A. The seed has a flattened, elongated ovoid shape. The testa is dark reddish-brown or yellow, smooth and shiny. The seeds are 4-6 mm long, 2-3 mm wide and 1.5-2 mm thick; one end is rounded and the other end forms an oblique point near which the hilum appears as a slight depression. When viewed with a lens, the surface of the seed-coat is seen to be minutely pitted. Inside the testa a narrow, whitish endosperm and an embryo composed of 2 large, flattened, yellowish and oily cotyledons are present; the radicle points towards the hilum.

B. Microscopic examination (*2.8.23*). The powder is greasy to the touch. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0095.-1): fragments of the outer testa [A, B] with cells that are polygonal (surface view [Aa]) or narrow (transverse section [Ba]) and filled with mucilage [Bb]; fragments of the collenchymatously thickened sub-epidermal layer (transverse section [Bc], surface view [Ab]) with rounded cells with triangular intercellular spaces often attached to the sclerenchymatous layer composed of elongated cells, with thickened and pitted walls [Ca], some with strongly thickened and pitted walls [G]; fragments (surface view [C]) consisting of the hyaline layer with thin-walled cells [Cb] often remaining attached to the layer of elongated sclereids and crossing them at approximately right angles [Ca]; fragments of the inner testa (surface view [D]), composed of moderately thickened polygonal cells filled with brown-orange pigment; small polyhedral masses of pigment [H]; numerous fragments of parenchyma from the testae, with large, slightly and regularly thickened cells (surface view [J, L]); parenchyma of the endosperm [K] and cotyledons [E] containing aleurone grains and oil droplets; very numerous isolated oil droplets [F].

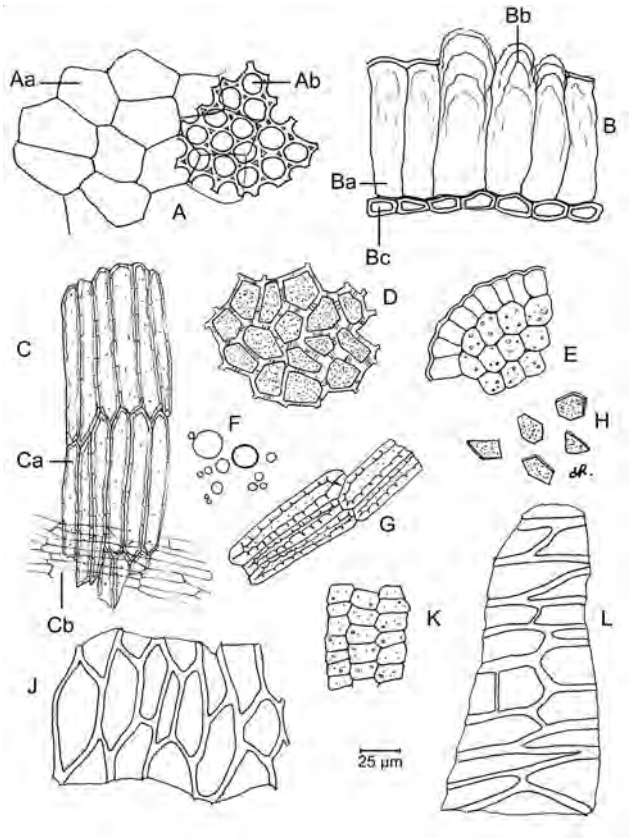

Figure 0095.-1. – *Illustration for identification test B of powdered herbal drug of linseed*

TESTS

**Foreign matter** (*2.8.2*): maximum 10 per cent of seeds with a dull coat and maximum 1.5 per cent of other foreign matter.

**Swelling index** (*2.8.4*): minimum 4.

**Cadmium** (*2.4.27*): maximum 0.5 ppm.

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

**01/2012:2378**

# LIQUORICE DRY EXTRACT FOR FLAVOURING PURPOSES

## Liquiritiae extractum siccum ad saporandum

DEFINITION

Dry extract produced from *Liquorice root (0277)*.

*Content*: 5.0 per cent to 7.0 per cent of 18β-glycyrrhizic acid ($C_{42}H_{62}O_{16}$; $M_r$ 823) (dried extract).

PRODUCTION

The extract is produced from the cut herbal drug by a suitable procedure using water.

CHARACTERS

*Appearance*: yellowish-brown or brown powder.

Very sweet taste.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *ethyl acetate R*, *methanol R* (50:50 *V/V*).

*Test solution.* To 0.30 g of the extract to be examined add 30 mL of *hydrochloric acid R1* and boil on a water-bath under a reflux condenser for 60 min. After cooling, extract the mixture with 2 quantities, each of 20 mL, of *ethyl acetate R*. Combine the organic layers and filter through a filter covered with *anhydrous sodium sulfate R*. Evaporate the filtrate to dryness *in vacuo* and dissolve the residue in 2.0 mL of the solvent mixture.

*Reference solution.* Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5.0 mL of the solvent mixture.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *water R*, *ethanol (96 per cent) R*, *ethyl acetate R* (1:9:25:65 *V/V/V/V*).

*Application*: 20 µL [or 10 µL] as bands.

*Development*: over a path of 15 cm [or 7 cm].

*Drying*: in air for 5 min.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Thymol: a red zone | A yellow zone |
| _____ | _____ |
| _____ | _____ |
| Glycyrrhetic acid: a violet zone | A violet zone (glycyrrhetic acid) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.8.17*): maximum 7.0 per cent.

**Ochratoxin A** (*2.8.22*): maximum 80 µg per kilogram of extract.

The maximum content applies to the pure undiluted extract. Where excipients are added to reduce the strength of the extract, the maximum content should be reduced proportionally.

ASSAY

Liquid chromatography (*2.2.29*).

*Solvent mixture*: *water R*, *methanol R* (20:80 *V/V*).

*Test solution.* Place 0.200 g of the extract to be examined in a 150 mL ground-glass conical flask. Add 100.0 mL of the solvent mixture and sonicate for 2 min. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 50.0 mg of *monoammonium glycyrrhizate CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *glacial acetic acid R*, *acetonitrile R*, *water R* (6:30:64 *V/V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Run time*: 3 times the retention time of 18β-glycyrrhizic acid.

*Retention time*: 18β-glycyrrhizic acid = about 9 min.

*Identification of peaks*: use the chromatogram supplied with *monoammonium glycyrrhizate CRS* and the chromatogram obtained with the reference solution to identify the peaks due to 18β-glycyrrhizic acid and 18α-glycyrrhizic acid.

*System suitability*: reference solution:

- the chromatogram obtained with the reference solution is similar to the chromatogram supplied with *monoammonium glycyrrhizate CRS*;
- *resolution*: minimum 2.0 between the peaks due to 18β-glycyrrhizic acid and 18α-glycyrrhizic acid.

Calculate the percentage content of 18β-glycyrrhizic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.979}{A_2 \times m_1 \times 5}$$

$A_1$ = area of the peak due to 18β-glycyrrhizic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to 18β-glycyrrhizic acid in the chromatogram obtained with the reference solution;

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *monoammonium glycyrrhizate CRS* used to prepare the reference solution, in grams;

$p$ = percentage content of 18β-glycyrrhizic acid in *monoammonium glycyrrhizate CRS*;

0.979 = peak correlation factor between 18β-glycyrrhizic acid and monoammonium glycyrrhizate.

**01/2012:0277**

# LIQUORICE ROOT

## Liquiritiae radix

DEFINITION

Dried, unpeeled or peeled, whole or cut root and stolons of *Glycyrrhiza glabra* L. and/or of *Glycyrrhiza inflata* Bat. and/or *Glycyrrhiza uralensis* Fisch.

*Content*: minimum 4.0 per cent of 18β-glycyrrhizic acid ($C_{42}H_{62}O_{16}$; $M_r$ 823) (dried drug).

IDENTIFICATION

A. The root has few branches. Its bark is brown or brownish-grey with longitudinal striations and bears traces of lateral roots. The cylindrical stolons are 1-2 cm in diameter; their external appearance is similar to that of the root but there are occasional small buds. The fracture of the root and the stolon is granular and fibrous. The cork layer is thin; the secondary phloem region is thick and light yellow with radial striations. The yellow xylem cylinder is compact, with a radiate structure. The stolon has a central pith, which is absent from the root. The external part of the bark is absent from the peeled root.

B. Microscopic examination (*2.8.23*). The powder is light yellow or faintly greyish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of yellow thick-walled fibres, 700-1200 µm long and 10-20 µm wide with a punctiform lumen, often accompanied by crystal sheaths containing prisms of calcium oxalate 10-35 µm long and 2-5 µm wide. The walls of the vessels are yellow, 5-10 µm thick, lignified and have numerous bordered pits with a slit-shaped aperture; fragments of cork consisting of thin-walled cells and isolated prisms of calcium oxalate occur as well as fragments of parenchymatous tissue. Fragments of cork are absent from the peeled root. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows the following diagnostic characters: simple, round or oval starch granules, 2-20 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.50 g of the powdered herbal drug (180) (*2.9.12*) in a 50 mL round-bottomed flask add 16.0 mL of *water R* and 4.0 mL of *hydrochloric acid R1* and heat on a water-bath under a reflux condenser for 30 min. Cool and filter. Dry the filter and the round-bottomed flask at 105 °C for 60 min. Place the filter in the round-bottomed flask, add 20.0 mL of *ether R* and heat in a water-bath at 40 °C under a reflux condenser for 5 min. Cool and filter. Evaporate the filtrate to dryness. Dissolve the residue in 5.0 mL of *ether R*.

*Reference solution.* Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5.0 mL of *ether R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *concentrated ammonia R*, *water R*, *ethanol (96 per cent) R*, *ethyl acetate R* (1:9:25:65 *V/V/V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in air for 5 min.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the chromatograms obtained with the test solution and the reference solution show in the lower half a quenching zone due to glycyrrhetic acid.

*Detection B*: treat with *anisaldehyde solution R*, and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results B*: the chromatogram obtained with the reference solution shows in the lower half a violet zone due to glycyrrhetic acid and in the upper third a red zone due to thymol. The chromatogram obtained with the test solution shows in the lower half a violet zone corresponding to the zone of glycyrrhetic acid in the chromatogram obtained with the reference solution and a yellow zone (isoliquiridigenine) in the upper third under the zone of thymol in the chromatogram obtained with the reference solution. Further zones may be present.

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent for the unpeeled drug and maximum 6.0 per cent for the peeled drug.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent for the unpeeled drug and maximum 0.5 per cent for the peeled drug.

**Ochratoxin A** (*2.8.22*): maximum 20 µg per kilogram of herbal drug.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Place 1.000 g of the powdered herbal drug (180) (*2.9.12*) in a 150 mL ground-glass conical flask. Add 100.0 mL of an 8 g/L solution of *ammonia R* and treat in an ultrasonic bath for 30 min. Centrifuge a part of the solution and dilute 1.0 mL of the supernatant layer to 5.0 mL with an 8 g/L solution of *ammonia R*. Filter through a membrane filter (nominal pore size 0.45 µm); use the filtrate as the test solution.

*Solution A.* Dissolve 0.130 g of *monoammonium glycyrrhizate CRS* in an 8 g/L solution of *ammonia R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a).* Dilute 5.0 mL of solution A to 100.0 mL with an 8 g/L solution of *ammonia R*.

*Reference solution (b).* Dilute 10.0 mL of solution A to 100.0 mL with an 8 g/L solution of *ammonia R*.

*Reference solution (c).* Dilute 15.0 mL of solution A to 100.0 mL with an 8 g/L solution of *ammonia R*.

*Column*:

– *size*: *l* = 0.10 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *glacial acetic acid R*, *acetonitrile R*, *water R* (6:30:64 *V/V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

Establish a calibration curve with the mass of monoammonium glycyrrhizate in the reference solutions, in grams, as the abscissa and the corresponding peak areas as the ordinate.

Using the retention times and the peak areas determined from the chromatograms obtained with the reference solutions, locate and integrate the peak due to 18β-glycyrrhizic acid in the chromatogram obtained with the test solution.

Calculate the percentage content of 18β-glycyrrhizic acid using the following expression:

$$A \times \frac{5}{m} \times B \times \frac{823}{840}$$

$A$ = mass equivalent of monoammonium glycyrrhizate in the test solution, determined from the calibration curve, in grams;

$B$ = declared percentage content of *monoammonium glycyrrhizate CRS*;

$m$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

823 = molecular mass of 18β-glycyrrhizic acid;

840 = molecular mass of monoammonium glycyrrhizate (without any water of crystallisation).

LABELLING

The label states whether the drug is peeled or unpeeled.

**07/2014:2453**
**corrected 10.0**

# LONG PEPPER

## Piperis longi fructus

DEFINITION

Dried, ripe or nearly ripe fruiting spikes of *Piper longum* L. or *Piper retrofractum* Vahl (syn. *P. chaba* Hunter and *P. officinarum* (Miq.) C. DC.) or a mixture of both species.

*Content*:

– *essential oil*: minimum 6.0 mL/kg (dried drug);

– *piperine* ($C_{17}H_{19}NO_3$; $M_r$ 285.3): minimum 3.0 per cent (dried drug).

IDENTIFICATION

A. *P. longum*. The fruiting spikes are cylindrical or irregularly cylindrical, 1-2.5 cm long (rarely longer than 2.5 cm), 3-5 mm in diameter, blackish-brown or almost black. The spikes are quite compact, tough, composed of small fruits firmly fixed on the receptacle in regular or oblique rows. The berries are spherical, about 1 mm in diameter. The bracts are black, small, punctiform, confined to depressions between adjacent berries. The remains of the peduncle may be present at the base of the cylinder. Spikes can be easily broken; the fracture is irregular and granular.

*P. retrofractum*. The fruiting spikes are similar to those of *P. longum* but clearly more robust, straight and cylindrical, 2.5-4 cm long (rarely smaller than 2.5 cm), 5-8 mm in diameter, brown or reddish-brown. The berries are also firmly fixed on the receptacle but, in contrast to those of *P. longum*, arranged more obviously in spiral rows. The bracts are more prominent than those of *P. longum*.

B. Microscopic examination (*2.8.23*). The powder is grey or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2453.-1): fragments of the endocarp (surface view [A]), consisting of sclereids, more or less elongated, about 75 µm long, pitted, with irregularly thickened walls and wide channels [Aa], associated with the reddish-brown pigmented layer of the testa with indistinct cells [Ab] and also associated with the inner testa with rectangular, brown, thin-walled cells [Ac]; fragments of the endocarp (transverse section [D]), showing sclereids with irregularly thickened inner walls on the 3 lower sides [Da], usually associated with the testa (namely the pigmented layer with indistinct cells [Db] and the layer of the inner testa [Dc]); fragments of the parenchyma of the mesocarp [B, C] containing more or less polygonal sclereids, isolated [Ba] or in groups [Bb], and oil cells about 50 µm in diameter [Ca]; numerous ovoid or polygonal cells of the parenchyma of the seed [Dd]; fragments of the epicarp [F] with thin-walled cells; rare fragments from the centre of the spike [E], consisting of parenchymatous cells [Eb] and elongated sclereids up to 400 µm long [Ea]; a few fragments of vascular tissue [H] with spiral or striated vessels [Ha] and fibres [Hb]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. Starch is visible as rounded, compound granules, each about 20 µm in diameter [Ga], made up of tiny individual granules, ovoid or polyhedral by compression, free [Gb] or included in the parenchymatous cells of the seed [G].

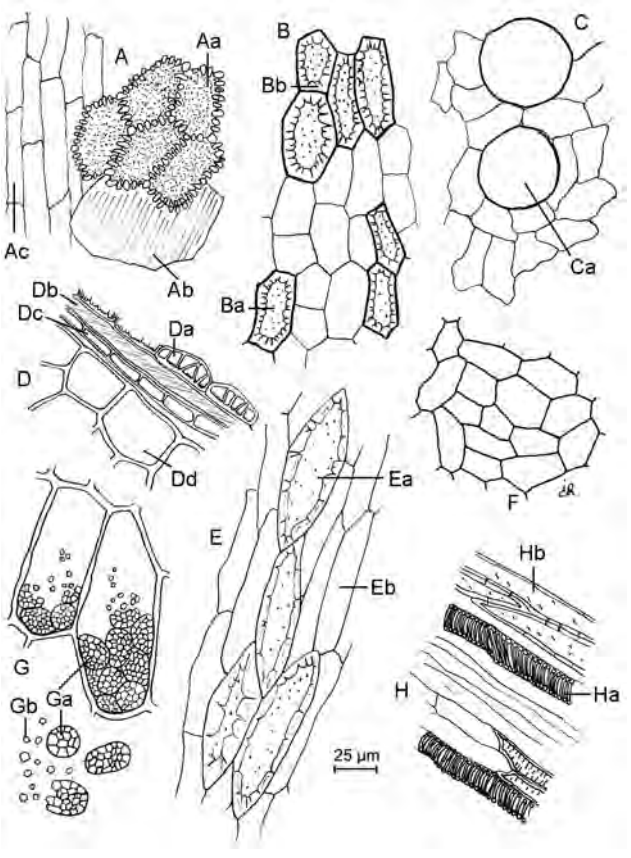

Figure 2453.-1. – *Illustration for identification test B of powdered herbal drug of long pepper*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

*Reference solution*. Dissolve 10 mg of *borneol R* and 15 mg of *piperine R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

Herbal drugs

*Mobile phase*: *ethyl acetate R*, *cyclohexane R* (30:50 *V/V*).

*Application*: 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |

| ——— | ——— |
| | A quenching zone |
| Piperine: a quenching zone | A strong quenching zone (piperine) |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *anisaldehyde solution R* and heat at 100 °C for 5 min; examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A purple-grey zone |
| ——— | ——— |
| | A purple zone |
| Borneol: a yellowish-brown zone | A violet zone |
| | A purple-grey zone |
| ——— | ——— |
| Piperine: a green or brownish zone | A green or brownish zone (piperine) |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the freshly powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 25.0 g of the freshly powdered herbal drug (1400) (*2.9.12*), a 1000 mL round-bottomed flask, 400 mL of *water R* as the distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

**Piperine**. Liquid chromatography (*2.2.29*). *Carry out the assay protected from light.*

*Test solution.* Disperse 0.250 g of the powdered herbal drug (355) (*2.9.12*) in 40 mL of *ethanol (96 per cent) R*. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of *ethanol (96 per cent) R*, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 15.0 mg of *piperine CRS* in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b).* Disperse 0.250 g of *long pepper for system suitability HRS* (355) (*2.9.12*) in 40 mL of *ethanol (96 per cent) R*. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of *ethanol (96 per cent) R*, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *water R*;
– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 50 | 50 |
| 5 - 20 | 50 → 5 | 50 → 95 |
| 20 - 22 | 5 → 0 | 95 → 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 343 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *long pepper for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to piperine and peak 2.

*Retention time*: piperine = about 10 min.

*System suitability*: reference solution (b):

– *peak-to-valley ratio*: minimum 4, where $H_p$ = height above the baseline of peak 2 and $H_v$ = height above the baseline of the lowest point of the curve separating the peak due to piperine from peak 2.

Calculate the percentage content of piperine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

$A_1$ = area of the peak due to piperine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to piperine in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *piperine CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of piperine in *piperine CRS*.

**04/2013:1537**

# LOOSESTRIFE

## Lythri herba

DEFINITION

Dried flowering tops, whole or cut, of *Lythrum salicaria* L.

*Content*: minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1) (dried drug).

IDENTIFICATION

A. The stems are rigid, 4-angled, branching at the top, brownish-green, longitudinally wrinkled and pubescent. The leaves are opposite, decussate, rarely verticillate in threes and sometimes alternate at the inflorescence which forms a long terminal spike. The leaves are sessile, lanceolate and cordate at the base, 5-15 cm long and 1-2.5 cm wide, pubescent on the lower surface; the subsidiary veins form arcs that anastomose near the leaf margin. The flowers have a pubescent, tubular, persistent gamosepalous calyx, 4-8 mm long, consisting of 6 sepals bearing 6 small, triangular teeth alternating with 6 large, acute teeth at least half as long as the tube; a polypetalous corolla consisting of 6 violet-pink petals, each expanded at the top with a wavy outline and narrowing at the base. The androecium consists of 2 verticils of 6 stamens (1 verticil with short, barely emerging stamens, the other with long stamens extending well out of the corolla). The fruit, if formed, is a small capsule included in the persistent calyx.

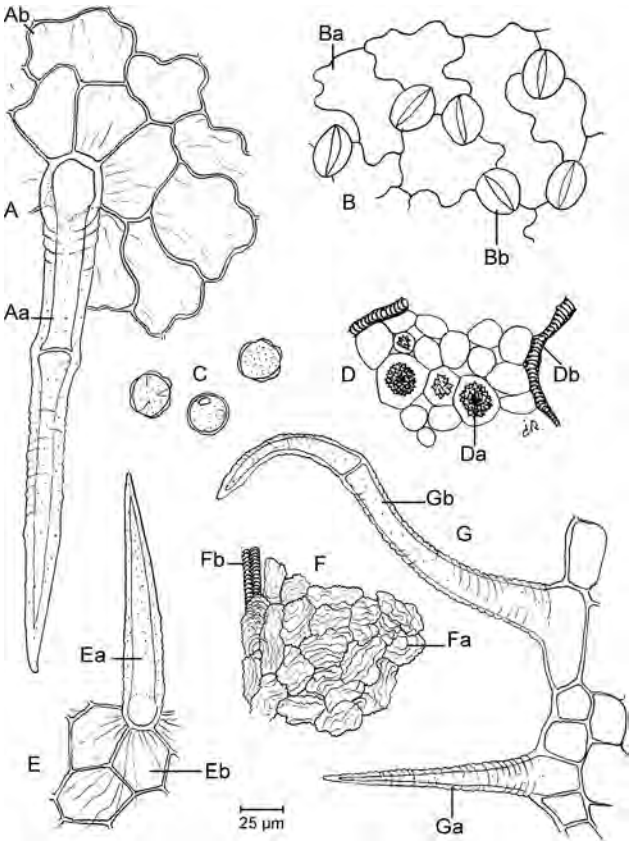

Figure 1537.-1. – *Illustration for identification test B of powdered herbal drug of loosestrife*

B. Microscopic examination (*2.8.23*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1537.-1): unicellular [Ea] or bicellular [Aa], uniseriate, thick-walled, finely pitted covering trichomes from the epidermis of the leaf [A] and stem [E]; numerous uniseriate, unicellular [Ga] or bicellular [Gb], thin-walled, finely pitted, annularly striated covering trichomes from the calyx (side view [G]); transparent violet-pink fragments from the petals [F] consisting of epidermal cells with sinuous walls and a grainy cuticle [Fa], covering fine spiral vessels [Fb]; fragments of parenchyma from the leaf [D] with numerous cells containing cluster crystals of calcium oxalate [Da], associated with spiral vessels [Db]; pollen grains with 3 pores and a thin and slightly granular exine [C]; fragments of the upper epidermis of the leaf [A] with large polygonal cells and sinuous walls, covered by a finely striated cuticle [Ab]; fragments of the lower epidermis of the leaf [B] with smaller polygonal cells [Ba] and anomocytic stomata [Bb] (*2.8.3*); fragments of the stem [E] consisting of polygonal cells with straight anticlinal walls and a striated cuticle [Eb].

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and heat in a water-bath at 65 °C for 5 min with frequent shaking. Cool and filter. Dilute the filtrate to 10 mL with *methanol R*.

*Reference solution*. Dissolve 0.5 mg of *chlorogenic acid R*, 1 mg of *hyperoside R*, 1 mg of *rutoside trihydrate R* and 1 mg of *vitexin R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: at 100-105 °C.

*Detection*: treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the reference solution shows in the lower third a yellowish-brown fluorescent zone due to rutoside and in the middle third a light blue fluorescent zone due to chlorogenic acid, above it a yellowish-brown fluorescent zone due to hyperoside and a green fluorescent zone due to vitexin. The chromatogram obtained with the test solution shows a bright green fluorescent zone slightly above the zone due to rutoside in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to hyperoside in the chromatogram obtained with the reference solution, and a bright green fluorescent zone corresponding to the zone due to vitexin in the chromatogram obtained with the reference solution.

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

ASSAY

**Tannins** (*2.8.14*). Use 0.750 g of the powdered herbal drug (180) (*2.9.12*).

**01/2013:1233**

# LOVAGE ROOT

## Levistici radix

DEFINITION

Whole or cut, dried rhizome and root of *Levisticum officinale* Koch.

*Content*: minimum 4.0 mL/kg of essential oil for the whole drug and minimum 3.0 mL/kg of essential oil for the cut drug (dried drug).

IDENTIFICATION

A. The rhizome and the large roots are often split longitudinally. The rhizome is short, up to 5 cm in diameter, light greyish-brown or yellowish-brown, simple or with several protuberances; the roots, showing little ramification, are the same colour as the rhizome; they are usually up to 1.5 cm thick and up to about 25 cm long; the fracture is usually smooth and shows a very wide yellowish-white bark and a narrow brownish-yellow wood.

B. Microscopic examination (*2.8.23*). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cork cells, polygonal or rounded in surface view, with brown contents; abundant parenchyma, mostly thin-walled and rounded but some with thicker walls; groups of small, reticulately thickened vessels embedded in small-celled, unlignified parenchyma; fragments of larger vessels with reticulate thickening, up to 125 µm in diameter; fragments of secretory canals up to 180 µm wide. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, simple, rounded or ovoid, up to about 12 µm, and numerous larger, compound granules, many with several components.

C. Examine the chromatograms obtained in the test for species of *Angelica* and *Ligusticum* described in the European Pharmacopoeia.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak fluorescent zones may be present in the chromatogram obtained with the test solution.

| **Reference solution** | **Test solution** |

TESTS

**Species of *Angelica* and *Ligusticum* described in the European Pharmacopoeia**. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1 g of the freshly powdered herbal drug (355) (*2.9.12*) add 4 mL of *heptane R* and sonicate for 5 min. Centrifuge the mixture and use the supernatant.

*Reference solution*. Dissolve 1 mg of *imperatorin R*, 1 mg of *(Z)-ligustilide R* and 1 mg of *osthole R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 *V/V/V*).

*Application*: 4 µL, as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 365 nm.

*Results A*: the chromatogram obtained with the test solution shows no blue fluorescent zone just below or above the zone due to imperatorin in the chromatogram obtained with the reference solution.

*Detection B*: examine in ultraviolet light at 254 nm.

*Results B*: the chromatogram obtained with the test solution shows no zone at or just below the zone due to imperatorin in the chromatogram obtained with the reference solution.

*Detection C*: treat the plate with a solution of 20 mL of *sulfuric acid R* in 180 mL of ice-cooled *methanol R*; heat at 100-105 °C for 5 min and examine in daylight.

*Results C*: the chromatogram obtained with the test solution shows no purple zone between the 2 reddish zones at the top of the chromatogram and the zone due to (*Z*)-ligustilide in the chromatogram obtained with the reference solution; the chromatogram obtained with the test solution shows no purple zone between the zones due to (*Z*)-ligustilide and osthole in the chromatogram obtained with the reference solution.

**Foreign matter** (*2.8.2*): maximum 3 per cent, determined on 50 g.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use a 2 L flask, 10 drops of *liquid paraffin R*, 500 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Reduce the herbal drug to a powder (500) (*2.9.12*) and immediately use 40.0 g for the determination. Distil at a rate of 2-3 mL/min for 4 h.

# LYCOPUS LUCIDUS HERB

## Lycopi herba

DEFINITION

Whole or fragmented, dried aerial parts of *Lycopus lucidus* var. *hirtus* (Regel) Makino & Nemoto.

*Content*: minimum 0.15 per cent of rosmarinic acid ($C_{18}H_{16}O_8$; $M_r$ 360.3) (dried drug).

IDENTIFICATION

A. *Whole drug.* The stems are square in cross-section with a hollowed pith and few branches, 50-100 cm long and 2-6 mm in diameter; the greenish-yellow or reddish outer surface shows, on each side, shallow longitudinal furrows and reddish nodes covered in white hairs. The leaves are opposite, with short petioles or almost sessile; when whole, the lamina, usually crumpled, is lanceolate or oblong, 5-10 cm long, with dentate margins, an acute apex and a slightly decurrent base, and is pubescent on both surfaces; the upper surface is dark green or blackish-green while the lower surface is greyish-green, and densely dotted with glandular trichomes; the inflorescence is grouped in axillary whorls and consists only of persistent calyces and leaf-like bracts, as the corollas have usually fallen off. The bracts are lanceolate with hairs on the margins. The calyx is hairy, and 2-lipped with 5 teeth. The texture is fragile.

*Fragmented drug.* It occurs in various sizes 1-3 cm long. The fragments of the stems are flattened, angular, longitudinally striated and have a hollowed whitish pith; some fragments have nodes covered in white hairs; the fragments of the leaves often show the dentate margin of the lamina, and prominent veins on the lower surface; some fragments have inflorescences in axillary whorls, reduced to brown 2-lipped calyces.

B. Microscopic examination (*2.8.23*). The powder is dark green or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2723.-1): fragments of the upper epidermis of the leaves (surface view [B]) consisting of cells usually with rigid walls [Ba] bearing covering trichomes and glandular trichomes; the covering trichomes have spiny walls, some are unicellular, short and conical [Bb], others are uni- [C, E] or multicellular (2-5 cells) [G], occasionally remaining only as circular, thickened scars on the epidermis [F]; the glandular trichomes, rarer, have a unicellular stalk and an ovoid head, either uni- or bicellular [Bc], sometimes associated with loosely arranged palisade parenchyma [Bd]; fragments of the lower epidermis of the lamina (surface view [A]) covered by a striated cuticle composed of cells with sinuous walls [Aa], diacytic stomata [Ab], uni- or multicellular covering trichomes similar to those of the upper epidermis, mainly visible on the veins, and numerous glandular trichomes, sometimes with a unicellular stalk and a unicellular head ([Ac], isolated side view [D]), or a unicellular stalk and a bicellular head [Ad], or a unicellular stalk and an octocellular head of laminaceous type [Ae] about 60-80 µm in diameter; bundles of long fibres [H, K] from the stems, with thick walls [Ha, Ka], sometimes associated with bordered-pitted vessels [Hb] or parenchymatous cells of the pith [Kb]; frequent sclereids [J], usually isolated [Ja, Jb] or in small groups [Jc], ovoid to rectangular, with varying thickened and channelled walls, from the pith near the nodes.

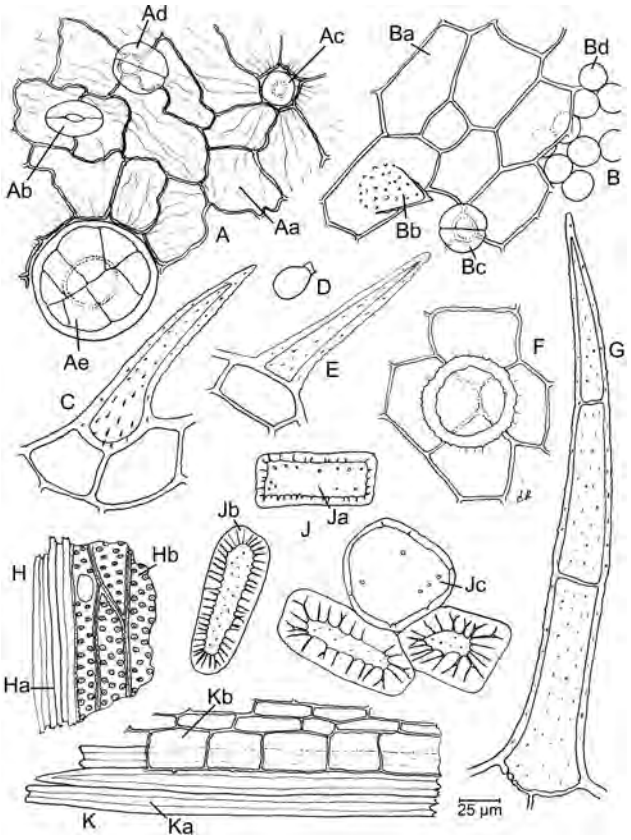

Figure 2723.-1. – *Illustration for identification test B of powdered herbal drug of lycopus lucidus herb*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *ethyl acetate R*. Sonicate for 10 min. Centrifuge and use the supernatant.

*Reference solution.* Dissolve 1.0 mg of *luteolin R* and 1.0 mg of *ursolic acid R* in 2.0 mL of *ethyl acetate R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *methylene chloride R*, *ethyl acetate R*, *cyclohexane R* (1:5:8:20 *V/V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: treat with *2.5 M alcoholic sulfuric acid R* and heat at 110 °C for 3 min. Examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A pale violet zone |
| _____ | _____ |
| | A reddish-violet zone |
| Ursolic acid: a violet zone | A violet zone (ursolic acid) |
| _____ | _____ |
| | 2 dark violet zones |
| Luteolin: a yellow zone | |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 1.000 g of the powdered herbal drug (355) (*2.9.12*) add 25.0 mL of a 70 per cent *V/V* solution of *methanol R* and weigh. Boil on a water-bath under a reflux condenser for 30 min. Allow to cool and weigh again. Compensate for the loss of solvent with a 70 per cent *V/V* solution of *methanol R* and mix. Filter the solution and dilute 2.0 mL of the filtrate to 10.0 mL with a 70 per cent *V/V* solution of *methanol R*. Filter this solution through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 10.0 mg of *rosmarinic acid CRS* in 20.0 mL of a 70 per cent *V/V* solution of *methanol R*. Dilute 1.0 mL of this solution to 25.0 mL with a 70 per cent *V/V* solution of *methanol R*.

*Reference solution (b).* Dissolve 5 mg of *ferulic acid R* in 25 mL of a 70 per cent *V/V* solution of *methanol R*. Dilute 1 mL of this solution to 10.0 mL with reference solution (a).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R*, *acetonitrile R*, *water for chromatography R* (1:19:80 *V/V/V*);
- *mobile phase B*: *phosphoric acid R*, *methanol R*, *acetonitrile R* (1:40:59 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 100 → 70 | 0 → 30 |
| 20 - 25 | 70 → 0 | 30 → 100 |
| 25 - 30 | 0 → 100 | 100 → 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 20 µL.

*Identification of peaks*: use the chromatogram obtained with reference solution (a) to identify the peak due to rosmarinic acid.

*Retention time*: ferulic acid = about 10 min; rosmarinic acid = about 14 min.

*System suitability*: reference solution (b):

- *resolution*: minimum 5.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 4}$$

$A_1$ = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *rosmarinic acid CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of rosmarinic acid in *rosmarinic acid CRS*.

**01/2018:2742**

# MAGNOLIA BIONDII FLOWER BUD

## Magnoliae biondii flos immaturus

DEFINITION

Whole, dried flower bud of *Magnolia biondii* Pamp. (syn. *Yulania biondii* (Pamp.) D.L.Fu).

*Content*:

- *essential oil*: minimum 14.0 mL/kg (anhydrous drug);
- *magnolin* ($C_{23}H_{28}O_7$; $M_r$ 416.5): minimum 3.0 per cent (anhydrous drug).

IDENTIFICATION

A. The flower bud, whose texture is light and fragile, is ovoid to elongated-ovoid, whitish-grey, yellowish-grey or greenish-grey, silky, pubescent, with a pointed apex; 1.2-3.0 cm long and 8-16 mm in diameter. The ligneous, short peduncle, covered in whitish lenticels, is usually present at the base of the flower bud. The flower bud is surrounded by 2-3 whorls of bracts: each bract has an outer surface densely covered in silky hairs, and a glabrous, brownish inner surface. The perianth consists of 9 light yellow or brownish tepals arranged in 3 whorls; the outer whorl consists of 3 sepaloid tepals, linear, whose length is about a quarter of that of the other tepals; the petaloid tepals are arranged in 2 inner whorls, each consisting of 3 tepals. The stamens and carpels are numerous, arranged in a spiral.

B. Microscopic examination (*2.8.23*). The unsieved powder is greenish to brownish-grey, dark-brown or slightly greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2742.-1): isolated and fragmented, multicellular (2-6 cells when whole) covering trichomes [B, C, D], whose cells have thick walls, often with spiral striations [Ba]; their bases are enlarged and consist of cells with very thick walls like sclereids, with granular orange-brown contents [Bb]; numerous sclereids, more or less branched, isolated [F] or in groups [E], with very thick, striated, channelled walls, up to 60 µm in diameter; fragments of perianth segments (surface view [A]; sectional view [G]) covered by a cuticle [Ga] and composed of polyhedral epidermal cells [Aa, Gb], paracytic stomata

Herbal drugs

(*2.8.3*) [Ab] and parenchyma consisting of rounded cells [Ad, Gc] and including rounded oil cells (up to 100 µm in diameter) with orange-yellow contents [Ac, Gd].

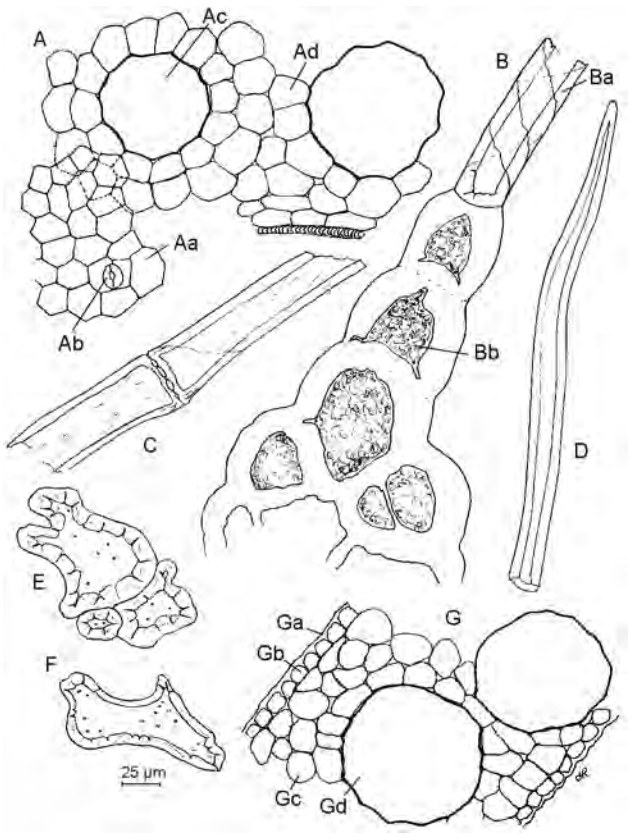

Figure 2742.-1. – *Illustration for identification test B of powdered herbal drug of Magnolia biondii flower bud*

C. Thin-layer chromatography (*2.2.27*) as described in the test for *Magnolia officinalis* Rehder & E.H.Wilson with the following modifications.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| Fargesin: a dark blue fluorescent zone | A dark blue fluorescent zone (fargesin) |
| _____ | _____ |
| Magnolin: a quenching zone | A quenching zone (magnolin) |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *vanillin reagent R*, heat at 100-105 °C for 5-7 min and examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A faint violet zone |
| _____ | _____ |
| Fargesin: a brown zone | A brown zone (fargesin) |
| | A dark blue zone |
| _____ | _____ |
| | A faint pinkish-violet zone |
| Magnolin: a pinkish-violet zone | A pinkish-violet zone (magnolin) |
| **Reference solution** | **Test solution** |

TESTS

***Magnolia officinalis* Rehder & E.H.Wilson**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Reduce the herbal drug to a powder using a blade grinder to prevent heating. To 0.5 g of the powdered herbal drug add 3.0 mL of *methanol R*. Sonicate for 15 min and centrifuge for 15 min. Transfer the supernatant to a 5 mL flask. Add 2 mL of *methanol R* to the residue, sonicate for 15 min and centrifuge. Transfer the supernatant into the same 5 mL flask. Dilute the combined supernatants to 5.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm) if necessary.

*Reference solution*. Dissolve 2.0 mg of *fargesin R* and 2.0 mg of *magnolin R* in *methanol R* and dilute to 5.0 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *methanol R*, *ethyl acetate R*, *toluene R* (1:5:30 *V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 7 cm.

*Drying*: in air.

*Detection*: treat with *vanillin reagent R*, heat at 100-105 °C for 5-7 min and examine in daylight.

*Results*: the chromatogram obtained with the test solution shows no pinkish zone (due to magnolol) just below the zone due to fargesin in the chromatogram obtained with the reference solution.

**Water** (*2.2.13*): maximum 100 mL/kg, determined on 25.0 g of the finely cut herbal drug.

**Total ash** (*2.4.16*): maximum 4.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 15.0 g of freshly, finely cut herbal drug, a 1 L round-bottomed flask, 300 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

**Magnolin**. Liquid chromatography (*2.2.29*).

*Test solution*. Reduce the herbal drug to a powder using a blade grinder to prevent heating. To 0.250 g of the powdered herbal drug add 35 mL of *methanol R*. Sonicate for 1 h, changing the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge for 15 min. Transfer the supernatant to a 100 mL volumetric flask. Repeat the extraction twice, adding to the residue 35 mL of *methanol R* the first time and 20 mL of *methanol R* the second time. Combine the supernatants, cool, and dilute to 100.0 mL with *methanol R*. Dilute 1.0 mL of the solution to 2.0 mL with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 5.0 mg of *magnolin CRS* in *methanol R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 5.0 mL with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R*.

*Reference solution (b).* To 0.250 g of *magnolia biondii flower for system suitability HRS* add 35 mL of *methanol R*. Sonicate for 1 h, changing the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge for 15 min. Transfer the supernatant to a 100 mL volumetric flask. Repeat the extraction twice, adding to the residue 35 mL of *methanol R* the first time and 20 mL of *methanol R* the second time. Combine the supernatants, cool, and dilute to 100.0 mL with *methanol R*. Dilute 1.0 mL of the solution to 2.0 mL with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *anhydrous acetic acid R*, *acetonitrile R*, *water for chromatography R* (0.1:14:85.9 *V/V/V*);
- *mobile phase B*: *anhydrous acetic acid R*, *water for chromatography R*, *acetonitrile R* (0.1:4.9:95 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 12 | 68 | 32 |
| 12 - 20 | 68 → 0 | 32 → 100 |
| 20 - 28 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 278 nm.

*Injection*: 20 µL.

*Identification of peaks*: use the chromatogram supplied with *magnolia biondii flower for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to eudesmin; use the chromatogram obtained with reference solution (a) to identify the peak due to magnolin.

*Retention time*: eudesmin = about 12 min; magnolin = about 13 min.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.8 between the peaks due to eudesmin and magnolin.

If necessary, dilute the test solution with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R* to obtain a peak due to magnolin with a height that is similar to or smaller than the height of the corresponding peak in the chromatogram obtained with reference solution (a). Take into account the additional dilution factor *d*.

Calculate the percentage content of magnolin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 4 \times d}{A_2 \times m_1}$$

$A_1$ = area of the peak due to magnolin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to magnolin in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *magnolin CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of magnolin in *magnolin CRS*;

$d$ = additional dilution factor.

**04/2014:2567**
**corrected 9.2**

# MAGNOLIA OFFICINALIS BARK

## Magnoliae officinalis cortex

DEFINITION

Dried bark from the stem and branch of *Magnolia officinalis* Rehder et E.H. Wilson.

*Content*: minimum 2.0 per cent for the sum of magnolol ($C_{18}H_{18}O_2$; $M_r$ 266.3) and honokiol ($C_{18}H_{18}O_2$; $M_r$ 266.3) (dried drug).

IDENTIFICATION

A. Fragments of stem and branch bark, quilled singly or double quilled, about 30 cm long and 2-7 mm thick. The outer surface is brownish-grey, rough, sometimes scaly, easily exfoliated, with distinct lenticels and longitudinal striations. The inner surface is reddish-brown or dark brown, smooth, with numerous fine, longitudinal striations. The texture is hard and difficult to break. The fracture is granular, brownish-grey in the outer layers and reddish-brown or dark brown in the inner layers.

B. Microscopic examination (*2.8.23*). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2567.-1): numerous sclereids [D] of various shapes and sizes, free or in groups, often branched, up to 100 µm long, with very thick, striated walls and conspicuous pit canals; oval [F] or rounded [G] oil cells, up to 100 µm in diameter, with orange-yellow contents; narrow, thick-walled fibres, often in bundles [C, H], accompanied by fusiform medullary rays (tangential section [Ca]) or consisting of files of rectangular cells (longitudinal section [Ha]); brown cork fragments with regularly and finely thickened walls [B]; fragments of phloem parenchyma [A] consisting of cells with irregular walls [Aa], accompanied by fusiform medullary rays (tangential section [Ab]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded, ovoid or polyhedral starch granules, about 2-12 µm in diameter, simple or 2-6 compound, free [J] or included in parenchyma cells [E].

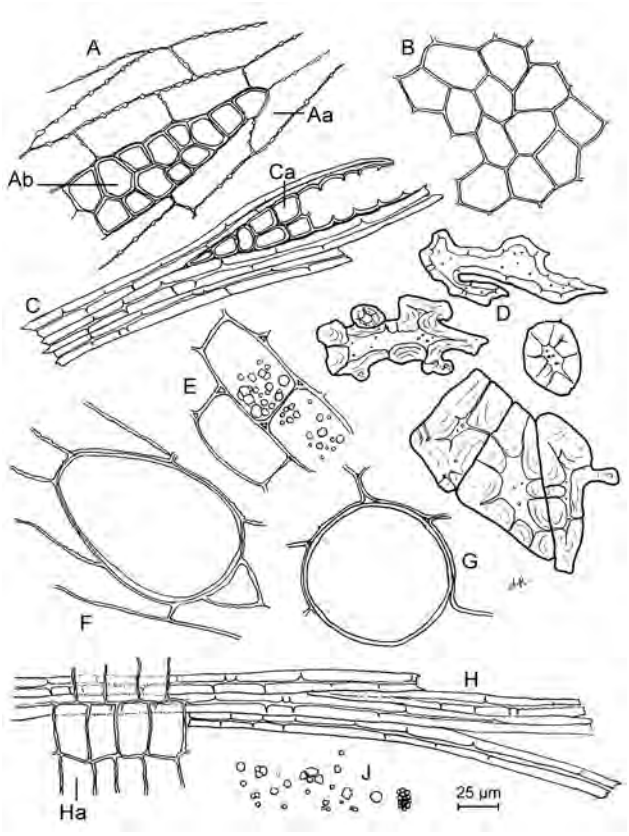

Figure 2567.-1. – *Illustration for identification test B of powdered herbal drug of Magnolia officinalis bark*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Reduce to a powder (355) (*2.9.12*), avoiding heating. To 0.5 g of the powdered herbal drug add 5 mL of *methanol R*, sonicate for 5 min, centrifuge, and use the supernatant. Filter through a membrane filter (nominal pore size 0.45 µm) if necessary.

*Reference solution.* Dissolve 1 mg of *honokiol R*, 1 mg of *magnolol R* and 2 mg of *eugenol R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *methanol R*, *ethyl acetate R*, *toluene R* (4:8:120 *V/V/V*).

*Application*: 5 µL [or 2 µL] as bands of 15 mm [or 8 mm].

*Development*: over a path of 15 cm [or 7 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |

TESTS

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 0.500 g of the powdered herbal drug (355) (*2.9.12*) add 80 mL of *methanol R* and heat in a water-bath under a reflux condenser for 30 min. Cool, then dilute to 100.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 4.0 mg of *honokiol CRS* and 4.0 mg of *magnolol CRS* in *methanol R* and dilute to 20.0 mL with the same solvent.

*Reference solution (b).* Dissolve 2.0 mg of *honokiol CRS* in 2.0 mL of *acetonitrile R*. To 1.0 mL of the solution add 15 µL of *acetic anhydride R* and mix. Heat at 50 °C for 60 min. Cool. Add successively, mixing after each addition, 16 µL of *concentrated ammonia R*, 1.0 mL of *acetonitrile R* and 2.0 mL of *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R1* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*: 0.5 per cent *V/V* solution of *acetic acid R*, *acetonitrile for chromatography R* (40:60 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 290 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of honokiol for the test solution and reference solution (a); 3 times the retention time of honokiol for reference solution (b).

*Relative retention* with reference to honokiol (retention time = about 8 min): magnolol = about 1.4; honokiol monoacetate isomer 1 = about 1.5; honokiol monoacetate isomer 2 = about 1.6; honokiol diacetate = about 2.6.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.8 between the peaks due to honokiol monoacetate isomers 1 and 2.

Calculate the sum of the percentage contents of honokiol and magnolol using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 5}{A_2 \times m_1} + \frac{A_3 \times m_3 \times p_2 \times 5}{A_4 \times m_1}$$

$A_1$ = area of the peak due to honokiol in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to honokiol in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to magnolol in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to magnolol in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *honokiol CRS* used to prepare reference solution (a), in grams;

$m_3$ = mass of *magnolol CRS* used to prepare reference solution (a), in grams;

$p_1$ = percentage content of honokiol in *honokiol CRS*;

$p_2$ = percentage content of magnolol in *magnolol CRS*.

**04/2013:2568**
**corrected 9.3**

# MAGNOLIA OFFICINALIS FLOWER

## Magnoliae officinalis flos

DEFINITION

Steamed and dried, unopened flower of *Magnolia officinalis* Rehder et E.H. Wilson.

*Content*: minimum 0.20 per cent of the sum of magnolol ($C_{18}H_{18}O_2$; $M_r$ 266.3) and honokiol ($C_{18}H_{18}O_2$; $M_r$ 266.3) (dried drug).

IDENTIFICATION

A. The greyish-yellow pedicel is short (0.5-2 cm) and densely tomentose. The brown or reddish-brown flower bud is elongated, conical, 4-7 cm long and 1.5-2.5 cm in diameter at the base; it usually consists of 12 perianth segments in several whorls. The stamens are numerous with a fine, short filament and a linear, yellowish-brown anther. The carpels are free and numerous, spirally arranged on a conical receptacle.

B. Microscopic examination (*2.8.23*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the perianth segments with polyhedral or elliptical epidermal cells, with irregularly thickened walls and anomocytic stomata (4-6 subsidiary cells) (*2.8.3*), accompanied by parenchyma that includes oval or rounded oil cells about 50 µm in diameter with orange-yellow contents; certain fragments contain epidermal cells with rounded papillae; numerous, branched sclereids, with channelled walls and a large lumen, about 15 µm in diameter; numerous elliptical pollen grains about 50 µm long and 40 µm wide, with a smooth exine.

C. Examine the chromatograms obtained in the test for other *Magnolia* species.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Eugenol: a faint quenching zone | |
| Magnolol: a dark blue fluorescent zone | A dark blue fluorescent zone (magnolol) |
| Honokiol: a quenching zone | A quenching zone (honokiol) |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *vanillin reagent R*, heat at 100-105 °C for 5-10 min and examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A bluish-violet zone |
| Eugenol: a brown zone | |
| Magnolol: a pinkish-violet zone | A pinkish-violet zone (magnolol) |
| Honokiol: a dark violet zone | A dark violet zone (honokiol) |
| | A bluish-violet zone |
| **Reference solution** | **Test solution** |

TESTS

**Other *Magnolia* species**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Reduce the herbal drug to a powder (710) (*2.9.12*), avoiding heating. To 0.5 g of the powdered herbal drug add 2.5 mL of *methanol R*. Sonicate for 15 min at a power of 80 W and a frequency of 37 kHz (sonication time may be adapted according to the power and frequency used), then centrifuge at 1500-2000 *g* for 10 min and transfer the supernatant to a 5 mL flask. Add 2 mL of *methanol R* to the residue, sonicate for 15 min and centrifuge. Transfer the supernatant into the same 5 mL flask. Dilute to 5 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm) if necessary.

*Reference solution*. Dissolve 1 mg of *honokiol R*, 1 mg of *magnolol R* and 2 mg of *eugenol R* in 4 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *methanol R*, *ethyl acetate R*, *toluene R* (1:5:30 *V/V/V*).

*Application*: 8 µL as bands of 8 mm.

*Development*: over a path of 7 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the test solution shows no blue fluorescent zone in the lower part of the plate and no green fluorescent zone in the upper part, nor any other fluorescent zone.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Reduce the herbal drug to a powder (710) (*2.9.12*) using a blade grinder equipped with a double-walled grinding chamber cooled to a temperature of about 10 °C. To 0.500 g of the powdered herbal drug add 10 mL of *methanol R*. Sonicate for 1 h at a power of 80 W and a frequency of 37 kHz (sonication time may be adapted according to the power and frequency used). Change the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge at 1500-2000 *g* for 15 min. Transfer the supernatant to a 20.0 mL flask. Add 9.5 mL of *methanol R* to the residue. Repeat the sonication for 1 h. Change the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge. Transfer the supernatant to the same 20.0 mL flask. Cool, then dilute to 20.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 5.0 mg of *honokiol CRS* in *methanol R* and dilute to 5.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with *methanol R*.

*Reference solution (b).* Dissolve 6.0 mg of *magnolol CRS* in *methanol R* and dilute to 20.0 mL with the same solvent.

*Reference solution (c).* Dissolve 2.0 mg of *honokiol R* in 2.0 mL of *acetonitrile R*. Add 30 µL of *acetic anhydride R* and mix. Heat at 50 °C for 60 min. Cool. Add successively, mixing after each addition, 32 µL of *concentrated ammonia R*, 2.0 mL of *acetonitrile R* and 4.0 mL of *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped ethylene-bridged polar-embedded octadecylsilyl silica gel for chromatography (hybrid material) R* (3.5 µm);
- *temperature*: 25 ± 2 °C.

*Mobile phase*:

- *mobile phase A*: *anhydrous formic acid R*, *water R* (0.1:99.9 *V/V*);
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 47 | 53 |
| 20 - 22 | 47 → 5 | 53 → 95 |
| 22 - 27 | 5 | 95 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 292 nm.

*Injection*: 20 µL.

*Relative retention* with reference to honokiol (retention time = about 10 min): magnolol = about 1.3; honokiol monoacetate isomer 1 = about 1.4; honokiol monoacetate isomer 2 = about 1.5; honokiol diacetate = about 1.9.

*System suitability*: reference solution (c):

- *resolution*: minimum 2.0 between the peaks due to honokiol monoacetate isomers 1 and 2.

If necessary, dilute the test solution to obtain peaks of honokiol and magnolol that are similar in height to the corresponding peaks in reference solutions (a) and (b).

Calculate the sum of the percentage contents of honokiol and magnolol using the following expression:

$$\frac{A_1 \times m_2 \times 0.16 \times p_1 \times d}{A_2 \times m_1} + \frac{A_3 \times m_3 \times p_2 \times d}{A_4 \times m_1}$$

$A_1$ = area of the peak due to honokiol in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to honokiol in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to magnolol in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to magnolol in the chromatogram obtained with reference solution (b);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *honokiol CRS* used to prepare reference solution (a), in grams;

$m_3$ = mass of *magnolol CRS* used to prepare reference solution (b), in grams;

$p_1$ = percentage content of honokiol in *honokiol CRS*;

$p_2$ = percentage content of magnolol in *magnolol CRS*;

$d$ = dilution factor of the test solution.

**01/2011:1541**

# MALLOW FLOWER

## Malvae sylvestris flos

DEFINITION

Whole or fragmented dried flower of *Malva sylvestris* L. or its cultivated varieties.

IDENTIFICATION

A. The flower consists of an epicalyx with 3 oblong or elliptical-lanceolate parts that are shorter than those of the calyx and situated immediately below it; a calyx with 5 pubescent triangular lobes, gamosepalous at the base; a corolla 3-4 times longer than the calyx with 5 wedge-shaped, notched petals fused to the staminal tube at their base; numerous stamens, the filaments of which fuse into a staminal tube covered by small star-shaped trichomes and occasional simple trichomes visible using a lens; numerous wrinkled carpels, glabrous or sometimes pubescent, enclosed in the staminal tube and arranged into a circle around a central style ending with numerous filiform stigmas. In cultivated varieties, the epicalyx is 3-7 partite, the calyx 5-8 partite and the corolla 5-10 partite.

B. Microscopic examination (*2.8.23*). The powder is bluish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1541.-1): unicellular, thick-walled, flexuous covering trichomes, from the calyx and the epicalyx, up to 2 mm in length, whole [L] or, most often, fragmented [Q]; fragments of the epidermis of the sepals (surface view [D, J]) with anomocytic stomata (*2.8.3*) [Dc]; club-shaped glandular trichomes with multicellular heads [Db] and short unicellular covering trichomes, somewhat curved, either isolated [J] or in star-shaped groups of 2-6 [Da]; fragments of covering trichomes [N]; isolated glandular trichomes (surface view [F], transverse section [G]); fragments of the mesophyll of the calyx and the epicalyx whose cells contain small cluster crystals of calcium oxalate [K]; veins of the sepals [P] with vessels [Pa] accompanied by cells with cluster crystals of calcium oxalate [Pb]; fragments of petal epidermis, with elongated cells and sinuous margins, narrow in the wild plant [A], shorter and broader in the cultivated varieties [B], bearing

sessile glandular trichomes with multicellular club-shaped heads [Ba, C, E]; fragments of petal mesophyll [H] consisting of large mucilage cells [Hc], sometimes cells with small cluster crystals of calcium oxalate [Hb] and spiral vessels [Ha]; spherical pollen grains, about 150 µm in diameter, with a roughly spiny exine [M].

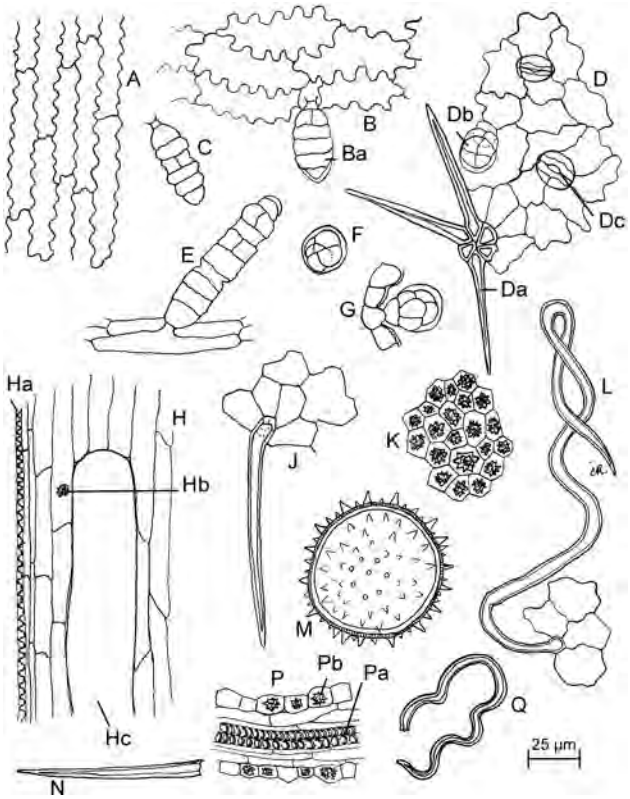

Figure 1541.-1. – *Illustration for identification test B of powdered herbal drug of mallow flower*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *ethanol (60 per cent V/V) R*. Stir for 15 min and filter.

*Reference solution*. 0.5 g/L solution of *quinaldine red R* in *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (15:30:60 *V/V/V*).

*Application*: 10 µL of the test solution and 5 µL of the reference solution, as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: examine in daylight.

*Results*: the chromatogram obtained with the reference solution shows an orange-red zone in the upper part of the middle third ; the chromatogram obtained with the test solution shows, below the zone in the chromatogram obtained with the reference solution, 2 violet zones in the middle third, with the principal zone (6″-malonyl malvin) situated just below the other violet zone (malvin).

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 14.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

**Swelling index** (*2.8.4*): minimum 15, determined on 0.2 g of the powdered herbal drug (710) (*2.9.12*) moistened with 0.5 mL of *anhydrous ethanol R*.

**07/2011:2391**

# MALLOW LEAF

## Malvae folium

DEFINITION

Whole or fragmented, dried leaf of *Malva sylvestris* L., *Malva neglecta* Wallr. or a mixture of both species.

IDENTIFICATION

A. The leaves of *M. sylvestris* are up to 12 cm long and up to 15 cm wide with 3, 5 or 7 lobes and sinuate at the base; the leaves of *M. neglecta* are up to 9 cm long and wide, round or kidney-shaped with 5-7 indistinct lobes. The leaves of both species have irregular dentate margins and are green or brownish-green. The abaxial surface of the lamina bears more hairs and shows a more prominent venation than the adaxial surface. The major veins on the upper surface of the leaves and the petioles may be violet. The petioles are as long as the leaves, up to 2 mm wide, rounded and somewhat flattened, longitudinally slightly grooved, green or brownish-green or violet. The fragmented drug consists of occasionally agglomerated, crumpled pieces of leaves showing prominent veins.

B. Microscopic examination (*2.8.23*). The powder is green or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2391.-1): fragments of the lamina (transverse section [F]), consisting of the lower epidermis (surface view [C]) and the upper epidermis (surface view [D], transverse section [Fb]), with cells that show straight, or more or less sinuous anticlinal walls; stomata mostly anisocytic (*2.8.3*) on both surfaces [Ca, Da]; long covering trichomes with thickened walls and tapering to a point at the apex, usually unicellular, whole [A, Fa] or fragmented [Db], but in *M. Sylvestris* they may be stellate with 2-8 components [H], each strongly pitted at the base; club-shaped glandular trichomes composed of 2-6 cells [E] occur in both species; fragments of the mesophyll consisting of palisade parenchyma (surface view [Dc], transverse section [Fc]) and spongy mesophyll cells containing mucilage, cells containing cluster crystals of calcium oxalate, often associated with vessels [B]; occasional spherical pollen grains, 110-170 µm in diameter, with a spiny exine [G].

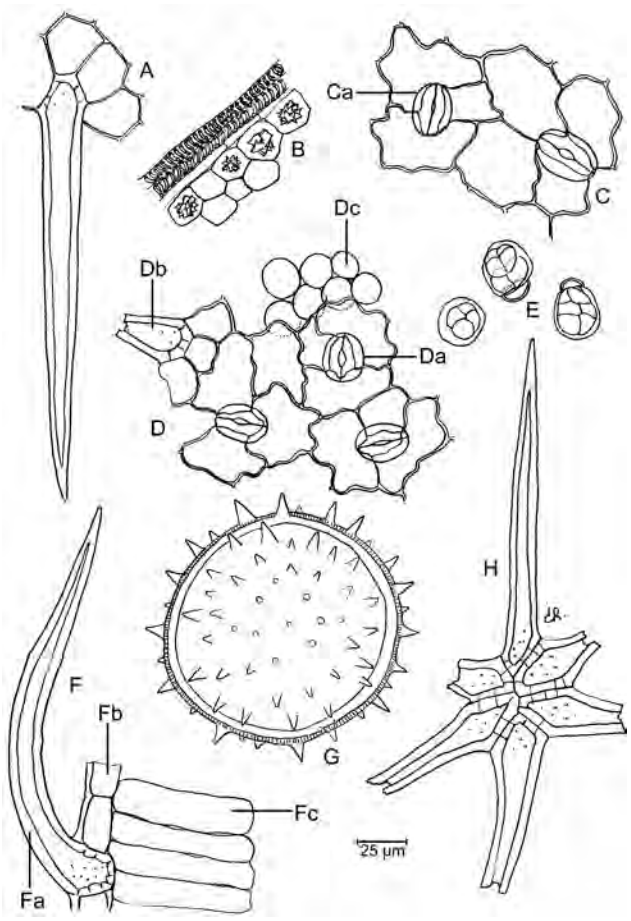

Figure 2391.-1. – *Illustration for identification test B of powdered herbal drug of mallow leaf*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2.0 g of the powdered herbal drug (710) (*2.9.12*) add 20 mL of an 80 per cent *V/V* solution of *tetrahydrofuran R*; extract for 10 min using sonication and filter.

*Reference solution.* Dissolve 3 mg of *hyperoside R* and 3 mg of *rutoside trihydrate R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *anhydrous acetic acid R*, *water R*, *ethyl formate R*, *3-pentanone R* (4:11:14:20:50 *V/V/V/V/V*).

*Application*: 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10-12 cm [or 6 cm].

*Drying*: in air.

*Detection*: heat at 100 °C for 10 min; spray or dip the warm plate in a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; remove the solvent with cold air; spray or dip the plate in a 50 g/L solution of *macrogol 400 R* in *methanol R*, dry in air and examine after 15 min in ultraviolet light at 365 nm.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Hyperoside: a yellow fluorescent zone | A yellow fluorescent zone |
| ——— | ——— |
| Rutoside: a yellow fluorescent zone | A yellow fluorescent zone |
| | A light blue fluorescent zone |
| | An orange fluorescent zone |
| | An orange fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of foreign organs, maximum 5 per cent of leaves with blisters of spores of *Puccinia malvacearum* and maximum 2 per cent of foreign elements.

Foreign organs can be flowers, fruits and parts of the stem. The blisters of spores on the leaves are mostly 1 mm wide, and red or brown. Examine under a microscope using *chloral hydrate solution R*. The spores of *Puccinia malvacearum* are oblong or oval with brownish walls and a small appendage.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 17.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

**Swelling index** (*2.8.4*): minimum 7, determined on 1.0 g of the powdered herbal drug (710) (*2.9.12*).

**04/2016:2430**

# MANDARIN EPICARP AND MESOCARP

## Citri reticulatae epicarpium et mesocarpium

DEFINITION

Dried epicarp and mesocarp of the ripe fruit of *Citrus reticulata* Blanco or its cultivars, partly freed from the white spongy tissue of the mesocarp.

*Content*: minimum 3.5 per cent of hesperidin ($C_{28}H_{34}O_{15}$; $M_r$ 611) (dried drug).

IDENTIFICATION

A. The pericarp consists of variously sized irregular pieces, or it is cut into strips, which may be folded or form compressed loops. The larger pieces are mostly lobed, the lobes attached at the base of the pericarp where the remains of a fruit stalk or stalk scar may be present. Isolated lobes of pericarp may also be present. Irregular pieces 0.5-7.6 cm long, and 0.4-4.6 cm wide; strips up to 7.6 cm long and up to 2 cm wide; both forms 1-4.5 mm thick. The outer surface is yellowish-brown or orange, reddish-brown or more rarely, blackish- or greenish-brown; often finely wrinkled and slightly shiny. Scattered, concave or raised oil glands are dense on the outer surface; when visible in transverse section oil glands appear as irregularly shaped cavities beneath the epicarp. The inner surface of the pericarp appears whitish or whitish-yellowish, rough

and often fibrous in texture, bearing yellowish-white or yellowish-brown raised, often branched vascular bundles. The texture is mostly hard, stiff and fragile, easily broken.

B. Microscopic examination (*2.8.23*). The powder is light yellowish or orange-brown, more rarely reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2430.-1): fragments of epicarp (surface view [H]) consisting of small polygonal cells, sub-square or rectangular, with slightly thickened anticlinal walls [Ha] and occasional rounded stomata [Hb] (18-27 µm in diameter) encircled by a combination of small polygonal plus narrow, elongate subsidiary cells; epicarp usually accompanied by sub-epicarpal layers of thin-walled cells containing prisms of calcium oxalate [Hc]; prisms commonly biconical, also rhomboidal or polyhedral prisms present, 5-30 µm long and 3-18 µm in diameter; fragments of pericarp (transverse section [E]) showing the epicarp covered by a thick cuticle [Ea] and sub-epicarpal layers composed of cells, some of which contain prisms of calcium oxalate [Eb]; sometimes more than 1 prism crystal is found in the same cell [Aa, Hd]; fragments of schizolysigenous oil glands [C]; numerous groups of mesocarp cells (transverse section [A], longitudinal section [D]) with irregularly thickened, weakly lignified cell walls; free prism crystals of calcium oxalate or single crystals within isolated cells [B]; yellow hesperidin crystals sometimes abundant in cells; small droplets of orange-yellow essential oil occasionally present; numerous small vascular bundles [F] with narrow reticulate or spiral xylem [Fa] (4-23 µm in diameter), and occasional pitted tracheids; vasculature, sometimes accompanied by crystal sheaths [Fb]; occasional isolated, short vessels [G]. Examine under a microscope using a 20 g/L solution of *potassium hydroxide R*. The mounting medium becomes yellow because of the presence of hesperidin.

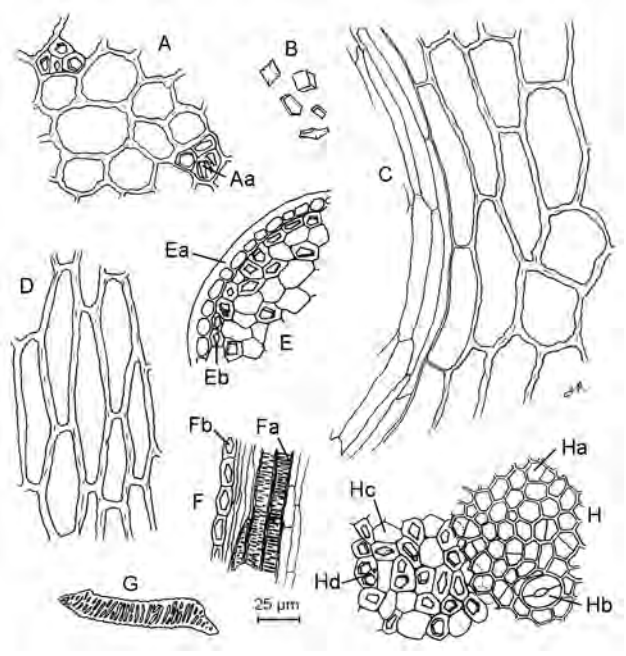

Figure 2430.-1. – *Illustration for identification test B of powdered herbal drug of mandarin epicarp and mesocarp*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and heat in a water-bath at 65 °C for 5 min, shaking frequently. Allow to cool and filter.

*Reference solution.* Dissolve 1 mg of *caffeic acid R* and 2 mg of *hesperidin R* in 5 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 *V/V/V*).

*Application*: 5 µL of the test solution and 10 µL of the reference solution as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air, then heat at 110-120 °C for 5 min.

*Detection*: treat with a 10 g/L solution of *aluminium chloride R* in *ethanol (96 per cent) R* and heat at 110-120 °C for 5 min; treat the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. After 60 min examine the chromatograms in ultraviolet light at 365 nm.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| Caffeic acid: a light blue fluorescent zone | |
| | A blue fluorescent zone |
| Hesperidin: a greenish-brown fluorescent zone | A greenish-brown fluorescent zone (hesperidin) |
| | A yellowish-green fluorescent zone |
| | A greenish fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Bitter-orange epicarp and mesocarp**. Examine the chromatograms obtained in the assay.

*Results*: the chromatogram obtained with the test solution shows no peak at the retention time of naringin with an area of more than 1 per cent of the area of the peak due to hesperidin.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Place 0.125 g of the powdered herbal drug (355) (*2.9.12*) in a 100 mL round-bottomed flask. Add 50.0 mL of *methanol R*, stir for 2 h and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 10.0 mg of *hesperidin CRS* in *methanol R* and dilute to 50.0 mL with the same solvent.

*Reference solution (b).* Dissolve 5.0 mg of *naringin R* in reference solution (a) and dilute to 25.0 mL with reference solution (a).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: *acetonitrile R*, *glacial acetic acid R*, *methanol R*, *water R* (2.7:3.7:22:71.6 *V/V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 283 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of hesperidin.

*Retention time*: naringin = about 15 min; hesperidin = about 20 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to naringin and hesperidin.

Calculate the percentage content of hesperidin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to hesperidin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to hesperidin in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *hesperidin CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of hesperidin in *hesperidin CRS*.

**01/2008:2355**
**corrected 10.0**

# MANDARIN OIL

## Citri reticulatae aetheroleum

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment, from the peel of the fresh fruit of *Citrus reticulata* Blanco.

CHARACTERS

*Appearance*: greenish, yellow or reddish orange liquid showing blue fluorescence.

Characteristic odour.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dilute 0.1 mL of the substance to be examined to 1 mL with *toluene R*.

*Reference solution.* Dissolve 2 µL of *methyl N-methylanthranilate R*, 4 mg of *guaiazulene R* and 10 mg of *α-terpineol R* in 10 mL of *toluene R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (15:85 *V/V*).

*Application*: 10 µL [or 2 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 365 nm.

*Results A*: the intense blue fluorescent zone in the chromatogram obtained with the test solution is similar in position and fluorescence to the zone due to methyl *N*-methylanthranilate in the chromatogram obtained with the reference solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

*Detection B*: spray with a 200 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 100 °C for 10 min; examine in daylight.

*Results B*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue zone |
| Guaiazulene: a blue zone | A blue zone |
| | A blue zone |
| _____ | _____ |
| | A blue zone |
| _____ | _____ |
| α-Terpineol: a blue zone | A blue zone (α-terpineol) |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.848 to 0.855.

**Refractive index** (*2.2.6*): 1.474 to 1.478.

**Optical rotation** (*2.2.7*): + 64° to + 75°.

**Fatty oils and resinified essential oils** (*2.8.7*). It complies with the test.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dilute 0.20 g of the substance to be examined to 10.0 mL with *heptane R*.

*Reference solution (a).* Dilute 5 µL of *α-pinene R*, 5 µL of *sabinene R*, 5 µL of *β-pinene R*, 5 µL of *β-myrcene R*, 5 µL of *p-cymene R*, 70 µL of *limonene R*, 20 µL of *γ-terpinene R* and 5 µL of *methyl N-methylanthranilate R* to 5.0 mL with *heptane R*.

*Reference solution (b).* Dissolve 5 µL of *limonene R* in 50 mL of *heptane R*. Dilute 0.5 mL of this solution to 5.0 mL with *heptane R*.

*Column*:

– *material*: fused silica;

– *size*: *l* = 60 m, Ø = 0.25 mm;

– *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.4 mL/min.

*Split ratio*: 1:70.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 90 | 50 → 230 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to sabinene and β-pinene and minimum 1.5 between the peaks due to *p*-cymene and limonene.

*Identification of components*: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. Disregard the peak due to heptane.

Determine the percentage content of each of these components. The limits are within the following ranges:

– *α-pinene*: 1.6 per cent to 3.0 per cent;
– *sabinene*: maximum 0.3 per cent;
– *β-pinene*: 1.2 per cent to 2.0 per cent;
– *β-myrcene*: 1.5 per cent to 2.0 per cent;
– *p-cymene*: maximum 1.0 per cent;
– *limonene*: 65.0 per cent to 75.0 per cent;
– *γ-terpinene*: 16.0 per cent to 22.0 per cent;
– *methyl N-methylanthranilate*: 0.30 per cent to 0.60 per cent;
– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (b).

**Residue on evaporation** (*2.8.9*): 1.6 per cent to 4.0 per cent, determined after heating on a water-bath for 4 h.

STORAGE

At a temperature not exceeding 25 °C.

**01/2012:1856**

# MARSHMALLOW LEAF

## Althaeae folium

DEFINITION

Whole or cut, dried leaf of *Althaea officinalis* L.

IDENTIFICATION

A. The leaves have long petioles and are about 7-10 cm long; the lamina is cordate or ovate with 3-5 shallow lobes and crenate or dentate margins; the venation is palmate. The petioles and both surfaces of the lamina are greyish-green and densely pubescent. Rarely, fragments of the inflorescence or immature fruits may be present.

B. Microscopic examination (*2.8.23*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1856.-1): numerous long, rigid, unicellular covering trichomes with thick walls, pointed at the apex, often fragmented [C], angular and pitted at the base where they are sometimes still united to form stellate structures with up to 8 components (surface view [B], transverse section [E]); few secretory trichomes, isolated, with unicellular stalks and globular, multicellular heads [F]; fragments of the lower [A] and upper [D] leaf epidermises in surface view with anomocytic [Aa] or paracytic [Da] stomata (*2.8.3*), glandular trichomes [Ab] and basal cells of covering trichomes [Ac], often accompanied by palisade parenchyma [Db]; cluster crystals of calcium oxalate, isolated [H] or included in the parenchyma of the mesophyll [Gc, Kb]; fragments of veins [G] with small, spiral [Gb] or annular [Ga] vessels, often accompanied by sheaths containing cluster crystals of calcium oxalate [Gc]; fragments of the lamina, in transverse section [K], showing the epidermises bearing broken covering trichomes [Ka], a symmetrical, heterogeneous mesophyll with some cells containing cluster crystals of calcium oxalate [Kb]; occasional pollen grains, spherical, with a roughly spiny exine, about 150 µm in diameter [J]. Examine under a microscope using *ruthenium red solution R*. The powder shows groups of parenchyma containing mucilage, which stains orange-red.

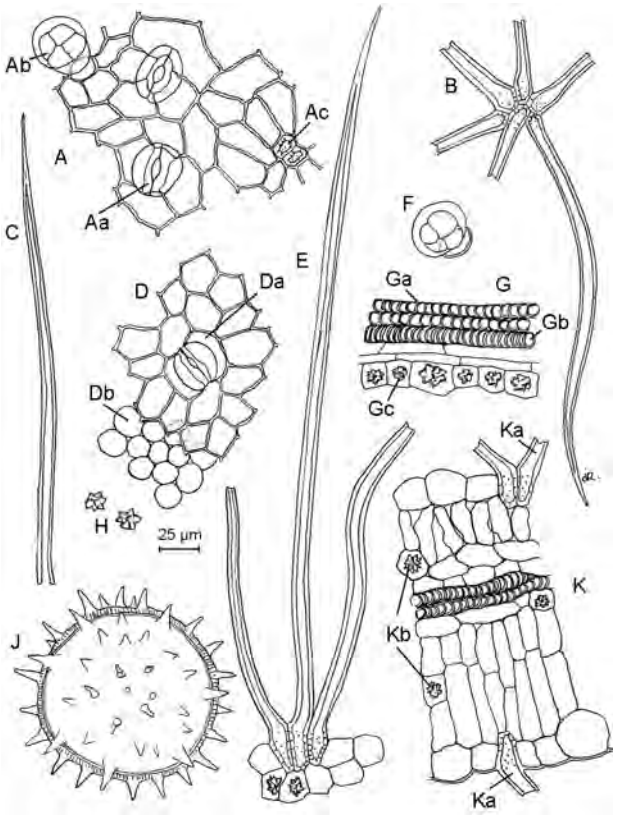

Figure 1856.-1. – *Illustration for identification test B of powdered herbal drug of marshmallow leaf*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Heat in a water-bath under a reflux condenser for 5 min. Allow to cool and filter. Distil the filtrate under reduced pressure until the total volume is about 2 mL.

*Reference solution.* Dissolve 2.5 mg of *chlorogenic acid R* and 2.5 mg of *quercitrin R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: at 100-105 °C.

*Detection*: spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 4 per cent of leaves infected by *Puccinia malvacearum*, showing red spots, and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 18.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

**Swelling index** (*2.8.4*): minimum 12, determined on 0.2 g of the powdered herbal drug (355) (*2.9.12*).

**01/2012:1126**

# MARSHMALLOW ROOT

## Althaeae radix

DEFINITION

Peeled or unpeeled, whole or cut, dried root of *Althaea officinalis* L.

IDENTIFICATION

A. The unpeeled, non-fragmented drug consists of cylindrical, slightly twisted roots, up to 2 cm thick, with deep longitudinal furrows. The outer surface is greyish-brown and bears numerous rootlet scars. The fracture is fibrous externally, rugged and granular internally. The section shows a more or less thick, whitish bark with brownish periderm, separated by the well-marked, brownish cambium from a white xylem. The stratified structure of the bark and the radiate structure of xylem become more distinct when moistened.

   The peeled drug has a greyish-white, finely fibrous outer surface. Cork and external cortical parenchyma are absent.

B. Microscopic examination (*2.8.23*). The powder is greyish-brown (unpeeled root) or whitish (peeled root). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1126.-1): fragments of colourless, mainly unlignified, thick-walled fibres [C, D, M] with split or pointed ends [D], sometimes accompanied by parenchymatous cells of the medullary rays [M], or grouped [C]; fragments of vessels, bordered-pitted or with reticulate or scalariform thickenings [G, H]; cluster crystals of calcium oxalate about 20-35 µm, mostly 25-30 µm in size, isolated [K] or included in parenchymatous cells [B]; fragments of parenchyma [E] with cells containing mucilage [Ea, F]; fragments of cork with thin-walled, tabular cells (surface view [A], transverse section [L]) (unpeeled root). Examine under a microscope using *ruthenium red solution R*. The powder shows groups of parenchyma containing mucilage, which stains orange-red. Examine under a microscope using *water R*. The powder shows numerous starch granules [J], about 3-25 µm in size, occasionally with a longitudinal hilum. The starch granules are mostly simple [Ja], a few being 2-4 compound [Jb].

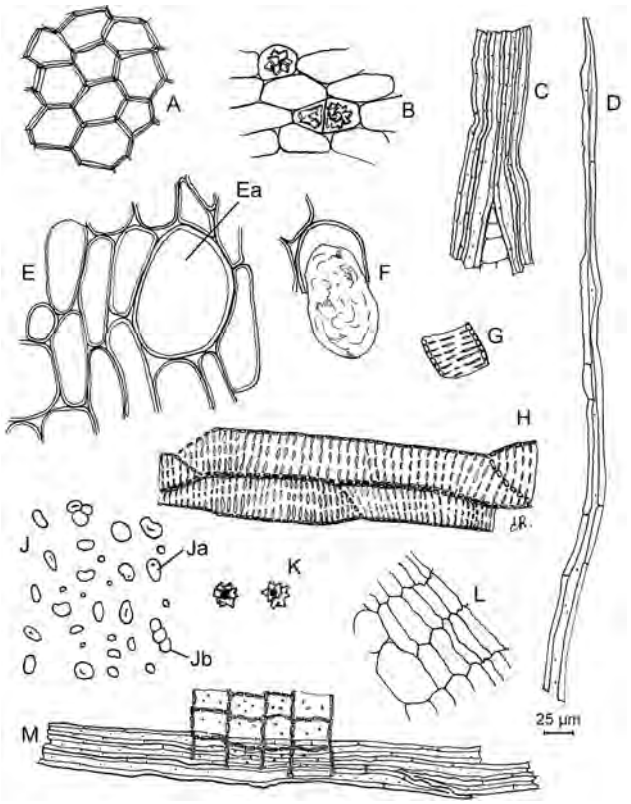

Figure 1126.-1. – *Illustration for identification test B of powdered herbal drug of marshmallow root*

TESTS

**Foreign matter** (*2.8.2*): maximum 2 per cent of brown deteriorated drug.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent for the peeled root and maximum 8.0 per cent for the unpeeled root.

**Swelling index** (*2.8.4*): minimum 10, determined on the powdered herbal drug (710) (*2.9.12*).

**01/2017:1876**
**corrected 10.0**

# MASTIC

## Mastix

DEFINITION

Dried resinous exudate obtained from stems and branches of *Pistacia lentiscus* L.

*Content*: minimum 10 mL/kg of essential oil (anhydrous drug).

IDENTIFICATION

A. Small light yellow to greenish-yellow, non-uniform, spherical or pyriform, clear or opaque, hard glassy fragments.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1 g of the substance to be examined in 10 mL of *methylene chloride R* and filter after 1-2 min.

*Reference solution.* Dissolve 25 mg of *eugenol R* and 25 mg of *borneol R* in 3 mL of *methylene chloride R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *light petroleum R*, *toluene R* (5:95 *V/V*).

*Application*: 1 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: spray with *vanillin reagent R* and heat at 100-105 °C for 5 min.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones of various colours may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A violet zone |
| _____ | _____ |
| | A pale violet zone |
| | A very pale violet zone |
| _____ | _____ |
| Eugenol: a brown zone | A blue zone |
| Borneol: a greenish-blue zone | A bluish-violet zone |
| | A dark violet zone |
| **Reference solution** | **Test solution** |

TESTS

**Acid value** (*2.5.1*): 50 to 70, determined on 1.0 g.

**Water** (*2.2.13*): maximum 10 mL/kg, determined on 25.0 g of the drug reduced to a powder (1400) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 0.5 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use a 500 mL round-bottomed flask and 200 mL of *water R* as the distillation liquid. Reduce the drug to a powder (1400) (*2.9.12*) and immediately use 20.0 g for the determination. Introduce 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

STORAGE

Do not powder.

**04/2018:2678**

# MATE LEAF

## Mate folium

DEFINITION

Leaf of *Ilex paraguariensis* A.St.-Hil., rapidly desiccated by heating and cut.

*Content*: minimum 1.0 per cent of caffeine ($C_8H_{10}N_4O_2$; $M_r$ 194.2) (dried drug).

IDENTIFICATION

A. The yellowish-green or brownish-green leaf is tough and brittle with a short petiole. It is 8-12 cm long and 5-6 cm wide. The lamina is elliptic oval and glabrous, with dentate margins. The venation is pinnate and prominent on the lower surface. The cut herbal drug occurs as glabrous, yellowish-green, irregular, angular pieces ranging in length from 2-4 mm.

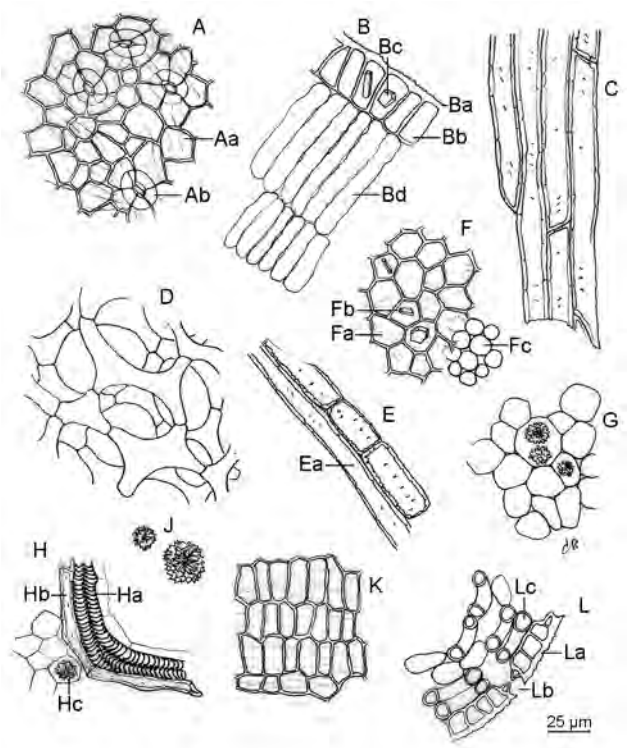

Figure 2678.-1. – *Illustration for identification test B of powdered herbal drug of mate leaf*

B. Microscopic examination (*2.8.23*). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2678.-1): fragments of the upper epidermis of the lamina (surface view [F], transverse section [B]), covered with an irregularly striated cuticle [Fa, Ba] and consisting of cells with slightly and regularly thickened walls [Fa, Bb], with some cells containing a prism of calcium oxalate [Fb, Bc], and accompanied by underlying palisade parenchyma [Fc, Bd]; fragments of the upper epidermis of the lamina from the area near a vein (surface view [K]), consisting of nearly rectangular cells in a regular arrangement; fragments of the lower epidermis of the lamina (surface view [A], transverse section [L]), covered by a striated cuticle [Aa, La] consisting of polygonal cells [Aa] and anomocytic stomata (*2.8.3*) [Lb, Ab]; fragments of spongy parenchyma (surface view [D]), sometimes accompanying the lower epidermis (transverse section [Lc]); cluster crystals of calcium oxalate of various sizes that may exceed 30 µm in diameter, isolated [J] or included in parenchyma cells [G]; groups of pericyclic fibres [C]; rectangular, thick-walled and channelled cells from the endodermis [E], often accompanying pericyclic fibres [Ea]; vascular bundles [H] consisting of spiral vessels with a small diameter [Ha], accompanied by fibres [Hb] and sometimes by parenchyma, with some cells containing a cluster crystal of calcium oxalate [Hc].

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and sonicate for 10 min. Centrifuge or filter.

*Reference solution.* Dissolve 7 mg of *caffeine R*, 1 mg of *chlorogenic acid R* and 1 mg of *rutoside trihydrate R* in 5 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *toluene R*, *water R*, *anhydrous formic acid R*, *ethyl formate R* (3:6:8:60 *V/V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in a current of air at room temperature.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| | A quenching zone |
| Caffeine: a quenching zone | A quenching zone (caffeine) |
| | A quenching zone |
| Chlorogenic acid: a quenching zone | A quenching zone (chlorogenic acid) |
| ——— | ——— |
| Rutoside: a quenching zone | A quenching zone (rutoside) |
| **Reference solution** | **Test solution** |

*Detection B*: heat at 100-105 °C for 5 min. Treat the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air. Examine in ultraviolet light at 366 nm.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. 1 or 2 faint blue fluorescent zones may be present in the upper third of the chromatogram obtained with the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | 1 or 2 red fluorescent zones |
| ——— | ——— |
| | An intense blue fluorescent zone |
| | A blue fluorescent zone |
| Chlorogenic acid: a blue fluorescent zone | An intense blue fluorescent zone (chlorogenic acid) |
| ——— | ——— |
| Rutoside: an orange fluorescent zone | An orange fluorescent zone (rutoside) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).
*Solution A*. Dissolve 30.0 mg of *caffeine CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Test solution.* Introduce 1.500 g of the powdered herbal drug (355) (*2.9.12*) into a 100 mL round-bottomed flask and add 40 mL of *methanol R*. Heat in a water-bath at 70 °C under a reflux condenser for 30 min. Allow to cool and filter through a plug of absorbent cotton into a 100 mL volumetric flask. Transfer the absorbent cotton with the drug residue into the round-bottomed flask. Add 40 mL of *methanol R*, proceed as before and filter into the same volumetric flask. Rinse the round-bottomed flask and the filter with *methanol R*, add the rinsings to the volumetric flask and dilute to 100.0 mL with *methanol R*. Shake to obtain a homogeneous solution. Transfer 10.0 mL of this solution into a volumetric flask, add 30 mL of *water R* and dilute to 50.0 mL with the mobile phase. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dilute 5.0 mL of solution A to 50.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 15.0 mg of *(−)-epicatechin R* in the mobile phase and dilute to 25.0 mL with the mobile phase. To 10.0 mL of the solution add 5.0 mL of solution A and dilute to 50.0 mL with the mobile phase.

*Column*:

- *size*: $l$ = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *methanol R*, *water for chromatography R* (25:75 *V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 272 nm.

*Injection*: 10 µL.

*Run time*: 3 times the retention time of caffeine.

*Retention time*: caffeine = about 11 min.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to caffeine and (−)-epicatechin.

Calculate the percentage content of caffeine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

$A_1$ = area of the peak due to caffeine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to caffeine in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *caffeine CRS* used to prepare solution A, in grams;

$p$ = percentage content of caffeine in *caffeine CRS*.

**07/2019:0404**

# MATRICARIA FLOWER

## Matricariae flos

DEFINITION

Dried capitula of *Matricaria recutita* L. (*Chamomilla recutita* (L.) Rauschert).

*Content*:

– *blue essential oil*: minimum 4 mL/kg (dried drug);

– *total apigenin 7-glucoside* ($C_{21}H_{20}O_{10}$; $M_r$ 432.4): minimum 0.25 per cent (dried drug).

IDENTIFICATION

A. Capitula, when spread out, consisting of an involucre made up of many bracts arranged in 1-3 rows; an elongated-conical receptacle, occasionally hemispherical (young capitula); 12-20 marginal ligulate florets with a white ligule; several dozen yellow central tubular florets. The involucre bracts are ovate or lanceolate, with a brownish-grey scarious margin. The receptacle is hollow, without paleae. The corolla of the ligulate florets has a brownish-yellow tube at the base extending to form a white, elongated-oval ligule. The inferior ovary is dark brown, ovoid or spherical, and has a long style and bifid stigma. The tubular florets are yellow and have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoecium similar to that of the ligulate florets.

B. Microscopic examination (*2.8.23*). The powder is light yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0404.-1): fragments of the outer epidermis of the bracts of the involucre (surface view [K]), consisting of, on the margin, thin-walled cells covered by a finely striated cuticle [Ka], anomocytic stomata (*2.8.3*) [Kb] and occasional biseriate glandular trichomes [Kc], and a central region [J] composed of elongated sclereids with moderately thickened and channelled walls [Ja]; fragments of the inner epidermis of the corolla of the ligulate florets consisting of thin-walled, polygonal cells, slightly papillose [B]; fragments of the outer epidermis of the ligulate florets consisting of sinuous cells, covered by a striated cuticle [D], often accompanied by underlying narrow vessels [Da]; fragments from the apex of the lobes of the corolla of the tubular florets [A] with elongated cells on the margin [Aa] and slightly papillose cells [Ab]; biseriate glandular trichomes with a short stalk (1 or 2 tiers of 2 cells) and a head of 2-3 tiers of 2 cells, on the epidermises of the corollas of both types of floret and of the bracts of the involucre and on the ovary (surface view [Eb, G, Kc], side view [Ha]); fragments of the base of the flower where the ovary is located, with a ring of thick-walled sclerous cells [C]; fragments of the epidermis surrounding the ovary (surface view [E]) consisting of thin, longitudinally elongated cells [Ea], with numerous glandular trichomes [Eb], alternating with large elongated cells filled with mucilage in transversally folded layers [Ec]; fragments of the epidermis surrounding the ovary (side view [H]) bearing glandular trichomes [Ha] and underlying parenchymatous cells containing small cluster crystals of calcium oxalate [Hb]; groups of cells at the apex of the stigmas forming elongated papillae [L]; pollen grains spherical or triangular, about 25 µm in diameter, with 3 pores and a spiny exine [F].

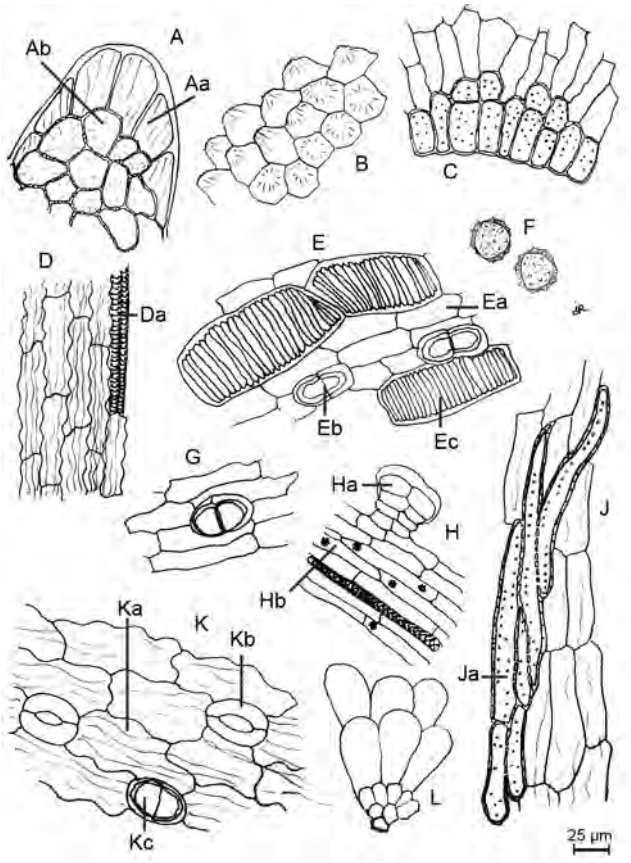

Figure 0404.-1. – *Illustration for identification test B of powdered herbal drug of matricaria flower*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dilute 50 µL of essential oil obtained in the assay of essential oil in 1 mL of *xylene R*.

*Reference solution.* Dissolve 2 µL of *chamazulene R*, 5 µL of *(–)-α-bisabolol R* and 10 mg of *bornyl acetate R* in 5 mL of *toluene R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine immediately in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| | 1 or 2 blue or bluish-violet zones |
| Chamazulene: a red or reddish-violet zone | A red or reddish-violet zone (chamazulene) |
| Bornyl acetate: a yellowish-brown zone | A brown zone (en-yne-dicycloether) |
| (−)-α-Bisabolol: a reddish-violet or bluish-violet zone | A reddish-violet or bluish-violet zone ((−)-α-bisabolol) |
| **Reference solution** | **Test solution** |

TESTS

**Broken drug**: maximum 25 per cent, determined on 20.0 g, passes through a sieve (710) (*2.9.12*).

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 13.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 30 g of whole herbal drug, a 1000 mL flask, 500 mL of *water R* as distillation liquid and 0.50 mL of *1,2,4-trimethylbenzene R* in the graduated tube. Distil at a rate of 3-4 mL/min for 4 h. Towards the end of this period, stop the flow of water to the condenser assembly but continue distilling until the blue, steam-volatile components have reached the lower end of the condenser. Immediately re-start the flow of water to the condenser assembly to avoid warming the separation space. Stop the distillation after a further 10 min.

**Total apigenin 7-glucoside**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: mobile phase B, mobile phase A (25:75 *V/V*).

*Test solution*. Reduce 40 g of the herbal drug to a powder (500) (*2.9.12*). Place 2.00 g of the powdered herbal drug in a 500 mL round-bottomed flask. Add 200 mL of *ethanol (96 per cent) R*. Heat the mixture under a reflux condenser on a water-bath for 15 min. Cool and filter. Rinse the filter and the residue with a few millilitres of *ethanol (96 per cent) R*. To the filtrate add 10 mL of freshly prepared *dilute sodium hydroxide solution R* and heat the mixture under a reflux condenser on a water-bath for about 1 h. Cool. Dilute to 250.0 mL with *ethanol (96 per cent) R*. To 50.0 mL of the solution add 0.5 g of *citric acid monohydrate R*. Shake for 5 min and filter. Dilute 5.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 10.0 mg of *apigenin 7-glucoside CRS* in 100.0 mL of *methanol R*. Dilute 25.0 mL of this solution to 200.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve 10.0 mg of *5,7-dihydroxy-4-methylcoumarin R* in 100.0 mL of *methanol R*. Dilute 25.0 mL of this solution to 100.0 mL with the solvent mixture. To 4.0 mL of this solution add 4.0 mL of reference solution (a) and dilute to 10.0 mL with the solvent mixture.

*Precolumn*:

- *size*: *l* = 8 mm, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: 0.5 per cent *V/V* solution of *phosphoric acid R*;
- *mobile phase B*: *phosphoric acid R*, *acetonitrile R* (0.5:99.5 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 9 | 75 | 25 |
| 9 - 19 | 75 → 25 | 25 → 75 |
| 19 - 24 | 25 | 75 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 340 nm.

*Injection*: 20 µL.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.8 between the peaks due to apigenin 7-glucoside and 5,7-dihydroxy-4-methylcoumarin.

Calculate the percentage content of total apigenin 7-glucoside using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.625}{A_2 \times m_1}$$

$A_1$ = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *apigenin 7-glucoside CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of apigenin 7-glucoside in *apigenin 7-glucoside CRS*.

**01/2008:1544**

# MATRICARIA LIQUID EXTRACT

## Matricariae extractum fluidum

DEFINITION

Liquid extract produced from *Matricaria flower (0404)*.

*Content*: minimum 0.30 per cent of blue residual oil.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure for liquid extracts using a mixture of 2.5 volumes of a 10 per cent *m/m* solution of ammonia ($NH_3$), 47.5 volumes of water and 50 volumes of ethanol (96 per cent).

CHARACTERS

*Appearance*: brownish, clear liquid.

Intense characteristic odour and characteristic bitter taste.

*Solubility*: miscible with water and with ethanol (96 per cent) with development of turbidity, soluble in ethanol (50 per cent *V/V*).

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Place 10 mL of the extract to be examined in a separating funnel and shake with 2 quantities, each of 10 mL, of *pentane R*. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulfate R* and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 0.5 mL of *toluene R*.

*Reference solution*. Dissolve 4 mg of *guaiazulene R*, 20 mg of *(–)-α-bisabolol R* and 20 mg of *bornyl acetate R* in 10 mL of *toluene R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the chromatogram obtained with the test solution shows several quenching zones, of which 2 main zones are in the middle third (en-yne-dicycloether).

*Detection B*: examine in ultraviolet light at 365 nm.

*Results B*: the chromatogram obtained with the test solution shows in the middle part an intense blue fluorescent zone (herniarin).

*Detection C*: spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

*Results C*: the chromatogram obtained with the reference solution shows in the lower third a reddish-violet or bluish-violet zone ((-)-α-bisabolol), in the middle third a yellowish-brown or greyish-green zone (bornyl acetate) and in the upper third a red or reddish-violet zone (guaiazulene). The chromatogram obtained with the test solution shows in the lower third yellowish-brown or greenish-yellow and violet zones and a reddish-violet or bluish-violet zone due to (-)-α-bisabolol in the chromatogram obtained with the reference solution; a brownish zone (en-yne-dicycloether) similar in position to the zone due to bornyl acetate in the chromatogram obtained with the reference solution; a red or reddish-violet zone (chamazulene) corresponding to guaiazulene in the chromatogram obtained with the reference solution and immediately above it 1 or 2 blue or bluish-violet zones; further weak zones may be present in the chromatogram obtained with the test solution.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* The extract to be examined.

*Reference solution.* Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: at 100-105 °C.

*Detection*: spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently spray with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the reference solution shows in the middle part a light blue fluorescent zone (chlorogenic acid), below it a yellowish-brown fluorescent zone (rutoside) and above it a yellowish-brown fluorescent zone (hyperoside). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding to the zone of rutoside in the chromatogram obtained with the reference solution, a light blue fluorescent zone corresponding to the zone of chlorogenic acid in the chromatogram obtained with the reference solution, a yellowish-brown fluorescent zone similar in position to the zone of hyperoside in the chromatogram obtained with the reference solution; it also shows above the yellowish-brown fluorescent zone a green fluorescent zone, then several bluish or greenish fluorescent zones and near the solvent front a yellowish fluorescent zone.

TESTS

**Ethanol** (*2.9.10*): 38 per cent *V/V* to 53 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 12.0 per cent.

ASSAY

Place 20.0 g in a 1000 mL round-bottomed flask, add 300 mL of *water R* and distil until 200 mL has been collected in a flask. Transfer the distillate into a separating funnel. Dissolve 65 g of *sodium chloride R* in the distillate and shake with 3 quantities, each of 30 mL, of *pentane R* previously used to rinse the reflux condenser and the flask. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulfate R* and filter into a tared 100 mL round-bottomed flask which has been dried in a desiccator for 3 h. Rinse the anhydrous sodium sulfate and the filter with 2 quantities, each of 20 mL, of *pentane R*. Evaporate the pentane in a water-bath at 45 °C. The residue of pentane is eliminated in a current of air for 3 min. Dry the flask in a desiccator for 3 h and weigh. The residual oil is blue (chamazulene).

**01/2008:1836**

# MATRICARIA OIL

## Matricariae aetheroleum

DEFINITION

Blue essential oil obtained by steam distillation from the fresh or dried flower-heads or flowering tops of *Matricaria recutita* L. (*Chamomilla recutita* L. Rauschert). There are 2 types of matricaria oil which are characterised as rich in bisabolol oxides, or rich in (−)-α-bisabolol.

CHARACTERS

*Appearance*: clear, intensely blue, viscous liquid.

Intense characteristic odour.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 20 µL of the substance to be examined in 1.0 mL of *toluene R*.

*Reference solution.* Dissolve 2 mg of *guaiazulene R*, 5 µL of *(−)-α-bisabolol R* and 10 mg of *bornyl acetate R* in 5.0 mL of *toluene R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection A*: examine in daylight.

*Results A*: see below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

| **Top of the plate** | |
|---|---|
| Guaiazulene: a blue zone | A blue zone (chamazulene) |
| _____ | _____ |
| _____ | _____ |
| **Reference solution** | **Test solution** |

*Detection B*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

*Results B*: see below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, yellowish-brown to greenish-yellow zones (lower third), violet zones (lower third) and further weak zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | 1 or 2 blue to bluish-violet zones |
| Guaiazulene: a red to reddish-violet zone | A red to reddish-violet zone (chamazulene) |
| ——— | ——— |
| Bornyl acetate: a yellowish-brown to greyish-green zone | A brown zone (en-yne-dicycloether) |
| ——— | ——— |
| (−)-α-Bisabolol: a reddish-violet to bluish-violet zone | A reddish-violet to bluish-violet zone ((−)-α-bisabolol)<br>A brownish zone |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks due to (−)-α-bisabolol and chamazulene in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dissolve 20 µL of the essential oil to be examined in *cyclohexane R* and dilute to 5.0 mL with the same solvent.

*Reference solution.* Dissolve 20 µL of *(−)-α-bisabolol R*, 5 mg of *chamazulene R* and 6 mg of *guaiazulene R* in *cyclohexane R* and dilute to 5.0 mL with the same solvent.

*Column*:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm, when using a column longer than 30 m, an adjustment of the temperature programme may be necessary,
- *stationary phase*: *macrogol 20 000 R*.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1-2 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 40 | 70 → 230 |
| | 40 - 50 | 230 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1.0 µL.

*Elution order*: order indicated in the composition of the reference solution. Record the retention times of these substances.

*Relative retention* with reference to chamazulene (retention time = about 34.4 min): β-farnesene = about 0.5; bisabolol oxide B = about 0.8; bisabolone = about 0.87; (−)-α-bisabolol = about 0.9; bisabolol oxide A = about 1.02.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to chamazulene and guaiazulene.

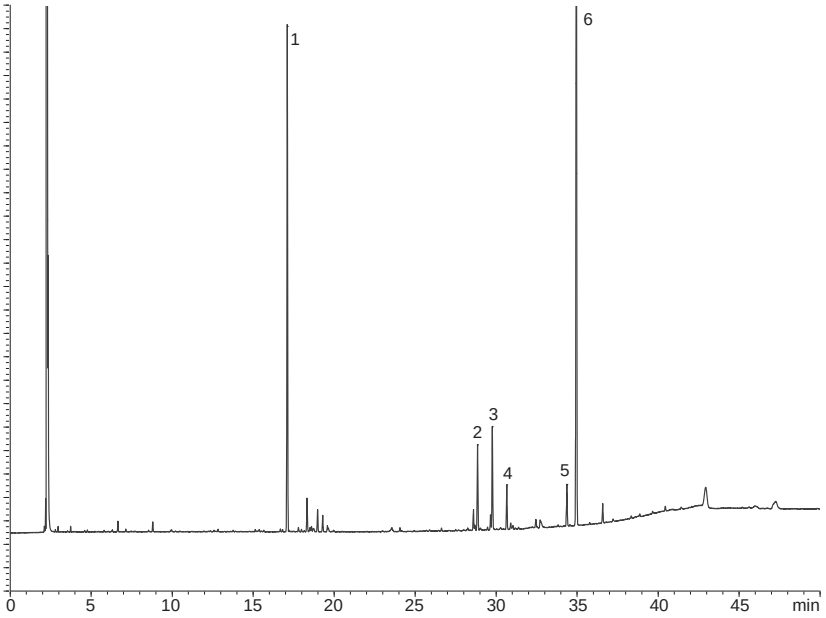
Using the retention times determined from the chromatogram obtained with the reference solution, locate (−)-α-bisabolol and chamazulene in the chromatogram obtained with the test solution; locate bisabolol oxides (bisabolol oxide B, bisabolone and bisabolol oxide A) using Figures 1836.-1 and 1836.-2 (disregard the peak due to cyclohexane). The chromatogram obtained with the test solution does not show a peak with the retention time of guaiazulene.

Determine the percentage content of the components. The limits are within the following ranges.

| | Matricaria oil rich in bisabolol oxides (per cent) | Matricaria oil rich in (−)-α-bisabolol (per cent) |
|---|---|---|
| Bisabolol oxides | 29 - 81 | |
| (−)-α-Bisabolol | | 10 - 65 |
| Chamazulene | ≥ 1.0 | ≥ 1.0 |
| Total of bisabolol oxides and (−)-α-Bisabolol | | ≥ 20 |

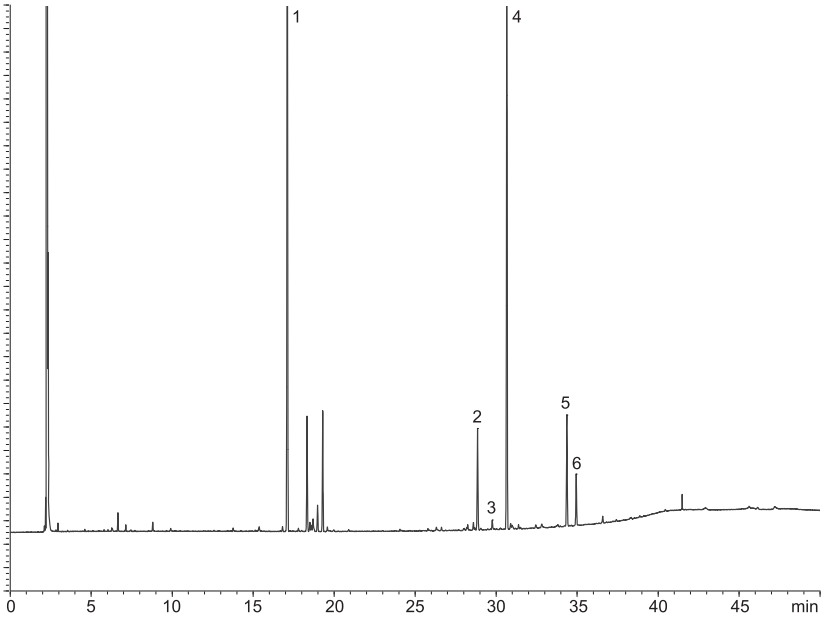
STORAGE

At a temperature not exceeding 25 °C.



1. β-farnesene
2. bisabolol oxide B
3. bisabolone
4. (−)-α-bisabolol
5. chamazulene
6. bisabolol oxide A

Figure 1836.-1. – *Chromatogram of matricaria oil rich in bisabolol oxides*



1. β-farnesene
2. bisabolol oxide B
3. bisabolone
4. (−)-α-bisabolol
5. chamazulene
6. bisabolol oxide A

# MEADOWSWEET

## Filipendulae ulmariae herba

DEFINITION

Whole or cut, dried flowering tops of *Filipendula ulmaria* (L.) Maxim. (syn. *Spiraea ulmaria* L.).

*Content*: minimum 1 mL/kg of essential oil (dried drug).

CHARACTERS

Aromatic odour of methyl salicylate, after crushing.

IDENTIFICATION

A. The stem, up to 5 mm in diameter, is greenish-brown, stiff, angular, hollow except at the apex, and has regular, straight, longitudinal furrows. The petiolate leaf, compound imparipinnate, has 2 reddish-brown angular stipules. It consists of 3-9 pairs of leaflets, unevenly dentate, some of which are small and fan-shaped. The leaflets are dark green and glabrous on the upper surface, tomentose and lighter, sometimes silvery on the lower surface. The terminal leaflet, the largest, is divided into 3 segments. The veins are prominent and brown on the lower surface. The inflorescence is complex and composed of very numerous flowers arranged in irregular cymose panicles. The flowers are creamish-white and about 3-6 mm in diameter; the calyx consists of 5 dark green, reflexed and hairy sepals fused at the base to a concave receptacle; the 5 free petals, which are readily detached, are pale yellow, obovate and distinctly narrowed at the base; the stamens are numerous with rounded anthers and they extend beyond the petals; the gynoecium consists of about 4-6 carpels, each with a short style and a globular stigma; the carpels become twisted together spirally to form yellowish-brown fruits with a helicoidal twist. Unopened flower buds are frequently present. If the fruit is present, it has a helicoidal twist and contains brownish seeds.

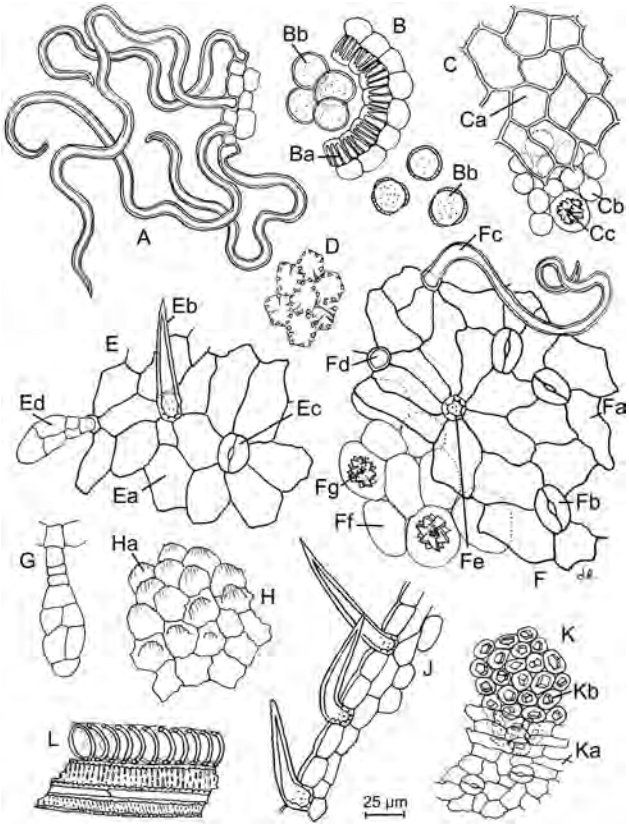

Figure 1868.-1. – *Illustration for identification test B of powdered herbal drug of meadowsweet*

B. Microscopic examination (*2.8.23*). The powder is green or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1868.-1): fragments of the epidermises of the leaves and sepals [C, E, F] with sinuous or wavy cells [Ca, Ea, Fa], short, thick-walled, conical covering trichomes thickened at the base (surface view [Eb], side view [J]), unicellular covering trichomes, thin-walled, very long and flexuous, with pointed ends (surface view [Fc], side view [A]) or their scars (flexuous

Herbal drugs

trichome [Fd], conical trichome [Fe]) and occasional clavate glandular trichomes with a 1- to 3-celled ([Ed] and [G], respectively), uniseriate stalk, a multicellular head and dense brown contents; fragments of the upper epidermis often accompanied by palisade parenchyma [Cb] including some hypertrophied cells containing a cluster crystal of calcium oxalate [Cc]; fragments of the lower epidermis with anomocytic stomata (*2.8.3*) [Ec, Fb], sometimes accompanied by spongy parenchyma [Ff] with some cells containing cluster crystals of calcium oxalate [Fg]; fragments of the petals [H] with thin-walled epidermal cells, some showing rounded papillae [Ha]; numerous spherical pollen grains with 3 pores and a faintly pitted exine [Bb]; fragments of the anther [B, D] whose fibrous layer shows specific thickenings (surface view [D], side view [Ba]); fragments of the ovary [K] with an epidermis bearing stomata [Ka] and with parenchyma containing prism crystals of calcium oxalate [Kb]; fragments of vascular tissue [L] with annular, spiral or pitted vessels from the leaves and stems.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Xylene solution obtained in the assay.

*Reference solution.* Dissolve 0.1 mL of *methyl salicylate R* and 0.1 mL of *salicylaldehyde R* in *xylene R* and dilute to 5 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *hexane R, toluene R* (50:50 *V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with 3 mL of *ferric chloride solution R3* and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| Methyl salicylate: a violet-brown zone | A violet-brown zone (methyl salicylate) |
| Salicylaldehyde: a violet-brown zone | A violet-brown zone (salicylaldehyde) |
| _____ | _____ |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5.0 per cent of stems with a diameter greater than 5 mm and maximum 2.0 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 50.0 g of the cut herbal drug, a 1000 mL flask, 300 mL of *dilute hydrochloric acid R* as the distillation liquid, and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

**07/2012:2120**

# MELILOT

## Meliloti herba

DEFINITION

Whole or cut, dried aerial parts of *Melilotus officinalis* (L.) Lam.

*Content*: minimum 0.3 per cent of coumarin ($C_9H_6O_2$; $M_r$ 146.1) (dried drug).

IDENTIFICATION

A. The stem is green, cylindrical, glabrous and finely ridged. The leaves are alternate, petiolate and trifoliate with 2 lanceolate stipules; the leaflets are up to about 3 cm long and 20 mm wide, elongated or ovate with a finely dentate margin, acute at the apex and base; the upper surface is dark green and glabrous, the lower surface paler green with short, fine hairs, especially at the base. The inflorescence is racemose with numerous pale yellow flowers, about 7 mm long, each having a hairy calyx with 5 deeply-divided, unequal teeth, and a papilionate corolla. The fruit is an indehiscent pod, often persistent within the calyx, yellowish-brown, short and tapering at the apex; the surface is glabrous and transversely wrinkled.

B. Microscopic examination (*2.8.23*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2120.-1): fragments of the leaf lamina (surface view [D]) showing unevenly thickened, slightly sinuous epidermal cells; numerous stomata [Db], mostly anomocytic (*2.8.3*) with 3-6 subsidiary cells [Da] and frequently, underlying palisade parenchyma [Dc]; uniseriate covering trichomes with 2 short, smooth-walled basal cells and a long terminal cell, bent at right angles, with a thick wall and a warty cuticle [A, B]; occasional glandular trichomes with a short, 2- or 3- celled stalk and ovoid, biseriate head with 4 indistinct cells [H]; fragments of the petals composed of cells with wavy walls [M]; fragments of vascular tissue from the stem [F, G], including large vessels [G], sometimes associated with unlignified septate fibres [Fa] and a sheath of parenchymatous cells containing prisms of calcium oxalate [Fb]; fragments of mesophyll [J] including some cells which may occasionally contain cluster crystals of calcium oxalate [Ja];

fragments of the stem epidermis with elongated, straight-walled cells and anomocytic (*2.8.3*) stomata [L]; fragments of the fibrous layer of the anthers (surface view [E], transverse section [K]); spherical or ovoid pollen grains about 25 µm long with 3 germinal pores and a smooth exine [C].

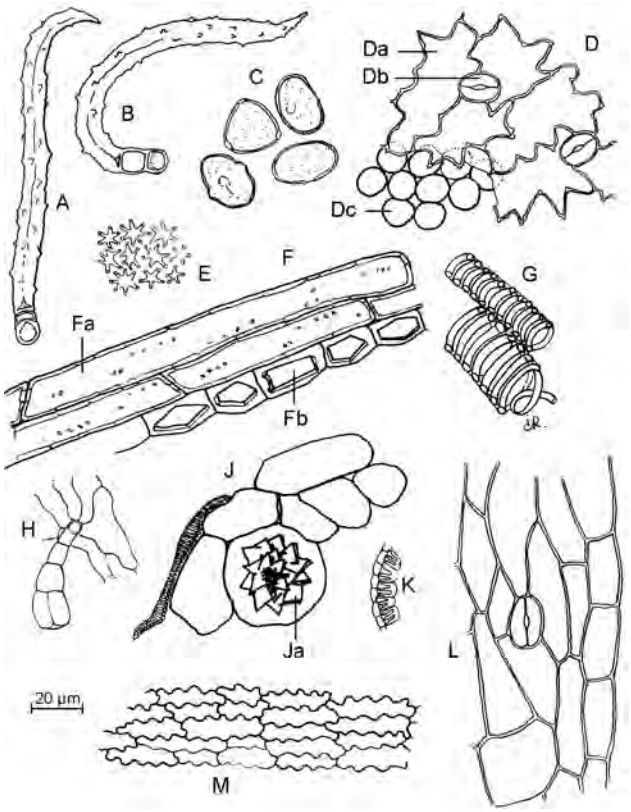

Figure 2120.-1. – *Illustration for identification test B of powdered herbal drug of melilot*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.3 g of the powdered herbal drug (355) (*2.9.12*) add 3 mL of *methanol R*. Heat on a water-bath at 100 °C for 1 min and filter.

*Reference solution.* Dissolve 50 mg of *coumarin CRS* and 20 mg of *o-coumaric acid R* in 50 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *dilute acetic acid R*, *ether R*, *toluene R* (10:50:50 *V/V/V*); use the upper layer.

*Application*: 25 µL [or 3 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 12 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *2 M alcoholic potassium hydroxide R* and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Coumarin: a greenish-yellow fluorescent zone | A greenish-yellow fluorescent zone (coumarin) |
| | A blue fluorescent zone |
| *o*-Coumaric acid: a greenish-yellow fluorescent zone | A greenish-yellow fluorescent zone (*o*-coumaric acid) may be present |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 2 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Completely reduce about 50 g of the herbal drug to a powder (500) (*2.9.12*). To 5.00 g of the powdered herbal drug add 90 mL of *methanol R* and boil under a reflux condenser for 30 min. Allow to cool. Filter under vacuum through a fibre-glass filter. Take up the residue and the fragmented filter with 90 mL of *methanol R*. Treat in the same manner as before. Combine the filtrates and dilute to 250.0 mL with *methanol R*.

*Reference solution.* Dissolve 25.0 mg of *coumarin CRS* in *methanol R* and dilute to 250.0 mL with the same solvent.

*Column*:

– *size*: $l$ = 0.25 m, Ø = 4 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *acetonitrile R*, 5 g/L solution of *phosphoric acid R* (22:78 *V/V*).

*Flow rate*: 1.7 mL/min.

*Detection*: spectrophotometer at 275 nm.

*Injection*: 20 µL.

*System suitability*:

– *retention time*: coumarin = about 7.8 min.

Calculate the percentage content of coumarin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to coumarin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to coumarin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *coumarin CRS* used to prepare the reference solution, in grams;

$p$ = percentage content of coumarin in *coumarin CRS*.

01/2011:1447

# MELISSA LEAF

## Melissae folium

DEFINITION

Dried leaf of *Melissa officinalis* L.

*Content*: minimum 1.0 per cent of rosmarinic acid ($C_{18}H_{16}O_8$; $M_r$ 360.3) (dried drug).

CHARACTERS

Odour reminiscent of lemon.

IDENTIFICATION

A. The leaves have a petiole of varying length; the lamina is broadly ovate, up to about 8 cm long and 5 cm wide, acute at the apex and rounded to cordate at the base; the margins are crenate to dentate. The upper surface is intense green, the lower surface is paler green and shows a conspicuous midrib and a raised, reticulate venation; scattered hairs occur on the upper surface and along the veins on the lower surface, which is also finely punctuate.

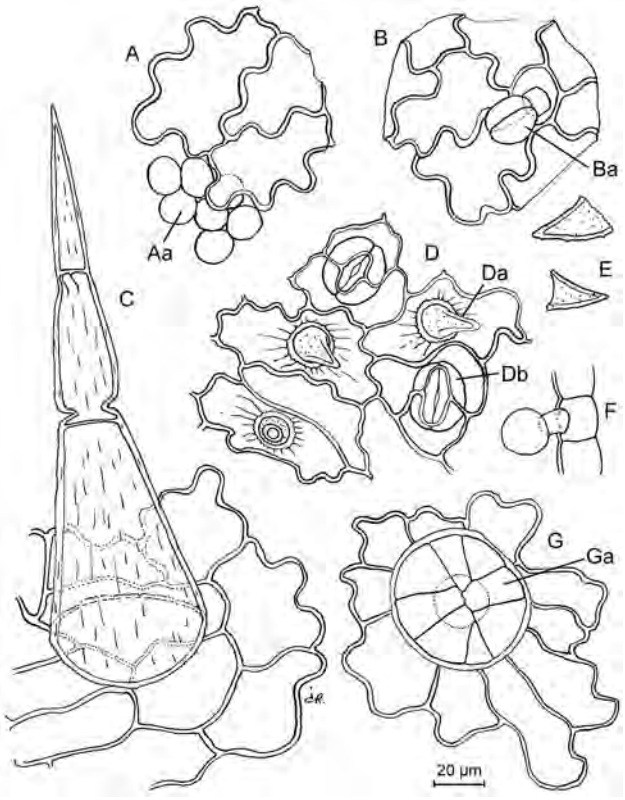

Figure 1447.-1.– *Illustration for identification test B of powdered herbal drug of melissa leaf*

B. Microscopic examination (*2.8.23*). The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1447.-1): fragments of the upper epidermis, in surface view, with sinuous walls [A, B, G], sometimes accompanied by palisade parenchyma [Aa]; fragments of the lower epidermis [D] with diacytic stomata (*2.8.3*) [Db]; short, straight, unicellular, conical covering trichomes with a finely striated cuticle, free [E] or attached to an epidermis [Da]; multicellular, uniseriate covering trichomes with pointed ends and thick, warty cuticles [C]; eight-celled secretory trichomes of lamiaceous type (surface view [Ga]); secretory trichomes with unicellular to tricellular stalks and unicellular or, more rarely, bicellular heads (surface view [Ba], transverse section [F]).

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Place 2.0 g of the powdered herbal drug (355) (*2.9.12*) in a 250 mL round-bottomed flask and add 100 mL of *water R*. Distil for 1 h using the apparatus for the determination of essential oils in herbal drugs (*2.8.12*) and 0.5 mL of *xylene R* in the graduated tube. After distillation transfer the organic phase to a 1 mL volumetric flask, rinsing the graduated tube of the apparatus with the aid of a small portion of *xylene R*, and dilute to 1.0 mL with the same solvent.

*Reference solution.* Dissolve 1.0 µL of *citronellal R* and 10.0 µL of *citral R* (composed of neral and geranial) in 25 mL of *xylene R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *hexane R* (10:90 *V/V*).

*Application*: 20 µL [or 4 µL] as bands.

*Development*: in an unsaturated tank over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 10-15 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Citronellal: a grey or greyish-violet zone at the border between the upper and middle thirds | A grey or greyish-violet zone (citronellal) at the border between the upper and middle thirds<br>A reddish-violet zone |
| Citral: 2 greyish-violet or bluish-violet zones at the border between the middle and lower thirds | 2 greyish-violet or bluish-violet zones (citral) at the border between the middle and lower thirds |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 10 per cent of stems with a diameter greater than 1 mm and maximum 2 per cent of other foreign matter, determined on 20 g.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Use brown-glass flasks. Disperse 0.100 g of the powdered herbal drug (355) (*2.9.12*) in 90 mL of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min, cool, and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 10 mL of *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent. Filter through a 0.45 µm filter.

*Reference solution (a).* Dissolve 20.0 mg of *rosmarinic acid CRS* in *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent. Dilute 20.0 mL of this solution to 100.0 mL with *ethanol (50 per cent V/V) R*.

*Reference solution (b).* Dissolve 5.0 mg of *ferulic acid R* in reference solution (a) and dilute to 50.0 mL with the same solution.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:
- *mobile phase A*: *phosphoric acid R*, *acetonitrile R*, *water R* (1:19:80 *V/V/V*);
- *mobile phase B*: *phosphoric acid R*, *methanol R*, *acetonitrile R* (1:40:59 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 100 → 55 | 0 → 45 |
| 20 - 25 | 55 → 0 | 45 → 100 |
| 25 - 30 | 0 → 100 | 100 → 0 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 20 µL.

*Relative retention* with reference to rosmarinic acid (retention time = about 11 min): ferulic acid = about 0.8.

*System suitability*: reference solution (b):
- *resolution*: minimum 4.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *rosmarinic acid CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of rosmarinic acid in *rosmarinic acid CRS*.

**01/2010:2524**

# MELISSA LEAF DRY EXTRACT

## Melissae folii extractum siccum

DEFINITION

Dry extract produced from *Melissa leaf (1447)*.

*Content*: minimum 2.0 per cent of rosmarinic acid ($C_{18}H_{16}O_8$; $M_r$ 360.3) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either hot water (not less than 70 °C) or a hydroalcoholic solvent that is at most equivalent in strength to ethanol (70 per cent *V/V*).

CHARACTERS

*Appearance*: brown or greenish-brown, amorphous powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.2 g of the extract to be examined add 5 mL of *methanol R*. Sonicate for 5 min and filter.

*Reference solution.* Dissolve 1.0 mg of *hyperoside R*, 1.0 mg of *rutoside trihydrate R* and 5.0 mg of *rosmarinic acid R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:6:90 *V/V/V*).

*Application*: 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

*Development*: over a path of 8 cm [or 6 cm].

*Drying*: in air.

*Detection*: heat at 100 °C for 5 min, spray the plate whilst still hot with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Rosmarinic acid: a light blue fluorescent zone | An intense light blue fluorescent zone (rosmarinic acid) |
| | A blue fluorescent zone |
| _____ | _____ |
| | A blue fluorescent zone |
| _____ | _____ |
| Hyperoside: an orange or greenish-yellow fluorescent zone | |
| | A light blue fluorescent zone |
| Rutoside: an orange or greenish-yellow fluorescent zone | |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.8.17*): maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Use brown glass flasks. To 0.200 g of the extract to be examined add 50 mL of *ethanol (50 per cent V/V) R*. Sonicate for 10 min and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 20.0 mg of *rosmarinic acid CRS* in *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent. Dilute 20.0 mL of this solution to 100.0 mL with *ethanol (50 per cent V/V) R*.

*Reference solution (b).* Dissolve 5 mg of *ferulic acid R* in reference solution (a) and dilute to 50 mL with reference solution (a).

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *rosmarinic acid CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of rosmarinic acid in *rosmarinic acid CRS*.

**01/2019:2071**

# MILK THISTLE DRY EXTRACT, REFINED AND STANDARDISED

## Silybi mariani extractum siccum raffinatum et normatum

DEFINITION

Dry extract, refined and standardised, produced from *Milk thistle fruit (1860)*.

*Content*: 90 per cent to 110 per cent of the nominal content of silymarin, expressed as silibinin ($C_{25}H_{22}O_{10}$; $M_r$ 482.4), stated on the label. The nominal content of silymarin is within the range 30 per cent *m/m* to 65 per cent *m/m* (anhydrous extract).

The content of silymarin corresponds to:

– *sum of the contents of silicristin and silidianin* (both $C_{25}H_{22}O_{10}$; $M_r$ 482.4): 20 per cent to 45 per cent, calculated with reference to total silymarin;

– *sum of the contents of silibinin A and silibinin B* (both $C_{25}H_{22}O_{10}$; $M_r$ 482.4): 40 per cent to 65 per cent, calculated with reference to total silymarin;

– *sum of the contents of isosilibinin A and isosilibinin B* (both $C_{25}H_{22}O_{10}$; $M_r$ 482.4): 10 per cent to 20 per cent, calculated with reference to total silymarin.

PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure, using one or more of the following solvents:

– ethyl acetate;

– acetone or mixture of acetone and water;

– ethanol or mixture of ethanol and water;

– methanol or mixture of methanol and water.

CHARACTERS

*Appearance*: yellowish-brown, amorphous powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.250 g of the extract to be examined in 5 mL of *methanol R*.

*Reference solution.* Dissolve 2 mg of *silibinin R* and 5 mg of *taxifolin R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:16.5:75 *V/V/V*).

*Application*: 10 µL [or 8 µL] of the test solution and 10 µL [or 2 µL] of the reference solution, as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: at 100-105 °C.

*Detection*: treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry for 30 min and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other yellowish-green fluorescent zones may be present between the zones due to silibinin and taxifolin in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Silibinin: a yellowish-green fluorescent zone | A yellowish-green fluorescent zone (silibinin) |
| Taxifolin: an orange fluorescent zone | An orange fluorescent zone (taxifolin) |
| | A yellowish-green fluorescent zone (silicristin) |
| | A fluorescent zone (line of application) |
| **Reference solution** | **Test solution** |

TESTS

**Water** (*2.5.12*): maximum 4.0 per cent, determined on 0.500 g.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 60.0 mg of the extract to be examined in *methanol R* and dilute to 100.0 mL with the same solvent.

*Reference solution.* Dissolve a quantity of *milk thistle dry extract HRS* corresponding to 10.0 mg of silibinin in *methanol R* and dilute to 100.0 mL with the same solvent.

*Column*:

– *size*: *l* = 0.125 m, Ø = 4 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *phosphoric acid R*, *methanol R*, *water for chromatography R* (0.5:35:65 *V/V/V*);

– *mobile phase B*: *phosphoric acid R*, *methanol R*, *water for chromatography R* (0.5:50:50 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 28 | 100 → 0 | 0 → 100 |
| 28 - 35 | 0 | 100 |
| 35 - 36 | 0 → 100 | 100 → 0 |
| 36 - 51 | 100 | 0 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 288 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *milk thistle dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B. In the chromatogram obtained with the test solution the peak due to silidianin may vary in size or be absent.

*Retention time*: silibinin B = about 30 min; if necessary, adjust the time periods of the gradient.

*System suitability*: reference solution:

- *resolution*: minimum 1.8 between the peaks due to silibinin A and silibinin B;
- the chromatogram is similar to the chromatogram supplied with *milk thistle dry extract HRS*.

Calculate the percentage content of total silymarin, expressed as silibinin, using the following expression:

$$\frac{(A_1 + A_2 + A_3 + A_4 + A_5 + A_6) \times m_1 \times p}{(A_7 + A_8) \times m_2}$$

Calculate the percentage content of the sum of silicristin and silidianin, with reference to total silymarin, using the following expression:

$$\frac{(A_1 + A_2) \times 100}{A_1 + A_2 + A_3 + A_4 + A_5 + A_6}$$

Calculate the percentage content of the sum of silibinin A and silibinin B, with reference to total silymarin, using the following expression:

$$\frac{(A_3 + A_4) \times 100}{A_1 + A_2 + A_3 + A_4 + A_5 + A_6}$$

Calculate the percentage content of the sum of isosilibinin A and isosilibinin B, with reference to total silymarin, using the following expression:

$$\frac{(A_5 + A_6) \times 100}{A_1 + A_2 + A_3 + A_4 + A_5 + A_6}$$

$A_1$ = area of the peak due to silicristin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to silidianin in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to silibinin A in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to silibinin B in the chromatogram obtained with the test solution;

$A_5$ = area of the peak due to isosilibinin A in the chromatogram obtained with the test solution;

$A_6$ = area of the peak due to isosilibinin B in the chromatogram obtained with the test solution;

$A_7$ = area of the peak due to silibinin A in the chromatogram obtained with the reference solution;

$A_8$ = area of the peak due to silibinin B in the chromatogram obtained with the reference solution;

$m_1$ = mass of *milk thistle dry extract HRS* used to prepare the reference solution, in grams;

$m_2$ = mass of the extract to be examined used to prepare the test solution, in grams;

$p$ = combined percentage content of silibinin A and silibinin B in *milk thistle dry extract HRS*.

**01/2014:1860**

# MILK THISTLE FRUIT

## Silybi mariani fructus

DEFINITION

Mature fruit, devoid of the pappus, of *Silybum marianum* L. Gaertn.

*Content*: minimum 1.5 per cent of silymarin, expressed as silibinin ($C_{25}H_{22}O_{10}$; $M_r$ 482.4) (dried drug).

CHARACTERS

No rancid odour.

IDENTIFICATION

A. The achene is strongly compressed, elongate-obovate, about 6-8 mm long, 3 mm broad and 1.5 mm thick; the outer surface is smooth and shiny with a grey or pale brown ground colour variably streaked dark brown longitudinally to give an overall pale greyish or brown colour; the fruit is tapering at the base and crowned at the apex with a glistening, pale yellow extension forming a collar about 1 mm high surrounding the remains of the style. Cut transversely, the fruit shows a narrow, brown outer area and 2 large, dense, white oily cotyledons.

B. Microscopic examination (*2.8.23*). The powder is brownish-yellow with darker specks. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epicarp composed of colourless cells, polygonal in surface view, the lumen appearing fairly large or as a small slit, depending on the orientation; groups of parenchymatous cells from the pigment layer, some of them containing colouring matter which appears bright red; very abundant groups of large sclereids from the testa with bright yellow pitted walls and a narrow lumen; occasionally fragments of small-celled parenchyma with pitted and beaded walls; abundant thin-walled parenchymatous cells from the cotyledons containing oil globules and scattered cluster crystals of calcium oxalate; a few larger, prismatic crystals of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (500) (*2.9.12*) add 10 mL of *methanol R*. Heat under reflux in a water-bath at 70 °C for 5 min. Cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 1.0 mL of *methanol R*.

*Reference solution*. Dissolve 2 mg of *silibinin R* and 5 mg of *taxifolin R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:16.5:75 *V/V/V*).

*Application*: 30 µL of the test solution and 10 µL of the reference solution, as bands.

*Development*: over a path of 10 cm.

*Drying*: at 100-105 °C.

*Detection*: treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to dry for 30 min and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other orange and yellowish-green fluorescent zones are present between the zones due to silibinin and taxifolin in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Silibinin: a yellowish-green fluorescent zone | A yellowish-green fluorescent zone (silibinin) |
| Taxifolin: an orange fluorescent zone | An orange fluorescent zone (taxifolin)<br>A yellowish-green fluorescent zone (silicristin) |
| | A light blue fluorescent zone (line of application) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (500) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Place 5.00 g of the powdered herbal drug (500) (*2.9.12*) in a continuous-extraction apparatus. Add 100 mL of *light petroleum R* and heat in a water-bath for 8 h. Allow the defatted drug to dry at room temperature. In a continuous-extraction apparatus, extract the latter with 100 mL of *methanol R* in a water-bath for 5 h. Evaporate the methanolic extract *in vacuo* to a volume of about 30 mL. Filter into a 50 mL volumetric flask, rinsing the extraction flask and the filter, and diluting to 50.0 mL with *methanol R*. Dilute 5.0 mL of this solution to 50.0 mL with *methanol R*.

*Reference solution*. Dissolve a quantity of *milk thistle dry extract HRS* corresponding to 10.0 mg of silibinin in *methanol R* and dilute to 100.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R*; *methanol R*, *water R* (0.5:35:65 *V/V/V*);
- *mobile phase B*: *phosphoric acid R*; *methanol R*, *water R* (0.5:50:50 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 28 | 100 → 0 | 0 → 100 |
| 28 - 35 | 0 | 100 |
| 35 - 36 | 0 → 100 | 100 → 0 |
| 36 - 51 | 100 | 0 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 288 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *milk thistle dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B. In the chromatogram obtained with the test solution the peak due to silidianin may vary in size, be absent or be present as the principal peak.

*Retention time*: silibinin B = about 30 min; if necessary, adjust the time periods of the gradient.

*System suitability*: reference solution:

- *resolution*: minimum 1.8 between the peaks due to silibinin A and silibinin B;
- the chromatogram obtained is similar to the chromatogram supplied with *milk thistle dry extract HRS*.

Calculate the percentage content of total silymarin, expressed as silibinin, using the following expression:

$$\frac{(A_1 + A_2 + A_3 + A_4 + A_5 + A_6) \times m_1 \times p \times 5}{(A_7 + A_8) \times m_2}$$

$A_1$ = area of the peak due to silicristin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to silidianin in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to silibinin A in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to silibinin B in the chromatogram obtained with the test solution;

$A_5$ = area of the peak due to isosilibinin A in the chromatogram obtained with the test solution;

$A_6$ = area of the peak due to isosilibinin B in the chromatogram obtained with the test solution;

$A_7$ = area of the peak due to silibinin A in the chromatogram obtained with the reference solution;

$A_8$ = area of the peak due to silibinin B in the chromatogram obtained with the reference solution;

$m_1$ = mass of *milk thistle dry extract HRS* used to prepare the reference solution, in grams;

$m_2$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$p$ = combined percentage content of silibinin A and silibinin B in *milk thistle dry extract HRS*.

**01/2008:1838**

# MINT OIL, PARTLY DEMENTHOLISED

## Menthae arvensis aetheroleum partim mentholum depletum

DEFINITION

Essential oil obtained by steam distillation from the fresh, flowering aerial parts, recently gathered from *Mentha canadensis* L. (syn. *M. arvensis* L. var. *glabrata* (Benth) Fern., *M. arvensis* var. *piperascens* Malinv. ex Holmes), followed by partial separation of menthol by crystallisation.

CHARACTERS

*Appearance*: colourless, pale yellow or greenish-yellow liquid.

Characteristic odour.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.1 mL of the substance to be examined in 1.0 mL of *toluene R*.

*Reference solution.* Dissolve 4 µL of *carvone R*, 4 µL of *pulegone R*, 10 µL of *menthyl acetate R*, 20 µL of *cineole R* and 50 mg of *menthol R* in 5 mL of *toluene R*.

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, a quenching zone may be present in the upper third of the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Carvone and pulegone: a quenching zone | A quenching zone<br>A quenching zone |
| **Reference solution** | **Test solution** |

*Detection B*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

*Results B*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, the zone due to cineole in the reference solution is absent in the chromatogram obtained with the test solution. No yellowish-brown zone below the intense reddish-violet zone is present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | An intense reddish-violet zone (near the solvent front) |
| Menthyl acetate: a bluish-violet zone | A bluish-violet zone (menthyl acetate) |
| | A strongly greenish zone |
| | A greenish zone |
| Carvone and pulegone: a reddish zone | A reddish zone |
| Cineole: a violet zone | |
| | A distinctly violet zone |
| Menthol: an intense blue zone | A very intense blue zone (menthol) |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are approximately similar in retention time to those in the chromatogram obtained with the reference solution. Carvone may be absent from the chromatogram obtained with the test solution.

TESTS

**Relative density** (*2.2.5*): 0.888 to 0.910.

**Refractive index** (*2.2.6*): 1.456 to 1.470.

**Optical rotation** (*2.2.7*): − 16.0° to − 34.0°.

**Acid value** (*2.5.1*): maximum 1.0, determined on 5.00 g of the substance to be examined dissolved in 50 mL of the prescribed mixture of solvents.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dissolve 0.20 g of the substance to be examined in *hexane R* and dilute to 10.0 mL with the same solvent.

*Reference solution.* Dissolve 10 mg of *limonene R*, 20 mg of *cineole R*, 40 mg of *menthone R*, 10 mg of *(+)-isomenthone R*, 40 mg of *menthyl acetate R*, 20 mg of *isopulegol R*, 60 mg of *menthol R*, 20 mg of *pulegone R* and 10 mg of *carvone R* in *hexane R* and dilute to 10.0 mL with the same solvent.

*Column*:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- *stationary phase*: *macrogol 20 000 R.*

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 60 |
| | 10 - 70 | 60 → 180 |
| | 70 - 75 | 180 |
| Injection port | | 200 |
| Detector | | 220 |

*Detection*: flame ionisation.

*Injection*: 1.0 µL.

*Elution order*: order indicated in the composition of the reference solution. Record the retention times of these substances.

*System suitability*: reference solution:

– *resolution*: minimum 1.5 between the peaks due to limonene and cineole.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The percentages are within the following ranges:

– *limonene*: 1.5 per cent to 7.0 per cent,
– *cineole*: maximum 1.5 per cent,
– *menthone*: 17.0 per cent to 35.0 per cent,
– *isomenthone*: 5.0 per cent to 13.0 per cent,
– *menthyl acetate*: 1.5 per cent to 7.0 per cent,
– *isopulegol*: 1.0 per cent to 3.0 per cent,
– *menthol*: 30.0 per cent to 50.0 per cent,
– *pulegone*: maximum 2.5 per cent,
– *carvone*: maximum 2.0 per cent.

The ratio of cineole content to limonene content is less than 1.

STORAGE

At a temperature not exceeding 25 °C.

**01/2013:1833**

# MOTHERWORT

## Leonuri cardiacae herba

DEFINITION

Whole or cut, dried flowering aerial parts of *Leonurus cardiaca* L.

*Content*: minimum 0.2 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; $M_r$ 464.4) (dried drug).

IDENTIFICATION

A. The stem pieces are hairy, longitudinally striated, quadrangular, hollow, and up to about 10 mm wide; they bear opposite and decussate, petiolate leaves and, in the axils of the upper leaves, about 6-12 small flowers, arranged in sessile whorls forming a long, leafy spike. The lower leaves are ovate-orbicular, palmately 3- to 5-lobed, rarely 7-lobed, the lobes irregularly dentate. The upper leaves are entire or slightly trifid, lanceolate with a serrate margin and cuneate at the base. The upper surface of the leaves is green with scattered hairs, the lower surface is paler green, densely pubescent and shows a prominent palmate and reticulate venation. The flowers have a funnel-shaped calyx, 3 mm to 5 mm long with 5 stiff, recurved teeth; the corolla is 2-lipped, the upper lip pink and pubescent on the outer surface, the lower lip white with purplish spots; stamens 4, densely pubescent.

B. Microscopic examination (*2.8.23*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1833.-1): numerous covering trichomes [A], whole [Aa] or fragmented [Ab], uniseriate, with warty walls, composed of 2-8 cells with slight swellings at the junctions, up to 1500 µm long; fragments of the upper epidermis (surface view [B]) with cells with straight or sinuous anticlinal walls [Ba], often accompanied by palisade parenchyma [Bb]; fragments of the lower epidermis (surface view [C]) with cells with sinuous anticlinal walls [Ca], diacytic stomata (*2.8.3*) [Cb], bearing glandular trichomes with a short unicellular stalk and a globular head composed of 8-16 cells [Cc], glandular trichomes with a uni- or bicellular stalk and a bi- or tetracellular head [Cd] and sometimes covering trichomes; fragments of the lamina, in transverse section [D], composed of epidermises bearing glandular trichomes with a globular head consisting of 8-16 cells [Da] or a bi- or tetracellular head [Db], a 1-layered palisade mesophyll extending almost halfway across the section [Dc], and a loosely arranged spongy parenchyma [Dd]; fragments of the calyx [G] with an epidermis consisting of polygonal cells bearing uni- or bicellular conical covering trichomes, with spiny walls [Ga], often associated with fusiform mesophyll cells with thick walls and containing small prism crystals of calcium oxalate [Gb]; isolated glandular trichomes [H], either with a multicellular stalk and a unicellular head from the anthers [Ha] or a uni- or multicellular stalk and bi- to tetracellular head [Hb]; spherical pollen grains, about 25-30 µm in diameter, with 3 pores and 3 furrows and a smooth exine [E]; thick-walled, lignified fibres [F]; fragments from the stem with spirally and annularly thickened vessels [K]; occasional fragments of pericarp [J] consisting of lobed cells with thick, pitted walls, each containing a single prism crystal of calcium oxalate [Ja].

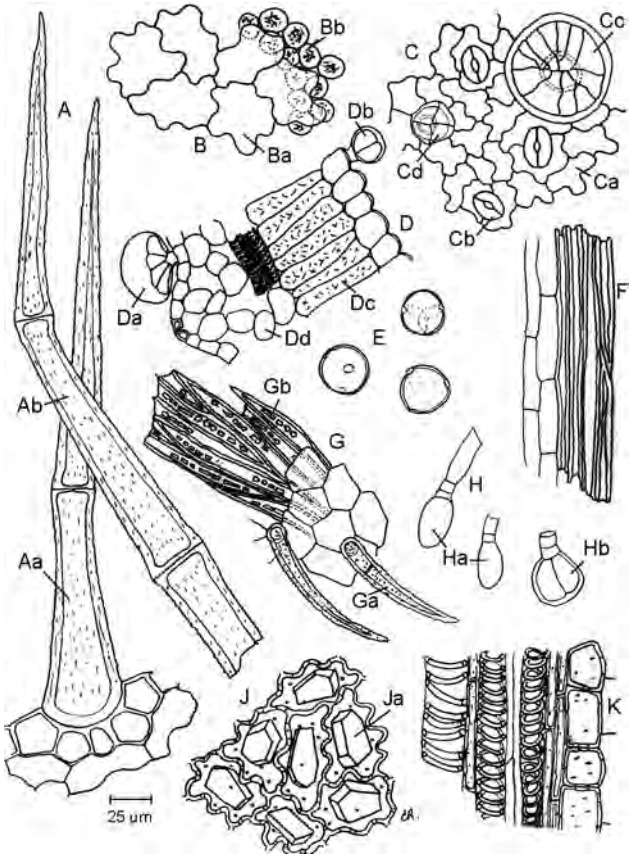

Figure 1833.-1. – *Illustration for identification test B of powdered herbal drug of motherwort*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Heat on a water-bath at 65 °C for 5 min with shaking. Cool and filter.

*Reference solution.* Dissolve 5 mg of *naphthol yellow S R* and 2.0 mg of *catalpol R* in 5.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *ethyl acetate R* (20:20:60 *V/V/V*).

*Application*: 20 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with *dimethylaminobenzaldehyde solution R2*, using about 5 mL for a plate 200 mm square; heat at 100-105 °C for 10 min until the spots appear; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak greyish-blue zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A wide white zone |
| | A greyish-blue zone (iridoid) |
| ——— | ——— |
| Naphthol yellow S: an intense yellow zone<br>Catalpol: a greyish-blue zone | 1 or 2 greyish-blue zones (iridoid) |
| ——— | ——— |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 2 per cent of brown or yellow leaves and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

ASSAY

*Stock solution.* In a 100 mL round-bottomed flask place 1.00 g of the powdered herbal drug (355) (*2.9.12*), add 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 20 mL of *acetone R* and 2 mL of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool and filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a paper filter into a volumetric flask and dilute to 100.0 mL with *acetone R* by rinsing the flask and the paper filter. Introduce 20.0 mL of the solution into a separating funnel, add 20 mL of *water R* and shake the mixture with 1 quantity of 15 mL and then 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 mL, of *water R*, filter the extracts over 10 g of *anhydrous sodium sulfate R* into a volumetric flask and dilute to 50.0 mL with *ethyl acetate R*.

*Test solution.* To 10.0 mL of the stock solution add 1 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

*Compensation liquid.* Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (*2.2.25*) of the test solution after 30 min, by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

$A$ = absorbance at 425 nm;

$m$ = mass of the substance to be examined, in grams.

**04/2018:2474**

# MOUTAN BARK

## Moutan cortex

DEFINITION

Dried, whole or fragmented, scraped or unscraped root bark of *Paeonia* ×*suffruticosa* Andrews, collected in autumn.

*Content*:

– *paeonol* ($C_9H_{10}O_3$; $M_r$ 166.2): minimum 2.2 per cent (dried drug);

– *paeoniflorin* ($C_{23}H_{28}O_{11}$; $M_r$ 480.5): minimum 1.1 per cent (dried drug).

IDENTIFICATION

A. The whole bark is quilled or crescent-shaped, about 2-4 mm thick, 0.6-1.4 cm in diameter and up to 20 cm long. The fragmented bark occurs as cleft rings, about 2-4 mm thick and 0.5-1 cm in diameter. The greyish-brown or yellowish-brown outer surface of the unscraped bark shows long transverse lenticels and rootlet scars; where the dermal tissue is absent, the exposed surface is pink. The outer surface of the scraped bark is pinkish to greyish-white; transverse lenticels and rootlet scars are present; sometimes remains of the outer bark are visible. The pale greyish-yellow or pale brown inner surface shows fine longitudinal striations. The texture is hard and fragile, easily broken. The fracture is greyish-white to pinkish or light brown and finely granular.

B. Microscopic examination (*2.8.23*). The powder is pale brown to pinkish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2474.-1): numerous fragments of parenchyma consisting of cells of various shapes and sizes: some rounded with slightly and regularly thickened and pitted walls [D], some with irregularly thickened beaded walls [J] and some [H] containing one [Ha] or more [Hb] cluster crystals of calcium oxalate up to 45 µm in diameter; files of cells containing cluster crystals of calcium oxalate may be present [A];

very numerous free cluster crystals of calcium oxalate [C]; more or less abundant fragments of cork with superimposed polyhedral cells (surface view [B], longitudinal section [E]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous rounded or polygonal starch granules about 3-15 µm in diameter, simple or 2-6 compound, free [G] or included in parenchyma cells [F]; the punctiform, cleft, V-, Y-, or X-shaped hilum is clearly visible.

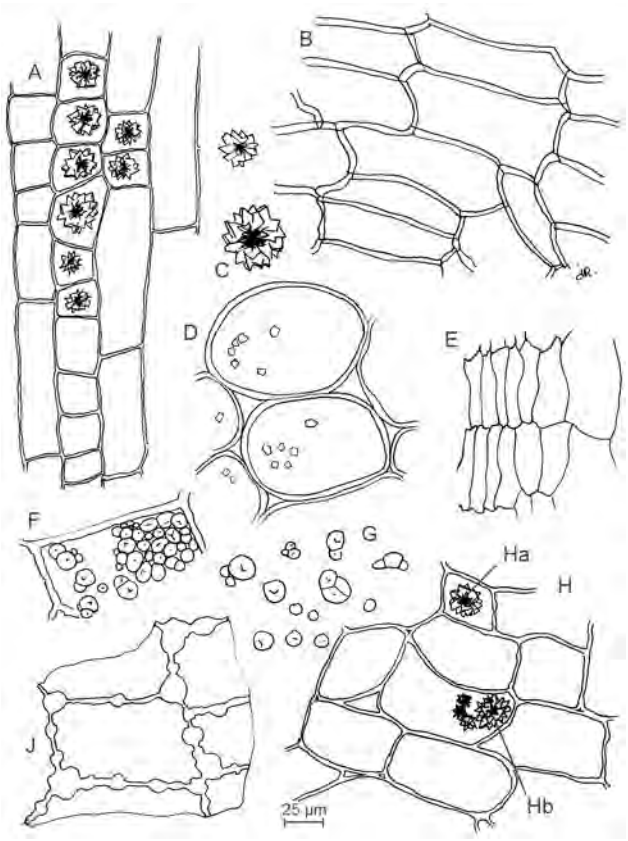

Figure 2474.-1. – *Illustration for identification test B of powdered herbal drug of moutan bark*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R* and heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant.

*Reference solution.* Dissolve 1 mg of *paeoniflorin R* and 1 mg of *paeonol R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *ethyl acetate R*, *methanol R*, *methylene chloride R* (3:5:5:35 *V/V/V/V*).

*Application*: 8 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |

| | A brown zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 1.0 per cent.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 0.200 g of the powdered herbal drug (355) (*2.9.12*) add 3.0 mL of *methanol R1* and sonicate for 30 min. Dilute to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R* and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 5.0 mg of *paeoniflorin CRS* in *methanol R1* and dilute to 5.0 mL with the same solvent.

*Reference solution (b).* Dissolve 7.0 mg of *paeonol CRS* in *methanol R1* and dilute to 10.0 mL with the same solvent. Dilute 3.0 mL of the solution to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

*Reference solution (c).* Dissolve 2.5 mg of *4′-hydroxyacetophenone R* in 2.5 mL of reference solution (a), add 12.5 mL of *methanol R1* and dilute to 50.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

*Reference solution (d).* Dilute 2.5 mL of reference solution (a) to 7.5 mL with *methanol R1*. Dilute this solution to 25.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

*Column:*

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase:*

- *mobile phase A*: 6.8 g/L solution of *potassium dihydrogen phosphate R*;
- *mobile phase B*: *methanol R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 70 | 30 |
| 15 - 18 | 70 → 40 | 30 → 60 |
| 18 - 25 | 40 | 60 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 10 µL of the test solution and reference solutions (b), (c) and (d).

*Retention time*: paeoniflorin = about 9.5 min; 4′-hydroxyacetophenone = about 10.5 min; paeonol = about 23 min.

*System suitability*: reference solution (c):

- *resolution*: minimum 1.5 between the peaks due to paeoniflorin and 4′-hydroxyacetophenone.

Calculate the percentage content of paeoniflorin using the following expression:

$$\frac{A_1 \times m_2 \times p_1}{A_2 \times m_1 \times 5}$$

$A_1$ = area of the peak due to paeoniflorin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to paeoniflorin in the chromatogram obtained with reference solution (d);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *paeoniflorin CRS* used to prepare reference solution (a), in grams;

$p_1$ = percentage content of paeoniflorin in *paeoniflorin CRS*.

Calculate the percentage content of paeonol using the following expression:

$$\frac{A_3 \times m_3 \times p_2 \times 0.3}{A_4 \times m_1}$$

$A_3$ = area of the peak due to paeonol in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to paeonol in the chromatogram obtained with reference solution (b);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_3$ = mass of *paeonol CRS* used to prepare reference solution (b), in grams;

$p_2$ = percentage content of paeonol in *paeonol CRS*.

**01/2011:1853**

# MULLEIN FLOWER

## Verbasci flos

DEFINITION

Dried flower, reduced to the corolla and the androecium, of *Verbascum thapsus* L., *V. densiflorum* Bertol. (*V. thapsiforme* Schrad), and *V. phlomoides* L.

IDENTIFICATION

A. The corolla of *V. thapsus* is pale yellow, yellow or brown, funnel-shaped, about 20 mm in diameter, with 5 slightly unequal and spreading lobes. The corolla lobes are densely hairy on the outer surface, glabrous on the inner surface, with a fine network of light brown veins. There are 5 stamens, alternating with the petal lobes; 2 of these are long, with glabrous filaments, the other 3 shorter, with densely tomentose filaments. The anthers are attached transversely. In *V. phlomoides* the corolla is up to about 30 mm in diameter, bright yellow or orange, and the anthers are obliquely attached to the filaments. The corolla of *V. densiflorum*, about 30 mm in diameter, is almost flat and deeply divided into 5 slightly unequal lobes, with rounded apices.

B. Microscopic examination (*2.8.23*). The powder is yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1853.-1): many covering trichomes from the corolla, whole and fragmented, pluricellular, of the candelabra type, with a central uniseriate axis from which whorls of branch cells arise at the position of the cross walls and at the apex (side view [A, B], surface view [F]); the covering trichomes from the stamen filaments [G] are unicellular, long, thin-walled and tubular, have a distinctly granular or striated surface with a sharp tip [Ga] or sometimes with a club-shaped tip [Gb, Gc]; numerous pollen grains, ovoid with a finely granular exine with 3 pores [D]; fragments of the fibrous layer of the anther with thickened walls giving a characteristic star-shaped appearance [C]; yellow fragments of the petals (surface view [E]) with polygonal and isodiametric epidermal cells [Ea]; fragments of the underlying mesophyll consisting of irregular parenchymatous cells [Eb] sometimes accompanied by spiral vessels [Ec].

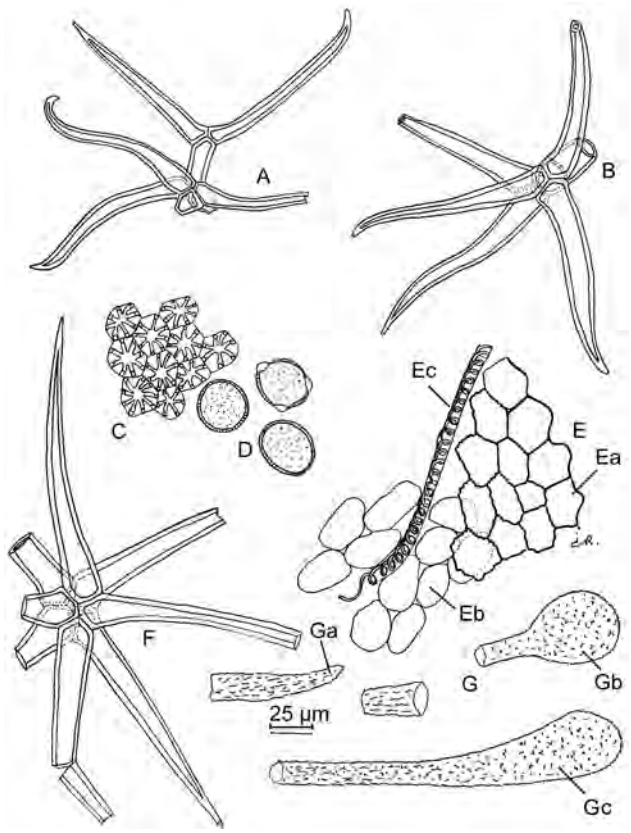

Figure 1853.-1. – *Illustration for identification test B of powdered herbal drug of mullein flower*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Heat 1.0 g of the powdered herbal drug (355) (*2.9.12*) in 10 mL of *methanol R* in a water-bath at 60 °C for 5 min, with stirring. Cool and filter.

*Reference solution*. Dissolve 1 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

*Application*: 10 µL of the reference solution and 30 µL of the test solution, as bands.

*Development*: over a path of 15 cm.

*Drying*: at 100-105 °C.

*Detection*: spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A yellow or yellowish-green fluorescent zone |
| Caffeic acid: a greenish-blue fluorescent zone | |
| | A bluish fluorescent zone |
| | A greenish fluorescent zone |
| | A yellowish-green fluorescent zone |
| | A bluish fluorescent zone |
| Hyperoside: a yellowish-brown fluorescent zone | |
| | A greenish fluorescent zone |
| Rutoside: a yellowish-brown fluorescent zone | |
| **Reference solution** | **Test solution** |

D. Boil 1.0 g of the powdered herbal drug (355) (*2.9.12*) with 15 mL of *water R* for 1 min. Filter. Add 1 mL of *hydrochloric acid R* and boil for 1 min. A greenish-blue colour develops and, after a few minutes, cloudiness appears and then a blackish precipitate (iridoids).

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of brown petals and maximum 2 per cent of fragments of the calyx and other foreign matter, determined on 20 g.

**Swelling index** (*2.8.4*): minimum 9, determined on the powdered herbal drug (710) (*2.9.12*), moistened with 2 mL of *ethanol (96 per cent) R*.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

STORAGE

In an airtight container.

**07/2017:1349**

# MYRRH

## Myrrha

DEFINITION

Gum-resin, hardened in air, obtained by incision or produced by spontaneous exudation from the stem and branches of *Commiphora myrrha* (Nees) Engl. (syn. *Commiphora molmol* (Engl.) Engl. ex Tschirch) and/or other species of *Commiphora*.

CHARACTERS

Bitter taste.

IDENTIFICATION

A. The light or dark orange-brown, irregular or roundish grains or pieces of different size show components of various colours. Their surface is mostly covered with grey or yellowish-brown dust.

B. Microscopic examination (*2.8.23*). The powder is brownish-yellow or reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: a few tissue fragments from the original plants including: reddish-brown cork fragments; single or grouped

polyhedral or elongated stone cells with partly strongly thickened, pitted and lignified walls with a brownish content; fragments of thin-walled parenchyma and sclerenchymatous fibres; irregular prismatic or polyhedral crystals of calcium oxalate, about 10-25 µm in size.

C. Examine the chromatograms obtained in the test for *Commiphora mukul*.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A reddish-violet zone |
| Anethole: a violet zone | |
| _____ | _____ |
| | A red zone |
| Thymol: an orange zone | |
| | A violet zone |
| | A brown zone |
| _____ | _____ |
| **Reference solution** | **Test solution** |

TESTS

**Commiphora mukul**. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.2 g of the powdered herbal drug (355) (*2.9.12*) add 4.0 mL of *ethanol (96 per cent) R*, sonicate for 10 min and filter.

*Reference solution*. Dissolve 10 mg of *thymol R* and 40 µL of *anethole R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *glacial acetic acid R*, *di-isopropyl ether R*, *cyclohexane R* (10:40:60 *V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 366 nm.

*Results A*: the chromatogram obtained with the test solution shows no blue or violet fluorescent zones in the lower third of the chromatogram.

*Detection B*: treat with *anisaldehyde solution R*, heat at 100 °C for 2 min and examine in daylight.

**Matter insoluble in ethanol**: maximum 75 per cent.

Place 1.00 g of the powdered herbal drug (250) (*2.9.12*) in a flask. Add 30 mL of *ethanol (96 per cent) R* and shake vigorously for 10 min. Filter the supernatant through a tared sintered-glass filter (16) (*2.1.2*), avoiding the transfer of sediment from the flask. Repeat the extraction with 2 quantities, each of 20 mL, of *ethanol (96 per cent) R*. Quantitatively transfer the sediment to the filter by rinsing the flask with *ethanol (96 per cent) R*. Dry the filter and the residue in an oven at 100-105 °C and weigh.

**Loss on drying** (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

**07/2017:1877**
**corrected 10.0**

# MYRRH TINCTURE

## Myrrhae tinctura

DEFINITION

Tincture produced from *Myrrh (1349)*.

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (90 per cent *V/V*) by a suitable procedure.

CHARACTERS

*Appearance*: clear, yellowish-brown or orange-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution*. Dilute 5 mL of the tincture to be examined to 10 mL with *ethanol (96 per cent) R*.

*Reference solution*. Dissolve 10 mg of *thymol R* and 40 µL of *anethole R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *glacial acetic acid R*, *di-isopropyl ether R*, *cyclohexane R* (10:40:60 *V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R*, heat at 100 °C for 2 min and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A reddish-violet zone |
| Anethole: a violet zone | |
| _____ | _____ |
| | A red zone |
| Thymol: an orange zone | |
| | A violet zone |
| | A brown zone |
| _____ | _____ |
| **Reference solution** | **Test solution** |

Herbal drugs

TESTS

**Ethanol** (*2.9.10*): 82 per cent *V/V* to 88 per cent *V/V*.

**Methanol and 2-propanol** (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

**Dry residue** (*2.8.16*): minimum 4.0 per cent.

STORAGE

Plastic containers are not recommended.

**01/2008:1821 corrected 6.0**

# NARROW-LEAVED CONEFLOWER ROOT

## Echinaceae angustifoliae radix

DEFINITION

Dried, whole or cut underground parts of *Echinacea angustifolia* (D.C.).

*Content*: minimum 0.5 per cent of echinacoside ($C_{35}H_{46}O_{20}$; $M_r$ 786.5) (dried drug).

IDENTIFICATION

*First identification*: *A, B, C.*

*Second identification*: *A, B, D.*

A. The root crown is up to about 30 mm in diameter and shows only a few stem bases. The roots are not very numerous, up to about 15 mm in diameter, cylindrical or slightly tapering and sometimes spirally twisted, the outer surface is pale brown to yellowish-brown. The fracture is short, dark brown with a radiate structure.

B. Microscopic examination (*2.8.23*). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: narrow lignified fibres (up to about 800 µm in length and 50 µm in diameter) joined together in long bundles surrounded by phytomelanin deposits; lignified reticulately or scalariformly thickened vessels (up to about 60 µm in diameter); abundant sclereids occuring singly or, more usually, in groups of 2 to 10, mostly elongated to rectangular, (up to about 150 µm in length and 40 µm wide), with intercellular spaces filled with phytomelanin deposit; fragments of oleoresin canal (80-150 µm in diameter) with yellowish-orange to reddish-brown content; groups of squarish to rectangular cells, about 30-45 µm from the outer layers of the roots; abundant fine-walled pitted parenchyma with sphaerocrystalline masses of inulin.

C. Examine the chromatograms obtained in the test for *Echinacea purpurea*.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint dark blue fluorescent zones may be present between the zones of echinacoside and cynarin in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Caffeic acid: a strong blue fluorescent zone | |
| Cynarin: a strong greenish fluorescent zone | A greenish fluorescent zone (cynarin) |
| Echinacoside: a strong greenish fluorescent zone | A strong greenish fluorescent zone (echinacoside) |
| **Reference solution** | **Test solution** |

D. Examine the chromatograms obtained in the assay.

*Results*: the chromatogram obtained with the test solution shows 1 major peak due to echinacoside and a minor peak due to cynarin. Peaks due to caffeic acid, caftaric acid and chlorogenic acid are minor peaks or may be absent.

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent.

***Echinacea purpurea***. Thin layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*, treat in an ultrasonic bath for 5 min. Centrifuge and use the supernatant solution.

*Reference solution*. Dissolve 1 mg of *echinacoside R*, 1 mg of *cynarin R* and 0.5 mg of *caffeic acid R* in 5.0 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (3:3:9:15 *V/V/V/V*).

*Application*: 25 µL [or 5 µL] of the test solution and 10 µL [or 2 µL] of the reference solution as bands.

*Development*: over a path of 15 cm [or 5 cm].

*Drying*: in a stream of cold air for about 10 min followed by 2 min at 100-105 °C.

*Detection*: treat the hot plate using a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*; examine in ultraviolet light at 365 nm after 30 min.

*Results*: the chromatogram obtained with the test solution shows no greenish fluorescent zone just below the zone due to caffeic acid in the chromatogram obtained with the reference solution and no greenish fluorescent zone below the zone due to cynarin in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution no zones apart from faint dark blue fluorescent zones are visible between the zones due to echinacoside and cynarin.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. In a 100 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (*2.9.12*) and add 80 mL of *ethanol (70 per cent V/V) R*. Treat in an ultrasonic bath for 15 min and dilute to 100.0 mL with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes so that visible solids settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45 µm) before injection.

*Reference solution*. Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 mL with the same solvent. Dilute 4.0 mL of this solution to 100.0 mL with *ethanol (70 per cent V/V) R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R*, *water R* (1:999 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 | 90 | 10 |
| 0 - 13 | 90 → 78 | 10 → 22 |
| 13 - 14 | 78 → 60 | 22 → 40 |
| 14 - 14.5 | 60 | 40 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 10 µL.

*Relative retention* with reference to chlorogenic acid: caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

*System suitability*: reference solution:

- *resolution*: minimum 10 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to echinacoside and cynarin using the chromatogram in Figure 1821.-1.

Calculate the percentage content of echinacoside from the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 2.221}{A_2 \times C_1}$$

$A_1$ = area of the peak due to echinacoside in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

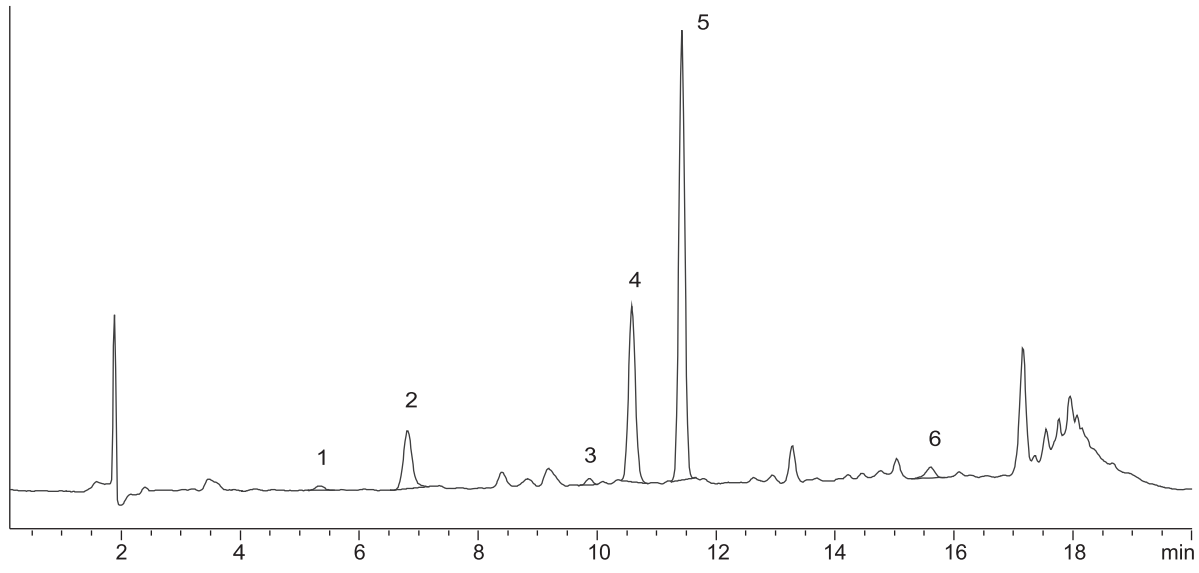
$C_1$ = concentration of the test solution, in milligrams per millilitre;

$C_2$ = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

2.221 = peak correlation factor between chlorogenic acid and echinacoside.

STORAGE

Store uncomminuted.



1. caftaric acid
2. chlorogenic acid
3. caffeic acid
4. cynarin
5. echinacoside
6. cichoric acid

Figure 1821.-1. – *Chromatogram for the assay of echinacoside in narrow-leaved coneflower root*

# NEROLI OIL

## Neroli aetheroleum

DEFINITION

Neroli oil is obtained by steam distillation from the fresh flowers of *Citrus aurantium* L. subsp. *aurantium* L. (*C. aurantium* L. subsp. *amara* Engl.).

CHARACTERS

*Appearance*: clear, pale-yellow or dark-yellow liquid.

Characteristic odour.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Examine the chromatograms obtained in the test for bergapten.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other zones may be present in the chromatograms obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| Methyl anthranilate: a blue fluorescent zone | A faint blue fluorescent zone (methyl anthranilate) |
| Bergapten: a greenish-yellow fluorescent zone | |
| _____ | _____ |
| **Reference solution** | **Test solution** |

*Detection B*: spray with *anisaldehyde solution R*; heat at 100-105 °C for 10 min; examine the chromatograms in ultraviolet light at 365 nm.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution the zone due to linalol is more intense than the zone due to linalyl acetate.

| Top of the plate | |
|---|---|
| | A brown fluorescent zone |
| Linalyl acetate: a brownish-red fluorescent zone | An intense brownish-red fluorescent zone (linalyl acetate) |
| _____ | _____ |
| Methyl anthranilate: a blue fluorescent zone | A faint blue fluorescent zone (methyl anthranilate) |
| | A faint brownish-red fluorescent zone |
| Linalol: a brownish-red fluorescent zone | A brownish-red fluorescent zone (linalol) |
| Bergapten: a greenish-yellow fluorescent zone | |
| _____ | _____ |
| | Several blue and brownish-red fluorescent zones |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the principal peaks in the chromatogram obtained with the test solution are similar in retention time to the principal peaks in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.863 to 0.880.

**Refractive index** (*2.2.6*): 1.464 to 1.474.

**Optical rotation** (*2.2.7*): + 1.5° to + 11.5°.

**Acid value** (*2.5.1*): maximum 2.0.

**Bergapten**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.1 g of the substance to be examined in *ethanol (96 per cent) R* and dilute to 5.0 mL with the same solvent.

*Reference solution.* Dissolve 2 µL of *methyl anthranilate R*, 10 µL of *linalyl acetate R*, 20 µL of *linalol R* and 5 mg of *bergapten R* in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (15:85 *V/V*).

*Application*: 10 µL [or 2 µL] as bands.

*Development*: over a path of 15 cm [or 8 cm].

*Drying*: in air.

*Detection*: examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the test solution does not show a zone corresponding to the zone due to bergapten in the chromatogram obtained with the reference solution.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* The substance to be examined.

*Reference solution (a).* Dissolve 20 µL of *β-pinene R*, 5 mg of *sabinene R*, 40 µL of *limonene R*, 40 µL of *linalol R*, 20 µL of *linalyl acetate R*, 5 mg of *α-terpineol R*, 5 µL of *neryl acetate R*, 5 µL of *geranyl acetate R*, 5 µL of *trans-nerolidol R*, 5 µL of *methyl anthranilate R* and 5 µL *(E,E)-farnesol R* in 2 mL of *heptane R*.

*Reference solution (b).* Dissolve 5 µL of *methyl anthranilate R* in *heptane R* and dilute to 10 mL with the same solvent.

*Column*:

- *material*: fused silica,
- *size*: *l* = 60 m, Ø = 0.25 mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 4 | 75 |
| | 4 - 42.8 | 75 → 230 |
| | 42.8 - 63 | 230 |
| Injection port | | 270 |
| Detector | | 270 |

*Detection*: flame ionisation.

*Injection*: 0.2 µL.

*Elution order*: order indicated in the composition of reference solution (a). Record the retention times of these substances.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

*Limits*:

- *β-pinene*: 7.0 per cent to 17.0 per cent,
- *limonene*: 9.0 per cent to 18.0 per cent,
- *linalol*: 28.0 per cent to 44.0 per cent,
- *linalyl acetate*: 2.0 per cent to 15.0 per cent,
- *α-terpineol*: 2.0 per cent to 5.5 per cent,
- *neryl acetate*: maximum 2.5 per cent,
- *geranyl acetate*: 1.0 per cent to 5.0 per cent,
- *trans-nerolidol*: 1.0 per cent to 5.0 per cent,
- *methyl anthranilate*: 0.1 per cent to 1.0 per cent,
- *(E,E)-farnesol*: 0.8 per cent to 4.0 per cent,
- *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b).

**Chiral purity**. Gas chromatography (*2.2.28*).

*Test solution*. Dissolve 20 mg of the substance to be examined in *pentane R* and dilute to 10.0 mL with the same solvent.

*Reference solution*. To 10 µL of *linalol R* add 10 µL of *linalyl acetate R*. Dilute to 10.0 mL with *pentane R*.

*Column*:

- *material*: fused silica,
- *size*: *l* = 25 m, Ø = 0.25 mm,
- *stationary phase*: *modified β-cyclodextrin for chiral chromatography R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.3 mL/min.

