes; no loss in chimney, in furnace or in ash pit.

Adaptability.

Most furnaces are equipped to burn only a good, high grade coal, that may be either of the anthracite or of the bituminous variety; but they can not burn both. On the other hand, poor grades of coal can not be burned at all unless the fuel bed gets constant stoking attention such as can not be given with ordinary hand

FURNACE VIEW OF A FILES HAND STOKER

firing methods. The Files hand stoker, however, by virtue of its construction, provides an equipment for the furnace that will successfully and efficiently burn all grades of anthracite, slack and bituminous. In a comparatively short time the proper removable grate sections can be substituted, and thus be independent of zone restrictions.

Advantages.

When a Files hand stoker is used, there is no need for opening the furnace door every few minutes to poke, slice, or rake the fires to keep them clean. This is done by pulling a hand lever in front of the furnace, which causes a section of stoker bars to cut up into the fuel bed 6 in. at a stroke, grind out the ash, pull over fresh fuel and carry any clinker down to the cleaning plate. Air is uniformly distributed. A maximum amount of water is thus evaporated for every pound of fuel used.

Co-operative Service.

This company will be pleased to furnish, to those interested, complete and detailed information as to how Files hand stoker can be installed to the best advantage.

MURPHY AUTOMATIC STOKER.

Description.

Forty-two years of fuel and power conserving service in hundreds of power plants have demonstrated the correctness of the principles upon which the construction of the Murphy automatic stoker is based.

Improvements have been made, which have increased its efficiency and durability; and today it stands, we believe, as the one automatic stoker which most completely fulfills the requirements of the modern boiler room.

At either side of stoker extending from front to rear is the coal magazine, into which coal may be introduced either by hand or mechanically. At bottom of this magazine is the coking plate, against which the inclined grates rest at their upper ends. Stoker boxes, operated by segment gear shafts and racks, push coal over coking plate and onto grates. Grates are made in pairs, one fixed and the other movable. Stationary grates at their lower ends rest on grate bearer, which also acts as a support for clinker grinder. Clinker grinder consists of a steel shaft, on which is slipped cast iron toothed segments, which are readily replaced in case of breakage.

Over the coking plate is the arch plate, from which a fire brick arch is sprung over entire stoker. On this arch plate are cast numerous ribs to form a series of air ducts immediately over the coking plate, conveying heated air from chamber above arch into combustion chamber. This arch plate also forms wall of magazine.

Stoker, or battery of stokers, can be operated by a small automatic engine, motor or by overhead shaft and ratchet drive. Arrangement is made for exhaust steam connections at lower end of grates for protection of this portion of grates and clinker grinders and for softening of clinker.

In connection with horizontal tubular boilers or water tube boilers horizontally baffled, the Murphy stoker can be installed with a flush front setting.

Adaptability.

Stoker is adaptable to any type of boiler, and to units of any size—50 h. p. and up.

Automatic.

It is automatic in all its functions. Handles economically all grades of bituminous coal, feeds and distributes it, and removes all ash and refuse.

Combustion.

The stoker feeds the coal, without opening fire doors, thus preventing admission of cold air with consequent lowering of stoker temperatures.

Efficiently handles variable loads and overloads up to 200% rating with minimum attention and without forced draft.

Practically Smokeless.

The large coking area of the Murphy stoker drives off all volatile gases and insures perfect coking of coal before the ordinary processes of combustion begin. A proper mixture of these gases with air (both at high

temperature) in the highly heated combustion chamber completely consumes them and practically eliminates smoke.

Wide Usefulness.

Its usefulness is not limited to the economical generation of steam; for it gives excellent results in all operations requiring high temperatures, such as brick drying, cement burning, salt evaporation, calcining of soda ash, heating furnaces, etc.

Maintenance and Operation.

Maintenance cost is low, averaging about 10¢ per horsepower per year.

MURPHY AUTOMATIC STOKER
Dutch oven setting

Operates with natural draft. Cost of actuation is less than 1% of total steam generated. Also effects greatest possible saving in labor.

MURPHY AUTOMATIC STOKER
Rear view

Designed to Meet Requirements.

Before making installation, this company thoroughly familiarizes itself with exact conditions under which the Murphy stoker is to be operated, and designs the stoker to meet the requirements.

An engineer will be sent to make an examination of any plant before submitting proposition.

The RILEY SELF-DUMPING UNDERFEED STOKER.

Adaptability.

Applied to any boiler, either water tube or fire tube; the Riley stoker is also adapted for heating and smelting furnaces.

Construction.

Stoker is of the inclined underfeed type; that is, the coal is forced up from beneath the point where air is admitted, and then is worked along toward bridge wall.

Instead of stationary dead plates, it has moving air supplying grates carried by reciprocating sides of retorts. These retort sides also move the overfeed grates which extend across the entire width of the stoker below the retorts. Beyond these are the rocker dump plates which continuously agitate, crush and discharge the ash. Motion of these reciprocating parts is adjustable, so as to control movement of fuel bed and dumping of refuse. This reciprocation of alternate retort sides, in opposite directions, is the distinctive feature of the Riley stoker.

Smokelessness.

The stoker and its forced draft fan are so connected as to give the correct amount of air for fuel burned. Complete combustion, without smoke, results at all times. The Riley stoker is guaranteed to meet smoke laws of any city in the United States.

Capacity.

Constant movement of fuel and shearing action on fuel bed, caused by reciprocation of retort sides, tends to prevent formation of clinker and does not allow flow of gases to become choked. This insures brisk combustion over every square inch of fuel bearing surface, and causes the Riley stoker to excel all others in capacity.

The boiler capacity which can be obtained with the Riley stoker depends upon the number of retorts that can be installed. With boilers fired from one end 300% to 350% of rating is easily obtained during peaks. In other cases where the boiler is fired by two stokers set back to back 500% to 600% of rating is possible.

FURNACE VIEW OF A NINE-RETORT RILEY STOKER SHOWING RELATIVE MOVEMENT OF FURNACE PARTS

Safety.

Each plunger connecting rod is provided with a shearing pin, which absolutely prevents damage to stoker in case plunger is blocked. This device is equally effective at all points in plunger stroke. Excessive pressure shears the pin, which allows rod to move freely without moving plunger. After obstruction has been removed, pin is easily replaced while crank passes its outer center.

Quick Response.

Moving grates in the Riley stoker give an ideal means of slicing and starting up quickly from a banked fire, fuel bed being instantly broken up and active combustion begun as soon as air is admitted. This feature makes the Riley stoker especially adapted for so-called "stand-by" plants. In case of factory loads, it enables stoker to drop load within two or three minutes and pick it up instantly when operation is resumed.

Manufacturers of the JONES UNDER-FEED STOKER.

Adaptability.

The Jones stoker is made in "Standard" (direct cleaning) and "A-C" (automatic cleaning) types, and is adaptable to any size of boiler and to any grade of bituminous coal. In addition to the generation of steam, its usefulness in any field where constant and easily controlled high temperatures are required has been demonstrated, and it is being successfully used in heating, annealing, melting, welding and forging furnaces, drying kilns, etc.

Description.

Great simplicity characterizes the Jones stoker. Few moving parts, absolutely none in contact with the fire, explain the extremely low repair costs.

The retort or fuel magazine is installed inside the furnace. It consists of a heavy casting, along the top edge of which are arranged tuyere blocks through which air is supplied. An auxiliary ram and pusher rod in bottom of retort moves in conjunction with main ram and insures equal distribution of fuel in the furnace. Note that, being at the bottom, it is entirely covered by fresh coal when stoker is in use. A lost motion connection permits adjustment in the movement of the pusher rod to suit any fuel.

The operation is shown in the sectional views. The volatile matter or hydro-carbons driven off during the coking process are thoroughly mixed with air coming through the tuyere openings before reaching the incandescent zone. This insures complete and therefore smokeless combustion. Supply of air and fuel being automatically proportioned to each other, there are no unconsumed gases, neither is there any unconsumed fuel due to sifting through grates, the fuel and fire being carried on dead plates.

In the automatic cleaning type, the ashes are carried to the rear of the furnace onto the dump plates, which, when dumped, drop the ashes into the ash pit below, as shown in the lower illustration.

Advantages.

The automatic features make possible remarkable results in fuel economy, smoke abatement, regularity of steam pressure and increased boiler capacity. For uncertainty of manual control is substituted mechanical regulation, automatic and positive.

The independent control of each stoker simplifies the care of the furnaces, particularly when two or more stokers are installed in one furnace, and enables the operator to hold his fires ready to respond quickly to unexpected calls for steam.

The installation of a Jones stoker under a boiler already in use involves no disarrangement of the plant. No special brickwork is required.

Where stokers are installed at the time of setting the boilers, a direct saving is made in the omission of grates, grate bearing bars, door arches, and dead plates.

The blowing equipment can be located at any convenient point.

THE JONES "STANDARD" STOKER COMPLETE

LONGITUDINAL SECTION THROUGH FURNACE AND JONES "A-C" STOKER

Steam admitted behind piston forces piston and ram forward, carrying portion of coal in hopper to retort. Pusher rod moves with ram to carry coal forward in retort, and thus secures even distribution of fuel.

Note that no moving part is in contact with fire; also that each stoker is a unit and regardless of number of units installed in a given furnace can be individually controlled, if desired, and fuel and air may be regulated to produce an even fire

ROCKING and DUMPING GRATES.

Stationary Grates.

For Power Transmission Equipment, see pages 838-39.

Ajax Rocking Grate for Bituminous Coal.

The simplest and most effective rocking grate on the market. Provides an air space of about 65% of entire grate area, insuring an air supply adequate to effect complete combustion. Removes ash and breaks up clinker in the most effective manner, at the same time perfectly retaining on surface of grate all unburned or half-burned coal.

Sections are divided into narrow elements, each consisting of a cross bar topped with independently removable saddles (Fig. 2) and having trunnions fitting into bearings on side frames. Trunnions at sides of furnace are held in place by a locking bar that fits down over the top of frame, and those at the center of a 2-section grate are covered with special saddles. Cross bars are of heavy rectangular section and have rocking levers and cast pins for connecting bars and links. Method of fastening and connecting various cross bars with shaker handles is shown in Fig. 3.

Cross bars are provided with universal V-channels over which fit the saddles forming the grate surface. Contacts between saddles and bars are deep and accurate, giving ample support to the saddles and holding them rigid an equal distance apart and in perfect alignment. Saddle tops are all of the same size rounded into a quadrant, undercut beneath to give a sharp cutting edge and are equally surrounded by air space when in normal position.

1. Grate in normal position. Unburned and half-burned coal on top, but ash and clinker at bottom ready for removal

2. Grate rocked forward. Fire broken up and ashes falling from the steep slopes on edges of saddle into ash pit. Open spaces back of alternate saddles formed to entrap clinkers, preparatory to their being cut off

3. Return to normal grate position. Clinkers caught between edges of saddles and sheared down into ash pit. Fire clean over forward half of each saddle

4. Grate rocked backward. Fire further broken up and resting on back halves of saddles. Remaining loose ash slides to ash pit and remaining clinkers fall into position for shearing

5. Grate returned to normal position. Ash and clinker all dropped and sheared from fire. Only live fuel left on grate and provided with ample air channels

FIG. 1. ACTION OF THE AJAX BITUMINOUS GRATE

Fig. 1 shows that the fire rests normally on tops of saddles and of its own weight drops down over them uniformly. The slightest agitation of the grate permits fine ash to fall between saddles, but to get rid of the larger clinkers, openings in grate surface must be made temporarily larger and moving edges of saddles must travel in a manner to dig the bottom away from fire bed. This is accomplished by combining a differential motion of the saddle bars and cutting action at the saddle edges which makes the Ajax grate entirely and absolutely self-cleaning, a feature provided for imperfectly or not at all in other makes.

Fig. 1 shows that every other cross bar is journaled on a higher plane than its neighbors, and in rocking, alternate rows of saddles must pass through different arcs, resulting in wider spaces between every second row of cutting edges at the end of each stroke. The wider opening goes from one edge to the other of each row of saddles with opposite lever strokes, effectually opening and redistributing the fire bed. The relative motion of adjoining bars causes spaces which are open on forward movement to be closed on backward movement and vice versa. Unburned coal is thus prevented from falling through on both sides of each saddle by this closing of the pockets as the grate rocks back to normal position.

The motion given the entire fuel bed by the rocking of the grate breaks up any caked masses of fuel, and with the air channels thus formed through the fire, together with the removal of ash and clinker, combustion is enabled to proceed with a rapidity limited only by capacity of chimney draft to draw air through the fire.

REPLACEMENT FEATURES—Saddles are small and interchangeable and straddle on universal corrugations on the cross bar.

Any saddle can be easily and quickly lifted out and a new one installed independently.

It is impossible to incorrectly replace a saddle, for the V-shaped edges on the shank compel correct alignment. Saddles can be removed and replaced while fire is on the

FIG. 2. SADDLE BAR FOR BITUMINOUS GRATE
Illustrating method of attaching saddles

FIG. 3. TWO-SECTION AJAX ROCKING GRATE FOR BITUMINOUS COAL

grate, as it is only necessary to temporarily brush away the fire over the bad spot.

The economy of replacing one or a few saddles instead of the entire cross bar is too evident to admit of any discussion.

Ajax Rocking Grate for Anthracite Coal.

This grate cleans the fire with minimum disturbance of the fuel bed, a desirable feature for burning anthracite.

Especially adapted to boilers under continuous or periodic heavy load which require forcing.

Divided into narrow elements similar to those in the bituminous type, but saddles are of a different shape, to form, when in normal position, a perfectly flat grate surface with air space reduced by close interlock to better meet anthracite requirements (Fig. 4).

Saddles are all similarly placed on the small unit plan to permit removal of one without disturbing the others, but journals of all cross bars are at equal height to make the movement of each saddle exactly the same.

Saddles are cast with groups of 7 alternating long and short fingers on each side of the saddle bar, each finger to interlock with the similar finger of the other length on adjoining bar. Each saddle is provided with 3 projections underneath which locate it rigidly to the universal V-channels on the saddle bar.

As the grate lever is rocked from limit to limit, the saddles take uniform opposite slopes from the horizontal, alternately in each direction, the opposite edges of each saddle going an equal distance above and below the normal surface. This slope is just a little greater than the angle of repose of the material, so that the light ash can slide off into the ash pit. Further the long fingers on each edge of each row are thus alternately thrust up into the fire, giving light blows which break up clinkers and break the fire of its own weight. Hard clinkers are caught between the upper surface of one set of fingers and the lower of the next as they pass each other and thus sheared down and discharged into the ash pit.

The total movement of the grate fingers is not sufficient to disturb the fuel bed to any great extent, but the agitation is ample to shake out all loose ash, cut up clinker and free the air channels through the fire.

FIG. 4. SADDLE BAR FOR ANTHRACITE GRATE
Illustrating method of attaching saddles

FIG. 5. SIX-SECTION AJAX ROCKING GRATE FOR ANTHRACITE COAL

Ajax Dumping Grate.

Adapted for various kinds of small anthracite coal which burns best without slicing or other agitation, and which often need not be disturbed only by a thorough sifting at rather long intervals to keep the fire in good condition. Such cleaning can be accomplished quickest, best and with least drop in boiler pressure by complete dumping of a large area of the grate at a time.

The Ajax dumping grate is designed to meet these conditions and is especially suitable for boilers under moderate load. Live coals rest perfectly flat on this grate, can be temporarily pushed away from front or back half of the section to be dumped, after which that entire portion may be tilted (Fig. 7) to permit all ash to fall forward into the ash pit. After cleaned portion is returned to normal position, live coals are redistributed thereon and other portions of the grate cleaned similarly.

The Ajax grate is strong and extremely simple. Parts subject to deterioration are few in number and easily replaced. Front and back halves of each section operate independently as with Ajax rocking grates. The advantage of 2 bars with correspondingly smaller surface units attached, in contrast to one as in some constructions, lies in the fact that only a small depth of ash pit is required.

Grate sections have beveled openings in side ribs (Fig. 6) which interlock with similarly shaped projections on the cross bars to form a rigid fire surface. The bar in the grate surface proper has ribs so strong that the heaviest fire can not warp it. Openings may be of any type. For the finest sizes of anthracite such as buckwheat, rice or culm, the Ajax is made in the pinhole type with holes from $\frac{1}{8}$ to $\frac{1}{4}$ in. diameter and placed so as to give an advantageously distributed air space ranging from 10% to 20% of the total grate area, ample to burn all fire that can be piled on.

Fine particles of unburned fuel with this construction can not fall through to the ash pit and thus reduce the economy that can be secured by using the cheaper sizes. Pin holes are conical, being larger at the bottom, thus they are self-cleaning and can not clog with ash. For the larger sizes of anthracite, herringbone grate surfaces, but on specially constructed bars, may be fitted to this type of Ajax grate. For bituminous coal, a rocking grate is recommended, although if a dumping grate is installed, it should be fitted with plain straight bar surface.

Products.

"DEAN" DUMPING and SHAKING GRATES; GARBAGE and REFUSE INCINERATORS and DESTRUCTORS; FIRE BRICK LININGS for Boiler Furnaces; ASH GATES.

Boiler Castings and Fronts, Boiler Room Floor Plates, Grates, Cast Iron Industrial Track, Turntables, Charging Cars, Trench Covers.

"Dean" Dumping Grates.

Built for burning small sizes of anthracite coal, with natural or forced draft. Bars tip in tandem (angle, 65°), and are supported at both ends by rectangular frame, eliminating tendency of bars to hang downward on the ends. Air spaces $\frac{1}{8}$ to $\frac{3}{8}$ -in. slot; also built in pinhole form, with $\frac{1}{4}$ or $\frac{5}{16}$ -in. diameter openings. Fires cleaned in one-half the time required with stationary bars.

Catalogue No. 7 sent on request.

"DEAN" DUMPING GRATES

"Dean" Shaking Grates.

For bituminous and the larger sizes of anthracite coal. Grates supported by a frame resting on ash pit floor, independent of brickwork; bars placed on 8-in. centers, allowing ample opening for largest clinkers; journals, self-locking; and sides of bars are made solid, to resist wear and tear.

"DEAN" SHAKING GRATES

Incinerators and Destructors.

This company have patterns and designs for incinerators for burning rubbish and waste material, suitable for institutions, hotels, schools, apartment houses, museums, factories, etc.

They also build garbage destructors of the brick set type suitable for large hospitals and hotels and a portable type for use in large residences, clubs, restaurants; etc., designed with a steel casing and lined with fire brick to be operated with coal, gas or oil as fuel.

Send for catalogue No. 8, "Dean Incinerators."

INCINERATOR

DESTRUCTOR

"Dean" Flat Suspended Arches.

For incinerators, furnaces, boilers, etc.

Fire brick blocks are 9 in. wide by 12 in. long by 10 in. high, suspended by cast iron clips bolted to heavy cast iron T's.

Each block can be removed and replaced independent of all others.

"DEAN" FLAT SUSPENDED ARCH

"Dean" Fire Brick Linings.

Made to withstand 3200° Fahr. of furnace temperature.

Standard side and bridge wall blocks are 24 by 18 by 8 in., with tongue and groove ends, thus minimizing number of joints and burning of furnace walls.

"DEAN" FIRE BRICK LINING

"Dean" Gates.

For ash hoppers. Made in two sizes, 24 by 24 in. and 24 by 36 in.

They open full size and are heavily constructed for hard service.

DRAKE NON-CLINKERING FURNACE BLOCKS; FURNACE ENGINEERING CO. GRATE BAR for Underfeed Stokers; ELLISON DRAFT GAUGES; DWIGHT CO₂ INDICATORS.

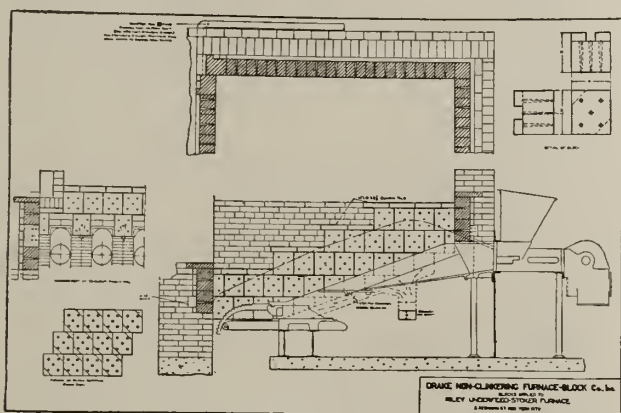

Weber Coniform Chimneys and Detrick Flat Suspended Arches.

Drake Non-clinkering Furnace Blocks.

Specially designed blocks having tapered perforations and lugs on back which form an air duct within the 9-in. furnace lining. Air admitted through perforations keeps the temperature of surface exposed to the fire below fusing point and enables the blocks to resist the corrosive action of combustion gases, effectively preventing clinker formation and burning of furnace walls.

Blocks are manufactured from a specially ground refractory material and properly burned to take care of expansion and contraction and to insure a smooth, hard surface on furnace face.

A special cover tile is supplied to prevent air from penetrating above clinker block line and acts as a bond to the blocks, thereby forming a rigid construction throughout.

DETAILS OF APPLICATION OF DRAKE NON-CLINKERING FURNACE BLOCKS

Furnace Engineering Co. Grate Bar for Underfeed Stokers.

This grate bar consists of a series of self-locking, upstanding units with uniform spacing of air passages in line with retort, the air passageways in vertical direction being graduated so as to give a uniform air supply.

DETAILS OF INSTALLATION OF TYPE "A" GRATE

Upstanding grate bars are set between a top and bottom terminal piece, the whole protected by interchangeable caps which have numerous graduated air passageways. Thus, air is distributed over the entire retort area, keeping all parts of the grate thoroughly cooled.

Ellison Draft Gauges.

The simple design and construction of these highly perfected gauges insure absolute scientific precision. An incline tube with oil of constant capillary attraction, which lubricates the surfaces and travels without friction over a single reading scale, self-correcting for capillary attraction and specific gravity, indicates equivalent water pressures direct, without factor.

The levels are long and very sensitive and are made of high pressure glass to withstand high temperatures. Scales are of white metal in black graduations. Gauges are furnished with vent plug, oil dropper, extra cover glass for cover type gauge and wood or machine mounting screws.

ELLISON U-TWIN DIFFERENTIAL DRAFT GAUGE
Upper gauge for furnace, lower gauge for flue

Detrick Flat Suspended Arches.

A full description of these arches will be found on page 686.

Dwight Co₂ Indicator.

Consists simply of a cast metal tank of special design and accurately calibrated indicating gauge. Reservoir in base of tank holds enough solution for 300 tests.

By pumping sample into tank, closing top and bottom cocks and shaking once or twice, the percentage of CO₂ can be read on gauge. Tests are practically instantaneous, requiring but one minute.

No glass parts, no solutions to pour and no water leveling. No experience is required to use Dwight CO₂ indicator, because its correct design and substantial construction assure absolute accuracy.

DWIGHT CO₂ INDICATOR
Type A—one-fifth actual size

BALANCED DRAFT REGULATION DEVICE
and TURNER BAFFLE WALLS.

Balanced Draft.

Balanced draft is a power plant essential. It is a system of better combustion obtained by the automatic regulation of both the supply of air to the furnace and the escape of gases from the furnace in such a manner as to maintain at all times a constant predetermined draft in the furnace for all rates of combustion.

Its principle is to supply all the air needed for perfect combustion but no more, and at the same time to maintain as little suction in the furnace as possible and still have sufficient draft to remove the gases from the furnace chamber as rapidly as they are formed.

These requirements are independent functions. They must be controlled separately and independently if best results are to be obtained.

DESCRIPTION AND OPERATION—The essential apparatus used for balanced draft consists of a furnace pressure regulator, with its pilot valve, and one or more hydraulic cylinders. An air pressure regulator and some form of mechanical draft, a fan driven by an engine or motor, and air ducts connecting the fan with the closed ash pits are necessary. Frequently they are already in use, in which case only the regulating apparatus is necessary.

The furnace pressure regulator may control the movement of the flue damper or the air gate or both, by hydraulic, pneumatic, electric, or any other means if so desired. The furnace pressure regulator is unique and of special design. A cast iron pipe connects the regulator with the furnace, the outer end of the tube terminating in the regulator box and being fitted with a shut-off damper. The regulator contains a swinging plate diaphragm and covers the outer end of the gas pipe, forming a chamber in which the pressure is the same as in the furnace.

The swinging diaphragm is mounted on knife edges and its axis passes through its center of gravity, the broad plate above the center being balanced by a counterweight below, so that the plate swings easily outward and inward in response to the slightest change in pressure on its broad surfaces, and thereby operates a pilot valve. This valve is connected by suitable piping to one or more hydraulic cylinders conveniently located on the boiler setting.

The piston of hydraulic cylinder is connected to the flue damper so that movement of piston in one direction closes the damper and reverse movement opens it. By this action of the pilot valve and the piston, the damper may be opened, closed or held indefinitely in any intermediate position between wide open and entirely closed.

Balanced Draft

TRADE-MARK

When the furnace pressure becomes normal in response to the movement of the damper the swinging diaphragm gradually returns to the vertical.

The compensating feature should be clearly understood. The flue damper does not go from wide open to

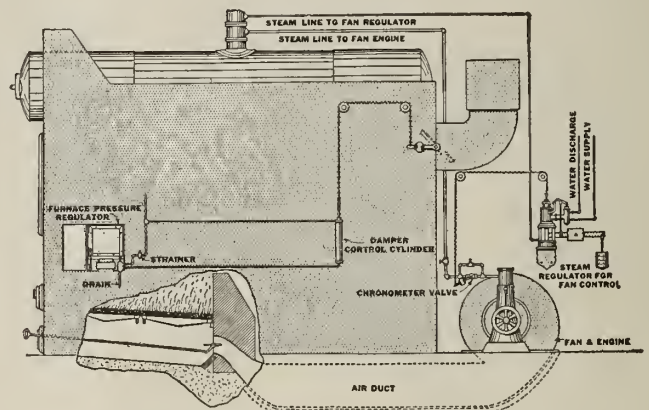

DIAGRAM OF BALANCED DRAFT SHOWING STEAM CONTROL OF FAN AND FURNACE AND FURNACE PRESSURE CONTROL OF FLUE DAMPER

tight shut and vice versa, but moves only as much as is required to restore the predetermined furnace pressure and is held indefinitely in that position until the furnace conditions require a further change.

The balanced draft fan speed regulator is of special design and is compensated, so that a slight drop of the steam pressure is immediately followed by only a slight increase of the fan speed which automatically is maintained until the steam pressure is restored or until a further drop in pressure again increases the speed to meet furnace and steam requirements. This prevents

BALANCED DRAFT FURNACE PRESSURE REGULATOR

the sudden "all on" or "all off" action of the blower so destructive to fuel beds and stokers.

The patents are broad and fundamental and cover any means of regulating simultaneously both the air supply to and the exit of the flue gases from any furnace so as to maintain a substantially uniform pressure in the furnace. This pressure may be at, above or below atmosphere as desired.

Balanced draft is used with all kinds of fuel, including coal, coke, breeze, oil and gas, and can be installed as part of the present plant.

By its use, any required amount of air can be forced through fuel beds of any thickness or density, thus maintaining whatever rate of combustion may be desired.

Turner Baffle Wall.

The Turner baffle wall is built by laying tile as diagonal shelves on the boiler tubes and filling the pockets thus formed with a plastic fire resisting cement. The cement hardens in place without application of heat, is non-porous and gastight and resists for years the hot-test stoker fires.

Turner Baffle Walls

TRADE-MARK

ADVANTAGES—The plastic material fills the space around bent tubes just as readily as around straight tubes. This feature is particularly valuable in rebaffling boilers. A bent tube makes the four spaces surrounding it irregular in shape. The fire brick ordinarily used and which is shaped to fill the space between the tubes on standard spacing may be cut to approximately fit the smallest of these spaces but can not be enlarged to fill the other three spaces.

Fire brick ordinarily used to repair boiler baffles are smaller than the fire brick used originally in the boiler when new, because the original size can only be gotten into place when the tubes are being laid up. Unless the tubes are sprung, a repair brick must be smaller to get in between the tubes, and its edges chamfered to allow it to be turned into place. It is inevitable, therefore, that the repaired wall built entirely of fire brick should be full of open joints and would not stop hot gases.

RETUBING—The plastic material used in the Turner wall shrinks in setting so that a straight tube may be easily pulled out and renewed without injuring the wall. The expansion of the tube when hot closes the small shrinkage space around it so there is no leakage of gas through the wall around the tubes. When replacing a bent or blistered tube the hole is enlarged to

get the tube out and when the straight new tube has been put in place, the hole in the wall is filled with plastic material by the fire room force and wall is as good as new. This feature is one of the advantages of the Turner wall.

SLOPING WALLS—Combustion engineers have discovered that a baffle wall sloping from the top of bridge wall to a point on the upper row of tubes halfway between the curtain wall and the front header gives surprisingly efficient results, as can be surmised by studying the accompanying illustration.

TURNER BAFFLE WALL INSTALLED IN SLOPING POSITION

The difficulty of building a sloping baffle wall by ordinary methods in a new boiler and the practical impossibility of rebuilding one by such methods after retubing the boiler are well known.

The Turner wall can be built sloping forward, vertically or at right angles of the tubes equally well, in either new or old boilers without disturbing the side or bridge walls.

CONSTRUCTION DETAILS—The tile used in the Turner wall are dovetailed into each other at the ends and are corrugated on both sides. The plastic material grips the tile by these corrugations and holds them in the wall. Each wall unit, whether tile or pocket filling, is self-contained and the expansion due to heat is taken up between them and is not transmitted to the side walls nor does the wall buckle.

On new settings the Turner baffle is bonded into a recess in the side wall of the furnace; on old work particular care is taken to make a gastight joint with side walls. This prevents leakage around the ends of the walls, a most difficult place to keep tight with ordinary construction. The material will not crumble, spall off or break down under the most intense heat developed in a furnace.

ERECTION—THE ENGINEER COMPANY contracts for walls complete in place. The company's specialists do nothing but this work. Boiler may be put on line 24 hours after wall is completed.

Submit make, horsepower and number of tubes in the boiler. Estimates will be gladly submitted and satisfaction guaranteed.

Product and Service.

DETRICK FLAT SUSPENDED ARCHES, adaptable to all types of boilers, stokers and furnaces.

The experience gained through the installation of over 4000 of these arches, under various conditions, has enabled the M. H. DETRICK COMPANY to build up an organization consisting of combustion engineers who are specialists in furnace design. Each individual installation is studied thoroughly by the Engineering Department.

Description.

The Detrick flat suspended arch is the only type of flat arch in which the tile are suspended and not rigidly held. Each tile is individually hung from the center, so that each tile becomes a unit in itself and is allowed to expand and contract freely.

There is no thrust on the side walls in a Detrick flat suspended arch. The thrust due to the entire weight of the arch is downward on the cast iron hangers, which in turn are supported by steel beams resting on the side walls.

The Detrick flat arch will not only outlast a sprung arch, but will also insure a maximum efficiency from the boiler, because it is not required to withstand internal stresses due to expansion or contraction and distributes the gases uniformly over the heating surface of the boiler because of the flat surface provided by this construction.

Construction Details.

As the arch must withstand the most severe service at the rear end where the tile is exposed to the flames on two surfaces, special attention has been paid to this feature with the idea of providing: (1) sufficient support for the cantilevered portion of the arch; (2) flexible construction to enable repairs to be made easily and quickly; (3) the apron wall suspended independent of the arch; (4) the end tile of small dimensions.

END CONSTRUCTION DETRICK FLAT SUSPENDED ARCH

Note ample fire brick protection from the end of the iron arch bar and removable end casting which is keyed to main arch bar by means of a cast iron wedge

Installation and Repairs.

In the erection of the Detrick flat arch no skilled labor is required. It is only necessary to string the tile on the cast iron beams. In repairing a Detrick flat arch,

it is only necessary to replace the individual tile that is burned, without disturbing the balance of the construction. This work does not require skilled labor.

TYPICAL APPLICATION OF DETRICK FLAT SUSPENDED ARCHES TO FRONT FEED INCLINED STOKER

TYPICAL APPLICATION OF DETRICK FLAT SUSPENDED ARCH TO V-TYPE STOKER

Users.

There are over 1,500,000 boiler horsepower successfully equipped with Detrick flat suspended arches.

GREEN'S FUEL ECONOMIZERS.

Also Green's Hi-efficiency Hi-speed Radial Flow Fans, Steel Plate Fans, Mechanical Draft Apparatus, Blowers, etc.

Fuel Economizers.

The Economizer consists of a number of cast iron tubes and headers through which the feed water passes on its way to the boiler and around which the waste gases of combustion pass on their way to the stack.

The average saving or increased capacity obtained by installing an Economizer varies from 10% to 15%, depending upon plant conditions, although in many cases greater savings have been made.

Economizers show an unusually high return on the investment due to the large saving in proportion to the small cost of installation, and they should be used in almost every boiler plant, especially as the conservation of fuel is a matter of national importance.

TYPICAL INSTALLATION OF GREEN'S FUEL ECONOMIZER

Economizer Practice.

The standard boiler rating is 10 sq. ft. of heating surface per horsepower and is based on the evaporation of 34.5 lbs. of water per hour from and at 212° Fahr. by the heat transmitted through that amount of heating surface or, the transmission of 33,480 B. t. u. per hour. Actual operating conditions, however, vary greatly, as the boiler may be operated at some point below this rating or perhaps at 400% of rating.

A percentage of the heat of the fuel always leaves the boiler in the flue gases as it is impractical and uneconomical to make the boiler surface large enough to transmit all of the heat generated in the furnace. This percentage of the heat of combustion present in the flue gases varies from 12% to 30% under average conditions.

Without an Economizer this heat would all be wasted, but by applying the "countercurrent" prin-

ciple and using the heat in the flue gases after they leave the boiler to heat the feed water before it enters the boiler, a large part of this heat may be saved.

By using an Economizer the temperature of the feed water may be raised from the water supply, hot well or exhaust steam feed water heater temperature to a temperature approaching that of the water in the boiler. The higher feed water temperature thus obtained results in a proportional saving in fuel as the transmission of less heat by the boiler surface combined with that recovered by the Economizer will produce the same amount of steam as would be produced if the Economizer were not used.

The average saving is 12.5%, and results under varying conditions of feed water temperature and boiler pressure may be approximated by estimating 1% saving of fuel for each 10° to 11° Fahr. added to the temperature of the feed water.

While this information will enable engineers to approximate the results that may be obtained with an Economizer, it is advisable to have this company's engineers calculate each case, taking into account all factors covering the individual installation before making any final plans or specifications for boilers or feed water heating equipment.

GENERAL DIMENSIONS OF GREEN'S ECONOMIZERS

SUPERHEATERS: Stationary, Portable, Locomotive and Marine.

Superheated Steam.

Steam as generated in a boiler has a fixed temperature, which is determined by the pressure. When steam from a boiler is subjected to further heating, its temperature and volume increase, and it becomes what is known as superheated steam.

The process of superheating consists of passing the saturated steam through tubes exposed to the hot gases of the furnace. In this way the temperature of the steam is raised without changing its pressure, and the heat energy in each pound is increased.

temperature at low pressure for special manufacturing requirements.

Steam Saving.

For various kinds of engines, it may be stated, generally, that the steam saving effected by superheating 100° Fahr., as compared with saturated steam, would be for turbines 10%, triple expansion engines 12%, compound engines 14%, and simple engines 18% and over.

Scope.

The Foster superheater is built in four general types, as follows:

Attached type for adding up to 200° or 250°

FIG. 1. TYPICAL INSTALLATION OF FOSTER SUPERHEATER IN BABCOCK & WILCOX WATER TUBE BOILER

Fuel Saving.

Fuel saving is, of course, the principal reason for installing superheaters, and this saving ranges from 6% to 40%, depending upon the type of power plant; the less economical the plant, the greater the saving with superheat.

Advantages.

Superheated steam possesses the following advantages over saturated steam, which effect fuel saving and augment the efficiency of a plant:

Elimination of condensation losses in cylinders and pipe lines; increase in efficiency of steam turbines by at least 10% due to absence of water, which causes friction and wear; reduction of lubrication required in cylinders, since there is no water present to wash oil from the walls; smaller steam lines required, due to reduced friction; same power can be obtained from old boilers when pressure has to be reduced; high

Fahr. superheat; Separately Fired type, for any variety of fuel and any range of superheat up to final temperature of 1200°; Waste Heat type for steel mills and smelter plants, or marine practice; Portable type, for heating steam, oil or air, with oil, coal or gas fuel.

The Foster superheater, for attachment within the boiler setting, is designed for installation in all types and makes of vertical and horizontal water tube boilers, return tubular boilers (Fig. 2), Scotch marine and other fire tube boilers. A total of many million horsepower is in successful operation.

Typical Construction.

Fig. 1 illustrates a water tube boiler equipped with Foster superheater. As may be seen, the superheater is located above the water tubes and underneath the drums, where it is exposed to the hot gases passing through the boiler. The superheater consists of a series of U-bend tubes or sections set parallel to each other, expanded into two steel manifolds running the full

Continued on next page

FIG. 2. FOSTER SUPERHEATER IN HORIZONTAL RETURN TUBULAR BOILER

width of the boiler, the saturated steam being led to one of these and thence through the U-bend tubes to the other, and through the outlet piping to the steam main.

An inspection of Fig. 3 shows the construction of the heating elements of the Foster superheater. These elements are U-shaped steel tubes covered with cast iron rings and split cast iron sleeve over the U-bend. The ends are expanded into inlet and outlet manifolds having reamed holes.

Where U-bend construction can not be used, or where straight elements are required, steel return

protects the steel tubes from the erosive and corrosive action of the furnace gases.

This construction provides a section of great ultimate strength with absolute freedom from internal strains, and forms a large reservoir for the storage of heat which is given up to the steam as required by the variations in gas temperature. This keeps the temperature of the steam constant.

Central inner cores provide annular spaces through which all steam must pass close to the heating surface. Fig. 3 shows the construction including headers and handhole plugs.

FIG. 3. CROSS SECTION OF RETURN BEND ELEMENT AND CONNECTING HEADERS USED IN CONSTRUCTION OF FOSTER SUPERHEATERS

headers with expanded joints and handhole plugs replace the U-bends.

Material.

All parts exposed to steam pressure are of steel, thus giving maximum strength. All parts exposed to gases of combustion are of cast iron, thus insuring long life.

Handholes.

Opposite the end of each element a handhole is fitted with a steel plug and metallic gasket, in order to give free access to every part of the interior for inspection and cleaning. The holes, into which the tubes are expanded and the handhole plates fitted, are reamed to gage.

Advantage of Extended Surface.

The extended surface formed by the cast iron annular rings or gills on the outside of the steel tubes greatly increases the absorption of heat from the hot gases, thus making the heat transfer to the steam flowing through the tubes, much more effective than that of a base construction. The cast iron outer surface also pro-

Advantages Obtained by Reheating Air.

The efficiency of compressed air is greatly increased by reheating.

The volume increases directly in proportion to the absolute temperature, and owing to the low specific heat of air the volume of 1 lb. of air may be greatly increased by the expenditure of a very small additional amount of heat.

FIG. 4. SMALL PORTABLE FOSTER SUPERHEATER

BETSON'S PLASTIC FIRE BRICK and
BETSON'S HI-HEAT CEMENT.

Uses of Plastic Fire Brick.

Betson's Plastic Fire Brick is the pioneer and ideal one-piece furnace lining. It is used in place of bricks, moulded blocks or special tiles in any make and style of boiler, old or new, for lining the furnace, making the front arch and wall, side walls, bridge wall, combustion chamber, back arch and baffles.

Betson's Plastic Fire Brick is made of the highest grade refractories, properly proportioned to take up the strains of expansion and contraction, due to varying temperatures. It is shipped in 650-lb. barrels, in a moist condition, ready for use.

FURNACE LININGS—Permanent, gastight furnace linings for water tube and return tubular boilers are easily made right in place, by any one. No special moulds, forms or tools required.

Betson's Plastic Fire Brick is first placed in chunks or balls. Next it is pounded in with a mallet. Then it is smoothed off with a trowel—and the job is done. The result is a one-piece furnace lining that has no joints, is leakless and lasts for years.

APPLYING BETSON'S PLASTIC FIRE BRICK FURNACE LINING

Made in one piece and of any desired thickness. Job can be done by any one in old or new boilers

BETSON'S PLASTIC FIRE BRICK AS USED FOR LINING FURNACE OF RETURN TUBULAR BOILER

SIDE WALLS—Betson's Plastic Fire Brick makes the most serviceable side walls in any boiler furnace. With ordinary fire brick or blocks, the extreme furnace temperatures make the joints loosen, then the mortar crumbles and the bricks finally fall out. With Betson's Plastic Fire Brick the construction is in one piece, without joints, so there is nothing to give way.

FRONT WALLS—Door openings, bridge walls, and other boiler furnace parts can be easily and quickly

There Is Only One
Plastic Fire Brick

TRADE-MARK

formed. These are made in one solid block, from the dead plate to a perfect fit around the boiler shell on fire tube boilers or up to the tube header on water tube boilers, and bonded in as a solid monolithic part of the side walls. Compared with ordinary construction the number of repairs or renewals can be reduced at least three to one.

Gastight Boiler Baffles.

Gastight baffles, of the right shape and slope are essential to the efficient operation of water tube boilers. Baffles made of special blocks or tiles are difficult to slope and shape, and because of the joints, they can not be made gastight.

Baffles made of Betson's Plastic Fire Brick (patented) are formed in one piece, without joints. Special tools are not required and the tubes do not have to be pried apart. The baffles can be made horizontal, vertical, and inclined to give the desired tapering gas passages so necessary for uniform velocity and high boiler efficiency.

HOW A BETSON VERTICAL BAF-
FLE IS FORMED

GASTIGHT BAFFLES OF BETSON PLASTIC FIRE BRICK
Easily formed to give the tapering gas passages necessary in modern high power boilers

Betson's Hi-Heat Cement.

For laying up fire brick and tile in settings, furnaces and retorts, Betson's No. 3 Hi-Heat Cement will give the best service. Fire brick usually begins to soften at 3000°, but Hi-Heat Cement withstands temperatures of 3100° and over. It will therefore maintain a perfect bond as long as the brick or tile lasts. The material is shipped in 500-lb. barrels and is ready for use by the addition of water.

Catalogues.

Specialized booklets dealing with the applications of Betson's Plastic Fire Brick, Boiler Baffles and Hi-Heat Cement are available. These practical and instructive catalogues are gladly sent on request.

CHARLES V. HOFFMAN COMPANY, INC.

Refractories and Furnace Cements

GENERAL OFFICE

97 Liberty Street
NEW YORK, N. Y.

FACTORY
LINCOLN,
BOUND BROOK, N. J.

Products.

"AlSiO" REFRACTORIES, FURNACE CEMENTS and MORTARS and COATINGS for High Temperatures.

Also, Fire Brick and Special Tile for various types of furnaces; Combustion Appliances: Flue Gas Analysers, CO₂ Recorders, Gas Collectors, Draft Gages, Pyrometers and Boiler Wall Covering; Steam Specialties.

"AlSiO" Refractories.

"AlSiO" is composed of materials and chemical elements possessing high temperature resisting qualities and mixed in such proportions as to produce a highly refractory combination for application where fire clay is commonly used, but with a wider range of use and far greater durability. It is in dry form and requires only the addition of water to obtain required consistency for use. It can be used as a mortar and applied with a trowel. It can be made thin for dipping the brick or to be used as a grout or wash on the face of finished brickwork. "AlSiO" is also made in special mixtures for special uses.

"AlSiO" High Temperature Cements or Mortars.

Originally formulated for use in laying up fire brick in boiler furnaces, it has been found to have a much greater adaptability. It can be used wherever it is desired to develop a high temperature in furnaces that must carry an overload, causing conditions that can be met only by the most durable of furnace material. The development of the highest furnace efficiency results in the highest furnace temperatures mainly through the use of correct amount of air.

When used as a mortar, a thin joint is all that is needed to make a durable job; and in finishing the joint, the material may be troweled smooth over the joints, which will leave no corners exposed to allow the hot gases to cut away the brick. A thick joint is not a disadvantage, but a thin joint is more economical. While "AlSiO" High Temperature Cement does not bond the bricks together in such a way that they can not be separated without breaking the brick, its adhesive qualities are such that it is possible to chisel the face of the furnace wall laid with "AlSiO" Cement without disturbing the joints or producing air or gas leaks.

ADVANTAGES—"AlSiO" High Temperature Cement being a very high fusion material (3300° Fahr.) it does not fuse between the bricks. Whether fused at the exposed face of the joint by high temperature, vitrified by moderate heat, or hardened under atmospheric conditions, the space between the bricks properly filled with "AlSiO" makes the joint perfectly airtight.

Should the temperature be high enough to fuse "AlSiO," the fusion will not penetrate between the bricks. When it is necessary to make local repairs, there will be a greater salvage of bricks, and repairs will be less expensive in consequence.

By building up furnace efficiency, high furnace temperatures result. A furnace built of inferior material and poorly constructed will not stand the high temperatures developed. Excess air or insufficient air can be determined readily by flue gas analysis, showing per-

TRADE-MARK

centage of CO₂ and drafts can be corrected, resulting in higher furnace temperatures. These high temperatures must be met by the use of the best furnace material, or a part of the economy effected will be lost through rapid destruction of furnace structure.

From the following table it is easy to determine that the more durable and heat resisting the furnace material is, the greater the possibility of economy of operation from its use.

FURNACE TEMPERATURE AND FUEL LOSSES BY CO₂ READINGS

CO ₂ , per cent	Furnace temperatures, degrees	Air excess per cent	Fuel loss per cent	Preventable loss per cent
15	3750	38	12	0
14	3500	47.8	13	1
13	3250	59.2	14	2
12	3000	72.5	15	3
11	2750	88.1	16	4
10	2500	107	18	6
9	2250	130	20	8
8	2000	158.7	23	11
7	1750	195.7	26	14
6	1500	245	30	18
5	1250	314	36	24
4	1000	417	45	33
3	750	590	60	48
2	500	935	90	78
1	250	1970

The presence of excess air is not always due to oversupply through grate, but often through side walls and other parts of the furnace and heat passages. Every part of the heating surfaces should be protected from the chilling effects of excess air by tight furnace and boiler walls from grate to stack. All these walls can be made perfectly airtight with "AlSiO," as it is not necessary to vitrify by high temperature when used in the cooler parts of the structure. It hardens sufficiently at atmospheric temperature.

ADAPTABILITY—"AlSiO" lends itself to many more uses than could be here enumerated. It is adapted to practically all types of furnaces whether coal, gas or oil fired, and can be used with all kinds of clay or silica fire brick. Special mixtures for brass foundries and chemical furnaces. Can be fired wet or dry.

APPLICATION—"AlSiO" High Temperature Cement or Mortar requires just enough water in the mixing to make it the proper consistency for use determined by the requirements of the work. Mix quite stiff for tamping or moulding into forms, for special shapes and baffles. Follow closely same practice as with portland cement, but add water only. Should a batch become "set" it can be worked over again with water without detriment, preventing waste.

SHIPMENTS—"AlSiO" is put up in 100-lb. bags, paper lined or of a close weave to prevent sifting and loss in handling.

Shipments are usually made day following receipt of order.

QUANTITY REQUIRED—About 500 lbs. for the 1000 brick laid with not more than $\frac{1}{16}$ -in. to $\frac{1}{8}$ -in. joint.

Co-operative Service.

This company will be glad to correspond and co-operate with all who are interested in furnace efficiency and fuel economy.

JOINTLESS FIRE BRICK CO.

TELEPHONE:
LINCOLN 9184

1130-1150 Clay Street
CHICAGO, ILL.

PLIBRICO IS WAREHOUSED IN ALL PRINCIPAL CITIES FOR PROMPT DELIVERY

Products.

Manufacturers of PLIBRICO JOINTLESS FIRE BRICK, a Plastic Refractory for all kinds of boiler settings, furnace linings, and baffles. Better than fire brick, and used wherever fire brick can be used. JOINTLESS FIRE BRICK CO. also manufacture a HIGH TEMPERATURE BOND for laying up ordinary fire brick, that will last as long as the brick.

Uses of Plibrico Jointless Fire Brick.

Plibrico forms a jointless one-piece lining in the front door arches, entire fronts, side walls, arches, bridge walls, baffles, etc. It can be used in any boiler, furnace or oven, and can be used wherever fire brick is employed.

Plibrico is used in all kinds of industrial plants, public and private institutions. It can not be excelled for patching broken and burned out linings.

Description.

Plibrico jointless fire brick is an unbaked high grade fire brick. It is plastic and is shaped and pounded into place like moulded clay. The furnace lining is thus made first, and is afterward baked out and vitrified. The result is a *one-piece jointless furnace lining*, better than any fire brick, guaranteed to stand 3100° Fahr., that will not leak air or gas, and will not crack or spall.

Plibrico should not be applied as a plaster over ordinary fire brick. It should never be used less than 4½ in. thick.

Fuel Economy and Efficiency.

Plibrico constitutes one of the largest factors in fuel economy and efficiency that can be installed in any power plant. The saving of fuel is not the only consideration but also the satisfaction and efficient results to be had from good equipment.

A jointless fire brick lining is a sure and determinable saving of one of the largest preventable losses of economy in a boiler plant.

SHOWING HOW EASILY PLIBRICO CAN BE PUT IN

Method of Application.

Instead of first baking fire brick and laying up

TRADE-MARK

with fire clay joints, apply putty form Plibrico (fire brick material), shape it not less than 4½ in. thick, and then bake into a one-piece monolithic, vitrified, finished furnace lining without joints, making the fire brick setting airtight and gas tight.

Advantages of Plibrico.

- (1) It is jointless.
- (2) It is plastic.
- (3) It is airtight and gastight.
- (4) It will stand 3100° Fahr.
- (5) It will save fuel.
- (6) It can be installed by inexperienced labor.
- (7) It will outlast fire brick.
- (8) It can be used in any boiler, furnace or oven.
- (9) It can be used wherever fire brick is used.
- (10) It can not be equalled for patching.