*Split ratio*: 1:30.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 65 | 50 → 180 |
| Injection port | | 230 |
| Detector | | 230 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*System suitability*: reference solution:

- *resolution*: minimum 5.5 between the peaks due to (*R*)(–)-linalol (1st peak) and (*S*)(+)-linalol (2nd peak); minimum 2.7 between the peaks due to (*R*)(–)-linalyl acetate (3rd peak) and (*S*)(+)-linalyl acetate 4th peak).

Calculate the percentage content of the specified (*S*)-enantiomers from the following expression:

$$\frac{A_1}{A_1 + A_2} \times 100$$

$A_1$ = area of the corresponding (*S*)-enantiomer,

$A_2$ = area of the corresponding (*R*)-enantiomer.

*Limits*:

- (*S*)(+)-linalol: maximum 30 per cent,
- (*S*)(+)-linalyl acetate: maximum 5 per cent.

STORAGE

At a temperature not exceeding 25 °C.

**01/2011:1897**

# NETTLE LEAF

## Urticae folium

DEFINITION

Whole or cut dried leaves of *Urtica dioica* L., *Urtica urens* L., or a mixture of the 2 species.

*Content*: minimum 0.3 per cent for the sum of caffeoylmalic acid and chlorogenic acid, expressed as chlorogenic acid ($C_{16}H_{18}O_9$; $M_r$ 354.3) (dried drug).

IDENTIFICATION

A. The leaves are dark green, dark greyish-green or brownish-green on the upper surface, paler on the lower surface; scattered stinging hairs occur on both surfaces, also small covering trichomes that are more numerous along the margins and on the veins on the lower surface. The lamina is strongly shrunken, ovate or oblong, up to 100 mm long and 50 mm wide, with a coarsely serrate margin and a cordate or rounded base. The venation is reticulate and distinctly prominent on the lower surface. The petiole is green or brownish-green, rounded or flattened, about 1 mm wide, longitudinally furrowed and twisted; it bears stinging hairs and covering trichomes.

B. Microscopic examination (*2.8.23*). The powder is green or greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1897.-1): fragments of unicellular stinging hairs [A, B, C], up to 2 mm long, composed of an elongated tapering cell with a slightly swollen stinging tip that readily breaks off, arising from a raised, multicellular base [Ca]; small glandular trichomes [F] (35-65 µm), with a uni- or bicellular stalk and a bi- or quadricellular head, isolated [Fa], or on fragments of the epidermis [Fb]; fragments of the upper epidermis of the leaves (surface view [G], transverse section [D]) showing slightly sinuous cells [Da, Gc], unicellular, straight or slightly curved covering trichomes, enlarged at the base, up to 700 µm long [Dc, Ga] and abundant large cystoliths [Db, Ea, Gb], empty or containing dense, granular masses of calcium carbonate; palisade parenchyma (surface view [E]) with rounded cells [Eb] surrounding cystoliths [Ea] (transverse section [Dd]); fragments of lower epidermis of leaves showing sinuous or wavy-walled cells [H], anomocytic [Ha] or anisocytic stomata [Hb] (*2.8.3*) accompanied by spongy mesophyll (surface view [Hc],

transverse section [De]) containing small cluster crystals of calcium oxalate (surface view [Hd], transverse section [Df]); occasional small groups of vessels, accompanied by parenchyma containing cluster crystals of calcium oxalate [J].

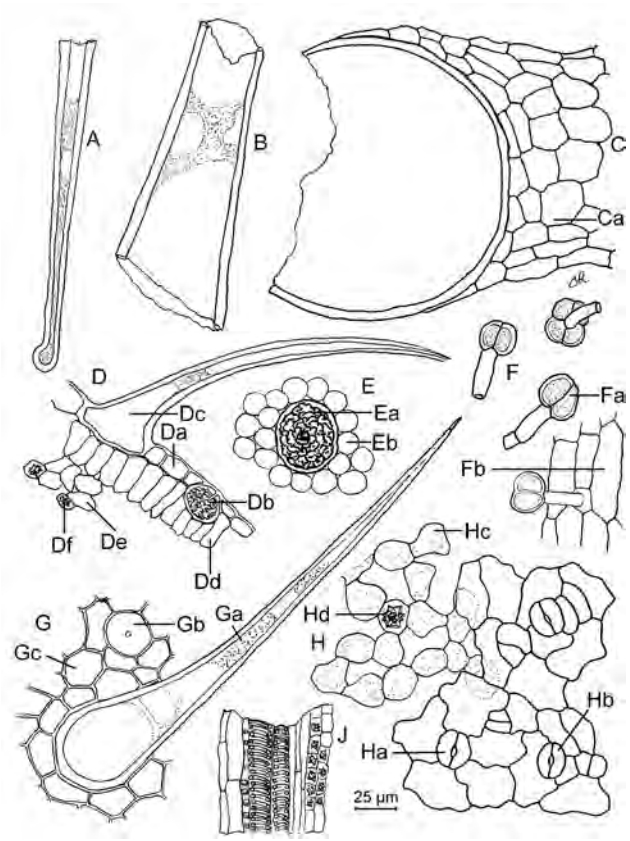

Figure 1897.-1. – *Illustration for identification test B of powdered herbal drug of nettle leaf*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter. Evaporate to dryness *in vacuo* at 40 °C. Dissolve the residue in 2 mL of *methanol R*.

*Reference solution.* Dissolve 1 mg of *scopoletin R* and 2 mg of *chlorogenic acid R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *methanol R*, *water R*, *ethyl acetate R* (2.5:4:4:50 *V/V/V/V*).

*Application*: 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 8 cm [or 6 cm].

*Drying*: in air.

*Detection*: heat at 100 °C for 5 min; spray the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue or yellow fluorescent zones may be present in the lower half of the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | 2 red zones |
| Scopoletin: an intense blue fluorescent zone | A blue fluorescent zone (scopoletin) |
| | A blue fluorescent zone |
| _____ | _____ |
| _____ | _____ |
| Chlorogenic acid: a blue fluorescent zone | A blue fluorescent zone (chlorogenic acid) |
| | A brownish-yellow zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of stems and maximum 5 per cent of other foreign matter (including inflorescences).

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 20.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 4.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 0.200 g of the powdered herbal drug (355) (*2.9.12*) add 25.0 mL of a 40 per cent *V/V* solution of *methanol R*. Extract for 30 min in an ultrasonic bath at 40 °C and filter.

*Reference solution.* Dissolve 10.0 mg of *chlorogenic acid CRS* in 100.0 mL of a 40 per cent *V/V* solution of *methanol R*. Dilute 5.0 mL of this solution to 25.0 mL with a 40 per cent *V/V* solution of *methanol R*.

*Precolumn*:

- *size*: *l* = 4 mm, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*:

- *mobile phase A*: mix 15 volumes of *methanol R* and 85 volumes of *water R* and adjust to pH 2.0 with *dilute phosphoric acid R*;
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 1 | 100 | 0 |
| 1 - 25 | 100 → 85 | 0 → 15 |
| 25 - 35 | 85 | 15 |
| 35 - 36 | 85 → 0 | 15 → 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 20 µL.

*Relative retention* with reference to chlorogenic acid (retention time = about 13 min): caffeoylmalic acid = about 2.2.

Herbal drugs

Calculate the percentage content of caffeoylmalic acid and chlorogenic acid, expressed as chlorogenic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 20}$$

$A_1$ = sum of the areas of the peaks due to caffeoylmalic acid and chlorogenic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *chlorogenic acid CRS* used to prepare the reference solution, in grams;

$p$ = percentage content of chlorogenic acid in *chlorogenic acid CRS*.

**01/2015:2538**
**corrected 8.7**

# NETTLE ROOT

## Urticae radix

DEFINITION

Dried, whole or fragmented underground parts of *Urtica dioica* L. or *Urtica urens* L., their hybrids or their mixtures.

IDENTIFICATION

A. Irregular cylindrical rhizome, greyish-brown, sporadically purple or greenish, 3-10 mm in diameter, the internodes are up to 2-3 cm long, with deep longitudinal furrows, alternating with short, slightly swollen nodes; the nodes bear numerous roots that are externally greyish-brown, 0.5-2 mm in diameter and up to about 10 cm long. The transverse section shows a thin, dark bark, the inner part is creamish-white with a hollow centre. The fracture of the rhizome is fibrous and uneven, especially in the inner part.

B. Microscopic examination (*2.8.23*). The powder is pale yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of brownish cork with thin-walled cells; fragments of vessels with bordered pits, 50-150 µm in diameter; fragments of fibres with thick lignified walls, occurring singly or in groups; abundant fragments of parenchyma with thin-walled cells, some containing large cluster crystals of calcium oxalate; rare, scattered, simple crystals of calcium oxalate; fragments of the medullary rays with moderately thick-walled, pitted cells.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 2 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Sonicate for 10 min and filter. Evaporate the filtrate to dryness and dissolve the residue in 2 mL of *methanol R*.

*Reference solution*. Dissolve 1 mg of *scopoletin R* in 10 mL of *methanol R* (solution A). Dissolve 10 mg of *arbutin R* and 20 mg of *β-sitosterol R* in *methanol R*, add 1 mL of solution A and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *methanol R*, *water R*, *ethyl acetate R* (2.5:4:4:50 *V/V/V/V*).

*Application*: 20 µL [or 10 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 8 cm [or 6 cm].

*Drying*: in air for 5 min.

*Detection A*: examine in ultraviolet light at 365 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Futhermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue or greenish-blue fluorescent zone |
| Scopoletin: a blue fluorescent zone | A blue fluorescent zone (scopoletin) |
| _____ | _____ |
| _____ | _____ |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A purple zone |
| β-sitosterol: a purple zone | A purple zone (β-sitosterol) |
| _____ | _____ |
| | A faint purple zone |
| _____ | _____ |
| Arbutin: a greenish-brown zone | |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Lead** (*2.4.27*): maximum 7.0 ppm.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 4.0 per cent.

**Extractable matter**: minimum 7.0 per cent.

To 2.000 g of the powdered herbal drug (250) (*2.9.12*) add a mixture of 6 g of *water R* and 14 g of *ethanol (96 per cent) R* and extract for 2 h, shaking frequently. Filter, evaporate 5.000 g of the filtrate to dryness on a water-bath and dry in an oven at 105 °C for 2 h. The residue weighs a minimum of 35 mg.

07/2012:2468

# NIAOULI OIL, CINEOLE TYPE

## Niaouli typo cineolo aetheroleum

DEFINITION

Essential oil obtained by steam distillation from young leafy branches of *Melaleuca quinquenervia* (Cav.) S.T.Blake.

CHARACTERS

*Appearance*: colourless or pale yellow liquid.

Aromatic odour of cineole.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 100 µL of the essential oil to be examined in *toluene R* and dilute to 10.0 mL with the same solvent.

*Reference solution.* Dissolve 25 µL of *trans-nerolidol R* and 50 µL of *cineole R* in *toluene R* and dilute to 5.0 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 3 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A faint grey zone |
| | A purple zone |
| 1,8-Cineole: a violet-brown zone | An intense violet-brown zone (1,8-cineole) |
| *trans*-Nerolidol: a dark violet zone | |
| | An intense violet-brown zone |
| | A violet-brown zone |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Relative density** (*2.2.5*): 0.904 to 0.925.

**Refractive index** (*2.2.6*): 1.463 to 1.472.

**Optical rotation** (*2.2.7*): – 4° to + 1°.

**Methyleugenol and isomethyleugenol**. Gas chromatography (*2.2.28*) as described in the test for chromatographic profile with the following modifications.

*Reference solution.* Dissolve 5 µL of *methyleugenol R* and 5 µL of *isomethyleugenol R* in *heptane R* and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of the solution to 5.0 mL with *heptane R*.

*Elution order*: order indicated in the composition of the reference solution; record the retention times of methyleugenol and isomethyleugenol.

*Identification of peaks*: using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

*Limits*:

- *methyleugenol*: maximum 0.05 per cent;
- *isomethyleugenol*: maximum 0.05 per cent.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dilute 0.2 mL of the essential oil to be examined to 10.0 mL with *heptane R*.

*Reference solution (a).* Dilute 10 µL of *α-pinene R*, 5 µL of *β-pinene R*, 10 µL of *limonene R*, 50 µL of *cineole R*, 5 µL of *p-cymene R*, 5 µL of *benzaldehyde R*, 5 mg of *α-terpineol R* and 5 µL of *trans-nerolidol R* in *heptane R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 5 µL of *limonene R* in *heptane R* and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of the solution to 5.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.3 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 5 | 65 |
| | 5 - 65 | 65 → 185 |
| | 65 - 80 | 185 → 230 |
| Injection port | | 230 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*Identification of peaks*: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution; the peak due to viridiflorol elutes with a relative retention of about 1.02 with reference to *trans*-nerolidol.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to limonene and 1,8-cineole.

Determine the percentage content of each of the following components. The limits are within the following ranges:

- *α-pinene*: 5.0 per cent to 15.0 per cent;
- *β-pinene*: 1.0 per cent to 4.0 per cent;
- *limonene*: 5.0 per cent to 10.0 per cent;

- *1,8-cineole*: 45.0 per cent to 65.0 per cent;
- *p-cymene*: 0.05 per cent to 4.0 per cent;
- *benzaldehyde*: 0.05 per cent to 0.5 per cent;
- *α-terpineol*: 3.0 per cent to 8.0 per cent;
- *trans-nerolidol*: 0.05 per cent to 1.5 per cent;
- *viridiflorol*: 2.5 per cent to 9.0 per cent;
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

STORAGE

At a temperature not exceeding 25 °C.

**07/2019:2383**

# NOTOGINSENG ROOT

## Notoginseng radix

DEFINITION

Whole or fragmented taproot, without secondary roots, of *Panax notoginseng* (Burkill) F.H.Chen [*Panax pseudoginseng* var. *notoginseng* (Burkill) G.Hoo & C.L.Tseng] treated with steam and dried.

*Content*: minimum 3.8 per cent for the sum of ginsenosides Rg1 ($C_{42}H_{72}O_{14}$,$2H_2O$; $M_r$ 837) and Rb1 ($C_{54}H_{92}O_{23}$,$3H_2O$; $M_r$ 1163) (dried drug).

IDENTIFICATION

A. The primary root is conical, subconical or cylindrical, up to 6 cm long and 4 cm in diameter. The outer surface, showing shallow transverse striations and secondary root scars, is brownish-grey or yellowish-grey. The aerial stem scar is surrounded by warty protuberances at the crown. The texture of the root is compact. The fracture is smooth, shiny, brownish-grey and shows a yellowish-grey ring (cambial zone) and many radial striations.

B. Microscopic examination (*2.8.23*). The powder is light yellowish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2383.-1): abundant fragments of parenchymatous cells with rounded or ovoid cells [D]; fragments of secretory canals (transverse section [G], longitudinal section [E]) with thin-walled cells [Ea, Ga] and containing a granular yellowish-brown resin diffused in the cells [Eb, Gb]; rare vessels, reticulate [B] or pitted, ranging from 20-50 µm in diameter; rare fragments of cork (surface view [A], transverse section [F]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The starch granules, sometimes deformed, single, with a diameter of 2-20 µm, or in groups of 2-9, are very abundant [C].

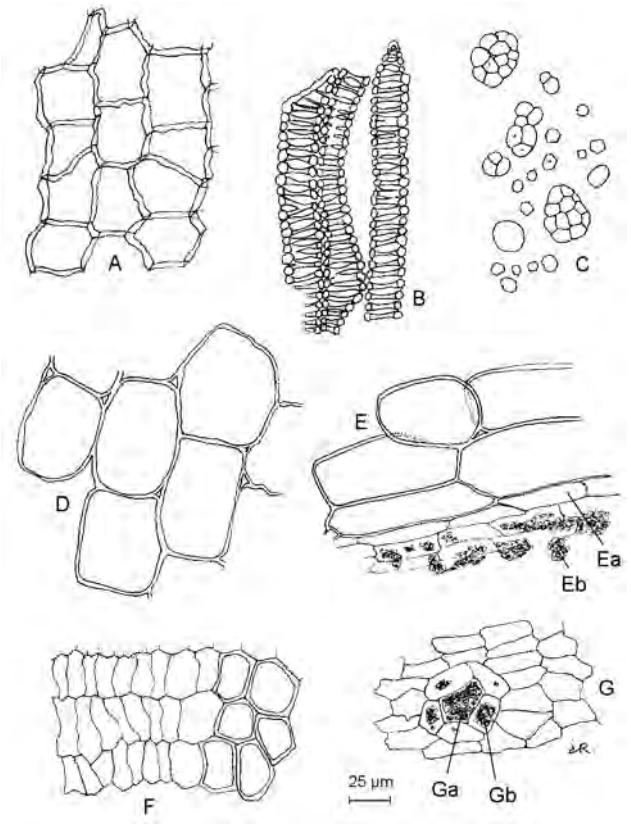

Figure 2383.-1. – *Illustration for identification test B of powdered herbal drug of notoginseng root*

C. Examine the chromatograms obtained in the test for *Panax ginseng* or *Panax quinquefolium*.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A violet zone (at the solvent front) |
| | A violet zone |
| Arbutin: a brown zone | |
| ——— | ——— |
| | A violet zone (ginsenosides Rg1 + Rg2) |
| | 2 violet zones |
| | 2 faint violet zones |
| ——— | ——— |
| Aescin: a grey zone | A violet zone |
| | Several violet and greenish zones |
| **Reference solution** | **Test solution** |

TESTS

***Panax ginseng* or *Panax quinquefolium***. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of a 70 per cent *V/V* solution of *methanol R* and boil under a reflux condenser for 15 min. Filter after cooling and dilute to 10.0 mL with *methanol R*.

*Reference solution*. Dissolve 5.0 mg of *aescin R* and 5.0 mg of *arbutin R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *water R*, *butanol R* (25:50:100 *V/V/V*); allow to stand for 10 min and use the upper layer.

*Application*: 20 µL, as bands of 15 mm [or 4 µL of the test solution and 2 µL of the reference solution, as bands of 8 mm].

*Development*: in an unsaturated tank, over a path of 10 cm [or 5 cm].

*Drying*: in air for 30 min.

*Detection*: treat with *anisaldehyde solution R* and heat at 105-110 °C for 5-10 min; examine in daylight.

*Results*: in the chromatogram obtained with the test solution, the absence of a violet zone immediately above the zone due to arbutin in the chromatogram obtained with the reference solution indicates the presence of *Panax ginseng*; in the chromatogram obtained with the test solution, the presence of a brown zone immediately below the violet zone due to ginsenosides Rg1 + Rg2 indicates adulteration with *Panax quinquefolium*.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Reduce about 50 g to a powder (355) (*2.9.12*). Place 0.250 g of the powdered herbal drug and 70 mL of a 50 per cent *V/V* solution of *methanol R* in a 250 mL round-bottomed flask. After adding a few grains of pumice, boil on a water-bath under a reflux condenser for 1 h. After cooling, centrifuge and collect the supernatant. Treat the residue as described above. Mix the collected liquids and evaporate to dryness under reduced pressure at a temperature not exceeding 60 °C. Take up the residue with 10.0 mL of a buffer solution, adjusted to pH 4.5, containing 3.5 g of *sodium dihydrogen phosphate R* and 7.2 g of *potassium dihydrogen phosphate R* in 1000 mL of *water R* (solution A). Wash a cartridge containing about 0.36 g of *octadecylsilyl silica gel for chromatography R* with 5 mL of *methanol R* followed by 20 mL of *water for chromatography R*. Apply 5.0 mL of solution A to the cartridge. Elute with 20 mL of *water for chromatography R*, followed by 15 mL of a 30 per cent *V/V* solution of *methanol R*. Discard the eluates after confirming that no ginsenosides are present, otherwise repeat the assay with another type of cartridge. Elute the cartridge with 20 mL of *methanol R* and evaporate the eluate to dryness. Take up the residue with 5.0 mL of *methanol R*.

*Reference solution.* Dissolve 3.0 mg of *ginsenoside Rb1 CRS*, 3.0 mg of *ginsenoside Rf R* and 3.0 mg of *ginsenoside Rg1 CRS* in *methanol R* and dilute to 5.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*;
- *mobile phase B*: *water for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 14 | 90 | 10 |
| 14 - 18 | 90 → 80 | 10 → 20 |
| 18 - 55 | 80 | 20 |

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 203 nm.

*Injection*: 20 µL.

*System suitability*: reference solution:

- *resolution*: minimum 3.0 between the peaks due to ginsenosides Rg1 and Rf.

Calculate the sum of the percentage contents of ginsenosides Rb1 and Rg1 using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p_1}{m_1 \times A_3} + \frac{A_2 \times m_3 \times 2 \times p_2}{m_1 \times A_4}$$

$A_1$ = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the reference solution;

$A_4$ = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *ginsenoside Rb1 CRS* used to prepare the reference solution, in grams;

$m_3$ = mass of *ginsenoside Rg1 CRS* used to prepare the reference solution, in grams;

$p_1$ = percentage content of ginsenoside Rb1 in *ginsenoside Rb1 CRS*;

$p_2$ = percentage content of ginsenoside Rg1 in *ginsenoside Rg1 CRS*.

**01/2008:1552**
**corrected 10.0**

# NUTMEG OIL

## Myristicae fragrantis aetheroleum

DEFINITION

Essential oil obtained by steam distillation of the dried and crushed kernels of *Myristica fragrans* Houtt.

CHARACTERS

*Appearance*: colourless or pale yellow liquid.

Spicy odour.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1 mL of the substance to be examined in *toluene R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 20 µL of *myristicine R* in 10 mL of *toluene R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with *vanillin reagent R*, heat at 100-105 °C for 10 min and examine in daylight.

*Results*: the chromatogram obtained with the reference solution shows in the upper third a pink or reddish-brown zone (myristicine); the chromatogram obtained with the

test solution shows a series of zones of which 1 is similar in position and colour to the zone in the chromatogram obtained with the reference solution; above this zone a brownish zone (safrole) and a violet zone (hydrocarbons) are present; below the myristicine zone, 5 blue zones of variable intensity are present.

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.885 to 0.905.

**Refractive index** (*2.2.6*): 1.475 to 1.485.

**Optical rotation** (*2.2.7*): + 8° to + 18°.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. The substance to be examined.

*Reference solution*. Dissolve 15 µL of *α-pinene R*, 15 µL of *β-pinene R*, 15 µL of *sabinene R*, 5 µL of *car-3-ene R*, 5 µL of *limonene R*, 5 µL of *γ-terpinene R*, 5 µL of *terpinen-4-ol R*, 5 µL of *safrole R* and 10 µL of *myristicine R* in 1 mL of *hexane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25-60 m, Ø = about 0.3 mm;
- *stationary phase*: *macrogol 20 000 R*.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 50 |
| | 10 - 75 | 50 → 180 |
| | 75 - 130 | 180 |
| Injection port | | 200 - 220 |
| Detector | | 240 - 250 |

*Detection*: flame ionisation.

*Injection*: 0.2 µL.

*Elution order*: order indicated in the composition of the reference solution; record the retention times of these substances.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene.

*Identification of components*: using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *α-pinene*: 15 per cent to 28 per cent;
- *β-pinene*: 13 per cent to 18 per cent;
- *sabinene*: 14 per cent to 29 per cent;
- *car-3-ene*: 0.5 per cent to 2.0 per cent;
- *limonene*: 2.0 per cent to 7.0 per cent;
- *γ-terpinene*: 2.0 per cent to 6.0 per cent;
- *terpinen-4-ol*: 2.0 per cent to 6.0 per cent;
- *safrole*: maximum 2.5 per cent;
- *myristicine*: 5.0 per cent to 12.0 per cent.

STORAGE

Protected from heat.

**01/2008:1887**
**corrected 6.0**

# OAK BARK

## Quercus cortex

DEFINITION

Cut and dried bark from the fresh young branches of *Quercus robur* L., *Q. petraea* (Matt.) Liebl. and *Q. pubescens* Willd.

*Content*: minimum 3.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1) (dried drug).

IDENTIFICATION

A. The bark occurs in channelled or quilled pieces, not more than 3 mm thick. The outer surface is light grey or greenish-grey, rather smooth, with occasional lenticels. The inner surface is dull brown or reddish-brown and has slightly raised longitudinal striations about 0.5-1 mm wide. The fracture is splintery and fibrous.

B. Microscopic examination (*2.8.23*). The powder is light brown or reddish-brown and fibrous. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: groups of thick-walled fibres surrounded by a moderately thickened parenchymatous sheath containing prism crystals of calcium oxalate; fragments of cork composed of thin-walled tabular cells filled with brownish or reddish contents; abundant sclereids, isolated and in groups, some large with thick, stratified walls and branching pits, others smaller and thinner-walled with simple pits, often with dense brown contents; fragments of parenchyma containing cluster crystals of calcium oxalate; occasional fragments of sieve tissue, thin-walled, some showing sieve areas on the oblique end-walls.

C. To 1 g of the powdered herbal drug (710) (*2.9.12*) add 10 mL of *ethanol (30 per cent V/V) R* and heat the mixture under a reflux condenser on a water-bath for 30 min. Cool and filter. To 1 mL of this solution add 2 mL of a 10 g/L solution of *vanillin R* in *hydrochloric acid R*. A red colour develops.

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

**Tannins** (*2.8.14*). Use 0.700 g of the powdered herbal drug (710) (*2.9.12*).

**01/2009:1878**

# OLIVE LEAF

## Oleae folium

DEFINITION

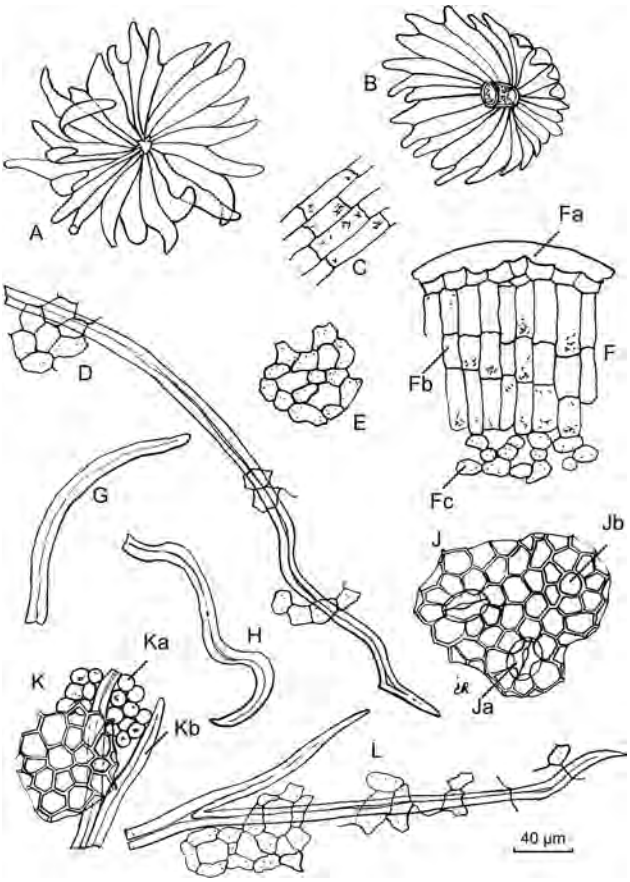
Dried leaf of *Olea europaea* L.

*Content*: minimum 5.0 per cent of oleuropein ($C_{25}H_{32}O_{13}$; $M_r$ 540.5) (dried drug).

IDENTIFICATION

A. The leaf is simple, thick and coriaceous, lanceolate to obovate, 30-50 mm long and 10-15 mm wide, with a mucronate apex and tapering at the base to a short petiole; the margins are entire and reflexed abaxially. The upper surface is greyish-green, smooth and shiny, the lower surface paler and pubescent, particularly along the midrib and main lateral veins.

B. Microscopic examination (*2.8.23*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis in surface view with small, thick-walled polygonal cells and, in the lower epidermis only, small anomocytic stomata (*2.8.3*); fragments of the lamina in sectional view showing a thick cuticle, a palisade composed of 3 layers of cells and a small-celled spongy parenchyma; numerous sclereids, very thick-walled and mostly fibre-like with blunt or, occasionally, forked ends, isolated or associated with the parenchyma of the mesophyll; abundant, very large peltate trichomes, with a central unicellular stalk from which radiate some 10-30 thin-walled cells that become free from the adjoining cells at the margin of the shield, giving an uneven, jagged appearance.



A. Peltate trichome, seen from above

B. Peltate trichome, seen from below

C. Palisade parenchyma

D, G, H and L. Fibre-like sclereids, some accompanied by parenchymatous fragments of the spongy mesophyll

E. Spongy parenchyma

F. Fragment of the lamina, in transverse section, showing a thick cuticle (Fa), palisade parenchyma composed of 3 layers of cells (Fb), and spongy parenchyma (Fc)

J. Fragment of lower epidermis with anomocytic stomata (Ja) and cicatrix of peltate trichome (Jb)

K. Fragment of upper epidermis, in surface view, with underlying palisade parenchyma (Ka) and sclereids of the spongy mesophyll (Kb)

Figure 1878.-1. – *Illustration of powdered herbal drug of olive leaf (see Identification B)*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter.

*Reference solution.* Dissolve 10 mg of *oleuropein R* and 1 mg of *rutoside trihydrate R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *water R*, *methanol R*, *methylene chloride R* (1.5:15:85 *V/V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: spray with *vanillin reagent R* and heat at 100-105 °C for 5 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| | A dark violet-blue zone (solvent front) |
| | A dark violet-blue zone |
| _____ | _____ |
| Oleuropein: a brownish-green zone | A brownish-green zone (oleuropein) |
| _____ | _____ |
| Rutoside: a brownish-yellow zone | |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 9.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* In a flask, place 1.000 g of the powdered herbal drug (355) (*2.9.12*) and add 50 mL of *methanol R*. Heat in a water-bath at 60 °C for 30 min with shaking. Allow to cool and filter into a 100 mL volumetric flask. Rinse the flask and the filter with *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 2.5 mL of this solution to 25.0 mL with *water R*.

*Reference solution.* Dissolve 5.0 mg of *oleuropein CRS* in 5.0 mL of *methanol R*. Dilute 1.0 mL of this solution to 25.0 mL with *water R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 25 °C.

*Mobile phase*:

– *mobile phase A*: dilute 1.0 mL of *glacial acetic acid R* to 100 mL with *water R*;
– *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 85 → 40 | 15 → 60 |
| 5 - 12 | 40 → 20 | 60 → 80 |
| 12 - 15 | 20 → 85 | 80 → 15 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL.

*Retention time*: oleuropein = about 9 min.

Calculate the percentage content of oleuropein using the following expression:

$$\frac{A_1 \times m_2 \times p \times 8}{A_2 \times m_1}$$

$A_1$ = area of the peak due to oleuropein in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to oleuropein in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined in the test solution, in grams;

$m_2$ = mass of *oleuropein CRS* in the reference solution, in grams;

$p$ = percentage content of oleuropein in *oleuropein CRS*.

**04/2009:2313**

# OLIVE LEAF DRY EXTRACT

## Oleae folii extractum siccum

DEFINITION

Dry extract produced from *Olive leaf (1878)*.

*Content*: minimum 16.0 per cent of oleuropein ($C_{25}H_{32}O_{13}$; $M_r$ 540.5) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (65-96 per cent *V/V*).

CHARACTERS

*Appearance*: greenish-brown or brown, amorphous powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.25 g of the extract to be examined add 10 mL of *methanol R*. Sonicate for 15 min and filter.

*Reference solution.* Dissolve 5 mg of *oleuropein R* and 1 mg of *rutoside trihydrate R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *water R*, *anhydrous formic acid R*, *ethyl acetate R* (7:13:80 *V/V/V*).

*Application*: 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.8.17*): maximum 8.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* To 0.250 g of the extract to be examined add 50 mL of *methanol R*. Sonicate for 15 min and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 2 mL of *methanol R* and dilute to 100.0 mL with *water R*.

*Reference solution (a).* Dissolve 10.0 mg of *oleuropein CRS* in 10.0 mL of *methanol R* and dilute to 25.0 mL with *water R*.

*Reference solution (b).* Dissolve 4 mg of *rutoside trihydrate R* in 10 mL of reference solution (a).

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*: *trifluoroacetic acid R*, *methanol R*, *water R* (1:400:600 *V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 233 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of oleuropein.

*Relative retention* with reference to oleuropein (retention time = about 11 min): rutoside = about 0.7.

*System suitability*: reference solution (b):

- *resolution*: minimum 3.0 between the peaks due to rutoside and oleuropein.

Calculate the percentage content of oleuropein using the following expression:

$$\frac{A_1 \times m_2 \times p \times 4}{A_2 \times m_1}$$

$A_1$ = area of the peak due to oleuropein in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to oleuropein in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *oleuropein CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of oleuropein in *oleuropein CRS*.

# OPIUM DRY EXTRACT, STANDARDISED

## Opii extractum siccum normatum

DEFINITION

Standardised dry extract produced from *Raw opium (0777)*.

*Content*:

– *morphine* ($C_{17}H_{19}NO_3$; $M_r$ 285.3): 19.6 per cent to 20.4 per cent (dried extract);

– *codeine* ($C_{18}H_{21}NO_3$; $M_r$ 299.4): minimum 2.0 per cent (dried extract).

Content adjusted if necessary by adding a suitable excipient (e.g. lactose, dextrin).

PRODUCTION

The extract is produced from the drug by a suitable procedure using water.

CHARACTERS

*Appearance*: brown, amorphous powder.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Triturate 0.05 g of the extract to be examined with 5 mL of *ethanol (70 per cent V/V) R*. Transfer to a 25 mL conical flask. Rinse with 3 mL of *ethanol (70 per cent V/V) R* and transfer the rinsings to the same 25 mL conical flask. Heat in a water-bath at 50-60 °C, while stirring, for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent V/V) R* and dilute the combined filtrates to 10 mL with the same solvent.

*Reference solution.* Dissolve 5 mg of *morphine hydrochloride R* in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscapine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*); use a freshly prepared mixture.

*Application*: 20 µL [or 6 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 8 cm].

*Drying*: at 100-105 °C for 15 min.

*Detection*: allow to cool and treat with *potassium iodobismuthate solution R2* and then with a 4 g/L solution of *sulfuric acid R*; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Noscapine: an orange-red or red zone | An orange-red or red zone (noscapine) |
| Papaverine: an orange-red or red zone | An orange-red or red zone (papaverine) |
| Codeine: an orange-red or red zone | An orange-red or red zone (codeine) |
| Morphine: an orange-red or red zone | An orange-red or red zone (morphine) |
| **Reference solution** | **Test solution** |

B. To 0.5 g of the extract to be examined add 5 mL of *water R*, shake for 5 min and filter. To the filtrate add 0.25 mL of *ferric chloride solution R2*. A red colour develops which does not disappear upon the addition of 0.5 mL of *dilute hydrochloric acid R*.

TESTS

**Thebaine**. Liquid chromatography (*2.2.29*).

*Test solution.* Suspend 0.500 g of the extract to be examined in 50 mL of *ethanol (50 per cent V/V) R*, mix using sonication for 1 h, allow to cool and dilute to 100.0 mL with the same solvent. Allow to stand. To 10.0 mL of the supernatant add 5 mL of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 mL with *water R* and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the combined eluates to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 5.0 mg of *thebaine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 12.0 mg of *morphine hydrochloride trihydrate CRS* in the mobile phase and dilute to 15.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of the solution add 10.0 mL of reference solution (b).

*Precolumn*:

– *size*: *l* = 4 mm, Ø = 4.0 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 1.0 g of *sodium heptanesulfonate monohydrate R* in 420 mL of *water R*, adjust to pH 3.2 with a 4.9 g/L solution of *phosphoric acid R* and add 180 mL of *acetonitrile R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (c).

*Run time*: twice the retention time of thebaine.

*System suitability*: reference solution (c):

– *resolution*: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;

$F$ = 6.250 for the determination of thebaine;

$p$ = percentage content of the relevant alkaloid in the corresponding CRS.

*Limit*:

– *thebaine*: maximum 6.0 per cent (dried extract).

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g of the extract to be examined by drying in an oven at 105 °C for 4 h.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for thebaine with the following modifications.

*Injection*: test solution and reference solution (c).

*System suitability*: reference solution (c):

– *repeatability*: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and the percentage content of codeine using the expression given in the test for thebaine, with $F$ = 10.417 for morphine and $F$ = 3.125 for codeine.

To obtain the $p$ value to be used for the calculation of the morphine content, multiply the percentage content of morphine hydrochloride in *morphine hydrochloride trihydrate CRS* by 0.887.

**01/2015:1840**
**corrected 8.5**

# OPIUM, PREPARED

## Opii pulvis normatus

DEFINITION

*Raw opium (0777)* powdered (180) (*2.9.12*) and dried at a temperature not exceeding 70 °C, with a morphine content adjusted, if necessary, by adding a suitable excipient or raw opium powder with a lower alkaloidal content.

*Content*:

– *morphine* ($C_{17}H_{19}NO_3$; $M_r$ 285.3): 9.5 per cent to 10.5 per cent (dried preparation);

– *codeine* ($C_{18}H_{21}NO_3$; $M_r$ 299.4): minimum 1.0 per cent (dried preparation).

CHARACTERS

*Appearance*: yellowish-brown or dark brown powder.

IDENTIFICATION

A. Microscopic examination (*2.8.23*). The powder (500) (*2.9.12*) is light brown. Examine under a microscope using *chloral hydrate solution R*. Before heating, the powder shows the following diagnostic characters (Figure 1840.-1): granules of latex agglomerated in irregular masses [A] and light brown elongated filaments. After heating, some fragments of vessels [J, K] and rather elongated, refringent crystals [F] are also visible, as well as a smaller number of round pollen grains with 3 pores and a very finely pitted exine [E] and fragments of elongated fibres [D]. Fragments of epicarp (surface view [B, C, G], transverse section [H]), consisting of polygonal cells with thick walls defining a stellate lumen, and sometimes anomocytic stomata (*2.8.3*) [Ba] may also be present. Some elements of various origin introduced during handling of the latex may also be present in small quantities (fragments of covering trichomes and starch granules).

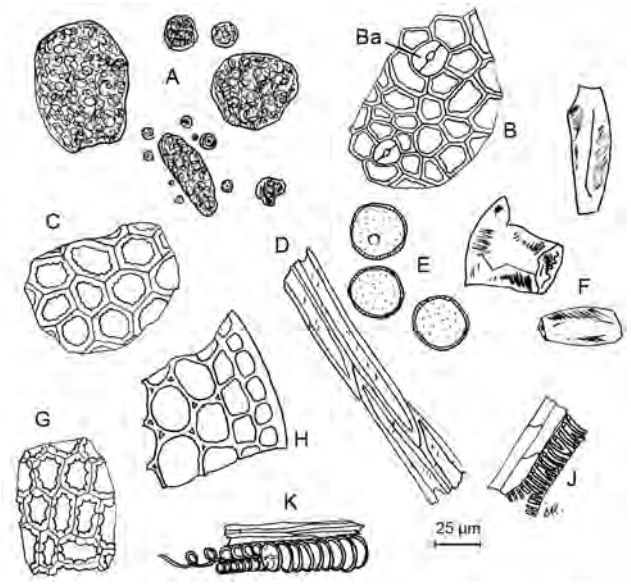

Figure 1840.-1. – *Illustration for identification test A of prepared opium*

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Triturate 0.10 g of the preparation to be examined with 5 mL of *ethanol (70 per cent V/V) R*. Transfer to a 25 mL conical flask. Rinse with 3 mL of *ethanol (70 per cent V/V) R* and transfer the rinsings to the same 25 mL conical flask. Heat in a water-bath at 50-60 °C, while stirring, for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent V/V) R* and dilute the combined filtrates to 10 mL with the same solvent.

*Reference solution*. Dissolve 5 mg of *morphine hydrochloride R* in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscapine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*); use a freshly prepared mixture.

*Application*: 20 µL [or 6 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 8 cm].

*Drying*: at 100-105 °C for 15 min.

*Detection*: allow to cool and treat with *potassium iodobismuthate solution R2* and then with a 4 g/L solution of *sulfuric acid R*; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

# OPIUM, RAW

## Opium crudum

*Raw opium is intended only as starting material for the manufacture of galenical preparations. It is not dispensed as such.*

DEFINITION

Air-dried latex obtained by incision from the unripe capsules of *Papaver somniferum* L.

*Content*:

- *morphine* ($C_{17}H_{19}NO_3$; $M_r$ 285.3): minimum 10.0 per cent (dried drug);

Herbal drugs

– *codeine* ($C_{18}H_{21}NO_3$; $M_r$ 299.4): minimum 2.0 per cent (dried drug).

CHARACTERS

*Appearance*: blackish-brown masses of various sizes, which tend to be soft and shiny and, after drying, become hard and brittle.

IDENTIFICATION

*Strip off any covering, cut the substance to be examined into thin slices, dry at about 60 °C for 48 h, if necessary, and reduce to a powder (500) (2.9.12).*

A. Microscopic examination (*2.8.23*). The powder (500) (*2.9.12*) is light brown. Examine under a microscope using *chloral hydrate solution R*. Before heating, the powder shows the following diagnostic characters (Figure 0777.-1): granules of latex agglomerated in irregular masses [A] and light brown elongated filaments. After heating, some fragments of vessels [J, K] and rather elongated, refringent crystals [F] are also visible, as well as a smaller number of round pollen grains with 3 pores and a very finely pitted exine [E] and fragments of elongated fibres [D]. Fragments of epicarp (surface view [B, C, G], transverse section [H]), consisting of polygonal cells with thick walls defining a stellate lumen, and sometimes anomocytic stomata (*2.8.3*) [Ba] may also be present. Some elements of various origin introduced during handling of the latex may also be present in small quantities (fragments of covering trichomes and starch granules).

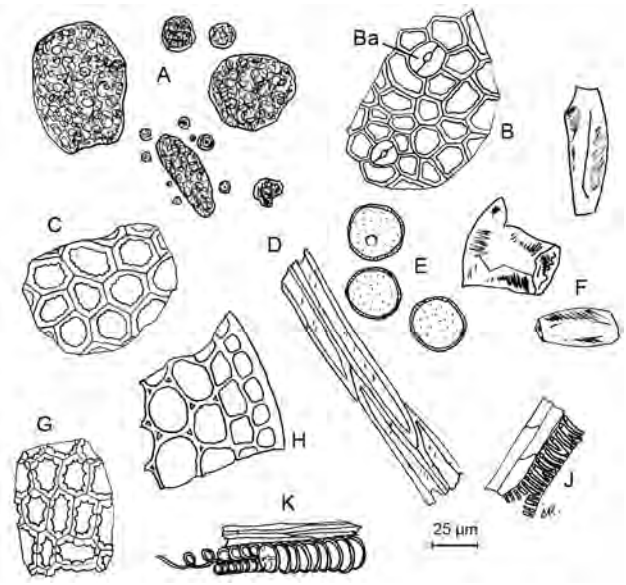

Figure 0777.-1. – *Illustration for identification test A of powdered raw opium*

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Triturate 0.10 g of the powdered substance to be examined (500) (*2.9.12*) with 5 mL of *ethanol (70 per cent V/V) R*. Transfer to a 25 mL conical flask. Rinse with 3 mL of *ethanol (70 per cent V/V) R* and transfer the rinsings to the same 25 mL conical flask. Heat in a water-bath at 50-60 °C, while stirring, for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent V/V) R* and dilute the combined filtrates to 10 mL with the same solvent.

*Reference solution.* Dissolve 5 mg of *morphine hydrochloride R* in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscapine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*); use a freshly prepared mixture.

*Application*: 20 µL [or 6 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 8 cm].

*Drying*: at 100-105 °C for 15 min.

*Detection*: allow to cool and treat with *potassium iodobismuthate solution R2* and then with a 4 g/L solution of *sulfuric acid R*; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| **Top of the plate** | |

| Noscapine: an orange-red or red zone | An orange-red or red zone (noscapine) |
| Papaverine: an orange-red or red zone | An orange-red or red zone (papaverine) |
| Codeine: an orange-red or red zone | An orange-red or red zone (codeine) |
| Morphine: an orange-red or red zone | An orange-red or red zone (morphine) |
| **Reference solution** | **Test solution** |

C. To 1.0 g of the powdered substance (500) (*2.9.12*) add 5 mL of *water R*, shake for 5 min and filter. To the filtrate add 0.25 mL of *ferric chloride solution R2*. A red colour develops which does not disappear upon the addition of 0.5 mL of *dilute hydrochloric acid R*.

TESTS

**Thebaine**. Liquid chromatography (*2.2.29*).

*Test solution.* Suspend 1.000 g of the substance to be examined, cut into thin slices, in 50 mL of *ethanol (50 per cent V/V) R*, mix using sonication for 1 h, allow to cool and dilute to 100.0 mL with the same solvent. Allow to stand. To 10.0 mL of the supernatant add 5 mL of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 mL with *water R* and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the combined eluates to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution* (a). Dissolve 5.0 mg of *thebaine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 12.0 mg of *morphine hydrochloride trihydrate CRS* in the mobile phase and dilute to 15.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of the solution add 10.0 mL of reference solution (b).

*Precolumn*:

– *size*: *l* = 4 mm, Ø = 4.0 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 1.0 g of *sodium heptanesulfonate monohydrate R* in 420 mL of *water R*, adjust to pH 3.2 with a 4.9 g/L solution of *phosphoric acid R* and add 180 mL of *acetonitrile R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (c).

*Run time*: twice the retention time of thebaine.

*System suitability*: reference solution (c):

– *resolution*: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;

$m_1$ = mass of the substance to be examined used to prepare the test solution, in grams;

$m_2$ = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;

$F$ = 6.250 for the determination of thebaine;

$p$ = percentage content of the relevant alkaloid in the corresponding CRS.

*Limit*:

– *thebaine*: maximum 3.0 per cent (dried drug).

**Loss on drying** (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g of the substance to be examined, cut into thin slices, by drying in an oven at 105 °C for 4 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

ASSAY

# OPIUM TINCTURE, STANDARDISED

## Opii tinctura normata

DEFINITION

Standardised tincture produced from *Raw opium (0777)*.

*Content*:

– *morphine* ($C_{17}H_{19}NO_3$; $M_r$ 285.3): 0.95 per cent to 1.05 per cent;

– *codeine* ($C_{18}H_{21}NO_3$; $M_r$ 299.4): minimum 0.1 per cent.

PRODUCTION

The tincture is produced from the drug by an appropriate procedure using equal volumes of ethanol (70 per cent *V/V*) and water.

CHARACTERS

*Appearance*: reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Dilute 1.0 mL of the tincture to be examined to 10 mL with *ethanol (70 per cent V/V) R*.

*Reference solution.* Dissolve 5 mg of *morphine hydrochloride R* in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscapine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*); use a freshly prepared mixture.

*Application*: 20 µL [or 6 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 8 cm].

*Drying*: at 100-105 °C for 15 min.

*Detection*: allow to cool and treat with *potassium iodobismuthate solution R2* and then with a 4 g/L solution of *sulfuric acid R*; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| Noscapine: an orange-red or red zone | An orange-red or red zone (noscapine) |
| Papaverine: an orange-red or red zone | An orange-red or red zone (papaverine) |
| Codeine: an orange-red or red zone | An orange-red or red zone (codeine) |
| Morphine: an orange-red or red zone | An orange-red or red zone (morphine) |
| **Reference solution** | **Test solution** |

TESTS

**Ethanol** (*2.9.10*): 31 per cent *V/V* to 34 per cent *V/V*.

Herbal drugs

**Thebaine**. Liquid chromatography (*2.2.29*).

*Test solution*. Dilute 2.000 g of the tincture to be examined to 25.0 mL with *ethanol (50 per cent V/V) R*. To 10.0 mL of the solution add 5 mL of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 mL with *water R* and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the combinated eluates to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 5.0 mg of *thebaine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 12.0 mg of *morphine hydrochloride trihydrate CRS* in the mobile phase and dilute to 15.0 mL with the mobile phase.

*Reference solution (c)*. Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of the solution add 10.0 mL of reference solution (b).

*Precolumn*:

- *size*: *l* = 4 mm, Ø = 4.0 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 1.0 g of *sodium heptanesulfonate monohydrate R* in 420 mL of *water R*, adjust to pH 3.2 with a 4.9 g/L solution of *phosphoric acid R* and add 180 mL of *acetonitrile R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (c).

*Run time*: twice the retention time of thebaine.

*System suitability*: reference solution (c):

- *resolution*: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;

$m_1$ = mass of the tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;

$F$ = 1.563 for the determination of thebaine;

$p$ = percentage content of the relevant alkaloid in the corresponding CRS.

*Limit*:

- *thebaine*: maximum 0.3 per cent.

**Dry residue** (*2.8.16*): minimum 4.0 per cent, determined on 3.00 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for thebaine with the following modifications.

*Injection*: test solution and reference solution (c).

*System suitability*: reference solution (c):

- *repeatability*: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and the percentage content of codeine using the expression given in the test for thebaine, with $F$ = 2.604 for morphine and $F$ = 0.781 for codeine.

To obtain the *p* value to be used for the calculation of the morphine content, multiply the percentage content of morphine hydrochloride in *morphine hydrochloride trihydrate CRS* by 0.887.

**01/2011:1880**
**corrected 10.0**

# OREGANO

## Origani herba

DEFINITION

Dried leaves and flowers separated from the stems of *Origanum onites* L. or *Origanum vulgare* L. subsp. *hirtum* (Link) Ietsw., or a mixture of both species.

*Content*:

- *essential oil*: minimum 25 mL/kg (anhydrous drug);
- *sum of the contents of carvacrol and thymol* (both $C_{10}H_{14}O$; $M_r$ 150.2): minimum 60 per cent in the essential oil.

IDENTIFICATION

A. *O. onites*. The leaf is yellowish-green, usually 4-22 mm long and 3-14 mm wide. It has a long or short petiole or is sessile. The lamina is ovate, elliptic or ovate-lanceolate. Margins are entire or serrate, the apex is acute or obtuse. The veins are yellowish and conspicuous on the adaxial surface. Flowers are solitary or seen as broken parts of the corymb. The calyx is bract-like and inconspicuous. The corolla is white, on top of inflorescences or single flowers, or inconspicuous. The bracts are imbricate and green like the leaves. The drug contains yellowish or yellowish-brown stem parts.

*O. vulgare* (subsp. *hirtum*). The leaf is green and usually 3-28 mm long and 2.5-19 mm wide. It is petiolate or sessile. The lamina is ovate or ovate-eliptic. The margins are entire or serrate, the apex is acute or obtuse. Flowers are rare, found as broken parts of the corymbs. Bracts are greenish-yellow and imbricate. The calyx is corolla-like and inconspicuous. The corolla is white, on top of inflorescences, slightly conspicuous or inconspicuous.

B. Microscopic examination (*2.8.23*). Reduce to a powder (710) (*2.9.12*). The powder is green (*O. vulgare*) or yellowish-green (*O. onites*). Examine under a microscope using *chloral hydrate solution R* (Figure 1880.-1).

*O. onites* powder shows fragments of leaf epidermis [A, D, G] composed of cells with sinuous walls, diacytic stomata (*2.8.3*) [Ga], covering trichomes and glandular trichomes; there are 2 types of glandular trichomes: some of lamiaceous type with 8-16 cells (surface view [Da]) and a very common type with a unicellular head and uni- [Gc], bi- [H] or tricellular stalk; the covering trichomes have smooth, thick walls; some are multicellular [B, Gb], often broken [Aa], and contain prisms of calcium oxalate, while others, which are rare, are unicellular and conical [C]; scars

from covering and glandular trichomes are visible on the epidermises [Gd, Ge]; pollen grains, with smooth exine, are frequent [E, F].

*O. vulgare* subsp. *hirtum* powder shows fragments of the upper epidermis with cells with sinuous, beaded walls, accompanied by palisade parenchyma [J]; fragments of the lower epidermis [N] composed of cells with finely and irregularly thickened walls, diacytic stomata (*2.8.3*) [Na], covering trichomes and glandular trichomes; there are 2 types of glandular trichomes: some of lamiaceous type with 12 cells, in surface view [Nb], and a rare type with a unicellular head [Nc] and bi- or tricellular stalk; the covering trichomes have thick, warty walls and contain fine needles of calcium oxalate; some are conical, multicellular and serrate [L, M], while others, which are rare, are unicellular [K]; there are occasional pollen grains, with smooth exine [E, F].

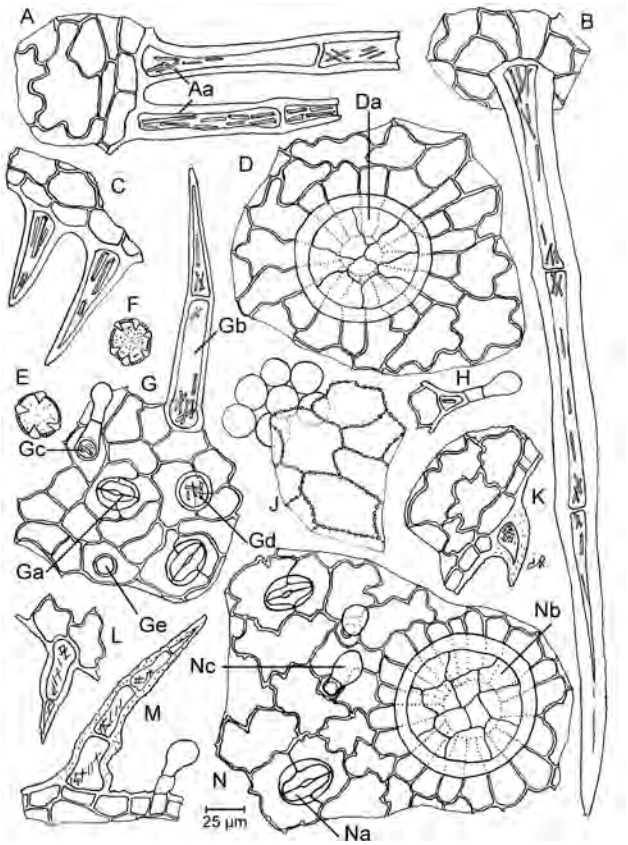

Figure 1880.-1. – *Illustration for identification test B of powdered herbal drug of oregano*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methylene chloride R* and shake for 3 min, then filter through about 2 g of *anhydrous sodium sulfate R*.

*Reference solution.* Dissolve 1 mg of *thymol R* and 10 µL of *carvacrol R* in 10 mL of *methylene chloride R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *methylene chloride R*.

*Application*: 20 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* using 10 mL for a plate 200 mm square and heat at 100-105 °C for 10 min.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third and upper part of the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| | A bluish-purple zone |
| ——— | ——— |
| | A pale green zone |
| Thymol: a pink zone | A pink zone (thymol) |
| Carvacrol: a pale violet zone | A pale violet zone (carvacrol) |
| ——— | ——— |
| | A pale purple zone |
| | A grey zone |
| | A pale green zone |
| | A bluish-purple zone |
| | An intense brown zone |
| **Reference solution** | **Test solution** |

TESTS

**Water** (*2.2.13*): maximum 120 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 15.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 4.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 30.0 g of the drug to be examined, a 1000 mL round-bottomed flask and 400 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 2 h without *xylene R* in the graduated tube.

**Carvacrol and thymol**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Filter the essential oil obtained in the assay of essential oil over a small amount of *anhydrous sodium sulfate R* and dilute to 5.0 mL with *heptane R* by rinsing the apparatus and the anhydrous sodium sulfate.

*Reference solution.* Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *heptane R* and dilute to 5.0 mL with the same solvent.

*Column*:
- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *nitrogen for chromatography R* or *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | **Time (min)** | **Temperature (°C)** |
|---|---|---|
| Column | 0 - 45 | 40 → 250 |
| Injection port | | 190 |
| Detector | | 210 |

*Detection*: flame ionisation.

*Injection*: 0.2 µL.

*Elution order*: order indicated in the composition of the reference solution; record the retention times of these substances.

*System suitability*: reference solution:

– *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of the sum of carvacrol and thymol.

**01/2013:2450**
**corrected 7.8**

# ORIENTVINE STEM

## Sinomenii caulis

DEFINITION

Dried, whole or fragmented stem of *Sinomenium acutum* (Thunb.) Rehder et E.H.Wilson, collected in late autumn and early winter.

*Content*: minimum 0.5 per cent of sinomenine ($C_{19}H_{23}NO_4$; $M_r$ 329.4) (dried drug).

IDENTIFICATION

A. *Whole drug.* Long cylindrical stem, somewhat curved, 60 cm long or more, 0.5-2 cm in diameter. The outer bark is greenish-brown or brown, sometimes greyish-brown, with relatively wide longitudinal striations and prominent verrucose lenticels; the nodes are slightly swollen and branched. The texture is light, hard and difficult to break; the fracture is uneven, greyish-yellow or pale greyish-brown; the bark is thin (about 1/10 of the diameter); the medullary rays are very conspicuous; the pith is yellowish-white or pale yellowish-brown.

*Fragmented drug.* Fragments of stems, in discs, about 1.5 cm in diameter and 0.3 cm thick, with greenish-brown, brown or greyish-brown outer surface; a transverse section shows a narrow, pale yellow cortical zone, it is mainly occupied by the vascular system (about 3/4 of the section) consisting of very numerous vascular bundles (about 15-20) in a circle around the yellowish-white or pale yellowish-brown, small, circular pith; each bundle is delimited on the outside by a narrow and continuous, wavy, light brown zone and is separated from the next bundle by a narrow, light brown medullary ray; the xylem vessels with a relatively wide interior lumen are clearly visible.

B. Microscopic examination (*2.8.23*). The powder is yellowish-brown or greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: rare fragments of epidermis with polyhedral cells, in surface view, covered with a thick, pale yellow cuticle about 50 µm in diameter; sclereids isolated or in groups, of various sizes and shapes (subsquare, fusiform, elliptical or irregular), with thickened, pitted walls with conspicuous pit canals, free or included in fragments of parenchyma; pale yellow or yellow fibres, 30-70 µm in diameter with thick, distinctly channelled walls and a very narrow lumen; fragments of parenchyma with thin-walled cells containing fine, needle-shaped crystals of calcium oxalate; fragments of xylem consisting of reticulate or pitted vessels, up to 200 µm in diameter, accompanied by ligneous parenchyma with slightly and regularly thickened and pitted cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, spherical starch granules about 10 µm in diameter, free or contained in parenchymatous cells.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2 g of the powdered herbal drug (355) (*2.9.12*) add 25 mL of *ethanol (96 per cent) R* and heat under reflux for 1 h. Filter and evaporate the filtrate to dryness. Dissolve the residue in 2 mL of *ethanol (96 per cent) R*.

*Reference solution.* Dissolve 5 mg of *sinomenine R* and 5 mg of *papaverine hydrochloride R* in 5 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *concentrated ammonia R*, *water R*, *toluene R*, *methanol R*, *ethyl acetate R* (2:10:20:30:40 *V/V/V/V/V*).

*Application*: 8 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Papaverine: a quenching zone | A quenching zone |
| Sinomenine: a quenching zone | A quenching zone (sinomenine) |
| | A dark blue fluorescent zone |
| **Reference solution** | **Test solution** |

*Detection B*: treat with a 10 g/L solution of *sodium nitrite R* in *potassium iodobismuthate solution R5* and allow to dry in air. Examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Papaverine: an orange zone | An orange zone |
| | 3 light orange zones |
| Sinomenine: an orange zone | An orange zone (sinomenine) |
| | 2 orange zones |
| | A light orange zone |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 3 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

**Aristolochic acids** (*2.8.21, Method A*). It complies with the test.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Disperse 0.500 g of the powdered herbal drug (355) (*2.9.12*) in 20.0 mL of *ethanol (70 per cent V/V) R* in a conical flask and weigh. Sonicate for 20 min. Cool and weigh again. Compensate the loss of solvent with *ethanol (70 per cent V/V) R* and stopper the flask. Shake thoroughly and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 3.0 mg of *sinomenine CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Disperse 0.250 g of *orientvine stem HRS* in 10.0 mL of *ethanol (70 per cent V/V) R* in a conical flask and weigh. Sonicate for 20 min. Cool and weigh again. Compensate the loss of solvent with *ethanol (70 per cent V/V) R* and stopper the flask. Shake thoroughly and filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase.* Adjust a 1.8 g/L solution of *disodium hydrogen phosphate dodecahydrate R* to pH 8.0 with a 0.8 g/L solution of *sodium dihydrogen phosphate R*, then adjust to pH 9.0 with a 10 g/L solution of *triethylamine R*. Mix 60 volumes of this solution with 40 volumes of *acetonitrile R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 262 nm.

*Injection*: 20 µL.

*Retention time*: sinomenine = about 3 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.5 between peak 1 and the peak due to sinomenine; identify peak 1 using the chromatogram supplied with *orientvine stem HRS*.

Calculate the percentage content of sinomenine using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to sinomenine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to sinomenine in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *sinomenine CRS* used to prepare reference solution (a), in grams;

$p$ = assigned percentage content of sinomenine in *sinomenine CRS*.

**01/2008:1822**
**corrected 6.0**

# PALE CONEFLOWER ROOT

## Echinaceae pallidae radix

DEFINITION

Dried, whole or cut underground parts of *Echinacea pallida* Nutt.

*Content*: minimum 0.2 per cent of echinacoside ($C_{35}H_{46}O_{20}$; $M_r$ 786.5) (dried drug).

IDENTIFICATION

A. The rhizome and roots are 4-20 mm in diameter, cylindrical and sometimes spirally twisted, longitudinally wrinkled or deeply furrowed; the outer surface is reddish-brown to greyish-brown.

B. Microscopic examination (*2.8.23*). The powder is greyish-brown to light yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: short lignified fibres (100-300 µm in length, up to about 80 µm in diameter) occurring singly or joined together in long bundles, sometimes with phytomelanin deposits; lignified reticulately or scalariformly thickened vessels (up to about 70 µm in diameter); abundant sclereids, occurring singly or in small groups of less than 10, varying considerably in shape from rounded to rectangular or irregular, sometimes much elongated and fibre-like and measuring up to 400 µm in length; all the sclereids have associated black, phytomelanin deposits; fragments of oleoresin canals (up to 240 µm in diameter) with yellowish-orange content; groups of squarish to rectangular cells of the outer layers (about 40 × 80 µm); abundant thin-walled pitted parenchyma with sphaerocrystalline masses of inulin.

C. Examine the chromatograms obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The chromatogram obtained with the test solution may also show a weak zone close to the solvent front.

| Top of the plate | |
|---|---|
| | A greenish-brown to brown zone |
| | A yellow zone |
| | A violet zone |
| *β*-Sitosterol: a violet to pink zone | A violet to pink zone (*β*-sitosterol) |
| *N*-Isobutyldodecatetraenamide: a greyish-blue zone | |
| | A dark grey-blue zone |
| **Reference solution** | **Test solution** |

D. Examine the chromatograms obtained in the assay.

*Results*: the major peak in the chromatogram obtained with the test solution is due to echinacoside. Peaks due to caftaric acid, caffeic acid, cynarin, chlorogenic acid and cichoric acid are minor peaks or may be absent.

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent.

**Other *Echinacea* species and *Parthenium integrifolium*.** Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methylene chloride R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

*Reference solution.* Dissolve 1 mg of *β-sitosterol R* and a volume of *N-isobutyldodecatetraenamide solution R* corresponding to 1 mg of *N-isobutyldodecatetraenamide R* in *methanol R* and dilute to 5.0 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *cyclohexane R*, *ethyl acetate R*, *toluene R* (0.9:3:6:24 *V/V/V/V*).

Herbal drugs

*Application*: 25 µL [or 5 µL] of the test solution and 10 µL [or 4 µL] of the reference solution as bands.

*Development*: over a path of 15 cm [or 5 cm].

*Drying*: in a stream of cold air for about 10 min.

*Detection*: treat the plate using *anisaldehyde solution R* and heat at 105 °C for 3 min; examine in daylight.

*Results*: the chromatogram obtained with the test solution shows no greyish-blue zone at the position of *N*-isobutyldodecatetraenamide in the chromatogram obtained with the reference solution, and no blue zone at the position of the violet zone due to *β*-sitosterol in the chromatogram obtained with the reference solution.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* In a 100 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (*2.9.12*) and add 80 mL of *ethanol (70 per cent V/V) R*. Sonicate for 15 min and dilute to 100.0 mL with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45 µm) before injection.

*Reference solution.* Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 mL with the same solvent. Dilute 4.0 mL of this solution to 100.0 mL with *ethanol (70 per cent V/V) R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R*, *water R* (1:999 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 | 90 | 10 |
| 0 - 13 | 90 → 78 | 10 → 22 |
| 13 - 14 | 78 → 60 | 22 → 40 |
| 14 - 20 | 60 | 40 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 10 µL.

*Relative retention* with reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

*System suitability*: reference solution:

- *resolution*: minimum 10 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to echinacoside, caftaric acid and cichoric acid using the chromatogram in Figure 1822.-1.

Calculate the percentage content of echinacoside using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 2.221}{A_2 \times C_1}$$

$A_1$ = area of the peak due to echinacoside in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

$C_1$ = concentration of the test solution, in milligrams per millilitre;

$C_2$ = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

2.221 = peak correlation factor between chlorogenic acid and echinacoside.

STORAGE

Uncomminuted.

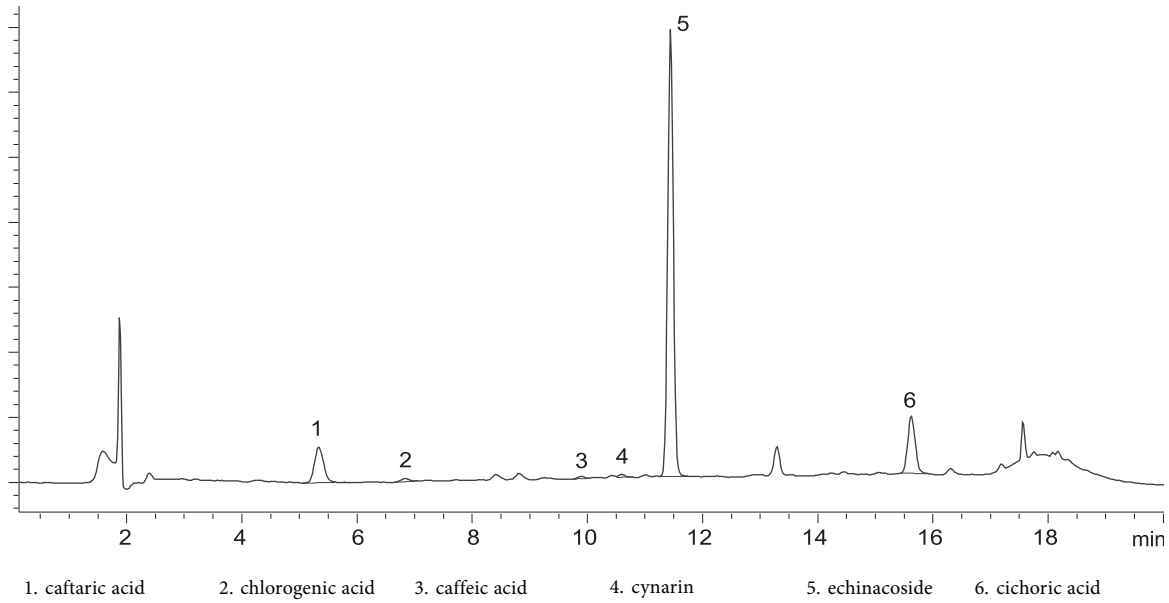

Figure 1822.-1. – *Chromatogram for the assay of echinacoside in pale coneflower root*

**01/2008:1459**
**corrected 6.0**

# PASSION FLOWER

## Passiflorae herba

DEFINITION

Fragmented or cut, dried aerial parts of *Passiflora incarnata* L. It may also contain flowers and/or fruits.
*Content*: minimum 1.5 per cent of total flavonoids, expressed as vitexin ($C_{21}H_{20}O_{10}$; $M_r$ 432.4) (dried drug).

IDENTIFICATION

A. The green or greenish-grey or brownish stem is ligneous, hollow, longitudinally striated, glabrous or very slightly pubescent, with a diameter that is generally less than 8 mm. The green or greenish-brown leaves are alternate, finely dentate and pubescent, deeply divided into 3 acute lobes of which the central lobe is the largest. The midrib is much more prominent on the lower surface. The petiole is pubescent and bears 2 dark nectaries near the lamina. The tendrils are very numerous and grow from the axils of the leaves; they are fine, smooth, round and terminated in cylindrical spirals. The radiate flowers, if present, have 3 small bracts and a corolla consisting of 5 white, elongated petals with several rows of filiform, petaloid appendices. If present, the greenish or brownish fruit is flattened and oval; it contains several flattened, brownish-yellow, pitted seeds.

B. Microscopic examination (*2.8.23*). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermis with sinuous walls and anomocytic stomata (*2.8.3*); numerous cluster crystals of calcium oxalate isolated or aligned along the veins; many isolated or grouped fibres from the stems associated with pitted vessels and tracheids; uniseriate trichomes with 1-3 thin-walled cells, straight or slightly curved, ending in a point or sometimes a hook. In addition, the powder shows, if flowers are present, papillose epidermises of the petals and appendages and pollen grains with a reticulate exine; and if mature fruits are present, scattered brown tannin cells and brownish-yellow, pitted fragments of the testa.

C. Examine the chromatograms obtained in the test for other species of *Passiflora*.

*Results*: the chromatogram obtained with the test solution shows below the zone due to rutoside in the chromatogram obtained with the reference solution a zone of intense yellow fluorescence, above it a zone of green fluorescence (diglycosylflavone), below the zone due to hyperoside in the chromatogram obtained with the reference solution a zone of yellow fluorescence (iso-orientin) and above a zone of green fluorescence (isovitexin), above the zone due to hyperoside in the chromatogram obtained with the reference solution a zone of brownish-yellow fluorescence (orientin) and above it a zone of green fluorescence (vitexin). These latter 2 zones may be absent. Further zones may be present.

TESTS

**Other species of *Passiflora*.** Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Heat to boiling under a reflux condenser for 10 min. Cool and filter.

*Reference solution.* Dissolve with heating 2.0 mg of *rutoside trihydrate R* and 2.0 mg of *hyperoside R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the reference solution shows in the lower third a zone of yellowish-brown fluorescence due to rutoside and in the middle third a zone of yellowish-brown fluorescence due to hyperoside. The chromatogram obtained with the test solution shows no intense zones of greenish-yellow or orange-yellow fluorescence between the zone due to diglycosylflavones and that due to iso-orientin (*P. coerulea* and *P. edulis*).

**Total ash** (*2.4.16*): maximum 13.0 per cent.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

ASSAY

*Stock solution.* In a 100 mL round-bottomed flask, introduce 0.200 g of the powdered herbal drug (250) (*2.9.12*) and add 40 mL of *ethanol (60 per cent V/V) R*. Heat in a water-bath at 60 °C under a reflux condenser for 30 min while shaking frequently. Allow to cool and filter the mixture through a plug of absorbent cotton in a 100 mL flask. Transfer the absorbent cotton with the drug residue into the round-bottomed flask. Add 40 mL of *ethanol (60 per cent V/V) R* and heat again in a water-bath at 60 °C under reflux for 10 min. Allow to cool and filter the mixture and the first filtrate from the 100 mL flask through a filter paper into the 100 mL volumetric flask. Dilute to 100 mL with the same solvent, while rinsing the flask, round-bottomed flask and filter.

*Test solution.* Introduce 5.0 mL of stock solution into a flask. Evaporate to dryness under reduced pressure and take up the residue with 10 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R*. Add 10 mL of a solution consisting of 25 g/L of *boric acid R* and 20 g/L of oxalic acid in *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

*Compensation liquid.* Introduce 5.0 mL of the stock solution into a second flask. Evaporate to dryness under reduced pressure and take up the residue with 10 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R*. Add 10 mL of *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

After 30 min, measure the absorbance (*2.2.25*) of the test solution at 401 nm, by comparison with the compensation liquid.

Calculate the percentage content of total flavonoids, expressed as vitexin, using the following expression:

$$\frac{A \times 0.8}{m}$$

i.e. taking the specific absorbance of vitexin to be 628.

$A$ = absorbance at 401 nm,

$m$ = mass of the herbal drug to be examined, in grams.

**01/2008:1882**

# PASSION FLOWER DRY EXTRACT

## Passiflorae herbae extractum siccum

DEFINITION

Dry extract produced from *Passion flower (1459)*.

*Content*: minimum 2.0 per cent of flavonoids, expressed as vitexin ($C_{21}H_{20}O_{10}$; $M_r$ 432.4) (dried extract).

PRODUCTION

The extract is produced from the herbal drug and ethanol (40 per cent *V/V* to 90 per cent *V/V*), methanol (60 per cent *V/V*) or acetone (40 per cent *V/V*) by an appropriate procedure.

CHARACTERS

*Appearance*: greenish-brown amorphous powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.25 g of the extract to be examined add *methanol R*. Shake, filter and dilute to 5 mL with *methanol R*.

*Reference solution.* Dissolve 2.0 mg of *hyperoside R* and 2.0 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

*Application*: 10 µL [or 5 µL] as bands.

*Development*: over a path of 15 cm [or 5 cm].

*Drying*: at 100-105 °C.

*Detection*: spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Other fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |

| | A yellow fluorescent zone |
| Rutoside: a yellowish-orange fluorescent zone | |
| ——— | ——— |
| | A green fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.8.17*): maximum 5.0 per cent, determined on 0.500 g.

ASSAY

*Stock solution.* To 50 mg of the extract to be examined add *ethanol (60 per cent V/V) R*. Shake, filter and dilute to 100.0 mL with *ethanol (60 per cent V/V) R*.

*Test solution.* Introduce 5.0 mL of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 mL volumetric flask. Rinse the round-bottomed flask with 3 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 mL volumetric flask. Add 10.0 mL of a solution containing 25.0 g/L of *boric acid R* and 20.0 g/L of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

*Compensation liquid.* Introduce 5.0 mL of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 mL volumetric flask. Rinse the round-bottomed flask with 3 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 mL volumetric flask. Add 10.0 mL of *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

After 30 min, measure the absorbance (*2.2.25*) of the test solution at 401 nm.

Calculate the percentage content of total flavonoids, expressed as vitexin, from the following expression:

$$\frac{A \times 0.8}{m}$$

i.e. taking the specific absorbance of vitexin to be 628.

$A$ = absorbance at 401 nm,

$m$ = mass of the extract to be examined, in grams.

**corrected 6.0**

# PELARGONIUM ROOT

## Pelargonii radix

DEFINITION

Dried, usually fragmented, underground organs of *Pelargonium sidoides* DC and/or *Pelargonium reniforme* Curt.

*Content*: minimum 2.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1) (dried drug).

IDENTIFICATION

A. The root is covered with dark, partly reddish-brown, longitudinally fissured bark. The transverse section shows, underneath the cork layer, yellow or white wood, which clearly shows partly brownish medullary rays.

B. Microscopic examination (*2.8.23*). The powder is brownish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: multilayer cork cells consisting of almost uniform, rectangular cells; fragments of parenchyma underneath the cork containing sclereids with a wide lumen; numerous calcium oxalate cluster crystals. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple starch granules without striations or cracks.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*, shake for 15 min and filter.

*Reference solution.* Dissolve 1 mg of *scopoletin R* and 2 mg of *esculin R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *water R*, *methanol R*, *ethyl acetate R* (10:14:76 *V/V/V*).

*Application*: 10 µL [or 5 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *alcoholic potassium hydroxide solution R*. Examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other blue fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue fluorescent zone |
| Scopoletin: a very bright blue fluorescent zone | A weak blue fluorescent zone (scopoletin) |
| ——— | ——— |
| | One or two bright blue fluorescent zones |
| Esculin: a very bright blue fluorescent zone | |
| | A blue fluorescent zone |
| | A weak blue fluorescent zone |
| ——— | ——— |
| | A blue fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

**Tannins** (*2.8.14*). Use 0.750 g of the powdered herbal drug (180) (*2.9.12*).

**01/2017:2425**

# PEONY ROOT, RED

## Paeoniae radix rubra

DEFINITION

Dried, whole or fragmented root of *Paeonia lactiflora* Pall. or *Paeonia veitchii* Lynch or a mixture of the two, with rhizome and rootlets removed.

*Content*: minimum 1.8 per cent of paeoniflorin ($C_{23}H_{28}O_{11}$; $M_r$ 480.5) (dried drug).

IDENTIFICATION

A. *Whole drug.* The whole root is cylindrical, slightly curved. Truncated at both ends, 4-40 cm long, 0.5-3 cm in diameter, externally brown or reddish-brown, rough, longitudinally furrowed and wrinkled, showing rootlet scars and transversely prominent lenticels. The outer bark is sometimes easily exfoliated. The texture is hard and fragile, easily broken.

*Fragmented drug.* The fragmented root usually occurs as longitudinal slices, 2-8 cm long, about 1-5 mm thick and 0.5-3 cm in diameter, or as transversal slices, about 2-4 mm thick and 0.5-3 cm in diameter. The edges are brown, the cut surface is chalk-white or pinkish, the bark is narrow and the wood shows distinct radial striations, sometimes with clefts.

B. Microscopic examination (*2.8.23*). The powder is greyish-white or pale brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2425.-1): reticulate or bordered pitted vessels [G] up to 65 µm in diameter; cluster crystals of calcium oxalate, 10-35 µm in diameter, isolated [C] or included in parenchymatous cells [B], sometimes several in the same cell [Ba], sometimes arranged in rows [Ga]; long, fusiform, ligneous fibres, with thickened and slightly lignified walls with large oblique or cross pits [E]; brown cork fragments (surface view [A], transverse section [D]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, spheroidal starch granules up to 50 µm in diameter [F].

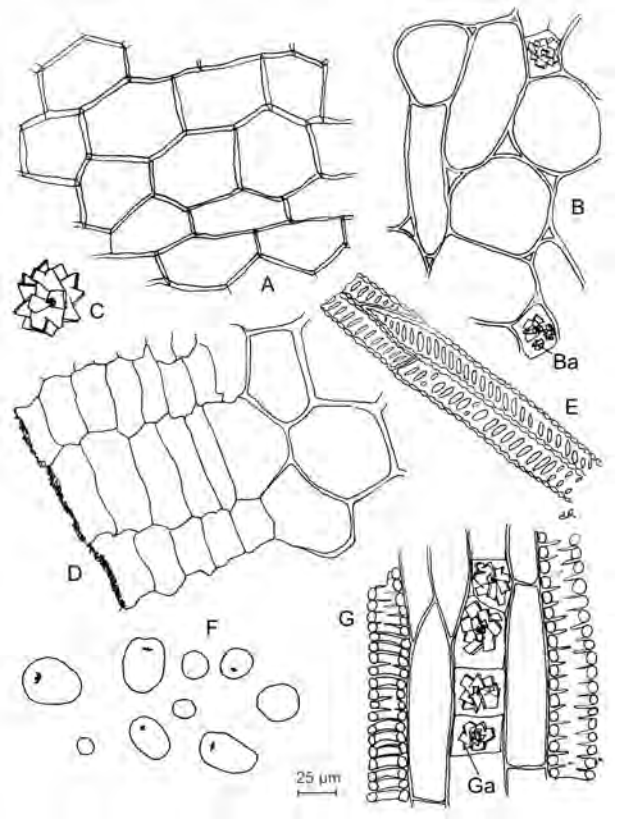

Figure 2425.-1. – *Illustration for identification test B of powdered herbal drug of peony root, red*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R* and heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant.

*Reference solution.* Dissolve 1 mg of *paeoniflorin R* and 1 mg of *paeonol R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *ethyl acetate R*, *methanol R*, *methylene chloride R* (3:5:5:35 *V/V/V/V*).

*Application*: 8 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. To 30.0 mg of the powdered herbal drug (355) (*2.9.12*) add 3.0 mL of *methanol R* and sonicate for 30 min. Dilute to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a)*. Dissolve 5.0 mg of *paeoniflorin CRS* in *methanol R* and dilute to 25.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 1.0 mg of *4′-hydroxyacetophenone R* in 6.0 mL of reference solution (a). Dilute 3.0 mL of this solution to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

*Reference solution (c)*. Dilute 2.5 mL of reference solution (a) to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *methanol R*, 6.8 g/L solution of *potassium dihydrogen phosphate R* (30:70 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: 18 min.

*Retention time*: paeoniflorin = about 8 min; 4′-hydroxyacetophenone = about 9 min.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to paeoniflorin and 4′-hydroxyacetophenone.

Calculate the percentage content of paeoniflorin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$ = area of the peak due to paeoniflorin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to paeoniflorin in the chromatogram obtained with reference solution (c);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *paeoniflorin CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of paeoniflorin in *paeoniflorin CRS*.

**01/2017:2424**

# PEONY ROOT, WHITE

## Paeoniae radix alba

DEFINITION

Whole or fragmented, peeled root, of *Paeonia lactiflora* Pall. with rhizome and rootlets removed, treated with boiling water and dried.

*Content*: minimum 1.6 per cent of paeoniflorin ($C_{23}H_{28}O_{11}$; $M_r$ 480.5) (dried drug).

IDENTIFICATION

A. *Whole drug.* The whole root is cylindrical, straight or slightly curved, truncated at both ends, 5-18 cm long, 1-2.5 cm in diameter, externally whitish or pale reddish-brown, glossy or with longitudinal wrinkles and rootlet scars. Blackish-brown zones due to lesions, especially those around the rootlet scars, and remains of brown cork are occasionally present. The texture is compact, relatively even and not easily broken.

*Fragmented drug.* The fragmented root usually occurs as longitudinal slices, 2-8 cm long, about 1-5 mm thick and 1-2.5 cm in diameter, or as transversal slices, about 2-4 mm thick and 1-2.5 cm in diameter. The edges are whitish or pale reddish-brown and the cut surface is whitish, often with a pinkish tone. The cambium ring and radial striations are distinct.

B. Microscopic examination (*2.8.23*). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2424.-1): bordered-pitted or reticulate vessels [A, E], 20-65 µm in diameter; cluster crystals of calcium oxalate, 10-35 µm in diameter, isolated [C, D] or included in parenchymatous cells [B, F], sometimes several in the same cell [Fa], often arranged in rows [Ba]; ligneous fibres with thickened walls with large pits [Ea]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous masses of gelatinised starch, either isolated [H] or associated with the remains of cells [G].

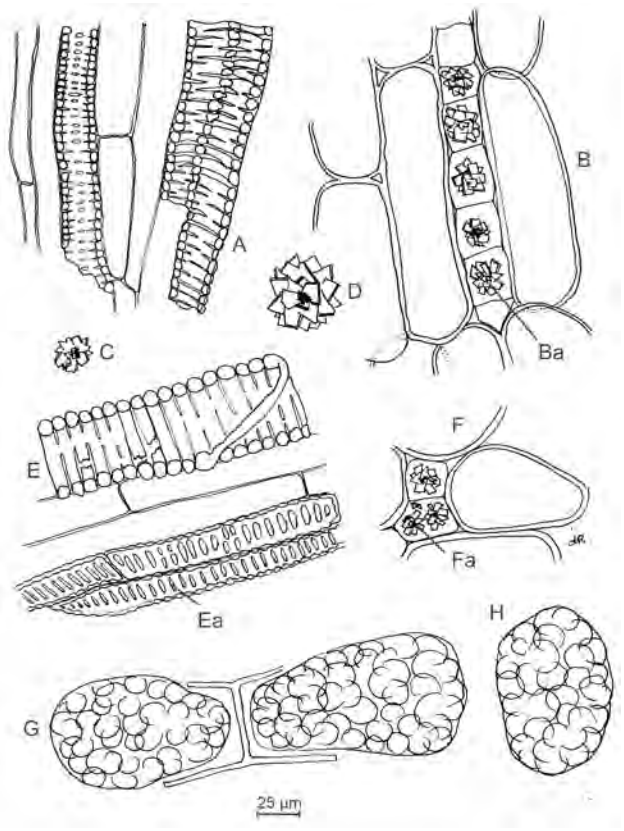

Figure 2424.-1. – *Illustration for identification test B of powdered herbal drug of peony root, white*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R* and heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant.

*Reference solution.* Dissolve 1 mg of *paeoniflorin R* and 1 mg of *paeonol R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *ethyl acetate R*, *methanol R*, *methylene chloride R* (3:5:5:35 *V/V/V/V*).

*Application*: 8 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

**corrected 10.0**

# PEPPER

## Piperis fructus

DEFINITION

Dried, ripe or nearly ripe fruit of *Piper nigrum* L. with an unbroken pericarp (black pepper) or with the outer layers of the pericarp removed (white pepper).

*Content*:

– *essential oil*: minimum 25 mL/kg (anhydrous drug);
– *piperine* ($C_{17}H_{19}NO_3$; $M_r$ 285.3): minimum 3.0 per cent (anhydrous drug).

IDENTIFICATION

A. *White pepper.* Spheroid berries, 3-5 mm in diameter, slightly flattened at one pole and with a small protuberance at the other, with smooth, externally matt, brownish-grey, greyish-white or pale yellowish-white surface, with numerous pale, linear striations between apex and base.

*Black pepper.* Spheroid berries, 3-6 mm in diameter, externally blackish-brown, with raised reticular wrinkles, bearing fine remains of the style at the apex and a scar of the peduncle at the base. The texture is hard, the epicarp can be stripped, the endocarp is greyish-white or pale yellow. The fracture is greyish-white, starchy, possessing a small space at the centre.

B. Microscopic examination (*2.8.23*).

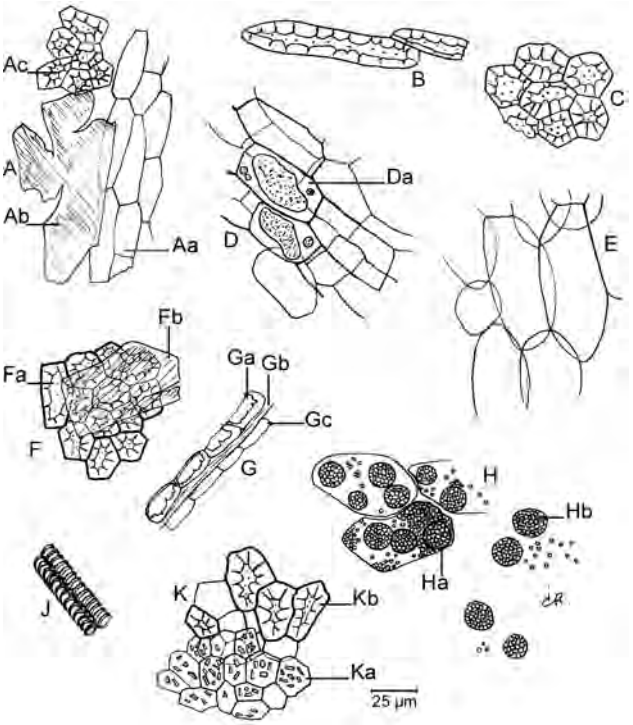

Figure 2477.-1. – *Illustration for identification test B of powdered herbal drug of pepper*

*White pepper.* The powder is light grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2477.-1): fragments of the endocarp in surface view, consisting of more or less polygonal sclereids about 20-30 µm in diameter, which have irregularly thickened walls [Ac, C, Fa] and which may or may not be associated with the testa [A, F], consisting of a layer of indistinct, reddish-brown pigmented cells constituting the 'pigmented layer' [Ab, Fb] and a layer of very thin-walled polygonal cells constituting the 'hyaline layer' [Aa]; fragments of the endocarp, in transverse section [G], showing sclereids with thickened inner walls on the 3 lower sides [Ga], usually associated with the testa (pigmented layer [Gb] and hyaline layer [Gc]); fragments of the parenchyma of the mesocarp [D] containing large oil cells 50-75 µm in diameter [Da]; numerous thin-walled, ovoid or polygonal cells of the parenchyma of the seed [E]; rare, elongated sclereids, with thickened walls, from the fruit peduncle [B]; a few fragments of vascular tissue with narrow spiral vessels [J]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. Rounded, compound starch granules [H], about 30 µm in diameter, made up of tiny individual granules, ovoid or polyhedral by compression, free [Hb] or included in the parenchymatous cells of the seed [Ha].

*Black pepper*. The powder is grey. Examine under a microscope using *chloral hydrate solution R*. In addition to the diagnostic characters described for white pepper, the powdered black pepper shows the following diagnostic characters (Figure 2477.-1): fragments of the epicarp [K] with extremely thin-walled, brownish-red pigmented, polygonal or ovoid cells, which contain small prisms of calcium oxalate [Ka], and which are associated with the outer layers of the mesocarp consisting of groups of sclereids with strongly thickened walls [Kb].

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

*Reference solution*. Dissolve 10 mg of *borneol R* and 15 mg of *piperine R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *cyclohexane R* (30:50 *V/V*).

*Application*: 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent.

**Water** (*2.2.13*): maximum 120 mL/kg, determined on 20.0 g of the freshly powdered herbal drug (1400) (*2.9.12*) reduced using a knife mill.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 10.0 g of the freshly powdered herbal drug (1400) (*2.9.12*), a 1000 mL round-bottomed flask, 400 mL of *water R* as the distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

**Piperine**. Liquid chromatography (*2.2.29*). *Carry out the assay protected from light.*

*Test solution*. Disperse 0.250 g of the powdered herbal drug (355) (*2.9.12*) in 40 mL of *ethanol (96 per cent) R*. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of *ethanol (96 per cent) R*, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a)*. Dissolve 15.0 mg of *piperine CRS* in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b)*. Disperse 0.250 g of *long pepper for system suitability HRS* (355) (*2.9.12*) in 40 mL of *ethanol (96 per cent) R*. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of *ethanol (96 per cent) R*, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *water R*;

– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 50 | 50 |
| 5 - 20 | 50 → 5 | 50 → 95 |
| 20 - 22 | 5 → 0 | 95 → 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 343 nm.

*Injection*: 10 µL.

*Retention time*: piperine = about 10 min.

*Identification of peaks*: use the chromatogram supplied with *long pepper for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to piperine and peak 2.

*System suitability*: reference solution (b):

– *peak-to-valley ratio*: minimum 4, where $H_p$ = height above the baseline of peak 2 and $H_v$ = height above the baseline of the lowest point of the curve separating the peak due to piperine from peak 2.

Calculate the percentage content of piperine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

$A_1$ = area of the peak due to piperine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to piperine in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *piperine CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of piperine in *piperine CRS*.

**07/2017:0406**

# PEPPERMINT LEAF

## Menthae piperitae folium

DEFINITION

Whole or cut, dried leaf of *Mentha ×piperita* L.

*Essential oil content*:

– for the whole drug, minimum 12 mL/kg (anhydrous drug);

– for the cut drug, minimum 9 mL/kg (anhydrous drug).

CHARACTERS

Penetrating odour reminiscent of menthol.

Peppermint leaf is green or brownish-green, with brownish-violet veins in some varieties. The petioles are green or brownish-violet.

IDENTIFICATION

A. The leaf is entire, broken or cut, thin, fragile and often crumpled; the entire leaf is 3-9 cm long and 1-3 cm wide. The lamina is oval or lanceolate, the apex acuminate, the margin sharply dentate and the base asymmetrical. Venation is pinnate, prominent on the lower surface, with lateral veins leaving the midrib at about 45°. The lower surface is slightly pubescent and secretory trichomes are visible under a lens (6×) as bright yellowish points. The petiole is grooved, usually up to 1 mm in diameter and 0.5-1 cm long.

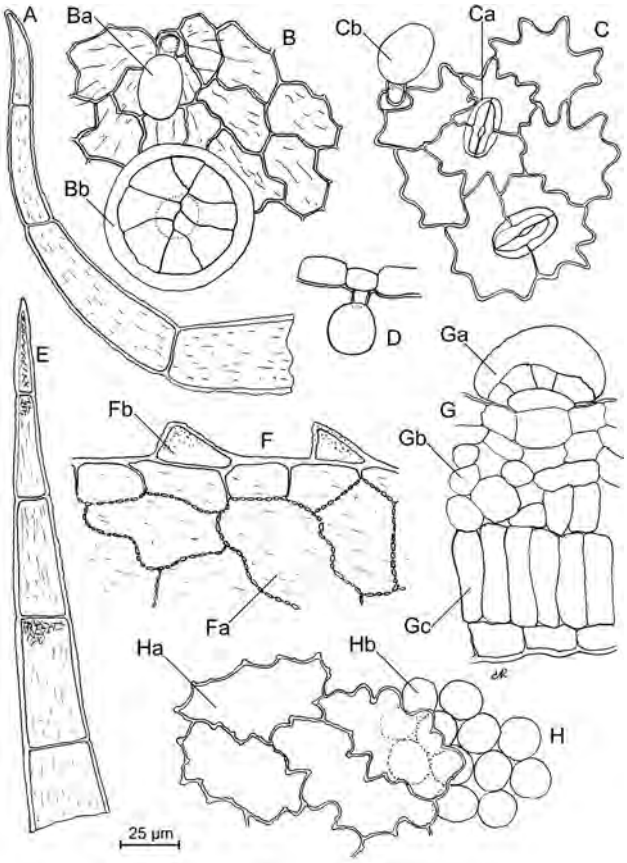

Figure 0406.-1. – *Illustration for identification test B of powdered herbal drug of peppermint leaf*

B. Microscopic examination (*2.8.23*). The powder is brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0406.-1): fragments of epidermises bearing covering and glandular trichomes; adaxial epidermis (surface view [B, H]) having cells with sinuous-wavy walls [Ha] and cuticle striated over the veins [B] associated with palisade parenchyma [Hb]; abaxial epidermis [C] with diacytic stomata (*2.8.3*) [Ca]; covering trichomes are usually fragmented, elongated, uniseriate with 3-8 cells with striated cuticle [A, E]; glandular trichomes of 2 types: a) unicellular stalk with small, rounded unicellular head 15-25 µm in diameter (surface view [Ba, Cb], transverse section [D]), b) unicellular stalk with enlarged oval head 55-70 µm in diameter composed of 8 radiating cells (surface view [Bb], transverse section [Ga]); fragments from near the leaf margin [F] with isodiametric cells whose anticlinal walls are more-or-less straight and beaded [Fa] and short, conical, unicellular or bicellular covering trichomes [Fb]; dorsiventral mesophyll fragments (transverse section [G]), with a single palisade layer [Gc] and 4-6 layers of spongy parenchyma [Gb]. Yellowish crystals of menthol under the cuticle of secretory cells may be present.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 2.5 mL of *methanol R* and 2.5 mL of *water R*, sonicate for 5 min and filter.

*Reference solution.* Dissolve 2 mg of *luteolin-7-glucoside R*, 2 mg of *rutoside trihydrate R* and 5 mg of *rosmarinic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (7:7:18:68 *V/V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

Herbal drugs

*Drying*: in air.

*Detection*: heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Rosmarinic acid: a light blue fluorescent zone | A light blue fluorescent zone (rosmarinic acid) |
| Luteolin-7-glucoside: an orange fluorescent zone | An orange-yellow fluorescent zone<br>A red fluorescent zone |
| Rutoside: an orange fluorescent zone | An orange-yellow fluorescent zone<br>An orange-yellow fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of stems, whose diameter is not greater than 1.5 mm; maximum 2 per cent of foreign elements; not more than 8 per cent of the leaves show brown stains due to *Puccinia menthae*.

Carry out the determination using 10 g of the drug.

**Water** (*2.2.13*): maximum 110 mL/kg, determined on 20.0 g.

**Total ash** (*2.4.16*): maximum 15.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.5 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 20.0 g of the crushed herbal drug, a 500 mL flask, 200 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 3-4 mL/min for 2 h.

**07/2017:2382**

# PEPPERMINT LEAF DRY EXTRACT

## Menthae piperitae folii extractum siccum

DEFINITION

Dry extract produced from *Peppermint leaf (0406)*.

*Content*: minimum 0.5 per cent of rosmarinic acid ($C_{18}H_{16}O_8$; $M_r$ 360.3) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (30-50 per cent *V/V*) or water at minimum 60 °C.

CHARACTERS

*Appearance*: brown, amorphous powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.2 g of the extract to be examined add 2.5 mL of *methanol R* and 2.5 mL of *water R*, sonicate for 5 min and filter.

*Reference solution.* Dissolve 2 mg of *luteolin-7-glucoside R*, 2 mg of *rutoside trihydrate R* and 5 mg of *rosmarinic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (7:7:18:68 *V/V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Rosmarinic acid: a light blue fluorescent zone | A light blue fluorescent zone (rosmarinic acid) |
| Luteolin-7-glucoside: an orange fluorescent zone | A faint orange fluorescent zone<br>An orange-yellow fluorescent zone<br>A red fluorescent zone |
| Rutoside: an orange fluorescent zone | An orange-yellow fluorescent zone<br>An orange-yellow fluorescent zone |
| **Reference solution** | **Test solution** |

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Use brown glass flasks. To 0.400 g of the extract to be examined add 15 mL of *ethanol (50 per cent V/V) R*, sonicate for 10 min and filter into a 20 mL volumetric flask. Rinse the flask and the filter with *ethanol (50 per cent V/V) R* and dilute to 20.0 mL with the same solvent.

*Reference solution (a).* Dissolve 10.0 mg of *rosmarinic acid CRS* in *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b).* Dissolve 5 mg of *ferulic acid R* in reference solution (a) and dilute to 50 mL with the same solution.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *phosphoric acid R*, *acetonitrile R*, *water for chromatography R* (1:19:80 *V/V/V*);

– *mobile phase B*: *phosphoric acid R*, *methanol R*, *acetonitrile R* (1:40:59 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 100 → 55 | 0 → 45 |
| 20 - 25 | 55 → 0 | 45 → 100 |
| 25 - 30 | 0 → 100 | 100 → 0 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 20 µL.

*Identification of peaks*: use the chromatogram obtained with reference solution (a) to identify the peak due to rosmarinic acid.

*Relative retention* with reference to rosmarinic acid (retention time = about 11 min): ferulic acid = about 0.8.

*System suitability*: reference solution (b):

– *resolution*: minimum 4.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *rosmarinic acid CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of rosmarinic acid in *rosmarinic acid CRS*.

**04/2019:0405**

# PEPPERMINT OIL

## Menthae piperitae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fresh aerial parts of *Mentha* × *piperita* L.

CHARACTERS

*Appearance:* colourless, pale yellow or pale greenish-yellow liquid.

Characteristic odour and taste followed by a sensation of cold.

*Solubility:* miscible with ethanol (96 per cent) and with methylene chloride.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Mix 0.1 g of the substance to be examined with *toluene R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 50 mg of *menthol R*, 20 µL of *cineole R*, 10 mg of *thymol R* and 10 µL of *menthyl acetate R* in *toluene R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL [or 1 µL] of the reference solution and 20 µL [or 2 µL] of the test solution, as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| Thymol: a quenching zone | |
| | Quenching zones may be present (carvone, pulegone) |
| _____ | _____ |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine immediately in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intensely coloured zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | An intense violet-red zone (near the solvent front) (hydrocarbons) |
| | A brownish-yellow zone (menthofuran) |
| _____ | _____ |
| Menthyl acetate: a violet-blue zone | A violet-blue zone (menthyl acetate) |
| | A greenish-blue zone (menthone) |
| Thymol: a pink zone | |
| | Light pink or greyish-blue or greyish-green zones may be present (carvone, pulegone, isomenthone) |
| 1,8-Cineole: a violet-blue or brown zone | A faint violet-blue or brown zone (1,8-cineole) |
| _____ | _____ |
| Menthol: an intense blue or violet zone | An intense blue or violet zone (menthol) |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks due to limonene, 1,8-cineole, menthone, menthofuran, isomenthone, menthyl acetate and menthol in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a). Isopulegol, pulegone and carvone may be present in the chromatogram obtained with the test solution.

TESTS

**Relative density** (*2.2.5*): 0.900 to 0.916.

**Refractive index** (*2.2.6*): 1.457 to 1.467.

**Optical rotation** (*2.2.7*): – 30° to – 10°.

**Acid value** (*2.5.1*): maximum 1.4, determined on 5.0 g diluted in 50 mL of the prescribed mixture of solvents.

**Fatty oils and resinified essential oils** (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

**Mint oil**. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the chromatogram obtained with the test solution does not show a peak with the retention time of isopulegol that has an area of more than 0.2 per cent of the total area.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Mix 0.20 mL of the substance to be examined with *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 10 µL of *limonene R*, 20 µL of *cineole R*, 40 µL of *menthone R*, 10 µL of *menthofuran R*, 10 µL of *(+)-isomenthone R*, 40 µL of *menthyl acetate R*, 20 µL of *isopulegol R*, 60 mg of *menthol R*, 20 µL of *pulegone R*, 10 µL of *piperitone R* and 10 µL of *carvone R* in *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Dissolve 5 µL of *isopulegol R* in *heptane R* and dilute to 10.0 mL with the same solvent. Dilute 0.1 mL of the solution to 5.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 60 |
| | 10 - 70 | 60 → 180 |
| | 70 - 75 | 180 |
| Injection port | | 200 |
| Detector | | 220 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*Identification of peaks*: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to limonene and 1,8-cineole; minimum 1.5 between the peaks due to piperitone and carvone.

Determine the percentage content of each of the following components. The limits are within the following ranges:

- *limonene*: 1.0 per cent to 3.5 per cent;
- *1,8-cineole*: 3.5 per cent to 8.0 per cent;
- *menthone*: 14.0 per cent to 32.0 per cent;
- *menthofuran*: 1.0 per cent to 8.0 per cent;
- *isomenthone*: 1.5 per cent to 10.0 per cent;
- *menthyl acetate*: 2.8 per cent to 10.0 per cent;
- *isopulegol*: maximum 0.2 per cent;
- *menthol*: 30.0 per cent to 55.0 per cent;
- *pulegone*: maximum 3.0 per cent;
- *carvone*: maximum 1.0 per cent;
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

The ratio of 1,8-cineole content to limonene content is a minimum of 2.

STORAGE

At a temperature not exceeding 25 °C.

**01/2008:0754**

# PERU BALSAM

## Balsamum peruvianum

DEFINITION

Balsam obtained from the scorched and wounded trunk of *Myroxylon balsamum* (L.) Harms var. *pereirae* (Royle) Harms.

*Content*: 45.0 per cent *m/m* to 70.0 per cent *m/m* of esters, mainly benzyl benzoate and benzyl cinnamate.

CHARACTERS

*Appearance*: dark brown, viscous liquid which is transparent and yellowish-brown when viewed in a thin layer; it is not sticky, non-drying and does not form threads.

*Solubility*: practically insoluble in water, freely soluble in anhydrous ethanol, not miscible with fatty oils, except for castor oil.

IDENTIFICATION

A. Dissolve 0.20 g in 10 mL of *ethanol (96 per cent) R*. Add 0.2 mL of *ferric chloride solution R1*. A green or yellowish-green colour develops.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.5 g of the substance to be examined in 10 mL of *ethyl acetate R*.

*Reference solution.* Dissolve 4 mg of *thymol R*, 30 mg of *benzyl cinnamate R* and 80 µL of *benzyl benzoate R* in 5 mL of *ethyl acetate R*.

*Plate*: *TLC silica gel $GF_{254}$ plate R*.

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *hexane R* (0.5:10:90 *V/V/V*).

*Application*: 10 µL, as bands of 20 mm by 3 mm.

*Development*: twice over a path of 10 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm and mark the quenching zones.

*Results A*: the chromatogram obtained with the reference solution shows in the upper third 2 quenching zones, the higher one due to benzyl benzoate and the lower one due to benzyl cinnamate. The chromatogram obtained with the test solution shows 2 quenching zones at the same levels and of approximately the same size.

*Detection B*: spray with a freshly prepared 200 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R*, using 10 mL for a plate 200 mm square and examine in daylight while heating at 100-105 °C for 5-10 min.

*Results B*: the zones due to benzyl benzoate and benzyl cinnamate are blue against a yellow background. The chromatogram obtained with the reference solution shows at about the middle a violet-grey zone (thymol). In the chromatogram obtained with the test solution, a blue zone

(nerolidol) is seen just below the level of the zone due to thymol in the chromatogram obtained with the reference solution. Just below the zone due to nerolidol, no blue zone is seen corresponding to a quenching zone seen when examined in ultraviolet light at 254 nm (colophony). In the upper and lower part of the chromatogram obtained with the test solution, other faint blue zones may be seen.

TESTS

**Relative density** (*2.2.5*): 1.14 to 1.17.

**Saponification value** (*2.5.6*): 230 to 255, determined on the residue obtained in the assay.

**Artificial balsams**. Shake 0.20 g with 6 mL of *light petroleum R1*. The light petroleum solution is clear and colourless and the whole of the insoluble parts of the balsam stick to the wall of the test-tube.

**Fatty oils**. Shake 1 g with 3 mL of a 1000 g/L solution of *chloral hydrate R*. The resulting solution is as clear as the 1000 g/L solution of *chloral hydrate R*.

**Turpentine**. Evaporate to dryness 4 mL of the solution obtained in the test for artificial balsams. The residue has no odour of turpentine.

ASSAY

To 2.50 g in a separating funnel add 7.5 mL of *dilute sodium hydroxide solution R* and 40 mL of *peroxide-free ether R* and shake vigorously for 10 min. Separate the lower layer and shake it with 3 quantities, each of 15 mL, of *peroxide-free ether R*. Combine the ether layers, dry over 10 g of *anhydrous sodium sulfate R* and filter. Wash the sodium sulfate with 2 quantities, each of 10 mL, of *peroxide-free ether R*. Combine the ether layers and evaporate to dryness. Dry the residue (esters) at 100-105 °C for 30 min and weigh.

STORAGE

Protected from light.

**01/2008:1842**

# PINE SYLVESTRIS OIL

## Pini sylvestris aetheroleum

DEFINITION

Essential oil obtained by steam distillation of the fresh leaves and branches of *Pinus sylvestris* L. A suitable antioxidant may be added.

CHARACTERS

*Appearance*: clear, colourless or pale yellow liquid.

Characteristic odour.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dilute 1 mL of the substance to be examined to 10 mL with *toluene R*.

*Reference solution*. Dissolve 10 mg of *borneol R* and 10 µL of *bornyl acetate R* in *toluene R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL [or 2 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A pink zone (hydrocarbons) |
| _____ | _____ |
| Bornyl acetate: a brown or grey-brown zone | A brown or grey-brown zone (bornyl acetate) |
| | A pink zone |
| _____ | _____ |
| Borneol: a brown or grey-brown zone | A cluster of violet zones |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Relative density** (*2.2.5*): 0.855 to 0.875.

**Refractive index** (*2.2.6*): 1.465 to 1.480.

**Optical rotation** (*2.2.7*): – 9° to – 30°.

**Acid value** (*2.5.1*): maximum 1.0.

**Peroxide value** (*2.5.5*): maximum 20.

**Fatty oils and resinified oils** (*2.8.7*). It complies with the test.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. The substance to be examined.

*Reference solution (a)*. Dissolve 30 µL of *α-pinene R*, 10 mg of *camphene R*, 20 µL of *β-pinene R*, 10 µL of *car-3-ene R*, 10 µL of *β-myrcene R*, 20 µL of *limonene R*, 10 µL of *p-cymene R*, 10 µL of *terpinolene R*, 10 µL of *bornyl acetate R* and 10 µL of *β-caryophyllene R* in 1 mL of *heptane R*.

*Reference solution (b)*. Dissolve 10 mg of *camphene R* in *heptane R* and dilute to 2 mL with the same solvent. Dilute 0.1 mL of the solution to 1 mL with *heptane R*.

*Column*:

- *material*: fused silica,
- *size*: *l* = 60 m, Ø = 0.22 mm,
- *stationary phase*: *macrogol 20 000 R* (0.2 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 65 |
| | 10 - 41 | 65 → 220 |
| | 41 - 50 | 220 |
| Injection port | | 220 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 0.2 µL.

*Elution order*: order indicated in the preparation of reference solution (a). Record the retention times of these substances.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to car-3-ene and β-myrcene.

*Identification of components*: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. The peak due to β-phellandrene is eluted after the peak due to limonene with a relative retention of about 1.03 with reference to limonene.

Determine the percentage content of these components. The limits are within the following ranges:

– *α-pinene*: 32.0 per cent to 60.0 per cent,
– *camphene*: 0.5 per cent to 2.0 per cent,
– *β-pinene*: 5.0 per cent to 22.0 per cent,
– *car-3-ene*: 6.0 per cent to 18.0 per cent,
– *β-myrcene*: 1.5 per cent to 10.0 per cent,
– *limonene*: 7.0 per cent to 12.0 per cent,
– *β-phellandrene*: maximum 2.5 per cent,
– *p-cymene*: maximum 2.0 per cent,
– *terpinolene*: maximum 4.0 per cent,
– *bornyl acetate*: 1.0 per cent to 4.0 per cent,
– *β-caryophyllene*: 1.0 per cent to 6.0 per cent,
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b).

STORAGE

At a temperature not exceeding 25 °C.

**04/2018:2660**
**corrected 9.6**

# PLATYCODON ROOT

## Platycodonis radix

DEFINITION

Dried whole or fragmented root of *Platycodon grandiflorus* (Jacq.) A.DC., peeled or unpeeled, with rootlets removed, collected in spring or autumn.

*Content*: minimum 0.3 per cent of total saponins, expressed as platycodin D ($C_{57}H_{92}O_{28}$; $M_r$ 1225) (dried drug).

IDENTIFICATION

A. *Whole drug.* The whole root is cylindrical or slightly fusiform, gradually tapering downwards, sometimes branched, slightly twisted, about 5-20 cm long and 0.3-2 cm in diameter. It shows deep, longitudinally twisted furrows and rootlet scars or transverse lenticel-like scars; the margins of the rootlet scars may appear shiny and slightly translucent; the upper part of the root also shows transverse striations. The outer surface of the peeled root is white or brownish-yellow, whilst the outer surface of the unpeeled root is brownish-yellow or brownish-grey. Sometimes the upper part shows a relatively short or inconspicuous rhizome, marked by several crescent-shaped or irregularly round stem scars. The texture is fragile and the fracture uneven.

*Fragmented drug.* The fragmented root occurs as thin discs, about 1.5-4 mm thick, sometimes oblique or irregular; most come from peeled roots, but sometimes showing patches of bark still adhering. The outer surface may sometimes also be cracked. A transverse section shows a distinctly crenate outline, a yellow or pale brown cortex, a distinct, more or less dark brown cambium ring and a well-developed yellow or pale brown xylem showing radial striations and occasional clefts.

B. Microscopic examination (*2.8.23*). The powder is yellowish-white or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2660.-1): reticulate or pitted xylem vessels (longitudinal section [B]) up to 56 µm in diameter, free or in groups of 2, 3 or more, accompanied by thin-walled parenchyma cells [Ba]; the sieve plates of the vessels have a thickened outline giving the appearance of a hole; numerous fragments of parenchyma consisting of ovoid cells [A] with slightly thickened and lignified walls; fragments of phloem containing articulated laticiferous tubes, with thick non-lignified walls and granular yellowish-grey or brown contents (longitudinal section [F], transverse section [D]); fragments of orange cork, consisting of several layers of superimposed cells (surface view [C], transverse section [E]), frequent in unpeeled roots and relatively rare in peeled roots; small calcium oxalate prism crystals may be present in the parenchymatous cells. Examine under a microscope using *glycerol R*. The powder shows numerous pieces of inulin, angular, irregular [H] or crystallised in a fan shape, free or included in parenchyma cells [G].

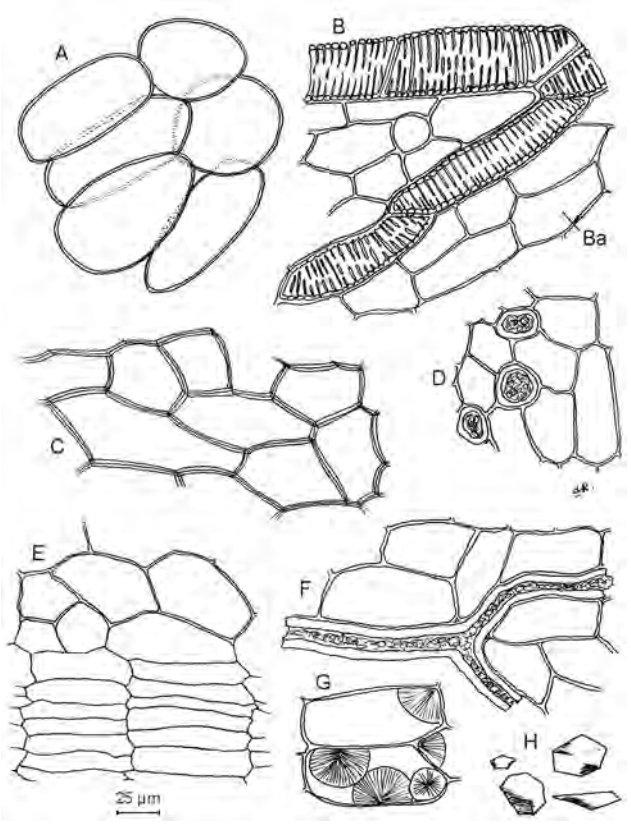

Figure 2660.-1. – *Illustration for identification test B of powdered herbal drug of platycodon root*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.500 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *ethanol (70 per cent V/V) R*. Sonicate for 10 min and centrifuge or filter. Evaporate the supernatant or filtrate to dryness under reduced pressure. Dissolve the residue in 1.0 mL of *water R*. Prepare a ready-to-use sample preparation cartridge containing 50 mg of octadecylsilyl silica gel (55 µm), using 3 mL of *methanol R* followed by 3 mL of *water R*. Apply 1.0 mL of the solution to be analysed to the top of the cartridge. Elute the cartridge with 3 mL of *water R* and collect the eluate. Evaporate the eluate to dryness under reduced pressure. Dissolve the residue in 1.0 mL of *methanol R*.

*Reference solution.* Dissolve 1.0 mg of *glucose R* and 1.0 mg of *xylose R* in 2.0 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *water R*, *methanol R*, *glacial acetic acid R*, *methylene chloride R* (2:3:8:15 *V/V/V/V*).

*Application*: 10 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100 °C for 3 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Xylose: a yellowish-brown zone | A yellowish-brown zone<br>A yellowish-brown zone |
| Glucose: a yellowish-brown zone | 2 yellowish-brown zones |
| **Reference solution** | **Test solution** |

TESTS

***Codonopsis pilosula* (Franch.) Nannf**. Examine the herbal drug as described in identification test B. The presence of sclereids, isolated or in groups, and starch granules indicates adulteration by *Codonopsis pilosula* (Franch.) Nannf.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Solvent mixture*: *water R*, *anhydrous ethanol R* (30:70 *V/V*).

*Test solution.* To 2.00 g of the powdered herbal drug (355) (*2.9.12*) add 50.0 mL of the solvent mixture and sonicate for 45 min. Allow to cool and filter. Rinse the filter with 10 mL of solvent mixture. Combine the filtrate and washings, and evaporate to dryness under reduced pressure. Take up the residue with the solvent mixture, transfer to a volumetric flask and dilute to 10.0 mL with the solvent mixture. Shake well and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 8.0 mg of *platycodin D CRS* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solutions (b), (c), (d), (e), (f), (g).* Dilute reference solution (a) to obtain 6 reference solutions of platycodin D, the concentrations of which span the expected value in the test solution.

*Reference solution (h).* Dissolve 5.0 mg of *platycodon root dry extract for system suitability HRS* in 1.0 mL of *methanol R*.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped solid core octadecylsilyl silica gel for chromatography R* (2.7 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *water for chromatography R*;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 85 → 75 | 15 → 25 |
| 10 - 30 | 75 | 25 |

*Flow rate*: 1.0 mL/min.

*Detection*: evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criteria:

- *carrier gas*: *nitrogen R*;
- *pressure*: 350 kPa;
- *evaporator temperature*: 45 °C.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *platycodon root dry extract for system suitability HRS* and the chromatogram obtained with reference solution (h) to identify the peaks due to saponins 1, 2 (platycodin D), 3, 4 and 5; use the chromatogram obtained with reference solution (a) to identify the peak due to platycodin D.

*Relative retention* with reference to platycodin D (retention time = about 21 min): saponin 1 = about 0.98; saponin 3 = about 1.03; saponin 4 = about 1.06; saponin 5 = about 1.08. Additional peaks may be present.

*System suitability*:

- *resolution*: minimum 1.5 between the peaks due to saponin 1 and platycodin D in the chromatogram obtained with reference solution (h);
- *signal-to-noise ratio*: minimum 50 for the principal peak in the chromatogram obtained with reference solution (a).

Establish a calibration curve with the common logarithm of the concentration (in milligrams per millilitre) of reference solutions (a), (b), (c), (d), (e), (f) and (g) (corrected by the assigned percentage content of *platycodin D CRS*) as the abscissa and the common logarithm of the corresponding peak area as the ordinate.

Calculate the percentage content of saponins 1, 2, 3, 4 and 5 using the following expression:

$$\frac{10^A}{m}$$

*A* = common logarithm of the concentration of the peak due to each saponin in the chromatogram obtained with the test solution, determined from the calibration curve;

*m* = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Calculate the percentage content of total saponins, expressed as platycodin D, by taking the sum of the percentage contents of saponins 1, 2, 3, 4 and 5.

**01/2017:2724**

# POLYGONUM CUSPIDATUM RHIZOME AND ROOT

## Polygoni cuspidati rhizoma et radix

DEFINITION

Dried, fragmented rhizome and root, with rootlets removed, of *Reynoutria japonica* Houtt. (syn. *Polygonum cuspidatum* Sieb. et Zucc.) collected in spring or autumn.

*Content*:

– *emodin* ($C_{15}H_{10}O_5$; $M_r$ 270.2): minimum 1.0 per cent (dried drug),

– *polydatin* ($C_{20}H_{22}O_8$; $M_r$ 390.4): minimum 1.5 per cent (dried drug).

IDENTIFICATION

A. Irregular thick slices or sections, about 2-9 cm long and 5-27 mm in diameter or sometimes cylindrical pieces. The outer surface is yellowish-brown, with longitudinal striations and rootlet scars. In transverse section, the brown or reddish-brown bark is relatively thin, separating easily from the wood. The wood is thick, yellowish-brown, with numerous radial striations. The pith of the rhizome is large, hollowed and transversally septate.

B. Microscopic examination (*2.8.23*). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2724.-1): very numerous cluster crystals of calcium oxalate, up to 100 µm in diameter, usually free [H], or sometimes inside parenchyma cells [Ca]; brownish-yellow fragments of cork (surface view [A]), with wavy striations in the cells; sclereids, elongated and ramified at one end, with clearly channelled walls, isolated or in small groups [G]; bundles of phloem fibres [E], thick-walled and channelled; fragments of the medullary rays [B], with rectangular or sub-rectangular cells with slightly thickened, beaded and pitted walls; fragments of large vessels, usually with bordered pits [D, F]; fragments of parenchyma with large ovoid cells having slightly thickened and pitted walls [C]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules, rounded or elliptical, on average 10 µm in diameter and with a punctiform or slightly eccentric slit-shaped hilum, simple or 2-10 compound [J].

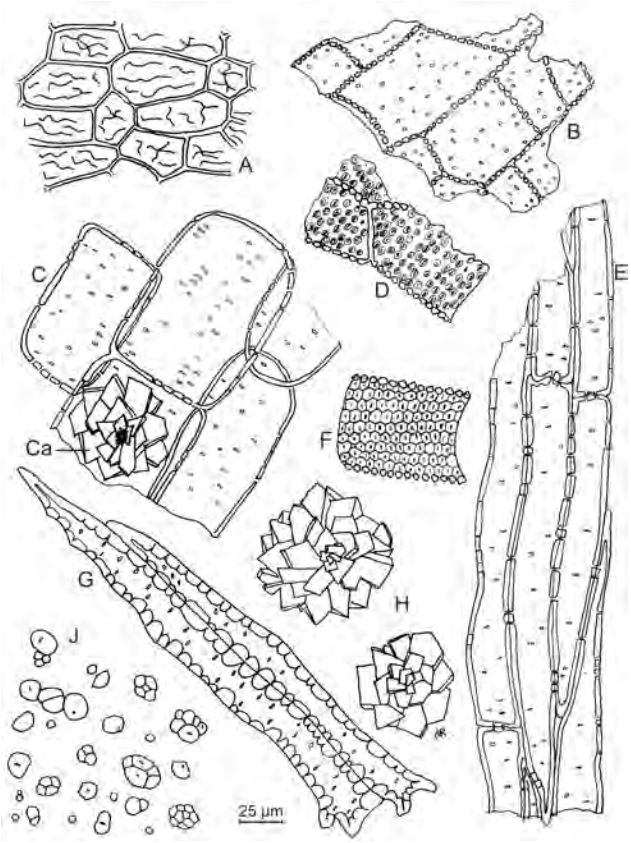

Figure 2724.-1. – *Illustration for identification test B of powdered herbal drug of Polygonum cuspidatum rhizome and root*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R* and sonicate for 10 min. Centrifuge or filter, and use the supernatant or the filtrate as the test solution.

*Reference solution.* Dissolve 1 mg of *polydatin R* and 1 mg of *resveratrol R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *methanol R*, *methylene chloride R* (20:80 *V/V*).

*Application*: 8 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| | 2 yellow fluorescent zones |
| Resveratrol: a blue fluorescent zone | A blue fluorescent zone (resveratrol) |
| | An orange fluorescent zone |
| _____ | _____ |
| | A blue fluorescent zone |
| | A broad orange fluorescent zone |
| _____ | _____ |
| Polydatin: a blue fluorescent zone | A blue fluorescent zone (polydatin) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 4 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

**Emodin**. Liquid chromatography (*2.2.29*).

*Test solution.* To 0.150 g of the powdered herbal drug (355) (*2.9.12*) in a round-bottomed flask add 150.0 mL of a 14 per cent *V/V* solution of *sulfuric acid R* and 150.0 mL of *methylene chloride R*. Heat under a reflux condenser in a water-bath at 60 °C for 2 h. Allow to cool and transfer the contents to a separating funnel. Separate the organic layer and shake the acid layer with 3 quantities, each of 15 mL, of *methylene chloride R*. Combine the organic extracts and evaporate to dryness. Dissolve the residue in *methanol R* and dilute to 100.0 mL with the same solvent. Filter the solution through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 5.0 mg of *emodin CRS* in *methanol R* and dilute to 50.0 mL with the same solvent. Dilute 5.0 mL of the solution to 20.0 mL with *methanol R*.

*Reference solution (b).* Dissolve 2.5 mg of *rhein R* in *methanol R* and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with reference solution (a).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: *phosphoric acid R, water for chromatography R* (0.1:99.9 *V/V*);

– *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 11 | 15 | 85 |
| 11 - 11.1 | 15 → 5 | 85 → 95 |
| 11.1 - 22 | 5 | 95 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL.

*Retention time*: rhein = about 4 min; emodin = about 6 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 5 between the peaks due to rhein and emodin.

Calculate the percentage content of emodin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

$A_1$ = area of the peak due to emodin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to emodin in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *emodin CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of emodin in *emodin CRS*.

**Polydatin**. Liquid chromatography (*2.2.29*). *Carry out the assay protected from bright light.*

*Test solution.* To 0.200 g of the powdered herbal drug (355) (*2.9.12*) in a round-bottomed flask add 50.0 mL of *ethanol (50 per cent V/V) R* and weigh. Heat under a reflux condenser in a water-bath at 95 °C for 30 min. Allow to cool, weigh and adjust to the original mass with *ethanol (50 per cent V/V) R* and shake well. Filter and dilute 3.0 mL of the filtrate to 25.0 mL with a 60 per cent *V/V* solution of *methanol R*.

*Reference solution (a).* Dissolve 5.0 mg of *polydatin CRS* in *methanol R* and dilute to 50.0 mL with the same solvent. Dilute 10.0 mL of the solution to 50.0 mL with a 60 per cent *V/V* solution of *methanol R*.

*Reference solution (b).* Dissolve 5.0 mg of *resveratrol R* in a 60 per cent *V/V* solution of *methanol R* and dilute to 50.0 mL with the same solution. Dilute 3.0 mL of the solution to 25.0 mL with reference solution (a).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 35 °C.

*Mobile phase*:

– *mobile phase A*: *water for chromatography R*;

– *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 12 | 82 | 18 |
| 12 - 18 | 82 → 5 | 18 → 95 |
| 18 - 25 | 5 | 95 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 306 nm.

*Injection*: 20 µL.

*Retention time*: polydatin = about 10 min; resveratrol = about 17 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 5 between the peaks due to polydatin and resveratrol.

Calculate the percentage content of polydatin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 1.67}{A_2 \times m_1}$$

$A_1$ = area of the peak due to polydatin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to polydatin in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *polydatin CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of polydatin in *polydatin CRS*.

**01/2017:2726**
**corrected 9.2**

# POLYGONUM ORIENTALE FRUIT

## Polygoni orientalis fructus

DEFINITION

Dried ripe fruit of *Persicaria orientalis* (L.) Spach (syn. *Polygonum orientale* L.).

*Content*: minimum 0.15 per cent of taxifolin ($C_{15}H_{12}O_7$; $M_r$ 304.3) (dried drug).

IDENTIFICATION

A. The fruit is roundish and oblate, the flattened sides slightly concave, about 2-3.5 mm in diameter and about 1-1.5 mm thick. The glossy surface is brownish-black or reddish-brown. There is a light brown and slightly protruding pedicel at the base with the remains of the membranous perianth. The texture is hard.

Herbal drugs

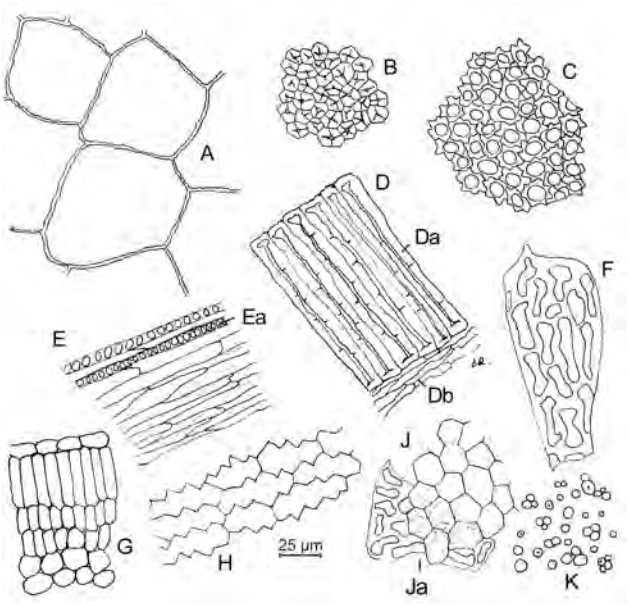

Figure 2726.-1. – *Illustration for identification test B of powdered herbal drug of Polygonum orientale fruit*

B. Microscopic examination (*2.8.23*). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2726.-1): fragments of the pericarp consisting of groups of yellowish-brown or reddish-brown palisade cells, 100-190 µm long and 15-30 µm wide, with thickened walls [Da], arranged as a single layer (side view [D]), which exhibit, on the outer surface, a polygonal or near-circular shape, narrow lumina and pitted walls (surface view [B]), and on the inner surface, a sinuous, anticlinal shape and circular lumina (surface view [C]); fragments of the inner part of the pericarp composed of brown rectangular cells [Db]; fragments of the parenchyma of the mesocarp, with colourless thin-walled cells [E], sometimes accompanied by fine annular or spiral vessels [Ea]; fragments of the testa consisting of a layer of cells with a barely visible zigzag [H] or polygonal [J] pattern mostly attached to a layer with a sinuous wall structure [Ja, F]; fragments of the cotyledons with thin-walled, small parenchyma cells (transverse section [G]); fragments of the endosperm with thin-walled cells [A]; possibly fragments of the perianth with cluster crystals of calcium oxalate up to 50 µm in diameter, small vascular bundles and a partly papillous epidermis. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous simple starch granules 2-9 µm in diameter, sometimes with a cleft hilum [K].

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Sonicate at 60 °C for 10 min. Allow to cool and filter; use the filtrate.

*Reference solution*. Dissolve 2.0 mg of *taxifolin R* and 3.0 mg of *kaempferol R* in 6 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *acetone R*, *glacial acetic acid R*, *anhydrous formic acid R*, *methylene chloride R* (4:5:5:50 *V/V/V/V*).

*Application*: 7 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: heat at 100 °C for 3 min; treat the still-warm plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, and then with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for 60 min. Examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. 0.500 g of the powdered herbal drug (355) (*2.9.12*) in a round-bottomed flask, add 25 mL of a 55 per cent *V/V* solution of *methanol R*. Heat under a reflux condenser in a water-bath at 90 °C for 1 h. Allow to cool and filter. Rinse the filter with 5.0 mL of *hydrochloric acid R1*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 50.0 mL with a 55 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a)*. Dissolve 5.0 mg of *taxifolin CRS* in a 55 per cent *V/V* solution of *methanol R*. Add 2.5 mL of *hydrochloric acid R1* and dilute to 25.0 mL with a 55 per cent *V/V* solution of *methanol R*. To 10.0 mL of this solution add 4.0 mL of *hydrochloric acid R1* and dilute to 50.0 mL with a 55 per cent *V/V* solution of *methanol R*.

*Reference solution (b)*. 0.500 g of *polygonum orientale fruit for system suitability HRS* in a round-bottomed flask, add 25.0 mL of a 55 per cent *V/V* solution of *methanol R*. Heat under a reflux condenser in a water-bath at 90 °C for 1 h. Allow to cool and filter. Rinse the filter with 5.0 mL of *hydrochloric acid R1*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 50.0 mL with a 55 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.150 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R*, *water for chromatography R* (0.1:99.9 *V/V*);
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 85 | 15 |
| 20 - 21 | 85 → 0 | 15 → 100 |
| 21 - 30 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 290 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *polygonum orientale fruit for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to epitaxifolin.

*Retention time*: taxifolin = about 14 min; epitaxifolin = about 16 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to taxifolin and epitaxifolin.

Calculate the percentage content of taxifolin using the following expression:

$$\frac{A_1 \times m_2 \times 0.4 \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to taxifolin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to taxifolin in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *taxifolin CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of taxifolin in *taxifolin CRS*.

**07/2012:2475**

# PORIA

## Poria

DEFINITION

Dried sclerotium without skin of *Wolfiporia extensa* (Peck) Ginns (syn. *Poria cocos* (Schw.) Wolf; *Wolfiporia cocos* (F.A. Wolf) Ryvarden & Gilb.).

IDENTIFICATION

A. Square, rectangular or polyhedral pieces, or slices, varying in length and thickness; whitish with a pale brown hue, flat and smooth, square, rectangular or polyhedral pieces, with no brown skin, difficult to break; slices easily broken, rough fracture with granular or farinaceous texture.

B. Microscopic examination (*2.8.23*). The powder is whitish with a pale brown hue. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: irregularly shaped and occasionally branched colourless particles, which dissolve gradually in *chloral hydrate solution R*. Examine under a microscope using a 50 g/L solution of *potassium hydroxide R*. The powder shows the following diagnostic characters: fragments of hyphae, colourless, slender, slightly curved, sometimes with septa, branched, 3-16 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (250) (*2.9.12*) add a mixture of 2 mL of *ethyl acetate R* and 3 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

*Reference solution.* Dissolve 10 mg of *4-aminobenzoic acid R*, 10 mg of *coumarin R* and 10 mg of *thymol R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *glacial acetic acid R*, *2-propanol R*, *cyclohexane R* (10:10:80 *V/V/V*).

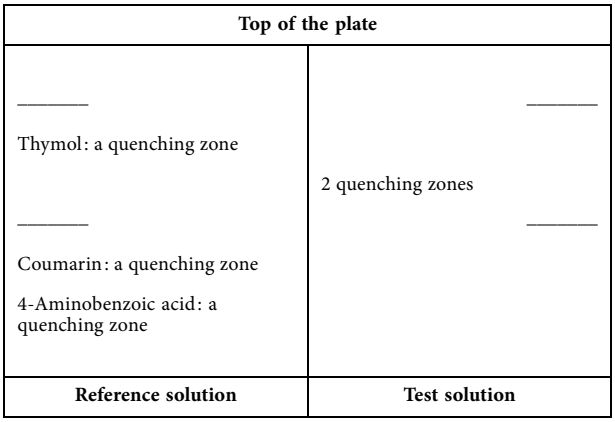
*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution between the zones due to 4-aminobenzoic acid and coumarin in the chromatogram obtained with the reference solution.



D. The herbal drug sticks to the pestle when moistened with *water R* and pressed into a mortar.

E. To a small piece of the herbal drug add 1 drop of *iodinated potassium iodide solution R1*. A deep red colour is produced.

TESTS

**Foreign matter** (*2.8.2*): maximum 0.1 per cent of brown skins and roots of conifer and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 13.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 1.0 per cent.

**Water-soluble extractive**: minimum 1.5 per cent.

To 5.00 g of the powdered herbal drug (355) (*2.9.12*) add 100 mL of boiling *water R*. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 100.0 mL with *water R* and filter. Evaporate 25.0 mL of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 18.75 mg.

**04/2013:1364**

# PRIMULA ROOT

## Primulae radix

DEFINITION

Whole or cut, dried rhizome and root of *Primula veris* L. or *Primula elatior* Hill.

IDENTIFICATION

A. The coarsely torose, greyish-brown rhizome is straight or slightly curved, about 1-5 cm long and about 2-4 mm thick. The rhizome crown often bears the remains of stems and leaves. Attached to the rhizome are numerous brittle roots, about 1 mm thick and usually 6-8 cm long. The root of *P. elatior* is light brown or reddish-brown, that of *P. veris* light yellow or yellowish-white. The fracture is smooth.

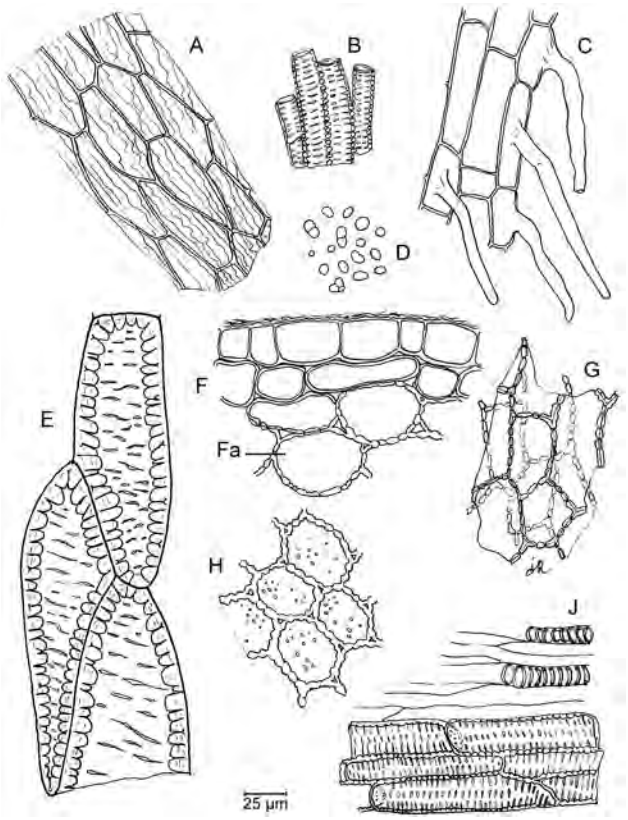


Figure 1364.-1. – *Illustration for identification test B of powdered herbal drug of primula root*

B. Microscopic examination (*2.8.23*). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1364.-1): fragments of parenchyma from the bark of the root or the rhizome and from the medulla of the rhizome [G, H], consisting of rounded or ovoid cells with irregularly thickened and pitted walls; brownish fragments from the dermal tissue of the root showing absorbent hairs [C]; yellow or brownish fragments of the epidermis of the rhizome covered by a striated cuticle (surface view [A], transverse section [F]) accompanied by parenchyma from the bark [Fa]; reticulate vessels [B] sometimes accompanied by spiral vessels [J]; groups of large, strongly pitted, yellowish-green sclereids from the medullary parenchyma of the rhizome [E], which are characteristic of *P. elatior*. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple or compound starch granules of various shapes and sizes [D].

C. Thin-layer chromatography (*2.2.27*) as described in the test for *Vincetoxicum hirundinaria* Medik. root with the following modifications.

*Detection*: treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.

*Results*: the main zone (aescin) in the chromatogram obtained with the reference solution is bluish-violet and is situated near the boundary between the lower and middle thirds. The chromatogram obtained with the test solution shows 1-2 strong dark violet zones a little below the zone due to aescin in the chromatogram obtained with the reference solution; further pale violet, yellowish or brownish-green zones may be visible.

TESTS

***Vincetoxicum hirundinaria* Medik. root**. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (500) (*2.9.12*) add 10 mL of *ethanol (70 per cent V/V) R* and heat under a reflux condenser for 15 min. Cool and filter.

*Reference solution.* Dissolve 10 mg of *aescin R* in 1.0 mL of *ethanol (70 per cent V/V) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (10:40:50 *V/V/V*); use the upper layer.

*Application*: 20 µL as bands.

*Development*: over a path of 12 cm.

*Drying*: in an oven at 100-105 °C.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the chromatograms obtained with the reference solution and the test solution show a quenching zone (aescin) near the boundary between the lower and the middle thirds. Mark this zone.

*Detection B*: examine in ultraviolet light at 365 nm.

*Results B*: in the chromatogram obtained with the test solution no zones of light-blue or greenish fluorescence occur below the main zone due to aescin in the chromatogram obtained with the reference solution.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

**01/2008:0858**
**corrected 6.0**

# PSYLLIUM SEED

## Psyllii semen

DEFINITION

Ripe, whole, dry seeds of *Plantago afra* L. (*Plantago psyllium* L.) or *Plantago indica* L. (*Plantago arenaria* Waldstein and Kitaibel).

CHARACTERS

Sweet taste.

IDENTIFICATION

*P. afra* seeds are light brown to very dark brown but never black, smooth and shiny having an elliptical oblong shape. They are 2-3 mm long and 0.8-1.0 mm wide, one end being wider than the other. Towards the middle of the dorsal surface there is a fairly marked transverse constriction of light colour. On the ventral surface, there is a linear lighter-coloured groove in the middle of which is a clear spot corresponding to the hilum and bounded by swollen edges.

*P. indica* seeds are almost identical to the seeds of *P. afra*, but a little less shiny; they are 2-3 mm long and have a maximum diameter of 1.5 mm.

TESTS

**Swelling index** (*2.8.4*): minimum 10.

**Foreign matter** (*2.8.2*): maximum 1.0 per cent, determined on 10.0 g of the drug, including greenish unripe seeds. Psyllium seed does not contain seeds having a dark central spot on the groove (*Plantago lanceolata* L. and *P. major* L.) or seeds with brownish-grey or pinkish outer coats (*P. ovata* Forssk. and *P. sempervirens* Crantz).

**Loss on drying** (*2.2.32*): maximum 14.0 per cent, determined on 1.000 g of drug by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 4.0 per cent.

STORAGE

Store protected from moisture.

**01/2008:1823**
**corrected 6.0**

# PURPLE CONEFLOWER HERB

## Echinaceae purpureae herba

DEFINITION

Dried, whole or cut flowering aerial parts of *Echinacea purpurea* (L.) Moench.

*Content*: minimum 0.1 per cent for the sum of caftaric acid ($C_{13}H_{12}O_9$; $M_r$ 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$; $M_r$ 474.3) (dried drug).

IDENTIFICATION

*First identification: A, B, C.*

*Second identification: A, B, D.*

A. The herbaceous perennial plant is 60-150 cm, rarely up to 180 cm high. The stem is green to red, upright and slightly branched. The leaves are alternate, ovate to ovate-lanceolate, irregularly serrate, rugose on both surfaces, dark green with prominent light green veins; the lamina is thick and shiny. The involucral bracts of the large capitulum are arranged in 2 or 3 rows. The solid receptacle is slightly convex. Each of the outer violet ligulate florets (4-6 cm) and of the inner violet-pink tubular florets is attached to a reddish acute and coriaceous bract, which overtops the tubular florets. The calyx is reduced to a very short crown, one of the sepals is up to 1 mm long.

B. Microscopic examination (*2.8.23*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: whitish-green groups of fibres, 150-200 µm in length, 10-15 µm in diameter, sometimes with black deposits; fragments of leaves in surface view showing anomocytic or anisocytic stomata (*2.8.3*) (about 35-40 µm in length); uniseriate covering trichomes or fragments thereof consisting mainly of 3 or 4 thick-walled cells of which the apical cell is markedly longer than the others; fragments of leaves with rosette-like arranged epidermal cells around the base of the covering trichomes; uniseriate glandular trichomes composed of very thin-walled cells; pitted parenchymatous cells from the pith of the stem as well as pitted elongated cells from the mesocarp of the achenes; fragments of parenchyma from the seeds with oil droplets; fragments of the epidermis of ligulate florets composed of red to violet papillous cells; spheroidal pollen grains, 30-40 µm in diameter, with a spiny exine.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

*Reference solution.* Dissolve 0.5 mg of *caffeic acid R* and 0.5 mg of *chlorogenic acid R* in 5.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (3:3:9:15 *V/V/V/V*).

*Application*: 25 µL [or 5 µL] of the test solution and 10 µL [or 2 µL] of the reference solution, as bands.

*Development*: over a path of 15 cm [or 5 cm].

*Drying*: in a stream of cold air for about 10 min, then at 100 °C for 2 min.

*Detection*: spray the still-warm plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*; after 30 min, examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | An intense red fluorescent zone |
| Caffeic acid: a strong blue fluorescent zone | A blue fluorescent zone |
| | A blue fluorescent zone |
| Chlorogenic acid: a strong blue fluorescent zone | A faint yellow-orange fluorescent zone |
| **Reference solution** | **Test solution** |

D. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

Herbal drugs

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* In a 100 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (*2.9.12*) and add 80 mL of *ethanol (70 per cent V/V) R*. Sonicate for 15 min and dilute to 100.0 mL with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle.

*Reference solution.* Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 mL with the same solvent. Dilute 4.0 mL of this solution to 100.0 mL with *ethanol (70 per cent V/V) R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R*, *water R* (1:999 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 | 90 | 10 |
| 0 - 13 | 90 → 78 | 10 → 22 |
| 13 - 14 | 78 → 60 | 22 → 40 |
| 14 - 20 | 60 | 40 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 10 µL.

*Relative retention* with reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

*System suitability*: reference solution:

- *resolution*: minimum 5 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to caftaric acid and cichoric acid using the chromatogram in Figure 1823.-1.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

$A_1$ = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

$A_3$ = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;

$C_1$ = concentration of the test solution, in milligrams per millilitre;

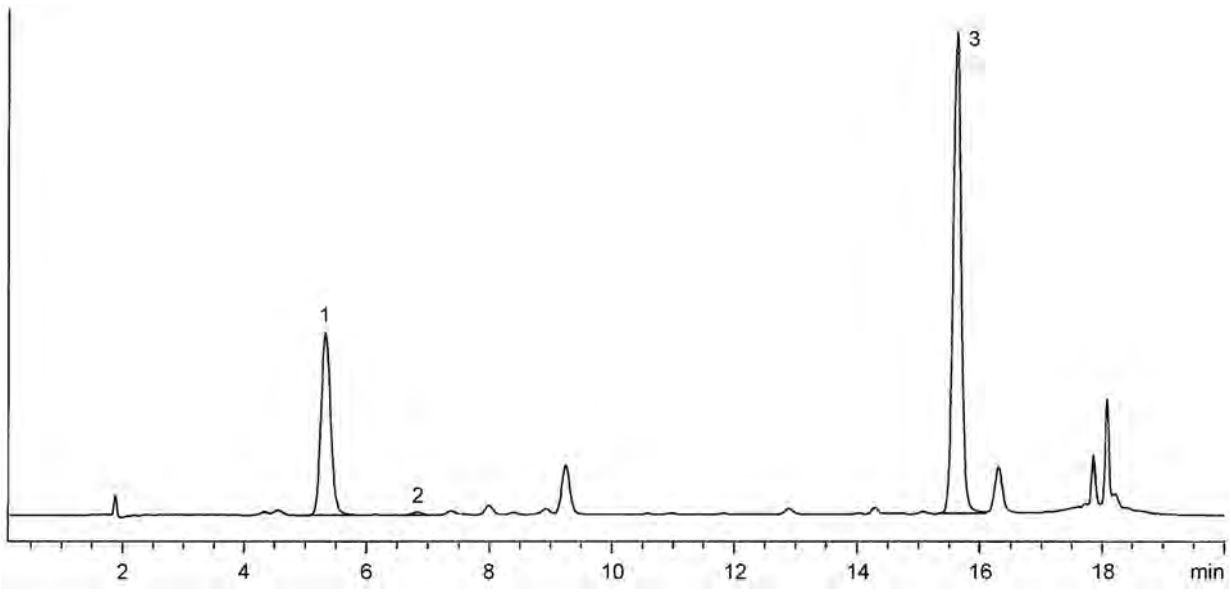
$C_2$ = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

0.695 = peak correlation factor based upon the liquid chromatography response observed;

0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

STORAGE

Uncomminuted.



1. caftaric acid 2. chlorogenic acid 3. cichoric acid

Figure 1823.-1. – *Chromatogram for the assay of caftaric acid and cichoric acid in purple coneflower herb*

**01/2008:1824**
**corrected 6.0**

# PURPLE CONEFLOWER ROOT

## Echinaceae purpureae radix

DEFINITION

Dried, whole or cut underground parts of *Echinacea purpurea* (L.) Moench.

*Content*: minimum 0.5 per cent for the sum of caftaric acid ($C_{13}H_{12}O_9$; $M_r$ 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$; $M_r$ 474.3) (dried drug).

IDENTIFICATION

*First identification: A, B, C, E.*

*Second identification: A, B, D, E.*

A. The rhizome is up to 15 cm long, branched, reddish-brown to dark brown on the surface and carries many stem bases; the inside is fibrous and white. The numerous roots are spirally twisted, light to dark brown and show a fine cross structuring on the surface.

B. Microscopic examination (*2.8.23*). The powder is light yellow to pinkish-beige. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous light-brown spindle-shaped fibres that are joined together in long bundles without black deposits; rare sclereids from the rhizomes and roots, usually occuring singly, those from the rhizomes being isodiametric, about 60 µm in diameter, with black deposits, those from the roots being 50-120 µm in length with no black deposits; secretory cavities up to 180 µm in diameter with yellow oil droplets; squarish to rectangular cells of the outer layers, some with reddish walls; bordered-pitted vessels from the rhizome, 30-40 µm in diameter.

C. Examine the chromatogram obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, faint greenish fluorescent zones may be present just below the zone situated in the middle of the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Caffeic acid: a strong blue fluorescent zone | A strong blue fluorescent zone |
| _____ | _____ |
| Cynarin: a strong greenish fluorescent zone | A blue fluorescent zone |
| _____ | _____ |
| Echinacoside: a strong greenish fluorescent zone | |
| **Reference solution** | **Test solution** |

D. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

E. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methylene chloride R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

*Reference solution.* Dissolve 1 mg of *β-sitosterol R* and a volume of *N-isobutyldodecatetraenamide solution R* corresponding to 1 mg of *N-isobutyldodecatetraenamide R* in 5.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *cyclohexane R*, *ethyl acetate R*, *toluene R* (0.9:3:6:24 *V/V/V/V*).

*Application*: 25 µL [or 5 µL], as bands.

*Development*: over a path of about 15 cm [or 5 cm].

*Drying*: in a stream of cold air for about 10 min.

*Detection*: dip the plate into *anisaldehyde solution R* for 1 s and heat at 100-105 °C for 3 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| | A bluish-violet zone |
| β-Sitosterol: a violet or pink zone | A violet or pink zone (β-sitosterol) |
| *N*-Isobutyldodecatetraenamide: a greyish-blue zone | A greyish-blue zone (*N*-isobutyldodecatetraenamide) |
| _____ | _____ |
| | A dark greyish-blue zone |
| **Reference solution** | **Test solution** |

TESTS

**Other *Echinacea* species and *Parthenium integrifolium*.** Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

*Reference solution.* Dissolve 1 mg of *echinacoside R*, 1 mg of *cynarin R* and 0.5 mg of *caffeic acid R* in 5.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (3:3:9:15 *V/V/V/V*).

*Application*: 10 µL [or 5 µL] of the test solution and 5 µL [or 2 µL] of the reference solution, as bands.

*Development*: over a path of 10 cm [or 5 cm].

*Drying*: in a stream of cold air for about 10 min, then at 105 °C for 2 min.

*Detection*: spray the still-warm plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*; after 30 min, examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the test solution shows no greenish fluorescent zone corresponding to the zone due to echinacoside in the chromatogram obtained with the reference solution, and no greenish fluorescent zone corresponding to the zone due to cynarin in the chromatogram obtained with the reference solution. No other zones apart from very faint dark blue fluorescent zones are seen in the lower half of the chromatogram of the test solution.

**Foreign matter** (*2.8.2*): maximum 3 per cent.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* In a 100 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (*2.9.12*) and add 80 mL of *ethanol (70 per cent V/V) R*. Sonicate for 15 min and dilute to 100.0 mL with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle.

*Reference solution.* Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 mL with the same solvent. Dilute 4.0 mL of this solution to 100.0 mL with *ethanol (70 per cent V/V) R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R, water R* (1:999 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 | 90 | 10 |
| 0 - 13 | 90 → 78 | 10 → 22 |
| 13 - 14 | 78 → 60 | 22 → 40 |
| 14 - 20 | 60 | 40 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 330 nm.

*Injection*: 10 µL.

*Relative retention* with reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

*System suitability*: reference solution:

- *resolution*: minimum 5 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to caftaric acid and cichoric acid using the chromatogram in Figure 1824.-1.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

$A_1$ = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

$A_3$ = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;

$C_1$ = concentration of the dried drug in the test solution, in milligrams per millilitre;

$C_2$ = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

0.695 = peak correlation factor based upon the liquid chromatography response observed;

0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

STORAGE

Uncomminuted.

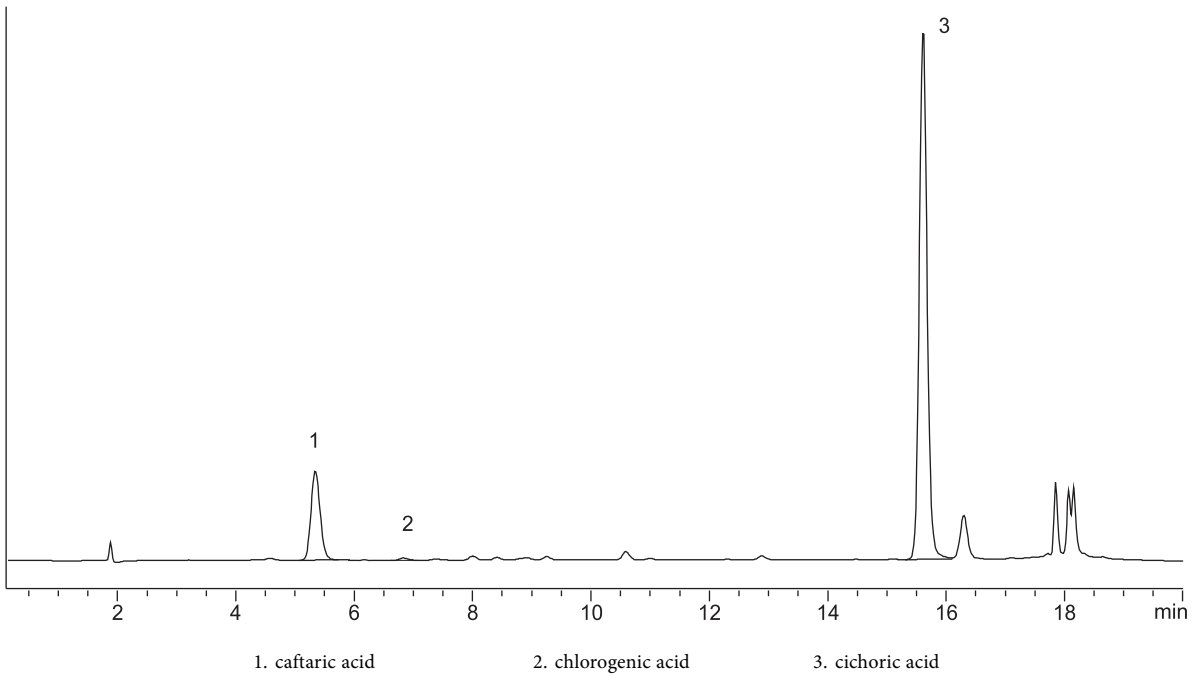


Figure 1824.-1. – *Chromatogram for the assay of caftaric acid and cichoric acid in purple coneflower root*

**01/2015:1886**

# PYGEUM AFRICANUM BARK

## Pruni africanae cortex

DEFINITION

Whole or fragmented, dried bark of the stems and branches of *Prunus africana* (Hook.f.) Kalkman (syn. *Pygeum africanum* Hook.f.).

IDENTIFICATION

A. The dark brown or reddish-brown bark occurs in curved, hard, irregular pieces. The outer surface has a wrinkled dark reddish-brown cork with areas of adhering lichen. The reddish-brown or dark brown inner surface bears longitudinal striations. It may also occur in rolled fragments with a fibrous fracture.

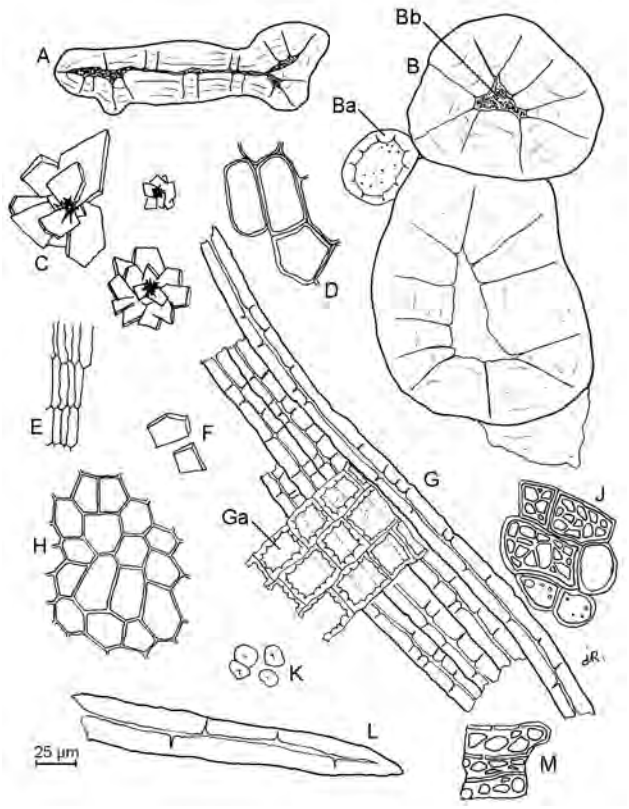

Figure 1886.-1. – *Illustration for identification test B of powdered herbal drug of pygeum africanum bark*

B. Microscopic examination (*2.8.23*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1886.-1): numerous sclereids, varying greatly in size, up to more than 500 µm in diameter, with very thick walls showing concentric striations and a reduced lumen, isolated [A] or in groups [B] sometimes accompanied by sclereids about 50 µm in diameter [Ba], some with granular reddish-brown contents [Bb]; isolated cluster crystals of calcium oxalate of various sizes [C] and a few calcium oxalate prisms [F]; numerous lignified fibres, usually broken, thick-walled and channelled with a narrow lumen, sometimes isolated [L], but usually in groups [G] accompanied by rectangular cells of the medullary rays [Ga]; fragments of parenchyma with reddish-brown, polygonal or ovoid cells [D], including some with reticulate walls [J, M]; fragments of cork (surface view [H], side view [E]). Examine under a microscope using *lactic reagent R*. The powder shows a few simple starch granules that stain violet-blue, rounded, 10-20 µm in diameter, with a punctiform or Y-shaped hilum [K].

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Extract 15.0 g of the powdered herbal drug (250) (*2.9.12*) with *methylene chloride R* for 30 min in a continuous extraction apparatus (Soxhlet type). Filter. Evaporate the solvent to dryness under reduced pressure. Dissolve the residue in 1 mL of *methylene chloride R*.

*Reference solution*. Dissolve 20 mg of *β-sitosterol R* and 20 mg of *ursolic acid R* in 10 mL of a mixture of equal volumes of *methanol R* and *methylene chloride R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *methanol R*, *methylene chloride R* (10:90 *V/V*).

*Application*: 10 µL as bands of 10 mm.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: treat with *vanillin reagent R*, heat at 100-105 °C for 10 min and allow to cool; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A violet zone |
| | Several weak violet, blue or grey zones |
| _____ | _____ |
| β-Sitosterol: a violet zone | A violet zone (β-sitosterol) |
| Ursolic acid: a blue zone | A blue zone (ursolic acid) |
| | Several weak violet, blue or grey zones |
| _____ | _____ |
| | A violet zone (β-sitosterol glucoside) |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3.0 per cent.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Extractable matter**: minimum 0.5 per cent.

Extract 20.0 g of the powdered herbal drug (250) (*2.9.12*) with *methylene chloride R* for 4 h in a continuous extraction apparatus (Soxhlet type). Evaporate the solution to dryness on a water-bath *in vacuo* and then dry the residue at 80 °C for 2 h. The residue weighs a minimum of 0.10 g.

**04/2013:1843**

# QUILLAIA BARK

## Quillajae cortex

DEFINITION

Whole or fragmented, dried bark, with the cork and underlying parenchyma removed, of *Quillaja saponaria* Molina *s.l.*

*Content*: minimum 6.5 per cent of triterpene glycosides, expressed as quillaia saponin III ($C_{104}H_{168}O_{55}$; $M_r$ 2298) (dried drug).

IDENTIFICATION

A. Large, flat pieces of variable length and width, 3-10 mm thick, or smaller, splintered pieces. The outer surface is brownish-white or pale reddish-brown, longitudinally striated or coarsely reticulated, with occasional blackish-brown patches of incompletely removed outer bark. The inner surface is yellowish-white and smooth. The fracture is splintery and laminated, the surface often glistening due to the presence of numerous large prisms of calcium oxalate.

B. Microscopic examination (*2.8.23*). The powder is pale pinkish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1843.-1): abundant phloem fibres [E, F], up to 1 mm long, isolated or, more usually, in groups, each fibre irregular in outline with lignified walls of varying thickness and an uneven lumen; numerous, multiseriate medullary rays, spindle-shaped (tangential section [Ca, Fb]), accompanied by either phloem fibres [Fa] or phloem parenchyma [Cb]; very numerous prisms of calcium oxalate, up to 200 µm long, free, whole or, more usually, fragmented [A] or included in phloem parenchyma cells [Cc, Cd]; occasional sclereids of 2 types: the 1st type is sub-rectangular with pitted, slightly thickened walls, isolated [G] or included in phloem parenchyma cells [H], while the 2nd type has an irregularly shaped outline and very thick walls [J], sometimes adjacent to the bundles of phloem fibres; occasional dark brown or reddish-brown fragments of cork [D]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous, small (5-20 µm), mainly simple, spherical starch granules, either scattered or as compacted masses in parenchyma cells [B].

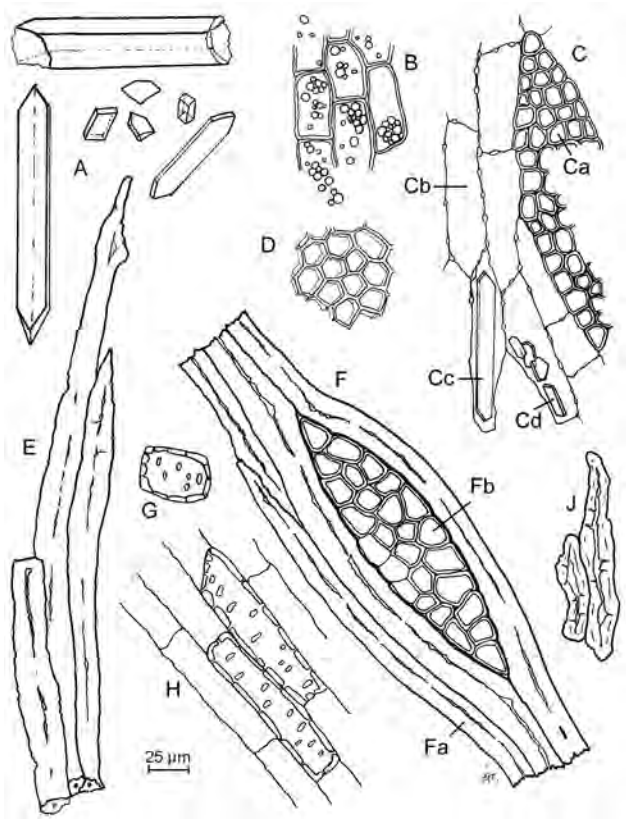

Figure 1843.-1. – *Illustration for identification test B of powdered herbal drug of quillaia bark*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R* and 5 mL of *water R*. Sonicate for 10 min and filter.

*Reference solution.* Dissolve 10 mg of *purified quillaia saponins R* and 2 mg of *sucrose R* in 1 mL of *water R* and mix with 1 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *anhydrous acetic acid R*, *ethyl acetate R*, *water R*, *propanol R* (1.5:30:30:40 *V/V/V/V*).

*Application*: 5 µL as bands of 6 mm.

*Development*: over a path of 6 cm.

*Drying*: in hot air.

*Detection*: treat with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R*; heat at 120 °C for 5 min and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Quillaia saponins: 3 or more green or brown zones | 3 or more green or brown zones (quillaia saponins)<br>A blue zone |
| Sucrose: a brown or blue zone | A brown or blue zone (sucrose) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Introduce 0.500 g of the powdered herbal drug (355) (*2.9.12*) into a round-bottomed flask, add 20 mL of a 20 g/L solution of *potassium hydroxide R* and heat under a reflux condenser in a water-bath for 2 h. After cooling, add 2 mL of *phosphoric acid R* and filter through a plug of absorbent cotton. Add the absorbent cotton to the residue, add 25 mL of *ethanol (96 per cent) R* and shake thoroughly. Filter. Combine the filtrates and dilute to 50.0 mL with *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 12.0 mg of *quillaia saponin for assay CRS* (containing monoammonium glycyrrhizate) in a mixture of equal volumes of *ethanol (96 per cent) R* and a 10 g/L solution of *phosphoric acid R*, and dilute to 50.0 mL with the same mixture of solvents.

*Reference solution (b).* Introduce 12 mg of *purified quillaia saponins HRS* into a 50 mL round-bottomed flask, add 20 mL of a 20 g/L solution of *potassium hydroxide R* and heat under a reflux condenser in a water-bath for 2 h. After cooling, add 2 mL of *phosphoric acid R*. Add 25 mL of *ethanol (96 per cent) R* and shake thoroughly. Dilute to 50.0 mL with *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 ± 2 °C.

*Mobile phase*: *acetonitrile R1*, 1 g/L solution of *phosphoric acid R* (35:65 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 50 µL.

*Run time*: 1.2 times the retention time of glycyrrhizic acid.

*Identification of peaks*: use the chromatogram supplied with *purified quillaia saponins HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to monodesmosidic quillaia saponins 1 and 3; a minor peak due to monodesmosidic quillaia saponin 2 may be present between the peaks due to monodesmosidic quillaia saponins 1 and 3.

*Retention time*: monodesmosidic quillaia saponin 1 = about 9 min; monodesmosidic quillaia saponin 3 = about 10 min; glycyrrhizic acid = about 13 min.

Calculate the percentage content of triterpene glycosides, expressed as quillaia saponin III, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2298 \times 0.6}{A_2 \times m_1 \times 957}$$

$A_1$ = sum of the areas of the peaks due to monodesmosidic quillaia saponins (1, 2 and 3) in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to glycyrrhizic acid derived from monoammonium glycyrrhizate in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *quillaia saponin for assay CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of monoammonium glycyrrhizate in *quillaia saponin for assay CRS*;

0.6 = response factor between monoammonium glycyrrhizate and monodesmosidic quillaia saponin 3;

2298 = molecular mass of quillaia saponin III;

957 = molecular mass of monodesmosidic quillaia saponin 3.

**01/2011:1881**

# RED POPPY PETALS

## Papaveris rhoeados flos

DEFINITION

Dried, whole or fragmented petals of *Papaver rhoeas* L.

IDENTIFICATION

A. The petal is dark red or dark violet-brown, very thin, floppy, wrinkled, often crumpled into a ball and velvety to the touch. It is broadly ovate with an entire margin, about 6 cm long and 4-6 cm wide, narrowing at the base where there is a black spot. The vascular bundles radiate from the base and they anastomose in a continuous arc, all at the same short distance from the margin.

B. Microscopic examination (*2.8.23*). Examine under a microscope using *chloral hydrate solution R*. The powder has an intense reddish-pink colour and shows the following diagnostic characters (Figure 1881.-1): fragments of epidermis composed of elongated, sinuous-walled cells [B, D, G] with small, rounded, anomocytic stomata (*2.8.3*) [Ba]; numerous vascular bundles with spiral vessels [E] embedded in the parenchyma; occasional fragments of the fibrous layer of the anthers [F]; rounded pollen grains, about 30 µm in diameter, with 3 pores and a finely verrucose exine [A, C, H].

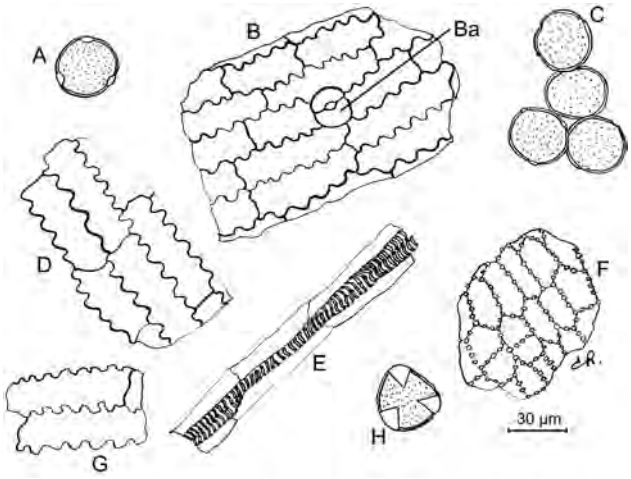

Figure 1881.-1. – *Illustration for identification test B of powdered herbal drug of red poppy petals*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *ethanol (60 per cent V/V) R*. Stir for 15 min. Filter through a filter paper.

*Reference solution.* Dissolve 1 mg of *quinaldine red R* and 1 mg of *sulfan blue R* in 2 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *water R*, *butanol R* (10:12:40 *V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | 2 yellow zones |
| Quinaldine red: an orange-red zone | |
| | A violet principal zone |
| | A violet zone |
| | A yellow zone |
| Sulfan blue: a blue zone | |
| | A compact group of violet zones |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 2.0 per cent of capsules and maximum 1.0 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 11.0 per cent.

**Colouring intensity**. Place 1.0 g of the powdered herbal drug (355) (*2.9.12*) in a 250 mL flask and add 100 mL of *ethanol (30 per cent V/V) R*. Allow to macerate for 4 h with frequent stirring. Filter and discard the first 10 mL. To 10.0 mL of the

Herbal drugs

filtrate add 2 mL of *hydrochloric acid R* and dilute to 100.0 mL with *ethanol (30 per cent V/V) R*. Allow to stand for 10 min. The absorbance (*2.2.25*) measured at 523 nm using *ethanol (30 per cent V/V) R* as the compensation liquid is not less than 0.6.

**07/2014:1879**

# RESTHARROW ROOT

## Ononidis radix

DEFINITION

Whole or cut, dried root of *Ononis spinosa* L.

IDENTIFICATION

A. The root is more or less flattened, twisted and branched, deeply wrinkled, brown and grooved longitudinally. The transversely cut surface shows a thin bark and a xylem cylinder with a conspicuously radiate structure. The fracture of the root is short and fibrous.

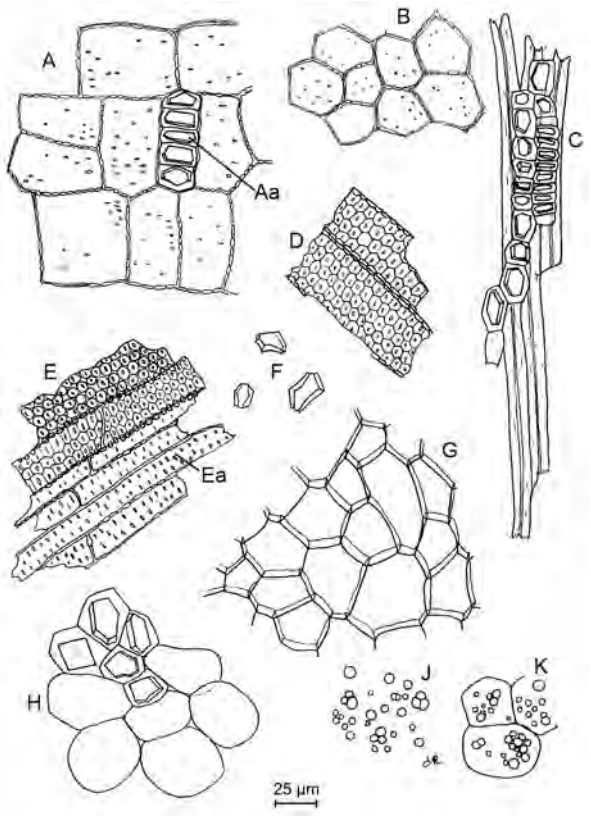

Figure 1879.-1. – *Illustration for identification test B of powdered herbal drug of restharrow root*

B. Microscopic examination (*2.8.23*). The powder is light brown or brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1879.-1): brown fragments of cork composed of thin-walled, polygonal cells (surface view [G]); groups of thick-walled, narrow fibres, often accompanied by a parenchymatous crystal sheath containing prisms of calcium oxalate [C]; vascular fragments [D, E] consisting of vessels with numerous bordered pits, often accompanied by lignified fibres with pitted walls [Ea]; thin-walled parenchymatous cells from the bark, some containing a single prism of calcium oxalate [H]; ligneous parenchyma cells with slightly thickened and pitted walls [A, B], some of which contain prisms of calcium oxalate [Aa]; numerous free prisms of calcium oxalate [F]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous, rounded starch granules, 5-10 µm in diameter, simple or sometimes 2-4 compound, free [J] or inside parenchymatous cells [K].

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (180) (*2.9.12*) add 15.0 mL of *methanol R* and boil under a reflux condenser for 30 min. Cool and filter.

*Reference solution.* Dissolve 10 mg of *resorcinol R* and 50 mg of *vanillin R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *ethanol (96 per cent) R*, *methylene chloride R*, *toluene R* (10:45:45 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 15 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm and 365 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the middle third of the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Vanillin: a zone visible at 254 nm | |
| Resorcinol: a zone visible at 254 nm | An intense blue fluorescent zone visible at 365 nm |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min. Examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| Vanillin: a greyish-violet zone | |
| Resorcinol: a red zone | A violet zone (onocol) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 8.0 per cent.

**Extractable matter**: minimum 15.0 per cent.

To 2.00 g of the powdered herbal drug (250) (*2.9.12*) add a mixture of 8 g of *water R* and 12 g of *ethanol (96 per cent) R* and allow to macerate for 2 h, shaking frequently. Filter, evaporate 5 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 75 mg.

**01/2015:0289**

# RHATANY ROOT

## Ratanhiae radix

DEFINITION

Dried, usually fragmented, underground organs of *Krameria triandra* Ruiz et Pav., known as Peruvian rhatany.

*Content*: minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1) (dried drug).

IDENTIFICATION

A. The taproot is dark reddish-brown and has a thick, knotty crown. The secondary roots are the same colour and nearly straight or somewhat tortuous. The bark is rugged or scaly in the older pieces and smooth with sharp, transverse fissures in the younger pieces; it separates readily from the wood. The fracture is fibrous in the bark and splintery in the wood. The smooth, transversely cut surface shows a dark brownish-red bark about one third of the radius in thickness; a dense, pale reddish-brown and finely porous wood is present with numerous fine medullary rays; the central heartwood is often darker.

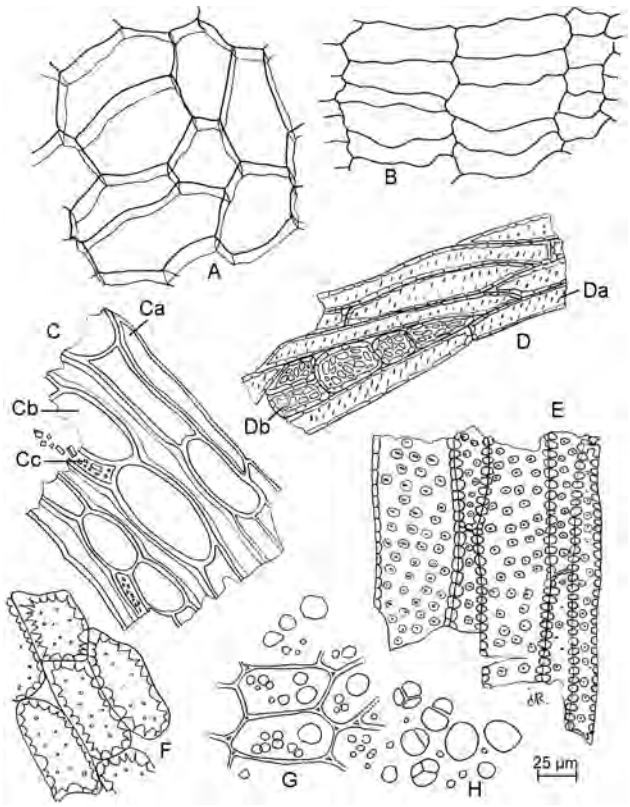

Figure 0289.-1. – *Illustration for identification test B of powdered herbal drug of rhatany root*

B. Microscopic examination (*2.8.23*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0289.-1): cork cells containing dark brown phlobaphenes (surface view [A], side view [B]); fragments of phloem [C] consisting of unlignified fibres, usually 12-30 µm in diameter with moderately thickened walls [Ca], parenchyma cells some containing prisms and microcrystals of calcium oxalate [Cc], and cells of the medullary rays [Cb]; fragments of vessels usually 20-60 µm in diameter with bordered pits [E]; fragments of tracheids [D] up to 20 µm wide with slit-shaped pits [Da] and cells of the medullary rays [Db]; lignified parenchymatous cells with thick and channelled walls [F]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded, simple or 2- to 4-compound starch granules, an individual granule measuring up to 30 µm in diameter [H] and some granules being found in the cells of the medullary rays and in the parenchyma [G].

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and sonicate for 10 min. Centrifuge or filter. Use the supernatant or filtrate.

*Reference solution.* Dissolve 5 mg of *thymol R* and 20 mg of *dichlorophenolindophenol, sodium salt R* in 20 mL of *ethanol (60 per cent V/V) R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *methylene chloride R*.

*Application*: 10 µL [or 4 µL] as bands of 8 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with a 5 g/L solution of *fast blue B salt R*, allow to dry in air and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Thymol: a brownish-yellow zone | A faint violet zone |
| | An orange zone |
| | A bluish-grey zone |
| Dichlorophenolindophenol: a greyish-blue zone | An intense violet zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 2 per cent of foreign matter and maximum 5 per cent of fragments of crown or root exceeding 25 mm in diameter. Root without bark may be present in very small quantities.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 5.5 per cent.

ASSAY

**Tannins** (*2.8.14*). Use 0.750 g of the powdered herbal drug (180) (*2.9.12*).

Herbal drugs

01/2015:1888

# RHATANY TINCTURE

## Ratanhiae tinctura

DEFINITION

Tincture produced from *Rhatany root (0289)*.

*Content*: minimum 1.0 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1).

PRODUCTION

The tincture is produced from 1 part of the herbal drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

*Appearance*: reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* The tincture to be examined.

*Reference solution.* Dissolve 5 mg of *thymol R* and 20 mg of *dichlorophenolindophenol, sodium salt R* in 20 mL of *ethanol (60 per cent V/V) R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *methylene chloride R*.

*Application*: 10 µL [or 4 µL] as bands of 8 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with a 5 g/L solution of *fast blue B salt R*, allow to dry in air and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Thymol: a brownish-yellow zone | A violet zone |
| | An orange zone |
| | A bluish-grey zone |
| Dichlorophenolindophenol: a greyish-blue zone | |
| | An intense violet zone |
| **Reference solution** | **Test solution** |

TESTS

**Ethanol** (*2.9.10*): 63 per cent *V/V* to 67 per cent *V/V*.

**Methanol and 2-propanol** (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

**Tannins** (*2.8.14*). Use 2.500 g of the tincture to be examined.

01/2008:0291
corrected 6.0

# RHUBARB

## Rhei radix

DEFINITION

Rhubarb consists of the whole or cut, dried underground parts of *Rheum palmatum* L. or of *Rheum officinale* Baillon or of hybrids of these two species or of a mixture. The underground parts are often divided; the stem and most of the bark with the rootlets are removed. It contains not less than 2.2 per cent of hydroxyanthracene derivatives, expressed as rhein ($C_{15}H_8O_6$, $M_r$ 284.2), calculated with reference to the dried drug.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The appearance is variable: disc-shaped pieces up to 10 cm in diameter and 1 cm to 5 cm in thickness; cylindrical pieces; oval or planoconvex pieces. The surface has a pinkish tinge and is usually covered with a layer of brownish-yellow powder. It shows, especially after moistening, a reticulum of darker lines. This structure causes the marbled appearance of the drug. The fracture is granular. The transverse section of the rhizome shows a narrow outer zone of radiating brownish-red lines. These medullary rays are crossed perpendicularly by a dark cambial ring. Inside this zone is a ring of small star-spot formations of anomalous vascular bundles. The root shows a more radiate structure.

B. Microscopic examination (*2.8.23*). The powder is orange to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: large calcium oxalate cluster crystals, which may measure more than 100 µm, and their fragments; reticulately thickened non-lignified vessels measuring up to 175 µm. Numerous groups of rounded or polygonal, thin-walled parenchyma cells. Sclereids and fibres are absent. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, rounded or compound (2 to 4) starch granules with a star-shaped hilum.

C. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

*Test solution.* Heat 50 mg of the powdered herbal drug (180) (*2.9.12*) in a water-bath for 15 min with a mixture of 1 mL of *hydrochloric acid R* and 30 mL of *water R*. Allow to cool and shake the liquid with 25 mL of *ether R*. Dry the ether layer over *anhydrous sodium sulfate R* and filter. Evaporate the ether layer to dryness and dissolve the residue in 0.5 mL of *ether R*.

*Reference solution.* Dissolve 5 mg of *emodin R* in 5 mL of *ether R*.

Apply separately to the plate as bands 20 µL of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *anhydrous formic acid R*, 25 volumes of *ethyl acetate R* and 75 volumes of *light petroleum R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in its central part a zone of orange fluorescence (emodin). The chromatogram obtained with the test solution shows: a zone due to emodin; above the emodin zone, two zones of similar fluorescence (physcione and chrysophanol, in order of increasing $R_F$ value); below the emodin zone, also two zones of similar fluorescence

Herbal drugs

(rhein and aloe-emodin, in order of decreasing $R_F$ value). Spray with a 100 g/L solution of *potassium hydroxide R* in *methanol R*. All the zones become red to violet.

D. To about 50 mg of the powdered herbal drug (180) (*2.9.12*) add 25 mL of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 mL of *ether R* and discard the aqueous layer. Shake the ether layer with 10 mL of *dilute ammonia R1*. The aqueous layer becomes red to violet.

TESTS

**Rheum rhaponticum**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

*Test solution*. To 0.2 g of the powdered herbal drug (180) (*2.9.12*) add 2 mL of *methanol R* and boil for 5 min under a reflux condenser. Allow to cool and filter. Use the filtrate as the test solution.

*Reference solution*. Dissolve 10 mg of *rhaponticin R* in 10 mL of *methanol R*.

Apply separately to the plate, as bands not more than 20 mm by 3 mm, 20 µL of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and spray with *phosphomolybdic acid solution R*. The chromatogram obtained with the test solution does not show a blue zone near the line of application (rhaponticin) corresponding to the zone in the chromatogram obtained with the reference solution.

**Loss on drying** (*2.2.32*). Not more than 12.0 per cent, determined on 1.000 g of the powdered herbal drug (180) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*). Not more than 12.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*). Not more than 2.0 per cent.

ASSAY

*Carry out the assay protected from bright light.*

Introduce 0.100 g of the powdered herbal drug (180) (*2.9.12*) into a 100 mL flask. Add 30.0 mL of *water R*, mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, add 50 mg of *sodium hydrogen carbonate R*, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 10.0 mL of the liquid to a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of *ferric chloride solution R1* and mix. Heat under a reflux condenser on a water-bath for 20 min, add 1 mL of *hydrochloric acid R* and heat for a further 20 min, shaking frequently. Cool, transfer to a separating funnel and shake with three quantities, each of 25 mL, of *ether R* previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 mL, of *water R*. Filter the ether extracts through a plug of absorbent cotton into a volumetric flask and dilute to 100.0 mL with *ether R*. Evaporate 10.0 mL carefully to dryness on a water-bath and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of rhein from the expression:

$$\frac{A \times 0.64}{m}$$

i.e. taking the specific absorbance of rhein to be 468, calculated on the basis of the specific absorbance of barbaloin.

$A$ = absorbance at 515 nm,

$m$ = mass of the herbal drug used, in grams.

**01/2012:1884**

# RIBWORT PLANTAIN

## Plantaginis lanceolatae folium

DEFINITION

Whole or fragmented, dried leaf and scape of *Plantago lanceolata* L. *s.l.*

*Content*: minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives expressed as acteoside ($C_{29}H_{36}O_{15}$; $M_r$ 624.6) (dried drug).

IDENTIFICATION

A. The leaf is up to 30 cm long and 4 cm wide, yellowish-green to brownish-green, with a prominent, whitish-green, almost parallel venation on the abaxial surface. It consists of a lanceolate lamina narrowing at the base into a channelled petiole. The margin is indistinctly dentate and often undulate. It has 3, 5 or 7 primary veins, nearly equal in length and running almost parallel. Hairs may be almost absent, sparsely scattered or sometimes abundant, especially on the lower surface and over the veins. The scape is brownish-green, longer than the leaves, 3-4 mm in diameter and is deeply grooved longitudinally, with 5-7 conspicuous ribs. The surface is usually covered with fine hairs.

B. Microscopic examination (*2.8.23*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1884.-1): fragments of epidermis, composed of cells with irregularly sinuous anticlinal walls, the fragments of the upper epidermis of the lamina (surface view [H], transverse section [D]) are accompanied by palisade parenchyma [Da, Ha], and those of the lower epidermis (surface view [G]) show stomata (*2.8.3*) mostly of the diacytic type [Ga] and sometimes of the anomocytic type [Gb]; the multicellular, uniseriate, conical covering trichomes are highly characteristic, whole [C] or mostly fragmented [A], with a basal cell larger than the other epidermal cells followed by a short cell supporting 2 or more elongated cells with the lumen narrow and variable, occluded at intervals corresponding to slight swellings in the trichome and giving a jointed appearance, the terminal cell has an acute apex and a filiform lumen; the glandular trichomes have a unicellular, cylindrical stalk and a multicellular, elongated, conical head consisting of several rows of small cells and a single terminal cell [B, Gc]; dense groups of lignified fibro-vascular tissue with narrow, spirally and annularly thickened vessels and slender, moderately thickened fibres [F]; fragments of the scape [E] with cells with thickened walls and a coarsely ridged cuticle, stomata [Ec], multicellular, uniseriate covering trichomes [Eb] and glandular trichomes [Ea] of the type previously described.

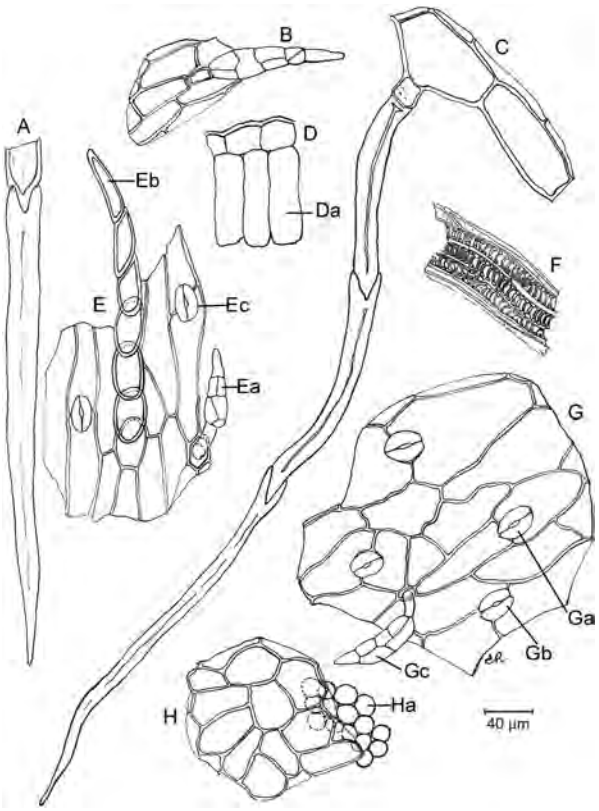

Figure 1884.-1. – *Illustration for identification test B of powdered herbal drug of ribwort plantain*

C. Examine the chromatograms obtained in the test for *Digitalis lanata* leaves.

*Results A*: see below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Acteoside: a yellow zone | A yellow zone (acteoside) |
| ——— | ——— |
| Aucubin: a blue zone | A blue zone (aucubin) |
| **Reference solution** | **Test solution** |

TESTS

***Digitalis lanata* leaves**. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *water R*, *methanol R* (30:70 *V/V*).

*Test solution.* Use a freshly prepared solution. To 1 g of the powdered herbal drug (355) (*2.9.12*) in a 25 mL flask, add 10 mL of the solvent mixture and shake for 30 min. Filter, rinse the flask and the filter with 2 quantities, each of 5 mL, of the solvent mixture. Dilute to 25 mL with the solvent mixture.

*Reference solution.* Dissolve 1 mg of *acteoside R* and 1 mg of *aucubin R* in 1 mL of the solvent mixture.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 8 cm; heat immediately after development at about 120 °C for 5-10 min.

*Detection A*: examine in daylight.

*Detection B*: examine in ultraviolet light at 365 nm.

*Results B*: the chromatogram obtained with the test solution shows no bright blue fluorescent zone just below the reddish-brown fluorescent zone corresponding to aucubin in the chromatogram obtained with the reference solution.

**Foreign matter** (*2.8.2*): maximum 5 per cent of leaves of different colour and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 14.0 per cent.

ASSAY

*Stock solution.* In a flask, place 1.000 g of the powdered herbal drug (355) (*2.9.12*) and add 90 mL of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 10 mL of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*.

*Test solution.* To a 10 mL volumetric flask add, mixing after each addition, 1.0 mL of the stock solution, 2 mL of *0.5 M hydrochloric acid*, 2 mL of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 mL of *water R*, and 2 mL of *dilute sodium hydroxide solution R*. Dilute to 10.0 mL with *water R*.

Immediately measure the absorbance (*2.2.25*) of the test solution at 525 nm using as compensation liquid a solution prepared as follows: to a 10 mL volumetric flask add 1.0 mL of the stock solution, 2 mL of *0.5 M hydrochloric acid* and 2 mL of *dilute sodium hydroxide solution R*, and dilute to 10.0 mL with *water R*.

Calculate the percentage content of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside, using the following expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance to be 185 for acteoside at 525 nm.

$A$ = absorbance of the test solution at 525 nm;

$m$ = mass of the substance to be examined, in grams.

**01/2013:1623**
**corrected 10.0**

# ROSELLE

## Hibisci sabdariffae flos

DEFINITION

Whole or cut dried calyces and epicalyces of *Hibiscus sabdariffa* L. collected during fruiting.

*Content*: minimum 13.5 per cent of acids, expressed as citric acid ($C_6H_8O_7$; $M_r$ 192.1) (dried drug).

CHARACTERS

Acidic taste.

IDENTIFICATION

A. The calyx is joined in the lower half to form an urceolate structure, the upper half dividing to form 5 long acuminate recurved tips. The tips have a prominent, slightly protruding midrib and a large, thick nectary gland about 1 mm in diameter. The epicalyx consists of 8-12 small, obovate leaflets, which are adnate to the base of the calyx.

The calyx and epicalyx are fleshy, dry, easily fragmented and bright red or deep purple, somewhat lighter at the base of the inner side.

B. Microscopic examination (*2.8.23*). The powder is red or violet-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1623.-1): predominantly red fragments [A, F] consisting of polygonal epidermal cells with very irregularly thickened walls (surface view [Ac, Fa]), some containing cluster crystals of calcium oxalate [Fb], with underlying parenchyma consisting of ovoid cells with slightly thickened walls [Aa], some containing cluster crystals of calcium oxalate [Ab] whilst others are filled with mucilage, unicellular, long, flexuous, twisted covering trichomes [Ad], rigid, straight, unicellular covering trichomes, simple or in groups of 2-4 [Fd], glandular trichomes with a unicellular stalk and a globular or oval, multicellular and biseriate head [Fe] and stomata usually of the anisocytic type (*2.8.3*) [Fc]; numerous fragments of vascular bundles [D] with spiral or reticulate vessels [Da], sometimes accompanied by sclerenchymatous fibres with a wide lumen [Db], and parenchyma [Dc], of which some cells contain cluster crystals of calcium oxalate [Dd], whilst others are mucilage-filled [De]; rare, rectangular, parenchymatous sclereids [H]; numerous fragments of rigid [C, G] or flexuous [J] covering trichomes; free cluster crystals of calcium oxalate [B] and glandular trichomes [E]; exceptionally, spherical pollen grains, about 200 µm in diameter, with a spiny exine.

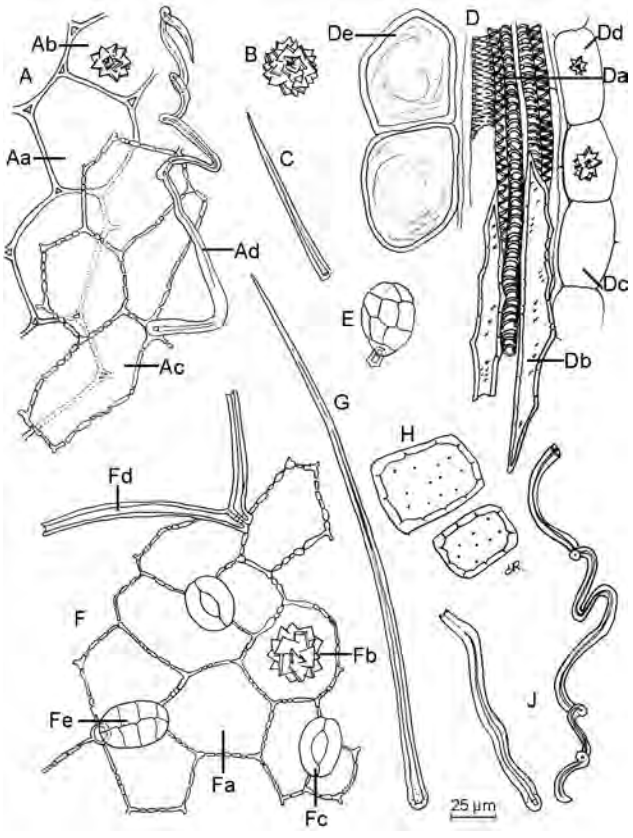

Figure 1623.-1. – *Illustration for identification test B of powdered herbal drug of roselle*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *ethanol (60 per cent V/V) R*. Shake for 15 min and filter.

*Reference solution*. Dissolve 2.5 mg of *quinaldine red R* and 2.5 mg of *sulfan blue R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *butanol R* (10:12:40 *V/V/V*).

*Application*: 5 µL [or 2 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: examine immediately in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Quinaldine red: an orange-red zone | |
| | An intense violet zone |
| Sulfan blue: a blue zone | |
| | An intense violet-blue zone |
| ——— | ——— |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 2 per cent of fragments of fruits (red funicles and parts of the 5-caverned capsule with yellowish-grey pericarp, whose thin walls consist of several layers of differently directed fibres; flattened, reniform seeds with a dotted surface) and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Colouring intensity**. Reduce 100 g to a powder (1400) (*2.9.12*) and homogenise. Reduce about 10 g of this mixture to a very fine powder (355) (*2.9.12*). To 1.0 g of this powder in a 100 mL flask add 25 mL of boiling *water R* and heat for 15 min on a water-bath with frequent shaking. Filter the hot mixture into a 50 mL graduated flask; rinse successively the 100 mL flask and the filter with 3 quantities, each of 5 mL, of warm *water R*. After cooling, dilute to 50 mL with *water R*. Dilute 5 mL of this solution to 50 mL with *water R*. Measure the absorbance (*2.2.25*) at 520 nm using *water R* as the compensation liquid. The absorbance is not less than 0.350 for the whole drug and not less than 0.250 for the cut drug.

ASSAY

Shake 1.00 g of the powdered herbal drug (355) (*2.9.12*) with 100.0 mL of *carbon dioxide-free water R* for 15 min. Filter. To 50.0 mL of the filtrate add 100 mL of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide* to pH 7.0, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 6.4 mg of citric acid.

**01/2013:1560**

# ROSEMARY LEAF

## Rosmarini folium

DEFINITION

Whole, dried leaf of *Rosmarinus officinalis* L.

Herbal drugs

*Content*:

– minimum 12 mL/kg of essential oil (anhydrous drug);

– minimum 3 per cent of total hydroxycinnamic derivatives, expressed as rosmarinic acid ($C_{18}H_{16}O_8$; $M_r$ 360.3) (anhydrous drug).

CHARACTERS

Strongly aromatic odour.

IDENTIFICATION

A. The leaves are sessile, tough, linear or linear-lanceolate, 1-4 cm long and 2-4 mm wide, with recurved edges. The upper surface is dark green, glabrous and grainy, the lower surface is greyish-green and densely tomentose with a prominent midrib.

B. Microscopic examination (*2.8.23*). The powder is greyish-green or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1560.-1): fragments of the lower epidermis (surface view [B, J]) with straight or sinuous-walled cells [Ba] and numerous diacytic stomata (*2.8.3*) [Bb] and glandular trichomes [Ja] or covering trichomes or their scars [Bc, Bd]; numerous multicellular, mostly branched, covering trichomes of the lower epidermis, usually fragmented [A, C, D]; fragments of the upper epidermis (surface view [F]) with cells with straight, thickened and pitted walls [Fa], and an underlying hypodermis composed of large, irregular cells with thickened and beaded anticlinal walls [Fb]; fragments of the lamina (transverse section [G]), showing the epidermis covered by a very thick cuticle [Ga], hypodermal cells extending across the mesophyll [Gb] at intervals, separating 1 or 2 layers of palisade parenchyma into large, crescent-shaped areas [Gc]; glandular trichomes of 2 types, the majority with a short, unicellular stalk and a radiate head composed of 8 cells (surface view [E], side view [H]), others, less abundant, with a uni- or bicellular stalk and a spherical, unicellular head [Ja, K].

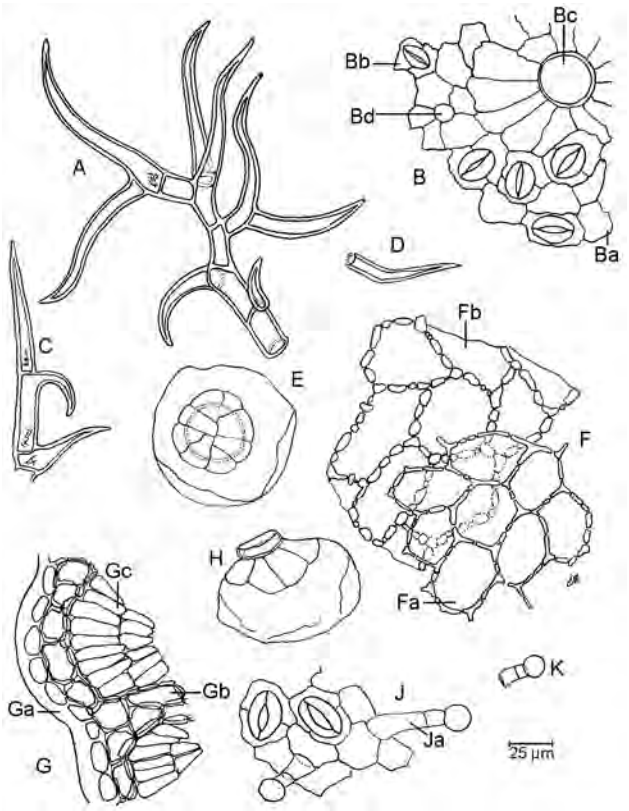

Figure 1560.-1. – *Illustration for identification test B of powdered herbal drug of rosemary leaf*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 20 µL of the oil obtained in the assay in 1 mL of *hexane R*.

*Reference solution.* Dissolve 5 mg of *borneol R*, 5 mg of *bornyl acetate R* and 10 µL of *cineole R* in 1 mL of *hexane R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R*, heat at 100-105 °C for 10 min and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| | A red zone |
| Bornyl acetate: a yellowish-brown zone | A yellowish-brown zone of low intensity |
| | A coloured zone of low intensity |
| Cineole: a violet zone | A violet zone |
| | Coloured zones of low intensity |
| Borneol: a violet-brown zone | A violet-brown zone |
| | A coloured zone of low intensity |
| **Reference solution** | **Test solution** |

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Grind 1.0 g of the herbal drug in 10 mL of *methanol R* and filter.

*Reference solution.* Dissolve 1.0 mg of *caffeic acid R* and 5.0 mg of *rosmarinic acid R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:25:85 *V/V/V*).

*Application*: 10 µL of the test solution and 20 µL of the reference solution, as bands.

*Development*: over a path of 8 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| | A pink fluorescent zone |
| Caffeic acid: a light blue fluorescent zone | A blue fluorescent zone of low intensity |
| Rosmarinic acid: a light blue fluorescent zone | An intense light blue fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of stems and maximum 2 per cent of other foreign matter.

**Water** (*2.2.13*): maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 9.0 per cent.

ASSAY

**Total hydroxycinnamic derivatives**

*Stock solution.* To 0.200 g of the powdered herbal drug (355) (*2.9.12*) add 80 mL of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 10 mL of *ethanol*

Herbal drugs

*(50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*.

*Test solution*. To 1.0 mL of the stock solution add 2 mL of *0.5 M hydrochloric acid*, 2 mL of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 mL of *water R*, and then add 2 mL of *dilute sodium hydroxide solution R* and dilute to 10.0 mL with *water R*; mix.

*Compensation solution*. Dilute 1.0 mL of the stock solution to 10.0 mL with *water R*.

Measure immediately the absorbance (*2.2.25*) of the test solution at 505 nm.

Calculate the percentage content of total hydroxycinnamic derivatives, expressed as rosmarinic acid, using the following expression:

$$\frac{A \times 2.5}{m}$$

i.e. taking the specific absorbance of rosmarinic acid to be 400.

$A$ = absorbance of the test solution at 505 nm;

$m$ = mass of the substance to be examined, in grams.

**Essential oil** (*2.8.12*). Use 25.0 g of the crushed herbal drug, a 1000 mL flask and 300 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 3 h.

**01/2008:1846**

# ROSEMARY OIL

## Rosmarini aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the flowering aerial parts of *Rosmarinus officinalis* L.

CHARACTERS

*Appearance*: clear, mobile, colourless or pale yellow liquid.

Characteristic odour.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 0.5 mL of the substance to be examined in *toluene R* and dilute to 10 mL with the same solvent.

*Reference solution*. Dissolve 50 mg of *borneol R*, 50 mg of *bornyl acetate R* and 100 µL of *cineole R* in *toluene R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray the plate with *vanillin reagent R* and heat the plate at 100-105 °C for 10 min. Examine immediately in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several violet-blue to violet-grey zones of medium intensity (terpene alcohols) are present in the lower third of the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | An intense violet zone |
| | A violet-grey zone |
| _____ | _____ |
| Bornyl acetate: a bluish-grey zone of low intensity | A bluish-grey zone of low intensity (bornyl acetate) |
| | A violet-pink zone |
| _____ | _____ |
| Cineole: an intense blue zone | An intense blue zone (cineole) |
| Borneol: a violet-blue zone of medium intensity | A violet -blue zone of medium intensity (borneol) |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.895 to 0.920.

**Refractive index** (*2.2.6*): 1.464 to 1.473.

**Optical rotation** (*2.2.7*): − 5° to + 8°.

**Acid value** (*2.5.1*): maximum 1.0.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. Dissolve 0.20 mL of the substance to be examined in *hexane R* and dilute to 10.0 mL with the same solvent.

*Reference solution*. Dissolve 20 µL of *α-pinene R*, 10 mg of *camphene R*, 20 µL of *β-pinene R*, 10 µL of *β-myrcene R*, 20 µL of *limonene R*, 50 µL of *cineole R*, 10 µL of *p-cymene R*, 50 mg of *camphor R*, 30 mg of *bornyl acetate R*, 10 mg of *α-terpineol R*, 10 mg of *borneol R* and 10 µL of *verbenone R* in *hexane R* and dilute to 10.0 mL with the same solvent.

*Column*:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- *stationary phase*: *macrogol 20 000 R*.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 50 |
| | 10 - 85 | 50 → 200 |
| | 85 - 110 | 200 |
| Injection port | | 200 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of the reference solution. Record the retention times of these substances.

*System suitability*: reference solution:

– *resolution*: minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to α-terpineol and borneol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

For rosemary oil, Spanish type, the percentages are within the following ranges:

– *α-pinene*: 18 per cent to 26 per cent,
– *camphene*: 8.0 per cent to 12.0 per cent,
– *β-pinene*: 2.0 per cent to 6.0 per cent,
– *β-myrcene*: 1.5 per cent to 5.0 per cent,
– *limonene*: 2.5 per cent to 5.0 per cent,
– *cineole*: 16.0 per cent to 25.0 per cent,
– *p-cymene*: 1.0 per cent to 2.2 per cent,
– *camphor*: 13.0 per cent to 21.0 per cent,
– *bornyl acetate*: 0.5 per cent to 2.5 per cent,
– *α-terpineol*: 1.0 per cent to 3.5 per cent,
– *borneol*: 2.0 per cent to 4.5 per cent,
– *verbenone*: 0.7 per cent to 2.5 per cent.

For rosemary oil, Moroccan and Tunisian type, the percentages are within the following ranges:

– *α-pinene*: 9.0 per cent to 14.0 per cent,
– *camphene*: 2.5 per cent to 6.0 per cent,
– *β-pinene*: 4.0 per cent to 9.0 per cent,
– *β-myrcene*: 1.0 per cent to 2.0 per cent,
– *limonene*: 1.5 per cent to 4.0 per cent,
– *cineole*: 38.0 per cent to 55.0 per cent,
– *p-cymene*: 0.8 per cent to 2.5 per cent,
– *camphor*: 5.0 per cent to 15.0 per cent,
– *bornyl acetate*: 0.1 per cent to 1.5 per cent,
– *α-terpineol*: 1.0 per cent to 2.6 per cent,
– *borneol*: 1.5 per cent to 5.0 per cent,
– *verbenone*: maximum 0.4 per cent.

STORAGE

At a temperature not exceeding 25 °C.

LABELLING

The label states that the content is Spanish type or Moroccan and Tunisian type.

**04/2014:2555**
**corrected 10.0**

# ROUND AMOMUM FRUIT

## Amomi fructus rotundus

DEFINITION

Dried, whole, peeled or unpeeled ripe fruit of *Amomum krervanh* Pierre ex Gagnep. or *Amomum compactum* Sol. ex Maton.

*Content*:

– *essential oil*: minimum 50 mL/kg for *A. krervanh* (anhydrous drug) and minimum 40 mL/kg for *A. compactum* (anhydrous drug);

– *1,8-cineole* ($C_{10}H_{18}O$; $M_r$ 154.3): minimum 65.0 per cent of the essential oil.

IDENTIFICATION

A. *A. krervanh*. The fruit is a trilocular, indehiscent capsule, subspherical, about 1.5-2 cm in diameter. The outer surface is whitish-yellow or pale brownish-yellow, smooth, and shows 3 deep longitudinal furrows. The apex bears a prominent stylopodium; the base shows the dentate scar of the stalk. Both ends and the hollows of the furrows are covered by a pale brown pubescence. The thin, brittle pericarp is easily broken, showing 3 locules each containing 4-10 seeds. The seeds are hard, irregularly polyhedral, with a slightly raised dorsal surface, 3-4 mm in diameter, brown on the surface, finely wrinkled, bearing the remains of the fine, membranous aril.

*A. compactum*. The fruit is a trilocular, indehiscent capsule, subspherical, about 1-2 cm in diameter. The outer surface is whitish-yellow or pale brownish-yellow, sometimes slightly reddish, and shows about 15 longitudinal furrows, 3 of which are deep. The apex bears a prominent stylopodium; the stalk is usually fragmented. Both ends and the hollows of the furrows are covered by a brownish-yellow pubescence. The thin, brittle pericarp is easily broken, showing 3 locules each containing 6-12 seeds. The seeds are hard, irregularly polyhedral, 2-3 mm in diameter, blackish-brown on the surface, wrinkled, bearing the remains of the transparent, membranous aril.

B. *A. krervanh*. Microscopic examination (*2.8.23*). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epicarp consisting of polyhedral cells, numerous scars of covering trichomes with thick, channelled walls and rare stomata, paracytic or anomocytic (*2.8.3*); covering trichomes, mostly unicellular and usually fragmented, with regularly thickened walls, up to 800 µm in length; fragments of mesocarp composed of round cells with spaces between them, containing fine acicular crystals or prisms of calcium oxalate; groups of ovoid sclereids with thick, channelled walls, about 50 µm in diameter, from the inner layers of the mesocarp; vascular bundles composed of spiral or reticulate vessels accompanied by fibres with thick, channelled walls and sclereids; fragments of the aril consisting of very fine cells, some of which contain small crystals; fragments of the outer testa consisting of elongated cells with distinct, yellow, finely and regularly thickened walls and rounded ends, accompanied by an underlying layer consisting of rectangular or polyhedral cells with orange-yellow contents, perpendicular to the previous layer; fragments of the reddish-brown inner testa composed of very thick-walled cells, regularly polyhedral in surface view and U-shaped in side view; fragments of the endosperm with round cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous round cells of the endosperm, filled with small starch granules aggregated into masses and free aggregates of starch granules.

*A. compactum*. Microscopic examination (*2.8.23*). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epicarp consisting of polyhedral cells, numerous scars of covering trichomes with thick, channelled walls and rare stomata,

usually paracytic (*2.8.3*); unicellular covering trichomes, usually fragmented, with regularly thickened walls, up to 800 µm in length; fragments of mesocarp composed of round cells with spaces between them, containing fine acicular crystals or prisms of calcium oxalate, and oil cells; groups of ovoid sclereids with thick, channelled walls, about 50 µm in diameter, from the inner layers of the mesocarp; vascular bundles composed of spiral or reticulate vessels accompanied by fibres with thick, channelled walls and sclereids; fragments of the aril consisting of very fine cells, some of which contain small crystals; fragments of the pale yellow outer testa consisting of elongated cells with indistinct walls and rounded ends, accompanied by an underlying layer consisting of rectangular or polyhedral cells with dark orange-red contents, perpendicular to the previous layer; fragments of the reddish-brown inner testa composed of thick-walled cells, regularly polyhedral in surface view and U-shaped in side view; fragments of the endosperm, with polyhedral cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous fragments of the endosperm with polyhedral cells, filled with small starch granules aggregated into masses and free aggregates of starch granules.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methylene chloride R*. Sonicate for 10 min. Centrifuge and use the supernatant.

*Reference solution.* Dissolve 10 µL of *bornyl acetate R*, 10 µL of *cineole R* and 10 mg of *borneol R* in 1 mL of *toluene R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *ethyl acetate R*, *toluene R* (7:93 *V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 366 nm.

*Results A*: see below the sequence of zones present in the chromatogram obtained with the test solution. The reference solution shows no spots at 366 nm. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| | A blue fluorescent zone |
| _____ | _____ |
| | A blue fluorescent zone |
| **Reference solution** | **Test solution** |

*Detection B*: treat with *anisaldehyde solution R*, heat at 100-105 °C for 3 min and examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Bornyl acetate: a greyish-brown zone | |
| 1,8-Cineole: a bluish-violet zone | A bluish-violet zone (1,8-cineole) |
| | A greyish-brown zone |
| Borneol: a greyish-brown zone at the border between the middle and lower thirds | |
| _____ | _____ |
| | A bluish-violet zone |
| | 1 or 2 bluish-violet zones |
| **Reference solution** | **Test solution** |

TESTS

**Water** (*2.2.13*): maximum 120 mL/kg, determined by distillation on 20.0 g of the powdered herbal drug (355) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 10.0 g of the herbal drug reduced to a powder (1400) (*2.9.12*) immediately before the assay, a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid and 0.5 mL of *trimethylpentane R* in the graduated tube. Distil at a rate of 3-3.5 mL/min for 5 h.

**1,8-Cineole**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dilute a volume of the essential oil-trimethylpentane mixture obtained in the assay of essential oil corresponding to 150 µL of the essential oil in *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dilute 10 µL of *β-pinene R* and 15 µL of *cineole R* in *heptane R* and dilute to 5.0 mL with the same solvent.

*Reference solution (b).* Dilute 5 µL of *cineole R* to 100.0 mL with *heptane R*. Dilute 1.5 mL of the solution to 10.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 0.9 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 60 | 60 → 210 |
| Injection port | | 230 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of peaks*: use the chromatogram obtained with reference solution (a) to identify the peaks due to β-pinene and 1,8-cineole.

*Relative retention* with reference to β-pinene (retention time = about 11 min): 1,8-cineole = about 1.3.

*System suitability*: reference solution (a):

– *resolution*: minimum 5 between the peaks due to β-pinene and 1,8-cineole.

Calculate the percentage content of 1,8-cineole. Disregard any peak due to the solvent or with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

LABELLING

The label states the species present.

**07/2014:2386**

# SAFFLOWER FLOWER

## Carthami flos

DEFINITION

Dried flower of *Carthamus tinctorius* L.

*Content*: minimum 1.0 per cent of total flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; $M_r$ 464.4) (dried drug).

IDENTIFICATION

A. The orange-yellow or reddish-orange, tubular, gamopetalous, actinomorphic florets are separate from the capitulum. Each floret consists of a long, filiform tube, about 1 cm long divided into 5 equal, narrow, lanceolate lobes, about 0.5 cm long. From the opening of the tube emerges the hollow cylinder formed by the fused yellow anthers, in which the filiform style persists, thickened near the apex.

B. Microscopic examination (*2.8.23*). The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2386.-1): fragments of the corolla tube [E] with epidermis consisting of elongated, thin-walled, finely striated cells whose margins are lobed [B, Ea, J], and with parenchyma consisting of small polygonal cells containing prisms of calcium oxalate [Eb]; outer epidermis bearing glandular trichomes, usually sheared off, with only the base [Ja] persisting on the epidermis; these trichomes are isolated, biseriate with a multicellular stalk and a bicellular head [C]; fragments of the lobes of the corolla showing at their apices a large number of small, rounded, very prominent papillae [G]; fragments of parenchyma containing vascular bundles [Ed] surrounded by secretory canals with reddish-brown contents [Ec]; fragments of the filaments of the anthers consisting of elongated, thick-walled, pitted cells [K] and fragments of the characteristic layer of the anther whose walls show thickenings in bands [H]; fragments of the stigma, covered with rather long, conical papillae [D], usually accompanied by pollen grains; rounded or elliptical pollen grains up to 60 µm in diameter with 3 pores and an echinulate exine [A]; isolated prisms of calcium oxalate [F].

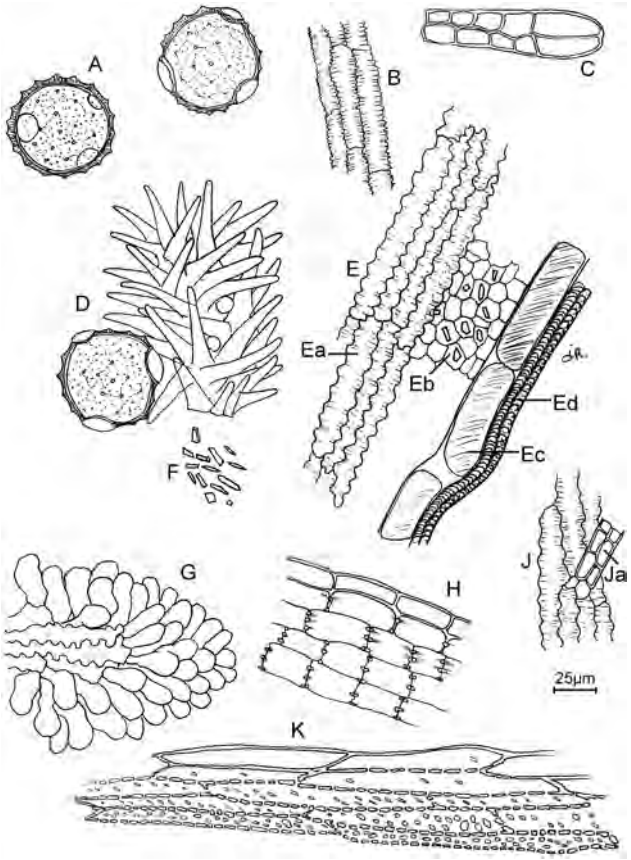

Figure 2386.-1. – *Illustration for identification test B of powdered herbal drug of safflower flower*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Sonicate for 10 min and centrifuge.

*Reference solution*. Dissolve 1 mg of *rutoside trihydrate R* and 5 mg of *quercetin dihydrate R* in 50 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

*Application*: 25 µL [or 10 µL] as bands of 15 mm [or 8 mm].

*Development*: over a path of 12 cm [or 7 cm].

*Drying*: in air.

*Detection A*: examine in daylight.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |

| | A green fluorescent zone |
| | A brown fluorescent zone |
| | A green fluorescent zone |
| ——— | ——— |
| Rutoside: a yellow fluorescent zone | |
| | A yellow fluorescent zone |
| | A green fluorescent zone |
| | A brown fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Absorbance** (*2.2.25*).

A. *Yellow pigment*: macerate 0.1 g of the powdered herbal drug (355) (*2.9.12*) in 150 mL of *water R*, stir for 1 h, filter through a sintered-glass filter (40) (*2.1.2*) and dilute to 500.0 mL, washing the residue, with *water R*. The absorbance is not less than 0.40 at 401 nm.

B. *Red pigment*: to 0.25 g of the powdered herbal drug (355) (*2.9.12*) add 50 mL of a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. Heat on a water-bath at 50 °C for 90 min. Allow to cool, filter through a sintered-glass filter (40) (*2.1.2*) and dilute to 100.0 mL, washing the residue with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. The absorbance is not less than 0.40 at 518 nm.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

*Solution A*. Place 0.250 g of the powdered herbal drug (180) (*2.9.12*) in a 250 mL flask and add 95 mL of *methanol R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 5 mL of *methanol R*. Combine the filtrate and the rinsing solution in a volumetric flask and dilute to 100.0 mL with *methanol R*.

*Test solution*. Place 5.0 mL of solution A in a volumetric flask and dilute to 20.0 mL with a 20 g/L solution of *aluminium chloride R* in *methanol R*.

*Compensation solution*. Place 5.0 mL of solution A in a volumetric flask and dilute to 20.0 mL with *methanol R*.

After exactly 15 min, measure the absorbance (*2.2.25*) of the test solution at 420 nm by comparison with the compensation solution. Calculate the percentage content of total flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A}{m}$$

taking the specific absorbance of hyperoside at 420 nm to be 400.

$A$ = absorbance of the test solution at 420 nm;

$m$ = mass of the herbal drug to be examined, in grams.

**01/2015:1370**

# SAGE LEAF (SALVIA OFFICINALIS)

## Salviae officinalis folium

DEFINITION

Whole or cut, dried leaves of *Salvia officinalis* L.

*Essential oil content*:

- for the whole drug, minimum 12 mL/kg (anhydrous drug);
- for the cut drug, minimum 10 mL/kg (anhydrous drug).

IDENTIFICATION

A. The lamina of whole sage leaf (Salvia officinalis) is about 2-10 cm long and 1-2 cm wide, oblong-ovate, elliptical. The margin is finely crenate to smooth. The apex is rounded or subacute and the base is shrunken at the petiole and rounded or cordate. The upper surface is greenish-grey and finely granular; the lower surface is white and pubescent and shows a dense network of raised veinlets.

B. Microscopic examination (*2.8.23*). The powder is light grey or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1370.-1): very numerous articulated and bent covering trichomes with narrow elongated cells and a base cell with very thick walls, whole [Bc] or fragmented, either isolated [C, G, H] or on an epidermis (surface view [Be], transverse section [Ab]); glandular trichomes of lamiaceous type, with a unicellular stalk and an 8- to 12-celled head covered by a common cuticle, isolated (side view [D]) or on an epidermis (surface view [Fa]); small glandular trichomes with a unicellular [Aa, Bd] or multicellular [Fb] stalk and a unicellular head, usually on an epidermis; more rarely, glandular trichomes (surface view [Eb, Ec], side view [Ed]) with a unicellular stalk [Ec] and a bicellular head [Eb, Ed]; fragments of the upper epidermis (surface view [E], transverse section [A]) with pitted, somewhat polygonal cells [Ea], covering trichomes and glandular trichomes, sometimes accompanied by 1 or 2 layers of palisade parenchyma [Ac, Ee]; some diacytic stomata (*2.8.3*) may be present; fragments of the lower epidermis [B, F] with sinuous cells [Ba] and numerous diacytic stomata (*2.8.3*) [Bb].

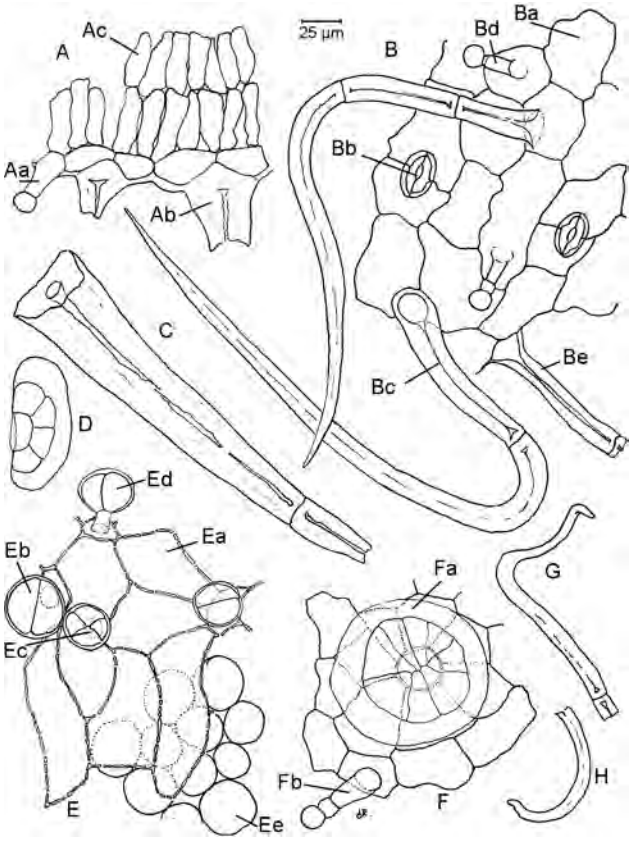

Figure 1370.-1. – *Illustration for identification test B of powdered herbal drug of sage leaf*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake 0.5 g of the freshly powdered herbal drug (355) (*2.9.12*) with 5 mL of *ethanol R* for 5 min.

*Reference solution.* Dissolve 20 µL of *thujone R* and 25 µL of *cineole R* in 20 mL of *ethanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 20 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: treat with a 200 g/L solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue zone (near the solvent front) |
| _____ | _____ |
| α-Thujone and β-thujone: 2 pinkish-violet zones | 2 pinkish-violet zones (α-thujone and β-thujone) |
| Cineole: a blue zone | A blue zone (cineole) |
| _____ | _____ |
| | Blue zones |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

**Water** (*2.2.13*): maximum 100 mL/kg, determined on 20.0 g.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 20.0 g of the herbal drug, cut, if necessary, immediately before the assay, a 500 mL flask and 250 mL of *water R* as the distillation liquid. Add 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

**07/2014:1561**

# SAGE LEAF, THREE-LOBED

## Salviae trilobae folium

DEFINITION

Whole or cut, dried leaves of *Salvia fructicosa* Mill. (syn. *Salvia triloba* L. fil).

*Essential oil content*:

– for the whole drug, minimum 18 mL/kg (anhydrous drug);

– for the cut drug, minimum 12 mL/kg (anhydrous drug).

CHARACTERS

Spicy odour when ground, similar to eucalyptus oil.

IDENTIFICATION

A. The lamina of whole three-lobed sage leaf is about 8-50 mm long and about 4-20 mm wide, and oblong-ovate or lanceolate. The margin is finely crenate and undulate but indistinct owing to the dense, hairy covering on both surfaces. The base is obtuse and sometimes bears 1 or 2 more or less developed lobes. The upper surface is grey-tomentose pubescent, the lower surface is densely white-tomentose pubescent; the venation is indistinct. The densely white-tomentose pubescent petiole is about 1 mm in diameter.

B. Microscopic examination (*2.8.23*). The powder is greyish-green and tomentose. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1561.-1): very numerous covering and glandular trichomes, whole and attached to fragments of the epidermises [A, D, G, H] or fragmented and free [B, C, E, F]; uniseriate covering trichomes, either unicellular [Ab] or multicellular articulated and thick-walled [Ad]; those on the upper epidermis are straight [Ga], those on the lower epidermis are tortuous [Da]; glandular trichomes of 2 types: some with a unicellular [Hd] or multicellular [Ca, Gb, He] stalk and a unicellular [Cb, Hd] or bicellular [Cc] head; others of lamiaceous type, with a unicellular stalk and a head composed of 8-12 radiating cells with a raised common cuticle [Ae, B]; the upper epidermis (surface view [A], transverse section [G]) with pitted and beaded cells [Aa],

somewhat polygonal, with a few diacytic stomata (*2.8.3*), covering trichomes [Ab, Ad, Ga] or their scars [Ac] and glandular trichomes [Ae, Af, Gb]; the lower epidermis (surface view [H], transverse section [D]) with sinuous or wavy-walled cells [Ha] and numerous diacytic stomata (*2.8.3*) [Hb], glandular trichomes [Db, Hd, He] and covering trichomes [Da, Hc], some of which are unicellular and short, with finely pitted walls [Dc].

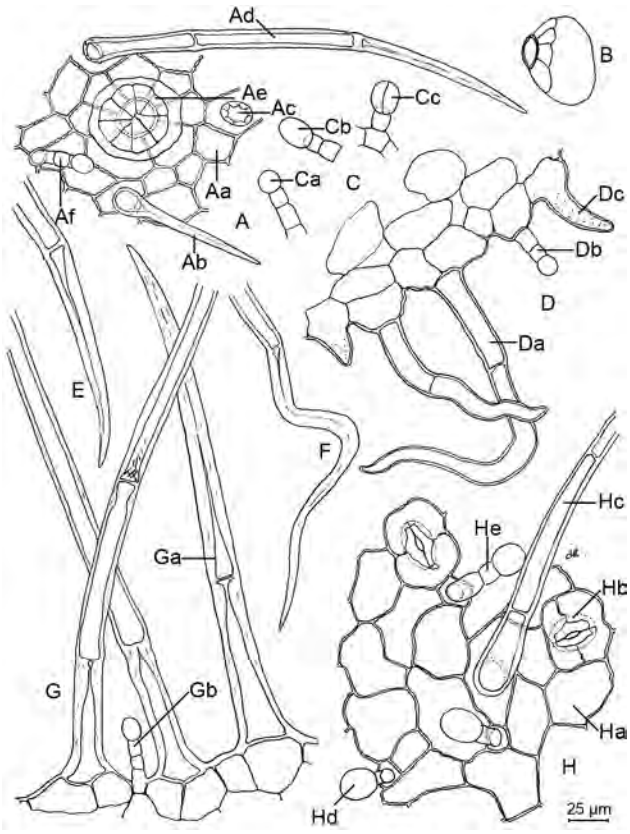

Figure 1561.-1. – *Illustration for identification test B of powdered herbal drug of three-lobed sage leaf*

C. Examine the chromatograms obtained in the test for thujone.

*Results*: the chromatogram obtained with the test solution shows a blue zone due to cineole, equal or greater in size and intensity to the zone in the chromatogram obtained with the reference solution. Further zones are present.

TESTS

**Thujone**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake 0.3 g of the freshly powdered herbal drug (355) (*2.9.12*) with 5.0 mL of *anhydrous ethanol R* for 5 min.

*Reference solution.* Dilute 20 µL of *thujone R* and 25 µL of *cineole R* in 20 mL of *anhydrous ethanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 20 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: treat with a 200 g/L solution of *phosphomolybdic acid R* in *anhydrous ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

*Results*: the chromatogram obtained with the reference solution shows in the middle part a blue zone (cineole) and in the upper part a pink-blue zone (thujone). The chromatogram obtained with the test solution shows no zone or a very faint pink-blue zone due to thujone.

**Foreign matter** (*2.8.2*): maximum 8 per cent of stems and maximum 2 per cent of other foreign matter.

**Water** (*2.2.13*): maximum 100 mL/kg, determined on 20.0 g.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 20.0 g of the herbal drug, cut, if necessary, immediately before the assay, a 500 mL flask and 250 mL of *water R* as the distillation liquid. Add 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

**01/2008:1889**
**corrected 10.0**

# SAGE TINCTURE

## Salviae tinctura

DEFINITION

Tincture produced from *Sage leaf (Salvia officinalis) (1370)*.

*Content*: minimum 0.1 per cent *m/m* of essential oil.

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 10 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

*Appearance*: brownish liquid with a characteristic odour.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* The tincture to be examined.

*Reference solution.* Dissolve 20 µL of *thujone R* and 25 µL of *cineole R* in 20 mL of *ethanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 20 µL, as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with a 200 g/L solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue zone (near the solvent front) |
| ——— | ——— |
| α-Thujone and β-thujone: 2 pinkish-violet zones | 2 pinkish-violet zones (α-thujone and β-thujone) |
| Cineole: a blue zone | A blue zone (cineole) |
| ——— | ——— |
| | Blue zones |
| **Reference solution** | **Test solution** |

TESTS

**Ethanol content** (*2.9.10*): 64 per cent *V/V* to 69 per cent *V/V*.

**Methanol and 2-propanol** (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent of 2-propanol.

**Dry residue** (*2.8.16*): minimum 2.0 per cent, determined on 3.00 g.

Herbal drugs

ASSAY

In a 500 mL round-bottomed flask, place 30.0 g of the tincture and add 100 mL of *water R*. Distil, using a descending condenser, into a separating funnel which has been marked beforehand at 50 mL. Stop the distillation process as soon as the distillate reaches the 50 mL mark. Rinse the condenser with 10 mL of *pentane R*. Dissolve in the distillate sufficient *sodium chloride R* to produce a saturated solution. Shake with 3 quantities, each of 20 mL, of *pentane R*. Dry the combined pentane layers, including the pentane from rinsing the condenser, over *anhydrous sodium sulfate R* and filter through a plug of absorbent cotton into a weighed 100 mL round-bottomed flask. Wash the sodium sulfate several times with small quantities of *pentane R*. Remove the pentane carefully at a temperature not exceeding 40 °C. Dry the residue in a desiccator over *diphosphorus pentoxide R* and hard paraffin at atmospheric pressure and at room temperature for 2 h. Weigh the residue (essential oil).

# SALVIA MILTIORRHIZA ROOT AND RHIZOME

## Salviae miltiorrhizae radix et rhizoma

DEFINITION

Dried, whole or fragmented rhizome and root of *Salvia miltiorrhiza* Bunge, collected in spring or autumn.

*Content*:

- *salvianolic acid B* ($C_{36}H_{30}O_{16}$; $M_r$ 719): minimum 3.0 per cent (dried drug);
- *tanshinone $II_A$* ($C_{19}H_{18}O_3$; $M_r$ 294.3): minimum 0.12 per cent (dried drug).

IDENTIFICATION

A. The rhizome is short and thick, sometimes with stem remnants at the apex. The roots are numerous, about 10-20 cm long and 0.3-1 cm in diameter, cylindrical and slightly curved; some are branched, with secondary roots and rootlets. The outer surface is reddish-brown or dark reddish-brown, marked with longitudinal striations. The bark of old roots comes off usually as purplish-brown scales. The texture is hard and fragile. The fracture is soft, fissured or slightly even and dense, with a reddish-brown outer part and a greyish-yellow or purplish-brown wood, showing bundles of yellowish-white vessels, arranged radially.

Cultivars are relatively stout, about 0.5-1.5 cm in diameter. The outer surface is brownish-red, longitudinally wrinkled. The bark adheres closely to the wood and is difficult to remove. The texture is compact; the fracture is relatively even.

B. Microscopic examination (*2.8.23*). The powder is brownish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2663.-1): fragments of cork consisting of subrectangular or polygonal cells, up to 150 µm in diameter, containing yellowish-brown pigment (surface view [A], transverse section [E]); fragments of parenchyma (longitudinal section [C]) consisting of polygonal or elongated cells, often septate [Ca]; fragments of parenchyma (transverse section [B]) with rounded cells; xylem fibres usually in bundles [F], long and fusiform, with walls showing pits shaped as crosses or oblique slits; very numerous reticulate or pitted vessels, 3-120 µm in diameter, free, in bundles (longitudinal section [D], transverse section [G]) or sometimes accompanying the fibres [Fa].

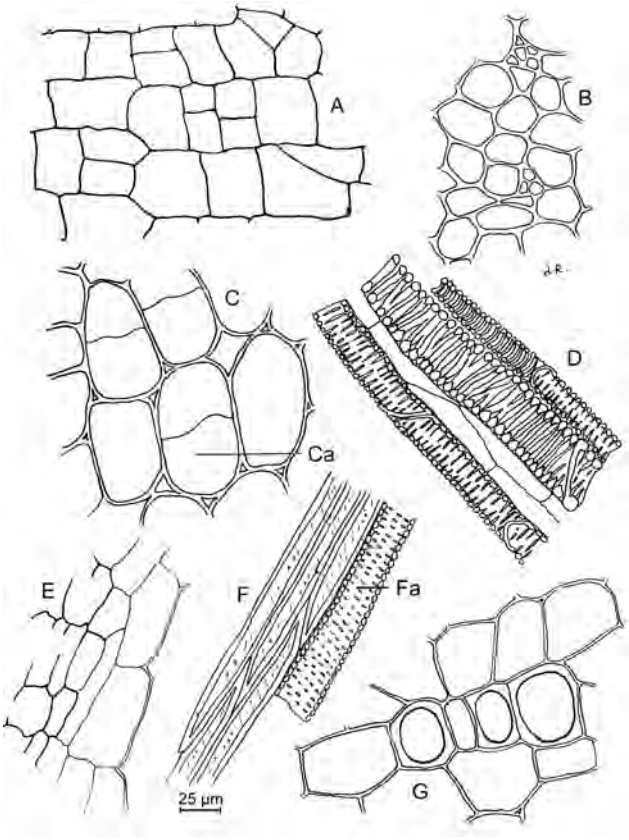

Figure 2663.-1. – *Illustration for identification test B of powdered herbal drug of salvia miltiorrhiza root and rhizome*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 40 mL of *methanol R*. Sonicate for 15 min. Filter. Evaporate the filtrate to 1 mL.

*Reference solution.* Dissolve 2 mg of *salvianolic acid B R* and 2 mg of *tanshinone $II_A$ R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *methanol R*, *anhydrous formic acid R*, *toluene R*, *methylene chloride R*, *ethyl acetate R* (5:20:20:30:40 *V/V/V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in daylight.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the upper third and middle part of the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| Tanshinone $II_A$: a prominent red zone | A prominent red zone (tanshinone $II_A$) |
| | An orange zone |
| _____ | _____ |
| | A faint brownish-green zone |
| Salvianolic acid B: a faint grey zone | A faint grey zone (salvianolic acid B) |
| _____ | _____ |
| **Reference solution** | **Test solution** |

*Detection B*: examine in ultraviolet light at 254 nm.

Herbal drugs

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the upper third and middle part of the chromatogram obtained with the test solution.

| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*). *Protect the solutions from light.*

*Test solution.* Disperse 0.30 g of the powdered herbal drug (355) (*2.9.12*) in 50.0 mL of a 70 per cent *V/V* solution of *methanol R*. Sonicate for 1 h. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a).* Dissolve 5.0 mg of *tanshinone $II_A$ CRS* in *methanol R* and dilute to 50.0 mL with the same solvent. Dilute 2.0 mL of the solution to 10.0 mL with *methanol R*.

*Reference solution (b).* Dissolve 5.0 mg of *salvianolic acid B CRS* in *methanol R* and dilute to 25.0 mL with the same solvent.

*Reference solution (c).* Dissolve 1 mg of *rosmarinic acid R* in *methanol R*, add 5 mL of reference solution (b) and dilute to 10.0 mL with *methanol R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: 0.1 per cent *V/V* solution of *anhydrous formic acid R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 79 → 71 | 21 → 29 |
| 10 - 15 | 71 → 65 | 29 → 35 |
| 15 - 25 | 65 → 28 | 35 → 72 |
| 25 - 37 | 28 → 0 | 72 → 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram obtained with reference solution (a) to identify the peak due to tanshinone $II_A$ and the chromatogram obtained with reference solution (b) to identify the peak due to salvianolic acid B.

*Relative retention* with reference to tanshinone $II_A$ (retention time = about 33 min): rosmarinic acid = about 0.3; salvianolic acid B = about 0.4.

*System suitability*:

- *resolution*: minimum 5.0 between the peaks due to rosmarinic acid and salvianolic acid B in the chromatogram obtained with reference solution (c);
- *symmetry factor*: maximum 2.0 for the peak due to salvianolic acid B in the chromatogram obtained with reference solution (b).

Calculate the percentage content of tanshinone $II_A$ using the following expression:

$$\frac{A_1 \times m_2 \times p_1}{A_2 \times m_1 \times 5}$$

$A_1$ = area of the peak due to tanshinone $II_A$ in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to tanshinone $II_A$ in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *tanshinone $II_A$ CRS* used to prepare reference solution (a), in grams;

$p_1$ = percentage content of tanshinone $II_A$ in *tanshinone $II_A$ CRS*.

Calculate the percentage content of salvianolic acid B using the following expression:

$$\frac{A_3 \times m_3 \times p_2 \times 2}{A_4 \times m_1}$$

$A_3$ = area of the peak due to salvianolic acid B in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to salvianolic acid B in the chromatogram obtained with reference solution (b);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_3$ = mass of *salvianolic acid B CRS* used to prepare reference solution (b), in grams;

$p_2$ = percentage content of salvianolic acid B in *salvianolic acid B CRS*.

**04/2008:2385**

# SANGUISORBA ROOT

## Sanguisorbae radix

DEFINITION

Whole or fragmented, dried underground parts of *Sanguisorba officinalis* L. without rootlets.

*Content*: minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1) (dried drug).

CHARACTERS

The adventitious roots are about 5-25 cm long and up to 2 cm in diameter.

Herbal drugs

IDENTIFICATION

A. The whole drug consists of the rhizome, often ramified, thick, short, fusiform or cylindrical and the adventitious roots whose surface is reddish-brown or blackish-brown, with longitudinal striations, sometimes with transverse fissures, and showing rootlet scars.

It may also be found as more or less cylindrical fragments up to 2 cm long or elliptical or irregular discs. The fracture is light-coloured and very fibrous.

B. Microscopic examination (*2.8.23*). The powder is light yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous, whole or fragmented phloem fibres, usually isolated, narrow, sometimes more than 500 µm long and often rough-walled; calcium oxalate cluster crystals, free or inside parenchyma cells; a few reticulate lignified vessels; rare cork fragments. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded or ovoid starch granules, single or in groups of 2-4; the diameter of a component granule may reach 30 µm. Some starch granules are found in the parenchyma cells or in cells of the medullary rays.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2.0 g of the powdered herbal drug (355) (*2.9.12*) add 50 mL of *water R* and boil under a reflux condenser for 30 min. Cool the solution and centrifuge for 10 min. Shake the supernatant with 2 quantities, each of 15 mL, of *di-isopropyl ether R* saturated with *hydrochloric acid R*. Combine the ether layers. Evaporate to dryness and dissolve the residue in 1.0 mL of *methanol R*. Filter through a polypropylene syringe filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 5 mg of *gallic acid R* and 20 mg of *resorcinol R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *ethyl acetate R*, *toluene R* (10:30:60 *V/V/V*).

*Application*: 10 µL [or 4 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|

| ——— | ——— |
| Gallic acid: a blackish-blue zone | A blackish-blue zone (gallic acid) |
| | A blackish-blue zone |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

**Tannins** (*2.8.14*). Use 0.500 g of the powdered herbal drug (180) (*2.9.12*).

**07/2019:2579**
**corrected 10.0**

# SAW PALMETTO EXTRACT

## Sabalis serrulatae extractum

DEFINITION

Extract produced from *Saw palmetto fruit (1848)*.

*Content*:

- *total fatty acids*: minimum 80.0 per cent (anhydrous extract);
- *lauric acid* ($C_{12}H_{24}O_2$; $M_r$ 200.3): minimum 23.0 per cent (anhydrous extract);
- *total sterols, expressed as β-sitosterol* ($C_{29}H_{50}O$; $M_r$ 414.7): minimum 0.20 per cent (anhydrous extract);
- *β-sitosterol* ($C_{29}H_{50}O$; $M_r$ 414.7): minimum 0.10 per cent (anhydrous extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (minimum 90 per cent *V/V*), or supercritical carbon dioxide or a mixture of mainly *n*-hexane and methylpentanes (bp: 65-70 °C).

CHARACTERS

*Appearance*: the ethanol extract is a dark greenish-brown, oily liquid; the supercritical carbon dioxide extract is a yellowish-brown or orange-brown, oily liquid; the hexane extract is a yellowish-green or orange-yellow, oily liquid.

*Odour*: strong but not rancid.

IDENTIFICATION

*First identification*: *B*.

*Second identification*: *A*.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 0.25 g of the extract to be examined in 20 mL of *ethanol (96 per cent) R*.

*Reference solution*. Dissolve 4 mg of *β-amyrin R* and 10 mg of *β-sitosterol R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *anhydrous acetic acid R*, *ethyl acetate R*, *toluene R* (1:30:70 *V/V/V*).

*Application*: 2 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present, especially in the lower third, in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue zone |
| | A blue zone |
| _____ | _____ |
| β-Amyrin: a blue zone | A strong bluish-violet zone |
| β-Sitosterol: a blue zone | |
| _____ | _____ |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the assay of total fatty acids.

*Results*: the peaks due to methyl caproate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitoleate, methyl palmitate, methyl linoleate, methyl linolenate, methyl oleate and methyl stearate in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with reference solution (b); the principal peaks are due to methyl laurate and methyl oleate.

TESTS

**Water** (*2.5.12, Method A*): maximum 3.0 per cent, determined on 0.5 g.

**Relative density** (*2.2.5*): 0.850 to 0.950.

**Refractive index** (*2.2.6*): 1.40 to 1.50.

**Acid value** (*2.5.1*): 150.0 to 220.0, determined on 0.500 g.

**Iodine value** (*2.5.4, Method A*): 30.0 to 60.0.

**Peroxide value** (*2.5.5*): maximum 5.0.

**Saponification value** (*2.5.6*): 220.0 to 250.0.

**Solvents**. Residual solvents are controlled as described in chapter *5.4*, unless otherwise justified and authorised.

ASSAY

**Total fatty acids**. Gas chromatography (*2.2.28*).

*Internal standard solution*. Dissolve 0.47 g of *methyl margarate R* in 20 mL of *dimethylformamide R* and dilute to 100.0 mL with the same solvent.

*Test solution*. Disperse 0.25 g of the extract to be examined in 10 mL of *dimethylformamide R*. Add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of a 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

*Reference solution (a)*. Dissolve 0.699 g of *lauric acid CRS* and 0.870 g of *oleic acid CRS* in *dimethylformamide R* and dilute to 10.0 mL with the same solvent. To 1.0 mL of the solution add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of a 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

*Reference solution (b)*. Disperse 0.25 g of *saw palmetto extract HRS* in 10 mL of *dimethylformamide R*. Add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of a 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.20 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 0.33 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 0.5 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 2 | 150 |
| | 2 - 7 | 150 → 190 |
| | 7 - 12 | 190 |
| | 12 - 22 | 190 → 220 |
| | 22 - 32 | 220 |
| Injection port | | 300 |
| Detector | | 300 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of peaks*: use the chromatogram supplied with *saw palmetto extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to methyl caproate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitoleate, methyl palmitate, methyl linoleate, methyl linolenate, methyl oleate, methyl stearate and methyl margarate.

*System suitability*: reference solution (b):

- *peak-to-valley ratio*: minimum 1.2, where $H_p$ = height above the baseline of the peak due to methyl linolenate and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to methyl linoleate.

Calculate the percentage content of total fatty acids, where caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic and stearic acids are expressed as lauric acid ($C_{12}H_{24}O_2$; $M_r$ 200.3) and linoleic, linolenic and oleic acids are expressed as oleic acid ($C_{18}H_{34}O_2$; $M_r$ 282.5), using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p_1 \times 0.1}{A_2 \times A_3 \times m_1} + \frac{A_5 \times A_4 \times m_3 \times p_2 \times 0.1}{A_6 \times A_3 \times m_1}$$

$A_1$ = sum of the areas of the peaks due to methyl caproate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitoleate, methyl palmitate and methyl stearate in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to methyl laurate in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to methyl margarate in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to methyl margarate in the chromatogram obtained with reference solution (a);

$A_5$ = sum of the areas of the peaks due to methyl linoleate, methyl linolenate and methyl oleate in the chromatogram obtained with the test solution;

$A_6$ = area of the peak due to methyl oleate in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *lauric acid CRS* used to prepare reference solution (a), in grams;

$m_3$ = mass of *oleic acid CRS* used to prepare reference solution (a), in grams;

$p_1$ = percentage content of lauric acid in *lauric acid CRS*;

$p_2$ = percentage content of oleic acid in *oleic acid CRS*.

Calculate the percentage content of lauric acid using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p \times 0.1}{A_2 \times A_3 \times m_1}$$

$A_1$ = area of the peak due to methyl laurate in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to methyl laurate in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to methyl margarate in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to methyl margarate in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *lauric acid CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of lauric acid in *lauric acid CRS*.

**Total sterols**. Gas chromatography (*2.2.28*).

*Derivatisation solution (a)*: *chlorotrimethylsilane R*, *N,O-bis(trimethylsilyl)acetamide R*, *N-trimethylsilylimidazole R* (2:3:3 *V/V/V*).

*Derivatisation solution (b)*: derivatisation solution (a), *N,O-bis(trimethylsilyl)trifluoroacetamide R*, *pyridine R* (1:1:1 *V/V/V*).

*Internal standard solution.* Dissolve 0.25 g of *cholesterol R* in 25.0 mL of *methylene chloride R*.

*Test solution.* Introduce 1.0 mL of the internal standard solution into a 50 mL round-bottomed flask and evaporate to dryness. Place 3.35 g of the extract to be examined, accurately weighed, into the round-bottomed flask and add 20 mL of a solution prepared as follows: dissolve 130 g of *potassium hydroxide R* in 200 mL of *water R* and dilute to 1000 mL with *methanol R*. Heat under reflux for 2 h, transfer quantitatively to a flask and dilute to 25.0 mL with *water R*. Apply 3.0 mL of this solution to a cartridge containing *diatomaceous earth R* capable of holding 3 mL of aqueous phase. Absorb the solution into the column by applying vacuum. Maintain the vacuum for at least 20 min, until the column returns to room temperature, indicating that the methanol is completely evaporated. Rinse the column with 90 mL of *methylene chloride R* and evaporate the eluate to dryness. Dissolve the residue in 1.0 mL of derivatisation solution (b).

*Reference solution (a).* To 9.0 mg of *β-sitosterol CRS* add 1.0 mL of the internal standard solution and dilute to 5.0 mL with *methylene chloride R*. Evaporate 0.6 mL of this solution to dryness under a stream of *nitrogen R*. Dissolve the residue in 1.0 mL of derivatisation solution (b).

*Reference solution (b).* Introduce 1.0 mL of the internal standard solution into a 50 mL round-bottomed flask and evaporate to dryness. Place 3.35 g of *saw palmetto extract HRS*, accurately weighed, into the round-bottomed flask and add 20 mL of a solution prepared as follows: dissolve 130 g of *potassium hydroxide R* in 200 mL of *water R* and dilute to 1000 mL with *methanol R*. Heat under reflux for 2 h, transfer quantitatively to a flask and dilute to 25.0 mL with *water R*. Apply 3.0 mL of this solution to a cartridge containing *diatomaceous earth R* capable of holding 3 mL of aqueous phase. Absorb the solution into the column by applying vacuum. Maintain the vacuum for at least 20 min, until the column returns to room temperature, indicating that the methanol is completely evaporated. Rinse the column with 90 mL of *methylene chloride R* and evaporate the eluate to dryness. Dissolve the residue in 1.0 mL of derivatisation solution (b).

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.20 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 0.33 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 0.5 mL/min.

*Split ratio*: 1:40.

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 200 |
| | 3 - 13 | 200 → 300 |
| | 13 - 35 | 300 |
| Injection port | | 325 |
| Detector | | 325 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of peaks*: use the chromatogram supplied with *saw palmetto extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to the trimethylsilyl derivatives of cholesterol, campesterol, stigmasterol, β-sitosterol and stigmastanol.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.6 between the peaks due to the trimethylsilyl derivatives of β-sitosterol and stigmastanol.

Calculate the percentage content of total sterols (campesterol, stigmasterol, β-sitosterol and stigmastanol), expressed as β-sitosterol, using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p}{A_2 \times A_3 \times m_1}$$

$A_1$ = sum of the areas of the peaks due to the trimethylsilyl derivatives of campesterol, stigmasterol, β-sitosterol and stigmastanol in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to the trimethylsilyl derivative of β-sitosterol in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *β-sitosterol CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of β-sitosterol in *β-sitosterol CRS*.

Calculate the percentage content of β-sitosterol using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p}{A_2 \times A_3 \times m_1}$$

$A_1$ = area of the peak due to the trimethylsilyl derivative of β-sitosterol in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to the trimethylsilyl derivative of β-sitosterol in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *β-sitosterol CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of β-sitosterol in *β-sitosterol CRS*.

**corrected 10.0**

# SAW PALMETTO FRUIT

## Sabalis serrulatae fructus

DEFINITION

Dried ripe fruit of *Serenoa repens* (W.Bartram) Small (syn. *Sabal serrulata* (Michx.) Schult.f.).

*Content*: minimum 11.0 per cent of total fatty acids (dried drug).

CHARACTERS

*Odour*: strong but not rancid.

IDENTIFICATION

*First identification: A, B, D.*

*Second identification: A, B, C.*

A. The fruit is an ovoid or subspherical drupe, with a dark brown or blackish, roughly wrinkled surface and more or less coppery sheen, up to 2.5 cm long and 1.5 cm in diameter. The apex sometimes bears the remains of the style and tubular calyx, with 3 teeth, and the base bears a small depression with the scar of the stalk. The epicarp and underlying mesocarp form a thin fragile layer, which partially peels off, revealing the thin, hard, pale brown endocarp, which is fibrous and easily separable. The seed is irregularly spherical or ovoid, up to 12 mm long and 8 mm in diameter, with a hard, smooth or finely pitted surface which is reddish-brown with a paler, raised and membranous area over the raphe and micropyle; cut transversely, the seed has a thin testa, narrow perisperm and a large area of dense, horny, greyish-white endosperm, with the embryo positioned to one side.

B. Microscopic examination (*2.8.23*). Reduce to a powder (1000) (*2.9.12*). The powder is reddish or blackish-brown and oily. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1848.-1): fragments of epicarp [A] consisting of polyhedral cells (10-40 µm), reddish-brown, pigmented and highly cutinised, in small groups separated by thin walls [Aa] and accompanied by considerably larger cells of the underlying layers [Ab]; groups of parenchyma cells of the mesocarp [E]; groups of xylem tissue of the mesocarp showing small, lignified, annular or spirally thickened vessels [F], sometimes accompanied by parenchyma containing small sclereids [Fa]; sclereids of the mesocarp (20-200 µm), usually occurring singly [J] but sometimes in small groups [G], with walls that are moderately thickened, distinctly striated and finely pitted; fragments of endocarp containing groups of sclereids about 300 µm long, with strongly thickened walls and numerous pits [B]; isolated sclereids of the endocarp [K]; fragments of the testa [C] consisting of small, thin-walled cells with brown contents [Ca] and underlying sclereids [Cb]; thick-walled endosperm cells [D] with large conspicuous pits, and containing aleurone grains and oil; very numerous fragments of the brown cuticle [H].

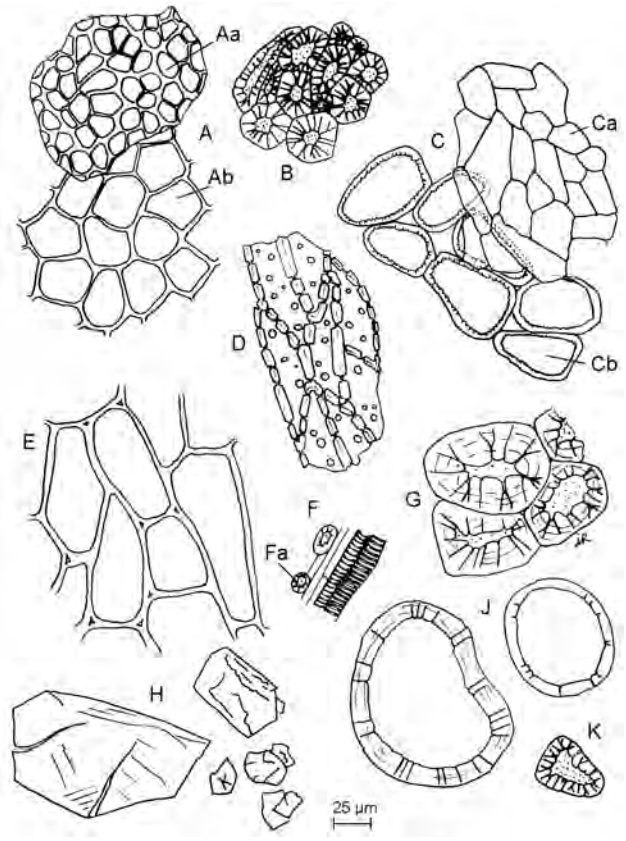

Figure 1848.-1. – *Illustration for identification test B of powdered herbal drug of saw palmetto fruit*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.5 g of the powdered herbal drug (710) (*2.9.12*), add 20 mL of *ethanol (96 per cent) R* and stir for 15 min. Filter.

*Reference solution.* Dissolve 4 mg of *β-amyrin R* and 10 mg of *β-sitosterol R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *acetic acid R*, *ethyl acetate R*, *toluene R* (1:30:70 *V/V/V*).

*Application*: 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R*; heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present, especially in the lower third, in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| | A strong blue zone |
| ——— | ——— |
| | 2 faint blue zones |
| β-Amyrin: a blue zone | |
| | A strong bluish-violet zone |
| β-Sitosterol: a blue zone | A faint blue zone |
| ——— | ——— |
| | A faint blue zone |
| **Reference solution** | **Test solution** |

D. Examine the chromatograms obtained in the assay of total fatty acids.

*Results*: the peaks due to caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic, linoleic, linolenic, oleic and stearic acids in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with reference solution (b); the principal peaks are due to lauric acid and oleic acid.

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

ASSAY

**Total fatty acids**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dissolve 0.47 g of *methyl margarate R* in 20.0 mL of *dimethylformamide R* and dilute to 100.0 mL with the same solvent.

*Test solution.* Reduce 50 g of the herbal drug to a powder (200) (*2.9.12*). Disperse 4.00 g of the powdered herbal drug in 60 mL of *dimethylformamide R*. Sonicate for 15 min and then shake for 30 min. Dilute to 100.0 mL with *dimethylformamide R*. Allow to stand for a few minutes and filter. To 20.0 mL of this solution add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of an 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

*Reference solution (a).* Dissolve 0.699 g of *lauric acid CRS* and 0.870 g of *oleic acid CRS* in *dimethylformamide R* and dilute to 10.0 mL with the same solvent. To 1.0 mL of the solution add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of an 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

*Reference solution (b).* Disperse 0.25 g of *saw palmetto extract HRS* in 10 mL of *dimethylformamide R*. Add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of an 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.20 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 0.33 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 0.5 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | **Time (min)** | **Temperature (°C)** |
|---|---|---|
| Column | 0 - 2 | 150 |
| | 2 - 7 | 150 → 190 |
| | 7 - 12 | 190 |
| | 12 - 22 | 190 → 220 |
| | 22 - 32 | 220 |
| Injection port | | 300 |
| Detector | | 300 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of peaks*: use the chromatogram supplied with *saw palmetto extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic, linoleic, linolenic, oleic and stearic acids and methyl margarate.

*System suitability*: reference solution (b):

– *peak-to-valley ratio*: minimum 1.2, where $H_p$ = height above the baseline of the peak due to linolenic acid and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to linoleic acid.

Calculate the percentage content of total fatty acids, where caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic and stearic acids are expressed as lauric acid ($C_{12}H_{24}O_2$; $M_r$ 200.3) and linoleic, linolenic and oleic acids are expressed as oleic acid ($C_{18}H_{34}O_2$; $M_r$ 282.5), using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p_1 \times 0.5}{A_2 \times A_3 \times m_1} + \frac{A_5 \times A_4 \times m_3 \times p_2 \times 0.5}{A_6 \times A_3 \times m_1}$$

$A_1$ = sum of the areas of the peaks due to caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic and stearic acids in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to lauric acid in the chromatogram obtained with reference solution (a);

$A_3$ = area of the peak due to methyl margarate in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to methyl margarate in the chromatogram obtained with reference solution (a);

$A_5$ = sum of the areas of the peaks due to linoleic, linolenic and oleic acids in the chromatogram obtained with the test solution;

$A_6$ = area of the peak due to oleic acid in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *lauric acid CRS* used to prepare reference solution (a), in grams;

$m_3$ = mass of *oleic acid CRS* used to prepare reference solution (a), in grams;

$p_1$ = percentage content of lauric acid in *lauric acid CRS*;

$p_2$ = percentage content of oleic acid in *oleic acid CRS*.

**07/2016:2428**
**corrected 9.1**

# SCHISANDRA FRUIT

## Schisandrae chinensis fructus

DEFINITION

Whole, dried or steamed and dried, ripe fruit of *Schisandra chinensis* (Turcz.) Baill.

*Content*: minimum 0.40 per cent of schisandrin ($C_{24}H_{32}O_7$; $M_r$ 432.5) (dried drug).

IDENTIFICATION

A. The berry is more or less spherical, up to 8 mm in diameter; red, reddish-brown or blackish outer surface, sometimes covered in a whitish frost; strongly shrivelled pericarp; presence of 1-2 reniform, yellowish-brown, lustrous seeds, with thin seed-coat.

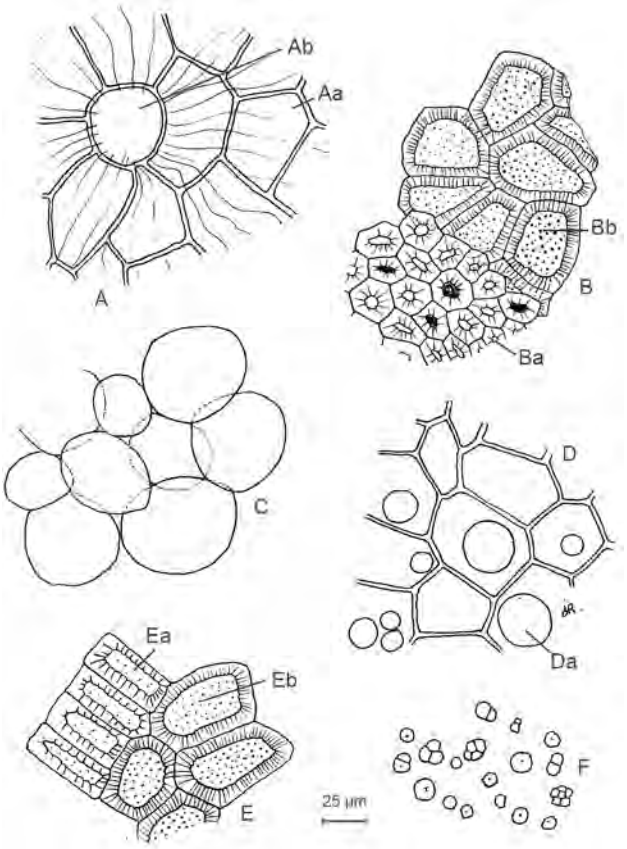

Figure 2428.-1. – *Illustration for identification test B of powdered herbal drug of schisandra fruit*

B. Microscopic examination (*2.8.23*). The powder is dark reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2428.-1): reddish-brown fragments of pericarp consisting of 1 layer of thin-walled epicarp cells (surface view [A]), covered by a striated cuticle [Aa] and accompanied by sparse essential oil cells [Ab], the cuticle is not striated above the essential oil cells; fragments of mesocarp [C] composed of several layers of ovoid, more or less flattened cells; fragments of the testa [B, E] with the outer layer consisting of polygonal sclereids, about 11-30 µm in diameter (surface view [Ba]) or in palisade arrangement (side view [Ea]), with thick, lignified, finely channelled walls and small lumen with reddish-brown or blackish contents with the inner layers of the testa consisting of sclereids with yellowish or slightly reddish walls, isolated or in small groups or together with the outer sclereids, about 80 µm in diameter, with slightly lignified, thickened and markedly channelled, pitted walls and a large lumen [Bb, Eb]; fragments of mostly colourless endosperm [D] consisting of polyhedral cells containing oil droplets [Da] and aleurone grains. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows parenchymatous cells of the mesocarp containing numerous small, round or slightly polyhedral starch granules and rare free starch granules, rounded or slightly polyhedral, simple or 2-5 compound [F]; the hilum is often visible.

C. Examine the chromatograms obtained in the test for *Schisandra sphenanthera*.

*Results A*: see below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak quenching zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| γ-Schisandrin: a quenching zone | A quenching zone (γ-schisandrin) |
| _____ | _____ |
| | A weak quenching zone |
| _____ | _____ |
| Schisandrin: a quenching zone | A quenching zone (schisandrin) |
| **Reference solution** | **Test solution** |

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| γ-Schisandrin: a brown zone | A brown zone (γ-schisandrin) |
| _____ | _____ |
| _____ | _____ |
| Schisandrin: an intense, brownish-green zone | An intense, brownish-green zone (schisandrin) |
| **Reference solution** | **Test solution** |

TESTS

***Schisandra sphenanthera***. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 2.5 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Extract at 25 °C in an ultrasonic bath for 5 min and centrifuge.

*Reference solution*. Dissolve 5 mg of *schisandrin R* and 5 mg of *γ-schisandrin R* in 5 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *acetic acid R*, *ethyl acetate R*, *toluene R* (2:22:46 *V/V/V*).

*Application*: 5 µL [or 2 µL] as bands of 10 mm [or 6 mm].

*Development*: over a path of 10 cm [or 7 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Detection B*: spray with a 100 g/L solution of *sulfuric acid R* in *methanol R* and heat in an oven at 120 °C for 7 min; examine in daylight.

*Results B*: the chromatogram obtained with the test solution shows a zone due to schisandrin and a zone due to γ-schisandrin; the chromatogram shows no intense violet-pink zone in the middle third.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Weigh 1.250 g of the powdered herbal drug (355) (*2.9.12*) into a 250 mL conical flask, add 90 mL of *methanol R* and sonicate for 30 min. Filter the solution into a volumetric flask, add 10 mL of *methanol R* whilst rinsing the filter and dilute to 100.0 mL with the same solvent.

*Reference solution*. Dissolve 5.0 mg of *schisandrin CRS* in *methanol R* and dilute to 100.0 mL with the same solvent.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*:
- *mobile phase A*: *water R*, *methanol R* (35:65 *V/V*);
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 100 | 0 |
| 10 - 16 | 100 → 58 | 0 → 42 |
| 16 - 26 | 58 | 42 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 250 nm.

*Injection*: 10 µL.

*Retention time*: schisandrin = about 8 min.

*System suitability*:
- *number of theoretical plates*: minimum 5000, calculated for the peak due to schisandrin in the chromatogram obtained with the reference solution.

Calculate the percentage content of schisandrin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to schisandrin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to schisandrin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *schisandrin CRS* used to prepare the reference solution, in grams;

$p$ = percentage content of schisandrin in *schisandrin CRS*.

**07/2019:0202**

# SENEGA ROOT

## Polygalae radix

DEFINITION

Dried, whole or fragmented root and root crown of *Polygala senega* L. or root of *Polygala tenuifolia* Willd., with rootlets removed.

IDENTIFICATION

A. *P. senega*. The root crown of the whole drug is greyish-brown and distinctly wider than the root; it forms an irregular head up to 3 cm in diameter consisting of numerous, tightly packed remains or scars of stems and violet-brown buds. The taproot is flexuous and tortuous, brown or yellow, usually single but occasionally branched into 2 or 3 roots, usually 1-8 mm in diameter at the crown, gradually tapering to the tip; the external surface is transversely and longitudinally striated and often shows a more or less distinct, decurrent, elongated spiral ridge. The transverse section of the root is more or less triangular. The fracture is short and shows a yellowish cortex of

varying thickness surrounding a paler, central, woody area irregular in shape, especially at the ridge. The fragmented drug consists of pieces of varying shape; fragments of the root crown comprise the tightly packed remains or scars of stems and violet-brown buds; fragments of the root have a brown or yellow, transversely and longitudinally striated external surface with a paler internal surface.

*P. tenuifolia*. The whole drug consists of the root, light yellowish-brown or brown, straight or curved, 3-15 cm in length and 3-8 mm in diameter, showing numerous transverse wrinkles and fissures and, to a lesser extent, longitudinal striations; round rootlet scars are often visible. The xylem is light yellow and readily detached, with some fragments consisting only of rolls of bark with their edges folded inwards. The fracture shows a yellowish cortex and a pale yellow, usually circular, central woody area. The fragmented drug consists of more or less cylindrical slices, solid or hollow in the central part where the xylem has detached. The external surface is yellowish-grey to brownish-grey and transversely striated; the transverse section is yellowish-brown and shows a rounded, pale yellow, central woody area.

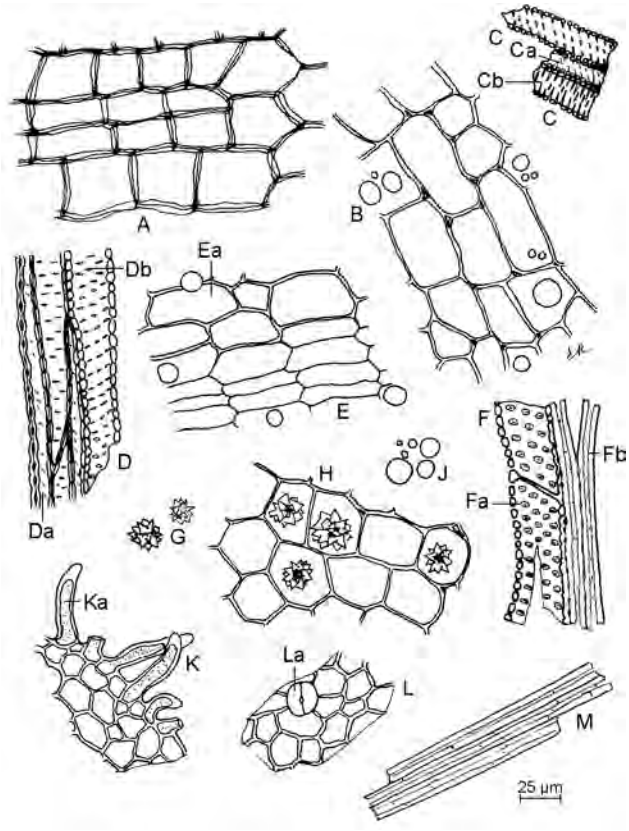

Figure 0202.-1. – *Illustration for identification test B of powdered herbal drug of senega root*

B. Microscopic examination (*2.8.23*). The powder is light yellow to brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0202.-1): fragments of lignified tissue [C, D, F] made up of numerous pitted tracheids [Ca, Da] and slightly larger, reticulate [Cb], pitted [Db] or bordered-pitted vessels [Fa]; yellowish parenchyma cells containing oil droplets [B]; fragments of cork (surface view [A], transverse section [E]), sometimes accompanied by phelloderm and parenchyma, some cells of which contain oil droplets [Ea]; numerous isolated oil droplets [J]. *P. tenuifolia* powder also contains calcium oxalate cluster crystals, isolated [G] or included in parenchymatous cells [H], and long, fine, thick-walled lignified fibres, most often fragmented, in clusters [M] or associated with vessels [Fb]. *P. senega* powder may show occasional fragments of epidermal tissue from bud scales [K, L] with stomata [La] and unicellular trichomes [Ka].

C. High-performance thin-layer chromatography (*2.8.25*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *ethanol (70 per cent V/V) R*. Sonicate at 80 °C for 15 min, filter or centrifuge and use the filtrate or supernatant.

*Reference solution (a)*. Dissolve 1 mg of *rutoside trihydrate R* and 30 mg of *puerarin R* in *methanol R* and dilute to 25.0 mL with the same solvent.

*Reference solution (b)*. Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c)*. Dissolve 2 mg of *chlorogenic acid R* and 30 mg of *puerarin R* in *methanol R* and dilute to 25 mL with the same solvent.

*Intensity marker*: puerarin.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:26:100 *V/V/V/V*).

*Application*: 3 µL as bands of 8 mm.

*Development*: 70 mm from the lower edge of the plate.

*Drying*: in a current of air at room temperature for 5 min.

*Detection*: heat at 100-105 °C for 3 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*System suitability*: reference solution (c):

– the chromatogram shows in the middle third 2 distinct zones; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (puerarin) shows a blue fluorescence.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint fluorescent zones may be present.

| **Top of the plate** | | |
|---|---|---|
| ——— | ——— | ——— |
| | | A blue zone |
| Puerarin: a blue zone | A blue zone | A blue zone |
| | A blue zone | A blue zone |
| | | A greyish zone, faint |
| Rutoside: an orange zone | An orange zone, faint | |
| | | A greenish-blue zone (at the border between the middle and lower third) |
| ——— | ——— | ——— |
| | | A bluish zone |
| | A whitish-blue zone | |
| | 3 bluish zones | |
| **Reference solution (a)** | **Test solution (*Polygala senega*)** | **Test solution (*Polygala tenuifolia*)** |

TESTS

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

**Extractable matter**: minimum 20.0 per cent.

To 1.00 g of the powdered herbal drug (355) (*2.9.12*) add a mixture of 4.5 g of *ethanol (96 per cent) R* and 15.5 g of *water R* and allow to macerate for 3 h, shaking frequently. Filter. Evaporate 5.0 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 50 mg.

**Foam index** (*2.8.24*): minimum 3.5, determined on 1.00 g of the powdered herbal drug (355) (*2.9.12*).

STORAGE

Protected from humidity.

LABELLING

The label states the species present.

**01/2015:0206**

# SENNA LEAF

## Sennae folium

DEFINITION

Dried leaflets of *Cassia senna* L. (syn. *Cassia acutifolia* Delile), known as Alexandrian or Khartoum senna, or *Cassia angustifolia* Vahl, known as Tinnevelly senna, or a mixture of the 2 species.

*Content*: minimum 2.5 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; $M_r$ 863) (dried drug).

IDENTIFICATION

A. *C. senna* occurs as greyish-green or brownish-green, thin, fragile leaflets, lanceolate, mucronate, asymmetrical at the base, usually 15-40 mm long and 5-15 mm wide, the maximum width being at a point slightly below the centre; the lamina is slightly undulant with both surfaces covered with fine, short trichomes. Pinnate venation is visible mainly on the lower surface, with lateral veins leaving the midrib at an angle of about 60° and anastomosing to form a ridge near the margin.

*Stomatal index* (*2.8.3*): 10-12.5-15.

*C. angustifolia* occurs as yellowish-green or brownish-green leaflets, elongated and lanceolate, slightly asymmetrical at the base, usually 20-50 mm long and 7-20 mm wide at the centre. Both surfaces are smooth with a very small number of short trichomes and are frequently marked with transverse or oblique lines.

*Stomatal index* (*2.8.3*): 14-17.5-20.

B. Microscopic examination (*2.8.23*). The powder is light green or greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0206.-1): fragments of epidermis (*C. angustifolia*: [A, B], *C. senna*: [J, K]) with polygonal cells [Aa, Ka], paracytic stomata (*2.8.3*) [Ab, Ac, Ba, Ja, Kb] and unicellular covering trichomes, conical in shape, with warty walls (surface view [Ad], side view (*C. senna*: [G])), or their scars [Bb, Jb], frequently accompanied by palisade parenchyma [Ae, Jc]; isolated, fragmented covering trichomes [E]; fibres [F] with a crystal sheath of prismatic crystals of calcium oxalate [Fa]; isolated prisms of calcium oxalate [D]; isolated cluster crystals of calcium oxalate [H]; fragments of median parenchyma from the lamina [C] with some cells containing cluster crystals of calcium oxalate [Ca], often accompanied by palisade parenchyma [Cb] and annular vessels [Cc].

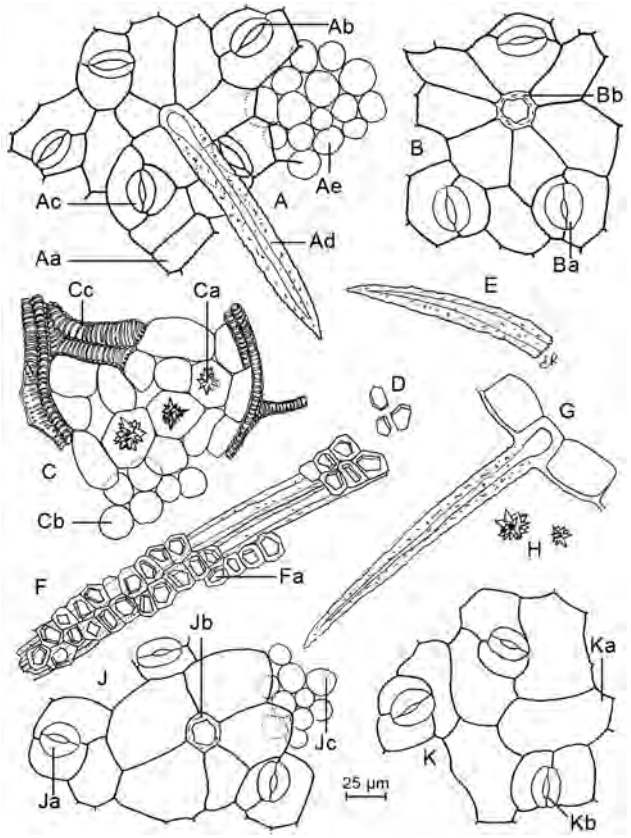

Figure 0206.-1. – *Illustration for identification test B of powdered herbal drug of senna leaf*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (180) (*2.9.12*) add 5 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

*Reference solution.* Dissolve 10 mg of *senna extract CRS* in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *ethyl acetate R*, *propanol R* (1:30:40:40 *V/V/V/V*).

*Application*: 10 µL as bands of 20 mm.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and treat with a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

*Results*: the principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing $R_F$ value), colour and size to the principal zones in the chromatogram obtained with the reference solution; between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible.

D. Place about 25 mg of the powdered herbal drug (180) (*2.9.12*) in a conical flask and add 50 mL of *water R* and 2 mL of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 mL of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulfate R*, evaporate

5 mL to dryness and to the cooled residue add 5 mL of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent of foreign organs and maximum 1 per cent of foreign elements.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.5 per cent.

ASSAY

*Carry out the assay protected from bright light.*

Place 0.150 g of the powdered herbal drug (180) (*2.9.12*) in a 100 mL flask. Add 30.0 mL of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 mL of the supernatant liquid to a 150 mL separating funnel. Add 0.1 mL of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 mL, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 mL of the supernatant liquid to a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of *ferric chloride solution R1* and mix. Place the flask in a water-bath so that the water level is above that of the liquid in the flask, and heat under a reflux condenser for 20 min. Add 3 mL of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 mL, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 mL, of *water R*. Transfer the combined ether layers to a volumetric flask and dilute to 100.0 mL with *ether R*. Evaporate 10.0 mL carefully to dryness and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

i. e. taking the specific absorbance of sennoside B to be 240.

$A$ = absorbance at 515 nm;

$m$ = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

**07/2015:1261**

# SENNA LEAF DRY EXTRACT, STANDARDISED

## Sennae folii extractum siccum normatum

DEFINITION

Standardised dry extract produced from *Senna leaf (0206)*.

*Content*: 5.5 per cent to 8.0 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; $M_r$ 863) (dried extract). The measured content does not deviate from the value stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent *V/V*).

CHARACTERS

*Appearance*: brownish or brown powder.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *ethanol (96 per cent) R*, *water R* (50:50 *V/V*).

*Test solution*. To 0.1 g of the extract to be examined add 5 mL of the solvent mixture and heat to boiling. Cool and centrifuge. Use the supernatant.

*Reference solution*. Dissolve 10 mg of *senna extract CRS* in 1 mL of the solvent mixture (a slight residue remains).

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *ethyl acetate R*, *propanol R* (1:30:40:40 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min; allow to cool and treat with a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

*Results*: the principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the reference solution. The chromatograms show in the lower third a prominent brown zone due to sennoside B and above it a yellow zone followed by another prominent brown zone due to sennoside A. In the upper half of the chromatograms are visible, in order of increasing $R_F$ value, a prominent reddish-brown zone and an orange-brown zone followed by a faint pink zone and 2 yellow zones. Close to the solvent front a dark pink zone appears, which may be followed by several faint zones.

B. Place about 25 mg of the extract to be examined in a conical flask and add 50 mL of *water R* and 2 mL of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 mL of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulfate R*, evaporate 5 mL to dryness and to the cooled residue add 5 mL of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

**Loss on drying** (*2.8.17*): maximum 5.0 per cent.

ASSAY

*Carry out the assay protected from bright light.*

Place 0.150 g of the extract to be examined in a 100 mL flask, disperse in *water R* and dilute to 100.0 mL with the same solvent. Filter the solution, discarding the first 10 mL of the filtrate. Transfer 20.0 mL of the filtrate to a 150 mL separating funnel. Add 0.1 mL of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 mL, of *ether R*. Allow the layers to separate and discard the ether layer. Add 0.10 g of *sodium hydrogen carbonate R* to the aqueous layer and shake for 3 min. Centrifuge and transfer 10.0 mL of the supernatant to a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 3 mL of *hydrochloric acid R* and heat for a further 30 min with

frequent shaking to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 mL, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with 2 quantities, each of 15 mL, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 mL with *ether R*. Evaporate 10.0 mL carefully to dryness and dissolve the residue in 10.0 mL of a 5.0 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides expressed as sennoside B using the following expression:

$$\frac{A \times 4.167}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

$A$ = absorbance at 515 nm;

$m$ = mass of the extract to be examined, in grams.

LABELLING

The label states the content of hydroxyanthracene glycosides.

**01/2015:0207**

# SENNA PODS, ALEXANDRIAN

## Sennae fructus acutifoliae

DEFINITION

Dried fruit of *Cassia senna* L. (syn. *Cassia acutifolia* Delile).

*Content*: minimum 3.4 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; $M_r$ 863) (dried drug).

IDENTIFICATION

A. Flattened reniform pods, green or greenish-brown with brown patches at the positions corresponding to the seeds, usually 40-50 mm long and at least 20 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain 6-7 flattened and obovate seeds, green or pale brown, with a continuous network of prominent ridges on the testa.

B. Microscopic examination (*2.8.23*). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0207.-1): fragments of the epicarp (surface view [B, K]) with polygonal cells, anomocytic [Ba] or paracytic [Bb, Ka] stomata (*2.8.3*) and covering trichomes [Kb] or their scars [Bc]; isolated conical warty covering trichomes, usually bent [C]; fragments of the mesocarp (surface view [D]) with fibres [Da] in 2 crossed layers accompanied by a layer of cells containing calcium oxalate prisms [Db] and sometimes cells of the underlying endocarp [Dc]; fragments of the outer layers of the testa (transverse section [J]) covered by a thick cuticle [Ja] with palisade cells about 50 µm long, with thick walls and a reduced lumen [Jb], accompanied by the hypodermis with pillar-like cells [Jc]; palisade cells of the testa (surface view [N]) and fragments of the hypodermis of the seed forming rings (surface view [A]); fragments of cotyledons (surface view [F], transverse section [E]) consisting of small cells of the epidermis [Ea, Fa] and of the palisade tissue [Eb, Fb]; prisms and cluster crystals of calcium oxalate, free [De, Ga] or included in parenchyma [G]; fragments of vascular bundles [L] with spiral vessels [La] and fibres with moderately thickened and pitted walls [Lb]; sclereids [M, O] and fibres [H] accompanied by crystal sheaths of calcium oxalate [Ha] from fruit stalks.

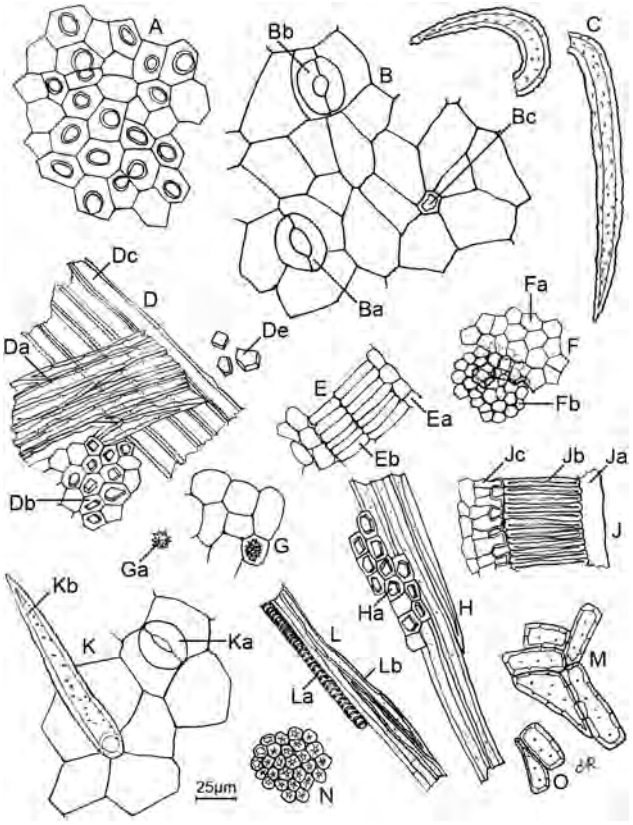

Figure 0207.-1. – *Illustration for identification test B of powdered herbal drug of Alexandrian senna pods*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (180) (*2.9.12*) add 5 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

*Reference solution.* Dissolve 10 mg of *senna extract CRS* in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R*, *water R*, *ethyl acetate R*, *propanol R* (1:30:40:40 *V/V/V/V*).

*Application*: 10 µL as bands of 20 mm.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and treat with a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

*Results*: the principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in order of increasing $R_F$ value), colour and size to the principal zones in the chromatogram obtained with the reference solution; between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible; the zones due to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered herbal drug (180) (*2.9.12*) in a conical flask and add 50 mL of *water R* and 2 mL of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 mL of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulfate R*, evaporate 5 mL to dryness and to the cooled residue add 5 mL of

*dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

**Foreign matter** (*2.8.2*): maximum 1 per cent.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

*Carry out the assay protected from bright light.*

Place 0.150 g of the powdered herbal drug (180) (*2.9.12*) in a 100 mL flask. Add 30.0 mL of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 mL of the supernatant liquid to a 150 mL separating funnel. Add 0.1 mL of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 mL, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 mL of the supernatant liquid to a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of *ferric chloride solution R1* and mix. Place the flask in a water-bath so that the water level is above that of the liquid in the flask, and heat under a reflux condenser for 20 min. Add 3 mL of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 mL, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 mL, of *water R*. Transfer the combined ether layers to a volumetric flask and dilute to 100.0 mL with *ether R*. Evaporate 10.0 mL carefully to dryness and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

$A$ = absorbance at 515 nm;

$m$ = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

# SENNA PODS, TINNEVELLY

## Sennae fructus angustifoliae

DEFINITION

Dried fruit of *Cassia angustifolia* Vahl.

*Content*: minimum 2.2 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; $M_r$ 863) (dried drug).

IDENTIFICATION

A. Flattened, slightly reniform pods, yellowish-brown or brown with dark brown patches at the positions corresponding to the seeds, usually 35-60 mm long and 14-18 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain 5-8 flattened and obovate seeds, green or pale brown, with incomplete, wavy, transverse ridges on the testa.

B. Microscopic examination (*2.8.23*). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0208.-1): fragments of the epicarp (surface view [B, K]) with polygonal cells, anomocytic [Ba] or paracytic [Bb, Ka] stomata (*2.8.3*) and covering trichomes [Kb] or their scars [Bc]; isolated conical warty covering trichomes, usually bent [C]; fragments of the mesocarp (surface view [D]) with fibres [Da] in 2 crossed layers accompanied by a layer of cells containing calcium oxalate prisms [Db] and sometimes cells of the underlying endocarp [Dc]; fragments of the outer layers of the testa (transverse section [J]) covered by a thick cuticle [Ja] with palisade cells about 50 µm long, with thick walls and a reduced lumen [Jb], accompanied by the hypodermis with pillar-like cells [Jc]; palisade cells of the testa (surface view [N]) and fragments of the hypodermis of the seed forming rings (surface view [A]); fragments of cotyledons (surface view [F], transverse section [E]) consisting of small cells of the epidermis [Ea, Fa] and of the palisade tissue [Eb, Fb]; prisms and cluster crystals of calcium oxalate, free [De, Ga] or included in parenchyma [G]; fragments of vascular bundles [L] with spiral vessels [La] and fibres with moderately thickened and pitted walls [Lb]; sclereids [M, O] and fibres [H] accompanied by crystal sheaths of calcium oxalate [Ha] from fruit stalks.

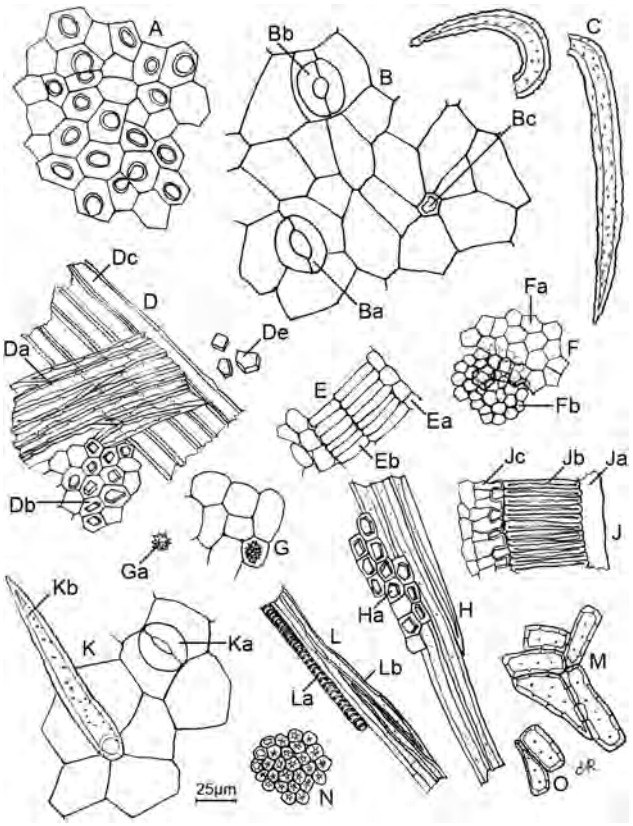

Figure 0208.-1. – *Illustration for identification test B of powdered herbal drug of Tinnevelly senna pods*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (180) (*2.9.12*) add 5 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

*Reference solution.* Dissolve 10 mg of *senna extract CRS* in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *ethyl acetate R*, *propanol R* (1:30:40:40 *V/V/V/V*).

*Application*: 10 µL as bands of 20 mm.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and treat with a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

*Results*: the principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in order of increasing $R_F$ value), colour and size to the principal zones in the chromatogram obtained with the reference solution; between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible; the zones due to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered herbal drug (180) (*2.9.12*) in a conical flask and add 50 mL of *water R* and 2 mL of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 mL of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulfate R*, evaporate 5 mL to dryness and to the cooled residue add 5 mL of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

# SERRATULA CORONATA HERB

## Serratulae coronatae herba

DEFINITION

Dried, whole or fragmented aerial part of *Serratula coronata* L. collected during flowering.

*Content*: minimum 5.0 per cent of β-ecdysterone ($C_{27}H_{44}O_7$; $M_r$ 480.6) (dried drug).

IDENTIFICATION

A. The stem is sulcate, erect, glabrous, usually terminally branched, rarely unbranched. Basal leaves are glabrescent, varying from pinnately lobed, or sometimes irregularly pinnatifid, to pinnatisect or pinnate; segments are elliptical to lanceolate, with hairy, irregularly serrate or dentate margins; main veins are sunken on the upper surface and prominent on the lower surface. Cauline leaves are similar to the basal leaves, but are smaller towards the top of the stem. The capitula, 15–25 mm in diameter, are campanulate and arranged as a loose, irregular panicle; they consist of an involucre, a receptacle with paleae up to 10 mm in length and numerous florets. Involucral bracts are yellowish-green tinged with reddish-brown to violet, rigid, acute and distinctly velutinous. Inner bracts are more elongated, sometimes hooked at the apex. Florets are pinkish-violet, tubular and 20–28 mm in length. Achenes, if present, are oblanceolate-ellipsoid and glabrous, sometimes still bearing a pappus of multiseriate, acute, unbranched hairs.

B. Microscopic examination (*2.8.23*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2754.-1): fragments of the upper epidermis of the leaf (surface view [D]), consisting of polygonal cells with slightly sinuous anticlinal walls [Da] and anomocytic stomata (*2.8.3*) with 3-5 subsidiary cells [Db], usually accompanied by palisade parenchyma [Dc]; fragments of the lower epidermis of the leaf (surface view [C]), composed of irregularly shaped cells [Ca] and anomocytic stomata with 3-5 subsidiary cells [Cb] often accompanied by spongy parenchyma cells [Cc]; fragments of the margin of the leaf lamina showing the remains of the bases of numerous uniseriate covering trichomes [B, H] composed of 3-5 cells with thickened walls and a striated cuticle [Ba], occasionally bearing very thin-walled cells [Bb]; fragments of the abaxial epidermis of the bracts of the involucre [A, G] with slightly thickened, elongated cells [Aa] bearing short, unicellular, lignified covering trichomes pointing in the same direction, fusiform in surface view [Ab] and spiny

in transverse section [Ga], and rare biseriate glandular trichomes [Ac]; fragments of the bristles of the calyx [J]; fragments of the style [E] composed of fine irregular cells [Ea], 1 or 2 secretory canals with orange contents [Eb] lying parallel to the annular vessels [Ec]; pollen grains, 60-70 µm in diameter, with 3 pores and a thick, spiny exine [F]; fragments of the ovary with long styloid calcium oxalate crystals and fragments of the corolla containing small prismatic crystals of calcium oxalate may also be present.

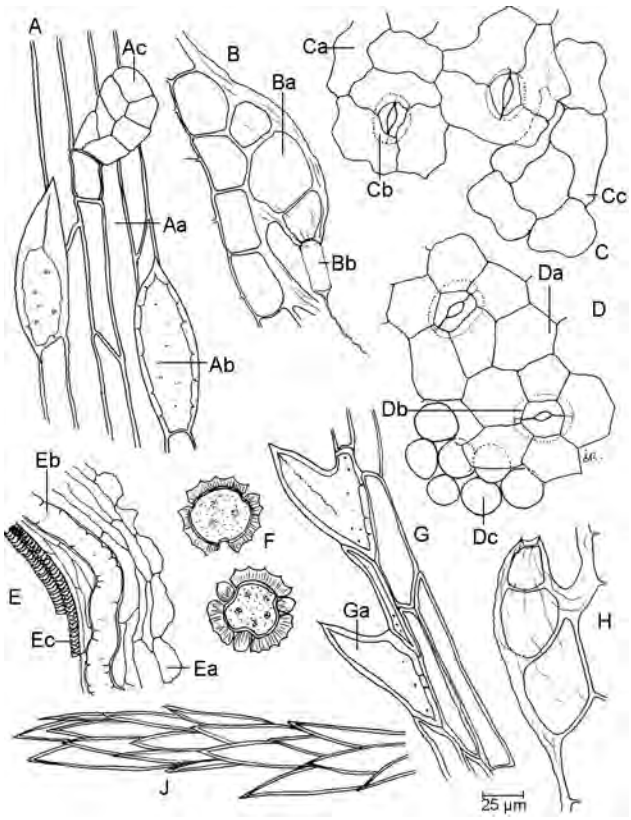

Figure 2754.-1. – *Illustration for identification test B of powdered herbal drug of Serratula coronata herb*

C. High-performance thin-layer chromatography (*2.8.25*).

*Test solution.* To 0.25 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

*Reference solution (a).* Dissolve 1.5 mg of *rutoside trihydrate R* and 2.5 mg of *isoquercitroside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c).* Dissolve 1.5 mg of *chlorogenic acid R* and 1.5 mg of *hyperoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Intensity marker*: isoquercitroside.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

*Application*: 2 µL as bands of 8 mm.

*Development*: 70 mm from the lower edge of the plate.

*Drying*: in a current of air at room temperature for 5 min.

*Detection*: heat at 100-105 °C for 3 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*System suitability*: reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent zones may be present.

| Top of the plate | |
|---|---|
| | A red zone, very faint to equivalent |
| | A yellow zone, very faint to intense |
| _____ | _____ |
| | 2 greenish-blue zones, very faint to equivalent (possibly overlapping with the yellow or orange zone below) |
| Isoquercitroside: a yellow or orange zone | A yellow or orange zone, very faint to faint |
| | A greenish-blue zone, equivalent |
| | A bluish zone, very faint to faint |
| _____ | _____ |
| Rutoside: a yellow or orange zone | A yellow or orange zone, very faint to faint |
| **Reference solution (a)** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Place 4.0 g of the powdered herbal drug (355) (*2.9.12*) in the cartridge of a continuous extraction apparatus (Soxhlet type). Place 150 mL of *methanol R* and a magnetic stirrer in a 500 mL round-bottomed flask and heat under reflux for 8 h. Transfer the resulting extract to a volumetric flask and dilute to 200.0 mL with *methanol R*.

*Reference solution (a).* Dissolve 10.0 mg of *β-ecdysterone CRS* in *methanol R* using sonication and dilute to 50.0 mL with the same solvent.

*Reference solution (b).* Dissolve 2 mg of *makisterone A R* in reference solution (a) using sonication and dilute to 10 mL with reference solution (a).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl diol silica gel for chromatography compatible with highly aqueous mobile phases R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*:

– *mobile phase A*: 0.125 per cent *V/V* solution of *anhydrous formic acid R*;

– *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 85 | 15 |
| 2 - 17 | 85 → 72.5 | 15 → 27.5 |
| 17 - 23 | 72.5 → 10 | 27.5 → 90 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 248 nm.

*Injection*: 20 µL.

*Identification of peaks*: use the chromatogram obtained with reference solution (a) to identify the peak due to β-ecdysterone; use the chromatogram obtained with reference solution (b) to identify the peak due to makisterone A.

*Retention time*: β-ecdysterone = about 11 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to β-ecdysterone and makisterone A.

Calculate the percentage content of β-ecdysterone using the following expression:

$$\frac{A_1 \times m_2 \times p \times 4}{A_2 \times m_1}$$

$A_1$ = area of the peak due to β-ecdysterone in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to β-ecdysterone in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *β-ecdysterone CRS* used to prepare reference solution (a), in grams;

$p$ = assigned percentage content of β-ecdysterone in *β-ecdysterone CRS*.

**01/2015:2639**

# SOPHORA FLOWER

## Sophorae japonicae flos

DEFINITION

Dried, opened flower of *Styphnolobium japonicum* (L.) Schott (syn. *Sophora japonica* L.).

*Content*:

– minimum 8.0 per cent of total flavonoids, expressed as rutoside ($C_{27}H_{30}O_{16}$; $M_r$ 611) (dried drug);

– minimum 6.0 per cent of rutoside ($C_{27}H_{30}O_{16}$; $M_r$ 611) (dried drug).

IDENTIFICATION

A. The opened flower is crumpled, rolled, and has a very thin and short pedicel. The dark green or brown, campanulate calyx is about 3-4 mm long and consists of 5 fused sepals with longitudinal striations at the base, divided at the apex into 5 slightly bilabiate lobes. The pale yellow or light yellowish-brown, papilionaceous type corolla is often broken and measures about 10-15 mm; the upper petal is the largest, subrounded, with a reflexed apex and a bright yellow unguis at its internal base. The other 4 petals are oblong. There are 10 free stamens surrounding a cylindrical and curved central style.

B. Microscopic examination (*2.8.23*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2639.-1): roundish [La] or triangular [Lb] pollen grains [L] with 3 pores and a smooth exine, about 18 µm in diameter; isolated covering trichomes [A, B, F, O] of varying lengths (60-660 µm), slightly flexed, usually consisting of 1 or 2 basal cells and a long pointed distal cell, with smooth or slightly warty walls; fragments of sepals [C] composed of anomocytic stomata (*2.8.3*) with 4-8 subsidiary cells [Ca], covering trichomes [Cb] or their scars [Cc]; fragments of petals [G, H] with cells covered by a finely striated cuticle [Ga, Ha], sometimes accompanied by fine annular or spiral vessels [Hb] and parenchyma with some cells containing crystalline masses of rutoside [Hc]; fragments of parenchyma [E] from the sepals containing prisms of calcium oxalate [Ea] and crystalline masses of rutoside [Eb]; fragments of anthers [N] showing the characteristic fibrous layer (transverse section [Na], surface view [K]) and immature pollen grains [Nb]; free prisms of calcium oxalate [M]. Examine under a microscope using *chloral hydrate solution R*, without heating the preparation: brownish-yellow rutoside crystals are visible, free or included in cells, as crystalline masses [Eb, Hc, J] or in fan-shaped aggregates of very fine needles [D, Ec, Gb].

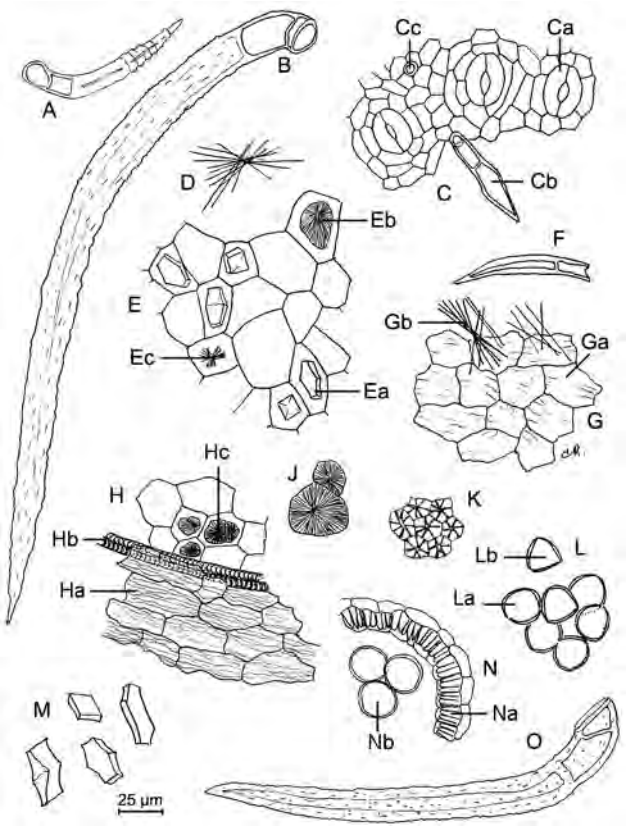

Figure 2639.-1. – *Illustration for identification test B of powdered herbal drug of sophora flower*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *methanol R*, sonicate for 10 min and filter.

*Reference solution.* Dissolve 10 mg of *hyperoside R* and 10 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

*Application*: 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*, allow to dry in air for about 30 min, and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | An orange-yellow zone |
| | A brown zone |
| Hyperoside: a yellowish-orange zone | |
| | 2 green zones |
| Rutoside: an orange-yellow zone | A very intense orange-yellow zone (rutoside) |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of flower buds and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 9.0 per cent.

ASSAY

**Total flavonoids**

*Stock solution*. Place 2.000 g of the powdered herbal drug (355) (*2.9.12*) in the cartridge of a continuous-extraction apparatus (Soxhlet type). Add 100 mL of *heptane R* and heat under a reflux condenser until the extraction liquid is colourless. Allow to cool and discard the heptane. Add 90 mL of *methanol R* and continue the extraction with heating under a reflux condenser until the extraction liquid is colourless. Allow to cool. Transfer the methanolic solution to a 100 mL volumetric flask. Rinse the extraction flask with a few millilitres of *methanol R*. Combine the methanolic solutions and dilute to 100.0 mL with *methanol R*. Dilute 10.0 mL of this solution to 100.0 mL with *water R* and shake vigorously.

*Test solution*. Dilute 10.0 mL of the stock solution to 100.0 mL with a 20 g/L solution of *aluminium chloride R* in *methanol R*.

*Compensation solution*. Dilute 10.0 mL of the stock solution to 100.0 mL with *methanol R*.

Measure the absorbance (*2.2.25*) of the test solution after 15 min by comparison with the compensation solution at 425 nm.

Calculate the percentage content of total flavonoids, expressed as rutoside, using the following expression:

$$\frac{A \times 1000}{m \times 37}$$

i.e. taking the specific absorbance of rutoside to be 370.

$A$ = absorbance of the test solution at 425 nm;

$m$ = mass of the herbal drug to be examined, in grams.

**Rutoside**. Liquid chromatography (*2.2.29*).

*Test solution*. Place 0.500 g of the powdered herbal drug (355) (*2.9.12*) in a conical flask and add 50.0 mL of *methanol R*. Weigh, sonicate for 30 min and allow to cool. Weigh and compensate for the loss of solvent with *methanol R*. Shake vigorously, filter, and dilute 2.0 mL of the filtrate to 10.0 mL with *methanol R*.

*Reference solution (a)*. Dissolve 10.0 mg of *rutoside trihydrate CRS* in 2 mL of *methanol R* and dilute to 10.0 mL with a 50 per cent *V/V* solution of *methanol R*. Dilute 2.0 mL of this solution to 10.0 mL with a 50 per cent *V/V* solution of *methanol R*.

*Reference solution (b)*. Dissolve 10.0 mg of *apigenin 7-glucoside R* and 10.0 mg of *rutoside trihydrate R* in 30 mL of *methanol R* and dilute to 50.0 mL with a 50 per cent *V/V* solution of *methanol R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: 1 per cent *V/V* solution of *glacial acetic acid R*;
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 68 | 32 |
| 5 - 20 | 68 → 50 | 32 → 50 |
| 20 - 30 | 50 → 0 | 50 → 100 |
| 30 - 35 | 0 | 100 |

*Flow rate*: 1.3 mL/min.

*Detection*: spectrophotometer at 350 nm.

*Injection*: 20 µL.

*Relative retention* with reference to rutoside (retention time = about 17 min): apigenin 7-glucoside = about 1.1.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to rutoside and apigenin 7-glucoside.

Calculate the percentage content of rutoside using the following expression:

$$\frac{A_1 \times m_2 \times p \times 5}{A_2 \times m_1}$$

$A_1$ = area of the peak due to rutoside in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *rutoside trihydrate CRS* used to prepare reference solution (a), in grams;

$p$ = assigned percentage content of rutoside in *rutoside trihydrate CRS*.

**01/2015:2427**

# SOPHORA FLOWER-BUD

## Sophorae japonicae flos immaturus

DEFINITION

Whole, dried flower bud of *Styphnolobium japonicum* (L.) Schott (syn. *Sophora japonica* L.).

*Content*:

– minimum 20.0 per cent of total flavonoids, expressed as rutoside ($C_{27}H_{30}O_{16}$; $M_r$ 611) (dried drug);

– minimum 15.0 per cent of rutoside ($C_{27}H_{30}O_{16}$; $M_r$ 611) (dried drug).

IDENTIFICATION

A. The flat flower bud, ovoid or ellipsoid, has a very thin and short pedicel and is about 7-10 mm long and 3-4 mm thick. The dark green or brown calyx, forming the lower part of the bud, is about 3-4 mm long and consists of 5 fused sepals with longitudinal striations at the base. The pale yellow or brownish-yellow corolla, unopened, delicate, extends beyond the calyx and contains 10 free stamens surrounding a central style.

B. Microscopic examination (*2.8.23*). The powder is pale yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2427.-1): roundish [La] or triangular [Lb] pollen grains [L] with 3 pores and a smooth exine, about 18 µm in diameter; isolated covering trichomes [A, B, F, O] of varying lengths (60-660 µm), slightly flexed, usually consisting of 1 or 2 basal cells and a long pointed distal cell, with smooth or slightly warty walls; fragments of sepals [C] composed of anomocytic stomata (*2.8.3*) with 4-8 subsidiary cells [Ca], covering trichomes [Cb] or their scars [Cc]; fragments of petals [G, H] with cells covered by a finely striated cuticle [Ga, Ha], sometimes accompanied by fine annular or spiral vessels [Hb] and parenchyma with some cells containing crystalline masses of rutoside [Hc]; fragments of parenchyma [E] from the sepals containing prisms of calcium oxalate [Ea] and crystalline masses of rutoside [Eb]; fragments of anthers [N] showing the characteristic fibrous layer (transverse section [Na], surface view [K]) and immature pollen grains [Nb]; free prisms of calcium oxalate [M]. Examine under a microscope using *chloral hydrate solution R*, without heating the preparation: brownish-yellow rutoside crystals are visible, free or included in cells, as crystalline masses [Eb, Hc, J] or in fan-shaped aggregates of very fine needles [D, Ec, Gb].

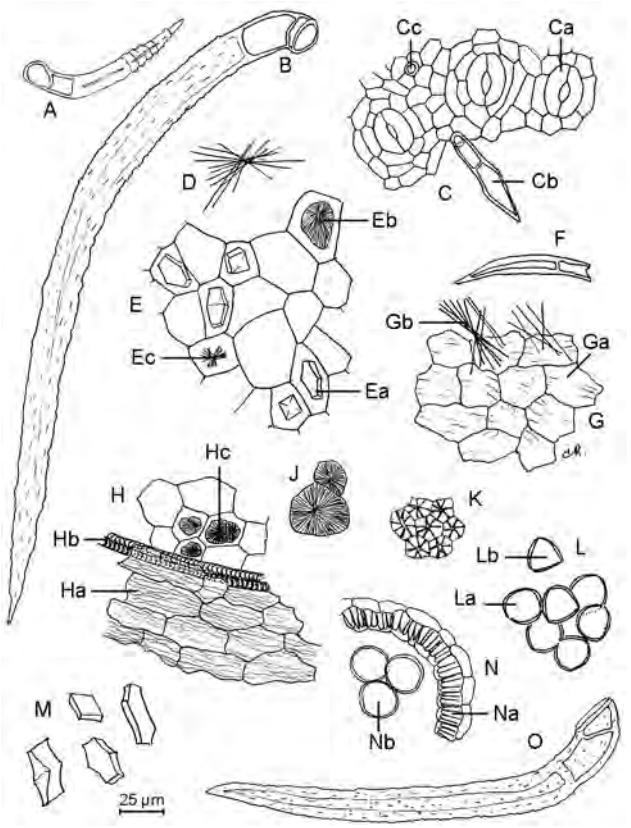

Figure 2427.-1. – *Illustration for identification test B of powdered herbal drug of sophora flower-bud*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.2 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *methanol R*, sonicate for 10 min and filter.

*Reference solution.* Dissolve 10 mg of *hyperoside R* and 10 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

*Application*: 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*, allow to dry in air for about 30 min, and examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

**corrected 7.0**

# SPANISH SAGE OIL

## Salviae lavandulifoliae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the aerial parts of *Salvia lavandulifolia* Vahl, collected at the flowering stage.

CHARACTERS

*Appearance*: clear, colourless or pale yellow, mobile liquid.

Camphor-like odour.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 0.1 mL of the essential oil to be examined in 10 mL of *toluene R*.

*Reference solution*. Dissolve 20 µL of *thujone R* and 30 µL of *cineole R* in 10 mL of *toluene R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL [or 3 µL] as bands of 10 mm [or 6 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with a freshly prepared 200 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 105 °C for 10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A blue zone |
| _____ | _____ |
| Thujone: 2 pinkish-violet zones | |
| Cineole: a blue zone | A blue zone (cineole) |
| _____ | _____ |
| | 3 blue zones |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Relative density** (*2.2.5*): 0.907 to 0.932.

**Refractive index** (*2.2.6*): 1.465 to 1.473.

**Optical rotation** (*2.2.7*): + 7° to + 17°.

**Acid value** (*2.5.1*): maximum 2.0, determined on 5.00 g.

**Solubility in alcohol** (*2.8.10*): 1 volume is soluble in 2 volumes and more of *ethanol (80 per cent V/V) R*.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. Dissolve 0.200 g of the essential oil to be examined in *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 0.200 g of *Spanish sage oil for peak identification CRS* in *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 5 µL of *limonene R* in *heptane R* and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of this solution to 5.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 43 | 60 → 232 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*System suitability*: reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with *Spanish sage oil for peak identification CRS*;
- *resolution*: minimum 1.5 between the peaks due to limonene and 1,8-cineole and minimum 1.5 between the peaks due to α-terpinyl acetate and borneol.

Use the chromatogram supplied with *Spanish sage oil for peak identification CRS* and the chromatogram obtained with reference solution (a) to locate the peaks due to α-pinene, sabinene, limonene, 1,8-cineole, thujone, camphor, linalol, linalyl acetate, terpinen-4-ol, sabinyl acetate, α-terpinyl acetate and borneol.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *α-pinene*: 4.0 per cent to 11.0 per cent;
- *sabinene*: 0.1 per cent to 3.5 per cent;
- *limonene*: 2.0 per cent to 6.5 per cent;
- *1,8-cineole*: 10.0 per cent to 30.5 per cent;
- *thujone*: maximum 0.5 per cent;
- *camphor*: 11.0 per cent to 36.0 per cent;
- *linalol*: 0.3 per cent to 4.0 per cent;
- *linalyl acetate*: maximum 5.0 per cent;
- *terpinen-4-ol*: maximum 2.0 per cent;
- *sabinyl acetate*: 0.5 per cent to 9.0 per cent;
- *α-terpinyl acetate*: 0.5 per cent to 9.0 per cent;
- *borneol*: 1.0 per cent to 7.0 per cent;
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

STORAGE

At a temperature not exceeding 25 °C.

**07/2018:2419**

# SPIKE LAVENDER OIL

## Spicae aetheroleum

DEFINITION

Essential oil obtained by steam distillation of the flowering tops of *Lavandula latifolia* Medik.

CHARACTERS

*Appearance*: clear, mobile, light yellow or greenish-yellow liquid.

*Odour*: reminiscent of cineole and camphor.

IDENTIFICATION

*First identification*: *B*.

*Second identification*: *A*.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dilute 20 µL of the essential oil to be examined to 1 mL with *toluene R*.

*Reference solution.* Dilute 10 µL of *cineole R*, 5 µL of *linalol R* and 5 µL of *linalyl acetate R* to 1 mL with *toluene R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 6 µL [or 2 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100 °C for 5 min; examine immediately in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A violet zone |
| _____ | _____ |
| Linalyl acetate: a violet zone | A faint violet or brown zone may be present (linalyl acetate)<br>A pink zone |
| _____ | _____ |
| 1,8-Cineole: a violet or brown zone | A violet or brown zone (1,8-cineole) |
| Linalol: a violet zone | An intense violet zone (linalol)<br>A greyish or brownish zone |
| **Reference solution** | **Test solution** |

B. The essential oil to be examined complies with the limits of the test for chromatographic profile.

TESTS

**Relative density** (*2.2.5*): 0.894 to 0.907.

**Refractive index** (*2.2.6*): 1.461 to 1.468.

**Optical rotation** (*2.2.7*): − 7° to + 2°.

**Acid value** (*2.5.1*): maximum 1.5, determined on 5.00 g of the essential oil to be examined.

**Solubility in alcohol** (*2.8.10*): 1.0 mL of the essential oil to be examined is soluble, sometimes with opalescence, in 3.0 mL of *ethanol (70 per cent V/V) R*.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dilute 200 µL of the essential oil to be examined to 10.0 mL with *heptane R*.

*Reference solution (a).* Dilute 200 µL of *spike lavender oil CRS* to 10.0 mL with *heptane R*.

*Reference solution (b).* Dilute 5 µL of *limonene R* to 50.0 mL with *heptane R*. Dilute 0.5 mL of this solution to 5.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 15 | 70 |
| | 15 - 70 | 70 → 180 |
| Injection port | | 220 |
| Detector | | 220 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: limonene, 1,8-cineole, camphor, linalol, linalyl acetate, α-terpineol, *trans*-α-bisabolene.

*Identification of peaks*: use the chromatogram supplied with *spike lavender oil CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to limonene, 1,8-cineole, camphor, linalol, linalyl acetate, α-terpineol and *trans*-α-bisabolene.

*System suitability*: reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with *spike lavender oil CRS*;
- *resolution*: minimum 1.5 between the peaks due to limonene and 1,8-cineole.

Determine the percentage content of each of the following components. The percentages are within the following ranges:

- *limonene*: 0.5 per cent to 3.0 per cent;
- *1,8-cineole*: 16.0 per cent to 39.0 per cent;
- *camphor*: 8.0 per cent to 16.0 per cent;
- *linalol*: 34.0 per cent to 50.0 per cent;
- *linalyl acetate*: maximum 1.6 per cent;
- *α-terpineol*: 0.2 per cent to 2.0 per cent;
- *trans-α-bisabolene*: 0.4 per cent to 2.5 per cent;
- *reporting threshold*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

STORAGE

At a temperature not exceeding 25 °C.

**01/2017:1438**

# ST. JOHN'S WORT

## Hyperici herba

DEFINITION

Whole or fragmented, dried flowering tops of *Hypericum perforatum* L., harvested during flowering time.

*Content*: minimum 0.08 per cent of total hypericins, expressed as hypericin ($C_{30}H_{16}O_8$; $M_r$ 504.4) (dried drug).

Herbal drugs

IDENTIFICATION

A. The branched and bare stem shows 2 more or less prominent longitudinal ridges. The leaves are opposite, sessile, exstipulate, oblong-oval and 15-30 mm long; present on the leaf margins are glands which appear as black dots and over all the surface of the leaves many small, strongly translucent excretory glands which are visible in transmitted light. The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, acute sepals, with black secretory glands on the margins; 5 orange-yellow petals, also with black secretory glands on the margins; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles.

The drug may also show the following: immature and ripe fruits and seeds. Immature fruits are green or yellowish, seeds are whitish. Occasional ripe fruits may be present; these are dry trilocular capsules containing numerous seeds, brown, broad or small-ovate, 5-10 mm long, with broad linear or punctiform glands, irregularly striated ducts, conducting secretions. Ripe seeds are 1-1.3 mm long, cylindrical or trigonous, shortly pointed at both ends, brown or almost black, minutely pitted longitudinally.

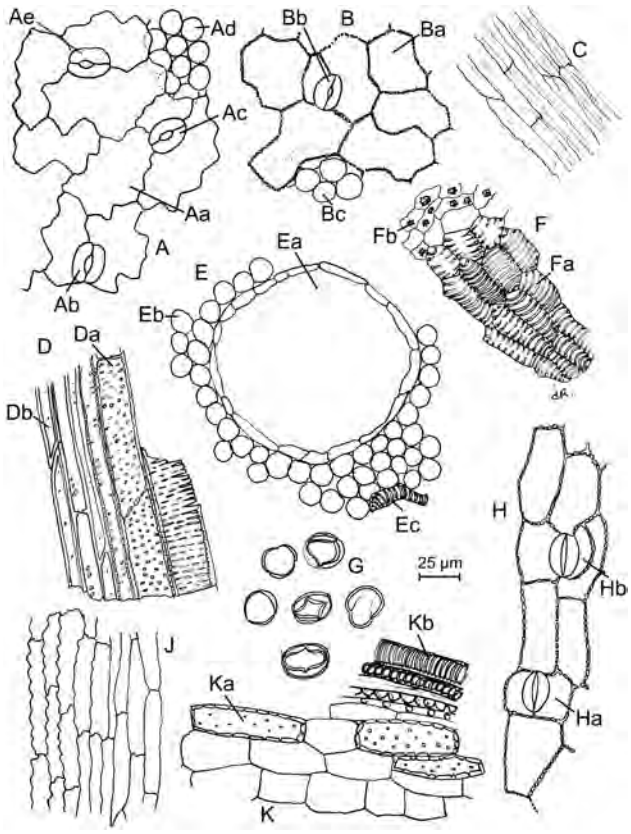

Figure 1438.-1. – *Illustration for identification test B of powdered herbal drug of St. John's wort*

B. Microscopic examination (*2.8.23*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1438.-1): fragments of the leaf epidermis [A, B] or stems [H] with paracytic [Ab, Ha], anisocytic [Ac, Bb, Hb] or anomocytic [Ae] stomata (*2.8.3*); fragments of the leaf epidermis often accompanied by palisade parenchyma [Ad, Bc]; polygonal cells of the upper epidermis with thickened and beaded walls [Ba]; more or less sinuous, thin-walled cells of the lower epidermis [Aa]; fragments of the leaf and sepal [E] with large, red-pigmented oil glands [Ea] associated with palisade parenchyma [Eb] and small vessels [Ec]; elongated cells of fragments of the petal epidermis with straight or wavy anticlinal walls [J]; vessels [D] with reticulate or pitted walls [Da] and groups of thick-walled fibres [Db]; fragments of the central parenchyma of the stems [K] with lignified and pitted rectangular cells [Ka] sometimes associated with vessels [Kb]; fragments of the anthers [F] showing the central part consisting of small cells containing cluster crystals of calcium oxalate [Fb] and cells from the fibrous layer [Fa]; fragments of the staminal filament with elongated, thin-walled cells with a striated cuticle [C]; numerous pollen grains with 3 germinal pores and a smooth exine, occurring singly [G] or in dense groups.

C. High-performance thin-layer chromatography (*2.8.25*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

*Reference solution (a)*. Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c)*. Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Intensity marker*: hyperoside.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:9:90 *V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: 70 mm from the lower edge of the plate.

*Drying*: in a current of air at room temperature for 5 min.

*Detection*: heat at 100-105 °C for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*System suitability*: reference solution (c):

– the chromatogram shows 2 distinct zones in the lower third which may, however, be partially overlapping. The lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

*Results*: see below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent zones, which may be blue, red or orange-yellow, may be present, especially above the red zones due to hypericin and pseudohypericin; the light blue fluorescent zone due to chlorogenic acid may be overlapped by the yellow or orange fluorescent zone due to hyperoside.

| Top of the plate | |
|---|---|
| | A red fluorescent zone or a faint red fluorescent zone |
| _____ | _____ |
| | 2 red fluorescent zones (hypericin and pseudohypericin) |
| | 2 yellow or orange fluorescent zones or 2 faint yellow or orange fluorescent zones |
| _____ | _____ |
| | A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone |
| Hyperoside: a yellow or orange fluorescent zone | A yellow or orange fluorescent zone or an intense yellow or orange fluorescent zone (hyperoside) |
| | A light blue fluorescent zone or a faint light blue fluorescent zone (chlorogenic acid) |
| Rutoside: a yellow or orange fluorescent zone | A yellow or orange fluorescent zone (rutoside) |
| **Reference solution (a)** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent of stems with a diameter greater than 5 mm and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (500) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

ASSAY

*Test solution.* In a 100 mL round-bottomed flask, introduce 0.800 g of the powdered herbal drug (500) (*2.9.12*), 60 mL of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R* and a magnetic stirrer. Boil the mixture in a water-bath at 70 °C under a reflux condenser for 30 min. Centrifuge (2 min at 700 *g*) and decant the supernatant into a 250 mL flask. Take up the residue with 60 mL of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R*. Heat again under a reflux condenser for 30 min. Centrifuge (2 min at 700 *g*) and decant the supernatant. Combine the extracts and evaporate to dryness. Take up the residue with 15 mL of *methanol R* using ultrasound and transfer to a 25 mL measuring flask. Rinse the 250 mL flask with *methanol R* and dilute to 25.0 mL with the same solvent. Centrifuge again, filter 10 mL through a syringe filter (0.2 µm). Discard the first 2 millilitres of the filtrate. Introduce 5.0 mL of the filtrate into a measuring flask and dilute to 25.0 mL with *methanol R*.

*Compensation liquid*: *methanol R*.

Measure the absorbance (*2.2.25*) of the test solution at 590 nm, by comparison with the compensation liquid.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{A \times 125}{m \times 870}$$

i.e. taking the specific absorbance of hypericin to be 870.

$A$ = absorbance at 590 nm;

$m$ = mass of the herbal drug to be examined, in grams.

**01/2017:1874**

# ST. JOHN'S WORT DRY EXTRACT, QUANTIFIED

## Hyperici herbae extractum siccum quantificatum

DEFINITION

Quantified dry extract obtained from *St. John's wort (1438)*.

*Content*:

- *total hypericins, expressed as hypericin* ($C_{30}H_{16}O_8$; $M_r$ 504.4): 0.10 per cent to 0.30 per cent (anhydrous extract);
- *flavonoids, expressed as rutoside* ($C_{27}H_{30}O_{16}$; $M_r$ 610.5): minimum 6.0 per cent (anhydrous extract);
- *hyperforin* ($C_{35}H_{52}O_4$; $M_r$ 536.8): maximum 6.0 per cent (anhydrous extract) and not more than the content stated on the label.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent *V/V*) or methanol (50-80 per cent *V/V*).

CHARACTERS

*Appearance*: brownish-grey powder.

IDENTIFICATION

High-performance thin-layer chromatography (*2.8.25*).

*Test solution.* To 0.1 g of the extract to be examined add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

*Reference solution (a).* Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c).* Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Intensity marker*: hyperoside.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:9:90 *V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: 70 mm from the lower edge of the plate.

*Drying*: in a current of air at room temperature for 5 min.

*Detection*: heat at 100-105 °C for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*System suitability*: reference solution (c):

- the chromatogram shows 2 distinct zones in the lower third which may, however, be partially overlapping. The lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

*Results*: see below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent

zones, which may be blue, red or orange-yellow, may be present, especially above the red zones due to hypericin and pseudohypericin; the light blue fluorescent zone due to chlorogenic acid may be overlapped by the yellow or orange fluorescent zone due to hyperoside.

| Top of the plate | |
|---|---|
| | A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone |
| ——— | ——— |
| | 2 red fluorescent zones (hypericin and pseudohypericin) |
| | 2 yellow or orange fluorescent zones or 2 faint yellow or orange fluorescent zones |
| ——— | ——— |
| | A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone |
| Hyperoside: a yellow or orange fluorescent zone | An intense yellow or orange fluorescent zone (hyperoside) |
| | A light blue fluorescent zone or a faint light blue fluorescent zone (chlorogenic acid) |
| Rutoside: a yellow or orange fluorescent zone | A yellow or orange fluorescent zone (rutoside) |
| **Reference solution (a)** | **Test solution** |

TESTS

**Water** (*2.5.12*): maximum 4.0 per cent, determined on 0.500 g.

ASSAY

**Total hypericins**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 70.0 mg of the extract to be examined in 25.0 mL of *methanol R*. Sonicate and centrifuge the solution. Expose the solution to a xenon lamp at about 765 W/m$^2$ for 8 min.

*Reference solution.* Dissolve a quantity of *St. John's wort dry extract HRS* corresponding to 0.15 mg of hypericin in 25.0 mL of *methanol R*. Sonicate and centrifuge. Expose the solution to a xenon lamp at about 765 W/m$^2$ for 8 min.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*: mix 39 volumes of *ethyl acetate R*, 41 volumes of a 15.6 g/L solution of *sodium dihydrogen phosphate R* adjusted to pH 2 with *phosphoric acid R* and 160 volumes of *methanol R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 590 nm.

*Injection*: 20 µL.

*Run time*: 15 min.

*Identification of peaks*: use the chromatogram supplied with *St. John's wort dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to pseudohypericin and hypericin.

*System suitability*: reference solution:

– the chromatogram obtained is similar to the chromatogram supplied with *St. John's wort dry extract HRS*;
– *resolution*: minimum 2 between the peaks due to pseudohypericin and hypericin.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p}{A_3 \times m_1}$$

$A_1$ = area of the peak due to pseudohypericin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to hypericin in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to hypericin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *St. John's wort dry extract HRS* used to prepare the reference solution, in grams;

$p$ = percentage content of hypericin in *St. John's wort dry extract HRS*.

**Hyperforin and flavonoids**. Liquid chromatography (*2.2.29*). *Carry out the assay protected from light.*

*Solvent mixture*: *water R*, *methanol R* (20:80 *V/V*).

*Test solution.* Dissolve 75.0 mg of the extract to be examined in 20.0 mL of the solvent mixture. Sonicate and centrifuge.

*Reference solution (a).* Dissolve 20.0 mg of *rutoside trihydrate CRS* in 200.0 mL of the solvent mixture.

*Reference solution (b).* Dissolve 75.0 mg of *St. John's wort dry extract HRS* in 20.0 mL of the solvent mixture. Sonicate and centrifuge.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

– *mobile phase A*: *phosphoric acid R*, *water R* (3:1000 *V/V*);
– *mobile phase B*: *phosphoric acid R*, *acetonitrile R* (3:1000 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Flow rate (mL/min) |
|---|---|---|---|
| 0 - 8 | 82 | 18 | 0.8 |
| 8 - 18 | 82 → 47 | 18 → 53 | 0.8 |
| 18 - 18.1 | 47 → 3 | 53 → 97 | 0.8 |
| 18.1 - 19 | 3 | 97 | 0.8 → 1.2 |
| 19 - 31 | 3 | 97 | 1.2 |

*Detection*: spectrophotometer at 360 nm, then at 275 nm after the elution of biapigenin (about 22 min).

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *St. John's wort dry extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to rutoside, hyperoside, isoquercitroside, quercitrin, quercetin, biapigenin, hyperforin and adhyperforin.

*System suitability*: reference solution (b):

– the chromatogram obtained is similar to the chromatogram supplied with *St. John's wort dry extract HRS*;
– *resolution*: minimum 2.0 between the peaks due to rutoside and hyperoside, and minimum 2.0 between the peaks due to hyperforin and adhyperforin.

Calculate the percentage content of hyperforin using the following expression:

$$\frac{A_4 \times m_4 \times p \times 2.3}{A_5 \times m_3 \times 10}$$

$A_4$ = area of the peak due to hyperforin in the chromatogram obtained with the test solution;

$A_5$ = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);

$m_3$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_4$ = mass of *rutoside trihydrate CRS* used to prepare reference solution (a), in grams;

2.3 = correction factor for hyperforin with respect to rutoside;

$p$ = percentage content of rutoside in *rutoside trihydrate CRS*.

Calculate the percentage content of flavonoids, expressed as rutoside, using the following expression:

$$\frac{m_4 \times p \times (A_6 + A_7 + A_8 + A_9 + A_{10} + A_{11})}{m_3 \times A_5 \times 10}$$

$A_5$ = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);

$A_6$ = area of the peak due to rutoside in the chromatogram obtained with the test solution;

$A_7$ = area of the peak due to hyperoside in the chromatogram obtained with the test solution;

$A_8$ = area of the peak due to isoquercitroside in the chromatogram obtained with the test solution;

$A_9$ = area of the peak due to quercitrin in the chromatogram obtained with the test solution;

$A_{10}$ = area of the peak due to quercetin in the chromatogram obtained with the test solution;

$A_{11}$ = area of the peak due to biapigenin in the chromatogram obtained with the test solution;

$m_3$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_4$ = mass of *rutoside trihydrate CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of rutoside in *rutoside trihydrate CRS*.

LABELLING

The label states the content of hyperforin.

**01/2008:1153**
**corrected 10.0**

# STAR ANISE

## Anisi stellati fructus

DEFINITION

Dried composite fruit of *Illicium verum* Hook.f.

*Content*:

- minimum 70 mL/kg of essential oil (anhydrous drug),
- minimum 86.0 per cent of *trans*-anethole in the essential oil.

CHARACTERS

The fruit carpels are brown.

Odour of anethole.

IDENTIFICATION

A. The fruit generally consists of 8 developed, one-seeded follicles, each 12-22 mm long and 6-12 mm high, radially arranged around a short, central, blunt-ending columella. In some fruits 1 or 2 follicles may be missing, but their position is clearly visible. Each follicle is boat-shaped or boot-shaped, with a greyish-brown dorsal surface showing rough markings and lateral surfaces bearing scars from the neighbouring follicles. One or more follicles are split open along the ventral suture, exposing a single, lenticular, shiny, reddish-brown seed about 8 mm in diameter. The markings on the dorsal surface are not visible from the ventral surface. Some of the follicles (1-3) may be imperfectly developed. Isolated follicles, pedicels and seeds may be present.

B. Microscopic examination (*2.8.23*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: brown epicarpal cells, polygonal in surface view, with a strongly striated cuticle and occasional anomocytic stomata (*2.8.3*); fragments of the endocarp with long palisade-like cells; fragments of the mesocarp with large parenchymatous cells, vessels, oil-containing cells and groups of stone cells; fragments of the seed testa with palisade-like, sclerified, strongly pitted, yellow cells up to 200 µm long; fragments of the columella and the fruit stalk with strongly and irregularly thickened, star-shaped stone cells about 400 µm long and 150 µm wide; rhomboidal or rectangular crystals of calcium oxalate.

C. Examine the chromatograms obtained in test B for *Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |

| | A greenish fluorescent zone |
| Hyperoside: a brownish-yellow fluorescent zone | A brownish-yellow fluorescent zone |
| Chlorogenic acid: a light blue fluorescent zone | |
| | A green fluorescent zone |
| Rutoside: a brownish-yellow fluorescent zone | A brownish-yellow fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

***Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp.**

A. Adulteration with *Illicium anisatum* or certain other *Illicium* spp. is indicated by the presence of fruits mainly consisting of more than 8 follicles; fruits either smaller than 2.5 cm or greater than 3.5 cm; follicles with the suture edged with a thickening extending to the neighbouring follicle, or with dorsal markings visible from the ventral surface; follicles somewhat undulate and ending in a fine beak or a

Herbal drugs

small, ventrally turned hook; follicles with a profile fitting into a rectangle; pedicels more than 5 cm long; seedless fruits; seeds either very flat or almost spherical.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R* and heat under a reflux condenser in a water-bath at 60 °C for 5 min. Allow to cool and filter.

*Reference solution.* Dissolve 1 mg of *caffeic acid R*, 1 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R*, 2.5 mg of *rutoside trihydrate R* and 2.5 mg of *hyperoside R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:26:100 *V/V/V/V*).

*Application*: 5 µL as bands.

*Development*: over a path of 6 cm.

*Drying*: in a current of warm air.

*Detection*: spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; after 30 min, examine in ultraviolet light at 365 nm.

*Results*: the chromatogram obtained with the test solution shows no brownish-yellow fluorescent zone at or above the position of the zone due to quercitrin in the chromatogram obtained with the reference solution. No yellow fluorescent zone is seen at or above the position of the zone due to caffeic acid in the chromatogram obtained with the reference solution. No brownish-yellow fluorescent zone is seen directly above the zone due to hyperoside in the chromatogram obtained with the reference solution.

**Water** (*2.2.13*): maximum 100 mL/kg, determined by distillation on 20.0 g of the powdered herbal drug (355) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 4.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use a 250 mL round-bottomed flask and 100 mL of *water R* as the distillation liquid. Immediately before the determination, reduce 50.0 g of the drug to a powder (1400) (*2.9.12*) and mix. Further reduce about 10.0 g of this mixture to a finer powder (710) (*2.9.12*). Use 2.50 g of the powder for the determination. Introduce 0.50 mL of *xylene R* into the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

***trans*-Anethole**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dilute the mixture of essential oil and *xylene R* obtained in the assay of essential oil to 5.0 mL with *xylene R* by rinsing the apparatus.

*Reference solution.* To 1.0 mL of *xylene R* add 20 µL of *estragole R*, 20 mg of *α-terpineol R* and 60 µL of *anethole R*.

*Column*:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.25 mm;

– *stationary phase*: *macrogol 20 000 R*.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 5 | 60 |
| | 5 - 80 | 60 → 210 |
| | 80 - 95 | 210 |
| Injection port | | 200 |
| Detector | | 220 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the preparation of the reference solution.

*System suitability*: reference solution:

– *resolution*: minimum 5 between the peaks due to estragole and α-terpineol.

Use the retention times from the chromatogram obtained with the reference solution locate the components of the reference solution in the chromatogram obtained with the test solution.

Calculate the percentage content of *trans*-anethole. Disregard any peak due to the solvent or with an area less than 0.05 per cent of the area of the principal peak in the chromatogram obtained with the test solution.

**corrected 7.0**

# STAR ANISE OIL

## Anisi stellati aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Illicium verum* Hook.f.

CHARACTERS

*Appearance*: clear, colourless or pale yellow liquid.

IDENTIFICATION

*First identification*: *B.*

*Second identification*: *A.*

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 10 µL of *linalol R*, 30 µL of *anisaldehyde R* and 200 µL of *anethole R* and in *toluene R* and dilute to 15 mL with the same solvent. Dilute 1 mL of this solution to 5 mL with *toluene R*.

*Plate*: *TLC silica gel* $F_{254}$ *plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (7:93 *V/V*).

*Application*: 5 µL as bands of 10 mm (for normal TLC plates) or 2 µL as bands of 10 mm (for fine particle TLC plates).

*Development*: over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A quenching zone, partly separated |
| Anethole: a quenching zone | A very strong quenching zone (anethole) |
| Anisaldehyde: a quenching zone | A quenching zone (anisaldehyde) |
| **Reference solution** | **Test solution** |

*Detection B*: spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 10 min.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A violet-brown zone, not fully separated |
| Anethole: a brown zone | A very strong brown zone (anethole) |
| Anisaldehyde: a yellow zone | A yellow zone (anisaldehyde) |
| Linalol: a grey zone | A grey zone (linalol) |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.979 to 0.985.

**Refractive index** (*2.2.6*): 1.553 to 1.556.

**Freezing point** (*2.2.18*): 15 °C to 19 °C.

**Fenchone**. Gas chromatography (*2.2.28*) as described in the test for chromatographic profile with the following modifications.

*Test solution.* Dissolve 400 µL of the substance to be examined in 2.0 mL of *hexane R*.

*Reference solution (a).* Dilute 10 µL of *fenchone R* to 1.2 g with *hexane R*.

*Reference solution (b).* Dilute 100 µL of reference solution (a) to 100 mL with *hexane R*.

*System suitability*: reference solution (b):

– *signal-to-noise ratio*: minimum 10 for the principal peak.

*Limit*:

– *fenchone*: maximum 0.01 per cent.

**Pseudoisoeugenyl 2-methylbutyrate**. Gas chromatography (*2.2.28*) as described in the test for chromatographic profile with the following modifications.

*Test solution.* The substance to be examined.

*Reference solution (a).* Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 mL of this solution to 100 mL with *hexane R*.

*Reference solution (b). Pseudoisoeugenyl 2-methylbutyrate for peak identification CRS.*

*System suitability*:

– the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS.*

– *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

*Limit*: locate the peak due to pseudoisoeugenyl 2-methylbutyrate by comparison with the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS.*

– *pseudoisoeugenyl 2-methylbutyrate*: maximum 0.01 per cent.

**Fatty oils and resinified essential oils** (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dissolve 200 µL of the substance to be examined in 1.0 mL of *hexane R*.

*Reference solution.* To 1.0 mL of *hexane R*, add 20 µL of *linalol R*, 20 µL of *estragole R*, 20 µL of *α-terpineol R*, 60 µL of *anethole R* and 30 µL of *anisaldehyde R*.

*Column*:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.25 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 5 | 60 |
| | 5 - 80 | 60 → 210 |
| | 80 - 95 | 210 |
| Injection port | | 200 |
| Detector | | 220 |

*Detection*: flame ionisation.

*Injection*: 0.2 µL.

*Elution order*: order indicated in the composition of the reference solution; record the retention times of these substances.

*System suitability*: reference solution:

– *resolution*: minimum 1.5 between the peaks due to estragole and α-terpineol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-anethole and foeniculin using the chromatogram shown in Figure 2108.-1 (disregard any peak due to hexane).

Determine the percentage content of these components. The percentages are within the following ranges:

– *linalol*: 0.2 per cent to 2.5 per cent,

– *estragole*: 0.5 per cent to 6.0 per cent,

– *α-terpineol*: maximum 0.3 per cent,

– *cis-anethole*: 0.1 per cent to 0.5 per cent,

– *trans-anethole*: 86 per cent to 93 per cent,

– *anisaldehyde*: 0.1 per cent to 0.5 per cent,

– *foeniculin*: 0.1 per cent to 3.0 per cent.

STORAGE

At a temperature not exceeding 25 °C.

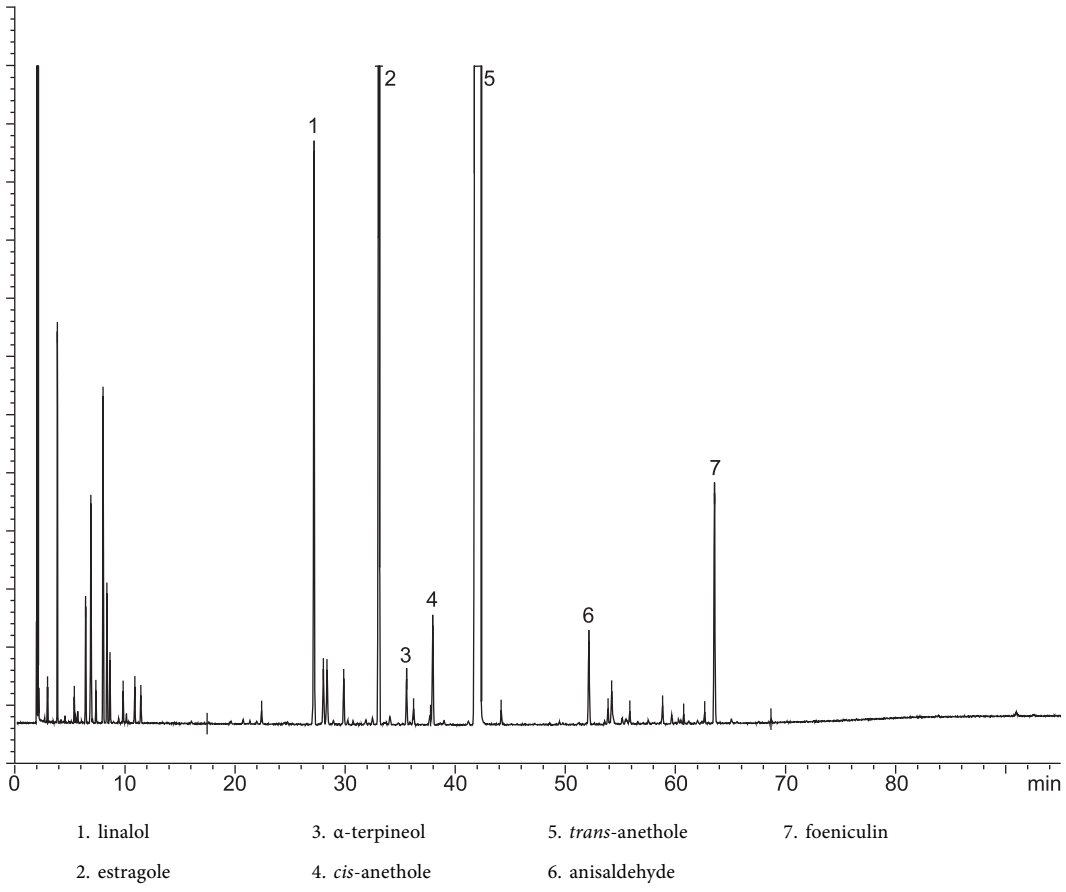

Figure 2108.-1. – *Chromatogram for the test for chromatographic profile of star anise oil*

**01/2012:0246**
**corrected 9.2**

# STRAMONIUM LEAF

## Stramonii folium

DEFINITION

Dried leaf or dried leaf and flowering, and occasionally fruit-bearing, tops of *Datura stramonium* L. and its varieties.

*Content*: minimum 0.25 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; $M_r$ 289.4) (dried drug). The alkaloids consist mainly of hyoscyamine with varying proportions of hyoscine (scopolamine).

CHARACTERS

Unpleasant odour.

IDENTIFICATION

A. The leaves are dark brownish-green or dark greyish-green with a short petiole, often much twisted and shrunken during drying, thin and brittle, ovate or triangular-ovate, dentately lobed with an acuminate apex and often unequal at the base. Young leaves are pubescent on the veins, older leaves are nearly glabrous. Stems are green or purplish-green, slender, curved and twisted, wrinkled longitudinally and sometimes wrinkled transversely, branched dichasially, with a single flower or an immature fruit in the fork. Flowers, on short pedicels, have a gamosepalous calyx with 5 lobes and trumpet-shaped brownish-white or purplish corolla. The fruit is a capsule, usually covered with numerous short, stiff emergences; seeds are brown or black with a minutely pitted testa.

B. Microscopic examination (*2.8.23*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0246.-1): fragments of upper [A] and lower [C] epidermises of the lamina, in surface view, showing cells with slightly wavy anticlinal walls and a smooth cuticle accompanied by palisade [Aa] and spongy [Ca] parenchyma; anisocytic [Ac, Cb] and anomocytic [Ab] stomata (*2.8.3*), more frequent on the lower epidermis; fragments of covering trichomes, conical [E], uniseriate with 3-5 cells with warty walls, some of them collapsed [Ea]; glandular trichomes, short and clavate (side view [B]) with heads formed by 2-7 cells; dorsiventral mesophyll (transverse section [F]), with a single layer of palisade cells [Fa] and a spongy parenchyma [Fb] containing cluster crystals of calcium oxalate [Fc]; fragments of spongy parenchyma [D] with some cells containing small cluster crystals of calcium oxalate [Db], associated with annularly and spirally thickened vessels [Da], in surface view. The powdered herbal drug may also show: fibres and reticulately thickened vessels from the stems; subspherical pollen grains about 60-80 µm in diameter with 3 germinal pores and a nearly smooth exine [G]; fragments of the corolla [H] with wavy-walled cells [Ha] and underlying mesophyll [Hb] with some cells containing prisms [Hc] or cluster crystals [Hd] of calcium oxalate; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of the testa [J], and occasional prisms and microsphenoidal crystals of calcium oxalate.

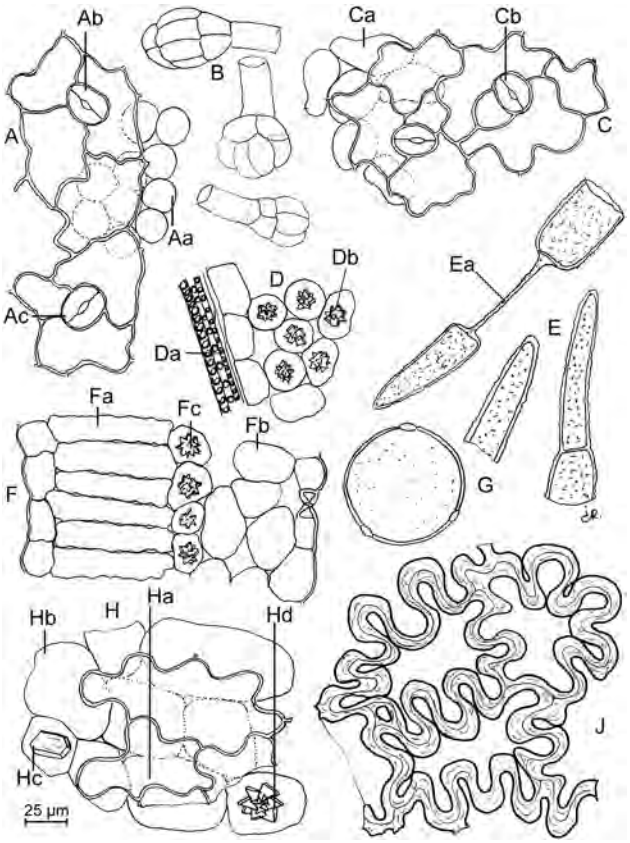

Figure 0246.-1. – *Illustration for identification test B of powdered herbal drug of stramonium leaf*

C. Examine the chromatograms obtained in the chromatography test.

*Results*: the principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

D. Shake 1 g of the powdered herbal drug (180) (*2.9.12*) with 10 mL of *dilute sulfuric acid R1* for 2 min. Filter and add to the filtrate 1 mL of *concentrated ammonia R* and 5 mL of *water R*. Shake cautiously with 15 mL of *peroxide-free ether R*, avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulfate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 mL of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 mL of *acetone R* and, dropwise, a 30 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

TESTS

**Chromatography**. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (180) (*2.9.12*) add 10 mL of *dilute sulfuric acid R1*, shake for 15 min and filter. Wash the filter with *dilute sulfuric acid R1* until 25 mL of filtrate is obtained. To the filtrate add 1 mL of *concentrated ammonia R* and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulfate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

*Reference solution*. Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 mL of *methanol R*. Mix 3.8 mL of the hyoscyamine sulfate solution and 4.2 mL of the hyoscine hydrobromide solution and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

*Application*: 10 µL and 20 µL of each solution, as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

*Development*: over a path of 10 cm.

*Drying*: at 100-105 °C for 15 min; allow to cool.

*Detection A*: spray with *potassium iodobismuthate solution R2*, using about 10 mL for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

*Results A*: the zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatograms) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µL of the test solution or near the point of application in the chromatogram obtained with 10 µL of the test solution.

*Detection B*: spray with *sodium nitrite solution R* until the coating is transparent; examine after 15 min.

*Results B*: the zones due to hyoscyamine in the chromatograms obtained with the reference solution and the test solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

**Foreign matter** (*2.8.2*): maximum 3 per cent of stems with a diameter greater than 5 mm.

**Total ash** (*2.4.16*): maximum 20.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying (*2.2.32*) on 2.000 g of the powdered herbal drug (180) (*2.9.12*) by drying in an oven at 105 °C.

b) Moisten 10.0 g of the powdered herbal drug (180) (*2.9.12*) with a mixture of 5 mL of *ammonia R*, 10 mL of *ethanol (96 per cent) R* and 30 mL of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulfuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 mL by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 mL, of *0.25 M sulfuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2nd separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 mL, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulfate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulfate with 3 quantities, each of 10 mL, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 mL of *0.01 M sulfuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

$d$ = loss on drying, as a percentage;

$n$ = volume of *0.02 M sodium hydroxide*, in millilitres;

$m$ = mass of the powdered herbal drug, in grams.

STORAGE

Protected from moisture.

**01/2008:0247**
**corrected 10.0**

# STRAMONIUM, PREPARED

## Stramonii pulvis normatus

DEFINITION

Stramonium leaf powder (180) (*2.9.12*) adjusted, if necessary, by the addition of powdered lactose or stramonium leaf of lower content of total alkaloids.

*Content*: 0.23 per cent to 0.27 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; $M_r$ 289.4) (dried drug).

CHARACTERS

*Appearance*: greyish-green powder.

Unpleasant odour.

IDENTIFICATION

A. Microscopic examination (*2.8.23*) of the powder (180) (*2.9.12*). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) (*2.8.3*); covering trichomes are conical, uniseriate with 3-5 cells and warty walls; glandular trichomes are short and clavate with heads formed by 2-7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered herbal drug may also show the following diagnostic characters: fibres and reticulately thickened vessels from the stems; subspherical pollen grains usually about 60-80 µm in diameter with 3 germinal pores and nearly smooth exine; fragments of the corolla with papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.

B. Examine the chromatograms obtained in the Chromatography test.

*Results*: the principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

C. Shake 1 g with 10 mL of *dilute sulfuric acid R1* for 2 min. Filter and add to the filtrate 1 mL of *concentrated ammonia R* and 5 mL of *water R*. Shake cautiously with 15 mL of *peroxide-free ether R*, avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulfate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 mL of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 mL of *acetone R* and, dropwise, a 30 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

TESTS

**Chromatography**. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the drug to be examined add 10 mL of *dilute sulfuric acid R1*, shake for 15 min and filter. Wash the filter with *dilute sulfuric acid R1* until 25 mL of filtrate is obtained. To the filtrate add 1 mL of *concentrated ammonia R* and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulfate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

*Reference solution.* Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 mL of *methanol R*. Mix 3.8 mL of the hyoscyamine sulfate solution and 4.2 mL of the hyoscine hydrobromide solution and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

*Application*: 10 µL and 20 µL of each solution as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

*Development*: over a path of 10 cm.

*Drying*: at 100-105 °C for 15 min and allow to cool.

*Detection A*: spray with *potassium iodobismuthate solution R2*, using about 10 mL for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

*Results A*: the zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µL of the test solution or near the point of application in the chromatogram obtained with 10 µL of the test solution.

*Detection B*: spray with *sodium nitrite solution R* until the coating is transparent; examine after 15 min.

*Results B*: the zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 20.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying (*2.2.32*) on 2.000 g by drying in an oven at 105 °C.

b) Moisten 10.0 g with a mixture of 5 mL of *ammonia R*, 10 mL of *ethanol (96 per cent) R* and 30 mL of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulfuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 mL by distilling on a water-bath and transfer it to

a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 mL, of *0.25 M sulfuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2nd separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 mL, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulfate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulfate with 3 quantities, each of 10 mL, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 mL of *0.01 M sulfuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88(20 - n)}{(100 - d)m}$$

$d$ = loss on drying, as a percentage;

$n$ = volume of *0.02 M sodium hydroxide*, in millilitres;

$m$ = mass of the herbal drug, in grams.

STORAGE

In an airtight container.

# SWEET ORANGE OIL

## Aurantii dulcis aetheroleum

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment from the fresh peel of the fruit of *Citrus* × *sinensis* (L.) Osbeck. A suitable antioxidant may be added.

CHARACTERS

*Appearance*: clear, pale yellow or orange, mobile liquid, which may become cloudy when chilled.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

Examine the chromatograms obtained in the test for bergapten.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| Bergapten: a greenish-yellow fluorescent zone | |
| _____ | _____ |
| | Many blue fluorescent zones |
| **Reference solution** | **Test solution** |

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| | A brown fluorescent zone |
| Linalyl acetate: a brownish-orange fluorescent zone | A faint brownish-orange fluorescent zone (linalyl acetate) |
| _____ | _____ |
| | Many orange fluorescent zones |
| Linalol: a brownish-orange fluorescent zone | A brownish-orange fluorescent zone (linalol) |
| Bergapten: a faint greenish-yellow fluorescent zone | |
| | Many brownish-orange fluorescent zones |
| _____ | _____ |
| | Many blue fluorescent zones |
| **Reference solution** | **Test solution** |

B. It complies with the limits of the test for chromatographic profile.

TESTS

**Relative density** (*2.2.5*): 0.842 to 0.850.

**Refractive index** (*2.2.6*): 1.470 to 1.476.

**Optical rotation** (*2.2.7*): + 94° to + 99°.

**Peroxide value** (*2.5.5, Method B*): maximum 20.

**Fatty oils and resinified essential oils** (*2.8.7*). It complies with the test.

**Bergapten**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dilute 0.2 mL of the substance to be examined in 1 mL of *ethanol (96 per cent) R*.

*Reference solution*. Dissolve 2 mg of *bergapten R*, 10 µL of *linalol R* and 20 µL of *linalyl acetate R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (15:85 *V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 365 nm.

*Results A*: the chromatogram obtained with the test solution shows no greenish-yellow fluorescent zone corresponding to that of bergapten in the chromatogram obtained with the reference solution.

*Detection B*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine the plate in ultraviolet light at 365 nm.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. Dilute 200 µL of the substance to be examined to 10.0 mL with *heptane R*.

*Reference solution (a)*. Dilute 5 µL of *α-pinene R*, 5 µL of *sabinene R*, 5 µL of *β-pinene R*, 5 µL of *β-myrcene R*, 5 µL of *octanal R*, 70 µL of *limonene R*, 5 µL of *linalol R*, 5 µL of *decanal R*, 10 µL of *citral R* (composed of neral and geranial) and 5 µL of *valencene R* to 5.0 mL with *heptane R*.

*Reference solution (b)*. Dilute 5 µL of *limonene R* to 50.0 mL with *heptane R*. Dilute 0.1 mL of the solution to 5.0 mL with *heptane R*.

*Column*:

– *material*: fused silica;

– *size*: *l* = 60 m, Ø = 0.25 mm;

Herbal drugs

– *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.4 mL/min.

*Split ratio*: 1:70.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 90 | 50 → 230 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*Identification of peaks*: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to sabinene and β-pinene.

Determine the percentage content of each of these components. The percentages are within the following ranges:

– *α-pinene*: 0.4 per cent to 0.6 per cent;

– *sabinene*: 0.2 per cent to 1.1 per cent;

– *β-pinene*: 0.02 per cent to 0.3 per cent;

– *β-myrcene*: 1.5 per cent to 2.5 per cent;

– *octanal*: 0.1 per cent to 0.4 per cent;

– *limonene*: 92.0 per cent to 97.0 per cent;

– *linalol*: 0.2 per cent to 0.7 per cent;

– *decanal*: 0.1 per cent to 0.4 per cent;

– *neral*: 0.02 per cent to 0.10 per cent;

– *geranial*: 0.03 per cent to 0.20 per cent;

– *valencene*: 0.02 per cent to 0.5 per cent.

*Reporting threshold*: 0.01 per cent (reference solution (b)).

**Residue on evaporation**: 1.0 per cent to 5.0 per cent.

Evaporate 5.0 g to dryness on a water-bath and dry at 100-105 °C for 4 h.

STORAGE

At a temperature not exceeding 25 °C.

**04/2018:2634**

# SZECHWAN LOVAGE RHIZOME

## Ligustici chuanxiong rhizoma

DEFINITION

Whole or fragmented rhizome, gently baked to dryness, of *Ligusticum sinense* Oliv. 'Chuanxiong' (*Conioselinum anthriscoides* (H.Boissieu) Pimenov & Kljuykov, syn. *Ligusticum chuanxiong* Hort. ex S.H.Qiu, Y.Q.Zeng, K.Y.Pan, Y.C.Tang & J.M.Xu), with rootlets removed, collected in summer when the nodes of the stem become obviously swollen and purplish.

*Content*: minimum 3.5 mL/kg of essential oil.