PLIBRICO CAN BE MOULDED TO FIT ANY PLACE IN FURNACE OR SETTING

How Supplied.

Plibrico comes in steel containers of about 650 lbs. in a stiff, moist, plastic consistency, ready for use. It weighs 120 lbs. to the cubic foot. The amount required is easily estimated by measuring the length, thickness and height of the particular arch or wall to be installed or replaced, thus arriving at the contents (expressed in cubic feet). Then multiply the number of cubic feet by 120 which will give the number of pounds required. High Temperature Bond comes in 100-lb. bags and 500-lb. steel drums.

PLIBRICO CONTAINER

Co-operative Service.

Estimate on requirements furnished on receipt of blue prints.

Book of instructions on setting all types of boiler furnaces sent on request. Gives full directions on how to build and maintain tight furnace linings.

McLEOD & HENRY CO.

Manufacturers of Forms for Boiler Settings

TROY, N. Y.

NEW YORK OFFICE: 1400 Broadway

BOSTON OFFICE: 141 Milk Street

Products.

"STEEL MIXTURE" FORMS for Boiler Settings, as follows: Boiler Door Arches, Firebox Blocks, Combustion Chamber Arches, Blow-off Pipe Protectors.

Also, Dutch Oven Arches, Fire Brick, Fire Clay.

"Steel Mixture" Forms.

Forms are made of a material which has been named "Steel Mixture." It is a hard and refractory substance especially produced for boiler setting use, and is noted for its ability to give long service under boiler furnace conditions.

"Steel Mixture" is installed in thousands of power plants, where it is used regularly in preference to other forms of construction.

On receipt of order a special point is made of furnishing just what is wanted.

Special shapes made to order.

Boiler Door Arches.

The boiler door arches are of standard form and made in suitable sizes, so that practically any size or shape can be supplied. The arches flare up and to the sides so as not to obstruct the spreading of the fuel. Not being bonded to the brickwork above, any disturbance of the latter due to expansion does not tend to destroy them.

They are easy to install, as they are composed of a very few simple parts, which come all ready to put together. These parts have tongue and groove joints, which hold them rigidly in place.

Tongued and Grooved Firebox Blocks.

These blocks are made in three thicknesses: 6, 8 and 9 ins.; and in two heights: 12 and 18 ins. All sizes come in three lengths: 12, 18 and 24 ins.

Their use greatly reduces the number of joints in the furnace wall, which thus exposes a smoother and more durable surface to the action of the fire. Clinkers do not adhere to them as easily as to small brickwork.

They can be laid up, according to individual ideas, for lining the firebox or building bridge walls. For the latter, they will be bullnosed or beveled in any specified way.

Back Combustion Chamber Arch.

Foote's combustion chamber arch fits any horizontal boiler. It is carried by the walls of the setting and is not affected by the expansion of the boiler. The clevis arm bar, which can be supported from above, is furnished in most cases. The bar is protected by being set in a groove of the material as shown in the illustration. The pieces are shiplapped together so as to produce a gastight joint.

There is ample headroom for working in the com-

"STEEL MIXTURE" BOILER SETTING

"STEEL MIXTURE" BOILER DOOR ARCH

"STEEL MIXTURE" FURNACE ROOF ARCH BLOCKS

FOOTE'S BACK ARCH

bustion chamber, so that once in place the arch should last indefinitely.

Product.

"HOTT PATCH" FURNACE CEMENT.

"Hott Patch" Furnace Cement.

DESCRIPTION—"Hott Patch" furnace cement is a patented compound containing chemicals which make it permanently adhesive, even under very high operating temperatures. It is the product of many experiments, and has been used with satisfaction in some of the largest plants in the United States.

Has the same coefficient of expansion and contraction as fire brick, insuring a firm and continuous adhesion between the brick and the bonding material. It has to be air dried or baked before it is refractory.

Put up in barrels weighing approximately 500 lbs. Sold on approval.

USES—Adapted to boiler settings, furnace linings, foundry ladles, cupola, and electric furnace spouts.

ADVANTAGES—Shipped dry, thus saving weight of water which is in the semipaste form.

No unequal expansion, contraction, disintegration, or loosening of bricks, as is the case where fire clay is used as a bonding material.

Saves the expense of replacement of boiler settings and furnace linings.

No need of moistening the fire brick before the use of "Hott Patch" furnace cement.

APPLICATION—Applied the same way as fire clay mortar. It is recommended that the material be laid with a close joint. One coat of "Hott Patch," applied with a stiff brush, will complete the job. The high temperature causes the formation of a glaze, which prevents clinkers from sticking, stops air seepage, and protects the brick.

COVERING CAPACITY—About 350 lbs. per thousand 9-in. brick.

Products and Services.

HYTEMPITE, a Refractory Cement for bonding silica and fire clay brick, and for kindred uses.

INSULBRIX, a specially prepared Cellular Insulating Refractory Brick which keeps heat in or out.

POWDERED COAL EQUIPMENT: Quigley System for preparing, distributing and burning powdered coal and other fuels.

Carbosand, a highly Refractory Granular Material for making rammed-in linings, special tile, patches, and repairs in furnace structures.

Hytempite.

A high temperature furnace cement which forms a lasting union between materials to be joined. It sets at normal temperatures and retains its strength up to temperatures at which the best quality of brick loses its strength and becomes soft.

HYTEMPITE FOR CUPOLAS
AND LADLES

HYTEMPITE FOR BOILER
SETTINGS

Hytempite, when used in place of fire clay for laying up brickwork, greatly adds to the life of the structure.

It is successfully used for furnace and boiler settings and repairs; for setting tile, retorts, oil stills; lining metal melting furnaces, pit furnaces, open flame melting furnaces, foundry cupolas and ladles, and as a core wash.

Tests have proven that Hytempite used as a binder, when air set, forms a joint as strong as the refractory material united, and that the strength is not impaired but increased by the action of heat. This property makes a wall or structure impossible to obtain with fire clay, or

HYTEMPITE FOR SPECIAL
SHAPES AND TILE

MIXING REFRACTORY MA-
TERIALS WITH HYTEM-
PITE FOR RAMMED-IN
LININGS

HYTEMPITE FOR PIT FUR-
NACES

other materials which depend on heat to effect a bond or vitrification.

Hytempite withstands the cutting action of flames and is especially recommended for oil furnaces where the gases are usually of high velocity.

Hytempite can be used as a coating or wash, or to smoothen and harden the surface of a furnace lining to protect it from abrasion, etc.

Hytempite can be used wherever fire brick or tile is used.

HYTEMPITE FOR LAYING
UP LININGS OF LARGE
LADLES

HYTEMPITE FOR COATING
CORES

Insulbrix.

A specially prepared cellular insulating refractory brick for furnaces or other structures. These brick are made in standard fire brick size and special shapes. Their weight is about one-half that of ordinary fire brick. They have low thermal conductivity—1 in. of Insulbrix being equal to six to ten times the same thickness of fire, or red brick, depending upon conditions such as furnace temperature, conductivity of other brick, etc. They have high heat resisting quality, their fusing point being over 2900° Fahr. without showing shrinkage at 1800° Fahr. They have a crushing strength of 425 lbs. to the sq. in. They are used as an insulating course in boiler settings, furnaces, kilns, ovens, or other structures where the conservation of heat in the heating chamber is an important item.

INSULBRIX

Quigley Powdered Coal System.

For preparing, transporting and burning powdered coal. Pulverized coal is transported in bulk through small diameter standard wrought pipe to bins at furnaces.

Entire equipment is dusttight from coal siding to furnaces.

With this improved method of burning powdered coal, the fuel is automatically weighed as sent to the furnace bins. By turning a hand or chain wheel absolute control of fuel fed to the burners is obtained.

Send for bulletins describing complete system, with illustrations of plants now in successful operation.

WALSH FIRE CLAY PRODUCTS COMPANY

Manufacturers of Fire Brick and Refractory Material

4070 North Main Street
ST. LOUIS, MO.

BRANCH OFFICES

CHICAGO, ILL., 7 W. Madison Street

NEW YORK, N. Y., 220 Fifth Avenue

Products.

The WALSH BRAND of STANDARD FIRE BRICK and SPECIAL SHAPES used in Linings for Blast Furnaces, Stoves, Cupolas, Brass Furnaces, and for the construction of all kinds of Iron and Steel Furnaces, Malleable Iron Air Furnaces, Heating Furnaces, Copper Smelting and Copper Refining Furnaces, also in the construction of Smelting Furnaces, tin, zinc, lead, silver, and gold, Linings of Cement Rotaries, Boiler Furnaces and special material for the modern powerhouse and high powered stokers, including all special work for drawing.

Also Standard Brick, Glass Tank Flux and Refractory Blocks and Specials used in the construction of Glass Furnaces, Lehrs, Annealing Ovens, etc.

Service.

The Walsh brands of fire brick have been on the market many years, an old tried out line of furnace material. The output is large, therefore, this company is in shape to take care of large orders quickly and always glad to receive small favors. The greater part of this business is repeat orders, showing the popularity of these brands of fire brick. They are manufactured for quality and are considered among the best produced.

In the early part of 1919 this company brought into operation its third fire brick plant, it being one of the largest and most modern in the country. Every consideration was given to latest devices and machinery for the work intended, and it has, after a year's service, met all demands.

The engineering department of this company is composed of men competent in their line and will be found an aid whenever needed in problems of construction, furnishing plans and specifications when necessary.

This organization, in all departments, is composed of experts, qualified with years of experience in the manufacture, sales, and use of fire brick.

Much progress has been made in the glass product line, the material being of the highest quality and is received with much favor by glass manufacturers.

Clays.

This company produces all its own clays and selects the various kinds and grades for the work intended.

Walsh XX Brand.

A brand of brick in the standard 9 in. and 9 in. series, also in special shapes.

It is of an open, porous structure, manufactured from selected Missouri flint clays, made to resist high heats and sudden changes in temperature.

It is a brick of quality and very popular where much is expected and where furnace temperatures are high.

Walsh Brand.

A brand of brick, made in the standard 9 in. and 9 in. series, also special shapes.

It is made in two kinds. First, a tough, dense material, of selected high grade clay, made to resist high heats and abrasion. Second, brick made semiopen, of the same clays as above, to resist high heats and quick changes.

Both of these brick have many uses, the dense brick is popular where there are fluxes such as in lead, tin and other smelting operations.

Full information concerning these splendid brick gladly furnished on request.

Information.

This company solicits inquiries. Information will be cheerfully given concerning the various kinds of material required in furnace construction.

Shipping Facilities.

Being conveniently located on the various railroads, with direct connections, prompt shipments may be expected.

Export Trade.

The large stocks carried at the various plants enable this company to make prompt shipments. The export trade is increasing very fast, indicating that the high quality of these brands of fire brick are being appreciated and repeat orders are the result.

AMERICAN-BALL ENGINES, including Angle Compound, Duplex Compound and Simple Engines; Triple Expansion 4-cylinder Pump and Dredge Engines; 4-cylinder and 2-cylinder Angle Type Variable Speed Paper Mill Engines; 2-cylinder Horizontal Variable Speed Paper Mill Engines; Constant Speed Engines for Paper Mill Work.

MARINE ENGINES, including United States Shipping Board Standard Triple Expansion Vertical Inverted Type.

For Boilers and Superheaters, see page 641.

American-Ball Engines.

These so well and favorably known engines—fundamental features of design originated by Frank H. Ball and F. O. Ball—embody the best modern engineering practice in the following features of design and construction: marine type connecting rods, balanced crank shaft, automatic pressure system of lubrication, sensitive balanced automatic governor, attached indicator reducing motion.

See specific descriptions under illustrations.

Send for bulletins giving detailed specifications.

ANGLE COMPOUND ENGINE

Sizes up to 650 h.p. for belted and for direct connected service. A special advantage of the angle construction with its cylinders at right angles is in its four impulses per revolution. This gives a nearly uniform torque and makes it especially adaptable for driving alternators run in parallel, as well as electric generators in isolated steam plants. Small floor space. Twice the power on the floor space required by a simple engine; perfect balance and high speeds without vibration, pounding or noise; requires only light and inexpensive foundations and may be installed on upper floors without foundations.

SIMPLE ENGINE

Sizes up to 325 h.p. for both belted and direct connected service. Operate at high speed. Of fully enclosed self-oiling type. Equipped with balanced automatic shaft governor and the well-known American-Ball valves which take up wear automatically and remain tight indefinitely, as proved by 10,000 engines in operation. Moving parts easily accessible.

4-CYLINDER VARIABLE SPEED PAPER MILL ENGINE

Sizes to meet the load demand. Another application of the Angle construction. 4 cylinders arranged in pairs at right angles. 8 power strokes per revolution evenly distributed 45° apart and engine may be operated at extremely high speeds as well as low speeds, so that a speed range of 8:1 and even 10:1 is obtained for direct connected paper machine drive. A special system of governing makes speed regulation perfect, regardless of severe changes in load. This insures even thickness of paper.

DUPLEX COMPOUND ENGINE

Sizes up to 325 h.p. for belted and for direct connected service. An improved form of piston valve provides practical means of adjustment for wear. Crosshead designed to secure greatest strength and rigidity with least weight. Smoothly running independent of unequal division of work between the pistons if such should occur. Simultaneous cut-offs in both cylinders divide the work almost exactly between the two pistons at all stages of load, from the simple friction load to the fullest overload capacity. Pistons easily accessible.

4-CYLINDER TRIPLE-EXPANSION PUMP ENGINE

For driving centrifugal pumps in dredges, for sewage, or for water irrigation or water works plants, wherever high economy is imperative.

With 4 cylinders arranged in pairs at right angles, the balance is perfect and high rotative speeds can be used, suitable for driving pumps. Usual sizes 160 to 1300 h.p.

CHANDLER & TAYLOR CO.

High Grade Steam Engines and Boilers
INDIANAPOLIS, IND.

Products.

Manufacturers of STEAM ENGINES, Simple, Tandem and Cross Compound, for direct connection to electric generators; VARIABLE SPEED STEAM ENGINES, for paper mills and other places where variable speeds are required; BELTED STEAM ENGINES, Throttling and Automatic; SPECIAL STEAM ENGINES, for direct connection to fans, ice machines, etc.

STEAM BOILERS, Horizontal Tubular and Locomotive Firebox; STEEL CASINGS; STACKS and BREECHINGS; HEAVY GRAY IRON CASTINGS.

Direct Connected Steam Engines.

Simple and tandem compound engines of this type furnished from 25 to 300 kw. in capacity and cross compound in from 50 to 500 kw. Compound engine effects saving of approximately 20% compared with simple engine.

Above engines can be equipped with valve guaranteed to remain steamtight for 5 years and to operate properly under any steam pressure or superheat.

CROSS COMPOUND DIRECT CONNECTED ENGINE

Variable Speed Steam Engines.

Open and enclosed frame variable speed engines furnished for practically any horsepower required and with speed change ratios from 1 to 10. Built for belting to back lines of paper machines and, when made with center crank frames, can be directed right into

ENCLOSED TYPE VARIABLE SPEED ENGINE

back line. Enclosed type, with our safety stop device, is rapidly becoming a standard product for paper mills.

Belted Steam Engines.

Open or enclosed type with throttling or automatic governors. Open types built from 15 to 250 h. p. and enclosed types up to 450 h. p.

OPEN TYPE THROTTLING ENGINE

Special Steam Engines.

Special engines for direct connection to fans, blowers, ice machines, etc., and for operating under extremely low or extremely high steam pressure. Engines furnished for any reasonable horsepower in low, medium or high speed, single or double reversing.

Steam Boilers.

Horizontal tubular boilers in sizes from 15 to 250 h. p. All boilers built to a factor of safety of 5 and will pass inspection of all well-known insurance companies. Firebox boilers furnished in from 15 to 60 h. p. and built to a factor of safety of 5.

Steel casings for single boilers, or in batteries, or any special form of furnace construction. Standard stacks and breechings, or made to special order.

STATIONARY TUBULAR BOILER

Heavy Castings and Machine Work.

Our equipment permits the execution of moderate sized contracts for heavy castings and machine work.

FAIRBANKS, MORSE & CO.

Manufacturers of Oil Engines

CHICAGO, ILL.

Products.

OIL ENGINES, 10 to 200 h.p.

Kerosene Engines, 1½ to 20 h.p.

All kinds of Scales, Railway Supplies, Motor Cars, Standpipes, Coaling Stations, Water Systems, Tanks and Towers, Hoists, Air Compressors, etc.

For Centrifugal, Steam and Power Pumps, see page 737; for Electric Motors, see page 1113.

"Y" Oil Engine.

EXCLUSIVE FEATURES—(1) The "Y" oil engine gives unfailing, reliable power from a wide variety of low priced fuel oils.

(2) *Operation without Water in the Cylinder*—Water could be used with the fuel to increase the power of the engine but it would result in certain rapid wear on both cylinder and piston. In other words, a possible higher rating has been sacrificed to insure long life to the engine. So the "Y" engine is made with all parts large enough to easily give full power without the use of water injection.

(3) *Perfect Lubrication*—Fuel is injected into the combustion chamber, not into the cylinder where it would impair lubrication. The fuel never comes into contact with the lubricating oil. The main bearings are ring oiling with large oil reservoirs. Piston, piston pin and crank pin are lubricated from a force feed pump.

(4) *No Excessive Temperature*—There is no hot ball or hot bulb to overheat or burn out. The combustion chamber is water jacketed and its temperature is thereby always under control.

(5) *Airtight Crank Case*—Special air seals on the crank shaft are used instead of stuffing boxes which would require repacking. With this construction the main bearings are not inclosed in the crank case; thus lubrication is not interfered with by air pulsations and the bearings may be inspected readily.

(6) *Special Quick Starting Arrangement.*

(7) *New Standard of Low Power Costs*—The "Y" oil engine produces power at a lower cost than any other

75 H.P. "Y" OIL ENGINE DIRECT CONNECTED TO FAIRBANKS-MORSE ALTERNATOR

type of plant figured on a basis of first cost including interest and depreciation, fuel, attendance and all other power plant expenses.

It is simple, without carburetors, mixers, timers, batteries, electric igniters, spark plugs, magnetos, switches or high pressure air compressors, etc. It is practically automatic in operation.

All of the above facts prove economy in maintenance and attendance costs.

DESCRIPTION—This engine operates on the 2-stroke moderately high pressure principle with the fuel injected under pressure in amounts positively governed in proportion to the load; the heat remaining in the combustion chamber, together with that from compression of the air, ignites the oil which then burns and creates a pressure which is more than that in the ordinary internal combustion engine. It operates reliably and continuously on low priced fuel oils.

Thousands of "Y" engines are giving continuous satisfaction in the performance of varied work, proving that its many advantages are appreciated and meet with the approval of discriminating engine users.

SPRINGFIELD, OHIO

Products.

INTERNAL COMBUSTION ENGINES for industrial service and operating all kinds of stationary or portable machinery, electric generators, pumps, compressors, gasoline plants, refrigerating machinery, etc.

Description.

Four-cycle; throttling governors; electric ignition; single cylinder horizontal, and vertical of 2, 3 or 4 cylinders.

These engines are built in a factory that has followed the best steam engine practice in its machine shop and testing departments for the last 32 years.

TYPE V ENGINE INSTALLED BY UNITED STATES GOVERNMENT

TYPE S ENGINE

The work is manufactured under the limit system. Every detail is permanently standardized by a thorough system of jigs and gages. Testing is by prony brake.

The Foos factory is equipped with every modern device suggested by experience for the economical manufacture of gas engines, and all the stability required by a purchaser who expects to operate his engine from 25 to 30 years.

Horsepower Ratings.

TYPE V ENGINE—Natural gas or producer gas, vertical multiple cylinder; 50 to 325 h. p.

TYPE S ENGINE—Natural gas, producer gas, kerosene, 38° distillate, alcohol, gasoline. Single cylinder horizontal; 8 to 90 h. p. according to fuel and service. Suitable for electric light up to 50 h. p. and for practically any other power requirement in all sizes.

Engineering Service.

This company will give expert advice to prospective purchasers and may be depended upon to make suitable recommendations in every case where it is permitted to make a thorough investigation of the customer's requirements. It offers the co-operation of experienced gas engine men (engineers) in its promotion and service departments. Dimension sheets sent to engineers on application to the factory.

TYPE V ENGINE

325 h. p. One of 27 engines in the Hazel-Atlas Glass Co., Washington, Pa.

ESTABLISHED 1845

THE HOOVEN, OWENS, RENTSCHLER CO.

Engines and Machinery

HAMILTON, OHIO

OFFICES IN MOST LARGE CITIES

Products.

HAMILTON CORLISS ENGINES, POPPET VALVE and UNIFLOW ENGINES, GAS and GAS-STEAM ENGINES, MARINE ENGINES, SUGAR MILLS and CRUSHERS.

Hamilton Pumping Engines, horizontal and vertical; Blowing Engines for blast furnaces; special heavy Cast Iron and Semi-steel Castings.

Hamilton Corliss Engines.

For slow and medium speeds, with releasing gear. Hamilton Corliss Engines have been made since 1882. The first engine built is still in perfect running order. Nearly 5000 have been installed in hundreds of industries.

For heavy work where absolute reliability counts, for plants where steam is used for heating, for all conditions where shutdowns would be costly, the Hamilton Corliss Engine is the ideal power producer. Particularly suitable for paper mills, iron and steel plants, hotels and office buildings, textile industries, etc. Send for bulletin.

CORLISS ENGINES, NOS. 4052, 4053 AND 4054

Three 16x30 simple heavy duty Hamilton Corliss Engines direct connected to 200 kw. generators. Installed in the new Hamilton Co. Court House, Cincinnati, Ohio

Hamilton Poppet Valve and Uniflow Engines.

The latest improvements are incorporated in the Hamilton Poppet Valve and Uniflow Engines. They permit use of higher steam pressures with higher steam temperatures and greater rotative speeds. For economical efficiency the highest type developed in steam engine field. Send for bulletin.

Hamilton Gas and Gas-steam Engines.

This company built Henry Ford's power plant at Detroit, Mich. These big gas-steam units aggregate nearly 60,000 h.p. Nothing is too big for THE HOOVEN, OWENS, RENTSCHLER Co. to undertake with their large

HAMILTON

human and mechanical facilities. Send for detailed technical information.

Hamilton Marine Engines.

Standardized production on marine engines from 500 to 5000 h.p. During the war 200 en-

INTERIOR FORD POWER PLANT

gines were built for the Emergency Fleet Corporation working up the production to four complete 2800 h.p.

2800 H.P. TRIPLE EXPANSION MARINE ENGINE

engines a week. Send for booklet, "Building Marine Engines on a Quantity Basis."

Hamilton Sugar Mills.

Cane crushing and grinding mills built complete with power equipment. Many large "Centrals" in Cuba have Hamilton mills. One produced 55,000,000 lbs. of sugar from 1918-19 crop. Send for Sugar Mill Catalogue containing complete mechanical details with illustrations.

Hamilton Service.

This company maintains a large staff of engineers who are authorities in their respective lines. Use them as consulting engineers. Ask them to solve any power problems—to answer any question. This service is free.

THE HOUSTON, STANWOOD & GAMBLE CO.

Manufacturers of Engines, Boilers and Boiler Settings
CINCINNATI, OHIO

Products.

STEAM ENGINES: Throttling Governor and Shaft Governor, Open, also Enclosed Self-oiling.

BOILERS: Horizontal Tubular, Scotch Marine and Locomotive Firebox.

Feed Water Heaters, Stacks, Sheet and Plate Work.

Steam Engines.

This company builds single valve steam engines in sizes from 20 h. p. to 350 h. p.; in the case of engines with throttling governor twin engines with capacity up to 700 h. p. are built.

The larger sizes are all side crank, but it also builds center crank engines in sizes up to 75 h. p. Most of these engines are for medium speed, so that this company does not specialize on direct connected dynamo driving. These engines can be used for many kinds of direct connected service, such as fans, blowers, rotary pumps, etc.

THROTTLING ENGINE

SHAFT GOVERNOR ENGINE, OPEN STYLE

ENCLOSED SELF-OILING ENGINE WITH SHAFT GOVERNOR

Horizontal Tubular Boiler with Steel Casing Setting.

The steel casing setting is a steel jacket which surrounds and supports a heat resisting wall, consisting of a layer of non-conducting material (such as asbestos) and courses of fire brick. A few common brick are used where not exposed to the heat.

This steel jacket reduces the expense of operating horizontal tubular boilers very substantially by almost eliminating leakage of air through the walls into the furnace, thus reducing the fuel consumption; and by holding fire brick together and in place. The repairs are very much reduced, as the cracking of the walls is the cause of most of the repairs required by the ordinary all brick setting. There are other advantages, such as the elimination of most of the common brick; a reduction in space because of thinner walls; cleanliness and neatness in appearance.

The steel casing is very easy to install. The casing is riveted up at the factory into a small number of sections, which have only to be bolted together, not riveted, at destination. The casing is assembled complete at the factory, fitted and carefully marked.

MUNCIE SEMI-DIESEL CRUDE and FUEL OIL ENGINES.

M & G Straight Drive Friction Clutch Pulleys, Roller Bearing Type; Muncie Reversible Friction Clutch Pulleys and Cut-off Couplings.

Muncie Oil Engine.

DESCRIPTION—The Muncie Oil Engine is of the Semi-Diesel type, single cylinder, horizontal construction, operating on the two-cycle principle, obtaining temperature for ignition on the second stroke by means of an especially designed igniter head, which upon starting is preheated by outside means. When engine is in operation temperature of igniter head is maintained by heat of the combustion of fuel.

Crank case is enclosed and front end of piston is used as a scavenging pump. When on the back stroke, it draws air, only, into crank case, through automatic air inlet valve chamber attached to crank case near cylinder. The air is compressed on the next, or forward stroke, within crank case, to a pressure of about 3 lbs.; is then admitted into combustion chamber through transfer ports uncovered by piston.

When on the next, or rearward stroke, a charge of fuel is forced by the governor driven injection pump through injector nozzle in cylinder head, as a finely vaporized mass, directly on to igniter spoon in combustion chamber. Here it is volatilized and ignited by heat from the igniter head, compression plate, and increasing heat of compression, ignition occurring only at end of compression stroke upon closest contact of the gaseous vapor with igniter head and other heated portions.

Exhaust takes place through the lower ports, when uncovered by piston at the completion of the expansion or working stroke, and is aided by inrushing air from crank case admitted slightly later on opposite side.

Principles of combustion employed embody patented devices without whose uses such success as is produced in the Muncie can not be obtained. The particular design of the combustion chamber is patented.

The Muncie Oil Engine is a slow speed engine, all sizes developing their rated capacity at or near 750 lin. ft. per minute piston travel. Even the 20 h. p. engine operates at as low speed as 250 r. p. m. (with piston travel of 540 ft. per minute). The reduced piston travel as compared to other engines means many years of life added.

The Muncie is also of *medium compression type*, and will give better economy, even, than many engines so proudly referred to as high compression

engines. Our design permits of a better efficiency, and the actual use of as low and lower grades of fuels, successfully than any other semi-Diesel engine with higher compression, and in the Muncie the user is not submitted to the trials that such engines encounter through dangerous explosions, bumping and pounding, reduced fuel economy due to losing compression, etc., since such design engines will not maintain their economy at any but their height of compression, and ideal functioning of all accessories.

FUELS USED—Heavy crude oils, heavy fuel oils, 18° to 28° Baumé or higher, kerosene, distillate, naphtha, solar oil, gas oil, or other distillates of petroleum commonly used as liquid fuels, which are free from dirt or grit, or non-combustible matter, and contain less than 1% of water or sulphur, with flashing point 100° Fahr. (open cup) of above.

FUEL CONSUMPTION—From .60 to .70 lbs. ($\frac{2}{3}$ to $\frac{3}{4}$ pts., average run of fuels) per b.h.p. hour, the higher efficiency obtaining in larger sizes. Best economy resulting from oils of 24° to 28° Baumé.

GENERAL USAGE—For any stationary requirement where the duty is heavy or severe and constant and reliable service is expected, and the sizes offered will suffice; such as ordinary industrial or municipal plants, lighting or pumping, machine shops, ginning plants, flour mills, feed mills, gravel boats, heavy dredges, mine pumping or power plants, pipe line service pumping stations, or operation in crude oil fields. Sizes, 10 to 125 h.p. single units; 250 h.p. twinned units.

SPECIFICATIONS—Catalogue 23 contains full specifications.

FULL RIGHT-HAND VIEW 100 H.P. TYPE "C" SPECIAL HEAVY DUTY MUNCIE OIL ENGINE
16-in. bore by 24-in. stroke, speed 190 r.p.m., weight 32,500 lbs. Sizes, 100 and 125 h.p. only

parallel motion* prevents the brake blocks from dragging on the brake ring when the hoist is in operation and insures a perfect contact and equal pressure on all parts of the brake blocks. Hence even wear and maximum effective life of the blocks are secured.

The Nordberg axial plate type clutch as used on Nordberg hoists is the only type of friction clutch that has equal driving power in both directions of rotation. Gripping of clutch is accomplished without producing any end thrust on drum shaft or drum.

The specially designed features, on the brake and clutch operating cylinders, for controlling oil, combined with the floating lever control between the platform and operating valve, make the operation of the brakes and clutches as perfect as if operated directly by hand. However, the parts may be moved with only a few pounds exerted on the operating levers.

Diesel Type Stationary and Marine Oil Engines.

Nordberg Diesel type stationary and marine oil engines are especially adapted for heavy duty work, and range in sizes from 330 to 3000 boiler h.p. For stationary service they are used extensively in electric light and power plants, flour mills, mining industries, machine-shops, textile works, cement industries, water works, shipyards, chemical works, refineries, compressor plants, irrigation plants, ice manufacture, etc. Nordberg Diesel engines are made for either constant or variable speed and when operated at variable speed can be used in connection with compressors, blowing engines, pumps, ice machines, etc. For operation in high elevations and for continuous non-stop service they will be found particularly well adapted. They burn a large variety of fuel oils with exceptional economy. Particular attention is called to the large sizes of Nordberg marine and stationary units.

Coal Mine Hoists.

For coal mines where depth is not excessive and rapid hoisting is desired, Nordberg coal mine hoists will be found especially well adapted and economical. Equipped with oil-operated post brakes and where cylindro-conical drums will prove advantageous Nordberg hoists are fitted with them. A Nordberg safety stop which will safeguard the hoists under all operating conditions can also be furnished. Sizes range from 100 h.p. with drums of 4-ft. diameter to larger sizes with immense drums and greater horsepower.

All post brakes are so designed that the posts move with parallel motion when engaging and releasing. The

Air Compressors and Blowing Engines.

Nordberg air compressors and blowing engines are built in the larger sizes only, the air compressor having capacities of 2,000 cu. ft. per minute and larger and the blowing engines 10,000 cu. ft. per minute or more. They are arranged for motor, steam or oil engine drive. Owing to the demand for higher speeds, Nordberg air compressors are equipped with plate valves in place of Corliss valves operated by wrist plates and eccentrics. Nordberg plate valves consist of thin strips of steel seated on cast iron seats. The cast iron seats, carrying the valves, guides and guards, are built in the form of a cylinder which fits into the same set of parts formerly used for the Corliss valves. This form of construction makes it possible to convert any of the older types of Nordberg air compressors into the most modern compressors on the market, simply by dispensing with the valve gear and Corliss valves and substituting Nordberg plate valves. Air compressors of the two-stage type equipped with Nordberg plate valves can be operated at no capacity, half capacity or full capacity and these are under control of an air governor which will operate to maintain a constant discharge pressure.

FOUR 1250 B.H.P. NORDBERG-CARELS DIESEL ENGINES DIRECT CONNECTED TO GENERATORS, AND ONE 750 B.H.P. ENGINE DIRECT CONNECTED TO AIR COMPRESSOR, BURRO MOUNTAIN COPPER CO., TYRONE, N. M.

A LARGE NORDBERG COAL HOIST, AMERICAN COAL MINING COMPANY, BICKNELL, IND.

Capable of hoisting 4 tons of coal per trip—6000 tons in 8 hours

A NORDBERG COMPRESSOR BUILT FOR THE UNITED VERDE EXTENSION MINE
Capacity 4000 cu. ft. at 163½ r.p.m.

Steam Engines.

The Nordberg-Todd Uniflow and poppet valve engines are the highest type of steam prime movers known to the engineering profession. Producing exceptional operating economies when new, they maintain them over a long period of years. The Uniflow engines have poppet valve gears; furnished in sizes of 200 h.p. and up. Suitable for operating condensing, non-condensing or with high back pressure and with any steam pressure or superheat; when operating under any of these conditions, with wide variations of load, steam consumption is exceptionally low.

Nordberg poppet Corliss compound engines are used when the power required is constant and the lowest possible steam consumption is desired. They are for condensing operation only.

Both simple tandem and cross compound Nordberg Corliss engines may be had in sizes of 100 h.p. and up.

Metal Mine Hoists.

STEAM DRIVEN—When the depth is from 1,000 ft. to 14,000 ft., Nordberg mine hoists are specially designed to meet the conditions. The motive power may be simple Corliss or compound condensing Corliss engine. Nordberg post brakes operated by oil, Nordberg oil-operated axial plate clutches, and Nordberg safety stops are used. Cyliandro-conical drums are specified when their use is advantageous. Safety is the first consideration of Nordberg engineers.

NORDBERG TWIN TANDEM COMPOUND CONDENSING HOIST AT ANVIL MINE OF NEWPORT IRON CO., BESSEMER, MICH.
Rope pull, 24,000 lbs.

NORDBERG-TODD UNIFLOW POPPET® VALVE ENGINES
Consume less steam per horsepower than any other steam prime mover

ELECTRICALLY DRIVEN—Nordberg electrically driven metal mine hoists are equipped with drums 4 ft. or larger in diameter and have motors of 100 h.p. capacity or more. They comprise the direct coupled, the single reduction gear, and the double reduction gear types. Post brakes, axial plate clutches, hydraulically operated devices and Nordberg safety stops are among the features worthy of note.

Steam Stamps and Condensers.

Nordberg steeple compound steam stamps are generally used to crush the ore leaving the jaw crushers to a size that will pass an ⅛-in. mesh screen. A single Nordberg stamp has a capacity of 700 tons of ore per 24 hours. They operate compound condensing and are extremely economical in steam consumption.

Nordberg condensers comprise jet condensers, either steam or power driven; surface condensers, with either steam or power operated air pumps; and, where the quantity of steam to be condensed is large, counter-current jet condensers with Corliss engine-operated air and circulating pumps are recommended.

Nordberg Service.

Nordberg's corps of highly trained engineers will gladly assist in the solution of engineering problems involving the use of any of the above mentioned apparatus. State the conditions to Nordberg.

FIRST MOTION MINE HOIST, ELM ORLU MINE
One of the largest first motion mine hoists used in this country. It winds 3500 ft. of rope at a speed of 2500 ft. per min.

SINGLE-VALVE and FOUR-VALVE, SIMPLE, TANDEM COMPOUND and CROSS COMPOUND STEAM ENGINES; STEAM TURBINES.

DIRECT and ALTERNATING CURRENT GENERATORS, direct connected, belted and coupled types; MOTOR GENERATORS, BOOSTERS and BALANCERS; TURBO-GENERATOR UNITS, direct and alternating current.

BLOWERS, turbine and motor driven.

Engines, Single-valve and Four-valve Type.

BEARINGS—The main bearing on all sizes is of the quarter box type. Shells are lined with genuine babbitt, carefully pened in place and bored out in accurate jigs, and are, therefore, interchangeable; and all shells may be quickly and easily removed without taking shaft out of bed. Horizontal adjustment is secured by a wedge, and vertical adjustment by drawing down the cap.

MAIN BEARING

CROSSHEAD—Crosshead body is made of annealed cast steel. Shoes are of cast iron, faced with genuine babbitt, and are of the cylindrical type.

Crosshead pin is made of hardened steel, ground perfectly true. Ends are tapered where they fit the body, and provision is made for turning 90° as it wears.

CONNECTING ROD—Connecting rod is forged from the best open hearth steel, insuring ample strength under the most severe operating conditions. Straps at both ends are slotted out of the solid forging, and there is no strain on loose parts, such as keys or bolts. Crosshead pin box is of solid phosphor bronze, while the crank pin box is of bronze, lined with babbitt, pened and bored.

CONNECTING ROD

GOVERNOR—The governor used on all Ridgway engines is the pioneer centrifugal-inertia governor, and is distinctive for its refinement of construction and perfection of operation.

TYPES—Ridgway side crank, single-valve and four-valve engines are built in the simple, tandem compound, and cross compound types. The sizes of simple and tandem compound engines range from 30 to 900 h.p., and cross compound engines up to 1500 h.p.

SINGLE-VALVE ENGINE—Cylinder and valve on this engine are the same that the company has used for over 25 years on its center crank engines.

FOUR-VALVE ENGINE—The accelerating gear is a system of toggle joints, by means of which the motion from the eccentric is so modified that the valves are at rest during one-half of the stroke, and opening and closing occurs when they have their maximum velocity. The travel of the valves after closing is only enough to secure a satisfactory seal, and is much less than with any similar type of gear. As a result, friction in, and the strains on, the accelerating gear are reduced to a minimum, and it operates easily and noiselessly, even when comparatively loose. The port openings are unusually liberal at points of cut-off up to and including one-quarter, without being greater at later points than is necessary or desirable.

DETAIL SHOWING VALVE GEAR

PHANTOM VIEW OF GEAR CASE

The exhaust valve gear is identical with that used on releasing gear Corliss engines. It is the usual wrist-plate motion; but instead of being mounted on the cylinder, it is located on the same bracket which carries the steam valve gear.

SECTION OF CYLINDER AND VALVES

Direct Current Generators.

Ridgway direct current generators are provided with a compensating field winding, making them capable of handling the most extreme overloads without sparking or injury. For haulage, hoisting, and industrial work, where there are frequent overloads, they

are without an equal. The field is of laminated construction throughout and responds almost instantly to changes in the magnetizing current. This feature means better regulation than is possible with a cast iron or cast steel field. Three-wire generators are built from the two-wire designs, with but slight changes in the connections and the use of a single choke coil.

SINGLE-VALVE, SIDE CRANK ENGINE WITH DIRECT CONNECTED, DIRECT CURRENT GENERATOR
Sizes 25 kw. to 750 kw.

Alternating Current Generators.

Ridgway alternating current generators are of the revolving field type, with strip wound field coils on the large sizes and wire wound coils on the small. The armature core is built of thin laminations of transformer steel, clamped between heavy cast iron rings in such a way as to leave the outside of the core exposed, thereby securing the maximum ventilating effect. Standard alternating current generators are wound two-phase or three-phase, for 25 and 60 cycles, and in the usual voltages. Special machines can often be built from standard patterns. The line covers direct connected, belted and coupled, or water wheel type of machines.

FOUR-VALVE, SIDE CRANK ENGINE WITH DIRECT CONNECTED ALTERNATING GENERATOR
Sizes 35 k.v.a. to 750 k.v.a.

Motor Generator Sets.

The increasing use of central station power in certain industrial plants has created a demand for motor generator sets of various characteristics, especially for transforming alternating to direct current.

MOTOR GENERATOR SET, SYNCHRONOUS MOTOR AND DIRECT CURRENT GENERATOR
Sizes 10 kw. to 1000 kw.

Ridgway direct and alternating current generators, when combined into a motor generator set, possess all of the good features of the separate machines, and make a unit having the highest possible efficiency and overload capacity. Combinations can be made of self-starting synchronous motors, with or without exciters, induction motors, direct current two-wire and three-wire generators, series boosters and direct current motors. Sets with synchronous motors can be arranged to operate with either end acting as the motor.

Turbo-generator Units.

The Ridgway-Rateau-Smoother turbine is built under a license to use the well-known Rateau patents. This turbine is of the impulse type, in which the steam acts solely by its velocity. Simplicity in the governor and valve gear, together with large clearances between stationary and moving elements, are features which should appeal to every prospective user.

Ridgway direct and alternating current generators, turbo-type, follow the most advanced practice in the design and construction of such machinery.

TURBO-ALTERNATOR UNIT. RATEAU TURBINE
Sizes 300 kw. to 3000 kw.

Blowers (Turbine and Motor Driven).

High speed blowers, for blast furnace, smelter, and similar work, have many advantages over low speed engine driven blowers. The RIDGWAY DYNAMO & ENGINE CO. has built a number of such blowers, both turbine and motor driven, and each installation has been a marked success. The variations, requirements and conditions of operation are so great as to preclude any description in this book, but inquiries for such equipment are invited and will be given prompt attention.

TURBINE DRIVEN BLOWER

Service.

Courtesy, strict attention to all details, and an efficient organization, coupled with the best facilities for promptly and satisfactorily filling all orders, are directly responsible for the success gained by this company.

The Engineering Department is always at the command of prospective customers requiring information regarding the best type of equipment to use for special purposes.

STERLING ENGINE COMPANY

Marine and Stationary Gasoline Engines

BUFFALO, N. Y.

Products.

"STERLING" GASOLINE MOTORS for stationary work for driving centrifugal pumps and electric generators.

"Sterling" Marine Gasoline Engine.

"Sterling" Prestige.

The "Sterling" engines, designed for driving centrifugal pumps and electric generators, are backed by an organization represented in practically every country on the globe. The marine product has been manufactured for over 16 years, during which time it has been extensively used by the United States Navy and many foreign navies. The racing engine, built by this company, holds the world's marine speed record for 6, 30 and 90 miles and has held the American championship for 8 consecutive years.

Maximum Fire Protection Service.

The "Sterling" engine provides a dependable source of auxiliary power to meet fire emergencies.

The wonderful records made by the motors, and the reputation they have gained in the marine field for exceptional power and longevity, has led to the redesigning and adaptation of the engines for stationary work, and today there are numerous units installed in townships, villages and factories as standby plants for fire protection; driving centrifugal pumps, and also generators. The motors are admirable for this service as they develop their rated power at speeds up to 1400 r.p.m.

Notable Advantages.

The "Sterling" is a quiet and smooth running engine. Vibration has been practically eliminated by scientific precision in design and construction. Longevity is assured through the extensive use of drop forgings for crank shaft (chrome nickel steel), cam shafts and connecting rods, for bearing caps and timing gears, in addition to which, bronze and aluminum castings of great tensile strength are specified throughout the motors, the material being the best procurable. An examination of the motors will readily disclose a high standard of workmanship.

As required by state laws governing factory equipment, all moving parts including the flywheel are neatly enclosed. However, unusual provision has been made for accessibility. All covers are easily removed and attached and ample space is provided in which to make adjustments if required. Accurate dimensions are ad-

TRADE-MARK

hered to so that parts ordered in replacement will always fit properly.

The equipment of electric starter and electric generator, with battery, assures power immediately to meet any emergency. This power is constant, as the motors may be de-

pended upon to run satisfactorily for long periods at maximum revolutions per minute under full load.

MODEL EC2, 25 H.P. "STERLING" MOTOR DIRECT CONNECTED TO A KINGSFORD CENTRIFUGAL SANITARY PUMP

STANDARD SIZES UNDERWRITERS' FIRE PUMPS AND THE "STERLING" ENGINES REQUIRED

Gallons per minute	No. 1½-in. streams	H. p.	Engine, Sterling Model

†Regular equipment includes electric starter-generator (single unit). Price \$925.00 is without starter-generator. Information concerning engines not illustrated or described here will be sent on request

“Sterling” Model FC, 60-300 H. P. Motors.

Regular equipment includes electric starter and generator; storage battery; starter and generator cable; electric switches; hydrometer; ammeter; high tension dual magneto, impulse starter type; primary and secondary wires; spark plugs; hexagon ball nut terminals; complete hollow crank shaft oiling system with gauges, tank, tubing and pumps; water circulating pump; carburetor; gasoline strainer; engine controls; emergency starting lever; governor; forged stub shaft, machined for mounting flexible coupling.

Extra equipment furnished on request.

DESCRIPTION
— “Sterling”

commercial engines are built heavier than the average motor offered for similar purposes, assuring exceptional strength. The upper base is quite rigid, due to the fact that it has no two parallel sides and is strongly ribbed.

In addition, the arch webb construction for holding the journal caps, renders practically impossible the bending or distortion of either base or crank case under heavy load.

Large handhole plates are provided on both sides of the upper base. The lower base is a single rigid jointless casting extending the full length of the engine and designed expressly for stationary work.

The crank shafts on all Model F “Sterlings” are in revolving balance, provided for by counterweights on the crank sheet opposite each throw. The crank shaft is of exceptionally large diameter drop forged from chrome nickel steel, double heat treated, and has a tensile strength of 115,000 lbs. per sq. in. The important item is to have sufficient bearing surface. Connecting rod bearings throughout the Model F motors are 3½ in. long, intermediate bearings 4 in. long. The end main bearings are 3¾ in. long on the 4-cylinder model, and 4⅞ in. long on the 6- and 8-cylinder models. The total bearing surface on the 4-cylinder model is 200.23 sq. in., the 6-cylinder 305.86 sq. in., and the 8-cylinder 392.59 sq. in.

The inner wall of the cylinder is skirted into the base, providing a guide for the piston during the full length of the stroke. Spark plugs pass through water jacketed bosses in the cylinders, keeping them cool and giving them longer life. Valve seats water jacketed completely around circumference.

The oiling system of all Model EC and FC “Sterlings” is the hollow crank shaft force feed lubricating type, whereby oil is supplied to main bearings under pressure and conducted to connecting rod bearings, also under pressure, by holes drilled in the crankshaft. A pressure of approximately 15 lbs. of oil is maintained on these bearings. An oil sight gauge and an oil pres-

sure gauge provide a constant, accurate check on the oiling system.

A 2-spark dual magneto firing 2 plugs simultaneously in each cylinder is furnished with each FC motor, assuring the absolute dependability of this vitally important function.

FC 8-CYLINDER “STERLING” DIRECT CONNECTED TO 3-STAGE DAYTON-DOWD TURBINE FIRE PUMP

FC 4-CYLINDER “STERLING” MOTOR DIRECT CONNECTED TO 3-STAGE GOULDS CENTRIFUGAL UNDERWRITERS’ PUMP

Tests and Guarantee.

Every “Sterling” engine is subjected to a severe and rigorous test and never leaves the plant until it is in perfect order and has been thoroughly “run in” and limbered up. The company guarantees every engine for one year from date of shipment and will replace within that time, all parts giving out under normal service, because of defect in material or workmanship.

GUARANTEED FUEL AND H.P. CURVES, MODEL FC, “STERLING”

The FC 5½-in. bore motors at 1200 r. p. m. or even at 1400 r. p. m., are, from a standpoint of fuel economy, a most desirable size for the Underwriters’ Fire Pumps. Less power would be insufficient, more power superfluous. The FC motors possess just the right reserve

TRADE-MARK

Pittsburgh Heavy Duty Oil Engine.

The Pittsburgh Brons Hvid heavy duty oil engine is a scientifically designed and highly efficient type of prime mover, utilizing crude petroleum or its refined products, such as fuel oil. It operates on the "constant pressure" combustion principle.

The fuel, entering air heated to about 1000° Fahr., due to high compression is completely and rapidly burned. This means that low grade fuels may be used with high thermal efficiency. The percentage of heat units which do useful work in heavy duty oil engines, high compression types, is higher than in any other type of commercial engine.

Where the heat units go may be seen in the diagram below, paying particular attention to the shaded portion.

100 h.p. Brons Hvid Heavy Oil Engine

1,000 h.p. Condensing Steam Plant

DIAGRAM SHOWING UTILIZATION OF HEAT UNITS

The Pittsburgh heavy duty oil engines have been developed after an intimate study of the subject and by carefully conducted experiments by engineers of many years' experience in designing oil engines. This engine is built on a quality basis with a satisfactory and economical performance the principal aim.

All engines are thoroughly tested and are fully guaranteed for material and workmanship.

FRONT VIEW OF 4-CYLINDER
100 B.H.P. PITTSBURGH
HEAVY DUTY OIL ENGINE
Direct connected to a 65 kw.
generator

vertical, single acting, trunk piston Brons Hvid type, having cylinders with 8½-in. bore and 12-in. stroke, operating at speed of 400 r.p.m. and developing 25 b.h.p. per cylinder.

The engine design has been carried along the thoroughly tested practice of modern Diesel engine construction. The engine is rugged in construction for heavy duty service, yielding a complete, self-contained and compact unit easy to operate. Takes up the least amount of engine room space. Fully meets the demand of a well balanced, quiet running, simple, reliable and economical power. Excellent shop facilities, and use of jigs and templates insure exactness and interchangeability of parts.

FUEL—Fuel shall consist of crude petroleum or its refined products such as fuel oil, etc., and shall be of suitable quality. With a heat value of 18,500 B.t.u. per lb. it will be consumed at the rate of not more than 0.6 lbs. per brake horsepower hour at full load.

CROSS SECTION OF PITTSBURGH HEAVY DUTY OIL ENGINE,
TYPE M.V.

Description.

ENGINE—Engine is of enclosed, heavy duty, 4-cycle,

TROY ENGINE & MACHINE CO.

Manufacturers of Steam Engines Exclusively

TROY, PA.

Products.

TROY VERTICAL and HORIZONTAL STEAM ENGINES for every service, within capacities of 2 to 120 h. p.

Troy Vertical Automatic Engine.

Self-oiling with enclosed frame, or cup lubrication; with 2 wheels for belted service or extended base for direct connection to generator. Equipped with Rites inertia governor, giving perfect balance. Regulation and stability obtained by weighting arm at one or both ends and by adjustment of coil spring. Variation between no load and full load seldom exceeds 2%.

Speed adjusted at standard revolutions as per table unless otherwise ordered. Standard driving pulley has same diameter and face as governor wheel. Equipment includes lubricator, drain cocks, throttle valve, wrenches, etc.