IDENTIFICATION

A. *Whole drug.* The whole rhizome is irregularly knotty and fist-like, 2-7 cm in diameter. Externally, greyish-brown to yellowish-brown, rough and shrunken, with many nodular stem bases on the upper part of the rhizome, each with parallel and raised annulations and concave, subrounded stem scars. Numerous tuberculous rootlet scars are visible on the lower part and at the nodes.

*Fragmented drug.* The fragmented rhizome occurs as thick slices or irregular pieces. The slices have a conspicuously irregular outline. The cut surface is whitish-yellow to brownish-yellow. The texture is compact, difficult to break; the fracture shows a yellowish-white or greyish-yellow medulla, scattered with yellowish-brown oil dots. The cambium occurs as an undulate ring.

B. Microscopic examination (*2.8.23*). The powder is pale yellow to brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2634.-1): brownish-yellow cork fragments, showing polyhedral cells with slightly sinuous walls (surface view [A]) or rectangular cells (transverse section [E]); very numerous fragments of parenchyma [B, G] with slightly thickened cells; cluster crystals of calcium oxalate (10-25 µm in diameter), isolated [F] or included in the parenchyma cells [G], more or less numerous depending on the sample; reticulate or scalariform spiral vessels (14-50 µm in diameter), isolated or included in the parenchyma with thin-walled cells [D]; secretory canals, usually broken with thin-walled secretory cells containing droplets of oil, are sometimes visible (longitudinal section [C], transverse section [H]); very rarely fusiform fibres with thickened walls. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous starch granules, isolated [Ba] or included in parenchyma cells [B]; the granules are simple, rounded, ovoid, oblong or reniform, 5-16 µm in diameter and up to 22 µm long; the punctiform, slit- or V-shaped hilum may be visible. Occasional 2- to 4-compound starch granules may be present.

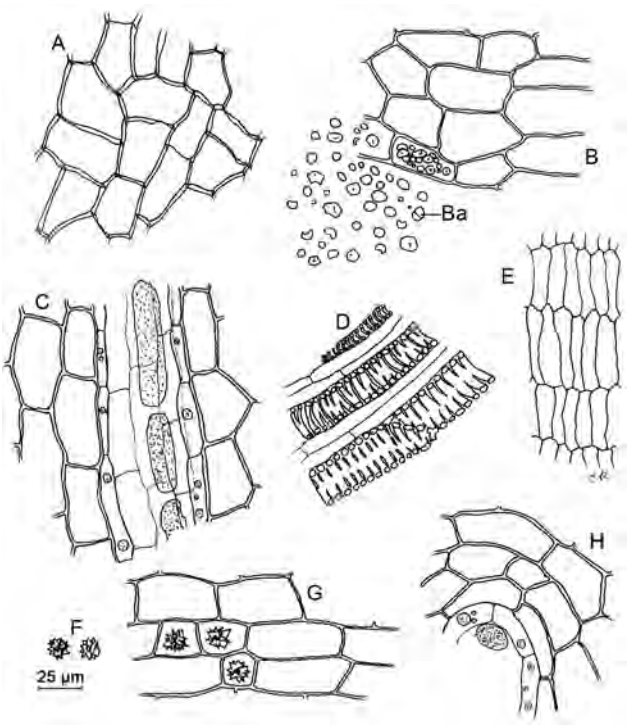

Figure 2634.-1. – *Illustration for identification test B of powdered herbal drug of szechwan lovage rhizome*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *methanol R* and mix for 10 min. Centrifuge and use the supernatant.

*Reference solution.* Dissolve 1 mg of *imperatorin R* and 1 mg of *osthole R* in 1.0 mL of *methanol R.*

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 *V/V/V*).

*Application*: 4 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| | A bluish fluorescent zone |
| | A weak quenching zone |
| Osthole: a blue fluorescent zone | 2 quenching zones |
| Imperatorin: a quenching zone | |
| _____ | _____ |
| | 2 quenching zones |
| **Reference solution** | **Test solution** |

*Detection B*: treat with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R*, heat at 120 °C for 3 min and examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A reddish zone |
| _____ | _____ |
| | A weak yellowish zone (*Z*-ligustilide) |
| | 2 pink zones |
| Osthole: a violet zone | |
| Imperatorin: a yellow zone | A brownish zone |
| _____ | _____ |
| | A brownish zone |
| | A reddish-violet zone |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 25.0 g of the freshly crushed herbal drug, a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid and 0.50 mL of *trimethylpentane R* in the graduated tube. Distil at a rate of 3-3.5 mL/min for 3 h.

**01/2008:1837**
**corrected 7.0**

# TEA TREE OIL

## Melaleucae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the foliage and terminal branchlets of *Melaleuca alternifolia* (Maiden and Betch) Cheel, *M. linariifolia* Smith, *M. dissitiflora* F. Mueller and/or other species of *Melaleuca*.

CHARACTERS

*Appearance*: clear, mobile, colourless or pale yellow liquid. Characteristic odour.

IDENTIFICATION

*First identification: B.*

Herbal drugs

*Second identification*: *A*.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 0.1 mL of the substance to be examined in 5 mL of *heptane R*.

*Reference solution*. Dissolve 30 µL of *cineole R*, 60 µL of *terpinen-4-ol R* and 10 mg of *α-terpineol R* in 10 mL of *heptane R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *heptane R* (20:80 *V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min while observing. Examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Cineole: a violet-brown zone | A violet-brown zone, less intense (cineole) |
| Terpinen-4-ol: a brownish-violet zone | A brownish-violet zone terpinen-4-ol) |
| α-terpineol: a violet or brownish-violet zone | A violet or brownish-violet zone (α-terpineol) |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.885 to 0.906.

**Refractive index** (*2.2.6*): 1.475 to 1.482.

**Optical rotation** (*2.2.7*): + 5° to + 15°.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. Dissolve 0.15 mL of the substance to be examined in 10 mL of *hexane R*.

*Reference solution*. Dissolve 5 µL of *α-pinene R*, 5 µL of *sabinene R*, 15 µL of *α-terpinene R*, 5 µL of *limonene R*, 5 µL of *cineole R*, 30 µL of *γ-terpinene R*, 5 µL of *p-cymene R*, 5 µL of *terpinolene R*, 60 µL of *terpinen-4-ol R*, 5 µL of *aromadendrene R* and 5 mg of *α-terpineol R* in 10 mL of *hexane R*.

*Column*:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- *stationary phase*: *macrogol 20 000 R*.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.3 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 1 | 50 |
| | 1 - 37 | 50 → 230 |
| | 37 - 45 | 230 |
| Injection port | | 240 |
| Detector | | 240 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of the reference solution. Record the retention times of these substances.

*System suitability*: reference solution:

- *resolution*: minimum 2.7 between the peaks due to terpinen-4-ol and aromadendrene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The percentages are within the following ranges:

- *α-pinene*: 1.0 per cent to 6.0 per cent,
- *sabinene*: maximum 3.5 per cent,
- *α-terpinene*: 5.0 per cent to 13.0 per cent,
- *limonene*: 0.5 per cent to 4.0 per cent,
- *cineole*: maximum 15.0 per cent,
- *γ-terpinene*: 10.0 per cent to 28.0 per cent,
- *p-cymene*: 0.5 per cent to 12.0 per cent,
- *terpinolene*: 1.5 per cent to 5.0 per cent,
- *terpinen-4-ol*: minimum 30.0 per cent,
- *aromadendrene*: maximum 7.0 per cent,
- *α-terpineol*: 1.5 per cent to 8.0 per cent.

STORAGE

At a temperature not exceeding 25 °C.

**04/2019:2483**

# THOMSON KUDZUVINE ROOT

## Puerariae thomsonii radix

DEFINITION

Whole or fragmented, dried root of *Pueraria montana* (Lour.) Merr. var. *thomsonii* (Benth.) M.R.Almeida (syn. *Pueraria thomsonii* (Benth.)), with the outer bark removed.

*Content*: minimum 0.4 per cent of total isoflavonoids, expressed as puerarin ($C_{21}H_{20}O_9$; $M_r$ 416.4) (dried drug), of which minimum 55 per cent consists of puerarin.

IDENTIFICATION

A. Cylindrical, subfusiform or semi-cylindrical, 12-15 cm long and 4-8 cm in diameter, sometimes in longitudinally or obliquely cut thick slices, varying in size. Externally yellowish-white or pale brown. The root is heavy, texture hard and starchy. A transverse section shows pale brown concentric rings formed by fibres. A longitudinal section shows several longitudinal striations formed by fibres.

B. Microscopic examination (*2.8.23*). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2483.-1): thick-walled

Herbal drugs

lignified fibres, which occur in bundles, surrounded by a calcium oxalate prism sheath [A]; rare sclereids, subrounded or elliptical, about 50 µm in diameter [E]; fragments of xylem [F] consisting of relatively large vessels with hexagonal or elliptical bordered-pits, arranged very densely [Fa] and xylem parenchyma cells with slightly thickened and pitted walls [Fb], fragments of parenchyma [C]; isolated prism crystals [B]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules [D], simple or 2-20 compound; the individual granules, 15-30 µm in diameter, are spheroidal, semi-rounded or polygonal with a punctiform, slit-shaped or stellate hilum.

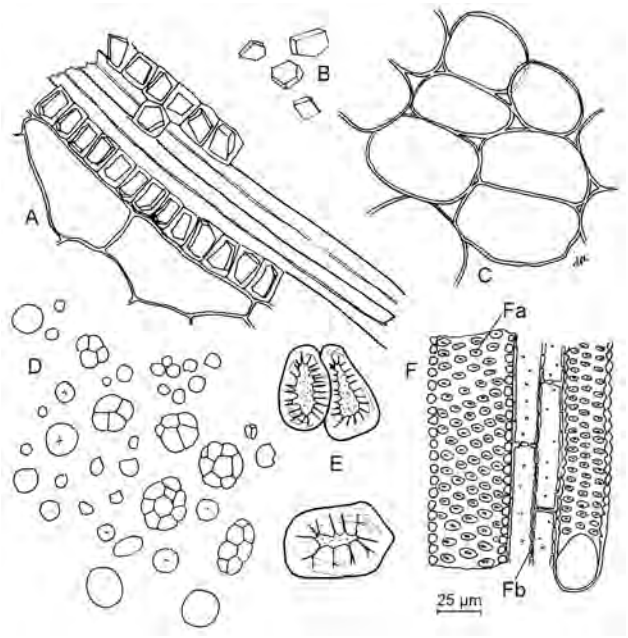

Figure 2483.-1 – *Illustration for identification test B of powdered herbal drug of Thomson kudzuvine root*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Sonicate 0.5 g of the powdered herbal drug (355) (*2.9.12*) with 5 mL of *methanol R*, then centrifuge; use the supernatant.

*Reference solution.* Dissolve 5 mg of *daidzin R* and 5 mg of *puerarin R* in 5 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *water R*, *methylene chloride R*, *methanol R*, *ethyl acetate R* (10:20:22:40 *V/V/V/V*); use the lower layer.

*Application*: 7 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A weak quenching zone |
| _____ | _____ |
| Daidzin: a quenching zone | A weak quenching zone |
| Puerarin: a quenching zone | A weak quenching zone |
| _____ | _____ |
| | Several quenching zones |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Introduce 1.00 g of the powdered herbal drug (355) (*2.9.12*) into a 250 mL conical flask, add 50.0 mL of *ethanol (30 per cent V/V) R* and weigh. Heat under a reflux condenser for 30 min. Allow to cool and weigh again. Adjust to the initial mass with *ethanol (30 per cent V/V) R*, mix well and filter.

*Reference solution.* Introduce an amount of *kudzuvine root dry extract HRS* corresponding to 3.0 mg of puerarin into a 250 mL conical flask, add 50.0 mL of *ethanol (30 per cent V/V) R* and weigh. Heat under a reflux condenser for 30 min. Allow to cool and weigh again. Adjust to the initial mass with *ethanol (30 per cent V/V) R*, mix well and filter.

*Column*: 2 columns coupled in series:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped monolithic octadecylsilyl silica gel for chromatography R*.

*Mobile phase*:

- *mobile phase A*: *glacial acetic acid R*, *water for chromatography R* (0.1:99.9 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 16.5 | 90 → 71 | 10 → 29 |

*Flow rate*: 3.0 mL/min.

*Detection*: spectrophotometer at 260 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *kudzuvine root dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to the isoflavonoids (puerarin, 3-methoxypuerarin, 6-*O*″-D-xylosylpuerarin and daidzin).

*Relative retention* with reference to puerarin (retention time = about 3.4 min): 6-*O*″-D-xylosylpuerarin = about 1.15; daidzin = about 1.4.

*System suitability*: reference solution:

- *peak-to-valley ratio*: minimum 10, where $H_p$ = height above the baseline of the peak due to 3-methoxypuerarin and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to puerarin.

Herbal drugs

Calculate the percentage content of puerarin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$ = area of the peak due to puerarin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to puerarin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *kudzuvine root dry extract HRS* used to prepare the reference solution, in grams;

$p$ = percentage content of puerarin in *kudzuvine root dry extract HRS*.

Calculate the percentage content of total isoflavonoids (puerarin, 6-*O*″-D-xylosylpuerarin and daidzin) using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$ = sum of the areas of the peaks due to the isoflavonoids (puerarin, 6-*O*″-D-xylosylpuerarin and daidzin) in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to puerarin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *kudzuvine root dry extract HRS* used to prepare the reference solution, in grams;

$p$ = percentage content of puerarin in *kudzuvine root dry extract HRS*.

**07/2014:0865**

# THYME

## Thymi herba

DEFINITION

Whole leaves and flowers separated from the previously dried stems of *Thymus vulgaris* L. or *Thymus zygis* L. or a mixture of both species.

*Content*:

– *essential oil*: minimum 12 mL/kg (anhydrous drug);

– *sum of the contents of thymol and carvacrol* (both $C_{10}H_{14}O$; $M_r$ 150.2): minimum 40 per cent in the essential oil.

CHARACTERS

Strong odour reminiscent of thymol.

IDENTIFICATION

A. The leaf of *Thymus vulgaris* is usually 4-12 mm long and up to 3 mm wide, sessile or with a very short petiole. The lamina is tough, entire, lanceolate or ovate, covered on both surfaces by a grey or greenish-grey indumentum; the edges are markedly rolled up towards the abaxial surface. The midrib is depressed on the adaxial surface and is very prominent on the abaxial surface. The calyx is green, often with violet spots and is tubular; at the end are 2 lips of which the upper one is bent back and at the end has 3 lobes, the lower is longer and has 2 hairy teeth. After flowering, the calyx tube is closed by a crown of long, stiff hairs. The corolla, about twice as long as the calyx, is usually brownish in the dry state and is slightly bilabiate.

The leaf of *Thymus zygis* is usually 1.7-6.5 mm long and 0.4-1.2 mm wide; it is acicular or linear-lanceolate and the edges are markedly rolled towards the abaxial surface. Both surfaces of the lamina are green or greenish-grey and the midrib is sometimes violet; the edges, in particular at the base, have long, white hairs. The dried flowers are very similar to those of *T. vulgaris*.

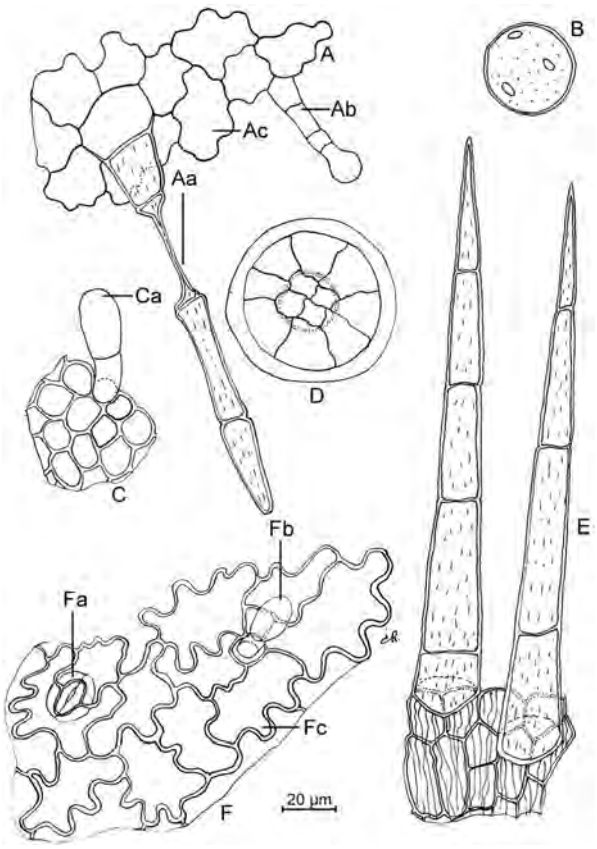

Figure 0865.-1. – *Illustration for identification test B of powdered herbal drug of thyme*

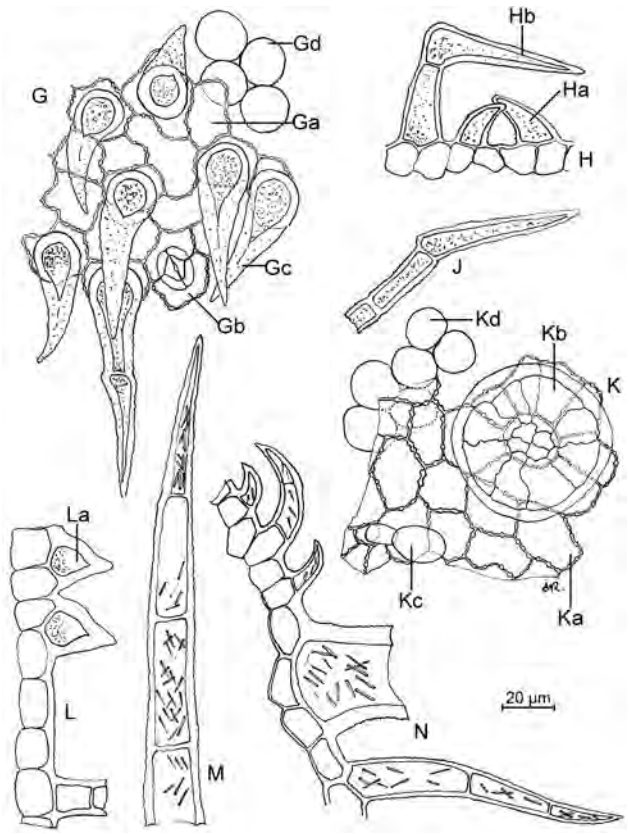

Figure 0865.-2. – *Illustration for identification test B of powdered herbal drug of thyme*

B. Microscopic examination (*2.8.23*). The powder of both species is greyish-green or greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0865.-1 and Figure 0865.-2): fragments of the outer epidermis of the corolla (surface view [A, C, F]), consisting of cells with wavy and slightly thickened [Fc] or unthickened [Ac] walls, numerous uniseriate, multicellular, covering trichomes, often with 1 cell collapsed [Aa], glandular trichomes with a unicellular head and a unicellular [Ca, Fb] or multicellular [Ab] stalk, diacytic stomata (*2.8.3*) [Fa] and glandular trichomes generally with 12 cells [D]; cells of the epidermis from the base of the corolla, isodiametric with slightly thickened walls [C]; pollen grains, relatively rare, spherical and smooth, with 6 germinal slit-like pores, measuring about 35 µm in diameter [B]; the powder of *T. zygis* also contains numerous thick bundles of fibres from the main veins and from fragments of stems; the epidermises of the leaves (surface view [G, K]) have cells with anticlinal walls that are sinuous and beaded [Ga, Ka], and diacytic stomata (*2.8.3*) [Gb]; numerous glandular trichomes made up of 12 secretory cells, the cuticle of which is generally raised by the secretion to form a globular or ovoid, bladder-like covering [Kb]; glandular trichomes with a unicellular stalk and a globular or ovoid head [Kc]; in both species, the adaxial epidermis bears covering trichomes with warty walls that are shaped as pointed teeth [Gc], and is usually associated with underlying palisade parenchyma [Gd, Kd]; the abaxial epidermis (transverse section [H, L]) bears covering trichomes of different types: unicellular, straight or slightly curved [Ha, La]; bicellular or tricellular, articulated and most often elbow-shaped [Hb, J] (*T. vulgaris*); bicellular or tricellular, more or less straight [N], or very large, multicellular [M], at the base of the lamina (*T. zygis*); fragments of calyx covered by numerous, uniseriate trichomes with 5-6 cells and a weakly striated cuticle (surface view [E]).

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge or filter; use the supernatant or the filtrate.

*Reference solution*. Dissolve 1 mg of *rutoside trihydrate R* and 1 mg of *rosmarinic acid R* in 5 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (1:1:15 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 20 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: heat at 100 °C for 3 min, treat the still-hot plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | 2 red fluorescent zones |
| Rosmarinic acid: a blue fluorescent zone | A blue fluorescent zone (rosmarinic acid) |
| | 1 or 2 blue fluorescent zones |
| | 2 yellow or orange fluorescent zones |
| | A green fluorescent zone may be present |
| Rutoside: an orange-yellow fluorescent zone | |
| **Reference solution** | **Test solution** |

D. Examine the chromatograms obtained in the assay for thymol and carvacrol.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Foreign matter** (*2.8.2*): maximum 10 per cent of stems and maximum 2 per cent of other foreign matter. Stems must not be more than 1 mm in diameter and 15 mm in length.

***Thymus serpyllum* L.** Adulteration with *T. serpyllum* L. is indicated by the presence of leaves with long trichomes at their base and with weakly pubescent other parts.

**Water** (*2.2.13*): maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 15.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 30.0 g of the herbal drug, a 1000 mL round-bottomed flask and 400 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 2 h without *xylene R* in the graduated tube.

**Thymol and carvacrol**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Filter the essential oil obtained in the determination of essential oil over a small amount of *anhydrous sodium sulfate R* and dilute to 5.0 mL with *heptane R* by rinsing the apparatus and the anhydrous sodium sulfate. Dilute a volume of the filtered solution corresponding to 100 µL of the essential oil to 5.0 mL with *heptane R*.

*Reference solution (a).* Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *heptane R* and dilute to 5.0 mL with the same solvent.

*Reference solution (b).* Dilute 10 µL of *carvacrol R* to 10.0 mL with *heptane R*. Dilute 100 µL of the solution to 10.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 30-60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *nitrogen for chromatography R* or *helium for chromatography R*.

*Flow rate*: 1-2 mL/min.

*Split ratio*: 1:100.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 45 | 40 → 220 |
| Injection port | | 190 |
| Detector | | 210 |

*Detection*: flame ionisation.

*Injection*: 0.2 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of thymol and carvacrol. Disregard any peak due to the solvent or with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**01/2012:1374**
**corrected 10.0**

# THYME OIL, THYMOL TYPE

## Thymi typo thymolo aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fresh flowering aerial parts of *Thymus vulgaris* L., *T. zygis* L. or a mixture of both species.

CHARACTERS

*Appearance*: clear, yellow or very dark reddish-brown, mobile liquid.

Odour reminiscent of thymol.

*Solubility*: miscible with anhydrous ethanol and with light petroleum.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.2 mL of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 5 mg of *thymol R* and 10 µL of *carvacrol R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *methylene chloride R*.

*Application*: 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 12 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A pink zone |
| _____ | _____ |
| Thymol: an orange-brown zone | An intense orange-brown zone (thymol) |
| Carvacrol: an orange-grey zone | A faint orange-grey zone (carvacrol) may be present |
| _____ | _____ |
| | A pink zone |
| | A violet zone |
| | A brownish-grey zone |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Relative density** (*2.2.5*): 0.915 to 0.935.

**Refractive index** (*2.2.6*): 1.490 to 1.505.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dissolve 200 µL of the substance to be examined in *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 5 µL of *β-myrcene R*, 5 µL of *α-terpinene R*, 20 µL of *p-cymene R*, 10 µL of *γ-terpinene R*, 5 µL of *linalol R*, 5 µL of *terpinen-4-ol R*, 40 mg of *thymol R* and 5 µL of *carvacrol R* in 5 mL of *heptane R*.

*Reference solution (b).* Dissolve 10 µL of *carvacrol R* in *heptane R* and dilute to 10.0 mL with the same solvent. Dilute 100 µL of the solution to 10.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.5 mL/min.

Herbal drugs

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 75 | 65 → 215 |
| Injection port | | 230 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol.

*Identification of peaks*: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. The peak due to α-thujene elutes with a relative retention of about 0.8 with reference to β-myrcene. The peak due to carvacrol methyl ether elutes with a relative retention of about 0.9 with reference to thymol.

Determine the percentage content of these components. The limits are within the following ranges:

– *α-thujene*: 0.2 per cent to 1.5 per cent;
– *β-myrcene*: 1.0 per cent to 3.0 per cent;
– *α-terpinene*: 0.9 per cent to 2.6 per cent;
– *p-cymene*: 14.0 per cent to 28.0 per cent;
– *γ-terpinene*: 4.0 per cent to 12.0 per cent;
– *linalol*: 1.5 per cent to 6.5 per cent;
– *terpinen-4-ol*: 0.1 per cent to 2.5 per cent;
– *carvacrol methyl ether*: 0.05 per cent to 1.5 per cent;
– *thymol*: 37.0 per cent to 55.0 per cent;
– *carvacrol*: 0.5 per cent to 5.5 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

STORAGE

At a temperature not exceeding 25 °C.

**01/2008:1596**

# TOLU BALSAM

## Balsamum tolutanum

DEFINITION

Oleo-resin obtained from the trunk of *Myroxylon balsamum* (L.) Harms var. *balsamum*.

*Content*: 25.0 per cent to 50.0 per cent of free or combined acids, expressed as cinnamic acid ($C_9H_8O_2$; $M_r$ 148.2) (dried drug).

CHARACTERS

*Appearance*: hard, friable, brownish to reddish-brown mass; thin fragments are brownish-yellow when examined against the light.

Reminiscent odour of vanillin.

*Solubility*: practically insoluble in water, very soluble to freely soluble in alcohol, practically insoluble in light petroleum.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Stir 0.40 g of the fragmented drug with 10 mL of *methylene chloride R* for 5 min and filter.

*Reference solution.* Dissolve 50 mg of *benzyl cinnamate R* in *methylene chloride R*, add 50 µL of *benzyl benzoate R* and dilute to 10 mL with *methylene chloride R*.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *light petroleum R*, *toluene R* (5:95 *V/V*).

*Application*: 20 µL, as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with *vanillin reagent R* and heat at 100-105 °C for 5 min. Examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the test and reference solutions. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Benzyl benzoate: a greyish-blue zone | a greyish-blue zone |
| Benzyl cinnamate: a greyish-green zone | a greyish-green zone |
| **Reference solution** | **Test solution** |

TESTS

**Acid value**: 100 to 160.

Dissolve 0.5 g of the fragmented drug in 50 mL of *alcohol R*. Add 0.5 mL of *acid blue 93 solution R* and 5.0 mL of *0.5 M alcoholic potassium hydroxide*. Stir vigorously and titrate with *0.5 M hydrochloric acid* until the colour changes from brownish-red to blackish-green ($n_1$ mL of *0.5 M hydrochloric acid*). Carry out a blank test in the same manner ($n_2$ mL of *0.5 M hydrochloric acid*). Calculate the acid value in the same manner as the saponification value (*2.5.6*).

**Matter insoluble in alcohol**: maximum 5 per cent.

Boil 2.0 g of the fragmented drug with 25 mL of *alcohol (90 per cent V/V) R* and filter. Wash the residue with *alcohol (90 per cent V/V) R*, boiling until completely extracted, then dry the residue at 100-105 °C. Weigh the residue.

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 2.000 g of the fragmented drug by spreading on a flat evaporating dish 9 cm in diameter and allowing to dry *in vacuo* for 4 h.

**Total ash** (*2.4.16*): maximum 0.3 per cent.

ASSAY

Boil 1.500 g under a reflux condenser with 25 mL of *0.5 M alcoholic potassium hydroxide* for 1 h. Evaporate the ethanol and heat the residue with 50 mL of *water R* until the substance is homogeneously distributed. After cooling, add 80 mL of *water R* and a solution of 1.5 g of *magnesium sulfate R* in 50 mL of *water R*. Mix, and allow to stand for 10 min. Filter through a pleated filter paper and wash the residue with 20 mL of *water R*. Combine the filtrate and the washings, acidify with *hydrochloric acid R* and extract with 4 quantities, each of 40 mL, of *ether R*. Discard the aqueous layer. Combine the organic extracts and wash with 2 quantities, each of 20 mL, and with 3 quantities, each of 10 mL, of a 50 g/L solution of *sodium hydrogen carbonate R*. Discard the ether layer. Combine the aqueous extracts, acidify with *hydrochloric acid R* and stir once with 30 mL, twice with 20 mL and once with 10 mL of *methylene chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulfate R*. Filter through a pleated filter and wash the residue with 10 mL of *methylene chloride R*. Reduce the combined methylene chloride extracts to 10 mL by distillation and eliminate the remaining methylene chloride in a current of air. Dissolve

the residue with heating in 10 mL of *alcohol R* previously neutralised to *phenol red solution R*. After cooling, titrate with *0.1 M sodium hydroxide*, using the same indicator.

1 mL of *0.1 M sodium hydroxide* is equivalent to 14.82 mg of total acids, expressed as cinnamic acid.

STORAGE

Do not store in powdered form.

**07/2010:1478**

# TORMENTIL

## Tormentillae rhizoma

DEFINITION

Whole or cut, dried rhizome, freed from the roots, of *Potentilla erecta* (L.) Raeusch. (*P. tormentilla* Stokes).

*Content*: minimum 7 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1) (dried drug).

IDENTIFICATION

A. The rhizome is cylindrically spindle-shaped, with a very irregular appearance, often forming, twisted, knotty tubers, up to 10 cm long and 1-2 cm thick, very hard and scarcely branched. The surface is brown to reddish-brown, rugose and has remains of roots and transversely elongated depressed whitish scars from the stems. At the top of the rhizome the remains of numerous aerial stems may be present. The fracture is short and granular, dark red to brownish-yellow.

B. Microscopic examination (*2.8.23*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: coarsely serrate cluster crystals of calcium oxalate, up to 60 µm in diameter; fragments of thin-walled parenchyma containing reddish-brown tannin; groups of narrow, bordered-pitted vessels with lateral pores; thick-walled and pitted, polygonal parenchyma; groups and fragments of sclerenchymatous thick-walled fibres; occasional fragments of cork with thin-walled, brown, tabular cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows spherical or elliptical starch granules, up to about 20 µm in length.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *water R*, shake for 10 min and filter. Shake the filtrate with 2 quantities, each of 10 mL, of *ethyl acetate R* and filter the combined upper phases over 6 g of *anhydrous sodium sulfate R*. Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 1.0 mL of *ethyl acetate R*.

*Reference solution.* Dissolve 1.0 mg of *catechin R* in 1.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R*, *ether R*, *hexane R*, *ethyl acetate R* (20:20:20:40 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air for 10-15 min.

*Detection*: spray with a freshly prepared 5 g/L solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense turning reddish-brown. Examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones are present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Catechin: an intense reddish-brown zone | A more intense reddish-brown zone (catechin)<br>A fainter zone<br>An intense zone<br>Fainter zones |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent of root and stems as well as rhizomes with black fracture and maximum 2 per cent of other foreign matter.

**Cadmium** (*2.4.27*): maximum 2.0 ppm.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

ASSAY

**Tannins** (*2.8.14*). Use 0.500 g of the powdered herbal drug (180) (*2.9.12*).

**01/2008:1895**

# TORMENTIL TINCTURE

## Tormentillae tinctura

DEFINITION

Tincture produced from *Tormentil (1478)*.

*Content*: minimum 1.5 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; $M_r$ 126.1).

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Red or reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Mix 1.0 mL of the tincture to be examined with 1.0 mL of *alcohol (70 per cent V/V) R*.

*Reference solution.* Dissolve 1.0 mg of *catechin R* in 1.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *ether R*, *glacial acetic acid R*, *hexane R*, *ethyl acetate R* (20:20:20:40 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air for 10-15 min.

*Detection*: spray with a freshly prepared 5 g/L solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense, turning reddish-brown. Examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Catechin: an intense zone | An intense zone (catechin) |
| ——— | ——— |
| | A fainter zone |
| | An intense zone |
| | Fainter zones |
| **Reference solution** | **Test solution** |

TESTS

**Ethanol content** (*2.9.10*): 64 per cent *V/V* to 69 per cent *V/V*.

**Methanol and 2-propanol** (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

**Tannins** (*2.8.14*). Use 2.50 g of the tincture to be examined.

**01/2009:0532**

# TRAGACANTH

## Tragacantha

[9000-65-1]

DEFINITION

Air-hardened, gummy exudate, flowing naturally or obtained by incision from the trunk and branches of *Astragalus gummifer* Labill. and certain other species of *Astragalus* from western Asia.

IDENTIFICATION

A. Tragacanth occurs in thin, flattened, ribbon-like, white or pale yellow, translucent strips, about 30 mm long and 10 mm wide and up to 1 mm thick, more or less curved, horny, with a short fracture; the surface is marked by fine longitudinal striae and concentric transverse ridges. It may also contain pieces similar in shape but somewhat thicker, more opaque and more difficult to fracture.

B. Microscopic examination (*2.8.23*). The powder is white or almost white and forms a mucilaginous gel with about 10 times its mass of *water R*. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows in the gummy mass numerous stratified cellular membranes that turn slowly violet when treated with *iodinated zinc chloride solution R*. The gummy mass includes starch grains, isolated or in small groups, usually rounded in shape and sometimes deformed, with diameters varying between 4 µm and 10 µm, occasionally up to 20 µm, and a central hilum visible between crossed nicol prisms.

C. Examine the chromatograms obtained in the test for acacia.
*Results*: the chromatogram obtained with the test solution shows 3 zones due to galactose, arabinose and xylose. A faint yellowish zone at the solvent front and a greyish-green zone between the zones due to galactose and arabinose may be present.

D. Moisten 0.5 g of the powdered herbal drug (355) (*2.9.12*) with 1 mL of *ethanol (96 per cent) R* and add gradually, while shaking, 50 mL of *water R* until a homogeneous mucilage is obtained. To 5 mL of the mucilage add 5 mL of *water R* and 2 mL of *barium hydroxide solution R*. A slight flocculent precipitate is formed. Heat on a water-bath for 10 min. An intense yellow colour develops.

TESTS

**Acacia**. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 100 mg of the powdered herbal drug (355) (*2.9.12*) in a thick-walled centrifuge test-tube, add 2 mL of a 100 g/L solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test-tube and heat the mixture at 120 °C for 1 h. Centrifuge the resulting hydrolysate, transfer the clear supernatant carefully into a 50 mL flask, add 10 mL of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 mL of *water R* and 0.9 mL of *methanol R*. Centrifuge to separate the amorphous precipitate, collect the supernatant and, if necessary, dilute to 1 mL with *methanol R*.

*Reference solution*. Dissolve 10 mg of *arabinose R*, 10 mg of *galactose R*, 10 mg of *rhamnose R* and 10 mg of *xylose R* in 1 mL of *water R* and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: 16 g/L solution of *sodium dihydrogen phosphate R*, *butanol R*, *acetone R* (10:40:50 *V/V/V*).

*Application*: 10 µL as bands.

*Development A*: over a path of 10 cm.

*Drying A*: in a current of warm air for a few minutes.

*Development B*: over a path of 15 cm using the same mobile phase.

*Drying B*: at 110 °C for 10 min.

*Detection*: spray with *anisaldehyde solution R* and dry at 110 °C for 10 min.

*Results*: the chromatogram obtained with the reference solution shows 4 clearly separated coloured zones due to galactose (greyish-green or green), arabinose (yellowish-green), xylose (greenish-grey or yellowish-grey) and rhamnose (yellowish-green), in order of increasing $R_F$ value; the chromatogram obtained with the test solution does not show a yellowish-green zone corresponding to the zone of rhamnose in the chromatogram obtained with the reference solution.

**Methylcellulose**. Examine the chromatograms obtained in the test for acacia.

*Results*: the chromatogram obtained with the test solution does not show a red zone near the solvent front.

**Sterculia gum**

A. Place 0.2 g of the powdered herbal drug (355) (*2.9.12*) in a 10 mL ground-glass-stoppered cylinder graduated in 0.1 mL. Add 10 mL of *ethanol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 mL.

B. To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 100 mL of *water R* and shake. Add 0.1 mL of *methyl red solution R*. Not more than 5.0 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Foreign matter**: maximum 1.0 per cent.

Place 2.0 g of the powdered herbal drug (355) (*2.9.12*) in a 250 mL round-bottomed flask and add 95 mL of *methanol R*. Swirl to moisten the powder and add 60 mL of *hydrochloric acid R1*. Add a few glass beads about 4 mm in diameter and heat on a water-bath under a reflux condenser for 3 h, shaking occasionally. Remove the glass beads and filter the hot suspension *in vacuo* through a sintered-glass filter (160) (*2.1.2*). Rinse the flask with a small quantity of *water R* and pass the rinsings through the filter. Wash the residue on the filter with about 40 mL of *methanol R* and dry to constant

mass at 110 °C (about 1 h). Allow to cool in a desiccator and weigh. The residue weighs a maximum of 20 mg.

**Flow time**: minimum 10 s, or minimum 50 s if the substance to be examined is to be used for the preparation of emulsions.

Place 1.0 g of the powdered herbal drug (125-250) (*2.9.12*) in a 1000 mL round-bottomed flask with a ground-glass stopper, add 8.0 mL of *ethanol (96 per cent) R* and close the flask. Disperse the suspension over the inner surface of the flask by shaking, taking care not to wet the stopper. Open the flask and add as a single portion 72.0 mL of *water R*. Stopper the flask and shake vigorously for 3 min. Allow to stand for 24 h and shake vigorously again for 3 min. Eliminate air bubbles by applying vacuum above the mucilage for 5 min. Transfer the mucilage to a 50 mL cylinder. Dip in the mucilage a piece of glass tubing 200 mm long and 6.0 mm in internal diameter and graduated at 20 mm and 120 mm from the lower end; the tubing must not be rinsed with surface-active substances. When the mucilage has reached the upper mark, close the tube with a finger. Withdraw the closed tube, remove the finger and measure with a stop-watch the time needed for the meniscus to reach the lower graduation. Carry out this operation 4 times and determine the average value of the last 3 determinations.

**Total ash** (*2.4.16*): maximum 4.0 per cent.

**Microbial contamination**

TAMC: acceptance criterion $10^4$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

LABELLING

The label states whether or not the contents are suitable for preparing emulsions.

**01/2015:1441**

# TURMERIC, JAVANESE

## Curcumae zanthorrhizae rhizoma

DEFINITION

Dried rhizome, cut in slices, of *Curcuma zanthorrhiza* Roxb. (syn. *C. zanthorrhiza* D. Dietrich).

*Content*:

– *essential oil*: minimum 50 mL/kg (anhydrous drug);

– *dicinnamoyl methane derivatives, expressed as curcumin* ($C_{21}H_{20}O_6$; $M_r$ 368.4): minimum 1.0 per cent (anhydrous drug).

CHARACTERS

Aromatic odour.

IDENTIFICATION

A. Orange-yellow or yellowish-brown or greyish-brown slices, mostly peeled 1.5-6 mm thick and 15-50 mm, more rarely up to 70 mm, in diameter. Fragments of the brownish-grey cork are sporadically present. The transverse surface is yellow with dark spots in the paler centre. The fracture is short and finely grained.

B. Microscopic examination (*2.8.23*). The powder is orange-yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1441.-1): fragments of parenchyma [C, E] with large, rounded or ovoid cells containing orange-yellow or yellowish-brown secretory cells [Ea]; fragments of spiral [Fa, G] or reticulate [F] vessels; rare fragments of cork (surface view [B], side view [D]); fragments of epidermis [H] with fragments of thick-walled unicellular covering trichomes [Ha] with a pointed tip [Hb]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous ovoid or irregular starch granules [A], about 30-50 µm long and about 10-30 µm wide, with a more or less visible eccentric hilum.

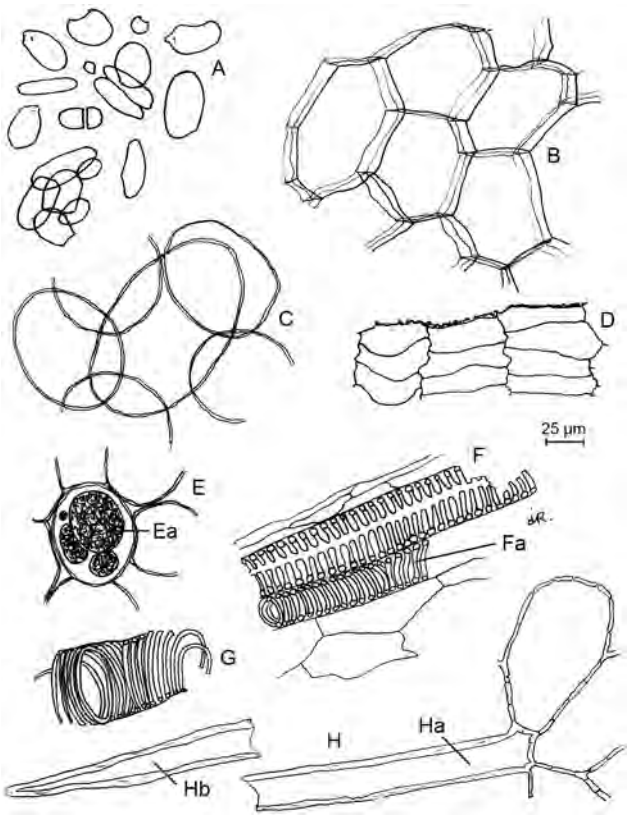

Figure 1441.-1. – *Illustration for identification test B of powdered herbal drug of Javanese turmeric*

C. Thin-layer chromatography (*2.2.27*). Examine the chromatograms obtained in the test for *Curcuma longa* L.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |

| Curcuminoids: 2 yellow zones | A yellow zone (curcuminoids) |
| **Reference solution** | **Test solution** |

TESTS

***Curcuma longa L.*** Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the freshly powdered herbal drug (355) (*2.9.12*) add 10 mL of *ethanol (96 per cent) R*, shake, allow to stand for 30 min with occasional shaking and filter; use the filtrate.

*Reference solution.* Dissolve 20 mg of *curcuminoids R* and 10 mg of *thymol R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *toluene R* (20:80 *V/V*).

*Application*: 10 µL [or 3 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 365 nm.

*Results A*: the chromatogram obtained with the test solution does not show a very intense greenish fluorescent zone in the lower third.

*Detection B*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

**Water** (*2.2.13*): maximum 120 mL/kg, determined on 20.0 g of the powdered herbal drug (500) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 8.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 2.5 g of the freshly powdered herbal drug (500) (*2.9.12*), a 2 L round-bottomed flask, 400 mL of *water R* as the distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2 mL/min for 3 h.

**Dicinnamoyl methane derivatives**. Disperse 0.500 g of the powdered herbal drug (500) (*2.9.12*) in 30 mL of *ethanol (96 per cent) R* in a 100 mL round-bottomed flask. Heat under a reflux condenser for 2.5 h. Cool and filter into a volumetric flask, rinse the round-bottomed flask and the filter with *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at 425 nm using *ethanol (96 per cent) R* as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, using the following expression:

$$\frac{A \times 5000}{1607 \times m}$$

i.e. taking the specific absorbance of curcumin to be 1607.

$A$ = absorbance at 425 nm,

$m$ = mass of the herbal drug to be examined, in grams.

**01/2015:2543**
**corrected 10.0**

# TURMERIC RHIZOME

## Curcumae longae rhizoma

DEFINITION

Whole, cured (by boiling or steaming), dried rhizome of *Curcuma longa* L. (syn. *Curcuma domestica* Valeton) with roots and outer surface removed.

*Content*:

– *essential oil*: minimum 25 mL/kg (anhydrous drug);

– *dicinnamoyl methane derivatives, expressed as curcumin* ($C_{21}H_{20}O_6$; $M_r$ 368.4): minimum 2.0 per cent (anhydrous drug).

CHARACTERS

Spicy odour.

IDENTIFICATION

A. The rhizome is ovate, oblong-ovoid, pyriform or cylindrical, often shortly branched, up to 6 cm long and 15 mm thick. The primary rhizome shows scars from the lateral branches. The surface is slightly dusty, spotted and brownish-yellow, yellow or brownish-grey, finely striated. The fracture is granular, smooth, non-fibrous, slightly glossy, uniformly orange-yellow; it shows a narrow cortex that is darker on the outside.

B. Microscopic examination (*2.8.23*). The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2543.-1): fragments of parenchyma including some secretory cells that contain masses of brownish-yellow oil [G]; reticulate or pitted vessels [B, D]; rare fragments of epidermis (surface view [F]), with cells whose walls are slightly and irregularly thickened [Fa] and scars of covering trichomes [Fb]; occasional long and flexuous, thick-walled, unicellular covering trichomes, fragmented and free [E] or attached to fragments of epidermis [J]; rare fragments of cork (surface view [A], side view [H]), sometimes covered by epidermis [Ha]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, free or included in parenchymatous cells, usually gelatinised and agglomerated in a starchy paste; occasional ovoid starch granules, often deformed by curing [C], are also present.

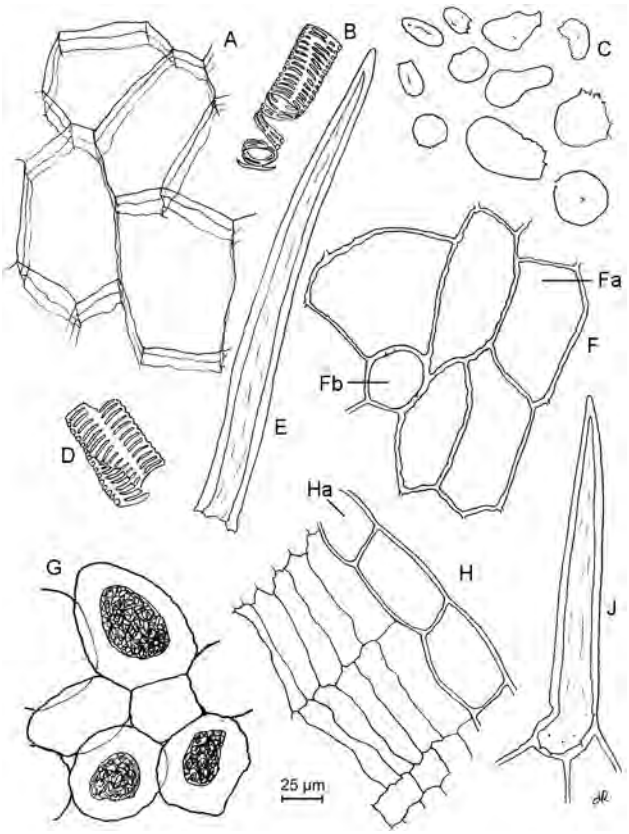

Figure 2543.-1. – *Illustration for identification test B of powdered herbal drug of turmeric rhizome*

C. Thin-layer chromatography (*2.2.27*). Examine the chromatograms obtained in the test for *Curcuma zanthorrhiza* Roxb.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Curcuminoids: a greenish fluorescent zone | A greenish fluorescent zone (curcuminoids) |
| ——— | ——— |
| Curcuminoids: 2 greenish fluorescent zones | 2 greenish fluorescent zones (curcuminoids) |
| **Reference solution** | **Test solution** |

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A faint pink zone |
| | An intense reddish zone |
| ——— | ——— |
| Thymol: a dark zone | |
| | A pinkish-red zone |
| Curcuminoids: a brown zone | A brown zone (curcuminoids) |
| ——— | ——— |
| Curcuminoids: 2 yellow zones | 2 yellow zones (curcuminoids) |
| **Reference solution** | **Test solution** |

TESTS

***Curcuma zanthorrhiza* Roxb.** (syn. *Curcuma zanthorrhiza* D. Dietr.). Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1 g of the freshly powdered herbal drug (355) (*2.9.12*) add 10 mL of *ethanol (96 per cent) R*, shake, allow to stand for 30 min with occasional shaking and filter; use the filtrate.

*Reference solution.* Dissolve 20 mg of *curcuminoids R* and 10 mg of *thymol R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *toluene R* (20:80 *V/V*).

*Application*: 10 µL [or 3 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 365 nm.

*Detection B*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

*Results B*: the chromatogram obtained with the test solution shows no dark zone just above the zone due to thymol in the chromatogram obtained with the reference solution.

**Water** (*2.2.13*): maximum 120 mL/kg, determined on 15.0 g of the powdered herbal drug (500) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 7.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 2.5 g of the freshly powdered herbal drug (500) (*2.9.12*), a 2 L round-bottomed flask, 400 mL of *water R* as the distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2 mL/min for 3 h.

**Dicinnamoyl methane derivatives**. Disperse 0.500 g of the powdered herbal drug (500) (*2.9.12*) in 30 mL of *ethanol (96 per cent) R* in a 100 mL round-bottomed flask. Heat under a reflux condenser for 2.5 h. Cool and filter into a volumetric flask, rinse the round-bottomed flask and the filter with *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at 425 nm using *ethanol (96 per cent) R* as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, using the following expression:

$$\frac{A \times 5000}{1607 \times m}$$

i.e. taking the specific absorbance of curcumin to be 1607.

$A$ = absorbance at 425 nm;

$m$ = mass of the herbal drug to be examined, in grams.

**07/2014:1627**
**corrected 9.4**

# TURPENTINE OIL

## Terebinthinae aetheroleum

DEFINITION

Essential oil obtained by steam distillation, followed by rectification at a temperature below 180 °C, from the oleoresin obtained by tapping *Pinus pinaster* Aiton and/or *Pinus massoniana* D.Don. A suitable antioxidant may be added.

CHARACTERS

*Appearance*: clear, colourless or pale yellow liquid.

Odour reminiscent of α-pinene and β-pinene.

IDENTIFICATION

*First identification*: B.

*Second identification*: A.

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dilute 1 mL of the oil to be examined in 10 mL of *toluene R*.

*Reference solution.* Dissolve 10 µL of *β-caryophyllene R* and 10 mg of *caryophyllene oxide R* in 10 mL of *toluene R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present below the zone due to caryophyllene oxide in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| β-Caryophyllene: a pink zone | A pink zone |
| Caryophyllene oxide: a pink zone | A pink zone (caryophyllene oxide) |
| | A brownish-violet zone |
| **Reference solution** | **Test solution** |

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results*: the peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Relative density** (*2.2.5*): 0.856 to 0.872.

**Refractive index** (*2.2.6*): 1.465 to 1.475.

**Optical rotation** (*2.2.7*): − 40° to − 28°.

**Acid value** (*2.5.1*): maximum 1.0.

**Peroxide value** (*2.5.5, Method B*): maximum 20.

**Fatty oils and resinified essential oils** (*2.8.7*). It complies with the test.

**Chromatographic profile**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dilute 1.0 mL of the oil to be examined in *heptane R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 30 µL of *α-pinene R*, 10 mg of *camphene R*, 20 µL of *β-pinene R*, 10 µL of *car-3-ene R*, 10 µL of *β-myrcene R*, 20 µL of *limonene R*, 10 µL of *longifolene R*, 10 µL of *β-caryophyllene R* and 10 mg of *caryophyllene oxide R* in 1.0 mL of *heptane R*.

*Reference solution (b).* Dissolve 5 µL of *β-caryophyllene R* in *heptane R* and dilute to 10.0 mL with the same solvent. Dilute 0.1 mL of the solution to 1.0 mL with *heptane R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Split ratio*: 1:200.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 60 |
| | 10 - 80 | 60 → 200 |
| | 80 - 120 | 200 |
| Injection port | | 200 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1.0 µL.

*Elution order*: order indicated in the composition of reference solution (a); record the retention times of these substances.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to car-3-ene and β-myrcene.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The limits are within the following ranges:

- *α-pinene*: 70.0 per cent to 85.0 per cent;
- *camphene*: 0.5 per cent to 2.0 per cent;
- *β-pinene*: 5.0 per cent to 20.0 per cent;
- *car-3-ene*: maximum 1.0 per cent;
- *β-myrcene*: 0.4 per cent to 1.5 per cent;
- *limonene*: 1.0 per cent to 7.0 per cent;
- *longifolene*: 0.2 per cent to 4.0 per cent;
- *β-caryophyllene*: 0.1 per cent to 3.0 per cent;
- *caryophyllene oxide*: maximum 1.0 per cent;
- *disregard limit*: the area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Residue on evaporation** (*2.8.9*): maximum 2.5 per cent, determined after heating on a water-bath for 3 h.

STORAGE

At a temperature not exceeding 25 °C.

04/2019:2937

# TYPHAE POLLEN

## Typhae pollis

DEFINITION

Dried pollen of *Typha angustifolia* L., *Typha orientalis* C.Presl or other species of the genus *Typha* with single pollen grains (monads).

*Content*: minimum 0.8 per cent of total flavonoids, expressed as typhaneoside ($C_{34}H_{42}O_{20}$; $M_r$ 771) (dried drug).

IDENTIFICATION

A. Yellow or brownish-yellow, granular powder, mixed with small, irregular, mostly translucent, fragments of floral organs. The powder floats on water and disperses rapidly. The texture is fine and light, feels silky when rubbed between the fingers and easily adheres to the skin.

B. Microscopic examination (*2.8.23*). The powder is yellow to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2937.-1): single, light yellow pollen grains (monads), usually rounded, subtriangular or subrectangular with numerous intermediary forms, 17-32 µm in diameter, with a single, more or less distinct, germinal pore and a finely reticulate exine; a few collapsed grains [F]. The following fragments of floral organs may be present: fragments of stamens, either containing pollen grains [C] or showing the endothecium [G]; the endothecium is covered by a cuticle and, in side view [D], shows cells with walls thickened on 3 sides, whereas in surface view or from an angle [Ga, H], the cell walls appear as wave-shaped or punctiform thickenings; fragments of bracts consisting of either slightly lignified, fusiform cells [A] or slightly thickened, narrow, elongated, rectangular cells sometimes containing fine annular vessels [E]; raphides of calcium oxalate, either free [J] or included in rounded, thin-walled, parenchymatous cells; styloid crystals of calcium oxalate, usually broken [B].

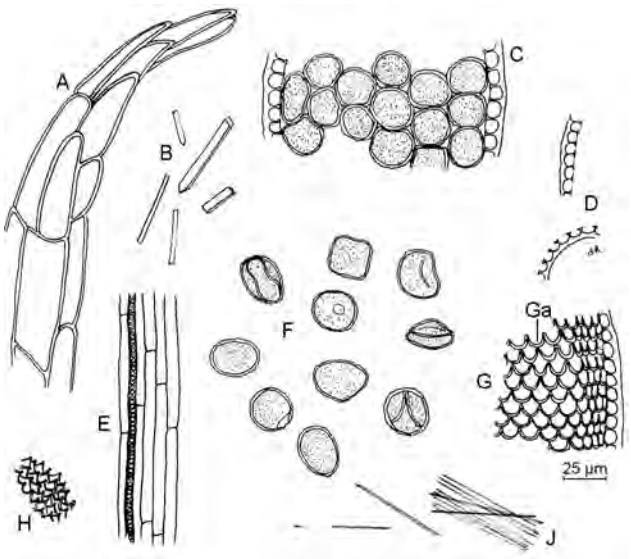

Figure 2937.-1. – *Illustration for identification test B of powdered herbal drug of typhae pollen*

C. High-performance thin-layer chromatography (*2.8.25*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5.0 mL of *methanol R* and sonicate for 15 min. Centrifuge or filter and use the supernatant or the filtrate. If necessary, filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a)*. Dissolve 3.0 mg of *isorhamnetin-3-O-neohesperidoside R* and 3.0 mg of *typhaneoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c)*. Dissolve 3 mg of *chlorogenic acid R* and 3 mg of *isorhamnetin-3-O-neohesperidoside R* in *methanol R* and dilute to 10 mL with the same solvent.

*Intensity marker*: typhaneoside.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: 7 cm from the lower edge of the plate.

*Drying*: in a current of cold air for 5 min.

*Detection*: heat at 100 °C for 3 min; treat the warm plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; examine in ultraviolet light at 366 nm.

*System suitability*: reference solution (c):

– the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (isorhamnetin-3-*O*-neohesperidoside) shows a green fluorescence and the upper zone (chlorogenic acid) shows a light blue fluorescence.

*Results*: see below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint blue, green and/or orange fluorescent zones may be present.

| Top of the plate | |
|---|---|
| Isorhamnetin-3-*O*-neohesperidoside: a green fluorescent zone, intense | A green fluorescent zone, intense (isorhamnetin-3-*O*-neohesperidoside)<br>A yellow fluorescent zone, faint |
| Typhaneoside: a green fluorescent zone, intense | A green fluorescent zone, intense (typhaneoside)<br>A yellow fluorescent zone, faint |
| **Reference solution (a)** | **Test solution** |

TESTS

**Foreign matter**: maximum 10 per cent.

Weigh 10 g of the herbal drug onto a sieve (125) (*2.1.4*) and sieve gently with light tapping. The material remaining on the sieve weighs a maximum of 1.0 g.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 4.0 per cent.

Herbal drugs

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Introduce 1.0 g of the sieved herbal drug obtained in the test for foreign matter into a round-bottomed flask and add 50 mL of *methanol R*. Heat in a water-bath under a reflux condenser at 90 °C for 30 min. Allow to cool and filter. Repeat the extraction with a further 50 mL of *methanol R*. Allow to cool and filter. Combine the filtrates and evaporate to dryness under reduced pressure. Dissolve the residue in *methanol R* and dilute to 10.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.22 µm).

*Reference solution (a).* Dissolve 8.0 mg of *typhaneoside CRS* in *methanol R* and dilute to 25.0 mL with the same solvent.

*Reference solution (b).* Dissolve 0.230 g of *typhae pollen dry extract for system suitability HRS* in *methanol R* and dilute to 10 mL with the same solvent. Weigh and sonicate for 10 min. Allow to cool, weigh again and compensate for the loss of solvent with *methanol R*. Shake thoroughly and filter through a membrane filter (nominal pore size 0.22 µm).

*Column:*

– *size*: *l* = 0.15 m, Ø = 2.1 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (1.8 µm);

– *temperature*: 25 °C.

*Mobile phase*: *acetonitrile R*, 0.1 per cent *V/V* solution of *anhydrous formic acid R* (12.5:87.5 *V/V*).

*Flow rate*: 0.4 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 2 µL.

*Run time*: 30 min.

*Identification of peaks*: use the chromatogram supplied with *typhae pollen dry extract for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to flavonoids 1, 2, 3, 5 and 6; use the chromatogram obtained with reference solution (a) to identify the peak due to typhaneoside (flavonoid 4).

*Relative retention* with reference to typhaneoside (retention time = about 16.2 min): flavonoid 1 = about 0.55; flavonoid 2 = about 0.76; flavonoid 3 = about 0.90; flavonoid 5 = about 1.23; flavonoid 6 = about 1.41.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.3 between the peaks due to flavonoid 3 and typhaneoside.

Calculate the percentage content of total flavonoids, expressed as typhaneoside, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1 \times 5}$$

$A_1$ = sum of the areas of the peaks due to typhaneoside and flavonoids 1, 2, 3, 5 and 6 in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to typhaneoside in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *typhaneoside CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of typhaneoside in *typhaneoside CRS*.

**01/2018:2729**

# UNCARIA STEM WITH HOOKS

## Uncariae rhynchophyllae ramulus cum uncis

DEFINITION

Fragments of dried branch or stem of *Uncaria rhynchophylla* (Miq.) Miq. ex Havil., each bearing paired hooks.

*Content*: minimum 0.2 per cent of total alkaloids, expressed as isorhynchophylline ($C_{22}H_{28}N_2O_4$; $M_r$ 384.5) (dried drug).

IDENTIFICATION

A. The glabrous, reddish-brown fragments of the stem are about 2-3 cm long and bear paired hooks. The stem is cylindrical or sub-square, 2-5 mm in diameter, with fine longitudinal striations. The hooks, rounded and curved downwards, are paired, opposite to each other on the stem; occasionally there is only 1 hook; the hooks are about 1-5 cm long, with an acute apex and a relatively broad base. Petiole scars and arc-shaped stipule scars are visible on the stem, below the hook. A transverse section of the stem shows either a central cavity or a spongy, whitish pith.

B. Microscopic examination (*2.8.23*). The powder is reddish-brown or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2729.-1): brown fragments of the epidermis composed of irregular polygonal cells (surface view [D]); fragments of the dermal tissue (transverse section [A]) consisting of the epidermis [Ab] covered by a thick cuticle [Aa] and collenchymatous cells of the parenchyma [Ac]; fragments of phloem parenchyma with some cells containing sandy crystals of calcium oxalate (longitudinal section [J]); numerous pericyclic fibres, often in groups, with thick unchannelled walls [C]; sclereids of the cortical parenchyma with slightly thickened walls and oblique pits, varying greatly in shape and size, sometimes elongated [G], sometimes rectangular [H], isolated or in small groups; fragments of the xylem [E, K] consisting of large bordered-pitted vessels [Ka], bordered-pitted tracheids [Kb], annular vessels [Ea], these vessels are often associated with the outer layers of the pith with cells with channelled walls [Eb]; numerous rectangular cells of the medullary rays (longitudinal section [F]) with cells whose walls are regularly thickened and pitted; fragments of the pith with rounded to ovoid cells with slightly pitted walls [B].

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 1.0 g of the powdered herbal drug (710) (*2.9.12*) add 1 mL of *concentrated ammonia R*. After 30 min, add 25 mL of *ethyl acetate R* and sonicate for 20 min. Filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in 1 mL of *methanol R*, centrifuge and use the supernatant.

*Reference solution.* Dissolve 1 mg of *isorhynchophylline R* and 1 mg of *rhynchophylline R* in 2 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *water R*, *methanol R*, *methylene chloride R* (1:15:125 *V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

Herbal drugs

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other quenching zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A quenching zone |
| _____ | _____ |
| Isorhynchophylline: a quenching zone | A quenching zone (isorhynchophylline) |
| _____ | _____ |
| | A quenching zone |
| Rhynchophylline: a quenching zone | A quenching zone (rhynchophylline) |
| | A quenching zone |
| **Reference solution** | **Test solution** |

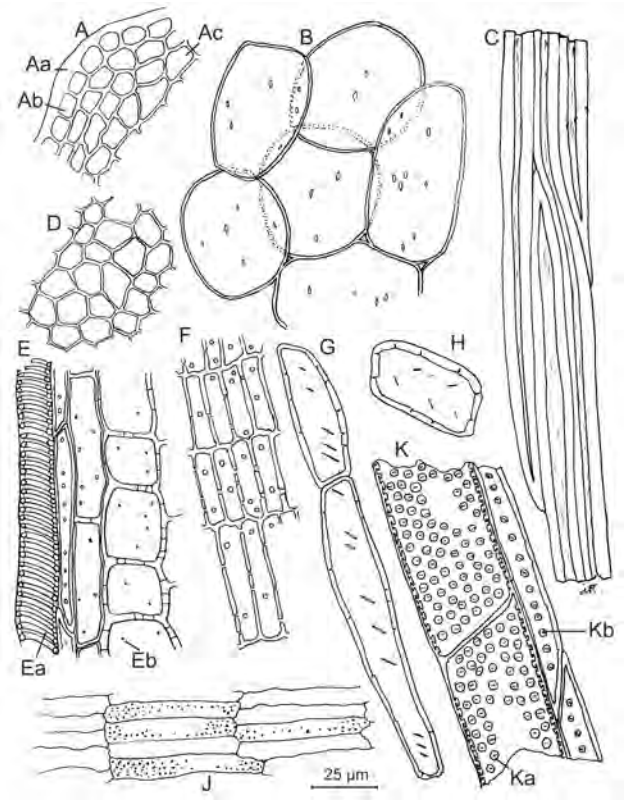

Figure 2729.-1. – *Illustration for identification test B of powdered herbal drug of uncaria stem with hooks*

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*). *Use freshly prepared solutions. Store and inject them at 5 °C, using a cooled autosampler.*

*Test solution.* To 0.500 g of the powdered herbal drug (710) (*2.9.12*) add 3.0 mL of *concentrated ammonia R*. After 30 min, add 50.0 mL of a mixture of equal volumes of *methanol R* and *methylene chloride R*. Sonicate for 30 min. Filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 5.0 mg of *isorhynchophylline CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 25.0 mL with the same mixture of solvents. Dilute 1.0 mL of the solution to 10.0 mL with *methanol R*.

*Reference solution (b).* Dissolve 5.0 mg of *uncaria stem with hooks dry extract for system suitability HRS* in 1.0 mL of *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography with extended pH range R* (5 µm).

*Mobile phase*:

- *mobile phase A*: dilute 0.15 mL of *diethylamine R* to 1 L with *water for chromatography R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 75 | 25 |
| 3 - 15 | 75 → 70 | 25 → 30 |
| 15 - 25 | 70 → 55 | 30 → 45 |
| 25 - 35 | 55 | 45 |
| 35 - 40 | 55 → 10 | 45 → 90 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 245 nm.

*Injection*: 10 µL.

*Identification of peaks*: use the chromatogram supplied with *uncaria stem with hooks dry extract for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to alkaloids 1, 2, 3, 4, 6, 7, 8 and 9; use the chromatogram obtained with reference solution (a) to identify the peak due to isorhynchophylline.

*Relative retention* with reference to isorhynchophylline (retention time = about 28 min): alkaloid 1 = about 0.50; alkaloid 2 = about 0.58; alkaloid 3 = about 0.94; alkaloid 4 = about 0.97; alkaloid 6 = about 1.05; alkaloid 7 = about 1.13; alkaloid 8 = about 1.22; alkaloid 9 = about 1.27. Additional peaks may be present.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to alkaloid 4 and isorhynchophylline.

Calculate the percentage content of total alkaloids expressed as isorhynchophylline using the following expression:

$$\frac{(\Sigma A_1) \times m_2 \times p}{A_2 \times m_1 \times 25}$$

$\Sigma A_1$ = sum of the areas of the peaks due to alkaloids 1, 2, 3, 4, 6, 7, 8, 9 and the peak due to isorhynchophylline, in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to isorhynchophylline in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *isorhynchophylline CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of isorhynchophylline in *isorhynchophylline CRS*.

**07/2010:2400**

# VALERIAN DRY AQUEOUS EXTRACT

## Valerianae extractum aquosum siccum

DEFINITION

Extract produced from *Valerian root (0453)*.

*Content*: minimum 0.02 per cent of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; $M_r$ 234.3) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using water at not less than 60 °C.

CHARACTERS

*Appearance*: brown or brownish, hygroscopic powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Suspend 1.0 g of the extract to be examined in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm). Use the filtrate as the test solution.

*Reference solution.* Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A faint violet zone due to valerenic acid may be present in the chromatogram obtained with the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| _____<br>Valerenic acid: a violet zone | _____ |
| Acetoxyvalerenic acid: a violet zone | A violet zone (acetoxyvalerenic acid) |
| _____ | _____<br>A violet zone (hydroxyvalerenic acid) |
| **Reference solution** | **Test solution** |

TESTS

**Loss on drying** (*2.8.17*): maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Solvent mixture*: *methanol R*, *water R* (50:50 *V/V*).

*Test solution.* In a 300 mL conical flask suspend 1.00 g of the extract to be examined in 40 mL of *water R* whilst swirling. Add 40 mL of *methanol R* and swirl for 1 h at 200 r/min. Filter the suspension into a volumetric flask and rinse the conical flask with 3 quantities, each of 5 mL, of the solvent mixture. Dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve a quantity of *valerian dry extract HRS* corresponding to 1.0 mg of valerenic acid in *methanol R* and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 50.0 mL with *methanol R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*, 5 g/L solution of *phosphoric acid R* (20:80 *V/V*);
- *mobile phase B*: 5 g/L solution of *phosphoric acid R*, *acetonitrile R1* (20:80 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 55 | 45 |
| 5 - 18 | 55 → 20 | 45 → 80 |
| 18 - 22 | 20 | 80 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Identification of peaks*: use the chromatogram supplied with *valerian dry extract HRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to acetoxyvalerenic acid and hydroxyvalerenic acid.

*Relative retention* with reference to valerenic acid (retention time = about 19 min): hydroxyvalerenic acid = about 0.2; acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 0.2}{A_3 \times m_1}$$

$A_1$ = area of the peak due to hydroxyvalerenic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to valerenic acid in the chromatogram obtained with reference solution (b);

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *valerian dry extract HRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of valerenic acid in *valerian dry extract HRS*.

Herbal drugs

07/2014:1898

# VALERIAN DRY HYDROALCOHOLIC EXTRACT

## Valerianae extractum hydroalcoholicum siccum

DEFINITION

Extract produced from *Valerian root (0453)*.

*Content*: minimum 0.25 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; $M_r$ 234.3) (anhydrous extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (30-90 per cent *V/V*) or methanol (40-55 per cent *V/V*).

CHARACTERS

*Appearance*: brown, hygroscopic powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Suspend 1 g of the extract to be examined in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

# VALERIAN ROOT

## Valerianae radix

DEFINITION

Dried, whole or fragmented underground parts of *Valeriana officinalis* L. *s.l.*, including the rhizome surrounded by the roots and stolons.

Herbal drugs

*Content*:

– *essential oil*: minimum 4 mL/kg (dried drug);

– *sesquiterpenic acids*: minimum 0.17 per cent *m/m*, expressed as valerenic acid ($C_{15}H_{22}O_2$; $M_r$ 234.3) (dried drug).

IDENTIFICATION

A. The rhizome is yellowish-grey or pale brownish-grey, obconical or cylindrical, up to about 50 mm long and 30 mm in diameter; the base is elongated or compressed, usually entirely covered by numerous roots. The apex usually exhibits a cup-shaped scar from the aerial parts; stem bases are rarely present. When cut longitudinally, the pith exhibits a central cavity transversed by septa. The roots are numerous, almost cylindrical, of the same colour as the rhizome, 1-3 mm in diameter and sometimes more than 100 mm long. A few filiform fragile secondary roots are present. The fracture is short. The stolons show prominent nodes separated by longitudinally striated internodes, each 20-50 mm long, with a fibrous fracture.

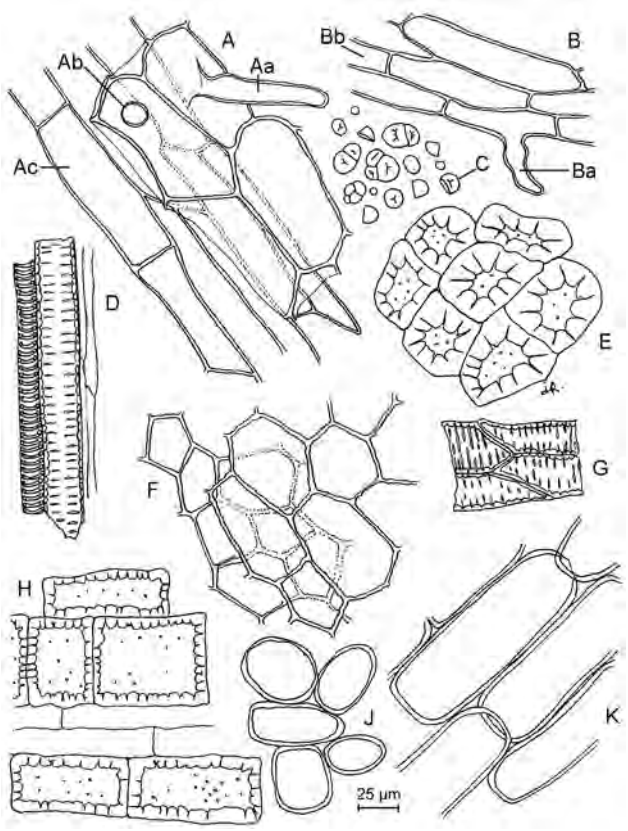

Figure 0453.-1. – *Illustration for identification test B of powdered herbal drug of valerian root*

B. Microscopic examination (*2.8.23*). The powder is pale yellowish-grey or pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0453.-1): occasional groups of rectangular sclereids with moderately thickened walls and a large lumen, from the stem base [H]; very numerous fragments of parenchyma with large ovoid cells (longitudinal section [K], transverse section [J]); spiral, reticulate or pitted lignified vessels, isolated or in small groups [D, G]; thin-walled, elongated cells of the piliferous layer (surface view [A], transverse section [B]), some with root hairs [Aa, Ba] or their scars [Ab]; the piliferous layer is usually accompanied by an underlying layer of cells with slightly thickened and elongated walls [Ac, Bb]; fragments of dermal tissue from the rhizome composed of 1 or 2 layers of polygonal cells with irregularly thickened walls [F]; a few groups of sclereids with thick walls and a narrow lumen [E] from the pith of the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules, simple or 2- to 6-compound, but frequently separated, rounded or irregular and up to about 15 µm in diameter; most of the granules show a rather indistinct cleft or radiate hilum [C].

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Suspend 1 g of the powdered herbal drug (355) (*2.9.12*) in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm). Use the filtrate.

*Reference solution*. Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Valerenic acid: a violet zone | A violet zone (valerenic acid) |
| Acetoxyvalerenic acid: a violet zone | A violet zone (acetoxyvalerenic acid) |
| | 2 faint or very faint violet zones |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of stem bases and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of well-homogenised powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 5.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 40.0 g of freshly powdered herbal drug (500) (*2.9.12*), a 2000 mL flask, 500 mL of *water R* as the distillation liquid and 0.50 mL of *1,2,4-trimethylbenzene R* in the graduated tube. Distil at a rate of 3-4 mL/min for 4 h.

**Sesquiterpenic acids**. Liquid chromatography (*2.2.29*).

*Test solution*. Place 1.50 g of the powdered herbal drug (710) (*2.9.12*) in a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of *methanol R1*. Mix and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Place the filter with the residue in the 100 mL round-bottomed flask. Add 20 mL of *methanol R1* and heat on a water-bath under the reflux condenser for 15 min. Allow to cool and filter. Combine the filtrates and dilute to 50.0 mL with *methanol R1*, rinsing the round-bottomed flask and the filter.

*Reference solution*. Dissolve an amount of *valerian dry extract HRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *acetonitrile R1*, 5 g/L solution of *phosphoric acid R* (20:80 *V/V*);

– *mobile phase B*: 5 g/L solution of *phosphoric acid R*, *acetonitrile R1* (20:80 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 55 | 45 |
| 5 - 18 | 55 → 20 | 45 → 80 |
| 18 - 22 | 20 | 80 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Peak identification*: use the chromatogram supplied with *valerian dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

*System suitability*: reference solution:

– *relative retention* with reference to valerenic acid (retention time = about 19 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

$A_1$ = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *valerian dry extract HRS* used to prepare the reference solution, in grams;

$p$ = percentage content of valerenic acid in *valerian dry extract HRS*.

# VALERIAN ROOT, CUT

## Valerianae radix minutata

DEFINITION

Dried, cut underground parts of *Valeriana officinalis* L. *s.l.*, including the rhizome, roots and stolons.

It is produced from *Valerian root (0453)* for the purpose of being used in herbal teas.

*Content*:

– *essential oil*: minimum 3 mL/kg (dried drug);

– *sesquiterpenic acids*: minimum 0.10 per cent *m/m* expressed as valerenic acid ($C_{15}H_{22}O_2$; $M_r$ 234.3) (dried drug).

IDENTIFICATION

A. Microscopic examination (*2.8.23*). The powder is pale yellowish-grey or pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2526.-1): occasional groups of rectangular sclereids with moderately thickened walls and a large lumen, from the stem base [H]; very numerous fragments of parenchyma with large ovoid cells (longitudinal section [K], transverse section [J]); spiral, reticulate or pitted lignified vessels, isolated or in small groups [D, G]; thin-walled, elongated cells of the piliferous layer (surface view [A], transverse section [B]), some with root hairs [Aa, Ba] or their scars [Ab]; the piliferous layer is usually accompanied by an underlying layer of cells with slightly thickened and elongated walls [Ac, Bb]; fragments of dermal tissue from the rhizome composed of 1 or 2 layers of polygonal cells with irregularly thickened walls [F]; a few groups of sclereids with thick walls and a narrow lumen [E] from the pith of the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*.

The powder shows numerous starch granules, simple or 2- to 6-compound, but frequently separated, rounded or irregular and up to about 15 µm in diameter; most of the granules show a rather indistinct cleft or radiate hilum [C].

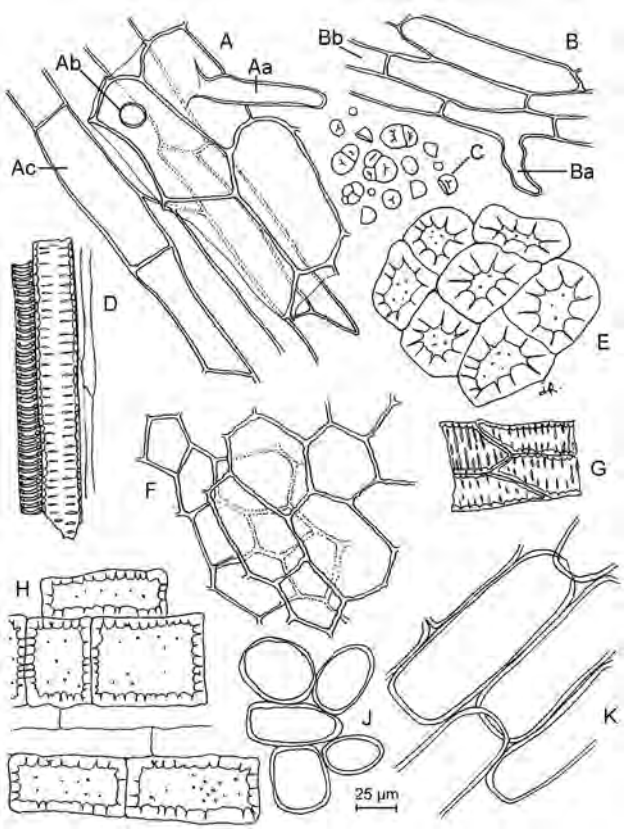

Figure 2526.-1. – *Illustration for identification test A of powdered herbal drug of cut valerian root*

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Suspend 1 g of the powdered herbal drug (355) (*2.9.12*) in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm). Use the filtrate.

*Reference solution.* Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

# VALERIAN TINCTURE

## Valerianae tinctura

DEFINITION

Tincture produced from *Valerian root (0453)*.

*Content*: minimum 0.015 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; $M_r$ 234.3).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (60 to 80 per cent *V/V*) by an appropriate procedure.

CHARACTERS

*Appearance*: brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Dilute 5 mL of the tincture to be examined with 5 mL of *ethanol (70 per cent V/V) R*.

*Reference solution.* Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |

| Valerenic acid: a violet zone | A violet zone (valerenic acid) |
| Acetoxyvalerenic acid: a violet zone | A violet zone (acetoxyvalerenic acid) |
| _____ | _____ |
| | 2 faint or very faint violet zones |
| **Reference solution** | **Test solution** |

TESTS

**Ethanol** (*2.9.10*): 95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dilute 10.0 g of the tincture to be examined to 50.0 mL with *methanol R1*.

*Reference solution.* Dissolve an amount of *valerian dry extract HRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*, 5 g/L solution of *phosphoric acid R* (20:80 *V/V*);
- *mobile phase B*: 5 g/L solution of *phosphoric acid R*, *acetonitrile R1* (20:80 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 55 | 45 |
| 5 - 18 | 55 → 20 | 45 → 80 |
| 18 - 22 | 20 | 80 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Peak identification*: use the chromatogram supplied with *valerian dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

*System suitability*: reference solution:

- *relative retention* with reference to valerenic acid (retention time = about 19 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

$A_1$ = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;

$m_1$ = mass of the tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *valerian dry extract HRS* used to prepare the reference solution, in grams;

$p$ = percentage content of valerenic acid in *valerian dry extract HRS*.

**07/2012:1854**

# VERBENA HERB

## Verbenae herba

DEFINITION

Whole or fragmented, dried aerial parts of *Verbena officinalis* L. collected during flowering.

*Content*: minimum 1.5 per cent of verbenalin ($C_{17}H_{24}O_{10}$; $M_r$ 388.4) (dried drug).

IDENTIFICATION

A. The stem is greenish-brown, quadrangular, longitudinally grooved and roughly hairy, especially on the angles. The larger leaves are petiolate and deeply pinnately lobed, with bluntly dentate margins, the smaller leaves are sessile, not lobed, with crenate or dentate margins; the surfaces are rough and covered with bristly hairs, particularly over the veins, which are prominent on the lower surface. The flowers are numerous, arranged in a slender spike in the axils of leaf-like bracts; the tubular calyx has 5 acutely pointed lobes with the pale pink or lilac corolla forming a tube about twice as long as the calyx.

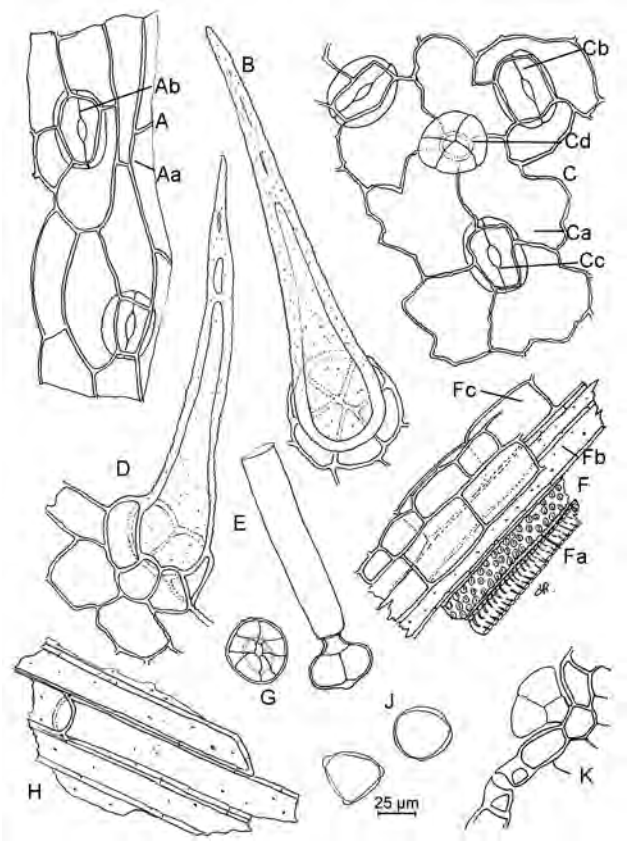

Figure 1854.-1. – *Illustration for identification test B of powdered herbal drug of verbena herb*

B. Microscopic examination (*2.8.23*). The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1854.-1): fragments of the leaves, which in surface view [C] show sinuous-walled epidermal cells [Ca] with anisocytic [Cb] or anomocytic [Cc] stomata (*2.8.3*), more numerous on the lower epidermis; fragments of stem epidermis [A] consisting of long, polygonal or rectangular epidermal cells [Aa] with thickened walls and stomata [Ab]; covering trichomes, unicellular, thick-walled, up to 500 µm long, wide at the base and arising from the centre of a single ring of domed, spherical epidermal cells (surface view [B], side view [D]); occasional glandular trichomes of 2 types: (a) long stalk with a flattened head about 35 µm in diameter and consisting of 4-8 radiating cells in side view [E] or in surface view of the head [G], and (b) short unicellular stalk and an enlarged ovate head composed of 4 radiating cells (surface view [Cd], transverse section [K]); triangular-ovoid or rounded pollen grains about 30 µm in diameter, with 3 pores and a smooth exine [J]; many fragments of stems [F] consisting of groups of fibres [Fb], vessels [Fa] and fragments of parenchyma [Fc]; isolated fragments of fibres [H].

C. Examine the chromatograms obtained in test B for *Aloysia citrodora*.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A brown or green zone |
| Arbutin: a blue or brown zone | |
| | An intense brownish-grey zone |
| Rutoside: a dark brownish-yellow zone | |
| **Reference solution** | **Test solution** |

TESTS

***Aloysia citrodora***

A. A lemon-like odour indicates the presence of *Aloysia citrodora*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.5 g of the powdered herbal drug (710) (*2.9.12*) add 5 mL of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

*Reference solution*. Dissolve 10 mg of *arbutin R* and 10 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

*Development*: over a path of 12 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R* and heat at 100-105 °C for about 10 min; examine in daylight.

*Results*: the chromatogram obtained with the test solution shows no intense blue or violet zone approximately at the position of rutoside in the chromatogram obtained with the reference solution.

Herbal drugs

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Internal standard solution.* Dissolve 10.0 mg of *ferulic acid R* in *ethanol (60 per cent V/V) R* and dilute to 100.0 mL with the same solvent.

*Test solution.* To 1.00 g of the powdered herbal drug (710) (*2.9.12*) add 50.0 mL of the internal standard solution and stir with a magnetic stirrer for 2 h. Centrifuge for 15 min and filter the supernatant using a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve the contents of a vial of *verbenalin CRS* in the internal standard solution and dilute to 5.0 mL with the same solution.

*Precolumn*:

- *size*: *l* = 0.01 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 20 °C.

*Mobile phase*:

- *mobile phase A*: 0.3 per cent *V/V* solution of *phosphoric acid R*;
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 93 → 83 | 7 → 17 |
| 20 - 30 | 83 | 17 |
| 30 - 35 | 83 → 75 | 17 → 25 |

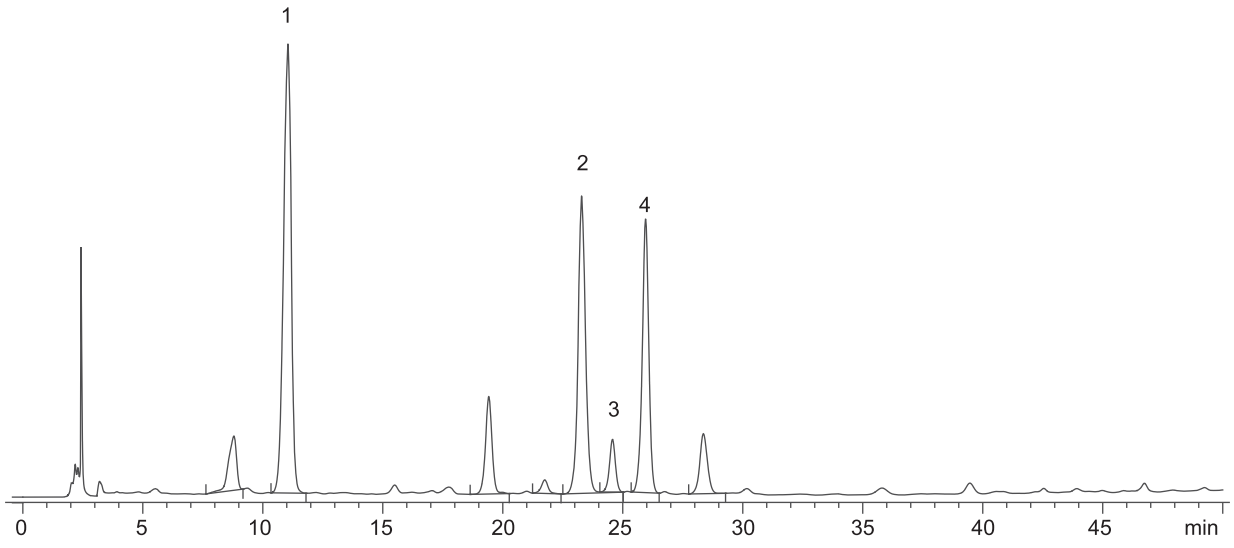
*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 20 µL.

*System suitability*: test solution:

- the chromatogram obtained is similar to the chromatogram shown in Figure 1854.-2;
- *resolution*: minimum 3.5 between the peaks due to ferulic acid and acteoside.



1. verbenalin 2. ferulic acid 3. unknown substance (may be absent) 4. acteoside

Figure 1854.-2. – *Chromatogram for the assay of verbena herb: test solution*

Calculate the percentage content of verbenalin using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times 1000}{A_2 \times A_3 \times m_1}$$

$A_1$ = area of the peak due to verbenalin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to verbenalin in the chromatogram obtained with the reference solution;

$A_3$ = area of the peak due to ferulic acid in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug used to prepare the test solution, in grams;

$m_2$ = mass of verbenalin in the reference solution, in grams.

**01/2019:1835**

# WHITE HOREHOUND

## Marrubii herba

DEFINITION

Whole or fragmented dried flowering aerial parts of *Marrubium vulgare* L.

*Content*: minimum 0.7 per cent of marrubiin ($C_{20}H_{28}O_4$; $M_r$ 332.4) (dried drug).

IDENTIFICATION

A. The stems are up to 50 cm long, quadrangular, up to 7 mm wide, young stems are densely covered with whitish downy hairs, older stems are greenish-grey and less hairy. The lower leaves are broadly ovate to almost orbicular, upper leaves less broadly ovate, both petiolate; lamina 1.5-4 cm long, 1-3.5 cm wide, apex sub-acute, base tapering or somewhat cordate, margin dentate to crenate, petiole up to 3 cm long; venation pinnate, prominent on the lower surface, distinctly depressed on the upper surface. Both leaf surfaces are densely covered with fine, white, woolly hairs, older leaves having fewer hairs on the dark greyish-green upper surface. The flowers are small, sessile in dense axillary clusters. The calyx is 5 mm long, persistent, with 5 long and 5 short, alternating, hooked, recurved fringing spines; throat of calyx with an internal ring of long silky hairs; corolla 7 mm long, dull white, 4-lobed, upper lobe 2-lipped, lower-lobe 3-lipped; 4 short stamens; style with bifid stigma.

B. Microscopic examination (*2.8.23*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1835.-1): numerous covering trichomes of different types, isolated or associated with fragments of the epidermis of the leaves: a) covering trichomes in tufts [B, H] with 3-20 rigid branches of various sizes with smooth, regularly thickened walls, sometimes sessile [B], sometimes arising from a multicellular stalk [H], some branches are unicellular [Ba, Ha], others are multicellular (2-6 cells), 100-200 µm long, thick-walled and swollen at the junctions [Bb, Hb]; b) unicellular covering trichomes; c) multicellular covering trichomes similar to the branches of the trichomes in tufts; glandular trichomes of different types: a) glandular trichomes with a unicellular stalk and a unicellular [D], bicellular [Hc] or quadricellular head (surface view [Gb]); b) glandular trichomes with a multicellular stalk and a unicellular head [A]; c) glandular trichomes of lamiaceous type with a unicellular stalk and an 8-celled head covered with a cuticle (surface view [Gd]); fragments of the epidermis of the leaves [G] consisting of polygonal cells with slightly sinuous walls [Ga], stomata of the diacytic type (*2.8.3*) [Gc], covering trichomes and glandular trichomes; covering trichomes from the inner surface of the calyx, twisted or coiled, up to 1000 µm long, bi- or tricellular, thickened at the cell junctions, with a flexuous, very elongated distal cell [C]; fragments of palisade parenchyma (surface view [Bc]) containing small needle-shaped crystals of calcium oxalate; fragments of vascular tissue from the stems and veins [F]; fragments of petals with papillose cells [J]; spherical pollen grains, about 25 µm in diameter with a smooth exine [E].

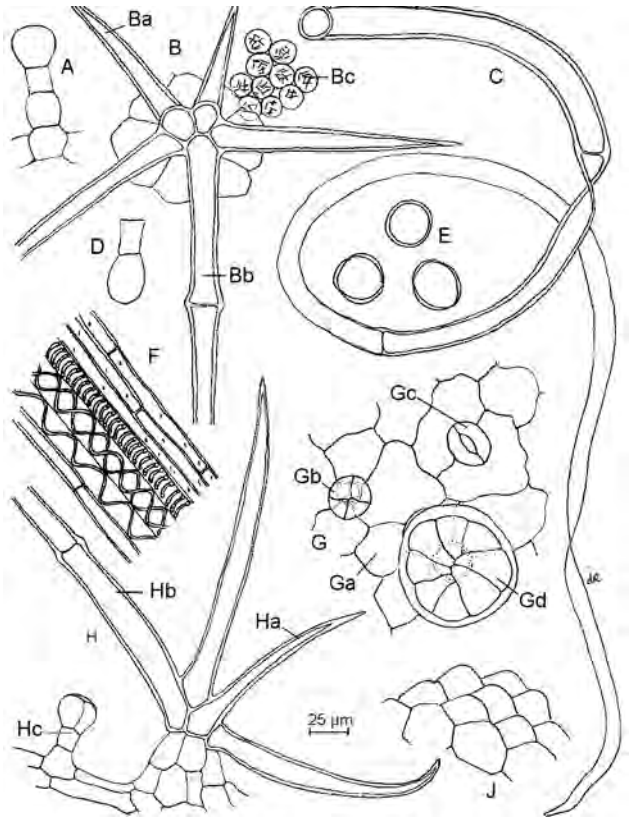


Figure 1835.-1. – *Illustration for identification test B of powdered herbal drug of white horehound*

C. Thin-layer chromatography (*2.2.27*).

*Test solution (a).* To 1.0 g of the powdered herbal drug (710) (*2.9.12*) add 2 mL of *dilute hydrochloric acid R* and 8 mL of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

*Test solution (b).* To 1.0 g of the powdered herbal drug (710) (*2.9.12*) add 10 mL of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

*Reference solution.* Dissolve 10 mg of *cholesterol R* and 10 mg of *guaiazulene R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *methanol R*, *toluene R* (5:95 *V/V*).

*Application*: 20 µL [or 5 µL] of test solutions (a) and (b) and 10 µL [or 2 µL] of the reference solution, as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

Herbal drugs

*Detection*: treat with a 5 g/L solution of *vanillin R* in a mixture of 20 volumes of *ethanol (96 per cent) R* and 80 volumes of *sulfuric acid R* and examine in daylight immediately after heating at 130 °C for 5-10 min.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Further zones in the chromatograms obtained with test solutions (a) and (b) may be present. The zone due to marrubiin in the chromatogram obtained with test solution (a) is more intense than that in the chromatogram obtained with test solution (b). During extraction with hydrochloric acid and methanol, conversion of pre-marrubiin to marrubiin takes place which leads to an increase in intensity of the zone.

| Top of the plate | | |
|---|---|---|
| Guaiazulene: a reddish-violet zone | A bluish-violet zone | A bluish-violet zone |
| ——— | | ——— |
| | A bluish-violet zone | A bluish-violet zone |
| ——— | | ——— |
| Cholesterol: a bluish-violet zone | An intense bluish-violet zone (marrubiin) | A bluish-violet zone (marrubiin) |
| | A bluish-violet zone | A bluish-violet zone |
| | A bluish-violet zone | A bluish-violet zone |
| **Reference solution** | **Test solution (a)** | **Test solution (b)** |

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 15.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Reduce 50 g of the herbal drug to a powder (250) (*2.9.12*) and homogenise. To 1.00 g of the powdered herbal drug in a 50 mL round-bottomed flask add 15 mL of a mixture of 2 volumes of *dilute hydrochloric acid R* and 8 volumes of *methanol R*. Heat in a water bath at 80 °C under a reflux condenser for 30 min. Allow to cool to room temperature and filter through a plug of adsorbent cotton into a 25 mL volumetric flask. Dilute to 25.0 mL with *methanol R* by rinsing the round-bottomed flask and the filter.

*Reference solution.* Dissolve 2.0 mg of *marrubiin CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*;
- *mobile phase B*: dilute 0.5 mL of *phosphoric acid R* to 1000 mL with *water for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 40 → 90 | 60 → 10 |
| 15 - 20 | 90 → 40 | 10 → 60 |
| 20 - 25 | 40 | 60 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 217 nm.

*Injection*: 20 µL.

Locate the peak due to marrubiin by comparison with the chromatogram obtained with the reference solution.

Calculate the percentage content of marrubiin from the following expression:

$$\frac{A_1 \times m_2 \times p \times 2.5}{A_2 \times m_1}$$

$A_1$ = area of the peak due to marrubiin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to marrubiin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in milligrams;

$m_2$ = mass of *marrubiin CRS* used to prepare the reference solution, in milligrams;

$p$ = percentage content of marrubiin in *marrubiin CRS*.

**01/2008:1855**
**corrected 6.0**

# WILD PANSY (FLOWERING AERIAL PARTS)

## Violae herba cum flore

DEFINITION

Dried flowering aerial parts of *Viola arvensis* Murray and/or *Viola tricolor* L.

*Content*: minimum 1.5 per cent of flavonoids, expressed as violanthin ($C_{27}H_{30}O_{14}$; $M_r$ 578.5) (dried drug).

IDENTIFICATION

A. The stem is angular and hollow. The leaves are oval, petiolate, with a cordate base or elongated and obtuse, with lyrate stipules, divided in the middle. The flowers, with a long peduncle, are zygomorphic, with 5 oval, lanceolate sepals, an appendage pointed outwards and 5 petals of which the lower one bears a spur; in *Viola arvensis*, the petals are shorter than the calyx, the lower petal is cream coloured, with black lines, the 4 upper petals may be cream coloured or violet blue; in *Viola tricolor*, the petals are longer than the calyx and violet coloured, more or less tinged with yellow. The androecium consisting of 5 stamens bears at the apex a membranous connective appendage with 2 spurs. The trilocular ovary shows a short style and globular stigmata. The fruit are navicular capsules, three-lobed, yellowish brown, 5 mm to 10 mm long. The pale yellow, pyriform seeds are about 1 mm long, bearing a caruncle.

B. Microscopic examination (*2.8.23*). The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis of the leaves in surface view with wavy-walled cells and anomocytic stomata (*2.8.3*); conical unicellular covering trichomes, widened at the base and sharply pointed at the apex, with a striated cuticle; glandular trichomes with a multicellular head, and a short, multicellular stalk in the indentations of the leaf margins; cluster crystals of calcium oxalate, sometimes included in parenchyma; fragments of the corolla with wavy-walled epidermal cells, those from the mid-region papillose and with some extended to form flask or bottle-shaped projections, those from the base of the petals with covering trichomes up to about 300 µm long with characteristic hump-like swellings along their length;

spherical or polyhedral pollen grains, 60 µm to 80 µm in diameter, with finely pitted exines and 5 pores (*Viola arvensis*) or 4 pores (*Viola tricolor*); occasional fragments of spiral and reticulate vessels and groups of fibres from the stem.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Heat in a water-bath at 65 °C for 5 min, with frequent stirring, 2.0 g of the powdered herbal drug (355) (*2.9.12*) in 10 mL of *alcohol (70 per cent V/V) R*. Cool and filter.

*Reference solution.* Dissolve 2.5 mg of *rutoside trihydrate R*, 2.5 mg of *hyperoside R* and 1.0 mg of *caffeic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *anhydrous formic acid R*, *acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

*Application*: 10 µL, as bands.

*Development*: over a path of 12 cm.

*Drying*: at 100-105 °C.

*Detection*: spray with a solution containing 10 g/L of *diphenylboric acid aminoethyl ester R* and 50 g/L of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Caffeic acid: a greenish-blue to light blue fluorescent zone | A blue fluorescent zone |
| Hyperoside: a yellowish-brown fluorescent zone | A yellowish-green fluorescent zone |
| Rutoside: a yellowish-brown fluorescent zone | An intense yellowish-brown fluorescent zone (rutoside) |
| | A yellowish-green fluorescent zone |
| | A yellowish-green fluorescent zone |
| | A yellowish-green fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent.

**Swelling index** (*2.8.4*): minimum 9, determined on the powdered herbal drug (355) (*2.9.12*).

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 15.0 per cent.

ASSAY

*Stock solution.* In a 200 mL flask, introduce 0.300 g of the powdered herbal drug (250) (*2.9.12*) and 40 mL of *alcohol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 mL volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 mL flask, add 40 mL of *alcohol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 mL volumetric flask as used previously. Rinse the 200 mL flask with a further quantity of *alcohol (60 per cent V/V) R*, filter and transfer to the same 100 mL volumetric flask. Dilute to volume with *alcohol (60 per cent V/V) R* and filter.

*Test solution.* Introduce 5.0 mL of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 mL volumetric flask. Rinse the round-bottomed flask with 3 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 mL volumetric flask as used previously. Add 10.0 mL of a solution containing 25.0 g/L of *boric acid R* and 20.0 g/L of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

*Compensation liquid.* Introduce 5.0 mL of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 mL volumetric flask. Rinse the round-bottomed flask with 3 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 mL volumetric flask as used previously. Add 10.0 mL of *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

Measure the absorbance (*2.2.25*) of the test solution at 405 nm after 30 min.

Calculate the percentage content of total flavonoids, expressed as violanthin from the expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of violanthin to be 400.

$A$ = measured absorbance at 405 nm,

$m$ = mass of the herbal drug to be examined, in grams.

**07/2014:1891**

# WILD THYME

## Serpylli herba

DEFINITION

Whole or cut, dried, flowering aerial parts of *Thymus serpyllum* L.

*Content*: minimum 3.0 mL/kg of essential oil (dried drug).

IDENTIFICATION

A. The stem is much branched, up to about 1.5 mm in diameter, cylindrical or indistinctly quadrangular, green, reddish or purplish, the older stems brown and woody, the younger stems pubescent. The leaves are opposite, 3-12 mm long and up to 4 mm wide, elliptical to ovate-lanceolate with an obtuse apex, cuneate and shortly petiolate at the base; the margin is entire and markedly ciliate, especially near the base; both surfaces are more or less glabrous but distinctly punctate. The inflorescence is composed of about 6-12 flowers in rounded to ovoid, terminal heads. The calyx is tubular, 2-lipped with the upper lip dividing to form 3 teeth, the lower lip with 2 teeth, edged with long hairs; the inner surfaces are strongly pubescent, the hairs forming a closed tube after flowering. The corolla is purplish-violet

or red, 2-lipped, the lower lip with 3 lobes and the upper lip notched, the inner surface is strongly pubescent; 4 epipetalous stamens project from the corolla tube.

B. Microscopic examination (*2.8.23*). The powder is greyish-green or greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1891.-1): fragments of the leaf epidermises [A, B, F] covered by a finely striated cuticle and consisting of cells with sinuous anticlinal walls [Aa, Ba, Fa] and diacytic stomata (*2.8.3*) [Ab, Bb, Fb]; cells of the adaxial leaf epidermis [B] with wavy, irregularly thickened anticlinal walls [Ba]; numerous covering trichomes on both epidermises and the leaf margins, with some of the cells containing very small crystals of calcium oxalate [Af, Ca, Fd], the majority are short, conical, unicellular, with thickened and warty walls (surface view [Bc], side view [Fc]); fewer multicellular covering trichomes, long, tapering to a point, composed of up to 8 cells, slightly swollen at the joints, with finely pitted walls, on an epidermis [Ae] or fragmented [C]; abundant glandular trichomes, mostly multicellular of the lamiaceous type [Ac] with a unicellular stalk and a glandular head consisting of 12 inconspicuous cells, others with a unicellular stalk and a unicellular globular or ovoid head [Ad]; purplish-violet fragments of the corolla whose inner epidermis consists of cells with rounded papillae [D] and whose outer epidermis [E], with a striated cuticle, consists of cells with lobed walls [Ea], unicellular [Eb] or multicellular [Ec] uniseriate covering trichomes, glandular trichomes with a unicellular head and a unicellular stalk [Ed] and glandular trichomes of the lamiaceous type; relatively rare pollen grains, spherical, about 30 µm in diameter, with a finely pitted exine and 6 germinal pores [G].

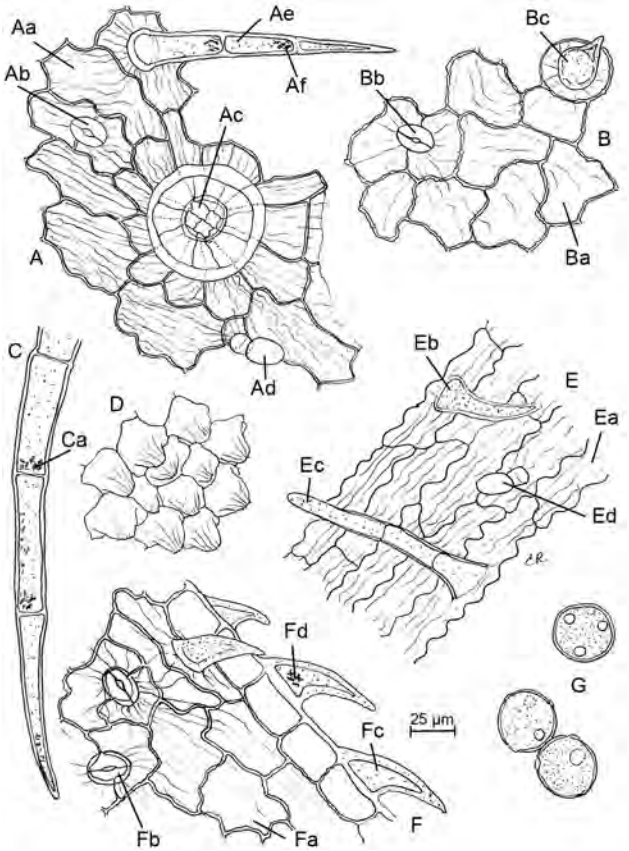

Figure 1891.-1.– *Illustration for identification test B of powdered herbal drug of wild thyme*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge or filter; use the supernatant or the filtrate.

*Reference solution*. Dissolve 1 mg of *rutoside trihydrate R* and 1 mg of *rosmarinic acid R* in 5 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (1:1:15 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands of 20 mm [or 8 mm].

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: heat at 100 °C for 3 min; treat the still-hot plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| | A red fluorescent zone |
| Rosmarinic acid: a blue fluorescent zone | A blue fluorescent zone (rosmarinic acid) |
| | 1 or 2 blue fluorescent zones |
| | A yellow or orange fluorescent zone |
| | A green or blue fluorescent zone may be present |
| Rutoside: an orange-yellow fluorescent zone | |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent, determined on 30 g.

***Thymus vulgaris* L. or *Thymus zygis* L.** Adulteration with *T. vulgaris* L. or *T. zygis* L. is indicated by the presence of acicular to linear-lanceolate leaves with a strongly bent margin, the adaxial surface showing covering trichomes shaped as pointed teeth with warty walls, the abaxial surface showing many types of warty covering trichomes: unicellular, straight or slightly curved, bicellular or tricellular, often elbow-shaped, and bicellular or tricellular, more or less straight.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 3.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 50.0 g of the cut herbal drug, a 1000 mL round-bottomed flask and 500 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 2 h without *xylene R* in the graduated tube.

**01/2013:1583**

# WILLOW BARK

## Salicis cortex

DEFINITION

Whole or fragmented dried bark of young branches or whole dried pieces of current-year twigs of various species of genus *Salix* including *S. purpurea* L., *S. daphnoides* Vill. and *S. fragilis* L.

*Content*: minimum 1.5 per cent of total salicylic derivatives, expressed as salicin ($C_{13}H_{18}O_7$; $M_r$ 286.3) (dried drug).

IDENTIFICATION

A. The bark is 1-2 mm thick and occurs in flexible, elongated, quilled or curved pieces. The outer surface is smooth or slightly wrinkled longitudinally and greenish-yellow or brownish-grey. The inner surface is smooth or finely striated longitudinally and white, pale yellow or reddish-brown, depending on the species. The fracture is short in the outer part and coarsely fibrous in the inner region. The diameter of current-year twigs is not greater than 10 mm. The wood is white or pale yellow.

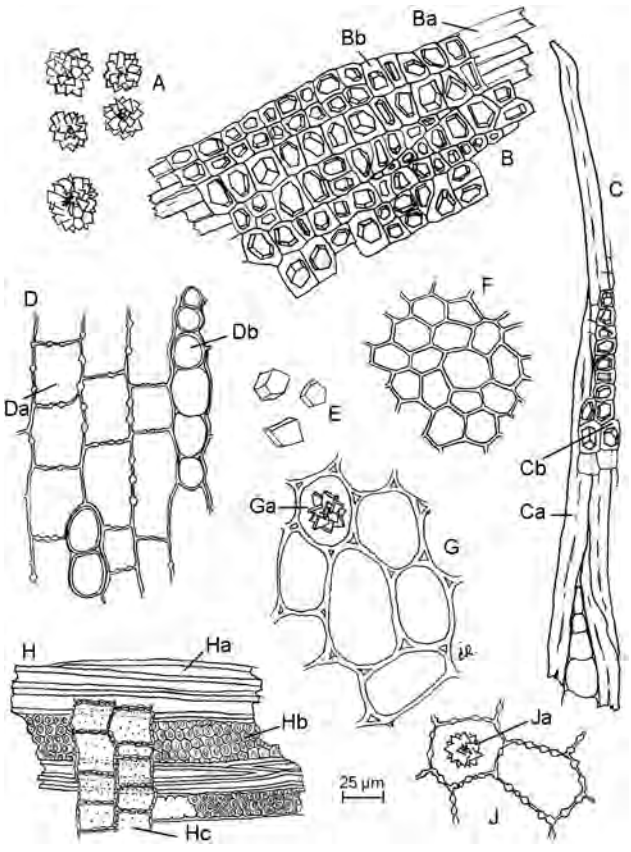

Figure 1583.-1. – *Illustration for identification test B of powdered herbal drug of willow bark*

B. Microscopic examination (*2.8.23*). The powder is pale yellow, greenish-yellow or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1583.-1): bundles [B, C] of narrow fibres [Ba, Ca], up to about 600 µm long, with very thick walls and surrounded by a crystal sheath containing prisms of calcium oxalate [Bb, Cb]; parenchymatous cells of the cortex [D, J], with thick, pitted and deeply beaded walls [Da], and containing large cluster crystals of calcium oxalate [Ga, Ja]; some parenchyma cells are collenchymatous [G]; uniseriate medullary rays (tangential section [Db]); thickened cork cells (surface view [F]); numerous scattered prism crystals [E] and cluster crystals [A] of calcium oxalate; fragments of brownish collenchyma from the buds may also be present. Twigs show, additionally, wood fragments [H] composed of lignified fibres [Ha] and vessels [Hb], sometimes accompanied by medullary rays [Hc].

C. Thin-layer chromatography (*2.2.27*).

*Test solution (a).* To 1.0 g of the powdered herbal drug (355) (*2.9.12*) add 10 mL of *methanol R*. Heat on a water-bath at about 50 °C, with frequent shaking, for 10 min. Cool and filter.

*Test solution (b).* To 5.0 mL of test solution (a) add 1.0 mL of a 50 g/L solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

*Reference solution.* Dissolve 2 mg of *salicin R* and 2 mg of *chlorogenic acid R* in 1.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *water R*, *methanol R*, *ethyl acetate R* (8:15:77 *V/V/V*).

*Application*: 10 µL [or 2 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in a current of warm air.

*Detection*: treat with a mixture of 5 volumes of *sulfuric acid R* and 95 volumes of *methanol R*. Heat at 100-105 °C for 5 min and examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Furthermore, other zones may be present in the chromatograms obtained with test solutions (a) and (b).

| Top of the plate | | |
|---|---|---|
| Salicin: a reddish-violet zone | Several reddish-violet zones may be present<br>A weak reddish-violet zone (salicin) | A reddish-violet zone (salicin) |
| Chlorogenic acid: a brown zone | | |
| **Reference solution** | **Test solution (a)** | **Test solution (b)** |

TESTS

**Foreign matter** (*2.8.2*): maximum 3 per cent of twigs with a diameter greater than 10 mm and maximum 2 per cent of other foreign matter.

**Cadmium** (*2.4.27*): maximum 2.0 ppm.

**Loss on drying** (*2.2.32*): maximum 11 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 1.000 g of the powdered herbal drug (355) (*2.9.12*) add 40 mL of *methanol R* and 40.0 mL of a 4.2 g/L solution of *sodium hydroxide R*. Heat in a water-bath at about 60 °C under a reflux condenser, with frequent shaking, for about 1 h. After cooling, add 4.0 mL of a 103.0 g/L solution of *hydrochloric acid R*. Filter the suspension into a 100 mL

volumetric flask, wash and dilute to 100.0 mL with a mixture of equal volumes of *methanol R* and *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 5.0 mg of *picein R* in 25.0 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* (solution A). Dissolve 15.0 mg of *salicin CRS* in 25 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*; add 5.0 mL of solution A and dilute to 50.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

- *mobile phase A*: *tetrahydrofuran R*, 0.5 per cent *V/V* solution of *phosphoric acid R* (1.8:98.2 *V/V*);
- *mobile phase B*: *tetrahydrofuran R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 100 | 0 |
| 15 - 17 | 100 → 90 | 0 → 10 |
| 17 - 23 | 90 | 10 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 10 µL.

*Retention time*: salicin = about 6.4 min; picein = about 7.7 min.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to salicin and picein.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to salicin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to salicin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *salicin CRS* used to prepare the reference solution, in grams;

$p$ = percentage content of salicin in *salicin CRS*.

**04/2008:2312**

# WILLOW BARK DRY EXTRACT

## Salicis corticis extractum siccum

DEFINITION

Dry extract produced from *Willow bark (1583)*.

*Content*: minimum 5.0 per cent of total salicylic derivatives, expressed as salicin ($C_{13}H_{18}O_7$; $M_r$ 286.3) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either water or a hydroalcoholic solvent equivalent in strength to a maximum of 80 per cent *V/V* ethanol.

CHARACTERS

*Appearance*: yellowish-brown amorphous powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution (a).* To 0.200 g of the extract to be examined add 5 mL of *methanol R*. Sonicate for 5 min, filter and dilute to 10 mL with *methanol R*.

*Test solution (b).* To 5.0 mL of test solution (a) add 1.0 mL of a 50 g/L solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

*Reference solution.* Dissolve 2.0 mg of *salicin R* and 2.0 mg of *chlorogenic acid R* in 1.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *water R*, *methanol R*, *ethyl acetate R* (8:15:77 *V/V/V*).

*Application*: 10 µL [or 2 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in a current of warm air.

*Detection*: spray with a mixture of 5 volumes of *sulfuric acid R* and 95 volumes of *methanol R*. Heat at 100-105 °C for 5 min and examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Furthermore, other zones may be present in the chromatogram obtained with test solutions (a) and (b).

| Top of the plate | | |
|---|---|---|
| | Several reddish-violet zones may be present | |
| Salicin: a reddish-violet zone | A weak reddish-violet zone (salicin) | A reddish-violet zone (salicin) |
| Chlorogenic acid: a brown zone | | |
| **Reference solution** | **Test solution (a)** | **Test solution (b)** |

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 0.300 g of the extract to be examined add 40 mL of *methanol R* and 40.0 mL of *0.1 M sodium hydroxide*. Heat in a water-bath at about 60 °C under a reflux condenser, with frequent shaking, for about 1 h. After cooling, add 4.0 mL of *1 M hydrochloric acid*. Filter the suspension into a 100 mL volumetric flask, then wash and dilute to 100.0 mL with a mixture of equal volumes of *water R* and *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 5.0 mg of *picein R* in 25.0 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* (solution A). Dissolve 15.0 mg of *salicin CRS* in 25 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Add 5.0 mL of solution A and dilute to 50.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Herbal drugs

*Mobile phase*:
- *mobile phase A*: *tetrahydrofuran R*, 0.5 per cent *V/V* solution of *phosphoric acid R* (1.8:98.2 *V/V*);
- *mobile phase B*: *tetrahydrofuran R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |

| 17 - 23 | 90 | 10 |
| 23 - 25 | 90 → 100 | 10 → 0 |
| 25 - 40 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 10 µL.

*Retention time*: salicin = about 6.4 min; picein = about 7.7 min.

*System suitability*: reference solution:
- *resolution*: minimum 1.5 between the peaks due to salicin and picein.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, from the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to salicin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to salicin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *salicin CRS* used to prepare the reference solution, in grams;

$p$ = percentage content of salicin in *salicin CRS*.

**04/2011:1380**

# WORMWOOD

## Absinthii herba

DEFINITION

Basal leaves or slightly leafy, flowering tops, or mixture of these dried, whole or cut organs of *Artemisia absinthium* L.

*Content*: minimum 2 mL/kg of essential oil (dried drug).

IDENTIFICATION

A. The leaves are greyish or greenish, densely tomentose on both surfaces. The basal leaves, with long petioles, have triangular or oval bipinnatisect or tripinnatisect lamina, with rounded or lanceolate segments. The cauline leaves are less segmented and the apical leaves are lanceolate. The stem of the flower-bearing region is greenish-grey, tomentose, up to 2.5 mm in diameter and usually with 5 flattened longitudinal grooves. The capitula are arranged as loose, axillary panicles, inserted at the level of the lanceolate or slightly pinnatisect leaves; they are spherical or flattened hemispherical, 2-4 mm in diameter and consist of a grey, tomentose involucre, the outer bracts linear, inner layer ovate, blunt at the apices with scarious margins, a receptacle with very long paleae up to 1 mm or more long, numerous yellow, tubular, hermaphroditic florets about 2 mm long and few yellow, ray florets.

B. Microscopic examination (*2.8.23*). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1380.-1.): many T-shaped trichomes [A] with a short uniseriate stalk consisting of 1-5 small cells, perpendicularly capped by a very long, undulating terminal cell tapering at the ends; fragments of epidermises (surface view [D]) with sinuous or wavy walls, anomocytic stomata (*2.8.3*) [Da], covering trichomes [Db] and glandular trichomes containing oil [Dc] or not containing oil [Dd], each with a short, biseriate, 2-celled stalk and a biseriate head with 2-4 cells; free glandular trichomes (side view [C]); fragments of the corollas of the tubular and ray florets, some containing small cluster crystals of calcium oxalate [H]; numerous paleae each composed of a small cell forming a stalk and a very long, cylindrical and thin-walled terminal cell about 1-1.5 mm long, either whole [E] or limited to the distal part [B]; spheroidal pollen grains, about 30 µm in diameter, with 3 pores and a finely warty exine [G]; fragments of vascular tissue from the leaves [F] or the stems [J] consisting of vessels with spiral or annular thickenings [Fa], or with bordered pits [Ja], fibres [Fb, Jb] and parenchymatous cells with pitted, moderately thickened walls [Fc, Jc].

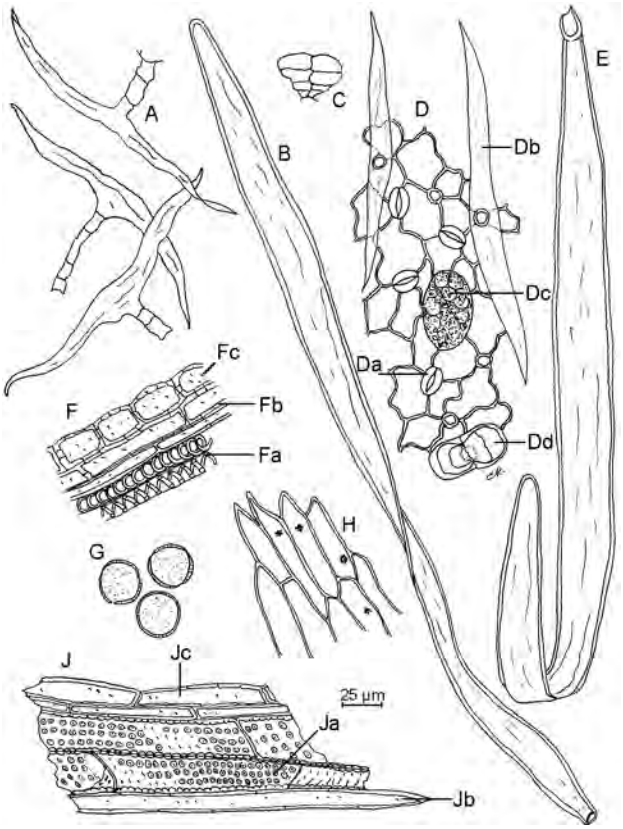

Figure 1380.-1. – *Illustration for identification test B of powdered herbal drug of wormwood*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Place 2 g of the powdered herbal drug (355) (*2.9.12*) in 50 mL of boiling *water R* and allow to stand for 5 min, shaking the flask several times. After cooling, add 5 mL of a 100 g/L solution of *lead acetate R*. Mix and filter. Rinse the flask and the residue on the filter with 20 mL of *water R*. Shake the filter with 50 mL of *methylene chloride R*. Separate the organic layer, dry over *anhydrous sodium sulfate R*, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *ethanol (96 per cent) R*.

*Reference solution*. Dissolve 2 mg of *methyl red R* and 2 mg of *resorcinol R* in 10.0 mL of *methanol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *acetone R*, *glacial acetic acid R*, *toluene R*, *methylene chloride R* (10:10:30:50 *V/V/V/V*).

*Application*: 10 µL as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection A*: spray with *acetic anhydride - sulfuric acid solution R* and examine in daylight.

*Results A*: the chromatogram obtained with the test solution shows a blue zone due to artabsin shortly above a red zone due to methyl red in the chromatogram obtained with the reference solution.

*Detection B*: examine in daylight while heating at 100-105 °C for 5 min.

*Results B*: the chromatogram obtained with the reference solution shows in the middle third a red zone due to methyl red and below it a light pink zone due to resorcinol. The chromatogram obtained with the test solution shows an intense red or brownish-red zone due to absinthin with a similar $R_F$ value to that of the zone due to resorcinol in the chromatogram obtained with the reference solution. Other zones are visible, but less intense than that due to absinthin.

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of stems with a diameter greater than 4 mm and maximum 2 per cent of other foreign matter.

**Bitterness value** (*2.8.15*): minimum 10 000.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.0 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 50.0 g of the cut drug, a 1000 mL round-bottomed flask and 500 mL of *water R* as the distillation liquid. Add 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for not less than 3 h.

**07/2014:1382**

# YARROW

## Millefolii herba

DEFINITION

Whole or cut, dried flowering tops of *Achillea millefolium* L.

*Content*:

– *essential oil*: minimum 2 mL/kg (dried drug);
– *proazulenes, expressed as chamazulene* ($C_{14}H_{16}$; $M_r$ 184.3): minimum 0.02 per cent (dried drug).

IDENTIFICATION

A. The leaves are green or greyish-green, faintly pubescent on the upper surface and more pubescent on the lower surface, 2-3 pinnately divided with linear lobes and a finely pointed whitish tip. The capitula are arranged in a corymb at the end of the stem. Each capitulum, 3-5 mm in diameter, consists of the receptacle, usually 4-5 ligulate ray-florets and 3-20 tubular disk-florets. The involucre consists of 3 rows of imbricate lanceolate, pubescent green bracts arranged with a brownish or whitish, membranous margin. The receptacle is slightly convex and, in the axillae of paleae, bears ligulate ray-florets with a three-lobed, whitish or reddish ligule and tubular disk-florets with a radial, five-lobed, yellowish or light brownish corolla. The pubescent green, partly brown or violet stems are longitudinally furrowed, up to 3 mm thick with a light-coloured medulla.

B. Microscopic examination (*2.8.23*). The powder is green or greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1382.-1): fragments of the stem epidermis (surface view [K]), with cells having a smooth cuticle and anomocytic stomata (*2.8.3*); fragments of leaf and bract epidermises (surface view [B]), with cells having wavy and irregularly thickened walls, a finely striated cuticle and anomocytic stomata (*2.8.3*); very rare glandular trichomes with a short stalk and a head formed of 2 rows of 3-5 cells enclosed in a bladder-like membrane [H]; uniseriate, whole or fragmented covering trichomes [A] consisting of 4-6 small, more or less isodiametric cells at the base and a thick-walled, often somewhat tortuous terminal cell, about 400 µm to greater than 1000 µm long; fragments of the ligulate corolla with papillary epidermal cells [D]; fragments of the corolla tubes, with sinuous epidermal cells, covered by a thin striated cuticle (surface view [F]); small-celled parenchyma from the corolla tubes containing cluster crystals of calcium oxalate [E]; groups of lignified and pitted cells from the bracts [G]; spherical pollen grains, about 30 µm in diameter, with 3 germinal pores and a spiny exine [C]; groups of sclerenchymatous fibres and small vessels with spiral or annular thickening, from the stem [J].

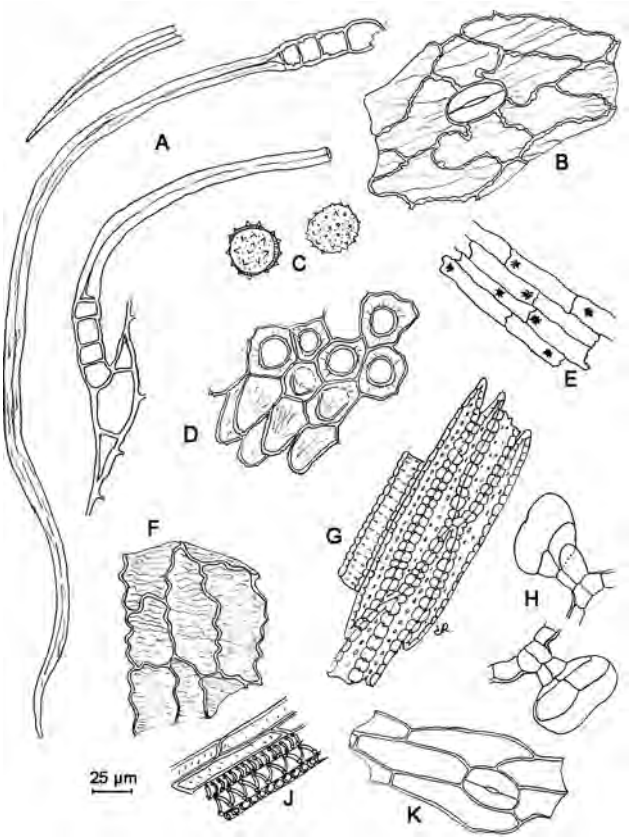

Figure 1382.-1. – *Illustration for identification test B of powdered herbal drug of yarrow*

C. To 2.0 g of the powdered herbal drug (710) (*2.9.12*) add 25 mL of *ethyl acetate R*, shake for 5 min and filter. Evaporate to dryness on a water-bath and dissolve the residue in 0.5 mL of *toluene R* (solution A). To 0.1 mL of this solution add 2.5 mL of *dimethylaminobenzaldehyde solution R8* and heat on a water-bath for 2 min. Allow to cool. Add 5 mL of *light petroleum R* and shake the mixture vigorously. The aqueous layer shows a blue or greenish-blue colour.

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Use solution A prepared in identification test C.

*Reference solution.* Dissolve 10 mg of *cineole R* and 10 mg of *guaiazulene R* in 20 mL of *toluene R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

*Application*: 20 µL as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.

*Results*: the chromatogram obtained with the reference solution shows in the upper part a red zone (guaiazulene) and in the middle part a blue or greyish-blue zone (cineole). The chromatogram obtained with the test solution shows a violet zone a little above the zone due to guaiazulene in the chromatogram obtained with the reference solution; below this zone a reddish-violet zone; below which, 1-2 not clearly separated greyish-violet or greyish zones (which changes to greenish-grey after a few hours) and a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution. Furthermore, other faint zones may be present.

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 0.500 g of the powdered herbal drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 2.5 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 20.0 g of cut herbal drug, a 1000 mL round-bottomed flask and 500 mL of a mixture of 1 volume of *water R* and 9 volumes of *ethylene glycol R* as the distillation liquid. Add 0.50 mL of *1,2,4-trimethylbenzene R* in the graduated tube. Distil at a rate of 3-4 mL/min for 4 h.

Stop cooling at the end of distillation and continue distilling until the blue, steam-volatile components have reached the lower end of the cooler. Immediately start cooling again, to avoid warming the separation space. Stop the distillation after 10 min.

**Proazulenes**. To ensure that as little water as possible is transferred, transfer the blue mixture of essential oil and 1,2,4-trimethylbenzene obtained in the assay of essential oil into a 50 mL volumetric flask with the aid of small portions of *xylene R*, rinsing the graduated tube of the apparatus with *xylene R*, and dilute to 50.0 mL with the same solvent. Measure the absorbance (*2.2.25*) at 608 nm using *xylene R* as the compensation liquid.

Calculate the percentage content of proazulenes, expressed as chamazulene, using the following expression:

$$\frac{A \times 2.1}{m}$$

i.e. taking the specific absorbance of chamazulene to be 23.8.

$A$ = absorbance at 608 nm;

$m$ = mass of the herbal drug to be examined, in grams.

**01/2017:2656**

# ZANTHOXYLUM BUNGEANUM PERICARP

## Zanthoxyli bungeani pericarpium

DEFINITION

Dried pericarp of the ripe fruit, with seeds removed, of *Zanthoxylum bungeanum* Maxim.

*Content*: minimum 15 mL/kg of essential oil (anhydrous drug).

IDENTIFICATION

A. Single, dehiscent spherical capsules, split along the ventral suture, 4-5 mm in diameter; the outer surface is dark red or brownish-red, with numerous convex, translucent verrucose oil dots; the inner surface is light yellow and smooth; the endocarp is mostly separated from the mesocarp at the base and is rolled up.

B. Microscopic examination (*2.8.23*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epicarp, covered by a striated cuticle, consisting of polygonal cells, with rigid walls and anomocytic stomata (*2.8.3*) with 5-7 subsidiary cells, some cells of the epicarp contain orange-yellow granular contents; fragments of the mesocarp consisting of parenchymatous cells some of which contain cluster crystals of calcium oxalate, elongated cells of the oil glands containing droplets of essential oil, vascular bundles with spiral vessels accompanied by fibres with regularly thickened, pitted walls and pointed ends, sometimes bifurcated, prisms of calcium oxalate, especially in the area of the vascular bundles; fragments of the endocarp consisting of several layers of narrow, elongated, thick-walled, pitted cells in a parquetry arrangement, with the arrangements in the different layers oriented crosswise to each other.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 0.5 g of the powdered herbal drug (355) (*2.9.12*) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge or filter. Use the supernatant or filtrate.

*Reference solution.* Dissolve 1 mg of *chlorogenic acid R* and 1 mg of *emodin R* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *water R*, *methanol R*, *ethyl acetate R* (10:20:80 *V/V/V*).

*Application*: 5 µL as bands of 8 mm.

*Development*: over a path of 6 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 366 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Emodin: a yellow fluorescent zone | A red fluorescent zone<br>A green fluorescent zone |
| _____ | _____ |
| | A red fluorescent zone may be present<br>A faint green fluorescent zone |
| | 2 green fluorescent zones |
| | A green fluorescent zone |
| _____ | _____ |
| | A green fluorescent zone |
| Chlorogenic acid: a blue fluorescent zone | A blue fluorescent zone |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent of seeds and maximum 2 per cent of other foreign matter.

**Water** (*2.2.13*): maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (710) (*2.9.12*).

**Total ash** (*2.4.16*): maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid** (*2.8.1*): maximum 1.5 per cent.

ASSAY

**Essential oil** (*2.8.12*). Use 15.0 g of freshly powdered herbal drug (710) (*2.9.12*), a 500 mL round-bottomed flask, 250 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

# HOMOEOPATHIC PREPARATIONS: INTRODUCTION

*All general texts and other monographs of the European Pharmacopoeia that are relevant to homoeopathy are applicable.*

*The 'Homoeopathy' chapter of the European Pharmacopoeia contains general monographs and individual monographs describing starting materials and preparations used virtually exclusively for homoeopathic medicines. Reference to these monographs for other purposes may be authorised by licensing authorities.*

**04/2017:1038**

# HOMOEOPATHIC PREPARATIONS

## Praeparationes homoeopathicae

DEFINITION

Homoeopathic preparations are prepared from substances, products or preparations called stocks, in accordance with a homoeopathic manufacturing procedure. A homoeopathic preparation is usually designated by the Latin name of the stock, followed by an indication of the degree of dilution and/or potentisation, if applicable.

**Raw materials**

Raw materials for the production of homoeopathic preparations may be of natural or synthetic origin.

For raw materials of zoological or human origin, adequate measures are taken to minimise the risk of agents of infection, including viruses (*5.1.7*), in the homoeopathic preparations. For this purpose, it is demonstrated that:

- the method of production includes a step or steps that have been shown to remove or inactivate agents of infection;
- where applicable, raw materials of zoological origin comply with the monograph *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)*;
- where applicable, the animals and the tissues used to obtain the raw materials comply with the health requirements of the competent authorities for animals for human consumption;
- for materials of human origin, the donor follows the recommendations applicable to human blood donors and to donated blood (see *Human plasma for fractionation (0853)*), unless otherwise justified and authorised.

A raw material of botanical, zoological or human origin may be used either in the fresh state or in the dried state. Where appropriate, fresh material may be kept deep-frozen. Raw materials of botanical origin comply with the requirements of the monograph *Herbal drugs for homoeopathic preparations (2045)*.

Where justified and authorised for transportation or storage purposes, fresh plant material may be kept in ethanol (96 per cent) or in ethanol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Raw materials comply with any requirements of the relevant monographs of the European Pharmacopoeia.

**Vehicles**

Vehicles are excipients used for the preparation of certain stocks or for the potentisation process. They may include, for example: purified water, ethanol of a suitable concentration, glycerol and lactose.

Vehicles comply with any requirements of the relevant monographs of the European Pharmacopoeia.

**Stocks**

Stocks are substances, products or preparations used as starting materials for the production of homoeopathic preparations. A stock is usually one of the following: a mother tincture or a glycerol macerate, for raw materials of botanical, zoological or human origin, or the substance itself, for raw materials of chemical or mineral origin.

Mother tinctures comply with the requirements of the monograph *Mother tinctures for homoeopathic preparations (2029)*.

Glycerol macerates are liquid preparations obtained from raw materials of botanical, zoological or human origin by using glycerol or a mixture of glycerol and either ethanol of a suitable concentration or a solution of sodium chloride of a suitable concentration.

**Potentisation**

Dilutions and triturations are obtained from stocks by a process of potentisation in accordance with a homoeopathic manufacturing procedure: this means successive dilutions and succussions, or successive appropriate triturations, or a combination of the 2 processes.

The potentisation steps are usually one of the following:

- 1 part of the stock plus 9 parts of the vehicle; they may be designated as 'D', 'DH' or 'X' (decimal);
- 1 part of the stock plus 99 parts of the vehicle; they may be designated as 'C' or 'CH' (centesimal).

The number of potentisation steps defines the degree of dilution; for example, 'D3', '3 DH' or '3X' means 3 decimal potentisation steps, and 'C3', '3 CH' or '3C' means 3 centesimal potentisation steps.

'LM' potencies are manufactured according to a specific procedure with a 50 000 dilution factor by alternate steps of liquid dilution and impregnation of pillules. The number of potentisation steps defines the degree of dilution, for example, 3rd LM means 3 successive LM dilutions.

**Dosage forms**

A dosage form of a homoeopathic preparation complies with any relevant dosage form monograph in the European Pharmacopoeia, and with the following:

- for the purpose of dosage forms for homoeopathic use, 'active substances' are considered to be 'dilutions or triturations of homoeopathic stocks' or 'homoeopathic stocks' (in case of a mother tincture or a glycerol macerate);
- these dosage forms can contain one or more 'active substances';
- they are prepared using appropriate excipients.

*Homoeopathic dosage form 'pillule'*

Pillules for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients. *Pillules for homoeopathic preparations (2153)* are intended for impregnation or coating with one or more homoeopathic preparations. The impregnated pillules comply with the requirements of the monograph *Homoeopathic pillules, impregnated (2079)*. The coated pillules comply with the requirements of the monograph *Homoeopathic pillules, coated (2786)*. Both are intended for sublingual or oral use.

*Homoeopathic dosage form 'tablet'*

Tablets for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients according to the monograph *Tablets (0478)*. They may be prepared either by compressing one or more 'active substances' with

the excipients or by impregnating preformed tablets with one or more liquid 'active substances'. The preformed tablets for impregnation are obtained from sucrose, lactose or other suitable excipients according to the monograph *Tablets (0478)*. Tablets for homoeopathic use are intended for sublingual or oral use.

*Homoeopathic dosage forms 'parenteral preparation', 'eye preparation', 'nasal preparation'*

For the last potentisation step(s), an ethanol-free vehicle is used to minimise the content of ethanol in the final preparation.

The residual ethanol content (*2.9.10*) is not greater than 1 per cent *V/V* unless otherwise justified and authorised.

*Manufacturing methods*

Homoeopathic preparations are produced using the methods described in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*. The preparations obtained using the manufacturing methods listed in Table 1038.-1 are restricted to the production of the corresponding dosage forms indicated in the right-hand column of table.

The competent authority has the right to accept or reject particular combinations of manufacturing method and substance.

Table 1038.-1.

# HERBAL DRUGS FOR HOMOEOPATHIC PREPARATIONS

## Plantae medicinales ad praeparationes homoeopathicas

DEFINITION

Herbal drugs for homoeopathic preparations are mainly whole plants or parts of plants, fragmented or broken, and include algae, fungi or lichens, in an unprocessed state, usually in fresh form. The state, fresh or dried, in which the drug is used, is defined in the individual monograph of the European Pharmacopoeia or, in its absence, in the individual monograph of an official national pharmacopoeia of a member state. In the absence of such a monograph, the state in which the herbal drug is used has to be defined. Certain exudates that have not been subjected to a specific treatment are also considered to be herbal drugs for homoeopathic preparations. Herbal drugs for homoeopathic preparations are precisely defined by the botanical scientific name of the source species according to the binomial system (genus, species, variety and author).

*Whole* describes a herbal drug for homoeopathic preparations that has not been reduced in size and is presented, dried or undried, as harvested.

*Fragmented* describes a herbal drug for homoeopathic preparations that has been reduced in size after harvesting to permit ease of handling, drying and/or packaging.

*Broken* describes a herbal drug for homoeopathic preparations in which the more fragile parts of the plant have broken during drying, packaging or transportation.

For dried herbal drugs for homoeopathic preparations, *cut* describes size reduction, other than powdering, that reduces the particle size below that which is described in the macroscopic identity of the herbal drug for homoeopathic preparations.

PRODUCTION

Herbal drugs for homoeopathic preparations are obtained from cultivated or wild plants. Suitable collection, cultivation, harvesting, sorting, drying, fragmentation and storage conditions are essential to guarantee the quality of herbal drugs for homoeopathic preparations.

Herbal drugs for homoeopathic preparations are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminants. They do not present signs of decay.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the plant are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs for homoeopathic preparations.

Fresh herbal drugs are processed as rapidly as possible after harvesting. Where justified and authorised for transportation or storage purposes, fresh plant material may be deep-frozen; it may also be kept in ethanol (96 per cent) or in ethanol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Adequate measures have to be taken in order to ensure that the microbiological quality of homoeopathic preparations containing 1 or more herbal drugs comply with the recommendations given in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use*.

IDENTIFICATION

Herbal drugs for homoeopathic preparations are identified using their macroscopic and, where necessary, microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

TESTS

The tests for foreign matter and loss on drying should be performed before any further processing of the fresh plant.

**Foreign matter** (*2.8.2*). Where a fresh plant is used as a starting material for the manufacture of homoeopathic preparations, the content of foreign matter is as low as possible; if necessary, the maximum content of foreign matter is indicated in the individual monograph.

Where a dried plant is used as a starting material for the manufacture of homoeopathic preparations, carry out a test for foreign matter, unless otherwise prescribed in the individual monograph. The content of foreign matter is not more than 2 per cent *m/m*, unless otherwise prescribed or justified and authorised.

**Adulteration**. A specific appropriate test may apply to herbal drugs for homoeopathic preparations liable to be falsified.

**Loss on drying** (*2.2.32*). Carry out a test for loss on drying on dried herbal drugs for homoeopathic preparations.

If a fresh plant is processed more than 24 h after harvesting, a test for loss on drying should be carried out. The minimum limit is indicated in the individual monograph.

**Water** (*2.2.13*). A determination of water is carried out on herbal drugs for homoeopathic preparations with a high essential oil content.

**Pesticides** (*2.8.13*). Herbal drugs for homoeopathic preparations comply with the requirements for pesticide residues. The requirements take into account the origin and the nature of the plant, where necessary the preparation in which the plant might be used and, where available, knowledge of the complete record of treatment of the batch of the plant. Where justified, the test for pesticides may be performed on the mother tincture according to the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

*If appropriate, herbal drugs for homoeopathic preparations comply with other tests, such as the following, for example.*

**Total ash** (*2.4.16*).

**Bitterness value** (*2.8.15*).

**Heavy metals** (*2.4.27*). Unless otherwise stated in an individual monograph or unless otherwise justified and authorised:

- *cadmium*: maximum 1.0 ppm;
- *lead*: maximum 5.0 ppm;
- *mercury*: maximum 0.1 ppm.

If justified by the nature or origin of the herbal drug or if required by the competent authority, suitable limits for the content of other heavy metals such as arsenic or nickel are defined.

Where justified, the test for heavy metals may be performed on the mother tincture according to the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

**Aflatoxin $B_1$** (*2.8.18*). Where appropriate, limits for aflatoxins may be required.

**Ochratoxin A** (*2.8.22*). Where appropriate, a limit for ochratoxin A may be required.

**Radioactive contamination**. In some specific circumstances, the risk of radioactive contamination is to be considered.

ASSAY

Where applicable, herbal drugs for homoeopathic preparations are assayed by an appropriate method.

STORAGE

Store dried herbal drugs protected from light.

**01/2017:2029**

# MOTHER TINCTURES FOR HOMOEOPATHIC PREPARATIONS

## Tincturae maternae ad praeparationes homoeopathicas

DEFINITION

Mother tinctures for homoeopathic preparations are liquid preparations obtained by the solvent action of a suitable vehicle upon raw materials. The raw materials are usually in the fresh form but may be dried. Mother tinctures for homoeopathic preparations may also be obtained from plant juices, with or without the addition of a vehicle. For some preparations, the matter to be extracted may undergo a preliminary treatment.

PRODUCTION

Mother tinctures for homoeopathic preparations are prepared by maceration, percolation, digestion, infusion, decoction, fermentation or as described in the individual monographs, usually using ethanol of suitable concentration.

Mother tinctures for homoeopathic preparations are obtained using a fixed proportion of raw material to solvent, taking the moisture content of the raw material into account, unless otherwise justified and authorised.

If fresh plants are used, suitable procedures are used to ensure freshness. The competent authorities may require that the freshness is demonstrated by means of a suitable test.

Where the mother tincture contains ethanol, it is tested for 2-propanol (*2.9.11*), with a maximum limit of 0.05 per cent *V/V*, unless assurance of compliance with this limit is provided by a detailed knowledge of the ethanol supply chain and the mother tincture manufacturing process.

Mother tinctures for homoeopathic preparations are usually clear. A slight sediment may form on standing and that is acceptable as long as the composition of the tincture is not changed significantly.

The manufacturing process is defined so that it is reproducible.

**Production by maceration**. Unless otherwise prescribed, reduce the matter to be extracted to pieces of suitable size, mix thoroughly and extract according to the prescribed extraction method with the prescribed extraction solvent. Allow to stand in a closed vessel for the prescribed time. The residue is separated from the extraction solvent and, if necessary, pressed out. In the latter case, the 2 liquids obtained are combined.

**Adjustment of the contents**. Adjustment of the content of constituents may be carried out if necessary, either by adding the extraction solvent of suitable concentration, or by adding another mother tincture for homoeopathic preparations of the vegetable or animal matter used for the preparation.

CHARACTERS

Where appropriate, the appearance and odour of the mother tincture are determined.

IDENTIFICATION

Where applicable, at least 1 chromatographic identification test is carried out.

TESTS

The limits in an individual monograph are set to include official methods of production. Specific limits will apply to each defined method of production.

*If the test for relative density is carried out, the test for ethanol need not be carried out, and vice versa.*

**Relative density** (*2.2.5*). The mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

**Ethanol** (*2.9.10*). The ethanol content complies with that prescribed in the monograph.

**Methanol** (*2.9.11*): maximum 0.05 per cent *V/V*, unless otherwise prescribed or justified and authorised.

**Dry residue** (*2.8.16*). Where applicable, the mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

**Pesticides** (*2.8.13*). Where applicable, the mother tincture for homoeopathic preparations complies with the test. This requirement is met if the herbal drug has been shown to comply with the test.

Justification is provided in cases where the test for pesticides is performed on the mother tincture, instead of on the herbal drug according to the requirements of the general monograph *Herbal drugs for homoeopathic preparations (2045)*. Limits are set, taking into consideration the nature and the origin of the herbal drug. The dilution factor of the mother tincture and the limit of quantification of the method are also taken into account when setting these limits.

**Heavy metals** (*2.4.27*). Justification is provided in cases where the test for heavy metals is performed on the mother tincture, instead of on the herbal drug according to the requirements of the general monograph *Herbal drugs for homoeopathic preparations (2045)*. Limits are set, taking into consideration the nature and the origin of the herbal drug. The dilution factor of the mother tincture and the limit of quantification of the method are also taken into account when setting these limits.

If required by the competent authority, suitable limits for the content of other heavy metals such as arsenic or nickel may be defined.

**Aflatoxin $B_1$** (*2.8.18*). Where appropriate, limits for aflatoxins may be required. Justification is provided in cases where the test for aflatoxin $B_1$ is performed on the mother tincture, instead of on the herbal drug. Limits are set, taking into consideration the nature and the origin of the herbal drug. The dilution factor of the mother tincture and the limit of quantification of the method are also taken into account when setting these limits.

ASSAY

Where applicable, an assay with quantitative limits is performed.

STORAGE

Protected from light. A maximum storage temperature may be specified.

LABELLING

The label states:

- that the product is a mother tincture for homoeopathic preparations (designated as 'TM' or 'Ø');
- the name of the raw material using the Latin title of the European Pharmacopoeia monograph where one exists;
- the method of preparation;
- the ethanol content or other solvent content, in per cent *V/V*, in the mother tincture;
- the ratio of raw material to mother tincture;
- where applicable, the storage conditions.

**01/2017:2371**
**corrected 9.2**

# METHODS OF PREPARATION OF HOMOEOPATHIC STOCKS AND POTENTISATION

## Via praeparandi stirpes homoeopathicas et potentificandi

Homoeopathic stocks are prepared, using suitable methods, from raw materials that comply with the requirements of the monograph *Homoeopathic preparations (1038)*. The methods described below, combined with established methods for potentisation, are examples of methods, but other methods described in an official national pharmacopoeia of a Member State may equally be used.

Where material of animal or human origin is to be used, particular reference is made to the requirements concerning the use of such raw material of zoological or human origin in the monograph *Homoeopathic preparations (1038)*.

In the preparation of liquid dilutions, the ethanol of the concentration prescribed in the method may, if necessary, be replaced by ethanol (36 per cent *V/V*) or ethanol (18 per cent *V/V*).

When the individual monograph allows that the mother tincture be prepared from more than one plant species, the mother tincture can be prepared from the specified parts of an individual plant species or from any mixture thereof. If for the preparation of a mother tincture the loss on drying has to be determined, the herbal drug or mixture of herbal drug with ethanol has to be processed immediately after the value of the loss on drying has been determined.

Unless otherwise stated, mother tinctures are prepared by maceration lasting 10-30 days.

Maceration may be replaced by long maceration (maximum 60 days) or very long maceration (maximum 180 days), provided it is demonstrated that the quality of the resulting mother tincture is the same as that of the mother tincture prepared by maceration.

Unless otherwise stated in the individual monograph, the term 'part(s)' denotes 'mass part(s)'. Unless otherwise stated in the method, the maximum temperature for the preparation is 25 °C.

### 1. MOTHER TINCTURES AND LIQUID POTENTISATIONS

#### *METHOD 1.1. HYDROALCOHOLIC MOTHER TINCTURES PREPARED WITHOUT HEATING*

**METHOD 1.1.1 (HOMÖOPATHISCHES ARZNEIBUCH (HAB) 1a: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.1 is used for fresh herbal drugs containing generally more than 70 per cent of expressed juice and no essential oil or resin or mucilage. Mother tinctures prepared according to Method 1.1.1 are mixtures of equal parts of expressed juices and ethanol (90 per cent *V/V*).

Express the comminuted herbal drug. Immediately mix the expressed juice with an equal mass of ethanol (90 per cent *V/V*). Allow to stand in a closed container for not less than 5 days, then filter.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (50 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (50 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

2 parts of the mother tincture;

8 parts of ethanol (50 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (50 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

The 1st 'centesimal' dilution (C1) is made from:

2 parts of the mother tincture;

98 parts of ethanol (50 per cent *V/V*).

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st 'centesimal' dilution;

99 parts of ethanol (50 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

#### METHOD 1.1.2 (HAB 1b: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.2 is used where the latex of a herbal drug is to be processed.

Mother tinctures prepared according to Method 1.1.2 are mixtures of fresh plant latex with ethanol (36 per cent *V/V*). Mix the fresh latex with 2 parts by mass of ethanol (36 per cent *V/V*) and filter.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (36 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (36 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of ethanol (36 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 1.1.3 (HAB 2a: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.3 is used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Method 1.1.3 (ethanol content approximately 50 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (90 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ($A_2$), in kilograms, of ethanol (90 per cent *V/V*) required for the mass ($m$) of raw material, then subtract the amount of ethanol (90 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (50 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (50 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

2 parts of the mother tincture;

8 parts of ethanol (50 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (50 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

The 1st 'centesimal' dilution (C1) is made from:

2 parts of the mother tincture;

98 parts of ethanol (50 per cent *V/V*).

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st 'centesimal' dilution;

99 parts of ethanol (50 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

#### METHOD 1.1.4 (HAB 2b: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.4 is used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Method 1.1.4 (ethanol content approximately 36 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (70 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ($A_2$), in kilograms, of ethanol (70 per cent *V/V*) required for the mass (*m*) of raw material, then subtract the amount of ethanol (70 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (36 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (36 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

2 parts of the mother tincture;

8 parts of ethanol (36 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

**METHOD 1.1.5 (HAB 3a: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.5 is used for fresh herbal drugs containing essential oil or resin, or generally less than 60 per cent moisture.

Mother tinctures prepared according to Method 1.1.5 (ethanol content approximately 65 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (*2.2.13*) or loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (90 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ($A_3$), in kilograms, of ethanol (90 per cent *V/V*) required for the mass (*m*) of raw material, then subtract the amount of ethanol (90 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (70 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (70 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of ethanol (70 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (70 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2. Use ethanol (50 per cent *V/V*) for dilutions from D4 onwards.

The 1st 'centesimal' dilution (C1) is made from:

3 parts of the mother tincture;

97 parts of ethanol (70 per cent *V/V*).

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st 'centesimal' dilution;

99 parts of ethanol (50 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

**METHOD 1.1.6 (HAB 3b: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.6 is used for fresh herbal drugs containing essential oils or resins or generally less than 60 per cent moisture.

Mother tinctures prepared according to Method 1.1.6 (ethanol content approximately 57 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (*2.2.13*) or loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (80 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ($A_3$), in kilograms, of ethanol (80 per cent *V/V*) required for the mass (*m*) of raw material, then subtract the amount of ethanol (80 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the

above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (50 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (50 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of ethanol (50 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (36 per cent *V/V*).

The 3rd decimal dilution (D3) is made from:

1 part of the 2nd decimal dilution;

9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D3.

#### METHOD 1.1.7 (HAB 3C: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.7 is used for fresh herbal drugs containing generally less than 60 per cent moisture (loss on drying).

Mother tinctures prepared according to Method 1.1.7 (ethanol content approximately 35 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (50 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ($A_3$), in kilograms, of ethanol (50 per cent *V/V*) required for the mass ($m$) of raw material, then subtract the amount of ethanol (50 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol (36 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (36 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of ethanol (36 per cent *V/V*).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 1.1.8 (HAB 4a: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.8 is generally used for dried herbal drugs.

Mother tinctures prepared according to Method 1.1.8 are prepared by maceration or percolation as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (anhydrous, 96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

*Production by maceration.* Unless otherwise prescribed, comminute the herbal drug, mix thoroughly with ethanol of the appropriate concentration and allow to stand in a closed container for an appropriate time. Separate the residue from the ethanol and, if necessary, press out. In the latter case, combine the 2 liquids obtained.

*Production by percolation.* If necessary, comminute the herbal drug. Mix thoroughly with a portion of ethanol of the appropriate concentration and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow slowly, at room temperature, making sure that the herbal drug to be extracted is always covered with the remaining ethanol. The residue may be pressed out and the expressed liquid combined with the percolate.

If adjustment to a given concentration is necessary, calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of percolate or macerate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the percolate or macerate.

Mix the macerate or percolate with the calculated amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of ethanol of the same concentration.

The 3rd decimal dilution (D3) is made from:

1 part of the 2nd decimal dilution;

9 parts of ethanol of the same concentration.

Unless a different ethanol concentration is specified, use ethanol (50 per cent *V/V*) for subsequent decimal dilutions from D4 onwards and proceed as stated for D3.

The 1st 'centesimal' dilution (C1) is made from:

10 parts of the mother tincture (D1);

90 parts of ethanol of the same concentration.

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st 'centesimal' dilution;

99 parts of ethanol (50 per cent *V/V*), unless a different ethanol concentration is specified.

Subsequent centesimal dilutions are produced as stated for C2.

#### METHOD 1.1.9 (HAB 4b: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.9 is generally used for animal matter.

Mother tinctures prepared according to Method 1.1.9 are prepared by maceration or percolation as described below, using 1 part of animal matter and 10 parts of ethanol of the appropriate concentration (anhydrous, 96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

*Production by maceration*. Unless otherwise prescribed, comminute the animal matter, mix thoroughly with ethanol of the appropriate concentration and allow to stand in a closed container for an appropriate time. Separate the residue from the ethanol and, if necessary, press out. In the latter case, combine the 2 liquids obtained.

*Production by percolation*. If necessary, comminute the animal matter. Mix thoroughly with a portion of ethanol of the appropriate concentration and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow slowly at room temperature, making sure that the animal matter to be extracted is always covered with the remaining ethanol. The residue may be pressed out and the expressed liquid combined with the percolate.

If adjustment to a given concentration is necessary, calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of percolate or macerate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the percolate or macerate.

Mix the macerate or percolate with the calculated amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of ethanol of the same concentration.

The 3rd decimal dilution (D3) is made from:

1 part of the 2nd decimal dilution;

9 parts of ethanol of the same concentration.

Unless a different ethanol concentration is specified, use ethanol (50 per cent *V/V*) for subsequent decimal dilutions from D4 onwards and proceed as stated for D3.

The 1st 'centesimal' dilution (C1) is made from:

10 parts of the mother tincture (D1);

90 parts of ethanol of the same concentration.

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st 'centesimal' dilution;

99 parts of ethanol (50 per cent *V/V*), unless a different ethanol concentration is specified.

Subsequent centesimal dilutions are produced as stated for C2.

#### METHOD 1.1.10 (FRENCH PHARMACOPOEIA)

Method 1.1.10 is generally used for herbal drugs. The state of the herbal drug, fresh or dried, is specified in the individual monograph.

Mother tinctures prepared according to Method 1.1.10 are prepared by maceration.

Comminute appropriately the herbal drug. Take a sample and determine the loss on drying at 105 °C for 2 h (*2.2.32*) or the water content (*2.2.13*). Taking this value into account, calculate and add to the herbal drug the quantities of ethanol of the appropriate concentration required to produce, unless otherwise prescribed, a 1 in 10 mother tincture (1:10 mother tincture) with a suitable ethanol content. Allow to macerate for at least 10 days, with sufficient shaking.

Separate the residue from the ethanol and strain under pressure if necessary. Allow the combined liquids to stand for 48 h and filter. For mother tinctures with a required assay content, adjustment may be carried out, if necessary, by adding ethanol of the same concentration as used for the preparation of the tincture.

**Potentisation**

The 1st decimal dilution (D1) is made from:

1 part of the mother tincture;

9 parts of ethanol of the appropriate concentration.

The 2nd decimal dilution (D2) is made from:

1 part of the 1st decimal dilution;

9 parts of ethanol of the appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2, using ethanol of the appropriate concentration.

The 1st centesimal dilution (C1) is made from:

1 part of the mother tincture;

99 parts of ethanol of the appropriate concentration.

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st centesimal dilution;

99 parts of ethanol of the appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2, using ethanol of the appropriate concentration.

#### METHOD 1.1.11 (FRENCH PHARMACOPOEIA)

Method 1.1.11 is generally used for animal matter.

Mother tinctures prepared according to Method 1.1.11 are prepared by maceration.

The mass ratio of raw material to mother tincture is usually 1 to 20. To the raw material, appropriately comminuted, add the quantity of ethanol of the appropriate concentration required to produce a 1 in 20 mother tincture. Allow to macerate for at least 10 days, with sufficient shaking. Decant and filter. Allow to stand for 48 h and filter again. For mother tinctures with a required assay content, adjustment may be carried out, if necessary, by adding ethanol of the same concentration as used for the preparation of the tincture.

**Potentisation**

The 1st decimal dilution (D1) is made from:

1 part of the mother tincture;

9 parts of ethanol of the appropriate concentration.

The 2nd decimal dilution (D2) is made from:

1 part of the 1st decimal dilution;

9 parts of ethanol of the appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2, using ethanol of the appropriate concentration.

The 1st centesimal dilution (C1) is made from:

1 part of the mother tincture;

99 parts of ethanol of the appropriate concentration.

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st centesimal dilution;

99 parts of ethanol of the appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2, using ethanol of the appropriate concentration.

*METHOD 1.2. HYDROALCOHOLIC MOTHER TINCTURES PREPARED WITH HEATING*

**METHODS 1.2.1, 1.2.2. ETHANOLIC DIGESTIONS (HAB 18a, 18b: HEAT-TREATED MOTHER TINCTURES)**

Methods 1.2.1 and 1.2.2 are used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Methods 1.2.1 (ethanol content approximately 50 per cent *V/V*) and 1.2.2 (ethanol content approximately 36 per cent *V/V*) are ethanolic digestions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

– Method 1.2.1: ethanol (90 per cent *V/V*);

– Method 1.2.2: ethanol (70 per cent *V/V*).

Use the following expression to calculate the amount ($A_2$), in kilograms, of ethanol of the appropriate concentration required for the mass ($m$) of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Warm the mixture containing the total amount of ethanol of the appropriate concentration to 37 °C in a covered container and maintain at this temperature for 1 h, swirling from time to time. Cool, allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

– Method 1.2.1: ethanol (50 per cent *V/V*);

– Method 1.2.2: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

2 parts of the mother tincture;

8 parts of ethanol (50 per cent *V/V*) (Method 1.2.1) or ethanol (36 per cent *V/V*) (Method 1.2.2).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (36 per cent *V/V*) (Method 1.2.1) or ethanol (18 per cent *V/V*) (Method 1.2.2).

The 3rd decimal dilution (D3) is made from:

1 part of the 2nd decimal dilution;

9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D3.

**METHODS 1.2.3, 1.2.4, 1.2.5. ETHANOLIC DIGESTIONS (HAB 18c, 18d, 18e: HEAT-TREATED MOTHER TINCTURES)**

Methods 1.2.3, 1.2.4 and 1.2.5 are used for fresh herbal drugs containing essential oil or resin or generally less than 60 per cent moisture.

Mother tinctures prepared according to Methods 1.2.3 (ethanol content approximately 65 per cent *V/V*), 1.2.4 (ethanol content approximately 57 per cent *V/V*) and 1.2.5 (ethanol content approximately 35 per cent *V/V*) are ethanolic digestions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (*2.2.13*) or loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

– Method 1.2.3: ethanol (90 per cent *V/V*);

– Method 1.2.4: ethanol (80 per cent *V/V*);

– Method 1.2.5: ethanol (50 per cent *V/V*).

Use the following expression to calculate the amount ($A_3$), in kilograms, of ethanol of the appropriate concentration required for the mass ($m$) of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Warm the mixture containing the total amount of ethanol of the appropriate concentration to 37 °C in a covered container and maintain at this temperature for 1 h, swirling from time to time. Cool, allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

- Method 1.2.3: ethanol (70 per cent *V/V*);
- Method 1.2.4: ethanol (50 per cent *V/V*);
- Method 1.2.5: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of ethanol (70 per cent *V/V*) (Method 1.2.3), ethanol (50 per cent *V/V*) (Method 1.2.4) or ethanol (36 per cent *V/V*) (Method 1.2.5).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (50 per cent *V/V*) (Method 1.2.3), ethanol (36 per cent *V/V*) (Method 1.2.4) or ethanol (18 per cent *V/V*) (Method 1.2.5).

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

#### METHOD 1.2.6. ETHANOLIC DIGESTIONS (HAB 18f: HEAT-TREATED MOTHER TINCTURES)

Method 1.2.6 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.2.6 are ethanolic digestions prepared by heat treatment and additional maceration as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

Unless otherwise prescribed, comminute appropriately the herbal drug, mix thoroughly with the total amount of ethanol of the appropriate concentration, warm the mixture to 37 °C in a covered container and maintain at this temperature for 1 h, swirling from time to time. Cool, then allow to stand in a closed container for an appropriate time. After sedimentation, decant the supernatant and, if necessary, press out. In the latter case, combine the 2 liquids obtained. Filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of the filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of ethanol of the same concentration.

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 96 per cent *V/V* - 90 per cent *V/V* - 80 per cent *V/V* - 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

#### METHODS 1.2.7, 1.2.8. ETHANOLIC DECOCTIONS (HAB 19a, 19b: HEAT-TREATED MOTHER TINCTURES)

Methods 1.2.7 and 1.2.8 are used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Methods 1.2.7 (ethanol content approximately 50 per cent *V/V*) and 1.2.8 (ethanol content approximately 36 per cent *V/V*) are ethanolic decoctions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

- Method 1.2.7: ethanol (90 per cent *V/V*);
- Method 1.2.8: ethanol (70 per cent *V/V*).

Use the following expression to calculate the amount ($A_2$), in kilograms, of ethanol of the appropriate concentration required for the mass of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Heat the mixture containing the total amount of ethanol of the appropriate concentration to boiling under reflux, and maintain for 30 min, unless otherwise specified in the individual monograph. Cool or allow to cool, allow to stand in a closed container for 12-36 h, then express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

– Method 1.2.7: ethanol (50 per cent *V/V*);

– Method 1.2.8: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

2 parts of the mother tincture;

8 parts of ethanol (50 per cent *V/V*) (Method 1.2.7) or ethanol (36 per cent *V/V*) (Method 1.2.8).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (36 per cent *V/V*) (Method 1.2.7) or ethanol (18 per cent *V/V*) (Method 1.2.8).

The 3rd decimal dilution (D3) is made from:

1 part of the 2nd decimal dilution;

9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D3.

**METHODS 1.2.9, 1.2.10, 1.2.11. ETHANOLIC DECOCTIONS (HAB 19c, 19d, 19e: HEAT-TREATED MOTHER TINCTURES)**

Methods 1.2.9, 1.2.10 and 1.2.11 are used for fresh herbal drugs containing essential oil or resin or generally less than 65 per cent moisture.

Mother tinctures prepared according to Methods 1.2.9 (ethanol content approximately 65 per cent *V/V*), 1.2.10 (ethanol content approximately 57 per cent *V/V*) and 1.2.11 (ethanol content approximately 35 per cent *V/V*) are ethanolic decoctions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (*2.2.13*) or loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

– Method 1.2.9: ethanol (90 per cent *V/V*);

– Method 1.2.10: ethanol (80 per cent *V/V*);

– Method 1.2.11: ethanol (50 per cent *V/V*).

Use the following expression to calculate the amount ($A_3$), in kilograms, of ethanol of the appropriate concentration required for the mass of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Heat the mixture containing the total amount of ethanol of the appropriate concentration to boiling under reflux, and maintain for 30 min, unless otherwise specified in the individual monograph. Cool or allow to cool, then allow to stand in a closed container for 12-36 h, express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

– Method 1.2.9: ethanol (70 per cent *V/V*);

– Method 1.2.10: ethanol (50 per cent *V/V*);

– Method 1.2.11: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of ethanol (70 per cent *V/V*) (Method 1.2.9), ethanol (50 per cent *V/V*) (Method 1.2.10) or ethanol (36 per cent *V/V*) (Method 1.2.11).

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of ethanol (50 per cent *V/V*) (Method 1.2.9), ethanol (36 per cent *V/V*) (Method 1.2.10) or ethanol (18 per cent *V/V*) (Method 1.2.11).

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

**METHOD 1.2.12. ETHANOLIC DECOCTIONS (HAB 19f: HEAT-TREATED MOTHER TINCTURES)**

Method 1.2.12 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.2.12 are ethanolic decoctions prepared by heat treatment and additional maceration as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

Unless otherwise prescribed, comminute appropriately the herbal drug, mix thoroughly with the total amount of ethanol of the appropriate concentration, heat to boiling under reflux

and maintain for 30 min. Cool or allow to cool, then allow to stand in a closed container for 12-36 h. After sedimentation, decant the supernatant and, if necessary, press out. In the latter case, combine the 2 liquids obtained. Filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of ethanol of the same concentration.

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 96 per cent *V/V* - 90 per cent *V/V* - 80 per cent *V/V* - 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

#### METHOD 1.2.13. ETHANOLIC INFUSIONS (HAB 20: HEAT-TREATED MOTHER TINCTURES)

Method 1.2.13 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.2.13 are ethanolic infusions prepared by heat treatment and additional maceration as described below using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph. The quantities of ethanol (96 per cent *V/V*) and purified water required to achieve the specified ethanol concentration are added separately as described below.

Unless otherwise prescribed, comminute appropriately the herbal drug, mix thoroughly with the total amount of ethanol (96 per cent *V/V*), cover and allow to stand for 15 min. Add the purified water (heated to boiling) and heat the mixture to boiling under reflux for 5 min. Cool, or allow to cool, then allow to stand in a closed container for 12-36 h. After sedimentation, decant the supernatant and, if necessary, press out. In the latter case, combine the 2 liquids obtained. Filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ($A_1$), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$ = mass of filtrate, in kilograms;

$N_0$ = percentage dry residue or percentage assay content as required in the individual monograph;

$N_x$ = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of ethanol of the same concentration.

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 90 per cent *V/V* - 80 per cent *V/V* - 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

### *METHOD 1.3. AQUEOUS MOTHER TINCTURES PREPARED WITHOUT HEATING*

#### METHOD 1.3.1. AQUEOUS MACERATES (HAB 49: AQUEOUS MOTHER TINCTURES)

Method 1.3.1 is used for fresh herbal drugs.

Mother tinctures prepared according to Method 1.3.1 are aqueous macerates prepared by short maceration with water as described below. This method is used solely in the manufacture of injections and eye preparations.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

Use the following expression to calculate the amount, in kilograms, of water required for the mass of raw material:

$$\frac{m \times (300 - T)}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Add the comminuted herbal drug to the calculated amount of water. Allow to stand for 2 h, then express the mixture and filter the resulting liquid. The mother tincture is used immediately, unless otherwise justified.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of water for injection.

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

### *METHOD 1.4. AQUEOUS MOTHER TINCTURES PREPARED WITH HEATING*

#### METHOD 1.4.1. AQUEOUS DIGESTIONS (HAB 24b: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.1 is used for fresh herbal drugs.

Mother tinctures prepared according to Method 1.4.1 are aqueous digestions prepared by heat treatment with water as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

Use the following expression to calculate the amount, in kilograms, of water required for the mass of raw material:

$$\frac{m \times (400 - T)}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Heat the mixture containing the total amount of water in a covered container to 37 °C and maintain at this temperature for 1 h, swirling from time to time. Express the mixture and filter the resulting liquid. The mother tincture is used immediately, unless otherwise justified.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

4 parts of the mother tincture;

6 parts of water for injection.

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 1.4.2. AQUEOUS DECOCTIONS (HAB 23b: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.2 is used for fresh herbal drugs.

Mother tinctures prepared according to Method 1.4.2 are aqueous decoctions prepared by heat treatment with water as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

Use the following expression to calculate the amount, in kilograms, of water required for the mass of raw material:

$$\frac{m \times (300 - T)}{100}$$

$m$ = mass of raw material, in kilograms;

$T$ = percentage loss on drying of the sample.

Heat the calculated amount of water to above 90 °C and add the comminuted herbal drug. Maintain the mixture at this temperature under reflux for 30 min, then express the mixture and filter the resulting liquid. The mother tincture is used immediately, unless otherwise justified.

**Potentisation**

The 1st 'decimal' dilution (D1) is made from:

3 parts of the mother tincture;

7 parts of water for injection.

The 2nd decimal dilution (D2) is made from:

1 part of the 1st 'decimal' dilution;

9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 1.4.3. AQUEOUS DECOCTIONS (HAB 23a: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.3 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.4.3 are aqueous decoctions prepared by heat treatment with water as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

Mix 1 part of the comminuted dried herbal drug with 10 parts of boiling water and boil under reflux for 30 min, unless otherwise specified in the individual monograph. Filter while hot. If gentle pressure applied to the residue does not achieve a final mass of mother tincture equal to 10 parts, pour a sufficient amount of boiling water over the residue and express gently. Use the resulting extract to make the mother tincture up to 10 parts. Filter the combined liquid. The filtrate is the mother tincture. The mother tincture is used immediately, unless otherwise justified.

For starch-containing material process 1 part of herbal drug with 100 parts of water. In that case the mother tincture corresponds to the 2nd decimal dilution (Ø = D2).

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 1.4.4. AQUEOUS INFUSIONS (HAB 24a: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.4 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.4.4 are aqueous infusions prepared by heat treatment with water and additional maceration as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

1 part of dried herbal drug is extracted with 10 parts of water.

Grind 1 part of the comminuted herbal drug in a mortar thoroughly with 3-5 parts of water, allow to stand for 15 min, then add the remainder of the water, which has been heated to boiling point. Place the mixture in a water-bath and maintain at a temperature above 90 °C for 5 min, swirling from time to time. Cover, allow to cool, then separate the residue from the liquid. If gentle pressure applied to the residue does not achieve a final mass of mother tincture equal to 10 parts, pour a sufficient amount of cold water over the residue and express gently. Use the resulting extract to make the mother tincture up to 10 parts. Filter the combined liquid. The filtrate is the mother tincture. The mother tincture is used immediately, unless otherwise justified.

**Potentisation**

The mother tincture corresponds to the 1st 'decimal' dilution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

1 part of the mother tincture (D1);

9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

### 2. GLYCEROL MACERATES

*METHOD 2.1*

Method 2.1 is used for maceration of raw materials of animal or herbal origin in glycerol (85 per cent) or glycerol/ethanol mixtures of appropriate concentration. Pathological material is excluded.

The raw materials are finely minced before use, where appropriate.

#### METHODS 2.1.1, 2.1.2 (HAB 42a AND 42b: MOTHER TINCTURES AND LIQUID DILUTIONS THEREOF)

Raw materials of animal origin - freshly killed animals or parts thereof - are used. Animals are processed immediately after being killed.

**Maceration**

Disperse 1 part of finely minced animal material in:

– 9 parts (decimal dilutions) or 99 parts (centesimal dilutions) of glycerol (85 per cent) for Method 2.1.1; or

– 2.1 parts of glycerol (85 per cent) for Method 2.1.2.

Allow to macerate for at least 2 h, then succuss. Filter when necessary.

Where justified, 1 part of glycerol (85 per cent) may be added to 1 part of animal material before mincing. Where very small amounts of animal material are used, the dilution may be prepared by dispersing 1 part of finely minced animal material in 99 parts of glycerol (85 per cent) (C1 or 'D2' if to be used for further decimal dilutions).

**Potentisation**

*Method 2.1.1*

The 2nd decimal dilution (D2) is made from:

1 part of the glycerol macerate D1;

9 parts of glycerol (85 per cent) or ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2 but with ethanol (18 per cent *V/V*) as the vehicle.

The 2nd centesimal dilution (C2) is made from:

1 part of the glycerol macerate C1;

99 parts of ethanol (18 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

*Method 2.1.2*

The 1st 'decimal' dilution (D1) is made from:

3 parts of the glycerol macerate;

7 parts of water for injections.

The 2nd decimal dilution (D2) is made from:

1 part of D1;

9 parts of water for injections.

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 2.1.3 (FRENCH PHARMACOPOEIA)

Raw materials of herbal or animal origin are used.

**Maceration**

Comminute the raw material appropriately. Take a sample and determine the loss on drying at 105 °C for 2 h (*2.2.32*) or the water content (*2.2.13*). Taking this value into account, calculate and add to the raw material the quantity of the ethanol/glycerol mixture of the appropriate concentration to produce, unless otherwise prescribed, a 1 in 20 glycerol macerate. Allow to macerate for at least 21 days, with sufficient shaking. Decant and strain under pressure if necessary. Allow the combined liquids to stand for 48 h and filter.

**Potentisation**

The 1st decimal dilution (D1) is made from:

1 part of the glycerol macerate;

9 parts of a water/ethanol/glycerol mixture of appropriate concentration.

The 2nd decimal dilution (D2) is made from:

1 part of the 1st decimal dilution;

9 parts of a water/ethanol/glycerol mixture of appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2 or using another appropriate vehicle.

The 1st centesimal dilution (C1) is made from:

1 part of the glycerol macerate;

99 parts of a water/ethanol/glycerol mixture of appropriate concentration.

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st centesimal dilution;

99 parts of a water/ethanol/glycerol mixture of appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2 or using another appropriate vehicle.

*METHOD 2.2*

#### METHODS 2.2.1, 2.2.2, 2.2.3, 2.2.4 (HAB 41a, 41b, 41c AND 41d: GLYCEROL MOTHER TINCTURES AND LIQUID DILUTIONS THEREOF)

Method 2.2 is used for maceration of raw materials of animal origin in a glycerol solution containing sodium chloride. Pathological material is excluded.

Raw materials from freshly killed animals, parts or secretions thereof are used in Methods 2.2.1, 2.2.2 and 2.2.3. Lower animals are killed with carbon dioxide in a covered vessel. All animals are processed immediately after being killed.

Blood components from live horses are used in method 2.2.4.

**Sample collection and/or pre-treatment**

The raw materials used in Methods 2.2.1, 2.2.2 and 2.2.3 are finely minced before use, where appropriate.

The blood used in Method 2.2.4 is collected by a veterinarian. Blood obtained from animals killed by bleeding must not be used. Take 200 mL of this blood and add 15 IU of heparin sodium and 0.625 mL of a 9 g/kg solution of sodium chloride per millilitre. Separate the blood components by fractional centrifugation and resuspend each individual cell sediment in 1.1 mL of a 9 g/kg solution of sodium chloride. These cell suspensions are processed into the glycerol macerate.

**Maceration**

Mix 1 part of finely minced animal material, secretions or blood cell suspensions, according to the method used, with 5 parts of a sodium chloride solution of the appropriate concentration (see Table 2371.-1) and 95 parts of glycerol. Allow to stand protected from light for at least 7 days, then decant. If necessary for Methods 2.2.1, 2.2.2 and 2.2.3, centrifuge before decanting, then filter the supernatant if necessary. The decanted liquid or the filtrate respectively is the glycerol macerate.

Any sediment present must be resuspended before processing the glycerol macerate.

Table 2371.-1

| Methods 2.2.1 and 2.2.4 | Method 2.2.2 | Method 2.2.3 |
|---|---|---|
| 15 g/kg solution of sodium chloride in purified water | 40 g/kg solution of sodium chloride in purified water | 80 g/kg solution of sodium chloride in purified water |

**Vehicle**

0.2 parts of sodium hydrogen carbonate and 8.8 parts of sodium chloride in 991 parts of water for injections or purified water as appropriate.

**Potentisation**

The glycerol macerate corresponds to the 2nd decimal dilution ('D2') or the 1st centesimal dilution (C1).

The 3rd decimal dilution (D3) is made from:

1 part of the 2nd decimal dilution;

9 parts of the appropriate vehicle.

Subsequent decimal dilutions are produced as stated for D3.

Where appropriate, the 4th decimal dilution (D4) is made from 1 part of the 3rd decimal dilution, 5.6 parts of the vehicle and 3.4 parts of water for injections.

The 2nd centesimal dilution (C2) is made from:

1 part of the 1st centesimal dilution;

99 parts of the appropriate vehicle.

Subsequent centesimal dilutions are produced as stated for C2.

## 3. LIQUID DILUTIONS

*METHOD 3.1*

Methods 3.1.1, 3.1.2 and 3.1.3 are used for dissolution of any suitable inorganic or organic starting material, for example minerals or venoms.

Unless otherwise specified, dissolve 1 part of the starting material in 9 parts (D1) or 99 parts (C1) of the liquid vehicle and succuss.

Where justified and authorised, in case of insufficient solubility of the starting material in the specified vehicle, directly produce the first possible dilution. For example, if the starting material is slightly soluble, dissolve 1 part of the starting material in 99 parts of the vehicle (C1 or 'D2' if to be used for further decimal dilutions).

**METHODS 3.1.1, 3.1.2 (HAB 5a, 5b: SOLUTIONS, AQUEOUS SOLUTIONS)**

**Vehicles**

The vehicles in Table 2371.-2 may be used.

Table 2371.-2

| Method 3.1.1 | Method 3.1.2 |
|---|---|
| Anhydrous ethanol | Water for injections |
| Ethanol (96 per cent *V/V*) | Purified water |
| Ethanol (90 per cent *V/V*) | |
| Ethanol (80 per cent *V/V*) | |
| Ethanol (70 per cent *V/V*) | |
| Ethanol (50 per cent *V/V*) | |
| Ethanol (36 per cent *V/V*) | |
| Ethanol (18 per cent *V/V*) | |
| Purified water | |
| Glycerol (85 per cent) | |

For Method 3.1.1, if ethanol (18 per cent *V/V*) is used, the starting material may be dissolved in 7.58 parts of purified water and the ethanol concentration adjusted by adding 1.42 parts of ethanol (96 per cent *V/V*) to the solution, for decimal dilutions. For centesimal dilutions, use 83.4 parts of purified water for 15.6 parts of ethanol (96 per cent *V/V*).

For Method 3.1.2, if the starting material is not stable and/or soluble in water, glycerol (85 per cent) may be added at a concentration of not more than 35 per cent of the vehicle, for potentisation up to D4.

**Potentisation**

Unless otherwise specified, the 2nd decimal dilution (D2) is made from:

1 part of the 1st decimal dilution (D1);

9 parts of ethanol (50 per cent *V/V*) for Method 3.1.1 or 9 parts of water for injections (or purified water, as appropriate) for Method 3.1.2.

Subsequent decimal dilutions are produced as stated for D2.

Unless otherwise specified, the 2nd centesimal dilution (C2) is made from:

1 part of the 1st centesimal dilution (C1);

99 parts of ethanol (50 per cent *V/V*) for Method 3.1.1 or 99 parts of water for injections (or purified water, as appropriate) for Method 3.1.2.

Subsequent centesimal dilutions are produced as stated for C2.

**Additives**

For Method 3.1.1, if a reaction such as precipitation is observed in the final dilution, the following additives may be used to enhance stability and/or solubility, unless otherwise specified:

- glacial acetic acid;
- concentrated hydrochloric acid;
- lactic acid;
- sodium hydroxide.

Where solutions or dilutions have been pH-adjusted, they must not be potentised further.

**METHOD 3.1.3**

**Vehicles**

Suitable vehicles, for example, ethanol of an appropriate concentration, glycerol or purified water may be used alone or combined.

**Potentisation**

Unless otherwise specified, the 2nd decimal dilution (D2) is made from:

1 part of the 1st decimal dilution (D1);

9 parts of the appropriate vehicle.

Subsequent decimal dilutions are produced as stated for D2.

Unless otherwise specified, the 2nd centesimal dilution (C2) is made from:

1 part of the 1st centesimal dilution (C1);

99 parts of the appropriate vehicle.

Subsequent centesimal dilutions are produced as stated for C2.

*METHOD 3.2*

Method 3.2 is generally used to produce liquid dilutions of triturations of substances that for the most part are sparingly soluble to practically insoluble.

**METHODS 3.2.1, 3.2.2 (HAB 8a, 8b: LIQUID PREPARATIONS MADE FROM TRITURATIONS, AQUEOUS PREPARATIONS MADE FROM TRITURATIONS)**

Preparations made according to Method 3.2.1 and Method 3.2.2 are produced from triturations D4, D5 and D6 or from triturations C4, C5 and C6, prepared according to method 4.1.1 by at least 2 potentisation steps.

**Vehicles**

The vehicles in Table 2371.-3 may be used.

Table 2371.-3

| Method 3.2.1 | Method 3.2.2 |
|---|---|
| 1st potentisation:<br>Purified water | All potentisations:<br>Water for injections<br>Purified water |
| 2nd potentisation:<br>Ethanol (36 per cent *V/V*) | |
| Further potentisations:<br>Ethanol (50 per cent *V/V*) | |

**Potentisation**

For the first liquid potentisation, dissolve 1 part of the trituration in 9 parts (decimal dilutions) or 99 parts (centesimal dilutions) of the specified vehicle (see Table 2371.-3) and succuss. For further potentisations, proceed in the same manner with 1 part of the previous dilution.

The D6, D7, C6 and C7 dilutions produced by the above method are not to be used for the preparation of further dilutions. For the preparation of higher dilutions use the D8 or C8 dilution.

**METHOD 3.2.3**

Preparations made according to Method 3.2.3 are produced from triturations D2 onwards and from triturations C1, C2, C3 and C4, prepared according to method 4.1.2.

**Vehicles**

Suitable vehicles such as ethanol of an appropriate concentration or purified water may be used.

**Potentisation**

Unless otherwise specified, the first liquid decimal dilution (Dn-1) is made from:

1 part of the decimal trituration Dn-2;

9 parts of purified water or of another suitable vehicle in appropriate proportions.

The following decimal dilution (Dn) is made from:

1 part of the first liquid decimal dilution Dn-1;

9 parts of a suitable vehicle.

Subsequent decimal dilutions are produced as stated for Dn.

Unless otherwise specified, the first liquid centesimal dilution (Cn-1) is made from:

1 part of the centesimal trituration Cn-2;

99 parts of purified water or of another suitable vehicle in appropriate proportions.

The following centesimal dilution (Cn) is made from:

1 part of the first liquid centesimal dilution Cn-1;

99 parts of a suitable vehicle.

Subsequent centesimal dilutions are produced as stated for Cn.

4. TRITURATIONS

*METHOD 4.1*

Method 4.1 is used for triturations, that is solid dilutions, of raw materials or of triturations prepared according to Methods 4.2.1 or 4.2.2. The duration and intensity of the trituration are such that homogeneity and potentisation are achieved.

**Vehicle**

Unless otherwise specified, lactose monohydrate is used.

**METHOD 4.1.1 (HAB 6: TRITURATIONS)**

Triturations are prepared manually or mechanically. Mechanical trituration must be used for quantities exceeding 1 kg. The resulting particle size of the raw material in the first decimal or centesimal dilution does not exceed 100 µm, unless otherwise prescribed in the individual monograph.

**Ratios of raw material to vehicle**

| Decimal triturations | Centesimal triturations |
|---|---|
| The 1st decimal trituration (D1) is made from: | The 1st centesimal trituration (C1) is made from: |
| 1 part of the raw material | 1 part of the raw material |
| 9 parts of the vehicle | 99 parts of the vehicle |
| Subsequent decimal triturations (Dn) are produced as stated for D1, using 1 part of the previous trituration (Dn-1). | Subsequent centesimal triturations (Cn) are produced as stated for C1, using 1 part of the previous trituration (Cn-1). |

Where fresh plant material is used, the quantity of vehicle added is such so as to obtain 10 parts of the trituration (decimal trituration) or 100 parts of the trituration (centesimal trituration) from 1 part of the raw material (replace the mass of water lost from the fresh plant by an equivalent amount of the vehicle). A suitable gentle drying process may need to be applied to the solid dilution.

Where justified and authorised, it may be necessary to directly produce a C1 or 'D2' if to be used for further decimal triturations as the first solid trituration, made from 1 part of raw material and 99 parts of vehicle.

**Trituration**

Unless otherwise justified and authorised, the method consists of dividing the vehicle into 3 equal parts and adding the raw material to the first part, then adding the second and third part of the vehicle, thoroughly triturating after each addition.

For mechanical trituration, use a machine allowing the requirements for particle size of the first decimal or centesimal solid trituration to be met. A machine fitted with a scraping device may be used to ensure even trituration. The time required to prepare one trituration is at least 1 h, unless otherwise justified and authorised.

For manual trituration, divide the vehicle into 3 equal parts and briefly triturate the first part in a porcelain mortar. Add the raw material, triturate the mixture for 6 min, scrape down for 4 min with an appropriate non-metallic device (for example, a porcelain spatula). Triturate for a further 6 min, scrape down again for a further 4 min, then add the second part of the vehicle and continue as above. Proceed in the same manner with the rest of the vehicle. The minimum time required for the whole process is thus 1 h. Carry out the whole process again for each subsequent solid dilution.

Triturations from D5 or C5 onwards may also be prepared by intense mechanical treatment by a suitable mixing machine as follows: add the solid trituration to one third of the vehicle and mix. Add the second third of the vehicle, mix and proceed in the same manner with the last third of the vehicle. The whole process lasts minimum 1 hour, unless otherwise justified and authorised.

It is possible to change to a liquid medium from the 4th, 5th and 6th decimal or centesimal triturations, as described in Methods 3.2.1 and 3.2.2.

**METHOD 4.1.2 (FRENCH PHARMACOPOEIA)**

**Trituration**

Triturations are prepared as follows:

*Decimal triturations*

Reduce 1 part of the homoeopathic stock to a powder. Triturate carefully with a small quantity of the vehicle. Add the vehicle in small quantities until 9 parts of this vehicle have been used. The resulting trituration is the 1st decimal trituration (D1).

Triturate as described above 1 part of this trituration with 9 parts of the vehicle. The resulting trituration is the 2nd decimal trituration (D2).

In all cases, it is possible to change to a liquid medium after the 7th decimal trituration (D7) as described in Method 3.2.3.

*Centesimal triturations*

Proceed in the same manner but following a centesimal series.

In all cases, it is possible to change to a liquid medium after the 3rd centesimal trituration (C3) as described in Method 3.2.3.

*METHOD 4.2*

Method 4.2 is used for triturations, that is solid dilutions, of liquid preparations such as mother tinctures and solutions, their dilutions, mixtures and co-potentised mixtures.

Gradually impregnate the total amount of vehicle, gently dry the moist mixture, mill and sieve if necessary, then mix and triturate until homogeneity and potentisation are achieved. Trituration is further carried out as described for Method 4.1.1 or Method 4.1.2.

**Vehicle**

Unless otherwise specified, lactose monohydrate is used.

**METHOD 4.2.1 (HAB 7: TRITURATIONS)**

**Ratios of starting material to vehicle**

The quantity of vehicle added must always be such so as to obtain 10 parts of the trituration (decimal trituration) or 100 parts of the trituration (centesimal trituration) from the required number of parts of the liquid preparation (see Table 2371.-4), taking the mass of the dry residue into consideration. Where the dry residue is considered negligible, the quantity of vehicle added is 10 parts (decimal trituration) or 100 parts (centesimal trituration), for 1 part of the liquid preparation.

Table 2371.-4

| Decimal triturations | Centesimal triturations |
|---|---|
| **Mother tinctures prepared according to Methods 1.1.1, 1.1.3 and 1.1.4** | |
| The 1st 'decimal' trituration (D1) is made from: | The 1st 'centesimal' trituration (C1) is made from: |
| 2 parts of the mother tincture | 2 parts of the mother tincture |
| maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration | maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration |
| **Mother tinctures prepared according to Methods 1.1.2, 1.1.5, 1.1.6 and 1.1.7** | |
| The 1st 'decimal' trituration (D1) is made from: | The 1st 'centesimal' trituration (C1) is made from: |
| 3 parts of the mother tincture | 3 parts of the mother tincture |
| maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration | maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration |
| **Mother tinctures prepared according to Methods 1.1.8 and 1.1.9** | |
| *The mother tincture corresponds to the 1st decimal dilution (D1)* | |
| The 2nd decimal trituration (D2) is made from: | The 1st 'centesimal' trituration (C1) is made from: |
| 1 part of the mother tincture | 10 parts of the mother tincture |
| maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration | maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration |
| **Solutions prepared according to Method 3.1.1 or liquid dilutions, mixtures and co-potentised mixtures** | |
| Decimal trituration n+1 (Dn+1) is made from: | Centesimal trituration n+1 (Cn+1) is made from: |
| 1 part of the dilution (Dn) | 1 part of the dilution (Cn) |
| maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration | maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration |

**METHOD 4.2.2**

**Ratios of starting material to vehicle**

| **Mother tinctures prepared according to Methods 1.1.10 and 1.1.11** | |
|---|---|
| The 1st decimal trituration (D1) is made from: | The 1st centesimal trituration (C1) is made from: |
| 1 part of the mother tincture | 1 part of the mother tincture |
| 10 parts of the vehicle | 100 parts of the vehicle |

## 5. OTHER PREPARATIONS

*METHOD 5.1*

Method 5.1 is used for preparing homoeopathic preparations by co-potentising 2 or more stocks and/or dilutions thereof, where co-potentisation consists of mixing several stocks or dilutions of stocks then potentising them together in one or more potentisation steps.

**METHODS 5.1.1, 5.1.2, 5.1.3 (HAB 40a, 40b, 40c: CO-POTENTISED MIXTURES)**

The stocks and/or dilutions in Table 2371.-5 may be used.

Table 2371.-5

| Method 5.1.1 | Method 5.1.2 | Method 5.1.3 |
|---|---|---|
| Stocks | Aqueous preparations | Triturations |
| Solutions | Glycerol macerates and aqueous dilutions thereof | |
| Triturations | Triturations | |
| Liquid dilutions | | |
| Mother tinctures whose method of production specifies a 1/10 (or 1/100) dilution | | |

**Vehicles**

The choice of the vehicle is determined by and must comply with any special requirement for the particular stock as well as the dosage form (see table Table 2371.-6).

Table 2371.-6

| Method 5.1.1 | Method 5.1.2 | Method 5.1.3 |
|---|---|---|
| Ethanol (96 per cent *V/V*) | Water for injections | Lactose monohydrate |
| Ethanol (90 per cent *V/V*) | Purified water | |
| Ethanol (80 per cent *V/V*) | Sugar syrup (sucrose, purified water (64:36)) | |
| Ethanol (70 per cent *V/V*) | | |
| Ethanol (50 per cent *V/V*) | | |
| Ethanol (36 per cent *V/V*) | | |
| Ethanol (18 per cent *V/V*) | | |

For Method 5.1.1, when starting from a trituration and where justified, purified water is used for the 1st potentisation step.

For Method 5.1.2, when starting from a glycerol macerate containing sodium chloride, unless otherwise justified and authorised, the following vehicle is used: 0.2 parts of sodium hydrogen carbonate and 8.8 parts of sodium chloride in 991 parts of water for injections.

**Potentisation**

For each potentisation step, combine and succuss or triturate 1 part of the given mixture with 9 parts (decimal dilutions) or 99 parts (centesimal dilutions) of the appropriate vehicle.

**METHOD 5.1.4**

**Vehicles**

Ethanol of an appropriate concentration, purified water or lactose monohydrate may, for example, be used.

**Potentisation**

Potentisation may be performed as prescribed for Methods 5.1.1, 5.1.2 and 5.1.3, either on the last step or on several successive steps.

**METHOD 5.1.5**

**Vehicle**

Ethanol of an appropriate concentration, purified water or lactose monohydrate may, for example, be used.

**Potentisation**

For a co-potentisation of centesimal dilutions, each dilution (Cn-1) represents 1 per cent of the final product and the proportion of vehicle to be added is reduced by the proportion of the active substances [i.e. 100 per cent – (1 per cent × the number of active substances)]. The same procedure applies, in the appropriate proportions, when co-potentising decimal dilutions.

*METHOD 5.2*

Method 5.2 is used to prepare potencies with a 50 000 dilution factor (LM) by alternate steps of liquid dilution and impregnation of sucrose pillules (category 1, unless otherwise authorised).

**Solid and liquid potencies**

Use a dropper (*2.1.1*).

To prepare pillules of 1st LM potency, a C3 trituration of the substance to be potentised is processed as follows: dissolve 60 mg of the C3 trituration in a volume of ethanol (18 per cent *V/V*) or another authorised concentration, corresponding to 500 drops. To 1 drop of this solution add a volume of ethanol (90 per cent *V/V*) or another authorised concentration, corresponding to 100 drops and succuss at least 100 times. Use all of this solution to impregnate a mass of pillules corresponding to 50 000 pillules, then allow to dry in air.

To prepare pillules of 2nd LM potency, process pillules of 1st LM potency as follows: dissolve 1 pillule of 1st LM potency in 1 drop of purified water, add a volume of ethanol (90 per cent *V/V*) or another authorised concentration, corresponding to 100 drops and succuss at least 100 times. Use all of this solution to impregnate a mass of pillules corresponding to 50 000 pillules, then allow to dry in air.

Subsequent solid potencies are prepared as for the 2nd LM potency.

Liquid potencies (HAB 17)

To prepare a liquid LM potency, dissolve 1 pillule of the required potency in 10.0 mL of ethanol (18 per cent *V/V*) or another authorised concentration. The potency of the solution corresponds to the potency of the pillule dissolved therein.

**01/2017:2153**

# PILLULES FOR HOMOEOPATHIC PREPARATIONS

## Granula ad praeparationes homoeopathicas

DEFINITION

Solid preparations obtained from sucrose, lactose or other suitable excipients. They possess a suitable mechanical strength to resist handling without crumbling or breaking. They are intended for impregnation or coating with one or more homoeopathic preparations. The impregnated pillules comply with the requirements of the monograph *Homoeopathic pillules, impregnated (2079)*. The coated pillules comply with the requirements of the monograph *Homoeopathic pillules, coated (2786)*.

PRODUCTION

In the manufacture, packaging, storage and distribution of pillules for homoeopathic preparations, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use*.

If a system of sizing is used, the indications in Table 2153.-1 are used.

Table 2153.-1. – *Classification of pillules according to their mass and size*

| Category | Number of pillules for homoeopathic preparations | Mass (g) | Fineness (µm) |
|---|---|---|---|
| 1 | 470 - 530 | 1.0 | 1000 - 1600 |
| 2 | 160 - 333 | 1.0 | 1400 - 2000 |
| 3 | 110 - 130 | 1.0 | 1800 - 2500 |
| 4 | 70 - 90 | 1.0 | 2000 - 2800 |
| 5 | 40 - 50 | 1.0 | 2500 - 3350 |
| 6 | 16 - 30 | 1.0 | 3150 - 4500 |
| 7 | 10 | 0.9 - 1.1 | 4000 - 5600 |
| 8 | 5 | 0.9 - 1.1 | 5600 - 6700 |
| 9 | 3 | 0.9 - 1.1 | 7100 - 8000 |
| 10 | 2 | 0.9 - 1.1 | 8000 - 9500 |

*NOTE*: for categories 7-10, the mass is obtained by weighing the specified number of pillules.

CHARACTERS

*Appearance*: white or almost white spheroids.

*Solubility*: usually freely soluble in water.

IDENTIFICATION

The excipients used for the manufacture of pillules for homoeopathic preparations are identified by one or more suitable test(s).

TESTS

*If the test for fineness is carried out, the test for uniformity of mass need not be carried out, and vice versa.*

**Uniformity of mass.** Carry out the test using 20 pillules to constitute 1 unit. Weigh individually 20 units taken at random and determine the individual and average masses. Not more than 2 of the individual masses deviate from the average mass by more than 10 per cent and none deviate by more than 20 per cent.

**Fineness** (*2.9.35*): not less than 90 per cent *m/m* of the pillules are between the lower and upper limits of the corresponding category as indicated in Table 2153.-1.

**Uniformity of impregnation**: none of the individual values deviate by more than 10 per cent from the average of 10 determinations.

*Methylene blue impregnation solution. Use a freshly prepared solution.* Dissolve 1.000 g of *methylene blue R* in 50 mL of *ethanol (70 per cent V/V) R* and dilute to 1000.0 mL with the same solvent.

*Test solution.* Impregnate a suitable quantity of pillules for homoeopathic preparations with a suitable quantity of the methylene blue impregnation solution, to achieve a content of 10 µL of impregnation solution per gram of pillules. Dissolve 5.000 g (*m* g) of these impregnated pillules in *water R* and dilute to 25.0 mL with the same solvent.

*Reference solution.* Dilute 1.0 mL of the methylene blue impregnation solution to 100.0 mL with *water R*. To 5.0 mL of this solution add 5.000 g of pillules for homoeopathic preparations, dissolve in *water R* and dilute to 25.0 mL with the same solvent.

Measure the absorbance (*2.2.25*) of the test solution and the reference solution at 665 nm. Calculate the percentage of impregnation of the pillules for homoeopathic preparations using the following expression:

$$\frac{A_1 \times 500}{A_2 \times m}$$

$A_1$ = absorbance of the test solution;

$A_2$ = absorbance of the reference solution;

$m$ = mass of the impregnated pillules used to prepare the test solution, in grams.

Carry out 10 individual determinations.

**Microbial contamination**

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^1$ CFU/g (*2.6.12*).

Absence of *Staphylococcus aureus* (*2.6.13*).

Absence of *Pseudomonas aeruginosa* (*2.6.13*).

LABELLING

The label states:

- the composition of the pillules;
- where applicable, the size of the pillules.

**04/2017:2079**

# HOMOEOPATHIC PILLULES, IMPREGNATED

## Granula homoeopathica imbuta

DEFINITION

Solid preparations obtained from sucrose, lactose or other suitable excipients. They possess a suitable mechanical strength to resist handling without crumbling or breaking. Impregnated homoeopathic pillules are prepared by impregnation of *Pillules for homoeopathic preparations (2153)* with one or more liquid homoeopathic preparations. They are intended for sublingual or oral use.

PRODUCTION

The impregnation process takes place using liquid preparations containing ethanol usually at a concentration of at least 68 per cent *V/V* according to either of the following approaches:

- in proportions of 1 mass part of liquid to 100 mass parts of pillules;
- in proportions of 1 volume part of liquid to 100 mass parts of pillules.

In the manufacture, packaging, storage and distribution of homoeopathic pillules, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

CHARACTERS

*Appearance*: white, almost white or slightly coloured spheroids.

*Solubility*: usually freely soluble in water.

TESTS

**Microbial contamination**. Unless otherwise justified, authorised and labelled, the pillules are intended for sublingual administration and the following acceptance criteria apply.

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^1$ CFU/g (*2.6.12*).

Absence of *Staphylococcus aureus* (*2.6.13*).

Absence of *Pseudomonas aeruginosa* (*2.6.13*).

**01/2015:2786**

# HOMOEOPATHIC PILLULES, COATED

## Granula homoeopathica velata

DEFINITION

Solid preparations prepared from sucrose *Pillules for homoeopathic preparations (2153)* (category 5), by coating with a syrup made from homoeopathic preparations either potentised or mixed with sucrose syrup. Triturations can be incorporated separately. Coated homoeopathic pillules possess a suitable mechanical strength to resist handling without crumbling or breaking. They are intended for sublingual or oral use. Coated homoeopathic pillules may also be called 'globuli velati'.

PRODUCTION

In the manufacture, packaging, storage and distribution of coated homoeopathic pillules, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter *5.1.4. Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

For coating, use homoeopathic stocks (in case of a mother tincture or a glycerol macerate) and/or decimal dilutions thereof or decimal triturations and a syrup made from 64 parts of sucrose and 36 parts of purified water. The homoeopathic preparations used are prepared according to the general monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*.

To prepare 100 parts of coated homoeopathic pillules, the pillules are coated with the syrup using one of the following procedures, depending upon the type of homoeopathic preparation used.

**Aqueous dilutions**

Mix 1 part of an aqueous preparation with 9 parts of the syrup and potentise by succussion; evenly apply the mixture to $(100 - x)$ parts of pillules (where $x$ is the mass of sucrose in the syrup). The potency of the coated homoeopathic pillules corresponds to the potency of the liquid preparation used for coating.

**Triturations**

Mix 10 parts of a trituration with 20 parts of the syrup; evenly apply the mixture to $(100 - x - y)$ parts of pillules (where $x$ is the mass of sucrose in the syrup and $y$ is the mass of lactose monohydrate in the incorporated trituration). The potency of the coated homoeopathic pillules corresponds to the potency of the trituration used.

**Mixtures**

Unless otherwise justified and authorised, prepare a mixture obtained from 10 parts of a liquid preparation (obtained from aqueous preparations, triturations or aqueous dilutions of glycerol macerates) and 90 parts of the syrup, adding sufficient purified water to evenly apply the mixture to $(100 - x - y)$ parts of pillules (where $x$ is the mass of sucrose in the syrup and $y$ is the mass of lactose monohydrate in the incorporated triturations). The potency/potencies of the coated homoeopathic pillules correspond to the potency/potencies of the individual preparations used in the mixture.

TESTS

**Uniformity of mass.** Carry out the test using 20 coated homoeopathic pillules to constitute 1 unit. Weigh individually 20 units taken at random and determine the individual and average masses. Not more than 2 of the individual masses deviate from the average mass by more than 10 per cent and none deviate by more than 20 per cent.

**Microbial contamination.** Unless otherwise justified, authorised and labelled, coated homoeopathic pillules are intended for sublingual administration and the following acceptance criteria apply.

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^1$ CFU/g (*2.6.12*).

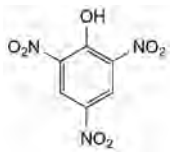
Absence of *Staphylococcus aureus* (*2.6.13*).

Absence of *Pseudomonas aeruginosa* (*2.6.13*).

**04/2016:2695**

# ACIDUM PICRINICUM FOR HOMOEOPATHIC PREPARATIONS(1)

## Acidum picricum ad praeparationes homoeopathicas



$C_6H_3N_3O_7$ $M_r$ 229.1
[88-89-1]

DEFINITION

2,4,6-Trinitrophenol (picric acid).

*Content*: 98.5 per cent to 101.5 per cent.

*The commercial substance is supplied immersed in water.*

*CAUTION: dry picric acid may explode if subjected to shock or excessive heat. Appropriate precautions must be taken and only very small quantities handled.*

CHARACTERS

*Appearance of picric acid*: light yellow.

IDENTIFICATION

A. Melting point (*2.2.14*): 121 °C to 123 °C, determined on the moistened substance to be examined dried in a desiccator to constant mass.

B. Suspend 0.1 g of the moistened substance to be examined in 1 mL of *water R*. Add 1 mL of *sodium sulfide solution R*. A red colour is produced.

TESTS

*Dry 5.0 g of the moistened substance to be examined in a desiccator to constant mass and use it to prepare solution S and to carry out the tests and the assay.*

**Solution S**. To 1.5 g of the dried substance to be examined add 30 mL of *distilled water R*, heat to boiling, allow to cool and filter. Dilute to 30 mL with *distilled water R*.

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*).

Dissolve 0.1 g of the dried substance to be examined in 10 mL of *distilled water R* and heat to 50 °C.

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R* and filter if necessary.

**Sulfates** (*2.4.13*): maximum 0.1 per cent.

Dilute 3 mL of solution S to 15 mL with *distilled water R* and filter if necessary.

ASSAY

Dissolve 0.200 g of the dried substance to be examined in 100 mL of *water R*. Titrate with *0.1 M sodium hydroxide*, using 0.2 mL of *phenol red solution R* as indicator.

1 mL of *0.1 M sodium hydroxide* is equivalent to 22.91 mg of $C_6H_3N_3O_7$.

**07/2019:2824**

# ACIDUM SUCCINICUM FOR HOMOEOPATHIC PREPARATIONS(2)

## Acidum succinicum ad praeparationes homoeopathicas

$C_4H_6O_4$ $M_r$ 118.1
[110-15-6]

DEFINITION

Butanedioic acid (succinic acid).

*Content*: 99.0 per cent to 101.0 per cent.

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: soluble in water and in ethanol (96 per cent), sparingly soluble in acetone.

IDENTIFICATION

*First identification: C.*

*Second identification: A, B, D.*

A. Solution S (see Tests) is strongly acid (*2.2.4*).

B. Melting point (*2.2.14*): 184 °C to 189 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *succinic acid CRS*.

D. Neutralise 3 mL of solution S with *1 M sodium hydroxide*, then add 1 mL of *silver nitrate solution R2*. A white precipitate is formed.

TESTS

**Solution S**. Dissolve 5.0 g in *distilled water R* and dilute to 100 mL with the same solvent.

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 200 ppm, determined on solution S.

**Oxalates**. Neutralise 5 mL of solution S with *dilute ammonia R1*, using 0.1 mL of *phenolphthalein solution R* as indicator. Add 0.1 mL of *acetic acid R* and 5 mL of *calcium sulfate solution R*. The solution remains clear for at least 20 min.

(1) FRENCH TITLE: Picricum acidum pour préparations homéopathiques
(2) FRENCH TITLE: Succinicum acidum pour préparations homéopathiques

ASSAY

Dissolve 0.500 g in 50 mL of *water R*. Titrate with *1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*) or using 0.2 mL of *phenolphthalein solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 59.05 mg of $C_4H_6O_4$.

**07/2018:2290**
**corrected 10.0**

# AGARICUS PHALLOIDES FOR HOMOEOPATHIC PREPARATIONS(3)

## Amanita phalloides ad praeparationes homoeopathicas

DEFINITION

Whole, fresh mushroom (fruiting body) *Amanita phalloides* (Vaill. ex Fr.) Link.

IDENTIFICATION

A. In young specimens, the cap, 50-150 mm in diameter, is hemispherical to campanulate with margins rolled inwards and is still covered by the white universal veil; in mature specimens, the cap is expanded, umbrella-like, convex to nearly plane and occasionally depressed; its colour is pale green along the margin and elsewhere greyish-green to yellowish-green, typically with fine grey streaks growing thicker towards the centre; the cuticle is peelable up to the middle of the cap as a fine membrane; the underlying flesh appears greenish-yellow, becoming more intense towards the centre of the cap, while in the other parts of the mushroom the flesh is uniformly whitish; lamellae are free, closely packed, white with a slight yellowish tinge; lamellulae are truncate; the stipe, about 10 cm high and 2 cm in diameter, is thin and solid, with a whitish, membranous, striate annulus and an enlarged and bulbous base that almost always shows a tough, white, membranous sac-like volva torn into irregular lobes at the top. In old specimens, the stipe is hollow, whitish and often covered with small greenish scales around the annulus. The spores are white.

B. Examined under a lens (x10), the upper surface is shiny, dry, appearing somewhat uneven, with no remains of the veil.

C. Examine under a microscope using a solution containing 1.5 g of *iodine R*, 5 g of *potassium iodide R* and 100 g of *chloral hydrate R* in 100 mL of *water R*. The spores are blackish-blue (starch reaction), short elliptical to subspherical, 8-11 µm long and 7-9 µm in diameter.

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent.

**Loss on drying** (*2.2.32*): minimum 85.0 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

**Other *Amanita* species**. Veil remnants on caps are typical for most *Amanita* species, but not for *A. phalloides*. Therefore all mushrooms with veil remnants on the cap have to be discarded. The presence of veil remnants (patches) on the cap indicates adulteration with *A. citrina* (Schaeff.) Pers. (whitish-yellow cap with whitish to brownish patches) or with *A. muscaria* (L.: Fr.) Lamarck, *A. caesarea* (Scop.: Fr.) Pers., or *A. rubescens* Pers. (orange to bright red cap with white patches); a brownish cap indicates adulteration with *A. pantherina* (DC.) Krombh.; a greenish-white cap and a white stipe with a labile annulus indicates adulteration with *A. verna* (Bull.: Fr.) Lamarck.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

*Content*: 0.001 per cent *m/m* to 0.010 per cent *m/m* for the sum of α-amanitine and β-amanitine ($C_{39}H_{54}N_{10}O_{14}S$; $M_r$ 919).

PRODUCTION

The mother tincture is prepared according to the following methods as prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.5;
- method 1.1.10, using 5 parts of the cut drug for 100 parts of ethanol (45 per cent *V/V*) and maceration for 3 weeks.

CHARACTERS

*Appearance*: brownish-yellow, yellowish or green liquid.

IDENTIFICATION

Carry out test A when method 1.1.5 is used and carry out test B when method 1.1.10 is used.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Evaporate to dryness 20 mL of the mother tincture under vacuum at about 40 °C. Dissolve the residue in 1 mL of *water R* and add 1 mL of *methanol R*. Filter immediately.

*Reference solution*. Dissolve 10 mg of *rutoside trihydrate R* and 10 mg of *sennoside B R* in *methanol R* and dilute to 40 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (17:17:66 *V/V/V*).

*Application*: 40 µL [or 10 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in a current of warm air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: locate a quenching zone (sennoside B) in the lower third and a quenching zone (rutoside) in the middle third of the chromatogram obtained with the reference solution.

*Detection B*: treat immediately with a 1 per cent *V/V* solution of *cinnamic aldehyde R* in *methanol R* and allow to dry; treat with *hydrochloric acid R*; examine in daylight.

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Sennoside B: a quenching zone | | A violet zone<br>A violet zone<br>2 faint greyish-violet zones may be present |
| **Reference solution (detection A)** | **Reference solution (detection B)** | **Test solution (detection B)** |

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* The mother tincture to be examined.

*Reference solution.* Dissolve 2 mg of *gramine R* and 2 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel $F_{254}$ plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *water R*, *methanol R*, *methylene chloride R* (4:6:30:60 *V/V/V/V*).

*Application*: 40 µL [or 10 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in a current of warm air.

*Detection*: treat with a 5 per cent *V/V* solution of *cinnamic aldehyde R* in *methanol R* and expose to *hydrochloric acid R* vapour for 30 min; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Gramine: a yellow zone<br>Rutoside: a yellow zone | |
| | A pink zone<br>A pink zone |
| | An orange-yellow zone |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.895 to 0.915 when method 1.1.5 is used.

**Ethanol** (*2.9.10*): 40 per cent *V/V* to 50 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 0.8 per cent.

**Mother tincture of Agaricus muscarius**. Thin-layer chromatography (*2.2.27*).

*Test solution.* The mother tincture to be examined.

*Reference solution.* Dissolve 10 mg of *leucine R* and 10 mg of *threonine R* in 5 mL of *water R* and dilute to 20 mL with *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *glacial acetic acid R*, *water R*, *acetone R*, *butanol R* (10:20:35:35 *V/V/V/V*).

*Application*: 20 µL [or 10 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in a current of warm air.

*Detection*: treat with a 1 g/L solution of *ninhydrin R* in *butanol R* and heat at 105 °C for 5-10 min; examine in daylight.

*Results*: the presence of noticeable zones in the chromatogram obtained with the test solution, in the same position as the zones due to leucine and threonine in the chromatogram obtained with the reference solution, indicates adulteration with mother tincture of Agaricus muscarius.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Evaporate 2.000 g of the mother tincture to be examined to dryness. Dissolve the residue in 2.0 mL of *water for chromatography R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 10.0 mg of *tryptophan CRS* in mobile phase A and dilute to 20.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped solid core octadecylsilyl silica gel for chromatography R* (2.6 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 1.54 g of *ammonium acetate R* in 900 mL of *water for chromatography R*, adjust to pH 5.0 with *glacial acetic acid R* and dilute to 1 L with *water for chromatography R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 95 | 5 |
| 2 - 17 | 95 → 80 | 5 → 20 |
| 17 - 22 | 80 → 50 | 20 → 50 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 303 nm.

*Injection*: 10 µL.

*Relative retention* with reference to tryptophan (retention time = about 3 min): β-amanitine = about 2.9; α-amanitine = about 3.2.

*System suitability*: test solution:

- *resolution*: minimum 2.0 between the peaks due to β-amanitine and α-amanitine.

Calculate the percentage content *m/m* of α-amanitine and β-amanitine using the following expression:

$$\frac{(A_2 + A_3) \times m_1}{A_1 \times m_2} \times p \times K \times 0.1$$

$A_1$ = area of the peak due to tryptophan in the chromatogram obtained with the reference solution;

$A_2$ = area of the peak due to α-amanitine in the chromatogram obtained with the test solution;

$A_3$ = area of the peak due to β-amanitine in the chromatogram obtained with the test solution;

$m_1$ = mass of *tryptophan CRS* used to prepare the reference solution, in grams;

$m_2$ = mass of the mother tincture to be examined used to prepare the test solution, in grams;

$p$ = percentage content of tryptophan in *tryptophan CRS*;

$K$ = correction factor between α-amanitine, β-amanitine and tryptophan (0.1).

**07/2014:2023**

# ALLIUM SATIVUM FOR HOMOEOPATHIC PREPARATIONS[4]

## Allium sativum ad praeparationes homoeopathicas

DEFINITION

Fresh bulb of *Allium sativum* L.

CHARACTERS

It has a characteristic odour after cutting.

IDENTIFICATION

The bulb is generally 3 cm to 5 cm broad and almost spherical; the flat base bears the remnants of numerous short greyish-brown adventitious roots. The bulb consists of about 10 daughter bulbs (cloves) arranged roughly in a circle around a central axis. Individual daughter bulbs are 1 cm to 3 cm long, laterally compressed and convex on the dorsal side. Each daughter bulb has a tough, white or reddish skin around a fleshy tubular leaf, investing a more or less rounded elongated cone of leaf primordia and vegetative apex.

TESTS

**Water** (*2.2.13*): minimum 55.0 per cent, determined on 10.0 g of the finely cut drug, if performed to demonstrate the freshness of the drug.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

PRODUCTION

The mother tincture of *Allium sativum* L. is prepared by maceration of the cut drug using alcohol of a suitable concentration.

CHARACTERS

*Appearance*: brownish-yellow liquid.

It has a peculiar and unpleasant aromatic odour.

IDENTIFICATION

A. To 2 mL of the mother tincture to be examined, add 0.2 mL of *dilute sodium hydroxide solution R*. A yellowish-white precipitate develops.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Extract 5 mL of the mother tincture to be examined with 2 quantities, each of 10 mL, of *ether R*. Combine the ether layers and dry over *anhydrous sodium sulfate R*. Filter and evaporate the filtrate in a water-bath at low temperature. Dissolve the residue in 0.4 mL of *methanol R*.

*Reference solution*. Dissolve 10 mg of *resorcinol R*, 10 mg of *thymol R* and 30 mg of *gallic acid R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *anhydrous formic acid R*, *toluene R*, *di-isopropyl ether R* (10:40:50 *V/V/V*).

*Application*: 40 µL of the test solution and 10 µL of the reference solution.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm and identify gallic acid; spray with *anisaldehyde solution R*, heat to 105-110 °C for 5-10 min. Examine in daylight within 10 min.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other zones may also be visible in the chromatogram obtained with the test solution.

| | A violet zone may be present |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.885 to 0.960.

**Ethanol** (*2.9.10*): 50 per cent *V/V* to 70 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 4.0 per cent.

STORAGE

In an airtight container.

**01/2018:2916**

# AMMONIUM CARBONICUM FOR HOMOEOPATHIC PREPARATIONS[5]

## Ammonii carbonas ad praeparationes homoeopathicas

DEFINITION

Mixture of varying proportions of diammonium carbonate ($(NH_4)_2CO_3$; $M_r$ 96.1), ammonium hydrogen carbonate ($NH_4HCO_3$; $M_r$ 79.1) and ammonium carbamate ($NH_2COONH_4$; $M_r$ 78.1).

*Content*: 30.0 per cent to 37.0 per cent of $NH_3$ ($M_r$ 17.03).

CHARACTERS

*Appearance*: white or almost white, translucent masses or white or almost white, crystalline powder, with a strong smell of ammonia.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in *water R* and dilute to 20 mL with the same solvent. The solution is slightly alkaline (*2.2.4*).

B. It gives the reaction of carbonates and bicarbonates (*2.3.1*).

(4) FRENCH TITLE: Allium sativum pour préparations homéopathiques
(5) FRENCH TITLE: Ammonium carbonicum pour préparations homéopathiques

C. It gives the reaction of ammonium salts and salts of volatile bases (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in 100 mL of *distilled water R*. Boil until the volume is reduced to about 10 mL. Verify that the emitted vapours no longer make *barium hydroxide solution R* cloudy. Cool and dilute to 50 mL with *distilled water R*.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method I*).

**Chlorides** (*2.4.4*): maximum 20 ppm.

Dissolve 2.5 g by gradually adding a mixture of 5 mL of *nitric acid R* and 10 mL of *water R*.

**Sulfates** (*2.4.13*): maximum 60 ppm, determined on solution S.

ASSAY

Dissolve 2.5 g in *water R* and dilute to 100 mL with the same solvent. To 10.0 mL of the solution add 10.0 mL of *1 M hydrochloric acid*. Shake continuously until the effervescence ceases. Add 40 mL of *water R*. Titrate the excess of acid with *1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *1 M hydrochloric acid* is equivalent to 17.03 mg of $NH_3$.

STORAGE

In an airtight container.

**07/2014:2094**
**corrected 10.0**

# ANACARDIUM FOR HOMOEOPATHIC PREPARATIONS[6]

## Semecarpus anacardium ad praeparationes homoeopathicas

DEFINITION

Dried fruit of *Semecarpus anacardium* L. (*Anacardium orientale* L.).

*Content*: minimum 6.0 per cent *m/m* of total phenol derivatives expressed as eugenol ($C_{10}H_{12}O_2$; $M_r$ 164.2) (dried drug).

IDENTIFICATION

A. The dried fruit is oval and more or less heart-shaped; about 2 cm long, nearly 2 cm wide and 0.5 cm thick. Its surface is smooth, shiny and blackish. A transverse section shows a rather well developed, tough pericarp riddled with rather wide lacunae containing an abundant thick reddish-brown juice. The pericarp covers a white kernel under a reddish skin. The fruit may include the blackish, fleshy, wrinkled, cupuliferous receptacle.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of suitably cut herbal drug, add 10 mL of *ethanol (90 per cent V/V) R*. Heat under reflux on a water-bath at 60 °C for 15 min. Allow to cool and filter.

*Reference solution*. Dissolve 5 mg of *gallic acid R* and 5 mg of *caffeic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *methanol R*, *toluene R* (15:85 *V/V*).

*Application*: 20 µL of the test solution and 10 µL of the reference solution, as bands.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with a solution containing 10 g/L of *diphenylboric acid aminoethyl ester R* and 50 g/L of *macrogol 400 R* in *methanol R*. Examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| | A greenish-blue fluorescent zone |
| _____ | _____ |
| | Several violet-blue fluorescent zones |
| | A yellow fluorescent zone |
| Caffeic acid: a violet-blue fluorescent zone | |
| _____ | _____ |
| Gallic acid: a violet-blue fluorescent zone | A violet-blue fluorescent zone (gallic acid) |
| **Reference solution** | **Test solution** |

TESTS

***Anacardium occidentale* L.** Fruits of *Anacardium occidentale* L. are not present. These are up to 35 mm long, 30 mm large, 20 mm thick, light brown and distinctly kidney-shaped. The pericarp is smooth or slightly crinkled with dark marbling in places.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the finely divided herbal drug by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 5.0 per cent.

ASSAY

**Total phenol derivatives**. Absorption spectrophotometry (*2.2.25*).

*Stock solution*. Place 4.500 g of the crushed herbal drug in a flask. Add 200 mL of *ethanol (90 per cent V/V) R*. Boil in a water-bath under reflux for 4 h. Cool the flask. Quantitatively transfer into a volumetric flask. Dilute to 250.0 mL with *ethanol (90 per cent V/V) R*. Filter the liquid through a paper filter 125 mm in diameter. Discard the first 50 mL of the filtrate. Dilute 5.0 mL of filtrate to 50.0 mL with *ethanol (90 per cent V/V) R* and shake. Dilute 5.0 mL of this solution to 10.0 mL with *ethanol (90 per cent V/V) R* and shake.

*Test solution*. To 2.0 mL of stock solution add 1.0 mL of *phosphomolybdotungstic reagent R* and 10 mL of *water R*, mix and dilute to 25.0 mL with a 290 g/L solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 mL.

*Reference solution*. Dissolve 80.0 mg of *eugenol R* in *ethanol (90 per cent V/V) R* and dilute to 250.0 mL with the same solvent. Dilute 5.0 mL of the solution to 25.0 mL with *ethanol (90 per cent V/V) R*. To 2.0 mL of this solution add 1.0 mL of *phosphomolybdotungstic reagent R* and 10 mL of *water R*, mix and dilute to 25.0 mL with a 290 g/L solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 mL.

(6) FRENCH TITLE: Anacardium orientale pour préparations homéopathiques

Measure the absorbance (*2.2.25*) of the test solution and the reference solution at 755 nm after 30 min using *water R* as compensation liquid.

Calculate the percentage content *m/m* of total phenol derivatives, expressed as eugenol, from the following expression:

$$\frac{A_1 \times m_2 \times 400}{A_2 \times m_1}$$

$A_1$ = absorbance of the test solution;

$A_2$ = absorbance of the reference solution;

$m_1$ = mass of the drug to be examined, in milligrams;

$m_2$ = mass of eugenol in the reference solution, in milligrams.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

The mother tincture of Anacardium is prepared by maceration using ethanol of a suitable concentration from the dried fruit of *Semecarpus anacardium* L. (*Anacardium orientale* L.).

*Content*: 0.5 per cent *m/m* to 1.0 per cent *m/m* of total phenol derivatives expressed as eugenol.

CHARACTERS

*Appearance*: yellowish-brown or reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*) as described under Identification B of the drug with the following modification.

*Test solution.* The tincture to be examined.

*Results*: see identification B for the drug.

TESTS

**Relative density** (*2.2.5*): 0.815 to 0.845.

**Ethanol** (*2.9.10*): 85 per cent *V/V* to 95 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 1.50 per cent.

ASSAY

**Total phenol derivatives**. Absorption spectrophotometry (*2.2.25*) as described in the assay of the drug to be examined with the following modifications.

*Stock solution.* Place 8.000 g of the mother tincture to be examined in a volumetric flask and dilute to 250.0 mL with *ethanol (90 per cent V/V) R*. Dilute 5.0 mL of this solution to 20.0 mL with *ethanol (90 per cent V/V) R*.

*Test solution.* To 2.0 mL of stock solution add 1.0 mL of *phosphomolybdotungstic reagent R* and 10 mL of *water R*, mix and dilute to 25.0 mL with a 290 g/L solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 mL.

*Reference solution.* Dissolve 80.0 mg of *eugenol R* in *ethanol (90 per cent V/V) R* and dilute to 250.0 mL with the same solvent. Dilute 5.0 mL of the solution to 25.0 mL with *ethanol (90 per cent V/V) R*. To 2.0 mL of this solution add 1.0 mL of *phosphomolybdotungstic reagent R* and 10 mL of *water R*, mix and dilute to 25.0 mL with a 290 g/L solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 mL.

Measure the absorbance (*2.2.25*) of the test solution and the reference solution at 755 nm after 30 min, using *water R* as compensation liquid.

Calculate the percentage content *m/m* of total phenol derivatives expressed as eugenol, using the following expression:

$$\frac{A_1 \times m_2 \times 80}{A_2 \times m_1}$$

$A_1$ = absorbance of the test solution;

$A_2$ = absorbance of the reference solution;

$m_1$ = mass of the mother tincture to be examined, in milligrams;

$m_2$ = mass of eugenol in the reference solution, in milligrams.

**07/2014:2024**

# APIS FOR HOMOEOPATHIC PREPARATIONS[(7)]

## Apis mellifera ad praeparationes homoeopathicas

DEFINITION

Live worker honey bee (*Apis mellifera* L.).

CHARACTERS

Characters described under Identification.

PRODUCTION

If the bee has been exposed to treatment to prevent or cure diseases, appropriate measures are taken to ensure that the levels of residues are as low as possible.

IDENTIFICATION

The body is about 15 mm long, black, with a silky sheen, and covered with red hairs with a touch of grey. The broad tibiae are without spines. The posterior margins of the segments and legs are brown, with gradual transition to orange-red. The claws are two-membered, the maxillary palps single-membered. On the hind legs are baskets or scoops invested with bristles. The wings have 3 complete cubital cells, with the radial cell twice as long as it is wide; the 3 cells on the lower margin and the 3 middle cells are closed. A duct connects the barbed sting with the poison sac.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

PRODUCTION

The mother tincture of *Apis mellifera* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Pale yellow liquid that may darken on storage.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* The mother tincture to be examined.

(7) FRENCH TITLE: Apis mellifica pour préparations homéopathiques

*Reference solution*. Dissolve 12 mg of *4-aminobutanoic acid R*, 12 mg of *leucine R* and 12 mg of *proline R* in 5 mL of *water R* and dilute to 50 mL with *alcohol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *water R*, *ethanol R* (17:63 *V/V*).

*Application*: 20 µL, as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R* and heat at 100-105 °C for 10 min; examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Other zones may also be visible.

# ARSENICUM ALBUM FOR HOMOEOPATHIC PREPARATIONS[8]

## Arsenii trioxidum ad praeparationes homoeopathicas

$As_2O_3$ $M_r$ 197.8
[1327-53-3]

DEFINITION

*Content*: 99.5 per cent to 100.5 per cent of $As_2O_3$.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble to sparingly soluble in water. It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

A. Dissolve 20 mg in 1 mL of *dilute hydrochloric acid R*, add 4 mL of *water R* and 0.1 mL of *sodium sulfide solution R*. The resulting yellow precipitate is soluble in *dilute ammonia R1*.

B. Dissolve 20 mg in 1 mL of *hydrochloric acid R1*, add 5 mL of *hypophosphorous reagent R* and heat for 15 min on a water-bath. A black precipitate develops.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Prepare a 100 g/L solution in *dilute ammonia R1*, heating if necessary.

**Sulfides**: maximum 20 ppm.

Dissolve 1.0 g in 10.0 mL of *dilute sodium hydroxide solution R*. Add 0.05 mL of *lead acetate solution R*. Any colour in the test solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 10.0 mL of a 0.015 g/L solution of *sodium sulfide R* in *dilute sodium hydroxide solution R* and 0.05 mL of *lead acetate solution R*.

ASSAY

Dissolve 40.0 mg in a mixture of 10 mL of *dilute sodium hydroxide solution R* and 10 mL of *water R*. Add 10 mL of *dilute hydrochloric acid R* and 3 g of *sodium hydrogen carbonate R* and mix. Add 1 mL of *starch solution R* and titrate with *0.05 M iodine*.

1 mL of *0.05 M iodine* is equivalent to 4.946 mg of $As_2O_3$.

**07/2018:2141**

# AURUM CHLORATUM NATRONATUM FOR HOMOEOPATHIC PREPARATIONS[9]

## Natrii tetrachloroauras dihydricus ad praeparationes homoeopathicas

$Na[AuCl_4],2H_2O$ $M_r$ 397.8
[13874-02-7]

DEFINITION

Sodium tetrachloroaurate(1-) dihydrate.

*Content*: 97.0 per cent to 101.0 per cent of $Na[AuCl_4],2H_2O$.

CHARACTERS

*Appearance*: orange-yellow, hygroscopic powder or crystals.

*Solubility*: very soluble or freely soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 20 mg in 2.0 mL of *0.1 M nitric acid*. Add 0.1 g of *oxalic acid R* and boil in a water-bath for 1 h. A deposit of metallic gold is formed.

B. Solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

C. Solution S gives reaction (b) of sodium (*2.3.1*).

TESTS

**Solution S**. Ignite 0.20 g in a porcelain crucible at 600 °C ± 50 °C for 30 min. Allow to cool and extract with 3 mL of *water R*, heating if necessary. Use the supernatant.

**Free hydrochloric acid**. When a glass rod impregnated with *concentrated ammonia R* is held close to the substance to be examined, no white fumes are produced.

(8) FRENCH TITLE: Arsenicum album pour préparations homéopathiques
(9) FRENCH TITLE: Aurum muriaticum natronatum pour préparations homéopathiques

**Nitrates**: maximum 200 ppm.

Dissolve 0.20 g in 4.0 mL of *nitrate-free water R*. Add 0.6 g of *zinc R* and 10 mL of *dilute sulfuric acid R*. Heat the solution on a water-bath for 30 min, allow to cool and filter. Rinse the filter with *nitrate-free water R* and dilute the filtrate to 20.0 mL with the same solvent. To 5.0 mL of this solution add 0.4 mL of a 100 g/L solution of *potassium chloride R*, 0.1 mL of *diphenylamine solution R* and, dropwise with shaking, 5.0 mL of *nitrogen-free sulfuric acid R*. Heat in a water-bath at 50 °C for 15 min, centrifuge if necessary and use the clear supernatant. Any blue colour in the solution is not more intense than that in a reference solution prepared at the same time and in the same manner using a mixture of 1.0 mL of *nitrate standard solution (10 ppm $NO_3$) R* and 3.0 mL of *nitrate-free water R*.

ASSAY

Dissolve 40.0 mg in 10 mL of *potassium iodide solution R*. Allow to stand for 5 min. Titrate with *0.01 M sodium thiosulfate* until decolourised. Shortly before reaching the endpoint, add 0.5 mL of *starch solution R*.

1 mL of *0.01 M sodium thiosulfate* is equivalent to 1.989 mg of $Na[AuCl_4],2H_2O$.

STORAGE

In an airtight container, protected from light.

**01/2017:2142**

# BARIUM CHLORATUM FOR HOMOEOPATHIC PREPARATIONS(10)

## Barii chloridum dihydricum ad praeparationes homoeopathicas

$BaCl_2,2H_2O$ $M_r$ 244.3
[10326-27-9]

DEFINITION

*Content*: 99.0 per cent to 101.0 per cent of $BaCl_2,2H_2O$.

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, very slightly soluble or practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 0.1 g in 1 mL of *water R*. Add 0.3 mL of *dilute sulfuric acid R*. A white precipitate is formed; it is insoluble in *dilute hydrochloric acid R* and in *dilute nitric acid R*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in *water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.1 mL of *phenolphthalein solution R*. Not more than 0.2 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

ASSAY

Dissolve 0.200 g in 100 mL of *water R*. Add 100 mL of *methanol R*, 10 mL of *concentrated ammonia R* and 2 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* until the colour changes from violet to colourless.

1 mL of *0.1 M sodium edetate* is equivalent to 24.43 mg of $BaCl_2,2H_2O$.

**01/2016:2489**
**corrected 10.0**

# BELLADONNA FOR HOMOEOPATHIC PREPARATIONS(11)

## Atropa belladonna ad praeparationes homoeopathicas

DEFINITION

Whole, fresh, flowering plant of *Atropa belladonna* L., harvested at the end of flowering, with the ligneous base of the stems removed.

IDENTIFICATION

The root crown is short, thick, cylindrical, with one or more heads, and with many branching roots extending from it; these are grey or brown, fleshy, cylindrical or fusiform, very rarely twisted. The erect stem of the youngest part is cylindrical and pubescent. The petiolate leaves are alternate, simple, oval, attenuated at both ends, lacking stipules, with pinnate venation, up to 20 cm long and 10 cm wide; on the flowering stems they are paired and unequal in size. The drooping, pedunculate, solitary flowers appear between the petioles of the paired leaves; they are actinomorphous, pentameric, with superior ovaries; they have a gamosepalous, glandular, green calyx, which grows larger after flowering. The corolla, 2-3 cm long, is campanulate, gamopetalous, greenish-yellow with violet veins in the upper part; it is hairy and deciduous, divided into 5 narrow, rounded lobes. The 5 alternipetalous stamens, attached at the base of the corolla, have long filaments which are hairy in the lower part; they bear bilocular, introrse anthers which dehisce longitudinally. The superior ovary consists of 2 carpels with axile placentation. The style is simple, ending in a slightly cordiform stigma, extending beyond the stamens. The fruit is a spherical, fleshy berry, the size of a cherry, green then black and shiny when ripe. The seeds are numerous, reniform with a testa showing markings.

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent.

**Loss on drying** (*2.2.32*): minimum 75.0 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

*Content*: 0.020 per cent *m/m* to 0.050 per cent *m/m* of hyoscyamine ($C_{17}H_{23}NO_3$; $M_r$ 289.4).

(10) FRENCH TITLE: Baryta muriatica pour préparations homéopathiques
(11) FRENCH TITLE: Belladonna pour préparations homéopathiques

PRODUCTION

The mother tincture is prepared from the comminuted herbal drug according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.3;
- method 1.1.10, using ethanol (45 per cent *V/V*) and a maceration time of 3-5 weeks.

CHARACTERS

*Appearance*: brown liquid.

IDENTIFICATION

Examine the chromatograms obtained in the test for atropine.

*Detection A*: spray with *potassium iodobismuthate solution R2* until orange or brown zones become visible against a yellow background. Examine in daylight.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present, in particular in the middle of the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| Hyoscine: an orange or brown zone | An orange or brown zone, sometimes very faint or absent (hyoscine) |
| _____ | _____ |
| _____ | _____ |
| Hyoscyamine: an orange or brown zone | An orange or brown zone (hyoscyamine) |
| **Reference solution** | **Test solution** |

The zone due to hyoscine in the chromatogram obtained with the reference solution and that with the same $R_F$ in the chromatogram obtained with the test solution are located at the limit between the middle third and the upper third and they may therefore appear in either part of the chromatogram.

TESTS

**Relative density** (*2.2.5*): 0.932 to 0.947 when method 1.1.3 is used.

**Ethanol** (*2.9.10*): 40 per cent *V/V* to 50 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 1.4 per cent.

**Mother tincture of Hyoscyamus niger – mother tincture of Datura stramonium.**

Concentrate 10 mL of the mother tincture to be examined on a water bath until a volume of 5 mL is obtained. Add 10 mL of *water R* and filter. Shake the filtrate with 5 mL of *methylene chloride R* and collect the organic layer. Filter and evaporate the filtrate to dryness under reduced pressure. Take up the residue with 10 mL of hot *water R*, and add 0.1 mL of *dilute ammonia R1*. A greenish-blue fluorescence appears when examined under ultraviolet light at 365 nm.

The absence of greenish-blue fluorescence indicates substitution by the mother tincture of Hyoscyamus niger and/or by the mother tincture of Datura stramonium.

**Atropine**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Evaporate 10 mL of the mother tincture to be examined on a water-bath. Take up the residue with 5 mL of *dilute sulfuric acid R1* and filter. Make alkaline with *concentrated ammonia R* and extract with 15 mL of *1,1-dimethylethyl methyl ether R*. Dry the ether layer over *anhydrous sodium sulfate R* and filter. Evaporate to dryness on a water-bath and dissolve the residue in 1 mL of *methanol R*.

*Reference solution*. Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R* (solution A). Dissolve 15 mg of *hyoscine hydrobromide R* in 10 mL of *methanol R* (solution B). To 8 mL of solution A add 1.8 mL of solution B and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: at 105 °C for 15 min; allow to cool.

*Detection B*: after detection A (see Identification), spray with *sodium nitrite solution R* until the yellow background disappears. Examine in daylight.

*Result B*: no greyish-blue zone (atropine) appears in place of the brown or reddish-brown zone due to hyoscyamine in the chromatogram obtained with the test solution.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Introduce 1.500 g of the mother tincture to be examined into a volumetric flask and dilute to 10.0 mL with *water for chromatography R*. Apply the mixture to a cartridge filled with a cation-exchange material (60 µm; 60 mg), pre-conditioned with 2 mL of *methanol R2* and then 2 mL of *water for chromatography R*. Rinse the volumetric flask with 1 mL of a mixture of 2 volumes of *anhydrous formic acid R* and 98 volumes of *water for chromatography R*, and apply the rinsings to the cartridge. Wash the cartridge with 2 mL of a mixture of 2 volumes of *anhydrous formic acid R* and 98 volumes of *water for chromatography R* and then with 2 mL of *methanol R2*. Dry the cartridge with the aid of a vacuum and elute with 3.5 mL of a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R2*. Expel the solvent remaining in the cartridge into the eluate, add 40 µL of *glacial acetic acid R* and dilute to 5.0 mL with *water for chromatography R*.

*Reference solution (a)*. Dissolve 10.0 mg of *hyoscyamine sulfate CRS* in *methanol R2* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 10.0 mg of *hyoscine hydrobromide R* in *methanol R2* and dilute to 10.0 mL with the same solvent.

*Reference solution (c)*. Mix 3.0 mL of reference solution (a) and 2.5 mL of reference solution (b) and dilute to 25.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *triethylamine R*, *acetonitrile for chromatography R*, *phosphate buffer solution pH 7.0 R6* (0.01:5:95 *V/V/V*);
- *mobile phase B*: *triethylamine R*, *phosphate buffer solution pH 7.0 R6*, *acetonitrile for chromatography R* (0.01:40:60 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 90 | 10 |
| 5 - 20 | 90 → 10 | 10 → 90 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL of the test solution and reference solution (c).

Homoeopathic preparations

*Retention time*: hyoscyamine = about 12 min; hyoscine = about 13.5 min.

*System suitability*: reference solution (c):

- *resolution*: minimum 5 between the peaks due to hyoscyamine and hyoscine;
- *symmetry factor*: maximum 2.0 for the peak due to hyoscyamine.

Calculate the percentage content *m/m* of hyoscyamine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 16.667}$$

$A_1$ = area of the peak due to hyoscyamine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to hyoscyamine in the chromatogram obtained with reference solution (c);

$m_1$ = mass of the mother tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *hyoscyamine sulfate CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of anhydrous hyoscyamine in *hyoscyamine sulfate CRS*.

**07/2014:2143**

# CADMIUM SULFURICUM FOR HOMOEOPATHIC PREPARATIONS(12)

## Cadmii sulfas hydricus ad praeparationes homoeopathicas

$CdSO_4,8/3H_2O$ $M_r$ 256.5

DEFINITION

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives reaction (a) of sulfates (*2.3.1*).

B. To 2 mL of solution S (see Tests) add 2 mL of *sodium sulfide solution R*. A yellow precipitate is formed.

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.3 mL of *methyl orange solution R*. Not more than 0.5 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Nitrates**: maximum 100 ppm.

Dissolve 1.0 g in *water R* and dilute to 20.0 mL with the same solvent. To 1.0 mL of this solution add 0.2 mL of a 10 g/L solution of *sulfanilic acid R* in *acetic acid R* and 0.2 mL of a recently prepared 3 g/L solution of *naphthylamine R* in *acetic acid R*. Add a turning of *zinc R*. A pink colour is produced within 5 min. It is not more intense than that of a mixture of 0.5 mL of *nitrate standard solution (10 ppm $NO_3$) R* and 0.5 mL of *water R*, prepared at the same time.

**Zinc sulfate, alkaline-earth sulfates, rare-earth sulfates**. Dissolve 1.0 g in 17 mL of *water R*. Add 0.5 mL of *hydrochloric acid R* and 1 g of *thioacetamide R*. Heat in a water-bath for 10 min. Dilute to 20.0 mL with *water R* and filter. Evaporate 10.0 mL of this solution to dryness in an oven. Ignite the residue at about 800 ± 50 °C to constant mass. The residue weighs a maximum of 2 mg.

**Arsenic** (*2.4.2, Method A*): maximum 2 ppm, determined on 5 mL of solution S.

**Water** (*2.5.12*): 16.0 per cent to 20.0 per cent, determined on 80 mg. Shake for 10 min before carrying out the determination.

ASSAY

Dissolve 0.200 g in 50 mL of *water R*. Add 10 mL of *ammonium chloride buffer solution pH 10.0 R* and 50 mg of *mordant black 11 triturate R1*. Titrate with *0.1 M sodium edetate* until the colour changes from red to green.

1 mL of *0.1 M sodium edetate* is equivalent to 20.85 mg of $CdSO_4$.

**07/2018:2996**

# CALCIUM FLUORATUM FOR HOMOEOPATHIC PREPARATIONS(13)

## Calcii fluoridum ad praeparationes homoeopathicas

$CaF_2$ $M_r$ 78.1
[7789-75-5]

DEFINITION

*Content*: 98.0 per cent to 102.0 per cent of $CaF_2$.

CHARACTERS

*Appearance*: fine, white or almost white powder.

*Solubility*: practically insoluble in water, slightly soluble in mineral acids.

IDENTIFICATION

A. To 0.80 g add 20 mL of *hydrochloric acid R* and heat to boiling under a reflux condenser until complete dissolution (about 30 min). After cooling, add 0.1 mL of *phenolphthalein solution R*, and then *concentrated ammonia R* until a pink colour is obtained. Add *glacial acetic acid R* until the solution is decolourised, then add 1 mL in excess. Filter and dilute to 40 mL with *water R*. Dilute 1 mL of the solution obtained to 5 mL with *distilled water R* and add 2 mL of *ammonium oxalate solution R*. A white precipitate is formed which dissolves in 2 mL of *dilute hydrochloric acid R*.

B. In a lead or platinum crucible, mix 10 mg with 20 mg of *anhydrous colloidal silica R* and a few drops of *sulfuric acid R*, with the aid of a copper wire, in order to give a thin slurry. Cover the crucible with a thin, transparent plate of plastic under which a drop of *water R* is suspended, and warm gently. A white ring is rapidly formed around the drop of water.

(12) FRENCH TITLE: Cadmium sulfuricum pour préparations homéopathiques
(13) FRENCH TITLE: Calcarea fluorica pour préparations homéopathiques

TESTS

**Free acid**. Shake 5.0 g with 2 g of *calcium chloride R* and 100 mL of *water R* for 5 min. Heat to 70 °C and filter. To 40 mL of the filtrate, maintained at 70 °C, add 0.1 mL of *methyl red solution R*. Not more than 1.0 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator to yellow.

ASSAY

Introduce 0.150 g into a 500 mL conical flask and add 8 mL of *hydrochloric acid R*. Boil for 3-4 min on a preheated hot plate and allow to cool. Add 300 mL of *water R*, followed by *strong sodium hydroxide solution R* until the first appearance of persistent opalescence (about pH 14). Add 0.13 g of *calconecarboxylic acid triturate R* and titrate with *0.1 M sodium edetate* until the colour changes from red-violet to pure blue. The opalescence caused by the strong sodium hydroxide solution disappears during the course of the titration. If still visible at the end of the titration, it can be dissolved by adding a few drops of *hydrochloric acid R*.

1 mL of *0.1 M sodium edetate* is equivalent to 7.81 mg of $CaF_2$.

**01/2017:2144**

# CALCIUM IODATUM FOR HOMOEOPATHIC PREPARATIONS(14)

## Calcii iodidum tetrahydricum ad praeparationes homoeopathicas

$CaI_2,4H_2O$ $M_r$ 366.0
[13640-62-5]

DEFINITION

*Content*: 97.0 per cent to 102.0 per cent of $CaI_2$ (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, very hygroscopic powder.

*Solubility*: very soluble or freely soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of calcium (*2.3.1*).

B. Solution S (see Tests) gives reaction (b) of iodides (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in *distilled water R* and dilute to 100.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_5$ (*2.2.2, Method II*).

**Free iodine, iodates**. To 5 mL of solution S add 2 mL of *methylene chloride R*. Shake and allow to stand. The organic layer is colourless (*2.2.2, Method I*) (free iodine). Add 0.2 mL of *dilute sulfuric acid R*. Shake and allow to stand. The organic layer remains colourless (*2.2.2, Method I*) (iodates).

**Sulfates** (*2.4.13*): maximum 150 ppm.

Dilute 10 mL of solution S to 15 mL with *distilled water R*.

**Iron** (*2.4.9*): maximum 10 ppm, determined on 10 mL of solution S.

**Water** (*2.5.12*): 18.0 per cent to 22.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.300 g in 50 mL of *water R*. Add 5 mL of *dilute nitric acid R* and 25.0 mL of *0.1 M silver nitrate*. Shake. Add 2 mL of *ferric ammonium sulfate solution R2* and titrate with *0.1 M ammonium thiocyanate* until the colour changes to reddish-yellow.

1 mL of *0.1 M silver nitrate* is equivalent to 14.70 mg of $CaI_2$.

STORAGE

In an airtight container.

**07/2014:2486**
**corrected 10.0**

# COCCULUS FOR HOMOEOPATHIC PREPARATIONS(15)

## Anamirta cocculus ad praeparationes homoeopathicas

DEFINITION

Dried, ripe fruit of *Anamirta cocculus* (L.) Wight & Arn. (syn. *A. paniculata* Colebr.).

*Content*: minimum 0.80 per cent of picrotoxinin ($C_{15}H_{16}O_6$; $M_r$ 292.3) (dried drug).

IDENTIFICATION

*First identification: A, B, D.*

*Second identification: A, B, C.*

A. The fruits are dark greyish-brown or black, reniform or sub-spherical, about 6-10 mm in diameter and 9-12 mm long; the outer surface is irregularly wrinkled with a ridge about 4-6 mm long running between the pale, circular scar left by the stalk and the small beak of the remains of the stigma. The pericarp is hard, about 1 mm thick and the inner surface is brownish-grey, hard and woody. Cut transversely, the fruit shows a single, cup-shaped seed into the hollow of which an ingrowth of the mesocarp and endocarp projects. Cut longitudinally, the endosperm shows the presence of 2 narrow cavities in each of which is enclosed 1 of the foliaceous cotyledons.

B. Microscopic examination (*2.8.23*). Reduce to a powder (710) (*2.9.12*). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2486.-1): fragments of the epicarp (surface view [D]) consisting of thin-walled, polygonal cells, about 30-50 µm in diameter [Da], anomocytic stomata (*2.8.3*) [Db], and cells in a pattern consisting of a cell with slightly thickened walls, pitted at the centre, surrounded by 4-6 cells [Dc]; fragments of the epicarp and outer layers of the mesocarp (transverse section [C]) showing the epicarp covered by a fine cuticle [Ca] and cells of the mesocarp, ovoid or rounded, some containing prisms of calcium oxalate [Cb]; numerous fragments of the inner layers of the mesocarp and of the endocarp [A] consisting of sclereids [Aa] and short fibres with pitted walls [Ab]; fragments of the endocarp consisting of layers of variously oriented fibres (surface view [E]); sclereids and isolated fibres [B]; vascular bundles (longitudinal section [F]), accompanied by fibres [Fa]; fragments of the endosperm [G, H] containing very numerous small acicular crystals.

(14) FRENCH TITLE: Calcarea iodata pour préparations homéopathiques
(15) FRENCH TITLE: Cocculus indicus pour préparations homéopathiques

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2.00 g of the powdered herbal drug (710) (*2.9.12*) add 20 mL of *ethanol (90 per cent V/V) R*, shake for 2 h and then centrifuge (1000 *g*). Use the supernatant.

*Reference solution.* Dissolve 10 mg of *picrotin R* and 10 mg of *picrotoxinin R* in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *methanol R*, *ethyl acetate R*, *heptane R* (10:40:50 *V/V/V*).

*Application*: 40 µL [or 10 µL] as bands of 20 mm [or 10 mm].

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: spray with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine immediately in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Above the zone due to picrotoxinin, several pink or violet zones may also be visible in the chromatogram obtained with the test solution.

| **Top of the plate** | |
|---|---|
| Picrotoxinin: a blue zone | A blue zone (picrotoxinin) |
| Picrotin: a blue zone | A blue zone (picrotin) |
| **Reference solution** | **Test solution** |

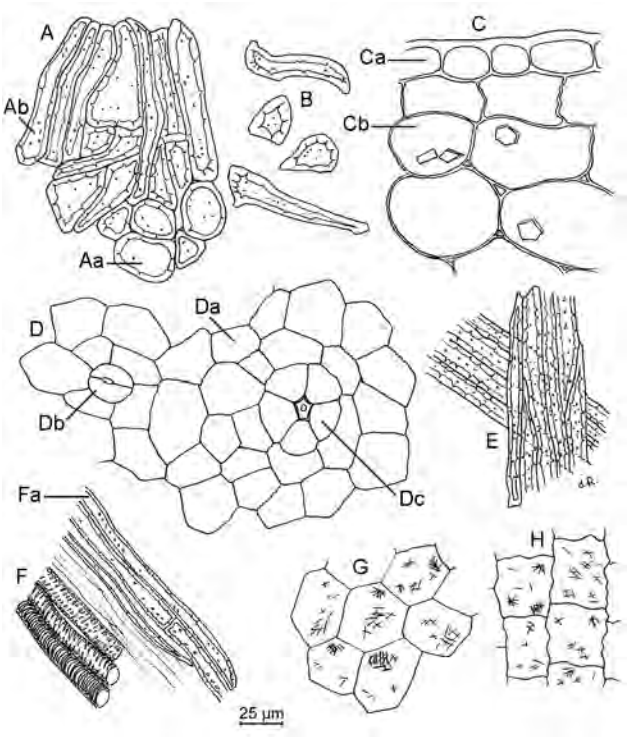

Figure 2486.-1. – *Illustration for identification test B of powdered herbal drug of Cocculus*

D. Examine the chromatograms obtained in the assay.

*Results*: the peaks due to picrotoxinin and picrotin in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with the reference solution.

TESTS

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 2.000 g of the powdered herbal drug (710) (*2.9.12*) add 20.0 mL of *ethanol (90 per cent V/V) R*, shake for 2 h and then centrifuge at 1000 *g* for 5 min. Dilute 2.0 mL of the supernatant to 20.0 mL with the mobile phase and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution.* Dissolve 5.0 mg of *picrotin CRS* and 5.0 mg of *picrotoxinin CRS* in 10.0 mL of *acetonitrile R*. Dilute 2.0 mL of the solution to 20.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *acetonitrile R1*, *water R* (30:70 *V/V*).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 200 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of *picrotoxinin CRS*.

*Retention time*: picrotin = about 6 min; picrotoxinin = about 9.5 min.

*System suitability:* reference solution:

– *resolution*: minimum 2.0 between the peaks due to picrotin and picrotoxinin.

Calculate the percentage content of picrotoxinin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to picrotoxinin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to picrotoxinin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *picrotoxinin CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of picrotoxinin in *picrotoxinin CRS*.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

*Content*: 0.07 per cent *m/m* to 0.15 per cent *m/m* of picrotoxinin ($C_{15}H_{16}O_6$).

PRODUCTION

The mother tincture is prepared from the dried, ripe fruit of *A. cocculus* (L.) Wight & Arn. according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.8 using the powdered herbal drug (710) (*2.9.12*) and ethanol (90 per cent *V/V*); use ethanol (70 per cent *V/V*) to prepare the 4th decimal dilution and ethanol (50 per cent *V/V*) for subsequent dilutions;
- method 1.1.10 using the crushed drug in fragments of about 2-3 mm, ethanol (90 per cent *V/V*) and a maceration time of about 3 weeks.

CHARACTERS

*Appearance*: yellow or dark yellow liquid.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*) as described in identification test C for the herbal drug with the following modification.

*Test solution.* The mother tincture to be examined.

B. Examine the chromatograms obtained in the assay.

*Results*: the peaks due to picrotoxinin and picrotin in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with the reference solution.

TESTS

**Relative density** (*2.2.5*): 0.830 to 0.845 when method 1.1.8 is used.

**Ethanol** (*2.9.10*): 85 per cent *V/V* to 95 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 0.7 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the assay of the herbal drug with the following modification.

*Test solution.* Dilute 0.500 g of the mother tincture to be examined to 10.0 mL with the mobile phase and filter using a membrane filtre (nominal pore size 0.45 µm).

Calculate the percentage content of picrotoxinin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$ = area of the peak due to picrotoxinin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to picrotoxinin in the chromatogram obtained with the reference solution;

$m_1$ = mass of the mother tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *picrotoxinin CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of picrotoxinin in *picrotoxinin CRS*.

**07/2014:1624**

# CROCUS FOR HOMOEOPATHIC PREPARATIONS(16)

## Croci sativi stigma ad praeparationes homoeopathicas

DEFINITION

Dried stigmas of *Crocus sativus* L. usually joined by the base to a short style.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The dark brick-red stigmas, when dry, are 20 mm to 40 mm long and after soaking with water, about 35 mm to 50 mm long. The tubes, gradually widening at the top, are incised on one side, the upper margin is open and finely crenated. The style connecting the 3 stigmas is pale yellow and not more than 5 mm long.

B. Examine under a microscope using *chloral hydrate solution R*. It shows the following diagnostic characters: elongated epidermal cells, frequently with a short, central papilla; in water they release a yellow colouring matter; the upper border of the stigma has finger-shaped papillae, up to 150 µm long; between them are single, globular pollen grains, about 100 µm wide, with a finely pitted exine, vascular bundles with small spirally thickened vessels and no fibres.

C. Carefully crush pieces of the herbal drug to coarse particles and moisten with 0.2 mL of *phosphomolybdic acid solution R*. The particles turn blue within 1-2 min or they have a blue areole around them.

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Carefully crush 0.1 g of the herbal drug with a glass rod and moisten with 0.2 mL of *water R*. After 3 min add 5 mL of *methanol R*, allow to stand for 20 min, protected from light, and filter through a plug of glass wool.

*Reference solution.* Dissolve 5 mg of *naphthol yellow R* in 5 mL of *methanol R* and add a solution of 5 mg of *Sudan red G R* in 5 mL of *methylene chloride R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *water R*, *2-propanol R*, *ethyl acetate R* (10:25:65 *V/V/V*).

*Application*: 10 µL of the test solution and 5 µL of the reference solution as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection A*: examine in daylight.

*Results A*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| A red zone | |
| A yellow zone | |
| | 2 yellow zones |
| | An intense yellow zone (crocine) |
| **Reference solution** | **Test solution** |

*Detection B*: examine in ultraviolet light at 254 nm.

Homoeopathic preparations

*Results B*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| A red zone | 1 or 2 quenching zones |
| A yellow zone | A quenching zone |
| **Reference solution** | **Test solution** |

*Detection C*: treat with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

*Results C*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| A red zone | 1 or 2 red to reddish-violet zones |
| A blue to bluish-green zone | A red to reddish-violet zone |
| | 2 blue to bluish-green zones |
| | An intense blue to bluish-green zone (crocine) |
| **Reference solution** | **Test solution** |

E. Dilute 0.1 mL of the test solution (see Identification D) with 1 mL of *methanol R*. Deposit 0.1 mL of this solution on a filter paper, allow to dry and spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Examine in ultraviolet light at 365 nm. The spot shows an intense orange-yellow fluorescence.

TESTS

**Colouring intensity**. Introduce 0.10 g into a 5 mL volumetric flask and dilute to 5.0 mL with *distilled water R*. Close the flask and shake every 30 min for 8 h. Then allow to stand for 16 h. Dilute 1.0 mL to 500.0 mL with *distilled water R*. The absorbance (*2.2.25*) measured at 440 nm using *distilled water R* as the compensation liquid, is not less than 0.44.

**Foreign matter**. Examine the herbal drug microscopically. No parts with rough walls, no crystals and no pollen grains containing 3 germinal pores are present.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 7.0 per cent, determined on the residue obtained in the test for loss on drying.

**07/2014:2146**

# CUPRUM ACETICUM FOR HOMOEOPATHIC PREPARATIONS(17)

## Cupri acetas monohydricus ad praeparationes homoeopathicas

$Cu(C_2H_3O_2)_2,H_2O$ $M_r$ 199.7
[6046-93-1]

(17) FRENCH TITLE: Cuprum aceticum pour préparations homéopathiques

DEFINITION

*Content*: 99.0 per cent to 101.0 per cent of $Cu(C_2H_3O_2)_2,H_2O$.

CHARACTERS

*Appearance*: greenish-blue crystals or green powder.

*Solubility*: soluble in water, slightly soluble or very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives reaction (a) of acetates (*2.3.1*).

B. Dissolve 0.1 g in 10 mL of *water R* and add *dilute ammonia R1* dropwise. A dark blue colour is produced.

TESTS

**Solution S**. Dissolve 3.0 g in a mixture of 40 mL of *distilled water R* and 0.6 mL of *glacial acetic acid R*, with heating at 70 °C. Cool and dilute to 45 mL with *distilled water R*.

**Appearance of solution**. Solution S is clear (*2.2.1*).

**Impurities not precipitating with hydrogen sulfide**: maximum 0.1 per cent, calculated as sulfates.

To 2.000 g add 92 mL of *water R* and 8.0 mL of *dilute sulfuric acid R*. Heat to 70 °C. Pass a current of *hydrogen sulfide R* until there is no longer precipitation of copper sulfide. Allow to cool and stand, then filter. Evaporate to dryness 50.0 mL of the filtrate in a crucible. Ignite the residue at about 600 ± 50 °C to constant mass.

**Chlorides** (*2.4.4*): maximum 50 ppm, determined on solution S.

**Sulfates** (*2.4.13*): maximum 150 ppm, determined on solution S.

**Iron** (*2.4.9*): maximum 20 ppm.

Dissolve 0.500 g in 10 mL of *water R*. Transfer to a separating funnel. Add 20 mL of *hydrochloric acid R1* and 10 mL of *methyl isobutyl ketone R*. Shake vigorously for 3 min. Allow to stand. Transfer the organic layer to a second separating funnel and add 10 mL of *water R*. Shake vigorously for 3 min. Allow to stand. The aqueous layer complies with the limit test for iron.

**Nickel**: maximum 10 ppm.

To the residue obtained in the test for impurities not precipitating with hydrogen sulfide, add 2.0 mL of *hydrochloric acid R* and 1.0 mL of *sulfuric acid R*. Evaporate to dryness. Dissolve the residue in a mixture of 3.0 mL of *dilute sulfuric acid R* and 17.0 mL of *water R*. To 4.0 mL of this solution add 4.0 mL of *water R*, 5.0 mL of *bromine water R*, 7.0 mL of *dilute ammonia R1* and 3.0 mL of a 10 g/L solution of *dimethylglyoxime R* in *ethanol (90 per cent V/V) R*. This solution is not more intensely coloured within 1 min than a solution prepared as follows: mix 4.0 mL of a 1 ppm solution of nickel (Ni) prepared from *nickel standard solution (10 ppm Ni) R*, 4.0 mL of *water R* and 5.0 mL of *bromine water R*; carefully add 7.0 mL of *dilute ammonia R1* and 3.0 mL of a 10 g/L solution of *dimethylglyoxime R* in *ethanol (90 per cent V/V) R*.

ASSAY

Dissolve 0.400 g in *water R* and dilute to 50 mL with the same solvent. Add 6.0 mL of *glacial acetic acid R*, 10.0 g of *potassium iodide R* and 1 mL of *starch solution R*. Titrate with *0.1 M sodium thiosulfate*.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 19.97 mg of $Cu(C_2H_3O_2)_2,H_2O$.

**04/2016:1610**

# CUPRUM METALLICUM FOR HOMOEOPATHIC PREPARATIONS[18]

## Cuprum ad praeparationes homoeopathicas

Cu $A_r$ 63.5
[7440-50-8]

DEFINITION

*Content*: 98.0 per cent to 102.0 per cent of Cu.

CHARACTERS

*Appearance*: reddish-brown powder.

*Solubility*: practically insoluble in water, soluble in nitric acid, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. To 2 mL of solution S (see Tests) add 0.5 mL of *potassium ferrocyanide solution R*. A reddish-brown precipitate is formed.

B. To 5 mL of solution S add 0.6 mL of *ammonia R*. A blue precipitate is formed. Add 2 mL of *ammonia R*. The precipitate disappears; the solution has an intense blue colour.

TESTS

**Solution S**. Dissolve 2.0 g in 10 mL of *nitric acid R*. After nitrous fumes are no longer evolved, dilute to 60 mL with *distilled water R*.

**Acidity or alkalinity**. To 5.0 g add 20 mL of *carbon dioxide-free water R*. Boil for 1 min. Cool. Filter and dilute to 25.0 mL with *carbon dioxide-free water R*. To 10 mL of the solution add 0.1 mL of *bromothymol blue solution R1*. Not more than 0.5 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Chlorides** (*2.4.4*): maximum 100 ppm, determined on solution S.

**Sulfates** (*2.4.13*): maximum 300 ppm, determined on solution S.

**Iron**: maximum 50 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 1.00 g in 5 mL of *nitric acid R* and dilute to 50.0 mL with *water R*.

*Reference solutions.* Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluted as necessary with a 1 per cent *V/V* solution of *nitric acid R*.

*Source*: iron hollow-cathode lamp.

*Wavelength*: 248.3 nm.

*Flame*: air-acetylene.

**Lead**: maximum 100 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Use the test solution prepared for the test for iron.

*Reference solutions.* Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluted as necessary with a 1 per cent *V/V* solution of *nitric acid R*.

*Source*: lead hollow-cathode lamp.

*Wavelength*: 283.3 nm.

*Flame*: air-acetylene.

**Zinc**: maximum 50 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Use the test solution prepared for the test for iron.

*Reference solutions.* Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluted as necessary with a 1 per cent *V/V* solution of *nitric acid R*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Flame*: air-acetylene.

ASSAY

Dissolve 0.100 g in 5 mL of *nitric acid R*. Heat to expel the nitrous fumes. Add 200 mL of *water R* and neutralise (*2.2.3*) with *dilute ammonia R1*. Add 1 g of *ammonium chloride R* and 3 mg of *murexide R*. Titrate with *0.1 M sodium edetate* until the colour changes from green to violet.

1 mL of *0.1 M sodium edetate* is equivalent to 6.354 mg of Cu.

**01/2019:2705**

# DIGITALIS FOR HOMOEOPATHIC PREPARATIONS[19]

## Digitalis purpurea ad praeparationes homoeopathicas

DEFINITION

Fresh leaf of *Digitalis purpurea* L, collected just before or during flowering.

IDENTIFICATION

A. The flower is light to dark violet. The leaf is variable in size, usually 10-50 cm long and 4-15 cm wide, simple, entire, lanceolate, oblong, and ending in a subacute apex. The margins of the lamina are crenate or dentate. It is thick with a velvety or rough texture. The lamina is decurrent, attenuated along the midrib, the whole forming a winged, triangular petiole, with purple-pink spots at the base. The venation is pinnate, with the lateral veins leaving the midrib at about 45°; they anastomose near the leaf margin forming arcs, and are connected to each other by an extensive network of tertiary veinlets. The upper surface is greyish-green and pubescent, but sometimes almost glabrous. The veins are sunken, forming depressed lines around bulging areas in the lamina. The lower surface is paler and very tomentose; the whitish veins are prominent giving the surface a honeycomb-like appearance.

B. From non-flowering plants, take a fragment of the lower epidermis of the leaf. Examine under a microscope using *chloral hydrate solution R*. The leaf has a smooth cuticle and shows the following diagnostic characters: epidermal cells 30-75 µm long, with distinctly sinuous anticlinal walls; numerous anomocytic stomata (*2.8.3*); covering trichomes often articulated and bent at right angles, uniseriate, usually with 3-5 cells, sometimes collapsed, and a terminal cell covered in a sometimes smooth but usually verrucose or slightly striated cuticle; glandular trichomes with unicellular stalks and globular bicellular heads; glandular trichomes with multicellular, uniseriate stalks and unicellular heads.

TESTS

**Foreign matter** (*2.8.2*): maximum 5 per cent.

(18) FRENCH TITLE: Cuprum metallicum pour préparations homéopathiques
(19) FRENCH TITLE: Digitalis purpurea pour préparations homéopathiques

***Digitalis lanata***. The presence of brownish-yellow flowers, of oval lanceolate, narrow leaves, with entire margins or with dentate margins only near the apex, the existence of a few glandular trichomes of epidermal cells with very characteristic beaded walls, and the absence of covering trichomes, indicates adulteration with *Digitalis lanata* Ehrh.

***Digitalis lutea***. The presence of brownish-yellow flowers, of sessile, lanceolate, denticulate, almost glabrous leaves and the scarcity of smooth covering trichomes, indicates adulteration with *Digitalis lutea* L.

***Digitalis grandiflora***. The presence of brownish-yellow flowers, of oblong or oval leaves with serrate margins, non-reticulate venation and veins bearing rare, very large covering trichomes with large pits, indicates adulteration with *Digitalis grandiflora* All.

**Loss on drying** (*2.2.32*): minimum 70.0 per cent, determined on 5.0 g of the comminuted herbal drug by drying in an oven at 105 °C for 2 h.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

The mother tincture is prepared from the fresh leaf of *Digitalis purpurea* L, collected just before or during flowering.

*Content*: 0.003 per cent *m/m* to 0.013 per cent *m/m* of digitoxin ($C_{41}H_{64}O_{13}$; $M_r$ 765).

PRODUCTION

The mother tincture is prepared from the comminuted herbal drug according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.3;
- method 1.1.10, using ethanol (65 per cent *V/V*) and a maceration time of 3-5 weeks.

CHARACTERS

*Appearance*: light greenish-brown or brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution*. Evaporate 10 mL of the mother tincture to be examined to dryness under reduced pressure. Take up the residue in 1 mL of a mixture of equal volumes of *ethyl acetate R* and *methanol R*.

*Reference solution*. Dissolve 5 mg of *digitoxin R* and 2 mg of *gitoxin R* in a mixture of equal volumes of *ethyl acetate R* and *methanol R*, and dilute to 10 mL with the same mixture of solvents.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *water R*, *methanol R*, *ethyl acetate R* (7.5:10:75 *V/V/V*).

*Application*: 20 µL [or 10 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with a mixture of 2 volumes of a 10 g/L solution of *chloramine R* and 8 volumes of a 250 g/L solution of *trichloroacetic acid R* in *ethanol (96 per cent) R*, then heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Digitoxin: a bluish-green fluorescent zone | A bluish-green fluorescent zone (digitoxin) |
| Gitoxin: a light blue fluorescent zone | A light blue fluorescent zone (gitoxin) |
| ——— | ——— |
| | A faint brownish-yellow fluorescent zone may be present |
| | A faint light blue fluorescent zone may be present |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.935 to 0.955 when method 1.1.3 is used.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 2.5 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Dilute 8.0 g of the mother tincture to be examined to 10.0 mL with *water for chromatography R* and filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution (a)*. Dissolve 10.0 mg of *digitoxin for LC assay CRS* in *methanol R2* and dilute to 10.0 mL with the same solvent. Dilute 2.00 mL of the solution to 20.0 mL with a mixture of equal volumes of *methanol R2* and *water for chromatography R*.

*Reference solution (b)*. Dissolve 10.0 mg of *lanatoside C R* and 10.0 mg of *digoxin R* in *methanol R2* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with a mixture of equal volumes of *methanol R2* and *water for chromatography R*.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *water for chromatography R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 80 | 20 |
| 2 - 32 | 80 → 40 | 20 → 60 |
| 32 - 33 | 40 → 80 | 60 → 20 |
| 33 - 38 | 80 | 20 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL.

*Retention time*: digitoxin = about 25 min.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to lanatoside C and digoxin.

Calculate the percentage content of digitoxin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$ = area of the peak due to digitoxin in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to digitoxin in the chromatogram obtained with reference solution (a);

$m_1$ = mass of the mother tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *digitoxin for LC assay CRS* used to prepare reference solution (a), in grams;

$p$ = percentage content of *digitoxin for LC assay CRS*.

**07/2014:2026**

# FERRUM METALLICUM FOR HOMOEOPATHIC PREPARATIONS(20)

## Ferrum ad praeparationes homoeopathicas

Fe $A_r$ 55.85
[7439-89-6]

DEFINITION

Iron obtained by reduction or sublimation as a fine blackish-grey powder.

*Content*: 97.5 per cent to 101.0 per cent.

CHARACTERS

*Appearance*: fine, blackish-grey powder, without metallic lustre.

*Solubility*: practically insoluble in water and in ethanol (96 per cent). It dissolves with heating in dilute mineral acids.

IDENTIFICATION

Dissolve 50 mg in 2 mL of *dilute sulfuric acid R* and dilute to 10 mL with *water R*. The solution gives reaction (a) of iron (*2.3.1*).

TESTS

**Solution S**. To 10.0 g add 40 mL of *water R*. Boil for 1 min. Cool, filter and dilute to 50.0 mL with *water R*.

**Alkalinity**. To 10 mL of solution S add 0.1 mL of *bromothymol blue solution R1*. Not more than 0.1 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

**Substances insoluble in hydrochloric acid**. Dissolve 2.00 g in 40 mL of *hydrochloric acid R*. Heat on a water-bath. As soon as fumes are no longer evolved, filter through a sintered-glass filter (16) (*2.1.2*). Rinse with *water R*. Dry the residue in an oven at 100-105 °C for 1 h. The residue weighs a maximum of 20 mg (1.0 per cent).

**Substances soluble in water**. Evaporate 10.0 mL of solution S on a water-bath and dry at 100-105 °C for 1 h. The residue weighs a maximum of 2 mg (0.1 per cent).

**Chlorides** (*2.4.4*): maximum 50 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfides and phosphides**. In a 100 mL conical flask carefully mix 1.0 g with 10 mL of *dilute hydrochloric acid R*. Within 30 s *lead acetate paper R* moistened with *water R* and placed over the mouth of the flask is not coloured more intensely than light brown by the resulting fumes.

**Arsenic** (*2.4.2*): maximum 5 ppm.

Boil 0.2 g in 25 mL of *dilute hydrochloric acid R* until completely dissolved. The solution complies with limit test A.

**Copper**: maximum 50 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. Dissolve 1.00 g in a mixture of 60 mL of *dilute hydrochloric acid R* and 10 mL of *dilute hydrogen peroxide solution R*. Reduce to a volume of 5 mL and dilute to 50.0 mL with *water R*.

*Reference solutions*. Prepare the reference solutions using *copper standard solution (0.1 per cent Cu) R*, diluting with a 1 per cent *V/V* solution of *hydrochloric acid R*.

*Source*: copper hollow-cathode lamp.

*Wavelength*: 324.8 nm.

*Flame*: air-acetylene.

**Lead**: maximum 50 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. In a separating funnel, place 20 mL of the test solution prepared for the test for copper. Add 25 mL of *lead-free hydrochloric acid R*. Stir with 3 quantities, each of 25 mL, of *di-isopropyl ether R*. Collect the aqueous layer. Add 0.10 g of *sodium sulfate decahydrate R*. Evaporate to dryness. Take up the residue with 1 mL of *lead-free nitric acid R* and dilute to 20 mL with *water R*.

*Reference solutions*. Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluting with a 10 per cent *V/V* solution of *nitric acid R* containing 5 g/L of *sodium sulfate decahydrate R*.

*Source*: lead hollow-cathode lamp.

*Wavelength*: 217 nm.

*Flame*: air-acetylene.

ASSAY

Stir for 10 min 0.100 g in a hot solution of 1.25 g of *copper sulfate pentahydrate R* in 20 mL of *water R* in a 100 mL conical flask with a ground-glass stopper. Filter rapidly and wash the filter. Combine the filtrate and the washings, acidify with *dilute sulfuric acid R* and titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

1 mL of *0.02 M potassium permanganate* is equivalent to 5.585 mg of Fe.

LABELLING

The label indicates whether the substance is obtained by reduction or sublimation.

(20) FRENCH TITLE: Ferrum metallicum pour préparations homéopathiques

**01/2008:2092**
**corrected 9.0**

# HEDERA HELIX FOR HOMOEOPATHIC PREPARATIONS[21]

## Hedera helix ad praeparationes homoeopathicas

DEFINITION

Fresh, young, fully developed but not yet lignified branch of *Hedera helix* L., harvested immediately before or at the beginning of flowering.

IDENTIFICATION

The fresh, young branches of *Hedera helix* L. are thin and flexible, climbing; they cling to their support by stem-roots. The leaves are alternate, simple and petiolate. The petiole shows a cylindrical section. The upper surface of the leaves is glabrous and shiny, darker than the lower surface. The lamina is usually divided into 3-5 more or less deeply cut lobes on sterile branches; it is oval, with a pointed apex on fertile branches. The inflorescences are arranged in a simple semi-globular corymb and grouped in terminal clusters. The pedicels of the umbel are covered in whitish hairs. Each flower shows 5 small teeth formed by the upper part of the sepals and 5 petals covered in very small inverted hairs.

TESTS

**Foreign matter** (*2.8.2*): if required by the competent authority, maximum 5 per cent.

**Loss on drying** (*2.2.32*): if required by the competent authority, minimum 50 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

PRODUCTION

The mother tincture of *Hedera helix* L. is prepared by maceration using ethanol of a suitable concentration.

*Content*: minimum 0.15 per cent *m/m* of hederacoside C ($C_{59}H_{96}O_{26}$; $M_r$ 1221).

CHARACTERS

*Appearance*: dark greenish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* The mother tincture to be examined.

*Reference solution.* Dissolve 1 mg of *α-hederin R* and 1 mg of *hederacoside C R* in *methanol R* and dilute to 2 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (1:1:4 *V/V/V*).

*Application*: 20 µL as bands.

*Development*: over half of the plate.

*Drying*: in air.

*Detection*: spray with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other faint zones may also be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| α-Hederin: a violet zone | A violet zone (α-hederin) |
| Hederacoside C: a brown zone | A brown zone (hederacoside C) |
| ——— | A greyish-brown zone ——— |
| | A yellow zone |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.890 to 0.925.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 70 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 2.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* In a 20.0 mL volumetric flask, dilute 3.000 g of the mother tincture to be examined to 20.0 mL with the mobile phase.

*Reference solution.* In a 50.0 mL volumetric flask, dissolve 20.0 mg of *hederacoside C R* in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 35 volumes of *water R*, adjusted to pH 3 with *phosphoric acid R*, and 65 volumes of *methanol R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 205 nm.

*Injection*: 20 µL.

*Retention time*: hederacoside C = about 8 min.

Calculate the percentage content *m/m* of hederacoside C using the following expression:

$$\frac{A_1 \times m_2 \times C \times 0.4}{A_2 \times m_1}$$

$A_1$ = area of the peak due to hederacoside C in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to hederacoside C in the chromatogram obtained with the reference solution;

$m_1$ = mass of the mother tincture in the test solution, in grams;

$m_2$ = mass of *hederacoside C R* in the reference solution, in grams;

$C$ = percentage content of *hederacoside C R*.

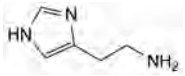
# HISTAMINUM FOR HOMOEOPATHIC PREPARATIONS(22)

## Histaminum ad praeparationes homoeopathicas



$C_5H_9N_3$ $M_r$ 111.1
[51-45-6]

DEFINITION

2-(1*H*-Imidazol-4-yl)ethan-1-amine.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: slightly yellow, deliquescent crystals.

*Solubility*: soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Melting point (*2.2.14*): 82 °C to 85 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *histamine CRS*.

TESTS

**Solution S**. Dissolve 0.3 g in 2.75 mL of *2 M hydrochloric acid R* and dilute to 10 mL with *distilled water R*.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_3$ (*2.2.2, Method I*).

**Histidine**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Solution S.

*Reference solution (a)*. Dissolve 25 mg of *histidine hydrochloride monohydrate CRS* in *water R* and dilute to 50 mL with the same solvent.

*Reference solution (b)*. Mix 1 mL of the test solution and 1 mL of reference solution (a).

*Plate*: *TLC silica gel G plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *water R*, *acetonitrile R* (5:20:75 *V/V/V*).

*Application*: 1 µL of the test solution and reference solution (a); 2 µL of reference solution (b).

*Development*: over a path of 10 cm [or 7 cm].

*Drying*: at 100-105 °C for 15 min.

*Detection*: spray with *ninhydrin solution R1* and heat at 110 °C for 10 min.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Limit*:

– *histidine*: any spot due to histidine in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (1.7 per cent).

**Sulfates** (*2.4.13*): maximum 0.1 per cent.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

**Water** (*2.5.12*): maximum 2.0 per cent, determined on 0.300 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 0.5 g.

ASSAY

Dissolve 50.0 mg in 5 mL of *anhydrous formic acid R* and add 20 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 mL of *0.1 M perchloric acid* is equivalent to 5.557 mg of $C_5H_9N_3$.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

**01/2012:2500 corrected 10.0**

# HYDRASTIS CANADENSIS FOR HOMOEOPATHIC PREPARATIONS(23)

## Hydrastis canadensis ad praeparationes homoeopathicas

The herbal drug complies with the requirements of the monograph *Goldenseal rhizome (1831)*.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

The mother tincture is prepared from the whole or cut, dried rhizome and roots of *Hydrastis canadensis* L.

*Content*:

– *hydrastine* ($C_{21}H_{21}NO_6$; $M_r$ 383.4): 0.10 per cent to 0.40 per cent;

– *berberine* ($C_{20}H_{18}NO_4$; $M_r$ 336.4): 0.20 per cent to 0.50 per cent.

PRODUCTION

The mother tincture is prepared by the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

– Method 1.1.8, using the powdered herbal drug (710) (*2.9.12*) and ethanol (70 per cent *V/V*) [or ethanol (62 per cent *m/m*)];

– Method 1.1.10, using the fragmented herbal drug (pieces about 1 cm in diameter), ethanol (65 per cent *V/V*) and maceration for 3-5 weeks.

CHARACTERS

*Appearance*: yellowish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution*. The mother tincture to be examined.

*Reference solution*. Immediately before use, dissolve 5 mg of *hydrastine hydrochloride R* and 5 mg of *berberine chloride R* in 10 mL of *methanol R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

(22) FRENCH TITLE: Histaminum pour préparations homéopathiques
(23) FRENCH TITLE: Hydrastis canadensis pour préparations homéopathiques

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

*Application*: 20 µL [or 5 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air.

*Detection*: examine in ultraviolet light at 365 nm.

*Results*: see below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Berberine: a bright yellow fluorescent zone<br>Hydrastine: a deep blue fluorescent zone | A bright yellow fluorescent zone (berberine)<br>A deep blue fluorescent zone (hydrastine) |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.890 to 0.905 when method 1.1.8 is used.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 1.2 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Dilute about 1.000 g, accurately weighed, of the mother tincture to be examined to 20.0 mL with the mobile phase.

*Reference solution*. Immediately before use, dissolve 10.0 mg of *hydrastine hydrochloride CRS* and 10.0 mg of *berberine chloride CRS* in *methanol R* and dilute to 100.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 9.93 g of *potassium dihydrogen phosphate R* in 730 mL of *water R*, add 270 mL of *acetonitrile R* and mix.

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Injection*: 10 µL.

*Elution order*: hydrastine, berberine.

*Identification of peaks*: use the chromatogram obtained with the reference solution to identify the peaks due to hydrastine and berberine.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to hydrastine and berberine.

Calculate the percentage content *m/m* of hydrastine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.913}{A_2 \times m_1 \times 5}$$

Calculate the percentage content *m/m* of berberine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.905}{A_2 \times m_1 \times 5}$$

(24) FRENCH TITLE: Hyoscyamus niger pour préparations homéopathiques

# HYOSCYAMUS FOR HOMOEOPATHIC PREPARATIONS(24)

## Hyoscyamus niger ad praeparationes homoeopathicas

DEFINITION

Whole, fresh flowering plant of *Hyoscyamus niger* L.

IDENTIFICATION

Hyoscyamus is an annual or biennial plant, with a well developed taproot. The robust, erect stem is hollow and subcylindrical and up to 80 cm long. The soft, viscid, dull dark-green leaves are densely pubescent on both surfaces, especially on the veins. The lower leaves are petiolate and are arranged in a rosette; the lower cauline leaves are semi-amplexicaul and the upper ones are completely amplexicaul. The lamina, up to 25 cm long, is oblong to ovate with 2 to 5 broadly dentate lobes on each side. The midrib is well developed. The secondary veins arise at a wide angle from the midrib and terminate in the apices of the lobes. The flowering tops are densely pubescent and form a short drooping cluster. Each flower arises in the axils of a large bract. The gamosepalous calyx is covered with dense cotton-like hairs and has 5 triangular-ovate lobes, each ending in a short point that becomes spiny. The gamopetalous corolla, with 5 nearly equal lobes, is yellowish and with a delicate, brown to blackish-violet venation. The fruit, sometimes present at the base of the inflorescences, is a pyxis distinctly swollen at the base.

TESTS

**Foreign matter** (*2.8.2*): if required by the competent authority, maximum 5 per cent.

**Loss on drying** (*2.2.32*): if required by the competent authority, minimum 50 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

***Hyoscyamus albus* L.** The presence of middle and upper leaves with a petiole and of fruits barely swollen at the base indicates adulteration by *Hyoscyamus albus* L.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

PRODUCTION

The mother tincture of *Hyoscyamus niger* L. is prepared by maceration of the drug, using ethanol of a suitable concentration.

*Content*: 0.002 per cent *m/m* to 0.01 per cent *m/m* of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; $M_r$ 289.4).

CHARACTERS

*Appearance*: dark greenish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Evaporate 10 mL of the mother tincture to be examined in a water-bath at 40 °C, under reduced pressure. Take up the residue with 1 mL of *ammonia R*, and shake with 2 quantities, each of 10 mL, of *ether R*. Combine the ether layers, dry over *anhydrous sodium sulfate R* and filter. Evaporate on a water-bath and dissolve the residue in 0.50 mL of *methanol R*.

*Reference solution (a).* Dissolve 50 mg of *hyoscyamine sulfate R* in 10 mL of *methanol R* (solution A). Dissolve 15 mg of *hyoscine hydrobromide R* in 10 mL of *methanol R* (solution B). Mix 4 mL of solution A and 2 mL of solution B and dilute to 10 mL with *methanol R*.

*Reference solution (b).* Dissolve 20 mg of *atropine sulfate R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

*Application*: 20 µL, as bands.

*Development*: over a path of 10 cm.

*Drying*: at 100-105 °C for 15 min.

*Detection A*: spray with *dilute potassium iodobismuthate solution R* until orange zones become visible. Examine in daylight.

*Results A*: see below the sequence of the zones present in the chromatograms obtained with the reference solutions and the test solution. Other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | | |
|---|---|---|
| Hyoscine: an orange zone | | An orange zone (hyoscine) |
| Hyoscyamine: an orange zone | Atropine: an orange zone | A orange zone (hyoscyamine/atropine) |
| | | Faint orange zones (line of application) |
| **Reference solution (a)** | **Reference solution (b)** | **Test solution** |

*Detection B*: subsequently spray with *sodium nitrite solution R* until the yellow background disappears. Examine in daylight after 15 min.

*Results B*: see test for atropine.

TESTS

**Relative density** (*2.2.5*): 0.930 to 0.960.

**Atropine**. Examine the chromatograms obtained in the test for identification.

*Results*: the zone due to hyoscyamine in the chromatogram obtained with the test solution changes from orange to reddish-brown but not to greyish-blue (atropine).

**Ethanol** (*2.9.10*): 40 per cent *V/V* to 50 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 1.2 per cent.

ASSAY

Evaporate 100.0 g of the mother tincture to be examined, at a low temperature under reduced pressure, until a residue of about 10 g is obtained. Quantitatively transfer the residue to a separating funnel using a few millilitres of *ethanol (70 per cent V/V) R*. Add 5 mL of *concentrated ammonia R* and 25 mL of *water R*. Extract with successive fractions of a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the last organic fraction. Take up the residue in *0.25 M sulfuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Combine the organic layers and extract several times with *0.25 M sulfuric acid*. Separate the layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with at least 3 quantities, each of 30 mL, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulfate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulfate with 3 quantities, each of 10 mL, of *chloroform R*. Combine the chloroform fractions, evaporate to dryness on a water-bath and dry in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 10.0 mL of *0.005 M sulfuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.01 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content *m/m* of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{0.2894(10 - n)}{m}$$

$n$ = volume of *0.01 M sodium hydroxide* used, in millilitres;

$m$ = mass of the mother tincture used, in grams.

**01/2008:2028**
**corrected 9.0**

# HYPERICUM FOR HOMOEOPATHIC PREPARATIONS[(25)]

## Hypericum perforatum ad praeparationes homoeopathicas

DEFINITION

Whole, fresh plant of *Hypericum perforatum* L., at the beginning of the flowering period.

IDENTIFICATION

The perennial plant consists of a spindle-shaped root and a branched rhizome, giving rise to long, decumbent runners. The cylindrical, erect stem is woody at the base, 0.2 m to 1 m long, branched in the upper part, with 2 raised longitudinal lines.

The leaves are opposite, sessile, exstipulate, oblong-oval and 15 mm to 30 mm long. The leaf margins show black glandular dots, and many small translucent oil glands are present on the entire surface and are visible by transmitted light.

The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, lanceolate sepals with acuminate apices, and black oil glands near the entire margins; 5 orange-yellow petals, much longer than the sepals, with black oil glands near the terminal margins only;

(25) FRENCH TITLE: Hypericum perforatum pour préparations homéopathiques

3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles. Each petal is asymmetrically linear-ovate in shape, with one of the margin entire and the other dentate.

TESTS

**Foreign matter** (*2.8.2*): maximum 4 per cent of fruits and maximum 1 per cent of other foreign matter.

**Loss on drying** (*2.2.32*): if performed to demonstrate the freshness of the drug, minimum 55 per cent, determined on 5.0 g of finely cut drug by drying in an oven at 105 °C.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

PRODUCTION

The mother tincture of *Hypericum perforatum* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Dark red to brownish red liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution*. The mother tincture to be examined.

*Reference solution*. Dissolve 5 mg of *rutoside trihydrate R*, 1 mg of *hypericin R* and 5 mg of *hyperoside R* in *methanol R* and dilute to 5 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:9:90 *V/V/V*).

*Application*: 10 µL of the test solution and 5 µL of the reference solution, as 10 mm bands.

*Development*: over a path of 10 cm.

*Drying*: at 100-105 °C for 10 min.

*Detection*: spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then a 50 g/L solution of *macrogol 400 R* in *methanol R*. Examine the plates after 30 min in ultraviolet light at 365 nm.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution, the zone due to rutoside may be weak or even absent. The chromatogram obtained with the test solution shows a group of zones that may be blue or yellow, with a $R_F$ similar to that of the zone due to hyperoside in the chromatogram obtained with the reference solution. Other weak zones may also be visible.

| **Top of the plate** | |
|---|---|
| | A yellow to blue zone |
| Hypericin: a red zone | 2 red zones |

| | Several zones |
| ——— | ——— |
| Hyperoside: a yellow to orange zone | Blue or yellow zones |
| Rutoside: a yellow to orange zone | A yellow to orange zone |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.900 to 0.920.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 75 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 1.3 per cent.

**01/2017:2513**
**corrected 10.0**

# IGNATIA FOR HOMOEOPATHIC PREPARATIONS(26)

## Strychnos ignatii ad praeparationes homoeopathicas

DEFINITION

Dried, ripe seed of *Strychnos ignatii* P.J.Bergius.

*Content*: minimum 1.80 per cent for the sum of the contents of brucine ($C_{23}H_{26}N_2O_4$; $M_r$ 394.5) and strychnine ($C_{21}H_{22}N_2O_2$; $M_r$ 334.4), of which minimum 65 per cent consists of strychnine (dried drug).

IDENTIFICATION

A. The seed is grey, brown and dull, up to 3 cm long and 10-25 mm thick. It is irregular, with 3-5 distinct sides: one of these is usually wider, convex and glabrous; the others are angular and flattened and show the remains of testa hairs forming lighter zones in the depressions. The stony granular texture resembles that of pebbles from a river bed; the hilum is found on the most rounded end and forms a small, light brown depression. The fracture shows a compact, semi-translucent, horny endosperm; the embryo is located in the centre and is about 10-15 mm long, with a foliaceous cotyledon.

B. *CAUTION: take all necessary handling precautions when reducing this toxic herbal drug to a powder.*

Wash the herbal drug rapidly in cold water, then expose to steam; once sufficiently softened, cut into thin slices and crush in a suitable apparatus. Allow to dry, finish reducing to a powder (710) (*2.9.12*) and pass through a covered sieve.

Microscopic examination (*2.8.23*). The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2513.-1): oil droplets [D]; fragments of endosperm [B, C, F] consisting of thick-walled cells of various sizes, the smallest located at the periphery of the endosperm [Cb] and the largest towards the centre of the seed [F]; a few fragments of the outer layer of the endosperm (surface view [J], transverse section [Ca]), with polygonal cells sometimes associated with the inner layer of the testa, composed of cells with indistinct walls (surface view [E], transverse section [Cd]); sclerified covering trichomes [A, K], sheared off, not enlarged at the base [Aa] and with walls composed of small, oblique, sclerified strips, tightly fused longitudinally [Ab, Ka]; numerous fragments of strips [G, H] and rare rounded tips of covering trichomes [K].

(26) FRENCH TITLE: Ignatia amara pour préparations homéopathiques

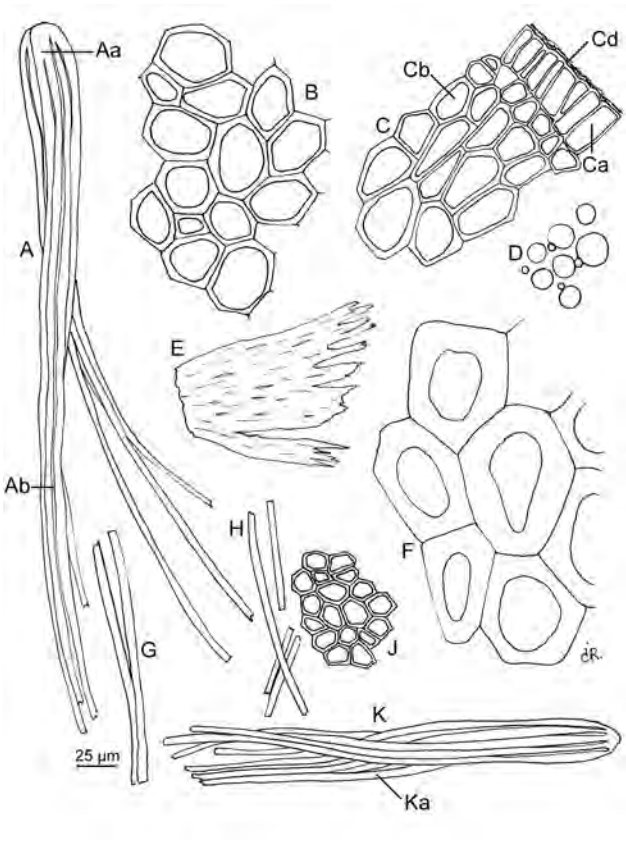

Figure 2513.-1. – *Illustration for identification test B of powdered herbal drug of Ignatia*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2.0 g of the powdered herbal drug (710) (*2.9.12*) add 20 mL of *ethanol (70 per cent V/V) R*, allow to macerate for 15 min at room temperature, with stirring, and centrifuge. Use the supernatant.

*Reference solution.* Dissolve 10 mg of *brucine R* and 10 mg of *strychnine R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *methanol R*, *methylene chloride R* (1:5:95 *V/V/V*); use the lower layer.

*Application*: 10 µL [or 5 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air, then in an oven at 105-110 °C for 15 min; allow to cool.

*Detection*: spray with *iodoplatinate reagent R* and examine immediately in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|

| Strychnine: a violet zone<br>Brucine: a blue zone | A violet zone (strychnine)<br>A blue zone (brucine) |
| **Reference solution** | **Test solution** |

TESTS

*CAUTION: when the powdered herbal drug (710) (2.9.12) is used, take the necessary precautions as indicated under Identification B.*

**Foreign matter** (*2.8.2*): maximum 1.0 per cent.

***Strychnos nux-vomica* L.** The presence of flattened discoid seeds and the presence in the powdered herbal drug, examined under a microscope, of testa cells transformed into hairs, with a sclerified base and a lignified tip, bent at a right angle and with 7-10 lignified ridges, and of numerous sclerified rods, indicate adulteration with *Strychnos nux-vomica* L.

**Loss on drying** (*2.2.32*): maximum 12.0 per cent, determined on 1.00 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 3.5 per cent.

**Aflatoxins** (*2.8.18*): maximum 2 µg/kg (aflatoxin $B_1$) and maximum 4 µg/kg (sum of aflatoxins $B_1$, $B_2$, $G_1$ and $G_2$).

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 1.000 g of the powdered herbal drug (710) (*2.9.12*) add 10.0 mL of *ethanol (60 per cent V/V) R*. Boil gently, with stirring, under a reflux condenser. After 30 min, cool and filter into a 20.0 mL volumetric flask. Wash the filter with *ethanol (60 per cent V/V) R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

*Reference solution.* Dissolve 10.0 mg of *brucine CRS* and 10.0 mg of *strychnine CRS* in *acetonitrile R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R* (3.5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *triethylamine R*, *acetonitrile for chromatography R*, *methanol R2*, *tris(hydroxymethyl)aminomethane buffer solution pH 9.0 R* (0.1:7.5:7.5:85 *V/V/V/V*);
- *mobile phase B*: *triethylamine R*, *tris(hydroxymethyl)aminomethane buffer solution pH 9.0 R*, *acetonitrile for chromatography R*, *methanol R2* (0.1:15:42.5:42.5 *V/V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 25 | 100 → 70 | 0 → 30 |
| 25 - 30 | 70 → 65 | 30 → 35 |
| 30 - 31 | 65 → 0 | 35 → 100 |
| 31 - 32 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 260 nm.

*Injection*: 10 µL.

*Elution order*: brucine, strychnine.

*System suitability*: reference solution:

- *resolution*: minimum 3.0 between the peaks due to brucine and strychnine.

Calculate the percentage contents of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to brucine or strychnine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to brucine or strychnine in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *brucine CRS* or *strychnine CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of brucine in *brucine CRS* or strychnine in *strychnine CRS*.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

The mother tincture is prepared from the dried, ripe seed of *Strychnos ignatii* P.J.Bergius.

*Content*: 0.18 per cent *m/m* to 0.36 per cent *m/m* for the sum of the contents of brucine ($C_{23}H_{26}N_2O_4$; $M_r$ 394.5) and strychnine ($C_{21}H_{22}N_2O_2$; $M_r$ 334.4), of which minimum 65 per cent is strychnine.

PRODUCTION

The mother tincture is prepared by the following methods prescribed in the general monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.8, using the powdered herbal drug (710) (*2.9.12*) and ethanol (70 per cent *V/V*);
- method 1.1.10, using the powdered herbal drug, ethanol (65 per cent *V/V*) and a maceration time of 3-5 weeks.

CHARACTERS

*Appearance*: brownish-yellow liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*) as described in identification test C for the herbal drug with the following modification.

*Test solution*. The mother tincture to be examined.

TESTS

**Relative density** (*2.2.5*): 0.890 to 0.904 when method 1.1.8 is used.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 1.2 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the assay of the herbal drug with the following modification.

*Test solution*. Dilute 2.000 g of the mother tincture to be examined to 20.0 mL with *ethanol (60 per cent V/V) R*.

Calculate the percentage contents of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$ = area of the peak due to brucine or strychnine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to brucine or strychnine in the chromatogram obtained with the reference solution;

$m_1$ = mass of the mother tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *brucine CRS* or *strychnine CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of brucine in *brucine CRS* or strychnine in *strychnine CRS*.

**07/2014:2501**

# KALIUM BICHROMICUM FOR HOMOEOPATHIC PREPARATIONS(27)

## Kalii bichromas ad praeparationes homoeopathicas

$K_2Cr_2O_7$ $M_r$ 294.2
[7778-50-9]

DEFINITION

*Content*: 99.0 per cent to 101.0 per cent of $K_2Cr_2O_7$.

CHARACTERS

*Appearance*: orange crystals.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives reaction (b) of potassium (*2.3.1*).

B. Dissolve 10 mg in 5 mL of *water R*. Add 0.25 mL of *dilute sulfuric acid R*, 0.5 mL of *strong hydrogen peroxide solution R* and 1 mL of *ether R*. Shake. The upper layer is blue.

TESTS

**Solution S1**. Dissolve 5.0 g in *distilled water R* and dilute to 50.0 mL with the same solvent.

**Solution S2**. To 20.0 mL of solution S1 add 20 mL of *hydrochloric acid R* and 50 mL of *tributyl phosphate R*. Stir for 2 min. Remove the lower layer and shake it with 10 mL of *ether R*. Evaporate the lower layer to dryness under reduced pressure. Dissolve the residue in 10 mL of *distilled water R*. Add *dilute ammonia R1* until the solution is neutral to *blue litmus paper R* and dilute to 20.0 mL with *distilled water R*.

**Appearance of solution**. Solution S1 is clear (*2.2.1*).

**Calcium** (*2.4.3*): maximum 500 ppm.

Dilute 2.0 mL of solution S2 to 15 mL with *distilled water R*.

**Chlorides** (*2.4.4*): maximum 50 ppm.

Dissolve 1.0 g in 15 mL of *dilute nitric acid R*. Use 1 mL of *nitric acid R* instead of the prescribed *dilute nitric acid R*.

**Sulfates** (*2.4.13*): maximum 150 ppm.

Dilute 10 mL of solution S2 to 15 mL with *distilled water R*.

ASSAY

Dissolve 0.100 g in 25 mL of *water R*. Add 2 g of *potassium iodide R* and 25 mL of *dilute sulfuric acid R*. Allow to stand in the dark for 10 min. Add 150 mL of *water R*. Titrate with *0.1 M sodium thiosulfate* until the colour changes from blue to green, adding 1 mL of *starch solution R* near the end of the titration.

(27) FRENCH TITLE: Kalium bichromicum pour préparations homéopathiques

1 mL of *0.1 M sodium thiosulfate* is equivalent to 4.903 mg of $K_2Cr_2O_7$.

**01/2017:2676**

# MAGNESIUM FLUORATUM FOR HOMOEOPATHIC PREPARATIONS(28)

## Magnesium fluoratum ad praeparationes homoeopathicas

$MgF_2$ $M_r$ 62.3
[7783-40-6]

DEFINITION

*Content*: 98.5 per cent to 100.5 per cent of $MgF_2$.

CHARACTERS

*Appearance*: white or almost white powder or crystals.

*Solubility*: practically insoluble in water, very slightly soluble in dilute nitric acid and in concentrated sulfuric acid, practically insoluble in anhydrous acetic acid.

IDENTIFICATION

A. Mix 0.2 g with 2 g of *potassium hydrogen sulfate R* in a platinum crucible and melt at 800 °C. Cool, carefully take up the melt in 20 mL of *water R* and boil briefly. Cool and filter. Dilute 0.5 mL of the filtrate to 2 mL with *water R*. The solution gives the reaction of magnesium (*2.3.1*).

B. Mix 0.2 g with 1 g of *anhydrous sodium carbonate R* in a platinum crucible and melt at 850 °C. Cool, take up the melt in 10 mL of *dilute acetic acid R* and boil briefly. Cool, filter and dilute the filtrate to 20 mL with *water R*. To 0.4 mL of this solution add dropwise a mixture of 0.1 mL of *alizarin S solution R* and 0.1 mL of *zirconyl nitrate solution R*. The colour changes from red to yellow.

TESTS

**Solution S**. Boil 5.0 g with 100.0 mL of *distilled water R* under a reflux condenser for about 5 min. Allow to cool, then filter under vacuum.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Carbonates**. Suspend 0.5 g in 5 mL of *carbon dioxide-free water R* and add 5 mL of *dilute acetic acid R*. Quickly stopper the test tube with a stopper fitted with a glass tube bent twice through 90° and which dips at the other end in *barium hydroxide solution R*. Warm the mixture. The barium hydroxide solution remains clear.

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 200 ppm, determined on solution S.

**Water-soluble matter**: maximum 0.5 per cent.

Boil 2.00 g with 100 mL of *water R* for 5 min. Filter the hot solution, then cool the filtrate and dilute to 100 mL with *water R*. Evaporate 50 mL of this solution to dryness in an evaporating dish and dry at 100-105 °C. The residue weighs a maximum of 5 mg.

ASSAY

Thoroughly mix 0.100 g with 2 g of *potassium hydrogen sulfate R* in a platinum crucible and melt at 800 °C. Allow to cool, carefully take up the melt in 10 mL of *dilute hydrochloric acid R* and heat to dissolve. Dilute the solution to 100.0 mL with *water R*. Transfer 50.0 mL of this solution to a 500 mL conical flask and dilute to 300 mL with *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 mL of *0.1 M sodium edetate* is equivalent to 6.23 mg of $MgF_2$.

**01/2017:2505**
**corrected 10.0**

# MAGNESIUM PHOSPHORICUM FOR HOMOEOPATHIC PREPARATIONS(29)

## Magnesii hydrogenophosphas trihydricus ad praeparationes homoeopathicas

$MgHPO_4,3H_2O$ $M_r$ 174.3
[7782-75-4]

DEFINITION

*Content*: 98.0 per cent to 102.0 per cent.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water, practically insoluble in ethanol (96 per cent). It dissolves in dilute acids.

IDENTIFICATION

A. Dissolve 0.1 g in a mixture of 2 mL of *dilute nitric acid R* and 8 mL of *water R*. The solution gives reaction (b) of phosphates (*2.3.1*).

B. Dissolve 0.1 g in a mixture of 2 mL of *dilute nitric acid R* and 8 mL of *water R*. Add 10 mL of *ammonium molybdate solution R* and filter. The filtrate gives the reaction of magnesium (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in 30 mL of *dilute hydrochloric acid R* and dilute to 50.0 mL with the same acid.

**Arsenic** (*2.4.2, Method B*): maximum 5 ppm, determined on 1.0 g.

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dissolve 0.25 g in 5 mL of *dilute nitric acid R* and dilute to 15 mL with *water R*.

**Magnesium dihydrogen phosphate and magnesium phosphate**. Dissolve 2.00 g in 30.0 mL of *1 M hydrochloric acid*. Add 20 mL of *water R* and 0.05 mL of *methyl orange solution R*. Titrate the excess of hydrochloric acid with *1 M sodium hydroxide*. The volume of *1 M hydrochloric acid* used is between 11.0 mL and 12.5 mL.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

**Iron** (*2.4.9*): maximum 50 ppm.

Dilute 2 mL of solution S to 10 mL with *water R*.

ASSAY

Dissolve 0.280 g in a mixture of 1 mL of *hydrochloric acid R1* and 5 mL of *water R*. Add 25.0 mL of *0.1 M sodium edetate* and dilute to 200 mL with *water R*. Neutralise with *concentrated ammonia R*, add 10 mL of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Titrate the excess of *0.1 M sodium edetate* with *0.1 M zinc sulfate* until the colour changes from pure blue to violet.

(28) FRENCH TITLE: Magnesia fluorata pour préparations homéopathiques
(29) FRENCH TITLE: Magnesia phosphorica pour préparations homéopathiques

1 mL of *0.1 M sodium edetate* is equivalent to 17.43 mg of $MgHPO_4,3H_2O$.

**01/2017:2514**
**corrected 10.0**

# NUX-VOMICA FOR HOMOEOPATHIC PREPARATIONS(30)

## Strychnos nux-vomica ad praeparationes homoeopathicas

DEFINITION

Dried, ripe seed of *Strychnos nux-vomica* L.

*Content*: minimum 1.50 per cent for the sum of the contents of brucine ($C_{23}H_{26}N_2O_4$; $M_r$ 394.5) and strychnine ($C_{21}H_{22}N_2O_2$; $M_r$ 334.4), of which 43 per cent to 67 per cent is strychnine (dried drug).

IDENTIFICATION

A. The seed is discoid, with a slightly raised margin, 20-25 mm in diameter and about 5 mm thick. It is not quite flat, with one surface slightly convex and the other slightly concave. Some seeds are irregularly curved. The colour of the seed ranges from light grey to greenish-grey and its satiny appearance is due to a silky down, consisting of dense hairs radiating from a central point on each of the faces. One of the surfaces has a raised point at the centre (the hilum), from which extends a radial ridge ending in a slight protuberance on the edge of the seed (the micropyle). A grey horny endosperm makes up most of the seed. The embryo, which is located in the central cavity, is small (about 6 mm long), with 2 cotyledons; the radicle is turned towards the micropyle.

B. *CAUTION: take all necessary handling precautions when reducing this toxic herbal drug to a powder.*

Wash the herbal drug rapidly in cold water, then expose to vapour from boiling water; once sufficiently softened, cut into thin slices and crush in a suitable apparatus. Allow to dry, finish reducing to a powder (710) (*2.9.12*) and pass through a covered sieve.

Microscopic examination (*2.8.23*). The powder is grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2514.-1): fragments of the outer testa (surface view [B], transverse section [C]), with cells with an enlarged, sclerified, strongly thickened and channelled base [Ba, Cb], transformed into curved or straight hairs, usually broken, with 7-10 lignified ridges [Bb, Ca] and a rounded lignified tip [D]; numerous rods or strips, highly variable in length and 5-15 µm wide, from the lignified ridges of the hairs [A]; numerous fragments of endosperm [F], consisting of very thick-walled polyhedral cells, some of which contain oil and aleurone grains; a few fragments of the outer layers of the endosperm (surface view [E], transverse section [C]); in surface view [E] the cells are polyhedral [Ea], sometimes associated with the brown pigmented layer of the testa formed of cells with indistinct walls [Eb]; in transverse section [C] the cells are elongated [Cc], sometimes associated with the pigmented layer [Cd] and the outer testa [Cb].

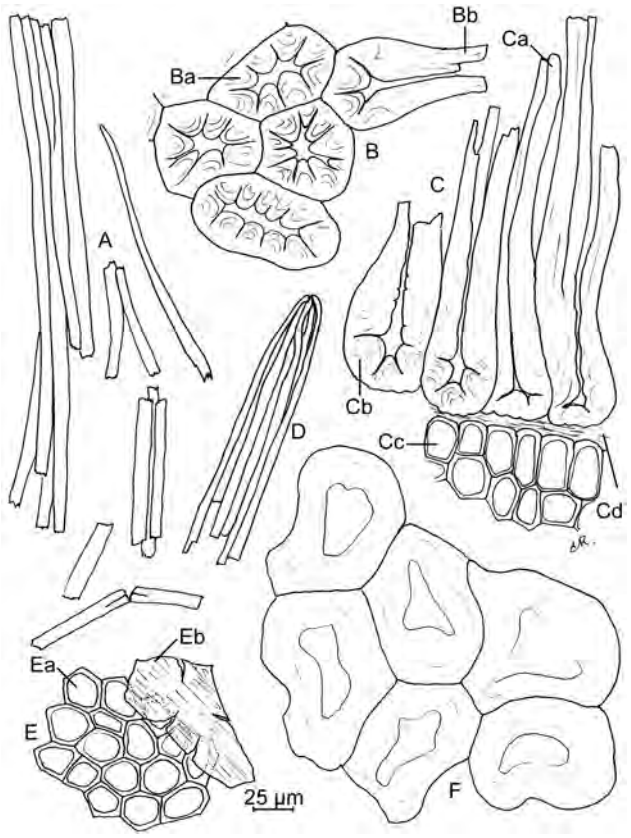

Figure 2514.-1. – *Illustration for identification test B of powdered herbal drug of Nux-vomica for homoeopathic preparations*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 2.0 g of the powdered herbal drug (710) (*2.9.12*) add 20 mL of *ethanol (70 per cent V/V) R*, allow to macerate for 15 min at room temperature, with stirring, and centrifuge. Use the supernatant.

*Reference solution.* Dissolve 10 mg of *brucine R* and 10 mg of *strychnine R* in 10 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *methanol R*, *methylene chloride R* (1:5:95 *V/V/V*); use the lower layer.

*Application*: 10 µL [or 5 µL] as bands.

*Development*: over a path of 15 cm [or 6 cm].

*Drying*: in air, then in an oven at 105-110 °C for 15 min; allow to cool.

*Detection*: spray with *iodoplatinate reagent R* and examine immediately in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| _____ | _____ |
| _____ | _____ |
| Strychnine: a violet zone | A violet zone (strychnine) |
| Brucine: a blue zone | A blue zone (brucine) |
| **Reference solution** | **Test solution** |

(30) FRENCH TITLE: Nux-vomica pour préparations homéopathiques

TESTS

When the powdered herbal drug (710) (*2.9.12*) is used, take the necessary precautions as indicated under Identification B.

**Foreign matter** (*2.8.2*): maximum 1.0 per cent.

***Strychnos ignatii* P.J. Bergius**. The presence of irregularly shaped seeds that are neither discoid nor flattened and the presence in the powdered herbal drug, examined under a microscope, of sclerified hairs, usually sheared off, not thickened at the base and with walls composed of small, oblique, sclerified strips, tightly fused longitudinally, indicate adulteration with *Strychnos ignatii* P.J. Bergius.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.00 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 3.0 per cent.

**Aflatoxins** (*2.8.18*): maximum 2 µg/kg (aflatoxin $B_1$) and maximum 4 µg/kg (sum of aflatoxins $B_1$, $B_2$, $G_1$ and $G_2$).

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* To 1.000 g of the powdered herbal drug (710) (*2.9.12*) add 10.0 mL of *ethanol (60 per cent V/V) R*. Boil gently, under a reflux condenser, with stirring. After 30 min, cool and filter into a 20.0 mL volumetric flask. Wash the filter with *ethanol (60 per cent V/V) R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

*Reference solution.* Dissolve 10.0 mg of *brucine CRS* and 10.0 mg of *strychnine CRS* in *acetonitrile R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R* (3.5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *triethylamine R*, *acetonitrile for chromatography R*, *methanol R2*, *tris(hydroxymethyl)aminomethane buffer solution pH 9.0 R* (0.1:7.5:7.5:85 *V/V/V/V*);
- *mobile phase B*: *triethylamine R*, *tris(hydroxymethyl)aminomethane buffer solution pH 9.0 R*, *acetonitrile for chromatography R*, *methanol R2* (0.1:15:42.5:42.5 *V/V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 25 | 100 → 70 | 0 → 30 |
| 25 - 30 | 70 → 65 | 30 → 35 |
| 30 - 31 | 65 → 0 | 35 → 100 |
| 31 - 32 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 260 nm.

*Injection*: 10 µL.

*Elution order*: brucine, strychnine.

*System suitability*: reference solution:

- *resolution*: minimum 3.0 between the peaks due to brucine and strychnine.

Calculate the percentage content of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

$A_1$ = area of the peak due to brucine or to strychnine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to brucine or to strychnine in the chromatogram obtained with the reference solution;

$m_1$ = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *brucine CRS* or of *strychnine CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of brucine in *brucine CRS*, or strychnine in *strychnine CRS*.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

The mother tincture is prepared from the dried ripe seed of *Strychnos nux-vomica* L.

*Content*: 0.15 per cent *m/m* to 0.30 per cent *m/m* for the sum of the contents of brucine ($C_{23}H_{26}N_2O_4$; $M_r$ 394.5) and strychnine ($C_{21}H_{22}N_2O_2$; $M_r$ 334.4), of which 43 per cent to 67 per cent is strychnine.

PRODUCTION

The mother tincture is prepared by the following methods prescribed in the general monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.8, using the powdered herbal drug (710) (*2.9.12*) and ethanol (70 per cent *V/V*);
- method 1.1.10, using the powdered herbal drug, ethanol (65 per cent *V/V*) and a maceration time of 3-5 weeks.

CHARACTERS

*Appearance*: yellow or light brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*) as described in identification test C for the herbal drug with the following modification.

*Test solution.* The mother tincture to be examined.

TESTS

**Relative density** (*2.2.5*): 0.888 to 0.903 when method 1.1.8 is used.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the assay of the herbal drug with the following modifications.

*Test solution.* Dilute 2.000 g of the mother tincture to be examined to 20.0 mL with *ethanol (60 per cent V/V) R*.

Calculate the percentage content of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$ = area of the peak due to brucine or to strychnine in the chromatogram obtained with the test solution;

$A_2$ = area of the peak due to brucine or to strychnine in the chromatogram obtained with the reference solution;

$m_1$ = mass of the mother tincture to be examined used to prepare the test solution, in grams;

$m_2$ = mass of *brucine CRS* or of *strychnine CRS* used to prepare the reference solution, in grams;

$p$ = assigned percentage content of brucine in *brucine CRS*, or strychnine in *strychnine CRS*.

**01/2016:2683**

# PETROLEUM RECTIFICATUM FOR HOMOEOPATHIC PREPARATIONS(31)

## Petroleum ad praeparationes homoeopathicas

DEFINITION

Petroleum spirit distilling between 180 °C and 220 °C obtained by rectification of crude oil.

CHARACTERS

*Appearance*: clear, colourless, highly flammable liquid.

*Solubility*: practically insoluble in water, freely soluble in acetone, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Relative density (see Tests).

B. Refractive index (see Tests).

C. Distillation range (see Tests).

TESTS

**Solution S**. Dissolve 1 g in 99 g of *ethanol (90 per cent V/V) R*.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of the substance to be examined, add 5 mL of *carbon dioxide-free water R* and 0.25 mL of *phenol red solution R* and shake. The aqueous phase is yellow. Add 0.05 mL of *0.01 M sodium hydroxide* and shake. The aqueous phase is red.

**Relative density** (*2.2.5*): 0.752 to 0.762.

**Refractive index** (*2.2.6*): 1.422 to 1.426.

**Distillation range** (*2.2.11*): minimum 90 per cent *m/m* distils between 180 °C and 220 °C.

**Aromatic hydrocarbons**. The absorbance (*2.2.25*) of solution S between 250 nm and 400 nm is not greater than 0.100.

**Non-volatile matter**: maximum 0.04 per cent.

Evaporate 5.000 g to dryness on a water-bath and dry the residue in an oven at 100-105 °C for 2 h. The residue weighs a maximum of 2.0 mg.

STORAGE

In an airtight container.

LABELLING

The label states that the substance is obtained by rectification.

**07/2017:2844**

# SELENIUM FOR HOMOEOPATHIC PREPARATIONS(32)

## Selenium ad praeparationes homoeopathicas

Se $A_r$ 79.0
[7782-49-2]

DEFINITION

Amorphous selenium.

*Content*: 98.0 per cent to 101.0 per cent of Se (dried substance).

CHARACTERS

*Appearance*: black, reddish-brown or red powder, softens at 50 °C to 60 °C.

*Solubility*: practically insoluble in water, soluble in concentrated sulfuric acid giving a green solution.

IDENTIFICATION

A. Warm 5 mL of solution S1 (see Tests) on a water-bath and add 50 mg of *hydrazine sulfate R*. A red colour is produced.

B. To 5 mL of solution S1 add 0.5 mL of *dilute hydrochloric acid R* and 2 mL of a 100 g/L solution of *thiourea R*. A red precipitate is formed.

TESTS

**Solution S1**. Dissolve 20 mg in 1 mL of *nitric acid R*, warming on a water-bath. Continue warming until the evolution of brown fumes has ceased, then cool and add 10 mL of *water R*.

**Solution S2**. To the residue obtained in the test for sulfated ash add 2 mL of *nitric acid R* and 3 mL of *hydrochloric acid R* and evaporate to dryness on a water-bath. Take up the residue in a mixture of 1 mL of *dilute hydrochloric acid R* and 25 mL of hot *water R*. Cool, filter and dilute to 50.0 mL by washing the filter with *water R*.

**Appearance of solution**. Solution S2 is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Sulfur**: maximum 0.2 per cent.

To 0.100 g add 1 mL of *nitric acid R* dropwise, then add 2 mL of *hydrochloric acid R* and evaporate to dryness on a water-bath. Add 2 mL of *hydrochloric acid R* and evaporate again to dryness on a water-bath. Dissolve the residue in 6 mL of a mixture of 1 mL of *dilute hydrochloric acid R* and 30 mL of *distilled water R*, then filter and dilute the filtrate to 20 mL by washing the filter with *distilled water R*. Dilute 5 mL of this solution to 15 mL with *distilled water R*. The solution complies with the limit test for sulfates (*2.4.13*) (0.6 per cent of sulfate corresponds to 0.2 per cent of sulfur).

**Water-soluble selenium compounds**: maximum 5 ppm.

*Test solution*. Shake 1.0 g with 20 mL of *water R* for 30 min and filter, washing the filter with 2 quantities, each of 5 mL, of *water R*. Adjust the filtrate to pH 2 with *dilute hydrochloric acid R*, and add 5.0 mL of a freshly prepared 1 g/L solution of *2,3-naphthalenediamine R* in *0.1 M hydrochloric acid*. Dilute to 50 mL with *water R* and allow to stand, protected from light, for 2 h. Shake the mixture with 10 mL of *toluene R* for

(31) FRENCH TITLE: Pétrole pour préparations homéopathiques
(32) FRENCH TITLE: Sélénium pour préparations homéopathiques.

3 min and allow the layers to separate for 3 min. Isolate the organic layer and dilute to 10.0 mL with *toluene R*.

*Reference solution*. Mix 5.0 mL of *selenium standard solution (1 ppm Se) R* and 25 mL of *water R*, and prepare in the same manner as for the filtrate in the test solution.

*Compensation liquid*. Treat 30 mL of *water R* in the same manner as for the filtrate in the test solution.

Measure the absorbance (*2.2.25*) of the test solution and the reference solution at 380 nm by comparison with the compensation liquid.

The absorbance of the test solution is not greater than that of the reference solution.

**Iron** (*2.4.9*): maximum 100 ppm.

To 5 mL of solution S2 add 5 mL of *water R*.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

**Sulfated ash** (*2.4.14*): maximum 0.3 per cent, determined on 1.000 g.

ASSAY

Dissolve 0.2000 g in 10 mL of *nitric acid R*. Warm until the evolution of brown fumes has ceased and the solution is only slightly yellow. Cool, add 2 g of *sulfamic acid R* and dilute to 100.0 mL with *water R*. To 10.0 mL of this solution add 50 mL of *water R* and 2.0 g of *potassium iodide R*. Titrate with *0.1 M sodium thiosulfate*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium thiosulfate* is equivalent to 1.974 mg of Se.

**01/2016:2289**
**corrected 10.0**

# STAPHYSAGRIA FOR HOMOEOPATHIC PREPARATIONS(33)

## Delphinium staphisagria ad praeparationes homoeopathicas

DEFINITION

Dried, ripe seed of *Delphinium staphisagria* L.

*Content*: minimum 1.5 per cent of total alkaloids, expressed as delphinine ($C_{33}H_{45}NO_9$; $M_r$ 599.7) (dried drug).

IDENTIFICATION

A. The isolated seed has an irregular, flattened, tetrahedral shape, measuring 3-7 mm on each side; one of the sides is convex; the others are flat or concave. The surface is generally dark brown, rarely light brown, and shows a raised network defining alveoli; on the surface there are occasionally greyish spots. The seed coat is brittle and encloses an abundant endosperm, which is whitish to dark brown. The more or less wrinkled seeds are sometimes found as 5-6 seeds fitting together into an ovoid mass.

B. Microscopic examination (*2.8.23*). Reduce to a powder (710) (*2.9.12*). The powder consists of a mixture of dark brown and white particles with oily constituents. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2289.-1): fragments of the episperm consisting of a layer of large cells with regularly thickened walls and a wide lumen, elongated (surface view [A]), more or less isodiametric (transverse section [D]); the outside surface of the episperm cells generally exhibits numerous short, unequal, irregularly bent, cylindrical papillae, often with a globoid head, that look like cuticular papillae but are the conidiophores of a fungus present in almost every seed [Aa, Da]; underlying the episperm is an intermediate area, partly collapsed, composed of 5-6 layers of tangentially elongated, colourless, thin-walled cells [Cd, Db]; fragments of the inner testa, usually associated with the endosperm [B, C]; the inner testa comprises brown cells that, in transverse section, form a layer and are regular, 4-7 µm wide, with numerous U-shaped thickenings [Ca], whereas in surface view [Ba] they are elongated and about 70-100 µm long, with thin, finely striated walls; the endosperm consists of pentagonal or hexagonal cells, isodiametric or slightly elongated, with straight, thin walls [Bb, Cb], containing aleurone grains and oil droplets [Bc, Cc].

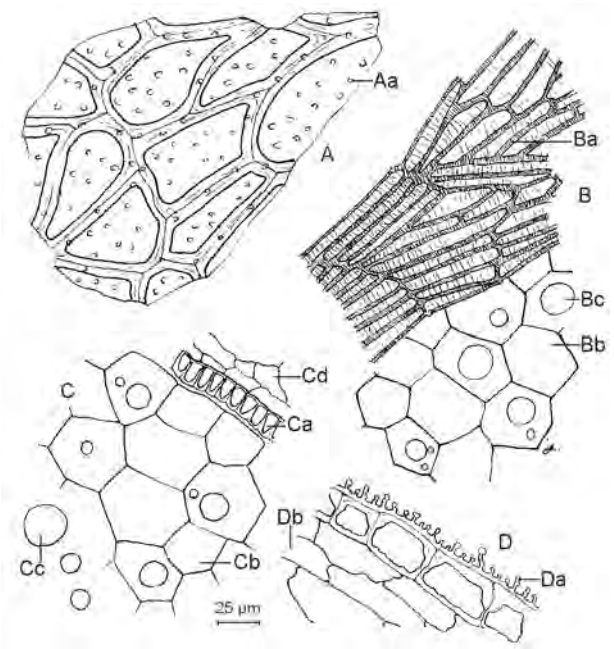

Figure 2289.-1. – *Illustration for identification test B of powdered herbal drug of Staphysagria for homoeopathic preparations*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. To 1.0 g of the powdered herbal drug (710) (*2.9.12*) add 10 mL of *ethanol (90 per cent V/V) R* and boil under a reflux condenser for 15 min. Allow to cool and filter.

*Reference solution*. Dissolve 10 mg of *hyoscine hydrobromide R* and 10 mg of *papaverine hydrochloride R* in *ethanol (90 per cent V/V) R* and dilute to 50 mL with the same solvent.

*Plate*: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

*Mobile phase*: *concentrated ammonia R*, *anhydrous ethanol R*, *acetone R*, *toluene R* (3:7:45:45 *V/V/V/V*).

*Application*: 30 µL [or 20 µL] as bands.

*Development*: over a path of 10 cm [or 6 cm].

*Drying*: in air.

*Detection*: treat with *dilute potassium iodobismuthate solution R*, then with *sodium nitrite solution R* until the yellow background disappears; examine in daylight.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

(33) FRENCH TITLE: Staphysagria pour préparations homéopathiques

| Top of the plate | |
|---|---|
| Papaverine: an orange zone<br>Hyoscine: an orange zone | 3-4 orange zones |
| **Reference solution** | **Test solution** |

TESTS

**Foreign matter** (*2.8.2*): maximum 1 per cent.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

**Total ash** (*2.4.16*): maximum 7.0 per cent.

ASSAY

To 2.000 g of the powdered herbal drug (710) (*2.9.12*) add 20 mL of *ethanol (90 per cent V/V) R*, and boil under a reflux condenser for 15 min. Allow to cool and filter through a plug of absorbent cotton, rinsing the filter with *ethanol (90 per cent V/V) R*. Add 2 mL of *dilute hydrochloric acid R* and evaporate to about 5 mL under reduced pressure. Add 20 mL of *water R*. Shake with 4 quantities, each of 25 mL, of *light petroleum R*. Discard the organic layers. Add to the aqueous layer 3 mL of *dilute ammonia R1* and shake with 4 quantities, each of 25 mL, of *1,1-dimethylethyl methyl ether R*. Dry the combined organic layers over *anhydrous sodium sulfate R*, filter and evaporate to dryness under reduced pressure at about 40 °C. Dissolve the residue in 10 mL of *anhydrous acetic acid R*. Titrate with *0.02 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.02 M perchloric acid* is equivalent to 11.99 mg of delphinine ($C_{33}H_{45}NO_9$).

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

DEFINITION

*Content*: 0.10 per cent *m/m* to 0.40 per cent *m/m* of total alkaloids, expressed as delphinine ($C_{33}H_{45}NO_9$; $M_r$ 599.7).

PRODUCTION

The mother tincture is prepared from the dried seed of *Delphinium staphisagria* L. according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.8 using the powdered herbal drug (710) (*2.9.12*) and *ethanol (90 per cent V/V) R*; use *ethanol (70 per cent V/V) R* to prepare the 4th decimal dilution, and use *ethanol (50 per cent V/V) R* for subsequent dilutions;
- method 1.1.10 using the fragmented herbal drug and *ethanol (65 per cent V/V) R*.

CHARACTERS

*Appearance*: pale yellow liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*) as described in identification test C for the herbal drug with the following modification.

*Test solution.* The mother tincture to be examined.

*Results*: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| Papaverine: an orange zone<br>Hyoscine: an orange zone | 2-4 orange zones |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.830 to 0.840 when method 1.1.8 is used.

**Ethanol** (*2.9.10*): 60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue** (*2.8.16*): minimum 0.7 per cent.

ASSAY

Potentiometric titration (*2.2.20*) as described in the assay of the herbal drug with the following modifications.

To 20.00 g of the mother tincture to be examined add 2 mL of *dilute hydrochloric acid R* and evaporate to about 5 mL under reduced pressure. Continue as described in the assay of the herbal drug, beginning at the words "Add 20 mL of *water R*".

**04/2011:2515**
**corrected 9.0**

# SULFUR FOR HOMOEOPATHIC PREPARATIONS(34)

## Sulfur ad praeparationes homoeopathicas

S $A_r$ 32.07
[7704-34-9]

DEFINITION

Obtained by sublimation.

*Content*: 99.0 per cent to 101.0 per cent.

CHARACTERS

*Appearance*: yellow powder.

*Solubility*: practically insoluble in water, soluble in carbon disulfide, slightly soluble in vegetable oils.

mp: about 120 °C.

IDENTIFICATION

A. Heated in the presence of air, it burns with a blue flame, emitting sulfur dioxide, which changes the colour of moistened *blue litmus paper R* to red.

B. Heat 0.1 g with 0.5 mL of *bromine water R* until decolourised. Add 5 mL of *water R* and filter. The solution gives reaction (a) of sulfates (*2.3.1*).

(34) FRENCH TITLE: Sulfur pour préparations homéopathiques

TESTS

**Solution S**. To 5.0 g add 50 mL of *carbon dioxide-free water R* prepared from *distilled water R*. Allow to stand for 30 min with frequent shaking and filter.

**Appearance of solution**. Solution S is colourless (*2.2.2, Method II*).

**Odour** (*2.3.4*). It has no perceptible odour of hydrogen sulfide.

**Acidity or alkalinity**. To 5 mL of solution S add 0.1 mL of *phenolphthalein solution R1*. The solution is colourless. Add 0.2 mL of *0.01 M sodium hydroxide*. The solution is red. Add 0.3 mL of *0.01 M hydrochloric acid*. The solution is colourless. Add 0.15 mL of *methyl red solution R*. The solution is orange-red.

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 100 ppm, determined on solution S.

**Sulfides**. To 10 mL of solution S add 2 mL of *buffer solution pH 3.5 R* and 1 mL of a freshly prepared 1.6 g/L solution of *lead nitrate R* in *carbon dioxide-free water R*. Shake. After 1 min any colour in the solution is not more intense than that in a reference solution prepared at the same time using 1 mL of *lead standard solution (10 ppm Pb) R*, 9 mL of *carbon dioxide-free water R*, 2 mL of *buffer solution pH 3.5 R* and 1.2 mL of *thioacetamide reagent R*.

**Arsenic** (*2.4.2, Method B*): maximum 8 ppm.

Shake 2.5 g with 50 mL of *dilute ammonia R1* for 1 h and filter. Evaporate 25 mL of the filtrate to dryness. Add 2 mL of *water R* and 3 mL of *nitric acid R* to the residue and evaporate to dryness. The residue complies with the test.

Prepare the standard using 1 mL of *arsenic standard solution (10 ppm As) R*.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Carry out the oxygen-flask method (*2.5.10*), using 60.0 mg in a 1000 mL combustion flask with a polytetrafluoroethylene joint. Absorb the combustion products in a mixture of 5 mL of *dilute hydrogen peroxide solution R* and 10 mL of *water R*. Heat to boiling, boil gently for 2 min and cool. Using 0.2 mL of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide* until the colour changes from colourless to red. Carry out a blank titration under the same conditions.

1 mL of *0.1 M sodium hydroxide* is equivalent to 1.603 mg of S.

STORAGE

Protected from light.

**07/2014:2030**

# URTICA DIOICA FOR HOMOEOPATHIC PREPARATIONS(35)

## Urtica dioica ad praeparationes homoeopathicas

DEFINITION

Whole, fresh, flowering plant of *Urtica dioica* L.

CHARACTERS

The plant causes an itching, burning sensation on the skin.

(35) FRENCH TITLE: Urtica dioica pour préparations homéopathiques

IDENTIFICATION

A. The perennial plant has a taproot that sends out creeping subterranean rhizomes, more or less 4-angled in transverse section, from which extend adventious secondary roots and very numerous brownish hairy rootlets. The stipes are erect, generally unbranched, 3-5 mm in diameter and 0.3-1.5 m high, rarely up to 2.5 m high, 4-angled, greyish-green and covered in short hairs and stinging hairs.

   The decussate leaves are 30-150 mm long and 20-80 mm wide. The petiole is hispid and usually slightly less than one-third the length of the lamina. The leaf blade is ovate, acuminate, cordate or rounded at the base, and coarsely dentate; the apical tooth is distinctly larger than the lateral teeth. The upper side of the leaves is dark green and usually matt, both sides bear short serried hairs intermingled with long stinging hairs. The 2 stipules are linear-subulate and free. The inflorescences growing from the leaf axils are complex, the flowers unisexual, and, particularly in male plants, generally distinctly longer than the petiole. After shedding their pollen, male inflorescences are erect at an oblique angle or horizontal; female inflorescences are pendent when the fruit is ripe. All flowers have long stalks. The perianth of the male flowers is divided half-way down into equal green lobes, widest at their base, with short bristles and stinging hairs at the margins. The stamens are equal and opposite to the perianth segments, each with a long, whitish filament that curves inwards before pollen is shed and spreads out afterwards. The ovary is rudimentary, button or cup-shaped. The perianth of the female flowers is downy or bristly on the outside and consists of outer, and 2 inner segments; the inner segments are about twice the length of the outer ones. The hypogynous, ovate, unilocular ovary bears a large capitate stigma with a brush-like shock of hair. As the one-seeded fruit grows ripe, the 2 inner segments of the perianth fold around it like wings.

B. It complies with the test for *Urtica urens* (see Tests).

TESTS

***Urtica urens***. The margin of the lamina is not serrate with teeth twice as long as wide. The clusters of flowers in the axils are longer than the petiole of the leaf. Unisexual, apetalous flowers are not together on the same plant and in the same cluster.

**Foreign matter** (*2.8.2*): maximum 5 per cent.

**Loss on drying** (*2.2.32*): minimum 65.0 per cent, determined on 5.0 g of finely cut herbal drug by drying in an oven at 105 °C for 2 h, if performed to demonstrate the freshness of the herbal drug.

## Mother tincture

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

PRODUCTION

The mother tincture of Urtica dioica is prepared by maceration using ethanol of a suitable concentration.

CHARACTERS

*Appearance*: greenish-brown or orange-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution*. The mother tincture to be examined.

*Reference solution*. Dissolve 10 mg of *phenylalanine R* and 10 mg of *serine R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10 mL with the same mixture of solvents.

*Plate*: *TLC silica gel plate R*.

Homoeopathic preparations

*Mobile phase*: *glacial acetic acid R*, *water R*, *acetone R*, *butanol R* (10:20:35:35 *V/V/V/V*).

*Application*: 20 µL, as bands.

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: spray with a 1 g/L solution of *ninhydrin R* in *ethanol (96 per cent) R*, heat at 105-110 °C for 5-10 min and examine in daylight within 10 min.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Phenylalanine: a violet to reddish-brown zone | 4 red to violet zones |
| ——— | ——— |
| Serine: a reddish-violet zone | A violet zone |
| | A violet zone |
| **Reference solution** | **Test solution** |

TESTS

**Relative density** (*2.2.5*): 0.930 to 0.950.

**Ethanol** (*2.9.10*): 40 per cent *V/V* to 56 per cent *V/V*.

**Methanol** (*2.9.11*): maximum 0.10 per cent *V/V*.

**Dry residue** (*2.8.16*): minimum 1.1 per cent.

# EUROPEAN PHARMACOPOEIA – 10th EDITION

published July 2019

replaces the 9th Edition on 1 January 2020

## BOOK

Volumes I, II and III of this publication 10.0 constitute the 10th Edition of the European Pharmacopoeia. They will be complemented by **non-cumulative supplements** (see the publication schedule opposite) that are to be kept for the duration of the 10th Edition. Each new edition or supplement of the European Pharmacopoeia is usually published 6 months before its implementation date.

To use the 10th Edition correctly, make sure that you have all the published supplements and consult the index of the most recent supplement to ensure that you use the latest versions of the monographs and general chapters.

A cumulative list of reagents will be published in supplements 10.4 and 10.7. A list of new reagents published during the course of the 10th Edition is available under 'Useful information' in Pharmeuropa Online.

## ELECTRONIC VERSION

The 10th Edition is also available in an electronic format containing all of the monographs and general chapters found in the book. With the publication of each supplement the electronic version is replaced by a new, fully updated, cumulative version. Each update of the electronic version is usually available 6 months before its implementation date. A list of new reagents published during the course of the 10th Edition is available under 'Useful information' in Pharmeuropa Online.

## CORRECTIONS

Corrections are to be taken into account as soon as possible and not later than the end of the month following the month of publication (see the publication schedule opposite).

## PHARMACOPOEIAL HARMONISATION

See the information given in general chapter *5.8. Pharmacopoeial harmonisation*.

## ARCHIVES

http://pheur.edqm.eu

The European Pharmacopoeia Archives contain all obsolete editions and supplements in PDF format. They are available to all European Pharmacopoeia subscribers with an up-to-date subscription (book or electronic version) and a registered EPID code. To access the archives, register the EPID code which can be found on the inside-front cover. The registration page is accessible through the EDQM website (https://pheur.edqm.eu/user/register/).

# PHARMEUROPA ONLINE

European Pharmacopoeia's free online forum

http://pharmeuropa.edqm.eu

Pharmeuropa Online contains preliminary drafts of new and revised texts proposed for inclusion in the European Pharmacopoeia and gives an opportunity for all interested parties to comment on the specifications before they are finalised.

Pharmeuropa Online also contains information on the work programme or of general interest and articles published in Pharmeuropa Bio & Scientific Notes (containing scientific articles on pharmacopoeial matters).

**Archives** of Pharmeuropa and Pharmeuropa Bio & Scientific Notes can be accessed via this website.

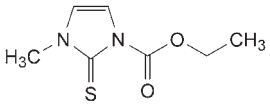
## CARBIMAZOLE(1)

Carbimazolum



$C_7H_{10}N_2O_2S$

[22232-54-8] $M_r$ 186.2

*CAS number*

DEFINITION

Ethyl 3-methyl-2-thioxo-2,3-dihydro-1*H*-imidazole-1-carboxylate.

*Chemical name in accordance with IUPAC nomenclature rules*

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

*For the meaning of black and white diamonds see chapter 5.8. Pharmacopoeial harmonisation*

♦CHARACTERS

*Appearance*: white or yellowish-white, crystalline powder.

*Solubility*: slightly soluble in water, soluble in acetone and in ethanol (96 per cent). ♦

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

*Application of the first and second identification is defined in the General Notices (chapter 1)*

◊A. Melting point (*2.2.14*): 122 °C to 125 °C.◊

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *carbimazole CRS*.

*Reference standard available from the EDQM (see http://crs.edqm.eu)*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reagent described in chapter 4*

*Reference solution*. Dissolve 10 mg of *carbimazole CRS* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel GF254 plate R*.

*Further information on certain reagents available in the Knowledge database (http://go.edqm.eu/knowledge)*

*Mobile phase*: *acetone R*, *methylene chloride R* (20:80 *V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air for 30 min.

*Vertical line in the margin indicating where the text has been modified*

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

*Horizontal line in the margin indicating where part of the text has been deleted*

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Reference to a general chapter*

*Test solution.* Dissolve 5.0 mg of the substance to be examined in 10.0 mL of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Use this solution within 5 min of preparation.

(1) This monograph has undergone pharmacopoeial harmonisation. See chapter 5.8. *Pharmacopoeial harmonisation*.

SPECIMEN

*IMPORTANT NOTICE*

# GENERAL MONOGRAPHS

The European Pharmacopoeia contains a number of general monographs covering classes of products. These general monographs give requirements that are applicable to all products in the given class or, in some cases, to any product in the given class for which there is a specific monograph in the Pharmacopoeia (see *1. General Notices*, General monographs). Where no restriction on scope of a general monograph is given in a preamble, it is applicable to all products in the class defined, irrespective of whether there is an individual monograph for the product in the Pharmacopoeia.

Whenever a monograph is used, it is essential to ascertain whether there is a general monograph applicable to the product in question. The general monographs listed below are published in the General Monographs section (unless otherwise stated). This list is updated where necessary and republished in each supplement.

Allergen products (1063)

Chemical precursors for radiopharmaceutical preparations (2902)

Dosage Forms monographs
*(published in the Dosage Forms section or the Homoeopathic Preparations section, as appropriate)*

Essential oils (2098)

Herbal drug extracts (0765)

Herbal drug preparations (1434)

Herbal drugs (1433)

Herbal drugs for homoeopathic preparations (2045)
*(published in the Homoeopathic Preparations section)*

Herbal teas (1435)

Herbal teas, instant (2620)

Homoeopathic preparations (1038)
*(published in the Homoeopathic Preparations section)*

Immunosera for human use, animal (0084)

Immunosera for veterinary use (0030)

Live biotherapeutic products for human use (3053)

Methods of preparation of homoeopathic stocks and potentisation (2371)
*(published in the Homoeopathic Preparations section)*

Monoclonal antibodies for human use (2031)

Mother tinctures for homoeopathic preparations (2029)
*(published in the Homoeopathic Preparations section)*

Pharmaceutical preparations (2619)

Products of fermentation (1468)

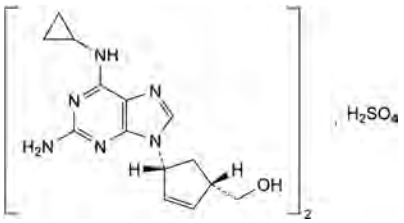
# ABACAVIR SULFATE

## Abacaviri sulfas



$C_{28}H_{38}N_{12}O_6S$ $M_r$ 671
[188062-50-2]

DEFINITION

Bis[[(1*S*,4*R*)-4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]cyclopent-2-enyl]methanol] sulfate.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *abacavir sulfate CRS*.

B. Enantiomeric purity (see Tests).

C. Solution S (see Tests) gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.250 g in *water R* and dilute to 25.0 mL with the same solvent.

**Enantiomeric purity**. Liquid chromatography (*2.2.29*).

*Solution A*. Mix 0.5 mL of *trifluoroacetic acid R* and 100 mL of *methanol R*.

*Solution B*. Mix 30 volumes of *methanol R*, 30 volumes of *2-propanol R* and 40 volumes of *heptane R*.

*Test solution*. Dissolve 40 mg of the substance to be examined in 30 mL of solution A. Sonicate until dissolution is complete. Add 30 mL of *2-propanol R* and dilute to 100.0 mL with *heptane R*.

*Reference solution (a)*. Dissolve 2 mg of *abacavir for system suitability CRS* (containing impurities A and D) in 1.5 mL of solution A. Sonicate until dissolution is complete. Add 1.5 mL of *2-propanol R* and dilute to 5.0 mL with *heptane R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution B. Dilute 1.0 mL of this solution to 10.0 mL with solution B.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *amylose derivative of silica gel for chiral separation R* (10 µm);
– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: *diethylamine R*, *2-propanol R*, *heptane R* (0.1:15:85 *V/V/V*);
– *mobile phase B*: *heptane R*, *2-propanol R* (50:50 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 25 | 100 | 0 |
| 25 - 27 | 100 → 0 | 0 → 100 |
| 27 - 37 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 286 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *abacavir for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A and D.

*Relative retention* with reference to abacavir (retention time = about 17 min): impurity D = about 0.8; impurity A = about 0.9.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurities D and A; minimum 1.5 between the peaks due to impurity A and abacavir.

*Limit*:

– *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and transfer them to low-adsorption, inert glass vials.*

*Test solution*. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent. Sonicate until dissolution is complete.

*Reference solution (a)*. Dissolve 2.5 mg of *abacavir for peak identification CRS* (containing impurities B and D) in 10.0 mL of *water R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: dilute 0.5 mL of *trifluoroacetic acid R* in 1000 mL of *water R*;
– *mobile phase B*: *water R*, *methanol R* (15:85 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 95 | 5 |
| 5 - 25 | 95 → 70 | 5 → 30 |
| 25 - 40 | 70 → 10 | 30 → 90 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *abacavir for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B and D.

*Relative retention* with reference to abacavir (retention time = about 22 min): impurity D = about 1.04; impurity B = about 1.3.

*System suitability*: reference solution (a):

– *peak-to-valley ratio*: minimum 3.0, where $H_p$ = height above the baseline of the peak due to impurity D and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to abacavir.

*Limits*:

– *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.32*): maximum 0.5 per cent, determined on 60.0 mg.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

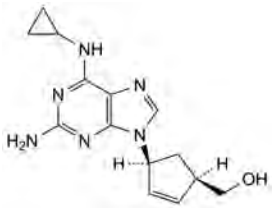
Dissolve 0.300 g in 50 mL of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 33.54 mg of $C_{28}H_{38}N_{12}O_6S$.

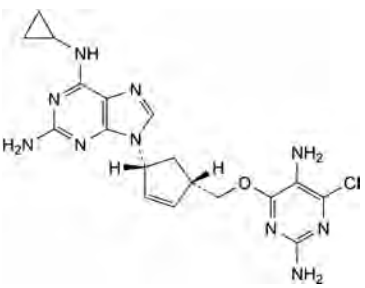
IMPURITIES

*Specified impurities: A, B.*

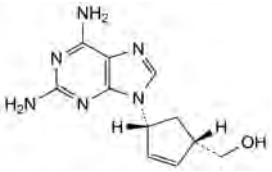
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, F.*



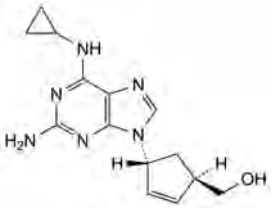
A. [(1*R*,4*S*)-4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]cyclopent-2-enyl]methanol,



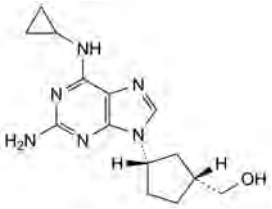
B. 6-(cyclopropylamino)-9-[(1*R*,4*S*)-4-[[(2,5-diamino-6-chloropyrimidin-4-yl)oxy]methyl]cyclopent-2-enyl]-9*H*-purin-2-amine,



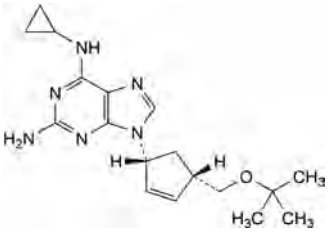
C. [(1*S*,4*R*)-4-(2,6-diamino-9*H*-purin-9-yl)cyclopent-2-enyl]methanol,



D. [(1*R*,4*R*)-4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]cyclopent-2-enyl]methanol,



E. [(1*R*,3*S*)-3-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]cyclopentyl]methanol,



F. 6-(cyclopropylamino)-9-[(1*R*,4*S*)-4-[[(1,1-dimethylethyl)oxy]methyl]cyclopent-2-enyl]-9*H*-purine-2-amine.

**07/2019:0308**

# ACACIA, DRIED DISPERSION

## Acaciae gummi dispersione desiccatum

DEFINITION

Powder obtained from a dispersion of *Acacia (0307)* after a drying process.

CHARACTERS

It dissolves completely, after about 20 min, in twice its mass of water. The liquid obtained is colourless or yellowish, dense, viscous, adhesive, translucent and weakly acid to blue litmus paper. It is practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Examine under a microscope using *ethanol (96 per cent) R* as the mounting medium. The preparation to be examined consists of predominantly spheroidal or irregular and angular particles varying in size (4-500 µm), with 1 or more rounded cavities containing 1 or several air bubbles; a few flat fragments are also present. Only traces of starch granules are visible and no plant tissue is observed.

B. Examine the chromatograms obtained in the test for glucose and fructose.

*Results*: see below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution.

| Top of the plate | |
|---|---|
| | 3 blue zones, very faint |
| Rhamnose: a greenish-brown zone | A greenish-brown zone, very faint to equivalent (rhamnose) |
| Xylose: a brownish-grey zone | |
| ——— | ——— |
| Arabinose: a brownish-grey zone | A brownish-grey zone, intense (arabinose) |
| Glucose: a greyish-blue zone | |
| Galactose: a greyish-blue zone | A greyish-blue zone, intense (galactose) |
| ——— | ——— |
| | 1 or 2 brownish-grey zones, very faint to equivalent |
| | 1 or 2 blue zones, faint to equivalent |
| **Reference solution (a)** | **Test solution** |

C. Dissolve 1 g of the preparation to be examined in 2 mL of *water R* by stirring frequently for 20 min. Add 2 mL of *ethanol (96 per cent) R*. After shaking, a white gelatinous mucilage is formed that becomes fluid upon addition of 10 mL of *water R*.

TESTS

**Solution S**. Dissolve 3.0 g of the preparation to be examined in 25 mL of *water R* by stirring for 10 min. Allow to stand for 20 min and dilute to 30 mL with *water R*.

**Glucose and fructose**. High-performance thin-layer chromatography (*2.8.25*).

*Test solution*. To 0.1 g in a thick-walled centrifuge tube add 2 mL of a 100 g/L solution of *trifluoroacetic acid R* and shake vigorously. Stopper the tube and heat the mixture at 120 °C for 1 h. Centrifuge, transfer 1 mL of the clear supernatant into a 10 mL flask and add 5 mL of *methanol R*.

*Reference solution (a)*. Dissolve 5 mg of *arabinose R*, 5 mg of *galactose R*, 5 mg of *glucose R*, 5 mg of *rhamnose R* and 5 mg of *xylose R* in 1 mL of *water R* and dilute to 10.0 mL with *methanol R*.

*Reference solution (b)*. Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c)*. Dissolve 5 mg of *galactose R* and 5 mg of *glucose R* in 1 mL of *water R* and dilute to 10 mL with *methanol R*.

*Intensity marker*: galactose.

*Plate*: *TLC silica gel $F_{254}$ plate R* (2-10 µm).

*Mobile phase*: *water R*, *acetonitrile R* (15:85 *V/V*).

*Application*: 4 µL of the test solution and reference solutions (a) and (b), and 2 µL of reference solution (c), as bands of 8 mm.

*Development A*: 70 mm from the lower edge of the plate, in an unsaturated tank.

*Drying A*: in air.

*Development B*: 70 mm from the lower edge of the plate, in an unsaturated tank, using freshly prepared mobile phase.

*Drying B*: in air.

*Detection*: treat with a solution prepared as follows: dissolve 4 g of *diphenylamine R* and 4 mL of *aniline R* in 160 mL of *acetone R* and add *phosphoric acid R* until the precipitate formed dissolves again (about 30 mL). Heat at 120 °C for 5-10 min and examine in daylight.

*System suitability*: reference solution (c):

– the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (galactose) and the upper zone (glucose) are greyish-blue.

*Results*: the chromatogram obtained with the test solution shows no greyish-blue zone and no reddish zone between the zones due to galactose and arabinose in the chromatogram obtained with reference solution (a).

**Starch, dextrin and agar**. To 10 mL of solution S, previously boiled and cooled, add 0.1 mL of *0.05 M iodine*. No blue or reddish-brown colour develops.

**Sterculia gum**

A. Place 0.2 g in a 10 mL ground-glass-stoppered cylinder graduated in 0.1 mL. Add 10 mL of *ethanol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 mL.

B. To 1.0 g add 100 mL of *water R* and shake. Add 0.1 mL of *methyl red solution R*. Not more than 5.0 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Tannins**. To 10 mL of solution S add 0.1 mL of *ferric chloride solution R1*. A gelatinous precipitate is formed, but neither the precipitate nor the liquid is dark blue.

**Tragacanth**. Examine the chromatograms obtained in the test for glucose and fructose.

*Results*: the chromatogram obtained with the test solution shows no faint to intense brownish-grey zone corresponding to the zone due to xylose in the chromatogram obtained with reference solution (a).

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Total ash** (*2.4.16*): maximum 4.0 per cent.

**Microbial contamination**

TAMC: acceptance criterion $10^4$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are*

*recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

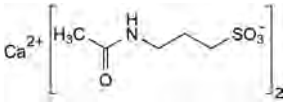
*The following characteristic may be relevant for acacia dried dispersion used as a viscosity-increasing agent and/or suspending agent in aqueous preparations.*

**Apparent viscosity**. Determine the dynamic viscosity using a capillary viscometer (*2.2.9*) or a rotating viscometer (*2.2.10*) on a 100 g/L solution of acacia, dried dispersion (dried substance).

**01/2017:1585**

# ACAMPROSATE CALCIUM

## Acamprosatum calcicum



$C_{10}H_{20}CaN_2O_8S_2$ $M_r$ 400.5
[77337-73-6]

DEFINITION

Calcium bis[3-(acetylamino)propane-1-sulfonate].

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *Ph. Eur. reference spectrum of acamprosate calcium*.

B. It gives reaction (a) of calcium (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 5.5 to 7.0 for solution S.

**Impurity A**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.40 g of the substance to be examined in *distilled water R* and dilute to 20.0 mL with the same solvent. Dilute 10.0 mL of this solution to 100.0 mL with *borate buffer solution pH 10.4 R*. Place 3.0 mL of the solution obtained in a 25 mL ground-glass-stoppered tube. Add 0.15 mL of a freshly prepared 5 g/L solution of *fluorescamine R* in *acetonitrile R*. Shake immediately and vigorously for 30 s. Place in a water-bath at 50 °C for 30 min. Cool under a stream of cold water. Centrifuge and filter the supernatant through a suitable membrane filter (nominal pore size 0.45 µm), 25 mm in diameter.

*Reference solution*. Dissolve 50 mg of *acamprosate impurity A CRS* in *distilled water R* and dilute to 200.0 mL with the same solvent. Dilute 0.4 mL of the solution to 100.0 mL with *borate buffer solution pH 10.4 R*. Treat 3.0 mL of this solution in the same way as the test solution

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 170 $m^2$/g and a pore size of 12 nm.

*Mobile phase*: *acetonitrile R*, *methanol R*, *0.1 M phosphate buffer solution pH 6.5 R* (10:10:80 *V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 261 nm.

*Injection*: 20 µL.

*Run time*: 6 times the retention time of impurity A

*Retention times*: fluorescamine = about 4 min; impurity A = about 8 min; acamprosate is not detected by this system.

*Limits*:
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.4 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY

To 4 g of *cation-exchange resin R* (75-150 µm) add 20 mL of *distilled water R* and stir magnetically for 10 min. Introduce this suspension into a glass column, 45 cm long and 2.2 cm in internal diameter, equipped with a polytetrafluoroethylene flow cap covered by a glass-wool plug. Allow a few millilitres of this solution to flow, then place a plug of glass wool over the resin. Pass 50 mL of *1 M hydrochloric acid* through the column. The pH of the eluate is close to 1. Wash with 3 quantities, each of 200 mL, of *distilled water R* to obtain an eluate at pH 6. Dissolve 0.100 g of the substance to be examined in 15 mL of *distilled water R*. Pass through the column and wash with 3 quantities, each of 25 mL, of *distilled water R*, collecting the eluate. Allow to elute until an eluate at pH 6 is obtained. Titrate the solution obtained with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* corresponds to 20.02 mg of $C_{10}H_{20}CaN_2O_8S_2$.

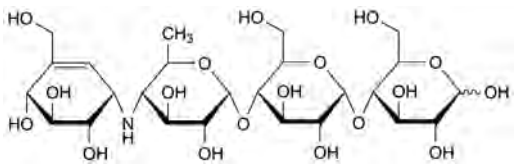
IMPURITIES

A. 3-aminopropane-1-sulfonic acid (homotaurine).

**01/2017:2089**

# ACARBOSE

## Acarbosum



$C_{25}H_{43}NO_{18}$ $M_r$ 646
[56180-94-0]

DEFINITION

*O*-4,6-Dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-D-glucopyranose, which is produced by certain strains of *Actinoplanes utahensis*.

*Content*: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or yellowish, hygroscopic, amorphous powder.