Several hundred vertical direct connected engine sets similar to illustration have lately been supplied to the United States Government.

Troy Horizontal Automatic Engine.

Two methods of lubrication—self-oiling or tank gravity system. Steam pressures, 60 to 160 lbs.; special cylinders for higher pressures. Subbase used with self-oiling engines contains oil reser-

voir and fittings. Full equipment. Speed and direction of rotation should be specified.

Troy Vertical Throttling Engines.

Plain slide valve, in smaller sizes; but balanced valve can be substituted for steam pressures from 100 to 160 lbs. Special cylinders made for higher pressures or for superheat. Engine self-oiling, or cup lubrication. Full equipment supplied. Also built duplex or in pairs to suit customers.

Troy Horizontal High Pressure Throttling Engines.

Sizes from 15 h. p. up. Massive frame and base. Self-oiling system or tank gravity lubrication. Left-hand engines, as illustrated, are standard. Special equipment for direct connection to fans, blowers, pumps, etc.

HORIZONTAL THROTTLING ENGINE

Experience.

Troy engines are the result of 25 years' experience in the design and construction of steam engines. The benefit of this experience is offered to our patrons.

DE LAVAL STEAM TURBINE CO.

560 Johnson Avenue
TRENTON, N. J.

Products.

DE LAVAL STEAM TURBINES; CENTRIFUGAL PUMPS; BOILER FEED PUMPS; BLOWERS and COMPRESSORS; STEAM TURBINE GENERATORS and DYNAMOS; SPEED REDUCING GEARS.

Special Centrifugal Machinery.

Service.

Our Engineering Department will supply detailed information regarding characteristics and best manner of using turbines, pumps, gears, compressors, etc.

General Description.

De Laval steam turbine driven pumps, blowers and dynamos give continuous service and require little attention.

All De Laval turbines, pumps and blowers are, so far as possible, of the horizontally split casing type, with all piping connections on the lower half of the casing.

All De Laval machinery is interchangeable. Parts can be inserted in the machine by relatively unskilled persons.

Turbine driven machinery occupies little space and requires only light foundations.

De Laval Steam Turbines.

Made in single stage, velocity stage, and pressure stage types, in capacities from 1 to 15,000 h. p. and for all steam and exhaust conditions.

De Laval Speed Reducing Gears.

For steam turbine service in driving ship propellers, centrifugal fans and pumps, direct current generators and other slow and medium speed machinery.

De Laval Centrifugal Pumps.

These pumps include single stage and multistage, for all heads and capacities, from direct driven boiler feeders to the largest geared pumps for water works service.

De Laval Centrifugal Blowers and Compressors.

Made for all deliveries and for all pressures up to 125 lbs. per sq. in.

Guarantee and Further Information.

Every De Laval machine is guaranteed as to efficiency and operating characteristics, and is tested before leaving the shop.

State the character of work and literature will be sent.

THE JAMES LEFFEL & CO.

Manufacturers of Turbine Water Wheels, Engines and Boilers

426 East Street
SPRINGFIELD, OHIO

Products.

TURBINE WATER WHEELS: High and Low Head. WATER WHEEL GOVERNORS.

HYDRAULIC MACHINERY and FITTINGS: Gate Hoists; Steel Pipe; Shafting; Gearing; Pulleys; Bearings; Bridgetrees.

STEAM ENGINES: Automatic and Throttling; Horizontal and Vertical; Stationary.

BOILERS: A. S. M. E. Code; Firebox; Internally Fired; Locomotive; Portable; Scotch; Steam; Horizontal Return Tubular; Vertical Tubular.

Leffel Turbine Water Wheels.

VERTICAL LEFFEL TURBINE WATER WHEELS—Equipped with latest type of Leffel double steel bucket runners mounted on vertical steel shafts. Revolving parts are carried on large top and bottom lignum-vitae step bearings. Gate casings are fitted with balanced swing type gates, each gate removable separately and fitted with adjustable steel connections. Gates are operated with Leffel's latest type of gate equipment. Bearings are of special design and large dimensions.

HORIZONTAL LEFFEL TURBINES—Built in various types and designs, single and double discharges. Frequently, to suit requirements, two or more turbines are built on one horizontal shaft, developing high horsepower and speeds, for direct connection to driven machinery. Some are constructed with steel casings and others for open penstocks.

TYPE "Z" LEFFEL TURBINES—Specially designed for developing highest speed, horsepower and efficiencies. Vertical and horizontal designs for direct connection to the electric generators, milling machines, saws, grinders, pumps and other high speed machinery. The most modern designs in all details are embodied in these turbines.

CO-OPERATIVE SERVICE—This company is prepared to inspect locations and requirements, and will promptly submit drawings and proposals for complete turbine installations for developing maximum results at lowest initial cost and minimum operating expenses.

Water Wheel Governors.

This company furnishes governors for regulating the speed of the different designs and capacities of turbine water wheels. These governors are of the very latest types and designs throughout.

Special Hydraulic Machinery and Fittings.

This company builds many designs of hydraulic machinery, including head gate hoisting machinery, steel pipe and fittings, shafting, gearing, pulleys, bearings and bridgetrees.

Leffel Engines and Boilers.

Leffel horizontal and vertical steam engines and boilers combine those principles of design and construction found best through 54 years of engine and boiler building experience.

Built in various sizes and types from 3 h. p. up.

LEFFEL CLASS "A" THROTTLING ENGINE ON BASE

VERTICAL LEFFEL TURBINE WATER WHEEL

SECTIONAL VIEW OF LEFFEL INTERNALLY FIRED RETURN TUBULAR OR SCOTCH MARINE TYPE OF PORTABLE BOILER

Guarantee.

All Leffel products are guaranteed to be first class throughout and of the latest designs of their respective types, built strong and substantial.

Their rated capacity, power, speed and efficiency values are also guaranteed, when properly installed and operated. Any part proving defective within one year from date of shipment, because of imperfect material or design, will be replaced free of charge on cars at factory.

Catalogues.

Catalogues containing complete data will be furnished on application.

Double Helical Reduction Gears; Turbo-alternator Units; Geared Direct Connected Turbo-generator Units; Geared and Direct Connected Turbo-blowers for forced draft, etc.; Turbo-pumps; Geared Belted Turbines.

TRADE-MARK

of turbine in large sizes, and our tests show this type to be equally as efficient, relatively, when built in small sizes.

Speeds.

It is our policy to limit speeds of larger turbines to 3600 r.p.m. and of the smaller sizes to 5000 r. p. m. as a maximum, and to obtain required steam consumption by multistaging if necessary. By this means, rotation stresses are kept at a low figure, affording a large margin of safety, a very important feature, and one which should not be lost sight of by the prospective purchaser.

MOORE STEAM TURBINE AND REDUCTION GEAR AS BUILT IN SIZES FROM 10 TO 500 H.P.

TYPICAL DIRECT CONNECTED, DIRECT CURRENT TURBO-GENERATOR UNIT

Built in sizes from 5 kw. to 50 kw.

General.

Designers and users of steam turbines have found that the most efficient type of steam turbine is the combination type, that is, one type of turbine is used for the high pressure part of the expansion, combined with another type for the low pressure stages. A familiar example of this is the combination of a single velocity stage for the high pressure element, with Parsons or Rateau stages for the low pressure.

Moore Single Stage Turbine.

Consists of a single velocity stage, made up of a set of diverging expanding nozzles and a wheel carrying two rows of moving blades, with a set of stationary reversing vanes following the first row of moving blades.

Moore Multistage Turbine.

Consists of the same single velocity stage used in the single stage turbine, followed by two or more single

Construction Features.

TURBINE CASINGS—Casings and diaphragms split horizontally, so that upper half can be removed, exposing the rotor. Halves of diaphragms attached permanently to upper and lower halves of casing, so that when upper half of casing is lifted, the upper half of diaphragm comes with it, leaving rotor so it can be removed.

Ample surfaces at joints prevent steam leakage. Vertical joints reduced to a minimum.

ROTOR—Consists of a single velocity stage wheel carrying two rows of moving buckets, followed by two or more single pressure stage wheels, all mounted on the same shaft.

TYPICAL "MOORE" 3600 R.P.M. DIRECT CONNECTED TYPE TURBO-ALTERNATOR UNIT WITH DIRECT CONNECTED EXCITER

Turbine is equipped with oil relay and emergency governor

pressure stages. Each of these single stages consists of a set of nozzles and a wheel. This form of multistage turbine has proved to be the most efficient type

MOORE STEAM TURBINE DIRECT CONNECTED TO MULTISTAGE CENTRIFUGAL PUMP

Co-operative Service.

The engineering department is always prepared to go into engineering requirements in detail, and give advice and recommendations without any obligation whatever.

Products.

STEAM TURBINES.

CENTRIFUGAL TURBO-PUMP SETS for all classes of service.

TURBO-GENERATOR SETS, D. C. or A. C., direct connected or through Terry Reduction Gears.

DUPLEX EXCITERS.

TURBO-BLOWERS for forced or induced draft.

REDUCTION GEARS; combined TURBO-GEAR UNITS.

Capacities of Terry Turbines.

Horizontal Terry turbines are built in sizes up to 1000 h.p., combined gear units in sizes up to 125 h.p., while the vertical types cover a range from 1 to 600 h.p.

Terry Non-condensing Turbines.

PRINCIPLE OF OPERATION—The outstanding feature which makes the Terry turbine so simple and reliable is its principle of operation.

It is of the compound velocity stage impulse type, i. e., the steam is expanded to desired point in a correctly formed jet or nozzle, wherein its pressure energy is converted into kinetic or velocity energy.

Steam is distributed by a steam chest or steam ring to a series of nozzles.

In these nozzles the steam is expanded from approximately boiler pressure to exhaust pressure.

Issuing from the nozzle at high velocity, it strikes the side of the steam bucket in which its direction is reversed 180°.

As the initial impact absorbs only a part of the total energy, the jet of steam passes into a reversing chamber which returns it to the wheel bucket.

FIG. 1. NON-CONDENSING TERRY TURBINE WITH COVERS LIFTED

Split case, short shaft span, large interchangeable bearings and maximum accessibility. Low temperature and constant alignment. Indestructible wheel

This action is repeated several times until all of the available energy is exhausted.

A distinct advantage of the Terry principle of operation is that the highest economies are obtained at lower speeds.

FEATURES OF DESIGN—*Accessibility*—The Terry turbine may be completely dismantled, including removal of rotor without disturbing the alignment or the steam and exhaust piping.

This is accomplished by splitting the casing on the shaft center line, including bearings and glands, and locating steam and exhaust connections in the lower half.

Simplicity, Safety and Reliability—The Terry turbine is built with a totally enclosed one-piece wheel with uniform rotary motion.

This indestructible wheel is made of special composition steel with semicircular buckets milled from the solid metal (Fig. 4).

The bladelike portion between these buckets receives no power-producing action from the steam, but merely serves to split the jet.

The power-producing action of the steam takes place entirely on the curved surface at the back of the bucket (Fig. 2), therefore erosion does not alter the angle at which the steam enters or leaves the bucket.

FIG. 3. DIAGRAM SHOWING WHEEL CLEARANCES

AA—rim clearance. B—large blade clearance. CC—side clearance (about 1 in.). Blades can not foul, as they are protected by rims. Rubbing at AA will do no damage. Side clearance is so large that end play from excessive external thrust can not damage wheel

FIG. 2. ACTION OF STEAM IN TERRY TURBINE

Action is such that steam is returned to the wheel again and again until all available energy is utilized. Power producing action of steam takes place on back of buckets, so that erosion of blade edges has little effect on economy or power

FIG. 4. INDESTRUCTIBLE WHEEL OF TERRY TURBINE

Buckets cut from the solid and protected from rubbing by raised wheel rim. Notch at center of blade reduces blade weight and stresses. Wheel can not burst and injure operators

This construction enables the Terry turbine to maintain its original efficiency after a great many years of service.

The fact that steam impinges against the wheel in a direction perpendicular to the axis makes it unnecessary to provide for end thrust.

The large wheel clearances are shown in Fig. 3. It is impossible for wheel buckets and reversing chamber buckets to foul. The blades of the wheel are protected by projecting rims (Figs. 3 and 4), which will take care of any rubbing that might occur if for any reason the radial clearance should become reduced.

Its rugged, simple construction makes it a fool-proof piece of apparatus that can be operated by engineers not familiar with turbine operation.

CRITICAL SPEED WELL ABOVE ANY OPERATING SPEED—The short span permitted by the single wheels in Terry turbines, combined with the stocky shafts used, bring the critical speed well above any operating speed. This eliminates all shaft whipping and excessive vibration.

HIGH EFFICIENCY AT PARTIAL LOADS AND OVERLOADS—Each nozzle of the Terry turbine acts independently of the others and produces its own proportion of the total power. Partial loads may, therefore, be procured at practically full load economy by closing the desired number of nozzles by means of hand valves furnished for the purpose.

See Fig. 5, showing variation in steam consumption from full load to lower loads.

FIG. 5. CURVE SHOWING VARIATION IN STEAM CONSUMPTION OF TERRY TURBINES AT VARIOUS LOADS

Vertical lines show where a nozzle has been closed. High points show steam consumption with nozzle open, low points with nozzle closed. This high efficiency at low loads is due to fact that shutting of nozzles as load decreases prevents throttling in governor valve so that steam reaches remaining nozzles with full energy. This hand control does not in any way interfere with automatic speed governor

READILY ADAPTABLE TO CHANGES IN PLANT CONDITIONS—The design of the Terry turbine makes it readily adaptable to the development or changes in plant conditions.

The feature of the independent nozzle control previously described makes it possible to install a turbine which will operate at high efficiency under present load conditions and have reserve power in the form of a nozzle continually kept closed.

Should it become necessary to operate at a lower steam pressure or should the pressure be increased for higher plant efficiency, the nozzles can easily be changed to meet new conditions with minimum shutdown and slight expense.

HIGH PRESSURES AND SUPERHEATS—The Terry turbine is particularly adapted to the special cast steel

construction so vital to long life under high steam pressures and superheats where cast iron will not stand up.

Terry Condensing Turbines.

Furnished as straight high pressure, low pressure, mixed pressure or bleeder type turbine.

A very important feature incorporated in the design of the Terry condensing turbine is known as "composite design." The combination of a single velocity wheel for the high pressure end, with multipressure elements in the low pressure end, secures maximum efficiency.

This "composite design" reduces the over-all length to a minimum, or with a given over all length, makes it possible to use a greater number of multipressure stages in the low pressure end with consequent higher efficiency.

Terry condensing turbines possess the same features of accessibility, high efficiencies at partial loads, etc., as do the non-condensing turbines. The bearings, glands, interstage diaphragms, casing and bearing pedestals are all horizontally split and the steam and exhaust connections are on the lower half.

Short shaft span with operating speed well below critical speed and low temperature in the casing, insure reliable operation and long life.

FIG. 6. TERRY "COMPOSITE DESIGN" CONDENSING TURBINE SHOWING SPLIT CONSTRUCTION

Centrifugal Turbo-pump Sets.

Terry centrifugal turbo-pump sets are adapted for all classes of service, including boiler feed, condenser circulation, hot well, dredging, fire service, vacuum, water works and general service.

The advantages embodied in these pump sets are reliable operation, high efficiency, low maintenance charges and absence of waterhammer, valves and rubbing reciprocating parts.

They may be automatically governed by pressure regulators. In this way the speed of the unit is automatically varied so as to maintain constant pressure in the discharge line regardless of the amount of water used.

FIG. 7. TERRY CONDENSER CIRCULATING SET
Note the rugged appearance, compactness and simplicity. Where high efficiency is required, a Terry geared unit is used

Turbo-generator Sets.

Turbo-generator sets furnished in sizes from 1 kw. to 750 kw., geared or direct connected, condensing or non-condensing. Used extensively for main units in small plants or auxiliary sets for night lighting, week-end service, marine work, lifting magnet sets, etc. In non-condensing work, the turbine may be designed to exhaust against most any back pressure desired for heating, manufacturing or other purposes.

The nozzles may be so arranged that efficient operation may be obtained with varying back pressures. In condensing work, the turbine may be designed to operate on exhaust steam entirely or may be equipped with the well-known Rateau control where the supply of exhaust steam is intermittent. Bleeder turbines are also furnished, permitting the extraction of exhaust steam for heating or other purposes at desirable pressures.

Terry turbo-generator units have many individual advantages, such as small space, light foundations, absence of vibration, low cost of upkeep, long life and clean exhaust steam.

FIG. 8. TERRY TURBO-GENERATOR SET

D. C. units geared to permit high turbine speed and efficiency and low generator speed for good operating characteristics

Duplex Exciters.

These sets consist of an exciter-generator driven from one end by a motor and from the other end by a specially governed Terry turbine. Exciter ordinarily is driven by the motor. Should the motor fail, the turbine will automatically take hold without causing appreciable fluctuation in the exciter voltage.

A governor on the unit not only controls its speed but may be adjusted while running to take the load off the motor and throw it on the turbine when more steam is needed by the feed water heater. The control from motor to turbine and vice versa may be handled entirely from the switchboard.

These sets have met with marked success because of their inherent reliability.

FIG. 9. TERRY DUPLEX EXCITER UNIT

Insures continuous excitation, and is used extensively because of reliability and adaptability to automatic heat balance

Turbo-blower Sets for Forced and Induced Draft.

Fan units are usually installed in objectionable locations, often requiring very light foundations in places

where they are subject to excessive heat and dirt. The Terry turbine, with its freedom from vibration, its ability to operate over long periods under adverse conditions without attention, is particularly adaptable to this service. Turbine drive also obviates the objectionable large fans necessary with engine drive, because of the low speed required by the engine for reliable service.

FIG. 10. TERRY INDUCED DRAFT FAN

Small space and light foundations make it readily adaptable to plant conditions. Its high speed avoids the necessity of large bulky fans

Reduction Gears.

Terry gears and pinions are of the stub-tooth double helical type, cut by the most accurate method and are interchangeable. The lubricating system is unusual in the ample supply of cool oil under pressure to the bearings.

All Terry gears have forced feed lubrication, ring oiling not having been found satisfactory.

Cooling is effected by large water chambers, cored in the walls of the gear case, eliminating risk of leakage where pipe cooling coils are used.

Bearings are split horizontally to permit their replacement without removing the couplings.

Gears furnished for either direction of rotation, the only change being the location of the oil spray piping above or below the contact point.

FIG. 11. TERRY REDUCTION GEAR

Note horizontally split casings, giving complete accessibility

Combined Turbo-gear Units.

In sizes up to 125 h.p., geared turbine units may be obtained in one common rigid frame casing.

Each part of the unit possesses the same features of design contained in the separate turbine and gear.

The advantages embodied in this type of unit are: decreased cost, light weight, compactness, maintained correct alignment and no flexible coupling. Both turbine and gear are horizontally split to permit easy access to interior for inspection or repairs.

ALLIS-CHALMERS MANUFACTURING COMPANY

Complete Centrifugal Pumping Units

MILWAUKEE, WIS.

For District Offices see page 1114

Products.

Specialists in the selection, design and manufacture of the following:

CENTRIFUGAL PUMPS and CENTRIFUGAL PUMPING UNITS for every service: Mill and Factory Water Supply Pumps, City Service Pumps, High Pressure Fire Pumps, Underwriters' Fire Pumps, Drainage Pumps, Sewage Pumps, Boiler Feed Pumps, Condenser Pumps, Hot Well Pumps, Heating System Pumps, Filter Pumps, Sugarhouse Pumps, Paper Mill Pumps, Mine Pumps, Irrigation Pumps and Pumps for Special Service.

For Power and Electrical Equipment, see pages 1114-15.

Service.

Co-operative service begins with a careful consideration of the customers' pumping conditions by our engineering organization, after which a suitable pump and drive will be selected from our complete lines so as to give the best economy and service when operated in the customer's plant. Before shipment, the majority of the standard pumps are given a careful shop test in the centrifugal pump testing laboratory without extra charge, under contract conditions or approximate contract conditions, so that the customer is assured that the unit when carefully installed in place will perform in accordance with the guarantees.

Combined Units.

The ALLIS-CHALMERS MANUFACTURING COMPANY recommend their combined units, consisting of pump and motive power of their own manufacture as insurance that each part of the complete machine will be properly selected for its share of the work.

With complete data at hand on the pumps and whatever drive has been determined, whether motor, turbine, steam engine or oil engine, all of which this

company manufactures, there is no danger of the drive being too large or too small for the pump, or similar difficulties which are possibilities when the pump and drive are furnished by different makers.

The economical and satisfactory service which these complete units are giving in service has impressed us with the value to the purchaser of our "*complete units of undivided responsibility.*"

Types of Pumps.

The types of pumps manufactured as standards are the single stage type "S" and the multistage, both horizontal; also horizontal and vertical types for special services.

TYPE "S"—This type, which is a horizontal split casing, single stage, double suction, enclosed runner, bronze fitted pump, has the most general application to all classes of pumping service. It is built as a standard and carried in stock in sizes from 2 to 20 ins. These pumps will operate against heads up to 200 ft. and are simple, reliable and economical in operation.

MOTOR DRIVEN TYPE "S" PUMP

Type "S" pump lends itself readily to direct connection to an electric motor or steam turbine; and these are the commonest methods of drive, although belt drive is often used when it is desirable to retain the advan-

ALLIS-CHALMERS COMBINED UNITS IN POWERHOUSE OF UNITED VERDE COPPER COMPANY

TURBINE DRIVEN TYPE "S" PUMP

tages of the type "S" pump operated at a relatively high speed but driven by a slower running driving agent.

The design of the Allis-Chalmers type "S" pump was carefully worked out after an exhaustive series of tests and has been proved under all conditions of operation in a great many different services.

DATA, STANDARD TYPE "S"
Approximate Capacities of Standard Sizes

Size	Capacity in g. p. m.		Total head in feet		Speed, r. p. m.
	Norm.	Max.	Norm.	Max.	
2	125	225	85	95	1730
3	300	500	85	110	1740
4	450	750	130	145	1750

8	1500	2400	170	190	1750
10	2500	3750	175	200	1750
12	4500	6500	165	200	1450
14	5500	7500	170	200	1450
16	6500	9000	135	170	1160
18	9500	12000	90	100	860
20	12000	14500	80	90	690
24	15000	20000	110	140	690

Table is only approximate and for more detailed information the company's centrifugal pump catalogue will be sent on request.

MULTISTAGE PUMPS—For heads higher than can be developed in a single stage, this company recommends their standard horizontal split casing, bronze fitted, hydraulically balanced, multistage pumps. These pumps are built in sizes from 2½ to 14 ins. and for normal heads up to 500 ft. Special multistage pumps are also built for heads up to 1000 ft.

MOTOR DRIVEN MULTISTAGE PUMP

Multistage pumps have their widest application as boiler feed pumps, mine drainage pumps, fire pumps, etc., and in all of these services the features of the Allis-Chalmers multistage pumps are proving their practical usefulness in many installations.

Horizontally Divided Casings.

Allis-Chalmers type "S" and standard multistage pumps are all made with horizontally divided casings with the suction and discharge nozzles located in the lower half casing. This makes it possible to easily remove the top half casing without disturbing the piping connections.

AMERICAN STEAM PUMP COMPANY

BATTLE CREEK, MICH.

NEW YORK OFFICE, 17 Battery Place

CHICAGO OFFICE, 1220 Monadnock Block

Products.

AMERICAN-MARSH VACUUM PUMPS; AMERICAN POWER PUMPS; AMERICAN-MARSH BOILER FEED PUMPS; AMERICAN-MARSH CENTRIFUGAL PUMPS; MARSH DEEP WELL ENGINES.

American Compound Pumps, Water Works Pumps, Elevator Pumps, Belt or Steam Driven Air Compressors.

American-Marsh Steam Pumps, Automatic Boiler Feed Pumps and Receivers, Hydraulic Pressure Pumps, Tank Pumps, Magma Pumps, Oil Pumps, Brine Pumps, Sinking Pumps, Air Compressors, Jet Condensers.

American-Marsh Pump.

Of the improved Marsh design. Consists of all the advantages and governing element of the well-known Marsh pump combined with the American simple, positive and reliable auxiliary valve which is mechanically actuated by a lever arm connected to the crosshead attached to piston rod. With this combination the inside trip tube and packing box formerly used in the Marsh design are eliminated. The American-Marsh is the very best pump ever produced; it is positive in action, possessing a perfect governing element and will not hang up under all the varying conditions.

Made of the best material and rugged and substantial in design. Steam and water cylinders joined by heavy cast iron yokes with ring and plug fit to insure perfect alignment of wearing parts. Special bronze fittings (not common brass) furnished regularly without extra charge, consisting of removable bronze liners, bronze piston rods, valve seats, valve bolts, springs; also either good grade hard or soft rubber valves or bronze valves, as the service may require, are furnished.

Pumps for Heating Service.

Due to the positive full stroke, self-governing element and special fitting, these pumps are particularly adapted for use in connection with heating systems of all descriptions. The American-Marsh is the very best pump made for extreme hot water service.

STYLE "S" AMERICAN-MARSH VACUUM PUMP
Side suction; double base; delivery opposite

American-Marsh Boiler Feed Pump.

Heavily constructed and bronze fitted; equipped with solid bronze piston rods, bronze valve seats, bolts and springs and heavy cast bronze removable water cylinder bushings, with the exception of the three smallest sizes, in which the bushing is pressed into place. Waterways large and direct, with ample valve area. Ample handhole plates, giving immediate access to all water valves, furnished in the larger size piston pumps and in all outside center packed plunger pumps.

In cases where the boiler pressure exceeds 150 lbs., the outside center packed plunger type is recommended. Description and other data on application.

AMERICAN GEARED POWER PUMP

AMERICAN-MARSH BOILER FEED PUMP

American-Marsh Centrifugal Pump.

Very simply constructed; hence first cost is much less than any other style of pump. No valves used in construction and practically noiseless in operation. Occupy but little space; cost of foundation is small.

TYPE "B" AMERICAN-MARSH CENTRIFUGAL PUMP

Marsh Deep Well Engine.

Designed for pumping wells in which the water drops below suction reach of the regular horizontal pump. Steam head or steam cylinder is located at the surface of the ground, while the water cylinder is lowered to the water and operated by means of a well rod connecting the steam and water pistons.

CENTRIFUGAL PUMPS, for water works, irrigation, drainage, mine, fire protection, quarry, dredge, hydraulic, giant, caisson, foundation, sump, trench, bilge, boiler feed, condensing and general purpose pumping.

DEEP WELL TURBINE CENTRIFUGAL PUMPS for pumping wells 12 in. and larger in diameter.

DEEP WELL PLUNGER PUMPS, Single Acting, Double Acting, and 2-stroke.

"American" Centrifugal Pumps.

These pumps are built in about 50 standard types, each designated by a letter of the alphabet; and, in addition, a large number of special pumps are designed and built. Centrifugal pumps are made with either open type or enclosed type impellers, with or without diffusers and with either single suction or double suction in single stage pumps. Most of our double suction pumps and some single suction pumps are made with split casing, so designed

that the upper half of the casing can be removed to expose the internal working parts without disturbing the pipe connections.

IMPORTANT FEATURES—The important features of "American" centrifugals are skillful designing so that they attain high efficiencies with flat efficiency curves, thus being economical in use through a wide range of delivery; use of good material in their construction, careful machining and accurate adjustments. Bearings are ring or chain oiled. Impellers are given both rotative and end thrust balance. In single suction, open impeller type pumps, the sides and edges of impeller and interior of casing are carefully machined and closely adjusted at sides to prevent leakage. The split casing types are fitted with labyrinth rings around suction openings to reduce leakage to minimum. Multistage, enclosed impeller types are designed to have fewest points of leakage back to suction opening.

Water for water seal on high pressure side packing box is taken from first stage of the pump, thus reducing friction on shaft.

Multistage opposed im-

TYPE DSMD

High pressure, double suction, single stage, split volute, for total heads to 200 ft.

TYPE KTMD

High pressure, multistage, horizontally split casing, motor driven, for total heads up to 1000 ft.

CROSS SECTION OF TYPE KTMD "AMERICAN" CENTRIFUGAL PUMP
Illustrating hydraulic balancing device and also the diffuser vanes

PELLER types have long radius pipe bends connecting stages in pairs, so that end thrust in one stage is equalized by end thrust in opposite direction in the other stage.

TESTING—Pumps made from each separate set of patterns in all sizes of stock pumps, and all specially designed pumps are carefully tested under working conditions and their characteristics plotted.

No pump is allowed to leave the works that does not show the efficiency guaranteed.

THRUST BALANCE—“American” multistage, single suction, split casing, centrifugal pumps, with enclosed impellers, are provided with hydraulic thrust bearings in which a rotating disk within pump casing is separated from a stationary disk by a film of water, the water within the enclosed space acting as a hydraulic cushion. This hydraulic balance has advantages over the mechanical thrust bearing, although both types can be furnished, depending on conditions.

For pumping gritty water, we make a pump with very wide bearings entirely removed from the volute chamber. This pump is known as Type P. Between the bearings in this pump is placed a ball bearing for taking care of end thrust. This ball bearing is held in place by a threaded collar which is locked in position.

Many types of “American” vertical

TYPE AED

Low pressure, single stage, horizontal centrifugal pump, direct connected to steam engine, for total heads up to 30 ft.

TYPE P

High pressure, horizontal, with gritproof bearing, for total heads to 125 ft.

TYPE PMD

High pressure, single stage, horizontal centrifugal, with gritproof bearing. Motor driven, for total heads to 125 ft.

TYPE DS

Double suction, horizontal, split volute, single stage centrifugal, for total heads to 200 ft.

TYPE RMD

High pressure, single stage, double suction, vertical split volute, for total heads to 200 ft.

centrifugals and all “American” deep well turbine centrifugals are provided with roller or ball thrust bearings placed at top of the shaft and so designed that the entire weight of shaft and attached impeller, or impellers, is carried at the surface.

EFFICIENCY—Skillful designing and careful workmanship enable “American” centrifugal pumps to compete in point of efficiency with pumps of their kind made by any other manufacturer. The larger the pump and the higher the head, within certain limitations, the higher the efficiency.

Several standard types of these pumps are designed in larger sizes to maintain their highest efficiencies on total heads up to 200 ft. for each stage. Specially designed pumps that maintain highest efficiencies on total heads of over 400 ft. for each stage have been built by this company, and these pumps attain up to 80% efficiencies.

EQUIPMENT—“American” centrifugal pumps are equipped with plain pulley for belt drive, with grooved sheave for rope drive, steam engine, gasoline engine, electric motor, steam turbine, or with hydraulic turbine.

The pumps are also supplied unmounted, with flexible shaft coupling for any power, or mounted on a base, but without attached power.

MATERIAL—“American” centrifugal pumps are made of all-iron, of iron with bronze fittings

TYPE EE

Single stage, belt driven, high pressure, for heads to 125 ft.

TYPE I

High pressure, 2-stage, belt driven, for total heads to 250 ft.

TYPE IMD

High pressure, 2-stage, motor driven, for total heads to 250 ft.

TYPE A OR TYPE E

Single stage, belt driven
Type A, low pressure.
Type E, high pressure, for heads to 125 ft.

TYPE C OR TYPE G

Type C, low pressure, single stage, vertical shaft, for total heads to 50 ft.
Type G, high pressure, single stage, vertical shaft, for total heads to 100 ft.

TYPE Q

High pressure, vertical type, single stage, with submerged water seal, for total heads to 100 ft.
Patented March 7 1916

or of all-bronze. For some conditions, special acid resisting metals are used.

SIZES AND CAPACITIES—
“American” centrifugal pumps are made in any size, from $\frac{3}{4}$ in. to the largest built. They are made in both horizontal and vertical types, and in any number of stages. For approximate capacities, see table on following page.

Mine Pumping.

“American” electrically driven centrifugals for mine pumping have the advantages of occupying small space; are so designed that they are least affected by water containing grit, or acid solutions; have all internal parts easily accessible in case repairs are needed; require little attention; and they obviate the use of steam pipes in shafts and underground chambers. The sinker pumps are designed to operate under variable heads, and are so constructed that they will not overload motors if total head is less than that for which pump is designed.

TYPE KTMD, SPECIAL—Illustration below shows a 6-stage high pressure, horizontally split shell, enclosed impeller, diffuser type, centrifugal pump, direct connected to electric motor.

This is a special type for mine service with marine type motor-thrust bearing and with flange coupling between bearing and motor, and flexible shaft coupling between thrust bearing and pump to provide for installing in an inclined shaft.

The 3-stage high pressure, horizontally split shell, enclosed impeller, diffuser type, centrifugal pump, direct connected to electric motor, is especially designed for mine service and equipped to operate in an inclined shaft.

TYPE H
High pressure, 2-stage, vertical shaft, for total heads to 150 ft.

TYPE OKMD
Vertical plain centrifugal type mine-sinking pump, direct connected to vertical type motor

TYPE GMD
High pressure, single stage, vertical shaft, motor driven, for total heads to 100 ft.

TYPE KTMD, SPECIAL

TYPE KTMD, 3-STAGE

Deep Well Turbine Centrifugal Pumps.

The “American” deep well turbine centrifugal pump is designed to meet conditions which will not permit the use of plain centrifugals when mounted either horizontally or vertically. Made in sizes to operate in wells 12 ins. and larger in diameter, inside of casing. Special designs of this pump provide a combination of a deep well turbine, located in the well for elevating water to surface, and a single stage or multistage centrifugal mounted on same shaft at surface and driven by same power, to act as a booster pump for forcing water through mains or into an elevated tank or standpipe.

This pump has the shaft enclosed in an inner casing, so that water passage to surface is between inner and outer water casing. The pump is so constructed that any water passing up through packing gland above top impeller is drained out through an orifice into the well, preventing gritty water from getting into bearings. The entire weight of main shaft and attached impellers is carried on roller or ball bearings at surface, operating between large disks.

These pumps are designed to deliver from 200 to 3000 gals. of water per minute.

The turbine may be belt driven from any convenient power; but, where electric power is obtainable, electric motor can be mounted vertically on pump head and thus secure the most compact and economical drive. When electric motor is used, it is attached to turbine shaft by means of a flexible coupling. This equalizes any unequal alignment between motor and pump shaft, removes from pump all weight of motor and allows motor and pump to rotate together, the inequalities in either being balanced, saving friction common to other designs.

“American” Deep Well Plunger Pumps.

The latest practice in deep well plunger pumps is represented in

TYPE NMD
High pressure, 2-stage, motor driven, vertical turbine for operating in drill holes 12 to 30 ins. in diameter. Patented, and other patents pending

TYPE KNMD
Combination deep well turbine and booster pump. Patented and patents pending

TYPE CMD
Low pressure, single stage, vertical pump, direct connected to vertical type motor; for use in pits to 15 ft. in depth

the "American" line of this type. These pumps are built in types of power heads for operating single acting, double acting or 2-stroke cylinders. Each of these types of power heads can be adapted to be driven by belt, electric motor, gas or gasoline engine, or by steam engine. Power frame heads are substantially built to meet requirements of high lifts and large volumes of water from deep wells. The bearing boxes on frame, the wrist pin boxes, crank boxes, and the guide through which plunger travels are of large proportions. Bearing boxes are lined with babbitt metal, and run cool under maximum load. Crank shafts are made of steel, while gears and pinions are machine cut.

Compound steam heads are used when steam is delivered to pump at from 80 to 125 lbs. pressure. Special designs of large size deep well plunger pumps, not illustrated, are made with 36-in. stroke. Deep well plunger pumps are made in sizes to operate in wells 3 ins. and larger in diameter.

All water cylinders are made of bronze. The double acting cylinder delivers water on both down-stroke and up-stroke, and has about 60% greater capacity than a single acting cylinder of equal diameter and length of stroke. The 2-stroke cylinders are perfectly balanced and have practically double the displacement capacity of a single acting cylinder of equal diameter and length of stroke.

"AMERICAN" ALL-BRONZE BALL VALVE SINGLE ACTING WATER CYLINDER

FIG. 380-A. "AMERICAN" ALL-BRONZE DOUBLE ACTING WATER CYLINDER

FIG. 195. "AMERICAN" ALL-BRONZE 2-STROKE WATER CYLINDER

Complete line of "American" deep well plunger pumps is illustrated and described in Catalogue No. 130.

Irrigation Pumping.

"American" centrifugal pumps have gained merited prominence in the irrigation field, because they are made in a large number of special designs for this purpose, to meet nearly every condition of service.

Bulletin 150 describing types of pumps adapted for irrigation work mailed on request.

Water Works Pumps.

"American" centrifugal pumps for water works installations have the advantage of being low in first cost, low in foundation cost, low in housing cost; require small expense for attendance and repairs; are not likely to get out of order or to rupture the mains by sudden changes of pressure; and are so designed that they produce a more flexible installation than plunger pumps.

By installing a water works system of "American" centrifugals of comparatively small units, and piping the pumps so that they can be operated separately, in parallel or in series, only a sufficient number of pumps need be operated at any time to supply desired quantity of water at required head, and these pumps can be operated at their maximum efficiency.

By manipulating a few valves, other pumps can be coupled-in to increase the quantity of delivery, or by coupling the pumps in series, to raise the pressure for fire service.

Catalogue 149 showing a number of water works designs will be sent on request to any one interested.

Fire Protection Pumping.

"American" centrifugal fire pumps conform to underwriters' specifications. They combine simplicity with reliability. A special feature of these pumps is that they are so designed that, in case of hose rupture, they will not overload motor, but will consume less power than when operating under standard fire pressure. Capacity, 500 to 1500 gals. per minute, or larger, as ordered. Discharge pressure, 100 lbs. or more per sq. in.

Information Required When Installing "American" Centrifugal Pumps

- State: (1) Quantity of water required.
 (2) Kind of pump suggested for economical results.
 (3) Static head, or total distance from fluid at rest to center of mouth of discharge pipe.
 (4) Velocity head, or energy required to set fluid in motion and raise it to velocity attained when passing through discharge opening of pump.
 (5) Friction head, or friction throughout piping, bends, valves, etc.

SIX 14-INCH "AMERICAN" CENTRIFUGALS INSTALLED FOR IRRIGATING 6,000 ACRES AND DELIVERING OVER 50,000,000 GALS. OF WATER PER DAY, ON LIFTS OF 84 TO 110 FT.

INSTALLATION OF "AMERICAN" CENTRIFUGALS, CITY WATER WORKS, HOLLAND, MICH.

INSTALLATION OF "AMERICAN" CENTRIFUGALS, CITY WATER WORKS, LINCOLN, NEBR.

TYPE KMD, UNDERWRITERS' FIRE PUMP
 High pressure, 2-stage, horizontal split shell; direct connected by flexible shaft coupling to high speed enclosed ventilated motor

BLACKMER ROTARY PUMP CO.

SALES OFFICES
1347 Book Building
DETROIT, MICH.

Product.

Sole manufacturers of the BLACKMER ROTARY PUMP.

Blackmer Rotary Pump (Patented).

The Blackmer rotary pump is a different and exclusive application of the rotary or centrifugal principle.

There is no other pump on the market like it. It has proved its greater efficiency and economy by its varied uses over a number of years.

Wide Variety of Uses.

Blackmer pumps are giving satisfactory service in breweries, tanneries, chemical works, oil stations, cotton oil mills, soap factories, distilleries and packing houses and refineries.

They act as bilge pumps on boats, large and small, in salt or fresh water.

They are used in water works, irrigation plants, quarries, sugar refineries, creameries and dairies.

It is thus evident that they are adapted to the widest variety of usages.

Improvements.

Gradual improvements have raised the early high standing of Blackmer efficiency to a point where it is generally accepted as one of the most efficient pumps now on the market.

The improved Blackmer rotary pump handles a surprisingly large volume of fluid.

Its action is continuous and dependable; it starts easily without priming.

Blackmer pumps are standardized throughout. The interchangeability of all its parts, whether of iron or bronze, is a highly important feature, as pumps cost at piecemeal no more than as a unit.

Construction.

The illustration shows the interior construction of the Blackmer rotary pump, which consists of cylinder, revolving piston and 4 buckets.

As the piston revolves with the shaft, the buckets are held out against the cylinder by centrifugal force and gravity. The air is thus exhausted from the extension or water chamber, and the fluid which is under atmospheric pressure flows into the pumps and fills the extension chamber.

The buckets drop into this extension chamber at the left and pass to the right, drawing liquid in at suction and pushing it out at discharge. The only fluid that will carry by the discharge port is that which fills the recesses in the piston. Here, it acts as a fluid packing, and keeps the pump at all times suction-tight.

The ports of the Blackmer pump run diagonally across the cylinder, which gives the bucket an even wear.

Friction everywhere is reduced to the lowest point.

Suction Lift.

The large extension chamber, found in the Black-

mer pump, enables these pumps with centrifugal force to make a good suction lift.

When properly installed with suction lift that is given for them in specification table, each pump will pick the liquid from the bottom without priming.

Slippage.

The Blackmer pump is protected against slippage losses by the fact that the buckets are hinged; this device allows freedom for the buckets to drop out against the wall of the cylinder by their own weight, as well as by centrifugal force.

All wear is automatically taken up and the pump is kept at full efficiency until the buckets are used up. New buckets can be installed at small expense, so that the same pump is always ready for another long term of usefulness.

Renewable Linings.

Another remarkable and distinctive feature of the Blackmer pumps, as applied to rotary pumps, is the renewable linings. These can be taken out and replaced without special tools or experience, and without disturbing the connections, in 30 minutes' time. This is an important consideration—the independence from the machinshop's aid.

Nos. 2, 4, 6, 8, 10 and 12 are made with these replaceable linings. They prolong the life of the pump indefinitely.

For liquids containing acid, a special acid resisting bronze is furnished at the extra cost of the metal.

Belt Driven Regular Pumps.

Are made in the solid as well as lined type. The lined types have two heads. Specifications for the lined and solid are the same. The solid types are Nos. 0 to 8, inclusive. Nos. 2, 4, 6 and 8 are solid or lined. Nos. 10 and 12 are lined only.

All belted pumps are furnished with tight and loose pulley.

All solid or lined iron pumps are fitted with bronze buckets and bronze glands, up to the No. 8. On the Nos. 8, 10 and 12 they are fitted with iron buckets and iron, bronze-bushed glands.

Each pump is provided with a friction clutch or slide gear, in the double, triple, four and six pump units, and can be used together or separately.

Furnish units with pumps of either 50, 100 or 200 gals. per minute.

Engineers consider floor space when designing.

BELT DRIVEN PUMP

Sanitary Creamery and Food Pumps.

Nos. 11, 01, 02, 03 made in either iron or bronze, with tight and loose pulley. Similar to others except that shaft is in 2 pieces. Head is fastened to cylinder by bracket and screw, which enables one to take it apart, clean and put it together in a few minutes.

SANITARY CREAMERY AND FOOD PUMP

No. 9 Transfer Pump.

Used for transferring from barrels and tanks. Also made with gears, which doubles its capacity and doubles the suction life.

NO. 9 TRANSFER PUMP

Single, Double, Triple, Four and Six Pump Units.

Extensively used by large oil companies, tanneries, chemical plants, heat treating plants, or any company who wishes to conserve space.

Connections are by gear and pinion to either engines or motors.

DOUBLE UNIT PUMP CONNECTED BY GEAR TO GASOLINE ENGINE

SINGLE UNIT ROTARY PUMP CONNECTED TO MOTOR

BUFFALO STEAM PUMP COMPANY

BUFFALO, N. Y.

BRANCHES IN ALL PRINCIPAL CITIES

Products.

SINGLE STAGE and MULTISTAGE, DOUBLE SUCTION, CENTRIFUGAL PUMPS.

Specifications, Class "S" Single Stage, Double Suction, Centrifugal Pumps.

SHELL—Heavy gray cast iron, divided on horizontal center line, machined to gauge, drilling to template. Close clearances with runner preventing leakage.

WEARING RINGS—Brass. Furnished in shell.

RUNNER—Enclosed type, double suction, hard cast iron to withstand abrasion, finished to template.

SHAFT—Open hearth machine steel, accurately finished all over. Large size shafts are hammer forged. All rotating parts assembled on shaft and balanced before putting in pump.

BEARINGS—Ring oiling. Solid bearing bushings on 4-in. sizes and smaller. Split bearing bushings on 5-in. sizes and larger.

THRUST BEARING—Bearing surfaces water cooled on 5-in. sizes and larger, insuring perfect condition of lubricant. (Factory reserves discretion as to best type bearing to suit customer's requirements of head and running speed.)

STUFFING BOXES—Extra deep. Glands of cast iron, allowing ample packing space. Water seals and necessary connections furnished.

COMPANION FLANGES—Furnished on pumps 6-in. size and smaller, having flanged openings.

COUPLING—Flanged or flexible, as desired.

SUBBASE—Cast iron, ribbed and stiffened.

FINISH—All pumps painted, filled and rubbed down. Bright parts exposed to weather protected by slushing compound.

FITTINGS—Drain and air cocks, piping for water seal and water jacket on thrust bearing.

Add code words:
JCESF for brass runner.
JCHBY for brass glands.
JCFXD for brass covered shaft.
JCGMP for monel metal shaft.
JCWAF for motor base and flanged coupling.
JCXRS for motor base and flexible coupling.

Specifications, Class "RDS" Double Suction, Multi-stage Centrifugal Pumps.

CASING—Cast iron, divided on horizontal center line.
IMPELLERS—Cast iron. Double suction, enclosed type. Hydraulically balanced. Mounted on shaft by feather keys and lock nuts.

CLEARANCE RINGS—Bronze, "L" section, floating type.

SHAFT BEARINGS—Ring oiling, removal shells, babbitt lined.

THRUST BEARING—Multiple collar, marine type. Housing split horizontally, babbitted and water jacketed. Oil circulates continuously over thrust collars.

GLANDS—Cast iron, brass bushed.

WATER SEALS—Brass cage rings with suitable circulating holes. Provided at each stuffing box. Seal on suction end has water supply connection.

SHAFT—Steel, brass covered in pump and through glands.

SUBBASE—Cast iron, ribbed and stiffened.

PULLEY—Cast iron, one piece. Pedestal bearings cast iron, bearings similar to main pump bearings.

COUPLING—Flexible type.

FINISH—Painted, filled and rubbed down outside with final finishing coat. Bright parts exposed to weather protected by a slushing compound.

FITTINGS—Drain and air cocks. Piping for water jacket on thrust bearing and for water seal.

NOTE—To determine number of stages required to pump given quantity against given head, use number of stages that will develop head nearest to that required. If head developed by number of stages selected is less than that required, the capacity will be somewhat decreased; if head developed is greater, the capacity will be somewhat increased.

MULTISTAGE TURBINE PUMP

HORIZONTAL SPLIT PUMP

For supplying buildings with water, circulating hot and cold water and brine, and for boiler feed purposes

ESTABLISHED 1869

INCORPORATED 1900

COLUMBUS STEAM PUMP WORKS CO.

(JAMES G. PULLING & COMPANY)

COLUMBUS, OHIO

NEW YORK OFFICE, S. B. WHINERY, 95 Liberty Street

NEW ORLEANS OFFICE, HAUBTMAN & LOEB Co., LTD.

Products.

PUMPS for every service which include: Acid, Air, Ammonia, Boiler Feed, Brine, Centrifugal, Creamery, Filter Press, Deep Well, Duplex, Fire, Hydraulic, Oil, Plunger, Power, Reciprocating, Sewage, Slush, Sugar House, Tank, Tar, Vacuum.

TRADE-MARK

Experience and Services.

This company has been in the pump business for over fifty years, and during that time has accumulated a vast store of experience that is at the disposal of engineers who have pump problems to solve.

The company has made a specialty of pumps for handling heavy liquids of all description and can furnish the very best of references from the largest users in this country.

General Service Pumps, Single Cylinder Double Acting Pattern.

This type pump is designed for working pressure not to exceed 150 lbs.

Note the absence of outside working parts.

Pumps are absolutely guaranteed not to short stroke or hit heads when changing from full load to no load.

Furnished plain iron fitted unless otherwise specified.

However same can be brass fitted at small additional expense.

PULLING GENERAL SERVICE, SINGLE CYLINDER DOUBLE ACTING PUMPS

exceed 150 lbs. Where boiler pressure exceeds this, the use of outside packed plunger pumps is recommended.

These pumps are fitted with either brass or rubber valves. When pumping cold water, soft or medium valves are preferable, but when pumping hot water the valves should be hard rubber or brass. Note the absence of outside working parts.

Duplex Boiler Feed Pumps.

Although this type is designed especially for boiler feeding service, all of the pumps listed are adapted for general service or the pumping of liquids substantially free from grit, aciduous or foreign matter that would tend to obstruct the water passages, or effect the proper seating of valves.

Pumps can be furnished plain iron or brass fitted as desired.

*Sizes 12 x 8 x 12 to 20 x 12 x 16 inclusive, are of the separate water cylinder type. Any of the above pumps can be furnished brass fitted at slight additional cost.

Duplex Outside Center Packed Plunger Pumps.

This type is especially adapted for situations where the liquid to be pumped contains considerable grit or sand, or where the pressure to be pumped against is high. It is well adapted for hot water. In this type of pump, the plungers, being externally packed, are always in sight of the attendant engineer, so that any leakage can be readily detected and the stuffing boxes adjusted or repacked.

The pump ends, on the machines listed below, will stand a constant working pressure of 300 lbs.

Any of the above pumps will be fitted with composition plungers, lined glands and bronze rods at a slight additional cost.

Power Pumps, Horizontal Single Cylinder Double Acting Type.

This type is used extensively in connection with water systems in small village water works, water stations, office buildings, factories, refineries, refrigerating plants and mines, where water to be pumped does not contain a large proportion of solid matter and for general pumping where the working pressure does not exceed 150 lbs.

Motor driven pumps are generally used because of the ease and efficiency with which power may be transmitted to them. However, all sizes of belt driven machines can be furnished, if desired.

Low Vacuum Pumps, Single Cylinder Double Acting Pattern.

This type is designed for elevating water, or other liquids to a moderate height with small consumption of steam. They have water cylinders as large or larger than the steam cylinders, therefore they can not feed their own boilers, but when desired an auxiliary boiler feed pump may be supplied for this purpose. Furnished either iron or brass fitted as desired.

					1½	2½	10	8	4,050

Other sizes than those listed can be furnished for other requirements when desired.

Tests and Guarantees.

The policy of this company, from the inception of the business, has been to build the very best pump that accurate designing and skilled workmanship applied to the best material can produce. Over fifty years of successful pump manufacturing has demonstrated the wisdom of this course.

Every pump is thoroughly tested before leaving the factory and is fully guaranteed to be exempt from any defects arising due to faulty workmanship or material. Its satisfactory operation is also guaranteed on condition that it is properly set up, reasonably cared for and used for the service and capacity of its proportion and design.

CENTRIFUGAL TURBO BOILER FEED PUMPS.
STEAM TURBINES.

For Turbo Undergrate Blowers, see page 976.

Coppus Centrifugal Turbo Boiler Feed Pump, Type CCC.

This pump is a complete unit in itself, having one shaft common to pump and steam turbine.

On the turbine end, mechanical packing of the labyrinth type is employed, which is steamtight for ordinary back pressures, can not and does not need to be adjusted and is not subject to wear. On the pump end is the only stuffing box of the unit, with high grade plastic metallic packing.

One oil reservoir serves both bearings and on account of the very ingenious oiling system, the oil level for the ball bearings is maintained regardless of the amount of oil in the oil chamber.

Excess pressure pump governor and safety stop valve are furnished with every pump, making possible positive and instant control of feed water and protection should water supply give out.

ADVANTAGES—
Simplicity of Construction and Low Upkeep—Very few working parts. No valves to be reground or to cause back leakage. Only one stuffing box, easily re-packed. Oiling sys-

*All flanged pump and turbine connections are furnished with companion flanges.

tem requires filling only a few times each year, compared with the daily oiling necessary for reciprocating pumps. No complicated governing devices and no sliding valves. Needs very little attention.

Continuous, Steady Flow of Water without Pulsation—Insures longer life to pipe lines, valves and fittings.

Great Flexibility, Constant and Easy Control of Feed Capacity—After excess pressure governor has once been set to a certain pressure, feed water capacity is regulated by simply throttling or opening hand feed valve at boiler. Constant water level is easily maintained. Water can be cut off at the boiler, for a short period of time, without stopping the pump, as is the case with a reciprocating pump.

Exhaust Steam Free From Oil—Steam in turbine does not come in contact with any oil, thus exhaust steam can be used directly for heating purposes.

Longer Life and Less Depreciation—The high grade of materials used, superior workmanship, few moving parts, absence of cylinders requiring reboring and re-bushing, elimination of minor repairs such as is the case with reciprocating pumps, also careful inspections and tests, insure long life and continuous operation.

Higher Steam Economy—Efficiency remains practically constant through years of use. Steam economy should not drop more than 3% to 5% during the life of the pump.

Less Floor Space Required—Requires but a fraction of the floor space necessary for a reciprocating pump or a "two-unit" turbine driven centrifugal pump of corresponding capacity.

DATA REQUIRED WHEN MAKING INQUIRIES—

Name and location of plant. Total rated capacity in boiler horsepower of boilers to be fed by pump. Capacity developed by boiler. Steam pressure. Degree superheat, if any. Temperature of feed water. Positive suction head (in feet) or pressure (in lbs.) under which water flows to pump. Back pressure against which steam is exhausted, in pounds. Approximate length and size of feed line from pump to boiler. State if there is a big drop in steam pressure from boiler to pump. Advise if an open or closed heater is used or any other special arrangement.

Coppus Steam Turbines.

This company builds steam turbines in 12, 16 and 20-in. sizes up to 50 h.p., suitable for direct connection to centrifugal pumps, electric generators, blowers, etc. They are built only as double-stage turbines with speed controlling governors.

DAYTON-DOWD COMPANY

Manufacturers of Centrifugal Pumps

345 York Street
QUINCY, ILL.

Products.

DAYTON-DOWD TYPE "CS" SPLIT CASE SINGLE-STAGE and MULTISTAGE CENTRIFUGAL PUMPS, both horizontal and vertical styles, belted and direct connected; TYPE "SS" SINGLE-STAGE PUMPS, horizontal and vertical styles, belt driven and direct connected; UNDERWRITERS' FIRE PUMPS.

Automatic Sump or Ejector Pumps, and Contractors' Portable Gasoline Engine Driven Pumping Outfits, direct connected and belt driven, mounted on truck or skids.

Uses.

Dayton-Dowd centrifugal pumps are adapted to every class of service where centrifugal pumps can be used: city water works, filtration plants, boiler feed, sewage pumping, irrigation, reclamation, sluicing, fire service, contractors' service, mine drainage, dry dock and marine pumping, brine circulation, hot water circulation; pumping oil, acids, chemicals, and numerous other applications.

Every pump is especially designed and built to meet the particular requirements of each installation. All pumps thoroughly tested, and must meet the exact conditions of service before leaving the works.

Dayton-Dowd Type "CS" Single-stage Double Suction, Centrifugal Pumps.

Built in sizes from 1¼-in. discharge to 36-in. discharge.

Casing split horizontally, which permits access to working parts by merely lifting top half of the casing, making it unnecessary to disturb pipe connections or alignment of the pump. Impellers are of "non-overloading" design, which effectually protects the motive power from being overloaded in case head is varied from normal.

DAYTON-DOWD 10-IN. TYPE "CS" SINGLE-STAGE TURBINE DRIVEN PUMP

Dayton-Dowd Type "SS" Single-stage Pumps.

Adapted to any general pumping service where the head does not exceed 130 ft., as contractors' service, irrigation, drainage, sewage pumping, etc.

Furnished belt driven, and arranged for direct connection to motor or gas engine. Built in both horizontal and vertical styles.

DAYTON-DOWD TYPE "SS" SINGLE-STAGE PUMP

Dayton-Dowd Type "CSU" Multistage Pumps.

For high pressure service, such as boiler feed, fire pressure systems, mine pumping, and in fact any pumping conditions where a high head is encountered. Furnished in the multistage construction, with pulley for belt drive, or with extended base and flexible coupling for direct connection to motor, turbine, etc.

Full advantage is taken of the old turbine principle in a new way to increase efficiency and obtain diffusion vane effect without intricate construction. Axial thrust entirely eliminated by means of an automatic balancing device of the disk type, which effectually keeps the rotating elements in their proper place of rotation. Simple and rugged, reliable in operation, up to the minute in design and construction, and developing the highest efficiency.

TYPE "CSU" 3-IN. 3-STAGE AUTOMATICALLY BALANCED TURBINE DRIVEN BOILER FEEDER

Dayton-Dowd Underwriters' Approved Fire Pumps.

Dayton-Dowd fire pumps are built in 500-gal., 750-gal., 1000-gal. and 1500-gal. sizes in the multistage construction to work against any desired pressure.

Dayton-Dowd fire pumps are built to conform to the underwriters' specifications, and are approved by both the National Board of Fire Underwriters and the Associated Factory Mutual Fire Insurance Association.

DAYTON-DOWD 1000-GAL. UNDERWRITERS' CENTRIFUGAL FIRE PUMP

DEMING PUMPING MACHINERY for operation by any power: TRIPLEX POWER PUMPS; DEEP WELL POWER WORKING HEADS; ARTESIAN WELL CYLINDERS; HORIZONTAL POWER PISTON PUMPS; DIAPHRAGM PUMPS.

Deming Hydro-pneumatic Water Systems, operated by hand or windmill, gasoline engine, or electric motor.

Also, Rotary Pumps, Hydraulic Pressure Test Pumps; Deep Well Power Pumps; Trench Pumps; Air, Ammonia, Creamery, Bilge, Sewage and Sump Pumps; Pumping Outfits, stationary and portable.

Agencies for Deming Pumps.

Many agencies, not mentioned above, carry in stock Deming hand and windmill pumps and cylinders, spray pumps, hydraulic rams, etc. The above agencies, however, specialize on Deming power pumps.

Co-operative Engineering Service.

Manufacturers, engineers, and others are invited to refer pumping and water system problems to the engineering department of this company. On receipt of layout of conditions and statement of requirements, an estimate for the pumping equipment will be submitted. Blue prints, also photographs showing typical installations on request.

Information Required for Estimate Basis.

(1) For what purpose pump is to be used; (2) maximum quantity to be pumped per minute, hour or day of 24 hours; (3) to what height liquid is to be lifted by suction, and diameter and length of suction pipe; (4) height or pressure against which liquid is to be discharged; (5) diameter and length of discharge pipe; (6) whether liquid to be pumped is hot or cold, salt or fresh, acid or clear, thick or gritty; (7) power available for driving pump; (8) if electric motor, state whether current is direct or alternating; if direct, give voltage; if alternating, state voltage, cycle and phase; (9) advise if pump is to be driven by belt from motor, or to have same direct connected by gearing or otherwise.

Triplex Power Pumps.

The application of Deming pumps, due to variety of styles and sizes, is practically unlimited where belts, water wheels, electric motors, or steam, gas, or gasoline engines are available for power. Efficiency is higher than direct acting steam pumps.

BELT DRIVEN—For water works, boiler feeding, paper and pulp mills, and all kinds of factory pumping.

ELECTRIC DRIVEN—For water works, compression and open tank pumping; for private water supply, fire service, boiler feeding, brine circulating, hydraulic ele-

vators, hydraulic pressure accumulators, mine pumping, irrigating, etc.

GAS OR GASOLINE DRIVEN—For water works, railway tank service, private water supply, mine pumping, irrigating, etc.

Triplex Power Pump, Fig. 50.

Standard design, single acting; designed for suction lift of 25 ft. or less.

FRAME—Of large sizes, made in one casting with guides and crank shaft bearings lined with antifriction metal. In sizes 4 by 4 in. and smaller, frame and cylinder cast in one piece.

CRANK SHAFT—Of best open hearth steel casting in one piece.

GEARING—Machine cut, and is double in sizes 9 by 10 in. and larger. Gear ratios 5 to 1.

PINION SHAFT—Of steel, running in antifriction metal, and bolted to main housings.

CONNECTING RODS—In sizes 4 by 6 in. and larger, have bronze boxes with wedge and screw adjustment at crosshead end, and marine type babbitted boxes at crank end. Smaller sizes have bronze bushings at crosshead ends.

CROSSHEADS—Run in bored guides. Sizes 4 by 6 in. and larger have bronze adjustable shoes.

PLUNGERS—Of best cast iron, finished true and smooth; packing of ample depth.

CYLINDERS AND BASE—In one casting in sizes 10 by 10 in. and smaller; in larger sizes, the cylinders are in separate castings.

FIG. 50. TRIPLEX POWER PUMP
 Sizes $5\frac{1}{2} \times 8$ with Type "B" drive

VALVE CHAMBERS—In sizes 3½ by 4 in. and larger, separate castings bolted to cylinders.

VALVES—Of large area and readily accessible—for cold water are rubber disks, protected on top from cylindrically wound springs by brass plates; for hot water are either special hard composition or bronze valves.

VALVE SEATS—Bronze, of grid type, screwed into decks. Iron seats and valves furnished, if required.

GREASE CUPS—Furnished with all pumps.
Pumps furnished with bronze plungers, and varying otherwise from standard construction, at extra price.

Many other power pumps, also different types of drive are shown in Power Pump Bulletins

*Note—Sizes 9 by 10 and larger regularly furnished with tight pulley only

Horizontal Power Piston Pump, Fig. 708.

Pumps of this type are much used at present in construction work of all kinds. Especially suited for long distance pumping, in many cases forcing water horizontally a mile or more from source of supply. Fig. 708 illustrates a typical horizontal power pump. Adapted for suction lift of 24 ft. and is good for 200 lbs. working pressure. Made in 3 sizes, with capacities of 490, 750 and 1100 gals. per hour, respectively. Several other types of piston pump are made, with capacities from 450 to 18,000 gals. per hour.

FIG. 708. HORIZONTAL POWER PISTON PUMP

Diaphragm Pump, Fig. 1473.

Fig. 1473 power diaphragm pump is recommended for handling large quantities of muddy and gritty water quickly and economically. The diaphragm is 12½ in. diameter, of best quality rubber, and valves are of metal, rubber faced, both being easily renewable. Waterways are large and practically non-chokable. Furnished with 1 or 1½ h.p. engine as desired. Gears of jack are machine cut, from solid blanks to reduce friction and noise. Pump may also be had without engine and jack for hand operation.

FIG. 1473. DIAPHRAGM PUMP

*Extra for 15-ft. of suction hose, including coupling and galvanized strainer

Deep Well Power Working Head, Fig. 80.

This pump, with differential plunger, is designed for operation of deep well cylinders, and contains many desirable features which extensive experience in this line of pumping machinery indicates as the best.

BEARINGS—Lined with best antifriction metal, the pinion shaft bearings being bolted to main housings.

GEARING—Machine cut, the main gear (or gears) being bolted to a large flange (or flanges) integral with the crank shaft.

CONNECTING ROD—Of steel with marine type box at crank end, and bronze bushing at crosshead end.

CROSSHEAD—Has bronze shoe adjustable for wear, and runs in polished guides.

DIFFERENTIAL PLUNGER—Equalizes flow of water, with consequent greater economy and ease of operation.

AIR CHAMBER—Supplied; also grease cups, or oil cups and wrenches furnished with all pumps.

DISCHARGE—Can be connected at either front or back of pump.

When electric motor or steam engine is to be direct connected, we can furnish these working heads with different types of drive, for which see Power Pump Bulletins.

Fairbanks-Morse Pumps.

Fairbanks-Morse pump installations are giving continuous service and satisfaction in municipal plants, mines, oil fields, railroads, rice fields, irrigation projects, canneries, bleacheries, smelteries and in manufacturing plants in all sorts of industry.

Fairbanks-Morse pumps are constructed and finished in a manner insuring durability, efficiency, reliability,

ease of operation and low cost of maintenance. Guaranteed by Fairbanks-Morse quality.

Owing to the wide variety of pumping equipment required to supply the diversified needs of various industries and projects, an attempt has been made to show but a few installations, the purpose of which is to give a general idea of the adaptability of Fairbanks-Morse pumps to various lines of work.

SINGLE CYLINDER, DUPLEX and TRIPLEX POWER PUMPS, SINGLE and DOUBLE ACTING; SINGLE STAGE and MULTISTAGE, HORIZONTAL and VERTICAL CENTRIFUGAL PUMPS; DEEP WELL TRIPLEX PUMPS; DEEP WELL WORKING HEADS and CYLINDERS; VACUUM PUMPS; HYDRAULIC RAMS.

Air Compressors; Rotary and Diaphragm Pumps; Boiler Testing Pumps; Bilge, Quarry, Spray and Windmill Pumps; Turbo Driven Pumps; Hydraulic Pressure Pumps; House or Tank Pumps; Force and Lift Pumps; Pumps for Private House Water Systems; Pumping Outfits; Turbo Pumping Outfits; Special Pumps for all services.

Uses and Service.

The Goulds line includes types and capacities for all pumping services. Some of the more common of these are:

General water supply; boiler feeding, hydraulic elevator and pressure machinery service; condenser service; fire protection; vacuum service on heating systems; circulating cooling water for gas engines; pumping brine, ammonia, tar, soap, clay, sewage, chemicals, wine, acids, etc.; stuff pumping in paper mills, vacuum service in paper mills, refineries, etc.; pumping oils and gasoline; mine pumping; pumping out excavations, etc.

For service with pneumatic tanks, they can be furnished to pump both air and water.

These pumps can be furnished for belt, chain, gear or direct drive from all types of drivers.

The Goulds line also includes all types of hand pumps for all services.

The pumps illustrated and described here are only a few of a very complete line. A set of bulletins, describing all the Gould types made, will be sent on request.

Single Acting Triplex Plunger Pumps (Bulletin 101).

For general water supply, municipal water works, boiler feeding, hydraulic elevators, mine pumping, etc. Furnished for any standard form of drive.

FRAME—Close grained iron, cast in one piece with cross-head guides and cylinders, forming exceptionally rigid construction and accurate alignment of all working parts.

CRANK SHAFT—High carbon open hearth steel, accurately machined to gauge.

BEARINGS—Crank shaft and pinion shaft bearings are of babbit metal.

GEARING—Gear and pinion charcoal iron, machine cut from the solid. A gear guard covers the pinion and adjacent teeth of the gear. Gear ratio 5 to 1.

CROSSHEADS—Sizes 4 by 6 in. and larger, fitted with adjustable bronze shoes which run in bored guides. Sizes 3½ by 4

TRADE-MARK

in. and smaller; the crossheads are cylindrical in form, made of bronze, and run in bored guides.

CONNECTING RODS—Sizes 4 by 6 in. and larger, strap head and wedge adjustment with bronze boxes at crank end and adjustable bronze boxes, marine type, at cross-

head end. Sizes 3½ by 4 in. and smaller have adjustable boxes babbitted at crank end and bronze bushings at crosshead end.

CYLINDERS—Close grained iron, cast in one piece, with standards.

PLUNGERS—Sizes 2½ by 4 in. and larger are fitted with hard cast iron plungers. Sizes 2 by 3 in. and smaller have bronze plungers accurately machined and ground true and smooth.

GOULDS SINGLE ACTING
TRIPLEX PLUNGER PUMP

Made in various types, for working pressures from 100 to 300 lbs., and for elevations from 231 to 293 ft. Capacities ranging from 120 to 21,000 gals. per hour

Ratings based on pumping cold water.

For high suction lifts select pumps to run at slow speeds.

GLANDS—Sizes 2½ by 4 in. and larger have iron glands. Sizes 2 by 3 in. and smaller have bronze glands.

BASE AND VALVE BOXES—Charcoal iron, in one casting, of liberal proportion, affording large valve area.

VALVES—3 by 4 in. and smaller bronze valves. 3½ by 4 in. and larger, for cold water, rubber disks on bronze grid seats with cylindrically wound springs. For hot water, the grid seat valve with special disk is recommended.

AIR CHAMBERS—Supplied with pump. Vacuum chamber to order.

SPECIAL CONSTRUCTION—Phosphor bronze plungers, lined cylinders and glands, rawhide pinion, etc.; to order.

Single Acting Triplex Plunger Pumps (Bulletin 103).

For general water supply, municipal water works, boiler feeding, hydraulic elevators, mine pumping, oil pipe lines, accumulators, hydraulic presses, etc. Furnished for any standard form of drive.

SINGLE ACTING TRIPLEX PLUNGER PUMP

Made for working pressures from 100 to 1,500 lbs. and for elevations from 230 to 3,500 ft. Capacities ranging from 3,060 to 69,060 gals. per hour

Ratings based on pumping cold water.

FRAME—Consists of two standards which carry the main bearings, the seats for the two outside cylinders and the out-

side crosshead guides. Standards are held together by the center crosshead guide and the seat for the center cylinder.

CRANK SHAFT—High carbon open hearth steel, accurately machined to gauge. Fitted with crank disks at the ends of the crank shaft.

BEARINGS—Crank shaft bearings are phosphor bronze and pinion shaft bearings are of babbitt metal.

GEARING—Gear, charcoal iron, machine cut from the solid. Pinion, forged steel. Gear guard covers the pinion and adjacent teeth of the gear.

CROSSHEADS—Fitted with adjustable bronze shoes which run in bored guides.

CONNECTING RODS—Cast steel, strap head and wedge adjustment with bronze boxes at crank end and adjustable bronze boxes, marine type, at crosshead end.

CYLINDERS—Separate charcoal iron castings, bronze lined.

PLUNGERS—Hard cast iron, accurately machined, ground true and smooth.

GLANDS—Iron, and of easy access for adjustment and re-packing.

VALVE BOXES—Separate charcoal iron castings, each containing a set of suction and discharge valves.

VALVES—Special to meet requirements.

AIR CHAMBER—Supplied on all pumps for pressures up to 400 lbs. On pumps for pressures above 400 lbs., a spring alleviator can be furnished at extra price.

PINION SHAFT AND PULLEY—For belt drive an extended pinion shaft is regularly furnished; but the pulley and outboard bearing required are extra.

PIPE CONNECTIONS—At either end of pump.

SPECIAL CONSTRUCTION—Phosphor bronze plungers, bronze lined glands, etc., to order.

Horizontal Double Acting Piston Vacuum Pumps (Bulletin 106).

For vacuum heating systems, suction box on paper machines, vacuum pans and surface condensers.

FRAME—Cast iron in one piece bolted to the cylinder, supporting the bearings and crosshead guides.

HORIZONTAL DOUBLE ACTING PISTON VACUUM PUMP

Displacements of 10,200 to 81,000 gals. per hour

FIG. 1049 TYPE

Displacement, gals. per minute	Pistons		Displacement 1 revolution of crank shaft, gals.	Revolutions per minute	Size of pipe		Geared	Single pulley, in.

1350	18	18	39.31	35	10	10	4 to 1	42x8

CRANK SHAFT—High carbon open hearth steel, accurately machined to gauge.

BEARINGS—Crank shaft and pinion shaft bearings are of babbit metal.

GEARING—Gear and pinion charcoal iron, machine cut from the solid. A gear guard covers the pinion and adjacent teeth of the gear.

CROSSHEADS—Cast iron, with adjustable planed crosshead guides.

CONNECTING RODS—Steel, and fitted with phosphor bronze boxes, strap heads and wedge adjustment at crank end and gib and key at crosshead end.

CYLINDER—Charcoal iron, fitted with removable cast bronze lining, bolted in. This lining can be turned to distribute the wear.

PISTON—Bronze, with a bronze follower and fitted with fibrous packing.

PISTON ROD—Tobin bronze.

STUFFING BOX AND GLAND—Bronze, fitted with fibrous packing.

VALVES—Rubber disks on bronze grid seats with cylindrically wound springs.

PIPE CONNECTIONS—Suction at top and one side of cylinder, discharge at the other side, except 8 by 10-in. and 10 by 10-in. sizes, which have side suction only.

Single Stage, Double Suction Centrifugal Pumps (Bulletin 110).

For general water supply, hot water circulating in heating systems, for irrigating, booster or mine service, where the total net head does not exceed 150 ft., this pump is superior, due to the high efficiency obtained.

The prominent features of this type of pump are: Simple construction, single moving element; can be cared for by unskilled labor; no valves to get out of order, and with electricity will operate noiselessly. It is possible to close valve in discharge pipe without serious injury to the pump or driving mechanism. Built for all standard forms of drive.

GOULDS SINGLE STAGE DOUBLE SUCTION CENTRIFUGAL PUMP

Capacities from 4,800 to 480,000 gals. per hour

IMPELLER—Close grained iron, accurately machined to a smooth finish. It is of the enclosed type, so designed as to give high efficiency and make it impossible to seriously overload the motive power under any conditions at the specified speed.

SHAFT—Special alloy steel, heat treated, accurately machined to gauge.

BEARINGS—Removable shells lined with best quality anti-friction metal. They are of the ring oiling type, provided with large oil reservoirs.

STUFFING BOX—Provided with brass water sealing rings, which prevent air entering the pump.

CASING—Close grained iron, divided horizontally, the two halves bolted together, giving easy access to the interior.

HOUSING—Bearings of ring oiling type, mounted in housings bolted to lower half of pump casing. Housings are provided with removable shells, lined with the best genuine bab-bitt which is bored and scraped to fit the shaft.

Centrifugal Fire Pumps (Bulletin 118).

These pumps have all the characteristics that are desirable for fire protection service. They have the indorsement of the Associated Factory Mutual Fire Insurance Companies, Underwriters' Laboratories, Inc., the National Board of Fire Underwriters and the National Fire Protection Association, and have proved by the rigid tests given them to be up to standard in every respect.

ENGINE DRIVEN CENTRIFUGAL FIRE PUMP FOR STAND-BY SERVICE

2-STAGE, NO. 8, 1500-GALLON CENTRIFUGAL FIRE PUMP, ELECTRIC MOTOR DRIVEN

FIG. 3014 TYPE

†Can be arranged for other pressures and speeds.

*Weight includes pump mounted upon extended bed plate and flexible coupling. Does not include weight of motor or other driver.

Multistage Centrifugal Pumps (Bulletin 120).

For pumping installations where the head is greater than can be efficiently dealt with in a single stage, we offer the multistage.

These pumps embody all the latest features, the value of which experience has fully demonstrated.

Where the size of the pump has permitted, the casing is horizontally divided, with the suction and discharge nozzles cast upon the lower half of the casing. This applies to sizes Nos. 4, 5, 6 and 8. The small sizes, Nos. 2-S, 2-L and 3, have vertically divided casings of the sectional type, which are held together by horizontal bolts in accordance with the best practice.

These pumps can be furnished in 2 to 5 stages. The small sizes can be built up to 6 stages.

Deep Well Working Heads (Bulletin 108).

For operating single and double acting deep well cylinders.

FRAME—Consists of two cast iron standards bolted to the base, strongly braced and fastened together with center guide and tie pieces, forming a very rigid construction.

CRANK SHAFT—High carbon open hearth steel, accurately machined to gauge.

BEARINGS—Crank and pinion shaft bearings, babbitt metal.

GEARING—Charcoal iron, machine cut from the solid.

CONNECTING ROD—Strap head with wedge adjustment and bronze box at crank end, and adjustable babbitted boxes at crosshead end.

DIFFERENTIAL PLUNGER—Cast iron, working through an outside packed stuffing box with bolted gland. Furnished with single acting cylinders only.

AIR CHAMBER—Regularly furnished.

GOULDS DEEP WELL WORKING HEADS

Vertical Single Stage Centrifugal Pump (Bulletin 114).

The Goulds new vertical centrifugal pump is made for service in a pit where the water level is at such a depth below the surface of the ground that the ordinary horizontal shaft pump can not be used. The pump is installed in the pit above or below the water level. A steel shaft is extended to the surface, where a pulley is mounted upon it for belt drive. The shaft can also be direct connected to a vertical electric motor at this point.

PUMP MOUNTED IN STEEL FRAME, DIRECT CONNECTED TO AN ELECTRIC MOTOR

GOULDS VERTICAL, SINGLE STAGE CENTRIFUGAL PUMP

Co-operative Service.

Parties contemplating the installation of pumping equipment are invited to present their problems to this organization, which is prepared to assist in selecting the proper and most economical pump for their purposes.

Guarantee.

Every Goulds pump is guaranteed to satisfactorily perform the specific work for which it is sold.

Bulletins.

The following bulletins, any of which will be sent on request, give complete specifications on the various standard types of Goulds Power Pumps:

- No. 100. Double Acting, Single Cylinder Piston Pumps.
- No. 101. Single Acting Triplex Plunger Pumps, Outside Guided Type.
- No. 103. Single Acting Triplex Plunger Pumps, Large Capacity and High Pressure Types.
- No. 104. Double Acting Triplex Piston Pumps, Vertical Type.
- No. 105. Single Stage, Single Side Suction Centrifugal Pumps.
- No. 106. Vacuum and Stuff Pumps.
- No. 107. Deep Well Triplex Pumps.

NEW YORK, N. Y. — PHILADELPHIA, PA. CHICAGO, ILL. KANSAS CITY, MO. SAN FRANCISCO, CAL.

Products.

ROTATING PLUNGER TYPE STEAM JACKETED PUMPS; TURBINE DRIVEN PUMPS; GASOLINE ENGINE DRIVEN PUMPS; ELECTRICALLY DRIVEN PUMPS; BELT DRIVEN PUMPS; STRAINERS.

For Road Oiling Equipment, see page 128; for Friction Clutch Pulleys and Cut-off Couplings, see page 834.

Rotating Plunger Type Steam Jacketed Pumps.

Kinney rotating plunger type steam jacketed pump direct connected by flexible coupling through a turbo type speed reducer to a steam turbine and controlled by emergency pump governor. See Fig. 191.

FIG. 191

KINNEY ROTATING PLUNGER TYPE STEAM JACKETED PUMP

This type of pump and drive is designed for handling all classes of heavy viscous materials, such as asphaltic oils, asphalts, paving pitches, glucose, molasses, tar and tar products. It is equally well adapted for handling materials of a much lighter specific gravity. These pumps are furnished in any size. Prices on application.

Turbine Driven Pumping Unit.

The Kinney marine unit, direct connected to a steam turbine and controlled by an automatic pressure pump governor. See Fig. 181. Both pump and turbine are manufactured by THE KINNEY

FIG. 181

KINNEY TURBINE DRIVEN PUMPING UNIT

MANUFACTURING Co. for use in marine work and are designed for fuel oil and lubricating oil. This pump is built in capacities from 10 gals. per minute at 300 lbs. pressure to 45 gals. per minute at 50 lbs. pressure. The unit is very compact, being self-contained. It is fitted with a lantern type of stuffing box which prevents all packing trouble.

The discharge from this pump is uniform and without pulsation. This feature is of great value in pumping fuel oil to burners for firing marine boilers. Its freedom from pulsation and smooth, uniform delivery insure long life to baffle plates and bridge walls of fire chambers.

Illustration, Fig. 182, shows another type of Kinney turbine driven pumping unit.

A high pressure unit with gear and pinion reduction and pump governor. It is particularly adapted for fuel oil burner systems of any capacity, at a working pressure up to 300 lbs. per sq. in. Prices on application.

FIG. 182

KINNEY TURBINE DRIVEN PUMPING UNIT

Gasoline Engine Driven Pumping Unit.

This gasoline engine driven pump is direct connected through gear and pinion and friction oil bath clutch to the Kinney 100 h. p. 6-cylinder gas engine. It is designed for handling heavy crude oil. See Fig. 192. These units are furnished in any size and capacity and for all kinds of heavy viscous materials as well as lighter fluids. Prices on application.

FIG. 192
KINNEY GASOLINE ENGINE DRIVEN PUMPING UNIT

Electric Driven Pumping Unit.

Pump is connected to a motor by a silent chain. See Fig. 194. It is also furnished gear driven and is adapted for pumping all kinds of heavy viscous materials as well as liquids of a lighter gravity. Prices on application.

FIG. 194
KINNEY ELECTRIC DRIVEN PUMPING UNIT

Steam Jacketed Pumping Unit.

This type is furnished in any size and capacity. The

FIG. 184
KINNEY STEAM JACKETED PUMPING UNIT

illustration, Fig. 184, shows the pump connected through flexible coupling to a vertical, all enclosed type of engine with pump lubrication. This unit has the advantage of great flexibility of speed and variation of capacity. Prices on application.

Belt Driven Pump with Tight and Loose Pulleys.

This type of pump, Fig. 195, is furnished in any size and of any capacity, and is adapted for handling all heavy viscous materials as well as liquids of lighter gravity.

FIG. 195
KINNEY BELT DRIVEN PUMP WITH TIGHT AND LOOSE PULLEYS

Strainers.

Both the plain and steam jacketed strainers are furnished in any size.

The steam jacketed type is particularly adapted for use in connection with the pumping of heavy viscous materials where heat is required to keep the material in a fluid state.

These strainers are of the basket type. When the basket is removed, all insoluble matter is removed with it.

Prices on application.

Development and construction of Ground
Water Supply Systems for Railroad, Mining,
Industrial, Municipal and Irrigation Service.

Layne Vertical Turbine Pump.

The value of a well lies in the economical delivery
of its yield to the desired height or pressure and depends
chiefly upon a pump of known and positive performance.

After much experimenting, LAYNE & BOWLER COM-
PANY perfected a vertical turbine pump suitable for wells
of various depths, the simplicity of design and superior
construction of which have won a marked recognition
from pump authorities.

The Layne vertical turbine pump consists of 3 gen-
eral parts: discharge head, discharge column and bowls
or stages.

The discharge head contains
the power connection, thrust
bearings, adjusting screws, lubri-
cating device, discharge nipples
and base plate.

The discharge column con-
sists of line shaft, shaft bearings,
shaft casing and discharge cas-
ing. The shaft casing and dis-
charge casing together, transmit
to the base plate all the dead load
or weight of the bowls or stages,
where the weight hangs sus-
pended.

The bowls or stages contain
the impellers, diffusion rings,
guide passages and suction. The
weight of the water in motion
through the bowls is transmitted
to the thrust bearings in the dis-
charge head by the line shaft.

In order that the line shaft
may operate under tension, the
Layne vertical turbine pump is
purposely designed to produce
some down thrust.

DISCHARGE HEAD TYPES—

The Layne vertical turbine pump
can be furnished in the following
discharge heads. Oil balance,
for lifts of 300 ft. and over.

LAYNE VERTICAL TUR-
BINE PUMP
Direct connected motor,
high pressure head

TRADE-MARK

Special twin bearing, for lifts not exceeding
350 ft. Standard ball bearing, for lifts not
exceeding 150 ft.

Oil Balance Head—The oil balance head
has made possible the lifting of water from
depths of 400 to 500 ft. without undue fric-
tion and resultant wear on bearings. In this
design the entire weight of shafting, impellers
and water discharge is carried on a film of oil.
The design is very simple with all parts located

above the surface and readily accessible. It can be
adapted to any lift regardless of depth or quantity of
water to be handled.

The head is constructed with a series of pistons or
pressure plates rigidly attached to the pump shaft at re-
quired intervals, which rotate with the shaft. An oil
pump is also connected to the pump shaft by means of
rawhide and steel gears. As the main pump shaft
revolves, the oil pump forces oil to the underside of the
rotating pistons and there builds up a pressure inside the
piston casing sufficient to lift the shaft with its entire
load a fraction of an inch in height and forms an oil
cushion or film underneath each piston, upon which they
float.

A thrust collar at top of shaft operates on ball
bearings; is adjustable by thumbscrews, and fixes the
height to which the shaft may be raised for proper
clearance of the impellers in the bowls.

A pressure gauge and regulating valve are provided
in the oil line, so that, by means of a thumbscrew, the oil
pressure may be regulated to any amount necessary to
carry all or a part of the load or weight.

An oil tank or reservoir is located in one or more of

CHARACTERISTIC CURVES OF 15-INCH TURBINE PUMP OPER-
ATING AT CONSTANT SPEED OF 1125 R.P.M.

the arch legs, cast hollow, with circulation from the bearings provided by means of an overflow valve from pressure regulator. The upper thrust collar bearing is lubricated by sight feed cup. Overflow from bearings is connected with oil reservoir. In a belted head, two annular ball bearings are placed one above and one below the pulley, to reduce the friction on bearings due to the belt tension.

Special Twin Bearing Head—This type head designed for lifts not exceeding 350 ft. Consists of two separate, self-aligning ball thrust bearings, so arranged as to equalize on each the entire weight of the shafting, impellers and pump discharge. An adjusting device near the top of shaft takes care of impeller clearance in the bowls.

Forced lubrication to all bearings is provided by means of centrifugal circulating oiler connected to main shaft with oil flow indicator near top of head. In belt driven type, special provision is made for the thrust due to the belt tension.

This is a neat, compact assembly with all parts readily accessible at the ground surface, well proportioned and with ample bearing area to support the entire load without undue friction and wear.

Standard Ball Bearing Head—Furnished for all high pressure work on lifts not exceeding 150 ft. and standard for average conditions. It consists of a self-aligning ball thrust bearing to carry the entire weight of all moving parts, as well as weight of water discharged. An adjustable collar at top of shaft provides for impeller adjustment.

Lubrication is furnished by sight feed oil cups at top of pump. Bearing is housed, with overflow chamber provided to prevent leakage and waste of oil.

Heads for Special Conditions—Where the pumping problem presents unusual conditions the LAYNE & BOWLER COMPANY are prepared to design and build special types of heads to meet such conditions.

Power Connection—Any type head manufactured by this company can be fitted for direct connected motor, direct connected steam turbine or belt drive. Direct connection for motors and turbines are made with flexible couplings of the Layne & Bowler manufacture.

Angle of Discharge—All style discharge heads can be fitted with any of the following angles of discharge without extra charge.

Open Surface: Angle of discharge nipple 60° or 90° off the vertical.

Above Ground: For working against medium pressures. Angle of discharge nipple 60° or 90° off vertical.

Below Ground: For working against high pressures. Angle of discharge nipple 90° only.

DISCHARGE COLUMN—The patented enclosed line shaft embodied in the discharge column is distinctly a Layne feature and is covered by valid patents already upheld by court decisions.

The main pump or drive shaft is surrounded or enclosed with a standard steel casing, which extends from the discharge head to the bowl. The shaft casing is in sections 6 ft. 8 in. in length, connected by threaded bronze bushings which serve the two-fold purpose of casing couplings and lateral shaft bearings.

At the discharge head the shaft casing is connected to the base plate by means of an increaser nipple, which provides annular space around the shaft. The increaser nipple is packed against internal pressure at the surface and bored for oil pump connection.

Lubricating oil is forced into the shaft casing and completely fills the annular space between the shaft and casing for its entire length from discharge head to the bowl. The lower end of shaft casing is sealed against leakage of oil and admission of sand, grit or other matter by a reducer nipple connected to the guide bell in the initial bowl of stage.

In this manner the shaft for its entire length, with all shaft bearings, is thoroughly lubricated by immersion. In fact, the shaft operates in oil at all times, preventing the bearings from becoming heated.

Shaft diameters range from 1½ in. to 3½ in., and shaft casing diameters from 2½ in. to 6 in.

By its connection with the base plate, the shaft casing is made to carry a portion of the weight of the bowls. This weight keeps the shaft casing under tension and adds stiffness to it, which operates to overcome any lateral vibration in the main shaft.

The enclosed line shaft feature prevents any water or sand coming in contact with the shaft or shaft bearings and makes it possible for the pump to operate where grit and sand must be handled.

Water leaves the bowls in the Layne turbine pump with uniform stream line motion and passes to the surface without the creation of eddies at shaft couplings or shaft bearings, as these are all enclosed in the shaft casing, which presents a smooth exterior at each joint. This is important, as it materially reduces the frictional losses in the discharge column.

Discharge Casing—It is made up of standard lap welded casing and standard pipe sizes from 7 to 16 in., dependent upon capacity. Casing couplings are threaded in the 12-in. pump, but flanged in all larger sizes.

The discharge casing is connected at its upper end with base plate and at lower end with pump bowls. In this manner all dead weight in the well is suspended from the base plate, the shaft casing carrying a part, but the discharge casing the greater amount.

Additional protection against shaft vibration is afforded by setting light weight brass spiders in the discharge casing at each joint.

All surfaces in contact with water are reduced to a minimum, consistent with strength, and are carefully machined and hand finished.

BOWLS OR STAGES—Layne vertical turbine pumps are manufactured in standard bowl sizes, having outside diameters, including oil line, from 11⅝ in. to 28½ in., and in larger diameters on special order. Bowls in all sizes are made of best grade cast iron and hand finished. Diffusion rings and guide passages are carefully smoothed to cut down friction losses.

Multistages—Layne turbine pumps, in all sizes, can be furnished in any number of stages to meet any capacity against any head. All bowls or stages nest together and are suspended from the base plate by means of discharge casing and shaft casing.

The weight of main shaft, impeller shaft, impellers and part of the down thrust of the water discharged is carried by the thrust bearings in discharge head. No

DISCHARGE COLUMN
Showing enclosed line shaft (patented)

support is derived through any attachment to the well or pit casing.

Suction—All Layne turbine pump bowls are manufactured with bottom suction, made by bolting a tapered flange nipple onto the bottom of last stage. They are guaranteed to operate under 20-ft. suction lift below bottom of lower stage, and it is the Layne & Bowler practice to fit them with a perforated suction pipe 20 ft. in length. The perforations act as a strainer to exclude the entry into the pump of any debris which might possibly choke the impeller or guide passages.

Impellers—They range in capacity from 250 to 6000 g.p.m. and are made both in gray iron and bronze, the former being preferred on account of longer life, although the bronze impeller develops slightly better efficiencies.

The closed type bottom suction impeller is used in all high efficiency pumps. All water passages are hand finished and polished to cut down skin friction. Extreme care is exercised in the balancing of the weight of all impellers, as in that feature rests the life of the installation. A slight adjustment in impeller clearance is all that is required, and this is made in all discharge heads at top of shaft by an adjusting nut.

The impeller or runner shaft has two bearings, one in the initial stage and the other in the suction nipple which bolts on to the lower stage. Lubrication for the upper bearing comes from the enclosed line shaft; while the bottom bearing is supplied from the surface by a separate oil line made of $\frac{1}{4}$ -in. pipe, placed on outside of bowls and discharge column and tapped into suction nipple.

PUMP SPEEDS—Layne turbine pumps are designed to operate at speeds from 800 to 1200 r. p. m. in direct connected motor and steam turbine driven units. Where 25 cycle current is encountered, the smaller size pumps may be operated at 1455 r.p.m. For belt driven units, speeds range from 600 to not exceeding 1000 r.p.m.

Direction of rotation in all pumps is left-handed or anticlockwise.

Layne Patent Shutter Screen.

This water screen is designed especially for large bore wells or for installations where large supplies of water are required. It is made of non-corrosive copper bearing steel plate, perforated in staggered louver form with $\frac{1}{2}$ -in. blank spaces left between vertical rows of openings, which gives unusual strength against collapse.

The shape of the perforations with the overhanging lip or shield prevents water from passing horizontally from the water bearing strata into the well tube and causes an upward flow at a much lower velocity than found in any other type of screen. With properly proportioned gauge of screen openings a velocity is obtained through the screen which is so slow as not to carry in suspension any of the sand or gravel from the surrounding medium. Matter that is in suspension is dropped at the screen as the water flows upward through the opening and is deflected downward outside the walls by the shape of the screen opening.

The Layne patent shutter screen is made in diameters from 8 to 36 in. in No. 10-gauge plate and 10 to 40 in. in No. 8-gauge plate, and in 5-ft. sections, unless otherwise specially ordered. It may be riveted together in continuous lengths to fit any thickness of strata. The size or gauge of openings range from .018-in. to $\frac{3}{16}$ -in.

VERTICAL CONE BOTTOM—To facilitate the setting of

the shutter screen, a vertical cone bottom is furnished with it, perforated in the same manner and constructed of same gauge metal. The cone has a cylindrical cutting edge at its lower end, which serves to guide the screen vertically downward through the water bearing material and prevents the tendency to deflect when an uneven formation is encountered.

Vertical cones are furnished with top diameter to correspond to diameter of shutter screen and bottom diameters from 6 to 12 in. larger.

SHUTTER SEAL—Where the vertical cone can not be sealed against a hard stratum so as to prevent the entry into the well tube of sand, gravel or other material, a shutter seal with either solid or perforated bottom is inserted through the well tube into the shutter strainer, driven into position at bottom of same and locked against upward movement by pressure. The shutter seal is perforated in same manner as the shutter screen to admit the free flow of water, but all the sand or gravel from the bottom is excluded.

The shutter seal is furnished in diameters to correspond to shutter screen sizes and in 5-ft. lengths.

RIVETED PIT OR WELL CASING—This company manufactures riveted pit or well casing in all diameters from 8 to 40 in. It is made from Nos. 6-, 8- and 10-gauge plate of ingot iron, open hearth, charcoal or copper bearing steel, in 5-ft. lengths, and with single, double or butt lap riveted joints.

The anticorrosive quality of the steel selected for the manufacture of this well casing insures longevity for wells constructed by this company.

Gravel Wall Wells.

Actual tests have proved that many wells would produce from 3 to 4 times their yield if a scientifically designed screen were installed. It is now firmly established that the value of the well is in the screen. Gravel wall wells equipped with shutter screens are far superior to any other type in yield, in durability, and in low maintenance cost.

CONSTRUCTION AND OPERATION—A circular hole of diameter 16 in. or larger is drilled with rotary machine through the top formation to water bearing stratum. In this is set the pit or riveted casing, built up of 5-ft. sections riveted together, which extends from ground surface into the water bearing stratum any distance found desirable.

The thickness of the water bearing stratum having

SHUTTER SCREEN
Showing vertical cone
bottom

GRAVEL WALL
WELL
Composite view showing
method of construction

been predetermined from test hole, the shutter screen with vertical cone bottom, of required length, is riveted together into one continuous section. The bottom diameter of vertical cone is proportioned to fit the inside of the pit, the top diameter to fit the shutter screen, and the diameter of and opening in shutter screen to meet the character of material found in water stratum, as well as the demand to be made on the well.

The screening section is placed in the well with vertical cone resting at top of water stratum, the intervening distance between top of screen and ground surface being filled out with false or temporary casing. Gravel is fed into the annular space between screen and pit and the screen bailed to final position in water stratum. The next operation is to continue simultaneously the feeding of gravel and the pumping out of loose sand, gravel or other material, which operation is continued until well takes no further gravel and until water clears of sand. Then the false casing connecting the screen with the surface is removed, the shutter seal driven into position through cone and well tube sealed against any upward flow of material from the bottom.

Keystone Wire Wrapped Screen.

This type screen is especially adapted for deep oil or water well work where several water bearing strata may be encountered but at widely separated intervals. The quality of water in some of these may be found satisfactory, while in others it may be highly mineralized and unfit for use. The Keystone screen can be connected at any point in the well casing by special coupling devices manufactured by this company, so that the flow from any number of strata may be combined or excluded, as conditions may warrant.

CONSTRUCTION—Keystone wire wrapping screen is manufactured of perforated pipe wrapped spirally with brass or heavily galvanized tempered steel wire, rolled in shape of a keystone, the narrow edge of the keystone being wound next the pipe so that a smooth exterior is presented.

The pipe is perforated in special drill presses, in such a manner as not to cause an appreciable weakening in the material. The perforations are $\frac{3}{8}$ in. in diameter and in vertical, staggered rows $\frac{3}{4}$ -in. center to center.

The wire is wound and spaced accurately to form openings between successive turns from 5/1000 of an inch to any width which conditions may call for. The wire is attached to the pipe by vertical rows of solder $\frac{1}{2}$ in. in width and is finished off at start and finish with

a steel collar shrunk over each end of the wire. By the use of the electric weld, the ends of the wire are welded to the part already wound on the perforated pipe and forms a continuous wire from one end of the screen to the other.

Intake area in any screen is paramount. Keystone screen offers a maximum separating area which admits water at lower velocities than other types of screens. The spiral winding of the keystone shaped wire connects laterally all perforations in the pipe core, so that water must travel only a minimum distance to enter the well tube.

Keystone screen will not sand, jam or clog. Anything passing the space formed by the knife edges at the outer surface of the screen will pass through the perforations in the pipe and be pumped out. Any incrustation or lodgment does not totally exclude inflow, as water passes around and under the obstruction to some perforation, through the continuous "V"-shaped space formed by the successive windings of the keystone shaped wire. Keystone screen may be removed, cleaned and replaced in the well without injury to the screen.

It is regularly made in all standard well casing and pipe sizes ranging from 2 to 12 in., and in larger diameters on special order. Pipe stock is either standard black or galvanized finish. Screen lengths conform to random pipe lengths, but may be cut to any intermediate length before winding, if desired. All attachments, such as lead packer, ratchet lead packer, threaded top connection, threaded coupling, open ring bottom, back pressure valve, bottom bail, etc., can be furnished for Keystone screen. Other and special attachments to meet unusual conditions can be designed and furnished on application.

Construction Contracts.

In the contracting field, LAYNE & BOWLER COMPANY has built up an enviable reputation as one of the largest and foremost developers and constructors of ground water supply systems. Since the founding of the company the fixed policy of "no water no pay" has been the basis of all well construction contracts entered into by this company.

LAYNE & BOWLER COMPANY has a most efficient line of well products, modern well drilling machinery in charge of expert drillers, and experienced civil, hydraulic and mechanical engineers to examine into and pass upon soil conditions.

LAYNE & BOWLER COMPANY proposals, which are thorough engineering reports, not mere price quotations, cover fully the clients' requirements. They treat of all the engineering, operating and maintenance problems involved and include plans and estimates of the types of installations best suited to requirements, also comparative costs of operation and maintenance under variable service conditions. Such reports are the result of care and study by expert engineers whose designs and conclusions are in accord with approved practice.

Guaranteed Results.

The reputation and future prestige of the company are behind every undertaking and an additional security of a surety bond to the amount of the contract is offered to substantiate the company's guarantee to deliver the maximum possible amount of water per 24 hours. This confidence is due to the scientific precision of design and masterly execution that constitutes LAYNE & BOWLER COMPANY's service. Mistakes and the element of chance are eliminated, because the company investigates first and drills last.

PERFORATIONS THROUGH WIRE

LEA-COURTENAY COMPANY

Manufacturers of Centrifugal Pumping Machinery

15 Maine Street
NEWARK, N. J.

BRANCHES IN PRINCIPAL CITIES

Products and Services.

CENTRIFUGAL PUMPS which include: Double Suction Single Stage Pumps; Single Suction Multistage Pumps; Underwriters' Fire Pumps.

LEA-COURTENAY COMPANY maintains a corps of engineers who are experts in their line. Their services are available, without obligation, for the solution of pumping machinery problems and for the selection of pumps which will properly fulfill requirements. Lea-Courtenay pumps are manufactured in standard sizes, all parts being practically interchangeable. Impellers, however, are always made to suit individual conditions.

Description.

Lea-Courtenay pumps are furnished with motor, turbine and gasolene engine drive; with capacities from 100 to 7500 gals. per minute, at any head up to a total head of 1000 ft. They handle hot and cold liquids of any consistency; are made of cast iron and of special bronze mixtures for mine water.

Tests.

To prove their ability to perform the service for which they are intended, all pumps made by this company are subjected to severe and rigid tests in a separate test plant, equipped with the most modern appliances, including a complete set of Venturi meters. Pumps are tested under actual service conditions; i. e. for boiler feed work, the pumps are tested with hot water at the temperature for which the pump has been ordered, and with a total head on the suction side to correspond exactly with that the pump is to work against.