*Solubility*: very soluble in water, soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *acarbose for identification CRS*.

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**pH** (*2.2.3*): 5.5 to 7.5 for solution S.

**Specific optical rotation** (*2.2.7*): + 168 to + 183 (anhydrous substance).

Dilute 2.0 mL of solution S to 10.0 mL with *water R*.

**Absorbance** (*2.2.25*): maximum 0.15 at 425 nm for solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.200 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve the contents of a vial of *acarbose CRS* in 5.0 mL of *water R*.

*Reference solution (b)*. Dissolve the contents of a vial of *acarbose for peak identification CRS* (acarbose containing impurities A, B, C, D, E, F and G) in 1 mL of *water R*.

*Reference solution (c)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*: mix 750 volumes of *acetonitrile R1* and 250 volumes of a solution containing 0.60 g/L of *potassium dihydrogen phosphate R* and 0.35 g/L of *disodium hydrogen phosphate dihydrate R*.

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: 2.5 times the retention time of acarbose.

*Identification of impurities*: use the chromatogram supplied with *acarbose for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C, D, E, F and G.

*Relative retention* with reference to acarbose (retention time = about 16 min): impurity D = about 0.5; impurity B = about 0.8; impurity A = about 0.9; impurity C = about 1.2; impurity E = about 1.7; impurity F = about 1.9; impurity G = about 2.2.

*System suitability*: reference solution (b):

- the chromatogram obtained is similar to the chromatogram supplied with *acarbose for peak identification CRS*;
- *peak-to-valley ratio*: minimum 1.2, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to acarbose.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.63; impurity D = 0.75; impurity E = 1.25; impurity F = 1.25; impurity G = 1.25;
- *impurity C*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.5 per cent);
- *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent);
- *impurity A*: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.6 per cent);
- *impurity B*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *impurities F, G*: for each impurity, not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent);
- *impurity E*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.0 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

**Water** (*2.5.12*): maximum 4.0 per cent, determined on 0.300 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{25}H_{43}NO_{18}$ taking into account the assigned content of *acarbose CRS*.

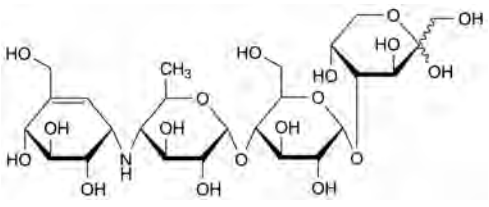
STORAGE

In an airtight container.

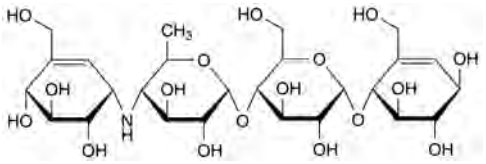
IMPURITIES

*Specified impurities*: *A, B, C, D, E, F, G.*

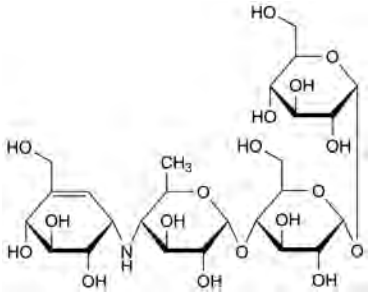
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *H.*



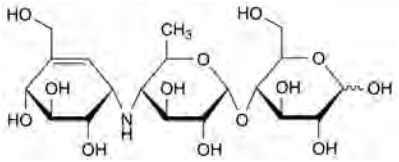
A. *O*-4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-D-*arabino*-hex-2-ulopyranose,



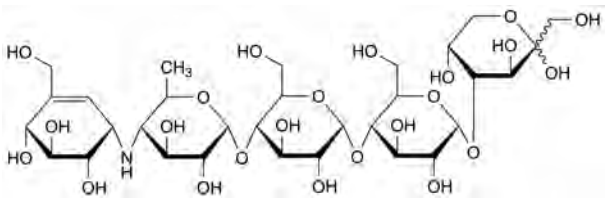
B. (1*R*,4*R*,5*S*,6*R*)-4,5,6-trihydroxy-2-(hydroxymethyl)cyclohex-2-enyl 4-*O*-[4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl]-α-D-glucopyranoside,



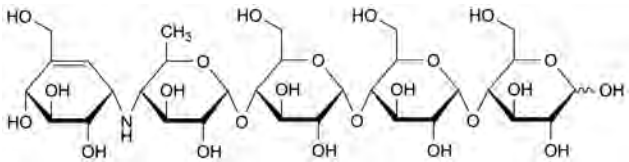
C. α-D-glucopyranosyl 4-*O*-[4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl]-α-D-glucopyranoside,



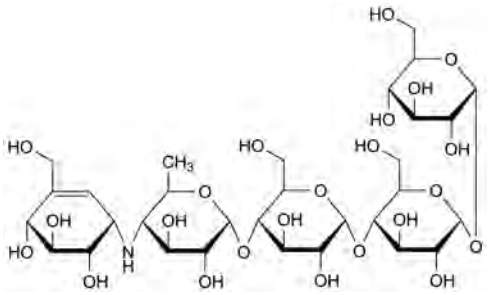
D. 4-*O*-[4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl]-D-glucopyranose,



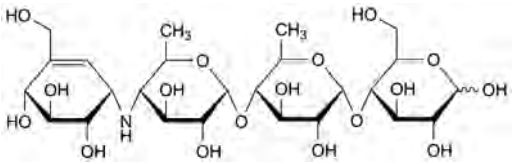
E. *O*-4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-D-*arabino*-hex-2-ulopyranose (4-*O*-α-acarbosyl-D-fructopyranose),



F. *O*-4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-D-glucopyranose (4-*O*-α-acarbosyl-D-glucopyranose),



G. α-D-glucopyranosyl *O*-4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranoside (α-D-glucopyranosyl α-acarboside),



H. *O*-4,6-dideoxy-4-[[(1*S*,4*R*,5*S*,6*S*)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]-α-D-glucopyranosyl-(1→4)-*O*-6-deoxy-α-D-glucopyranosyl-(1→4)-D-glucopyranose.

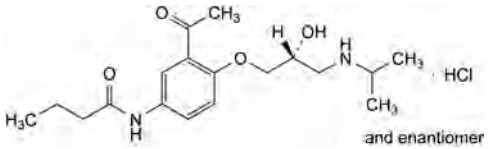
# ACEBUTOLOL HYDROCHLORIDE

## Acebutololi hydrochloridum



$C_{18}H_{29}ClN_2O_4$ $M_r$ 372.9
[34381-68-5]

DEFINITION

*N*-[3-Acetyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)-amino]propoxy]phenyl]butanamide hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water and in ethanol (96 per cent), very slightly soluble in acetone and in methylene chloride.

mp: about 143 °C.

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 20.0 mg in a 0.1 per cent *V/V* solution of *hydrochloric acid R* and dilute to 100.0 mL with the same acid solution. Dilute 5.0 mL of this solution to 100.0 mL with a 0.1 per cent *V/V* solution of *hydrochloric acid R*.

*Spectral range*: 220-350 nm.

*Absorption maxima*: at 233 nm and 322 nm.

*Specific absorbance at the absorption maximum*: 555 to 605 at 233 nm.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *acebutolol hydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 20 mL with the same solvent.

*Reference solution (a)*. Dissolve 20 mg of *acebutolol hydrochloride CRS* in *methanol R* and dilute to 20 mL with the same solvent.

*Reference solution (b)*. Dissolve 20 mg of *pindolol CRS* in *methanol R* and dilute to 20 mL with the same solvent. To 1 mL of this solution add 1 mL of reference solution (a).

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *perchloric acid R*, *methanol R*, *water R* (5:395:600 *V/V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ (*2.2.2, Method II*).

Dissolve 0.5 g in *water R* and dilute to 10 mL with the same solvent.

**pH** (*2.2.3*): 5.0 to 7.0.

Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (a)*. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 100.0 mL with mobile phase A. Dilute 0.5 mL of this solution to 50.0 mL with mobile phase A.

*Reference solution (b)*. Dissolve the contents of a vial of *acebutolol impurity I CRS* in 1.0 mL of mobile phase A.

*Reference solution (c)*. Mix 2.0 mL of reference solution (a) and 1.0 mL of reference solution (b) and dilute to 10.0 mL with mobile phase A.

*Reference solution (d)*. Dissolve 5.0 mg of *acebutolol impurity C CRS* in 10 mL of *acetonitrile R* and dilute to 25.0 mL with mobile phase A. Dilute 0.5 mL of this solution to 50.0 mL with mobile phase A.

*Reference solution (e)*. Dissolve 5.0 mg of *acebutolol impurity B CRS* in 10.0 mL of *acetonitrile R* and dilute to 25.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 50.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.125 m, Ø = 4 mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: mix 2.0 mL of *phosphoric acid R*, and 3.0 mL of *triethylamine R* and dilute to 1000 mL with *water R*;
- *mobile phase B*: mix equal volumes of *acetonitrile R* and mobile phase A;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 98 | 2 |
| 2 - 30.5 | 98 → 10 | 2 → 90 |
| 30.5 - 41 | 10 | 90 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 25 µL.

*System suitability*: reference solution (c):

- *resolution*: minimum 7.0 between the peaks due to impurity I and acebutolol.

*Limits*:

- *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent);
- *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent);
- *impurity I*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 mL of *ethanol (96 per cent) R* and add 1 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

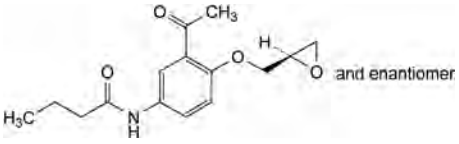
1 mL of *0.1 M sodium hydroxide* is equivalent to 37.29 mg of $C_{18}H_{29}ClN_2O_4$.

STORAGE

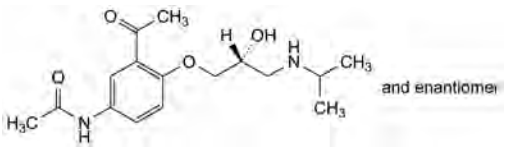
Protected from light.

IMPURITIES

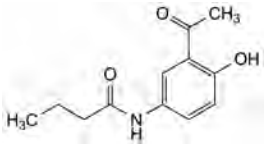
*Specified impurities: A, B, C, D, E, F, G, H, I, J, K.*



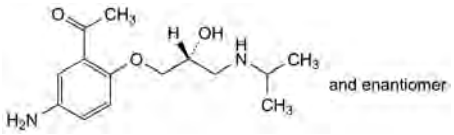
A. *N*-[3-acetyl-4-[(2*RS*)-oxiran-2-ylmethoxy]phenyl]-butanamide,



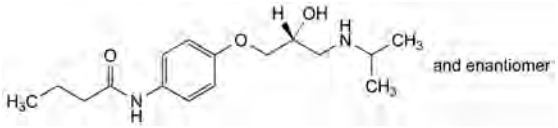
B. *N*-[3-acetyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)-amino]propoxy]phenyl]acetamide (diacetolol),



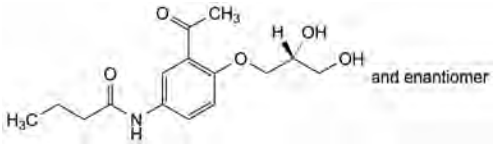
C. *N*-(3-acetyl-4-hydroxyphenyl)butanamide,



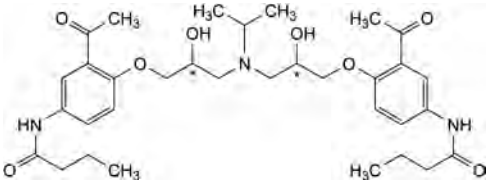
D. 1-[5-amino-2-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)-amino]propoxy]phenyl]ethanone,



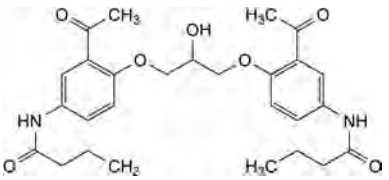
E. *N*-[4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]-propoxy]phenyl]butanamide,



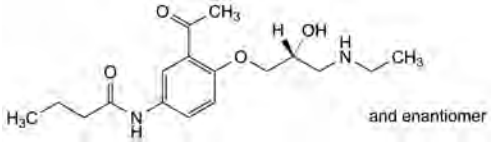
F. *N*-[3-acetyl-4-[(2*RS*)-2,3-dihydroxypropoxy]phenyl]-butanamide,



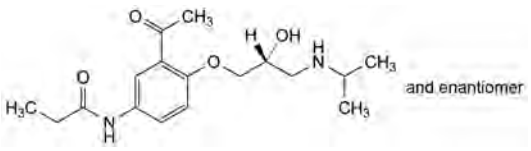
G. *N*,*N*′-[[(1-methylethyl)imino]bis[(2-hydroxypropane-1,3-diyl)oxy(3-acetyl-1,4-phenylene)]]dibutanamide (biamine),



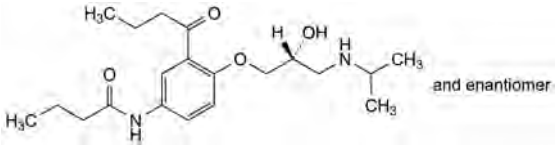
H. *N*,*N*′-[(2-hydroxypropane-1,3-diyl)bis[oxy(3-acetyl-1,4-phenylene)]]dibutanamide,



I. *N*-[3-acetyl-4-[(2*RS*)-3-(ethylamino)-2-hydroxy-propoxy]phenyl]butanamide,



J. *N*-[3-acetyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)-amino]propoxy]phenyl]propanamide,

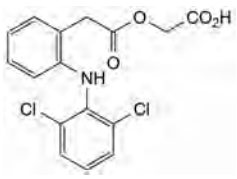


K. *N*-[3-butanoyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)-amino]propoxy]phenyl]butanamide.

**01/2018:1281**

# ACECLOFENAC

## Aceclofenacum



$C_{16}H_{13}Cl_2NO_4$ $M_r$ 354.2
[89796-99-6]

DEFINITION

[[[2-[(2,6-Dichlorophenyl)amino]phenyl]acetyl]oxy]acetic acid.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in acetone, soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 2.0 mL of the solution to 50.0 mL with *methanol R*.

*Spectral range*: 220-370 nm.

*Absorption maximum*: 275 nm.

*Specific absorbance at the absorption maximum*: 320 to 350.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison: Ph. Eur. reference spectrum of aceclofenac.*

C. Dissolve about 10 mg in 10 mL of *ethanol (96 per cent) R*. To 1 mL of the solution, add 0.2 mL of a mixture, prepared immediately before use, of equal volumes of a 6 g/L solution of *potassium ferricyanide R* and a 9 g/L solution of *ferric chloride R*. Allow to stand protected from light for 5 min. Add 3 mL of a 10.0 g/L solution of *hydrochloric acid R*. Allow to stand protected from light for 15 min. A blue colour develops and a precipitate is formed.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture*: mobile phase A, mobile phase B (30:70 *V/V*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 21.6 mg of *diclofenac sodium CRS* (impurity A) in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 2.0 mL of the test solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Mix 1.0 mL of reference solution (a) and 1.0 mL of reference solution (b) and dilute to 100.0 mL with the solvent mixture.

*Reference solution (d).* Dissolve 4.0 mg of *aceclofenac impurity F CRS* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (e).* Dissolve 2.0 mg of *aceclofenac impurity H CRS* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (f).* Mix 1.0 mL of reference solution (b), 1.0 mL of reference solution (d) and 1.0 mL of reference solution (e) and dilute to 100.0 mL with the solvent mixture.

*Reference solution (g).* Dissolve 5.0 mg of *aceclofenac impurity I CRS* in the solvent mixture and dilute to 50.0 mL with solvent mixture. Dilute 1.0 mL of the solution to 50.0 mL with the solvent mixture.

*Reference solution (h).* Dissolve 4 mg of *aceclofenac for peak identification CRS* (containing impurities B, C, D, E and G) in 2 mL of the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent;
- *temperature*: 40 °C.

*Mobile phase:*

- *mobile phase A*: 1.12 g/L solution of *phosphoric acid R* adjusted to pH 7.0 with a 42 g/L solution of *sodium hydroxide R*;
- *mobile phase B*: *water R*, *acetonitrile R* (10:90 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 25 | 70 → 50 | 30 → 50 |
| 25 - 30 | 50 → 20 | 50 → 80 |
| 30 - 50 | 20 | 80 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 275 nm.

*Injection*: 10 µL of the test solution and reference solutions (c), (d), (e), (f), (g) and (h).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peak due to impurity A; use the chromatogram supplied with *aceclofenac for peak identification CRS* and the chromatogram obtained with reference solution (h) to identify the peaks due to impurities B, C, D, E and G; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity F; use the chromatogram obtained with reference solution (e) to identify the peak due to impurity H; use the chromatogram obtained with reference solution (g) to identify the peak due to impurity I.

*Relative retention* with reference to aceclofenac (retention time = about 11 min): impurity A = about 0.8; impurity G = about 1.3; impurity H = about 1.5; impurity I = about 2.3; impurity D = about 3.1; impurity B = about 3.2; impurity E = about 3.3; impurity C = about 3.5; impurity F = about 3.7.

*System suitability*: reference solution (c):

- *resolution*: minimum 5.0 between the peaks due to impurity A and aceclofenac.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *impurities B, C, D, E, G*: for each impurity, not more than the area of the peak due to aceclofenac in the chromatogram obtained with reference solution (f) (0.2 per cent);
- *impurity F*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.2 per cent);
- *impurity H*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.15 per cent);
- *impurity I*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (g) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the peak due to aceclofenac in the chromatogram obtained with reference solution (f) (0.10 per cent);
- *total*: maximum 0.7 per cent;
- *disregard limit*: 0.25 times the area of the peak due to aceclofenac in the chromatogram obtained with reference solution (f) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 40 mL of *methanol R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

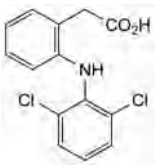
1 mL of *0.1 M sodium hydroxide* is equivalent to 35.42 mg of $C_{16}H_{13}Cl_2NO_4$.

STORAGE

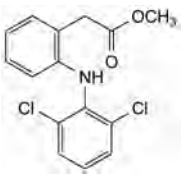
Protected from light.

IMPURITIES

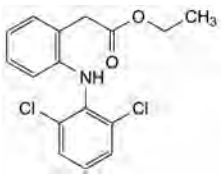
*Specified impurities: A, B, C, D, E, F, G, H, I.*



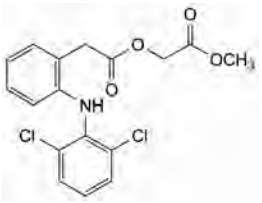
A. [2-[(2,6-dichlorophenyl)amino]phenyl]acetic acid (diclofenac),



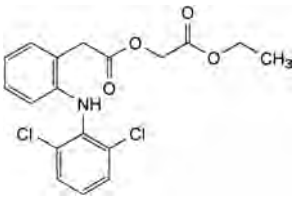
B. methyl [2-[(2,6-dichlorophenyl)amino]phenyl]acetate (methyl ester of diclofenac),



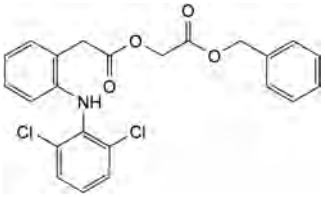
C. ethyl [2-[(2,6-dichlorophenyl)amino]phenyl]acetate (ethyl ester of diclofenac),



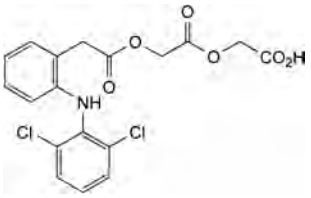
D. methyl [[[2-[(2,6-dichlorophenyl)amino]phenyl]-acetyl]oxy]acetate (methyl ester of aceclofenac),



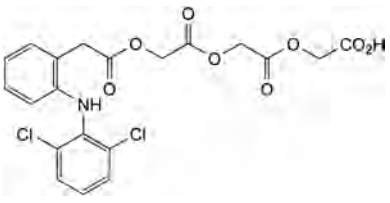
E. ethyl [[[2-[(2,6-dichlorophenyl)amino]phenyl]-acetyl]oxy]acetate (ethyl ester of aceclofenac),



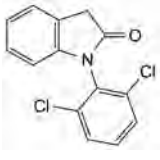
F. benzyl [[[2-[(2,6-dichlorophenyl)amino]phenyl]-acetyl]oxy]acetate (benzyl ester of aceclofenac),



G. [[[[[2-[(2,6-dichlorophenyl)amino]phenyl]-acetyl]oxy]acetyl]oxy]acetic acid (acetic aceclofenac),



H. [[[[[[[2-[(2,6-dichlorophenyl)amino]phenyl]-acetyl]oxy]acetyl]oxy]acetyl]oxy]acetic acid (diacetic aceclofenac),

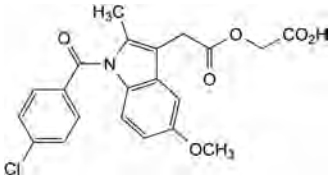


I. 1-(2,6-dichlorophenyl)-1,3-dihydro-2*H*-indol-2-one.

**01/2017:1686**

# ACEMETACIN

## Acemetacinum



$C_{21}H_{18}ClNO_6$ $M_r$ 415.8
[53164-05-9]

DEFINITION

[[[1-(4-Chlorobenzoyl)-5-methoxy-2-methyl-1*H*-indol-3-yl]acetyl]oxy]acetic acid.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: yellow or greenish-yellow, crystalline powder.

*Solubility*: practically insoluble in water, soluble in acetone, slightly soluble in anhydrous ethanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *acemetacin CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in *acetonitrile for chromatography R* and dilute to 20.0 mL with the same solvent.

*Reference solution (a)*. Dilute 5.0 mL of the test solution to 50.0 mL with *acetonitrile for chromatography R*. Dilute 1.0 mL of this solution to 100.0 mL with *acetonitrile for chromatography R*.

*Reference solution (b)*. Dissolve 5.0 mg of *acemetacin impurity A CRS* and 10.0 mg of *indometacin CRS* (impurity B) in *acetonitrile for chromatography R*, and dilute to 50.0 mL with the same solvent.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 20.0 mL with *acetonitrile for chromatography R*.

*Reference solution (d)*. To 1 mL of reference solution (b), add 10 mL of the test solution and dilute to 20 mL with *acetonitrile for chromatography R*.

*Reference solution (e)*. Dissolve the contents of a vial of *acemetacin impurity mixture CRS* (containing impurities C, D, E and F) in 1.0 mL of the test solution.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 1.0 g of *potassium dihydrogen phosphate R* in 900 mL of *water R*, adjust to pH 6.5 with *1 M sodium hydroxide* and dilute to 1000 mL with *water R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 95 | 5 |
| 5 - 9 | 95 → 65 | 5 → 35 |
| 9 - 16 | 65 | 35 |
| 16 - 28 | 65 → 20 | 35 → 80 |
| 28 - 34 | 20 | 80 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Injection*: 20 µL.

*Identification of impurities*:

- use the chromatogram supplied with *acemetacin impurity mixture CRS* and the chromatogram obtained with reference solution (e) to identify the peaks due to impurities C, D, E and F;
- use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B.

*Relative retention* with reference to acemetacin (retention time = about 15 min): impurity A = about 0.7; impurity B = about 0.9; impurity F = about 1.2; impurity C = about 1.3; impurity D = about 1.5; impurity E = about 2.2.

*System suitability*: reference solution (d):

- *peak-to-valley ratio*: minimum 15, where $H_p$ = height above the baseline of the peak due to impurity B and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to acemetacin.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 1.3; impurity D = 1.4; impurity F = 1.3;
- *impurity E*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *impurities C, D, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 20 mL of *acetone R* and add 10 mL of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

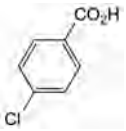
1 mL of *0.1 M sodium hydroxide* is equivalent to 41.58 mg of $C_{21}H_{18}ClNO_6$.

STORAGE

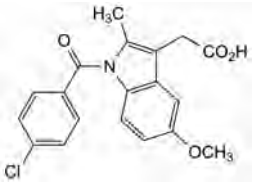
Protected from light.

IMPURITIES

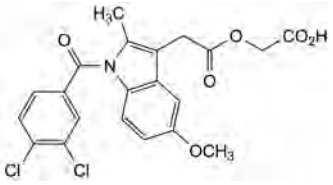
*Specified impurities: A, B, C, D, E, F.*



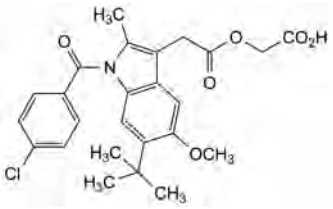
A. 4-chlorobenzoic acid,



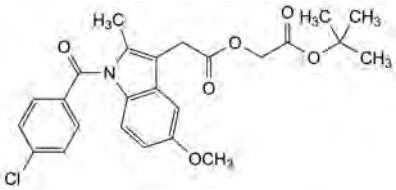
B. [1-(4-chlorobenzoyl)-5-methoxy-2-methylindol-3-yl]acetic acid (indometacin),



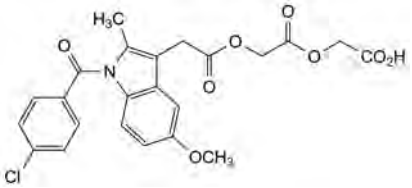
C. [[[1-(3,4-dichlorobenzoyl)-5-methoxy-2-methyl-1*H*-indol-3-yl]acetyl]oxy]acetic acid,



D. [[[1-(4-chlorobenzoyl)-6-(1,1-dimethylethyl)-5-methoxy-2-methyl-1*H*-indol-3-yl]acetyl]oxy]acetic acid,



E. 1,1-dimethylethyl [[[1-(4-chlorobenzoyl)-5-methoxy-2-methyl-1*H*-indol-3-yl]acetyl]oxy]acetate,

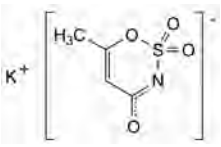


F. [[[[[1-(4-chlorobenzoyl)-5-methoxy-2-methyl-1*H*-indol-3-yl]acetyl]oxy]acetyl]oxy]acetic acid.

01/2017:1282

# ACESULFAME POTASSIUM

## Acesulfamum kalicum



$C_4H_4KNO_4S$ $M_r$ 201.2
[55589-62-3]

DEFINITION

Potassium 6-methyl-1,2,3-oxathiazin-4-olate 2,2-dioxide.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: soluble in water, very slightly soluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, C.*

*Second identification: B, C.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *acesulfame potassium CRS.*

B. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 5 mg of the substance to be examined in *water R* and dilute to 5 mL with the same solvent.
*Reference solution (a).* Dissolve 5 mg of *acesulfame potassium CRS* in *water R* and dilute to 5 mL with the same solvent.
*Reference solution (b).* Dissolve 5 mg of *acesulfame potassium CRS* and 5 mg of *saccharin sodium R* in *water R* and dilute to 5 mL with the same solvent.
*Plate*: *cellulose for chromatography R* as the coating substance.
*Mobile phase*: *concentrated ammonia R*, *acetone R*, *ethyl acetate R* (10:60:60 *V/V/V*).
*Application*: 5 µL as bands.
*Development*: twice over 2/3 of the plate.
*Drying*: in a current of warm air.
*Detection*: examine in ultraviolet light at 254 nm.
*System suitability*: reference solution (b):
– the chromatogram shows 2 clearly separated zones.
*Results*: the principal zone in the chromatogram obtained with the test solution is similar in position and size to the principal zone in the chromatogram obtained with reference solution (a).

C. 0.5 mL of solution S (see Tests) gives reaction (b) of potassium (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 20 mL of solution S add 0.1 mL of *bromothymol blue solution R1*. Not more than 0.2 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Impurity A**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.80 g of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 50 mg of *acetylacetamide R* (impurity A) in *water R* and dilute to 25 mL with the same solvent. To 5 mL of the solution add 45 mL of *water R* and dilute to 100 mL with *methanol R*.

*Reference solution (b).* To 10 mL of reference solution (a) add 1 mL of the test solution and dilute to 20 mL with *methanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *water R*, *ethanol (96 per cent) R*, *ethyl acetate R* (2:15:74 *V/V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air until the solvents are completely removed.

*Detection*: spray with *phosphoric vanillin solution R* and heat at 120 °C for about 10 min; examine in daylight.

*System suitability*: the chromatogram obtained with reference solution (a) shows a clearly visible spot and the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

*Limit*:
– *impurity A*: any spot due to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.125 per cent).

**Impurity B**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 4.0 mg of *acesulfame potassium impurity B CRS* in *water R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 200.0 mL with *water R*.

*Reference solution (b).* Dissolve 0.100 g of the substance to be examined in reference solution (a) and dilute to 10.0 mL with the same solution.

*Column*:
– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: mix 40 volumes of *acetonitrile R* and 60 volumes of a 3.3 g/L solution of *tetrabutylammonium hydrogen sulfate R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 234 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of acesulfame.

*Relative retention* with reference to acesulfame (retention time = about 5.3 min): impurity B = about 1.6.

*System suitability*:
– *signal-to-noise ratio*: minimum 10 for the peak due to impurity B in the chromatogram obtained with reference solution (a);
– *peak-to-valley ratio*: minimum 1.2, where $H_p$ = height above the baseline of the peak due to impurity B and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to acesulfame, in the chromatogram obtained with reference solution (b).

*Limit*:
– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (20 ppm).

**Fluorides**: maximum 3 ppm.

Potentiometry (*2.2.36, Method I*).

*Test solution.* Dissolve 3.000 g of the substance to be examined in *distilled water R*, add 15.0 mL of *total-ionic-strength-adjustment buffer R1* and dilute to 50.0 mL with *distilled water R*.

*Reference solutions.* To 0.5 mL, 1.0 mL, 1.5 mL and 3.0 mL of *fluoride standard solution (10 ppm F) R* add 15.0 mL of *total-ionic-strength-adjustment buffer R1* and dilute to 50.0 mL with *distilled water R*.

*Indicator electrode*: fluoride-selective.

*Reference electrode*: silver-silver chloride.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

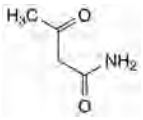
ASSAY

Dissolve 0.150 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

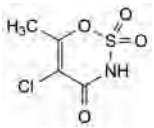
1 mL of *0.1 M perchloric acid* is equivalent to 20.12 mg of $C_4H_4KNO_4S$.

IMPURITIES

*Specified impurities: A, B.*



A. 3-oxobutanamide (acetylacetamide),

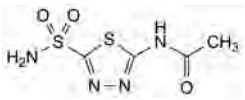


B. 5-chloro-6-methyl-1,2,3-oxathiazin-4(3*H*)-one 2,2-dioxide.

**01/2017:0454**

# ACETAZOLAMIDE

## Acetazolamidum



$C_4H_6N_4O_3S_2$ $M_r$ 222.2
[59-66-5]

DEFINITION

*N*-(5-Sulfamoyl-1,3,4-thiadiazol-2-yl)acetamide.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very slightly soluble in water, slightly soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Solution A*. Dissolve 30.0 mg in *0.01 M sodium hydroxide* and dilute to 100.0 mL with the same solvent. Dilute 10.0 mL of the solution to 100.0 mL with *0.01 M sodium hydroxide*.

*Solution B*. Dilute 25.0 mL of solution A to 100.0 mL with *0.01 M sodium hydroxide*.

*Spectral range*: 230-260 nm for solution A; 260-350 nm for solution B.

*Absorption maximum*: at 240 nm for solution A; at 292 nm for solution B.

*Specific absorbance at the absorption maximum*: 162 to 176 for solution A; 570 to 620 for solution B.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *acetazolamide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *ethanol (96 per cent) R*, evaporate to dryness and record new spectra using the residues.

C. Introduce about 20 mg into a test-tube and add 4 mL of *dilute hydrochloric acid R* and 0.2 g of *zinc powder R*. Immediately place a piece of *lead acetate paper R* over the mouth of the tube. The paper shows a brownish-black colour.

D. Dissolve about 25 mg in a mixture of 0.1 mL of *dilute sodium hydroxide solution R* and 5 mL of *water R*. Add 0.1 mL of *copper sulfate solution R*. A greenish-blue precipitate is formed.

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $Y_5$ or $BY_5$ (*2.2.2, Method II*).

Dissolve 1.0 g in 10 mL of *1 M sodium hydroxide*.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 40 mg of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve the contents of a vial of *acetazolamide for system suitability CRS* (containing impurities A, B, C, D, E and F) in 1.0 mL of the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped propoxybenzene silica gel for chromatography R* (4 µm).

*Mobile phase*: *acetonitrile for chromatography R*, 6.8 g/L solution of *potassium dihydrogen phosphate R* (10:90 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 265 nm.

*Injection*: 25 µl.

*Run time*: 3.5 times the retention time of acetazolamide.

*Identification of impurities*: use the chromatogram supplied with *acetazolamide for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C, D, E and F.

*Relative retention* with reference to acetazolamide (retention time = about 8 min): impurity E = about 0.3; impurity D = about 0.4; impurity B = about 0.6; impurity C = about 1.4; impurity A = about 2.1; impurity F = about 2.6.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to impurities E and D.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 2.3; impurity C = 2.6; impurity D = 1.6;
- *impurities A, B, C, D, E, F*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Sulfates** (*2.4.13*): maximum 500 ppm.

To 0.4 g add 20 mL of *distilled water R* and dissolve by heating to boiling. Allow to cool with frequent shaking and filter.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

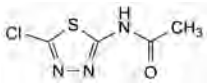
Dissolve 0.200 g in 25 mL of *dimethylformamide R*. Titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M ethanolic sodium hydroxide* is equivalent to 22.22 mg of $C_4H_6N_4O_3S_2$.

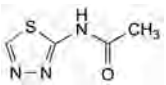
IMPURITIES

*Specified impurities: A, B, C, D, E, F.*

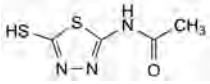
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): G.



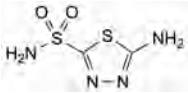
A. *N*-(5-chloro-1,3,4-thiadiazol-2-yl)acetamide,



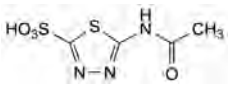
B. *N*-(1,3,4-thiadiazol-2-yl)acetamide,



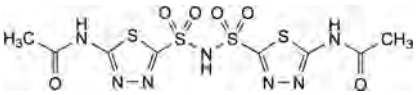
C. *N*-(5-sulfanyl-1,3,4-thiadiazol-2-yl)acetamide,



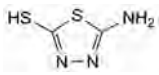
D. 5-amino-1,3,4-thiadiazole-2-sulfonamide,



E. 5-acetamido-1,3,4-thiadiazole-2-sulfonic acid,



F. *N*-[5-[(5-acetamido-1,3,4-thiadiazol-2-yl)sulfonyl]-sulfamoyl-1,3,4-thiadiazol-2-yl]acetamide,

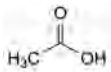


G. 5-amino-1,3,4-thiadiazole-2-thiol.

**01/2017:0590**

# ACETIC ACID, GLACIAL

## Acidum aceticum glaciale



$C_2H_4O_2$ $M_r$ 60.1

[64-19-7]

DEFINITION

*Content*: 99.0 per cent *m/m* to 100.5 per cent *m/m*.

CHARACTERS

*Appearance*: crystalline mass or clear, colourless, volatile liquid.

*Solubility*: miscible with water, with ethanol (96 per cent) and with methylene chloride.

IDENTIFICATION

A. A 100 g/L solution is strongly acid (*2.2.4*).

B. To 0.03 mL add 3 mL of *water R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives reaction (b) of acetates (*2.3.1*).

TESTS

**Solution S**. Dilute 20 mL to 100 mL with *distilled water R*.

**Appearance**. The substance to be examined is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Freezing point** (*2.2.18*): minimum 14.8 °C.

**Reducing substances**. Dilute 2.0 mL to 10.0 mL with *water R*. Add 0.1 mL of *0.02 M potassium permanganate*. Heat on a water-bath for 1 min, the colour remains pink.

**Chlorides** (*2.4.4*): maximum 25 mg/L.

Dilute 10 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 50 mg/L, determined on solution S.

**Iron** (*2.4.9*): maximum 5 ppm.

Dissolve the residue obtained in the test for residue on evaporation by heating with 2 quantities, each of 15 mL, of *water R* and dilute to 50.0 mL with *water R*. Dilute 5.0 mL of the solution to 10.0 mL with *water R*.

**Residue on evaporation**: maximum 0.01 per cent.

Evaporate 20 g to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 2.0 mg.

ASSAY

Weigh accurately a conical flask with a ground-glass stopper containing 25 mL of *water R*. Add 1.0 mL of the substance to be examined and weigh again accurately. Add 0.5 mL of *phenolphthalein solution R* and titrate with *1 M sodium hydroxide*.

1 mL of *1 M sodium hydroxide* is equivalent to 60.1 mg of $C_2H_4O_2$.

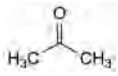
STORAGE

In an airtight container.

**04/2019:0872**

# ACETONE

## Acetonum



$C_3H_6O$ $M_r$ 58.08

[67-64-1]

DEFINITION

Propanone.

CHARACTERS

*Appearance*: volatile, clear, colourless liquid.

*Solubility*: miscible with water and with ethanol (96 per cent).

The vapour is flammable.

IDENTIFICATION

A. Relative density (see Tests).

B. To 1 mL, add 3 mL of *dilute sodium hydroxide solution R* and 0.3 mL of a 25 g/L solution of *sodium nitroprusside R*. An intense red colour is produced which becomes violet with the addition of 3.5 mL of *acetic acid R*.

C. To 10 mL of a 0.1 per cent *V/V* solution of the substance to be examined in *ethanol (50 per cent V/V) R*, add 1 mL of a 10 g/L solution of *nitrobenzaldehyde R* in *ethanol (50 per cent V/V) R* and 0.5 mL of *strong sodium hydroxide solution R*. Allow to stand for about 2 min and acidify with *acetic acid R*. A greenish-blue colour is produced.

TESTS

**Appearance of solution**. To 10 mL add 10 mL of *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 5 mL add 5 mL of *carbon dioxide-free water R*, 0.15 mL of *phenolphthalein solution R* and 0.5 mL of *0.01 M sodium hydroxide*. The solution is pink. Add 0.7 mL of *0.01 M hydrochloric acid* and 0.05 mL of *methyl red solution R*. The solution is red or orange.

**Relative density** (*2.2.5*): 0.790 to 0.793.

**Reducing substances**. To 30 mL add 0.1 mL of *0.02 M potassium permanganate* and allow to stand in the dark for 2 h. The mixture is not completely decolourised.

**Related substances**. Gas chromatography (*2.2.28*).

*Test solution*. The substance to be examined.

*Reference solution (a)*. To 0.5 mL of *methanol R* add 0.5 mL of *2-propanol R* and dilute to 100.0 mL with the test solution. Dilute 1.0 mL of this solution to 10.0 mL with the test solution.

*Reference solution (b)*. Dilute 100 µL of *benzene R* to 100.0 mL with the test solution. Dilute 0.20 mL of this solution to 100.0 mL with the test solution.

*Column*:

– *material*: fused silica,

– *size*: *l* = 50 m, Ø = 0.3 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

*Carrier gas*: *helium for chromatography R*.

*Linear velocity*: 21 cm/s.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 11 | 45 → 100 |
| | 11 - 20 | 100 |
| Injection port | | 150 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Retention time*: impurity C = about 7.5 min.

*System suitability*:

– *resolution*: minimum 5.0 between the peak due to impurity A (2nd peak) and the peak due to impurity B (3rd peak) in the chromatogram obtained with reference solution (a);

– *signal-to-noise ratio*: minimum 5 for the peak due to impurity C in the chromatogram obtained with reference solution (b).

*Limits*:

– *impurities A, B*: for each impurity, not more than the difference between the areas of the corresponding peaks in the chromatogram obtained with reference solution (a) and the areas of the corresponding peaks in the chromatogram obtained with the test solution (0.05 per cent *V/V*),

– *impurity C*: not more than the difference between the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) and the area of the corresponding peak in the chromatogram obtained with the test solution (2 ppm *V/V*),

– *any other impurity*: for each impurity, not more than the difference between the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) and the area of the corresponding peak in the chromatogram obtained with the test solution (0.05 per cent *V/V*).

**Matter insoluble in water**. Dilute 1.0 mL to 20 mL with *water R*. The solution is clear (*2.2.1*).

**Residue on evaporation**: maximum 50 ppm.

Evaporate 20.0 g to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 1 mg.

**Water** (*2.5.12*): maximum 3 g/L, determined on 10.0 mL.

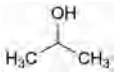
STORAGE

Protected from light.

IMPURITIES

*Specified impurities: A, B, C.*

A. methanol,



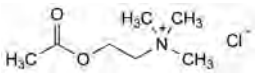
B. propan-2-ol (isopropanol),

C. benzene.

01/2017:1485

# ACETYLCHOLINE CHLORIDE

## Acetylcholini chloridum



$C_7H_{16}ClNO_2$ $M_r$ 181.7
[60-31-1]

DEFINITION

2-(Acetyloxy)-*N*,*N*,*N*-trimethylethanaminium chloride.

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white crystalline powder or colourless crystals, very hygroscopic.

*Solubility*: very soluble in water, freely soluble in alcohol, slightly soluble in methylene chloride.

IDENTIFICATION

*First identification: B, E.*

*Second identification: A, C, D, E.*

A. Melting point (*2.2.14*): 149 °C to 152 °C.

Introduce the substance to be examined into a capillary tube. Dry in an oven at 100-105 °C for 3 h. Seal the tube and determine the melting point.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *acetylcholine chloride CRS*.

C. Examine the chromatograms obtained in the test for related substances.

*Results*: the principal zone in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal zone in the chromatogram obtained with reference solution (b).

D. To 15 mg add 10 mL of *dilute sodium hydroxide solution R*, 2 mL of *0.02 M potassium permanganate* and heat. The vapours formed change the colour of *red litmus paper R* to blue.

E. 0.5 mL of solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ or $BY_6$ (*2.2.2, Method II*).

**Acidity**. Dilute 1 mL of solution S to 10 mL with *carbon dioxide-free water R*. Add 0.05 mL of *phenolphthalein solution R*. Not more than 0.4 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Related substances**. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use.*

*Test solution (a).* Dissolve 0.30 g of the substance to be examined in *methanol R* and dilute to 3.0 mL with the same solvent.

*Test solution (b).* Dilute 1 mL of test solution (a) to 10 mL with *methanol R*.

*Reference solution (a).* Dilute 1 mL of test solution (a) to 100 mL with *methanol R*.

*Reference solution (b).* Dissolve 20.0 mg of *acetylcholine chloride CRS* in *methanol R* and dilute to 2.0 mL with the same solvent.

*Reference solution (c).* Dissolve 20 mg of *choline chloride R* in *methanol R*, add 0.4 mL of test solution (a) and dilute to 2.0 mL with *methanol R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: mix 20 volumes of a 40 g/L solution of *ammonium nitrate R*, 20 volumes of *methanol R* and 60 volumes of *acetonitrile R*.

*Application*: 5 µL as bands of 10 mm by 2 mm.

*Development*: over 2/3 of the plate.

*Detection*: spray with *potassium iodobismuthate solution R3*.

*System suitability*: the chromatogram obtained with reference solution (c) shows 2 clearly separated zones.

*Limits*:

– *any impurity*: any zones in the chromatogram obtained with test solution (a), apart from the principal zone, are not more intense than the principal zone in the chromatogram obtained with reference solution (a) (1 per cent).

**Trimethylamine**. Dissolve 0.1 g in 10 mL of *sodium carbonate solution R* and heat to boiling. No vapours appear which turn *red litmus paper R* blue.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

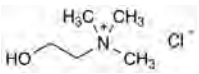
Dissolve 0.200 g in 20 mL of *carbon dioxide-free water R*. Neutralise with *0.01 M sodium hydroxide* using 0.15 mL of *phenolphthalein solution R* as indicator. Add 20.0 mL of *0.1 M sodium hydroxide* and allow to stand for 30 min. Titrate with *0.1 M hydrochloric acid*.

1 mL of *0.1 M sodium hydroxide* is equivalent to 18.17 mg of $C_7H_{16}ClNO_2$.

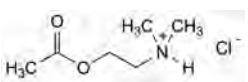
STORAGE

In ampoules, protected from light.

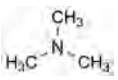
IMPURITIES



A. 2-hydroxy-*N*,*N*,*N*-trimethylethanaminium chloride (choline chloride),



B. 2-(acetyloxy)-*N*,*N*-dimethylethanaminium chloride,

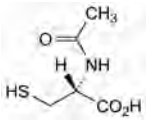


C. *N*,*N*-dimethylmethanamine.

**01/2017:0967**

# ACETYLCYSTEINE

## Acetylcysteinum



$C_5H_9NO_3S$ $M_r$ 163.2
[616-91-1]

DEFINITION

(2*R*)-2-(Acetylamino)-3-sulfanylpropanoic acid.

*Content*: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

*First identification*: *A, C.*

*Second identification*: *A, B, D, E.*

A. Specific optical rotation (see Tests).

B. Melting point (*2.2.14*): 104 °C to 110 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs of *potassium bromide R*.

*Comparison*: *acetylcysteine CRS*.

D. Examine the chromatograms obtained in the test for related substances.

*Results*: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (b).

E. To 0.5 mL of solution S (see Tests) add 0.05 mL of a 50 g/L solution of *sodium nitroprusside R* and 0.05 mL of *concentrated ammonia R*. A dark violet colour develops.

TESTS

**Solution S**. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 2.0 to 2.8.

To 2 mL of solution S add 8 mL of *carbon dioxide-free water R* and mix.

**Specific optical rotation** (*2.2.7*): + 21.0 to + 27.0 (dried substance).

In a 25 mL volumetric flask, mix 1.25 g with 1 mL of a 10 g/L solution of *sodium edetate R*. Add 7.5 mL of a 40 g/L solution of *sodium hydroxide R*, mix and dissolve. Dilute to 25.0 mL with *phosphate buffer solution pH 7.0 R2*.

**Related substances**. Liquid chromatography (*2.2.29*). *Except where otherwise prescribed, prepare the solutions immediately before use.*

*Test solution (a).* Suspend 0.80 g of the substance to be examined in 1 mL of *1 M hydrochloric acid* and dilute to 100.0 mL with *water R*.

*Test solution (b).* Dilute 5.0 mL of test solution (a) to 100.0 mL with *water R*. Dilute 5.0 mL of this solution to 50.0 mL with *water R*.

*Test solution (c).* Use test solution (a) after storage for at least 1 h.

*Reference solution (a).* Suspend 4.0 mg of *acetylcysteine CRS*, 4.0 mg of *L-cystine R* (impurity A), 4.0 mg of *L-cysteine R* (impurity B), 4.0 mg of *acetylcysteine impurity C CRS* and 4.0 mg of *acetylcysteine impurity D CRS* in 1 mL of *1 M hydrochloric acid* and dilute to 100.0 mL with *water R*.

*Reference solution (b).* Suspend 4.0 mg of *acetylcysteine CRS* in 1 mL of *1 M hydrochloric acid* and dilute to 100.0 mL with *water R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: stir 3 volumes of *acetonitrile R* and 97 volumes of *water R* in a beaker; adjust to pH 3.0 with *phosphoric acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL, 3 times; inject *0.01 M hydrochloric acid* as a blank.

*Run time*: 5 times the retention time of acetylcysteine (about 30 min).

*Retention time*: impurity A = about 2.2 min; impurity B = about 2.4 min; 2-methyl-2-thiazoline-4-carboxylic acid, originating in test solution (c) = about 3.3 min; acetylcysteine = about 6.4 min; impurity C = about 12 min; impurity D = about 14 min.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurities A and B and minimum 2.0 between the peaks due to impurities C and D.

From the chromatogram obtained with test solution (a), calculate the percentage content of the known impurities ($T_1$) and the unknown impurities ($T_2$) using the following equations:

$$T_1 = \frac{A_1 \times m_2 \times 100}{A_2 \times m_1}$$

$$T_2 = \frac{A_3 \times m_3 \times 100}{A_4 \times m_1}$$

$A_1$ = peak area of individual impurity (impurity A, impurity B, impurity C and impurity D) in the chromatogram obtained with test solution (a);

$A_2$ = peak area of the corresponding individual impurity (impurity A, impurity B, impurity C and impurity D) in the chromatogram obtained with reference solution (a);

$A_3$ = peak area of unknown impurity in the chromatogram obtained with test solution (a);

$A_4$ = peak area of acetylcysteine in the chromatogram obtained with reference solution (b);

$m_1$ = mass of the substance to be examined in test solution (a);

$m_2$ = mass of the individual impurity in reference solution (a);

$m_3$ = mass of acetylcysteine in reference solution (b).

*Limits*:

– *impurities A, B, C, D*: for each impurity, maximum 0.5 per cent;
– *any other impurity*: for each impurity, maximum 0.5 per cent;
– *total*: maximum 0.5 per cent;

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak with a retention time of about 3.3 min due to 2-methyl-2-thiazoline-4-carboxylic acid.

**Zinc**: maximum 10 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

*Test solution.* Dissolve 1.00 g in *0.001 M hydrochloric acid* and dilute to 50.0 mL with the same acid.

*Reference solutions.* Prepare the reference solutions using *zinc standard solution (5 mg/mL Zn) R*, diluting with *0.001 M hydrochloric acid*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.8 nm.

*Atomisation device*: air-acetylene flame.

Use a correction procedure for non-specific absorption.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 70 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 60 mL of *water R* and add 10 mL of *dilute hydrochloric acid R*. After cooling in iced water, add 10 mL of *potassium iodide solution R* and titrate with *0.05 M iodine*, using 1 mL of *starch solution R* as indicator.

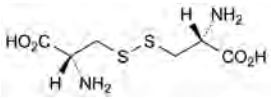
1 mL of *0.05 M iodine* is equivalent to 16.32 mg of $C_5H_9NO_3S$.

STORAGE

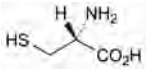
Protected from light.

IMPURITIES

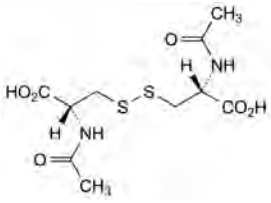
*Specified impurities*: *A, B, C, D.*



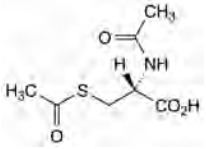
A. 3,3′-disulfanediylbis[(2*R*)-2-aminopropanoic acid] (L-cystine),



B. (2*R*)-2-amino-3-sulfanylpropanoic acid (L-cysteine),



C. (2*R*,2′*R*)-3,3′-disulfanediylbis[2-(acetylamino)propanoic acid] (*N*,*N*′-diacetyl-L-cystine),



D. (2*R*)-2-(acetylamino)-3-(acetylsulfanyl)propanoic acid (*N*,*S*-diacetyl-L-cysteine).

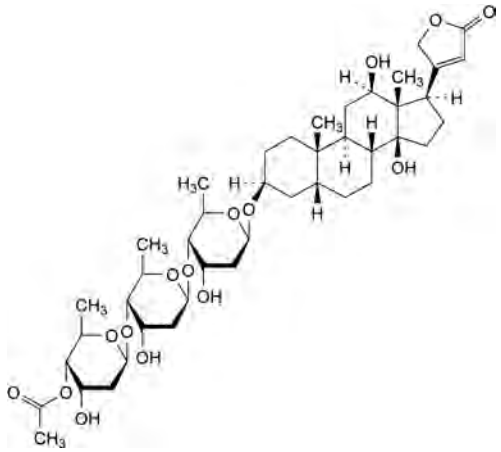
**corrected 6.7**

# β-ACETYLDIGOXIN

## β-Acetyldigoxinum



$C_{43}H_{66}O_{15}$ $M_r$ 823

[5355-48-6]

DEFINITION

3β-[(4-*O*-Acetyl-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12β,14-dihydroxy-5β-card-20(22)-enolide.

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *β-acetyldigoxin CRS.*

TESTS

**Specific optical rotation** (*2.2.7*): + 26.2 to + 28.2 (dried substance).

Dissolve 0.50 g in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 25.0 mL with the same mixture of solvents.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture.* Mix equal volumes of *methanol R2* and *acetonitrile for chromatography R.*

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 10.0 mg of *β-acetyldigoxin CRS* in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 20.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 5 mg of *gitoxin CRS* (impurity D) in the solvent mixture and dilute to 100.0 mL with the solvent mixture. To 5.0 mL of this solution, add 0.5 mL of reference solution (a) and dilute to 100.0 mL with the solvent mixture.

*Reference solution (d).* Dissolve 5.0 mg of *β-acetyldigoxin for peak identification CRS* (containing impurities A and B) in 10.0 mL of the solvent mixture.

*Column*:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (4 µm).

*Mobile phase*:

– *mobile phase A*: *water for chromatography R*;

– *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 70 | 30 |
| 10 - 20 | 70 → 35 | 30 → 65 |
| 20 - 20.1 | 35 → 70 | 65 → 30 |
| 20.1 - 25 | 70 | 30 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 225 nm.

*Injection*: 10 µL of the test solution and reference solutions (b), (c) and (d).

*Identification of impurities*: use the chromatograms obtained with reference solutions (c) and (d) to identify the peaks due to impurities A, B and D.

*Relative retention* with reference to β-acetyldigoxin (retention time = about 9 min): impurity B = about 0.3; impurity A = about 0.7; impurity D = about 1.2.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to β-acetyldigoxin and impurity D;

– *symmetry factor*: maximum 2.5 for the peak due to β-acetyldigoxin.

*Limits*:

– *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *impurity D*: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *any other impurity*: for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *sum of impurities other than A, B and D*: not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent);

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Loss on drying** (*2.2.32*): maximum 1.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{43}H_{66}O_{15}$ from the declared content of *β-acetyldigoxin CRS*.

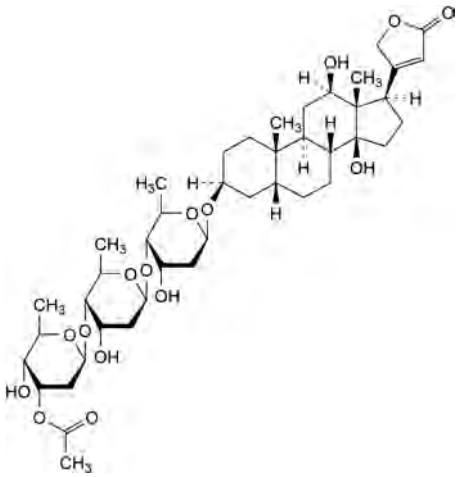
STORAGE

Protected from light.

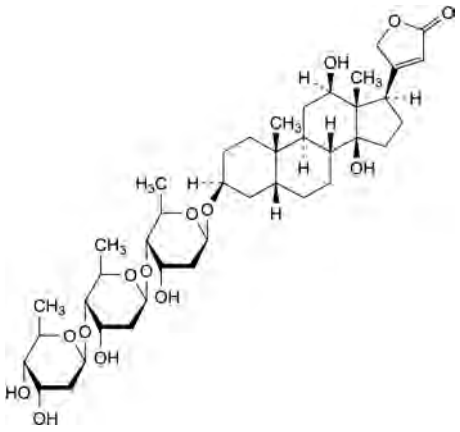
IMPURITIES

*Specified impurities*: *A, B, D.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E, F, G, H.*



A. 3β-[(3-*O*-acetyl-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12β,14-dihydroxy-5β-card-20(22)-enolide (α-acetyldigoxin),



B. 3β-[(2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12β,14-dihydroxy-5β-card-20(22)-enolide (digoxin),

**01/2018:2903**

# ACETYLENE INTERMIX (1 PER CENT) IN NITROGEN

## Acetylenum (1 per centum) in nitrogenio intermixtum

DEFINITION

A mixture containing 1 per cent *V/V* of acetylene in *Low-oxygen nitrogen (1685)*.

*Content*: 0.95 per cent *V/V* to 1.05 per cent *V/V* of acetylene ($C_2H_2$) in nitrogen ($N_2$).

This monograph applies to acetylene intermix (1 per cent) in nitrogen used in the preparation of lung function test gas mixtures for medicinal use.

PRODUCTION

The acetylene used in the manufacturing process is produced by hydrolysis of calcium carbide.

Prior to using the gas in the manufacturing process, the acetylene may be passed through an activated charcoal filter.

The acetylene is stored in cylinders, which may be filled with a porous mass with acetone the only solvent permitted.

CHARACTERS

*Appearance*: colourless gas.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

*Results*: the peak due to acetylene in the chromatogram obtained with the gas to be examined is similar in retention time and size to the peak due to acetylene in the chromatogram obtained with the reference gas.

B. Gas chromatography (*2.2.28*).

*Gas to be examined.* The substance to be examined.

*Reference gas. Nitrogen R1.*

*Column*:

– *material*: stainless steel;
– *size*: *l* = 2 m, Ø = 2 mm;
– *stationary phase*: *molecular sieve for chromatography R* (0.5 nm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 20 mL/min.

*Temperature*:

– *column*: 80 °C;
– *detector*: 130 °C.

*Detection*: thermal conductivity.

*Injection*: 10 µL.

*Retention time*: nitrogen = about 2 min.

*Results*: the principal peak in the chromatogram obtained with the gas to be examined is similar in retention time to the principal peak in the chromatogram obtained with the reference gas.

TESTS

**Acetone**. Gas chromatography (*2.2.28*).

*Gas to be examined.* The substance to be examined.

*Reference gas.* Mixture containing 250 ppm *V/V* of *acetone R* in *nitrogen R*.

*Column*:

– *material*: fused silica;
– *size*: *l* = 10 m, Ø = 0.53 mm;
– *stationary phase*: *polyorganosiloxane for oxygen-containing compounds R* (film thickness 10 µm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 50 mL/min.

*Temperature*:

– *column*: 200 °C;
– *injection port*: 240 °C;
– *detector*: 250 °C.

*Detection*: flame ionisation.

*Injection*: 25 µL.

*Retention time*: acetone = about 1 min.

*Calculation of percentage content*:

– use the concentration of acetone in the reference gas.

*Limit*:

– *acetone*: maximum 250 ppm *V/V*.

**Arsine**: maximum 0.25 ppm *V/V*, determined using an arsine detector tube (*2.1.6*).

**Phosphine**: maximum 0.2 ppm *V/V*, determined using a phosphine detector tube (*2.1.6*).

**Hydrogen sulfide**: maximum 0.2 ppm *V/V*, determined using a hydrogen sulfide detector tube (*2.1.6*).

**Water** (*2.5.28*): maximum 10 ppm *V/V*.

ASSAY

Gas chromatography (*2.2.28*).

*Gas to be examined.* The substance to be examined.

*Reference gas.* Mixture containing 1.0 per cent *V/V* of *acetylene R* in *nitrogen R1*.

*Column*:

– *material*: stainless steel;
– *size*: *l* = 2 m, Ø = 2 mm;
– *stationary phase*: 3 per cent *squalane R* on alumina.

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 20 mL/min.

*Temperature*:

– *column*: 100 °C;
– *detector*: 250 °C.

*Detection*: flame ionisation.

*Injection*: 100 µL.

*Retention time*: acetylene = about 6 min.

Calculate the percentage content of $C_2H_2$.

STORAGE

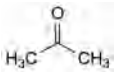
As a compressed gas, in appropriate high-pressure cylinders complying with the legal regulations.

LABELLING

The label states the nominal content, in per cent *V/V*, of acetylene in nitrogen.

IMPURITIES

*Specified impurities: A, B, C, D, E.*



A. propan-2-one (acetone),

B. arsane (arsine),

C. phosphane (phosphine),

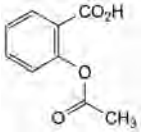
D. hydrogen sulfide,

E. water.

**01/2017:0309**

# ACETYLSALICYLIC ACID

## Acidum acetylsalicylicum



$C_9H_8O_4$ $M_r$ 180.2

[50-78-2]

DEFINITION

2-(Acetyloxy)benzoic acid.

*Content*: 99.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 143 °C (instantaneous method).

IDENTIFICATION

*First identification: A, B.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *acetylsalicylic acid CRS*.

B. To 0.2 g add 4 mL of *dilute sodium hydroxide solution R* and boil for 3 min. Cool and add 5 mL of *dilute sulfuric acid R*. A crystalline precipitate is formed. Filter, wash the precipitate and dry at 100-105 °C. The melting point (*2.2.14*) is 156 °C to 161 °C.

C. In a test tube mix 0.1 g with 0.5 g of *calcium hydroxide R*. Heat the mixture and expose to the fumes produced a piece of filter paper impregnated with 0.05 mL of *nitrobenzaldehyde solution R*. A greenish-blue or greenish-yellow colour develops on the paper. Moisten the paper with *dilute hydrochloric acid R*. The colour becomes blue.

D. Dissolve with heating about 20 mg of the precipitate obtained in identification test B in 10 mL of *water R* and cool. The solution gives reaction (a) of salicylates (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in 9 mL of *ethanol (96 per cent) R*.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 0.100 g of the substance to be examined in *acetonitrile for chromatography R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 50.0 mg of *salicylic acid R* (impurity C) in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 10 mg of *salicylic acid R* (impurity C) in the mobile phase and dilute to 10.0 mL with the mobile phase. To 1.0 mL of the solution add 0.2 mL of the test solution and dilute to 100.0 mL with the mobile phase.

*Reference solution (c).* Dissolve with the aid of ultrasound the contents of a vial of *acetylsalicylic acid for peak identification CRS* (containing impurities A, B, D, E and F) in 1.0 mL of *acetonitrile R*.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *phosphoric acid R*, *acetonitrile for chromatography R*, *water R* (2:400:600 *V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 237 nm.

*Injection*: 10 µL.

*Run time*: 7 times the retention time of acetylsalicylic acid.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity C; use the chromatogram supplied with *acetylsalicylic acid for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, D, E and F.

*Relative retention* with reference to acetylsalicylic acid (retention time = about 5 min): impurity A = about 0.7; impurity B = about 0.8; impurity C = about 1.3; impurity D = about 2.3; impurity E = about 3.2; impurity F = about 6.0.

*System suitability*: reference solution (b):
- *resolution*: minimum 6.0 between the peaks due to acetylsalicylic acid and impurity C.

*Limits*:
- *impurities A, B, C, D, E, F*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);
- *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent);
- *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In a flask with a ground-glass stopper, dissolve 1.000 g in 10 mL of *ethanol (96 per cent) R*. Add 50.0 mL of *0.5 M sodium hydroxide*. Close the flask and allow to stand for 1 h. Using 0.2 mL of *phenolphthalein solution R* as indicator, titrate with *0.5 M hydrochloric acid*. Carry out a blank titration.

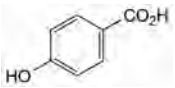
1 mL of *0.5 M sodium hydroxide* is equivalent to 45.04 mg of $C_9H_8O_4$.

STORAGE

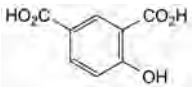
In an airtight container.

IMPURITIES

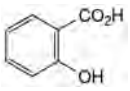
*Specified impurities: A, B, C, D, E, F.*



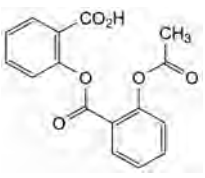
A. 4-hydroxybenzoic acid,



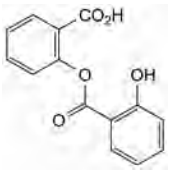
B. 4-hydroxybenzene-1,3-dicarboxylic acid (4-hydroxyisophthalic acid),



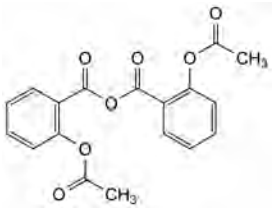
C. 2-hydroxybenzenecarboxylic acid (salicylic acid),



D. 2-[[2-(acetyloxy)benzoyl]oxy]benzoic acid (acetylsalicylsalicylic acid),



E. 2-[(2-hydroxybenzoyl)oxy]benzoic acid (salsalate, salicylsalicylic acid),



F. 2-(acetyloxy)benzoic anhydride (acetylsalicylic anhydride).

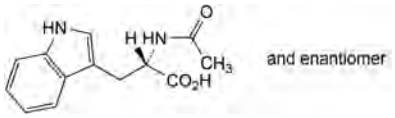
# *N*-ACETYLTRYPTOPHAN

## *N*-Acetyltryptophanum



$C_{13}H_{14}N_2O_3$ $M_r$ 246.3
[87-32-1]

DEFINITION

(*RS*)-2-Acetylamino-3-(1*H*-indol-3-yl)propanoic acid.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

PRODUCTION

Tryptophan used for the production of *N*-acetyltryptophan complies with the test for impurity A and other related substances in the monograph on *Tryptophan (1272)*.

CHARACTERS

*Appearance*: white or almost white, crystalline powder, or colourless crystals.

*Solubility*: slightly soluble in water, very soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

mp: about 205 °C.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D, E.*

A. Optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *N-acetyltryptophan CRS.*

C. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 50 mg of the substance to be examined in 0.2 mL of *concentrated ammonia R* and dilute to 10 mL with *water R*.
*Reference solution (a).* Dissolve 50 mg of *N-acetyltryptophan CRS* in 0.2 mL of *concentrated ammonia R* and dilute to 10 mL with *water R*.
*Reference solution (b).* Dissolve 10 mg of *tryptophan R* in the test solution and dilute to 2 mL with the test solution.
*Plate*: *TLC silica gel $F_{254}$ plate R.*
*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (25:25:40 *V/V/V*).
*Application*: 2 µL.
*Development*: over a path of 10 cm.
*Drying*: in an oven at 100-105 °C for 15 min.
*Detection*: examine in ultraviolet light at 254 nm.
*System suitability*: reference solution (b):
– the chromatogram shows 2 clearly separated spots.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 2 mg in 2 mL of *water R*. Add 2 mL of *dimethylaminobenzaldehyde solution R6*. Heat on a water-bath. A blue or greenish-blue colour develops.

E. It gives the reaction of acetyl (*2.3.1*). Proceed as described for substances hydrolysable only with difficulty.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ or $GY_7$ (*2.2.2, Method II*).

Dissolve 1.0 g in a 40 g/L solution of *sodium hydroxide R* and dilute to 100 mL with the same alkaline solution.

**Optical rotation** (*2.2.7*): – 0.1° to + 0.1°.

Dissolve 2.50 g in a 40 g/L solution of *sodium hydroxide R* and dilute to 25.0 mL with the same alkaline solution.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the test and reference solutions immediately before use.*

*Buffer solution pH 2.3.* Dissolve 3.90 g of *sodium dihydrogen phosphate R* in 1000 mL of *water R*. Add about 700 mL of a 2.9 g/L solution of *phosphoric acid R* and adjust to pH 2.3 with the same acid solution.

*Solvent mixture*: *acetonitrile R*, *water R* (10:90 *V/V*).

*Test solution.* Dissolve 0.10 g of the substance to be examined in a mixture of 50 volumes of *acetonitrile R* and 50 volumes of *water R* and dilute to 20.0 mL with the same mixture of solvents.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 4.0 mL of reference solution (a) to 100.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve the contents of a vial of *1,1´-ethylidenebistryptophan CRS* in 1 mL of reference solution (b).

*Column*:
– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*:
– *mobile phase A*: *acetonitrile R*, buffer solution pH 2.3 (115:885 *V/V*);
– *mobile phase B*: *acetonitrile R*, buffer solution pH 2.3 (350:650 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 100 | 0 |
| 10 - 45 | 100 → 0 | 0 → 100 |
| 45 - 65 | 0 | 100 |

*Flow rate*: 0.7 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (c).

*Retention time*: *N*-acetyltryptophan = about 29 min; 1,1′-ethylidenebis(tryptophan) = about 34 min.

*System suitability*: reference solution (c):

- *resolution*: minimum 8.0 between the peaks due to *N*-acetyltryptophan and 1,1′-ethylidenebis(tryptophan); if necessary, adjust the time programme for the elution gradient (an increase in the duration of elution with mobile phase A produces longer retention times and a better resolution);
- *symmetry factor*: maximum 3.5 for the peak due to 1,1′-ethylidenebistryptophan in the chromatogram obtained with reference solution (c).

*Limits*:

- *impurities A, B, C, D, E, F, G, H, I, J, K, L*: for each impurity, not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent);
- *total*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.01 times the area of the principal peak the chromatogram obtained with reference solution (a) (0.01 per cent).

**Ammonium** (*2.4.1, Method B*): maximum 200 ppm, determined on 0.10 g.

Prepare the standard using 0.2 mL of *ammonium standard solution (100 ppm $NH_4$) R*.

**Iron** (*2.4.9*): maximum 10 ppm.

Dissolve 1.0 g in 50 mL of *hydrochloric acid R1*, with heating at 50 °C. Allow to cool. In a separating funnel, shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Examine the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 5 mL of *methanol R*. Add 50 mL of *anhydrous ethanol R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

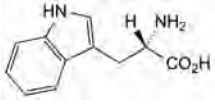
1 mL of *0.1 M sodium hydroxide* is equivalent to 24.63 mg of $C_{13}H_{14}N_2O_3$.

STORAGE

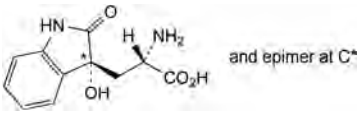
Protected from light.

IMPURITIES

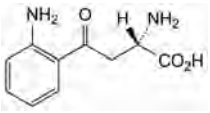
*Specified impurities*: *A, B, C, D, E, F, G, H, I, J, K, L.*



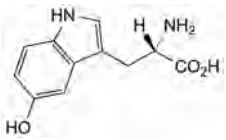
A. (*S*)-2-amino-3-(1*H*-indol-3-yl)propanoic acid (tryptophan),



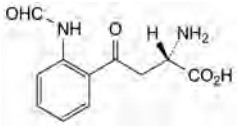
B. (*S*)-2-amino-3-[(3*RS*)-3-hydroxy-2-oxo-2,3-dihydro-1*H*-indol-3-yl]propanoic acid (dioxyindolylalanine),



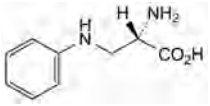
C. (*S*)-2-amino-4-(2-aminophenyl)-4-oxobutanoic acid (kynurenine),



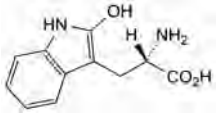
D. (*S*)-2-amino-3-(5-hydroxy-1*H*-indol-3-yl)propanoic acid (5-hydroxytryptophan),



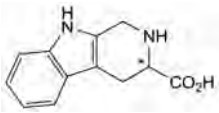
E. (*S*)-2-amino-4-[2-(formylamino)phenyl]-4-oxobutanoic acid (*N*-formylkynurenine),



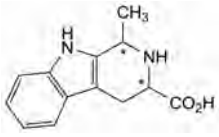
F. (*S*)-2-amino-3-(phenylamino)propanoic acid (3-phenylaminoalanine),



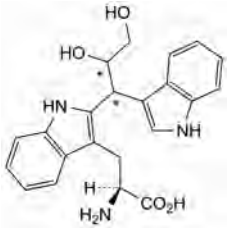
G. (*S*)-2-amino-3-(2-hydroxy-1*H*-indol-3-yl)propanoic acid (2-hydroxytryptophan),



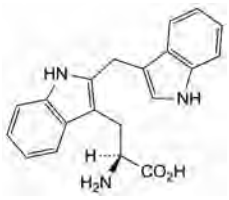
H. (3*RS*)-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid,



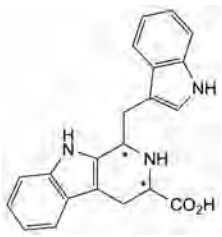
I. 1-methyl-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid,



J. (*S*)-2-amino-3-[2-[2,3-dihydroxy-1-(1*H*-indol-3-yl)propyl]-1*H*-indol-3-yl]propanoic acid,



K. (*S*)-2-amino-3-[2-(1*H*-indol-3-ylmethyl)-1*H*-indol-3-yl]propanoic acid,

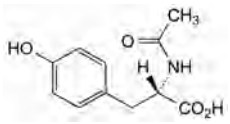


L. 1-(1*H*-indol-3-ylmethyl)-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid.

**01/2017:1384**
**corrected 10.0**

# *N*-ACETYLTYROSINE

## *N*-Acetyltyrosinum



$C_{11}H_{13}NO_4$ $M_r$ 223.2
[537-55-3]

DEFINITION

(2*S*)-2-(Acetylamino)-3-(4-hydroxyphenyl)propanoic acid.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, practically insoluble in cyclohexane.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *N-acetyltyrosine CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 80 mg of the substance to be examined in a mixture of 3 volumes of *glacial acetic acid R*, 3 volumes of *water R* and 94 volumes of *anhydrous ethanol R*, and dilute to 10 mL with the same mixture of solvents.
*Reference solution.* Dissolve 80 mg of *N-acetyltyrosine CRS* in a mixture of 3 volumes of *glacial acetic acid R*, 3 volumes of *water R* and 94 volumes of *anhydrous ethanol R*, and dilute to 10 mL with the same mixture of solvents.
*Plate*: *TLC silica gel $F_{254}$ plate R.*
*Mobile phase*: *water R*, *glacial acetic acid R*, *ethyl acetate R* (10:15:75 *V/V/V*).
*Application*: 5 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: examine in ultraviolet light at 254 nm.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Solution S (see Tests) is strongly acid (*2.2.4*).

TESTS

**Solution S**. Dissolve 2.50 g in *water R* and dilute to 100.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): + 46 to + 49 (dried substance).
Dilute 10.0 mL of solution S to 25.0 mL with *water R*.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*
*Test solution.* Dissolve 50.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.
*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.
*Reference solution (b).* Dissolve 20.0 mg of *tyrosine CRS* (impurity A) in 2 mL of a 40 g/L solution of *sodium hydroxide R* and dilute to 20.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.
*Reference solution (c).* Dilute 1.0 mL of reference solution (b) to 10.0 mL with mobile phase A.
*Reference solution (d).* Dilute 1.0 mL of reference solution (b) to 20.0 mL with the test solution.
*Column*:
– *size*: *l* = 0.15 m, Ø = 3 mm;
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 40 °C.
*Mobile phase*:
– *mobile phase A*: mix 1.0 mL of *phosphoric acid R* and 1000 mL of *water for chromatography R*;
– *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 97 | 3 |
| 2 - 15 | 97 → 62 | 3 → 38 |

*Flow rate*: 0.7 mL/min.
*Detection*: spectrophotometer at 219 nm.
*Injection*: 2 µL of the test solution and reference solutions (a), (c) and (d).
*Relative retention* with reference to *N*-acetyltyrosine (retention time = about 6 min): impurity A = about 0.5.
*System suitability*: reference solution (d):
– *resolution*: minimum 5.0 between the principal peak and the peak due to impurity A.
*Limits*:
– *impurity A*: not more than 0.8 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.8 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: maximum 1.0 per cent;

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dilute 10 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 200 ppm.

Dissolve 1.0 g in *distilled water R* and dilute to 20 mL with the same solvent.

**Ammonium** (*2.4.1, Method B*): maximum 200 ppm, determined on 0.100 g.

Prepare the standard using 0.2 mL of *ammonium standard solution (100 ppm $NH_4$) R*.

**Iron** (*2.4.9*): maximum 20 ppm.

In a separating funnel, dissolve 0.5 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. The aqueous layer complies with the test.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 25 IU/g, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.180 g in 50 mL of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 22.32 mg of $C_{11}H_{13}NO_4$.

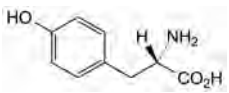
STORAGE

Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

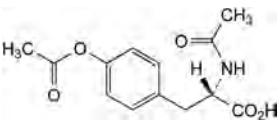
IMPURITIES

*Specified impurities: A.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B*.



A. (2*S*)-2-amino-3-(4-hydroxyphenyl)propanoic acid (tyrosine),

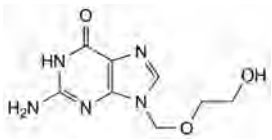


B. (2*S*)-2-(acetylamino)-3-[4-(acetoxy)phenyl]propanoic acid (diacetyltyrosine).

**01/2014:0968**

# ACICLOVIR

## Aciclovirum



$C_8H_{11}N_5O_3$ $M_r$ 225.2
[59277-89-3]

DEFINITION

2-Amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*-purin-6-one.

*Content*: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: slightly soluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in heptane. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *aciclovir CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

Dissolve 0.25 g in a 4 g/L solution of *sodium hydroxide R* and dilute to 25 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture*: *dimethyl sulfoxide R*, *water R* (20:80 *V/V*).

*Phosphate buffer solution pH 2.5*. Dissolve 3.48 g of *dipotassium hydrogen phosphate R* in 1000 mL of *water R* and adjust to pH 2.5 with *phosphoric acid R*.

*Phosphate buffer solution pH 3.1*. Dissolve 3.48 g of *dipotassium hydrogen phosphate R* in 1000 mL of *water R* and adjust to pH 3.1 with *phosphoric acid R*.

*Test solution*. Dissolve 25 mg of the substance to be examined in 5.0 mL of *dimethyl sulfoxide R* and dilute to 25.0 mL with *water R*.

*Reference solution (a)*. Dissolve 5 mg of *aciclovir for system suitability CRS* (containing impurities A, B, J, K, N, O and P) in 1 mL of *dimethyl sulfoxide R* and dilute to 5.0 mL with *water R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve the contents of a vial of *aciclovir for peak identification 1 CRS* (containing impurities C and I) in 200 µL of *dimethyl sulfoxide R* and dilute to 1.0 mL with *water R*.

*Reference solution (d)*. Dissolve the contents of a vial of *aciclovir for peak identification 2 CRS* (containing impurities F and G) in 1.0 mL of reference solution (a).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *acetonitrile R*, phosphate buffer solution pH 3.1 (1:99 *V/V*);

– *mobile phase B*: *acetonitrile R*, phosphate buffer solution pH 2.5 (50:50 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 27 | 100 → 80 | 0 → 20 |
| 27 - 40 | 80 | 20 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL of the test solution and reference solutions (b), (c) and (d).

*Identification of impurities*: use the chromatogram supplied with *aciclovir for peak identification 1 CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities C and I; use the chromatogram supplied with *aciclovir for peak identification 2 CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities A, B, F, G, J, K, N, O and P.

*Relative retention* with reference to aciclovir (retention time = about 13 min): impurity B = about 0.4; impurity P = about 0.7; impurity C = about 0.9; impurity N = about 1.37; impurities O and Q = about 1.42; impurity I = about 1.57; impurity J = about 1.62; impurity F = about 1.7; impurity A = about 1.8; impurities K and R = about 2.5; impurity G = about 2.6.

*System suitability*:

– *resolution*: minimum 1.5 between the peaks due to impurity C and aciclovir in the chromatogram obtained with reference solution (c); minimum 1.5 between the peaks due to impurities F and A and minimum 1.5 between the peaks due to impurities K and G in the chromatogram obtained with reference solution (d).

*Limits*:

– *correction factor*: for the calculation of content, multiply the peak area of impurity I by 1.5;

– *impurity B*: not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent);

– *sum of impurities O and Q*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *sum of impurities K and R*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *impurities A, G, J, N, P*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *impurities C, F, I*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent);

– *total*: not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);

– *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

**Water** (*2.5.12*): maximum 6.0 per cent, determined on 0.500 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14, Method D*): less than 0.50 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.150 g in 60 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 mL of *0.1 M perchloric acid* is equivalent to 22.52 mg of $C_8H_{11}N_5O_3$.

IMPURITIES

*Specified impurities: A, B, C, F, G, I, J, K, N, O, P, Q, R.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. # ACITRETIN

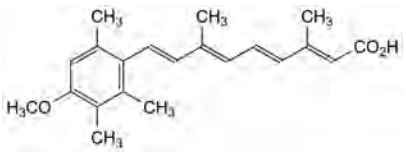
## Acitretinum



$C_{21}H_{26}O_3$ $M_r$ 326.4
[55079-83-9]

DEFINITION

(2*E*,4*E*,6*E*,8*E*)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: yellow or greenish-yellow, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in tetrahydrofuran, slightly soluble in acetone and in ethanol (96 per cent), very slightly soluble in cyclohexane.

It is sensitive to air, heat and light, especially in solution.

It shows polymorphism (*5.9*).

*Carry out all operations as rapidly as possible and avoid exposure to actinic light; use freshly prepared solutions.*

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *acitretin CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *2-propanol R* by heating under reflux; filter, evaporate to dryness and record new spectra using the residues.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

*Test solution (a).* Dissolve 25.0 mg of the substance to be examined in 5 mL of *tetrahydrofuran R* and dilute to 100.0 mL with *anhydrous ethanol R*.

*Test solution (b).* Dilute 10.0 mL of test solution (a) to 25.0 mL with *anhydrous ethanol R*.

*Reference solution (a).* Dissolve 25.0 mg of *acitretin CRS* in 5 mL of *tetrahydrofuran R* and dilute to 100.0 mL with *anhydrous ethanol R*. Dilute 10.0 mL of the solution to 25.0 mL with *anhydrous ethanol R*.

*Reference solution (b).* Dissolve 1 mg of *tretinoin CRS* in *anhydrous ethanol R* and dilute to 20.0 mL with the same solvent. Mix 5.0 mL of the solution with 2.5 mL of reference solution (a) and dilute to 100.0 mL with *anhydrous ethanol R*.

*Reference solution (c).* Dilute 1.0 mL of the test solution (a) to 100.0 mL with *anhydrous ethanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *anhydrous ethanol R*.

*Reference solution (d).* Dissolve 2.5 mg of *acitretin for impurity A identification CRS* in 0.5 mL of *tetrahydrofuran R* and dilute to 10.0 mL with *anhydrous ethanol R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography for separation of polycyclic aromatic hydrocarbons R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*: 0.3 per cent *V/V* solution of *glacial acetic acid R* in a mixture of 8 volumes of *water for chromatography R* and 92 volumes of *anhydrous ethanol R*.

*Flow rate*: 0.6 mL/min.

*Detection*: spectrophotometer at 360 nm.

*Autosampler*: set at 4 °C.

*Injection*: 10 µL of test solution (a) and reference solutions (b), (c) and (d).

*Run time*: 2.5 times the retention time of acitretin.

*Identification of impurities*: use the chromatogram supplied with *acitretin for impurity A identification CRS* and the chromatogram obtained with reference solution (d) to identify the peak due to impurity A.

*Relative retention* with reference to acitretin (retention time = about 6 min): impurity A = about 0.8; tretinoin = about 0.85.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to tretinoin and acitretin.

*Calculation of percentage contents*:

– for each impurity, use the concentration of acitretin in reference solution (c).

*Limits*:

– *impurity A*: maximum 0.2 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.5 per cent;
– *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 100 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (b) and reference solution (a).

Calculate the percentage content of $C_{21}H_{26}O_3$ taking into account the assigned content of *acitretin CRS*.

STORAGE

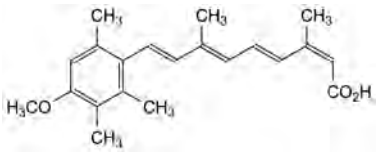
In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of inert gas.

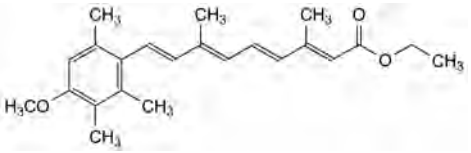
IMPURITIES

*Specified impurities: A.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*



A. (2*Z*,4*E*,6*E*,8*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid,

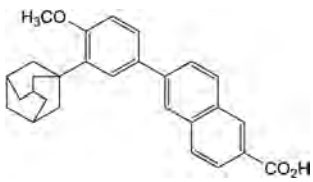


B. ethyl (2*E*,4*E*,6*E*,8*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoate.

**01/2017:2445**

# ADAPALENE

## Adapalenum



$C_{28}H_{28}O_3$ $M_r$ 412.5

[106685-40-9]

DEFINITION

6-(4-Methoxy-3-tricyclo[3.3.1.1$^{3,7}$]dec-1-ylphenyl)naphthalene-2-carboxylic acid.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, sparingly soluble in tetrahydrofuran, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *adapalene CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

Dissolve 0.2 g in *tetrahydrofuran R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *tetrahydrofuran R*, *acetonitrile R*, *water R* (20:37:43 *V/V/V*).

*Test solution (a)*. Dissolve 40.0 mg of the substance to be examined in 10 mL of *tetrahydrofuran R*, add 7 mL of the solvent mixture and dilute to 20.0 mL with *tetrahydrofuran R*.

*Test solution (b)*. Dissolve 20.0 mg of the substance to be examined in 50 mL of *tetrahydrofuran R*, add 35 mL of the solvent mixture and dilute to 100.0 mL with *tetrahydrofuran R*. Dilute 5.0 mL of the solution to 50.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of test solution (a) to 10.0 mL with *tetrahydrofuran R*. Dilute 1.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve 2.4 mg of *adapalene impurity C CRS* in 2 mL of *tetrahydrofuran R* and dilute to 20.0 mL with the same solvent. Dilute 2.0 mL of the solution to 20.0 mL with the solvent mixture. To 2.0 mL of this solution add 2.0 mL of reference solution (a) and dilute to 20.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve the contents of a vial of *adapalene for peak identification CRS* (containing impurities A, C and D) in 0.5 mL of *tetrahydrofuran R* and dilute to 1.0 mL with the solvent mixture.

*Reference solution (d).* Dissolve 20.0 mg of *adapalene CRS* in 50 mL of *tetrahydrofuran R*, add 35 mL of the solvent mixture and dilute to 100.0 mL with *tetrahydrofuran R*. Dilute 5.0 mL of the solution to 50.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped phenylsilyl silica gel for chromatography R* (5 µm) with a carbon loading of 7.5 per cent;
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *glacial acetic acid R*, *water R* (0.1:100 *V/V*);
- *mobile phase B*: *tetrahydrofuran R*, *acetonitrile R* (35:65 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2.5 | 50 | 50 |
| 2.5 - 40 | 50 → 28 | 50 → 72 |
| 40 - 42 | 28 | 72 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 25 µL of test solution (a) and reference solutions (a), (b) and (c).

*Identification of impurities*: use the chromatogram supplied with *adapalene for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, C and D.

*Relative retention* with reference to adapalene (retention time = about 20 min): impurity A = about 0.3; impurity C = about 0.9; impurity D = about 1.9.

*System suitability*: reference solution (b):

- *resolution*: minimum 4.5 between the peaks due to impurity C and adapalene;
- *signal-to-noise ratio*: minimum 10 for the peak due to impurity C.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.7; impurity C = 7; impurity D = 1.4;
- *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity D*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurity C*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

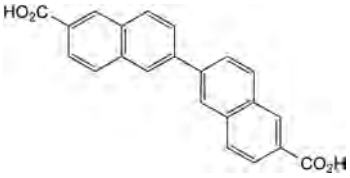
*Injection*: test solution (b) and reference solution (d).

Calculate the percentage content of adapalene from the declared content of *adapalene CRS*.

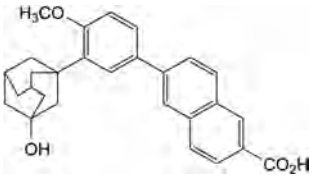
IMPURITIES

*Specified impurities: A, C, D.*

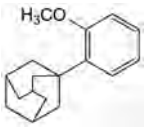
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*



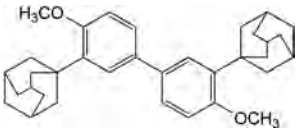
A. 2,2′-binaphthalene-6,6′-dicarboxylic acid,



B. 6-[3-(3-hydroxytricyclo[3.3.1.1$^{3,7}$]dec-1-yl)-4-methoxyphenyl]naphthalene-2-carboxylic acid,



C. 1-(2-methoxyphenyl)tricyclo[3.3.1.1$^{3,7}$]decane,

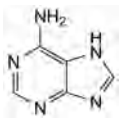


D. 1,1′-[4,4′-bis(methoxy)biphenyl-3,3′-diyl]bis(tricyclo[3.3.1.1$^{3,7}$]decane).

**01/2017:0800**

# ADENINE

## Adeninum



$C_5H_5N_5$ $M_r$ 135.1

[73-24-5]

DEFINITION

Adenine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7*H*-purin-6-amine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water and in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification: A.*

*Second identification: B, C.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *adenine CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 1 g add 3.5 mL of *propionic anhydride R* and boil for 15 min with stirring. Cool. To the resulting crystalline mass add 15 mL of *light petroleum R* and heat to boiling with vigorous stirring. Cool and filter. Wash the precipitate with two quantities, each of 5 mL, of *light petroleum R*. Dissolve the precipitate in 10 mL of *water R* and boil for 1 min. Filter the mixture at 30 °C to 40 °C. Allow to cool. Filter, and dry the precipitate at 100 °C to 105 °C for 1 h. The melting point (*2.2.14*) of the precipitate is 237 °C to 241 °C.

TESTS

**Solution S**. Suspend 2.5 g in 50 mL of *distilled water R* and boil for 3 min. Cool and dilute to 50 mL with *distilled water R*. Filter. Use the filtrate as solution S.

**Appearance of solution**. Dissolve 0.5 g in *dilute hydrochloric acid R* and dilute to 50 mL with the same acid. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.1 mL of *bromothymol blue solution R1* and 0.2 mL of *0.01 M sodium hydroxide*. The solution is blue. Add 0.4 mL of *0.01 M hydrochloric acid*. The solution is yellow.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance.

*Test solution (a).* Dissolve 0.10 g of the substance to be examined in *dilute acetic acid R*, with heating if necessary, and dilute to 10 mL with the same acid.

*Test solution (b).* Dilute 1 mL of test solution (a) to 10 mL with *dilute acetic acid R*.

*Reference solution (a).* Dissolve 10 mg of *adenine CRS* in *dilute acetic acid R*, with heating if necessary, and dilute to 10 mL with the same acid.

*Reference solution (b).* Dilute 1 mL of test solution (b) to 20 mL with *dilute acetic acid R*.

*Reference solution (c).* Dissolve 10 mg of *adenine CRS* and 10 mg of *adenosine R* in *dilute acetic acid R*, with heating if necessary, and dilute to 10 mL with the same acid.

Apply to the plate 5 µL of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *concentrated ammonia R*, 40 volumes of *ethyl acetate R* and 40 volumes of *propanol R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

**Chlorides** (*2.4.4*). To 10 mL of solution S add 1 mL of *concentrated ammonia R* and 3 mL of *silver nitrate solution R2*. Filter. Wash the precipitate with a little *water R* and dilute the filtrate to 15 mL with *water R*. The solution complies with the limit test for chlorides (100 ppm). When carrying out the test, add 2 mL of *dilute nitric acid R* instead of 1 mL of *dilute nitric acid R*.

**Sulfates** (*2.4.13*). Dilute 10 mL of solution S to 15 mL with *distilled water R*. The solution complies with the limit test for sulfates (300 ppm).

**Ammonium**. Prepare a cell consisting of two watch-glasses 60 mm in diameter placed edge to edge. To the inner wall of the upper watch-glass stick a piece of *red litmus paper R* 5 mm square and wetted with a few drops of *water R*. Finely powder the substance to be examined, place 0.5 g in the lower watch-glass and suspend in 0.5 mL of *water R*. To the suspension add 0.30 g of *heavy magnesium oxide R*. Briefly triturate with a glass rod. Immediately close the cell by putting the two watch-glasses together. Heat at 40 °C for 15 min. The litmus paper is not more intensely blue coloured than a standard prepared at the same time and in the same manner using 0.05 mL of *ammonium standard solution (100 ppm* $NH_4$*) R*, 0.5 mL of *water R* and 0.30 g of *heavy magnesium oxide R* (10 ppm).

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

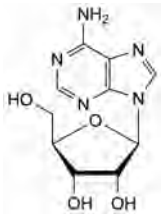
Dissolve 0.100 g in a mixture of 20 mL of *acetic anhydride R* and 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 13.51 mg of $C_5H_5N_5$.

**01/2009:1486**

# ADENOSINE

## Adenosinum



$C_{10}H_{13}N_5O_4$ $M_r$ 267.2

[58-61-7]

DEFINITION

9-β-D-Ribofuranosyl-9*H*-purin-6-amine.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: slightly soluble in water, soluble in hot water, practically insoluble in ethanol (96 per cent) and in methylene chloride. It dissolves in dilute mineral acids.

mp: about 234 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *adenosine CRS*.

TESTS

**Solution S**. Suspend 5.0 g in 100 mL of *distilled water R* and heat to boiling. Allow to cool, filter with the aid of vacuum and dilute to 100 mL with *distilled water R*.

**Appearance of solution**. Solution S is colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S, add 0.1 mL of *bromocresol purple solution R* and 0.1 mL of *0.01 M hydrochloric acid*. The solution is yellow. Add 0.4 mL of *0.01 M sodium hydroxide*. The solution is violet-blue.

**Specific optical rotation** (*2.2.7*): – 45 to – 49 (dried substance).

Dissolve 1.25 g in *1 M hydrochloric acid* and dilute to 50.0 mL with the same acid. Examine within 10 min of preparing the solution.

**Related substances**

Liquid chromatography (*2.2.29*).

*Solvent mixture*. Dissolve 6.8 g of *potassium hydrogen sulfate R* and 3.4 g of *tetrabutylammonium hydrogen sulfate R* in *water R*, adjust to pH 6.5 with a 60 g/L solution of *potassium hydroxide R* and dilute to 1000 mL with the same solvent. Use a freshly prepared solvent mixture.

*Test solution*. Dissolve 20 mg of the substance to be examined in the mobile phase and dilute to 20 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 5 mg of *adenine R* (impurity A) and 5 mg of *inosine R* (impurity G) in the mobile phase and dilute to 50 mL with the mobile phase. Dilute 4 mL of this solution to 100 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *water R*, solvent mixture (40:60 *V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL.

*Run time*: 1.5 times the retention time of adenosine.

*Relative retention* with reference to adenosine (retention time = about 13 min): impurity A = about 0.3; impurity G = about 0.4.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurities A and G.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.6; impurity G = 1.4;
- *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurity G*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 200 ppm, determined on solution S.

**Ammonium** (*2.4.1, Method B*): maximum 10 ppm, determined on 0.5 g.

Prepare the standard using 5 mL of *ammonium standard solution (1 ppm $NH_4$) R*.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

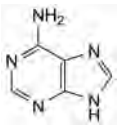
Dissolve 0.200 g, warming slightly if necessary, in a mixture of 20 mL of *acetic anhydride R* and 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 26.72 mg of $C_{10}H_{13}N_5O_4$.

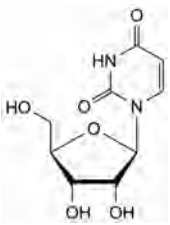
IMPURITIES

*Specified impurities*: *A, G*.

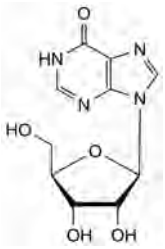
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, H*.



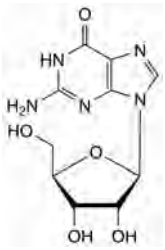
A. 7*H*-purin-6-amine (adenine),



F. 1-β-D-ribofuranosylpyrimidine-2,4(1*H*,3*H*)-dione (uridine),



G. 9-β-D-ribofuranosyl-1,9-dihydro-6*H*-purin-6-one (inosine),



H. 2-amino-9-β-D-ribofuranosyl-1,9-dihydro-6*H*-purin-6-one (guanosine).

**01/2017:1586**

# ADIPIC ACID

## Acidum adipicum

$C_6H_{10}O_4$ $M_r$ 146.1
[124-04-9]

DEFINITION

Hexanedioic acid.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: sparingly soluble in water, soluble in boiling water, freely soluble in ethanol (96 per cent) and in methanol, soluble in acetone.

IDENTIFICATION

A. Melting point (*2.2.14*): 151 °C to 154 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *adipic acid CRS*.

TESTS

**Solution S**. Dissolve 5.0 g with heating in *distilled water R* and dilute to 50 mL with the same solvent. Allow to cool and to crystallise. Filter through a sintered-glass filter (40) (*2.1.2*). Wash the filter with *distilled water R*. Collect the filtrate and the washings until a volume of 50 mL is obtained.

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.20 g of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 20 mg of *glutaric acid R* in 1.0 mL of the test solution and dilute to 10.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase, dilute 1.0 mL of the solution to 10.0 mL with the mobile phase.

*Column*:
- *size*: *l* = 0.125 m, Ø = 4.0 mm,
- *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 $m^2$/g and a pore size of 10 nm,
- *temperature*: 30 °C.

*Mobile phase*: mix 3 volumes of *acetonitrile R* and 97 volumes of a 24.5 g/L solution of *dilute phosphoric acid R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 209 nm.

*Injection*: 20 µL.

*Run time*: 3 times the retention time of adipic acid.

*System suitability*: reference solution (a):
- *resolution*: minimum 9.0 between the peaks due to glutaric acid and adipic acid.

*Limits*:
- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dilute 2.5 mL of solution S to 15 mL with *water R*.

**Nitrates**: maximum 30 ppm.

To 1 mL of solution S add 2 mL of *concentrated ammonia R*, 0.5 mL of a 10 g/L solution of *manganese sulfate R*, 1 mL of a 10 g/L solution of *sulfanilamide R* and dilute to 20 mL with *water R*. Add 0.10 g of *zinc powder R* and cool in iced water for 30 min; shake from time to time. Filter and cool 10 mL of the filtrate in iced water. Add 2.5 mL of *hydrochloric acid R1* and 1 mL of a 10 g/L solution of *naphthylethylenediamine dihydrochloride R*. Allow to stand at room temperature. After 15 min the mixture is not more intensely coloured than a standard prepared at the same time and in the same manner, using 1.5 mL of *nitrate standard solution (2 ppm $NO_3$) R* instead of 1 mL of solution S. The test is invalid if a blank solution prepared at the same time and in the same manner, using 1 mL of *water R* instead of 1 mL of solution S, is more intensely coloured than a 2 mg/L solution of *potassium permanganate R*.

**Sulfates** (*2.4.13*): maximum 500 ppm.

Dilute 3 mL of solution S to 15 mL with *distilled water R*.

**Iron** (*2.4.9*): maximum 10 ppm, determined on solution S.

**Loss on drying** (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent.

Melt 1.0 g completely over a gas burner, then ignite the melted substance with the burner. After ignition, lower or remove the flame in order to prevent the substance from boiling and keep it burning until completely carbonised. Carry out the test for sulfated ash using the residue.

ASSAY

Dissolve 60.0 mg in 50 mL of *water R*. Add 0.2 mL of *phenolphthalein solution R* and titrate with *0.1 M sodium hydroxide*.

1 mL of *0.1 M sodium hydroxide* is equivalent to 7.31 mg of $C_6H_{10}O_4$.

IMPURITIES

A. pentanedioic acid (glutaric acid),

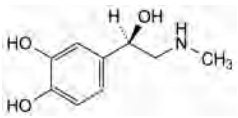
B. butanedioic acid (succinic acid),

C. heptanedioic acid (pimelic acid).

07/2008:2303

# ADRENALINE

## Adrenalinum



$C_9H_{13}NO_3$ $M_r$ 183.2
[51-43-4]

DEFINITION

4-[(1*R*)-1-Hydroxy-2-(methylamino)ethyl]benzene-1,2-diol.

Synthetic product.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white crystalline powder, becoming coloured on exposure to air and light.

*Solubility*: practically insoluble in water, in ethanol (96 per cent) and in methylene chloride. It dissolves in hydrochloric acid.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *adrenaline CRS*.

B. Specific optical rotation (see Tests).

TESTS

**Solution S**. Dissolve 1.000 g in a 25.75 g/L solution of *hydrochloric acid R* and dilute to 50.0 mL with the same solvent. Examine the solution immediately.

**Appearance of solution**. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): − 50.0 to − 54.0 (dried substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions protected from light.*

*Solvent mixture A*. Dissolve 5.0 g of *potassium dihydrogen phosphate R* and 2.6 g of *sodium octanesulfonate R* in *water for chromatography R* and dilute to 1000 mL with the same solvent (it is usually necessary to stir for at least 30 min to achieve complete dissolution). Adjust to pH 2.8 with *phosphoric acid R*.

*Solvent mixture B*: *acetonitrile R1*, solvent mixture A (13:87 *V/V*).

*Test solution*. Dissolve 40 mg of the substance to be examined in 5 mL of *0.1 M hydrochloric acid* and dilute to 50.0 mL with solvent mixture B.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solvent mixture B. Dilute 1.0 mL of this solution to 10.0 mL with solvent mixture B.

*Reference solution (b)*. Dissolve 1.5 mg of *noradrenaline tartrate CRS* (impurity B) and 1.5 mg of *adrenalone hydrochloride R* (impurity C) in solvent mixture B, add 1.0 mL of the test solution and dilute to 100 mL with solvent mixture B.

*Reference solution (c)*. Dissolve the contents of a vial of *adrenaline impurity mixture CRS* (containing impurities D and E) in 1.0 mL of the blank solution.

*Reference solution (d)*. Dissolve 4 mg of *adrenaline with impurity F CRS* in 0.5 mL of *0.1 M hydrochloric acid* and dilute to 5 mL with solvent mixture B.

*Blank solution*: *0.1 M hydrochloric acid*, solvent mixture B (1:9 *V/V*).

*Column*:
- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 50 °C.

*Mobile phase*:
- *mobile phase A*: *acetonitrile R1*, solvent mixture A (5:95 *V/V*);
- *mobile phase B*: *acetonitrile R1*, solvent mixture A (45:55 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 92 → 50 | 8 → 50 |
| 15 - 20 | 50 → 92 | 50 → 8 |
| 20 - 25 | 92 | 8 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *adrenaline impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D and E; use the chromatogram supplied with *adrenaline with impurity F CRS* and the chromatogram obtained with reference solution (d) to identify the peak due to impurity F.

*Relative retention* with reference to adrenaline (retention time = about 4 min): impurity F = about 0.2; impurity B = about 0.8; impurity C = about 1.3; impurity D = about 3.3; impurity E = about 3.7.

*System suitability*: reference solution (b):
- *resolution*: minimum 3.0 between the peaks due to impurity B and adrenaline.

*Limits*:
- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 0.7; impurity E = 0.6;
- *impurities B, C, F*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurities D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 18 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

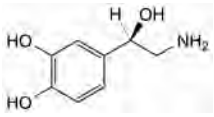
1 mL of *0.1 M perchloric acid* is equivalent to 18.32 mg of $C_9H_{13}NO_3$.

STORAGE

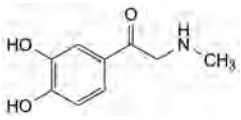
Under nitrogen, protected from light.

IMPURITIES

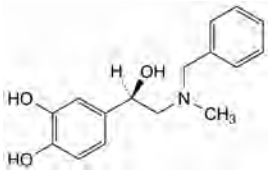
*Specified impurities: B, C, D, E, F.*



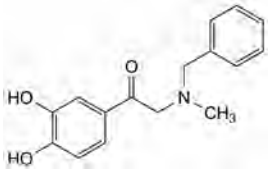
B. (1*R*)-2-amino-1-(3,4-dihydroxyphenyl)ethanol (noradrenaline),



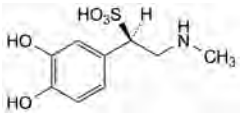
C. 1-(3,4-dihydroxyphenyl)-2-(methylamino)ethanone (adrenalone),



D. 4-[(1*R*)-2-(benzylmethylamino)-1-hydroxyethyl]benzene-1,2-diol,



E. 2-(benzylmethylamino)-1-(3,4-dihydroxyphenyl)ethanone,

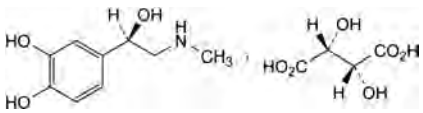


F. (1*R*)-1-(3,4-dihydroxyphenyl)-2-(methylamino)ethanesulfonic acid.

**01/2008:0254**

# ADRENALINE TARTRATE

## Adrenalini tartras



$C_{13}H_{19}NO_9$ $M_r$ 333.3

[51-42-3]

DEFINITION

(1*R*)-1-(3,4-Dihydroxyphenyl)-2-(methylamino)ethanol hydrogen (2*R*,3*R*)-2,3-dihydroxybutanedioate.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or greyish-white, crystalline powder.

*Solubility*: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 5 g in 50 mL of a 5 g/L solution of *sodium metabisulfite R* and make alkaline by addition of *ammonia R*. Keep the mixture at room temperature for at least 15 min and filter. Reserve the filtrate for identification test C. Wash the precipitate with 3 quantities, each of 10 mL, of *methanol R*. Dry at 80 °C. The specific optical rotation (*2.2.7*) of the residue (adrenaline base) is − 53.5 to − 50, determined using a 20.0 g/L solution in *0.5 M hydrochloric acid*.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs of adrenaline base prepared as described under identification test A.

*Comparison*: use adrenaline base prepared as described under identification test A from 50 mg of *adrenaline tartrate CRS* dissolved in 5 mL of a 5 g/L solution of *sodium metabisulfite R*. Keep the mixture at room temperature for at least 30 min. Filter through a sintered-glass filter (*2.1.2*).

C. 0.2 mL of the filtrate obtained in identification test A gives reaction (b) of tartrates (*2.3.1*).

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ (*2.2.2, Method II*).

Dissolve 0.5 g in *water R* and dilute to 10 mL with the same solvent. Examine the solution immediately.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions protected from light.*

*Solvent mixture A*. Dissolve 5.0 g of *potassium dihydrogen phosphate R* and then 2.6 g of *sodium octanesulfonate R* in *water for chromatography R*, and dilute to 1000 mL with the same solvent (it is usually necessary to stir for at least 30 min to achieve complete dissolution). Adjust to pH 2.8 with *phosphoric acid R*.

*Solvent mixture B*: *acetonitrile R1*, solvent mixture A (130:870 *V/V*).

*Test solution*. Dissolve 75 mg of the substance to be examined in 5 mL of *0.1 M hydrochloric acid* and dilute to 50 mL with solvent mixture B.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solvent mixture B. Dilute 1.0 mL of this solution to 10.0 mL with solvent mixture B.

*Reference solution (b)*. Dissolve 1.5 mg of *noradrenaline tartrate CRS* (impurity B) and 1.5 mg of *adrenalone hydrochloride R* (impurity C) in solvent mixture B, add 1.0 mL of the test solution and dilute to 100.0 mL with solvent mixture B.

*Reference solution (c)*. Dissolve the contents of a vial of *adrenaline impurity mixture CRS* (impurities D and E) in 0.1 mL of *0.1 M hydrochloric acid* and 0.9 mL of solvent mixture B.

*Reference solution (d)*. Dissolve 7.5 mg of *adrenaline tartrate with impurity A CRS* in 0.5 mL of *0.1 M hydrochloric acid* and dilute to 5.0 mL with solvent mixture B.

*Blank solution*: *0.1 M hydrochloric acid*, solvent mixture B (1:9 *V/V*).

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 50 °C.

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*, solvent mixture A (5:95 *V/V*);
- *mobile phase B*: *acetonitrile R1*, solvent mixture A (45:55 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 92 → 50 | 8 → 50 |
| 15 - 20 | 50 → 92 | 50 → 8 |
| 20 - 25 | 92 | 8 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *adrenaline impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D and E; use the chromatogram supplied with *adrenaline tartrate with impurity A CRS* and the chromatogram obtained with reference solution (d) to identify the peak due to impurity A.

*Relative retention* with reference to adrenaline (retention time = about 4 min): impurity B = about 0.8; impurity C = about 1.3; impurity A = about 3.2; impurity D = about 3.3; impurity E = about 3.7.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to impurity B and adrenaline.

*Limits*:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 0.7; impurity E = 0.6;

– *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);

– *impurities B, C*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *impurities D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* for 18 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 mL of *anhydrous acetic acid R*, heating gently if necessary. Titrate with *0.1 M perchloric acid* until a bluish-green colour is obtained, using 0.1 mL of *crystal violet solution R* as indicator.

1 mL of *0.1 M perchloric acid* is equivalent to 33.33 mg of $C_{13}H_{19}NO_9$.

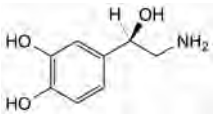
STORAGE

In an airtight container, or preferably in a sealed tube under vacuum or under an inert gas, protected from light.

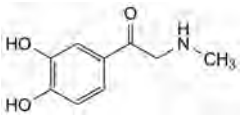
IMPURITIES

*Specified impurities: A, B, C, D, E.*

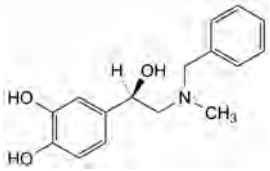
A. unknown structure,



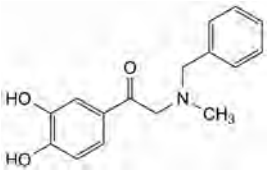
B. (1*R*)-2-amino-1-(3,4-dihydroxyphenyl)ethanol (noradrenaline),



C. 1-(3,4-dihydroxyphenyl)-2-(methylamino)ethanone (adrenalone),



D. 4-[(1*R*)-2-(benzylmethylamino)-1-hydroxyethyl]benzene-1,2-diol,



E. 2-(benzylmethylamino)-1-(3,4-dihydroxyphenyl)ethanone.

**01/2009:1238**

# AIR, MEDICINAL

## Aer medicinalis

DEFINITION

Compressed ambient air.

*Content*: 20.4 per cent *V/V* to 21.4 per cent *V/V* of oxygen ($O_2$).

CHARACTERS

*Appearance*: colourless gas.

*Solubility*: at 20 °C at a pressure of 101 kPa, 1 volume dissolves in about 50 volumes of water.

PRODUCTION

**Carbon dioxide**: maximum 500 ppm *V/V*, determined using an infrared analyser (*2.5.24*).

*Gas to be examined.* Filter the substance to be examined to avoid stray light phenomena.

*Reference gas (a).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*, containing less than 1 ppm *V/V* of *carbon dioxide R1*.

*Reference gas (b).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*, containing 500 ppm *V/V* of *carbon dioxide R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon dioxide in the gas to be examined.

**Carbon monoxide**: maximum 5 ppm *V/V*, determined using an infrared analyser (*2.5.25*).

*Gas to be examined.* Filter the substance to be examined to avoid stray light phenomena.

*Reference gas (a).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*, containing less than 1 ppm *V/V* of *carbon monoxide R*.

*Reference gas (b).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*, containing 5 ppm *V/V* of *carbon monoxide R*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon monoxide in the gas to be examined.

**Sulfur dioxide**: maximum 1 ppm *V/V*, determined using an ultraviolet fluorescence analyser (Figure 1238.-1).

The apparatus consists of the following:

- a system generating ultraviolet radiation with a wavelength of 210 nm, made up of an ultraviolet lamp, a collimator, and a selective filter; the beam is blocked periodically by a chopper rotating at high speeds;
- a reaction chamber, through which flows the gas to be examined;
- a system that detects radiation emitted at a wavelength of 350 nm, made up of a selective filter, a photomultiplier tube and an amplifier.

*Gas to be examined.* Filter the substance to be examined.

*Reference gas (a).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*.

*Reference gas (b).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*, containing 0.5 ppm *V/V* to 2 ppm *V/V* of *sulfur dioxide R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of sulfur dioxide in the gas to be examined.

**Oil**: maximum 0.1 mg/m$^3$, determined using an oil detector tube (*2.1.6*), when an oil-lubricated compressor is used for the production.

**Nitrogen monoxide and nitrogen dioxide**: maximum 2 ppm *V/V* in total, determined using a chemiluminescence analyser (*2.5.26*).

*Gas to be examined.* The substance to be examined.

*Reference gas (a).* Use a mixture of 21 per cent *V/V* of *oxygen R* and 79 per cent *V/V* of *nitrogen R1*, containing less than 0.05 ppm *V/V* of nitrogen monoxide and nitrogen dioxide.

*Reference gas (b).* Use a mixture of 2 ppm *V/V* of *nitrogen monoxide R* in *nitrogen R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of nitrogen monoxide and nitrogen dioxide in the gas to be examined.

**Water**: maximum 67 ppm *V/V*, determined using an electrolytic hygrometer (*2.5.28*), except where the competent authority decides that the following limit applies to medicinal air generated on-site and distributed in pipe-line systems operating at a pressure not greater than 10 bar and a temperature not less than 5 °C: maximum 870 ppm *V/V*, determined using an electrolytic hygrometer (*2.5.28*).

**Assay**. Determine the concentration of oxygen in air using a paramagnetic analyser (*2.5.27*).

IDENTIFICATION

*First identification: C.*

*Second identification: A, B.*

A. In a conical flask containing the substance to be examined, place a glowing wood splinter. The splinter remains glowing.

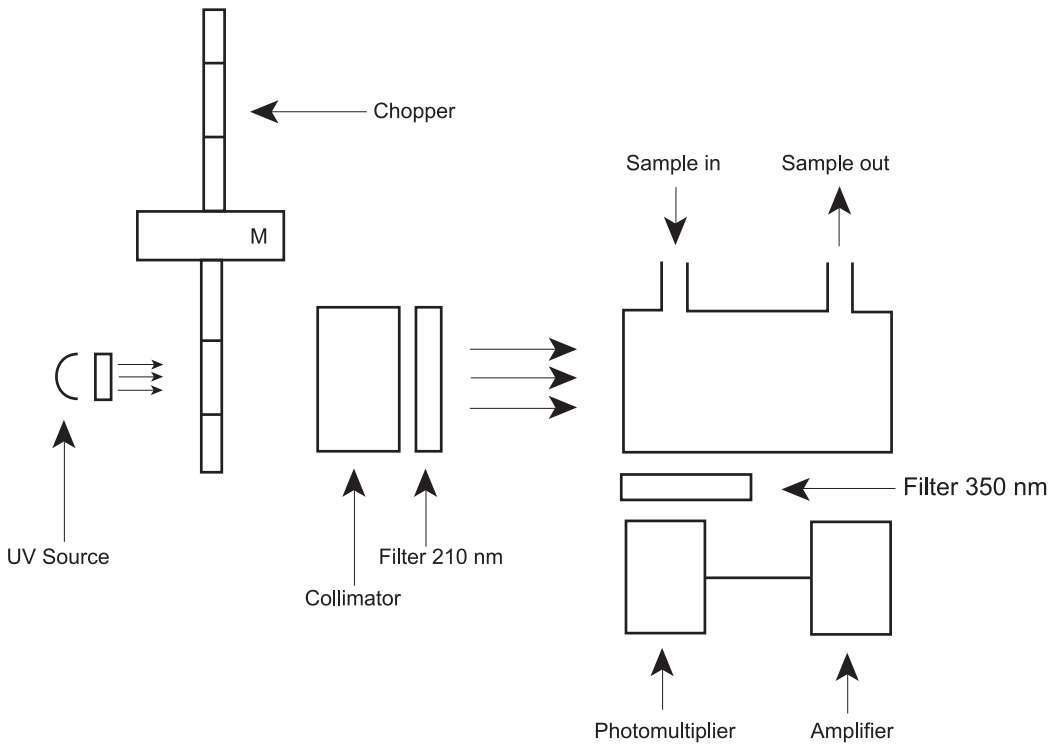


Figure 1238.-1. – *UV fluorescence analyser*

B. Use a gas burette (Figure 1238.-2) of 25 mL capacity in the form of a chamber in the middle of which is a tube graduated in 0.2 per cent between 19.0 per cent and 23.0 per cent, and isolated at each end by a tap with a conical barrel. The lower tap is joined to a tube with an olive-shaped nozzle and is used to introduce the gas into the apparatus. A cylindrical funnel above the upper tap is used to introduce the absorbent solution. Wash the burette with *water R* and dry. Open the 2 taps. Connect the nozzle to the source of the gas to be examined and set the flow rate to 1 L/min. Flush the burette by passing the gas to be examined through it for 1 min. Close the lower tap of the burette and immediately afterwards the upper tap. Rapidly disconnect the burette from the source of the gas to be examined. Rapidly give a half turn to the upper tap to eliminate any excess pressure in the burette. Keeping the burette vertical, fill the funnel with a freshly prepared mixture of 21 mL of a 560 g/L solution of *potassium hydroxide R* and 130 mL of a 200 g/L solution of *sodium dithionite R*. Open the upper tap slowly. The solution absorbs the oxygen and enters the burette. Allow to stand for 10 min without shaking. Read the level of the liquid meniscus on the graduated part of the burette. This figure represents the percentage *V/V* of oxygen. The value read is 20.4 to 21.4.

C. It complies with the limits of the assay.

TESTS

**Carbon dioxide**: maximum 500 ppm *V/V*, determined using a carbon dioxide detector tube (*2.1.6*).

**Sulfur dioxide**: maximum 1 ppm *V/V*, determined using a sulfur dioxide detector tube (*2.1.6*).

**Oil**: maximum 0.1 mg/m$^3$, determined using an oil detector tube (*2.1.6*), when an oil-lubricated compressor is used for the production.

**Nitrogen monoxide and nitrogen dioxide**: maximum 2 ppm *V/V*, determined using a nitrogen monoxide and nitrogen dioxide detector tube (*2.1.6*).

**Carbon monoxide**: maximum 5 ppm *V/V*, determined using a carbon monoxide detector tube (*2.1.6*).

**Water vapour**: maximum 67 ppm *V/V*, determined using a water vapour detector tube (*2.1.6*), except where the competent authority decides that the following limit applies to medicinal air generated on-site and distributed in pipe-line systems operating at a pressure not greater than 10 bar and a temperature not less than 5 °C: maximum 870 ppm *V/V*, determined using a water vapour detector tube (*2.1.6*).

STORAGE

As a gas, in suitable containers complying with the legal regulations or as a gas supplied by a pipe network.

LABELLING

Where applicable, the label states the production method, as regards to the use of an oil - lubricated compression.

IMPURITIES

A. $CO_2$: carbon dioxide,

B. $SO_2$: sulfur dioxide,

C. NO: nitrogen monoxide,

D. $NO_2$: nitrogen dioxide,

E. oil,

F. CO: carbon monoxide,

G. $H_2O$: water.

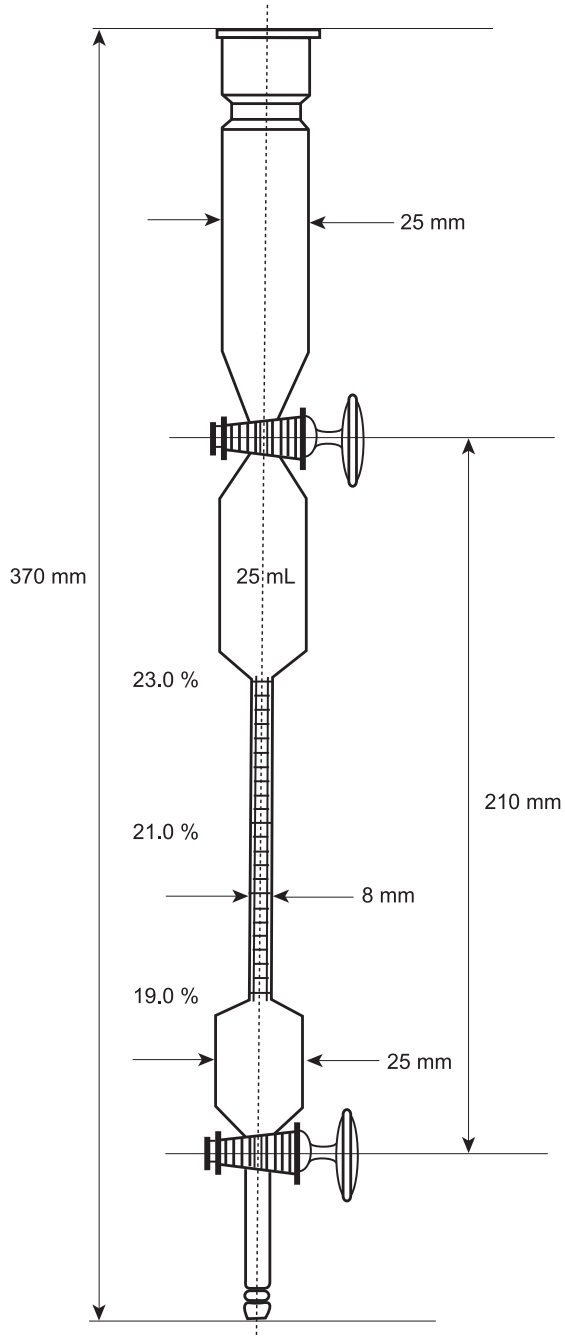

Figure 1238.-2. – *Gas burette*

**01/2008:1684**

# AIR, SYNTHETIC MEDICINAL

## Aer medicinalis artificiosus

DEFINITION

Mixture of *Nitrogen (1247)* and *Oxygen (0417)*.

*Content*: 95.0 per cent to 105.0 per cent of the nominal value which is between 21.0 per cent *V/V* to 22.5 per cent *V/V* of oxygen ($O_2$).

CHARACTERS

Colourless and odourless gas.

*Solubility*: at a temperature of 20 °C and a pressure of 101 kPa, 1 volume dissolves in about 50 volumes of water.

PRODUCTION

**Water** (*2.5.28*): maximum 67 ppm *V/V*.

**Assay** (*2.5.27*). Carry out the determination of oxygen in gases.

IDENTIFICATION

*First identification: C.*

*Second identification: A, B.*

A. In a conical flask containing the substance to be examined, place a glowing splinter of wood. The splinter remains glowing.

B. Use a gas burette (Figure 1684.-1) of 25 mL capacity in the form of a chamber, in the middle of which is a tube graduated in 0.2 per cent between 19.0 per cent and 23.0 per cent, and isolated at each end by a tap with a conical barrel. The lower tap is joined to a tube with an olive-shaped nozzle and is used to introduce the gas into the apparatus. A cylindrical funnel above the upper tap is used to introduce the absorbent solution. Wash the burette with *water R* and dry. Open both taps. Connect the nozzle to the source of the substance to be examined and set the flow rate to 1 L/min. Flush the burette by passing the substance to be examined through it for 1 min. Close the lower tap of the burette and immediately afterwards the upper tap. Rapidly disconnect the burette from the source of the substance to be examined. Rapidly give a half turn of the upper tap to eliminate any excess pressure in the burette. Keeping the burette vertical, fill the funnel with a freshly prepared mixture of 21 mL of a 560 g/L solution of *potassium hydroxide R* and 130 mL of a 200 g/L solution of *sodium dithionite R*. Open the upper tap slowly. The solution absorbs the oxygen and enters the burette. Allow to stand for 10 min without shaking. Read the level of the liquid meniscus on the graduated part of the burette. This figure represents the percentage *V/V* of oxygen. The value read is 95.0 per cent to 105.0 per cent of the nominal value.

C. It complies with the limits of the assay.

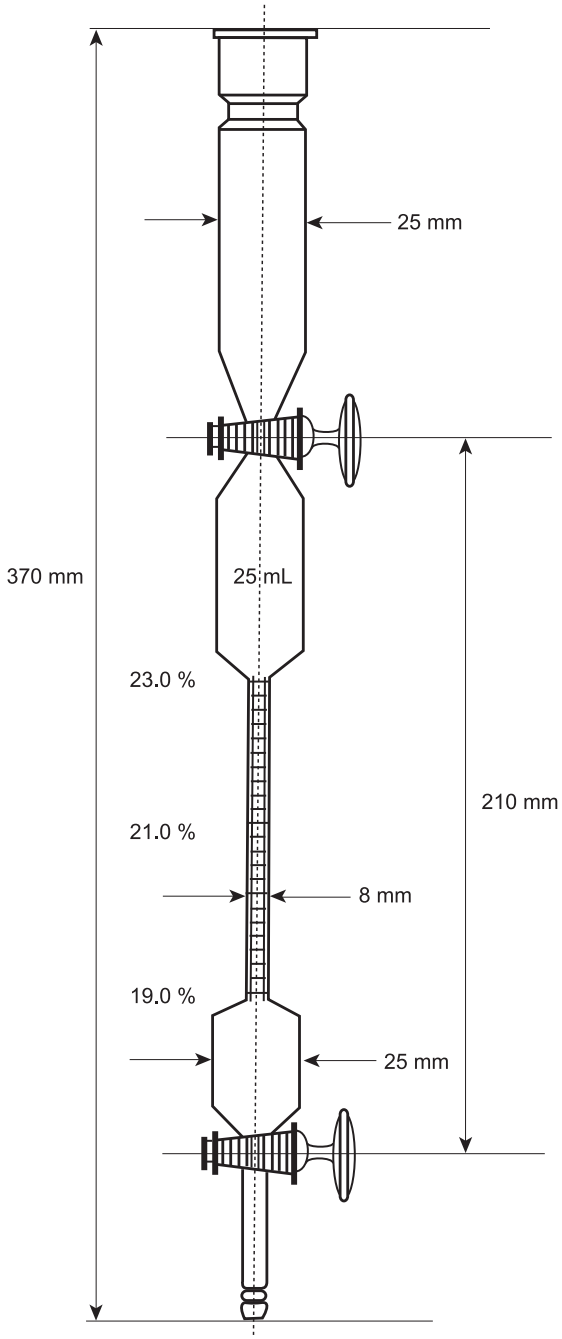

Figure 1684.-1.– *Gas burette*

TESTS

**Water vapour**: maximum 67 ppm *V/V*, determined using a water vapour detector tube (*2.1.6*).

STORAGE

As a compressed gas in suitable containers complying with the legal regulations or as a compressed gas supplied by a pipe network, after mixing of the components.

LABELLING

The label states the nominal content of $O_2$ in per cent *V/V*.

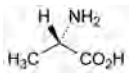
IMPURITIES

A. $H_2O$: water.

**01/2017:0752**

# ALANINE

## Alaninum



$C_3H_7NO_2$ $M_r$ 89.1

[56-41-7]

DEFINITION

(2*S*)-2-Aminopropanoic acid.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *alanine CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 50 mL with the same solvent.
*Reference solution*. Dissolve 10 mg of *alanine CRS* in *water R* and dilute to 50 mL with the same solvent.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 *V/V/V*).
*Application*: 5 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 0.5 g in a mixture of 0.25 mL of *hydrochloric acid R1*, 0.5 mL of a 100 g/L solution of *sodium nitrite R* and 1 mL of *water R*. Shake; gas is given off. Add 2 mL of *dilute sodium hydroxide solution R*, followed by 0.25 mL of *iodinated potassium iodide solution R*. After about 30 min, a yellow precipitate is formed.

TESTS

**Solution S**. Dissolve 2.5 g in *distilled water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

Dilute 10 mL of solution S to 20 mL with *water R*.

**Specific optical rotation** (*2.2.7*): + 13.5 to + 15.5 (dried substance).

Dissolve 2.50 g in *hydrochloric acid R1* and dilute to 25.0 mL with the same acid.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *dilute hydrochloric acid R1* or a sample preparation buffer suitable for the apparatus used.

*Test solution*. Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c)*. Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d)*. Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50.0 mL with solution A. Dilute 1.0 mL of the solution to 200.0 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test, blank and reference solutions into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):
- *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:
- for any ninhydrin-positive substance detected at 570 nm, use the concentration of alanine in reference solution (a);
- for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:
- *any ninhydrin-positive substance*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dilute 10 mL of solution S to 15 mL with *distilled water R*.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit*:
- *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in 3 mL of *anhydrous formic acid R*. Add 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 8.91 mg of $C_3H_7NO_2$.

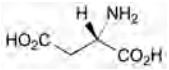
STORAGE

Protected from light.

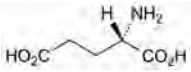
IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or

by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B*.



A. (2*S*)-2-aminobutanedioic acid (aspartic acid),

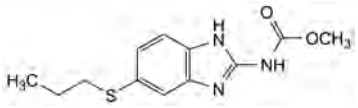


B. (2*S*)-2-aminopentanedioic acid (glutamic acid).

**04/2018:1386**
**corrected 9.6**

# ALBENDAZOLE

## Albendazolum



$C_{12}H_{15}N_3O_2S$ $M_r$ 265.3
[54965-21-8]

DEFINITION

Methyl *N*-[5-(propylsulfanyl)-1*H*-benzimidazol-2-yl]carbamate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or slightly yellowish powder.

*Solubility*: practically insoluble in water, freely soluble in anhydrous formic acid, very slightly soluble in methylene chloride, practically insoluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *albendazole CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

Dissolve 0.10 g in a mixture of 10 volumes of *anhydrous formic acid R* and 90 volumes of *methylene chloride R* and dilute to 10 mL with the same mixture of solvents.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture*: *sulfuric acid R*, *methanol R* (1:99 *V/V*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in 5 mL of the solvent mixture and immediately dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 5 mg of *albendazole for system suitability CRS* (containing impurities B, C, E, F and H) in 1 mL of the solvent mixture and dilute to 10 mL with the mobile phase.

*Reference solution (c).* Dilute 1 mL of the solvent mixture to 10 mL with the mobile phase. Use 1 mL of this solution to dissolve the contents of a vial of *albendazole impurity mixture CRS* (containing impurities A and D).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: 1.67 g/L solution of *ammonium dihydrogen phosphate R*, *methanol R* (30:70 *V/V*).

*Flow rate*: 0.7 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of albendazole.

*Identification of impurities*: use the chromatogram supplied with *albendazole impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and D; use the chromatogram supplied with *albendazole for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities B + C, E, F and H.

*Relative retention* with reference to albendazole (retention time = about 11 min): impurity D = about 0.35; impurities B and C = about 0.40; impurity E = about 0.45; impurity A = about 0.48; impurity F = about 0.57; impurity H = about 0.66.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurities B + C and E.

*Calculation of percentage contents*:

- *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.7; impurities B and C = 1.4; impurity D = 1.9; impurity E = 1.4;
- for each impurity, use the concentration of albendazole in reference solution (a).

*Limits*:

- *impurity H*: maximum 0.6 per cent;
- *impurity F*: maximum 0.5 per cent;
- *impurity A*: maximum 0.4 per cent;
- *sum of impurities B and C*: maximum 0.4 per cent;
- *impurity E*: maximum 0.3 per cent;
- *impurity D*: maximum 0.2 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 1.3 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

*In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.*

Dissolve 0.250 g in 3 mL of *anhydrous formic acid R* and add 40 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 26.53 mg of $C_{12}H_{15}N_3O_2S$.

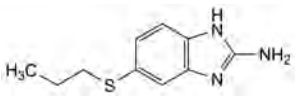
STORAGE

Protected from light.

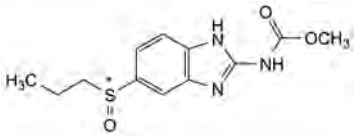
IMPURITIES

*Specified impurities: A, B, C, D, E, F, H.*

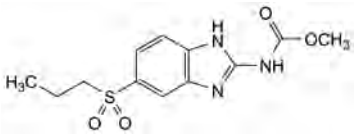
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, I, J, K, L.*



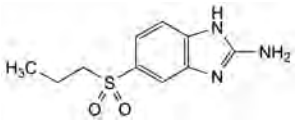
A. 5-(propylsulfanyl)-1*H*-benzimidazol-2-amine,



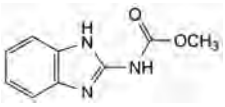
B. methyl *N*-[5-(propylsulfinyl)-1*H*-benzimidazol-2-yl]-carbamate,



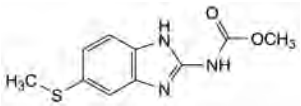
C. methyl *N*-[5-(propylsulfonyl)-1*H*-benzimidazol-2-yl]-carbamate,



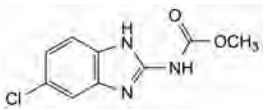
D. (2-amino-1*H*-benzimidazol-5-yl)propyl-λ⁶-sulfanedione,



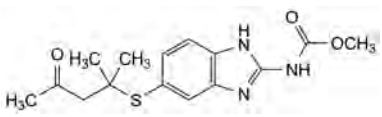
E. methyl *N*-(1*H*-benzimidazol-2-yl)carbamate,



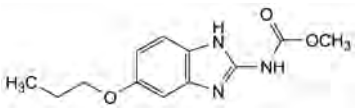
F. methyl *N*-[5-(methylsulfanyl)-1*H*-benzimidazol-2-yl]-carbamate,



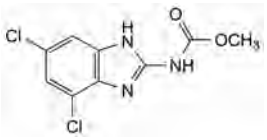
G. methyl *N*-(5-chloro-1*H*-benzimidazol-2-yl)carbamate,



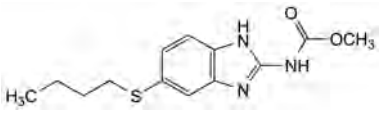
H. methyl *N*-[5-[(2-methyl-4-oxopentan-2-yl)sulfanyl]-1*H*-benzimidazol-2-yl]carbamate,



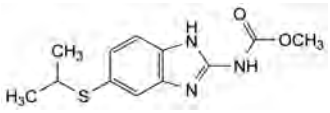
I. methyl *N*-(5-propoxy-1*H*-benzimidazol-2-yl)carbamate,



J. methyl *N*-(4,6-dichloro-1*H*-benzimidazol-2-yl)carbamate,



K. methyl *N*-[5-(butylsulfanyl)-1*H*-benzimidazol-2-yl]carbamate,

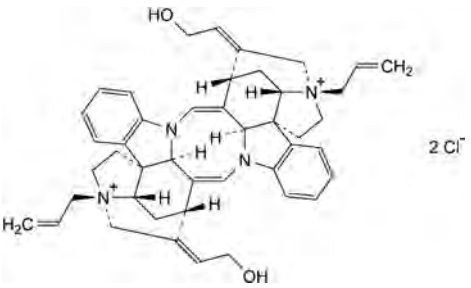


L. methyl *N*-[5-[(propan-2-yl)sulfanyl]-1*H*-benzimidazol-2-yl]carbamate.

**01/2008:1285**

# ALCURONIUM CHLORIDE

## Alcuronii chloridum



$C_{44}H_{50}Cl_2N_4O_2$ $M_r$ 738

[15180-03-7]

DEFINITION

(1*R*,3a*S*,10*S*,11a*S*,12*R*,14a*S*,19a*S*,20b*S*,21*S*,22a*S*,23*E*,26*E*)-23,26-bis(2-Hydroxyethylidene)-1,12-bis(prop-2-enyl)-2,3,11,11a,13,14,22,22a-octahydro-10*H*,21*H*-1,21:10,12-diethano-19a*H*,20b*H*-[1,5]diazocino[1,2,3-*lm*:5,6,7-*l′m′*]dipyrrolo[2′,3′-*d*:2″,3″:*d*′]dicarbazolediium dichloride (4,4′-didesmethyl-4,4′-bis(prop-2-enyl)toxiferin I dichloride).

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or slightly greyish-white, crystalline powder.

*Solubility*: freely soluble in water and in methanol, soluble in ethanol (96 per cent), practically insoluble in cyclohexane.

*Carry out the identification, tests and assay as rapidly as possible avoiding exposure to actinic light.*

IDENTIFICATION

*First identification: A, C.*

*Second identification: B, C.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *alcuronium chloride CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 10 mg of *alcuronium chloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: mix 15 volumes of a 58.4 g/L solution of *sodium chloride R*, 35 volumes of *dilute ammonia R2* and 50 volumes of *methanol R*.

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in air for 10 min.

*Detection*: spray with *0.1 M ammonium and cerium nitrate*.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$, $BY_6$ or $B_6$ (*2.2.2, Method I*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.1 mL of *methyl red solution R* and 0.2 mL of *0.01 M hydrochloric acid*. The solution is red. Add 0.4 mL of *0.01 M sodium hydroxide*. The solution is yellow.

**Specific optical rotation** (*2.2.7*): – 430 to – 451 (anhydrous substance), determined on solution S.

**Propan-2-ol** (*2.4.24, System A*): maximum 1.0 per cent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture.* Mix 100 mL of *methanol R*, 200 mL of *acetonitrile R* and 200 mL of a 6.82 g/L solution of *potassium dihydrogen phosphate R*. Dissolve 1.09 g of *sodium laurylsulfonate for chromatography R* in the mixture and adjust the apparent pH to 8.0 with a 100 g/L solution of *sodium hydroxide R*.

*Test solution.* Dissolve 0.20 g of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 0.5 mL of the test solution to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 4.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dilute 1.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (d).* To 5.0 mL of the test solution add 5.0 mg of *allylstrychnine bromide CRS*, dissolve in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 200 mL of *methanol R*, 400 mL of *acetonitrile R* and 400 mL of a 6.82 g/L solution of *potassium dihydrogen phosphate R*. Dissolve 2.18 g of *sodium laurylsulfonate for chromatography R* in the mixture and adjust the apparent pH to 5.4 with a 100 g/L solution of *phosphoric acid R*.

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of alcuronium.

*System suitability*: reference solution (d):

– *resolution*: minimum 4.0 between the peaks due to *N*-allylstrychnine and alcuronium.

*Limits*:

– *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one of the peaks has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

**Water** (*2.5.12*): maximum 5.0 per cent, determined on 0.500 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g by stirring in 70 mL of *acetic anhydride R* for 1 min. Titrate with *0.1 M perchloric acid* until the colour changes from violet-blue to greenish-blue, using 0.1 mL of *crystal violet solution R* as indicator.

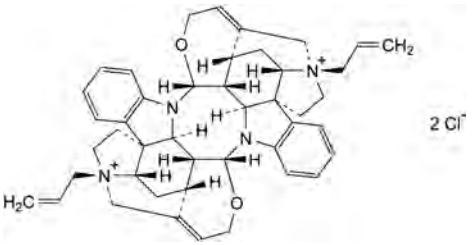
1 mL of *0.1 M perchloric acid* is equivalent to 36.9 mg of $C_{44}H_{50}Cl_2N_4O_2$.

STORAGE

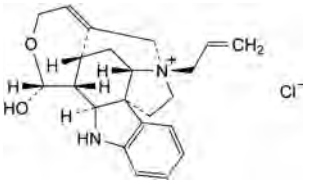
In an airtight container under nitrogen, protected from light, at a temperature of 2 °C to 8 °C.

IMPURITIES

*Specified impurities: A, B.*



A. (1*R*,3a*S*,9*R*,9a*R*,10*R*,11a*S*,12*R*,14a*S*,19a*S*,20*R*,-20a*R*,20b*S*,21*R*,22a*S*)-1,12-bis(prop-2-enyl)-2,3,9a,11,11a,13,14,19a,20a,21,22,22a-dodecahydro-10*H*,20b*H*-1,23:12,27-dimethano-9,10:20,21-bis(epoxyprop[2]eno)-9*H*,20*H*-[1,5]diazocino[1,2,3-*lm*:5,6,7-*l′m′*]dipyrrolo[2′,3′-*d*:2″,3″:*d*′]dicarbazolediium dichloride (4,4′-diallylcaracurin V dichloride),

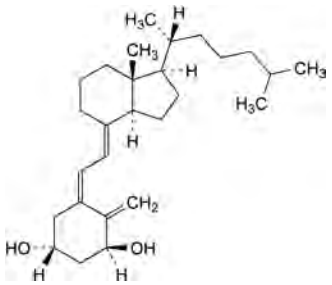


B. (4b*S*,7*R*,7a*S*,8a*R*,13*R*,13a*R*,13b*S*)-13-hydroxy-7-(prop-2-enyl)-5,6,7a,8,8a,11,13,13a,13b,14-decahydro-7,9-methano-7*H*-oxepino[3,4-*a*]pyrrolo[2,3-*d*]carbazolium chloride ((4*R*,17*R*)-4-allyl-17,18-epoxy-17-hydroxy-19,20-didehydrocuranium chloride).

01/2020:1286

# ALFACALCIDOL

## Alfacalcidolum



$C_{27}H_{44}O_2$ $M_r$ 400.6
[41294-56-8]

DEFINITION

(1*S*,3*R*,5*Z*,7*E*)-9,10-Secocholesta-5,7,10(19)-triene-1-3-diol.

*Content*: 97.0 per cent to 102.0 per cent.

A reversible isomerisation to pre-alfacalcidol takes place in solution, depending on temperature and time. The activity is due to both compounds (see Assay).

CHARACTERS

*Appearance*: white or almost white crystals.

*Solubility*: practically insoluble in water, freely soluble in ethanol (96 per cent), soluble in fatty oils.

It is sensitive to air, heat and light.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *Ph. Eur. reference spectrum of alfacalcidol.*

B. Examine the chromatograms obtained in the test for related substances.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Carry out the test as rapidly as possible, avoiding exposure to light and air, and prepare the solutions immediately before use.*

*Test solution.* Dissolve 5.0 mg of the substance to be examined in 25.0 mL of *acetonitrile R* and dilute to 50.0 mL with *water R*.

*Reference solution (a).* Dissolve 5.0 mg of *alfacalcidol CRS* in 25.0 mL of *acetonitrile R* and dilute to 50.0 mL with *water R*.

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 100.0 mL with a mixture of equal volumes of *acetonitrile R* and *water R*. Dilute 1.0 mL of this solution to 20.0 mL with the same mixture of solvents.

*Reference solution (c).* Dissolve 2 mg of *alfacalcidol for system suitability A CRS* (containing impurities A and D) in 10 mL of *acetonitrile R* and dilute to 20 mL with *water R*.

*Reference solution (d).* Dissolve 2 mg of *alfacalcidol for impurity B identification CRS* in 10 mL of *acetonitrile R* and dilute to 20 mL with *water R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 2.1 mm;
– *stationary phase*: *end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R* (1.7 µm);
– *temperature*: 32 °C.

*Mobile phase*: *methanol R, water for chromatography R, acetonitrile R* (15:17:68 *V/V/V*).

*Flow rate*: 0.3 mL/min.

*Detection*: spectrophotometer at 264 nm.

*Injection*: 5 µL of the test solution and reference solutions (b), (c) and (d).

*Run time*: twice the retention time of alfacalcidol.

*Identification of impurities*: use the chromatogram supplied with *alfacalcidol for system suitability A CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and D and pre-alfacalcidol; use the chromatogram supplied with *alfacalcidol for impurity B identification CRS* and the chromatogram obtained with reference solution (d) to identify impurity B.

*Relative retention* with reference to alfacalcidol (retention time = about 15 min): pre-alfacalcidol = about 0.91; impurity A = about 0.94; impurity D = about 0.96; impurity B = about 1.1.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity D and alfacalcidol;
– *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to pre-alfacalcidol and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A;
– *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity D.

*Limits*:

– *impurities A, B, D*: for each impurity, maximum 0.5 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 1.0 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the peak due to pre-alfacalcidol.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{27}H_{44}O_2$ taking into account the assigned content of *alfacalcidol CRS* and, if present, the peak due to pre-alfacalcidol.

STORAGE

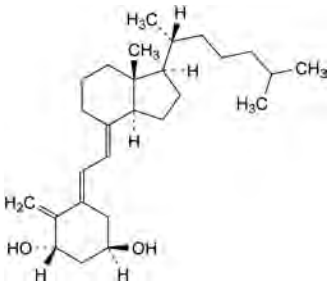
Under nitrogen, in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

The contents of an opened container are to be used immediately.

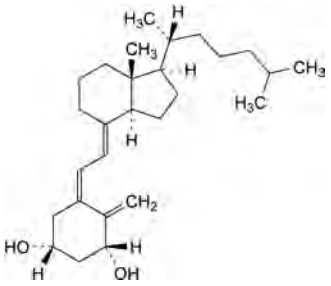
IMPURITIES

*Specified impurities: A, B, D.*

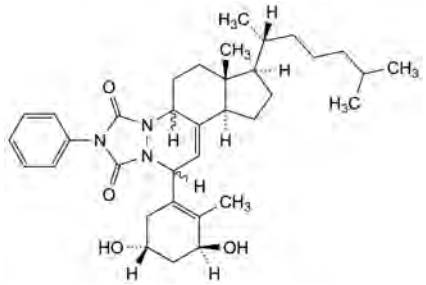
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C.*



A. (1*S*,3*R*,5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1,3-diol (*trans*-alfacalcidol),



B. (1*R*,3*R*,5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1,3-diol (1β-calcidol),



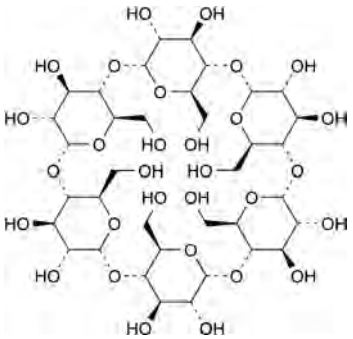
C. 6ξ-[(3*S*,5*R*)-3,5-dihydroxy-2-methylcyclohex-1-en-1-yl]-2-phenyl-2,5,10-triaza-17β-[(2*R*)-6-methylheptan-2-yl]-4-nor-9ξ-estr-7-ene-1,3-dione,

D. unknown structure.

**01/2017:1487 corrected 9.3**

# ALFADEX

## Alfadexum



$[C_6H_{10}O_5]_6$ $M_r$ 973
[10016-20-3]

DEFINITION

Cyclohexakis-(1→4)-(α-D-glucopyranosyl) (cyclomaltohexaose or α-cyclodextrin).

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, amorphous or crystalline powder.

*Solubility*: freely soluble in water, slightly soluble in propylene glycol, practically insoluble in anhydrous ethanol and in methylene chloride.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Examine the chromatograms obtained in the assay.
*Results*: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (c).

C. Dissolve 0.2 g in 2 mL of *iodine solution R4* by warming on a water-bath, and allow to stand at room temperature; a yellowish-brown precipitate is formed.

TESTS

**Solution S**. Dissolve 1.000 g in *carbon dioxide-free water R* and dilute to 100.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*).

**pH** (*2.2.3*): 5.0 to 8.0.

Mix 1 mL of a 223.6 g/L solution of *potassium chloride R* and 30 mL of solution S.

**Specific optical rotation** (*2.2.7*): + 147 to + 152 (dried substance), determined on solution S.

**Reducing sugars**: maximum 0.2 per cent.

*Test solution*. To 1 mL of solution S add 1 mL of *cupri-tartaric solution R4*. Heat on a water-bath for 10 min, cool to room temperature. Add 10 mL of *ammonium molybdate reagent R1* and allow to stand for 15 min.

*Reference solution*. Prepare a reference solution at the same time and in the same manner as the test solution, using 1 mL of a 0.02 g/L solution of *glucose R*.

Measure the absorbance (*2.2.25*) of the test solution and the reference solution at the absorption maximum at 740 nm using *water R* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

**Light-absorbing impurities**. Examine solution S between 230 nm and 750 nm. Between 230 nm and 350 nm, the absorbance (*2.2.25*) is not greater than 0.10. Between 350 nm and 750 nm, the absorbance (*2.2.25*) is not greater than 0.05.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 0.25 g of the substance to be examined in *water R* with heating, cool and dilute to 25.0 mL with the same solvent.

*Test solution (b)*. Dilute 5.0 mL of test solution (a) to 50.0 mL with *water R*.

*Reference solution (a)*. Dissolve 25.0 mg of *betadex CRS* (impurity A), 25.0 mg of *gammacyclodextrin CRS* (impurity B) and 50.0 mg of *alfadex CRS* in *water R*, then dilute to 50.0 mL with the same solvent.

*Reference solution (b)*. Dilute 5.0 mL of reference solution (a) to 50.0 mL with *water R*.

*Reference solution (c)*. Dissolve 25.0 mg of *alfadex CRS* in *water R* and dilute to 25.0 mL with the same solvent.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (10 μm).

*Mobile phase*: *methanol R*, *water R* (10:90 *V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: differential refractometer.

*Equilibration*: with the mobile phase for about 3 h.

*Injection*: 50 µL of test solution (a) and reference solutions (a) and (b).

*Run time*: 3.5 times the retention time of alfadex.

*Relative retention* with reference to alfadex (retention time = about 10 min): impurity B = about 0.7; impurity A = about 2.2.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurity B and alfadex; if necessary, adjust the concentration of methanol in the mobile phase.

*Limits*:

– *impurities A, B*: for each impurity, not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.25 per cent);

– *sum of impurities other than A and B*: not more than 0.5 times the area of the peak due to alfadex in the chromatogram obtained with reference solution (b) (0.5 per cent).

**Loss on drying** (*2.2.32*): maximum 11 per cent, determined on 1.000 g by drying in an oven at 120 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution (b) and reference solutions (a) and (c).

*System suitability*:

– *repeatability*: maximum relative standard deviation of 2.0 per cent for the peak due to alfadex after 5 injections of reference solution (a).

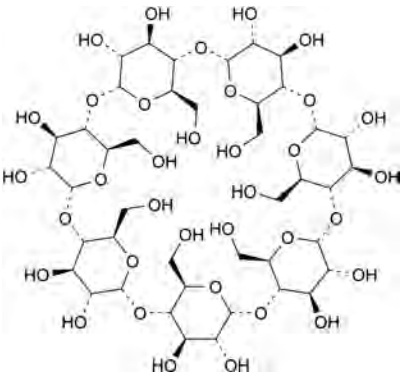
Calculate the percentage content of $[C_6H_{10}O_5]_6$ from the assigned content of *alfadex CRS*.

STORAGE

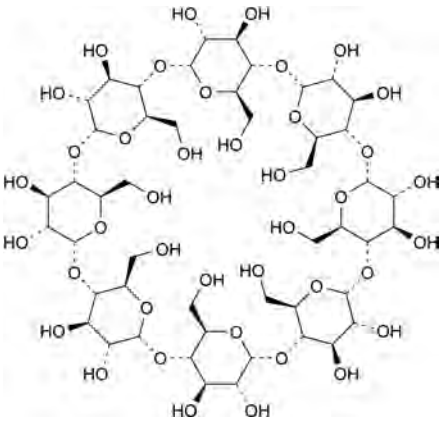
In an airtight container.

IMPURITIES

*Specified impurities: A, B.*



A. cycloheptakis-(1→4)-(α-D-glucopyranosyl) (betadex or cyclomaltoheptaose or β-cyclodextrin),



B. cyclooctakis-(1→4)-(α-D-glucopyranosyl) (cyclomaltooctaose or γ-cyclodextrin).

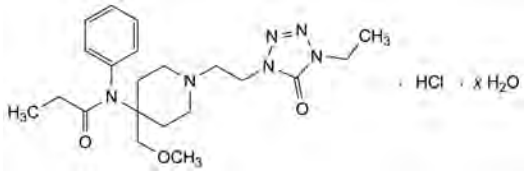
# ALFENTANIL HYDROCHLORIDE HYDRATE

## Alfentanili hydrochloridum hydricum



$C_{21}H_{33}ClN_6O_3$, $xH_2O$ $M_r$ 453.0 (anhydrous substance)
Anhydrous alfentanil hydrochloride: [69049-06-5]

DEFINITION

*N*-[1-[2-(4-Ethyl-5-oxo-4,5-dihydro-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide hydrochloride hydrate.

*Content*: 98.5 per cent to 101.5 per cent (anhydrous substance).

It contains a variable quantity of water.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: freely soluble in water, in ethanol (96 per cent) and in methanol.

mp: about 140 °C, with decomposition.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *alfentanil hydrochloride hydrate CRS*.
If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

B. Dissolve 50 mg in a mixture of 0.4 mL of *ammonia R* and 2 mL of *water R*. Mix, allow to stand for 5 min and filter. Acidify the filtrate with *dilute nitric acid R*. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.2 g in *water R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Test solution.* Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* In order to prepare impurity E *in situ*, dissolve 10 mg of the substance to be examined in 10.0 mL of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Neutralise with 10.0 mL of *dilute sodium hydroxide solution R* and evaporate to dryness on a water-bath. Cool and take up the residue in 10 mL of *methanol R*. Filter.

*Reference solution (b).* Dissolve the contents of a vial of *alfentanil impurity D CRS* in 1 mL of *methanol R*.

*Reference solution (c).* Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

*Blank solution*: *methanol R*.

*Column*:

- *size*: *l* = 0.1 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

- *mobile phase A*: 5 g/L solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water for chromatography R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 90 → 40 | 10 → 60 |
| 15 - 20 | 40 | 60 |
| 20 - 25 | 40 → 90 | 60 → 10 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity E; use the chromatogram obtained with reference solution (b) to identify the peak due to impurity D.

*Relative retention* with reference to alfentanil (retention time = about 8 min): impurity D = about 0.8; impurity E = about 0.9.

*System suitability*: reference solution (a):

- *resolution*: minimum 4.0 between the peaks due to impurity E and alfentanil.

*Calculation of percentage contents*:

- for each impurity, use the concentration of alfentanil hydrochloride hydrate in reference solution (c).

*Limits*:

- *impurity D*: maximum 0.2 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.4 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): 3.0 per cent to 4.0 per cent, determined on 0.500 g.

ASSAY

Dissolve 0.350 g in 50 mL of a mixture of 1 volume of *ethanol (96 per cent) R* and 4 volumes of *water R* and add 5.0 mL of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 45.30 mg of $C_{21}H_{33}ClN_6O_3$.

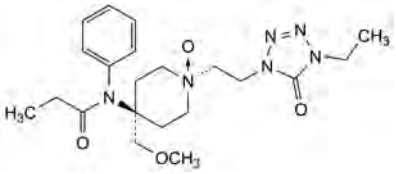
STORAGE

Protected from light.

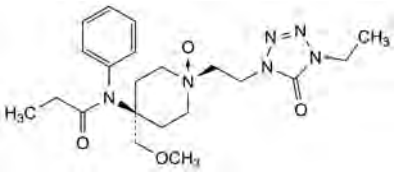
IMPURITIES

*Specified impurities: D.*

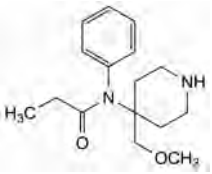
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, E, F, G, H.*



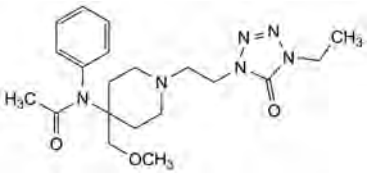
A. (1*s*,4*s*)-1-[2-(4-ethyl-5-oxo-4,5-dihydro-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)-4-(*N*-phenylpropanamido)piperidine 1-oxide,



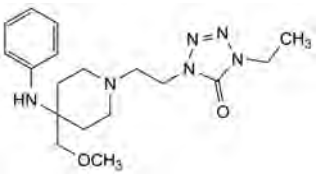
B. (1*r*,4*r*)-1-[2-(4-ethyl-5-oxo-4,5-dihydro-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)-4-(*N*-phenylpropanamido)piperidine 1-oxide,



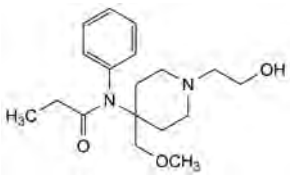
C. *N*-[4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide,



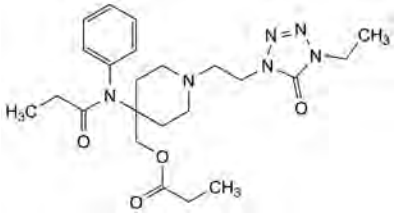
D. *N*-[1-[2-(4-ethyl-5-oxo-4,5-dihydro-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-*N*-phenylacetamide,



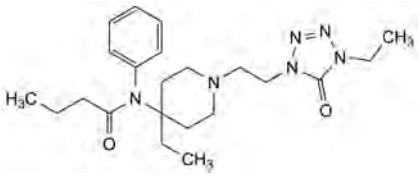
E. 1-ethyl-4-[2-[4-(methoxymethyl)-4-(phenylamino)piperidin-1-yl]ethyl]-1,4-dihydro-5*H*-tetrazol-5-one,



F. *N*-[1-(2-hydroxyethyl)-4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide,



G. *N*-[1-[2-(4-ethyl-5-oxo-4,5-dihydro-1*H*-tetrazol-1-yl)ethyl]-4-[(propanoyloxy)methyl]piperidin-4-yl]-*N*-phenylpropanamide,

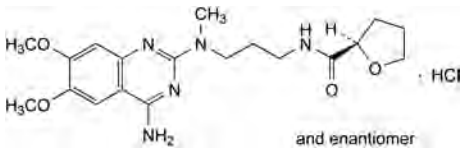


H. *N*-[1-[2-(4-ethyl-5-oxo-4,5-dihydro-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-*N*-phenylbutanamide.

**04/2017:1287**

# ALFUZOSIN HYDROCHLORIDE

## Alfuzosini hydrochloridum



$C_{19}H_{28}ClN_5O_4$ $M_r$ 425.9

[81403-68-1]

DEFINITION

(2*RS*)-*N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)methylamino]propyl]oxolan-2-carboxamide hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder, slightly hygroscopic.

*Solubility*: freely soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *alfuzosin hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**pH** (*2.2.3*): 4.0 to 5.5.

Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent. Use a freshly prepared solution.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 40 mg of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 4 mg of *alfuzosin for system suitability A CRS* (containing impurities B, F and G) in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 4 mg of *alfuzosin for peak identification CRS* (containing impurity D) in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C; if necessary, increase the temperature slightly to achieve the required resolution between the peaks due to impurity G and alfuzosin.

*Mobile phase*: mix 1 volume of *tetrahydrofuran R*, 20 volumes of *acetonitrile R* and 80 volumes of a solution prepared as follows: dilute 5.0 mL of *perchloric acid R* in 900 mL of *water for chromatography R*, adjust to pH 3.5 with *dilute sodium hydroxide solution R* and dilute to 1000 mL with *water for chromatography R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of alfuzosin.

*Identification of impurities*: use the chromatogram supplied with *alfuzosin for system suitability A CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities B, F and G; use the chromatogram supplied with *alfuzosin for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity D.

*Relative retention* with reference to alfuzosin (retention time = about 9 min): impurity D = about 0.4; impurity B = about 0.57; impurity F = about 0.63; impurity G = about 0.9.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurities B and F; minimum 1.5 between the peaks due to impurity G and alfuzosin.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity F by 0.6;
- *impurity D*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurity F*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.12*) : maximum 0.5 per cent, determined on 1.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 40 mL of *anhydrous acetic acid R* and 40 mL of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 42.59 mg of $C_{19}H_{28}ClN_5O_4$.

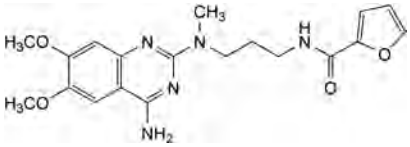
STORAGE

In an airtight container, protected from light.

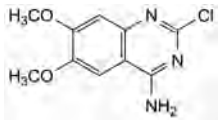
IMPURITIES

*Specified impurities: D, F.*

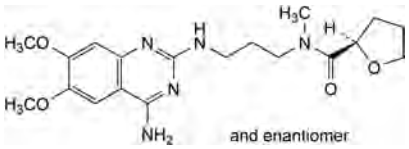
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, E, G.*



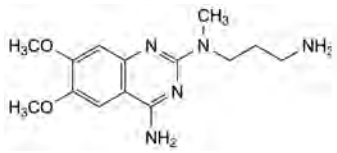
A. *N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)methylamino]propyl]furan-2-carboxamide,



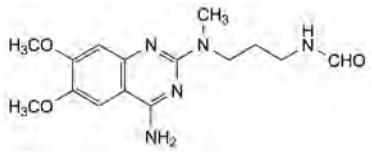
B. 2-chloro-6,7-dimethoxyquinazolin-4-amine,



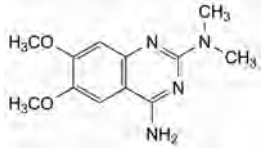
C. (2*RS*)-*N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)amino]propyl]-*N*-methyloxolan-2-carboxamide,



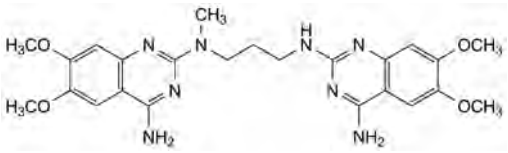
D. $N^2$-(3-aminopropyl)-6,7-dimethoxy-$N^2$-methylquinazolin-2,4-diamine,



E. *N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)methylamino]propyl]formamide,



F. 6,7-dimethoxy-$N^2$,$N^2$-dimethylquinazoline-2,4-diamine,



G. $N^2$-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)amino]propyl]-6,7-dimethoxy-$N^2$-methylquinazoline-2,4-diamine.

**01/2017:0591**

# ALGINIC ACID

## Acidum alginicum

DEFINITION

Mixture of polyuronic acids $[(C_6H_8O_6)_n]$ composed of residues of D-mannuronic and L-guluronic acids, obtained mainly from algae belonging to the Phaeophyceae. A small proportion of the carboxyl groups may be neutralised.

*Content*: 19.0 per cent to 25.0 per cent of carboxyl groups ($-CO_2H$) (dried substance).

CHARACTERS

*Appearance*: white or pale yellowish-brown, crystalline or amorphous powder.

*Solubility*: very slightly soluble or practically insoluble in ethanol (96 per cent), practically insoluble in organic solvents. It swells in water but does not dissolve; it dissolves in solutions of alkali hydroxides.

IDENTIFICATION

A. To 0.2 g add 20 mL of *water R* and 0.5 mL of *sodium carbonate solution R*. Shake and filter. To 5 mL of the filtrate add 1 mL of *calcium chloride solution R*. A voluminous gelatinous mass is formed.

B. To 5 mL of the filtrate obtained in identification test A add 0.5 mL of a 123 g/L solution of *magnesium sulfate R*. No voluminous gelatinous mass is formed.

C. To 5 mg add 5 mL of *water R*, 1 mL of a freshly prepared 10 g/L solution of *1,3-dihydroxynaphthalene R* in *ethanol (96 per cent) R* and 5 mL of *hydrochloric acid R*. Boil gently for 3 min, cool, add 5 mL of *water R*, and shake with 15 mL of *di-isopropyl ether R*. Carry out a blank test. The upper layer obtained with the substance to be examined exhibits a deeper bluish-red colour than that obtained with the blank.

TESTS

**Chlorides**: maximum 1.0 per cent.

To 2.50 g add 50 mL of *dilute nitric acid R*, shake for 1 h and dilute to 100.0 mL with *dilute nitric acid R*. Filter. To 50.0 mL of the filtrate add 10.0 mL of *0.1 M silver nitrate* and 5 mL of *toluene R*. Titrate with *0.1 M ammonium thiocyanate*, using 2 mL of *ferric ammonium sulfate solution R2* as indicator and shaking vigorously towards the end-point.

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

**Loss on drying** (*2.2.32*): maximum 15.0 per cent, determined on 0.1000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 8.0 per cent (dried substance), determined on 0.100 g.

**Microbial contamination**

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

ASSAY

To 0.2500 g add 25 mL of *water R*, 25.0 mL of *0.1 M sodium hydroxide* and 0.2 mL of *phenolphthalein solution R*. Titrate with *0.1 M hydrochloric acid*.

1 mL of *0.1 M sodium hydroxide* is equivalent to 4.502 mg of carboxyl groups (-$CO_2H$).

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for alginic acid used as disintegrant and/or binder.*

**Particle-size distribution** (*2.9.31* or *2.9.38*).

**Settling volume**. Place 75 mL of *water R* in a 100 mL graduated cylinder and add 1.5 g of the substance to be examined in 0.5 g portions, shaking vigorously after each addition. Dilute to 100.0 mL with *water R* and shake again until the substance is homogeneously distributed. Allow to stand for 4 h and determine the volume of the settled mass.

*The following characteristic may be relevant for alginic acid used as gelling agent or viscosity-increasing agent.*

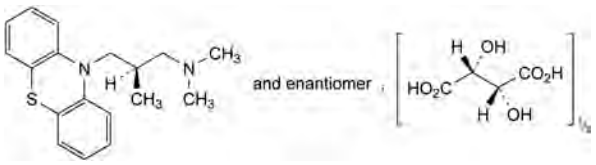
**Apparent viscosity**. Determine the dynamic viscosity using a rotating viscometer (*2.2.10*).

Prepare a 20 g/L suspension of alginic acid (dried substance) and add *0.1 M sodium hydroxide* until a solution is obtained.

**01/2014:2650**
**corrected 10.0**

# ALIMEMAZINE HEMITARTRATE

## Alimemazini hemitartras



$C_{20}H_{25}N_2O_3S$ $M_r$ 373.5
[4330-99-8]

DEFINITION

(*2RS*)-*N*,*N*,2-Trimethyl-3-(10*H*-phenothiazin-10-yl)propan-1-amine hemi[(2*R*,3*R*)-2,3-dihydroxybutanedioate].

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or very slightly yellowish powder.

*Solubility*: freely soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in toluene.

It deteriorates when exposed to air and light.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *alimemazine hemitartrate CRS*.

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ (*2.2.2, Method II*).

Dissolve 1.0 g in *water R* and dilute to 10 mL with the same solvent.

**pH** (*2.2.3*): 5.0 to 6.5. *Carry out the test protected from light and use a freshly prepared solution.*

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and use freshly prepared solutions.*

*Solvent mixture*: *acetonitrile R*, *water R* (20:80 *V/V*).

*Test solution*. Dissolve 35 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve 3.5 mg of *alimemazine for system suitability CRS* (containing impurities A, B and C) in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 40 °C.

*Mobile phase*: *acetonitrile R*, *methanol R*, 3.854 g/L solution of *ammonium acetate R* (10:40:50 *V/V/V*).

*Flow rate*: 1.3 mL/min.

*Detection*: spectrophotometer at 253 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of alimemazine.

*Identification of impurities*: use the chromatogram supplied with *alimemazine for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B and C.

*Relative retention* with reference to alimemazine (retention time = about 27 min): impurity A = about 0.1; impurity B = about 0.5; impurity C = about 1.4.

*System suitability*: reference solution (b):

- *resolution*: minimum 5.0 between the peaks due to alimemazine and impurity C.

*Calculation of percentage contents*:

- *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 4.4; impurity C = 0.4;
- for each impurity, use the concentration of alimemazine hemitartrate in reference solution (a).

*Limits*:

- *impurity B*: maximum 0.3 per cent;
- *impurities A, C*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

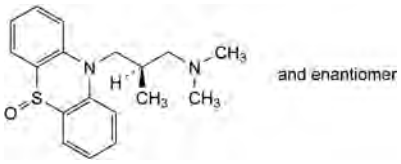
1 mL of *0.1 M perchloric acid* is equivalent to 37.35 mg of $C_{20}H_{25}N_2O_3S$.

STORAGE

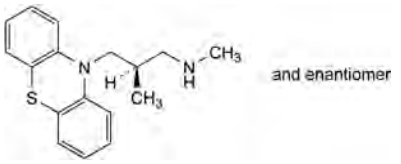
In an airtight container, protected from light.

IMPURITIES

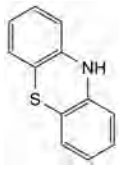
*Specified impurities: A, B, C.*



A. (2*RS*)-*N*,*N*,2-trimethyl-3-(5-oxido-10*H*-phenothiazin-10-yl)propan-1-amine,



B. (2*RS*)-*N*,2-dimethyl-3-(10*H*-phenothiazin-10-yl)propan-1-amine,

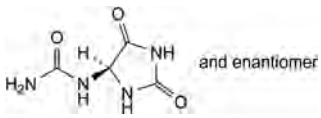


C. 10*H*-phenothiazine.

**01/2008:1288**
**corrected 6.0**

# ALLANTOIN

## Allantoinum



$C_4H_6N_4O_3$ $M_r$ 158.1
[97-59-6]

DEFINITION

Allantoin contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-(2,5-dioxoimidazolidin-4-yl)urea.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, very slightly soluble in alcohol.

It melts at about 225 °C, with decomposition.

IDENTIFICATION

*First identification: A.*

*Second identification: B, C, D.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *allantoin CRS*.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Boil 20 mg with a mixture of 1 mL of *dilute sodium hydroxide solution R* and 1 mL of *water R*. Allow to cool. Add 1 mL of *dilute hydrochloric acid R*. To 0.1 mL of the solution add 0.1 mL of a 100 g/L solution of *potassium bromide R*, 0.1 mL of a 20 g/L solution of *resorcinol R* and 3 mL of *sulfuric acid R*. Heat for 5 min to 10 min on a water-bath. A dark blue colour develops, which becomes red after cooling and pouring into about 10 mL of *water R*.

D. Heat about 0.5 g. Ammonia vapour is evolved, which turns *red litmus paper R* blue.

TESTS

**Solution S**. Dissolve 0.5 g in *carbon dioxide-free water R*, with heating if necessary, and dilute to 100 mL with the same solvent.

**Acidity or alkalinity**. To 5 mL of solution S add 5 mL of *carbon dioxide-free water R*, 0.1 mL of *methyl red solution R* and 0.2 mL of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.4 mL of *0.01 M hydrochloric acid*. The solution is red.

**Optical rotation** (*2.2.7*). The angle of optical rotation, determined on solution S, is − 0.10° to + 0.10°.

**Reducing substances**. Shake 1.0 g with 10 mL of *water R* for 2 min. Filter. Add 1.5 mL of *0.02 M potassium permanganate*. The solution must remain violet for at least 10 min.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using a suitable *cellulose for chromatography R* as the coating substance.

*Test solution (a).* Dissolve 0.10 g of the substance to be examined in 5.0 mL of *water R* with heating. Allow to cool. Dilute to 10 mL with *methanol R*. *Use the solution immediately after preparation.*

*Test solution (b).* Dilute 1 mL of test solution (a) to 10 mL with a mixture of 1 volume of *methanol R* and 1 volume of *water R*.

*Reference solution (a).* Dissolve 10 mg of *allantoin CRS* in a mixture of 1 volume of *methanol R* and 1 volume of *water R* and dilute to 10 mL with the same mixture of solvents.

*Reference solution (b).* Dissolve 10 mg of *urea R* in 10 mL of *water R*. Dilute 1 mL of this solution to 10 mL with *methanol R*.

*Reference solution (c).* Mix 1 mL of reference solution (a) and 1 mL of reference solution (b).

Apply to the plate 10 µL of test solution (a) and 5 µL each of test solution (b), reference solution (a), reference solution (b) and reference solution (c). Develop over a path of 10 cm using a mixture of 15 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air. Spray the plate with a 5 g/L solution of *dimethylaminobenzaldehyde R* in a mixture of 1 volume of *hydrochloric acid R* and 3 volumes of *methanol R*. Dry the plate in a current of hot air. Examine in daylight after 30 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

**Loss on drying** (*2.2.32*). Not more than 0.1 per cent, determined on 1.000 g by drying in an oven at 105 °C.

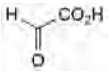
**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

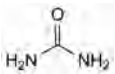
Dissolve 120.0 mg in 40 mL of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 15.81 mg of $C_4H_6N_4O_3$.

IMPURITIES



A. glyoxylic acid,

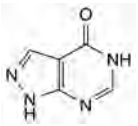


B. carbamide (urea).

**01/2017:0576**

# ALLOPURINOL

## Allopurinolum



$C_5H_4N_4O$ $M_r$ 136.1
[315-30-0]

DEFINITION

1,5-Dihydro-4*H*-pyrazolo[3,4-*d*]pyrimidin-4-one.

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water and in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification*: B.

*Second identification*: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 10 mg in 1 mL of a 4 g/L solution of *sodium hydroxide R* and dilute to 100.0 mL with a 10.3 g/L solution of *hydrochloric acid R*. Dilute 10.0 mL of this solution to 100.0 mL with a 10.3 g/L solution of *hydrochloric acid R*.

*Spectral range*: 220-350 nm.

*Absorption maximum*: at 250 nm.

*Absorption minimum*: at 231 nm.

*Absorbance ratio*: $A_{231}/A_{250}$ = 0.52 to 0.62.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *allopurinol CRS*.

C. Dissolve 0.3 g in 2.5 mL of *dilute sodium hydroxide solution R* and add 50 mL of *water R*. Add slowly and with shaking 5 mL of *silver nitrate solution R1*. A white precipitate is formed which does not dissolve on the addition of 5 mL of *ammonia R*.

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 20 mg of the substance to be examined in *concentrated ammonia R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 20 mg of *allopurinol CRS* in *concentrated ammonia R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *anhydrous ethanol R*, *methylene chloride R* (40:60 *V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions. Store and inject them at 8 °C, using a cooled autosampler.*

*Test solution (a).* Dissolve 25.0 mg of the substance to be examined in 2.5 mL of a 4 g/L solution of *sodium hydroxide R* and dilute immediately to 50.0 mL with the mobile phase.

*Test solution (b).* Dissolve 20.0 mg of the substance to be examined in 5.0 mL of a 4 g/L solution of *sodium hydroxide R* and dilute immediately to 250.0 mL with the mobile phase.

*Reference solution (a).* Dilute 2.0 mL of test solution (a) to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 5 mg of *allopurinol impurity A CRS*, 5 mg of *allopurinol impurity B CRS* and 5.0 mg of *allopurinol impurity C CRS* in 5.0 mL of a 4 g/L solution of *sodium hydroxide R* and dilute immediately to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 20.0 mg of *allopurinol CRS* in 5.0 mL of a 4 g/L solution of *sodium hydroxide R* and dilute immediately to 250.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: 1.25 g/L solution of *potassium dihydrogen phosphate R*.

*Flow rate*: 1.4 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (b).

*Run time*: twice the retention time of allopurinol.

*Elution order*: impurity A, impurity B, impurity C, allopurinol.

*Retention time*: allopurinol = about 10 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.1 between the peaks due to impurities B and C.

*Limits*:

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *sum of impurities other than A, B and C*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Impurities D and E**. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions. Store and inject them at 8 °C, using a cooled autosampler.*

*Solution A*: 1.25 g/L solution of *potassium dihydrogen phosphate R*.

*Test solution.* Dissolve 50.0 mg of the substance to be examined in 5.0 mL of a 4 g/L solution of *sodium hydroxide R* and dilute immediately to 100.0 mL with solution A.

*Reference solution.* Dissolve 5.0 mg of *allopurinol impurity D CRS* and 5.0 mg of *allopurinol impurity E CRS* in 5.0 mL of a 4 g/L solution of *sodium hydroxide R* and dilute immediately to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Column*:
– *size*: *l* = 0.05 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: *methanol R*, 1.25 g/L solution of *potassium dihydrogen phosphate R* (10:90 *V/V*).

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL.

*Run time*: 1.5 times the retention time of impurity E.

*Retention times*: impurity D = about 3.6 min; impurity E = about 4.5 min.

*System suitability*: reference solution:
– *resolution*: minimum 2.0 between the peaks due to impurities D and E.

*Limits*:
– *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent);
– *impurity E*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

**Impurity F**. Liquid chromatography (*2.2.29*).

Under the following conditions, any hydrazine in the sample reacts with benzaldehyde to give benzaldehyde azine.

*Solvent mixture.* Mix equal volumes of *dilute sodium hydroxide solution R* and *methanol R*.

*Solution A*. Dissolve 2.0 g of *benzaldehyde R* in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Prepare immediately before use.

*Test solution.* Dissolve 250.0 mg of the substance to be examined in 5 mL of the solvent mixture. Add 4 mL of solution A, mix and allow to stand for 2.5 h at room temperature. Add 5.0 mL of *hexane R* and shake for 1 min. Allow the layers to separate and use the upper layer.

*Reference solution.* Dissolve 10.0 mg of *hydrazine sulfate R* in the solvent mixture by sonicating for about 2 min and dilute to 50.0 mL with the solvent mixture. Dilute 1.0 mL to 20.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 20.0 mL with the solvent mixture. To 5.0 mL of the solution obtained, add 4 mL of solution A, mix and allow to stand for 2.5 h at room temperature. Add 5.0 mL of *hexane R* and shake for 1 min. Allow the layers to separate and use the upper layer.