FIG. 325. TESTING A LEA-COURTENAY 8-IN., 5-STAGE, ALL-BRONZE PUMP—ONE OF TWO FURNISHED A LARGE PENNSYLVANIA COAL COMPANY

Note the variable speed turbine, special reduction gear set and the Swiss torsion dynamometer

In testing all pumps a Swiss torsion dynamometer is used, which this company considers the only accurate means of measuring brake horsepower. It is more definite than a curve made by a motor manufacturer which is correct for one speed and load only and which requires

allowances for different conditions. By the Lea-Courtenay method of testing, the actual brake horsepower is secured on every individual pump that is shipped from the plant.

Lea-Courtenay Single Stage Pumps—known as Double Suction Volute.

Designed with and without diffusion vanes. The main case consists of only two parts and is horizontally split, with the suction and discharge always in the bottom half so that the top half may be easily removed without disturbing the suction and discharge pipe connections. All parts are easily accessible and pumps are bronze fitted throughout. On account of the double suction type of impeller taking water from both sides, this type of pump works in almost perfect hydraulic balance and is free from end thrust.

FIG. 474. LEA-COURTENAY 12-IN. DOUBLE SUCTION VOLUTE PUMP DIRECT CONNECTED TO 400 H. P. MOTOR
Delivering 4500 gals. per minute against 241-ft. head at 1750 r.p.m.

Double suction volute pumps are adaptable for a large range of uses. For irrigation and reclamation service, where large quantities of water are to be raised to moderate heads, they give excellent service. In power plants, they are used to advantage with steam turbine drive for general service against moderate pressures. Large packing houses are also using both steam turbine and motor driven single stage pumps for circulating brine. In large hot water heating plants the single stage pump fulfills all requirements for circulating water.

FIG. 431. LEA-COURTENAY 12-IN. PUMP WITH WATER COOLED MARINE THRUST BEARING AND WITHOUT DIFFUSION VANES
Desirable for heads up to 200 ft.

Single stage pumps have been built by this company for heads as high as 250 ft.; without diffusion vanes; running at 1750 r.p.m. This makes a very desirable pump for water works where motor drive is the chief form of power.

Lea-Courtenay Single Suction Uniflow Pumps.

These single suction multi-stage pumps (without diffusion vanes) made by this Company differ from Lea-Courtenay single suction turbine pumps in that they have well defined volutes at each and every stage.

Intake up to impeller is almost identical with other types of single suction pumps made by this company, but when the water leaves the impeller, instead of being guided into the second impeller by return passages constructed with vanes of various types, it is simply discharged into a volute, practically the same as in the double suction volute pump, and is led into the second wheel without shock loss. Velocity head is transformed into pressure head in such a manner that an extremely high efficiency is obtained.

The hydraulic balancing features of Uniflow pumps are fully described in a special bulletin, H-4.

Lea-Courtenay Single Suction Turbine Pumps.

These pumps consist of a series of side suction impellers mounted on one shaft, the oldest and best known type of multi-stage pumps.

The design has been perfected to such a point that pumps can be built with practically no end thrust and give perfect satisfaction without a marine thrust bearing.

FIG. 516. LEA-COURTENAY 4-STAGE BOILER FEED PUMP, DIRECT CONNECTED TO STEAM TURBINE
Designed to deliver 400 gals. per minute against an 800-ft. head

Lea-Courtenay Centrifugal Fire Pumps.

Built in accordance with specifications of the Associated Factory Mutual Fire Insurance Companies, National Board of Fire Underwriters and National Fire Protective Association, covering requirements for a simple and absolutely dependable fire pump, operated by means of power secured from outside sources.

FIG. 786. LEA-COURTENAY STANDARD 1000-GAL. MOTOR DRIVEN UNDERWRITERS' FIRE PUMP
Designed for all pressures and built on National standard specifications. Has been approved by all Underwriter Boards

In addition to the standard pump shown, special designs have been developed and are in service, meeting requirements of local ordinances.

FIG. 473. LEA-COURTENAY SPECIAL SELF-CONTAINED GAS-OLINE ENGINE DRIVEN PUMP UNIT

One of a number furnished to the United States Government for salvaging ships. Very desirable for emergency pumping of various kinds. Two of these units are now in use in Norfolk, Va., pumping 11,000 gals. of water a minute to meet temporary needs of the city water supply

Fire pumps installed, if desired, and advice given as to requirements which must be met in any part of the country and any auxiliary apparatus to meet requirements of installation.

A specially designed fire pump unit, gasoline engine driven, has been perfected for isolated conditions where only one source of power is available, either electric or steam turbine, and where it is necessary to have a standby unit. This unit is accepted by the underwriters for special requirements.

FIG. 789. LEA-COURTENAY SELF-CONTAINED GASOLINE ENGINE DRIVEN FIRE PUMP UNIT

Delivering 1000 gals. under 100 lbs. pressure at 1200 r.p.m. Complete with self-starting equipment

FIG. 476. LEA-COURTENAY 10-IN. PUMPS ARRANGED IN SERIES

Delivering 3000 gals. per minute against 180 lbs. pressure. This arrangement is very desirable where gritty water is handled at extremely high heads or under conditions where a hydraulically balanced pump could not be used, yet where a pumping unit of very high efficiency is required

LAMMERT & MANN CO.

Manufacturers of Rotary Vacuum Pumps; Engineers and Machinists

TELEPHONE:
WEST 4918

Wood and Walnut Streets
CHICAGO, ILL.

Products.

LAMMERT ROTARY VACUUM PUMPS, Air and Water Cooled for any high, dry vacuum service and pressure up to 25 lbs.

LAMMERT PRESSURE PUMPS.
Water Cooled Rotary Blowers.

TRADE-MARK

Lammert Pumps.

Lammert rotary dry vacuum and pressure pumps are made in a variety of types and sizes to meet the numerous service requirements.

For the past twenty years LAMMERT & MANN Co. have been making vacuum pumps and some of the largest concerns in America are using them with absolute satisfaction. They have demonstrated by actual on-the-job performance their superior adaptability in meeting the exacting requirements of the work for which they were designed.

Wide Range of Uses.

LAMMERT VACUUM PUMPS—Used for canning, preserving, milking, in chemical laboratories and for many varied special purposes where high, dry vacuum is required.

They are also adapted to the priming of centrifugal pumps, for which we have our automatic control.

LAMMERT PRESSURE PUMPS—Used for agitating liquids, cleaning generators, for machinestops and any service where pressure up to 25 lbs. can be used.

Distinctive Features.

Lammert pumps are dependable, economical and require the absolute minimum of attention. The oiling systems are flawless. The air cooled and small water cooled pumps are equipped with the capillary type of oiling—oil fed to the bearings and all moving parts by capillary attraction—very economical and efficient. The

large pumps are equipped with automatic oilers which deliver a constant flow of oil to the internal mechanism through the bearings, after which the oil is separated from the exhaust air and returned to the oil chamber to be used over and over again. This feature not only reduces the operating cost, but also cuts the attention required to the mini-

mum.

The smaller pumps may also be equipped with the automatic oiling feature, if desired.

Advantages.

There are no valves to stick, no pistons to wear, no cranks or connecting rods to complicate the working parts and consume power.

Lammert pumps are simple, compact and require little floor space.

They are quiet running without vibration. All parts are standard and interchangeable and each part is rigidly inspected and every pump is tested to its full rated capacity.

Every Lammert pump carries a full guarantee against faulty workmanship or material.

Types and Relative Vacuum Ratings.

Lammert pumps may be had air or water cooled, belt or motor driven. The air cooled pumps are designed for intermittent service and will develop a 26-in. vacuum at sea level. The water cooled types are for continuous duty and will easily maintain a 27½-in. vacuum at sea level.

The two-stage, high duty vacuum pumps are guaranteed to maintain a vacuum within ½ in. of the barometer and can be made to do within 1/10 in.

For special requirements various arrangements can be made to accomplish the desired result, such as "unit combination vacuum and pressure," etc.

Motor Driven Type
For continuous duty. Equipped with automatic oiler

Air Cooled Belted Type
For intermittent service. Capillary oiling

Water Cooled Belted Type
For continuous service. Capillary oiling

Two-stage Belted Type
Equipped with automatic oiler. Highest vacuum

LUITWIELER PUMPING ENGINE CO.

123 Ames Street
ROCHESTER, N. Y.

PACIFIC COAST BRANCH, 707 North Main Street; LOS ANGELES, CAL.

Products.

The LUITWIELER SYSTEM of NON-PULSATING PUMPING MACHINERY: DEEP WELL and TRIPLEX POWER PUMPS; HYDRO-PNEUMATIC PRESSURE SYSTEMS.

Scope of Use.

The Luitwieler system of non-pulsating pumping machinery is in use by city, village and corporate water works, private water supply, railroad tank service, cotton mills, chemical works, mines, manufacturing plants, irrigation, and all general and special purposes for which pumps are used, and particularly where it is desired to entirely eliminate pulsation, noise, jar, pound, vibration, etc.

Pumping Deep Wells With Electric Power.

Where electric energy is obtainable it is economically used as a driving power. Luitwieler pumping machinery consumes very little current; and the evenness and steadiness of load adapts it particularly to drive direct connected to motor by gearing.

Electrically operated pumps can be controlled automatically by float switch or pressure control so that little attention is required.

A large percentage of Luitwieler pumps are driven direct connected to electric motors.

PISTONS—The two pistons in the single working barrel are operated by pump rods which are balanced and of equal weight. One piston rod is hollow, and the other piston rod is solid. Each rod is attached to a yoke having an upper and lower roller. The cams, rotating against these rollers, move the yokes and pump rods up and down uniformly. The shape of the cams is such that before one cam stops lifting, the other cam takes the load. This makes the water movement continuous, without the pulsating action found in crank and steam pumps. No check valves are required, as the pistons keep the water moving continuously in a solid stream.

SIMPLICITY—The Luitwieler non-pulsating pump

has few parts, only about one-third the number found in the average pulsating pump on the market.

Unlike most deep well systems, it is not necessary to dismantle the pump in any way, not requiring the removal of shafts or gears, nor changes to the alignment of the working parts, which would require a skilled mechanic to realign, when installing.

It is therefore, possible with the Luitwieler pump, if necessary to make repairs, to disconnect the rods, slide the head back on the sliding rails, and begin the operation of pulling out the rods in a few minutes.

ELECTRICALLY DRIVEN DEEP WELL PUMP

The illustration herewith shows the method of connecting pistons and rods to pumping engine. The solid rod is connected to right-hand cross head at top and the hollow rod is connected to left-hand cross head at bottom. Rods are in line with center of well.

Working barrel may be located at any desired point at which the pistons are submerged when pumping. Such submergence should be not less than 5 ft., and sometimes 20 ft. is desirable. The self-contained feature is highly desirable and a satisfactory one.

Automatic Pumps.

The Luitwieler automatic system of water supply is particularly desirable for the farm, suburban home, hotel, asylum, industrial plant, municipality, etc. Special attention has been given both to the open tank and to the closed tank (hydro-pneumatic) systems.

The system is equipped with self-starters for both A.C. and D.C. motors; diaphragm pressure regulator or gage type pressure regulator; float switch in either closed or open type, and other necessary devices for the automatic operation of these pumps.

THE JOHN H. McGOWAN COMPANY

Steam and Power Driven Duplex Pumps for all Uses

CINCINNATI, OHIO.

Products.

DUPLEX STEAM and POWER DRIVEN PUMPS for all uses; DEEP WELL POWER HEADS.

Elevator and Water Works Pumping Engines; Electric Pumps furnished with all customary forms of drives in Mounted Motor and Extension Base Types.

TRADE-MARK

Specifications.

Complete specifications covering detailed construction will be furnished with all proposals for special equipment and for standard steam and power driven pumps when requested.

Installation Diagrams.

All bulletins relating to McGowan duplex steam or power driven pumps have the installation diagrams incorporated for the convenience of the buyer in planning their location.

Duplicate Parts

All McGowan duplex pumps are built on the interchangeable system, through the use of modern jigs and templates, except with regard to the final fitting necessary in the installation of large duplicate parts of pumping units, because of the variations in castings due to usual foundry practice.

McGowan Duplex Steam Pumps.

The valve plate design of duplex steam pump is built in the packed piston and outside center packed plunger patterns in all commercial sizes having fluid ends $8\frac{1}{2}$ by 12 in. and smaller. They represent a high standard of pump construction, which insures a decided reduction in the cost of maintenance and improvement in pump service, due to the following special features of construction:

FIG. 295
MCGOWAN DUPLEX STEAM PUMP

SPECIAL FEATURES OF CONSTRUCTION—(a) Steam piston—one-piece box type.

(b) Cross head—spool form, permitting rotating of pistons.

(c) Renewable cross head wipers, which avoid expense of the replacement or the refitting of the cross head end of rocker arms, as required in the solid rocker arm construction.

(d) Piston rod packing nuts fitted with brass swiveled glands, which prevent corrosion and permit of the adjustment of the packing nuts without disturbing the packing as in the fixed gland type.

FIG. 331
MCGOWAN DUPLEX STEAM PUMP

(e) Threaded packing boxes screwed into the inner heads of pump cylinders, obviate the necessity of housing gaskets on the pump end.

(f) Adjustable packed pistons in all pumps of the packed piston pattern, which permit the adjustment of the piston follower to compensate for wear of packing.

(g) Brass bushed plunger packing box neck rings in all outside center packed plunger pumps, which obviate the reboring of the packing boxes when repairs to the plungers are necessary. These repairs may be made without removing the pump from foundation.

BULLETINS—

No. 601 relates to packed piston boiler feed and general service pumps.

No. 602 relates to packed piston tank or lower service pumps.

No. 603 relates to outside center packed boiler feed or general service pumps.

No. 604 relates to packed piston automatic feed pumps and receivers.

FIG. 439
MCGOWAN DUPLEX STEAM PUMP

McGowan Duplex Power Pumps.

The valve plate design of the duplex power pump is built in the packed piston and outside center packed plunger patterns, the sizes corresponding to the pump ends used in the McGowan duplex steam pumps of the same design, and are interchangeable with them. They represent a line of commercial duplex power pumps adapted for all modern types of drives and have incorporated in their construction the following special features:

SPECIAL FEATURES—(1) The frame combines the packing box yokes, cross head guides, main and pinion shaft bearings and pedestal. The main and pinion shaft bearings are jig babbitted with high grade babbitt metal, which process assures perfect alignment of bearings with respect to each other and with respect to the cross head guides.

(2) Cross head, plunger or sleeve type, which over-travels the cross head guides at each end of the stroke and overcomes the pressure and wear indispensable with the use of the adjustable cross head. The bearing pressure per square inch is less than half that on the adjustable cross head due to the fact that the sleeve or plunger type of cross head furnishes a complete and uniform bearing throughout its entire length.

(3) Crank shafts, center crank type, made of high carbon cast steel and of such proportions as to adapt them for the maximum plunger loads with minimum strain on the main bearing caps.

(4) Connecting rods made of high carbon cast steel, equipped with the babbitted marine type of bearing at the crank end and brass bushed box at the cross head end. A lubricating channel is cast in the connecting

rods for lubricating both the cross head and crank bearings by means of compression grease cups communicating with the lubricating channel at the crank end.

(5) Gearing machine cut from the solid castings and provided with rear guards at meshing points of such form as may be readily removed for inspection or renewal of gears.

(6) Bed plates are supplied for all self-contained side or end motor mounted units.

BULLETINS—No. 801 relates to packed piston general service pumps.

No. 802 relates to packed piston tank or low service pumps.

No. 803 relates to outside center packed general service pumps.

No. 804 relates to packed piston automatic feed pumps and receivers.

McGowan Deep Well Power Heads.

For service in connection with single or double acting working barrels for tubular wells, or for service in connection with independent pump cylinders in open wells; adapted for the use of either the plunger rod or the displacement plunger. The former is used invariably in connection with double acting working barrels, and frequently in connection with single acting working barrels for surface discharge; the latter is used only in connection with single acting barrels, the size of the displacement plunger being governed by the size of the working barrel used.

FEATURES OF DESIGN—(a) Regularly built for trench line and surface discharge, through the provision of cast iron extension pieces at either side, as shown by the illustration. The extension pieces corresponding in height to that of the discharge tee, the foundation bolts extending through the extension pieces and the base of the power head to effect proper rigidity in its installation, when so equipped.

(b) Its adaptability for a variety of driving combinations; to illustrate: the belt driven deep well geared power heads may be equipped with (a) single driving gears; (b) double driving gears; (c) single driving pulley; (d) tight and loose pulley; (e) flywheel driving pulley, and (f) counterbalance weights on main driving gears. The direct connected deep well power heads may be equipped with (1) single driving gears; (2) double driving gears; (3) standard intermediate gears; (4) flywheel intermediate gear; (5) counterbalance weights on main driving gears.

(c) The solid cast iron frame construction combining the base, cross head guides, main and pinion shaft bearings; being of the column design, all vibration common to the built-up frame construction is overcome. All frames are so proportioned as to permit the double gearing of the power head without change of pattern. The opening in the base permits the removal of the packing box head, which surmounts the discharge tee.

FIG. 374
McGOWAN DUPLEX POWER PUMP

(d) Jig babbitted main and pinion shaft bearings, which process insures perfect alignment of bearings with respect to each other and with respect to the cross head guides.

(e) Gears are machine cut from the solid, and of ample strength for maximum plunger loads. Cast or wrought iron guards are provided at the meshing point of all gears, and are of such form as may be easily removed for the inspection or renewal of gears.

(f) A winding spool may be provided on the pinion shaft to afford a convenient means of raising and lowering the well parts when the connecting rod and packing box head are removed from the power head.

(g) The connecting rod is of open hearth steel I-beam section, finished with a standard babbitted bearing at the cross head and babbitted marine type bearing at crank end.

(h) The cross head is equipped with adjustable cross head shoes, conforming to the bore of the cross head guide to regulate the alignment and to provide for compensation of wear. The lower section of the cross head is provided with a lubricating chamber to effect submergence of the cross head pin.

OPERATION—The single geared deep well power heads are intended for installation in connection with wells where the water load does not exceed $\frac{1}{2}$ h. p. for the 10-in. stroke, $7\frac{1}{2}$ h. p. for the 16-in. stroke and 15 h. p. for the 24-in. stroke. Double gearing on deep well power heads permits an increase of 100% in the maximum horsepower allowed for single geared deep well power heads.

To insure the fullest degree of economy possible in the operation, the plunger load should be equalized as far as possible through the provision of proper plungers, gearing and counterbalance weights.

BULLETIN—No. 401 relates to deep well power heads.

McGowan Duplex Special Service Pumps.

Built in either packed piston, inside packed, outside center packed or ram patterns for all usual duties, in simple, compound and triple expansion types. The water works pumping engines are built in all capacities up to 5,000,000,000 gals. per day. Specifications and proposals furnished to conform to specified conditions.

HYDRAULIC DREDGES; DREDGING PUMPS: Steam, Belt or Electric Motor Driven, Lined or Unlined.

DREDGING AND PUMPING ACCESSORIES: Suction Hose; Ejectors; Flap and Foot Valves; Iron Elbows; Suction and Discharge Pipe; Flanges and Increasers.

STANDARD CENTRIFUGAL PUMPS for handling Water or Sewage: Belt, Steam, Turbine, Electric or Gasoline Motor Driven; Horizontal or Vertical Shaft; Submerged or Side or Double Suction Type; Single Stage or Multi-stage; Low or High Lift; High or Low Pressure; Horizontal Split.

Steam Engines: Single Cylinder Stationary and Marine Type, Single Cylinder, Compound, Triple Expansion, Vertical and Horizontal Types.

Special Centrifugal Pumping Outfits can be furnished complete, including driving engine, turbine or motor, or the pump only, adapted to engine or motor furnished by customer.

Experience.

During the 56 years devoted to this line of work, Morris experience has covered all services for which centrifugal pumps are used. Over 60,000 Morris pumps are in service in this country and abroad.

Hydraulic Dredging.

The hydraulic or suction dredge has been proved to be the most economical in handling sand, gravel, silt, mud, clay, loam, etc.; in fact, all classes of material, except solid rock. It not only dredges the material, but, with one operation, also delivers it to the desired point, and, besides, no other type dredge has the enormous capacity of some hydraulic dredges that are in service. The cost of the dredge, considering its capacity, is less than any other type. Morris dredging pumps have, in the Government dredges on the Mississippi River, handled over 3,000 cu. yds. of material per hour.

In operation, the dredging pump creates a partial vacuum in the suction pipe, producing a strong velocity of water in it, sufficient to draw in the material and keep it moving; the pump also produces the pressure necessary to force through the discharge pipe line to distance desired, and at the same time elevates to reasonable height.

Where the sand and gravel lie loose and the suction force of the pump is sufficient to draw it into the pipe without the aid of an agitator, the dredge becomes exceedingly simple. It consists principally of the dredg-

20-IN. DREDGE

ing pump with its driving equipment mounted on a scow; the suction being a pipe of sufficient length to reach to the bottom, with a piece of flexible suction hose in it to give necessary flexibility. The material is delivered into a flat deck scow with raised sides which retain the sand, and the water flows back into the river. Sometimes these dredge boats are self-propelling and provided with hoppers into which the material is pumped.

For general dredging service where all classes of material will be handled, it is necessary to use an agitator or cutter to cut and loosen the material before drawing it into the suction pipe. The suction pipe is mounted within a structural steel ladder, of suitable length and of heavy proportion, hinged to the dredge. The cutter is provided with a series of cutting blades and mounted on a powerful shaft supported on the ladder, and driven through gearing from an independent engine. If properly constructed, even shale rock can be dredged.

Naturally the dredge is most efficient when handling the greatest amount of material with the least amount of water. By the use of the rotary cutter and by systematically swinging the dredge and moving forward on the spuds, which are arranged in the stern as anchors, the amount of material fed to the pump can be regulated so that the maximum percentage of material is constantly carried.

PUMPS—Dredges are usually equipped with either 12-, 15-, 18-, or 20-in. pumps, the 20-in. having become a standard. The capacity of a pump depends on size, character of material and available power. In average dredging, allowing for delays, the output may be estimated at from 10% to 15%.

The power required to drive the dredging pump depends on the elevation to which the material is to be

raised, the length of delivery pipe, and character of material. For most economical operation the velocity through the pipe line should not be higher than is just necessary to carry the material satisfactorily. The practical maximum discharge pressure is from 45 to 55 lbs. For a long pipe line it is necessary to use relay pumps. As the pump must be built with large openings to pass all classes of material, the efficiency should be largely disregarded.

ENGINES—15-in. and larger dredging pumps are usually direct connected to compound or triple expansion engines, but can be connected to electric motors. Complete dredges have been built by this company, in which dredging pump, cutter, hoisting engine and all machinery is operated by electricity. An electric dredge requires a smaller working force than a steam dredge.

MORRIS MACHINE WORKS design and build complete dredges, including pump and driving engine, the hull and all machinery required, for steam or electricity.

Dredging Pumps.

BELT DRIVEN—This standard pump is the result of years of manufacturing dredging pumps and is very heavy and strong for average service. The pump shell is in one very heavy casting, with extra metal in parts most subject to wear. A removable disc is fitted to the suction side of the shell, giving easy

access to the interior or for the removal of the impeller. The impeller is of large size for moderate speed, with ample space between it and pump shell so that stones can not get wedged in.

Adjustable stuffing box bearing is of large size, fitted with water injection to keep sand out. Extra heavy frame and shaft pillow block have ample bearing surface. Pumps are regularly furnished complete with suction and discharge elbows, flap valve and ejector for priming.

STEAM DRIVEN—Standard dredging pumps are also furnished direct connected to single and double vertical simple engines. They are largely used by contractors in pumping out excavations, etc., on account of their ability of passing large solids.

Solid Lined Dredging Pumps (Patented).

This pump was designed for handling tailings or slimes in connection with gold recovery plants. A number are in use in this and foreign countries, and hundreds in South Africa. It has also found extensive use for ordinary dredging.

Prices are for pumps, and do not include elbows, valves, or ejector. Extra price for suction elbow includes a bearing in elbow with pump shaft extended through pump into elbow. Horsepower and speeds are for total head, i. e., actual elevation plus friction head in piping and fittings. Single pumps should not be used for heads higher than 60 ft. For higher heads, use 2-stage pumps. Prices on application. For 10-in. pump, 2 patterns: one for high speed and one for low speed as preferred. These pumps also built with tight and loose pulleys, or with base extended for direct connection to motor.

These pumps are now built in sizes from 2- to 12-in. discharge. Lining is made of manganese steel, or hard cast iron, and makes practically an independent pump enclosed within a cast iron casing. Everything is of heavy proportions; the shaft is large, the bearings of a special type, the stuffing box made to reduce the wear to the smallest possible extent.

Adjustments are made from the outside. There are no bolts or screws in the lining. No wear can come on the outer pump case, as it is completely protected by the lining. By removing the upper half of the pump shell, the lining can be taken out; or by removing the disc on the pump shell and the inner disc on the lining, the runner, of enclosed type, can be taken out.

The first cost, owing to its construction and extremely heavy proportions, is comparatively high; but when compared to its lasting qualities it will be found economical in operation.

Heavy Duty Sand and Gravel Pumps.

Designed for severe service and increased output. The double enclosed thrust bearing operating in oil eliminates troublesome thrust. The shell is extra heavy at points of wear. Stuffing box is arranged for water circulation. This type is also built for belt drive and direct connected to steam engine.

10-INCH HEAVY SERVICE DREDGING PUMP DIRECT CONNECTED TO 125 H.P. ELECTRIC MOTOR

Morris Dredging and Pumping Accessories and Parts.

Each individual unit or part of Morris machinery is designed and manufactured with uniform care, which insures machines of mechanical perfection and rugged construction. The MORRIS MACHINE WORKS guarantees its products as to design, materials and workmanship.

The Morris engineering department is at the service of clients who are in need of advice on pumping problems.

SUCTION HOSE—For contractors' and dredgers' use, a "smooth bore" rubber hose is recommended for suction purposes. Sizes above 18 in. can be made to order in any length required at 10 days' notice. Hose is furnished complete with nipples, bands and flanges for making connections to pump.

PRICE LIST OF SUCTION HOSE

Installation and Operation Morris Centrifugal Pumps.

The suction elevation or lift should be made as low as possible; the suction pipe short and direct with a minimum number of elbows or bends, and absolutely airtight. The total suction head (the actual elevation plus frictional resistances through suction piping) should not exceed 25 ft., and preferably much less. The larger the discharge pipe is and the fewer number of elbows, the less the friction head and power required to drive the pump.

Foundations are not so heavy as for a reciprocating pump, but amply rigid and strong to properly support the pump and maintain correct alignment. Pump should be correctly leveled on the foundation, and not bolted down until shaft is in line and turns freely in the bearings. If direct connected, the alignment of the coupling should be proved.

With a suction lift, if pump is handling clean water, the water seal can be supplied by water from the pressure portion of the pump shell; but otherwise at least 20 lbs. pressure should be supplied from any convenient source.

If a foot valve is used, particularly with pumps working under high lifts or delivering through long pipe lines, there is danger of injury to the pump, due to excessive pressure produced by water ram when the pump is stopped and the water commences to run backwards through the pipe until the foot valve is suddenly closed. In such cases place a gate valve on the discharge, which should be closed before the pump is shut down.

Provide a strainer on the suction intake to prevent large solids from entering the pump. Hot water must flow by gravity to the pump. See that pump turns in the right direction.

If the pump is operated at the correct speed for the total head, it will deliver the quantity of water for which it was built. If the head is greater, the discharge quantity will be diminished; and if less, it means an increased capacity.

Horizontal Split, Double Suction and Multistage Pumps.

SINGLE STAGE—This type of pump is especially adapted for high efficiency and for operating at high speed for direct connection to electric motor or turbine. It is also built for belt drive. Suction and discharge openings are in the bottom half of shell, therefore top can be removed without disconnecting them.

Brief specifications are: bronze enclosed impeller, bronze sleeved steel shaft, removable babbitted bearing

shells, S. K. F. ball bearing flexible coupling, bronze stuffing box glands.

Built in sizes 2 to 20 in. Also built of acid resisting bronze for operating in aciduous water.

HORIZONTAL SPLIT, DOUBLE SUCTION PUMP

MULTISTAGE—Where the head is too high for the double suction pump this company builds a multistage pump.

This type is designed along the same lines as the single stage double suction type, except that, being side suction, it develops an end thrust. This thrust is taken care of by a water cooled marine type bearing, running in oil. Leakage between stages is prevented by bronze labyrinth rings.

Built in sizes 2 to 14 in. Number of stages depending on the head. Also built of acid resisting bronze for operating in aciduous water.

HORIZONTAL SPLIT, MULTISTAGE PUMP

Morris Improved Standard Belt Driven Horizontal Pumps.

The horizontal pump is the type most extensively used for all purposes. It is of iron construction.

The pump is intended for all classes of service where a strong, substantial pump, able to take care of itself with the least of attention, is required. The pump shell is mounted directly on the base; a substantial bearing on each side of the pulley is lined with bab-bitt; the steel shaft is of large diameter; the stuffing box bearing is long and babbitt lined; the box is deep and arranged with gland. All parts are accurately machine fitted. Pump is furnished complete with oilers, and with or without primer.

*Refers to low lift pumps. Prices on larger pumps on application.
For priming pumps above 10-in. use foot valve or flap valve with steam ejector, which are extra. Prices on application.

Morris Vertical Pumps, Submerged and Suction Types.

While a horizontal shaft pump should be used wherever possible, there are many situations where a vertical shaft pump would be better adapted.

The submerged type is intended to be placed entirely submerged in water. It is therefore always primed and ready to start and there is not even a stuffing box to look after.

The suction type is intended to be placed in a pit where it is impossible or impractical to use a horizontal shaft pump, but above the water line so that it will operate with a suction lift. It can also operate submerged.

MORRIS MACHINE WORKS furnish vertical pumps, single or multistage, and will make recommendations upon receipt of full data as to service.

*Refers to low lift pumps.
Each pump is furnished complete with discharge elbow, one pair couplings, pulley, and one bearing.

Methods of Priming Centrifugal Pumps.

All pumps placed above water supply must, before starting, be primed; that is, completely filled with water. By use of foot valve, pump can be filled from city water service, from an overhead tank, by means of pails or by separate small pump. Where steam is available an ejector forms a very simple means of priming and can be used either with foot valve or flap valve (gate valve or check valve). The two illustrations below show clearly the piping required for either case.

If arranged with flap valve (Fig. 43), prime as follows: open valve A, then steam valve B, which will exhaust the air from pump shell allowing water to rise through suction pipe; when water spurts from pipe C, pump is filled; then close first valve A, then valve B and start the pump.

If arranged with foot valve (Fig. 44), proceed as follows: open valve A, then valve B. Water will be drawn up through suction pipe to ejector and delivered into pump; when pump is full, close valves and start.

Fig. 43 Fig. 44
METHODS OF PRIMING CENTRIFUGAL PUMPS

Morris Reciprocating Engine Driven Centrifugal Pumps.

Centrifugal pumps direct connected to steam engines are self-contained, take up but little space and make the most economical pumping unit. This company builds the engines, simple, compound or triple expansion, especially designed for direct connection to centrifugal pumps.

MORRIS MACHINE WORKS have a large variety of patterns for all sizes of pumps, so that for most reasonable heads direct connected pumps can be furnished that will not have to run at excessive speeds.

The side suction pump is intended for general service, and is largely used in pumping out excavations, etc.

STANDARD SIDE SUCTION STEAM PUMP

STANDARD DOUBLE SUCTION STEAM PUMP

Determination of Right- or Left-Hand Pumps.

When standing at the pump and looking over pump shell towards pulley or driver, if the top of shaft revolves from right to left, or anticlockwise, the pump is right hand; and if from left to right, or clockwise it is left hand.

*Low lift pumps. †Special high lift pumps. Quotations on larger sizes or on special combinations on application. Any steam pump with compound engines directly connected can be furnished. Prices for double and side suction iron pumps on application.

pletely as possible, to enable this company to promptly make recommendations and submit estimates:

- (1) Number of pumps required.
- (2) Capacity of pump in gallons per minute.
- (3) Kind of liquid to be handled.
- (4) What is total pumping head, including suction and discharge?
- (5) What is suction head?
- (6) What is discharge head?
- (7) What is length of suction and discharge piping, and size (if determined); also number and degree of elbows?
- (8) Is vertical or horizontal type of pump desired?
- (9) How will the pump be driven? Give full description of driver.
- (10) State position of suction and discharge preferred, and direction of rotation.

Crank and Flywheel Pumping Machinery, Gas Engine Driven Natural Gas Pumping Units, Diesel Type Oil Engines, Gas Engines, Pipe Line Tools and Equipment.

FIG. 1149. VERTICAL DUPLEX, DIRECT ACTING STEAM PUMP FOR BALLAST SERVICE
Built with tie rods to meet demand for a light weight, compact, vertical pump

FIG. 1135. VERTICAL SINGLE, DIRECT ACTING BOILER FEED PUMP

Also used for donkey feed and fire and bilge service. Valve motion has double lever drive and tappet collars, adjustable for controlling the stroke length while in operation. Suction and discharge valves removable from valve pot simultaneously. Working fluid pressure, 300 lbs.

FIG. 1124. HORIZONTAL DUPLEX, DIRECT ACTING, "CHESTER" TYPE, STEAM PUMP

100% valve area. An ideal pump for tank steamers handling heavy Mexican crudes. Used for cargo, fuel oil transfer and ballast service. Working fluid pressure, 100 to 200 lbs.

Power Pumps for Oil Pumping.

The use of the larger size power pumps, for pumping oil through pipe lines, is steadily increasing.

Formerly a great many of the Trunk Line pumping stations were equipped with triple expansion steam engines, the steam being supplied by oil fired boilers. The development of the Diesel oil engine has materially changed this; so much so that in some of the larger oil line pumping stations, today, the triple expansion, con-

densing steam engine has given way to power pumps driven by oil engines.

Notwithstanding the good economy of the triple expansion engines, the oil engine driven power pumping unit can be operated at approximately one-third of the cost of oil fired boiler units.

FIG. 1069. HORIZONTAL, 6-PLUNGER, TRIPLEX, END PACKED PLUNGER POWER PUMP FOR PUMPING OIL IN LARGE QUANTITIES AGAINST HIGH PRESSURES
1750 bbls. per hour against 900 lbs. pressure. Large valve areas and very accessible parts. Also built as a 4-plunger duplex power pump

FIG. 929. VERTICAL, TRIPLEX, SINGLE ACTING, GENERAL SERVICE TYPE, POWER PUMP

Shown with single reduction of gears and tight and loose pulleys, but these pumps can also be furnished with double reduction of gears and motor base, or with friction clutch on the pinion shaft.
The valve areas and fluid passages are unusually large and are easily accessible for inspection and repair

FIG. 122. HORIZONTAL, DUPLEX, DIRECT ACTING STEAM PUMP OF SEPARATE CHEST TYPE
Much used for refinery work. Separate chest construction permits the use of suction and discharge valve plates

FIG. 371. HORIZONTAL, DUPLEX, DIRECT ACTING STEAM PUMP OF THE BLOCK VALVE TYPE
For pumping heavy, hot liquids, such as tar and asphalt. Has large rectangular block valves, giving generous, unobstructive areas

FIG. 116. HORIZONTAL, DUPLEX, DIRECT ACTING, END PACKED PLUNGER, STEAM PUMP OF THE POT VALVE TYPE
With the plunger construction any leakage becomes immediately apparent. Especially adapted for pumping gritty fluids

FIG. 1078. POWER PUMP FOR MARINE PURPOSES
With increasing use of electricity on board ships, motor driven power pumps are finding extensive use. Built for every purpose

THOMPSON MANUFACTURING CO.

Manufacturers of Rotary Pumps

811 Twenty-fourth Street
DES MOINES, IOWA.

Product.

THOMPSON ROTARY PUMP for liquids, air and vacuums.

Uses.

The Thompson rotary pump is a distinct advance in both principle and design over other types. It is adaptable for use wherever there is liquid or air to be pumped, for vacuum heating, both return line and air line; for water works, irrigation pumping stations, drainage pumping stations and as bilge pump for either fresh or salt water. It gives satisfactory industrial service in oil refineries, tanneries, chemical plants, sugar refineries, foundries, oil stations and oil pipe lines; in fact, wherever there is a necessity for pumping air or liquids under vacuum or pressure.

Construction.

The cut herewith illustrates the pump with an end plate removed, showing the interior construction.

THOMPSON ROTARY PUMP
With end plate removed

There are three moving members—the crank, the impeller and a hinged plate. The hinged plate separates the suction and the discharge sides of the pump cylinder.

The pump pulley is supported by an outboard bearing and is keyed to the shaft.

The surfaces of the impeller and pump casing are cylindrical, therefore readily and accurately machined. The impeller is at no time in contact with the casing but is so adjusted as to maintain the closest clearance.

Thompson rotary pumps have been in use for 5 years without repairs or adjustment.

As compared with other types of rotary pumps this pump requires considerable less power per cubic foot displacement, due to the absence of sliding wings, gears and cams.

Equipment of Vacuum Unit.

The vacuum unit as shown consists of the Thompson rotary vacuum pump with outboard bearing and air chamber, motor belted to pump, suction strainer with air chamber, discharge chamber with air eliminator, and cast iron base.

The pump, strainer, or discharge chamber can be removed from the base without disturbing the piping.

The large self-cleaning suction strainer is made of fine mesh bronze, effectively protecting the pump.

A wide, endless, waterproof, leather belt drives the pump. A gravity idler gives the belt a good rap on the motor pulley and gives a uniform belt tension.

The equipment is simple and compact, does not require a concrete base, is completely assembled and thoroughly tested before shipment.

This unit can also be furnished with a noiseless enclosed gear drive instead of the belt drive.

TRADE-MARK

ally changes to kerosene. It is as simple and reliable as the Novo gasoline engine. The Novo kerosene engine operates on either kerosene or gasoline.

A gas mixer for burning natural or artificial gas can also be furnished for Novo engines at an extra cost.

Novo Gasoline and Kerosene Engines.

The Novo engine has won a countrywide reputation for reliability. Its light weight and compact, self-contained design especially adapt it to use in combination with portable or stationary power machinery.

The fuel is stored in the base, and the cooling water in the frostproof jacket over and around the cylinder. No tanks, fans, pipes or circulating pumps are required for cooling. The written guarantee with every engine covers the frost-proof feature.

Jump spark ignition is used, because it is simplest and most dependable.

Hit and miss governor is used, because it means economy of fuel consumption. At the same time, it insures absolute reliability.

The Novo kerosene engine is started on gasoline and automatic-

Fig. 1449. 8 H.P. AND 10 H.P. NOVO ENGINE

Novo Trench or Diaphragm Pumping Outfit.

These outfits consist of single or double diaphragm pump, 3-in. or 4-in., driven by Novo engine. used by contractors for draining trenches and excavations. A rubber diaphragm, containing a flap valve, takes the place of a piston, so that the pump is not greatly affected by sand and gravel in the water.

The double diaphragm or trench pump is used for handling extra large quantities of water.

The single diaphragm or trench outfits are furnished on steel skids or on hand trucks, as ordered. The double diaphragm or trench outfits are furnished on trucks only.

Truck mounted

Novo Centrifugal Pumping Outfits.

Made in two types—automobile chain drive and direct connected. Capacity from 40 to 650 gals. of water per minute. Total head from 10 to 60 ft.

The pump is of the single suction type. The impeller is cast iron. The shaft is open hearth, high carbon steel. Bearings are lubricated by grease cups.

Used by contractors for draining excavations; also used for irrigation and any pumping where a large volume of water must be handled against a moderate head.

FIG. 265. NOVO CHAIN DRIVEN CENTRIFUGAL PUMPING OUTFITS

Novo Triplex Pumping Outfits.

The Triplex pumping outfits, shown in Fig. 1446, are good for 150 to 200 lbs. pressure. The pump proper on these outfits embodies the principle of the three-throw crank shaft, so that the strokes follow and overlap one another. This gives a continuous and uniform flow of fluid.

†These outfits furnished with clutch on pump.

*Total head means vertical distance from source of water supply to point of discharge, including friction of water through pipe line. Pump must not be more than 20 ft. above water supply.

Novo Pyramid Force Pumping Outfits for Medium Pressure.

Cylinder of pump has removable brass lining. Valves and valve seats are of brass, and easily accessible. Piston rod of brass to prevent corrosion.

Outfits, as shown in Fig. 268, are suitable for general water supply and are especially suited for pneumatic water systems.

Novo Type U Outfits for High Pressure Pumping.

These are strong, heavily built outfits for long distance pumping, high vertical lifts, high pressures, severe conditions, where the suction lift is not greater than 25 ft.

Note the simple, compact, rigid, all-iron construction of this outfit. It can not get out of alignment. It will stand up under the hardest kind of work and operate continuously and successfully.

RUMSEY PUMP COMPANY, LTD.

109 Johnson Street
SENECA FALLS, N. Y.

Products.

Power Pumps for every pumping service, driven by belt, chain, gear or direct drive, including HYDRAULIC PRESSURE PUMPS; SINGLE and DOUBLE ACTING TRIPLEX PUMPS; ELECTRIC TRIPLEX PUMPS; DOUBLE ACTING POWER PUMPS; CENTRIFUGAL PUMPS; ROTARY POWER PUMPS; DEEP WELL PUMPING OUTFITS and WATER WORKS MACHINERY.

Trench Pumps, Hydraulic Rams, Hand Pumps of all kinds, Diaphragm Pumps, House Pumps, Hand and Windmill Well Pumps, Spray Pumps, etc.; Pneumatic Water Systems, Hydrants, Foot and Check Valves, Cylinders and Pump Accessories.

Complete electric, gas or gasoline pumping units may be furnished.

Catalogues.

General catalogue of Hand and Power Pumps, 56th edition, a complete reference book of pumping machinery; Catalogue A, Pneumatic Water Systems; Catalogue B, Triplex Power Pump; Catalogue C, Selected Hand Pumps; Catalogue DC, Rotary Pumps. Booklets on Centrifugal, Spray and Deep Well Pumps.

Triplex Pumps.

The design is simple and compact, with all working parts accessible for inspection or adjustment. All parts are made from the best materials. Only skilled workmen are employed for founding, machining and assembling. All pumps are rated at conservative speeds. The result is an article suitable for durable, practical service. These pumps are offered in a wide range of styles and sizes for any pumping application: For general water supply and fire protection; municipal water works; boiler feeding, circulating, mine pumping; hydraulic elevators; exerting pressures; pumping special liquids, chemicals, etc. Construction details necessarily vary according to the service for which pumps are rated or special conditions under which they are to operate. Detailed specifications of any pump will be sent on request.

Cranks are of the best cast or forged steel, of proper weight to take the heaviest strain to which they are subject. Bearings are of ample size, of bronze or lined with best babbitt scraped to a true surface. Gearing is machine cut from solid. Waterways are large and direct. Valve areas are correctly proportioned. Glands are arranged to keep the plunger packing tight with a very slight pressure on the studs, preventing undue friction. All pumps are equipped with suitable oiling devices and drips.

SINGLE GEARED TRIPLEX PUMP, SMALL SIZES, LIGHT SERVICE

DOUBLE GEARED TRIPLEX PUMP, STANDARD TYPE, 500-GAL. GENERAL SERVICE PUMP

ELECTRIC TRIPLEX PUMP WITH GEAR DRIVE
Type of water works pump—2,000,000-gal. unit

Each Rumsey triplex pump is carefully tested to its maximum working service before shipment and is fully guaranteed.

The design of our triplex pumps permits of considerable alteration from standard construction to meet special service or working conditions. Pumps are regularly fitted for handling cold water, but will be equipped for hot water without extra charge. For other alterations a slight margin above cost will be added. Any pump may be furnished with vacuum chamber, rawhide pinion, by-pass, etc., or arranged on bed plate or foundation for connection to driving power.

Single acting triplex pumps may be brass fitted to order when not regularly so equipped, and when construction limits permit, with brass covered or bronze plungers, brass lined or bronze glands and bronze bushed cylinders. Double acting triplex pumps may be brass fitted to order, with removable brass lined iron cylinders or removable bronze cylinders, iron pistons with brass followers or bronze pistons, or bronze piston rods.

DIRECTIONS FOR INQUIRIES—It will facilitate correspondence if clients, in asking for recommendations and prices, will furnish the following information:

- (1) For what purpose the pump is to be used.
 - (2) Quantity of liquid to be pumped per minute.
 - (3) Whether service is constant or intermittent, and the average number of hours per day pump will run.
 - (4) Height to which liquid is to be raised by suction, and diameter and length of suction pipe.
 - (5) Height in feet or pressure in pounds against which liquid has to be forced, also diameter and length of discharge pipe.
 - (6) Nature of liquid to be pumped, whether hot or cold, salt or fresh, acid, clear or gritty.
 - (7) Power available for driving pump.
- If a deep well pump is required, give information covered by items 1, 2, 3, 6 and 7 above. Also:
- (8) Total elevation between surface of the water and discharge point; and diameter and length of discharge pipe.
 - (9) Diameter and depth of well or pit, and distance from surface of ground to low water level.
 - (10) Vertical distance that the cylinder will be placed above low water level if not actually submerged at all times.

HYDRAULIC PRESSURE PUMP
WITH SPRING ALLEVIATOR

A sketch showing relative position of supply, pump and discharge point, with dimensions, and giving length, size and turns or bends of pipe lines, will be a great aid to a thorough understanding of conditions under which pump is to operate.

Double Acting Power Pumps.

Reliable pumps for tank pumping and general use where an inexpensive outfit is desired. Made with brass lined cylinder, leather packed piston, metal valves, large air chamber and back gearing.

These pumps are offered in capacities of from 4 to 65 gals. per minute. Illustration shows a 2 x 3-in. pump; larger sizes differ in design.

Geared or belted electric outfits can be furnished complete with, or ready to receive, electric motor.

Geared engine outfits complete with engine are offered in several sizes.

DOUBLE ACTING PUMP

Low Lift Centrifugal Pumps.

Rumsey centrifugals are offered in both horizontal and vertical types and in sizes from 1 to 10 ins., capacities 10 to 2400 gals. per minute for heads not more than 50 ft. Pumps for contractors, industrial plants, mines and quarries, for circulating, handling thick liquids and chemicals and many special applications. Direct connected electric sump pumps and horizontal pumps, and direct connected and geared gasoline pumping sets can be supplied.

ELECTRIC CENTRIFUGAL
PUMP

Rotary Power Pumps.

Rotaries are used with economy by thousands of manufacturers for handling liquids such as oils, acids and other chemicals. For water supply, they are popular because of their low cost and large capacity. For fire protection, rotaries are most dependable, throwing a continuous stream with a uniform strain on pump and driving power. Built in capacities to discharge up to four standard fire streams and arranged for hose or for piping to hydrants or sprinkler system.

SMALL TYPE OF ROTARY
POWER PUMP

Deep Well Pumping Sets.

The selection of equipment for raising water from deep wells is most important. Strength in the machine must be combined with accessibility of working parts; as the strain is severe and adjustments and repairs are expensive and difficult. Rumsey deep well working heads are correctly designed to give dependable, lasting service. Offered in a range of styles suitable for wells of any depth for operating Rumsey single or double acting cylinders.

DEEP WELL WORKING HEAD
Style for deep artesian wells

ELECTRIC TRIPLEX PUMP FOR HEAVY DUTY
This stationary mine pump replaced three relays of centrifugals

TABER PUMP COMPANY

295 Elm Street
BUFFALO, N. Y.

Products.

PUMPS: Rotary, Centrifugal, Sump and Hand Force.

Taber Rotary Pumps, Type G.

These pumps are built in several sizes for belt drive (Fig. 175) or for motor drive (Fig. 179).

They are carefully machined and gears are finished over-all. Accessibility to inlet and outlet connections is a desirable feature.

These pumps are adapted for handling various kinds of liquids including oils, chemical solutions and water, and are made in iron and bronze.

Fully described in Bulletin 25.

FIG. 175. TYPE G BELT DRIVEN ROTARY GEAR PUMP

Weight, lbs.	55	75	140	210

Taber Rotary Pumps, Type S.

These pumps are made particularly for handling gasoline and oils. They are very close fitted and are of the 4-bucket type.

The distinctive advantage of this type of pump for handling light liquids is that the buckets are hydraulically balanced and self-compensating, a new feature upon which patents are pending.

Pumps operate smoothly, and have wonderful suction properties, delivering efficiently against a 100-ft. head.

These pumps are of special interest to oil refineries. They are made for either belt, gasoline engine or electric motor drive, and where conditions require air chamber and low pressure relief valve, these can be furnished.

Fully described in Bulletin 31.

FIG. 300A. TYPE S MOTOR DRIVEN ROTARY PUMP

FIG. 307. TYPE S ROTARY PUMP CONNECTED TO NOVO ENGINE

Taber Rotary Pumps, Type T.

These pumps are particularly adapted for handling viscous materials, such as soap stock, asphalt, paints, molasses or any other products of this nature, there being a design for each specific requirement.

Made for belt, motor or engine drive.

Constructed of iron or bronze.

Fully described in Bulletin 22.

FIG. 146. TYPE T BELT DRIVEN CIRCULATING PUMP

FIG. 186. TYPE SV SINGLE-STAGE DOUBLE SUCTION PUMP

Taber Centrifugal Pumps, Type V.

Type V centrifugal pumps are carefully designed, single suction, open impeller type pumps. They are extensively used for circulating water and other fluids. When constructed of bronze, they are particularly adapted for circulating corrosive liquids such as tanning liquors and brine for refrigeration purposes.

Fully described in Bulletin 20.

Taber Centrifugal Pumps, Type SV.

These pumps are made up in single-stage units only, being of a double suction volute type, which can be furnished for either belt or motor drive from 150 to 1200 gals. per minute.

FIG. 194. SUMP PUMP

Tabilge Hand Force Pumps.

Fig. 171B illustrates the Tabilge high grade sump pump. These pumps are fitted with ball bearing thrust. Can be supplied with automatic starting and stopping device. Fully described in Bulletin No. 20.

Tabilge Hand Force Pumps.

Fig. 171B illustrates the Tabilge hand force pump, bronze fitted throughout. These pumps are built in accordance with Navy Yard Specifications and are of special interest to ship-chandlers and ship-builders.

Fully described in Bulletin 21.

FIG. 171B. SINGLE HANDED TABILGE HAND FORCE PUMP

Taber Hand Pumps, Type S.

Fig. 305 illustrates the Taber Type S suction hand pump. These pumps are similar in design to the Type S power pumps, having high suction properties and large delivery. It is never necessary to prime these pumps.

Fully described in Bulletin 30.

FIG. 305. TYPE S HAND PUMP

TRIMOUNT ROTARY POWER CO.

Manufacturers of Rotary Pumps

19 Heath Street

BOSTON, MASS.

FACTORY: 290 Whiting Avenue, EAST DEDHAM, MASS.

Products.

TRIMOUNT ROTARY PUMPS: Hand, Bilge, Power, Motor Driven, High Vacuum.

Also, Air Compressors, Motor Boat (friction driven) Whistle Outfits.

Trimount Rotary Pumps.

Owing to the unique construction of Trimount rotary pumps, the parts are few, thus reducing friction and wear to a minimum. There are no springs or weak parts to break or get out of order. When wear occurs, it is readily taken up by means of an adjusting screw.

Trimount rotary pumps require absolutely no priming. As no packing is used, they can be utilized for pumping any fluid of any density, and at any temperature. All the pumps, except high vacuum pumps and air compressors, are made entirely of bronze, giving them long life.

A strong feature of Trimount pumps is their high suction lift of from 6 to 25 ft., depending on the fluid pumped. Candy manufacturers and dealers in heavy oils, greases and liquids of similar viscosity, have found these pumps especially suitable for their needs.

The Trimount will pump anything that flows, no matter how heavy and sluggish that flow may be.

NO. 5 TRIMOUNT ROTARY PUMP WITH TIGHT AND LOOSE PULLEYS, MOUNTED ON BED PLATE

DATA, BRONZE POWER PUMPS

No.	Gals. per min.	R. p. m.	H. p.	Inlet, ins.	Outlet, ins.

Trimount Hand Pump.

This hand pump has small lugs on back to fasten to wall or partition (as for bilge purposes, or gasoline pumping in private garages).

If desired, these pumps are made with 5-in. pedestal to screw to flooring.

Three sizes of Trimount hand pumps are made.

High Vacuum Pump.

Designed for high pressure vacuum purposes such as exhausting incandescent lamp bulbs, vapor lamps, mercury arc rectifiers, X-ray tubes, thermos bottles, etc.

Immersed in oil in airtight case, driving shaft provided with oil-sealed bearing to prevent air from entering case.

It is intended that this pump be supported by a pump giving a vacuum within a few millimeters of the barometric height, and it is recommended that pump No. 1 be used for this purpose. A single No. 1 pump will serve for a number of the No. 2 pumps.

Special vacuum pump catalogue sent on request.

TWINVOLUTE PUMP & MFG. CO., INC.

Manufacturers of Centrifugal Pumps

WORKS AND MAIN OFFICE

NEWARK, N. J.

NEW YORK OFFICE: 55 William Street

Products.

CENTRIFUGAL PUMPS, including Horizontal Split Case, Vertical Split Case and Solid Case Types.

Services and Guarantee.

The Twinvolute centrifugal pump, covered by basic patents, is the result of 20 years' experience in the building of centrifugal pumps, and embodies all the latest improvements in this type of apparatus.

This company maintains an engineering department who will co-operate with the customer in selecting the best pump for the service, thereby effecting a saving in first cost as well as in operating expense.

All pumps are guaranteed to fulfil all that is claimed for them when properly installed and cared for.

This company will supply, without charge, any part returned, prepaid, within one year of shipment, which bears evidence of imperfection in material or workmanship.

Quotations will be made on listed or special pumps when requested.

Horizontal Split Case Pumps.

Made in sizes from 1½ in. and up, in single-stage and multistage types.

Head of 300 ft. can be obtained with single-stage pumps.

SPECIAL FEATURES—Peculiar design of labyrinth wearing rings.

Vertically split bearing shells.

Design and method of holding sleeves on shaft in place.

High economies.

Send for Bulletin No. 90.

HORIZONTAL SPLIT CASE PUMP, TYPE AS

Vertical Split Case Pumps.

Made only in single-stage type in sizes from 1½ in. and up.

Good for heads up to 120 ft. at normal speeds.
Has double suction impellers and outboard ring oiled bronze bearings.

VERTICAL SPLIT CASE PUMP, TYPE AE

Solid Case Pumps.

Made in sizes from 1 in. and up, in single-stage and two-stage types.

Single-stage pumps are known as type "NAO" and "AEO."

Two-stage pumps are known as type "BE" and have impellers back to back or are right- and left-hand, eliminating end thrust.

On sizes from 1½ in. up, outboard ring oiled bronze bearings are employed.

Send for Bulletin No. 87.

SOLID CASE PUMP, TYPE BE

Data Required for Estimates.

Number of pumps required?

Gallons per minute for each pump?

Is the water taken directly from the city main or from an open suction tank?

If connected to a city main, what is the pressure at the pump suction?

Give total discharge head.

Give total suction lift.

Is pump to work continuously or intermittently?

Hot or cold water?

MOTOR DATA—If direct current, give voltage.

If alternating, give voltage, phase and cycles.

The more information received, the better service can be rendered.

PUMPS and PUMPING EQUIPMENT of every type and for all purposes.

FEED WATER HEATERS, Open and Closed Type; SURFACE, JET and EJECTOR CONDENSERS; WATER METERS; AIR, GAS and AMMONIA COMPRESSORS; CORLISS PUMPING ENGINES; GYRATORY CRUSHER; JAW CRUSHERS; CRUSHING ROLLS; CRUSHER SCREENS; SAND RIDGLERS; CORE WIRE STRAIGHTENERS; OIL, GAS and GASOLINE ENGINES; WOOD PRESERVING MACHINERY and EQUIPMENT.

Also Stamp Mills, Log Washers, Sampling Machinery, Converters, etc.; Steam Accumulators; Gas Expanders and Vacuum Pumps; Huntington Grinding Mills; Wet Grinding Tube Mills; Gas Generating Plants.

Services.

Many years of experience in designing and building pumping machinery, meeting and overcoming every variety of problems have given our engineering staff a valuable and extensive knowledge of every phase of pumping. This experience and knowledge is at the disposal of prospective purchasers of pumping equipment. Correspondence is invited concerning any special service, which will have the prompt consideration of our engineering department. No pumping proposition is too large or too small, too severe or too unusual, to interest us.

Complete working drawings for the erection of crushing plants to meet every requirement and of any desired capacity will be furnished, together with foundation plans, including timber estimate, bolt list and masonry specifications.

Organization and Facilities.

The Worthington Company has larger plants, greater facilities and a more abundant production than any other pump manufacturer in the world. This corporation comprises:

Worthington Works, Harrison, N. J.
Blake-Knowles Works, East Cambridge, N. J.
Power & Mining Machinery Works, Cudahy, Wis.
Ingeco Works, Cudahy, Wis.
Deane Works, Holyoke, Mass.
Laidlaw Works, Elmwood Place, Cincinnati, Ohio
Snow Holly Works, Buffalo, N. Y.
Epping Carpenter Works, Pittsburgh, Pa.

Located in the principal manufacturing districts of the United States they afford unusual facilities for the prompt shipment of pumping machinery and equipment.

In addition to the regular lists, this corporation has on hand many odd patterns originally built to suit unusual or peculiar conditions, and is equipped to build special pumps of any size and for every purpose.

Duplex Piston Pump.

For all general purposes where water pressure does not exceed 150 to 200 lbs. per sq. in. and where a direct acting steam pump is the proper installation. Piston pattern pumps are designed for boiler feeding, tank supply, fire, hydraulic elevators and small water works service. The removable lining pattern has been designed for severe service—where the pump is subjected to unusual wear, owing to the presence in the water of large quantities of grit, or due to any cause.

DUPLIX PACKED PISTON PUMP

Outside Packed Plunger Pumps.

These pumps are designed for rough and heavy service, for working pressures 140 to 250 lbs. per sq. in., and where it is important that the moving parts can be quickly removed.

Capacity up to 5650 gals. per minute.

COMPOUND PACKED PRESSURE PUMP
Seranton pattern; 250 lbs. pressure

Pot Valve Pressure Pump.

Designed for high pressure boiler feeding and other

services requiring high water pressure. Good for 300 lbs. working pressure. Other pumps of this type are furnished for pressures up to 2000 lbs. per sq. in., suitable for hydraulic press work, steel mills and similar uses. Special pumps will be built for any service.

PRESSURE PATTERN BOILER FEED PUMP

Volute Centrifugal Pumps.

Built in three standard designs: the single side suction type, the double suction solid case type, and the double suction pump with horizontal split casing. Single suction pumps give best results when operating at heads under 80 ft. Double suction pumps in standard sizes range from 1- to 24-in. discharge; special pumps to 54-in. discharge. They are suitable for operating heads up to 200 ft. The pumps may be used for a great variety of purposes: the most important of which are water works service, sewage pumping plants, dry dock pumps, irrigation and drainage service.

60-IN. DOUBLE SUCTION VOLUTE PUMP

Circulating pumps for surface and barometric condensers, paper mills, sugar factories, etc. Pumps can be arranged for direct drive from steam and oil engines, and from electric motors. They can also be arranged for belt or chain drive. Standard sizes range from 3- to 24-in. discharge; special sizes up to 60-in. discharge.

STEAM TURBINE DRIVEN PUMP ENGINE INSTALLED AT NEW HAVEN WATER COMPANY

Turbine Centrifugal Pump.

This type of pump is now universally accepted by the best engineers for all services where it is desired to de-

6-IN. TWO-STAGE CENTRIFUGAL PUMP

liver water against high heads. These pumps are designed for operating by high speed motors or steam turbines and are particularly adapted for water station pumps, for mine water drainage, hydraulic mining, boiler feed service, underwriters' fire pumps, municipal high pressure fire service, etc.

THREE-STAGE DOUBLE SUCTION TURBINE CENTRIFUGAL PUMP

Deane Power Pumps.

Power pumps of every type are built for every conceivable purpose. These pumps are strong and durable. The designs are such that maximum strength, rigidity and durability are obtained with minimum wear.

TRIPLEX SINGLE ACTING PUMP

Simplex Feed Pumps.

SINGLE HORIZONTAL PISTON PUMPS—This company manufactures a full line of both horizontal and single steam pumps equipped with the well-known Blake, Model "A," simplex steam valve gear.

These pumps are simple, compact, accessible and durable machines, having large direct water passages and full valve areas, which reduce water friction to a minimum and particularly adapt the pumps for boiler feeding.

All parts of the pumps are interchangeable and can therefore be readily duplicated in case of accidental breakage or unusual wear.

Maximum working pressure: steam end, 250 lbs.; water end, 250 lbs.

VERTICAL VALVE POT TYPE PISTON PUMPS—This pump is a vertical direct acting type, equipped with Simplex Style "A" steam valve gear. Water end is double acting piston type having cylindrical or pot valve form of valve chambers. Made in a large range of sizes and capacities.

Special pumps are made with different combinations of steam and water cylinders adapted to individual conditions.

These pumps are especially adapted for marine service.

SINGLE HORIZONTAL BOILER FEED OR PRESSURE PISTON PUMP
Size, 7½ x 4½ x 10 in.

VERTICAL SIMPLEX PISTON PUMP VALVE POT TYPE
Size, 14 x 10 x 24 in.

Oil Pressure Pumps.

The California pattern is especially designed for handling oils of high viscosity, such as are found in the California and Mexican oil fields, that frequently require heating in order to minimize excessive pipe friction. They are intended for working pressures from 500 to 600 lbs. per sq. in., and can safely withstand shock pressures of 800 lbs.

CALIFORNIA PATTERN OIL PRESSURE PUMP

Deep Well Pumps.

The Glendora pump is unexcelled for deep well pumping in connection with municipal supply, irrigation, railroad tank service, office and factory buildings, paper mills, ice making plants and packing houses. It can be used in connection with any well 8 in. in diameter and above, and is most particularly applicable in deep wells where the service is severe and continuous.

Briefly stated the advantages of the Glendora type are:

Larger capacity from a given well than any other reciprocating pump; high mechanical efficiency; uniform, continuous flow of water in riser pipe; uniform load on prime mover; small engine or motor required to operate; absolute reliability; low operating cost; low maintenance cost; ability to discharge directly into mains; accessibility; heavy substantial construction.

GLENDORA DEEP WELL PUMP

Open Feed Water Heater.

The Blake-Knowles open feed water heater consists of a vertical, rectangular tank, comprising oil separator, heater, purifier, filter and receiver, in which cold water and exhaust steam are brought together in direct contact. The oil separator, which is made a part of the heater, effectively extracts all the oil present in the incoming exhaust steam. The cold water supply and overflow are controlled by floats and balanced valves. The boiler feed pump suction is arranged to draw off filtered and purified water only. This heater is particularly adaptable for heating systems, and wherever it is desired to pipe the return water direct to the heater.

SECTIONAL VIEW OF OPEN FEED WATER HEATER
Type 100 to 400 h.p.

Cylindrical types are also made where headroom will not permit rectangular type.

Surface Condensing Apparatus.

The largest and most important power plants in the United States—the plants which hold and are establishing new records for economical production of power, cost of operation and maintenance—are equipped with Worthington condensing apparatus.

The Worthington Company was the pioneer in the development of surface condensers for use in connection with steam turbines. The success with this type of apparatus has been due to the very careful consideration given to every phase of the problem present, but especially to the fact that this company alone, correctly analyzed the various attending phenomena, and from the very outset adopted the system and type of apparatus which has now become the standard for all builders of condensing apparatus.

WORTHINGTON SURFACE CONDENSER

Mounted on single combined air and circulating pump

SECTIONAL VIEW OF SURFACE CONDENSER
Mounted on single combined air and circulating pump

Jet Condensers.

The Worthington Company manufactures every type of jet condensing apparatus in use, including both the spirojector and ejector types, as well as the barometric type.

The latter is constructed of both the parallel and the counter current types.

All other condensers are of the counter current type.

Various so-called centrifugal jet condensers are also manufactured, in which a jet condenser is mounted directly on a centrifugal pump, which removes condensed steam and condensing water and delivers them to the desired point.

Apparatus of this type is operating satisfactorily with units up to 5000 kw. capacity.

COUNTER CURRENT JET CONDENSER

EJECTOR CONDENSER

Water Meters.

Worthington meters are built in three general types : the disc pattern, the turbine pattern and the duplex piston pattern, with variations of each type designed to suit particular conditions.

STANDARD FLAT DISC METER—The construction of this meter embodies the results of a wide experience. The disc spindle measuring chamber, abutment plate, interior screws (there are only

MODEL G., WORTHINGTON METER
Made in sizes 5/8, 3/4 and 1 in.

two), and the train of moving parts are of non-corrosive monel metal the natural alloy. These parts are those most subject to chemical action of acidulous or alkaline water, and this method is the only insurance against such chemical action. This train will outwear any other form or make of train gearing hitherto manufactured.

TURBINE METER—The Worthington turbine meter is a development of the Worthington turbine pump. It is of the current or velocity type, designed primarily to handle large volumes of water with minimum loss of pressure. The wheel is surrounded by a chamber of the volute pattern, providing at all points of the circumference the proportional cross-sectional area required for the volume of water discharge by the wheel. This form of casing reduces frictional losses by avoiding sudden changes in direction of flow. The wheel is of hard rubber, practically the specific gravity of the water, and is carried on a tobim bronze shaft which has a monel metal pivot turning on a sapphire jewel.

SECTION THROUGH 6-IN. TURBINE METER

VELOCITY TURBINE PATTERN

Standard meters suitable for 150 lbs. Pressure meters Nos. 2, 3, 4 and 6, for pressures up to 250 lbs.

12-in.	5300	7500	70	42	31	19	12	1	2400	2525	2625	2700

DUPLEX PISTON METER—This type of meter is especially adapted for measuring crude oil, petroleum, etc., and recording amount used in connection with oil burn-

ing apparatus. This type of meter is also essential to the proper testing of the boiler plant. For this purpose, the duplex piston meter should be connected on a by-pass so that the meter may be thrown in and out of service as desired without interrupting the flow of water to the boilers.

For the continuous measuring of large volumes of hot boiler feed water under pressure, the Worthington turbine hot water meter is recommended. Made in 8 sizes from 1/4 in. to 6 in. Capacity, 1 to 220 gals. per minute.

Feather Valve Compressor for Air, Gas and Ammonia.

Direct connected motor driven compressors designed for high rotative speed. Liberal bearing surfaces, increased pin sizes, greater strength of running gear and a volume regulator of great simplicity and high efficiency are provided to take care of requirements imposed by

100-CU. FT. FEATHER VALVE COMPRESSOR
Size, 18 x 11 x 14; speed, 257 r.p.m.

high speed. The Feather (Reg. U. S. Patent Office) valve adopted after years of investigation has, however, been the most important factor in the success of the Feather valve compressors. This valve consists of light strips of steel restrained but not rigidly secured at the end, and free to lift from the seat, in the middle, to permit the passage of air. The valve has no springs and no point of rigid contact. It seats by contact and not by impact so that the closing instead of being noisy and destructive, becomes merely an increase in the point of contact.

Completely Assembled

FEATHER VALVE

Corliss Pumping Engines.

The Worthington high duty Corliss engines are adapted and used for every form of hydraulic pumping in which it is desired to do the work with a minimum cost of fuel con-

CORLISS PUMPING ENGINE INSTALLED
FOR CORN PRODUCTS CO., ARGO, ILL.
Size, 27 x 13 3/4 x 24; capacity, 5,000,000 gals.

sumption. Engines of this type are being used in water works plants; furnishing hydraulic power in steel mills, rolling mills and furnace works; oil pipe line pumping, general mine pumping.

These engines are completely built in the company's own shops. In this way, knowing best the conditions and requirements to be met, an engine perfectly adapted to do the work is produced.

Crushers.

SUPERIOR McCULLY GYRATORY (PATENTED)—These crushers are capable of receiving and crushing the hardest rock or ore of any size that can be handled by the dipper of the largest steam shovels. When handling rock of this class its function is that of a preliminary crusher.

Force feed lubrication to eccentric; cut steel gears; main shaft 100% stronger than standard gyratories. Other models of the Superior McCully crushers are built to crush rock to pass through $\frac{3}{4}$ -in. ring.

Capacities, 4.5 to 1500 tons per hour, depending on size of crusher and the ring size of material crushed.

Receiving openings range from 8 to 72 in.; weight, 700 to 900,000 lbs.

JAW CRUSHERS—Superior—Crusher for coarse and intermediate crushing. Size of jaw openings, 36 by 24 in. to 84 by 66 in. Capacity, 70 to 600 tons per hour, depending on size of crushers and ring size of rock crushed.

All main bearings water cooled and easily removable for renewal.

Dodge—Crusher for uniform and medium fineness. The jaw being hinged at the bottom, the greatest movement is at the top.

This is directly opposite in principle to the Superior crusher in which the jaw is hinged at the top and has its greatest movement at the bottom. Size, 7 by 9 in. to 10 by 16 in. Ring size of crushed material $\frac{1}{2}$ to $1\frac{1}{2}$ in.

GARFIELD ROLLS—For re-crushing oversize from preliminary crushers. Require less power to produce large quantities of comparatively finely crushed stone or ore than any other type of re-crushing machine. Sizes, 36 by 12 in. to 72 by 24 in. Used extensively for hard and continuous service by large iron ore and copper mining companies.

36-IN. SUPERIOR McCULLY CRUSHER

SUPERIOR JAW CRUSHER
36 by 24 in.

GARFIELD CRUSHING ROLL

Crusher Screens.

Of heavy construction to handle the large pieces and enormous quantities of material discharged by jaw crushers. These screens are of the open end type, having no obstruction of any kind to impede the discharge of the material, and there are, therefore, a minimum number of parts subject to wear, and those that do wear can be easily and cheaply replaced.

STANDARD PIPE STRUT BAR SCREEN
Made in sizes 48 to 108 in. diameter and 8 to 30 ft. long

Sand Riddlers.

Rugged simplicity, high efficiency and enormous screening capacity of the Deane power riddlers have won for them an enviable reputation for use in construction work. The rectangular portable type here illustrated is capable of riddling 1 cu. yd. of sand in 5 minutes. On the saving in labor cost alone this machine will pay for itself in a very short time.

DEANE SAND RIDDLER

Core Wire Straighteners.

For straightening wire reclaimed from used cores.

A very simple and durable machine constructed of cast iron with working parts of forged steel. Can be operated at a very low cost by most unskilled labor.

Made in sizes to straighten wires from $\frac{1}{16}$ to $\frac{3}{4}$ in. in diameter.

CLIMAX CORE WIRE STRAIGHTENER

Oil Engines.

Of the high compression or Diesel cycle. The operation shows economies that greatly exceed those obtained by gas engines, steam engines or any other type of prime mover. The heaviest and cheapest oil that can be used for fuel. Only pure air is compressed and combustion takes place at a practically constant pressure.

In the four-stroke cycle used in the "Snow" oil engine, the sequence of events is as follows:

(1) Suction stroke. The piston travels out and pure air is drawn into the cylinder through the main inlet valve.

(2) Compression stroke. On return, stroke is compressed reaching a pressure of 480 lbs.

(3) Expansion stroke. Slightly before the beginning of the expansion stroke the spray valve opens, and the fuel is injected in a finely divided spray by means of compressed air at from 800 to 1000 lbs. pressure (55 to 70 atmospheres). The ignition and burning of the fuel

SINGLE CYLINDER ENGINE, 150 H.P.

NORMAL INDICATOR CARD

INDICATOR CONNECTED TO ROTATE 90° IN ADVANCE OF ENGINE CRANK, THEREBY INCREASING LENGTH OF CARD AT TIME OF ADMISSION OF FUEL

maintains the pressure at that of the maximum compression for a period depending on the load the engine is carrying. After the fuel is burned, and as the piston travels forward, the resulting mixture expands and the pressure falls gradually to the end of the stroke.

(4) Exhaust stroke. During the next stroke the exhaust valves open and the production of combustion escapes from the cylinder.

DEANE FORGED END HORIZONTAL POWER PUMP FOR OIL LINE HEAVY PRESSURE WORK

Wood Preserving Machinery.

This company manufactures complete wood preserving plants consisting of:

Steel impregnating cylinders or retorts; steel storage, charging, measuring, underground and emptying tanks; tie, block and bolster cars for handling the timber in and out of retorts; vacuum pumps and condensers either of the direct acting or flywheel pattern, for withdrawing the moisture and sap and surplus preservatives; general service or tank pumps for transferring the preserving fluids from tanks to retorts; pressure pumps for injecting the preservatives into the wood cells; centrifugal pumps for transferring preservative and for circulating and agitating hot creosote oil and zinc chloride, as demanded by the Card process; air compressors for blowing back the oil from retorts to tanks and for agitating and impregnating purposes; underwriter fire pumps for fire protection; feed pumps for feeding the boilers; feed water heaters of the open and closed pattern, for preheating boiler feed water, and such other equipment that goes to make up a complete plant.

IMPREGNATING RETORT

Standard form of retort is a hollow cylinder 6 to 9 ft. in diameter and from 50 to 150 ft. long. Built of extra heavy steel plate and fitted with steel doors at both ends. Track laid in cylinder as shown above

RAILROAD TIE CAR

PAVING BLOCK CAR

Ingeco Engines.

Oil, gas, gasoline and kerosene engines are manufactured by this company ranging in sizes to accommodate every need. The following is a partial list of the Ingeco engines with their sizes and uses:

1 h.p. Ingeco type "W" gasoline engine with built-in magneto.

1 3/4 h.p. Ingeco type "W" gasoline engine with oscillating magneto and speed regulator.

Ingeco type "W" throttling governor kerosene, distillate, gasoline and gas engines 3 to 15 h.p. with oscillating magneto. Most reliable and economical for general service, electric storage battery work, factory, foundry, feed mills, elevator, shops or farm.

Ingeco type "W" industrial engines, 10 and 15 h.p. for grain elevator and other industrial service.

Ingeco portable engines, hand and team trucks, 1 to 25 h.p.

Ingeco standard horizontal engines 6 to 160 h.p. with oscillating magneto. Operate on oil (39° Baume), kerosene, distillate, gasoline and gas, for general power and electric light service.

Ingeco oil country type gas engines, 35 to 160 h.p. with kilowatt high tension magnetos.

Ingeco semi-Diesel 2-cycle crude oil engines, 10 to 120 h.p. horizontal type.

Ingeco combined pumps and geared base engines for deep wells. Pumping engines in all sizes and modifications.

INGECO TYPE "W" ENGINE

Kerosene-oil-distillate-gasoline throttling governor. Illustrating 8, 10, 12 and 15 h.p. sizes

YEOMANS FORM "A" DUPLEX CENTRIFUGAL ELECTRIC SEWAGE EJECTORS; SHONE PNEUMATIC SEWAGE EJECTORS; YEOMANS SINGLE and DUPLEX ELECTRIC BILGE or SUMP PUMPS; YEOMANS HOUSE PUMPS; CONDENSATION RETURN PUMPS.

Also, Pumping Machinery for all purposes.

Yeomans Form "A" Sewage Ejector.

A duplex equipment consisting of two special vertical centrifugal pumps operating in dry pit, connected to cast iron sewage receiver and driven by direct con-

FORM "A" DUPLEX EJECTOR

nected vertical motors mounted on receiver cover, equipped with automatic controllers, high water alarm, pit drainage connections, cast iron bar screen of large area, gate and flush back check valves. Pumps arranged so that top plate can be raised without disturbing shafting, bearings or impellers. No accumulation of solids in receiver; minimum space requirements; high efficiency; noiseless; sanitary and reliable.

DATA, FORM "A" DUPLEX SEWAGE EJECTORS

No.	G. p. m. each unit	Pit diameter	Depth of pit below inlet
3	100-125	8 ft.	4 ft.
4	150-200	8 ft.	4 ft.
5	250-350	8 ft.	4 ft.
6	400-500	10 ft.	5 ft.

Shone Pneumatic Sewage Ejector.

The Shone ejector has been in successful service in all parts of the world for over 35 years. First installation in this country in 1888 is still in service.

At the World's Fair in Chicago in 1893, 52 Shone ejectors handled all sewage.

Unequalled for substantial design, durability, economy and reliability in operation. No screens required; bottom discharge and no accumulation of solids; special non-clogging check valves; no airtight floats; bronze, pressure operated, quick acting piston type automatic air valves.

Furnished with either motor or steam driven air compressors.

Compressors can be located at any desired distance from ejectors. Ejectors can be operated from air supply maintained for general purposes in industrial plants. Especially recommended for municipal work.

GRADE 1 BILGE PUMP

YEOMANS DUPLEX ELECTRIC BILGE PUMP

Yeomans Duplex Electric Bilge Pumps or Submerged Type Sewage Ejectors.

Construction similar to single bilge pumps; units

arranged so that one can be removed without disturbing the other.

Capacities per unit same as single bilge pumps.

Basin diameters: Nos. 1 and 2, 36 ins.; No. 3, 48 ins.; Nos. 4 and 5, 60 ins.

Yeomans Centrifugal House Pumps.

Most improved type, single and multistage, high efficiency, quiet running pumps with ring oiled, water cooled external shaft bearings, perfectly balanced rotors, flexible couplings. Special attention given to noiseless pumps for high class apartment buildings, residences and hotels. Complete automatic equipments furnished for either roof tank or compression tank service, any capacity.

YEOMANS MULTISTAGE CENTRIFUGAL HOUSE PUMP

Yeomans Condensation Return Pumps.

High grade equipments consisting of cast iron receiver with water glass, direct connected centrifugal pump and motor, all on one base, enclosed quick break butt contact automatic switch, seamless copper float and protective devices.

TYPE "H" PUMPS—For returns above basement floor level.

TYPE "V" PUMPS—For returns close to or below basement floor.

TYPE "H" CONDENSATION RETURN PUMP

TYPE "V" CONDENSATION RETURN PUMP

References.

Yeomans pumps and Shone ejectors have been in service in important city buildings, industrial plants and municipalities for many years. Installations can be referred to in all parts of the world.

A. D. COOK

Deep Well Pumps, Strainers and Accessories

LAWRENCEBURG, IND.

Products.

Manufacturer of COOK PATENT BRASS TUBE WELL STRAINERS; DEEP WELL PUMPS, Single and Double Stroke, Steam, Belt and Motor Driven.

Also, Cylinders (Working Barrels), Check Valves, Sucker Rods, Well Tools and Accessories.

Brass Tube Well Strainers.

The Cook strainer offers the most direct passage from sand stratum into the well, while the area of opening per lineal foot is equal to or greater than that of any other strainer. The absence of pockets for lodgment of sand and the low friction due to free passages materially increase the efficiency of this strainer.

CONSTRUCTION—The outstanding superiority of the Cook strainer is found in its strong integral construction. It is made from special hard drawn seamless brass tubes coupled securely to any desired length. Where electrolysis or mineral contents of the water would pit the strainer by attacking the zinc in the brass tubes, the tubes are made of pure copper, free from zinc.

The slots are milled uniformly and accurately from the inside of the metal tube. They are wider on the inside than on the outside, preventing choking up by allowing the free passage of any particle which enters through them.

The length of the strainer is governed by the conditions of drilling, pumping and well construction.

Bulletin No. 30 giving full details of the Cook strainer will be sent on request.

Double Stroke Deep Well Pump.

OPERATION—The double stroke pump head actuates two plunger valves in the working barrel, one lifting water while the other is filling. The upper plunger is attached to the lower crosshead of the pump head by a line of hollow rods and the lower plunger is attached to the upper crosshead by a line of solid rods, the rods being furnished in matched weights and lengths.

DISTINCTIVE FEATURES—The center of gravity is down close to the base plate, causing the pump to operate without vibration and eliminating any tendency toward top-heaviness, also rendering the pump more accessible for oiling and inspection. The crank shaft is a crucible nickel steel casting, heat treated, with flanges integral with shaft to which the main gears are bolted. All bolt holes are drilled standard to jigs so that perfect alignment of gears is obtained. All gears are interchangeable. Every detail in the design and construction of a perfect machine is executed perfectly. Bulletin 27B gives full description.

Products.

AIR COMPRESSORS; PISTON and CENTRIFUGAL PUMPS; ROCK DRILLS; PNEUMATIC TOOLS; PORTABLE HOISTS.

Also, Vacuum Pumps, Condensing Plants, Water Pumps, Air Lift Pumping Systems, Drill Sharpeners.

Air Compressors—"Ingersoll-Rand" and "Imperial" Types.

Each type of air compressor that this company builds is designed to meet the requirements of some one particular application.

Each size is constructed with the ultimate object in view of supplying some one demand more efficiently, more economically, than could be done by the same size of machine, made by any other manufacturer.

Each detail of every compressor built by this company receives the benefit of the best engineering skill, while the materials entering into the construction of every Ingersoll-Rand compressor are selected with particular reference to the functions they are called upon to play in conjunction with the machine's entire operation.

Each machine's workmanship is typical of all Ingersoll-Rand workmanship, the very best obtainable.

Summed up, such attention to design, materials and workmanship, means, that with an Ingersoll-Rand compressor, compressed air can be produced at bedrock prices, because more air is produced with a similar item of attendance, with a lower power input and a lower maintenance cost.

All Ingersoll-Rand compressors are of wholly enclosed construction with automatic splash and flood lubrication of the reciprocating parts. This makes for cleanliness, the exclusion of dirt and grit from wearing surfaces, economy of lubricant and lessened need of attendance.

Classes "ER" and "FR" Compressors.

Horizontal, double acting, single-stage machines with belt wheel, short belt drive complete with motor, or direct connected, piston valve steam engine, the latter with automatic cut-off control.

Imperial Types "X" and "XPV" Compressors.

Single-stage and two-stage steam driven machines of duplex type. Simple and cross compound steam cylinders. The Type "X" has plain D steam valves on small sizes and Meyer adjustable cut-off type on larger units. The Type "XPV" has balanced piston steam valves and is suitable for high steam pressures and superheat.

DATA, IMPERIAL "XPV" COMPRESSORS—STEAM DRIVE

Class "PRE" Compressors.

Duplex, single-stage and two-stage, direct connected, electrically connected units of capacities to 7500 cu. ft. per minute, pressures to 115 lbs. per sq. in. Regularly fitted with automatic clearance control.

Complete detail specifications and capacity ratings will be gladly furnished those who plan the installation of a machine of this type.

Class "ORC" Compressors.

Duplex steam driven compressors with single-stage or two-stage air cylinders and simple or cross compound Corliss valve steam cylinders. Capacities range from 1200 to 8500 cu. ft. per minute, pressures to 115 lbs. per sq. in.

For full details, address the nearest office.

Portable and Semiportable Compressors.

This Company builds portable and skid-mounted, semiportable air compressors with gasoline engine, electric motor or steam engine drive.

Units, such as these I-R outfits are ideal for construction work. They are easily taken to and erected on a job. They are compact, wholly self-contained and require no other foundation than the mounting provided.

Truck mounted outfits are remarkably light weight, yet sturdy, being all-steel in construction. Each unit is complete with compressor, driving unit, fuel tanks, air receiver, pressure gages, haulage attachments, ready for operation.

A substantial housing with curtains protects the machinery from the elements.

210 CU. FT. PORTABLE COMPRESSOR

DATA, PORTABLE AIR COMPRESSORS—GASOLINE MOTOR DRIVE
"Imperial Fourteen"

Piston displac., cu. ft. per min.	Air pressure, lbs.	Driving motor	Drive	Weight, com- plete, lbs.
45	90	Single-cyl.-2-cycle	Direct	1500
118	100	Four- cyl.-4-cycle	Direct	4000
210	100	Four- cyl.-4-cycle	Geared	6000

Data on electric and steam driven outfits, also skidded units, on request.

"Jackhammer" Rock Drills.

These tools are universally used for rock cutting, tearing up concrete, ditch digging, road construction, mining, quarrying and general work.

All these drills are of all-steel construction, automatically lubricating and self-rotating. Although primarily designed for use with compressed air, certain types will operate satisfactorily on steam.

"Jackhammers" weigh considerably less than the older piston drills, and require only one man to operate.

DATA, "JACKHAMER" ROCK DRILLS

Type	Weight, lbs.	Depth of hole	Described in Bulletin No.
BAR-33	21½	5 ft. (soft rock)	4043
BBR-13	35	8 ft.	4131
BCR-430	41	9-12 ft.	4321*†
DDR-13	70	18-20 ft.	4142*†

*Furnished in wet and dry patterns.
†Furnished with mounting if desired.

"JACKHAMER"
ROCK DRILL

"Sergeant" Tripod Drills.

For deep hole work, and for large diameter drill holes, the "Sergeant" drill is offered. It is sturdy in design, and can be relied on for uninterrupted high duty service.

Bulletin No. 4302.

"SERGEANT"
TRIPOD DRILL

"Little Tugger" Portable Hoists.

There are many places for this little hoist in all sorts of work. It can be clamped or bolted to any handy support and operated in any position. Either compressed air or steam furnishes power.

The load limit is a half ton and the drum capacity 450 ft. of 5/16-in. wire rope.

It finds application in handling everything, placing machinery on foundation, skidding heavy crates, hauling cars, hoisting ash buckets, erecting scaffolding, pulling scrapers and backfillers, handling pipe in trenches and a host of kindred jobs.

Bulletin No. 4333 for a full description.

"LITTLE TUGGER"
PORTABLE HOIST

"Little David" Riveting Hammers.

Sturdy, hard hitting tools for every grade of work. Distinctive in design and of superior ability to resist abuse.

They can be taken down or assembled in the field—a simple wrench is all that is needed.

Built in 5 sizes, with inside and outside triggers, and with or without safety rivet set retainers.

NO. 60 "LITTLE DAVID"
OPEN HANDLE RIVETER

NO. 1 "LITTLE
DAVID" JAM
RIVETER

Under equal test conditions, "Little David" riveters will exceed the work of any other hammers of like size.

The air consumption is low for the results obtained. They spend more time on the work and less time in the repair shop than any other make of riveters.

DATA, "LITTLE DAVID" RIVETING HAMMERS

Cameron Pumps.

These pumps have been manufactured and sold for over 50 years and the name Cameron together with its acorn trade-mark is a guarantee that the pump will be both efficient and lasting. The idea of simplicity and rugged strength has been carried out in the manufacture of all Cameron equipment, together with the accompanying principle of the use of very few parts—each having exceptional strength and wearing qualities. Every Cameron pump is designed in accordance with the best engineering practice and from the view point of the actual work which the particular pump is scheduled to perform. All metals used in the manufacture of Cameron pumps are carefully chosen for strength and wearing qualities together with a view to the nature of the fluids to be handled.

Centrifugal Pumps.

Cameron centrifugal pumps are manufactured in the following sizes and styles to meet service conditions:—

CAMERON CENTRIFUGAL PUMP

Classes "DV" and "FV" are single-stage, horizontal, double suction volute pumps made in sizes of from 2-in. to 24-in. diameter discharge, with capacities from 90 to 20,000 g.p.m. under total heads of from 10 to 230 ft.

Classes "MT" and "ST" are horizontal, single suction, multistage turbine pumps built for general high head service and in from 2 to 5 stages. They are manufactured in seven sizes varying between 2 1/2-in. to 10-in. diameter discharge with capacities from 125 to 2400 g.p.m. and operate against heads of from 45 to 230 ft. per stage.

Class "BT" single suction, multistage turbine pumps are made in 3 and 4 stages in 1 size only having a 5-in. diameter discharge. These pumps have capacities of from 400 to 550 g.p.m. against pressures of from 150 to 250 lbs. per sq. in.

All of the pumps mentioned above are mounted on a heavy cast iron bedplate of sufficient size and strength to lend rigidity to the entire unit and accommodate the driver if the pump is to be direct coupled to steam turbine, engine, electric motor, gas engine or other form of direct driver. If the pumps are to be belt driven, two outboard pedestal bearings and a flexible coupling are furnished.

In addition to the double suction volute pumps and the single suction multistage turbine pumps, the company also manufactures a single suction, open impeller pump arranged for belt drive. These pumps are extremely simple, having but 15 integral parts. They are made in sizes from 1-in. to 12-in. diameter discharge and have capacities from 15 to 6200 g.p.m. against heads of from 40 to 70 ft.

Simplex Direct Acting Pumps.

The Cameron Simplex pumps are extremely well known and universally recognized as the pumps having fewer working parts than any other in the same class. Their rugged construction, absence of outside valve gear; simplicity and special features in design and manufacture make them especially desirable for work which entails hard duty and continuous performance under adverse conditions. There are many different models in both horizontal and vertical types to suit conditions encountered. Cameron Simplex sinking pumps are suited for use in shaft sinking, contracting and, in fact, wherever a vertical pump can be used. Special vertical piston pumps are manufactured for use on board ship to meet the special need of this class of service.

Products.

Manufacturers of Air Compressors: Steam, Belt, Short Belt with Idler, Oil, Gasoline Engine and Direct Motor Drive; Oil, Gas and Gasoline Engines.

Also, Vacuum Pumps, Gasoline Extraction Outfits, Air Hoists, etc.

For Pneumatic Tools, Electric Tools, Rock Drills, Hammers and Geared Hoists, see pages 32-33.

TRADE-MARK

free air per minute. This compressor is guaranteed to run satisfactorily on any natural or artificial gas containing 600 B.t.u's. per cu. ft. or over.

The Class N-SGL Chicago Pneumatic Simplate valve compressor is guaranteed to run satisfactorily on any grade of gasoline.

Both machines are well suited to rough, heavy duty and in locations where the services of highly trained attendants are not available. In operation they require little attention.

Compressors.

This company's line of compressors is particularly complete and embraces machines for all possible requirements and conditions of service, up to capacities of 6000 ft. per minute. Standard sizes for steam, belt, electric and oil, gas and gasoline engine drive can be shipped promptly. Special types can be built to meet special requirements.

Chicago Pneumatic Simplate Disk Valves.

They are used exclusively in Chicago pneumatic compressors. The "Simplat" is unique and distinctive in both design and construction. Its chief advantages are that it is simple; that its plates are independent in action, one of another; that each plate has its individual springs; that the tension on the inlet and discharge valves differs according to the air handled; and lastly, that it is applicable to all positions and conditions.

Class N-SG Semi-portable Air Compressors (Gas and Gasoline Driven).

Due to its portability, this compressor is especially adapted to contractors' use. As shown, power and compressor cylinders are arranged tandem on same piston rod, thereby eliminating all gearing or other power consuming transmissions.

The Class N-SG Chicago Pneumatic Simplate valve compressor is made in capacities up to 325 cu. ft.

Class N-SO Compressors.

They are similar in design to the N-SG, except that they are guaranteed to operate on the following: any mineral oil of 28° Baume scale or lighter, containing not over 1% sulphur. Most of the common crude oils, fuel oils and residuums are included in the guarantee, such as star oil, diesel, calol, stove oil, solar oil, gas oil, kerosene, and all of the distillates between kerosene and lubricating oil.

Class N Compressors.

These compressors (N-SB belt driven and N-SS

CHICAGO PNEUMATIC SIMPLATE VALVE TANK MOUNTED PORTABLE COMPRESSOR

Can be operated on oil, gas or gasoline; also built for electric motor drive

steam driven) are rugged, self-contained machines, designed for hard service and require minimum of care and attention. Equipped with Simplate flat disk type of inlet and discharge valves.

Class O-CSC 2-stage Steam Driven Air Compressors.

These compressors are of enclosed construction, rugged design and high rotative speeds, simplified steam valve gear and unexcelled system of automatic lubrication. Equipped with Simplate valves.

Class O-CE Electric Motor Driven Air Compressors.

Class O-CE compressors are highly efficient and compact.

A variable volume of air delivered at a constant speed, and with a minimum power consumption, is one of its characteristics. Equipped with Simplate valves.

"Giant" Semi-Diesel Oil Engines.

For pumping, hoisting and power purposes generally, in mills, factories, grain elevators, electric plants, construction work, mine haulage and ventilation.

Of the horizontal, straight line crosshead type. In the larger sizes it is mounted on a substantial subbase so designed that when the machine is in operation, it is free from vibration. Parts are relatively few in number and the engine is well suited to rough, heavy duty under conditions that prevent the employment of a highly trained attendant. In operation, it requires little attention. Economy and durability are its characteristics. General design is strong, compact and graceful; the symmetry of every feature indicates the care used in its development.

"Giant" engines are guaranteed to run on any mineral oil of 28° Baume scale or lighter, containing not over 1% sulphur. Most of the common crude oils, and residuums are included in the guarantee, such as star oil, diesel, calol, stove oil, solar oil, gas oil, kerosene, and all of the distillates between kerosene and lubricating oil.

Principal features of this engine are: valveless 2-cycle power cylinders; positive self-oiling system of lubrication; hot plate ignition; no electrical firing devices; governed fuel injection; economy of fuel; perfect scavenging of cylinder; crosshead type of construction; rugged horizontal enclosed frame, removable covers and accessible bearings.

NOVO ENGINE COMPANY

C. E. BEMENT, VICE-PRESIDENT AND GENERAL MANAGER

Air Compressor Outfits, Saw Rigs and Woodworkers

10 Porter Street
LANSING, MICH.

CHICAGO OFFICE
800 Old Colony Building

Products.

NOVO AIR COMPRESSOR OUTFITS, RIP and SWING CUT-OFF SAW RIGS, and COMBINATION WOODWORKER.

For Novo Hoisting Outfits, see page 60; for Novo Engines and Pumping Outfits, see pages 764-65.

Novo Air Compressor Outfits.

The engine and compressor are mounted on a cast iron base supported on heavy steel trucks, with the receiver slung under, between the sills of the truck as shown in Fig. 276; or, if desired, this receiver can be mounted on end of truck. The engine drives the compressor by flexible coupling on sizes up to and including 6 h.p.; and by a clutch coupling on larger sizes.

In the pipe between the compressor and the receiver is a 3-way cock, which permits any air in the receiver to be retained, but the outlet from the compressor is opened for ease in starting.

The equipment of these air compressor outfits includes the proper size air receiver, pressure gage, relief

TRADE-MARK

valve, drain to receiver, stop cock for pipe or hose connection, and on outfits 6 h.p. and above an unloader is furnished.

Fig 276 shows the way the larger sizes of Novo air compressor outfits are mounted on steel team trucks. The construction of the smaller outfits is similar, but smaller hand trucks are used.

Novo Rip and Swing Cut-off Saw Rigs.

This saw rig is strong and rugged, built for handling large and long timbers. For cross-cutting, the material is placed against the gage and the saw moves forward cutting the timber. The swing arbor is operated by a foot lever, carefully balanced and strong in every way; for ripping, the swing arbor is locked in permanent position.

Outfits furnished complete with rip and cut-off saws and guides.

NOTE—The above outfits are water cooled of the reservoir type, with the exception of Type H compressors, which are water cooled by circulating pumps. †Outfits are equipped with 2-cylinder 15 h.p. engine and are similar in design to Fig. 276.

Novo Combination Woodworker.

This is a small outfit with attachments for ripping, cross-cutting, boring, sanding, grooving, planing and grinding. It is furnished with 12-in. rip saw, 14-in. cut-off saw, two gages, 6-in. joiner, 9-in. adjustable dado, 8-in. emery wheel, 10-in. sander, boring attachment with sliding table and 3/8-in., 1/2-in. and 3/4-in. bits. Band sawing attachment can be furnished with this outfit at an extra cost.

WHEELER CONDENSER AND ENGINEERING CO.

CARTERET, N. J.

BRANCHES

NEW YORK	BOSTON	SAN FRANCISCO	PHILADELPHIA	NEW ORLEANS	ATLANTA
DENVER	CINCINNATI	CHARLOTTE	PITTSBURGH	CHICAGO	ST. LOUIS
LONDON	YOKOHAMA	MELBOURNE	HAVANA	SHANGHAI	

Products.

Manufacturers of complete CONDENSING EQUIPMENT: HIGH VACUUM SURFACE, and JET CONDENSERS; WHEELER TURBO AIR PUMPS; WHEELER-EDWARDS AIR PUMPS; WHEELER STEAM JET AIR PUMPS; WHEELER ROTATIVE DRY VACUUM PUMPS; FORCED DRAFT STEEL, and NATURAL DRAFT WOODEN COOLING TOWERS; BRASS and COPPER TUBES; LILLIE and STANDARD EVAPORATORS; ATMOSPHERIC RELIEF VALVES.

Barometric Condensers, Feed Water Heaters, Receivers, Reheaters.

High Vacuum Surface Condensers.

For turbines of any capacity, condensing equipments operating on wet or dry system, with tube surface of condenser arranged to give best distribution of steam for high efficiency and maximum rate of heat transmission.

WHEELER HIGH VACUUM SURFACE CONDENSER, 50,000 SQ. FT.

Atmospheric Relief Valves.

Water sealed, can not chatter, closes vertically on its seat, has no outside working parts or packings, built in either the horizontal or vertical types, and protects the condenser.

ATMOSPHERIC RELIEF VALVE

Lillie and Standard Evaporators.

Multiple effects for all practical purposes. Lillie evaporators are manufactured and furnished exclusively by this company. Film evaporation; small space; mechanical circulation.

LILLIE VAPOR REVERSING QUADRUPLER EFFECT

Rotative Dry Vacuum Pump.

Will maintain a vacuum within 0.5 in. of barometer.

For high vacuum jet condenser and large surface condensing equipments. Clearance effect reduced.

ROTATIVE DRY VACUUM PUMP

Turbo Air Pump.

High speed rotary type for jet or surface condensers, direct connected to turbine or motor. A highly efficient and reliable pump.

Wheeler-Edwards Air Pumps for Air and Condensate.

Eliminate expense of independent air and hot well pumps. No suction or bucket valves. Single, duplex, or triplex sizes.

TURBO AIR PUMP

Wheeler Steam Jet Air Pump with Intercondenser.

This steam jet air pump is the most efficient steam jet air pump made.

Wheeler Jet Condensers.

For steam turbine. Vacuums 28 in. and up. Built on the counter-current rain type principle to insure maximum temperature and minimum quantity of discharge water and low pumping cost.

STEAM JET AIR PUMP

Brass and Copper Drawn Tubes.

Seamless drawn tubes made to specifications whether brass, copper, Muntz, Admiralty, tinned, or whatever special mixture is desired. The new Wheeler tube mill makes a specialty of condenser and evaporator tubes drawn and heat treated by experts in condenser work. We ourselves use over 2,000,000 lbs. per year.

VERTICAL TURBINE-DRIVEN JET CONDENSER

Cooling Towers.

Where ground space is limited Wheeler-Balcke forced draft steel towers are recommended.

Usually the Wheeler-Balcke natural draft wooden tower is recommended for manufacturing and industrial plants, also central stations where a supply of cooling water is scarce. Operating cost consists of water pumping costs only.

Designed for special low lift, so as to reduce this cost to a minimum.

WHEELER-BALCKE NATURAL DRAFT COOLING TOWER

ALBERGER HEATER COMPANY

BUFFALO, N. Y.

Products.

ALBERGER MULTIHEAD HEATERS: Domestic Service Heaters, Feed Water Heaters, Forced Circulation Hot Water Heaters, Laundry Heaters, Oil Heaters.

Condensers, Wort Coolers, Air Coolers, Oil Coolers and Heat Interchangers.

General Description.

The Alberger multihead heater is the ideal heater in the estimation of thousands of users, because it is a closed heater of the water tube type, giving an adequate supply of hot water at minimum cost for repairs and cleaning. It embodies the most efficient type of heater for delivering the highest rate of heat transmission, *without* the usual internal troubles, such as scale, corrosion, split tubes, leaky joints and heads, and expansion strains.

Construction.

The shell, tube heads, water channel, and the steam and water heads are made of a special grade of cast iron, selected for that purpose, as it is free from corrosion from water.