*Blank solution.* To 5 mL of the solvent mixture add 4 mL of solution A, mix and allow to stand for 2.5 h at room temperature. Add 5.0 mL of *hexane R* and shake for 1 min. Allow the layers to separate and use the upper layer.

*Column*:
– *size*: *l* = 0.25 m, Ø = 4.0 mm;
– *stationary phase*: *cyanosilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm;
– *temperature*: 30 °C.

*Mobile phase*: *2-propanol R*, *hexane R* (5:95 *V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 310 nm.

*Injection*: 20 µL.

*Relative retention* with reference to benzaldehyde (retention time = about 2.8 min): benzaldehyde azine = about 0.8.

*System suitability*: reference solution:
– *resolution*: minimum 2 between the peaks due to benzaldehyde azine and benzaldehyde;
– *signal-to-noise ratio*: minimum 20 for the peak due to benzaldehyde azine.

*Limit*:
– *impurity F*: the area of the peak due to benzaldehyde azine in the chromatogram obtained with the test solution is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm of hydrazine sulfate equivalent to 2.5 ppm of hydrazine).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

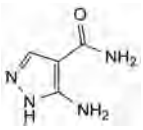
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (b) and reference solution (c).

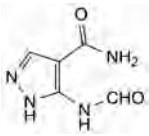
Calculate the percentage content of $C_5H_4N_4O$ from the declared content of *allopurinol CRS*.

IMPURITIES

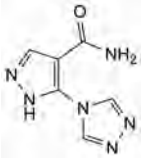
*Specified impurities: A, B, C, D, E, F.*



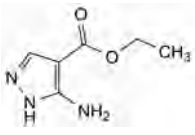
A. 5-amino-1*H*-pyrazole-4-carboxamide,



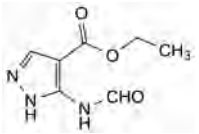
B. 5-(formylamino)-1*H*-pyrazole-4-carboxamide,



C. 5-(4*H*-1,2,4-triazol-4-yl)-1*H*-pyrazole-4-carboxamide,



D. ethyl 5-amino-1*H*-pyrazole-4-carboxylate,



E. ethyl 5-(formylamino)-1*H*-pyrazole-4-carboxylate,

F. diazane (hydrazine).

**corrected 10.0**

# ALMAGATE

## Almagatum

$Al_2Mg_6C_2O_{20}H_{14},4H_2O$ $M_r$ 630
[66827-12-1]

DEFINITION

Hydrated aluminium magnesium hydroxycarbonate.

*Content*:

- aluminium: 15.0 per cent to 17.0 per cent (calculated as $Al_2O_3$),
- magnesium: 36.0 per cent to 40.0 per cent (calculated as MgO),
- carbonic acid: 12.5 per cent to 14.5 per cent (calculated as $CO_2$).

CHARACTERS

*Appearance*: white or almost white, fine, crystalline powder.

*Solubility*: practically insoluble in water, in ethanol (96 per cent) and in methylene chloride. It dissolves with effervescence and heating in dilute mineral acids.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *Ph. Eur. reference spectrum of almagate*.

B. Dissolve 0.15 g in *dilute hydrochloric acid R* and dilute to 20 mL with the same acid. 2 mL of the solution gives the reaction of aluminium (*2.3.1*).

C. 2 mL of the solution prepared under identification test B gives the reaction of magnesium (*2.3.1*).

TESTS

**pH** (*2.2.3*): 9.1 to 9.7.

Disperse 4.0 g in 100 mL of *carbon dioxide-free water R*, stir for 2 min and filter.

**Neutralising capacity**. *Carry out the test at 37 °C*. Disperse 0.5 g in 100 mL of *water R*, heat, add 100.0 mL of *0.1 M hydrochloric acid*, previously heated and stir continuously; the pH (*2.2.3*) of the solution between 5 min and 20 min is not less than 3.0 and not greater than 4.5. Add 10.0 mL of *0.5 M hydrochloric acid*, previously heated, stir continuously for 1 h and titrate with *0.1 M sodium hydroxide* to pH 3.5; not more than 20.0 mL of *0.1 M sodium hydroxide* is required.

**Chlorides** (*2.4.4*): maximum 0.1 per cent.

Dissolve 0.33 g in 5 mL of *dilute nitric acid R* and dilute to 100 mL with *water R*. Prepare simultaneously the standard by diluting 0.7 mL of *dilute nitric acid R* to 5 mL with *water R* and adding 10 mL of *chloride standard solution (5 ppm Cl) R*.

**Sulfates** (*2.4.13*): maximum 0.4 per cent.

Dissolve 0.25 g in 5 mL of *dilute hydrochloric acid R* and dilute to 100 mL with *distilled water R*. Prepare simultaneously the standard by adding 0.8 mL of *dilute hydrochloric acid R* to 15 mL of *sulfate standard solution (10 ppm $SO_4$) R*.

**Sodium**: maximum 150 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. Dissolve 0.25 g in 50 mL of a 103 g/L solution of *hydrochloric acid R*.

*Reference solutions*. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with a 103 g/L solution of *hydrochloric acid R*.

**Loss on ignition**: 43.0 per cent to 49.0 per cent, determined on 1.000 g by ignition at 900 ± 50 °C.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Pseudomonas aeruginosa* (*2.6.13*).

ASSAY

**Aluminium**. Dissolve 1.000 g in 5 mL of *hydrochloric acid R*, heating if necessary. Allow to cool to room temperature and dilute to 100.0 mL with *water R* (solution A). Introduce 10.0 mL of solution A into a 250 mL conical flask, add 25.0 mL of *0.05 M sodium edetate*, 20 mL of *buffer solution pH 3.5 R*, 40 mL of *anhydrous ethanol R* and 2 mL of a freshly prepared 0.25 g/L solution of *dithizone R* in *anhydrous ethanol R*. Titrate the excess of sodium edetate with *0.05 M zinc sulfate* until the colour changes from greenish-violet to pink.

1 mL of *0.05 M sodium edetate* is equivalent to 2.549 mg of $Al_2O_3$.

**Magnesium**. Introduce 10.0 mL of solution A prepared in the assay of aluminium into a 500 mL conical flask, add 200 mL of *water R*, 20 mL of *triethanolamine R* with shaking, 10 mL of *ammonium chloride buffer solution pH 10.0 R* and 50 mg of *mordant black 11 triturate R*. Titrate with *0.05 M sodium edetate* until the colour changes from violet to pure blue.

1 mL of *0.05 M sodium edetate* is equivalent to 2.015 mg of MgO.

**Carbonic acid**: 12.5 per cent to 14.5 per cent.

*Test sample*. Place 7.00 mg of the substance to be examined in a tin capsule. Seal the capsule.

*Reference sample*. Place 7.00 mg of *almagate CRS* in a tin capsule. Seal the capsule.

Introduce separately the test sample and the reference sample into a combustion chamber of a CHN analyser purged with *helium for chromatography R* and maintained at a temperature of 1020 °C. Simultaneously, introduce *oxygen R* at a pressure of 40 kPa and a flow rate of 20 mL/min and allow complete combustion of the sample. Sweep the combustion gases through a reduction reactor and separate the gases formed by gas chromatography (*2.2.28*).

*Column*:

- *size*: *l* = 2 m, Ø = 4 mm;
- *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R*.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 100 mL/min.

*Temperature*:

- *column*: 65 °C;
- *detector*: 190 °C.

*Detection*: thermal conductivity.

*Run time*: 16 min.

*System suitability*:

– average percentage of carbon in 5 reference samples must be within ± 0.2 per cent of the value assigned to the CRS; the difference between the upper and the lower values of the percentage of carbon in these samples must be below 0.2 per cent.

Calculate the percentage content of carbonic acid in the test sample according to the following formula:

$$C \times K \times \frac{A}{m}$$

$C$ = percentage content of carbonic acid in the reference sample;

$K$ = mean value for the 5 reference samples of the ratio of the mass in milligrams to the area of the peak due to carbonic acid;

$A$ = area of the peak due to carbonic acid in the chromatogram obtained with the test sample;

$m$ = sample mass, in milligrams.

STORAGE

In an airtight container.

**01/2010:1064**

# ALMOND OIL, REFINED

## Amygdalae oleum raffinatum

DEFINITION

Fatty oil obtained from the ripe seeds of *Prunus dulcis* (Mill.) D.A. Webb var. *dulcis* or *Prunus dulcis* (Mill.) D.A. Webb var. *amara* (DC.) Buchheim or a mixture of both varieties by cold expression. It is then refined. A suitable antioxidant may be added.

CHARACTERS

*Appearance*: pale yellow, clear liquid.

*Solubility*: slightly soluble in ethanol (96 per cent), miscible with light petroleum.

*Relative density*: about 0.916.

It solidifies at about − 18 °C.

IDENTIFICATION

A. Identification of fatty oils by thin-layer chromatography (*2.3.2*).

*Results*: the chromatogram obtained is similar to the corresponding chromatogram shown in Figure 2.3.2.-1.

B. Composition of fatty acids (see Tests).

TESTS

**Specific absorbance** (*2.2.25*): 0.2 to 6.0, determined at the absorption maximum at 270 nm.

To 0.100 g add *cyclohexane R* and dilute to 10.0 mL with the same solvent. Adapt the concentration of the solution so that the absorbance lies between 0.5 and 1.5, measured in a 1 cm cell.

**Acid value** (*2.5.1*): maximum 0.5, determined on 5.0 g.

**Peroxide value** (*2.5.5, Method A*): maximum 5.0.

**Unsaponifiable matter** (*2.5.7*): maximum 0.9 per cent, determined on 5.0 g.

**Composition of fatty acids** (*2.4.22, Method A*). Use the mixture of calibrating substances in Table 2.4.22.-3.

*Composition of the fatty-acid fraction of the oil*:

– *saturated fatty acids of chain length less than $C_{16}$*: maximum 0.1 per cent;
– *palmitic acid*: 4.0 per cent to 9.0 per cent;
– *palmitoleic acid*: maximum 0.8 per cent;
– *margaric acid*: maximum 0.2 per cent;
– *stearic acid*: maximum 3.0 per cent;
– *oleic acid*: 62.0 per cent to 86.0 per cent;
– *linoleic acid*: 20.0 per cent to 30.0 per cent;
– *linolenic acid*: maximum 0.4 per cent;
– *arachidic acid*: maximum 0.2 per cent;
– *eicosenoic acid*: maximum 0.3 per cent;
– *behenic acid*: maximum 0.2 per cent;
– *erucic acid*: maximum 0.1 per cent.

**Sterols** (*2.4.23*).

*Composition of the sterol fraction of the oil*:

– *cholesterol*: maximum 0.7 per cent;
– *campesterol*: maximum 5.0 per cent;
– *stigmasterol*: maximum 4.0 per cent;
– *β-sitosterol*: 73.0 per cent to 87.0 per cent;
– *Δ5-avenasterol*: minimum 5.0 per cent;
– *Δ7-stigmastenol*: maximum 3.0 per cent;
– *Δ7-avenasterol*: maximum 3.0 per cent;
– *brassicasterol*: maximum 0.3 per cent.

**Water** (*2.5.32*): maximum 0.1 per cent, determined on 1.00 g.

STORAGE

In a well-filled container, protected from light.

**01/2015:0261**

# ALMOND OIL, VIRGIN

## Amygdalae oleum virginale

DEFINITION

Fatty oil obtained by cold expression from the ripe seeds of *Prunus dulcis* (Mill.) D.A.Webb var. *dulcis* or *Prunus dulcis* (Mill.) D.A.Webb var. *amara* (DC.) Buchheim or a mixture of both varieties.

CHARACTERS

*Appearance*: yellow, clear liquid.

*Solubility*: slightly soluble in ethanol (96 per cent), miscible with light petroleum.

*Relative density*: about 0.916.

It solidifies at about − 18 °C.

IDENTIFICATION

*First identification: A, C.*

*Second identification: A, B.*

A. Absorbance (see Tests).

B. Identification of fatty oils by thin-layer chromatography (*2.3.2*).

*Results*: the chromatogram obtained is similar to the corresponding chromatogram shown in Figure 2.3.2.-1.

C. Composition of fatty acids (see Tests).

TESTS

**Specific absorbance** (*2.2.25*): maximum 0.2, determined at the absorption maximum at 270 nm. The ratio of the absorbance measured at 232 nm to that measured at 270 nm is greater than 7.

To 0.100 g add *cyclohexane R* and dilute to 10.0 mL with the same solvent. Adapt the concentration of the solution so that the absorbance lies between 0.5 and 1.5, measured in a 1 cm cell.

**Acid value** (*2.5.1*): maximum 2.0, determined on 5.0 g.

**Peroxide value** (*2.5.5, Method A*): maximum 15.0.

**Unsaponifiable matter** (*2.5.7*): maximum 0.9 per cent, determined on 5.0 g.

**Composition of fatty acids**. (*2.4.22, Method A*). Use the mixture of calibrating substances in Table 2.4.22.-3.

*Composition of the fatty-acid fraction of the oil*:

- *saturated fatty acids of chain length less than $C_{16}$*: maximum 0.1 per cent,
- *palmitic acid*: 4.0 per cent to 9.0 per cent,
- *palmitoleic acid*: maximum 0.8 per cent,
- *margaric acid*: maximum 0.2 per cent,
- *stearic acid*: maximum 3.0 per cent,
- *oleic acid*: 62.0 per cent to 86.0 per cent,
- *linoleic acid*: 20.0 per cent to 30.0 per cent,
- *linolenic acid*: maximum 0.4 per cent,
- *arachidic acid*: maximum 0.2 per cent,
- *eicosenoic acid*: maximum 0.3 per cent,
- *behenic acid*: maximum 0.2 per cent,
- *erucic acid*: maximum 0.1 per cent.

**Sterols** (*2.4.23*).

*Composition of sterol fraction of the oil*:

- *cholesterol*: maximum 0.7 per cent,
- *campesterol*: maximum 4.0 per cent,
- *stigmasterol*: maximum 3.0 per cent,
- *β-sitosterol*: 73.0 per cent to 87.0 per cent,
- *Δ5-avenasterol*: minimum 10.0 per cent,
- *Δ7-stigmastenol*: maximum 3.0 per cent,
- *Δ7-avenasterol*: maximum 3.0 per cent,
- *brassicasterol*: maximum 0.3 per cent.

**Water** (*2.5.32*): maximum 0.1 per cent, determined on 1.00 g.

STORAGE

In a well-filled container, protected from light.

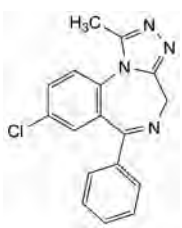
**corrected 10.0**

# ALPRAZOLAM

## Alprazolamum



$C_{17}H_{13}ClN_4$ $M_r$ 308.8
[28981-97-7]

DEFINITION

8-Chloro-1-methyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]-benzodiazepine.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone and in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Dissolve the substance to be examined in the smallest necessary quantity of *ethyl acetate R* and evaporate to dryness on a water-bath. Thoroughly mix 5.0 mg of the substance to be examined with 5.0 mg of *alprazolam CRS*. The melting point (*2.2.14*) of the mixture does not differ by more than 2 °C from the melting point of the substance to be examined.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *alprazolam CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethyl acetate R*, evaporate to dryness on a water-bath and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 10 mg of *alprazolam CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 10 mg of *alprazolam CRS* and 10 mg of *midazolam CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel $GF_{254}$ plate R*.

*Mobile phase*: *glacial acetic acid R*, *water R*, *methanol R*, *ethyl acetate R* (2:15:20:80 *V/V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 12 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

- the chromatogram shows 2 clearly separately spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Buffer solution.* Dissolve 7.7 g of *ammonium acetate R* in 1000 mL of *water for chromatography R* and adjust to pH 4.2 with *glacial acetic acid R*.

*Test solution.* Dissolve 0.100 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 2 mg of *alprazolam CRS* and 2 mg of *triazolam CRS* in *dimethylformamide R* and dilute to 100 mL with the same solvent.

*Reference solution (b).* Dilute 5.0 mL of the test solution to 100.0 mL with *dimethylformamide R*. Dilute 0.5 mL of this solution to 10.0 mL with *dimethylformamide R*.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped extra-dense bonded phenylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:
- *mobile phase A*: buffer solution, *methanol R* (44:56 *V/V*);
- *mobile phase B*: buffer solution, *methanol R* (5:95 *V/V*);
- *temperature*: 40 °C;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 98 | 2 |
| 15 - 35 | 98 → 1 | 2 → 99 |
| 35 - 40 | 1 | 99 |

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL; inject *dimethylformamide R* as a blank.

*Retention time*: triazolam = about 9 min; alprazolam = about 10 min.

*System suitability*: reference solution (a):
- *resolution*: minimum 1.5 between the peaks due to triazolam and alprazolam.

*Limits*:
- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

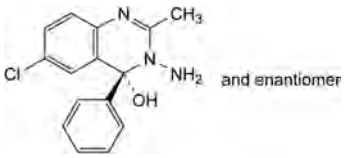
Dissolve 0.140 g in 50 mL of a mixture of 2 volumes of *acetic anhydride R* and 3 volumes of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Titrate to the 2nd point of inflexion.

1 mL of *0.1 M perchloric acid* is equivalent to 15.44 mg of $C_{17}H_{13}ClN_4$.

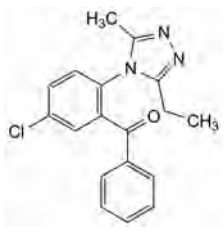
STORAGE

Protected from light.

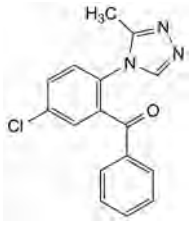
IMPURITIES



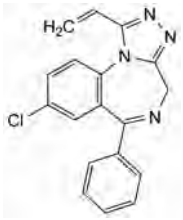
A. (4*RS*)-3-amino-6-chloro-2-methyl-4-phenyl-3,4-dihydroquinazolin-4-ol,



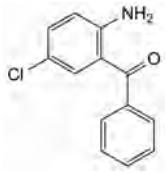
B. [5-chloro-2-[3-(hydroxymethyl)-5-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,



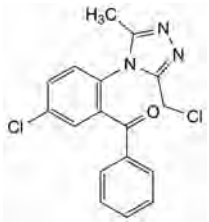
C. [5-chloro-2-[3-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,



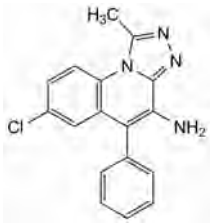
D. 8-chloro-1-ethenyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepine,



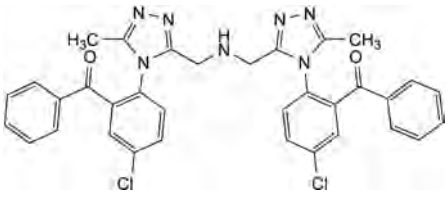
E. (2-amino-5-chlorophenyl)phenylmethanone,



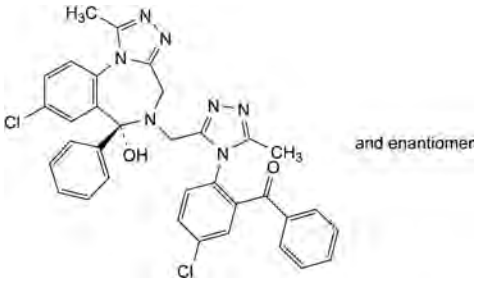
F. [5-chloro-2-[3-(chloromethyl)-5-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,



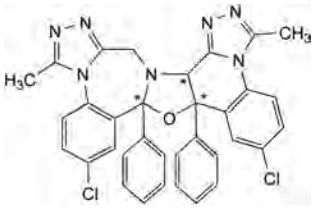
G. 7-chloro-1-methyl-5-phenyl[1,2,4]triazolo[4,3-*a*]quinolin-4-amine,



H. bis[[4-(2-benzoyl-4-chlorophenyl)-5-methyl-4*H*-1,2,4-triazol-3-yl]methyl]amine,



I. [5-chloro-2-[3-[[(6*RS*)-8-chloro-6-hydroxy-1-methyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepin-5(6*H*)-yl]methyl]-5-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,



J. 2,17-dichloro-6,13-dimethyl-18b,19a-diphenyl-8b,19a-dihydro-10*H*,18b*H*-[1,2,4]triazolo[4‴,3‴:1″,2″]-quinolo[3″,4″:4′,5′]oxazolo[3′,2′-*d*]-1,2,4-triazolo[4,3-*a*]-[1,4]benzodiazepine.

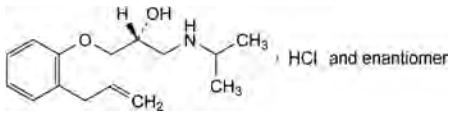
# ALPRENOLOL HYDROCHLORIDE

## Alprenololi hydrochloridum



$C_{15}H_{24}ClNO_2$ $M_r$ 285.8
[13707-88-5]

DEFINITION

(2*RS*)-1-[(1-Methylethyl)amino]-3-[2-(prop-2-enyl)phenoxy]-propan-2-ol hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: very soluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

*First identification*: *B, D.*

*Second identification*: *A, C, D.*

A. Melting point (*2.2.14*): 108 °C to 112 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *alprenolol hydrochloride CRS.*

C. Examine the chromatograms obtained in the test for impurity D.
*Detection*: examine in daylight, after exposure to iodine vapour for 30 min.
*Results*: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $B_9$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.2 mL of *methyl red solution R* and 0.2 mL of *0.01 M hydrochloric acid*; the solution is red. Add 0.4 mL of *0.01 M sodium hydroxide*; the solution is yellow.

**Impurity C**: maximum 0.1 per cent.

Dissolve 0.25 g in *ethanol (96 per cent) R* and dilute to 25 mL with the same solvent. The absorbance (*2.2.25*) measured at 297 nm is not greater than 0.20.

**Impurity D**. Thin-layer chromatography (*2.2.27*).

*Test solution (a).* Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Test solution (b).* Dilute 1 mL of test solution (a) to 50 mL with *methanol R.*

*Reference solution (a).* Dissolve 10 mg of *alprenolol hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 10 mg of *alprenolol hydrochloride CRS* and 10 mg of *oxprenolol hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (c).* Dilute 5 mL of test solution (b) to 50 mL with *methanol R.*

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: place 2 beakers each containing 30 mL of *ammonia R* at the bottom of the tank containing a mixture of 5 volumes of *methanol R* and 95 volumes of *ethyl acetate R.*

*Application*: 5 µL.

*Development*: over a path of 15 cm in a tank saturated for at least 1 h.

*Drying*: at 100 °C for 15 min.

*Detection*: expose to iodine vapour for up to 6 h.

*System suitability*: reference solution (b):
– the chromatogram shows 2 clearly separated spots.

*Limits*: test solution (a):
– *impurity D*: any spot with an $R_F$ value greater than that of the principal spot is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 4.0 mg of *alprenolol hydrochloride CRS* and 0.8 mg of *4-isopropylphenol R* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (b).* Dilute 4.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:
– *size*: *l* = 0.15 m, Ø = 4 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 0.656 g of *sodium octanesulfonate R* with 150 mL of *acetonitrile R* and dilute to 500 mL with phosphate buffer pH 2.8 prepared as follows: mix 1.78 g of *phosphoric acid R* and 15.6 g of *sodium dihydrogen phosphate R* and dilute to 2000 mL with *water R.*

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Equilibration*: with the mobile phase for about 1 h.

*Injection*: 20 µL.

*Run time*: twice the retention time of alprenolol.

*Retention time*: alprenolol = about 11 min; 4-isopropylphenol = about 18 min.

*System suitability*: reference solution (a):

– *resolution*: minimum 5 between the peaks due to alprenolol and 4-isopropylphenol; if necessary, adjust the concentration of sodium octanesulfonate and/or acetonitrile in the mobile phase (increase the concentration of sodium octanesulfonate to increase the retention time of alprenolol and increase the concentration of acetonitrile to decrease the retention times of both compounds).

*Limits*:

– *unspecified impurities*: for each impurity, not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.04 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 25 mL of a mixture of equal volumes of *anhydrous ethanol R* and *water R*. Add 10 mL of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 28.58 mg of $C_{15}H_{24}ClNO_2$.

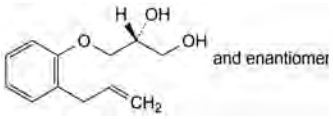
STORAGE

Protected from light.

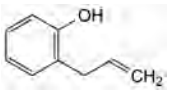
IMPURITIES

*Specified impurities: C, D.*

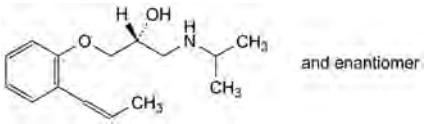
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B.*



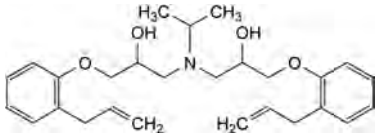
A. (2*RS*)-3-[2-(prop-2-enyl)phenoxy]propan-1,2-diol,



B. 2-(prop-2-enyl)phenol,



C. (2*RS*)-1-[(1-methylethyl)amino]-3-[2-(prop-1-enyl)phenoxy]propan-2-ol,

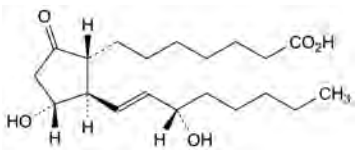


D. 1,1′-[(1-methylethyl)imino]bis[3-[2-(prop-2-enyl)phenoxy]propan-2-ol].

**04/2015:1488**

# ALPROSTADIL

## Alprostadilum



$C_{20}H_{34}O_5$ $M_r$ 354.5
[745-65-3]

DEFINITION

7-[(1*R*,2*R*,3*R*)-3-Hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid.

*Content*: 95.0 per cent to 102.5 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or slightly yellowish, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in ethanol (96 per cent), soluble in acetone, slightly soluble in ethyl acetate.

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): − 70 to − 60 (anhydrous substance).

Immediately before use, dissolve 50 mg in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *alprostadil CRS*.

C. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions protected from light.*

*Test solution.* Dissolve 10.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 10.0 mL with the same mixture of solvents.

*Reference solution (a).* Dilute 100 µL of the test solution to 20.0 mL with a mixture of equal volumes of *acetonitrile R1* and *water R*.

*Reference solution (b).* Dissolve 1.0 mg of *dinoprostone impurity C CRS* (alprostadil impurity H) and 1.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 20.0 mL with the same mixture of solvents.

*Reference solution (c).* In order to prepare impurities A and B *in situ*, dissolve 1 mg of the substance to be examined in 100 µL of *1 M sodium hydroxide* (the solution becomes brownish-red), wait for 3 min and add 100 µL of a 112 g/L solution of *phosphoric acid R* (yellowish-white opalescent solution); dilute to 5.0 mL with a mixture of equal volumes of *acetonitrile R1* and *water R*.

**System A**

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (4 µm) with a pore size of 6 nm;
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 3.9 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1.0 L with the same solvent; adjust to pH 2.5 with a 2.9 g/L solution of *phosphoric acid R* (approximately 600 mL is required); to 740 mL of the buffer solution add 260 mL of *acetonitrile R1*;
- *mobile phase B*: dissolve 3.9 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1.0 L with the same solvent; adjust to pH 2.5 with a 2.9 g/L solution of *phosphoric acid R* (approximately 600 mL is required); to 200 mL of the buffer solution add 800 mL of *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 75 | 100 | 0 |
| 75 - 76 | 100 → 0 | 0 → 100 |
| 76 - 86 | 0 | 100 |
| 86 - 87 | 0 → 100 | 100 → 0 |
| 87 - 102 | 100 | 0 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 200 nm.

*Injection*: 20 µL.

*Retention time*: alprostadil = about 63 min.

*System suitability*:

- *resolution*: minimum 1.5 between the peaks due to impurity H and alprostadil in the chromatogram obtained with reference solution (b).

**System B**

Use the same conditions as for system A with the following mobile phase and elution programme:

- *mobile phase A*: dissolve 3.9 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1.0 L with the same solvent; adjust to pH 2.5 with a 2.9 g/L solution of *phosphoric acid R* (approximately 600 mL is required); to 600 mL of the buffer solution add 400 mL of *acetonitrile R1*;
- *mobile phase B*: use mobile phase B as described under system A;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 50 | 100 | 0 |
| 50 - 51 | 100 → 0 | 0 → 100 |
| 51 - 61 | 0 | 100 |
| 61 - 62 | 0 → 100 | 100 → 0 |
| 62 - 72 | 100 | 0 |

*Relative retention* with reference to alprostadil (retention time = about 7 min): impurity A = about 2.4; impurity B = about 2.6.

*System suitability*:

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B in the chromatogram obtained with reference solution (c).

Carry out the test according to system A and B.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the impurities listed in Table 1488.-1 by the corresponding correction factor;

Table 1488.-1.

| Impurity | Relative retention (system A) | Relative retention (system B) | Correction factor |
|---|---|---|---|
| impurity G | 0.80 | - | 0.7 |
| impurity F | 0.88 | - | 0.8 |
| impurity D | 0.90 | - | 1.0 |
| impurity H | 0.96 | - | 0.7 |
| impurity E | 1.10 | - | 0.7 |
| impurity C | - | 1.36 | 1.9 |
| impurity K | - | 1.85 | 0.06 |
| impurity A | - | 2.32 | 0.7 |
| impurity B | - | 2.45 | 1.5 |
| impurity I | - | 4.00 | 1.0 |
| impurity J | - | 5.89 | 1.0 |

- *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent);
- *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *any other impurity*: not more than 1.8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.9 per cent), and not more than 1 such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Evaluate impurities appearing at relative retentions less than 1.2 by system A and impurities appearing at relative retentions greater than 1.2 by system B;
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.32*): maximum 0.5 per cent, determined on 50 mg.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances, system A. *Prepare the solutions protected from light.*

*Test solution.* Dissolve 10.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 25.0 mL with the same mixture of solvents. Dilute 3.0 mL of the solution to 20.0 mL with a mixture of equal volumes of *acetonitrile R1* and *water R*.

*Reference solution.* Dissolve 5.0 mg of *alprostadil CRS* in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 25.0 mL with the same mixture of solvents. Dilute 6.0 mL of the solution to 20.0 mL with a mixture of equal volumes of *acetonitrile R1* and *water R*.

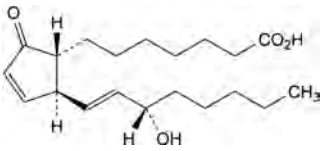
*Injection*: 20 µL.

Calculate the percentage content of $C_{20}H_{34}O_5$ taking into account the assigned content of *alprostadil CRS*.

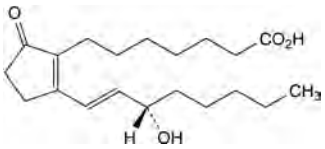
STORAGE

At a temperature of 2 °C to 8 °C.

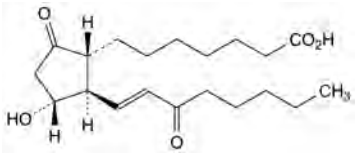
IMPURITIES



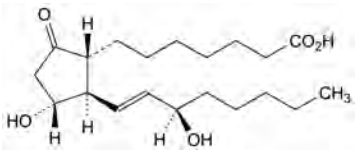
A. 7-[(1*R*,2*S*)-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopent-3-enyl]heptanoic acid (prostaglandin $A_1$),



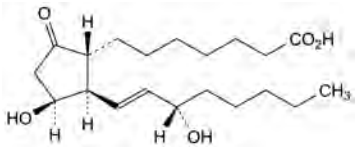
B. 7-[2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopent-1-enyl]heptanoic acid (prostaglandin $B_1$),



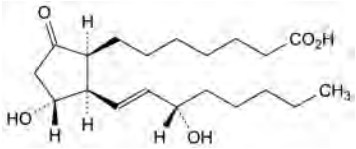
C. 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*)-3-oxooct-1-enyl]-5-oxocyclopentyl]heptanoic acid (15-oxoprostaglandin $E_1$),



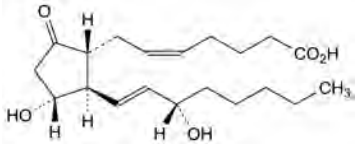
D. 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*R*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid (15-epiprostaglandin $E_1$),



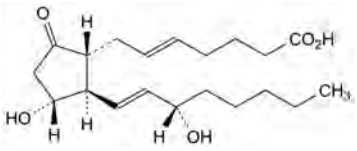
E. 7-[(1*R*,2*R*,3*S*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid (11-epiprostaglandin $E_1$),



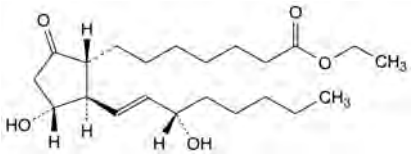
F. 7-[(1*S*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid (8-epiprostaglandin $E_1$),



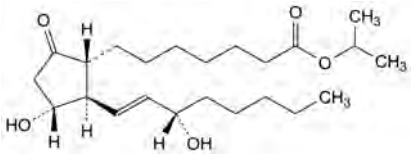
G. (5*Z*)-7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (dinoprostone),



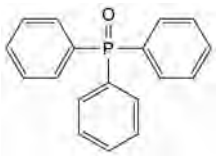
H. (5*E*)-7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxy-oct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid ((5*E*)-prostaglandin $E_2$),



I. ethyl 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoate (prostaglandin $E_1$, ethyl ester),



J. 1-methylethyl 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoate (prostaglandin $E_1$, isopropyl ester),



K. triphenylphosphine oxide.

**07/2013:1170**
**corrected 8.0**

# ALTEPLASE FOR INJECTION

## Alteplasum ad iniectabile

DEFINITION

Alteplase for injection is a sterile, freeze-dried preparation of alteplase, a tissue plasminogen activator produced by recombinant DNA technology. It has a potency of not less than 500 000 IU per milligram of protein.

Tissue plasminogen activator binds to fibrin clots and activates plasminogen, leading to the generation of plasmin and to the degradation of fibrin clots or blood coagulates.

Alteplase consists of 527 amino acids with a calculated relative molecular mass of 59 050 without consideration of the carbohydrate moieties attached at positions Asn 117, Asn 184 and Asn 448. The total relative molecular mass is approximately 65 000. Alteplase is cleaved by plasmin between amino-acids 275 and 276 into a two-chain form (A chain and B chain) that are connected by a disulfide bridge between Cys 264 and Cys 395. The single-chain form and the two-chain form show comparable fibrinolytic activity *in vitro*.

PRODUCTION

Alteplase is produced by recombinant DNA synthesis in cell culture; the fermentation takes place in serum-free medium.

The purification process is designed to remove efficiently potential impurities, such as antibiotics, DNA and protein contaminants derived both from the host cell and from the production medium, and potential viral contaminants.

If alteplase is stored in bulk form, stability (maintenance of potency) in the intended storage conditions must be demonstrated.

The production, purification and product consistency are checked by a number of analytical methods described below, carried out routinely as in-process controls.

**Protein content**. The protein concentration of alteplase solutions is determined by measuring the absorbance (*2.2.25*) of the protein solution at 280 nm and at 320 nm, using formulation buffer as the compensation liquid. If dilution of alteplase samples is necessary, the samples are diluted in formulation buffer. For the calculation of the alteplase concentration, the absorbance value ($A_{280} - A_{320}$) is divided by the specific absorption coefficient for alteplase of 1.9.

**Potency**. The potency of alteplase is determined in an *in vitro* clot-lysis assay as described under Assay. The specific activity of bulk alteplase is approximately 580 000 IU per milligram of alteplase.

***N*-terminal sequence**. *N*-terminal sequencing is applied to determine the correct *N*-terminal sequence and to determine semiquantitatively additional cleavage sites in the alteplase molecule, for example at position AA 275-276 or at position AA 27-28. The *N*-terminal sequence must conform with the sequence of human tissue plasminogen activator.

**Isoelectric focusing**. The consistency in the microheterogeneity of glycosylation of the alteplase molecule can be demonstrated by isoelectric focusing (IEF). A complex banding pattern with 10 major and several minor bands in the pH range 6.5-8.5 is observed. Denaturing conditions are applied to achieve a good separation of differently charged variants of alteplase. The broad charge distribution observed is due to a population of molecules, which differ in the fine structure of biantenary and triantenary complex-type carbohydrate residues, with different degrees of substitution with sialic acids. The banding pattern of alteplase test samples must be consistent with the pattern of alteplase reference standard.

**Single-chain alteplase content**. The alteplase produced by CHO (Chinese hamster ovary) cells in serum-free medium is predominantly single-chain alteplase. The single-chain form can be separated from the two-chain form by gel-permeation liquid chromatography under reducing conditions as described under Single-chain content (see Tests). The single-chain alteplase content in bulk samples must be higher than 60 per cent.

**Tryptic-peptide mapping**. The primary structure of the alteplase molecule is verified by tryptic-peptide mapping as described under Identification B. The reduced and carboxymethylated molecule is cleaved by trypsin into about 50 peptides, which are separated by reverse-phase liquid chromatography. A characteristic chromatogram (fingerprint) is obtained. The identity of the tryptic-peptide map of a given alteplase sample with the profile of a well-characterised reference standard is an indirect confirmation of the amino-acid sequence, because even single amino-acid exchanges in individual peptides can be detected by this sensitive technique. In addition, complex peaks of the glycopeptides can be isolated from the tryptic-peptide map and separated in a second dimension, either by reverse-phase liquid chromatography under modified conditions or by capillary electrophoresis. By this two-dimensional separation of glycopeptide variants, lot-to-lot consistency of the microheterogeneity of glycosylation can be demonstrated.

The tryptic-peptide map of alteplase samples must be consistent with the tryptic-peptide map of alteplase reference standard.

**Monomer content**. The monomer content of alteplase is measured by gel-permeation liquid chromatography under non-reduced conditions as described under Monomer content (see Tests). The monomer content of alteplase bulk samples must be higher than 95 per cent.

**Type I/Type II alteplase content**. CHO cells produce 2 glycosylation variants of alteplase. Type I alteplase contains 1 polymannose-type glycosylation at position Asn 117 and 2 complex-type glycosylation sites at positions Asn 184 and Asn 448. Type II alteplase is only glycosylated at positions Asn 117 and Asn 448.

The ratio of Type I/Type II alteplase is constant in the range of 45 to 65 per cent of Type I and 35 to 55 per cent of Type II. The content of alteplase Type I and Type II can be determined by a densitometric scan of SDS-PAGE (sodium dodecyl sulfate polyacrylamide gel electrophoresis) gel. Plasmin-treated samples of alteplase, which are reduced and carboxymethylated before loading on the gel, are separated into 3 bands: Type I alteplase A-chain (AA 1-275), Type II alteplase A-chain (AA 1-275) and alteplase B-chain (AA 276-527). The ratio of Type I/Type II alteplase is determined from a calibration curve, which is obtained by a densitometric scan of defined mixtures of purified Type I alteplase and Type II alteplase standards.

**SDS-PAGE**. SDS-PAGE (silver staining) is used to demonstrate purity of the alteplase bulk material and the integrity of the alteplase molecule. For alteplase bulk samples, no additional protein bands compared to reference standard or degradation products must occur in SDS-PAGE gels at a loading amount of 2.5 µg alteplase protein per lane and a limit of detection of 5 ng per protein (BSA) band.

**Bacterial endotoxins** (*2.6.14*): less than 1 IU per milligram of alteplase.

**Sialic acids**. Proceed using a suitable validated method developed according to general chapter *2.2.59. Glycan analysis of glycoproteins*. The sialic acids content for the test samples must be in the range of 70 to 130 per cent compared to alteplase reference standard, which contains about 3 moles of sialic acids per mole of alteplase.

**Neutral sugars**. Dilute alteplase samples and the reference standard in the assay buffer, containing 34.8 g/L of *arginine R*, 0.1 g/L of *polysorbate 80 R* and adjusted to pH 7.4 with *phosphoric acid R*, to a protein concentration of 50 µg/mL. Prepare the following concentrations of mannose in the same assay buffer for a calibration curve: 20, 30, 40, 50 and 60 µg/mL. Pipette 2 mL of alteplase samples and reference standard, as well as 2 mL of each mannose concentration in duplicate in reagent tubes. Add 50 µL of *phenol R*, followed by 5 mL of *sulfuric acid R*, in each reagent tube. Incubate the mixture for 30 min at room temperature. Measure the absorbance at 492 nm for each tube. Read the content of neutral sugars from the mannose calibration curve. The neutral sugar content is expressed in moles of neutral sugar per mole of alteplase, taking into account the dilution factor

for alteplase samples and reference standard and using a relative molecular mass of 180.2 for mannose and a relative molecular mass of 59 050 for the alteplase protein moiety. The neutral sugar content of the alteplase samples must be in the range of 70 to 130 per cent compared to alteplase reference standard, which contains about 12 moles of neutral sugar per mole of alteplase.

CHARACTERS

White or slightly yellow powder or solid friable mass.

*Reconstitute the preparation as stated on the label immediately before carrying out the Identification, Tests (except those for solubility and water) and Assay.*

IDENTIFICATION

A. The assay serves also to identify the preparation.

B. Tryptic-peptide mapping. Examine by liquid chromatography (*2.2.29*).

*Test solution.* Dilute the preparation to be examined with *water R* to obtain a solution containing about 1 mg of alteplase per millilitre. Dialyse about 2.5 mL of the solution for at least 12 h into a solution containing 480 g/L of *urea R*, 44 g/L of *tris(hydroxymethyl)aminomethane R* and 1.5 g/L of *sodium edetate R* and adjusted to pH 8.6, using a membrane with a cut-off point corresponding to a relative molecular mass of 10 000 for globular proteins. Measure the volume of the solution, transfer it to a clean test-tube and add per millilitre 10 µL of a 156 g/L solution of *dithiothreitol R*. Allow to stand for 4 h, cool in iced water and add per millilitre of solution 25 µL of a freshly prepared 190 g/L solution of *iodoacetic acid R*. Allow to stand in the dark for 30 min. Add per millilitre 50 µL of dithiothreitol solution to stop the reaction. Dialyse for 24 h against an 8 g/L solution of *ammonium hydrogen carbonate R*. Add 1 part of *trypsin for peptide mapping R* to 100 parts of the protein and allow to stand for 6 h to 8 h. Repeat the addition of trypsin and allow to stand for a total of 24 h.

*Reference solution.* Prepare as for the test solution using a suitable reference standard instead of the preparation to be examined.

The chromatographic procedure may be carried out using:

– a column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm to 10 µm);

*Mobile phase A.* 8 g/L solution of *sodium dihydrogen phosphate R*, adjusted to pH 2.85 with *phosphoric acid R*, filtered and degassed;

*Mobile phase B.* 75 per cent *V/V* solution of *acetonitrile R* in mobile phase A;

– as detector a spectrophotometer set at 210 nm.

Equilibrate the system with mobile phase A at a flow rate of 1 mL/min. After injection of the solution, increase the proportion of mobile phase B at a rate of 0.44 per cent per minute until the ratio of mobile phase A to mobile phase B is 60:40, then increase the proportion of mobile phase B at a rate of 1.33 per cent per minute until the ratio of mobile phase A to mobile phase B is 20:80 and then continue elution with this mixture for a further 10 min. Record the chromatogram for the reference solution: the test is not valid unless the resolution of peaks 6 (peptides 268-275) and 7 (peptides 1-7) is at least 1.5; $w_{h1}$ and $w_{h2}$ are not more than 0.4 min. Inject about 100 µL of the test solution and record the chromatogram. Verify the identity of the peaks by comparison with the chromatograms of the reference solution. There should not be any additional significant peaks or shoulders, a significant peak or shoulder being defined as one with an area response equal to or greater than 5 per cent of peak 19 (peptides 278-296); no significant peak is missing. A type chromatogram for identification of the peaks cited is shown in Figure 1170.-1.

TESTS

**Appearance of solution**. The reconstituted preparation is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 7.1 to 7.5.

**Solubility**. Add the volume of the liquid stated on the label. The preparation dissolves completely within 2 min at 20 °C to 25 °C.

**Protein content**. Prepare a solution of the substance to be examined with an accurately known concentration of about 1 g/L. Using a 34.8 g/L solution of *arginine R* adjusted to pH 7.3 with *phosphoric acid R*, dilute an accurately measured volume of the solution of the substance to be examined so that the absorbance measured at the maximum at about 280 nm is 0.5 to 1.0 (*test solution*). Measure the absorbance (*2.2.25*) of the solution at the maximum at about 280 nm and at 320 nm using the arginine solution as the compensation liquid. Calculate the protein content in the portion of alteplase taken from the following expression:

$$\frac{V(A_{280} - A_{320})}{1.9}$$

in which $V$ is the volume of the test solution, $A_{280}$ is the absorbance at the maximum at about 280 nm and $A_{320}$ is the absorbance at 320 nm.

**Single-chain content**. Examine by liquid chromatography (*2.2.29*).

*Test solution.* Dissolve the preparation to be examined in *water R* to obtain a solution containing about 1 mg of alteplase

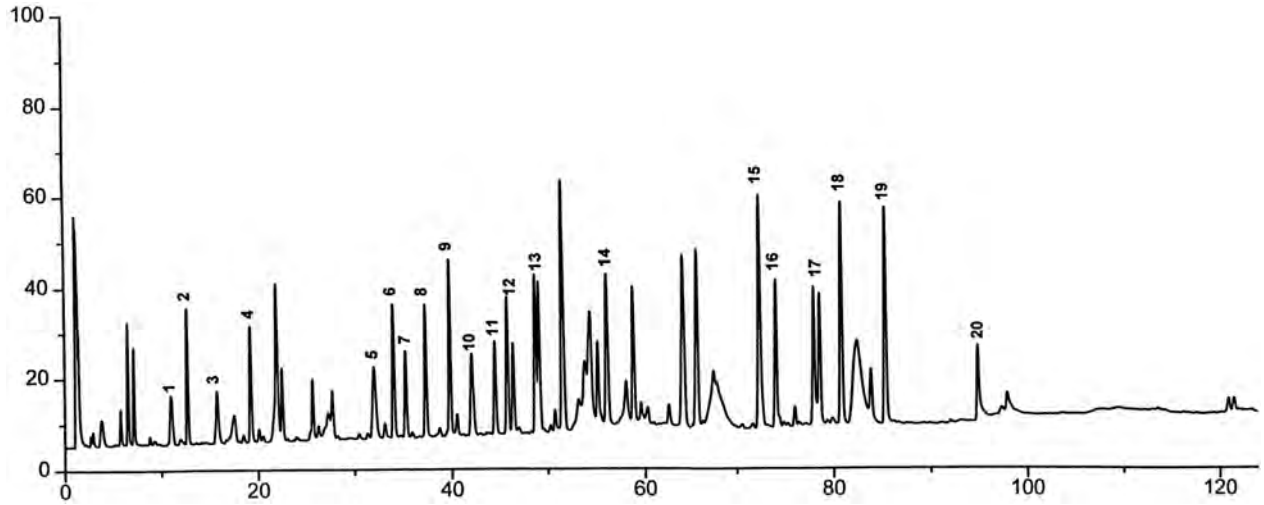


Figure 1170.-1. – *Chromatogram for tryptic-peptide mapping of alteplase*

per millilitre. Place about 1 mL of the solution in a tube, add 3 mL of a 3 g/L solution of *dithiothreitol R* in the mobile phase, place a cap on the tube and heat at about 80 °C for 3 min to 5 min.

The chromatographic procedure may be carried out using:

- a column 0.6 m long and 7.5 mm in internal diameter packed with silica-based, rigid, hydrophilic gel with spherical particles 10 µm to 13 µm in diameter, suitable for size-exclusion chromatography;
- as mobile phase at a flow rate of 0.5 mL/min a solution containing 30 g/L of *sodium dihydrogen phosphate R* and 1 g/L of *sodium dodecyl sulfate R*, adjusted to pH 6.8 with *dilute sodium hydroxide solution R*;
- as detector a spectrophotometer set at 214 nm.

Inject about 50 µL of the test solution and record the chromatogram. The chromatogram shows 2 major peaks corresponding to single-chain and two-chain alteplase. Calculate the relative amount of single-chain alteplase from the peak area values.

The test is not valid unless: the number of theoretical plates calculated on the basis of the single-chain alteplase peak is at least 1000. The content of single-chain alteplase is not less than 60 per cent of the total amount of alteplase-related substances found.

**Monomer content**. Examine by liquid chromatography (*2.2.29*).

*Test solution.* Reconstitute the preparation to be examined to obtain a solution containing about 1 mg per millilitre.

The chromatographic procedure may be carried out using:

- a column 0.6 m long and 7.5 mm in internal diameter packed with silica-based rigid, hydrophilic gel with spherical particles 10 µm to 13 µm in diameter, suitable for size-exclusion chromatography;
- as mobile phase at a flow rate of 0.5 mL/min a solution containing 30 g/L of *sodium dihydrogen phosphate R* and 1 g/L of *sodium dodecyl sulfate R*, adjusted to pH 6.8 with *dilute sodium hydroxide solution R*;
- as detector a spectrophotometer set at 214 nm.

Inject the test solution and record the chromatogram. The test is not valid unless the number of theoretical plates calculated for the alteplase monomer peak is at least 1000. Measure the response for all peaks, i.e. peaks corresponding to alteplase species of different molecular masses. Calculate the relative content of monomer from the area values of these peaks. The monomer content for alteplase must be at least 95 per cent.

**Water** (*2.5.12*). Not more than 4.0 per cent, determined by the semi-micro determination of water.

**Bacterial endotoxins** (*2.6.14*): less than 1 IU per milligram of protein.

**Sterility** (*2.6.1*). It complies with the test for sterility.

## ASSAY

The potency of alteplase is determined by comparing its ability to activate plasminogen to form plasmin with the same capacity of a reference preparation calibrated in International Units. The formation of plasmin is measured by the determination of the lysis time of a fibrin clot in given conditions.

The International Unit is the activity of a stated quantity of the International Standard of alteplase. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Solvent buffer.* A solution containing 1.38 g/L of *sodium dihydrogen phosphate monohydrate R*, 7.10 g/L of *anhydrous disodium hydrogen phosphate R*, 0.20 g/L of *sodium azide R* and 0.10 g/L of *polysorbate 80 R*.

*Human thrombin solution.* A solution of *human thrombin R* containing 33 IU/mL in solvent buffer.

*Human fibrinogen solution.* A 2 g/L solution of *fibrinogen R* in solvent buffer.

*Human plasminogen solution.* A 1 g/L solution of *human plasminogen R* in solvent buffer.

*Test solutions.* Using a solution of the substance to be examined containing 1 g/L, prepare serial dilutions using solvent buffer, for example 1:5000, 1:10 000, 1:20 000.

*Reference solutions.* Using a solution of a suitable reference standard having an accurately known concentration of about 1 g/L (580 000 IU of alteplase per millilitre), prepare 5 serial dilutions using *water R* to obtain reference solutions having known concentrations in the range 9.0 IU/mL to 145 IU/mL.

To each of a set of labelled glass test-tubes, add 0.5 mL of human thrombin solution. Allocate each test and reference solution to a separate tube and add to each tube 0.5 mL of the solution allocated to it. To each of a second set of labelled glass tubes, add 20 µL of human plasminogen solution, and 1 mL of human fibrinogen solution, mix and store on ice. Beginning with the reference/thrombin mixture containing the lowest number of International Units per millilitre, record the time and separately add 200 µL of each of the thrombin mixtures to the test tubes containing the plasminogen-fibrinogen mixture. Using a vortex mixer, intermittently mix the contents of each tube for a total of 15 s and carefully place in a rack in a circulating water-bath at 37 °C. A visibly turbid clot forms within 30 s and bubbles subsequently form within the clot. Record the clot-lysis time as the time between the first addition of alteplase solution and the moment when the last bubble rises to the surface. Using a least-squares fit, determine the equation of the line using the logarithms of the concentrations of the reference preparation in International Units per millilitre versus the logarithms of the values of their clot-lysis times in seconds, according to the following equation:

$$\log_{10} t = a + b\left(\log_{10} U_S\right)$$

in which $t$ is the clot-lysis time, $U_S$ the activity in International Units per millilitre of the reference preparation, $b$ is the slope and $a$ the $y$-intercept of the line. The test is not valid unless the correlation coefficient is − 0.9900 to − 1.0000. From the line equation and the clot-lysis time for the test solution, calculate the logarithm of the activity $U_A$ from the following equation:

$$\log_{10} U_A = \frac{\left[\left(\log_{10} t\right) - a\right]}{b}$$

Calculate the alteplase activity in International Units per millilitre from the following expression:

$$D \times U_A$$

in which $D$ is the dilution factor for the test solution. Calculate the specific activity in the portion of the substance to be examined from the following expression:

$$\frac{U_A}{P}$$

in which $P$ is the concentration of protein obtained in the test for protein content.

The estimated potency is not less than 90 per cent and not more than 110 per cent of the stated potency.

## STORAGE

Store in a colourless, glass container, under vacuum or under an inert gas, protected from light, at a temperature of 2 °C to 30 °C.

## LABELLING

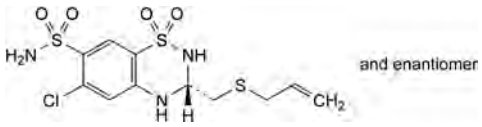
The label states:

- the number of International Units per container;
- the amount of protein per container;
- the name and volume of the liquid to be used for reconstitution.

**07/2008:2185**

# ALTIZIDE

## Altizidum



$C_{11}H_{14}ClN_3O_4S_3$ $M_r$ 383.9
[5588-16-9]

DEFINITION

(3*RS*)-6-Chloro-3-[(prop-2-enylsulfanyl)methyl]-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, soluble in methanol, practically insoluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *altizide CRS*.

If the spectra obtained show differences, dissolve 50 mg of the substance to be examined and 50 mg of the reference substance separately in 2 mL of *acetone R* and evaporate the solvent. Precipitate by adding 1 mL of *methylene chloride R*. Evaporate to dryness and record new spectra using the residues.

TESTS

**Impurity B**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 0.200 g of the substance to be examined in *acetone R* and dilute to 2.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 10.0 mg of *altizide impurity B CRS* in *acetone R* and dilute to 25.0 mL with the same solvent.

*Reference solution (b)*. To 1.0 mL of reference solution (a) add 1.0 mL of the test solution.

*Reference solution (c)*. Dilute 5.0 mL of reference solution (a) to 10.0 mL with *acetone R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *acetone R*, *methylene chloride R* (25:75 *V/V*).

*Application*: 10 µL of the test solution and reference solutions (b) and (c).

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with a mixture of equal volumes of a 10 g/L solution of *potassium permanganate R* and a 50 g/L solution of *sodium carbonate R*, prepared immediately before use. Allow to stand for 30 min and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Limit*: any spot due to impurity B is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use, except reference solution (b).*

*Test solution*. Dissolve 50 mg of the substance to be examined in 5 mL of *acetonitrile R* and dilute to 25 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)*. In order to produce impurity A *in situ*, dissolve 50 mg of the substance to be examined in 5 mL of *acetonitrile R* and dilute to 25 mL with *water R*. Allow to stand for 30 min.

*Reference solution (c)*. Dissolve 4 mg of *furosemide CRS* in 2 mL of *acetonitrile R*, add 2 mL of the test solution and dilute to 100 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

*Mobile phase*: *acetonitrile R*, *water R* previously adjusted to pH 2.0 with *perchloric acid R* (25:75 *V/V*).

*Flow rate*: 0.7 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 5 µL.

*Run time*: twice the retention time of altizide.

*Relative retention* with reference to altizide (retention time = about 25 min): impurity A = about 0.15; furosemide = about 1.05.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.0 between the peaks due to altizide and furosemide.

*Limits*:

– *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.32*): maximum 0.5 per cent, determined on 50.0 mg.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances, with the following modifications.

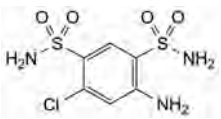
*Test solution*. Dissolve 25.0 mg of the substance to be examined in 2 mL of *acetonitrile R* and dilute to 25.0 mL with the mobile phase.

*Reference solution*. Dissolve 25.0 mg of *altizide CRS* in 2 mL of *acetonitrile R* and dilute to 25.0 mL with the mobile phase.

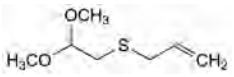
Calculate the percentage content of $C_{11}H_{14}ClN_3O_4S_3$ from the declared content of *altizide CRS*.

IMPURITIES

*Specified impurities: A, B.*



A. 4-amino-6-chlorobenzene-1,3-disulfonamide,



B. 3-[(2,2-dimethoxyethyl)sulfanyl]prop-1-ene.

**01/2017:0006**

# ALUM

## Alumen

$AlK(SO_4)_2,12H_2O$ $M_r$ 474.4
[7784-24-9]

DEFINITION

*Content*: 99.0 per cent to 100.5 per cent of $AlK(SO_4)_2,12H_2O$.

CHARACTERS

*Appearance*: granular powder or colourless, transparent, crystalline masses.

*Solubility*: freely soluble in water, very soluble in boiling water, soluble in glycerol, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives the reactions of sulfates (*2.3.1*).

B. Solution S gives the reaction of aluminium (*2.3.1*).

C. Shake 10 mL of solution S with 0.5 g of *sodium hydrogen carbonate R* and filter. The filtrate gives reaction (a) of potassium (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.5 g in *water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 3.0 to 3.5.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Ammonium** (*2.4.1*): maximum 0.2 per cent.

To 1 mL of solution S add 4 mL of *water R*. Dilute 0.5 mL of this solution to 14 mL with *water R*.

**Iron** (*2.4.9*): maximum 100 ppm.

Dilute 2 mL of solution S to 10 mL with *water R*. Use in this test 0.3 mL of *thioglycollic acid R*.

ASSAY

Dissolve 0.900 g in 20 mL of *water R* and carry out the complexometric titration of aluminium (*2.5.11*).

1 mL of *0.1 M sodium edetate* is equivalent to 47.44 mg of $AlK(SO_4)_2,12H_2O$.

**01/2017:0971**

# ALUMINIUM CHLORIDE HEXAHYDRATE

## Aluminii chloridum hexahydricum

$AlCl_3,6H_2O$ $M_r$ 241.4
[7784-13-6]

DEFINITION

*Content*: 95.0 per cent to 101.0 per cent.

CHARACTERS

*Appearance*: white or slightly yellow, crystalline powder or colourless crystals, deliquescent.

*Solubility*: very soluble in water, freely soluble in ethanol (96 per cent), soluble in glycerol.

IDENTIFICATION

A. Dilute 0.1 mL of solution S2 (see Tests) to 2 mL with *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

B. Dilute 0.3 mL of solution S2 to 2 mL with *water R*. The solution gives the reaction of aluminium (*2.3.1*).

TESTS

**Solution S1**. Dissolve 10.0 g in *distilled water R* and dilute to 100 mL with the same solvent.

**Solution S2**. Dilute 50 mL of solution S1 to 100 mL with *water R*.

**Appearance of solution**. Solution S2 is clear (*2.2.1*) and not more intensely coloured than reference solution $B_7$ (*2.2.2, Method II*).

**Sulfates** (*2.4.13*): maximum 100 ppm, determined on solution S1.

**Iron** (*2.4.9*): maximum 10 ppm, determined on solution S1.

**Alkali and alkaline-earth metals**: maximum 0.5 per cent.

To 20 mL of solution S2 add 100 mL of *water R* and heat to boiling. To the hot solution add 0.2 mL of *methyl red solution R*. Add *dilute ammonia R1* until the colour of the indicator changes to yellow and dilute to 150 mL with *water R*. Heat to boiling and filter. Evaporate 75 mL of the filtrate to dryness on a water-bath and ignite to constant mass. The residue weighs a maximum of 2.5 mg.

**Water** (*2.5.12*): 42.0 per cent to 48.0 per cent, determined on 50.0 mg.

ASSAY

Dissolve 0.500 g in 25.0 mL of *water R*. Carry out the complexometric titration of aluminium (*2.5.11*). Titrate with *0.1 M zinc sulfate* until the colour of the indicator changes from greyish-green to pink. Carry out a blank titration.

1 mL of *0.1 M sodium edetate* is equivalent to 24.14 mg of $AlCl_3,6H_2O$.

STORAGE

In an airtight container.

**01/2017:1664**
**corrected 10.0**

# ALUMINIUM HYDROXIDE, HYDRATED, FOR ADSORPTION

## Aluminii hydroxidum hydricum ad adsorptionem

$[AlO(OH)],xH_2O$

DEFINITION

*Content*: 90.0 per cent to 110.0 per cent of the content of aluminium stated on the label.

*NOTE*: *shake the gel vigorously for at least 30 s immediately before examining.*

CHARACTERS

*Appearance*: white or almost white, translucent, viscous, colloidal gel. A supernatant may be formed upon standing.

*Solubility*: a clear or almost clear solution is obtained with alkali hydroxide solutions and mineral acids.

IDENTIFICATION

Solution S (see Tests) gives the reaction of aluminium.

To 10 mL of solution S add about 0.5 mL of *dilute hydrochloric acid R* and about 0.5 mL of *thioacetamide reagent R*. No precipitate is formed. Add dropwise 5 mL of *dilute sodium hydroxide solution R*. Allow to stand for 1 h. A gelatinous white precipitate is formed which dissolves upon addition of 5 mL of *dilute sodium hydroxide solution R*. Gradually add 5 mL of *ammonium chloride solution R* and allow to stand for 30 min. The gelatinous white precipitate is re-formed.

TESTS

**Solution S**. Add 1 g to 4 mL of *hydrochloric acid R*. Heat at 60 °C for 1 h, cool, dilute to 50 mL with *distilled water R* and filter if necessary.

**pH** (*2.2.3*): 5.5 to 8.5.

**Adsorption power**. Dilute the substance to be examined with *distilled water R* to obtain an aluminium concentration of 5 mg/mL. Prepare *bovine albumin R* solutions with the following concentrations of bovine albumin: 0.5 mg/mL, 1 mg/mL, 2 mg/mL, 3 mg/mL, 5 mg/mL and 10 mg/mL. If necessary, adjust the gel and the *bovine albumin R* solutions to pH 6.0 with *dilute hydrochloric acid R* or *dilute sodium hydroxide solution R*.

For adsorption, mix 1 part of the diluted gel with 4 parts of each of the solutions of *bovine albumin R* and allow to stand at room temperature for 1 h. During this time shake the mixture vigorously at least 5 times. Centrifuge or filter through a non-protein-retaining filter. Immediately determine the protein content (*2.5.33, Method 2*) of either the supernatant or the filtrate.

It complies with the test if no bovine albumin is detectable in the supernatant or filtrate of the 2 mg/mL *bovine albumin R* solution (maximum level of adsorption) and in the supernatant or filtrate of *bovine albumin R* solutions of lower concentrations. Solutions containing 3 mg/mL, 5 mg/mL and 10 mg/mL *bovine albumin R* may show bovine albumin in the supernatant or filtrate, proportional to the amount of bovine albumin in the solutions.

**Sedimentation**. If necessary, adjust the substance to be examined to pH 6.0 using *dilute hydrochloric acid R* or *dilute sodium hydroxide solution R*. Dilute with *distilled water R* to obtain an aluminium concentration of approximately 5 mg/mL. If the aluminium content of the substance to be examined is lower than 5 mg/mL, adjust to pH 6.0 and dilute with a 9 g/L solution of *sodium chloride R* to obtain an aluminium concentration of about 1 mg/mL. After shaking for at least 30 s, place 25 mL of the preparation in a 25 mL graduated cylinder and allow to stand for 24 h.

It complies with the test if the volume of the clear supernatant is less than 5 mL for the gel with an aluminium content of about 5 mg/mL.

It complies with the test if the volume of the clear supernatant is less than 20 mL for the gel with an aluminium content of about 1 mg/mL.

**Chlorides** (*2.4.4*): maximum 0.33 per cent.

Dissolve 0.5 g in 10 mL of *dilute nitric acid R* and dilute to 500 mL with *water R*.

**Nitrates**: maximum 100 ppm.

Place 5 g in a test-tube immersed in ice-water, add 0.4 mL of a 100 g/L solution of *potassium chloride R*, 0.1 mL of *diphenylamine solution R* and, dropwise with shaking, 5 mL of *sulfuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 5 mL of *nitrate standard solution (100 ppm $NO_3$) R*.

**Sulfates** (*2.4.13*): maximum 0.5 per cent.

Dilute 2 mL of solution S to 20 mL with *water R*.

**Ammonium** (*2.4.1, Method B*): maximum 50 ppm, determined on 1.0 g.

Prepare the standard using 0.5 mL of *ammonium standard solution (100 ppm $NH_4$) R*.

**Arsenic** (*2.4.2, Method A*): maximum 1 ppm, determined on 1 g.

**Iron** (*2.4.9*): maximum 15 ppm, determined on 0.67 g.

**Bacterial endotoxins** (*2.6.14*): less than 5 IU of endotoxin per milligram of aluminium, if intended for use in the manufacture of an adsorbed product without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 2.50 g in 10 mL of *hydrochloric acid R*, heating for 30 min at 100 °C on a water-bath. Cool and dilute to 20 mL with *water R*. To 10 mL of the solution, add *concentrated ammonia R* until a precipitate is obtained. Add the smallest quantity of *hydrochloric acid R* needed to dissolve the precipitate and dilute to 20 mL with *water R*. Carry out the complexometric titration of aluminium (*2.5.11*). Carry out a blank titration.

STORAGE

At a temperature not exceeding 30 °C. Do not allow to freeze. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states the declared content of aluminium.

**01/2020:1388**

# ALUMINIUM MAGNESIUM SILICATE

## Aluminii magnesii silicas

DEFINITION

Mixture of colloidal-size particles of montmorillonite and saponite, practically free from grit and non-swellable ore.

The requirements for viscosity and ratio of aluminium content to magnesium content differ for the several types of aluminium magnesium silicate, as shown in the table below.

| Type | Viscosity (mPa·s) | | Al content / Mg content | |
|---|---|---|---|---|
| | min. | max. | min. | max. |
| IA | 225 | 600 | 0.5 | 1.2 |
| IB | 150 | 450 | 0.5 | 1.2 |
| IC | 800 | 2200 | 0.5 | 1.2 |
| IIA | 100 | 300 | 1.4 | 2.8 |

CHARACTERS

*Appearance*: almost white, coarse powder, granules or flakes (types IA, IC and IIA); almost white, fine powder (type IB).

*Solubility*: practically insoluble in water and in organic solvents.

It swells in water to produce a colloidal dispersion.

IDENTIFICATION

Carry out either tests A, B, C, F or tests D, E.

A. In a platinum crucible mix 1.0 g with 5.0 g of *anhydrous lithium metaborate R*. Heat slowly at first and ignite at 1000-1200 °C for 15 min. Allow to cool and crush the residue. 0.25 g of the residue gives the reaction of silicates (*2.3.1*).

B. Dissolve 1.0 g of the residue obtained in identification test A in a mixture of 5 mL of *dilute hydrochloric acid R* and 10 mL of *water R*. Filter to obtain a clear solution and add *ammonium chloride buffer solution pH 10.0 R*. A white, gelatinous precipitate is formed. Centrifuge and keep the supernatant for identification test C. Dissolve the precipitate in *dilute hydrochloric acid R*. Add dropwise *dilute sodium hydroxide solution R*. A white gelatinous precipitate is formed. Filter and add a few drops of *phenolphthalein solution R* to the residue. The residue turns pink. Wash the residue with *water R* until the pink colour is completely discharged and the residue remains white upon addition of a drop of *phenolphthalein solution R*. Sprinkle a few crystals of *sodium fluoride R* on the residue. The residue, in contact with the crystals, turns pink again in a short time.

C. To 2 mL of the supernatant obtained after centrifugation in identification test B, add 1 mL of *dilute ammonia R1* and 1 mL of *ammonium chloride solution R*. Upon the addition of *dilute ammonia R1* a white precipitate may form, which dissolves after addition of the *ammonium chloride solution R*. Add 1 mL of *disodium hydrogen phosphate solution R*. A white precipitate is formed.

D. X-ray diffraction (*2.9.33*), oriented sample.

Add 2 g in small portions to 100 mL of *water R*, with vigorous shaking. Allow to stand for at least 12 h to ensure complete hydration. Place 2 mL of the resulting mixture on a suitable glass slide and allow to dry in air at room temperature to produce an oriented film. Place the slide in a vacuum desiccator over *ethylene glycol R*. Evacuate the desiccator and close the stopcock so that the ethylene glycol saturates the chamber. Allow to stand for at least 12 h. Record the X-ray diffraction pattern and calculate the *d* values: the largest peak corresponds to a *d* value between 1.5 nm and 1.72 nm.

E. X-ray diffraction (*2.9.33*), random sample.

Prepare a random powder sample, record the X-ray diffraction pattern and determine the *d* values in the region between 0.148 nm and 0.154 nm. Peaks are found between 0.1492 nm and 0.1504 nm and between 0.1510 nm and 0.1540 nm.

F. It complies with the limits of the assay.

TESTS

**pH** (*2.2.3*): 9.0 to 10.0.

Disperse 5.0 g in 100 mL of *carbon dioxide-free water R*.

**Viscosity** (*2.2.10*). Weigh a quantity of the substance to be examined equivalent to 25.0 g of the dried substance and immediately transfer to a suitable 1 L blender jar containing a quantity of *water R*, at 25 ± 2 °C, that is sufficient to produce a mixture weighing 500 g. Blend for exactly 3 min, at 14 000-15 000 r/min. The heat generated during blending causes the temperature to rise to above 30 °C. Transfer the contents of the blender to a 600 mL beaker and allow to stand for 5 min. The sample temperature should be 33 ± 3 °C.

Using a suitable rotating viscometer equipped with a spindle as specified below, operate the viscometer at 60 r/min for exactly 6 min and record the scale reading.

For type IA, use a spindle with a cylinder 1.87 cm in diameter and 0.69 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.54 cm, and an immersion depth of 5.00 cm (No. 2 spindle); if the scale reading is greater than 90 per cent of the full scale, repeat the measurement using a spindle similar to the No. 2 spindle but with a cylinder 1.27 cm in diameter and 0.16 cm high (No. 3 spindle).

For type IC, use a No. 3 spindle; if the scale reading is greater than 90 per cent of the full scale, repeat the measurement using a spindle with a cylindrical shaft 0.32 cm in diameter and an immersion depth of 4.05 cm (No. 4 spindle).

For types IB and IIA, use a No. 2 spindle.

*Limits*:

| Type | Viscosity (mPa·s) | |
|---|---|---|
| | min. | max. |
| IA | 225 | 600 |
| IB | 150 | 450 |
| IC | 800 | 2200 |
| IIA | 100 | 300 |

**Acid demand**. Weigh a quantity of the substance to be examined equivalent to 5.00 g of the dried substance and disperse in 500 mL of *water R* using a suitable blender fitted with a 1 L jar. With constant mixing, add 3.0 mL portions of *0.1 M hydrochloric acid* at 5 s, 65 s, 125 s, 185 s, 245 s, 305 s, 365 s, 425 s, 485 s, 545 s, 605 s, 665 s and 725 s and add a 1.0 mL portion at 785 s. The pH (*2.2.3*) determined at 840 s is not greater than 4.0.

**Arsenic** (*2.4.2, Method A*): maximum 3 ppm.

Transfer 16.6 g to a 250 mL beaker containing 100 mL of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil gently, with occasional stirring, for 15 min. Allow the insoluble matter to settle and decant the supernatant through a rapid-flow filter paper into a 250 mL volumetric flask, retaining as much sediment as possible in the beaker. To the residue in the beaker add 25 mL of hot *dilute hydrochloric acid R*, stir, heat to boiling, allow the insoluble matter to settle and decant the supernatant through the filter into the volumetric flask. Repeat the extraction with 4 additional quantities, each of 25 mL, of hot *dilute hydrochloric acid R*, decanting each supernatant through the filter into the volumetric flask. At the last extraction, transfer as much of the insoluble matter as possible onto the filter. Allow the combined filtrates to cool to room temperature and dilute to 250.0 mL with *dilute hydrochloric acid R*. Dilute 5.0 mL of this solution to 25.0 mL with *dilute hydrochloric acid R*.

**Lead**: maximum 15 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Transfer 10.0 g to a 250 mL beaker containing 100 mL of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil for 15 min. Allow to cool to room temperature and allow the insoluble matter to settle. Decant the supernatant through a rapid-flow filter paper into a 400 mL beaker. To the insoluble matter in the 250 mL beaker add 25 mL of hot *water R*. Stir, allow the insoluble matter to settle and decant the supernatant through the filter into the 400 mL beaker. Repeat the extraction with 2 additional quantities, each of 25 mL, of *water R*, decanting each time the supernatant through the filter into the 400 mL beaker. Wash the filter with 25 mL of hot *water R*, collecting this filtrate in the 400 mL beaker. Concentrate the combined filtrates to about 20 mL by gently boiling. If a precipitate appears, add about 0.1 mL of *nitric acid R*, heat to boiling and allow to cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 50 mL volumetric flask. Transfer the remaining contents of the 400 mL beaker through the filter paper and into the flask with *water R*. Dilute this solution to 50.0 mL with *water R*.

*Reference solutions.* Prepare the reference solutions using *lead standard solution (10 ppm Pb) R*, diluted as necessary with *water R*.

*Source*: lead hollow-cathode lamp.

*Wavelength*: 217 nm.

*Atomisation device*: oxidising air-acetylene flame.

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying in an oven at 110 °C.

**Microbial contamination**.

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

ASSAY

**Aluminium**. Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* In a platinum crucible mix 0.200 g with 1.0 g of *anhydrous lithium metaborate R*. Heat slowly at first and ignite at 1000-1200 °C for 15 min. Allow to cool, place the crucible in a 100 mL beaker containing 25 mL of a 40 per cent *V/V* solution of *dilute nitric acid R* and add 50 mL of a 40 per cent *V/V* solution of *dilute nitric acid R*, filling and submerging the crucible. Place a polytetrafluoroethylene-coated magnetic stirring bar in the crucible and stir gently with a magnetic stirrer until dissolution is complete. Transfer the solution to a 200 mL volumetric flask, wash the beaker, crucible and magnetic stirrer bar with *water R*, collecting the washings in the volumetric flask, and dilute to 200.0 mL with *water R* (solution A). To 20.0 mL of solution A add 20 mL of a 10 g/L solution of *sodium chloride R* and dilute to 100.0 mL with *water R*.

*Reference solutions.* Dissolve, with gentle heating, 1.000 g of *aluminium R* in a mixture of 10 mL of *hydrochloric acid R* and 10 mL of *water R*. Allow to cool, then dilute to 1000.0 mL with *water R* (1 mg of aluminium per millilitre). Into 4 identical volumetric flasks, each containing 0.20 g of *sodium chloride R*, introduce 1.0 mL, 2.0 mL, 3.0 mL and 4.0 mL of this solution respectively, and dilute to 100.0 mL with *water R*.

*Blank solution.* Dissolve 0.20 g of *sodium chloride R* in *water R* and dilute to 100.0 mL with the same solvent.

*Source*: aluminium hollow-cathode lamp.

*Wavelength*: 309 nm.

*Atomisation device*: acetylene-nitrous oxide flame.

**Magnesium**. Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dilute 25.0 mL of solution A, prepared in the assay for aluminium, to 50.0 mL with *water R*. To 5.0 mL of this solution add 20.0 mL of *lanthanum chloride solution R* and dilute to 100.0 mL with *water R*.

*Reference solutions.* Place 1.000 g of *magnesium R* in a 250 mL beaker containing 20 mL of *water R* and carefully add 20 mL of *hydrochloric acid R*, warming if necessary to dissolve. Transfer the solution to a volumetric flask and dilute to 1000.0 mL with *water R* (1 mg of magnesium per millilitre). Dilute 5.0 mL of this solution to 500.0 mL with *water R*. Into 4 identical volumetric flasks, introduce 5.0 mL, 10.0 mL, 15.0 mL and 20.0 mL of the solution respectively. To each flask add 20.0 mL of *lanthanum chloride solution R* and dilute to 100.0 mL with *water R*.

*Blank solution.* Dilute 20 mL of *lanthanum chloride solution R* to 100.0 mL with *water R*.

*Source*: magnesium hollow-cathode lamp.

*Wavelength*: 285 nm.

*Atomisation device*: air-acetylene flame.

LABELLING

The label states the ratio of aluminium content to magnesium content, the viscosity and the corresponding type (see Definition).

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristic may be relevant for aluminium magnesium silicate used as viscosity-increasing agent and stabiliser.*

**Viscosity** (see Tests).

**01/2017:0311**

# ALUMINIUM OXIDE, HYDRATED

## Aluminii oxidum hydricum

DEFINITION

*Content*: 47.0 per cent to 60.0 per cent of $Al_2O_3$ ($M_r$ 102.0).

CHARACTERS

*Appearance*: white or almost white, amorphous powder.

*Solubility*: practically insoluble in water. It dissolves in dilute mineral acids and in solutions of alkali hydroxides.

IDENTIFICATION

Solution S (see Tests) gives the reaction of aluminium (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.5 g in 15 mL of *hydrochloric acid R*, heating on a water-bath. Dilute to 100 mL with *distilled water R*.

**Appearance of solution**. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $GY_6$ (*2.2.2, Method II*).

**Alkaline impurities**. Shake 1.0 g with 20 mL of *carbon dioxide-free water R* for 1 min and filter. To 10 mL of the filtrate add 0.1 mL of *phenolphthalein solution R*. Any pink colour disappears on the addition of 0.3 mL of *0.1 M hydrochloric acid*.

**Neutralising capacity**. *Carry out the test at 37 °C.* Disperse 0.5 g in 100 mL of *water R*, heat, add 100.0 mL of *0.1 M hydrochloric acid*, previously heated, and stir continuously; the pH (*2.2.3*) of the solution after 10 min, 15 min and 20 min is not less than 1.8, 2.3 and 3.0 respectively and is at no time greater than 4.5. Add 10.0 mL of *0.5 M hydrochloric acid*, previously heated, stir continuously for 1 h and titrate with *0.1 M sodium hydroxide* to pH 3.5; not more than 35.0 mL of *0.1 M sodium hydroxide* is required.

**Chlorides** (*2.4.4*): maximum 1 per cent.

Dissolve 0.1 g with heating in 10 mL of *dilute nitric acid R* and dilute to 100 mL with *water R*. Dilute 5 mL of the solution to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 1 per cent.

Dilute 4 mL of solution S to 100 mL with *distilled water R*.

**Arsenic** (*2.4.2, Method A*): maximum 4 ppm, determined on 10 mL of solution S.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of bile-tolerant gram-negative bacteria (*2.6.13*).

Absence of *Escherichia coli* (*2.6.13*).

ASSAY

Dissolve 0.800 g in 10 mL of *hydrochloric acid R1*, heating on a water-bath. Cool and dilute to 50.0 mL with *water R*. To 10.0 mL of the solution add *dilute ammonia R1* until a precipitate begins to appear. Add the smallest quantity of *dilute hydrochloric acid R* needed to dissolve the precipitate and dilute to 20 mL with *water R*. Carry out the complexometric titration of aluminium (*2.5.11*).

1 mL of *0.1 M sodium edetate* is equivalent to 5.098 mg of $Al_2O_3$.

STORAGE

In an airtight container, at a temperature not exceeding 30 °C.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for hydrated aluminium oxide used as adsorbent.*

**Particle-size distribution** (*2.9.31*).

**Specific surface area** (*2.9.26*).

**01/2017:2166**

# ALUMINIUM PHOSPHATE GEL

## Aluminii phosphatis liquamen

DEFINITION

Hydrated $AlPO_4$ in gel form.

*Content*: 19.0 per cent to 21.0 per cent of $AlPO_4$.

CHARACTERS

*Appearance*: gel.

*Solubility*: practically insoluble in water, in ethanol (96 per cent) and in methylene chloride. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

A. Solution S (see Tests) gives reaction (b) of phosphates (*2.3.1*).

B. Solution S gives the reaction of aluminium (*2.3.1*).

C. It complies with the assay.

TESTS

**Solution S**. Dissolve 2.00 g in *dilute hydrochloric acid R* and dilute to 100 mL with the same acid.

**pH** (*2.2.3*): 6.0 to 8.0.

**Peroxides**: maximum 150 ppm, expressed as hydrogen peroxide.

*Test solution.* Dissolve with heating 1.0 g of the substance to be examined in 5 mL of *dilute hydrochloric acid R*, then add 5 mL of *water R* and 2 mL of *divanadium pentoxide solution in sulfuric acid R*.

*Reference solution.* Dilute 1.0 mL of *dilute hydrogen peroxide solution R* to 200.0 mL with *water R*. To 1 mL of this solution add 9 mL of *water R* and 2 mL of *divanadium pentoxide solution in sulfuric acid R*.

The test solution is not more intensely coloured than the reference solution.

**Chlorides** (*2.4.4*): maximum 500 ppm.

Dissolve 1.3 g in 5 mL of *dilute nitric acid R* and dilute to 200 mL with *water R*.

**Soluble phosphates**: maximum 0.5 per cent, expressed as $PO_4$.

*Test solution.* Centrifuge 10.0 g until a clear supernatant is obtained. To 2.00 mL of the supernatant add 20.0 mL of a 10.3 g/L solution of *hydrochloric acid R* and dilute to 100.0 mL with *water R*. To 10.0 mL of this solution add 10.0 mL of *nitro-molybdovanadic reagent R* and dilute to 50.0 mL with *water R*. Allow to stand protected from light for 15 min.

*Reference solution.* Add 10.0 mL of *nitro-molybdovanadic reagent R* to 10.0 mL of a 143 mg/L solution of *potassium dihydrogen phosphate R* and dilute to 50.0 mL with *water R*. Allow to stand protected from light for 15 min.

Measure the absorbances (*2.2.25*) of the 2 solutions at 400 nm. The absorbance of the test solution is not greater than that of the reference solution.

**Sulfates** (*2.4.13*): maximum 0.2 per cent.

Dilute 25 mL of solution S to 100 mL with *distilled water R*.

**Soluble aluminium**: maximum 50 ppm.

To 16.0 g add 50 mL of *water R*. Heat to boiling for 5 min. Cool and centrifuge. Separate the supernatant. Wash the residue with 20 mL of *water R* and centrifuge. Separate the supernatant and add to the first supernatant. To the combined supernatants add 5 mL of *hydrochloric acid R* and 20 mL of *water R*. Introduce all of this solution into a 500 mL conical flask and carry out the complexometric titration of aluminium (*2.5.11*) using *0.01 M sodium edetate*.

**Arsenic** (*2.4.2, Method A*): maximum 1 ppm, determined on 1.0 g.

**Acid neutralising capacity**. Add 2.0 g to 30 mL of *0.1 M hydrochloric acid* heated to 37 °C and maintain at 37 °C while shaking. Determine the pH after 15 min. The pH (*2.2.3*) of the mixture is 2.0 to 2.5.

**Residue on ignition**: 19.0 per cent to 23.0 per cent.

Heat 0.500 g at 50 °C for 5 hours, then ignite at 500 ± 50 °C until constant mass.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of bile-tolerant gram-negative bacteria (*2.6.13*).

Absence of *Escherichia coli* (*2.6.13*).

ASSAY

Dissolve with heating 0.300 g in 5 mL of *dilute hydrochloric acid R*. Add 45 mL of *water R*, 10.0 mL of *0.1 M sodium edetate* and 30 mL of a mixture of equal volumes of *ammonium acetate solution R* and *dilute acetic acid R*. Heat to boiling and

maintain boiling for 3 min. Cool, then add 25 mL of *ethanol (96 per cent) R*. Titrate with *0.1 M zinc sulfate*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M zinc sulfate* is equivalent to 12.2 mg of $AlPO_4$.

STORAGE

In an airtight container.

**01/2017:1598**

# ALUMINIUM PHOSPHATE, HYDRATED

## Aluminii phosphas hydricus

$AlPO_4,xH_2O$ $M_r$ 122.0 (anhydrous substance)

DEFINITION

*Content*: 94.0 per cent to 102.0 per cent of $AlPO_4$ ($M_r$ 122.0) (ignited substance).

It contains a variable quantity of water.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water, practically insoluble in ethanol (96 per cent). It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

A. Solution S (see Tests) gives reaction (b) of phosphates (*2.3.1*).

B. Solution S gives the reaction of aluminium (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.00 g in *dilute hydrochloric acid R* and dilute to 100 mL with the same acid.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 5.5 to 7.2

Shake 4.0 g with *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

**Chlorides** (*2.4.4*): maximum 1.3 per cent.

Dissolve 50.0 mg in 10 mL of *dilute nitric acid R* and dilute to 200 mL with *water R*.

**Soluble phosphates**: maximum 1.0 per cent, calculated as $PO_4^{3-}$.

*Test solution*. Stir 5.0 g with 150 mL of *water R* for 2 h. Filter and wash the filter with 50 mL of *water R*. Combine the filtrate and the washings and dilute to 250.0 mL with *water R*. Dilute 10.0 mL of this solution to 100.0 mL with *water R*.

*Reference solution (a)*. Dissolve 2.86 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100 mL with the same solvent.

*Reference solution (b)*. Dilute 1 mL of reference solution (a) to 5 mL with *water R*.

*Reference solution (c)*. Dilute 3 mL of reference solution (a) to 5 mL with *water R*.

Treat each solution as follows. To 5.0 mL add 4 mL of *dilute sulfuric acid R*, 1 mL of *ammonium molybdate solution R*, 5 mL of *water R* and 2 mL of a solution containing 0.10 g of *4-methylaminophenol sulfate R*, 0.5 g of *anhydrous sodium sulfite R* and 20.0 g of *sodium metabisulfite R* in 100 mL of *water R*. Shake and allow to stand for 15 min. Dilute to 25.0 mL with *water R* and allow to stand for a further 15 min. Measure the absorbance (*2.2.25*) at 730 nm. Calculate the content of soluble phosphates from a calibration curve prepared using reference solutions (a), (b) and (c) after treatment.

**Sulfates** (*2.4.13*): maximum 0.6 per cent.

Dilute 8 mL of solution S to 100 mL with *distilled water R*.

**Arsenic** (*2.4.2*): maximum 1 ppm.

1.0 g complies with limit test A.

**Loss on ignition**. 10.0 per cent to 20.0 per cent, determined on 1.000 g at 800 ± 50 °C.

**Neutralising capacity**. Add 0.50 g to 30 mL of *0.1 M hydrochloric acid* previously heated to 37 °C and maintain at this temperature for 15 min while stirring. The pH (*2.2.3*) of the mixture after 15 min at 37 °C is 2.0 to 2.5.

ASSAY

Dissolve 0.400 g in 10 mL of *dilute hydrochloric acid R* and dilute to 100.0 mL with *water R*. To 10.0 mL of the solution, add 10.0 mL of *0.1 M sodium edetate* and 30 mL of a mixture of equal volumes of *ammonium acetate solution R* and *dilute acetic acid R*. Boil for 3 min, then cool. Add 25 mL of *ethanol (96 per cent) R* and 1 mL of a freshly prepared 0.25 g/L solution of *dithizone R* in *ethanol (96 per cent) R*. Titrate the excess of sodium edetate with *0.1 M zinc sulfate* until the colour changes to pink.

1 mL of *0.1 M sodium edetate* is equivalent to 12.20 mg of $AlPO_4$.

STORAGE

In an airtight container.

**01/2009:1676**
**corrected 7.0**

# ALUMINIUM SODIUM SILICATE

## Aluminii natrii silicas

DEFINITION

Silicic acid aluminium sodium salt of synthetic origin.

*Content*:

– *aluminium* (Al; $M_r$ 26.98): 2.7 per cent to 7.9 per cent (dried substance);

– *sodium* (Na; $M_r$ 22.99): 3.7 per cent to 6.3 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, fine, light, amorphous powder.

*Solubility*: practically insoluble in water and in organic solvents.

IDENTIFICATION

A. Transfer 1.0 g to a 100 mL beaker and add 10 mL of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil for 15 min. Allow to cool to room temperature, mix and centrifuge the solution. 2 mL of the supernatant gives the reaction of aluminium (*2.3.1*).

B. 2 mL of the supernatant obtained in identification test A gives reaction (a) of sodium (*2.3.1*).

C. 0.2 g gives the reaction of silicates (*2.3.1*).

TESTS

**pH** (*2.2.3*): 9.5 to 11.5.

Disperse 5.0 g in 100 mL of *carbon dioxide-free water R*.

**Arsenic** (*2.4.2, Method A*): maximum 3 ppm.

Transfer 8.3 g to a 250 mL beaker containing 50 mL of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil gently, with occasional stirring, for 15 min. Centrifuge, and decant the supernatant through a rapid-flow filter paper into a 250 mL volumetric flask. To the residue in the beaker, add 25 mL of hot *dilute hydrochloric acid R*, stir, centrifuge, and decant the supernatant through the same filter into the volumetric flask. Repeat the extraction with 3 additional quantities, each of 25 mL, of hot *dilute hydrochloric acid R*, filtering each supernatant through this filter into the volumetric flask. Allow the combined filtrates to cool to room temperature and dilute to 250.0 mL with *dilute hydrochloric acid R*. Dilute 10.0 mL of the solution to 25.0 mL with *water R*.

**Lead**: maximum 5 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Transfer 5.0 g to a 250 mL beaker containing 50 mL of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil for 15 min. Allow to cool to room temperature. Centrifuge, and decant the supernatant through a rapid-flow filter paper into a 250 mL beaker. To the insoluble matter add 25 mL of hot *water R*. Stir vigorously, centrifuge, and decant the supernatant through the same filter into the beaker. Repeat the extraction with 2 additional quantities, each of 25 mL, of hot *water R*, decanting each supernatant through the filter into the beaker. Wash the filter with 25 mL of hot *water R*, collecting the filtrate in the beaker. Concentrate the combined filtrates by gently boiling to about 15 mL. Add about 0.05 mL of *heavy metal-free nitric acid R*, heat to boiling and allow to cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 25 mL volumetric flask. Transfer the remaining contents of the beaker through the filter paper and into the volumetric flask with *water R* and dilute to 25.0 mL with the same solvent.

*Reference solutions.* Into 4 separate 100 mL volumetric flasks, introduce respectively 3.0 mL, 5.0 mL, 10.0 mL and 15.0 mL of *lead standard solution (10 ppm Pb) R*, add 0.20 mL of *heavy metal-free nitric acid R* and dilute to 100.0 mL with *water R*.

*Source*: lead hollow-cathode lamp.

*Wavelength*: 217.0 nm.

*Atomisation device*: air-acetylene flame.

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Loss on ignition**: 5.0 per cent to 11.0 per cent (dried substance), determined on 1.000 g by ignition in a platinum crucible to constant mass at 1000 ± 25 °C.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

ASSAY

**Aluminium**. Atomic absorption spectrometry (*2.2.23, Method I*).

*Acid mixture.* Add 50 mL of *nitric acid R* to 500 mL of *water R*. Dissolve in this solution 17 g of *tartaric acid R* and dilute to 1000 mL with *water R*.

*Blank solution.* Dissolve 1.4 g of *anhydrous lithium metaborate R* in 60 mL of the acid mixture and dilute to 200 mL with *water R*.

*Test solution.* In a platinum crucible mix 0.200 g with 1.4 g of *anhydrous lithium metaborate R*. Heat slowly at first and ignite at 1100 ± 25 °C for 15 min. Cool, then place the crucible in a 100 mL beaker containing 60 mL of the acid mixture. Place a polytetrafluoroethylene-coated magnetic stirring bar in the crucible and stir gently with a magnetic stirrer for 16 h. Transfer the contents of the crucible into a 200 mL volumetric flask. Wash the crucible, the magnetic stirring bar and the beaker with *water R* and dilute to 200.0 mL with the same solvent (solution A). To 10.0 mL of this solution, add 1.0 mL of *lanthanum chloride solution R* and dilute to 50.0 mL with *water R*.

*Reference solutions.* Into 5 separate 50 mL volumetric flasks, introduce respectively 1.0 mL, 2.5 mL, 5.0 mL, 7.5 mL and 10.0 mL of *aluminium standard solution (100 ppm Al) R*, add 1 mL of *lanthanum chloride solution R* and 10 mL of the blank solution, and dilute to 50.0 mL with *water R*.

*Source*: aluminium hollow-cathode lamp.

*Wavelength*: 309.3 nm.

*Atomisation device*: acetylene-nitrous oxide flame.

**Sodium**. Atomic emission spectrometry (*2.2.22, Method I*).

*Test solution.* To 2.0 mL of solution A, prepared in the assay of aluminium, add 1 mL of a 12.5 g/L solution of *caesium chloride R* and dilute to 20.0 mL with *water R*.

*Reference solutions.* Into 5 separate 200 mL volumetric flasks, each containing 10 mL of a 12.5 g/L solution of *caesium chloride R*, introduce respectively 1.0 mL, 2.0 mL, 4.0 mL, 6.0 mL and 10.0 mL of *sodium standard solution (200 ppm Na) R* and dilute to 200.0 mL with *water R*.

*Wavelength*: 589.0 nm.

**07/2012:1663**
**corrected 10.0**

# ALUMINIUM STEARATE

## Aluminii stearas

DEFINITION

Aluminium salts of a mixture of solid organic acids consisting mainly of variable proportions of aluminium stearate and aluminium palmitate. The organic acids are obtained from sources of vegetable or animal origin.

*Content*:

- *aluminium* (Al; $A_r$ 26.98): 3.0 per cent to 9.0 per cent (dried substance);
- *stearic acid in the fatty acid fraction*: minimum 40.0 per cent;
- *sum of stearic acid and palmitic acid in the fatty acid fraction*: minimum 90.0 per cent.

CHARACTERS

*Appearance*: white or almost white, very fine, light powder.

*Solubility*: practically insoluble in water and in anhydrous ethanol.

IDENTIFICATION

*First identification: C, D.*

*Second identification: A, B, D.*

A. Freezing point (*2.2.18*): minimum 53 °C, determined on the residue obtained in the preparation of solution S (see Tests).

B. Acid value (*2.5.1*): 195 to 210.
Dissolve 0.200 g of the residue obtained in the preparation of solution S in 25 mL of the prescribed mixture of solvents.

C. Examine the chromatograms obtained in the assay of stearic acid and palmitic acid.
*Results*: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 2 principal peaks in the chromatogram obtained with the reference solution.

D. 1 mL of solution S gives the reaction of aluminium (*2.3.1*). The addition of 0.5 mL of *dilute hydrochloric acid R* described in the general method is omitted.

TESTS

**Solution S**. To 5.0 g add 50 mL of *peroxide-free ether R*, 20 mL of *dilute nitric acid R* and 20 mL of *distilled water R* and heat gently under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 4 mL, of *distilled water R*. Combine the aqueous layers, wash with 15 mL of *peroxide-free ether R* and dilute to 50.0 mL with *distilled water R* (solution S). Evaporate the ether layer to dryness and dry the residue at 100-105 °C. Keep the residue for identification tests A and B.

**Acidity or alkalinity**. To 1.0 g add 20 mL of *carbon dioxide-free water R* and boil for 1 min with continuous shaking. Cool and filter. To 10 mL of the filtrate add 0.05 mL of *bromothymol blue solution R4*. Not more than 0.05 mL of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

**Chlorides** (*2.4.4*): maximum 0.1 per cent.

Dilute 0.5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 0.5 per cent.

Dilute 0.3 mL of solution S to 15 mL with *distilled water R*.

**Cadmium**: maximum 3 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

*For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead and nickel as practicable and store all reagent solutions in containers of borosilicate glass. Clean glassware before use by soaking in a warm 773 g/L solution of nitric acid R for 30 min and by rinsing with deionised water.*

*Blank solution*. Dilute 25 mL of *cadmium- and lead-free nitric acid R* to 100.0 mL with *water R*.

*Modifier solution*. Dissolve 20 g of *ammonium dihydrogen phosphate R* and 1 g of *magnesium nitrate R* in *water R* and dilute to 100 mL with the same solvent. Alternatively, use an appropriate matrix modifier as recommended by the graphite furnace atomic absorption (GFAA) spectrometer manufacturer.

*Test solution*. Place 0.100 g of the substance to be examined in a polytetrafluoroethylene digestion bomb and add 2.5 mL of *cadmium- and lead-free nitric acid R*. Close and seal the bomb according to the manufacturer's operating instructions. *When using a digestion bomb, be thoroughly familiar with the safety and operating instructions. Carefully follow the bomb manufacturer's instructions regarding care and maintenance of these digestion bombs. Do not use metal-jacketed bombs or liners that have been used with hydrochloric acid due to contamination from corrosion of the metal jacket by hydrochloric acid*. Heat the bomb in an oven at 170 °C for 3 h. Cool the bomb slowly in air to room temperature according to the bomb manufacturer's instructions. Place the bomb in a fume cupboard and open carefully as corrosive gases may be expelled. Dissolve the residue in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution*. Prepare a solution containing 0.00165 µg/mL of *cadmium nitrate tetrahydrate R* in the blank solution (equivalent to 0.006 µg/mL of Cd).

Dilute 1.0 mL of the test solution to 10.0 mL with the blank solution. Prepare mixtures of this solution, the reference solution and the blank solution in the following proportions: (1.0:0:1.0 *V/V/V*), (1.0:0.25:0.75 *V/V/V*), (1.0:0.5:0.5 *V/V/V*), (1.0:0.75:0.25 *V/V/V*). To each mixture add 50 µL of the modifier solution and mix. These solutions contain respectively 0 µg, 0.0015 µg, 0.0030 µg and 0.0045 µg of cadmium per millilitre from the reference solution. Keep the remaining test solution for use in the test for lead and nickel.

*Source*: cadmium hollow-cathode lamp.

*Wavelength*: 228.8 nm.

*Atomisation device*: furnace.

*Platform*: pyrolytically coated with integrated tube.

*Operating conditions*: use the temperature programme recommended for cadmium by the GFAA manufacturer. An example of temperature parameters for GFAA analysis of cadmium is shown below.

| Stage | Final temperature (°C) | Ramp time (s) | Hold time (s) |
|---|---|---|---|
| Drying | 110 | 10 | 20 |
| Ashing | 600 | 10 | 30 |
| Atomisation | 1800 | 0 | 5 |

**Lead**: maximum 10 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

*For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead and nickel as practicable and store all reagent solutions in containers of borosilicate glass. Clean glassware before use by soaking in a warm 773 g/L solution of nitric acid R for 30 min and by rinsing with deionised water.*

*Blank solution*. Use the solution described in the test for cadmium.

*Modifier solution*. Use the solution described in the test for cadmium.

*Test solution*. Use the solution described in the test for cadmium.

*Reference solution*. Prepare a solution of 0.100 µg/mL of Pb by suitable dilutions of *lead standard solution (100 ppm Pb) R* with the blank solution.

Prepare mixtures of the test solution, the reference solution and the blank solution in the following proportions: (1.0:0:1.0 *V/V/V*), (1.0:0.5:0.5 *V/V/V*), (1.0:1.0:0 *V/V/V*). To each mixture add 50 µL of the modifier solution and mix. These solutions contain respectively 0 µg, 0.025 µg and 0.05 µg of lead per millilitre from the reference solution.

*Source*: lead hollow-cathode lamp.

*Wavelength*: 283.3 nm.

*Atomisation device*: furnace.

*Platform*: pyrolytically coated with integrated tube.

*Operating conditions*: use the temperature programme recommended for lead by the GFAA manufacturer. An example of temperature parameters for GFAA analysis of lead is shown below.

| Stage | Final temperature (°C) | Ramp time (s) | Hold time (s) |
|---|---|---|---|
| Drying | 110 | 10 | 20 |
| Ashing | 450 | 10 | 30 |
| Atomisation | 2000 | 0 | 5 |

**Nickel**: maximum 5 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

*For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead and nickel as practicable and store all reagent solutions in containers of borosilicate glass. Clean glassware before use by soaking in a warm 773 g/L solution of nitric acid R for 30 min and by rinsing with deionised water.*

*Blank solution*. Use the solution described in the test for cadmium.

*Modifier solution*. Dissolve 20 g of *ammonium dihydrogen phosphate R* in *water R* and dilute to 100 mL with the same solvent. Alternatively, use an appropriate matrix modifier as recommended by the GFAA spectrometer manufacturer.

*Test solution*. Use the solution described in the test for cadmium.

*Reference solution*. Prepare a solution of 0.050 µg/mL of Ni by suitable dilutions of a 0.2477 µg/mL solution of *nickel nitrate hexahydrate R* with the blank solution.

Prepare mixtures of the test solution, the reference solution and the blank solution in the following proportions: (1.0:0:1.0 *V/V/V*), (1.0:0.5:0.5 *V/V/V*), (1.0:1.0:0 *V/V/V*). To each mixture add 50 µL of the modifier solution and mix. These solutions contain respectively 0 µg, 0.0125 µg and 0.025 µg of nickel per millilitre from the reference solution.

*Source*: nickel hollow-cathode lamp.

*Wavelength*: 232.0 nm.

*Atomisation device*: furnace.

*Platform*: pyrolytically coated with integrated tube.

*Operating conditions*: use the temperature programme recommended for nickel by the GFAA manufacturer. An example of temperature parameters for GFAA analysis of nickel is shown below.

| Stage | Final temperature (°C) | Ramp time (s) | Hold time (s) |
|---|---|---|---|
| Drying | 110 | 10 | 20 |
| Ashing | 1000 | 20 | 30 |
| Atomisation | 2300 | 0 | 5 |

**Loss on drying** (*2.2.32*): maximum 6.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

ASSAY

**Aluminium**. To 0.250 g in a 250 mL conical flask add 20 mL of *methanol R* and, slowly, 2 mL of *sulfuric acid R*. Heat the solution for 30 min under reflux on a water-bath, swirling frequently. Allow to cool. Add 100 mL of *water R* and adjust to about pH 1 by adding approximately 12 mL of *dilute sodium hydroxide solution R*. Add 20.0 mL of *0.1 M sodium edetate* and adjust to between pH 5 and pH 6 by the addition of *sodium acetate R*. Add 70 mg of *xylenol orange triturate R* and titrate immediately and quickly with *0.1 M zinc sulfate* until the colour changes from yellow to pinkish-violet.

1 mL of *0.1 M sodium edetate* is equivalent to 2.698 mg of Al.

**Stearic acid and palmitic acid**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution*. In a conical flask fitted with a reflux condenser, dissolve 0.100 g of the substance to be examined in 5 mL of *boron trifluoride-methanol solution R*. Boil under a reflux condenser for 10 min. Add 4 mL of *heptane R* through the condenser and boil again under a reflux condenser for 10 min. Allow to cool. Add 20 mL of *saturated sodium chloride solution R*. Shake and allow the layers to separate. Dry the organic layer over 0.1 g of *anhydrous sodium sulfate R* previously washed with *heptane R*. Dilute 1.0 mL of the solution to 10.0 mL with *heptane R*.

*Reference solution*. Prepare the reference solution in the same manner as the test solution using 50.0 mg of *palmitic acid CRS* and 50.0 mg of *stearic acid CRS* instead of the substance to be examined.

*Column*:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.32 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 0.5 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 2.4 mL/min.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 2 | 70 |
| | 2 - 36 | 70 → 240 |
| | 36 - 41 | 240 |
| Injection port | | 220 |
| Detector | | 260 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Relative retention* with reference to methyl stearate: methyl palmitate = about 0.9.

*System suitability*: reference solution:

– *resolution*: minimum 5.0 between the peaks due to methyl palmitate and methyl stearate;
– *repeatability*: maximum relative standard deviation of 3.0 per cent for the areas of the peaks due to methyl palmitate and methyl stearate after 6 injections; maximum relative standard deviation of 1.0 per cent for the ratio of the areas of the peaks due to methyl palmitate to the areas of the peaks due to methyl stearate after 6 injections.

**01/2017:0165**

# ALUMINIUM SULFATE

## Aluminii sulfas

$Al_2(SO_4)_3,xH_2O$ $M_r$ 342.1 (anhydrous substance)

DEFINITION

*Content*: 51.0 per cent to 59.0 per cent of $Al_2(SO_4)_3$.

It contains a variable quantity of water of crystallisation.

CHARACTERS

*Appearance*: colourless, lustrous crystals or crystalline masses.

*Solubility*: soluble in cold water, freely soluble in hot water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of sulfates (*2.3.1*).

B. Solution S gives the reaction of aluminium (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.5 g in *water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is not more opalescent than reference suspension III (*2.2.1*) and is colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 2.5 to 4.0.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Alkali and alkaline-earth metals**: maximum 0.4 per cent.

To 20 mL of solution S add 100 mL of *water R*, heat and add 0.1 mL of *methyl red solution R*. Add *dilute ammonia R1* until the colour of the indicator changes to yellow. Dilute to 150 mL with *water R*, heat to boiling and filter. Evaporate 75 mL of the filtrate to dryness on a water-bath and ignite. The residue weighs a maximum of 2 mg.

**Ammonium** (*2.4.1*): maximum 500 ppm.

Dilute 0.4 mL of solution S to 14 mL with *water R*.

**Iron** (*2.4.9*): maximum 100 ppm.

Dilute 2 mL of solution S to 10 mL with *water R*. Use 0.3 mL of *thioglycollic acid R* in this test.

ASSAY

Dissolve 0.500 g in 20 mL of *water R*. Carry out the complexometric titration of aluminium (*2.5.11*).

1 mL of *0.1 M sodium edetate* is equivalent to 17.11 mg of $Al_2(SO_4)_3$.

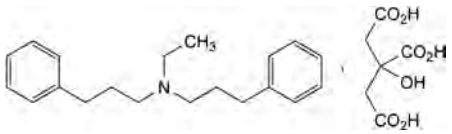
STORAGE

In an airtight container.

**01/2018:2156**
**corrected 10.0**

# ALVERINE CITRATE

## Alverini citras



$C_{26}H_{35}NO_7$ $M_r$ 473.6

[5560-59-8]

DEFINITION

*N*-Ethyl-3-phenyl-*N*-(3-phenylpropyl)propan-1-amine dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: slightly soluble in water and in methylene chloride, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *alverine citrate CRS*.

TESTS

**pH** (*2.2.3*): 3.5 to 4.5.

Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Related substances**. Gas chromatography (*2.2.28*): use the normalisation procedure. *Use freshly prepared solutions.*

*Test solution*. Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 20 mL with the same solvent. Add 2 mL of *concentrated ammonia R* and shake with 3 quantities, each of 15 mL, of *methylene chloride R*. To the combined lower layers add *anhydrous sodium sulfate R*, shake, filter, and evaporate the filtrate by suitable means at a temperature not exceeding 30 °C. Take up the residue with *methylene chloride R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 5 mg of *alverine impurity D CRS* (impurity D citrate) in 5 mL of *water R*, add 1 mL of *concentrated ammonia R* and shake with 3 quantities, each of 5 mL, of *methylene chloride R*. To the combined lower layers add *anhydrous sodium sulfate R*, shake, filter, and evaporate the filtrate by suitable means at a temperature not exceeding 30 °C. Take up the residue with *methylene chloride R*, add 0.2 mL of the test solution and dilute to 2.0 mL with *methylene chloride R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with *methylene chloride R*. Dilute 1.0 mL of this solution to 20.0 mL with *methylene chloride R*.

*Reference solution (c)*. Dissolve 20 mg of *alverine impurity C CRS* in *methylene chloride R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *methylene chloride R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.32 mm;
- *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.45 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 2.2 mL/min.

*Split ratio*: 1:11.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 7 | 120 |
| | 7 - 13 | 120 → 240 |
| | 13 - 21 | 240 |
| | 21 - 24 | 240 → 290 |
| | 24 - 39 | 290 |
| Injection port | | 290 |
| Detector | | 290 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peak due to impurity C; use the chromatogram obtained with reference solution (a) to identify the peak due to impurity D.

*Relative retention* with reference to alverine (retention time = about 18 min): impurity C = about 0.5; impurity D = about 0.97.

*System suitability*: reference solution (a):

- *resolution*: minimum 3.0 between the peaks due to impurity D and alverine.

*Limits*:

- *impurities C, D*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent (reference solution (b)).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 80 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.375 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 47.36 mg of $C_{26}H_{35}NO_7$.

STORAGE

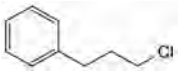
Protected from light.

IMPURITIES

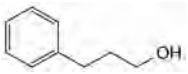
*Specified impurities: C, D.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or

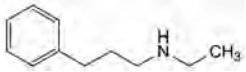
by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, E.*



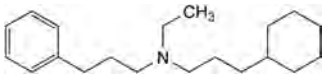
A. 1-chloro-3-phenylpropane,



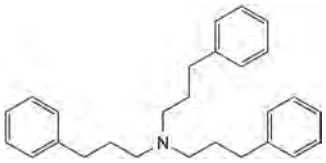
B. 3-phenylpropan-1-ol,



C. *N*-ethyl-3-phenylpropan-1-amine,



D. *N*-(3-cyclohexylpropyl)-*N*-ethyl-3-phenylpropan-1-amine,



E. 3-phenyl-*N*,*N*-bis(3-phenylpropyl)propan-1-amine.

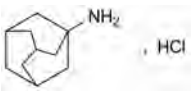
# AMANTADINE HYDROCHLORIDE

## Amantadini hydrochloridum



$C_{10}H_{18}ClN$ $M_r$ 187.7
[665-66-7]

DEFINITION

Tricyclo[3.3.1.1$^{3,7}$]decan-1-amine hydrochloride.

*Content*: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water and in ethanol (96 per cent). It sublimes on heating.

IDENTIFICATION

*First identification: A, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amantadine hydrochloride CRS.*

B. To 0.1 g add 1 mL of *pyridine R*, mix and add 0.1 mL of *acetic anhydride R*. Heat to boiling for about 10 s. Pour the hot solution into 10 mL of *dilute hydrochloric acid R*, cool to 5 °C and filter. The precipitate, washed with *water R* and dried *in vacuo* at 60 °C for 1 h, melts (*2.2.14*) at 147 °C to 151 °C.

C. Dissolve 0.2 g in 1 mL of *0.1 M hydrochloric acid*. Add 1 mL of a 500 g/L solution of *sodium nitrite R*. A white precipitate is formed.

D. 1 mL of solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Acidity or alkalinity**. Dilute 2 mL of solution S to 10 mL with *carbon dioxide-free water R*. Add 0.1 mL of *methyl red solution R* and 0.2 mL of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.4 mL of *0.01 M hydrochloric acid*. The solution is red.

**Related substances**. Gas chromatography (*2.2.28*).

*Internal standard solution*. Dissolve 0.500 g of *adamantane R* in *methylene chloride R* and dilute to 10.0 mL with the same solvent.

*Test solution*. Weigh 0.5 g of the substance to be examined into a centrifuge tube. Add 9 mL of *methylene chloride R* and 10 mL of a 210 g/L solution of *sodium hydroxide R*. Shake for 10 min. Discard the upper layer. Dry the lower layer over *anhydrous sodium sulfate R*. Filter and collect the filtrate in a volumetric flask. Add 0.1 mL of the internal standard solution and dilute to 10.0 mL with *methylene chloride R*.

*Reference solution*. Weigh 5 mg of *amantadine hydrochloride CRS* into a centrifuge tube. Add 9 mL of *methylene chloride R* and 10 mL of a 210 g/L solution of *sodium hydroxide R*. Shake for 10 min. Discard the upper layer. Dry the lower layer over *anhydrous sodium sulfate R*. Filter and collect the filtrate in a volumetric flask. Add 1.0 mL of the internal standard solution and dilute to 100.0 mL with *methylene chloride R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.53 mm;
- *stationary phase*: *base-deactivated phenyl(5)methyl(95)polysiloxane R* (film thickness 1 µm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 4 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 5 | 70 |
| | 5 - 23 | 70 → 250 |
| | 23 - 40 | 250 |
| Injection port | | 220 |
| Detector | | 300 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Relative retention* with reference to amantadine (retention time = about 14 min): internal standard = about 0.8.

*System suitability*: reference solution:

- *resolution*: minimum 5.0 between the peaks due to the internal standard and amantadine.

*Limits*:

- *unspecified impurities*: calculate the ratio ($R_1$) of the area of the peak due to amantadine to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with the test solution, calculate the ratio of the

area of any peak, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than $R_1$ (0.10 per cent);

– *total*: calculate the ratio ($R_2$) of 3 times the area of the peak due to amantadine to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than $R_2$ (0.3 per cent);

– *disregard limit*: calculate the ratio ($R_3$) of 0.5 times the area of the peak due to amantadine to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: disregard any peak with a ratio less than $R_3$ (0.05 per cent).

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 2.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

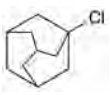
ASSAY

Dissolve 0.150 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

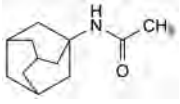
1 mL of *0.1 M sodium hydroxide* is equivalent to 18.77 mg of $C_{10}H_{18}ClN$.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B*.



A. 1-chlorotricyclo[3.3.1.1$^{3,7}$]decane,



B. *N*-(tricyclo[3.3.1.1$^{3,7}$]dec-1-yl)acetamide.

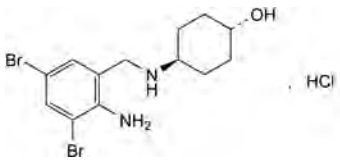
**corrected 9.2**

# AMBROXOL HYDROCHLORIDE

## Ambroxoli hydrochloridum



$C_{13}H_{19}Br_2ClN_2O$ $M_r$ 414.6
[23828-92-4]

DEFINITION

*trans*-4-[(2-Amino-3,5-dibromobenzyl)amino]cyclohexanol hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or yellowish, crystalline powder.

*Solubility*: sparingly soluble in water, soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 20.0 mg in *dilute sulfuric acid R1* and dilute to 100.0 mL with the same acid. Dilute 2.0 mL of the solution to 10.0 mL with *dilute sulfuric acid R1*.

*Spectral range*: 200-350 nm.

*Absorption maxima*: at 245 nm and 310 nm.

*Absorbance ratio*: $A_{245}/A_{310}$ = 3.2 to 3.4.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ambroxol hydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 5 mL with the same solvent.

*Reference solution.* Dissolve 50 mg of *ambroxol hydrochloride CRS* in *methanol R* and dilute to 5 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *concentrated ammonia R, propanol R, ethyl acetate R, hexane R* (1:10:20:70 *V/V/V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 25 mg in 2.5 mL of *water R*, mix with 1.0 mL of *dilute ammonia R1* and allow to stand for 5 min. Filter and acidify the filtrate with *dilute nitric acid R*. The filtrate gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.75 g in *methanol R* and dilute to 15 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.5 to 6.0.

Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 50 mg of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* In order to prepare impurity B *in situ*, dissolve 5 mg of the substance to be examined in 0.2 mL of *methanol R*, add 0.04 mL of a mixture of 1 volume of *formaldehyde solution R* and 99 volumes of *water R*. Heat at 60 °C for 5 min. Evaporate to dryness under a current of nitrogen. Dissolve the residue in 5 mL of *water R* and dilute to 20.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: a mixture of equal volumes of *acetonitrile R* and a solution prepared as follows: dissolve 1.32 g of *ammonium phosphate R* in 900 mL of *water R*, adjust to pH 7.0 with *phosphoric acid R* and dilute to 1000 mL with *water R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 248 nm.

*Injection*: 20 µL.

*Run time*: 3 times the retention time of ambroxol.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B.

*Relative retention* with reference to ambroxol (retention time = about 9 min): impurity B = about 0.6.

*System suitability*: reference solution (b):

- *resolution*: minimum 4.0 between the peaks due to impurity B and ambroxol.

*Limits*:

- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 70 mL of *ethanol (96 per cent) R* and add 5 mL of *0.01 M hydrochloric acid.* Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide.* Read the volume added between the 2 points of inflexion.

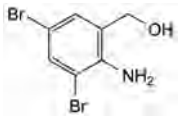
1 mL of *0.1 M sodium hydroxide* is equivalent to 41.46 mg of $C_{13}H_{19}Br_2ClN_2O$.

STORAGE

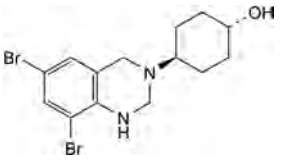
Protected from light.

IMPURITIES

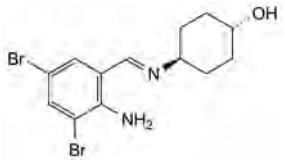
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E.*



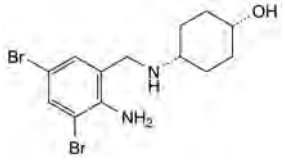
A. (2-amino-3,5-dibromophenyl)methanol,



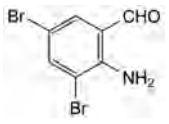
B. *trans*-4-(6,8-dibromo-1,4-dihydroquinazolin-3(2*H*)-yl)-cyclohexanol,



C. *trans*-4-[[(*E*)-2-amino-3,5-dibromobenzyliden]amino]-cyclohexanol,



D. *cis*-4-[(2-amino-3,5-dibromobenzyl)amino]cyclohexanol,

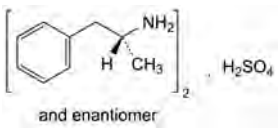


E. 2-amino-3,5-dibromobenzaldehyde.

**04/2019:0368**

# AMFETAMINE SULFATE

## Amfetamini sulfas



$C_{18}H_{28}N_2O_4S$ $M_r$ 368.5
[60-13-9]

DEFINITION

Bis[(2*RS*)-1-phenylpropan-2-amine] sulfate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

*First identification: A, B, D.*

*Second identification: C, D.*

A. Optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *amfetamine sulfate CRS.*

C. To 50 mL of solution S add 5 mL of *strong sodium hydroxide solution R* and 0.5 mL of *benzoyl chloride R* and shake. Continue to add *benzoyl chloride R* in portions of 0.5 mL, shaking after each addition, until no further precipitate is formed. Filter, wash the precipitate with *water R*, recrystallise twice from a mixture of equal volumes of *ethanol (96 per cent) R* and *water R*, then dry at 100-105 °C. The crystals melt (*2.2.14*) at 131 °C to 135 °C.

D. Solution S (see Tests) gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): – 0.04° to + 0.04° (measured in a 2 dm tube), determined on solution S.

**Acidity or alkalinity**. To 25 mL of solution S add 0.1 mL of *methyl red solution R*. Not more than 0.1 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture.* Mix 5 mL of *trifluoroacetic acid R* and 900 mL of *water for chromatography R*, adjust to pH 2.2 with *concentrated ammonia R* and dilute to 1000 mL with *acetonitrile R*.

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 5 mg of *1-phenylpropan-2-ol R* (impurity A) and 5 mg of *benzaldehyde R* (impurity D) in the solvent mixture and dilute to 10 mL with the solvent mixture. Dilute 1 mL of the solution to 100 mL with the solvent mixture.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: solvent mixture;
– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 1 | 100 | 0 |
| 1 - 16 | 100 → 65 | 0 → 35 |
| 16 - 21 | 65 → 0 | 35 → 100 |
| 21 - 23 | 0 | 100 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 257 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A and D.

*Relative retention* with reference to amfetamine (retention time = about 8 min): impurity D = about 1.6; impurity A = about 1.7.

*System suitability*: reference solution (b):

– *resolution*: minimum 4.0 between the peaks due to impurities D and A.

*Calculation of percentage contents:*

– for each impurity, use the concentration of amfetamine sulfate in reference solution (a).

*Limits*:

– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.5 per cent;
– *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

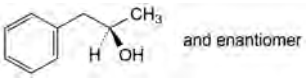
1 mL of *0.1 M perchloric acid* is equivalent to 36.85 mg of $C_{18}H_{28}N_2O_4S$.

STORAGE

Protected from light.

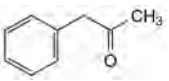
IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D.*

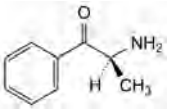


and enantiomer

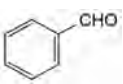
A. (2*RS*)-1-phenylpropan-2-ol,



B. 1-phenylpropan-2-one,



C. (2*S*)-2-amino-1-phenylpropan-1-one (cathinone),

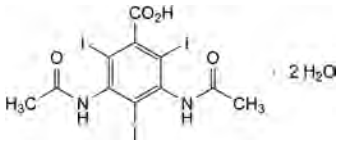


D. benzaldehyde.

01/2017:0873

# AMIDOTRIZOIC ACID DIHYDRATE

## Acidum amidotrizoicum dihydricum



$C_{11}H_9I_3N_2O_4,2H_2O$ $M_r$ 650
[50978-11-5]

DEFINITION

3,5-Bis(acetylamino)-2,4,6-triiodobenzoic acid dihydrate.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very slightly soluble in water and in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification*: A.

*Second identification*: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amidotrizoic acid dihydrate CRS*.

B. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 25 mg of the substance to be examined in a 3 per cent *V/V* solution of *ammonia R* in *methanol R* and dilute to 5 mL with the same solution.
*Reference solution*. Dissolve 25 mg of *amidotrizoic acid dihydrate CRS* in a 3 per cent *V/V* solution of *ammonia R* in *methanol R* and dilute to 5 mL with the same solution.
*Plate*: *TLC silica gel $GF_{254}$ plate R*.
*Mobile phase*: *anhydrous formic acid R*, *methyl ethyl ketone R*, *toluene R* (20:25:60 *V/V/V*).
*Application*: 2 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air until the solvents have evaporated.
*Detection*: in ultraviolet light at 254 nm.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Heat 50 mg gently in a small porcelain dish over a naked flame. Violet vapour is evolved.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in *dilute sodium hydroxide solution R* and dilute to 20 mL with the same solution.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*. Dissolve 0.250 g of *sodium hydroxide R* and 0.860 g of *sodium dihydrogen phosphate R* in 50 mL of *water R* and dilute to 1000 mL with the same solvent.

*Test solution*. Dissolve 40.0 mg of the substance to be examined in 10.0 mL of the solvent mixture with the aid of ultrasound.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve the contents of a vial of *amidotrizoic acid for system suitability CRS* (impurities A, B, C and D) in 1.0 mL of the solvent mixture.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*. Dissolve 3.4 g of *tetrabutylammonium hydrogen sulfate R* in a mixture of 230 mL of *acetonitrile R* and 770 mL of *water R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 236 nm.

*Injection*: 20 µL.

*Run time*: 4 times the retention time of amidotrizoic acid.

*Identification of impurities*: use the chromatogram supplied with *amidotrizoic acid for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, C and D.

*Relative retention* with reference to amidotrizoic acid (retention time = about 5 min): impurity B = about 0.8; impurity C = about 0.9; impurity A = about 1.4; impurity D = about 1.8.

*System suitability*:
- *resolution*: minimum 1.5 between the peaks due to impurities B and C in the chromatogram obtained with reference solution (c);
- *signal-to-noise ratio*: minimum 25 for the principal peak in the chromatogram obtained with reference solution (b).

*Limits*:
- *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *impurities A, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);
- *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent), except for the peaks due to impurities A and D.

**Halides expressed as chlorides** (*2.4.4*): maximum 150 ppm.

Dissolve 0.55 g in a mixture of 4 mL of *dilute sodium hydroxide solution R* and 15 mL of *water R*. Add 6 mL of *dilute nitric acid R* and filter.

**Free aromatic amines**. *Maintain the solutions and reagents in iced water, protected from bright light*. To 0.50 g in a 50 mL volumetric flask add 15 mL of *water R*. Shake and add 1 mL of *dilute sodium hydroxide solution R*. Cool in iced water, add 5 mL of a freshly prepared 5 g/L solution of *sodium nitrite R* and 12 mL of *dilute hydrochloric acid R*. Shake gently and allow to stand for exactly 2 min after adding the hydrochloric acid. Add 10 mL of a 20 g/L solution of *ammonium sulfamate R*. Allow to stand for 5 min, shaking frequently, and add 0.15 mL of a 100 g/L solution of *α-naphthol R* in *ethanol (96 per cent) R*. Shake and allow to stand for 5 min. Add 3.5 mL of *buffer solution pH 10.9 R*, mix and dilute to 50.0 mL with *water R*. The absorbance (*2.2.25*), measured within 20 min at 485 nm using as the compensation liquid a solution prepared at the same time and in the same manner but omitting the substance to be examined, is not greater than 0.30.

**Loss on drying** (*2.2.32*): 4.5 per cent to 7.0 per cent, determined on 0.500 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.150 g in a 250 mL round-bottomed flask add 5 mL of *strong sodium hydroxide solution R*, 20 mL of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 mL of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 mL of *dilute sulfuric acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 20.47 mg of $C_{11}H_9I_3N_2O_4$.

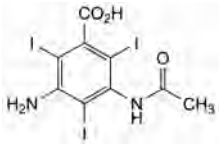
STORAGE

Protected from light.

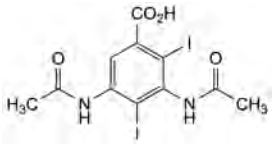
IMPURITIES

*Specified impurities*: *A, B, D.*

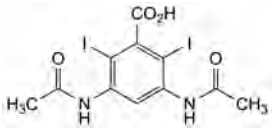
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E.*



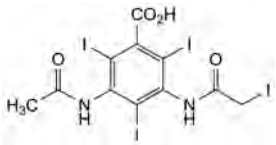
A. 3-(acetylamino)-5-amino-2,4,6-triiodobenzoic acid,



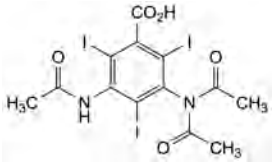
B. 3,5-bis(acetylamino)-2,4-diiodobenzoic acid,



C. 3,5-bis(acetylamino)-2,6-diiodobenzoic acid,



D. 3-(acetylamino)-5-[(iodoacetyl)amino]-2,4,6-triiodobenzoic acid,

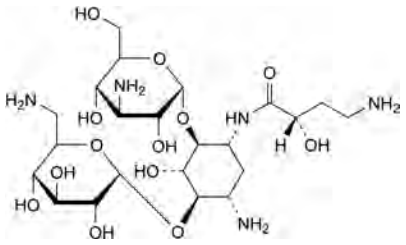


E. 3-(acetylamino)-5-(diacetylamino)-2,4,6-triiodobenzoic acid.

**07/2014:1289**

# AMIKACIN

## Amikacinum



$C_{22}H_{43}N_5O_{13}$ $M_r$ 585.6
[37517-28-5]

DEFINITION

6-*O*-(3-Amino-3-deoxy-α-D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-D-streptamine.

Antimicrobial substance obtained from kanamycin A.

Semi-synthetic product derived from a fermentation product.

*Content*: 96.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: sparingly soluble in water, slightly soluble in methanol, practically insoluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *amikacin CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (a)*. Dissolve 25 mg of *amikacin CRS* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (b)*. Dissolve 5 mg of *kanamycin monosulfate CRS* in 1 mL of the test solution and dilute to 10 mL with *water R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *methylene chloride R*, *ammonia R*, *methanol R* (25:30:40 *V/V/V*).

*Application*: 5 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**pH** (*2.2.3*): 9.5 to 11.5.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 97 to + 105 (anhydrous substance).

Dissolve 0.50 g in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 25 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 10.0 mL with mobile phase A.

*Reference solution (c)*. Dissolve 5 mg of *amikacin for system suitability CRS* (containing impurities A, B, F and H) in mobile phase A and dilute to 10 mL with mobile phase A.

*Reference solution (d)*. Dissolve 5.0 mg of *amikacin impurity I CRS* in mobile phase A and dilute to 20.0 mL with mobile phase A. Dilute 1.0 mL of the solution to 100.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: a mixture prepared with *carbon dioxide-free water R*, containing 1.8 g/L of *sodium octanesulfonate R*, 20 g/L of *anhydrous sodium sulfate R1*, 1.4 per cent *V/V* of *tetrahydrofuran R*, and 5 per cent *V/V* of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*; degas;
- *mobile phase B*: a mixture prepared with *carbon dioxide-free water R*, containing 1.8 g/L of *sodium octanesulfonate R*, 28 g/L of *anhydrous sodium sulfate R1*, 1.4 per cent *V/V* of *tetrahydrofuran R*, and 5 per cent *V/V* of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*; degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 100 | 0 |
| 3 - 38.0 | 100 → 30 | 0 → 70 |
| 38.0 - 38.1 | 30 → 0 | 70 → 100 |
| 38.1 - 68 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Post-column solution*: mixture of 1 volume of *carbonate-free sodium hydroxide solution R* and 24 volumes of previously degassed *carbon dioxide-free water R*, which is added in a pulseless manner to the column effluent using a 375 µL polymeric mixing coil.

*Flow rate of post-column solution*: 0.3 mL/min.

*Detection*: pulsed amperometric detector or equivalent with a gold indicator electrode, a silver-silver chloride reference electrode, and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and – 0.15 V reduction potentials, with pulse durations according to the instrument used.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *amikacin for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, F and H; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity I.

*Relative retention* with reference to amikacin (retention time = about 28 min): impurity I = about 0.13; impurity F = about 0.92; impurity B = about 0.95; impurity A = about 1.62; impurity H = about 1.95.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 5, where $H_p$ = height above the baseline of the peak due to impurity B and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to amikacin; if necessary, adjust the volume of tetrahydrofuran in the mobile phase.

*Calculation of percentage contents*:

- for impurity I, use the concentration of impurity I in reference solution (d);
- for impurities other than I, use the concentration of amikacin in reference solution (a).

*Limits*:

- *impurities A, B, F, H, I*: for each impurity, maximum 0.5 per cent;
- *any other impurity*: for each impurity, maximum 0.5 per cent;
- *total*: maximum 1.5 per cent;
- *reporting threshold*: 0.1 per cent.

**Water** (*2.5.12*): maximum 8.5 per cent, determined on 0.200 g.

**Sulfated ash** (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution*. Dissolve 50.0 mg of *amikacin CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: a mixture prepared with *carbon dioxide-free water R*, containing 1.8 g/L of *sodium octanesulfonate R*, 20 g/L of *anhydrous sodium sulfate R1*, 5.8 per cent *V/V* of *acetonitrile R1*, and 5 per cent *V/V* of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*; degas.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 200 nm.

*Injection*: 20 µL.

*Run time*: 1.3 times the retention time of amikacin.

*Retention time*: amikacin = about 30 min.

*System suitability*: reference solution:

- *symmetry factor*: maximum 1.5 for the peak due to amikacin; if necessary, adjust the amount of *acetonitrile R1* in the mobile phase; peak splitting may be observed when the retention time becomes too short;
- *repeatability*: maximum relative standard deviation of 1.5 per cent after 6 injections.

Calculate the percentage content of $C_{22}H_{43}N_5O_{13}$ taking into account the assigned content of *amikacin CRS*.

IMPURITIES

*Specified impurities: A, B, F, H, I.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, G.*

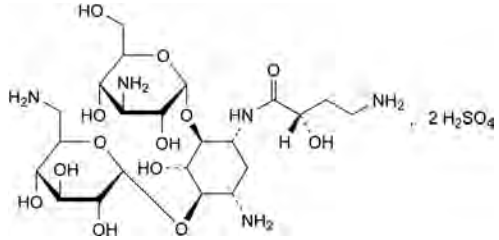
# AMIKACIN SULFATE

## Amikacini sulfas



$C_{22}H_{47}N_5O_{21}S_2$ $M_r$ 782
[39831-55-5]

DEFINITION

6-*O*-(3-Amino-3-deoxy-α-D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-D-streptamine sulfate.

Antimicrobial substance obtained from kanamycin A.

Semi-synthetic product derived from a fermentation product.

*Content*: 96.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: freely soluble in water, practically insoluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *amikacin sulfate CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (a)*. Dissolve 25 mg of *amikacin sulfate CRS* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (b)*. Dissolve 5 mg of *kanamycin monosulfate CRS* in 1 mL of the test solution and dilute to 10 mL with *water R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *methylene chloride R*, *ammonia R*, *methanol R* (25:30:40 *V/V/V*).

*Application*: 5 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. It gives reaction (a) of sulfates (*2.3.1*).

TESTS

**pH** (*2.2.3*): 2.0 to 4.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 76 to + 84 (dried substance).

Dissolve 0.50 g in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 33 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 10.0 mL with mobile phase A.

*Reference solution (c)*. Dissolve 5 mg of *amikacin for system suitability CRS* (containing impurities A, B, F and H) in mobile phase A and dilute to 10 mL with mobile phase A.

*Reference solution (d)*. Dissolve 6.6 mg of *amikacin impurity I CRS* in mobile phase A and dilute to 20.0 mL with mobile phase A. Dilute 1.0 mL of the solution to 100.0 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: a mixture prepared with *carbon dioxide-free water R*, containing 1.8 g/L of *sodium octanesulfonate R*, 20 g/L of *anhydrous sodium sulfate R1*, 1.4 per cent *V/V* of *tetrahydrofuran R*, and 5 per cent *V/V* of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*; degas;
– *mobile phase B*: a mixture prepared with *carbon dioxide-free water R*, containing 1.8 g/L of *sodium octanesulfonate R*, 28 g/L of *anhydrous sodium sulfate R1*, 1.4 per cent *V/V* of *tetrahydrofuran R*, and 5 per cent *V/V* of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*; degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 100 | 0 |
| 3 - 38.0 | 100 → 30 | 0 → 70 |
| 38.0 - 38.1 | 30 → 0 | 70 → 100 |
| 38.1 - 68 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Post-column solution*: mixture of 1 volume of *carbonate-free sodium hydroxide solution R* and 24 volumes of previously degassed *carbon dioxide-free water R*, which is added in a pulseless manner to the column effluent using a 375 µL polymeric mixing coil.

*Flow rate of post-column solution*: 0.3 mL/min.

*Detection*: pulsed amperometric detector or equivalent with a gold indicator electrode, a silver-silver chloride reference electrode, and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and − 0.15 V reduction potentials, with pulse durations according to the instrument used.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *amikacin for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, F and H; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity I.

*Relative retention* with reference to amikacin (retention time = about 28 min): impurity I = about 0.13; impurity F = about 0.92; impurity B = about 0.95; impurity A = about 1.62; impurity H = about 1.95.

*System suitability*: reference solution (c):

– *peak-to-valley ratio*: minimum 5, where $H_p$ = height above the baseline of the peak due to impurity B and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to amikacin; if necessary, adjust the volume of tetrahydrofuran in the mobile phase.

*Calculation of percentage contents*:

– for impurity I, use the concentration of impurity I in reference solution (d);
– for impurities other than I, use the concentration of amikacin sulfate in reference solution (a).

*Limits*:

– *impurities A, B, F, H, I*: for each impurity, maximum 0.5 per cent;
– *any other impurity*: for each impurity, maximum 0.5 per cent;
– *total*: maximum 1.5 per cent;
– *reporting threshold*: 0.1 per cent.

**Sulfate**: 23.3 per cent to 25.8 per cent (dried substance).

Dissolve 0.250 g in 100 mL of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 mL of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*.

Titrate with *0.1 M sodium edetate* adding 50 mL of *ethanol (96 per cent) R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 mL of *0.1 M barium chloride* is equivalent to 9.606 mg of sulfate ($SO_4$).

**Loss on drying** (*2.2.32*): maximum 13.0 per cent, determined on 0.500 g by drying in an oven at 105 °C at a pressure not exceeding 0.7 kPa for 3 h.

**Pyrogens** (*2.6.8*). If intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 5 mL of a solution containing 25 mg of the substance to be examined in *water for injections R*.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution.* Dissolve 37.4 mg of *amikacin CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mixture containing 1.8 g/L of *sodium octanesulfonate R*, 20 g/L of *anhydrous sodium sulfate R1*, 5.8 per cent *V/V* of *acetonitrile R1*, and 5 per cent *V/V* of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*; degas.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 200 nm.

*Injection*: 20 µL.

*Run time*: 1.3 times the retention time of amikacin.

*Retention time*: amikacin = about 30 min.

*System suitability*: reference solution:

- *symmetry factor*: maximum 1.5 for the peak due to amikacin; if necessary, adjust the amount of *acetonitrile R1* in the mobile phase; peak splitting may be observed when the retention time becomes too short;
- *repeatability*: maximum relative standard deviation of 1.5 per cent after 6 injections.

Calculate the percentage content of $C_{22}H_{47}N_5O_{21}S_2$ taking into account the assigned content of *amikacin CRS* and a correction factor of 1.335.

STORAGE

In an airtight container. If the substance is sterile, the container is also sterile and tamper-evident.

IMPURITIES

*Specified impurities: A, B, F, H, I.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, G.*

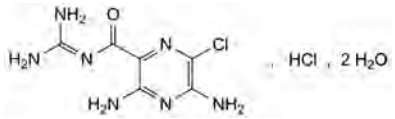
# AMILORIDE HYDROCHLORIDE DIHYDRATE

## Amiloridi hydrochloridum dihydricum



$C_6H_9Cl_2N_7O,2H_2O$ $M_r$ 302.1
[17440-83-4]

DEFINITION

3,5-Diamino-6-chloro-*N*-(diaminomethylidene)pyrazine-2-carboxamide hydrochloride dihydrate.

*Content*: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: pale yellow or greenish-yellow powder.

*Solubility*: slightly soluble in water and in anhydrous ethanol, practically insoluble in heptane.

IDENTIFICATION

*First identification: A, C, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amiloride hydrochloride CRS*.

B. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.
*Reference solution*. Dissolve 5 mg of *amiloride hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.
*Plate*: *TLC silica gel $F_{254}$ plate R*.
*Mobile phase*: *concentrated ammonia R*, *propanol R* (30:70 *V/V*).
*Application*: 5 µL; the volume may be adapted according to the type of plate used.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: examine in ultraviolet light at 254 nm.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent. 2 mL of the solution gives reaction (a) of chlorides (*2.3.1*); acidify with 5 mL of *dilute acetic acid R*, instead of *dilute nitric acid R*.

D. Water (see Tests).

TESTS

**Free acid**. Dissolve 1.0 g in a mixture of 50 mL of *methanol R* and 50 mL of *water R* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Not more than 0.3 mL of *0.1 M sodium hydroxide* is required to reach the end-point.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve 2.76 g of *sodium dihydrogen phosphate monohydrate R* in 850 mL of *water for chromatography R*, adjust to pH 3.0 with *phosphoric acid R* and dilute to 1.0 L with *water for chromatography R*.

*Test solution*. Dissolve 20 mg of the substance to be examined in 1 mL of *methanol R1* and dilute to 10.0 mL with solution A.

*Reference solution (a)*. Dissolve 2 mg of *amiloride impurity A CRS* in 0.5 mL of *methanol R1*, add 0.5 mL of the test solution and dilute to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 4 mg of *amiloride for peak identification CRS* (containing impurity C) in 0.5 mL of *methanol R1* and dilute to 2.0 mL with solution A.

*Reference solution (c)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Column*:
- *size*: *l* = 0.125 m, Ø = 4.0 mm;
- *stationary phase*: *base-deactivated end-capped octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*: dissolve 0.8 g of *sodium hexanesulfonate monohydrate R* in a mixture of 80 mL of *acetonitrile R1* and 920 mL of solution A.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of amiloride.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity A; use the chromatogram supplied with *amiloride for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peak due to impurity C.

*Relative retention* with reference to amiloride (retention time = about 10 min): impurity C = about 0.5; impurity A = about 0.8.

*System suitability*: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to impurity A and amiloride.

*Calculation of percentage contents*:

– for each impurity, use the concentration of amiloride hydrochloride dihydrate in reference solution (c).

*Limits*:

– *impurity C*: maximum 0.2 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.4 per cent;
– *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): 11.0 per cent to 13.0 per cent, determined on 0.200 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 26.61 mg of $C_6H_9Cl_2N_7O$.

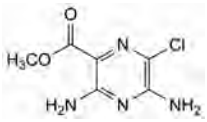
STORAGE

Protected from light.

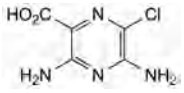
IMPURITIES

*Specified impurities: C.*

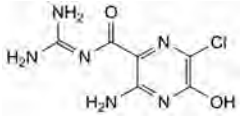
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B.*



A. methyl 3,5-diamino-6-chloropyrazine-2-carboxylate,



B. 3,5-diamino-6-chloropyrazine-2-carboxylic acid,



C. 3-amino-6-chloro-*N*-(diaminomethylidene)-5-hydroxypyrazine-2-carboxamide.

**01/2017:1687**

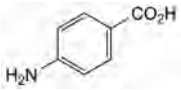
# 4-AMINOBENZOIC ACID

## Acidum 4-aminobenzoicum



$C_7H_7NO_2$ $M_r$ 137.1
[150-13-0]

DEFINITION

4-Aminobenzoic acid.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or slightly yellow, crystalline powder.

*Solubility*: slightly soluble in water, freely soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Melting point (*2.2.14*): 186 °C to 189 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *4-aminobenzoic acid CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 20 mL with the same solvent.
*Reference solution (a)*. Dissolve 20 mg of *4-aminobenzoic acid CRS* in *methanol R* and dilute to 20 mL with the same solvent.
*Reference solution (b)*. Dissolve 10 mg of *4-nitrobenzoic acid R* in 10 mL of reference solution (a).
*Plate*: suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.
*Mobile phase*: *glacial acetic acid R*, *hexane R*, *methylene chloride R* (5:20:75 *V/V/V*).
*Application*: 1 µL.
*Development*: over a path of 10 cm.
*Drying*: in air.
*Detection*: examine in ultraviolet light at 254 nm.
*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $B_5$ (*2.2.2, Method II*).

Dissolve 1.0 g in *ethanol (96 per cent) R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution.* Dissolve 25.0 mg of *4-nitrobenzoic acid R* and 25.0 mg of *benzocaine R* in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.12 m, Ø = 4.0 mm,
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 20 volumes of a mixture of 70 volumes of *acetonitrile R* and 80 volumes of *methanol R*, and 80 volumes of a solution containing 1.5 g/L of *potassium dihydrogen phosphate R* and 2.5 g/L of *sodium octanesulfonate R* adjusted to pH 2.2 with *phosphoric acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 20 µL.

*Run time*: 11 times the retention time of 4-aminobenzoic acid.

*Relative retention* with reference to 4-aminobenzoic acid (retention time = about 3 min): impurity A = about 4; impurity B = about 9.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent),
- *any other impurity*: not more than 0.5 times the area of the peak due to impurity A in the chromatogram obtained with the reference solution (0.1 per cent),
- *total*: not more than 2.5 times the area of the peak due to impurity A in the chromatogram obtained with the reference solution (0.5 per cent),
- *disregard limit*: 0.1 times the area of the peak due to impurity A in the chromatogram obtained with the reference solution (0.02 per cent).

**Impurity C and impurity D**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dissolve 20.0 mg of *lauric acid R* in *methylene chloride R* and dilute to 100.0 mL with the same solvent.

*Test solution.* Dissolve 1.000 g of the substance to be examined in 10.0 mL of an 84 g/L solution of *sodium hydroxide R* and extract with 2 quantities, each of 10 mL, of *methylene chloride R*. Combine and wash with 5 mL of *water R*; filter through *anhydrous sodium sulfate R*. Wash the filter with *methylene chloride R*. Evaporate in a water-bath at 50-60 °C to obtain a volume of about 1-5 mL. Add 1.0 mL of the internal standard solution and dilute to 10.0 mL with *methylene chloride R*.

*Reference solution (a).* Dissolve 20.0 mg of *aniline R* in *methylene chloride R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b).* Dissolve 20.0 mg of *p-toluidine R* in *methylene chloride R* and dilute to 100.0 mL with the same solvent.

*Reference solution (c).* Dilute 0.50 mL of reference solution (a), 0.50 mL of reference solution (b) and 10.0 mL of the internal standard solution to 100.0 mL with *methylene chloride R*.

*Column*:

- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.32 mm,
- *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.5 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Split ratio*: 1:10.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 4 | 130 |
| | 4 - 6.5 | 130 → 180 |
| | 6.5 - 11.5 | 180 |
| Injection port | | 280 |
| Detector | | 300 |

*Detection*: flame ionisation.

*Injection*: 2 µL; inject the test solution and reference solution (c).

*Retention time*: internal standard = about 9.5 min.

*Limits*:

- *impurity C*: calculate the ratio (*R*) of the area of the peak due to impurity C to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (c); calculate the ratio of the area of the peak due to impurity C to the area of the peak due to the internal standard from the chromatogram obtained with the test solution: this ratio is not greater than *R* (10 ppm),
- *impurity D*: calculate the ratio (*R*) of the area of the peak due to impurity D to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (c); calculate the ratio of the area of the peak due to impurity D to the area of the peak due to the internal standard from the chromatogram obtained with the test solution: this ratio is not greater than *R* (10 ppm).

**Iron** (*2.4.9*): maximum 40 ppm.

Dissolve 0.250 g in 3 mL of *ethanol (96 per cent) R* and dilute to 10.0 mL with *water R*.

**Water** (*2.5.12*): maximum 0.2 per cent, determined on 1.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

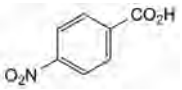
Dissolve 0.100 g with heating in 50 mL of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 13.71 mg of $C_7H_7NO_2$.

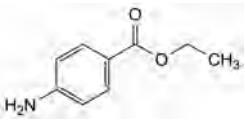
STORAGE

Protected from light.

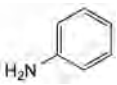
IMPURITIES



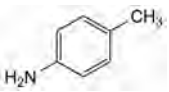
A. 4-nitrobenzoic acid,



B. ethyl 4-aminobenzoate (benzocaine),



C. aniline,



D. 4-methylaniline (*p*-toluidine).

**01/2017:0874**

# AMINOCAPROIC ACID

## Acidum aminocaproicum

$C_6H_{13}NO_2$ $M_r$ 131.2
[60-32-2]

DEFINITION

Aminocaproic acid contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 6-aminohexanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

It melts at about 205 °C with decomposition.

IDENTIFICATION

*First identification: A.*

*Second identification: B, C, D.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *aminocaproic acid CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with the test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.5 g in 4 mL of a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. Evaporate to dryness by heating on a water-bath. Dry the residue in a desiccator. Dissolve the residue in about 2 mL of boiling *ethanol R*. Allow to cool and maintain at 4 °C to 8 °C for 3 h. Filter under reduced pressure. The residue washed with about 10 mL of *acetone R* and dried at 60 °C for 30 min, melts (*2.2.14*) at 131 °C to 133 °C.

D. Dissolve about 5 mg in 0.5 mL of *distilled water R*. Add 3 mL of *dimethylformamide R* and 2 mL of *ascorbic acid solution R*. Heat on a water-bath. An orange colour develops.

TESTS

**Solution S**. dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is colourless (*2.2.2, Method II*) and remains clear (*2.2.1*) on standing for 24 h.

**pH** (*2.2.3*). The pH of solution S is 7.5 to 8.0.

**Absorbance** (*2.2.25*).

A. The absorbance of solution S at 287 nm is not more than 0.10 and at 450 nm is not more than 0.03.

B. Place 2.0 g in an even layer in a shallow dish 9 cm in diameter, cover and allow to stand at 98 °C to 102 °C for 72 h. Dissolve in *water R* and dilute to 10.0 mL with the same solvent. The absorbance of the solution at 287 nm is not more than 0.15 and at 450 nm is not more than 0.03.

**Ninhydrin-positive substances**. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

*Test solution (a).* Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Test solution (b).* Dilute 1 mL of test solution (a) to 50 mL with *water R*.

*Reference solution (a).* Dissolve 10 mg of *aminocaproic acid CRS* in *water R* and dilute to 50 mL with the same solvent.

*Reference solution (b).* Dilute 5 mL of test solution (b) to 20 mL with *water R*.

*Reference solution (c).* Dissolve 10 mg of *aminocaproic acid CRS* and 10 mg of *leucine CRS* in *water R* and dilute to 25 mL with the same solvent.

Apply separately to the plate 5 µL of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Dry the plate in a current of warm air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with the test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

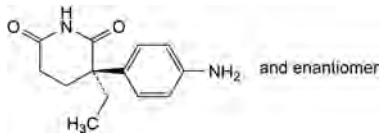
Dissolve 0.100 g in 20 mL of *anhydrous acetic acid R*. Using 0.1 mL of *crystal violet solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from bluish-violet to bluish-green.

1 mL of *0.1 M perchloric acid* is equivalent to 13.12 mg of $C_6H_{13}NO_2$.

**01/2017:1291**

# AMINOGLUTETHIMIDE

## Aminoglutethimidum



$C_{13}H_{16}N_2O_2$ $M_r$ 232.3
[125-84-8]

DEFINITION

(3*RS*)-3-(4-Aminophenyl)-3-ethylpiperidine-2,6-dione.

*Content*: 98.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or slightly yellow, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in acetone, soluble in methanol.

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Melting point (*2.2.14*): 150 °C to 154 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *aminoglutethimide CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 25 mg of the substance to be examined in *acetone R* and dilute to 5 mL with the same solvent.

*Reference solution (a).* Dissolve 25 mg of *aminoglutethimide CRS* in *acetone R* and dilute to 5 mL with the same solvent.

*Reference solution (b).* Dissolve 25 mg of *aminoglutethimide CRS* and 25 mg of *glutethimide CRS* in *acetone R* and dilute to 5 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: *glacial acetic acid R*, *methanol R*, *ethyl acetate R* (0.5:15:85 *V/V/V*).

*Application*: 5 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separed spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 1.0 g in *methanol R* and dilute to 20.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *methanol R*, *acetate buffer solution pH 5.0 R* (50:50 *V/V*).

*Test solution.* Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 5.0 mg of *aminoglutethimide impurity A CRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture.

*Reference solution (d).* Dilute 1.0 mL of the test solution to 10.0 mL with reference solution (a).

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (4 µm);

– *temperature*: 40 °C.

*Mobile phase*: mix 27 volumes of *methanol R* and 73 volumes of *acetate buffer solution pH 5.0 R*.

*Flow rate*: 1.3 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 10 µL of the test solution and reference solutions (b), (c) and (d).

*Run time*: 4 times the retention time of aminoglutethimide.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to aminoglutethimide (retention time = about 9 min): impurity A = about 1.3.

*System suitability*: reference solution (d):

– *resolution*: minimum 2.0 between the peaks due to aminoglutethimide and impurity A.

*Limits*:

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);

– *unspecified impurities*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);

– *sum of impurities other than A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent);

– *total*: maximum 2.0 per cent for the sum of the contents of all impurities;

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

**Impurity D**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light. Use shaking, not sonication or heat, to dissolve the reference substance and the substance to be examined.*

*Test solution.* Dissolve 0.100 g of the substance to be examined in *dimethyl sulfoxide R* and dilute to 100.0 mL with the same solvent.

*Reference solution.* Dissolve 3.0 mg of *aminoglutethimide impurity D CRS* in *dimethyl sulfoxide R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of this solution to 100.0 mL with *dimethyl sulfoxide R*.

*Column*:

– *size*: *l* = 0.12 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 0.285 g of *sodium edetate R* in *water R*, add 7.5 mL of *dilute acetic acid R* and 50 mL of *0.1 M potassium hydroxide* and dilute to 1000 mL with *water R*; adjust to pH 5.0 with *glacial acetic acid R*; mix 350 mL of this solution with 650 mL of *methanol R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 328 nm.

*Injection*: 10 µL.

*System suitability*: test solution:

– *number of theoretical plates*: minimum 3300, calculated for the principal peak;

– *mass distribution ratio*: 2.0 to 5.0 for the principal peak;

– *symmetry factor*: maximum 1.2 for the principal peak.

*Limit*:

– *impurity D*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (300 ppm).

**Sulfates** (*2.4.13*): maximum 500 ppm.

Dilute 6 mL of solution S to 15 mL with *distilled water R*.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 50 mL of *anhydrous acetic acid R* and titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

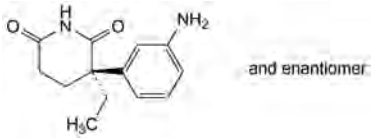
1 mL of *0.1 M perchloric acid* is equivalent to 23.23 mg of $C_{13}H_{16}N_2O_2$.

IMPURITIES

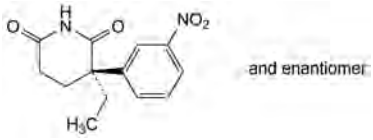
*Specified impurities: A, D.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or

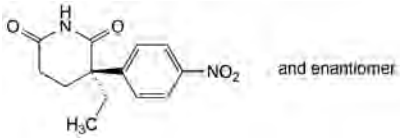
by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C.*



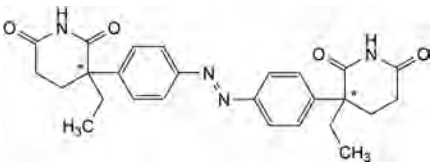
A. (3*RS*)-3-(3-aminophenyl)-3-ethylpiperidine-2,6-dione (3-aminoglutethimide),



B. (3*RS*)-3-ethyl-3-(3-nitrophenyl)piperidine-2,6-dione,



C. (3*RS*)-3-ethyl-3-(4-nitrophenyl)piperidine-2,6-dione,

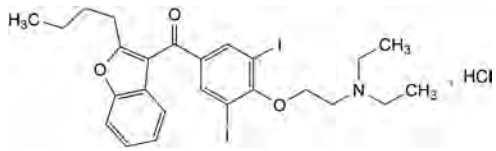


D. 3,3′-[diazenediylbis(4,1-phenylene)]bis(3-ethylpiperidine-2,6-dione) (azoglutethimide).

**01/2017:0803**

# AMIODARONE HYDROCHLORIDE

## Amiodaroni hydrochloridum



$C_{25}H_{30}ClI_2NO_3$ $M_r$ 682
[19774-82-4]

DEFINITION

(2-Butylbenzofuran-3-yl)[4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl]methanone hydrochloride.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, fine, crystalline powder.

*Solubility*: very slightly soluble in water, freely soluble in methylene chloride, soluble in methanol, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amiodarone hydrochloride CRS.*

B. It gives reaction (b) of chlorides (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_5$ or $BY_5$ (*2.2.2, Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 20 mL with the same solvent.

**pH** (*2.2.3*): 3.2 to 3.8.

Dissolve 1.0 g in *carbon dioxide-free water R*, heating at 80 °C, cool and dilute to 20 mL with the same solvent.

**Impurity H**. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use and keep protected from bright light.*

*Test solution.* Dissolve 0.500 g of the substance to be examined in *methylene chloride R* and dilute to 5.0 mL with the same solvent.

*Reference solution (a).* Dissolve 10.0 mg of *(2-chloroethyl)diethylamine hydrochloride R* (impurity H) in *methylene chloride R* and dilute to 50.0 mL with the same solvent. Dilute 2.0 mL of the solution to 20.0 mL with *methylene chloride R.*

*Reference solution (b).* Mix 2.0 mL of the test solution and 2.0 mL of reference solution (a).

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: *anhydrous formic acid R*, *methanol R*, *methylene chloride R* (5:10:85 *V/V/V*).

*Application*: 50 µL of the test solution and reference solution (a); 100 µL of reference solution (b).

*Development*: over 2/3 of the plate.

*Drying*: in a current of cold air.

*Detection*: spray with *potassium iodobismuthate solution R1* and then with *dilute hydrogen peroxide solution R*; examine immediately in daylight.

*System suitability*: reference solution (b):

– the spot due to impurity H is clearly visible.

*Limit*:

– *impurity H*: any spot due to impurity H is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.02 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Buffer solution pH 4.9.* To 800 mL of *water R* add 3.0 mL of *glacial acetic acid R*, adjust to pH 4.9 with *dilute ammonia R1* and dilute to 1000 mL with *water R.*

*Test solution.* Dissolve 0.125 g of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 25.0 mL with the same mixture of solvents.

*Reference solution.* Dissolve 5 mg of *amiodarone impurity D CRS*, 5 mg of *amiodarone impurity E CRS* and 5.0 mg of *amiodarone hydrochloride CRS* in *methanol R* and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with a mixture of equal volumes of *acetonitrile R* and *water R.*

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

*Mobile phase*: buffer solution pH 4.9, *methanol R*, *acetonitrile R* (30:30:40 *V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of amiodarone.

*Relative retention* with reference to amiodarone (retention time = about 24 min): impurity A = about 0.26; impurity D = about 0.29; impurity E = about 0.37; impurity B = about 0.49; impurity C = about 0.55; impurity G = about 0.62; impurity F = about 0.69.

*System suitability*: reference solution:

– *resolution*: minimum 3.5 between the peaks due to impurities D and E.

*Limits*:

– *impurities A, B, C, D, E, F, G*: for each impurity, not more than the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.2 per cent);
– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.10 per cent);
– *total*: not more than 2.5 times the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.5 per cent);
– *disregard limit*: 0.25 times the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.05 per cent).

**Iodides**: maximum 150 ppm.

*Prepare the test and reference solutions simultaneously.*

*Solution A*. Add 1.50 g of the substance to be examined to 40 mL of *water R* at 80 °C and shake until completely dissolved. Cool and dilute to 50.0 mL with *water R*.

*Test solution*. To 15.0 mL of solution A add 1.0 mL of *0.1 M hydrochloric acid* and 1.0 mL of *0.05 M potassium iodate*. Dilute to 20.0 mL with *water R*. Allow to stand protected from light for 4 h.

*Reference solution*. To 15.0 mL of solution A add 1.0 mL of *0.1 M hydrochloric acid*, 1.0 mL of an 88.2 mg/L solution of *potassium iodide R* and 1.0 mL of *0.05 M potassium iodate*. Dilute to 20.0 mL with *water R*. Allow to stand protected from light for 4 h.

Measure the absorbances (*2.2.25*) of the solutions at 420 nm, using a mixture of 15.0 mL of solution A and 1.0 mL of *0.1 M hydrochloric acid* diluted to 20.0 mL with *water R* as the compensation liquid. The absorbance of the test solution is not greater than half the absorbance of the reference solution.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying at 50 °C at a pressure not exceeding 0.3 kPa for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.600 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 75 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

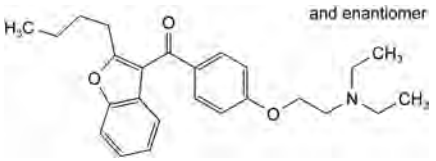
1 mL of *0.1 M sodium hydroxide* is equivalent to 68.18 mg of $C_{25}H_{30}ClI_2NO_3$.

STORAGE

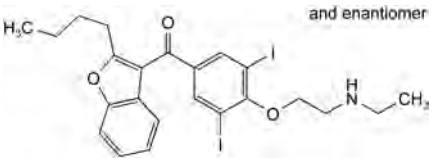
Protected from light, at a temperature not exceeding 30 °C.

IMPURITIES

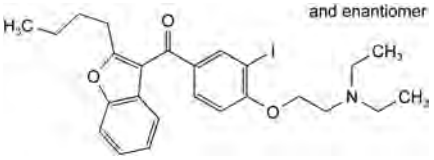
*Specified impurities*: *A, B, C, D, E, F, G, H.*



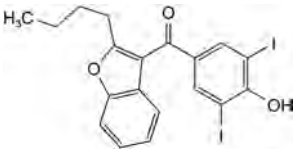
A. (2-butylbenzofuran-3-yl)[4-[2-(diethylamino)ethoxy]phenyl]methanone,



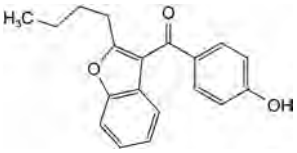
B. (2-butylbenzofuran-3-yl)[4-[2-(ethylamino)ethoxy]-3,5-diiodophenyl]methanone,



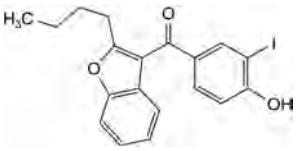
C. (2-butylbenzofuran-3-yl)[4-[2-(diethylamino)ethoxy]-3-iodophenyl]methanone,



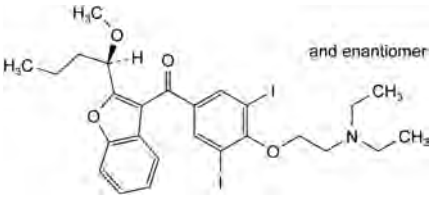
D. (2-butylbenzofuran-3-yl)(4-hydroxy-3,5-diiodophenyl)-methanone,



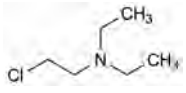
E. (2-butylbenzofuran-3-yl)(4-hydroxyphenyl)methanone,



F. (2-butylbenzofuran-3-yl)(4-hydroxy-3-iodophenyl)methanone,



G. [4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl][2-[(1*RS*)-1-methoxybutyl]benzofuran-3-yl]methanone,

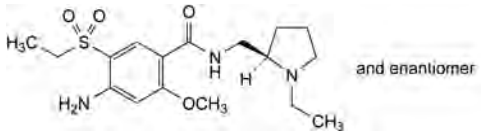


H. 2-chloro-*N*,*N*-diethylethanamine (2-chlorotriethylamine, (2-chloroethyl)diethylamine).

**01/2019:1490**

# AMISULPRIDE

## Amisulpridum



$C_{17}H_{27}N_3O_4S$ $M_r$ 369.5
[71675-85-9]

DEFINITION

4-Amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-(ethylsulfonyl)-2-methoxybenzamide.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in anhydrous ethanol.

mp: about 126 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *amisulpride CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

Dissolve 1.0 g in 3 mL of a mixture of 1 volume of *acetic acid R* and 4 volumes of *water R*, and dilute to 20 mL with *water R*.

**Impurity A**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (a)*. Dissolve 5 mg of *sulpiride impurity A CRS* (amisulpride impurity A) in *methanol R* and dilute to 25 mL with the same solvent. Dilute 2 mL of the solution to 20 mL with *methanol R*.

*Reference solution (b)*. Dilute 1 mL of the test solution to 10 mL with reference solution (a).

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: 50 per cent *V/V* solution of *concentrated ammonia R*, *anhydrous ethanol R*, *di-isopropyl ether R* (10:25:65 *V/V/V*); use the upper layer obtained after shaking the mixture.

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

*Retardation factors*: impurity A = about 0.2; amisulpride = about 0.5.

*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

*Limit*:

– *impurity A*: any spot due to impurity A is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.1 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *methanol R*, mobile phase A (12:16:72 *V/V/V*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in 16 mL of *methanol R*, add 12 mL of *acetonitrile R* and dilute to 100.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve the contents of a vial of *amisulpride for system suitability CRS* (containing impurity B) in 1 mL of the solvent mixture.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: dissolve 0.7 g of *sodium octanesulfonate R* in 930 mL of *water for chromatography R* and add 45.0 mL of a 5 per cent *V/V* solution of *dilute sulfuric acid R*; adjust to pH 2.3 with *dilute sulfuric acid R* and dilute to 1000 mL with *water for chromatography R*;
– *mobile phase B*: *methanol R1* ;
– *mobile phase C*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 18 | 72 | 16 | 12 |
| 18 - 35 | 72 → 50 | 16 → 38 | 12 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 225 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B.

*Relative retention* with reference to amisulpride (retention time = about 17 min): impurity B = about 1.1.

*System suitability*: reference solution (b):

– *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to impurity B and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to amisulpride.

*Calculation of percentage contents*:

– for each impurity, use the concentration of amisulpride in reference solution (a).

*Limits*:

– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.3 per cent;
– *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g with shaking in a mixture of 5 mL of *acetic anhydride R* and 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

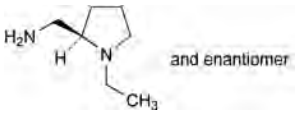
1 mL of *0.1 M perchloric acid* is equivalent to 36.95 mg of $C_{17}H_{27}N_3O_4S$.

IMPURITIES

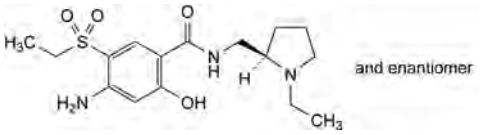
*Specified impurities*: *A*.

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or

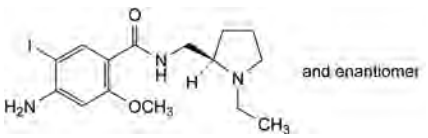
by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G, H*.



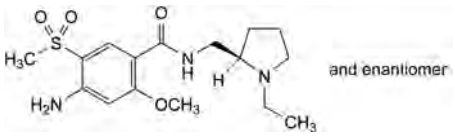
A. [(2*RS*)-1-ethylpyrrolidin-2-yl]methanamine,



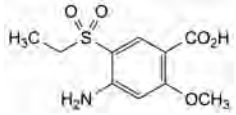
B. 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-(ethylsulfonyl)-2-hydroxybenzamide,



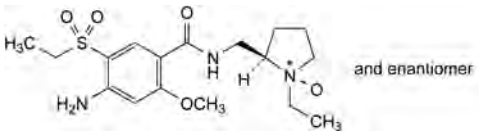
C. 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-iodo-2-methoxybenzamide,



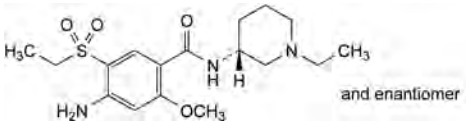
D. 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-2-methoxy-5-(methylsulfonyl)benzamide,



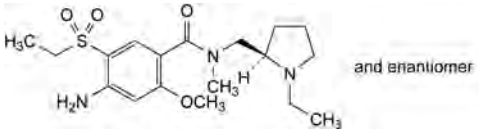
E. 4-amino-5-(ethylsulfonyl)-2-methoxybenzoic acid,



F. 4-amino-*N*-[[(2*RS*)-1-ethyl-1-oxidopyrrolidin-2-yl]methyl]-5-(ethylsulfonyl)-2-methoxybenzamide,



G. 4-amino-*N*-[(3*RS*)-1-ethylpiperidin-3-yl]-5-(ethylsulfonyl)-2-methoxybenzamide,



H. 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-(ethylsulfonyl)-2-methoxy-*N*-methylbenzamide.

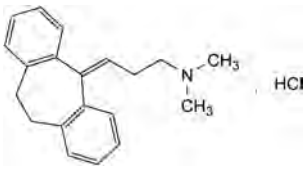
# AMITRIPTYLINE HYDROCHLORIDE

## Amitriptylini hydrochloridum



$C_{20}H_{24}ClN$ $M_r$ 313.9
[549-18-8]

DEFINITION

3-(10,11-Dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-ylidene)-*N*,*N*-dimethylpropan-1-amine hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder or colourless crystals.

*Solubility*: freely soluble in water, in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amitriptyline hydrochloride CRS*.

B. 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $B_7$ (*2.2.2, Method II*).

Dissolve 1.25 g in *water R* and dilute to 25 mL with the same solvent.

**Acidity or alkalinity**. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent. Add 0.1 mL of *methyl red solution R* and 0.2 mL of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.4 mL of *0.01 M hydrochloric acid*. The solution is red.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 5.0 mg of *dibenzosuberone CRS* (impurity A) and 5.0 mg of *cyclobenzaprine hydrochloride CRS* (impurity B) in 5.0 mL of the test solution and dilute to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 50.0 mL with the mobile phase.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mix 35 volumes of *acetonitrile R* and 65 volumes of a 5.23 g/L solution of *dipotassium hydrogen phosphate R* previously adjusted to pH 7.0 with *phosphoric acid R*.

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL.

*Run time*: 3 times the retention time of amitriptyline.

*Relative retention* with reference to amitriptyline (retention time = about 14 min): impurity B = about 0.9; impurity A = about 2.2.

*System suitability*: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurity B and amitriptyline.

*Limits*:

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *impurity A*: not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the peak due to amitriptyline in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 3 times the area of the peak due to amitriptyline in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the peak due to amitriptyline in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 30 mL of *ethanol (96 per cent) R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 31.39 mg of $C_{20}H_{24}ClN$.

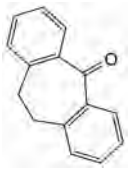
STORAGE

Protected from light.

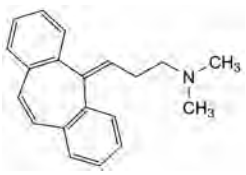
IMPURITIES

*Specified impurities*: *A, B.*

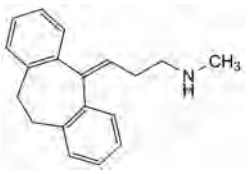
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, F, G.*



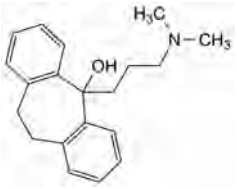
A. 10,11-dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-one (dibenzosuberone),



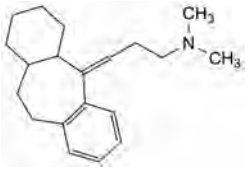
B. 3-(5*H*-dibenzo[*a*,*d*][7]annulen-5-ylidene)-*N*,*N*-dimethylpropan-1-amine (cyclobenzaprine),



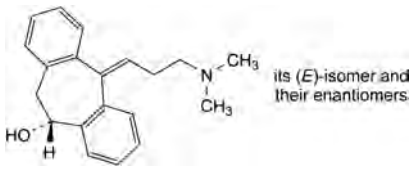
C. 3-(10,11-dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-ylidene)-*N*-methylpropan-1-amine (nortriptyline),



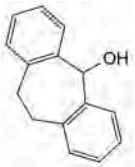
D. 5-[3-(dimethylamino)propyl]-10,11-dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-ol,



E. *N*,*N*-dimethyl-3-(1,2,3,4,4a,10,11,11a-octahydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-ylidene)propan-1-amine,



F. (5*EZ*,10*RS*)-5-[3-(dimethylamino)propylidene]-10,11-dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-10-ol,



G. 10,11-dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-ol (dibenzosuberol).

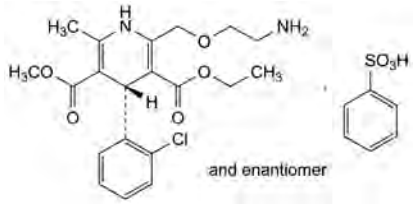
# AMLODIPINE BESILATE

## Amlodipini besilas



$C_{26}H_{31}ClN_2O_8S$ $M_r$ 567.1
[111470-99-6]

DEFINITION

3-Ethyl 5-methyl (4*RS*)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate benzenesulfonate.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

PRODUCTION

It is considered that alkyl benzenesulfonate esters are genotoxic and are potential impurities in amlodipine besilate. The manufacturing process should be developed taking into consideration the principles of quality risk management, together with considerations of the quality of starting materials, process capability and validation. The general method *2.5.41. Methyl, ethyl and isopropyl benzenesulfonate in active substances* is available to assist manufacturers.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: slightly soluble in water, freely soluble in methanol, sparingly soluble in anhydrous ethanol, slightly soluble in 2-propanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *amlodipine besilate CRS*.

TESTS

**Optical rotation** (*2.2.7*): − 0.10° to + 0.10°.

Dissolve 0.250 g in *methanol R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Test solution (a).* Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Test solution (b).* Dilute 5.0 mL of test solution (a) to 100.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 2.5 mg of *amlodipine impurity B CRS* and 2.5 mg of *amlodipine impurity G CRS* in the mobile phase and dilute to 25.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 2.5 mg of *amlodipine for peak identification CRS* (containing impurities D, E and F) in 5 mL of the mobile phase.

*Reference solution (d).* Dissolve 5.0 mg of *amlodipine impurity A CRS* in *acetonitrile R* and dilute to 5.0 mL with the same solvent. Dilute 1.0 mL of the solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (e).* Dissolve 50.0 mg of *amlodipine besilate CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 5.0 mL of the solution to 100.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*: 2.3 g/L solution of *ammonium acetate R*, *methanol R* (30:70 *V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 237 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a), (b), (c) and (d).

*Run time*: twice the retention time of amlodipine.

*Identification of impurities*: use the chromatogram supplied with *amlodipine for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D, E and F; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity A.

*Relative retention* with reference to amlodipine (retention time = about 20 min): impurity G = about 0.21; impurity B = about 0.25; impurity D = about 0.5; impurity F = about 0.8; impurity E = about 1.3.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to impurities G and B.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 1.7; impurity F = 0.7;
- *impurity D*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity A*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.15 per cent);
- *impurities E, F*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: maximum 0.8 per cent;
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard any peak due to benzene sulfonate (relative retention = about 0.14).

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.000 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (b) and reference solution (e).

Calculate the percentage content of $C_{26}H_{31}ClN_2O_8S$ taking into account the assigned content of *amlodipine besilate CRS*.

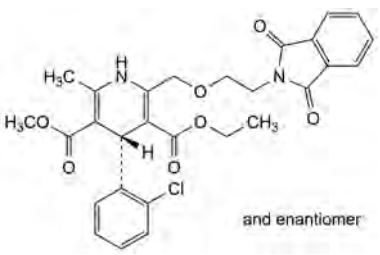
STORAGE

In an airtight container, protected from light.

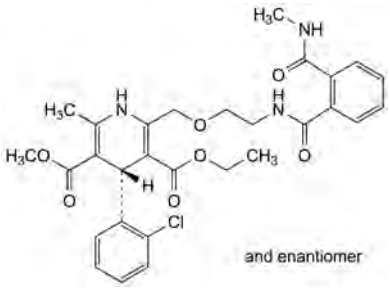
IMPURITIES

*Specified impurities: A, D, E, F.*

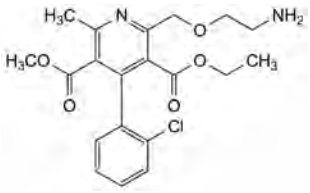
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, G, H.*



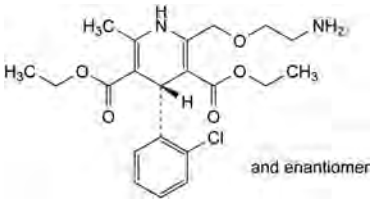
A. 3-ethyl 5-methyl (4*RS*)-4-(2-chlorophenyl)-2-[[2-(1,3-dioxo-1,3-dihydro-2*H*-isoindol-2-yl)ethoxy]methyl]-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate,



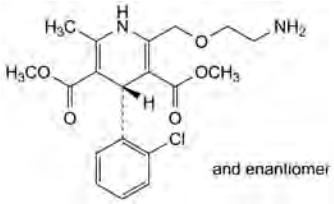
B. 3-ethyl 5-methyl (4*RS*)-4-(2-chlorophenyl)-6-methyl-2-[[2-[[2-(methylcarbamoyl)benzoyl]amino]-ethoxy]methyl]-1,4-dihydropyridine-3,5-dicarboxylate,



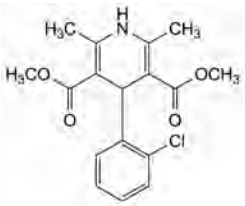
D. 3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate,



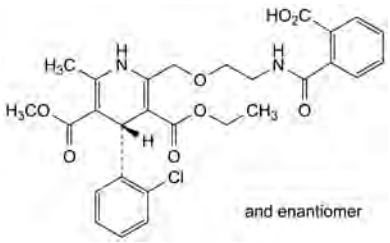
E. diethyl (4*RS*)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate,



F. dimethyl (4*RS*)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate,



G. dimethyl 4-(2-chlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,



H. 2-[[2-[[(4*RS*)-4-(2-chlorophenyl)-3-(ethoxycarbonyl)-5-(methoxycarbonyl)-6-methyl-1,4-dihydropyridin-2-yl]methoxy]ethyl]carbamoyl]benzoic acid.

**01/2017:0877**

# AMMONIA SOLUTION, CONCENTRATED

## Ammoniae solutio concentrata

$NH_3$ $M_r$ 17.03

DEFINITION

*Content*: 25.0 per cent *m/m* to 30.0 per cent *m/m*.

CHARACTERS

*Appearance*: clear, colourless liquid, very caustic.

*Solubility*: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. Relative density (*2.2.5*): 0.892 to 0.910.