The tubes are of pure copper. Copper, being a homogeneous material, will not split under temperature changes when drawn into tubes, and will last indefinitely.

All water and steam connections are on the body of the shell, so that it is not necessary to break these connections to secure access to the heating surface.

The standard tubes used in the Alberger heaters are $\frac{3}{4}$ -in. spirally corrugated, and, being straight, any one tube may be removed or replaced without disturbing any other tube.

The tubes are small, because conclusive experiments and practical usage show that small tubes transmit a much greater quantity of heat per square foot of heating surface.

Also, there is shown to be an increase of over 50% in the amount of heat transmitted through *corrugated* tubes over *plain* tubes of the same size.

Further, when water passes through a spirally corrugated tube, the rotating motion produces a scouring effect which keeps the tube free from scale.

HORIZONTAL TYPE OF HOT WATER HEATER

Expansion.

In the Alberger multihead heater, the unavoidable expansion due to temperature changes is properly taken care of by the use of "floating" heads, into which the tubes are expanded at one end of the heater. With this series of "floating" tube heads, the several groups of tubes can expand or contract entirely independent of each other, thus eliminating dangerous strains on the tubes and tube heads.

Capacities.

Alberger heaters are made in capacities from 200 to 200,000 gals. per hour. Standard parts are carried in stock so that prompt deliveries can be made on practically all sizes.

Made in 1-, 2-, 4- or 8-pass, either horizontal or vertical types, as required.

NOTE.—Heater = Size required. Lbs. st. = No. of pounds of steam required. Steam at 212°.

FOUNDED 1867

THE GRISCOM-RUSSELL CO.

Manufacturers of Power Plant and Marine Auxiliaries

CABLE ADDRESS:

"GRISPEN, NEW YORK"

91 West Street
NEW YORK, N. Y.WORKS:
MASSILLON, OHIO**Products.**

STORAGE, OIL and WATER HEATERS; EVAPORATORS; OIL COOLERS; FEED WATER FILTERS; STEAM, OIL and AIR SEPARATORS.

Grease Extractors.

Russell Storage Heater.

For supplying hot water in hotels, apartment houses, laundries, dye houses, etc. The water is in the shell and the steam in the tubes. A storage capacity of hot water is assured at all times. Shell is of steel and heating surface of seamless drawn brass tubing.

RUSSELL STORAGE HEATER

Reilly Heater.

This is a closed type heater for either marine or stationary power plants for boiler feed or other purposes. Steam is the heating medium. Shells are of cast iron and heating surface consists of seamless drawn copper tubing. Built in any required size.

REILLY HEATER

"G-R" Instantaneous Heater.

For heating boiler feed water or for supplying hot water for general service. Steam is the heating medium. Shell of cast iron and heating surface of straight seamless drawn brass tubing. Floating head construction permits expansion and contraction of tubes without strain on tube joints.

G-R INSTANTANEOUS HEATER

Massillon Open Heater.

For purification and heating of boiler feed water by direct contact of steam with water. Shell and trays of cast iron. A "Stratton Junior" Oil Separator can be supplied, if required, for the removal of oil from exhaust steam before it enters heater.

MASSILLON OPEN HEATER

Reilly Evaporator (Submerged Type).

The up-to-date method of purifying boiler feed water is by the use of Reilly Evaporators (submerged type). This system provides pure water, eliminates scale and boiler blow-down, reduces boiler take-down and boiler maintenance. Pays for itself in 6 months' to 1 year's operating time.

REILLY EVAPORATOR (Submerged type)

Multiwhirl Cooler.

For cooling lubricating oil used in turbine bearings, reduction gears, etc., and for quenching oils used in the heat treatment of steel.

MULTIWHIRL COOLER

Practically standard in United States Navy and Merchant Marine. Particular feature is a helical baffle which directs oil in its passage through cooler without causing appreciable pressure loss.

TRADE-MARK

Reilly Fuel Oil Heater.

Because of the high price of coal, fuel oil is receiving particular attention at the present time. In order to burn heavy oils properly, they must be heated before they are fed to the burner.

The Reilly Fuel Oil Heater is designed for this purpose. Oil passes through coils of seamless drawn steel tubing and high pressure steam is supplied to shell. Steam condensation is usually returned to boilers. Construction of Reilly Fuel Oil Heater prevents any contamination of condensed steam by oil, as oil joints are all outside of steam space.

REILLY FUEL OIL HEATER

Multiscreen Feed Water Filter.

The Multiscreen Filter is designed to remove the oil which is found in considerable quantities in the return condensed steam from engines, heating systems, etc., and thus protects the boiler from damage.

MULTISCREEN FEED WATER FILTER

Stratton Steam Separator.

For removal of water from steam supplied to engines, turbines, etc. Entering steam and water pass through helical path, which causes a swirling motion of entire mass. Water, which is heavier, is thrown out of steam path by action of centrifugal force. Built of either cast iron or cast steel, depending upon the service. Made in various types of inlet and outlet, to suit pipe connections.

STRATTON STEAM SEPARATOR

Bundy Oil Separator.

For removal of oil from exhaust steam in order to prevent contamination of heating systems or of boilers. Removable multiple baffle plate construction permits withdrawal of plates for cleaning. A record of 20 years establishes the superior efficiency of this type of oil separator.

BUNDY OIL SEPARATOR

Stratton Air Separator.

Water in compressed air is detrimental to efficient operation of sand blast machines, pneumatic tools, etc. These separators are designed for removal of this water from air. Centrifugal force accomplishes the separation. Separator is simple in construction; has no internal moving parts and will operate independently with a minimum of attention. Furnished in cast iron suitable for 200 lb. per sq. in. working air pressure and in various types of inlet and outlet to suit conditions.

COIL TYPE FEED WATER HEATERS; DIRECT CONTACT OPEN TYPE HEATERS and PURIFIERS; STORAGE HEATERS; STEAM and OIL SEPARATORS.
Coils and Bends of Iron, Brass and Copper Pipe.

National Direct Contact Feed Water Heaters.

CONSTRUCTION AND PRINCIPLE OF OPERATION—Heater consists of a cast iron shell within which are the contact pipes, trays, filter bed, etc.
Shell is either horizontal cylindrical or vertical rectangular, according to conditions, but contact pipes are always horizontal, regardless of shape of shell.
Oil Separator—Forms the back head of the cylindrical type and is of the same diameter as the shell.
Described on following page.

Contact Pipes—Extending from one end of the heater to the other are contact pipes, designed so as to heat the water by surface contact.
Each of these pipes is really a double cast iron pipe, the larger containing steam, while the smaller, which is not concentric, is filled with the cool feed water. The smaller, or water pipe, is closed at the back end, so that the feed water entering the front end completely fills it and the water is warmed by the steam which surrounds it. More water entering the pipe causes some to overflow the port at the top. As it overflows, it follows around the larger pipe as a thin film, which is warmed not only by the hot walls of the steam pipe but also by actual contact with the exhaust steam which fills the heater. When this film or curtain of water, which closely hugs the outside of the larger pipe, reaches the ribs projecting from the bottom, it breaks up into two

sheets of fine spray, and while in this form, mingles with the exhaust steam which passes through it.
Steam Pipe—The larger pipe is filled with steam which can only escape through the port at the bottom. This port extends the full length of the pipe.
Escaping steam must pass through the fine water spray and this intimate and thorough mingling heats the water to practically the temperature of the steam.
Trays—Heated water and condensed exhaust drop from the projecting ribs of the steam pipe to trays, which keep the hot water well spread out while flowing to a large vertical pipe which conducts it to the bottom of the heater.
Upward Filtration—All filtration is upward. The pump draws from above the filter, so that all water must pass upward through the filter material. The advantages of upward filtration are numerous.

9110	379500	103	216 1/4	45000					

Bottom Blow-off—Heater is provided with a bottom blow-off, which provides a means for washing out sediment and draining the heater. A strong reverse current can be passed through the filter bed, cleaning it and insuring longer life.

Cold Water Supply—Cold water supply is automatically regulated by a balanced valve in the water inlet pipe in proportion to the demands of the boiler feed pump.

Steam Inlet—Exhaust steam enters the heater at the back, first passing through the oil separator, and then enters the steam pipe, the only outlet of which is the port at the bottom.

Surface Blow-off—A trough extending the full width of the heater, just above the water line, serves as a skimmer for the surface blow-off, also as an overflow to the sewer. It is so connected that it automatically drains to the sewer.

Accessibility—Every interior part of the National direct contact feed water heater is easily accessible.

Large doors give access to the trays and filter bed and the removal of blank flanges provides for examining inside of contact pipes.

Drips and Auxiliary Water Supply—On the front of the heater, above the working water level, there is a connection for admitting gravity returns or other condensation which is free from oil. This is in addition to an inlet on the top of the heater which may be used for admitting trapped returns from heating or drying coils.

National Coil Type Feed Water Heater.

Water passes through drawn copper tubing guaranteed to withstand 600 lbs. pressure. This tubing is securely fixed in the cast iron or steel plate shell which is completely filled with the exhaust steam. The water does not come in contact with the steam or the shell.

Particularly adapted for use where water supply is free from oil or those substances which form scale or cause corrosion.

E-6	57 1/2	84 to 138	35,000 to 145,000	9800 to 13,300

The capacities in this condensed table are based on raising the temperature of the water from 40° to 206°.

National Storage Heaters.

Constantly and intermittently supplies large quantities of hot water for washing in mills, factories, hotels, apartments, etc.

Uses exhaust steam, thereby saving coal, or live steam if there is not sufficient exhaust.

Consists of a shell or tank containing a heating element made up of a set of removable U-bends of copper tubing.

Heating element is removable for inspection, repairs or substitution of a larger or smaller element. It is placed in the lower part of the shell where the entering water will come in contact with it, resulting in maximum efficiency in the transfer of heat.

The area through the tubes is sufficient for unrestricted flow of steam and condensation.

National Horizontal Oil Separator.

Insures complete separation of oil and exhaust steam, yet allows steam to pass through freely without friction. Oil is taken out of the current of steam by gravity, impact and change of direction, and baffle plates prevent it from being picked up again and carried along in the current. At the bottom a large drip opening leads from the storage chamber for draining the separator to the sewer.

These separators are made in two pieces to allow inspection and test of baffle plates. Joint is machined and guaranteed perfectly tight.

The steam, when condensed, is perfectly suitable for boiler feed, laundry or dye-house service, ice making or any other similar purpose.

NATIONAL OIL SEPARATOR

PRATT & CADY COMPANY INCORPORATED

SUCCESSOR TO I. B. DAVIS & SON, ESTABLISHED 1872

Feed Water Heaters, Hot Water Service Heaters and Power Pumps

HARTFORD, CONN.

For Branch Houses and Selling Agents, see Page 487

Products.

Manufacturers of HOT WATER SERVICE HEATERS; FEED WATER HEATERS; DUPLEX and TRIPLEX POWER PUMPS.

Hot Water Generators.

For Valves and Cocks, see pages 487-91.

Experience and Co-operative Service.

PRATT & CADY COMPANY, INCORPORATED have purchased the plant and business of I. B. Davis & Son, who have been engaged in the manufacture of feed water heaters since 1872. In continuing the manufacture of this line, they will adhere to the same high standards of material and workmanship which have built up such an enviable reputation during the past 48 years for apparatus bearing the "Davis" name.

Modern improvements, the result of long experience, should be a sufficient guarantee of reliable and co-operative service. Interested persons are cordially invited to submit intricate water heating problems for prompt consideration by the engineering department of this company.

P&C (Davis) Hot Water Service Heater, Type Z.

The P&C hot water service heater, type Z, is a perfect device for heating water for bakeries, bleacheries, breweries, colleges, hospitals, hotels, laundries, print and dye works and all places where hot water is required in quantities at a desired temperature. In this respect its large water capacity makes it invaluable, for it presents a reservoir of hot water which can be drawn on either constantly or at a moment's notice. The body of the shell and heads are of steel and the tubes are of seamless drawn brass, insuring maximum heating qualities.

P&C (Davis) Triplex Power Pump, Type G.

The illustration is an upper guided vertical triplex belt driven power pump.

Uprights, of strong box pattern, with no ribs on outside, can be readily cleaned.

Gearing very powerful, takes strain near center of load. Machine cut teeth render pump practically noiseless in operation.

Bearings, large and of ample strength for severe service. All boxes are babitted and adjustable.

Cast iron cylinders, glands and plungers.

Composition valves.

VALVE CHAMBERS—Both suction and discharge are separate, securely bolted to base of pump, and can be renewed.

SPECIAL CONSTRUCTION—Bronze lined base and glands, bronze plungers, rawhide pinions, etc., to order, at extra price.

CAPACITIES and SIZES—Send for catalogues containing full information.

ESTABLISHED 1894

INCORPORATED 1912

STACK HEATER COMPANY

Manufacturers and Designers of Water Heaters and Allied Specialties

33 Sudbury Street
BOSTON MASS.

Products.

STACK AUTOMATIC HOT WATER STORAGE SYSTEMS (Steam and Gas); STACK INSTANTANEOUS WATER HEATERS (Steam and Gas); SAFETY RELIEF VALVES.

Stack Feed Water Heaters, Stack Tank Heaters (Steam and Gas), Thermostats, Non-by-pass Tees.

Service.

Stack expert engineering department wishes to co-operate with engineers. This service is free, and is guaranteed to meet any requirements when recommendations are followed. Stack experience is at the command of engineers whether or not Stack appliances are used.

Construction.

Stack heaters are made of small seamless drawn copper tubes. The ratio of heating surface to volume of water is 3 times that of any other heater.

All waterways are of copper, bronze, or brass. No expansion joints are used, as each tube can expand and contract without stress or strain.

All coils are tested on 600 lbs. water pressure before assembling.

Advantages.

Speed in heating water, and free circulation; efficiency and economy.

Safety—no Stack system has ever blown up or exploded. Built under the same supervision for 25 years.

Tests.

All makes of heaters exhibited at the International Exposition were given a series of actual service tests. Stack heaters showed the greatest speed and efficiency in each test.

A copy of these tests is on file at the executive office, and will be shown architects and engineers interested.

Stack Instantaneous Steam Water Heater with Temperator.

Steam does not mix with water.

Suitable on either exhaust or high pressure steam.

Water at desired temperature, can not scald.

Steam used only while water is being drawn.

No moving parts or expansion joints.

Particularly adapted for wash-up sinks, first aid rooms, hospitals, restaurants, commercial requirements and factory use.

Larger sizes on application.

Stack Safety Relief Valve.

A combination faucet and relief valve, which insures, through constant use, that seats are free, and that the boiler pressure reaches the valve.

Does not waterhammer, and can not be tampered with—foolproof.

Order valves set at least 25 lbs. higher than water pressure at outlet.

STACK SAFETY RELIEF VALVE

Stack Gas Water Heater and Storage Systems.

Data and description of systems designed for residences, apartment houses, hotels, etc. is given in SWEET'S ARCHITECTURAL CATALOGUE, Fourteenth Edition, pages 1124-25.

THE WHITLOCK COIL PIPE COMPANY

Manufacturers of Standard Feed Water Heaters and Hot Water Service Heaters
HARTFORD, CONN.

NEW YORK OFFICE, Singer Building, 149 Broadway
SOUTHERN OFFICE, Charlotte, N. C.
BUFFALO OFFICE, White Building

CHICAGO OFFICE, Fisher Building, 343 S. Dearborn Street
PHILADELPHIA OFFICE, 527 Commercial Trust Building
BOSTON OFFICE, 50 Congress Street

Products.

AMERICAN STANDARD FEED WATER HEATERS; AMERICAN BERRYMAN FEED WATER HEATERS; AMERICAN STRAIGHT TUBE FEED WATER HEATERS; WHITLOCK AMERICAN INSTANTANEOUS HEATERS for hot water service; WHITLOCK AMERICAN STORAGE HEATERS; WHITLOCK AMERICAN HOT WATER CONVERTORS; SPECIAL HEATERS.

Also, Pipe Bends; Flanged Piping and Headers for high pressure power plant piping; Coils and Bends of iron, steel, copper and brass pipe and tubing of all descriptions.

Feed Water Heaters.

The necessity for, and the economy of, feed water heaters is so generally acknowledged that a discussion of this feature would be out of place here, and only the description of the distinctive features of the American standard feed water heater will be given.

DURABILITY OF CONSTRUCTION—The American standard feed water heater is particularly adapted to standing up under the severe service to which a closed feed water heater is subjected, when working under full boiler pressure and receiving the impact of each stroke of the feed pumps, by the following outstanding features:

(1) Seamless copper tubing, superior to brass, mechanically, in conductance of heat and in resistance to corrosion and electrolytic action.

(2) All joints brazed, eliminating possibility of leaks; there being no screwed or

flanged joints subject to boiler pressure. See construction of terminal connections of type "A" heaters Figs. 104 and 105, and type "B" heaters Figs. 25A and 25B.

(3) Coils firmly held but allowed to expand and contract freely by means of steel braces and patented swiveling malleable iron clamps.

(4) The best of material is used throughout. Nothing but seamless copper tubing and the best grades of gray iron and tank steel enter into the construction of these heaters.

FIG. 204. TYPE "B" AMERICAN STANDARD FEED WATER HEATER, HORIZONTAL PATTERN

FIG. 18. TYPE "A" AMERICAN STANDARD FEED WATER HEATER

FIG. 104. TYPE "A" MANIFOLD FITTING

FIG. 105. TYPE "A" COIL ASSEMBLY

FIG. 25A. TYPE "B" HEADER (PATENTED)

FIG. 25B. TYPE "B" COIL ASSEMBLY

HIGH FEED TEMPERATURE—Particular attention is called to the fact that all of the American standard feed water heaters are guaranteed to heat the rated amount of water (based on 30 lbs. per hour per boiler horsepower) to within 2° of the steam temperature, or to 210° when supplied with sufficient steam at atmospheric pressure. This result is achieved by furnishing a liberal amount of heating surface per rated horsepower, designed and constructed so as to secure the maximum efficiency in heat transmission.

These heaters are therefore not to be considered as "competition" heaters and are not in the same class with the ordinary commercial closed feed heater, which does not heat the water to within less than 7° to 8°, and frequently not to within less than 12° to 13° of the steam temperature. This point is more fully discussed in Bulletin No. 13, a copy of which will be sent on request.

Hot Water Service Heaters.

Under this heading are generally included all heaters for furnishing hot water for toilet service, bath, showers, manufacturing purposes, etc., in fact for every purpose except boiler feed. They may be broadly divided into two classes: instantaneous heaters and storage heaters.

INSTANTANEOUS HEATERS—

In this class the water is heated instantaneously as it passes through the heater, no hot water being held in storage. Used wherever the demand for hot water is fairly uniform or where the steam supply is large and flexible compared with the demand for hot water. They are frequently used in combination with storage tanks, the combination making, in effect, a storage heater.

There are 3 principal styles of this class: the copper coil, Type "AC" (Fig. 15A); the U-bend or Berryman, Type "R" (Fig. 151); and the Straight Tube, Floating Head Type "S" (Fig. 152). The proper type to use in any given case depends, of course, on conditions; and advice and recommendations on this point will be gladly given.

FIG. 15A. TYPE "AC" COPPER COIL HEATER

FIG. 151. TYPE "R" BERRYMAN HEATER

FIG. 152. TYPE "S" STRAIGHT TUBE FLOATING HEAD HEATER

STORAGE HEATERS—In this class a large body of hot water is always held in storage to answer sudden demands; the heating of the water proceeds uniformly

at all times whether hot water is being drawn or not. Used where the demand for hot water is intermittent and the steam supply is not flexible (as exhaust steam) or is limited in amount compared with the demand for hot water.

This company builds so many types of storage heaters that there is no room here for even a short description of the various designs; therefore only the most important, the Type "K," is shown.

Type "K" Service Heaters—These heaters are designed for use in hotels, office buildings, hospitals, laundries, factories, or wherever a large supply of hot water is required to provide for periods of heavy "peak" loads. The hot water builds up gradually between drafts, and is held in storage for sudden demands.

The features of construction are as follows:

- (1) Heating surface placed low in the shell—surrounded by the coldest water—insuring maximum efficiency and full value of storage capacity.
- (2) Individual tubes practically all the same length, preventing "short circuiting" of the steam and producing even distribution of steam.
- (3) Tubes of U-bend construction, minimizing stresses due to expansion and contraction.
- (4) Ends of tubes expanded and beaded over into a heavy cast iron tube sheet, making a perfect joint.
- (5) Heating section easily removable for inspection and cleaning.

FIG. 14. TYPE "K" WHITLOCK SERVICE HEATER
DIMENSIONS AND CAPACITIES

23	60	192	5	8	2250	3200

Manhole, 11 by 15 in.
Capacities given are based on heating the water from 40° to 180° Fahr. and using exhaust steam at atmospheric pressure. For other temperature ranges and steam pressures see Bulletin 27. Cradles are furnished when required at no extra expense. Companion flanges for steam connections when 3 in. or larger.

Special Heaters.

This company also designs and builds all kinds of special steam actuated heaters, such as oil heaters, air heaters, oil coolers, air coolers, evaporators, condensers, etc. Specifications and estimates on such apparatus will be submitted on request.

This company has developed a number of installation diagrams for piping layouts showing some of the more important types of installations in which Whitlock heaters are used, a few of which are shown on this page.

A complete set will be sent to architects or consulting engineers on request.

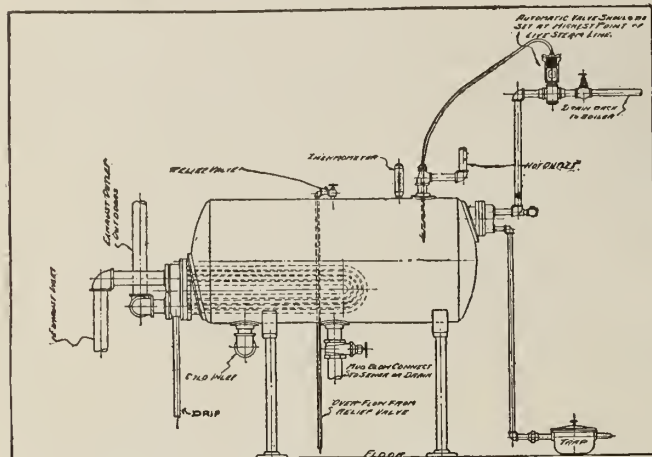

FIG. 113. WHITLOCK AMERICAN TYPE "K" STORAGE HEATER
INSTALLED FOR LAUNDRY SERVICE

Particularly adapted for laundry service on account of the varying draft of hot water and the fact that the steam condensing power of the heat must be constant in order to thoroughly utilize the exhaust steam from engine.

Diagram shows piping for the auxiliary live steam heating section. Supply of steam to this section is automatically controlled as shown.

FIG. 160A. WHITLOCK AMERICAN TYPE "K" STORAGE HEATER WORKING IN CONNECTION WITH A COAL BURNING AUXILIARY HEATER

In this type of installation steam is supplied to the Type "K" heater from the main heating boilers during the heating season; and at times when no steam is carried on the main heating boilers, the auxiliary coal burning heater is fired

AMERICAN WATER SOFTENER CO.

Mechanical Filtration and Water Softening Plants

PHILADELPHIA, PA.

Products and Services.

WATER SOFTENING PLANTS of both Sodium Zeolite (Decalso) and Lime and Soda Types; complete FILTRATION SYSTEMS; PRESSURE and GRAVITY FILTERS.

Plants for removing iron from well and other waters, for neutralizing acidity, for the elimination of tastes and odors and for the removal of organic matter and discolorations; Water Sterilizing Apparatus; Mechanical Filter Equipment and Appurtenances; Subsidence Basins and Plants for applying coagulants and reagents to waters which are to be clarified, purified or softened.

This company will make a Scientific Investigation of any Water Supply and will Recommend and Install Plants particularly designed to meet local conditions and guaranteed to give satisfactory results.

All plants installed by this company are guaranteed to be free from infringement of patents.

Decalso (Sodium Zeolite) Water Softeners.

Especially adapted to those cases where water *absolutely free from hardness* is essential. Made in both the closed pressure and open gravity types.

Decalso is a water softening material used in place of the ordinary filtering medium through which the hard water is passed in the quantity and for the period of time for which the particular plant is designed, the salts of lime and magnesia in the hard water being absorbed and replaced by sodium from the Decalso. When the available sodium is given up, Decalso is exhausted and is then regenerated or recharged with sodium by washing with a solution of common salt.

Regeneration is accomplished by breaking up the Decalso bed by reversal of current of water or with air or both in combination, followed by the salt solution and finally rinsing with water to remove any excess salt.

In appearance and general scheme of operation, Decalso water softeners are practically identical with standard filters described elsewhere on this page.

DISTINCTIVE FEATURES—No sludge is produced.

Can be regenerated and washed within 1 hour.

No manipulation or adjustment of chemical valves.

Minimum salt and wash water required for regeneration.

Activity retained for a long time; frequent renewals not required.

Softens water very rapidly, thus meeting peak loads and fluctuations with minimum size plant. Automatic and natural compensation for variations in the hardness of the raw water.

Lime and Soda Water Softeners.

Designed for the removal of scale-forming mineral matter from boiler feed waters and for softening very hard waters where 3 to 5 grains of hardness per gallon in the treated water is permissible.

Constructed of steel, concrete or wood and equipped with excelsior or sand filters according to conditions.

Full information on request.

Pressure and Gravity Filters.

PRESSURE FILTERS—Vertical or horizontal, both equipped for simple reverse current wash, for sectional washing or for mechanical or air agitation.

Will sustain any desired test or working pressure.

Water may be applied by gravity or pumped directly through them into piping systems, tanks, reservoirs or standpipes. Any number of pressure filters may be connected together in battery form. Filtering sand will last from 5 to 7 years without changing.

Made of steel or cast iron. Sizes and capacities given in tables below.

GRAVITY FILTERS—Built round or rectangular, of wood, steel, concrete or masonry and equipped for washing with or without mechanical or air agitation or for sectional washing.

Similar in operation to the pressure type.

Sizes and capacities given in table below.

VERTICAL
PRESSURE
FILTER OR
DECALSO
SOFTENER

HORIZONTAL PRES-
SURE FILTER

OPEN GRAVITY FILTER
OR DECALSO SOFTENER

SIZES AND CAPACITIES OF VERTICAL PRESSURE FILTERS OR DECALSO SOFTENERS

Diam., in.	Inlet and outlet pipes, in.	Waste pipe, in.	Capacity per hour, U. S. gals.	Approximate ship- ping weight, lbs.			Effective filtering area, sq. ft.	Test pressure per sq. in.
				Case	Parts	Filtering material		
24	1½	2	360-540	850	300	1200	3.14	Stock filters are made to stand 125 lbs. test. Filters to stand 150 or 200 lbs. test are special.
30	1½	2	600-900	1500	300	1650	4.90	
36	1½	2	840-1260	1575	425	2800	7.06	
42	2	2½	1120-1560	1625	650	3400	8.72	
48	2	2½	1140-1740	1700	700	3848	9.62	
48	2½	3	1500-2220	2025	850	5450	12.56	
50	2½	3	1620-2460	2350	875	5700	13.63	
60	2½	3	2340-3540	3300	950	7800	19.63	
72	3	4	3360-5040	4000	1300	10000	28.27	
78	3	4	3960-5940	5000	1300	12000	33.18	
84	4	5	4680-6900	5700	2000	13600	38.48	Stock filters are made to stand 100 lbs. test. Filters to stand 150 or 200 lbs. test are special.
96	4	5	6000-9000	9350	2000	17700	50.26	

Above capacities are conservative. Use minimum capacities for muddy waters. Where maximum capacities are exceeded, resistance will increase, filter will require washing more frequently, and filtered water will not be of as good quality.

SIZES AND CAPACITIES OF HORIZONTAL PRESSURE FILTERS

Diam., ft.	Length over all, ft.	Inlet and outlet pipes, in.	Waste pipe, in.	Capacity per hour, U. S. gals.	Approximate ship- ping weight, lbs.			Test pressure per sq. in.
					Case	Parts	Filtering material

8	20	8	10	19200-28800	18000	6500	66000	
8	25	8	10	24000-36000	22500	7000	82500	
8	30	8	10	28800-43200	27000	7500	99000	

Minimum capacities are recommended for turbid waters.

SIZES AND CAPACITIES OF OPEN GRAVITY FILTERS OR DECALSO SOFTENERS

Diam., ft.	Height, ft.	Inlet and outlet pipes, in.	Waste pipe, in.	Capacity per hour, U. S. gals.	Approximate ship- ping weight, lbs.			Area, sq. ft.
					Tank	Parts	Filter bed	
6	7	3	6	3420	1350	1200	11300	28.27
8	7	4	6	6120	1750	2250	20000	50.26
10	7	4	8	9600	2250	3300	31200	78.54
12	7	5	10	13800	2800	5500	45200	113.10
14	7	6	10	18840	3450	6500	61200	153.94
15	7	6	10	21600	4000	8300	70400	176.71
17	7	8	12	27780	4600	11000	90400	226.98

Capacities given are minimum for turbid waters and will be exceeded from 50% to 100% in filtering waters carrying small quantities of sediment.

E. B. BADGER & SONS CO.

Spray Equipment Water Cooling Systems and Air Washers

BOSTON, MASS.

NEW YORK OFFICE, 101 Park Avenue

CHICAGO OFFICE, 616 South Michigan Avenue

Products.

WATER COOLING SYSTEMS; AIR WASHERS; SPRAY PONDS.

Air Conditioning Apparatus; Air Coolers; Smoke Washers; Odor Condensers; Gas Scrubbers; Humidifiers; Spray, Sewage and Aerating Nozzles; Spray Equipment for acid plants.

For Expansion Joints, see page 433.

Water Cooling Systems.

These systems are adapted to cooling condensing water from stills, evaporators, etc., for reuse and are especially useful where water is scarce. When cooling water for steam power plants they are guaranteed to cool the water sufficiently to afford an average vacuum better than 28 in. based on modern condensing equipment and good operating conditions. Systems can be operated at 6 lbs. pressure or less and will cool to or below atmospheric temperature.

NOZZLE—As a result of extensive experience with spray plants, this company has developed a nozzle scientifically designed for spraying large volumes of water at low pressures with highest efficiency. Each of these spray nozzles is fitted with the improved turbine center. The design of this center is such that a rapid rotating motion is imparted to liquid passing through it, producing a strong centrifugal action and causing liquid to break up into fine spray as it leaves nozzle. At 5 lbs. pressure spray issues in the form of an inverted solid cone composed of particles that, while fine, will settle within the spray pond limit. At 7 lbs. pressure liquid is broken up into a mist producing the greatest cooling possible at low pressures. Note the large opening through center and the short, free water passageways. The former prevents clogging, the latter increases cooling efficiency of the nozzle as well as its capacity. The inside of shell and vanes is finished smooth, and all water passages are made as large as possible to reduce friction loss of water passing through nozzle.

There are no moving parts to wear out, all parts of the nozzle being stationary and only water rotating. Liability to clog is reduced to a minimum by providing a large waterway through nozzle. Ordinarily made of high grade bronze but other metals can be used when necessary for spraying acids, alkalis, etc.

STRAINERS—Efficiency of spraying for most processes depends on the fineness of

spray. Fine spray is made possible only by an efficient straining device. The company's duplex strainers have incorporated in them the latest developments in strainer construction, permitting ease of cleaning, reversal of flow, removal of solid matter without stopping operation and are designed to prevent clogging due to electrolytic action. This high development makes possible the use of sprays where it would otherwise be impracticable.

Air Washers.

Adapted to cooling and cleaning air for ventilation of turbogenerators, transformers, and other electrical and mechanical equipment; wherever cool, clean air of even temperature and humidity is required for successful operation of processes. These washers cool air to its wet bulb temperature, removing 98% of suspended dust. Compact in design they require little space.

AIR WASHER

NOZZLE

COOLING POND

THE BLACKBURN-SMITH CORPORATION

Manufacturers of Feed Water Filter and Grease Extractor

TELEPHONE:
BRYANT 1364

105 West 40th Street
NEW YORK, N. Y.

Products.

THE BLACKBURN-SMITH FEED WATER FILTER and GREASE EXTRACTOR.

The Blackburn-Smith Sewage Ejector System.

Blackburn-Smith Feed Water Filter and Grease Extractor.

This filter removes oil, grease, etc., from condensed exhaust steam, not removed by line separators or by separators, skimmers, etc., incorporated in open heaters. As it is installed at the last point before water enters the boilers it also removes all dirt, slime, etc., which the feed water receives from any source whatever.

The elimination of floating impurities means clean heating surfaces of the boiler, thus securing efficient heat transmission, and protection against overheating of the boiler. The safe re-use of condensation after filtration saves coal and water, and the clean hot water prevents straining the boilers by excessive expansion and contraction.

Construction and Operating Principle.

The filter chest is partitioned into two chambers, water entering through the inlet to the upper or filtering chamber and passing to the lower or outlet chamber through the filtering cartridges set in the partition, and then through the outlet to the feed line. The number of cartridges varies with the size of the unit, and each consists of two concentric perforated brass cylinders covered with terry cloth. The water passes through the cartridges with little friction; but as foreign matter accumulates on the filtering material, resistance shown by the readings of pressure gages indicates cleaning time. The spare set of outer cylinders and cloths is to be substituted for the foul set when the pressure difference reaches a certain maximum.

The construction advantages are as follows: two successive and uniform filtrations through separated

cloths which are not bunched in places and stretched thin in others; small easily handled cartridges that involve little cleaning expense and no incentive for neglect; easily installed in existing plants, as valves and by-pass are wholly within the filter and in straight line with the feed pipe.

The Twin Unit.

For the filtration of very dirty raw water or condensation in plants operating continuously or with heavy peak load, a twin unit should be used. This consists of two complete filter bodies controlled by a single set of inlet and outlet valves. In this way, one side is kept in service while the other is being cleaned, and no impurities get past during cleaning periods.

Sizes, Capacities and Dimensions.

The capacities given are only approximate. A twin unit may be selected so that either side alone will carry normal load while the other side is being cleaned and both sides thrown in during peak periods to obtain 100% overload capacity.

Our free engineering advice, based on information from clients, is desirable for proper selection of the unit needed.

Further Particulars.

Further particulars are given in our book "Feed Water Filtration," which will be sent on request.

SECTION OF FILTER BODY

L. M. BOOTH CO.

Water Softeners and Water Filters
Engineers and Contractors for Water Purification

MAIN OFFICE AND FACTORY

194 Market Street
NEWARK, N. J.

CABLE ADDRESS:

"BOOTHRO, NEW YORK"

NEW YORK OFFICE, 3 PARK ROW

Products and Services.

WATER SOFTENERS—Automatic, continuous, hot or cold water; the chemicals used are ordinary lime and commercial soda ash.

Engineering Departments—Mechanical and Chemical—for consultation concerning water conditions.

Application.

Wherever water requires softening or purifying, a Booth water softener will provide a constant supply of soft, pure water for all purposes.

Feed water is purified before it enters the steam boilers, so that no scale can be formed.

Types and Sizes.

Softeners can be of any size. The chemical tanks and regulators are usually located at ground level, but in small softeners all the machinery is placed on top of the main tank.

For domestic service we offer a special type of softener.

No Power Required.

As ordinarily installed on a flat concrete foundation at ground level, Booth water softeners deliver water to feed water heaters without repumping.

The feed of chemicals to the water is controlled automatically by the inflowing water. No outside power or hand labor is required for mixing chemicals. The water to be purified furnishes all necessary power.

Special Construction.

For requirements which can not readily be met by standard softeners, special equipment is built to suit the needs. Concrete tanks, especially in softeners for municipal water supplies, are frequently employed.

Plans and specifications furnished to purchasers who prefer to build concrete tanks to be equipped with Booth machinery.

Cost of Operation and Results.

The cost of chemicals depends entirely upon the character and amount of impurities in the water. Labor required is small.

Results, as well as material and workmanship, fully guaranteed.

Prices.

Approximate prices for 2 common sizes are:

1000 gals. per hour Type "F-T", \$1500.00.

10000 gals. per hour Type "F-8", \$4000.00.

Experience.

This company is the pioneer of continuous water softening in America.

A Booth water softener will keep boilers free from scale. It is backed by men who have had longer experience in practical water softening than any similar organization in America.

An inquiry will bring conclusive demonstration of the rare ability of these men to solve any bad water problem.

Preliminary Investigation.

A careful advance survey of all conditions surrounding the supply and use of the water is desirable.

When sufficient data can not be obtained by correspondence, an engineer is sent to gather the information. The chemical engineering department is at your service.

BOOTH WATER SOFTENER, TYPE F-8

EDWIN BURHORN CO.

Cooling Towers and Steel Plate Construction

25 West Broadway
NEW YORK, N. Y.

Products and Services.

COOLING TOWERS: "BURHORN" and "PACKERS" TYPES.

Tanks for all purposes, Stacks, Breechings, Hoppers, Penstocks, Coal Bunkers, and other Steel Plate Constructions; Gray Iron Castings, including Stoker Parts, Grate Bars, Retorts, etc.; Brass Castings, Steel Castings; Engineers, Manufacturers and Contractors.

"Burhorn" Cooling Towers.

The tower is provided at the top with a main trough, the two sides of which are notched at frequent intervals for discharge of the water into a series of distributing troughs below.

COOLING SURFACE—The cooling surface is made up of units of proper size and number to suit the capacity of the tower. Each unit consists of a series of parallel troughs notched on the two sides, resting on a similar series of parallel angle pieces running at right angles. The angle pieces stiffen the troughs so that they will maintain their level when full of water and will also bear the weight of a man.

This system erected level, causes the water to seek its level in the troughs regardless of how it enters from above, and the water then naturally leaves the troughs through the notches throughout their entire length uniformly.

The trough decks are arranged in series, one directly below the other, alternately at right angles. This method counteracts the tendency of the wind to blow the water to leeward side of tower, so that no matter in which direction the wind may blow, the water is always broken up into fine particles, and the maximum water surface is exposed to the surrounding air. This arrangement guarantees efficiency in cooling, and economy of water for make-up purposes.

LOUVRE SYSTEM—All four sides of the tower are fitted with a patented system of heavy galvanized louvres, fitted with troughs so arranged that any water that may lodge in the louvres is returned to the tower system as shown in illustration.

CONSTRUCTION—The steel frame of the tower is made up of 6 by 6 by $\frac{3}{8}$ in. corner posts fitting into cast

iron base plates, thoroughly braced and tied together with angles which support the steel channels carrying the cooling surface.

The steel frame is thoroughly painted before shipment and the various parts of the trough deck system are thoroughly dipped in a special protecting compound, insuring long life to the apparatus.

Isometric View
"BURHORN" LOUVRE SYSTEM, PATENTED

WINTER BY-PASS—Purchaser of towers receives right to use, without royalty, patented winter by-pass system, which consists of a branch pipe, controlled by valve, running to lowest deck of the tower. When the temperature is below freezing the by-pass should be used. Sufficient cooling under these conditions will be obtained and there will be no possibility of damage from ice formation in the tower.

FOUNDATION—The tower is a complete unit. The purchaser will furnish the necessary foundation and the supply pipe to the distributing header at the top of the tower and the discharge pipe from the collecting pan. Foundation plans furnished on request.

ECONOMY—The saving in the use of this cooling tower can be estimated approximately by comparing the cost of the make-up water (1% for every 10° the water is cooled) with the cost of water necessary without the cooling tower.

PATENTS—The important features of these cooling towers are covered by patents, but no extra price is added for same.

TESTS—The following tests show cooling results under summer conditions for refrigerating apparatus.

TYPICAL TEST ON A "BURHORN" COOLING TOWER

Date	Time	Water temperature, deg.		Air temperature, deg.		Direction of wind
		To tower	From tower	Wet bulb	Dry bulb	
July 10	4:00 P. M.	87	70	68	84	N. W.
July 11	3:30 P. M.	78	68	65	88	W.
	4:00 P. M.	78	65	64	85	W.
	4:15 P. M.	74	66	64	84	W.
July 14	11:30 A. M.	73	65	62	78	N. W.
	1:45 P. M.	76	69	67	81	heavy wind

GRAVER CORPORATION

(WM. GRAVER TANK WORKS)

Water Softening and Purifying Apparatus

EAST CHICAGO, IND.

SALES OFFICES AND RAILROAD DEPARTMENT: Steger Building, CHICAGO, ILL.

BRANCH OFFICES

FORT WORTH, TEX.

DENVER COLO.

Products.

Designers and builders of WATER SOFTENING, PURIFYING, STERILIZING and FILTRATION PLANTS for municipal, industrial and domestic supplies; COMBINED WATER SOFTENER and HEATER.

Swimming Pool Filters, and Filtering Sand.

For Steel Tanks, General Plate Construction, and Oil Refining Equipment, see page 622.

Graver Water Softening and Purifying Apparatus.

Prevents formation of scale in boiler tubes; provides clear, soft water for every industrial purpose. Softeners remove all harmful ingredients in solution. Filters remove objectionable ingredients in suspension. Saving in time, labor and material quickly pays cost of installation.

Graver Water Softeners and Filters.

Automatically remove soluble hardening ingredients and suspended matter from water. Operate continuously, softening chemical solution being fed in direct proportion to water flow.

Structural form that of cylindrical steel tank, through center of which runs a cylindrical softening chamber open at top and bottom. Raw water and softening solution of lime and soda ash enters softener at top of inner chamber. Mixture and reaction occur in downtake; hardening ingredients and sediment settle in tank and clear, softened water rises in outer shell, from which it is withdrawn.

Where there is an unusual amount of suspended matter a filter is built around the central column.

Readily adaptable to the hot water softening process wherever conditions justify treatment of hot water.

Quantity storage of softened water by increasing tank height.

Softening process simple and reliable. The softening chemical compounded according to the individual needs of the customer, after careful investigation by Graver water purification department, is kept in solution by mechanical agitation in a mixing tank. Mixing device mounted on tower top or placed on ground, according to the needs of customer. Sludge is disposed of by opening valve in the outer tank and washing into sewer.

GRAVER "TYPE K" WATER SOFTENER—Revolv-

VERTICAL TYPE GRAVER WATER FILTER—SECTIONAL VIEW

MIXING AND CONTROLLING APPARATUS—GRAVER INSTALLATION

Located on the outer top completely inclosed by waterproof housing

ing vanes in the downtake aid reaction. Vanes driven by water wheel operated by raw water flowing into downtake. In "Type K" automatic chemical feeder is of slightly different design. However, "Type K," as well as the other Graver apparatus, may be altered to meet individual conditions.

Graver Water Filters.

Vertical or horizontal types, pressure or gravity feed. Coagulant introduced by pressure of raw water. Thorough cleaning obtained by reversing the flow of water through the filtration medium of silica, sand or crushed quartz. Operate with equal efficiency singly or in batteries.

Graver Combined Water Softener and Heater.

Particularly adaptable for treatment of boiler feed waters, where exhaust steam is available; greater reduction in incrusting solids; also eliminates use of independent feed water heater.

GRAVER "TYPE K" WATER SOFTENER
Ground operated with quartz filter

GRAVER COMBINED WATER SOFTENER AND HEATER

B. FRANKLIN HART, JR., & CO.

Engineering Specialists
Water—Steam—Fuel Oil
50 Church Street
NEW YORK, N. Y.

Products.

The HART COOLING TOWER; FUEL OIL BOILER INSTALLATIONS; STAR SAFETY WATER TUBE BOILER.

Cooling Towers.

Plants using water for cooling purposes, whether for steam, or ammonia condensers, or in stills, evaporators and vacuum pans, or for cooling oil, chocolate (moulds) and other liquid or semiliquid materials, or for jacketing in combustion engines, *are made independent regarding water supply*, by the installation of a *cooling tower* by means of which the same water is used over and over again.

SAVING IN COST OF WATER AND COAL—It is unnecessary to purchase water from city mains, or to go to the expense of driving a well (which in many cases is a failure). Again available water may be so hot in summer as to make efficient vacuum conditions impossible and as a result additional fuel is necessary to operate. Or water may carry sand and grit in suspension that score and destroy pump cylinders.

SERVICE—Towers are rated in capacity to cool in gallons per minute—from 10 gals. upward. Complete equipment installed including substructure piping and pumps, or material furnished with detailed plans and specifications, so that purchasers may erect quickly and cheaply.

ORIGINAL FEATURES—Sectional cooling surfaces arranged in staggered decks with openings spaced so that a chimney effect is produced throughout the interior portions making them equally efficient with those exposed to the outside air currents. Water distribution through cones insuring perfect results no matter what proportion of water is used. Spray prevention that does not exclude the air necessary for rapid evaporation and consequent cooling.

STEAM POWER PLANTS—Modern turbine installations and compound condensing units require high vacuum conditions and these can not

be obtained without plenty of cold water. The Hart cooling tower furnishes this with practically no operating expense.

Our Slogan.

"Let us solve your cooling problem."

This has been our slogan for about 15 years, and we have solved many apparently hard ones. Our engineering staff is at your disposal, and a request from you will bring one of them to the job without charge or obligation.

Fuel Oil Burning.

This company is prepared to furnish plans, specifications, advice and superintendence in connection with fuel oil burning for power plants, including equipment and storage. Large oilproof reservoirs of reinforced concrete designed and guaranteed against fire hazard. The superior and even calorific value, and low cost of recently available petroleum in its natural state make fuel oil the steam maker of the present and future. Its use cuts fire-room operating expense in half, and wipes out the entire cost of handling coal and ashes.

A survey of present boiler operation costs and an estimate of the saving that will follow the use of oil will be made promptly on request. When burning oil the fire-room labor is cut in half and the cost of handling coal and ashes is cut out entirely. No worry about fuel supply.

Star Safety Water Tube Boiler.

For steam and hot water heating and for medium pressure power plants. No brickwork. Minimum space. Standard type for burning hard coal, gas or fuel oil and for soft coal where some smoke is not objectionable.

The down-draft type for soft coal without smoke. Internally fired. Straight tubes. Large storage capacity. Dry steam. Large heating surface, perfect safety. "Maximum steam disengaging surface combined with minimum space requirements and both in a boiler that is self-contained."

ICE PLANT, NEW YORK CITY

POWER PLANT, DETROIT, MICH.

STAR WATER TUBE BOILER

INTERNATIONAL FILTER CO.

Water Softening and Filtration Plants

NEW YORK OFFICE:
233 Broadway

42 South Dearborn Street
CHICAGO, ILL.

Products.

WATER SOFTENING PLANTS for industrial and municipal supplies and hotels, hospitals and similar institutions. Water Treatment for ice making, special industrial uses and boiler feed.

FILTRATION PLANTS for all purposes: domestic, industrial and municipal.

Swimming Pool Filters, Deoiling Filters; Syrup, Extract and Milk Filters, and Filtering Sand.

International Water Softeners.

JUNIOR SIZES (BULLETIN J-63)—Continuous and automatic in operation. Capacities 250 to 5,000 gals. per hour.

STYLE V, VARIABLE FLOW (BULLETIN V-63)—Continuous type designed to deliver softened water at any rate demanded up to full capacity. Sizes 5,000 to 100,000 gals. per hour.

STYLE H, HOT-FLOW (BULLETIN H-63)—Combines the exhaust steam feed water heater and softener for steam plant boiler feed.

For plants of 250 boiler horsepower or more, where space is limited and ample exhaust steam is available for heating the water.

STYLE I, INTERMITTENT (BULLETIN I-63)---

JUNIOR SOFTENER

HOT-FLOW SOFTENER

STYLE V SOFTENER

International Disk Filters.

Bulletin 31. For putting the "finishing touch" on water already comparatively clean. Upward filtration through compressed cotton fiber or cloth; disks replaceable when clogged. For drinking water supplies, ice plants in hotels and institutions; also for refiltering water coming from sand, quartz or charcoal filters. Capacities 75 to 600 gals. per hour.

DISK FILTER

International Sand Filters.

PRESSURE TYPE (BULLETIN 22)—*Style C*—Cast iron filters, 12- to 24-in. sizes; capacities 140 to 600 gals. per hour.

Style I—Built of steel, 30- to 60-in. sizes; capacities 900 to 3,600 gals. per hour.

Style L—Built of steel, 48- to 96-in. sizes; capacities 2,000 to 9,000 gals. per hour.

Style H—Horizontal filters built of steel for any working pressure required. Capacities of single units up to 30,000 gals. per hour.

OPEN TYPE (BULLETIN WG-32)—*Style G*—Open or gravity type; wood tank construction. Capacities of single units up to 30,000 gals. per hour.

STYLE I FILTER

GRAVITY FILTER

HORIZONTAL PRESSURE FILTER

BATTERY, STYLE L FILTERS

Proposals.

Complete proposals furnished. Give:

(1) Maximum capacity required gals. per hour; (2) source of supply; (3) at what pressure and how water will be delivered to apparatus; (4) copy of water analysis (or send 1-gal. sample in glass bottle); (5) floor space and headroom; (6) for what purpose purified water will be used.

JEWELL POLAR COMPANY

Manufacturers of Water Stills

TELEPHONE:
HARRISON 2190

565-567 West Van Buren Street
CHICAGO, ILL.

Products.

APPARATUS for DISTILLING, FILTERING, STERILIZING, AERATING, SOFTENING and STORING WATER: JEWELL POLAR STILLS; JEWELL POLAR FILTERS, Pressure or Gravity Type.

Jewell Polar Stills.

USES—Jewell Polar stills offer a simple and economical means for providing distilled water for any particular purpose.

MATERIAL—Jewell Polar stills are made of heavy cold rolled copper and brass with pure block tin interiors.

NOTABLE FEATURES—The valuable, exclusive features of these stills, which are recognized by chemists and engineers, are the result of over forty years' experience in all branches of water purification.

All gases and odors are automatically removed before raw water enters evaporator.

There are no condensing tubes to get "limed up" or "leaky."

All parts are easily accessible and interchangeable. Steam coil easily removed for cleaning.

Large plants may be operated in single or double effect. They conform to any building or piping arrangements.

Industrial Water Distilling Plants.

Steam operated. Standard stock sizes 15 to 1000 gals. per hour. Larger plants designed and built on order. Compact, automatic and dependable installations with or without storage tanks. Write for list of users.

STEAM LABORATORY STILL,
COPPER
Sizes, 2, 5 and 10 gals. per hour

JEWELL POLAR STILL WITH
STORAGE TANK
Sizes 0 to 7

GAS LABORATORY
STILL, COPPER
Sizes: 1, 2 and 3 gals.
per hour.

ELECTRICALLY OPERATED
LABORATORY STILL
Sizes: 1, 2 and 3 gals. per hour

Drinking Systems.

Jewell Polar stills are being adopted by mills, factories, hotels, clubs, etc., to provide unquestionable water for drinking purposes. They remove all gases and odors. Washed and sterilized air aerates vapor within the still insuring perfect aeration.

Over 350 vessels are equipped with Jewell Polar stills. They may be installed in connection with any circulation and refrigerating system.

Filters.

Jewell Polar filters, pressure or gravity type, in all capacities, are the standard of the world.

Data Required for Quotations; Catalogue.

In writing for quotations, please state amount of distilled water required per hour, or day of 10 or 24 hours; purpose water is to be used for. If laboratory type, whether steam, gas or electrically operated. If steam is available, state average pressure.

Send for complete catalogue on distilling equipment.

NORWOOD ENGINEERING COMPANY
Water Filters and Water Purification Plants
FLORENCE, MASS.

Products.

GRAVITY and PRESSURE FILTERS for domestic water supply.

SWIMMING POOL FILTERS for purifying and maintaining pure water in swimming pools.

MUNICIPAL WATER PURIFICATION PLANTS.

Wilson Pressure Filters for Domestic Water Supply.

These filters are built of cast iron in 5 sizes. They are operated by means of one lever operating a 3- or 5-way brass plug valve.

Filters are connected direct to supply pipe entering the building, thereby filtering all water used throughout the building. Where it is necessary to filter larger

water discharge line, which show the friction loss taking place in the filters; also with a coagulant feeding arrangement for feeding a small amount of sulphate of alumina into the raw water for removing bacteria.

Norwood Swimming Pool Filters.

Swimming pool filters are generally of the pressure type and are installed for the purpose of keeping the pool in a clean and sanitary condition at all times. This is obtained by means of a circulating pump having connection to the outlet of the pool, which pumps the water from the pool through the filters back to the pool again. The size of the filters is governed by the size of the pool. Best results are obtained when filters are installed of sufficient size to recirculate and refilter the pool in a period of 10 hours or less. These filters are built of cast iron up to 30 in. in diameter, and of heavy steel plate construction in all sizes above 30 in.

The Norwood 3-unit filter system is conceded by architects and engineers to be the most effective system known. Each filter is washed with filtered pool water by means of the circulating pump, thereby insuring the correct amount of wash water to thoroughly disintegrate the sand bed and clean it of all impurities.

The rate of filtration for swimming pool filters should not exceed 4 gals. for each square foot of filtering area per minute.

Each filtering outfit includes coagulant feeders, loss of head gages, sight glass tubes, and all accessories necessary to make the plant complete.

Battery of 3 Filters with Coagulant Feeder

Single Unit Wilson Filter with Coagulant Feeder

Combination Sand and Charcoal Filter
PRESSURE FILTERS FOR DOMESTIC
WATER SUPPLY

TYPICAL BATTERY OF THREE SWIMMING POOL FILTERS
With pump and motor for refiltration of swimming pools

Diameter	Height	Filtering area, sq. ft.	Capacity, gals. per min.	Size of connections	Shipping weight, lbs.

30"	60	9' 0" x 3' 6"	14,800
36"	85	11' 0" x 4' 6"	11,700
42"	115	12' 6" x 4' 9"	14,800
48"	150	14' 0" x 5' 6"	18,700

quantities of water than given in the accompanying table, filters are connected in a battery of 2 or more units—preferably 3 units, as shown in illustration above.

Where the water supply contains a large amount of color in solution, as well as objectionable odors, it is desirable to use a charcoal filter in connection with the sand filters, the water first passing through the sand filters and then through the charcoal filter—the latter filter having a chemical action on the water, thereby removing all color, as well as odor.

When desired, filters are equipped with pressure gages connected to the raw supply line and filtered

Municipal Water Purification Plants.

This company manufactures and installs filtration plants of both pressure and gravity types for municipal water purification systems. As each is an engineering problem in itself, estimates and other information will be furnished on request.

Co-operative Service.

The NORWOOD ENGINEERING COMPANY is prepared to make an investigation and study of any water problem in filtration work, and make such recommendations as will insure a satisfactory installation.

PITTSBURGH FILTER & ENGINEERING CO.

PITTSBURGH, PA.

BRANCH OFFICES: NEW YORK, N. Y., KANSAS CITY, MO.
WORKS: OIL CITY PA.

Products.

Manufacturers of PRESSURE FILTERS; GRAVITY FILTERS; SWIMMING POOL FILTERS; WATER SOFTENING PLANTS.

Feed Water Heaters; Equipment for Purification Plants; Gages, Operating Tables, Controllers, Chemical Feed, Hypo Feeding Devices, Sample Tables, etc.

For Oil Engines, see page 710.

Pressure Filters.

VERTICAL TYPES—The standard vertical type is most desirable for smaller quantities of water, such as required by hotels, laundries, boiler plants, mills, etc., rendering the most turbid waters clear and sparkling. Built of steel, in capacities of from 6,000 to 150,000 gals. per day; strainers of bronze screen; alum feed cup is furnished for supply pipe, and the best grade of filtering sand supplied. Either with or without agitator, as may be desired; but the agitator is recommended where water to be filtered carries a great amount of suspended matter.

STANDARD PRESSURE FILTER, VERTICAL TYPE

A line of vertical cast iron filters, without stirring devices, is especially adaptable to waters that do not carry a continually large amount of heavy clay in suspension. They range in size from 14 to 78 in., and in capacities from 5,000 to 200,000 gals. per day.

HORIZONTAL TYPE—Capacities range from 200,000 gals. per day up. Diameter of all sizes is 8 ft., the length varying with the capacity. Equipped with the manifold screen system as used in the gravity filters, and furnished with a central wash trough. Either with or without the air system of agitating, as may be desired.

Test: 100 lbs. per sq. in.

Gravity Filters.

Built in sizes from 5 to 20 ft. in diameter, of wood or steel, and are most suitable for small cities, hospitals, public institutions, paper mills, etc. They are equipped

with the manifold screen system and screens. The design of these screens and system of placing them are the result of exhaustive experiments to determine the most thorough and economical use of water for washing purposes, and to secure the nearest perfect draft on all parts of the bed in filtering.

Filters are furnished with the standard rake agitator operated by gears and belts, or with the system of air agitation.

Concrete filters built to sizes required.

Swimming Pool Filters.

A special line of filters is manufactured for swimming pool work for both private and public institutions. Prices furnished on application.

Water Softeners.

Both the intermittent and continuous process plants, for either hot or cold water; of steel, wood, or concrete; of any capacity from a few thousand gallons a day to millions of gallons.

Municipal Filter Plants.

The PITTSBURGH FILTER & ENGINEERING CO. are prepared to build complete, or equip, plants of any desired capacity, in the shortest time, and at lowest cost consistent with good workmanship and material. They are ready to assume the entire responsibility and deliver a completed plant, ready for daily operation, and one producing the purest water obtainable.

Long and varied experience enables this company to design plants to meet any peculiar local condition, and at the least cost for installation and operation.

"PERMUTIT" ZEOLITE, LIME-SODA and HEATER WATER SOFTENERS, FILTERS and APPARATUS for the Removal of Iron, Manganese and other Mineral and Organic Matter, Color, Odor, objectionable Gases and Tastes. Patented in the United States, Canada and all other countries.

Permutit
TRADE MARK

Zeolite Water Softeners.

DESCRIPTION—The mechanical parts of a "Permutit" zeolite water softener are somewhat similar to a sand filter. The filtering medium, however, instead of being sand, is a synthetic exchange silicate, insoluble in water, which has the remarkable property of absorbing all calcium and magnesium from the water as it passes through the softener. The operation is entirely automatic—it requires no skilled attention. When the guaranteed amount of perfectly softened water has been realized, the "Permutit" is easily regenerated or restored to its original efficiency by introducing a solution of common salt. This solution remains in contact with the "Permutit" a few hours, and is partially recovered for further use. There is no sludge of any character to contend with. The cost of operation is extremely low, because appa-

rus is supplied, which reclaims a large portion of the salt, previously used.

OPERATION—"Permutit" zeolite water softeners, as conditions demand, are either of the pressure or gravity type. They are designed to deliver water in any desired capacity and to operate over any working period. The cycle of their operation permits of regeneration without interfering with the required output of softened water.

Changes in hardness of water are automatically taken care of. No attention is required throughout the day's run. A few minutes before and after regeneration is all the operating time required. A "Permutit" softener may be installed under any pressure. The loss of head through the softener is about 3 lbs.

ADVANTAGES—Water softened by "Permutit" is ideal for industrial and domestic purposes.

Among the results obtained, the following may be mentioned:

In Boiler Houses—Entire prevention of scale, sludge and mud.

Elimination of the burning out of tubes due to scale and mud.
Elimination of expensive boiler cleaning, due to scale and mud.
Important fuel saving, 10% to 20% and upwards.

In Washrooms, Laundries, etc.—Soap saving averaging more than 50%.

An even greater saving in soda.
Appreciable saving in fuel.

Great improvement in the quality of the work.

In Dye Houses—Important saving in dye stuffs.

Certainty of absolute matching of shades.
Elimination of claims due to faulty dyeing.
Improvement in feel and luster of finished goods.

Wool-Scouring—Very large soap saving.

Even greater savings in soda and alkali.
Important reduction in time and mechanical operation.
Valuable improvement in feel and quality of wool.

Bleaching—Pure whites, without spots.
Greatly increased tensile strength and softness.
Dependable uniformity of results.

Important saving in time.
Appreciable economy of bleaching agents.

Finishing—Very great savings in soap.
Important economy in time.
Improvement in feel and luster.
Uniform results.

"Permutit" softeners are small and compact.

GUARANTEE—"Permutit" softeners are guaranteed to deliver for the manufacturing use of the purchaser 100% of the stipulated capacity, as neutral, clear water of zero hardness. It is furthermore guaranteed that scale, sludge or mud will not form or deposit in boilers or their connections when fed with the softened water.

A TYPICAL INSTALLATION OF A "PERMUTIT" ZEOLITE WATER SOFTENER

Lime-Soda Softeners.

These are built in continuous and intermittent types. A competent staff of engineers and chemists is available for studying local conditions regulating the choice of types that will adequately satisfy the requirements of any particular installation. Special and standard apparatus is built for any capacity.

APPLICATION—"Permutit" lime-soda water softeners are applied for softening boiler feed water and water required for industrial and municipal purposes.

TYPES AND SIZES—Either wood or steel equipment is available and the chemical feed can be operated from either the ground level or from the top of tanks.

DESIGN—Special attention is given to the necessity of providing sufficient time for re-actions and settling to produce maximum reduction of the hardness with accompanying minimum use of chemicals; accurate proportionate feed of chemicals is provided for, by various types of chemical feeding devices which are selected in accordance with the demand of local conditions; perfect filtration is provided by filters whose types and sizes are carefully selected to accomplish the desired results; control apparatus is provided to maintain constant flow of water through this system during periods of operation, under which conditions accurate chemical feeding is assured; sludge is removed by various types of equipment, depending on the size and duty of the softener, preference being given, when possible, to either a conical bottom sludge removal system or a mechanically operated revolving sludge removal pipe. Both insure positive sludge removal without clogging up.

Heater Lime-Soda Softeners (Hot Process).

The "Permutit" heater softener is built to satisfy varying conditions and for any capacity. It can be used in connection with feed water heaters now installed.

APPLICATION—The "Permutit" heater softener is principally used for softening boiler feed water and for special industrial water requirements.

TYPES AND SIZES—The heater softener is built for any capacity; its type consists normally of a steel settling tank over which is located the heater, so providing for flow of the heated water to the settling tank by gravity.

A positive acting simple chemical feed is provided to accurately control the feeding of chemicals in correct proportion to the flow of water through the system. The chemical feeding device is actuated by a prime mover which does not come in contact with the chemicals—a decidedly advantageous feature.

Adequate provision is made for proper re-action and settling time. Sludge is disposed of usually by means of a conical bottom controlled by a quick opening, wedge type, sludge valve. Control apparatus is furnished to provide proper flow of water through this system, to prevent flooding and to guarantee desired operating conditions. Filtration equipment is furnished to provide treated water containing no flocculent precipitate.

Filters and Filtration Equipment.

Industrial sizes of "Permutit" filters, both pressure and gravity types, and filtration equipment for industrial and municipal requirements, are available in any size and in many types. Chemical dosing apparatus required in filtration is available in any size and type indicated by local requirements.

FILTER TYPES AND SIZES—For industrial or boiler feed purposes, either steel pressure filters, or wood and steel gravity filters, are built in standard types and sizes. Special equipment is available to satisfy special requirements.

A 3,000,000-GALLON "PERMUTIT" FILTRATION PLANT

Design—Shells of filters are conservatively designed and carefully constructed. The company has perfected excellent filter operating facilities and strainer systems, which, with careful selection of the filtering medium, guarantee maximum beneficial results.

Application—These filters are suitable for clarifying boiler feed and industrial waters for practically any purpose.

Operation—The maintenance and operation of these filters are minimum, since the least possible amount of labor is required to properly operate them, and special designing has developed equipment that requires minimum wash water.

FILTRATION EQUIPMENT—Either wood, steel, or concrete filter units and filtration equipment are offered to satisfy local demands together with the desired control and chemical apparatus. A careful investigation and survey is made of the site and controlling conditions, to guarantee the application of types and sizes of equipment that will most accurately and economically fulfil the desired requirements.

Iron and Manganese Removal Plants.

"Permutit" iron and manganese removal plants are provided in any capacity and the choice of the type of plant is governed by the quantity of the water to be treated, the amount and the character of its iron content and local conditions. Mechanical and chemical equipment are used singly or in combination; use being made of "Permutit" aerators, chemical feeding devices, settling tanks, and iron removal oxidized filters, etc. A special zeolite is frequently applied for this service.

APPLICATION—These plants are furnished to provide "iron free" water, for boiler feed, industrial and municipal purposes.

CONSTRUCTION—On account of the widely varying conditions incident to the removal of iron and manganese and similar minerals from water, it is impossible to develop thoroughly standard equipment, but the competent staff of chemists and engineers of THE PERMUTIT COMPANY approach and solve such problems in a successful way by properly handling them as individual cases.

Literature.

Complete descriptions, illustrations of and information on, "Permutit" water rectifying apparatus are available. Data will be cheerfully furnished relative to design and operation of the plants.

Service.

A competent staff of water rectification engineers and sanitary experts is always available for consultation. Inquiries are welcomed and will receive prompt and careful attention.

ROBERTS FILTER MANUFACTURING CO.

MAIN OFFICE AND WORKS
DARBY, PA.

Products and Services.

ROBERTS' GRAVITY FILTERS.
ROBERTS' PRESSURE FILTERS.
This company constructs FILTRATION PLANTS for the purification of the entire water supply of a city, the largest industrial establishments, hospitals, hotels, apartment houses, residences, or for any purposes for which pure water is required, guaranteeing to render any *water fit for whatever use* it is intended.

Roberts' Gravity Filters.

Built rectangular or circular and work practically independent of pumps supplying filtered water to consumers, as they deliver into a basin or reservoir. Rate of filtration is therefore constantly uniform, and effects maximum bacterial removal. All functions controlled by hand wheels (as shown in wood tank illustration) or by operating tables, illustrated in connection with concrete gravity filter.

Roberts' wood tank gravity filters are made from 6 to 17 ft. in diameter, completely equipped as per illustration. They can often be installed in present buildings. This type is also made in steel.

Standard rates of filtration based on 2 gals. for each sq. ft. of filtering area per minute.

Roberts' Vertical Filters.

Built of cast iron or steel. Equipped with the Roberts' single control valve, coagulant tank, sight glass and baffle plate.

Made in sizes varying from 12 to 96 in. diameter.

ROBERTS' VERTICAL FILTER

Roberts' Horizontal Pressure Filter.

Extensively used in large manufacturing establishments, also for the filtration of city water supplies where conditions warrant their use. This type is made in sizes as per schedule below.

They are constructed to sustain an internal hydrostatic test pressure of 100 lbs. per sq. in., an additional charge being made for filters to sustain pressures above 100 lbs.

Built of first quality homogeneous mild steel. Heads are in one piece and are dished to a radius of 8 ft. Filters are supported on their foundations by either heavy cast iron or concrete cradles.

Co-operative Service and Catalogue.

To those who contemplate the installation of filtration plants, the benefit of our knowledge and experience is extended. Recommendations made gratuitously, plans prepared and estimates submitted. When conditions justify it, one of the engineering force will be sent to look over water works systems and collect full data as to conditions and requirements, that intelligent suggestions may be made, and detailed plans, close estimates and a comprehensive proposition submitted.

Complete catalogue on request.

ROBERTS' HORIZONTAL PRESSURE FILTER

All external piping is standard pipe with cast iron flanged and screwed fittings. Gate valves are of the double wedge type, with iron body and brass trimmings, and the globe valve in waste pipe is of special pattern.

Cylinder is provided with a manhole, also with handholes on either side just above the screen or strainer system, one near the front and one near the back to facilitate removal of filtering material should it become necessary to empty the cylinder, and one on either side, at the top near front and back heads

REFINITE WATER SOFTENERS.

TRADE-MARK

Services.

THE REFINITE COMPANY manufactures and sells a water softening system using the natural water softening mineral, Refinite. The factory, where the mineral is processed and prepared for use in this system, is located at Ardmore, S. D., near the mines from which the mineral is taken. General offices occupy the four-story Refinite Building at Omaha, Nebr. District offices are maintained in 16 cities in the United States and Canada.

From each district office sales engineers and erectors are available to furnish information, make calls on the trade and render engineering and other services that may be desired as well as to install and put into operation systems ordered.

Inquiries directed to the nearest office are thus given the most prompt and careful attention.

Principal Uses.

Refinite water softeners are built in different sizes to suit the various needs. They are in operation the country over. The principal users are textile mills, laundries, institutions, hospitals, hotels, beauty parlors, barber shops, steam power and central heating plants, machinestops, apartment buildings and private homes.

Description.

Refinite is nature's own water softening mineral. It is flinty and porous and is insoluble in water. As it comes from the ground it is known as "ardmoreite" and is classified as a natural zeolite. Refinite is the registered name for the mineral after it has been prepared for use in the Refinite system. THE REFINITE COMPANY owns or controls all of the known beds of "ardmoreite."

The Refinite water softener is designed to use Refinite mineral. It is the only system in which this mineral is used.

Construction.

The softener consists of a steel tank or container, provided with proper water inlet and outlet openings together with the necessary piping and valves for controlling the flow of water; water meter and a brine tank. It attaches to the cold water supply line.

Within the container is a bed of Refinite mineral. The mineral is supported by a layer of gravel resting on a soft water collector system. As the water to be softened passes through this bed, the lime and magnesia

salts present are taken up and retained by the mineral, sodium being released in exchange. This natural exchange action automatically ceases when all of the hardness is taken up. The water thus softened is neutral and desirable for any use.

After the bed of Refinite has softened its rated capacity of water, its exchange properties are restored by simply allowing a brine solution (common salt water) to stand in the container overnight.

Installation.

The Refinite water softener is quickly installed, occupies very little space for the volume of water handled; requires no expert supervision, practically no attention; is extremely low of operation cost, reasonable in price.

Each Refinite system is built and installed to give absolute satisfaction, to accomplish definite results at a definite cost, and each sale is conditioned upon the apparatus fulfilling these guarantees. To make these individual guarantees, the company must know the character and degree of hardness of the water and the amount to be softened in a 10-hour period.

Analyses of water are made without charge.

Manufacturers of SCAIFE PATENTED WATER FILTERS of any capacity for residences, public buildings, factories and municipalities, including PATENTED SAND and CHARCOAL FILTERS, TANDEM PATENTED STEEL PRESSURE FILTERS, Vertical and Horizontal.

SCAIFE and WE-FU-GO WATER SOFTENING SYSTEMS for boiler feed water, for domestic use and for every industrial purpose.

Mechanical Gravity Filters and Re-filtering Systems for swimming pools; Structural Steel Work, Stacks, Steel Tanks, Range Boilers, High Pressure Cylinders, Special Steel Containers.

Double Combination Sand and Charcoal Filters.

Scaife patented cast iron sand and charcoal filters are specially constructed and adapted for private residences, small apartments, etc., where the entire supply is to be filtered.

Made of cast iron for maximum working pressure of 100 lbs. per sq. in. The water, when double filtered, is first passed through quartz-filled cylinder and then through the other filter, which contains pure animal charcoal.

The charcoal filter never comes in direct contact with the impure water from the supply; therefore it is a perfect sanitary filter without the use of chemicals.

Tandem Patented Steel Quartz Pressure Filters.

Furnished either in single units or in pairs. When operated in pairs they are connected tandem so that each filter is cleaned with filtered water, one filter furnishing the water for cleaning the other. They are equipped with efficient strainers of special form to insure thorough washing by reversing the flow of water. Built for any required working pressure and with filtering material varied to meet any special requirement.

TANDEM STEEL QUARTZ PRESSURE
FILTERS

Water Softening and Purifying Systems.

The siphon continuous system is an automatic system not dependent upon moving mechanical devices for reagent introduction. The water enters the receiving tank, to which is connected a siphon and to the long leg of which smaller siphons connect from the solution tanks. Reagents introduced during the period of siphon discharge. This system can be modified to meet special conditions.

In addition to this type of apparatus 3 other standard continuous systems are built; also the We-Fu-Go intermittent softening and filtering system, and special systems are designed where required. Water softening and purifying apparatus must be designed to meet the particular water supply and operating conditions of each case. Estimates submitted when full data is supplied.

"SPRACO" SYSTEMS for Cooling Condensing Water; AIR WASHERS; GAS SCRUBBERS; "SPRACO" NOZZLES for Highway Construction and Maintenance; "SPRACO" PNEUMATIC PAINTING EQUIPMENT; PAINT GUNS.

Humidifiers; Park and Lawn Sprinklers and complete Irrigation Systems; Sewage Nozzles; Aerating Nozzles; Flow Meters; Mixing Nozzles; High Temperature Cement Sprayers.

"Spraco" System for Cooling Condensing Water.

GENERAL DESCRIPTION—Wherever water has to be cooled for condensers, water jackets, evaporators or transformers, a "Spraco" system, in connection with a properly designed cooling pond, will be found to be the most efficient, the simplest and most economical to operate. It costs much less to install than any other system of cooling water; and where there is an existing pond, cost is limited to the "Spraco" system itself, consisting of nozzles, special equipment and piping.

In a "Spraco" system the hot water is cooled by spraying it into the air, so that, when it falls into the basin or pond, its temperature is sufficiently reduced to permit of it being used over again, thus affording, at small expense, an abundant supply of cold water independently of where the plant may be located. This feature is frequently of great value, as a plant can be located where it is convenient to a fuel supply or distributing center, and without considering a condensing water supply, which can be furnished by a "Spraco" system at comparatively small expense. It also affords a simple remedy by which many power plants, now handicapped with hot condensing water, can reduce their operating expense. An earthen pond of inexpensive construction often meets all requirements; and where ground space is limited, a "Spraco" system can be installed, with satisfactory results, on the roof of a building.

ECONOMY—With the "Spraco" system it is possible to obtain an average vacuum of 28 in. the year round in almost all parts of the United States. The great cooling capacity of the "Spraco" systems has led to their adoption by many of the largest power plants.

The yearly saving effected by the "Spraco" cooling system will generally pay a 50% return on its cost.

POWER REQUIREMENTS—By reason of improvement in the "Spraco" nozzles, the power to operate sprays has been reduced fully 50% of what was formerly thought necessary. Under ordinary conditions, power necessary to operate sprays will average less than 1½% of the power generated by engine, whereas the average cooling tower will require for operation about 3% of power generated. It should be noted that spray creates a circulation of air, thus saving the power required to operate fans for this purpose.

WATER LOSS—The average yearly loss of water with this system will approximate less than 1½% of condensing water used. As boiler feed will average about 2% of condensing water, it is apparent that the addition of condensed steam to pond supply, where jet condensers are used, will more than make up water losses.

COOLING CAPACITY—The results obtained by the "Spraco" system, given on this page, show the cooling which can be obtained and the resulting vacuum. Under average hot weather conditions, temperature of cooled water will approximate temperature of the air, and in hottest summer hours will be from 2° to 6° Fahr. lower than surrounding air.

"SPRACO" NOZZLES—"Spraco" nozzles are provided with removable turbine centers having large passageways. Centers are held stationary in the nozzles, so that there are no moving parts to wear out, and the water, in passing through, is given a rapid rotating motion.

A high grade of bronze, smooth finished, is used for both shell and center, and ample metal is provided at all wearing points, assuring long life.

2500 H.P. "SPRACO" COOLING POND

ROOF "SPRACO" SYSTEM, BOSTON ICE CO., BOSTON, MASS.

CO-OPERATIVE SERVICE—The SPRAY ENGINEERING COMPANY is prepared to accept the responsibility for design and construction of an entire “Spraco” system, including pond, where desired, and to guarantee results. Their engineering force has had extensive experience in all details of power plant design, and has installed many hundreds of cooling systems in nearly every state of the Union and 15 foreign countries.

“Spraco” Air Washing and Cooling Equipment for Steam Turbine Generators and other Electrical Machinery.

With the advent of the modern, horizontal, high speed generators, the matter of the proper ventilation of same has become of great importance. The heat losses per unit of surface, or of active weight, are relatively much larger than in the older machines, making forced ventilation essential. The amount of air required varies with the size and type of the generator, some of the later and larger models using less air per kv-a on account of their higher efficiency.

The necessity of properly conditioning the ventilating air is now recognized by engineers as secondary only in importance to the securing of an ample supply of air. The air should be cleansed of all dirt, cooled, and humidified. To accomplish this in an efficient manner, a water-spray type of air washer and cooler has been found to be the best device. The SPRAY ENGINEERING COMPANY, pioneers in the design and manufacture of washers essentially for power plant service, has developed and perfected the well-known Spraco air washing and cooling equipments, used almost universally in this country and abroad.

The gain in efficiency and capacity, the saving in maintenance, and the longer life of a generator which

result from the use of “Spraco” equipment for cooling and cleaning air for such generators, have all a large monetary value. It makes the installation of an equipment of this kind inevitable in all progressive and up-to-date power plants.

TESTS—Following are the results of tests made in various parts of the country and at different times of the year :

TESTS MADE ON AIR WASHERS, GIVING ACTUAL THERMOMETER READINGS

Air entering washer	Air leaving washer	Wet bulb temp.	Degrees cooled	Place	Date
63.8°F.	49.3°F.	49.2°F.	14.5°F.	Penn.	November, 1914
70.0°F.	59.0°F.	59.0°F.	11.0°F.	Penn.	October, 1914
75.1°F.	58.5°F.	58.4°F.	16.6°F.	Mass.	June, 1914
93.0°F.	73.75°F.	73.75°F.	19.25°F.	Tex.	September, 1914

Gas Scrubbers.

The “Spraco” nozzles give highly satisfactory results in connection with furnace gas scrubbers, as the mistlike spray takes out everything which is held in suspension in the gases.

“Spraco” Nozzles for Highway Construction.

“Spraco” nozzles spray at the rate of ¼ to 1½ gals. per sq. yd., coating stone evenly. Require little power, do not clog, and are quickly taken apart and reassembled. The cost of a bituminous-bound, macadamized road (two 3-in. layers of No. 1 rock, with double spraying and heavy bituminous binder) can be cut 20%.

SPRAYING BITUMINOUS BINDER WITH “SPRACO” NOZZLES

“Spraco” Pneumatic Painting Equipment.

The modern method of applying paint and other coatings is by the use of compressed air. It gives better results than the hand brush method, and saves both time and labor. The “Spraco” pneumatic painting equipment is compact, portable, and adapted for either shop or field use.

SOME OF THE ADVANTAGES—One workman can do the work of 3 to 12 painters using brushes, depending upon the nature of the work. Uniformly finished coatings free from streaks and brush marks are produced. Rough, irregular and inaccessible surfaces are readily coated. Either a lighter or heavier coating can be obtained than is possible with hand brushes. Standard guns are capable of handling all classes of liquid coatings by using interchangeable caps and nose pieces. The gun and control head may be blown free from paint or cleaned without taking apart. The gun may be mounted on an extension pole for painting surfaces beyond the reach of the operator.

Products.

"SPRARITE" NOZZLES for cooling ponds for condensing water.

Special Spray Heads for Gas Washers, Humidifying, Air Washing, Air Blow Valves, Whitewashing, Painting and Spraying Machinery, Siphons, Ejectors, etc.

Spray Cooling.

With the development of steam turbines and condensing apparatus for condensing exhaust steam, an important question is the type, design, and selection of cooling equipment for cooling circulating water. Artificial cooling of condensing water may be accomplished in three ways, i. e., by the use of natural or forced draft cooling towers, and by means of spray ponds. The spray system has shown such remarkable cooling capacity that it has been adopted by more than 250 power and industrial plants using "Sprarite" equipment.

Spray cooling for the present purpose can be best illustrated by reference to the accompanying diagram. It consists in placing the spray nozzles in suitable arrangement on one or more lateral mains over the pond, through which the water is sprayed falling into the confines of the pond. The water thus sprayed comes into intimate contact with the air in finely broken up particles, thus reducing its temperature, the cooling resulting from the agents of evaporation, radiation and convection.

SPRAY COOLING INSTALLATION
In connection with surface condensing equipment

"Sprarite" Nozzles.

Cooling water by means of sprays can be best accomplished by the use of the low pressure "Sprarite" nozzles, which are made in various sizes as indicated in the following table. Nos. 6, 7 and 8 nozzles will be found suitable for any spray cooling installation, while the smaller sizes are adapted for special spray nozzle applications fully covered in the company's literature.

The selection of spray nozzles for any cooling system is of vital

importance as, no matter how well the system might otherwise be planned, its final cooling capacity will be no better than the spray nozzles used. "Sprarite" nozzles

operate under low pressure, 4 to 6 lbs. being sufficient. As will be noted from an examination of the accompanying illustration of "Sprarite" nozzle, it is very simple in construction, consisting of but two parts, body and core, and has no moving parts. The inlet water passes through two helical channels, meets before reaching discharge orifice, and is discharged in a beautiful, full mass formation of equal density throughout its entire area. A typical spray nozzle installation is also shown herewith.

INSTALLATION AT
SOUTHERN RAILWAY
AND LIGHT CO.,
NATCHEZ, MISS.

CONSTRUCTION—"Sprarite" nozzles are constructed entirely of brass, finished to glasslike smoothness inside and out, while the metal is of ample thickness at all wearing points to give life-long service.

SIZES AND CAPACITIES OF "SPRARITE" NOZZLES

[No.	Supply pipe, ins.	Diam. of orifice, ins.	Capacity in gallons per minute at different pressures, lbs. per sq. in.					
			5	6	7	8	9	10
2	3/4	1/4	2.90	3.14	3.38	3.62	3.86	4.10
3	1	5/8	5.87	6.34	6.81	7.28	7.75	8.32
4	1 1/4	3/8	8.5	9.19	9.88	10.87	11.28	11.95

CHLORINE CONTROL APPARATUS and APPLIANCES for water and sewage purification.

Chlorine Solution Injectors, Chlorine Solution Pumps, Special Automatic Valves for application of chemical solutions.

Special Apparatus for Water Purification, Measurement, Control, etc. Chlorine Apparatus for Industrial Use, Bleaching, etc.

Apparatus to manufacture Dakin's Hypochlorite Solution from Liquid Chlorine.

Special Apparatus to Apply, Control, Measure and Proportion Gases.

Consultants in problems of Gas Control.

Scientific Instruments and Special Apparatus for Sanitary and Industrial Research Work; Portable Bacteriological Testing Apparatus; Air Sampling Apparatus.

General Use.

W. & T. chlorine control apparatus and appliances are used to introduce liquid chlorine into water or sewage to effect bacteriological purification and destroy typhoid and other water-borne disease germs. Used extensively by municipalities and by industrial plants.

About Chlorine.

Pure chlorine compressed in cylinders is now recognized as the most efficient sterilizing agent for water and sewage. In its liquid state it replaces chloride of lime so largely used in the past for this purpose.

Liquid chlorine has come into general use in the field of water and sewage purification through the development by this company of suitable apparatus for its control and application.

There are now hundreds of installations of W. & T. apparatus treating

TRADE-MARK

water supplies, ranging from a few thousand gallons per day up to installations with a total capacity of one billion gallons per day, as installed by WALLACE & TIERNAN CO., INC., for the City of New York.

Types and Capacities of Equipment.

W. & T. equipment is made for either manual or automatic control, applying the chlorine to the water as a gas, or in solution with water. Wherever applicable, the solution feed type of equipment is recommended.

There are 20 different types of W. & T. equipment, with capacities ranging from 1/100 lb. of chlorine per day, upwards.

All W. & T. equipment is constructed on the unit system, and is so designed that it can be operated by the ordinary water works operator. A complete stock of parts is kept on hand for distribution from either the factory or the branch offices.

Operation and Cost.

Liquid chlorine, when controlled by W. & T. equipment becomes so efficient that the water supply of any city or town can be protected against water-borne diseases at a cost of from 17¢ to 50¢ per million gals.

Sewage and Trade Wastes.

Liquid chlorine is used extensively in the sterilization of sewage and trade wastes. It is particularly recommended where sewage is discharged into streams used as water supplies.

Liquid chlorine is the most effective sterilizing agent for tannery wastes, where the destruction of specific organisms, such as the anthrax spore, is required by law.

Liquid chlorine controlled by W. & T. equipment is applicable to any problem of sterilization or disinfection, bleaching or industrial use.

Co-operative Service.

A large staff of technically trained experts are available for consulting on all problems of gas control. Quotations and recommendations on equipment will be made on receipt of details. Send for information blank.

Literature.

A full set of technical publications describing the various phases of chlorination and W. & T. equipment is available, and will be sent on request.

Products.

Manufacturers of AMERICAN STEEL SPLIT PULLEY; AMERICAN STEEL SPLIT PULLEY with CORK INSERTS.

American Pressed Metal Sash Pulleys.
Reels, Spools, Beams, Stampings, and Pressed Metal Shapes.

Special Features of Belt Pulleys.

- (1) Simplicity of design and construction.
- (2) Ease of installation on shafting.
- (3) No key seating or set screws.
- (4) Well balanced and run true.
- (5) Stand greater strains than pulleys having much more weight.
- (6) Transmit maximum power with minimum belt slip.
- (7) Minimum air resistance effects enormous saving in power.
- (8) Recommended for rim speeds up to 6000 ft. per minute.

(9) 40% to 60% lighter than cast iron pulley designed for equal service.

(10) Guaranteed for double belt duty under any conditions not demanding a special pulley.

Construction.

Rim made from two or more channel sections. Mounted side by side forming in-turned rim flanges which stiffen rim at center where it is subjected to greatest strain from belt pull. This construction forms groove, running centrally around face of pulley (an exclusive feature) which prevents air cushioning by acting as an air escape. Rim has safety beaded edges.

Ends of arms milled to exact length and riveted to internal rim flange; *not* riveted through face of pulley. These flat "A" braced arms (edge on) cut, instead of fan, the air, thereby effecting power economy.

Furnished with crown or straight face.

Information.

Over 275 dealers carry American Steel Split Pulleys in stock.

Prices on application.

SIX-ARM PULLEY
7- to 42-in. diameter, inclusive

PULLEY
3-, 4-, 5- and 6-in.
diameter.

EIGHT-ARM PULLEY
44- to 72-in. diameter, inclusive, with faces narrower than 16 in.

SPECIAL HEAVY DUTY
PULLEY

For any especially severe service where nothing but a special will stand up

DOUBLE AND TRIPLE-ARM PULLEY
12- to 120-in. diameter, inclusive, when width of face is too great for safety with single arms

PULLEY WITH CORK
INSERTS

For use where an almost positive drive is required, insuring an absolute minimum of belt slip

CHARLES BOND COMPANY

Manufacturers of Power Transmission Equipment

617-619 Arch Street
PHILADELPHIA, PA.

Product.

FLEXIBLE INSULATED COUPLINGS.

Construction of Grundy Patent Flexible Insulated Coupling.

This coupling is constructed of three pieces only, the two outer flanges being of cast iron and the center disk of non-conducting material, with lugs on each side for transmitting the power to the outside flanges.

The central disk is made of specially selected leather or hard fiber, with lugs securely cemented and riveted to each side of the disk.

The larger sizes, Nos. 12 to 30 inclusive, have lugs cemented and bolted on and reinforced with steel plate as shown in illustration.

The disks supply the insulation while the lugs on each side transmit the power to outside flanges. The leather lugs are cut on a bias, tapering towards the disk; the cast iron driving flanges being machined with a corresponding taper, have a tendency to draw the flanges close to the disk, and to cause the leather lugs to receive and transmit the power at their strongest points.

The close connection made possible by this style of coupling reduces to a minimum the leverage, which is so objectionable on the old style pin couplings.

Scope of Use.

The Grundy coupling is specially adapted for connecting motors to pumps, machine tools, sewing machines, woodworking machinery, printing machinery, fans, blowers, shafting to angle drives, etc.

In the matter of neatness and utility, it is an ideal connection for use between dynamo and gas engine cranks or similar machinery.

It is a simple device for connecting the two ends of shafting where it is difficult to get the bearings in perfect alignment, or where they are liable to get out of adjustment.

Distinctive Features.

The Grundy coupling will transmit more horsepower than any other flexible coupling of equal diameter.

While maintaining a positive and silent drive, it is free from objectionable hammer action features.

It is perfectly balanced and adapted for revolving at high speeds. Can be run in either direction: is close connected; easy of access and practically free from repairs. Has been tested out under severe conditions. There are no loose cylinders, rings, threaded pins or bolts to give trouble.

The driving disk, being of non-conducting material, acts as a thorough insulator. As there are only three pieces to the entire coupling, there are no complicated parts to get out of order. It can be either set screwed or key seated, or both. It is a safety coupling, there being no projections to cause danger.

Guaranteed to give less trouble and to outwear anything else of its character on the market.

Where it is not possible to get perfect alignment of shafts, this coupling will adjust itself to circumstances, and can be used whether insulation is required or not.

*For standard sizes, the dimensions of "B" are twice "C" plus "P," but the length of hubs can be changed to suit conditions.

**Maximum capacity under steady load.

When small horsepower and large bores are required, couplings from No. 4 to No. 12 inclusive can be made with larger hubs, but are furnished only when details are given.

Horsepower shown above is for steady load and not for intermittent or bump loads. When Grundy couplings are to be used with gas engines, air compressors, A. C. electric motors, etc., it is advisable to get this company's recommendations.

Information Required When Making Inquiries.

Give the following information when making inquiries regarding the Grundy coupling:

Horsepower required; revolutions per minute; diameter of driving shaft and size of keyway; diameter of receiving shaft and size of keyway; whether couplings are to be set screwed; whether conditions under which the coupling is to operate are dry or subject to moisture; whether load is constant (if not, write fully regarding intermittent character of same); description of connection for which coupling is to be used.

Catalogue 38 S sent on request.

FIG. 1. BOND PATENT UNIVERSAL DROP HANGER

A good rigid hanger, with provisions for free movement in bearing for shaft to revolve. Metal is equally distributed in order that there will be sufficient amount where the greatest strain takes place.

Hanger has all the typical Bond features—Universal adjustment, babbitted and reamed bearings, case hardened steel set screws, hanger yoke cast separate and interchangeable with any drop or type of hanger for the same size shaft, etc.

Bolts supporting yoke are integral with the frame proper, thus strengthening the hanger at one of the most important points that carry the load of the line shaft.

FIG. 17. BOND SCIENTIFIC "LYESTRONG" STEEL SHAFT HANGER

Folded into shape from sheet metal, without breaking the fiber, insuring greatest strength and rigidity.

One-half the weight of cast iron hangers.

Every possible strain that a hanger may be subjected to is well provided for. Can be converted into floor stand by simply inverting the bearing.

Bearings used identical with those used in Bond cast iron hanger.

Belt shifter arm is malleable iron and can be attached very quickly to hanger, and makes a very simple and neat countershaft hanger.

FIG. 7. BOND UNIVERSAL BRACKET HANGER

Bearings babbitted and reamed. Fitted with ring oiling bearings, ball and socket adjustment

FIG. 4. BOND UNIVERSAL POST HANGER

Bearings babbitted and reamed. Fitted with ring oiling bearings, ball and socket adjustment

FIG. 5. BOND UNIVERSAL PILLOW BLOCK

Bearings babbitted and reamed. Fitted with ring oiling bearings, ball and socket adjustment

FIG. 6. BOND PEDESTAL PILLOW BLOCK

Bearings babbitted and reamed. Fitted with ring oiling bearings, ball and socket adjustment

FIG. 2. BOND BALL AND SOCKET RING OILING HANGER BEARING

Three component parts: top, bottom and oil reservoir. Top and bottom carefully babbitted and correctly reamed, making a true bearing surface throughout. Oil reservoir and bottom designed with ball and socket feature insure perfect alignment of shaft. Oil reservoir constructed to prevent leakage of oil. Tempered spring steel rings used for lubricating shaft, diameters of which are sufficiently larger than the shaft to allow them to revolve freely and constantly in oil so that shaft is kept well and evenly lubricated at all times. Each end of bearing provided with carefully designed scrapers or wipers to remove surplus oil and return it to reservoir, preventing leakage or dripping. Reservoir, when properly filled, will amply lubricate shaft from 4 to 6 months without refilling.

FIG. 24. BOND CLAMP BOX
Suits ordinary requirements and majority of conditions

FIG. 25. BOND FLAT BOX
Babbitted and reamed. Substantial, inexpensive bearing

FIG. 30. BOND VERTICAL CLAMP BOX

Babbitted and reamed.
Provided with grease or oil reservoir at top and arranged with parting cover to prevent accumulation of dirt or grit

FIG. 29. BOND SPLIT POST JOURNAL BEARING (ANGLE BOX)

Bearings babbitted and reamed.
An exceptionally good bearing for light work. Adapted for conveyor work on account of angle of the split in bearing and position of oil cup

FIG. 31. BOND SOLID JOURNAL OR POST BEARING (DOLLY BOX)

Babbitted and reamed
Oil receptacle is placed at an angle so that it can be used as a pillow block or as a post bearing on upright posts or posts placed at any angle.

FIG. 26. BOND RIGID RING OILING POST BOX

Designed on same principle as rigid ring oiling pillow block, and used as substitute for universal post hanger, where it is essential to bring shafting close to post

FIG. 19. BOND RIGID RING OILING PILLOW BLOCK

Designed on same principle as ring oiling ball and socket bearing used in Bond Universal hangers, with oil reservoir constructed as a rigid base for bearing

FIG. 22. BOND EXTRA HEAVY RIGID PILLOW BLOCK

For exceptionally heavy work, such as engine shafts, heavy elevator shafts in mines, etc.

FIG. 23. BOND HEAVY RIGID PILLOW BLOCK (PACIFIC TYPE)

Meets the requirements of sawmill trade. A special feature of this type is that it interlocks the length and width of bearing.
Drilled and tapped for grease cups

FIG. 42. BOND PATENT "SPIRO" SINGLE FLANGE COMPRESSION COUPLING

Has enormous gripping power. Sleeve "A" is tapered from center towards each end. Outer shell "B" and inner shell "C" are bored tapered to correspond with taper on sleeve. There is also a spiral slot cut the entire length of sleeve.

When sleeve is placed in position to connect two shafts, shells are placed on sleeve and bolts are used to draw up the two shells over sleeve.

By this method of one taper drawing over the other, and the special method of cutting a spiral slot in the sleeve, the coupling exerts an enormous gripping power on shaft, for the reason that every square inch of bearing surface of inner diameter of sleeve comes in direct contact with the shaft

FIG. 43. BOND PATENT "SPIRO" DOUBLE FLANGE COMPRESSION COUPLING

For large shafts (sizes 2 1/2 in. and above). Sleeve is of identically the same construction as in Fig. 42, with the exception that it is heavier and of larger proportions to suit larger shaft diameters.

Each of the two shells is constructed with two flanges cast on one hub with tapered bores similar to shells on single flange coupling.

Method of using bolts is different. A short and then a long bolt is used alternately. Short bolt extends from inside flange of one shell to inside flange of other shell, or, the flanges nearest to center of coupling.

Long bolt extends from outer flange of one shell to outer flange of the other. By this method, every bolt does the duty for which it is intended, making coupling very powerful for large shafts.

This type of coupling eliminates the expense of key seating the shaft, also the cost of keys

FIG. 45. BOND CLAMP COUPLING

A key seated coupling and requires key seating of the shaft.
Main feature is the clamping device, making coupling in halves, thus it can very readily be bolted to the ends of the shafts when in place

FIG. 39. Type A

FIG. 56. Type B

BOND GIRDER CLAMPS

Hangers can not be attached to iron girders without the use of a girder clamp of a similar construction to those illustrated above. A full line of patterns takes care of these conditions

FIG. 44. BOND PLATE COUPLING

Used where key seated couplings are required, with shaft key seated to suit

FIG. 40. BOND SQUARE JAW CLUTCH COUPLING

Used for connecting and disconnecting shafts. One-half of coupling is fastened to shaft with a key and other half slides on a feather key.

Finished all over. Jaws accurately planed to prevent backlash and to insure equal bearing pressure on each

FIG. 51. BOND DOUBLE FLANGE SOLID SET COLLAR

A collar of good mechanical construction at a moderate price. Both faces machined and edges carefully rounded. Countersunk to provide for low head set screw to assure safety

Fig. 47. Holscrew Type Fig. 48. Standard Type
BOND SOLID SAFETY SET COLLARS

Two types, one with low head set screw and countersunk, the other with hollow set screws, both insuring safety. Collars are machined all over

Fig. 49. Holscrew Type Fig. 50. Standard Type
BOND SPLIT SAFETY COLLARS

Have interlocking devices which bring parting line beyond center line of shaft, forming 3-point contact on shaft, making each half a collar in itself

BOND FRICTION CLUTCH
(Patented July 15, 1919)

Economical and practical in operation. Has the distinctive feature of a single adjustment on a multiple of friction shoes.

Friction shoes are brought in contact with friction drum by sturdy steel levers, giving a powerful grip. When clutch is disengaged, arrangement of levers makes a positive release.

No springs or other delicate mechanism are employed in the construction. Built with a minimum of working parts. Simple in construction, and powerful and easy in operation

BOND STATIONARY TRUCK CASTER

All casters are well proportioned; wheels turn freely on cold rolled steel axles

BOND STATIONARY TRUCK CASTER

Rough uneven floors or heavy loads have no effect on these casters, as they are built to stand the wear

BOND ANTIFRICTION SWIVEL TRUCK CASTER

Designed to meet the universal demand for a swivel wheel of good mechanical construction at a moderate price.

The plate swivels on hardened steel balls, swiveling easily under heavy loads.

The ball race is protected with a deep flange, making it dustproof

THE BROWN CLUTCH CO.

1500 Camp Street
SANDUSKY, OHIO

Products.

BROWN FRICTION CLUTCHES; FRICTION SHAFT COUPLINGS; HOISTS; PULLEYS.

Friction Clutch Pulleys.

Friction clutch pulleys are manufactured up to 150 h.p. The company designs special styles of clutch pulleys, and is able to furnish one for every case where a pulley is necessitated.

LINE SHAFT CLUTCH

Brown Friction Clutches.

LINE SHAFT CLUTCHES — These clutches are so constructed that they are easily secured to the shaft with keys, and are controlled by one lever.

They are furnished complete with either oil or grease cups and a shifting lever.

SHORT SHAFT CLUTCHES—Designed expressly for gas engines, where the crank shaft extends beyond the

LINE SHAFT CLUTCH WITH GEAR

SHORT SHAFT CLUTCH

LINE SHAFT CLUTCH SPROCKET WHEEL

flywheel a sufficient length to carry the belt pulley.

Finished Cast Iron Pulleys.

A vast variety of finished cast iron pulleys, bored, turned, and balanced with set screws or key seats, are manufactured so as to fill requirements of all kinds from stock.

NO. 0 CLUTCH PULLEY
For 10 h. p. and under

Specifications of Conveyor Hoists.

CAPACITY—1500 lbs. at 100 ft. per minute on single rope. Shipping weight, 1300 lbs.

DRUMS—Conveyor drum back geared 4 to 1; 14-in. diameter with 16-in. flanges 3 in. apart. Equipped with hand friction band brake. Is controlled by two 10 h.p. clutches on jack shaft operated by one lever making it a reversible drum. Conveyor drum operates about one-third faster than hoisting drum, requiring 5 h.p. engine. Should be driven about 400 r.p.m.

Hoisting drum back geared 6 to 1, controlled by 10 h.p. clutch or jack shaft. Drum is 12-in. diameter with 21-in. flanges 8 in. apart. Capacity 375 ft. of 1/2-in. cable. Equipped with friction band and ratchet brake.

SHAFTING—Main shaft 2-in. diameter, jack shaft 1 3/4-in. diameter. All bearings on main and jack shaft babbit.

DRIVE—Sprocket and chain, belt, or cut gears.

None supplied regularly.

CONVEYOR HOIST

For use on coal docks, in quarries and other places

Morgan Hoists.

Designed to meet the great demand for a hoist to carry heavy loads at high speed. Simple and easy to operate. Load can be stopped at will by releasing dog which engages ratchet, making it impossible for load to get away. The Morgan hoist is without a peer for safety and general utility. Manufactured also with double drum.

MORGAN SINGLE DRUM HOIST