B. It is strongly alkaline (*2.2.4*).

C. To 0.5 mL add 5 mL of *water R*. Bubble air through the solution and lead the gaseous mixture obtained over the surface of a solution containing 1 mL of *0.1 M hydrochloric acid* and 0.05 mL of *methyl red solution R*. The colour changes from red to yellow. Add 1 mL of *sodium cobaltinitrite solution R*. A yellow precipitate is formed.

TESTS

**Solution S**. Evaporate 220 mL almost to dryness on a water-bath. Cool, add 1 mL of *dilute acetic acid R* and dilute to 20 mL with *distilled water R*.

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

To 2 mL add 8 mL of *water R*.

**Oxidisable substances**. Cautiously add, whilst cooling, 8.8 mL to 100 mL of *dilute sulfuric acid R*. Add 0.75 mL of *0.002 M potassium permanganate*. Allow to stand for 5 min. The solution remains faintly pink.

**Pyridine and related substances**: maximum 2 ppm, calculated as pyridine.

Measure the absorbance (*2.2.25*) at 252 nm using *water R* as the compensation liquid. The absorbance is not greater than 0.06.

**Carbonates**: maximum 60 ppm.

To 10 mL in a test-tube with a ground-glass neck add 10 mL of *calcium hydroxide solution R*. Stopper immediately and mix. Any opalescence in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 mL of a 0.1 g/L solution of *anhydrous sodium carbonate R*.

**Chlorides** (*2.4.4*): maximum 1 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 5 ppm.

Dilute 3 mL of solution S to 15 mL with *distilled water R*.

**Iron** (*2.4.9*): maximum 0.25 ppm.

Dilute 4 mL of solution S to 10 mL with *water R*.

**Residue on evaporation**: maximum 20 mg/L.

Evaporate 50 mL to dryness on a water-bath and dry at 100-105 °C for 1 h. The residue weighs a maximum of 1 mg.

ASSAY

Weigh accurately a flask with a ground-glass neck containing 50.0 mL of *1 M hydrochloric acid*. Add 2 mL of the substance to be examined and re-weigh. Add 0.1 mL of *methyl red solution R* as indicator. Titrate with *1 M sodium hydroxide* until the colour changes from red to yellow.

1 mL of *1 M hydrochloric acid* is equivalent to 17.03 mg of $NH_3$.

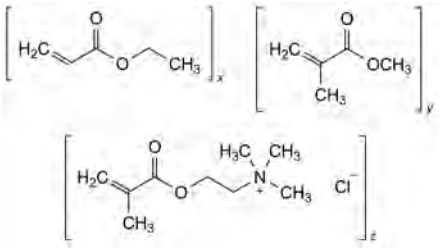
STORAGE

Protected from air, at a temperature not exceeding 20 °C.

**01/2019:2081**

# AMMONIO METHACRYLATE COPOLYMER (TYPE A)

## Ammonio methacrylatis copolymerum A



DEFINITION

Poly[ethyl propenoate-*co*-methyl 2-methylprop-2-enoate-*co*-*N*,*N*,*N*-trimethyl-2-[(2-methylprop-2-enoyl)oxy]ethan-1-aminium chloride] having a mean relative molecular mass of about 150 000.

The ratio of ethyl acrylate (ethyl propenoate) groups to methyl methacrylate (methyl 2-methylprop-2-enoate) groups to ammonio methacrylate (*N*,*N*,*N*-trimethyl-2-[(2-methylprop-2-enoyl)oxy]ethan-1-aminium chloride) groups is about 1:2:0.2.

*Content of ammonio methacrylate groups*: 8.9 per cent to 12.3 per cent (dried substance).

CHARACTERS

*Appearance*: colourless to white or almost white granules or powder.

*Solubility*: practically insoluble in water, freely soluble in anhydrous ethanol and in methylene chloride giving clear to cloudy solutions. Due to the polymeric nature of the substance, a stirring time of up to 5 h may be necessary.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ammonio methacrylate copolymer CRS*.

B. Viscosity (see Tests).

C. It complies with the limits of the assay.

TESTS

**Solution S**. Dissolve a quantity of the substance to be examined corresponding to 12.5 g of the dried substance in a mixture of 35.0 g of *acetone R* and 52.5 g of *2-propanol R*.

**Viscosity** (*2.2.10*): maximum 15 mPa·s, determined on solution S.

*Apparatus*: rotating viscometer.

*Dimensions*:

- *spindle*: diameter = 25.15 mm; height = 90.74 mm; shaft diameter = 4.0 mm;
- *cylinder*: diameter = 27.62 mm; height = 0.135 m.

*Stirring speed*: 30 r/min.

*Volume of solution*: 16 mL of solution S.

*Temperature*: 20 °C.

**Appearance of a film**. Spread 2 mL of solution S evenly on a glass plate. Upon drying a clear film is formed.

**Monomers**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve 3.5 g of *sodium perchlorate R* in *water R* and dilute to 100 mL with the same solvent.

*Test solution*. Dissolve 5.00 g of the substance to be examined in *methanol R* and dilute to 50.0 mL with the same solvent. To 10.0 mL of this solution add 5.0 mL of solution A, dropwise, while continuously stirring. Remove the precipitated polymer by centrifugation. Use the clear supernatant solution.

*Reference solution*. Dissolve 50.0 mg of *ethyl acrylate R* and 10.0 mg of *methyl methacrylate R* in *methanol R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 100.0 mL with *methanol R*. Add 10 mL of this solution to 5 mL of solution A.

*Column*:

- *size*: *l* = 0.12 m, Ø = 4.6 mm;
- *stationary phase*: irregular *end-capped octadecylsilyl silica gel for chromatography R* (7 µm).

*Mobile phase*: mix 20 volumes of *methanol R2* and 80 volumes of *water for chromatography R* previously ajusted to pH 2.0 with *phosphoric acid R*.

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 202 nm.

*Injection*: 50 µL.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (100 ppm);
- *impurity B*: not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (50 ppm).

**Methanol** (*2.4.24, System A*): maximum 1.5 per cent.

**Loss on drying** (*2.2.32*): maximum 3.0 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 5 h.

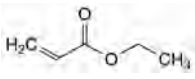
ASSAY

Dissolve 1.000 g in 75 mL of *glacial acetic acid R* at about 50 °C within about 30 min. Allow to cool to room temperature and add 25 mL of a 6 g/L solution of *copper acetate R* in *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

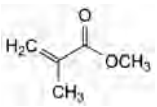
1 mL of *0.1 M perchloric acid* is equivalent to 20.77 mg of $C_9H_{18}O_2NCl$ (ammonio methacrylate groups).

IMPURITIES

*Specified impurities: A, B.*



A. ethyl propenoate (ethyl acrylate),

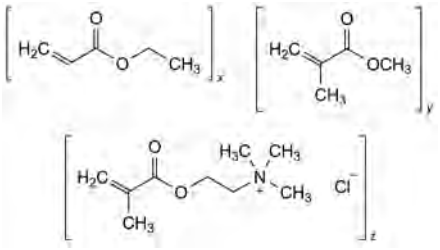


B. methyl 2-methylprop-2-enoate (methyl methacrylate).

**01/2019:2082**

# AMMONIO METHACRYLATE COPOLYMER (TYPE B)

## Ammonio methacrylatis copolymerum B



DEFINITION

Poly[ethyl propenoate-*co*-methyl 2-methylprop-2-enoate-*co*-*N*,*N*,*N*-trimethyl-2-[(2-methylprop-2-enoyl)oxy]ethan-1-aminium chloride] having a mean relative molecular mass of about 150 000.

The ratio of ethyl acrylate (ethyl propenoate) groups to methyl methacrylate (methyl 2-methylprop-2-enoate) groups to ammonio methacrylate (*N*,*N*,*N*-trimethyl-2-[(2-methylprop-2-enoyl)oxy]ethan-1-aminium chloride) groups is about 1:2:0.1.

*Content of ammonio methacrylate groups*: 4.5 per cent to 7.0 per cent (dried substance).

CHARACTERS

*Appearance*: colourless to white or almost white granules or powder.

*Solubility*: practically insoluble in water, freely soluble in anhydrous ethanol and in methylene chloride giving clear to cloudy solutions. Due to the polymeric nature of the substance, a stirring time of up to 5 h may be necessary.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ammonio methacrylate copolymer CRS*.

B. Viscosity (see Tests).

C. It complies with the limits of the assay.

TESTS

**Solution S**. Dissolve a quantity of the substance to be examined corresponding to 12.5 g of the dried substance in a mixture of 35.0 g of *acetone R* and 52.5 g of *2-propanol R*.

**Viscosity** (*2.2.10*): maximum 15 mPa·s, determined on solution S.

*Apparatus*: rotating viscometer.

*Dimensions*:

- *spindle*: diameter = 25.15 mm; height = 90.74 mm; shaft diameter = 4.0 mm;
- *cylinder*: diameter = 27.62 mm; height = 0.135 m.

*Stirring speed*: 30 r/min.

*Volume of solution*: 16 mL of solution S.

*Temperature*: 20 °C.

**Appearance of a film**. Spread 2 mL of solution S evenly on a glass plate. Upon drying a clear film is formed.

**Monomers**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve 3.5 g of *sodium perchlorate R* in *water R* and dilute to 100 mL with the same solvent.

*Test solution*. Dissolve 5.00 g of the substance to be examined in *methanol R* and dilute to 50.0 mL with the same solvent. To 10.0 mL of this solution add 5.0 mL of solution A, dropwise, while continuously stirring. Remove the precipitated polymer by centrifugation. Use the clear supernatant solution.

*Reference solution*. Dissolve 50.0 mg of *ethyl acrylate R* and 10.0 mg of *methyl methacrylate R* in *methanol R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 100.0 mL with *methanol R*. Add 10 mL of this solution to 5 mL of solution A.

*Column*:

- *size*: *l* = 0.12 m, Ø = 4.6 mm;
- *stationary phase*: irregular *end-capped octadecylsilyl silica gel for chromatography R* (7 µm).

*Mobile phase*: mix 20 volumes of *methanol R2* and 80 volumes of *water for chromatography R* previously ajusted to pH 2.0 with *phosphoric acid R*.

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 202 nm.

*Injection*: 50 µL.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (100 ppm);
- *impurity B*: not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (50 ppm).

**Methanol** (*2.4.24, System A*): maximum 1.5 per cent.

**Loss on drying** (*2.2.32*): maximum 3.0 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 5 h.

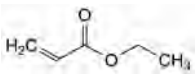
ASSAY

Dissolve 2.000 g in 75 mL of *glacial acetic acid R* at about 50 °C within about 30 min. Allow to cool to room temperature and add 25 mL of a 6 g/L solution of *copper acetate R* in *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

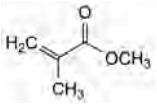
1 mL of *0.1 M perchloric acid* is equivalent to 20.77 mg of $C_9H_{18}O_2NCl$ (ammonio methacrylate groups).

IMPURITIES

*Specified impurities: A, B.*



A. ethyl propenoate (ethyl acrylate),



B. methyl 2-methylprop-2-enoate (methyl methacrylate).

01/2017:1389

# AMMONIUM BROMIDE

## Ammonii bromidum

$NH_4Br$ $M_r$ 97.9
[12124-97-9]

DEFINITION

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals, hygroscopic.

*Solubility*: freely soluble in water, sparingly soluble in ethanol (96 per cent).

It becomes yellow when exposed to light or air.

IDENTIFICATION

A. It gives reaction (a) of bromides (*2.3.1*).

B. 10 mL of solution S (see Tests) gives the reaction of ammonium salts (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.05 mL of *methyl red solution R*. Not more than 0.5 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Bromates**. To 10 mL of solution S add 1 mL of *starch solution R*, 0.1 mL of a 100 g/L solution of *potassium iodide R* and 0.25 mL of *0.5 M sulfuric acid* and allow to stand protected from light for 5 min. No blue or violet colour develops.

**Chlorides and sulfates**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 0.400 g of the substance to be examined in 50 mL of *water for chromatography R* and dilute to 100.0 mL with the same solvent.

*Test solution (b)*. Dilute 25.0 mL of test solution (a) to 50.0 mL with *water for chromatography R*.

*Reference solution (a)*. To 25.0 mL of test solution (a) add 1.0 mL of *sulfate standard solution (10 ppm $SO_4$) R* and 12.0 mL of *chloride standard solution (50 ppm Cl) R* and dilute to 50.0 mL with *water for chromatography R*.

*Reference solution (b)*. Dilute 10.0 mL of test solution (a) to 100.0 mL with *water for chromatography R*. To 2.0 mL of this solution add 8.0 mL of *chloride standard solution (50 ppm Cl) R* and dilute to 20.0 mL with *water for chromatography R*.

*Blank solution*: *water for chromatography R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 2 mm;

– *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (13 µm).

*Mobile phase*: dissolve 0.600 g of *potassium hydroxide R* in *water for chromatography R* and dilute to 1000.0 mL with the same solvent.

*Flow rate*: 0.4 mL/min.

*Detection*: conductivity detector equipped with a suitable ion suppressor.

*Injection*: 50 µL of test solution (b), reference solutions (a) and (b) and the blank solution.

*Run time*: 2.5 times the retention time of bromide.

*Retention time*: chloride = about 5 min; bromide = about 8 min; sulfate = about 16 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 8.0 between the peaks due to chloride and bromide.

*Calculation of percentage contents*:

– for chlorides, use the concentration of chloride in reference solution (a); correct the area of the peak due to chloride in the chromatogram obtained with reference solution (a) by subtracting the area of the peak due to chloride in the chromatogram obtained with test solution (b);

– for sulfates, use the concentration of sulfate in reference solution (a); correct the area of the peak due to sulfate in the chromatogram obtained with reference solution (a) by subtracting the area of the peak due to sulfate in the chromatogram obtained with test solution (b).

*Limits*:

– *chlorides*: maximum 0.6 per cent;

– *sulfates*: maximum 0.01 per cent.

**Iodides**. To 5 mL of solution S add 0.15 mL of *ferric chloride solution R1* and 2 mL of *methylene chloride R*. Shake and allow to separate. The lower layer is colourless (*2.2.2, Method I*).

**Iron** (*2.4.9*): maximum 20 ppm.

Dilute 5 mL of solution S to 10 mL with *water R*.

**Magnesium and alkaline-earth metals** (*2.4.7*): maximum 200 ppm, calculated as Ca.

10.0 g complies with the test for magnesium and alkaline-earth metals. The volume of *0.01 M sodium edetate* used does not exceed 5.0 mL.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in *water R*, add 5 mL of *dilute nitric acid R* and dilute to 50 mL with *water R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 9.794 mg of $NH_4Br$.

Calculate the percentage content of $NH_4Br$ using the following expression:

$$a - 2.763\,b$$

*a* = percentage content of $NH_4Br$ and $NH_4Cl$ obtained in the assay and calculated as $NH_4Br$;

*b* = percentage content of Cl obtained in the test for chlorides.

STORAGE

In an airtight container, protected from light.

01/2017:0007

# AMMONIUM CHLORIDE

## Ammonii chloridum

$NH_4Cl$ $M_r$ 53.49
[12125-02-9]

DEFINITION

*Content*: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water.

IDENTIFICATION

A. It gives the reactions of chlorides (*2.3.1*).

B. 10 mL of solution S (see Tests) gives the reaction of ammonium salts (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.05 mL of *methyl red solution R*. Not more than 0.5 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Bromides and iodides**. To 10 mL of solution S add 0.1 mL of *dilute hydrochloric acid R* and 0.05 mL of *chloramine solution R*. After 1 min, add 2 mL of *chloroform R* and shake vigorously. The chloroform layer remains colourless (*2.2.2, Method I*).

**Sulfates** (*2.4.13*): maximum 150 ppm.

Dilute 10 mL of solution S to 15 mL with *distilled water R*.

**Calcium** (*2.4.3*): maximum 200 ppm.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

**Iron** (*2.4.9*): maximum 20 ppm.

Dilute 5 mL of solution S to 10 mL with *water R*.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.00 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g.

ASSAY

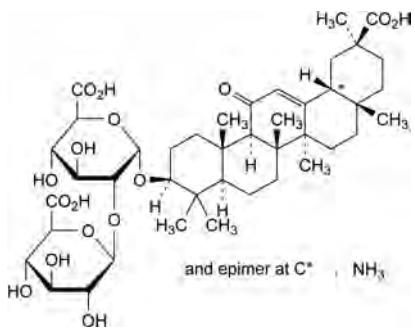
Dissolve 1.000 g in 20 mL of *water R* and add a mixture of 5 mL of *formaldehyde solution R*, previously neutralised to *phenolphthalein solution R*, and 20 mL of *water R*. After 1-2 min, titrate slowly with *1 M sodium hydroxide*, using a further 0.2 mL of the same indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 53.49 mg of $NH_4Cl$.

**01/2017:1772**

# AMMONIUM GLYCYRRHIZATE

## Ammonii glycyrrhizas



$C_{42}H_{65}NO_{16}$ $M_r$ 840

[53956-04-0]

DEFINITION

Mixture of ammonium 18α- and 18β-glycyrrhizate (ammonium salt of (20β)-3β-[[2-*O*-(β-D-glucopyranosyluronic acid)-α-D-glucopyranosyluronic acid]oxy]-11-oxoolean-12-en-29-oic acid), the 18β-isomer being the main component.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or yellowish-white, hygroscopic powder.

*Solubility*: slightly soluble in water, very slightly soluble in anhydrous ethanol, practically insoluble in acetone. It dissolves in dilute solutions of acids and of alkali hydroxides.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ammonium glycyrrhizate CRS*.

B. Dissolve 0.1 g in 20 mL of *water R*, add 2 mL of *dilute sodium hydroxide solution R* and heat cautiously. On heating, the solution gives off vapours that may be identified by the alkaline reaction of wet litmus paper (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method I*).

Dissolve 1.0 g in *ethanol (20 per cent V/V) R* and dilute to 100.0 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 49.0 to + 54.0 (anhydrous substance).

Dissolve 0.5 g in *ethanol (50 per cent V/V) R* and dilute to 50.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 20.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 50 mg of *ammonium glycyrrhizate CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 20.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 μm).

*Mobile phase*: *glacial acetic acid R*, *acetonitrile R*, *water R* (6:380:614 *V/V/V*).

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 μL.

*Run time*: 3 times the retention time of 18β-glycyrrhizic acid.

*Relative retention* with reference to 18β-glycyrrhizic acid (retention time = about 8 min): impurity A = about 0.8; 18α-glycyrrhizic acid = about 1.2.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to 18β-glycyrrhizic acid and 18α-glycyrrhizic acid.

*Limits*:

– *18α-glycyrrhizic acid*: not more than twice the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (10.0 per cent),

– *impurity A*: not more than the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (5.0 per cent),

– *any other impurity*: for each impurity, not more than 0.4 times the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (2.0 per cent),
– *sum of other impurities*: not more than 1.4 times the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (7.0 per cent),
– *disregard limit*: 0.04 times the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (0.2 per cent).

**Water** (*2.5.12*): maximum 6.0 per cent, determined on 0.250 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

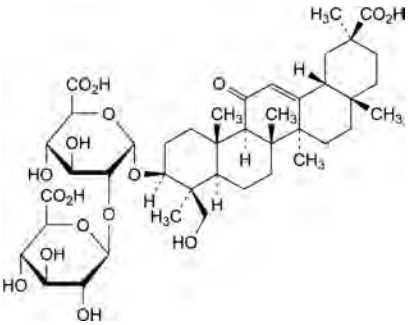
Dissolve 0.600 g in 60 mL of *anhydrous acetic acid R* heating at 80 °C if necessary. Cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 84.0 mg of $C_{42}H_{65}NO_{16}$.

STORAGE

In an airtight container.

IMPURITIES



A. (4β,20β)-3β-[[2-*O*-(β-D-glucopyranosyluronic acid)-α-D-glucopyranosyluronic acid]oxy]-23-hydroxy-11-oxoolean-12-en-29-oic acid (24-hydroxyglycyrrhizinic acid).

**01/2017:1390**

# AMMONIUM HYDROGEN CARBONATE

## Ammonii hydrogenocarbonas

$NH_4HCO_3$ $M_r$ 79.1
[1066-33-7]

DEFINITION

*Content*: 98.0 per cent to 101.0 per cent.

CHARACTERS

*Appearance*: fine, white or almost white, crystalline powder or white or almost white crystals, slightly hygroscopic.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

It volatilises rapidly at 60 °C. The volatilisation takes place slowly at ambient temperatures if the substance is slightly moist. It is in a state of equilibrium with ammonium carbamate.

IDENTIFICATION

A. It gives the reaction of carbonates and bicarbonates (*2.3.1*).

B. Dissolve 50 mg in 2 mL of *water R*. The solution gives the reaction of ammonium salts (*2.3.1*).

TESTS

**Solution S**. Dissolve 14.0 g in 100 mL of *distilled water R*. Boil to remove the ammonia, allow to cool and dilute to 100.0 mL with *distilled water R*.

**Chlorides** (*2.4.4*): maximum 70 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 70 ppm, determined on solution S.

**Iron** (*2.4.9*): maximum 40 ppm.

Dilute 1.8 mL of solution S to 10 mL with *water R*.

ASSAY

Dissolve cautiously 0.500 g in 50 mL of *carbon dioxide-free water R*. Titrate with *1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*). Read the volume added at the 2nd point of inflection, or at the point of inflection if only 1 point is detected.

1 mL of *1 M hydrochloric acid* is equivalent to 79.1 mg of $NH_4HCO_3$.

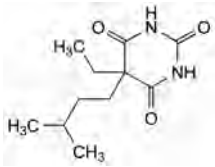
STORAGE

In an airtight container.

**01/2008:0594**
**corrected 6.0**

# AMOBARBITAL

## Amobarbitalum



$C_{11}H_{18}N_2O_3$ $M_r$ 226.3
[57-43-2]

DEFINITION

Amobarbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-ethyl-5-(3-methylbutyl)pyrimidin-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, freely soluble in alcohol, soluble in methylene chloride. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Determine the melting point (*2.2.14*) of the substance to be examined. Mix equal parts of the substance to be examined and *amobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 157 °C) is not greater than 2 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *amobarbital CRS*.

C. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance.

*Test solution.* Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 mL with the same solvent.

*Reference solution.* Dissolve 0.1 g of *amobarbital CRS* in *alcohol R* and dilute to 100 mL with the same solvent.

Apply separately to the plate 10 µL of each solution. Develop over a path of 18 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (*2.3.1*).

TESTS

**Appearance of solution**. Dissolve 1.0 g in a mixture of 4 mL of *dilute sodium hydroxide solution R* and 6 mL of *water R*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 1.0 g add 50 mL of *water R* and boil for 2 min. Allow to cool and filter. To 10 mL of the filtrate add 0.15 mL of *methyl red solution R* and 0.1 mL of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.2 mL of *0.01 M hydrochloric acid*. The solution is red.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance.

*Test solution.* Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 mL with the same solvent.

*Reference solution.* Dilute 0.5 mL of the test solution to 100 mL with *alcohol R*.

Apply separately to the plate 20 µL of each solution. Develop over a path of 15 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine the plate immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

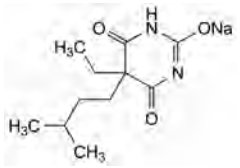
Dissolve 0.100 g in 5 mL of *pyridine R*. Add 0.5 mL of *thymolphthalein solution R* and 10 mL of *silver nitrate solution in pyridine R*. Titrate with *0.1 M ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 mL of *0.1 M ethanolic sodium hydroxide* is equivalent to 11.31 mg of $C_{11}H_{18}N_2O_3$.

**01/2008:0166**
**corrected 6.0**

# AMOBARBITAL SODIUM

## Amobarbitalum natricum



$C_{11}H_{17}N_2NaO_3$ $M_r$ 248.3
[64-43-7]

DEFINITION

Amobarbital sodium contains not less than 98.5 per cent and not more than the equivalent of 102.0 per cent of sodium derivative of 5-ethyl-5-(3-methylbutyl)pyrimidin-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, granular powder, hygroscopic, very soluble in carbon dioxide-free water (a small fraction may be insoluble), freely soluble in alcohol.

IDENTIFICATION

*First identification: A, B, E.*

*Second identification: A, C, D, E.*

A. Acidify 10 mL of solution S (see Tests) with *dilute hydrochloric acid R* and shake with 20 mL of *ether R*. Separate the ether layer, wash with 10 mL of *water R*, dry over *anhydrous sodium sulfate R* and filter. Evaporate the filtrate to dryness and dry the residue at 100 °C to 105 °C (test residue). Repeat the operations using 0.1 g of *amobarbital sodium CRS* (reference residue). Determine the melting point (*2.2.14*) of the test residue. Mix equal parts of the test residue and the reference residue and determine the melting point of the mixture. The difference between the melting points (which are about 157 °C) is not greater than 2 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing the spectrum obtained with the reference residue prepared from *amobarbital sodium CRS* with that obtained with the test residue (see identification test A).

C. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance.

*Test solution.* Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 mL with the same solvent.

*Reference solution.* Dissolve 0.1 g of *amobarbital sodium CRS* in *alcohol R* and dilute to 100 mL with the same solvent.

Apply separately to the plate 10 µL of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (*2.3.1*).

E. It gives reaction (a) of sodium (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in *alcohol (50 per cent V/V) R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*). Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent. Disregard any slight residue. The pH of the solution is not more than 11.0.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance.

*Test solution*. Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 mL with the same solvent.

*Reference solution*. Dilute 0.5 mL of the test solution to 100 mL with *alcohol R*.

Apply separately to the plate 20 µL of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine the plate immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spot at the point of application.

**Loss on drying** (*2.2.32*). Not more than 3.0 per cent, determined on 0.50 g by drying in an oven at 130 °C.

ASSAY

Dissolve 0.200 g in 5 mL of *ethanol R*. Add 0.5 mL of *thymolphthalein solution R* and 10 mL of *silver nitrate solution in pyridine R*. Titrate with *0.1 M ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 mL of *0.1 M ethanolic sodium hydroxide* is equivalent to 24.83 mg of $C_{11}H_{17}N_2NaO_3$.

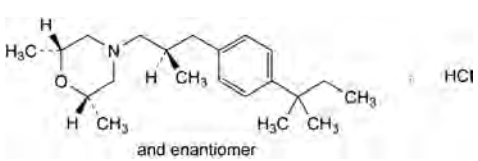
STORAGE

Store in an airtight container.

**04/2019:2756**

# AMOROLFINE HYDROCHLORIDE

## Amorolfini hydrochloridum



$C_{21}H_{36}ClNO$ $M_r$ 354.0
[78613-38-4]

DEFINITION

(2*RS*,6*SR*)-2,6-Dimethyl-4-[(2*RS*)-2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl]morpholine hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: slightly soluble in water, soluble in methanol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amorolfine hydrochloride CRS*.

B. To 20 mg add 4.0 mL of *water R*, and acidify with *dilute nitric acid R*. A precipitate is formed. Centrifuge, and to 2 mL of the supernatant add 0.4 mL of *silver nitrate solution R1*. A curdled, white precipitate is formed. Centrifuge and wash the precipitate with 3 quantities, each of 1 mL, of *water R*. Suspend the precipitate in 2 mL of *water R* and add 1.5 mL of *ammonia R*. The precipitate dissolves easily with the possible exception of a few large particles which dissolve slowly.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Buffer solution*. Dissolve 3.5 g of *dipotassium hydrogen phosphate R* in 1000 mL of *water for chromatography R* and adjust to pH 7.0 with *phosphoric acid R*.

*Test solution*. Dissolve 20 mg of the substance to be examined in mobile phase A and dilute to 20.0 mL with mobile phase A.

*Reference solution (a)*. Dissolve 4 mg of *amorolfine for system suitability CRS* (containing impurities D, E, I and J) in mobile phase A and dilute to 5 mL with mobile phase A.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (c)*. Dissolve 4 mg of *amorolfine for peak identification CRS* (containing impurity M) in mobile phase A and dilute to 5 mL with mobile phase A.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped amidohexadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:
- *mobile phase A*: *acetonitrile R1*, buffer solution, *methanol R2* (5:35:60 *V/V/V*);
- *mobile phase B*: buffer solution, *acetonitrile R1*, *methanol R2* (10:30:60 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 90 | 10 |
| 2 - 25 | 90 → 0 | 10 → 100 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *amorolfine for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities D, E, I and J; use the chromatogram supplied with *amorolfine for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurity M (peaks 1 and 2).

*Relative retention* with reference to amorolfine (retention time = about 15 min): impurity M (peak 1) = about 0.56; impurity M (peak 2) = about 0.60; impurity D = about 0.85; impurity J = about 0.97; impurity I = about 1.05; impurity E (peak 1) = about 1.14; impurity E (peak 2) = about 1.17.

*System suitability*:
- *resolution*: minimum 2.0 between the peaks due to impurity J and amorolfine in the chromatogram obtained with reference solution (a);
- *signal-to-noise ratio*: minimum 20 for the principal peak in the chromatogram obtained with reference solution (b).

*Calculation of percentage contents*:

– for each impurity, use the concentration of amorolfine hydrochloride in reference solution (b).

*Limits*:

– *impurity D*: maximum 0.2 per cent;
– *impurity E*: maximum 0.2 per cent for the sum of the areas of the 2 peaks;
– *impurity I*: maximum 0.15 per cent;
– *impurity M* : maximum 0.15 per cent for each peak;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.4 per cent;
– *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

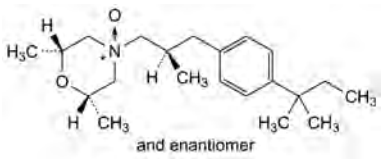
Dissolve 0.250 g in a mixture of 10.0 mL of *0.01 M hydrochloric acid* and 40 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 35.40 mg of $C_{21}H_{36}ClNO$.

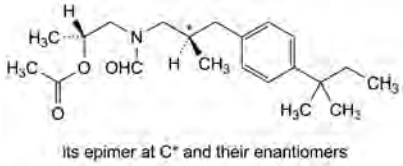
IMPURITIES

*Specified impurities: D, E, I, M.*

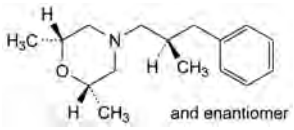
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, F, G, H, J, K, L, O.*



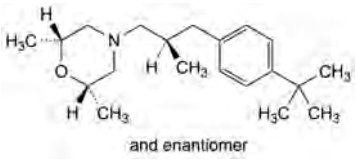
A. (2*RS*,4Ξ,6*SR*)-2,6-dimethyl-4-[(2*RS*)-2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl]morpholine 4-oxide,



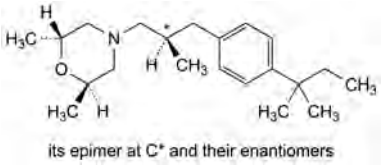
B. mixture of (2*RS*)-1-[*N*-[(2*R*)-2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl]formamido]propan-2-yl acetate and (2*RS*)-1-[*N*-[(2*S*)-2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl]formamido]propan-2-yl acetate,



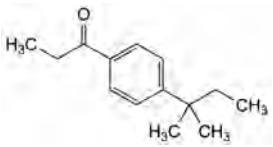
C. (2*RS*,6*SR*)-2,6-dimethyl-4-[(2*RS*)-2-methyl-3-phenylpropyl]morpholine,



D. (2*RS*,6*SR*)-2,6-dimethyl-4-[(2*RS*)-3-(4-*tert*-butylphenyl)-2-methylpropyl]morpholine,



E. mixture of (2*RS*,6*RS*)-2,6-dimethyl-4-[(2*R*)-2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl]morpholine and (2*RS*,6*RS*)-2,6-dimethyl-4-[(2*S*)-2-methyl-3-[4-(2-methylbutan-2-yl)phenyl]propyl]morpholine,



F. 1-[4-(2-methylbutan-2-yl)phenyl]propan-1-one,

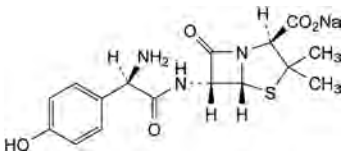
# AMOXICILLIN SODIUM

## Amoxicillinum natricum



$C_{16}H_{18}N_3NaO_5S$ $M_r$ 387.4
[34642-77-8]

DEFINITION

Sodium (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-(4-hydroxyphenyl)-acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo-[3.2.0]heptane-2-carboxylate.

Semi-synthetic product derived from a fermentation product.

*Content*: 89.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, very hygroscopic, powder.

*Solubility*: very soluble in water, sparingly soluble in anhydrous ethanol, very slightly soluble in acetone.

IDENTIFICATION

*First identification*: *A, D.*

*Second identification*: *B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: dissolve 0.250 g in 5 mL of *water R*, add 0.5 mL of *dilute acetic acid R*, swirl and allow to stand for 10 min in iced water. Filter the crystals and wash with 2-3 mL of a mixture of 1 volume of *water R* and 9 volumes of *acetone R*, then dry in an oven at 60 °C for 30 min.

*Comparison*: *amoxicillin trihydrate CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 25 mg of the substance to be examined in 10 mL of *sodium hydrogen carbonate solution R*.

*Reference solution (a)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.

*Reference solution (b)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.

*Plate*: *TLC silanised silica gel plate R*.

*Mobile phase*: mix 10 volumes of *acetone R* and 90 volumes of a 154 g/L solution of *ammonium acetate R* previously adjusted to pH 5.0 with *glacial acetic acid R*.

*Application*: 1 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 150 mm long and about 15 mm in diameter. Moisten with 0.05 mL of *water R* and add 2 mL of *sulfuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. It gives reaction (a) of sodium (*2.3.1*).

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*), it may show an initial, but transient, pink colour, and after 5 min, its absorbance (*2.2.25*) at 430 nm is not greater than 0.20.

Dissolve 1.0 g in *water R* and dilute to 10.0 mL with the same solvent. Examine immediately after dissolution.

**pH** (*2.2.3*): 8.0 to 10.0.

Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 240 to + 290 (anhydrous substance).

Dissolve 62.5 mg in a 4 g/L solution of *potassium hydrogen phthalate R* and dilute to 25.0 mL with the same solution.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Test solution (b)*. Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 mL with mobile phase A. *Prepare immediately before use*.

*Reference solution (a)*. Dissolve 30.0 mg of *amoxicillin trihydrate CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (b).* Dissolve 4.0 mg of *cefadroxil CRS* in mobile phase A and dilute to 50 mL with mobile phase A. To 5.0 mL of this solution add 5.0 mL of reference solution (a) and dilute to 100 mL with mobile phase A.

*Reference solution (c).* Dilute 2.0 mL of reference solution (a) to 20.0 mL with mobile phase A. Dilute 5.0 mL of this solution to 20.0 mL with mobile phase A.

*Reference solution (d).* To 0.20 g of *amoxicillin trihydrate R* add 1.0 mL of *water R*. Shake and add dropwise *dilute sodium hydroxide solution R* to obtain a solution. The pH of the solution is about 8.5. Store the solution at room temperature for 4 h. Dilute 0.5 mL of this solution to 50.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: mix 1 volume of *acetonitrile R* and 99 volumes of a 25 per cent *V/V* solution of *0.2 M potassium dihydrogen phosphate R* adjusted to pH 5.0 with *dilute sodium hydroxide solution R*;
- *mobile phase B*: mix 20 volumes of *acetonitrile R* and 80 volumes of a 25 per cent *V/V* solution of *0.2 M potassium dihydrogen phosphate R* adjusted to pH 5.0 with *dilute sodium hydroxide solution R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - $t_R$ | 92 | 8 |
| $t_R$ - ($t_R$ + 25) | 92 → 0 | 8 → 100 |
| ($t_R$ + 25) - ($t_R$ + 40) | 0 | 100 |
| ($t_R$ + 40) - ($t_R$ + 55) | 92 | 8 |

$t_R$ = retention time of amoxicillin determined with reference solution (c)

If the mobile phase has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient and in the assay.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 50 µL of reference solutions (b) and (c) with isocratic elution at the initial mobile phase composition and 50 µL of test solution (b) and reference solution (d) according to the elution gradient described under Mobile phase; inject mobile phase A as a blank according to the elution gradient described under Mobile phase.

*Identification of impurities*: use the chromatogram obtained with reference solution (d) to identify the 3 principal peaks eluted after the main peak corresponding to impurity C, amoxicillin dimer (impurity J; *n* = 1) and amoxicillin trimer (impurity J; *n* = 2).

*Relative retention* with reference to amoxicillin: impurity C = about 3.4; impurity J (*n* = 1) = about 4.1; impurity J (*n* = 2) = about 4.5.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to amoxicillin and cefadroxil; if necessary, adjust the ratio A:B of the mobile phase.

*Limits*:

- *impurity J* (*n* = 1): not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3 per cent);
- *any other impurity*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2 per cent);
- *total*: not more than 9 times the area of the principal peak in the chromatogram obtained with reference solution (c) (9 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

***N*,*N*-Dimethylaniline** (*2.4.26, Method A or B*): maximum 20 ppm.

**2-Ethylhexanoic acid** (*2.4.28*): maximum 0.8 per cent *m/m*.

**Water** (*2.5.12*): maximum 3.0 per cent, determined on 0.400 g.

**Bacterial endotoxins** (*2.6.14*): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: initial composition of the mixture of mobile phases A and B, adjusted where applicable.

*Injection*: test solution (a) and reference solution (a).

*System suitability*: reference solution (a):

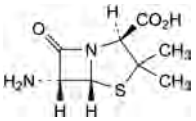
- *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections.

Calculate the percentage content of amoxicillin sodium by multiplying the percentage content of amoxicillin by 1.060.

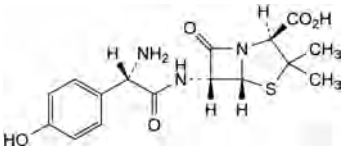
STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

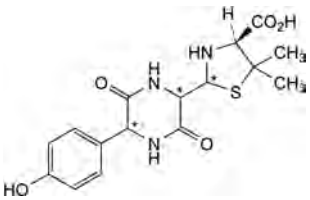
IMPURITIES



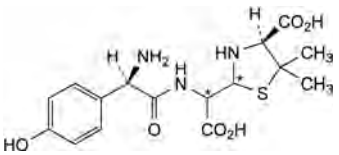
A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),



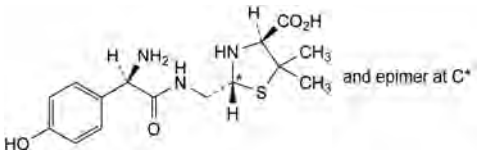
B. (2*S*,5*R*,6*R*)-6-[[(2*S*)-2-amino-2-(4-hydroxyphenyl)-acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo-[3.2.0]heptane-2-carboxylic acid (L-amoxicillin),



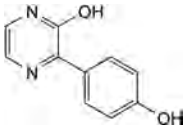
C. (4*S*)-2-[5-(4-hydroxyphenyl)-3,6-dioxopiperazin-2-yl]-5,5-dimethylthiazolidine-4-carboxylic acid (amoxicillin diketopiperazines),



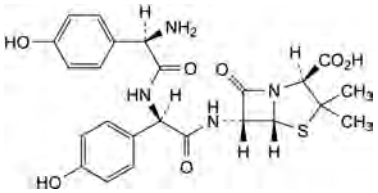
D. (4*S*)-2-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]carboxymethyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of amoxicillin),



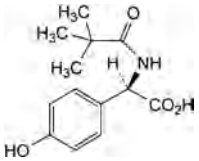
E. (2*RS*,4*S*)-2-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]-amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of amoxicillin),



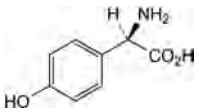
F. 3-(4-hydroxyphenyl)pyrazin-2-ol,



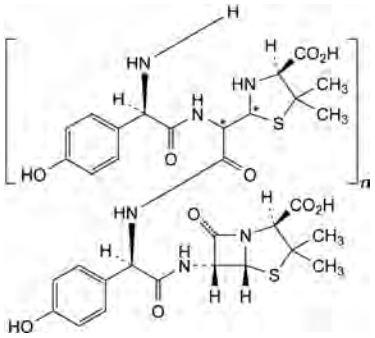
G. (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (D-(4-hydroxyphenyl)glycylamoxicillin),



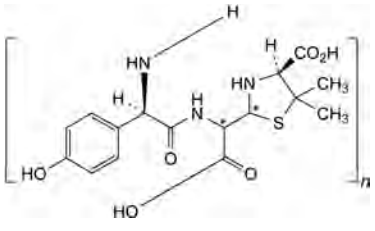
H. (2*R*)-2-[(2,2-dimethylpropanoyl)amino]-2-(4-hydroxyphenyl)acetic acid,



I. (2*R*)-2-amino-2-(4-hydroxyphenyl)acetic acid,



J. co-oligomers of amoxicillin and penicilloic acids of amoxicillin,



K. oligomers of penicilloic acids of amoxicillin.

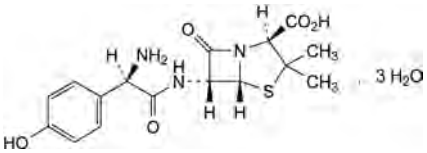
# AMOXICILLIN TRIHYDRATE

## Amoxicillinum trihydricum



$C_{16}H_{19}N_3O_5S,3H_2O$ $M_r$ 419.4
[61336-70-7]

DEFINITION

(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-Amino-2-(4-hydroxyphenyl)acetyl]-amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate.

Semi-synthetic product derived from a fermentation product.

*Content*: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: slightly soluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in fatty oils. It dissolves in dilute acids and dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification: A.*

*Second identification: B, C.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *amoxicillin trihydrate CRS*.

B. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 25 mg of the substance to be examined in 10 mL of *sodium hydrogen carbonate solution R*.
*Reference solution (a)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.
*Reference solution (b)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.
*Plate*: *TLC silanised silica gel plate R*.
*Mobile phase*: mix 10 volumes of *acetone R* and 90 volumes of a 154 g/L solution of *ammonium acetate R* previously adjusted to pH 5.0 with *glacial acetic acid R*.
*Application*: 1 µL.
*Development*: over a path of 15 cm.
*Drying*: in air.
*Detection*: expose to iodine vapour until the spots appear and examine in daylight.
*System suitability*: reference solution (b):
– the chromatogram shows 2 clearly separated spots.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 150 mm long and about 15 mm in diameter. Moisten with 0.05 mL of *water R* and add 2 mL of *sulfuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

TESTS

**Solution S**. With the aid of ultrasound or gentle heating, dissolve 0.100 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**pH** (*2.2.3*): 3.5 to 5.5 for solution S.

**Specific optical rotation** (*2.2.7*): + 290 to + 315 (anhydrous substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Buffer solution pH 5.0.* To 250 mL of *0.2 M potassium dihydrogen phosphate R* add *dilute sodium hydroxide solution R* to pH 5.0 and dilute to 1000.0 mL with *water R*.

*Test solution (a).* Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Test solution (b).* Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 mL with mobile phase A. *Prepare immediately before use.*

*Reference solution (a).* Dissolve 30.0 mg of *amoxicillin trihydrate CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (b).* Dissolve 4.0 mg of *cefadroxil CRS* in mobile phase A and dilute to 50 mL with mobile phase A. To 5.0 mL of this solution add 5.0 mL of reference solution (a) and dilute to 100 mL with mobile phase A.

*Reference solution (c).* Dilute 2.0 mL of reference solution (a) to 20.0 mL with mobile phase A. Dilute 5.0 mL of this solution to 20.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R*, buffer solution pH 5.0 (1:99 *V/V*);
- *mobile phase B*: *acetonitrile R*, buffer solution pH 5.0 (20:80 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - $t_R$ | 92 | 8 |
| $t_R$ - ($t_R$ + 25) | 92 → 0 | 8 → 100 |
| ($t_R$ + 25) - ($t_R$ + 40) | 0 | 100 |
| ($t_R$ + 40) - ($t_R$ + 55) | 92 | 8 |

$t_R$ = retention time of amoxicillin determined with reference solution (c)

If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient and in the assay.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

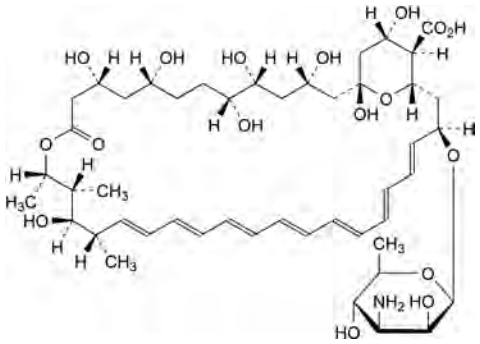
# AMPHOTERICIN B

## Amphotericinum B



$C_{47}H_{73}NO_{17}$ $M_r$ 924
[1397-89-3]

DEFINITION

Mixture of antifungal polyenes produced by the growth of certain strains of *Streptomyces nodosus* or obtained by any other means. It consists mainly of amphotericin B which is (1*R*,3*S*,5*R*,6*R*,9*R*,11*R*,15*S*,16*R*,17*R*,18*S*,19*E*,21*E*,23*E*,25*E*,27*E*,29*E*,31*E*,33*R*,35*S*,36*R*,37*S*)-33-[(3-amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,5,6,9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nonatriaconta-19,21,23,25,27,29,31-heptaene-36-carboxylic acid.

*Content*: minimum 750 IU/mg (dried substance).

CHARACTERS

*Appearance*: yellow or orange, hygroscopic powder.

*Solubility*: practically insoluble in water, soluble in dimethyl sulfoxide and in propylene glycol, slightly soluble in dimethylformamide, very slightly soluble in methanol, practically insoluble in ethanol (96 per cent).

It is sensitive to light in dilute solutions.

IDENTIFICATION

*First identification*: *B, D.*

*Second identification*: *A, C.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 25 mg in 5 mL of *dimethyl sulfoxide R* and dilute to 50 mL with *methanol R*. Dilute 2 mL of the solution to 200 mL with *methanol R*.

*Spectral range*: 300-450 nm.

*Absorption maxima*: at 362 nm, 381 nm and 405 nm.

*Absorbance ratios*:

– $A_{362}/A_{381}$ = 0.57 to 0.61;

– $A_{381}/A_{405}$ = 0.87 to 0.93.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *amphotericin B CRS*.

If the spectra obtained show differences, dry the substance to be examined and reference substance at 60 °C at a pressure not exceeding 0.7 kPa for 1 h and record new spectra.

C. To 1 mL of a 0.5 g/L solution in *dimethyl sulfoxide R*, add 5 mL of *phosphoric acid R* to form a lower layer, avoiding mixing the 2 liquids. A blue ring is immediately produced at the junction of the liquids. Mix, an intense blue colour is produced. Add 15 mL of *water R* and mix; the solution becomes pale yellow.

D. Examine the chromatograms obtained in the test for related substances.

*Results*: the principal peak in the chromatogram obtained with the test solution at 383 nm is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Protect the solutions from light and use within 24 h of preparation, except for reference solution (c) which should be injected immediately after its preparation.*

*Solvent mixture*: 10 g/L solution of *ammonium acetate R*, *N-methylpyrrolidone R*, *methanol R* (1:1:2 *V/V/V*).

*Test solution.* Dissolve 20.0 mg of the substance to be examined in 15 mL of *N-methylpyrrolidone R* and within 2 h dilute to 50.0 mL with the solvent mixture. Dilute 5.0 mL of this solution to 25.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 20.0 mg of *amphotericin B CRS* in 15 mL of *N-methylpyrrolidone R* and within 2 h dilute to 50.0 mL with the solvent mixture. Dilute 5.0 mL of this solution to 25.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 100.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 20.0 mg of *nystatin CRS* in 15 mL of *N-methylpyrrolidone R* and within 2 h dilute to 50.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 25.0 mL with reference solution (a). Dilute 2.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (d).* In order to prepare impurities B and C, dissolve 10 mg of the substance to be examined in 5 mL of *N-methylpyrrolidone R* and within 2 h add 35 mL of a mixture of 1 volume of *methanol R* and 4 volumes of *anhydrous ethanol R*. Add 0.10 mL of *dilute hydrochloric acid R*, mix and incubate at 25 °C for 2.5 h. Add 10 mL of 10 g/L solution of *ammonium acetate R* and mix.

*Reference solution (e).* Dissolve 4 mg of *amphotericin B for peak identification CRS* (containing impurities A and B) in 5 mL of *N-methylpyrrolidone R* and within 2 h dilute to 50 mL with the solvent mixture.

*Blank solution.* The solvent mixture.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);

– *temperature*: 20 °C.

*Mobile phase*:

– *mobile phase A*: mix 1 volume of *methanol R*, 3 volumes of *acetonitrile R* and 6 volumes of a 4.2 g/L solution of *citric acid monohydrate R* previously adjusted to pH 4.7 using *concentrated ammonia R*;

– *mobile phase B*: mix 12 volumes of *methanol R*, 20 volumes of a 4.2 g/L solution of *citric acid monohydrate R* previously adjusted to pH 3.9 using *concentrated ammonia R* and 68 volumes of *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 100 | 0 |
| 3 - 23 | 100 → 70 | 0 → 30 |
| 23 - 33 | 70 → 0 | 30 → 100 |
| 33 - 40 | 0 | 100 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer:

– at 303 nm: detection of tetraenes;

– at 383 nm: detection of heptaenes.

*Injection*: 20 µL of the test solution and reference solutions (b), (c), (d) and (e).

*Identification of impurities*: use the chromatograms supplied with *amphotericin B for peak identification CRS* and the chromatograms obtained with reference solution (e) to identify the peaks due to impurities A and B.

*Relative retention* with reference to amphotericin B (retention time = about 16 min): impurity B = about 0.75; impurity A = about 0.8; nystatin = about 0.85.

*System suitability at 383 nm*: reference solution (d):

– *resolution*: minimum 1.5 between the 2 peaks presenting a relative retention of about 0.7.

*Limits*:

– *impurity A at 303 nm*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent); if intended for use in the manufacture of parenteral preparations: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent);

– *any other impurity at 303 nm*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent);

– *impurity B at 383 nm*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent);

– *any other impurity at 383 nm*: for each impurity, not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);

– *total at 303 and 383 nm*: maximum 15.0 per cent;

– *disregard limit at 303 nm*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);

– *disregard limit at 383 nm*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa.

**Sulfated ash** (*2.4.14*): maximum 3.0 per cent, determined on 1.0 g; if intended for use in the manufacture of parenteral preparations: maximum 0.5 per cent.

**Bacterial endotoxins** (*2.6.14*): less than 1.0 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

*Protect all solutions from light throughout the assay.* Dissolve 25.0 mg in *dimethyl sulfoxide R* and dilute, with shaking, to 25.0 mL with the same solvent. Under constant stirring

of this stock solution, dilute with *dimethyl sulfoxide R* to obtain solutions of appropriate concentrations (the following concentrations have been found suitable: 44.4, 66.7 and 100 IU/mL). Prepare final solutions by diluting 1:20 with 0.2 M phosphate buffer solution pH 10.5 so that they all contain 5 per cent *V/V* of dimethyl sulfoxide. Prepare the reference and the test solutions simultaneously. Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE

Protected from light, at a temperature of 2 °C to 8 °C in an airtight container. If the substance is sterile, store in a sterile, tamper-evident container.

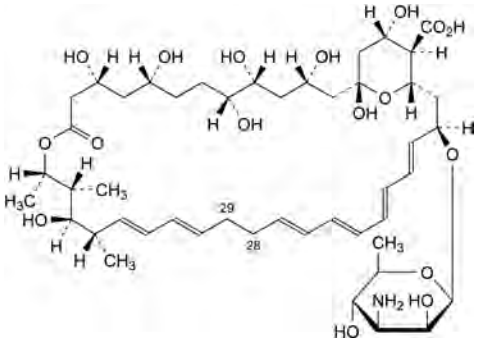
LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

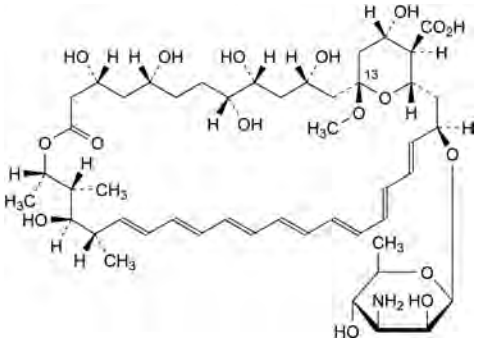
IMPURITIES

*Specified impurities: A, B.*

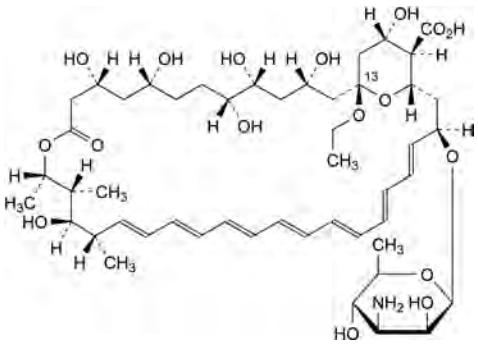
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C.*



A. amphotericin A (28,29-dihydro-amphotericin B),



B. amphotericin X1 (13-*O*-methyl-amphotericin B),

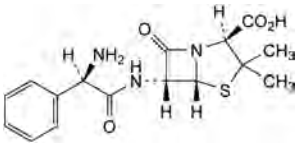


C. amphotericin X2 (13-*O*-ethyl-amphotericin B).

**01/2017:0167**

# AMPICILLIN

## Ampicillinum



$C_{16}H_{19}N_3O_4S$ $M_r$ 349.4

[69-53-4]

DEFINITION

(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-Amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

Semi-synthetic product derived from a fermentation product.

*Content*: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: sparingly soluble in water, practically insoluble in acetone, in ethanol (96 per cent) and in fatty oils. It dissolves in dilute solutions of acids and of alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: A, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs of *potassium bromide R*.

*Comparison*: *anhydrous ampicillin CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 25 mg of the substance to be examined in 10 mL of *sodium hydrogen carbonate solution R*.

*Reference solution (a)*. Dissolve 25 mg of *anhydrous ampicillin CRS* in 10 mL of *sodium hydrogen carbonate solution R*.

*Reference solution (b)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *anhydrous ampicillin CRS* in 10 mL of *sodium hydrogen carbonate solution R*.

*Plate*: *TLC silanised silica gel plate R*.

*Mobile phase*: mix 10 volumes of *acetone R* and 90 volumes of a 154 g/L solution of *ammonium acetate R* previously adjusted to pH 5.0 with *glacial acetic acid R*.

*Application*: 1 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 150 mm long and about 15 mm in diameter. Moisten with 0.05 mL of *water R* and add 2 mL of *sulfuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. Water (see Tests).

TESTS

**Appearance of solution**. The solutions are not more opalescent than reference suspension II (*2.2.1*).

Dissolve 1.0 g in 10 mL of *1 M hydrochloric acid*. Separately dissolve 1.0 g in 10 mL of *dilute ammonia R2*. Examine immediately after dissolution.

**pH** (*2.2.3*): 3.5 to 5.5.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 40 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 280 to + 305 (anhydrous substance).

Dissolve 62.5 mg in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 27.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Test solution (b)*. *Prepare immediately before use.* Dissolve 27.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A.

*Reference solution (a)*. Dissolve 27.0 mg of *anhydrous ampicillin CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (b)*. Dissolve 2.0 mg of *cefradine CRS* in mobile phase A and dilute to 50 mL with mobile phase A. To 5.0 mL of this solution add 5.0 mL of reference solution (a).

*Reference solution (c)*. Dilute 1.0 mL of reference solution (a) to 20.0 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: mix 0.5 mL of *dilute acetic acid R*, 50 mL of *0.2 M potassium dihydrogen phosphate R* and 50 mL of *acetonitrile R*, then dilute to 1000 mL with *water R*;
– *mobile phase B*: mix 0.5 mL of *dilute acetic acid R*, 50 mL of *0.2 M potassium dihydrogen phosphate R* and 400 mL of *acetonitrile R*, then dilute to 1000 mL with *water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - $t_R$ | 85 | 15 |
| $t_R$ - ($t_R$ + 30) | 85 → 0 | 15 → 100 |
| ($t_R$ + 30) - ($t_R$ + 45) | 0 | 100 |
| ($t_R$ + 45) - ($t_R$ + 60) | 85 | 15 |

$t_R$ = retention time of ampicillin determined with reference solution (c)

If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient and in the assay.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 50 µL of reference solutions (b) and (c) with isocratic elution at the initial mobile phase composition and 50 µL of test solution (b) according to the elution gradient described under Mobile phase; inject mobile phase A as a blank according to the elution gradient described under Mobile phase.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to ampicillin and cefradin; if necessary, adjust the ratio A:B of the mobile phase.

*Limit*:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

***N,N*-Dimethylaniline** (*2.4.26, Method B*): maximum 20 ppm.

**Water** (*2.5.12*): maximum 2.0 per cent, determined on 0.300 g.

**Sulfated ash** (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: initial composition of the mixture of mobile phases A and B, adjusted where applicable.

*Injection*: test solution (a) and reference solution (a).

*System suitability*: reference solution (a):

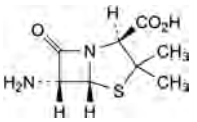
– *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections.

Calculate the percentage content of $C_{16}H_{19}N_3O_4S$ from the declared content of *anhydrous ampicillin CRS*.

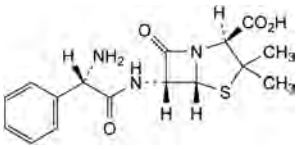
STORAGE

In an airtight container, at a temperature not exceeding 30 °C.

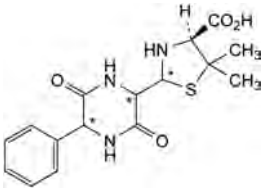
IMPURITIES



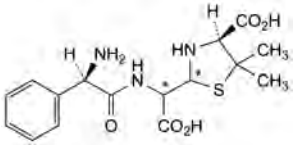
A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),



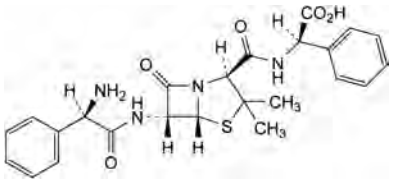
B. (2*S*,5*R*,6*R*)-6-[[(2*S*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-ampicillin),



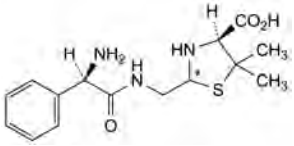
C. (4*S*)-2-(3,6-dioxo-5-phenylpiperazin-2-yl)-5,5-dimethylthiazolidine-4-carboxylic acid (diketopiperazines of ampicillin),



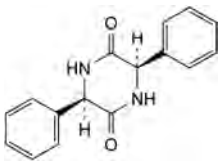
D. (4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-carboxymethyl]-5,5-dimethyl-1,3-thiazolidine-4-carboxylic acid (penicilloic acids of ampicillin),



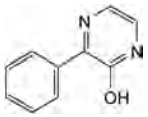
E. (2*R*)-2-[[[(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-phenylacetyl]-amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]-hept-2-yl]carbonyl]amino]-2-phenylacetic acid (ampicillinyl-D-phenylglycine),



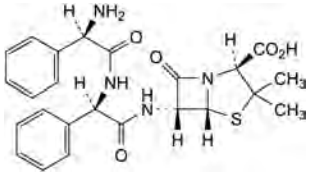
F. (2*RS*,4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-methyl]-5,5-dimethyl-1,3-thiazolidine-4-carboxylic acid (penilloic acids of ampicillin),



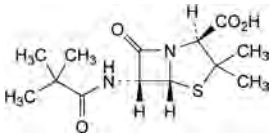
G. (3*R*,6*R*)-3,6-diphenylpiperazine-2,5-dione,



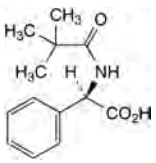
H. 3-phenylpyrazin-2-ol,



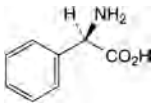
I. (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-[[(2*R*)-2-amino-2-phenylacetyl]-amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (D-phenylglycylampicillin),



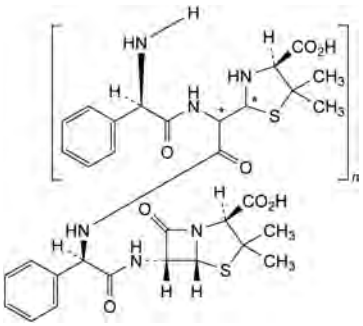
J. (2*S*,5*R*,6*R*)-6-[(2,2-dimethylpropanoyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,



K. (2*R*)-2-[(2,2-dimethylpropanoyl)amino]-2-phenylacetic acid,



L. (2*R*)-2-amino-2-phenylacetic acid (D-phenylglycine),

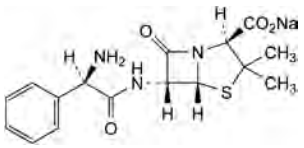


M. co-oligomers of ampicillin and of penicilloic acids of ampicillin.

**01/2017:0578**
**corrected 10.0**

# AMPICILLIN SODIUM

## Ampicillinum natricum



$C_{16}H_{18}N_3NaO_4S$ $M_r$ 371.4
[69-52-3]

DEFINITION

Sodium (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate.

Semi-synthetic product derived from a fermentation product.

*Content*: 91.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder, hygroscopic.

*Solubility*: freely soluble in water, sparingly soluble in acetone, practically insoluble in fatty oils and in liquid paraffin.

IDENTIFICATION

*First identification*: *A, D.*

*Second identification*: *B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: dissolve 0.250 g in 5 mL of *water R*, add 0.5 mL of *dilute acetic acid R*, swirl and allow to stand for 10 min in iced water. Filter the crystals through a small sintered-glass filter (40) (*2.1.2*), applying suction, wash with 2-3 mL of a mixture of 1 volume of *water R* and 9 volumes of *acetone R*, then dry in an oven at 60 °C for 30 min.

*Comparison*: *ampicillin trihydrate CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 25 mg of the substance to be examined in 10 mL of *sodium hydrogen carbonate solution R*.

*Reference solution (a)*. Dissolve 25 mg of *ampicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.

*Reference solution (b)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.

*Plate*: *TLC silanised silica gel plate R*.

*Mobile phase*: mix 10 volumes of *acetone R* and 90 volumes of a 154 g/L solution of *ammonium acetate R* previously adjusted to pH 5.0 with *glacial acetic acid R*.

*Application*: 1 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 150 mm long and about 15 mm in diameter. Moisten with 0.05 mL of *water R* and add 2 mL of *sulfuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. It gives reaction (a) of sodium (*2.3.1*).

TESTS

**Appearance of solution**. Solutions A and B are not more opalescent than reference suspension II (*2.2.1*) and the absorbance (*2.2.25*) of solution B at 430 nm is not greater than 0.15.

Place 1.0 g in a conical flask and add slowly and with continuous swirling 10 mL of *1 M hydrochloric acid* (solution A). Separately dissolve 1.0 g in *water R* and dilute to 10.0 mL with the same solvent (solution B). Examine immediately after dissolution.

**pH** (*2.2.3*): 8.0 to 10.0.

Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent. Measure 10 min after dissolution.

**Specific optical rotation** (*2.2.7*): + 258 to + 287 (anhydrous substance).

Dissolve 62.5 mg in a 4 g/L solution of *potassium hydrogen phthalate R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Test solution (b).* Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A. *Prepare immediately before use.*

*Reference solution (a).* Dissolve 27.0 mg of *anhydrous ampicillin CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (b).* Dissolve 2.0 mg of *cefradine CRS* in mobile phase A and dilute to 50 mL with mobile phase A. To 5.0 mL of this solution add 5.0 mL of reference solution (a).

*Reference solution (c).* Dilute 1.0 mL of reference solution (a) to 20.0 mL with mobile phase A.

*Reference solution (d).* To 0.20 g of the substance to be examined add 1.0 mL of *water R*. Heat the solution at 60 °C for 1 h. Dilute 0.5 mL of this solution to 50.0 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: mix 0.5 mL of *dilute acetic acid R*, 50 mL of *0.2 M potassium dihydrogen phosphate R* and 50 mL of *acetonitrile R*, then dilute to 1000 mL with *water R*;

– *mobile phase B*: mix 0.5 mL of *dilute acetic acid R*, 50 mL of *0.2 M potassium dihydrogen phosphate R* and 400 mL of *acetonitrile R*, then dilute to 1000 mL with *water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - $t_R$ | 85 | 15 |
| $t_R$ - ($t_R$ + 30) | 85 → 0 | 15 → 100 |
| ($t_R$ + 30) - ($t_R$ + 45) | 0 | 100 |
| ($t_R$ + 45) - ($t_R$ + 60) | 85 | 15 |

$t_R$ = retention time of ampicillin determined with reference solution (c)

If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient and in the assay.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 50 µL of reference solutions (b) and (c) with isocratic elution at the initial mobile phase composition and 50 µL of test solution (b) and reference solution (d) according to the elution gradient described under Mobile phase; inject mobile phase A as a blank according to the elution gradient described under Mobile phase.

*Identification of peaks*: use the chromatogram obtained with reference solution (d) to identify the peaks due to ampicillin and ampicillin dimer.

*Relative retention* with reference to ampicillin: ampicillin dimer = about 2.8.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to ampicillin and cefradin; if necessary adjust the ratio A:B of the mobile phase.

*Limits*:

– *ampicillin dimer*: not more than 4.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (4.5 per cent);

– *any other impurity*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2 per cent).

***N,N*-Dimethylaniline** (*2.4.26, Method B*): maximum 20 ppm.

**2-Ethylhexanoic acid** (*2.4.28*): maximum 0.8 per cent *m/m*.

**Methylene chloride**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dissolve 1.0 mL of *ethylene chloride R* in *water R* and dilute to 500.0 mL with the same solvent.

*Test solution (a).* Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Test solution (b).* Dissolve 1.0 g of the substance to be examined in *water R*, add 1.0 mL of the internal standard solution and dilute to 10.0 mL with *water R*.

*Reference solution.* Dissolve 1.0 mL of *methylene chloride R* in *water R* and dilute to 500.0 mL with the same solvent. To 1.0 mL of this solution add 1.0 mL of the internal standard solution and dilute to 10.0 mL with *water R*.

*Column*:

– *material*: glass;

– *size*: *l* = 1.5 m, Ø = 4 mm;

– *stationary phase*: *diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *macrogol 1000 R*.

*Carrier gas*: *nitrogen for chromatography R*.

*Flow rate*: 40 mL/min.

*Temperature*:

– *column*: 60 °C;

– *injection port*: 100 °C;

– *detector*: 150 °C.

*Detection*: flame ionisation.

Calculate the content of methylene chloride taking its density at 20 °C to be 1.325 g/mL.

*Limit*:

– *methylene chloride*: maximum 0.2 per cent *m/m*.

**Water** (*2.5.12*): maximum 2.0 per cent, determined on 0.300 g.

**Bacterial endotoxins** (*2.6.14*): less than 0.15 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: initial composition of the mixture of mobile phases A and B, adjusted where applicable.

*Injection*: test solution (a) and reference solution (a).

*System suitability*: reference solution (a):

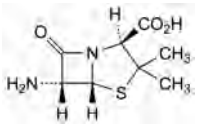
– *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections.

Calculate the percentage content of ampicillin sodium by multiplying the percentage content of ampicillin by 1.063.

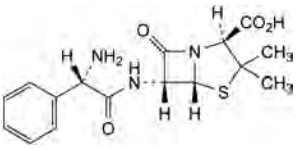
STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

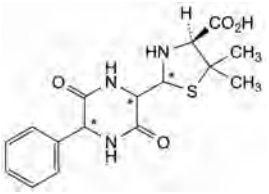
IMPURITIES



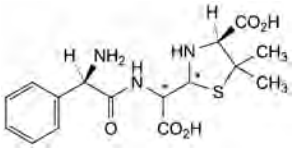
A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),



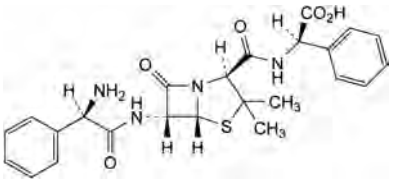
B. (2*S*,5*R*,6*R*)-6-[[(2*S*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-ampicillin),



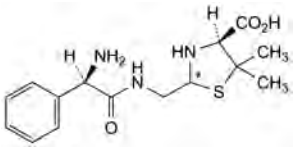
C. (4*S*)-2-(3,6-dioxo-5-phenylpiperazin-2-yl)-5,5-dimethylthiazolidine-4-carboxylic acid (diketopiperazines of ampicillin),



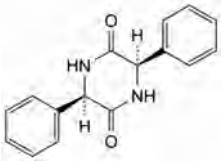
D. (4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-carboxymethyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of ampicillin),



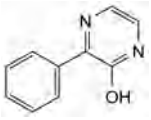
E. (2*R*)-2-[[[(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]amino]-2-phenylacetic acid (ampicillinyl-D-phenylglycine),



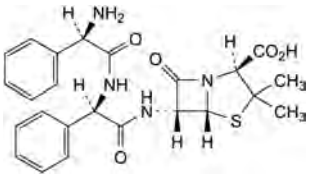
F. (2*RS*,4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of ampicillin),



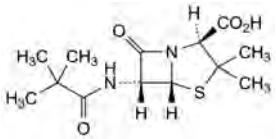
G. (3*R*,6*R*)-3,6-diphenylpiperazine-2,5-dione,



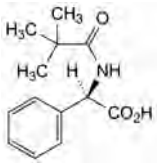
H. 3-phenylpyrazin-2-ol,



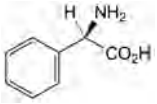
I. (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-[[(2*R*)-2-amino-2-phenylacetyl]-amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (D-phenylglycylampicillin),



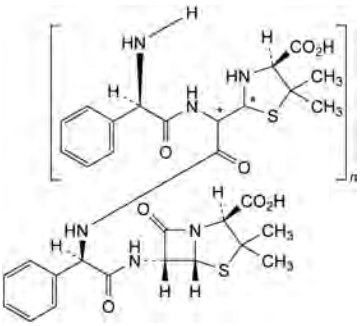
J. (2*S*,5*R*,6*R*)-6-[(2,2-dimethylpropanoyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,



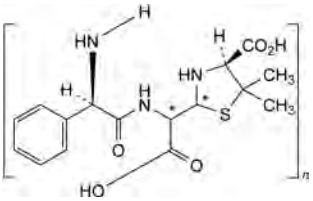
K. (2*R*)-2-[(2,2-dimethylpropanoyl)amino]-2-phenylacetic acid,



L. (2*R*)-2-amino-2-phenylacetic acid (D-phenylglycine),



M. co-oligomers of ampicillin and of penicilloic acids of ampicillin,



N. oligomers of penicilloic acids of ampicillin.

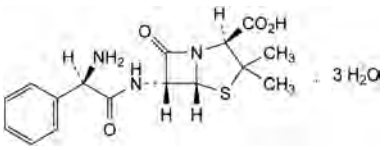
# AMPICILLIN TRIHYDRATE

## Ampicillinum trihydricum



$C_{16}H_{19}N_3O_4S,3H_2O$ $M_r$ 403.5
[7177-48-2]

DEFINITION

(2*S*,5*R*,6*R*)-6-[[(2*R*)-2-Amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate.

Semi-synthetic product derived from a fermentation product.

*Content*: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: slightly soluble in water, practically insoluble in ethanol (96 per cent) and in fatty oils. It dissolves in dilute solutions of acids and of alkali hydroxides.

IDENTIFICATION

*First identification: A, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *ampicillin trihydrate CRS*.

B. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 25 mg of the substance to be examined in 10 mL of *sodium hydrogen carbonate solution R*.
*Reference solution (a)*. Dissolve 25 mg of *ampicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.
*Reference solution (b)*. Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 mL of *sodium hydrogen carbonate solution R*.
*Plate*: *TLC silanised silica gel plate R*.
*Mobile phase*: mix 10 volumes of *acetone R* and 90 volumes of a 154 g/L solution of *ammonium acetate R* previously adjusted to pH 5.0 with *glacial acetic acid R*.
*Application*: 1 µL.
*Development*: over a path of 15 cm.
*Drying*: in air.
*Detection*: expose to iodine vapour until the spots appear and examine in daylight.
*System suitability*: reference solution (b):
– the chromatogram shows 2 clearly separated spots.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 150 mm long and about 15 mm in diameter. Moisten with 0.05 mL of *water R* and add 2 mL of *sulfuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. Water (see Tests).

TESTS

**Appearance of solution**. The solutions are not more opalescent than reference suspension II (*2.2.1*).

Dissolve 1.0 g in 10 mL of *1 M hydrochloric acid*. Separately dissolve 1.0 g in 10 mL of *dilute ammonia R2*. Examine immediately after dissolution.

**pH** (*2.2.3*): 3.5 to 5.5.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 40 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 280 to + 305 (anhydrous substance).

Dissolve 62.5 mg in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Test solution (b)*. Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A. *Prepare immediately before use.*

*Reference solution (a)*. Dissolve 27.0 mg of *anhydrous ampicillin CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (b)*. Dissolve 2 mg of *cefradine CRS* in mobile phase A and dilute to 50 mL with mobile phase A. To 5 mL of this solution, add 5 mL of reference solution (a).

*Reference solution (c)*. Dilute 1.0 mL of reference solution (a) to 20.0 mL with mobile phase A.

*Column*:
– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:
– *mobile phase A*: mix 0.5 mL of *dilute acetic acid R*, 50 mL of *0.2 M potassium dihydrogen phosphate R* and 50 mL of *acetonitrile R*, then dilute to 1000 mL with *water R*;
– *mobile phase B*: mix 0.5 mL of *dilute acetic acid R*, 50 mL of *0.2 M potassium dihydrogen phosphate R* and 400 mL of *acetonitrile R*, then dilute to 1000 mL with *water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - $t_R$ | 85 | 15 |
| $t_R$ - ($t_R$ + 30) | 85 → 0 | 15 → 100 |
| ($t_R$ + 30) - ($t_R$ + 45) | 0 | 100 |
| ($t_R$ + 45) - ($t_R$ + 60) | 85 | 15 |

$t_R$ = retention time of ampicillin determined with reference solution (c)

If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient and in the assay.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 50 µL of reference solutions (b) and (c) with isocratic elution at the initial mobile phase composition and 50 µL of test solution (b) according to the elution gradient described under Mobile phase; inject mobile phase A as a blank according to the elution gradient described under Mobile phase.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to ampicillin and cefradin; if necessary, adjust the ratio A:B of the mobile phase.

*Limit*:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

***N,N*-Dimethylaniline** (*2.4.26, Method B*): maximum 20 ppm.

**Water** (*2.5.12*): 12.0 per cent to 15.0 per cent, determined on 0.100 g.

**Sulfated ash** (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: initial composition of the mixture of mobile phases A and B, adjusted where applicable.

*Injection*: test solution (a) and reference solution (a).

*System suitability*: reference solution (a):

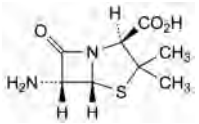
– *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections.

Calculate the percentage content of ampicillin from the declared content of *anhydrous ampicillin CRS*.

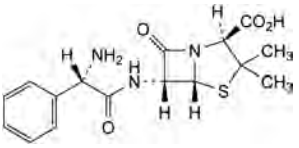
STORAGE

In an airtight container.

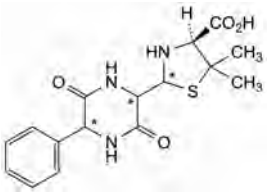
IMPURITIES



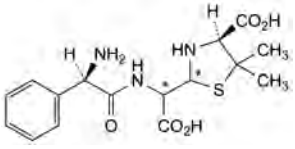
A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),



B. (2*S*,5*R*,6*R*)-6-[[(2*S*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-ampicillin),



C. (4*S*)-2-(3,6-dioxo-5-phenylpiperazin-2-yl)-5,5-dimethyl-1,3-thiazolidine-4-carboxylic acid (diketopiperazines of ampicillin),



D. (4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]carboxymethyl]-5,5-dimethyl-1,3-thiazolidine-4-carboxylic acid (penicilloic acids of ampicillin),

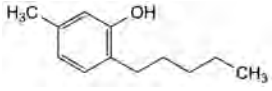
# AMYLMETACRESOL

## Amylmetacresolum



$C_{12}H_{18}O$ $M_r$ 178.3
[1300-94-3]

DEFINITION

5-Methyl-2-pentylphenol.

*Content*: 98.0 per cent to 102.0 per cent.

CHARACTERS

*Appearance*: clear or almost clear liquid, or solid crystalline mass, colourless or slightly yellow when freshly prepared. The substance changes colour during storage by darkening and/or discolouration to dark yellow, brownish-yellow or pink.

*Solubility*: practically insoluble in water, very soluble in acetone and in ethanol (96 per cent).

It solidifies at about 22 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: film between 2 plates of *potassium bromide R*.

*Comparison*: *amylmetacresol CRS*.

TESTS

**Related substances**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Internal standard solution.* Dissolve 0.100 g of *butylhydroxytoluene R* in *2-propanol R* and dilute to 10.0 mL with the same solvent.

*Test solution (a).* Dissolve 0.1000 g of the substance to be examined in *2-propanol R* and dilute to 10.0 mL with the same solvent.

*Test solution (b).* To 2.0 mL of test solution (a) add 2.0 mL of the internal standard solution and dilute to 10.0 mL with *2-propanol R*.

*Reference solution (a).* Dissolve 10 mg of *m-cresol R* (impurity B) and 10 mg of *p-cresol R* (impurity D) in *2-propanol R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b).* Dissolve the contents of a vial of *amylmetacresol for peak identification CRS* (containing impurities A, G and K) in 1.0 mL of *2-propanol R*.

*Reference solution (c).* Dissolve 0.1000 g of *amylmetacresol CRS* in *2-propanol R* and dilute to 10.0 mL with the same solvent. To 2.0 mL of this solution add 2.0 mL of the internal standard solution and dilute to 10.0 mL with *2-propanol R*.

*Reference solution (d).* Dilute 1.0 mL of test solution (a) to 100.0 mL with *2-propanol R*. Dilute 1.0 mL of this solution to 20.0 mL with *2-propanol R*.

*Column*:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.25 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 0.5 µm).

*Carrier gas*: *helium for chromatography R*.

*Linear velocity*: 33 cm/s.

*Split ratio*: 1:30.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 17.5 | 100 → 240 |
| | 17.5 - 32.5 | 240 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 1.0 µL of test solution (a) and reference solutions (a), (b) and (d).

*Identification of impurities*: use the chromatogram supplied with *amylmetacresol for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, G and K.

*Relative retention* with reference to amylmetacresol (retention time = about 16 min): impurity G (diastereoisomer 1) = about 0.51; impurity G (diastereoisomer 2) = about 0.53; impurity D = about 0.77; impurity B = about 0.78; impurity K = about 0.95; impurity A = about 0.99.

*System suitability*: reference solution (a):
- *resolution*: minimum 1.5 between the peaks due to impurities D and B.

*Limits*:
- *impurity A*: maximum 0.6 per cent;
- *impurities G* (sum of the 2 diastereoisomers), *K*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 1.0 per cent;
- *disregard limit*: the area of the peak due to amylmetacresol in the chromatogram obtained with reference solution (d) (0.05 per cent).

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*) as described in the test for related substances with the following modification.

*Injection*: 1.0 µL of test solution (b) and reference solution (c).

Calculate the percentage content of $C_{12}H_{18}O$ from the declared content of *amylmetacresol CRS*.

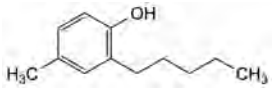
STORAGE

In an airtight, non-metallic container, protected from light.

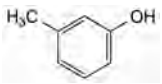
IMPURITIES

*Specified impurities: A, G, K.*

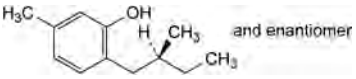
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, H, I, J.*



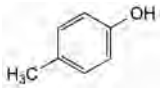
A. 4-methyl-2-pentylphenol,



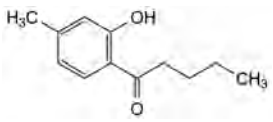
B. 3-methylphenol (*m*-cresol),



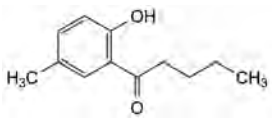
C. 5-methyl-2-[(2*RS*)-2-methylbutyl]phenol,



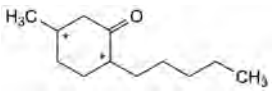
D. 4-methylphenol (*p*-cresol),



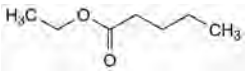
E. 1-(2-hydroxy-4-methylphenyl)pentan-1-one,



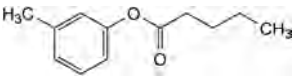
F. 1-(2-hydroxy-5-methylphenyl)pentan-1-one,



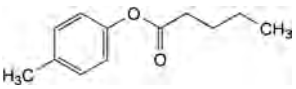
G. 5-methyl-2-pentylcyclohexanone,



H. ethyl pentanoate,



I. 3-methylphenyl pentanoate,



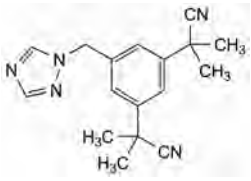
J. 4-methylphenyl pentanoate,

K. unknown structure.

**04/2013:2406**
**corrected 9.3**

# ANASTROZOLE

## Anastrozolum



$C_{17}H_{19}N_5$ $M_r$ 293.4

[120511-73-1]

DEFINITION

2,2′-[5-(1*H*-1,2,4-Triazol-1-ylmethyl)benzene-1,3-diyl]bis(2-methylpropanenitrile).

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water, freely soluble in anhydrous ethanol, practically insoluble in cyclohexane.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *anastrozole CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R1*, *water for chromatography R* (50:50 *V/V*).

*Test solution (a)*. Dissolve 25 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Test solution (b)*. Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 200.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 2.5 mg of *anastrozole impurity E CRS* in 20.0 mL of the solvent mixture. Dilute 1.0 mL of the solution to 50.0 mL with test solution (a).

*Reference solution (c).* Dissolve 25.0 mg of *anastrozole CRS* in the solvent mixture and dilute to 200.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped ethylene-bridged polar-embedded octadecylsilyl silica gel for chromatography (hybrid material) R* (3.5 µm).

*Mobile phase*:

- *mobile phase A*: *phosphoric acid R, water for chromatography R* (0.1:100 *V/V*);
- *mobile phase B*: *phosphoric acid R, acetonitrile R1* (0.1:100 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 95 | 5 |
| 2 - 54 | 95 → 35 | 5 → 65 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (b).

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity E.

*Relative retention* with reference to anastrozole (retention time = about 29 min): impurity E = about 1.05.

*System suitability*: reference solution (b):

- *resolution*: minimum 3.5 between the peaks due to anastrozole and impurity E.

*Calculation of percentage contents*:

- for each impurity, use the concentration of anastrozole in reference solution (a).

*Limits*:

- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.2 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.32*): maximum 0.3 per cent, determined on 50.0 mg.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (b) and reference solution (c).

Calculate the percentage content of $C_{17}H_{19}N_5$ taking into account the assigned content of *anastrozole CRS*.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. I. 2,2′-[5-(chloromethyl)benzene-1,3-diyl]bis(2-methylpropanenitrile).

01/2017:2621

# ANIMAL EPITHELIA AND OUTGROWTHS FOR ALLERGEN PRODUCTS

## Fragmenta epithelii phaneraeque bestiarum ad producta allergenica

DEFINITION

Animal epithelia and outgrowths for allergen products consist of hair, epithelium fragments, dander, feathers and other structures that grow from the epidermis of mammals or birds.

Animal epithelia and outgrowths may contain proteins deposited from the saliva and/or secretions from the sebaceous glands of the animal. They may be further processed (e.g. cut or washed) using qualified methods or are unprocessed.

PRODUCTION

Animal epithelia and outgrowths for allergen products are obtained from healthy animals selected to avoid possible transmissible agents of disease. The exact species and/or variety of animal is stated. Typical production steps, including animal management, source material collection and purification, are specified. The origin, quality, and traceability of the source material must be demonstrated.

It is expected that, where applicable, the animal care and husbandry follows the principles described for the protection of vertebrate animals used for experimental and other scientific purposes. A responsible veterinarian or another competent person confirms the identity of the species and that the animals are healthy. It is verified that the skin is visibly clean and intact before harvest and that the animals have not been recently treated with preparations for cutaneous application, such as antiparasitic drugs.

The collection of animal epithelia and outgrowths must be performed without injuring the skin of the animal. Confirmation that measures are in place to prevent cross-contamination by animal epithelia and outgrowths from other animals is provided, including during animal management, collection and processing. Methods involving the grinding of whole skin and/or pelts must not be used.

Where major changes to the production of the animal epithelia and outgrowths take place (e.g. when a new process or supplier is introduced), such changes are qualified.

Microbial contamination of the animal epithelia and outgrowths may be unavoidable and should be monitored on a representative number of batches of source material according to a justified sampling plan and each time a new supplier and/or a new process for the source material production is introduced; if a determination of microbial contamination is not applicable, this must be justified. Microbial contamination values and potential increases in microbial contamination are monitored during stability studies, in order to assess this aspect along with the source material characteristics upon storage.

Control methods and acceptance criteria relating to identity and purity of the animal epithelia and outgrowths are established. The acceptance criteria must ensure the consistency of the animal epithelia and outgrowths source material from a qualitative and quantitative point of view. The animal epithelia and outgrowths source material is stored under controlled conditions justified by stability data. The collection and production, as well as the handling of the source material, are such that consistent composition is ensured from batch to batch.

*ANIMAL EPITHELIA AND OUTGROWTHS FOR ALLERGEN PRODUCTS REFERENCE BATCH*

An appropriate reference batch is established for each animal epithelia and outgrowths source material. The nature of the reference batch depends on the testing approach to verify batch-to-batch consistency and to establish acceptable quality. The reference batch may be, for example, an internal reference preparation (if available), a source material extract or a sample of a production batch. Its characterisation must be described. The extent of characterisation of the reference batch depends on the nature of the animal epithelia and outgrowths source material, knowledge of the allergenic components and availability of suitable reagents. The reference batch is stored under controlled conditions ensuring its stability.

*BATCH-TO-BATCH CONSISTENCY*

To establish batch-to-batch consistency, one or more of the following tests are performed on each batch. The choice of tests must be justified.

**Total protein** (*2.5.33*).

**Protein profile**. Determined by using suitable electrophoresis methods (*2.2.31*, *2.2.54*).

**Allergen profile**. Relevant allergenic components are identified by means of suitable techniques using allergen-specific antibodies.

**Major allergen content**. Determined by using suitable immunochemical methods (*2.7.1*) such as enzyme-linked immunosorbent assay (ELISA).

**Total allergenic activity**. Determined by testing inhibition of the binding capacity of specific immunoglobulin E antibodies or by a suitable equivalent *in vitro* method.

CHARACTERS

Animal epithelia and outgrowths for allergen products are supplied as coloured powders or other materials such as feathers, dander or hairs.

IDENTIFICATION

The identity of animal epithelia and outgrowths is confirmed by their relevant macroscopic and microscopic characteristics in comparison to those of a reference batch or reference documents. Identity may also be confirmed using other methods such as ELISA or by genetic identification, if performed by generally accepted methods.

TESTS

**Foreign matter**. Foreign matter is defined as vermin (e.g. mites and fleas), dirt, and foreign animal epithelia and outgrowths. Foreign matter is determined by appropriate tests

(e.g. microscopic examination, ELISA), visual inspection and/or tactile inspection. Foreign matter is below a predefined and justified limit.

**Water** (*2.5.12* or *2.5.32*) or **loss on drying** (*2.2.32*). The water content of dried material is determined; specification limits must be supported by batch analysis and stability data.

STORAGE

The source materials are stored under controlled conditions justified by stability data.

LABELLING

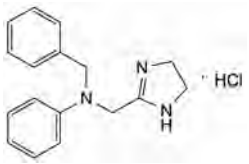
The label states:

- the species of the source animal;
- the nature of the animal epithelia and outgrowths.

**01/2017:0972**

# ANTAZOLINE HYDROCHLORIDE

## Antazolini hydrochloridum



$C_{17}H_{20}ClN_3$ $M_r$ 301.8
[2508-72-7]

DEFINITION

Antazoline hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-benzyl-*N*-[(4,5-dihydro-1*H*-imidazol-2-yl)methyl]aniline hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, soluble in alcohol, slightly soluble in methylene chloride.

It melts at about 240 °C, with decomposition.

IDENTIFICATION

*First identification: A, D.*

*Second identification: B, C, D.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *antazoline hydrochloride CRS*. Examine the substances as discs prepared using *potassium chloride R*.

B. Examine the chromatograms obtained in the test for related substances in daylight after spraying. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).

C. To 5 mL of solution S (see Tests) add, drop by drop, *dilute sodium hydroxide solution R* until an alkaline reaction is produced. Filter. The precipitate, washed with two quantities, each of 10 mL, of *water R* and dried in a desiccator under reduced pressure, melts (*2.2.14*) at 119 °C to 123 °C.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, heating at 60 °C if necessary. Allow to cool and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.2 mL of *methyl red solution R*. Not more than 0.1 mL of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance. Heat the plate at 110 °C for 15 min before using.

*Test solution (a).* Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5 mL with the same solvent.

*Test solution (b).* Dilute 1 mL of test solution (a) to 5 mL with *methanol R*.

*Reference solution (a).* Dilute 0.5 mL of test solution (a) to 100 mL with *methanol R*.

*Reference solution (b).* Dissolve 20 mg of *antazoline hydrochloride CRS* in *methanol R* and dilute to 5 mL with the same solvent.

*Reference solution (c).* Dissolve 20 mg of *xylometazoline hydrochloride CRS* in 1 mL of test solution (a) and dilute to 5 mL with *methanol R*.

Apply to the plate 5 µL of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *diethylamine R*, 10 volumes of *methanol R* and 85 volumes of *ethyl acetate R*. Dry the plate in a current of warm air for 15 min. Examine in ultraviolet light at 254 nm. The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots. Spray with a mixture of equal volumes of a 200 g/L solution of *ferric chloride R* and a 5 g/L solution of *potassium ferricyanide R*. Examine immediately in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

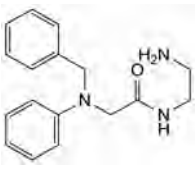
**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.250 g in 100 mL of *alcohol R*. Add 0.1 mL of *phenolphthalein solution R1*. Titrate with *0.1 M alcoholic potassium hydroxide*.

1 mL of *0.1 M alcoholic potassium hydroxide* is equivalent to 30.18 mg of $C_{17}H_{20}ClN_3$.

IMPURITIES



A. *N*-(2-aminoethyl)-2-(benzylphenylamino)acetamide.

01/2020:0209

# ANTICOAGULANT AND PRESERVATIVE SOLUTIONS FOR HUMAN BLOOD

## Solutiones anticoagulantes et sanguinem humanum conservantes

DEFINITION

Anticoagulant and preservative solutions for human blood are sterile and pyrogen-free solutions prepared with water for injections, filtered, distributed in the final containers and sterilised. The content of sodium citrate ($C_6H_5Na_3O_7,2H_2O$), glucose monohydrate ($C_6H_{12}O_6,H_2O$) or glucose ($C_6H_{12}O_6$) and sodium dihydrogen phosphate dihydrate ($NaH_2PO_4,2H_2O$) is not less than 95.0 per cent and not more than 105.0 per cent of that stated in the formulae below. The content of citric acid monohydrate ($C_6H_8O_7,H_2O$) or citric acid ($C_6H_8O_7$) is not less than 90.0 per cent and not more than 110.0 per cent of that stated in the formulae below. Subject to agreement by the competent authority, other substances, such as red-cell preservatives, may be included in the formula provided that their name and concentration are stated on the label.

Anticoagulant and preservative solutions for human blood are presented in airtight, tamper-evident containers of glass (*3.2.1*) or plastic (*3.3.4*).

## Anticoagulant acid-citrate-glucose solutions (ACD)

| | A | B |
|---|---|---|
| *Sodium citrate (0412)* | 22.0 g | 13.2 g |
| *Citric acid monohydrate (0456)* | 8.0 g | 4.8 g |
| or *Citric acid (0455)* | 7.3 g | 4.4 g |
| *Glucose monohydrate (0178)** | 24.5 g | 14.7 g |
| or *Glucose (0177)** | 22.3 g | 13.4 g |
| *Water for injections (0169)* to | 1000.0 mL | 1000.0 mL |
| Volume to be used per 100 mL of blood | 15.0 mL | 25.0 mL |

*The competent authority may require that the substances comply with the test for pyrogens given in the monographs on *Glucose monohydrate (0178)* and *Glucose (0177)*, respectively.

CHARACTERS

A colourless or faintly yellow, clear liquid, practically free from particles.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

*Test solution*. Dilute 2 mL of the solution to be examined (for formula A) or 3 mL (for formula B) to 100 mL with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

*Reference solution (a)*. Dissolve 10 mg of *glucose monohydrate CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.

*Reference solution (b)*. Dissolve 10 mg of *glucose R*, 10 mg of *fructose R*, 10 mg of *lactose monohydrate R* and 10 mg of *sucrose R* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.

Apply separately to the plate 2 µL of each solution and thoroughly dry the points of application. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The volumes of solvents have to be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol (96 per cent) R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

B. To 2 mL add 5 mL of *cupri-citric solution R*. Heat to boiling. An orange precipitate is formed and the solution becomes yellow.

C. To 2 mL (for formula A) add 3 mL of *water R* or to 4 mL (for formula B) add 1 mL of *water R*. The solution gives the reaction of citrates (*2.3.1*).

D. 0.5 mL gives reaction (b) of sodium (*2.3.1*).

TESTS

**pH** (*2.2.3*). The pH of the solution to be examined is 4.7 to 5.3.

**Hydroxymethylfurfural**. To 2.0 mL add 5.0 mL of a 100 g/L solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 mL of a 5 g/L solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using 2.0 mL of a solution containing 5 ppm of *hydroxymethylfurfural R* for formula A or 3 ppm of *hydroxymethylfurfural R* for formula B.

**Sterility** (*2.6.1*). They comply with the test for sterility.

**Pyrogens** (*2.6.8*). They comply with the test for pyrogens. Dilute with a pyrogen-free, 9 g/L solution of *sodium chloride R* to obtain a solution containing approximately 5 g/L of sodium citrate. Inject 10 mL of the diluted solution per kilogram of the rabbit's mass.

ASSAY

**Citric acid**. To 10.0 mL (for formula A) or to 20.0 mL (for formula B) add 0.1 mL of *phenolphthalein solution R1*. Titrate with *0.2 M sodium hydroxide* until a pink colour is obtained.

1 mL of *0.2 M sodium hydroxide* is equivalent to 14.01 mg of $C_6H_8O_7,H_2O$ or to 12.81 mg of $C_6H_8O_7$.

**Sodium citrate**. Prepare a chromatography column 0.10 m long and 10 mm in internal diameter and filled with *strongly acidic ion-exchange resin R* (300 µm to 840 µm). Maintain a 1 cm layer of liquid above the resin at all times. Wash the column with 50 mL of de-ionised *water R* at a flow rate of 12-14 mL/min.

Dilute 10.0 mL of the solution to be examined (for formula A) or 15.0 mL (for formula B) to about 40 mL with de-ionised *water R* in a beaker and transfer to the column reservoir, washing the beaker 3 times with a few millilitres of de-ionised *water R*. Allow the solution to run through the column at a flow rate of 12-14 mL/min and collect the eluate. Wash the column with 2 quantities, each of 30 mL, and with one quantity of 50 mL, of de-ionised *water R*. The column can be used for 3 successive determinations before regeneration with 3 times its volume of *dilute hydrochloric acid R*. Titrate the combined eluate and washings (about 150 mL) with *0.2 M sodium hydroxide*, using 0.1 mL of *phenolphthalein solution R1* as indicator.

Calculate the content of sodium citrate in grams per litre from the following expressions:

For formula A: $1.961n - 1.40C$

or $1.961n - 1.53C'$

For formula B: $1.307n - 1.40C$

or $1.307n - 1.53C'$

$n$ = number of millilitres of *0.2 M sodium hydroxide* used in the titration;

$C$ = content of citric acid monohydrate in grams per litre determined as prescribed above;

$C'$ = content of citric acid in grams per litre determined as prescribed above.

**Reducing sugars**. Dilute 5.0 mL (for formula A) or 10.0 mL (for formula B) to 100.0 mL with *water R*. Introduce 25.0 mL of the solution into a 250 mL conical flask with ground-glass neck and add 25.0 mL of *cupri-citric solution R1*. Add a few pieces of porous material, attach a reflux condenser, heat so that boiling begins within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Add 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R* with caution and in small quantities. Titrate with *0.1 M sodium thiosulfate* using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator ($n_1$ mL). Carry out a blank titration using 25.0 mL of *water R* ($n_2$ mL).

Calculate the content of reducing sugars as glucose or as glucose monohydrate, as appropriate, from Table 0209.-1.

Table 0209.-1

| Volume of *0.1 M sodium thiosulfate* ($n_2 - n_1$ mL) | Glucose (mg) | Glucose monohydrate (mg) |
|---|---|---|
| 8 | 19.8 | 21.6 |
| 9 | 22.4 | 24.5 |
| 10 | 25.0 | 27.2 |
| 11 | 27.6 | 30.2 |
| 12 | 30.3 | 33.1 |
| 13 | 33.0 | 36.1 |
| 14 | 35.7 | 39.0 |
| 15 | 38.3 | 42.1 |
| 16 | 41.3 | 45.2 |

STORAGE

Store in an airtight, tamper-evident container, protected from light.

LABELLING

The label states:

- the composition and volume of the solution;
- the maximum amount of blood to be collected in the container.

## Anticoagulant citrate-phosphate-glucose solution (CPD)

| | |
|---|---|
| *Sodium citrate (0412)* | 26.3 g |
| *Citric acid monohydrate (0456)* | 3.27 g |
| or *Citric acid (0455)* | 2.99 g |
| *Glucose monohydrate (0178)** | 25.5 g |
| or *Glucose (0177)** | 23.2 g |
| *Sodium dihydrogen phosphate dihydrate (0194)* | 2.51 g |
| *Water for injections (0169)* to | 1000.0 mL |
| Volume to be used per 100 mL of blood | 14.0 mL |

*The competent authority may require that the substances comply with the test for pyrogens given in the monographs on *Glucose monohydrate (0178)* and *Glucose (0177)*, respectively.

CHARACTERS

A colourless or faintly yellow, clear liquid, practically free from particles.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

*Test solution*. Dilute 2 mL of the solution to be examined to 100 mL with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

*Reference solution (a)*. Dissolve 10 mg of *glucose monohydrate CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.

*Reference solution (b)*. Dissolve 10 mg of *glucose R*, 10 mg of *fructose R*, 10 mg of *lactose monohydrate R* and 10 mg of *sucrose R* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.

Apply separately to the plate 2 µL of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The volumes of solvents have to be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol (96 per cent) R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

B. To 2 mL add 5 mL of *cupri-citric solution R*. Heat to boiling. An orange precipitate is formed and the solution becomes yellow.

C. To 2 mL add 3 mL of *water R*. The solution gives the reaction of citrates (*2.3.1*).

D. 1 mL gives reaction (b) of phosphates (*2.3.1*).

E. 0.5 mL gives reaction (b) of sodium (*2.3.1*).

TESTS

**pH** (*2.2.3*). The pH of the solution is 5.3 to 5.9.

**Hydroxymethylfurfural**. To 2.0 mL add 5.0 mL of a 100 g/L solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 mL of a 5 g/L solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2 min to

3 min, is not greater than that of a standard prepared at the same time in the same manner using 2.0 mL of a solution containing 5 ppm of *hydroxymethylfurfural R*.

**Sterility** (*2.6.1*). They comply with the test for sterility.

**Pyrogens** (*2.6.8*). They comply with the test for pyrogens. Dilute with a pyrogen-free, 9 g/L solution of *sodium chloride R* to obtain a solution containing approximately 5 g/L of sodium citrate. Inject 10 mL of the diluted solution per kilogram of the rabbit's mass.

ASSAY

**Sodium dihydrogen phosphate**. Dilute 10.0 mL to 100.0 mL with *water R*. To 10.0 mL of this solution add 10.0 mL of *nitro-molybdovanadic reagent R*. Mix and allow to stand at 20 °C to 25 °C for 30 min. At the same time and in the same manner, prepare a reference solution using 10.0 mL of a standard solution containing 0.219 g of *potassium dihydrogen phosphate R* per litre. Measure the absorbance (*2.2.25*) of the 2 solutions at 450 nm using as the compensation liquid a solution prepared in the same manner using 10 mL of *water R*. Calculate the content of sodium dihydrogen phosphate dihydrate (*P*) in grams per litre from the expression:

$$\frac{11.46 \times C \times A_1}{A_2}$$

$C$ = concentration of *potassium dihydrogen phosphate R* in the standard solution in grams per litre;

$A_1$ = absorbance of the test solution;

$A_2$ = absorbance of the reference solution.

**Citric acid**. To 20.0 mL add 0.1 mL of *phenolphthalein solution R1* and titrate with *0.2 M sodium hydroxide*.

Calculate the content of citric acid monohydrate (*C*), or citric acid (*C′*), in grams per litre from the equations:

$$C = 0.7005n - 0.4490P$$

$$C' = 0.6404n - 0.4105P$$

$n$ = number of millilitres of *0.2 M sodium hydroxide* used in the titration;

$P$ = content of sodium dihydrogen phosphate dihydrate in grams per litre determined as prescribed above.

**Sodium citrate**. Prepare a chromatography column 0.10 m long and 10 mm in internal diameter and filled with *strongly acidic ion-exchange resin R* (300 µm to 840 µm). Maintain a 1 cm layer of liquid above the resin at all times. Wash the column with 50 mL of de-ionised *water R* at a flow rate of 12-14 mL/min.

Dilute 10.0 mL of the solution to be examined to about 40 mL with de-ionised *water R* in a beaker and transfer to the column reservoir, washing the beaker 3 times with a few millilitres of de-ionised *water R*. Allow the solution to run through the column at a flow rate of 12-14 mL/min and collect the eluate. Wash the column with 2 quantities, each of 30 mL, and with one quantity of 50 mL, of de-ionised *water R*. The column can be used for 3 successive determinations before regeneration with 3 times its volume of *dilute hydrochloric acid R*. Titrate the combined eluate and washings (about 150 mL) with *0.2 M sodium hydroxide*, using 0.1 mL of *phenolphthalein solution R1* as indicator.

Calculate the content of sodium citrate in grams per litre from the following expressions:

$$1.961n - 1.257P - 1.40C$$

$$1.961n - 1.257P - 1.53C'$$

$n$ = number of millilitres of *0.2 M sodium hydroxide* used in the titration;

$P$ = content of sodium dihydrogen phosphate dihydrate in grams per litre determined as prescribed above;

$C$ = content of citric acid monohydrate in grams per litre determined as prescribed above;

$C'$ = content of citric acid in grams per litre determined as prescribed above.

**Reducing sugars**. Dilute 5.0 mL to 100.0 mL with *water R*. Introduce 25.0 mL of the solution into a 250 mL conical flask with ground-glass neck and add 25.0 mL of *cupri-citric solution R1*. Add a few pieces of porous material, attach a reflux condenser, heat so that boiling begins within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Add 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R* with caution and in small quantities. Titrate with *0.1 M sodium thiosulfate* using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator ($n_1$ mL). Carry out a blank titration using 25.0 mL of *water R* ($n_2$ mL).

Calculate the content of reducing sugars as glucose or as glucose monohydrate, as appropriate, from Table 0209.-1.

STORAGE

Store in an airtight, tamper-evident container, protected from light.

LABELLING

The label states:

- the composition and volume of the solution;
- the maximum amount of blood to be collected in the container.

**07/2013:1928**
**corrected 10.0**

# ANTI-T LYMPHOCYTE IMMUNOGLOBULIN FOR HUMAN USE, ANIMAL

## Immunoglobulinum anti-T lymphocytorum ex animali ad usum humanum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, obtained from serum or plasma of animals, mainly rabbits or horses, immunised with human lymphocytic antigens.

The immunoglobulin has the property of diminishing the number and function of immunocompetent cells, in particular T-lymphocytes. The preparation contains principally immunoglobulin G. It may contain antibodies against other lymphocyte subpopulations and against other cells. The preparation is intended for intravenous administration, after dilution with a suitable diluent where applicable. The preparation may contain excipients such as stabilisers.

Applicable provisions of the monograph on *Immunosera for human use, animal (0084)* are stated below.

PRODUCTION

*GENERAL PROVISIONS*

The production method has been shown to yield consistently immunoglobulins of acceptable safety, potency in man and stability.

Any reagent of biological origin used in production shall be free of contamination with bacteria, fungi and viruses. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

During development studies, it shall be demonstrated that the production method yields a product that:

- does not transmit infectious agents,
- is characterised by a defined pattern of immunological activity, notably: antigen binding, complement-dependent and independent cytotoxicity, cytokine release, induction of T-cell activation, cell death,
- does not contain antibodies that cross-react with human tissues to a degree that would impair clinical safety,
- has a defined maximum content of anti-thrombocyte antibody activity,
- has a defined maximum content of haemoglobin.

The product has been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated.

*Reference preparation*. A batch shown to be suitable for checking the validity of the assay and whose efficacy has been demonstrated in clinical trials, or a batch representative thereof.

*ANIMALS*

The animals used are of a species approved by the competent authority, are healthy and exclusively reserved for production of anti-T lymphocyte immunoglobulin. They are tested and shown to be free from a defined list of infectious agents. The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, tests for additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoglobulin production.

The species, origin and identification number of the animals are specified.

*IMMUNISATION*

The antigens used are identified and characterised, where appropriate. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

Human antigens such as continuously growing T-lymphocyte cell lines or thymocytes are used to immunise the animals. Cells may be subjected to a sorting procedure. The immunising antigens are shown to be free from infectious agents by validated methods for relevant blood-borne pathogens, notably hepatitis B virus (HBV), hepatitis C virus (HCV) and human immunodeficiency virus (HIV) and other relevant adventitious agents originating from the preparation of the antigen. The cells used comply with defined requirements for purity of the cell population and freedom from adventitious agents.

*COLLECTION OF BLOOD OR PLASMA*

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product.

No antimicrobial preservative is added to the plasma and serum samples. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoglobulin is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

**Tests for contaminating viruses**. Each pool is tested for contaminating viruses by suitable *in vitro* tests including inoculation to cell cultures capable of detecting a wide range of viruses relevant for the particular product. Where applicable, *in vitro* tests for contaminating viruses are carried out on the adsorbed pool, after the last production stage that may introduce viral contaminants.

*PURIFICATION AND VIRAL INACTIVATION*

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immuno-adsorption or by other suitable chemical or physical methods. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that effect immunobiological characteristics of the product.

Unless otherwise justified and authorised, validated procedures are applied for removal and/or inactivation of viruses.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in the light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

If the method of preparation includes a step for adsorption of cross-reacting anti-human antibodies using material from human tissues and/or red blood cells, the human materials are submitted to a validated procedure for inactivation of infectious agents, unless otherwise justified and authorised. If erythrocytes are used for adsorption, the donors for such materials comply with the requirements for donors of blood and plasma of the monograph on *Human plasma for fractionation (0853)*. If other human material is used, it is shown by validated methods to be free from relevant blood-borne pathogens, notably HBV, HCV and HIV. If substances are used for inactivation or removal of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the anti-T lymphocyte immunoglobulin.

*FINAL BULK*

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. No antimicrobial preservative is added either during the manufacturing procedure or for preparation of the final bulk solution. During manufacturing, the solution is passed through a bacteria-retentive filter.

*FINAL LOT*

The final bulk of anti-T-lymphocyte immunoglobulin is distributed aseptically into sterile, tamper-evident containers. The containers are closed as to prevent contamination.

Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use.

CHARACTERS

*Appearance*:

– *liquid preparation*: clear or slightly opalescent, colourless or pale yellow liquid;
– *freeze-dried preparation*: white or slightly yellow powder or solid friable mass, which after reconstitution gives a liquid preparation corresponding to the description above.

IDENTIFICATION

A. Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. It is recommended that the test be carried out using antisera specific to the plasma proteins of each species of domestic animal commonly used in the preparation of materials of biological origin in the country concerned and antisera specific to human plasma proteins. The preparation is shown to contain proteins originating from the animal used for the anti-T lymphocyte immunoglobulin production.

B. Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal serum of the animal used for production, compare this serum and the preparation to be examined, both diluted to a concentration that will allow a clear gammaglobulin precipitation arc to be obtained on the gel. The main component of the preparation to be examined corresponds to the IgG component of normal serum of the animal used for production.

C. The preparation complies with the assay.

TESTS

**Solubility**. For the freeze-dried preparation, to a container add the volume of the liquid stated on the label. The preparation dissolves completely within the time stated on the label.

**Extractable volume** (*2.9.17*). It complies with the requirement for extractable volume.

**pH** (*2.2.3*). The pH is within the limits approved for the particular product.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg after dilution, where applicable.

**Total protein** (*2.5.33*): 90 per cent to 110 per cent of the amount stated on the label.

**Stabiliser**. Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

**Distribution of molecular size**. Size-exclusion chromatography (*2.2.30*).

*Test solution.* Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range 2-20 g/L is usually suitable.

*Reference solution.* Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/L solution of *sodium chloride R* to the same protein concentration as the test solution.

*Column*:

– *size*: *l* = 0.6 m, Ø = 7.5 mm,
– *stationary phase*: *silica gel for size-exclusion chromatography R*, a grade suitable for fractionation of globular proteins in the molecular mass range of 20 000 to 200 000.

*Mobile phase*: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R* and 11.688 g of *sodium chloride R* in 1 L of *water R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 50-600 µg of protein.

*Retention time*: identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of dimer corresponds to polymers and aggregates.

*System suitability*:

– *reference solution*: the principal peak corresponds to IgG monomer and there is a peak corresponding to dimer with a retention time relative to monomer of 0.85 ± 0.05,
– *test solution*: the relative retentions of monomer and dimer are 1 ± 0.05 with reference to the corresponding peaks in the chromatogram obtained with the reference solution.

*Limits*:

– *total monomer and dimer*: at least 95 per cent of the total area of the peaks;
– *total polymers and aggregates*: maximum 5 per cent of the total area of the peaks.

**Purity**. Polyacrylamide gel electrophoresis (*2.2.31*), under non-reducing and reducing conditions.

*Resolving gel.* Non-reducing conditions: 8 per cent acrylamide; reducing conditions: 12 per cent acrylamide.

*Test solution.* Dilute the preparation to be examined to a protein concentration of 0.5-2 mg/mL.

*Reference solution.* Dilute the reference preparation to the same protein concentration as the test solution.

*Application*: 10 µL.

*Detection*: Coomassie staining.

*Results*: compared with the electropherogram of the reference solution, no additional bands are found in the electropherogram of the test solution.

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method A*). The 1 to 64 dilution does not show agglutination.

Where applicable, dilute the preparation to be examined as prescribed for use before preparing the dilutions for the test.

**Haemolysins**. Prepare a 1 to 64 dilution of the preparation to be examined, diluted if necessary as stated on the label. Take 6 aliquots of the 1 to 64 dilution. To 1 volume of 3 of the aliquots, add 1 volume of a 10 per cent *V/V* suspension of group A1, group B and group O erythrocytes in a 9 g/L solution of *sodium chloride R*, respectively. To 1 volume of the remaining 3 aliquots, add 1 volume of a 10 per cent *V/V* suspension of group A1, group B and group O erythrocytes in a 9 g/L solution of *sodium chloride R*, respectively, and to each aliquot 1 volume of fresh group AB serum (as a source of complement). Mix and incubate at 37 °C for 1 h. Examine the supernatant liquids for haemolysis. No signs of haemolysis are present.

**Thrombocyte antibodies**. Examined by a suitable method, the level of thrombocyte antibodies is shown to be below that approved for the specific product.

**Water** (*2.5.12*): maximum 3 per cent.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*). Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 mL per kilogram of the rabbit's body mass.

ASSAY

The biological activity is determined by measuring the complement-dependent cytotoxicity on target cells. Flow cytometry is performed with read-out of dead cells stained using propidium iodide. The activity is expressed as the concentration of anti-T lymphocyte immunoglobulin in milligrams per millilitre which mediates 50 per cent cytotoxicity.

*Lymphocyte separation medium.* Commercial separation media with low viscosity and a density of 1.077 g/mL.

*Complement.* Commercial complement is suitable.

*Buffered salt solution pH 7.2.* Dissolve 8.0 g of *sodium chloride R*, 0.2 g of *potassium chloride R*, 3.18 g of *disodium hydrogen phosphate dodecahydrate R* and 0.2 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent.

*Buffer solution for flow cytometry.* Add 40 mL of 0.1 per cent *V/V sodium azide R* and 10 mL of foetal calf serum to 440 mL of buffered salt solution pH 7.2. The foetal calf serum is inactivated at 56 °C for 30 min prior to use. Store at 4 °C.

*Propidium iodide solution.* Dissolve *propidium iodide R* in buffered salt solution pH 7.2, to a concentration of 1 mg/mL. Store this stock solution at 2-8 °C and use within 1 month. For the assay, dilute this solution with buffer solution for flow cytometry, to obtain a concentration of 5 µg/mL. Store at 2-8 °C and use within 3 h.

*Microtitre plates.* Plates used to prepare immunoglobulin dilutions are U- or V-bottomed polystyrene or poly(vinyl chloride) plates without surface treatment.

*Micronic tubes.* Suitable for flow cytometry measurement.

*Cell suspension.* Collect blood in anticoagulant from at least one healthy donor. Immediately isolate the peripheral blood mononuclear cells (PBMC) by gradient centrifugation in lymphocyte separation medium so that the PBMC form a visible clean interface between the plasma and the separation medium. Collect the layer containing the cells and dispense into centrifuge tubes containing buffered salt solution pH 7.2. Centrifuge at 400 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the centrifugation and resuspension procedure of the cells twice. After the third centrifugation, resuspend the cell pellet in 1 mL of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to $7 \times 10^6$/mL by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 12 h.

If necessary, the first PBMC pellet may be resuspended in buffered salt solution pH 7.2 containing 20 per cent foetal calf serum and stored overnight at 2 °C. Centrifuge at 400 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to $7 \times 10^6$/mL by adding buffer solution for flow cytometry.

It is also possible for cells to be immediately frozen and stored in nitrogen using the following method.

*Buffer solution for freezing.* To 20 mL of cell culture medium, add 25 mL of foetal calf serum and 5 mL of dimethyl sulfoxide (DMSO). Store this solution at 2-8 °C and use within 3 h.

$20 \times 10^6$ cells per ampoule are frozen. These ampoules are stored in liquid nitrogen.

*Buffer solution for thawing.* To 450 mL of cell culture medium, add 50 mL of foetal calf serum. Store this solution at 2-8 °C and use within 3 h.

Each ampoule is thawed in a water-bath at 37 °C with shaking. Cell suspension is repeated in a buffer solution for thawing. Centrifuge at 200 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the procedure for centrifugation and resuspension of cells once. After the second centrifugation, resuspend the cells pellet in 1 mL of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to $7 \times 10^6$/mL by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 3 h.

*Test solutions.* For freeze-dried preparations, reconstitute as stated on the label. Prepare 3 independent series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

*Reference solutions.* For freeze-dried preparations, reconstitute according to the instructions for use. Prepare 3 independent dilution series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

Distribute 75 µL of each of the dilutions of the test solution or reference solution to each of a series of wells of a microtitre plate. Add 25 µL of the cell suspension of PBMC into each well. Add 25 µL of rabbit complement to each of the wells. Incubate at 37 °C for 30 min.

Centrifuge the plates at 200 *g* at 4 °C for 8 min, discard the supernatant and keep the plate on ice. Preparation for flow cytometry measurement is done step-wise by using a certain number of wells in order to allow labelling with *propidium iodide R* solution and measurement within a defined time period. Resuspend carefully the cell pellet of a certain number of wells with 200 µL of propidium iodide solution. Transfer the suspension into tubes. Incubate at 25 °C for 10 min then place immediately on ice.

Proceed with fluorescence measurement in a flow cytometer. Define a region including all propidium iodide-positive cells on the basis of Forward-Scattered, light (FSC) and flourescence (FL2 or FL3 for propidium iodide). Measure the percentage of propidium iodide-positive cells, without gating but excluding debris. Analyse at least 3000 cells for each of the test and reference solutions.

Use the percentages of dead cells to estimate the potency as the concentration in milligrams per millilitre of the preparation to be examined necessary to induce 50 per cent of cytotoxicity by fitting a sigmoidal dose response curve to the data obtained with the test and the reference preparations and by using a 4-parameter logistic model (see, for example, chapter *5.3*) and suitable software. The test is not valid unless the percentage of propidium iodide-positive cells at the lower asymptote of the curve is less then 15 per cent and the percentage of propidium iodide-positive cells at the upper asymptote of the curve is at least 80 per cent.

The estimated activity is 70 per cent to 130 per cent of the activity approved for the particular product.

The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

## STORAGE

Protected from light at the temperature stated on the label.

*Expiry date.* The expiry date is calculated from the beginning of the assay.

## LABELLING

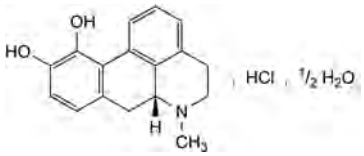
The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content,
- for freeze-dried preparations:
  - the name and the volume of the reconstitution liquid to be added,
  - the quantity of protein in the container,
  - that the immunoserum is to be used immediately after reconstitution,
  - the time required for complete dissolution,
- the animal species of origin,
- the name and amount of stabiliser, where applicable,
- the dilution to be made before use of the product.

01/2020:0136

# APOMORPHINE HYDROCHLORIDE HEMIHYDRATE

## Apomorphini hydrochloridum hemihydricum



$C_{17}H_{18}ClNO_2,½H_2O$ $M_r$ 312.8
[41372-20-7]

DEFINITION

(6a*R*)-6-Methyl-5,6,6a,7-tetrahydro-4*H*-dibenzo[*de*,*g*]quinoline-10,11-diol hydrochloride hemihydrate.

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or slightly yellowish-brown or green-tinged greyish, crystalline powder or crystals; on exposure to air and light, the green tinge becomes more pronounced.

*Solubility*: sparingly soluble in water and in ethanol (96 per cent), practically insoluble in toluene.

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 10.0 mg in a 10.3 g/L solution of *hydrochloric acid R* and dilute to 100.0 mL with the same acid solution. Dilute 10.0 mL of the solution to 100.0 mL with a 10.3 g/L solution of *hydrochloric acid R*.

*Spectral range*: 230-350 nm

*Absorption maximum*: at 273 nm.

*Shoulder*: at 300-310 nm.

*Specific absorbance at the absorption maximum*: 530 to 570.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *apomorphine hydrochloride hemihydrate CRS*.

C. To 5 mL of solution S (see Tests) add a few millilitres of *sodium hydrogen carbonate solution R* until a permanent, white precipitate is formed. The precipitate slowly becomes greenish. Add 0.25 mL of *0.05 M iodine* and shake. The precipitate becomes greyish-green. Collect the precipitate. The precipitate dissolves in *methylene chloride R* giving a violet-blue solution and in *ethanol (96 per cent) R* giving a blue solution.

D. To 2 mL of solution S (see Tests) add 0.1 mL of *nitric acid R*. Mix and filter. The filtrate gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.25 g without heating in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ or $GY_5$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.0 to 5.0 for solution S.

**Specific optical rotation** (*2.2.7*): – 52 to – 48 (dried substance).

Dissolve 0.25 g in a 2.06 g/L solution of *hydrochloric acid R* and dilute to 25.0 mL with the same acid solution.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in a 1 per cent *V/V* solution of *glacial acetic acid R* and dilute to 20.0 mL with the same solution.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with a 1 per cent *V/V* solution of *glacial acetic acid R*. Dilute 1.0 mL of this solution to 10.0 mL with a 1 per cent *V/V* solution of *glacial acetic acid R*.

*Reference solution (b).* Dissolve 12.5 mg of *apomorphine impurity B CRS* in a 1 per cent *V/V* solution of *glacial acetic acid R* and dilute to 10.0 mL with the same solution.

*Reference solution (c).* Dilute 2.0 mL of reference solution (b) to 10.0 mL with a 1 per cent *V/V* solution of *glacial acetic acid R*. Dilute 2.0 mL of this solution to 100.0 mL with a 1 per cent *V/V* solution of *glacial acetic acid R*.

*Reference solution (d).* Dissolve 25 mg of *boldine R* in a 1 per cent *V/V* solution of *glacial acetic acid R* and dilute to 10 mL with the same solution. To 1 mL of this solution add 1 mL of the test solution and dilute to 10 mL with a 1 per cent *V/V* solution of *glacial acetic acid R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 35 °C.

*Mobile phase*:

– *mobile phase A*: 1.1 g/L solution of *sodium octanesulfonate R*, adjusted to pH 2.2 with a 50 per cent *m/m* solution of *phosphoric acid R*;
– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 85 | 15 |
| 2 - 32 | 85 → 68 | 15 → 32 |
| 32 - 37 | 68 | 32 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B.

*Relative retention* with reference to apomorphine (retention time = about 18 min): impurity B = about 0.4; boldine = about 0.9.

*System suitability*: reference solution (d):

– *resolution*: minimum 2.5 between the peaks due to boldine and apomorphine.

*Calculation of percentage contents*:

– for impurity B, use the concentration of impurity B in reference solution (c);
– for impurities other than B, use the concentration of apomorphine hydrochloride hemihydrate in reference solution (a).

*Limits*:

– *impurity B*: maximum 0.15 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.5 per cent;
– *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): 2.5 per cent to 4.2 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the first 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 30.38 mg of $C_{17}H_{18}ClNO_2$.

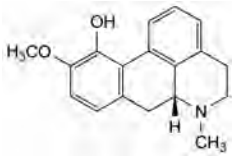
STORAGE

In an airtight container, protected from light.

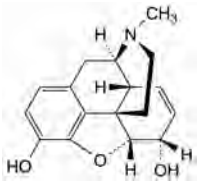
IMPURITIES

*Specified impurities: B.*

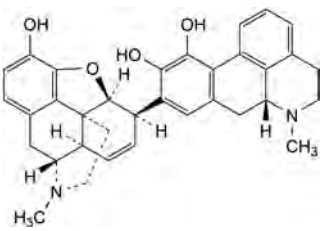
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C.*



A. (6a*R*)-10-methoxy-6-methyl-5,6,6a,7-tetrahydro-4*H*-dibenzo[*de*,*g*]quinolin-11-ol (apocodeine),



B. 7,8-didehydro-4,5α-epoxy-17-methylmorphinan-3,6α-diol (morphine),

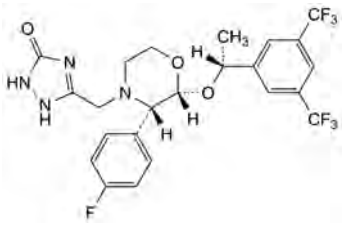


C. (6a*R*)-9-[7,8-didehydro-4,5α-epoxy-3-hydroxy-17-methylmorphinan-6α-yl]-6-methyl-5,6,6a,7-tetrahydro-4*H*-dibenzo[*de*,*g*]quinoline-10,11-diol (morphine-apomorphine dimer).

**01/2017:2757**

# APREPITANT

## Aprepitantum



$C_{23}H_{21}F_7N_4O_3$ $M_r$ 534.4
[170729-80-3]

DEFINITION

5-[[(2*R*,3*S*)-2-[(1*R*)-1-[3,5-Bis(trifluoromethyl)phenyl]-ethoxy]-3-(4-fluorophenyl)morpholin-4-yl]methyl]-1,2-dihydro-3*H*-1,2,4-triazol-3-one.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water, sparingly soluble in anhydrous ethanol, practically insoluble in heptane.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *aprepitant CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness on a water-bath and record new spectra using the residues.

TESTS

**Specific optical rotation** (*2.2.7*): + 66.0 to + 70.0 (anhydrous substance), measured at 25 °C.

Dissolve 0.250 g in *methanol R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Solvent mixture*: *acetonitrile R1*, *water for chromatography R* (50:50 *V/V*).

*Test solution.* Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 40.0 mg of *aprepitant CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 20.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 4 mg of *aprepitant for system suitability CRS* (containing impurity A) in 5.0 mL of the solvent mixture.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography compatible with 100 per cent aqueous mobile phases R* (5 µm);

– *temperature*: 35 °C.

*Mobile phase*:

– *mobile phase A*: 0.1 per cent *V/V* solution of *phosphoric acid R*;

– *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 65 | 35 |
| 2 - 22 | 65 → 20 | 35 → 80 |
| 22 - 32 | 20 | 80 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram supplied with *aprepitant for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity A.

*Relative retention* with reference to aprepitant (retention time = about 15 min): impurity A = about 0.97.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity A and aprepitant.

*Limits*:

– *impurity A*: maximum 0.15 per cent;

– *unspecified impurities*: for each impurity, maximum 0.10 per cent;

– *total*: maximum 0.2 per cent;

– *reporting threshold*: 0.05 per cent (reference solution (b)).

**Water** (*2.5.32*): maximum 0.2 per cent, determined on 0.200 g by direct sample introduction.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

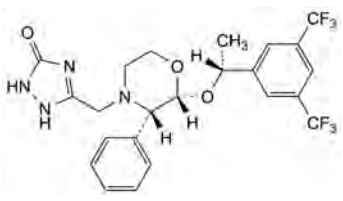
*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{23}H_{21}F_7N_4O_3$ taking into account the assigned content of *aprepitant CRS*.

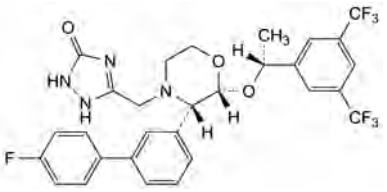
IMPURITIES

*Specified impurities: A.*

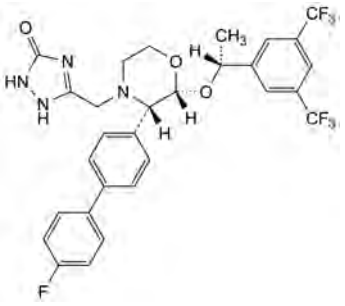
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C.*



A. 5-[[(2*R*,3*S*)-2-[(1*R*)-1-[3,5-bis(trifluoromethyl)phenyl]-ethoxy]-3-phenylmorpholin-4-yl]methyl]-1,2-dihydro-3*H*-1,2,4-triazol-3-one,



B. 5-[[(2*R*,3*S*)-2-[(1*R*)-1-[3,5-bis(trifluoromethyl)phenyl]-ethoxy]-3-(4′-fluorobiphenyl-3-yl)morpholin-4-yl]-methyl]-1,2-dihydro-3*H*-1,2,4-triazol-3-one,



C. 5-[[(2*R*,3*S*)-2-[(1*R*)-1-[3,5-bis(trifluoromethyl)phenyl]-ethoxy]-3-(4′-fluorobiphenyl-4-yl)morpholin-4-yl]-methyl]-1,2-dihydro-3*H*-1,2,4-triazol-3-one.

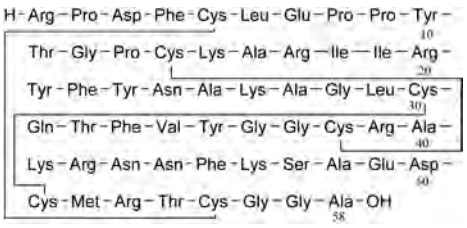
# APROTININ

## Aprotininum



$C_{284}H_{432}N_{84}O_{79}S_7$ $M_r$ 6511
[9087-70-1]

DEFINITION

Aprotinin is a polypeptide consisting of a chain of 58 amino acids. It inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin and trypsin. It contains not less than 3.0 Ph. Eur. U. of aprotinin activity per milligram, calculated with reference to the dried substance.

PRODUCTION

The animals from which aprotinin is derived must fulfil the requirements for the health of animals suitable for human consumption.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

**Histamine** (*2.6.10*): maximum 0.2 µg of histamine base per 3 Ph. Eur. U.

CHARACTERS

*Appearance*: almost white hygroscopic powder.

*Solubility*: soluble in water and in isotonic solutions, practically insoluble in organic solvents.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Solution S (see Tests).

*Reference solution.* Dilute *aprotinin solution BRP* in *water R* to obtain a concentration of 15 Ph. Eur. U./mL.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *water R*, *glacial acetic acid R* (80:100 *V/V*) containing 100 g/L of *sodium acetate R*.

*Application*: 10 µL.

*Development*: over a path of 12 cm.

*Drying*: in air.

*Detection*: spray with a solution of 0.1 g of *ninhydrin R* in a mixture of 6 mL of a 10 g/L solution of *cupric chloride R*, 21 mL of *glacial acetic acid R* and 70 mL of *anhydrous ethanol R*. Dry the plate at 60 °C.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Determine the ability of the substance to be examined to inhibit trypsin activity using the method described below.

*Test solution.* Dilute 1 mL of solution S to 50 mL with *buffer solution pH 7.2 R*.

*Trypsin solution.* Dissolve 10 mg of *trypsin BRP* in *0.002 M hydrochloric acid* and dilute to 100 mL with the same acid.

*Casein solution.* Dissolve 0.2 g of *casein R* in *buffer solution pH 7.2 R* and dilute to 100 mL with the same buffer solution.

*Precipitating solution*: *glacial acetic acid R*, *water R*, *anhydrous ethanol R* (1:49:50 *V/V/V*).

Mix 1 mL of the test solution with 1 mL of the trypsin solution. Allow to stand for 10 min and add 1 mL of the casein solution. Incubate at 35 °C for 30 min. Cool in iced water and add 0.5 mL of the precipitating solution. Shake and allow to stand at room temperature for 15 min. The solution is cloudy. Carry out a blank test under the same conditions using *buffer solution pH 7.2 R* instead of the test solution. The solution is not cloudy.

TESTS

**Solution S**. Prepare a solution of the substance to be examined containing 15 Ph. Eur. U./mL, calculated from the activity stated on the label.

**Appearance of solution**. Solution S is clear (*2.2.1*).

**Absorbance** (*2.2.25*): maximum 0.80 by measuring at the absorption maximum at 277 nm.

Prepare a solution of the substance to be examined containing 3.0 Ph. Eur. U./mL.

**Des-Ala-aprotinin and des-Ala-des-Gly-aprotinin**. Capillary zone electrophoresis (*2.2.47*): use the normalisation procedure.

*Test solution.* Prepare a solution of the substance to be examined in *water R* containing not less than 1 Ph. Eur. U./mL.

*Reference solution.* Dilute *aprotinin solution BRP* in *water R* to obtain the same concentration as the test solution.

*Capillary*:

- *material*: uncoated fused silica;
- *size*: effective length = 45-60 cm, Ø = 75 µm.

*Temperature*: 25 °C.

*CZE buffer.* Dissolve 8.21 g of *potassium dihydrogen phosphate R* in 400 mL of *water R*, adjust to pH 3.0 with *phosphoric acid R*, dilute to 500.0 mL with *water R* and filter through a membrane filter (nominal pore size 0.45 µm).

*Detection*: spectrophotometer at 214 nm.

*Between-run rinsing*: rinse the capillary for at least 1 min with *0.1 M sodium hydroxide* filtered through a membrane filter (nominal pore size 0.45 µm) and for 2 min with the CZE buffer.

*Injection*: under pressure or vacuum (for example, 3 s at a differential pressure of 3.5 kPa).

*Migration*: apply a field strength of 0.2 kV/cm, using the CZE buffer as the electrolyte in both buffer reservoirs.

*Run time*: 30 min.

*Identification of impurities*: use the electropherogram supplied with *aprotinin solution BRP* and the electropherogram obtained with the reference solution to identify the peaks due to impurities A and B.

*Relative migration* with reference to aprotinin (migration time = about 22 min): impurity A = about 0.98; impurity B = about 0.99.

*System suitability*: reference solution after at least 6 injections:

- *migration time*: aprotinin = 19.0 min to 25.0 min;
- *resolution*: minimum 0.8 between the peaks due to impurities A and B; minimum 0.5 between the peaks due to impurity B and aprotinin;
- *peak distribution*: the electropherogram obtained is qualitatively and quantitatively similar to the electropherogram supplied with *aprotinin solution BRP*;
- *height of the principal peak*: at least 1000 times the height of the baseline noise. If necessary, adjust the sample load to give peaks of sufficient height.

*Limits*:

- *impurity A*: maximum 8.0 per cent;
- *impurity B*: maximum 7.5 per cent.

**Pyroglutamyl-aprotinin and related compounds**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Prepare a solution of the substance to be examined in mobile phase A, containing about 5 Ph. Eur. U./mL.

*Reference solution.* Dissolve the contents of a vial of *aprotinin for system suitability CRS* in 2.0 mL of mobile phase A.

*Column*:

- *size*: *l* = 0.075 m, Ø = 7.5 mm;
- *stationary phase*: *strong cation-exchange silica gel for chromatography R* (10 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 3.52 g of *potassium dihydrogen phosphate R* and 7.26 g of *disodium hydrogen phosphate dihydrate R* in 1000 mL of *water for chromatography R*; filter and degas;
- *mobile phase B*: dissolve 3.52 g of *potassium dihydrogen phosphate R*, 7.26 g of *disodium hydrogen phosphate dihydrate R* and 66.07 g of *ammonium sulfate R* in 1000 mL of *water for chromatography R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 21 | 92 → 64 | 8 → 36 |
| 21 - 30 | 64 → 0 | 36 → 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 40 µL.

*Relative retention* with reference to aprotinin (retention time = 17.0 min to 20.0 min): impurity C = about 0.9.

*System suitability*: reference solution:

- *resolution*: minimum 1.5 between the peaks due to impurity C and aprotinin;
- *symmetry factor*: maximum 1.3 for the peak due to aprotinin.

*Limits*:

- *impurity C*: maximum 1.0 per cent;
- *any other impurity*: maximum 0.5 per cent;
- *sum of impurities other than C*: maximum 1.0 per cent.

**Aprotinin oligomers**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution.* Prepare a solution of the substance to be examined in *water R* containing about 5 Ph. Eur. U./mL.

*Reference solution.* Treat the substance to be examined to obtain about 2 per cent aprotinin oligomers. For example, heat freeze-dried aprotinin at about 110 °C for about 4 h. Then dissolve in *water R* to obtain a concentration of about 5 Ph. Eur. U./mL.

*Column*: 3 columns coupled in series:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 20 000 to 10 000 000 (8 µm).

*Mobile phase*: *acetonitrile R*, *glacial acetic acid R*, *water for chromatography R* (2:2:6 *V/V/V*); filter and degas.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 277 nm.

*Injection*: 100 µL.

*Run time*: 40 min.

*Relative retention* with reference to aprotinin monomer (retention time = 24.5 min to 25.5 min): aprotinin dimer = about 0.9.

*System suitability*: reference solution:

- *resolution*: minimum 1.3 between the peaks due to aprotinin dimer and monomer;
- *symmetry factor*: maximum 2.5 for the peak due to aprotinin monomer.

*Limit*:

- *total*: maximum 1.0 per cent.

**Loss on drying** (*2.2.32*): maximum 6.0 per cent, determined on 0.100 g by drying *in vacuo*.

**Bacterial endotoxins** (*2.6.14*): less than 0.14 IU per European Pharmacopoeia Unit of aprotinin, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

## ASSAY

The activity of aprotinin is determined by measuring its inhibitory action on a solution of trypsin of known activity. The inhibiting activity of the aprotinin is calculated from the difference between the initial activity and the residual activity of the trypsin.

The inhibiting activity of aprotinin is expressed in European Pharmacopoeia Units. 1 Ph. Eur. U. inhibits 50 per cent of the enzymatic activity of 2 microkatals of trypsin.

Use a reaction vessel with a capacity of about 30 mL, provided with:

- a device that will maintain a temperature of 25 ± 0.1 °C;
- a stirring device, such as a magnetic stirrer;
- a lid with 5 holes for accommodating the electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of the reagents.

An automatic or manual titration apparatus may be used. In the latter case the burette is graduated in 0.05 mL and the pH-meter is provided with a wide reading scale and glass-silver-silver chloride or other suitable electrodes.

*Test solution.* Prepare a solution of the substance to be examined in *0.0015 M borate buffer solution pH 8.0 R* expected to contain 1.67 Ph. Eur. U./mL (about 0.6 mg (*m* mg) per millilitre).

*Trypsin solution.* Prepare a solution of *trypsin BRP* containing about 0.8 microkatals per millilitre (about 1 mg/mL), using *0.001 M hydrochloric acid* as the solvent. Use a freshly prepared solution and keep in iced water.

*Trypsin and aprotinin solution.* To 4.0 mL of the trypsin solution add 1.0 mL of the test solution. Dilute immediately to 40.0 mL with *0.0015 M borate buffer solution pH 8.0 R*. Allow to stand at room temperature for 10 min and then keep in iced water. Use within 6 h of preparation.

*Dilute trypsin solution.* Dilute 0.5 mL of the trypsin solution to 10.0 mL with *0.0015 M borate buffer solution pH 8.0 R*. Allow to stand at room temperature for 10 min and then keep in iced water.

Maintain an atmosphere of nitrogen in the reaction flask and stir continuously; introduce 9.0 mL of *0.0015 M borate buffer solution pH 8.0 R* and 1.0 mL of a freshly prepared 6.9 g/L solution of *benzoylarginine ethyl ester hydrochloride R*. Adjust to pH 8.0 with *0.1 M sodium hydroxide*. When the temperature has reached equilibrium at 25 ± 0.1 °C, add 1.0 mL of the trypsin and aprotinin solution and start a timer. Maintain at pH 8.0 by the addition of *0.1 M sodium hydroxide* and note the volume added every 30 s. Continue the reaction for 6 min. Determine the number of millilitres of *0.1 M sodium hydroxide* used per second ($n_1$ mL). Carry out, under the same conditions, a titration using 1.0 mL of the dilute trypsin solution. Determine the number of millilitres of *0.1 M sodium hydroxide* used per second ($n_2$ mL).

Calculate the aprotinin activity in European Pharmacopoeia Units per milligram using the following expression:

$$\frac{4000(2n_2 - n_1)}{m}$$

The estimated activity is not less than 90 per cent and not more than 110 per cent of the activity stated on the label.

## STORAGE

In an airtight, tamper-evident container, protected from light.

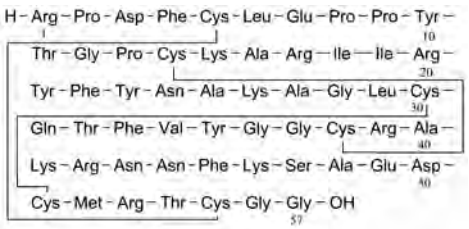
## LABELLING

The label states:

- the number of European Pharmacopoeia Units of aprotinin activity per milligram;
- where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

## IMPURITIES

A. aprotinin-(1-56)-peptide,



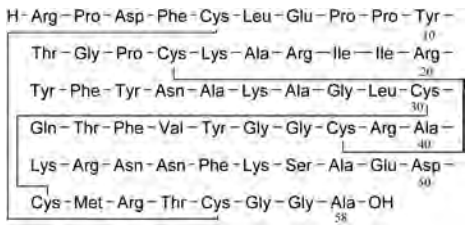
B. aprotinin-(1-57)-peptide,

C. (5-oxoprolyl)aprotinin (pyroglutamylaprotinin).

**01/2019:0579**
**corrected 10.0**

# APROTININ CONCENTRATED SOLUTION

## Aprotinini solutio concentrata



$C_{284}H_{432}N_{84}O_{79}S_7$ $M_r$ 6511

DEFINITION

Aprotinin concentrated solution is a solution of aprotinin, a polypeptide consisting of a chain of 58 amino acids, which inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin and trypsin. It contains not less than 15.0 Ph. Eur. U. of aprotinin activity per millilitre.

PRODUCTION

The animals from which aprotinin is derived must fulfil the requirements for the health of animals suitable for human consumption.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

**Histamine** (*2.6.10*): maximum 0.2 µg of histamine base per 3 Ph. Eur. U.

CHARACTERS

*Appearance*: clear, colourless liquid.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Solution S (see Tests).

*Reference solution.* Dilute *aprotinin solution BRP* in *water R* to obtain a concentration of 15 Ph. Eur. U./mL.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *water R*, *glacial acetic acid R* (80:100 *V/V*) containing 100 g/L of *sodium acetate R.*

*Application*: 10 µL.

*Development*: over a path of 12 cm.

*Drying*: in air.

*Detection*: spray with a solution of 0.1 g of *ninhydrin R* in a mixture of 6 mL of a 10 g/L solution of *cupric chloride R*, 21 mL of *glacial acetic acid R* and 70 mL of *anhydrous ethanol R*. Dry the plate at 60 °C.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Determine the ability of the preparation to be examined to inhibit trypsin activity using the method described below.

*Test solution.* Dilute 1 mL of solution S to 50 mL with *buffer solution pH 7.2 R.*

*Trypsin solution.* Dissolve 10 mg of *trypsin BRP* in *0.002 M hydrochloric acid* and dilute to 100 mL with the same acid.

*Casein solution.* Dissolve 0.2 g of *casein R* in *buffer solution pH 7.2 R* and dilute to 100 mL with the same buffer solution.

*Precipitating solution*: *glacial acetic acid R*, *water R*, *anhydrous ethanol R* (1:49:50 *V/V/V*).

Mix 1 mL of the test solution with 1 mL of the trypsin solution. Allow to stand for 10 min and add 1 mL of the casein solution. Incubate at 35 °C for 30 min. Cool in iced water and add 0.5 mL of the precipitating solution. Shake and allow to stand at room temperature for 15 min. The solution is cloudy. Carry out a blank test under the same conditions using *buffer solution pH 7.2 R* instead of the test solution. The solution is not cloudy.

TESTS

**Solution S**. Prepare a solution containing 15 Ph. Eur. U./mL, if necessary by dilution, on the basis of the activity stated on the label.

**Appearance of solution**. Solution S is clear (*2.2.1*).

**Absorbance** (*2.2.25*): maximum 0.80 by measuring at the absorption maximum at 277 nm.

Prepare a solution containing 3.0 Ph. Eur. U./mL.

**Des-Ala-aprotinin and des-Ala-des-Gly-aprotinin**. Capillary zone electrophoresis (*2.2.47*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined in *water R* to obtain a concentration of not less than 1 Ph Eur. U./mL.

*Reference solution.* Dilute *aprotinin solution BRP* in *water R* to obtain the same concentration as the test solution.

*Capillary*:

– *material*: uncoated fused silica;

– *size*: effective length = 45-60 cm, Ø = 75 µm.

*Temperature*: 25 °C.

*CZE buffer.* Dissolve 8.21 g of *potassium dihydrogen phosphate R* in 400 mL of *water R*, adjust to pH 3.0 with *phosphoric acid R*, dilute to 500.0 mL with *water R* and filter through a membrane filter (nominal pore size 0.45 µm).

*Detection*: spectrophotometer at 214 nm.

*Between-run rinsing*: rinse the capillary for at least 1 min with *0.1 M sodium hydroxide* filtered through a membrane filter (nominal pore size 0.45 µm) and for 2 min with the CZE buffer.

*Injection*: under pressure or vacuum (for example, 3 s at a differential pressure of 3.5 kPa).

*Migration*: apply a field strength of 0.2 kV/cm, using the CZE buffer as the electrolyte in both buffer reservoirs.

*Run time*: 30 min.

*Identification of impurities*: use the electropherogram supplied with *aprotinin solution BRP* and the electropherogram obtained with the reference solution to identify the peaks due to impurities A and B.

*Relative migration* with reference to aprotinin (migration time = about 22 min): impurity A = about 0.98; impurity B = about 0.99.

*System suitability*: reference solution after at least 6 injections:

– *migration time*: aprotinin = 19.0 min to 25.0 min;

– *resolution*: minimum 0.8 between the peaks due to impurities A and B; minimum 0.5 between the peaks due to impurity B and aprotinin;
– *peak distribution*: the electropherogram obtained is qualitatively and quantitatively similar to the electropherogram supplied with *aprotinin solution BRP*;
– *height of the principal peak*: at least 1000 times the height of the baseline noise. If necessary, adjust the sample load to give peaks of a sufficient height.

*Limits*:
– *impurity A*: maximum 8.0 per cent;
– *impurity B*: maximum 7.5 per cent.

**Pyroglutamyl-aprotinin and related compounds**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined in mobile phase A to a concentration of about 5 Ph. Eur. U./mL.

*Reference solution.* Dissolve the contents of a vial of *aprotinin for system suitability CRS* in 2.0 mL of mobile phase A.

*Column*:
– *size*: *l* = 0.075 m, Ø = 7.5 mm;
– *stationary phase*: *strong cation-exchange silica gel for chromatography R* (10 µm);
– *temperature*: 40 °C.

*Mobile phase*:
– *mobile phase A*: dissolve 3.52 g of *potassium dihydrogen phosphate R* and 7.26 g of *disodium hydrogen phosphate dihydrate R* in 1000 mL of *water for chromatography R*; filter and degas;
– *mobile phase B*: dissolve 3.52 g of *potassium dihydrogen phosphate R*, 7.26 g of *disodium hydrogen phosphate dihydrate R* and 66.07 g of *ammonium sulfate R* in 1000 mL of *water for chromatography R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 21 | 92 → 64 | 8 → 36 |
| 21 - 30 | 64 → 0 | 36 → 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 40 µL.

*Relative retention* with reference to aprotinin (retention time = 17.0 min to 20.0 min): impurity C = about 0.9.

*System suitability*: reference solution:
– *resolution*: minimum 1.5 between the peaks due to impurity C and aprotinin;
– *symmetry factor*: maximum 1.3 for the peak due to aprotinin.

*Limits*:
– *impurity C*: maximum 1.0 per cent;
– *any other impurity*: maximum 0.5 per cent;
– *sum of impurities other than C*: maximum 1.0 per cent.

**Aprotinin oligomers**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined in *water R* to obtain a concentration of about 5 Ph. Eur. U./mL.

*Reference solution.* Treat the substance to be examined to obtain about 2 per cent aprotinin oligomers. For example, heat freeze-dried aprotinin at about 110 °C for about 4 h. Then dissolve in *water R* to obtain a concentration of about 5 Ph. Eur. U./mL.

*Column*: 3 columns coupled in series:
– *size*: *l* = 0.30 m, Ø = 7.8 mm;
– *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 20 000 to 10 000 000 (8 µm).

*Mobile phase*: *acetonitrile R*, *glacial acetic acid R*, *water for chromatography R* (2:2:6 *V/V/V*); filter and degas.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 277 nm.

*Injection*: 100 µL.

*Run time*: 40 min.

*Relative retention* with reference to aprotinin monomer (retention time = 24.5 min to 25.5 min): aprotinin dimer = about 0.9.

*System suitability*: reference solution:
– *resolution*: minimum 1.3 between the peaks due to aprotinin dimer and monomer;
– *symmetry factor*: maximum 2.5 for the peak due to aprotinin monomer.

*Limit*:
– *total*: maximum 1.0 per cent.

**Specific activity of the dry residue**: minimum 3.0 Ph. Eur. U. of aprotinin activity per milligram of dry residue.

Evaporate 25.0 mL to dryness in a water-bath, dry the residue at 110 °C for 15 h and weigh. From the mass of the residue and the activity determined as described below, calculate the number of European Pharmacopoeia Units per milligram of dry residue.

**Bacterial endotoxins** (*2.6.14*): less than 0.14 IU per European Pharmacopoeia Unit of aprotinin, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The activity of aprotinin is determined by measuring its inhibitory action on a solution of trypsin of known activity. The inhibiting activity of the aprotinin is calculated from the difference between the initial activity and the residual activity of the trypsin.

The inhibiting activity of aprotinin is expressed in European Pharmacopoeia Units. 1 Ph. Eur. U. inhibits 50 per cent of the enzymatic activity of 2 microkatals of trypsin.

Use a reaction vessel with a capacity of about 30 mL, provided with:
– a device that will maintain a temperature of 25 ± 0.1 °C;
– a stirring device, such as a magnetic stirrer;
– a lid with 5 holes for accommodating the electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of the reagents.

An automatic or manual titration apparatus may be used. In the latter case the burette is graduated in 0.05 mL and the pH-meter is provided with a wide reading scale and glass-silver-silver chloride or other suitable electrodes.

*Test solution.* With *0.0015 M borate buffer solution pH 8.0 R* prepare an appropriate dilution (*D*) of the aprotinin concentrated solution expected, on the basis of the stated potency, to contain 1.67 Ph. Eur. U./mL.

*Trypsin solution.* Prepare a solution of *trypsin BRP* containing about 0.8 microkatals per millilitre (about 1 mg/mL), using *0.001 M hydrochloric acid* as the solvent. Use a freshly prepared solution and keep in iced water.

*Trypsin and aprotinin solution.* To 4.0 mL of the trypsin solution add 1.0 mL of the test solution. Dilute immediately to 40.0 mL with *0.0015 M borate buffer solution pH 8.0 R*. Allow to stand at room temperature for 10 min and then keep in iced water. Use within 6 h of preparation.

*Dilute trypsin solution.* Dilute 0.5 mL of the trypsin solution to 10.0 mL with *0.0015 M borate buffer solution pH 8.0 R*. Allow to stand at room temperature for 10 min and then keep in iced water.

Maintain an atmosphere of nitrogen in the reaction flask and stir continuously; introduce 9.0 mL of *0.0015 M borate buffer solution pH 8.0 R* and 1.0 mL of a freshly prepared

6.9 g/L solution of *benzoylarginine ethyl ester hydrochloride R*. Adjust to pH 8.0 with *0.1 M sodium hydroxide*. When the temperature has reached equilibrium at 25 ± 0.1 °C, add 1.0 mL of the trypsin and aprotinin solution and start a timer. Maintain at pH 8.0 by the addition of *0.1 M sodium hydroxide* and note the volume added every 30 s. Continue the reaction for 6 min. Determine the number of millilitres of *0.1 M sodium hydroxide* used per second ($n_1$ mL). Carry out, under the same conditions, a titration using 1.0 mL of the dilute trypsin solution. Determine the number of millilitres of *0.1 M sodium hydroxide* used per second ($n_2$ mL).

Calculate the aprotinin activity in European Pharmacopoeia Units per millilitre using the following expression:

$$4000(2n_2 - n_1) \times D$$

*D* = dilution factor of the aprotinin concentrated solution to be examined in order to obtain a solution containing 1.67 Ph. Eur. U./mL.

The estimated activity is not less than 90 per cent and not more than 110 per cent of the activity stated on the label.

STORAGE

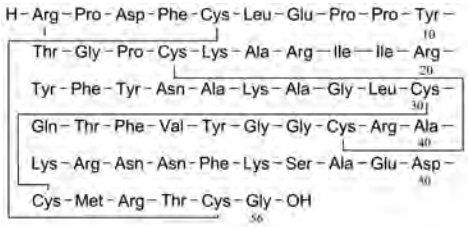
In an airtight, tamper-evident container, protected from light.

LABELLING

The label states:

- the number of European Pharmacopoeia Units of aprotinin activity per millilitre;
- where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

IMPURITIES



A. aprotinin-(1-56)-peptide,

B. aprotinin-(1-57)-peptide,

C. (5-oxoprolyl)aprotinin (pyroglutamylaprotinin).

**01/2020:1171**

# ARACHIS OIL, HYDROGENATED

## Arachidis oleum hydrogenatum

DEFINITION

Oil obtained by refining, bleaching, hydrogenating and deodorising oil obtained from the shelled seeds of *Arachis hypogaea* L. Each type of hydrogenated arachis oil is characterised by its nominal drop point.

CHARACTERS

*Appearance*: white or faintly yellowish, soft mass which melts to a clear, pale yellow liquid when heated.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride and in light petroleum (bp: 65-70 °C), very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, C.*

*Second identification: A, B.*

A. Drop point (see Tests).

B. Identification of fatty oils by thin-layer chromatography (*2.3.2*).

*Results*: the chromatogram obtained is similar to the corresponding chromatogram shown in Figure 2.3.2.-1.

C. Composition of fatty acids (see Tests).

TESTS

**Drop point** (*2.2.17*): 32 °C to 43 °C, and within 3 °C of the nominal value.

**Acid value** (*2.5.1*): maximum 0.5.

Dissolve 10.0 g in 50 mL of the prescribed solvent by heating on a water-bath.

**Peroxide value** (*2.5.5, Method A*): maximum 5.0.

Dissolve 5.0 g in 30 mL of the prescribed solvent by heating on a water-bath.

**Unsaponifiable matter** (*2.5.7*): maximum 1.0 per cent, determined on 5.0 g.

**Alkaline impurities** (*2.4.19*). It complies with the test.

**Composition of fatty acids**. Gas chromatography (*2.4.22, Method A*) with the following modifications. Use the mixture of calibrating substances in Table 2.4.22.-3.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.25 mm;
- *stationary phase*: *cyanopropylpolysiloxane R* (film thickness 0.2 µm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 0.7 mL/min.

*Split ratio*: 1:100.

*Temperature*:

- *column*: 180 °C for 20 min;
- *injection port and detector*: 250 °C.

*Detection*: flame ionisation.

*Composition of the fatty-acid fraction of the substance*:

- *saturated fatty acids of chain length less than $C_{14}$*: maximum 0.5 per cent;
- *myristic acid*: maximum 0.5 per cent;
- *palmitic acid*: 5.0 per cent to 16.0 per cent;
- *stearic acid*: 3.0 per cent to 19.0 per cent;
- *oleic acid and isomers*: 54.0 per cent to 78.0 per cent;

– *linoleic acid and isomers*: maximum 10.0 per cent;
– *arachidic acid*: 1.0 per cent to 3.0 per cent;
– *eicosenoic acids*: maximum 2.1 per cent;
– *behenic acid*: 1.0 per cent to 5.0 per cent;
– *erucic acid and isomers*: maximum 0.5 per cent;
– *lignoceric acid*: 0.5 per cent to 3.0 per cent.

STORAGE

Protected from light.

LABELLING

The label states the nominal drop point.

**01/2019:0263**

# ARACHIS OIL, REFINED

## Arachidis oleum raffinatum

DEFINITION

The refined fatty oil obtained from the shelled seeds of *Arachis hypogaea* L. A suitable antioxidant may be added.

CHARACTERS

*Appearance*: clear, yellowish, viscous liquid.

*Solubility*: very slightly soluble in ethanol (96 per cent), miscible with light petroleum.

*Relative density*: about 0.915.

It solidifies at about 2 °C.

IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Identification of fatty oils by thin-layer chromatography (*2.3.2*).

*Results*: the chromatogram obtained is similar to the corresponding chromatogram shown in Figure 2.3.2.-1.

B. Composition of fatty acids (see Tests).

TESTS

**Acid value** (*2.5.1*): maximum 0.5, determined on 10.0 g.

**Peroxide value** (*2.5.5, Method A*): maximum 5.0.

**Unsaponifiable matter** (*2.5.7*): maximum 1.0 per cent, determined on 5.0 g.

**Alkaline impurities** (*2.4.19*). It complies with the test.

**Composition of fatty acids**. (*2.4.22, Method A*). Use the mixture of calibrating substances in Table 2.4.22.-3.

*Composition of the fatty-acid fraction of the oil*:

– *saturated fatty acids of chain length less than* $C_{16}$: maximum 0.4 per cent;
– *palmitic acid*: 5.0 per cent to 14.0 per cent;
– *stearic acid*: 1.3 per cent to 6.5 per cent;
– *oleic acid*: 35.0 per cent to 76.0 per cent;
– *linoleic acid*: 8.0 per cent to 43.0 per cent;
– *linolenic acid*: maximum 0.6 per cent;
– *arachidic acid*: 0.5 per cent to 3.0 per cent;
– *eicosenoic acid*: 0.5 per cent to 3.0 per cent;
– *behenic acid*: 1.0 per cent to 5.0 per cent;
– *erucic acid*: maximum 0.5 per cent;
– *lignoceric acid*: 0.5 per cent to 3.0 per cent.

**Water** (*2.5.32*): maximum 0.1 per cent, determined on 1.00 g.

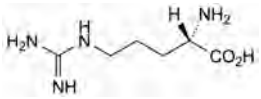
STORAGE

In a well-filled container, protected from light.

**01/2017:0806**

# ARGININE

## Argininum



$C_6H_{14}N_4O_2$ $M_r$ 174.2
[74-79-3]

DEFINITION

(2*S*)-2-Amino-5-guanidinopentanoic acid.

Product of fermentation or of protein hydrolysis.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals, hygroscopic.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, C.*

*Second identification: A, B, D, E.*

A. Specific optical rotation (see Tests).

B. Solution S (see Tests) is strongly alkaline (*2.2.4*).

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *arginine CRS*.

If the spectra obtained show differences, dry the substance to be examined and the reference substance in an oven at 105 °C and record new spectra.

D. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in a 10.3 g/L solution of *hydrochloric acid R* and dilute to 50 mL with the same solution.

*Reference solution*. Dissolve 10 mg of *arginine CRS* in a 10.3 g/L solution of *hydrochloric acid R* and dilute to 50 mL with the same solution.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *concentrated ammonia R*, *2-propanol R* (30:70 *V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: at 105 °C until the ammonia disappears completely.

*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve about 25 mg in 2 mL of *water R*. Add 1 mL of *α-naphthol solution R* and 2 mL of a mixture of equal volumes of *strong sodium hypochlorite solution R* and *water R*. A red colour develops.

TESTS

**Solution S**. Dissolve 2.5 g in *distilled water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): + 25.5 to + 28.5 (dried substance).

Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 mL with the same acid.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *water R* or a sample preparation buffer suitable for the apparatus used.

*Test solution*. Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c)*. Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d)*. Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50.0 mL with solution A. Dilute 1.0 mL of the solution to 200.0 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test, blank and reference solutions into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:

– for any ninhydrin-positive substance detected at 570 nm, use the concentration of arginine in reference solution (a);
– for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:

– *any ninhydrin-positive substance*: for each impurity, maximum 0.2 per cent;
– *total*: maximum 0.5 per cent;
– *reporting threshold*: 0.05 per cent.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Chlorides** (*2.4.4*): maximum 200 ppm.

To 5 mL of solution S add 0.5 mL of *dilute nitric acid R* and dilute to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 300 ppm.

To 10 mL of solution S, add 1.7 mL of *dilute hydrochloric acid R* and dilute to 15 mL with *distilled water R*.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit*:

– *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 mL of *water R*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*).

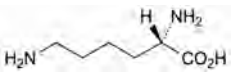
1 mL of *0.1 M hydrochloric acid* is equivalent to 17.42 mg of $C_6H_{14}N_4O_2$.

STORAGE

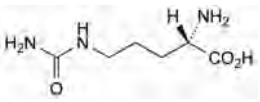
In an airtight container, protected from light.

IMPURITIES

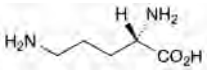
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C.*



A. (2*S*)-2,6-diaminohexanoic acid (lysine),



B. (2*S*)-2-amino-5-(carbamoylamino)pentanoic acid (citrulline),

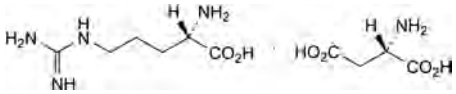


C. (2*S*)-2,5-diaminopentanoic acid (ornithine).

**01/2017:2096**

# ARGININE ASPARTATE

## Arginini aspartas



$C_{10}H_{21}N_5O_6$ $M_r$ 307.3
[7675-83-4]

DEFINITION

(2*S*)-2-Amino-5-guanidinopentanoic acid (2*S*)-2-aminobutanedioate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white granules or powder.

*Solubility*: very soluble in water, practically insoluble in alcohol and in methylene chloride.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *arginine aspartate CRS*.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances.
*Results*: the 2 principal spots in the chromatogram obtained with test solution (b) are similar in position, colour and size to the 2 principal spots in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 6.0 to 7.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 25 to + 27 (dried substance).

Dissolve 2.50 g in *dilute hydrochloric acid R* and dilute to 25.0 mL with the same acid.

**Ninhydrin-positive substances**. Thin-layer chromatography (*2.2.27*).

*Test solution (a)*. Dissolve 0.20 g of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Test solution (b)*. Dilute 1 mL of test solution (a) to 10 mL with *water R*.

*Reference solution (a)*. Dissolve 25 mg of *arginine R* and 25 mg of *aspartic acid R* in *water R* and dilute to 25 mL with the same solvent.

*Reference solution (b)*. Dilute 2 mL of reference solution (a) to 50 mL with *water R*.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *ammonia R*, *propanol R* (36:64 *V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: at 100-105 °C for 10 min.

*Detection*: spray with *ninhydrin solution R* and heat at 100-105 °C for 10 min.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

*Limit*: test solution (a):

– *any impurity*: any spots, apart from the 2 principal spots, are not more intense than each of the 2 principal spots in the chromatogram obtained with reference solution (b) (0.2 per cent).

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dilute 2.5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 300 ppm.

To 0.5 g add 2.5 mL of *dilute hydrochloric acid R* and dilute to 15 mL with *distilled water R*. Examine after 30 min.

**Ammonium** (*2.4.1*): maximum 100 ppm, determined on 100 mg.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 60 °C for 24 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

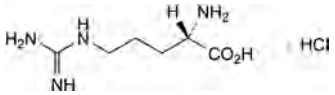
Dissolve 80.0 mg in 2 mL of *anhydrous formic acid R*. Add 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 10.24 mg of $C_{10}H_{21}N_5O_6$.

**01/2017:0805**
**corrected 10.0**

# ARGININE HYDROCHLORIDE

## Arginini hydrochloridum



$C_6H_{15}ClN_4O_2$ $M_r$ 210.7
[1119-34-2]

DEFINITION

(2*S*)-2-Amino-5-guanidinopentanoic acid hydrochloride.

Product of fermentation or of protein hydrolysis.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B, E.*

*Second identification: A, C, D, E.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *arginine hydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 50 mL with the same solvent.
*Reference solution*. Dissolve 10 mg of *arginine hydrochloride CRS* in *water R* and dilute to 50 mL with the same solvent.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *concentrated ammonia R*, *2-propanol R* (30:70 *V/V*).
*Application*: 5 µL.
*Development*: over 2/3 of the plate.
*Drying*: at 105 °C until the ammonia disappears completely.
*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 25 mg in 2 mL of *water R*. Add 1 mL of *α-naphthol solution R* and 2 mL of a mixture of equal volumes of *strong sodium hypochlorite solution R* and *water R*. A red colour develops.

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.5 g in *distilled water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): + 21.0 to + 23.5 (dried substance).

Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 mL with the same acid.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *water R* or a sample preparation buffer suitable for the apparatus used.

*Test solution*. Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c)*. Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d)*. Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50 mL with solution A. Dilute 1 mL of the solution to 200 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test, blank and reference solutions into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:

– for any ninhydrin-positive substance detected at 570 nm, use the concentration of arginine hydrochloride in reference solution (a);
– for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:

– *any ninhydrin-positive substance*: for each impurity, maximum 0.2 per cent;
– *total*: maximum 0.5 per cent;
– *reporting threshold*: 0.05 per cent.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dilute 10 mL of solution S to 15 mL with *distilled water R*.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit*:

– *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 3 mL of *anhydrous formic acid R*. Add 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

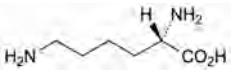
1 mL of *0.1 M perchloric acid* is equivalent to 21.07 mg of $C_6H_{15}ClN_4O_2$.

STORAGE

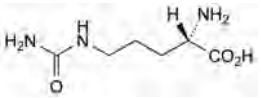
Protected from light.

IMPURITIES

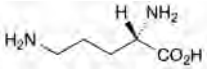
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C.*



A. (2*S*)-2,6-diaminohexanoic acid (lysine),



B. (2*S*)-2-amino-5-(carbamoylamino)pentanoic acid (citrulline),



C. (2*S*)-2,5-diaminopentanoic acid (ornithine).

**07/2010:2407**

# ARGON

## Argon

Ar $A_r$ 39.95
[7440-37-1]

DEFINITION

Gas obtained by fractional distillation of ambient air.

*Content*: minimum 99.995 per cent *V/V* of Ar, calculated by deduction of the sum of impurities found when performing the test for impurities and the water content.

This monograph applies to argon for medicinal use.

CHARACTERS

*Appearance*: colourless gas.

*Solubility*: at 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 29 volumes of water.

IDENTIFICATION

A. Verify that the gas is not oxygen using a paramagnetic analyser (*2.5.27*).

B. Gas chromatography (*2.2.28*).

*Gas to be examined.* The substance to be examined.

*Reference gas.* Use the following mixture of gases in *argon R1*: *methane R1* (5 ppm *V/V*), *nitrogen R1* (5 ppm *V/V*), *oxygen R* (5 ppm *V/V*).

*Column*:

– *material*: stainless steel;
– *size*: *l* = 2 m, Ø = 3 mm;
– *stationary phase*: *molecular sieve for chromatography R* (particle size 150-180 µm, pore size 0.5 nm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 10 mL/min.

*Temperature*:

– *column*: 50 °C;
– *detector*: 150 °C.

*Detection*: thermal conductivity.

*Injection*: 25 µL.

*System suitability*: reference gas:

– *resolution*: minimum 3.0 between the peaks due to argon/oxygen and nitrogen and minimum 2.0 between the peaks due to nitrogen and methane.

*Results*: the principal peak in the chromatogram obtained with the gas to be examined is similar in retention time to the principal peak in the chromatogram obtained with the reference gas.

TESTS

**Impurities**. Gas chromatography (*2.2.28*).

*Gas to be examined.* The substance to be examined.

*Reference gas.* Use the following mixture of gases in *argon R1*: *methane R1* (5 ppm *V/V*), *nitrogen R1* (5 ppm *V/V*), *oxygen R* (5 ppm *V/V*).

*Column*:

– *material*: stainless steel;
– *size*: *l* = 4 m, Ø = 4 mm;
– *stationary phase*: *molecular sieve for chromatography R* (particle size 150-180 µm, pore size 0.5 nm).

*Carrier gas*: *argon R1*.

*Flow rate*: 70 mL/min.

*Temperature*:

– *column*: 80 °C;
– *detector*: 40 °C.

*Detection*: discharge ionisation.

*Injection*: 1 mL.

*Sample rate*: 100 mL/min.

*Relative retention* with reference to impurity C (retention time = about 4.7 min): impurity A = about 0.4; impurity B = about 0.7.

*System suitability*: reference gas:

– *resolution*: minimum 3.0 between the peaks due to impurities A and B and minimum 2.0 between the peaks due to impurities B and C.

*Limits*:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference gas (5.0 ppm *V/V*);
– *total*: maximum 0.0040 per cent of the sum of the areas of all the peaks (40.0 ppm *V/V*).

**Water** (*2.5.28*): maximum 10.0 ppm *V/V*, determined using an electrolytic hygrometer.

STORAGE

In gaseous or liquid state, in suitable containers, complying with the legal regulations.

IMPURITIES

*Specified impurities*: *A, D.*

*Other detectable impurities*: *B, C.*

A. oxygen,

B. nitrogen,

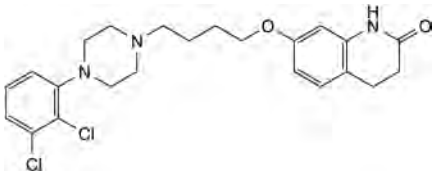
C. methane,

D. water.

**04/2014:2617**
**corrected 10.0**

# ARIPIPRAZOLE

## Aripiprazolum



$C_{23}H_{27}Cl_2N_3O_2$ $M_r$ 448.4

[129722-12-9]

DEFINITION

7-[4-[4-(2,3-Dichlorophenyl)piperazin-1-yl]butoxy]-3,4-dihydroquinolin-2(1*H*)-one.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white crystals or crystalline powder.

*Solubility*: practically insoluble in water, soluble in methylene chloride, very slighty soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *aripiprazole CRS.*

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. If intended for use in the manufacture of parenteral preparations, the solution is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_5$ (*2.2.2, Method II*).

Dissolve 0.5 g in a mixture of 10 volumes of *acetic acid R* and 90 volumes of *anhydrous ethanol R* and dilute to 20 mL with the same mixture of solvents. Sonicate for about 15 min, shaking occasionally, until dissolution is complete.

**Related substances**. Liquid chromatography (*2.2.29*). *Protect the solutions from light.*

*Solvent mixture*: *acetic acid R*, *methanol R*, *acetonitrile R*, *water R* (1:10:30:60 *V/V/V/V*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 5 mg of the substance to be examined and 5 mg of *aripiprazole impurity F CRS* in the solvent mixture and dilute to 100 mL with the solvent mixture. Dilute 1 mL of the solution to 50 mL with the solvent mixture.

*Reference solution (c).* Dissolve 50.0 mg of *aripiprazole CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 50.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R*, 0.05 per cent *V/V* solution of *trifluoroacetic acid R* (10:90 *V/V*);
- *mobile phase B*: 0.05 per cent *V/V* solution of *trifluoroacetic acid R*, *acetonitrile R* (10:90 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 80 | 20 |
| 2 - 10 | 80 → 65 | 20 → 35 |
| 10 - 20 | 65 → 10 | 35 → 90 |
| 20 - 25 | 10 | 90 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (b).

*Relative retention* with reference to aripiprazole (retention time = about 11 min): impurity F = about 1.1.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to aripiprazole and impurity F.

*Calculation of percentage contents*:

- for each impurity, use the concentration of aripiprazole in reference solution (a).

*Limits*:

- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.2 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 5 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

Dissolve 1.0 mg of the substance to be examined in 20 mL of a 5.17 g/L solution of *hydrochloric acid R*.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution and reference solution (c).

*System suitability*: reference solution (c):

- *symmetry factor*: maximum 2.0.

Calculate the percentage content of $C_{23}H_{27}Cl_2N_3O_2$ taking into account the assigned content of *aripiprazole CRS*.

STORAGE

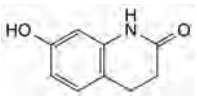
Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

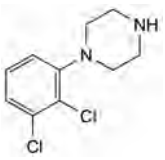
The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

IMPURITIES

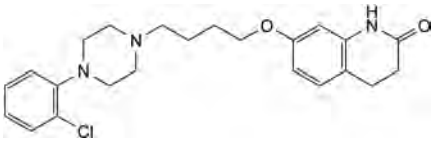
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, F, G.*



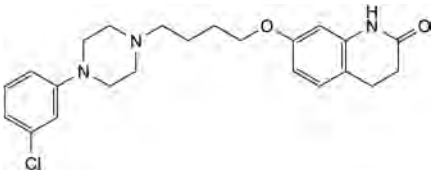
A. 7-hydroxy-3,4-dihydroquinolin-2(1*H*)-one,



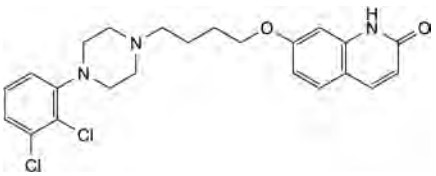
B. 1-(2,3-dichlorophenyl)piperazine,



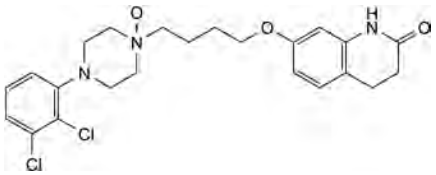
C. 7-[4-[4-(2-chlorophenyl)piperazin-1-yl]butoxy]-3,4-dihydroquinolin-2(1*H*)-one,



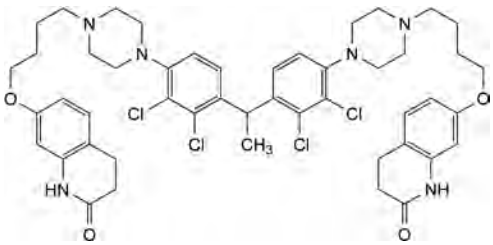
D. 7-[4-[4-(3-chlorophenyl)piperazin-1-yl]butoxy]-3,4-dihydroquinolin-2(1*H*)-one,



E. 7-[4-[4-(2,3-dichlorophenyl)piperazin-1-yl]butoxy]-quinolin-2(1*H*)-one,



F. 7-[4-[4-(2,3-dichlorophenyl)-1-oxidopiperazin-1-yl]butoxy]-3,4-dihydroquinolin-2(1*H*)-one,



G. 7,7′-[ethane-1,1-diylbis[(2,3-dichlorobenzene-4,1-diyl)piperazine-4,1-diylbutane-4,1-diyloxy]]bis[3,4-dihydroquinolin-2(1*H*)-one].

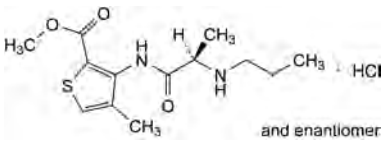
# ARTICAINE HYDROCHLORIDE

## Articaini hydrochloridum



$C_{13}H_{21}ClN_2O_3S$ $M_r$ 320.8
[23964-57-0]

DEFINITION

Methyl 4-methyl-3-[[(2*RS*)-2-(propylamino)propanoyl]-amino]thiophene-2-carboxylate hydrochloride.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water and in ethanol (96 per cent).

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. Dissolve 50.0 mg in a 1 g/L solution of *hydrochloric acid R* and dilute to 100.0 mL with the same acid. Dilute 5.0 mL of the solution to 100.0 mL with a 1 g/L solution of *hydrochloric acid R*. Examined between 200 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 272 nm. The specific absorbance at the maximum is 290 to 320.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: place dropwise 20 µL of the test solution on 300 mg discs.

*Test solution*. Dissolve 0.1 g in 5 mL of *water R*, add 3 mL of a saturated solution of *sodium hydrogen carbonate R* and shake twice with 2 mL of *methylene chloride R*. Combine the methylene chloride layers, dilute to 5.0 mL with *methylene chloride R* and dry over *anhydrous sodium sulfate R*.

*Comparison*: *articaine hydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 20 mg of the substance to be examined in 5 mL of *ethanol (96 per cent) R*.

*Reference solution*. Dissolve 20 mg of *articaine hydrochloride CRS* in 5 mL of *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *triethylamine R*, *ethyl acetate R*, *heptane R* (10:35:65 *V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.50 g in *water R* and dilute to 10 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method I*).

**pH** (*2.2.3*): 4.2 to 5.2.

Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 5.0 mg of *articaine impurity A CRS* and 2.5 mg of *articaine impurity E CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 50.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 45 °C.

*Mobile phase*: mix 25 volumes of *acetonitrile R* and 75 volumes of a solution prepared as follows: dissolve 2.02 g of *sodium heptanesulfonate R* and 4.08 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000 mL with the same solvent. Adjust to pH 2.0 with *phosphoric acid R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Injection*: 10 µL.

*Run time*: 5 times the retention time of articaine.

*Relative retention* with reference to articaine (retention time = about 9 min): impurity A = about 0.8; impurity E = about 0.86.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.2 between the peaks due to impurities A and E.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *sum of impurities other than A*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 5 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*) using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 32.08 mg of $C_{13}H_{21}ClN_2O_3S$.

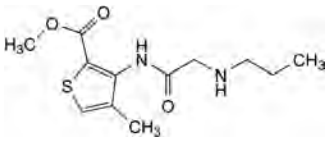
STORAGE

Protected from light.

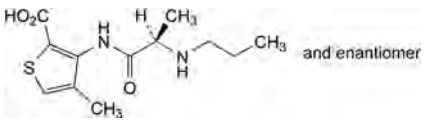
IMPURITIES

*Specified impurities: A.*

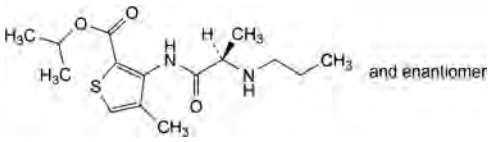
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G, H, I, J.*



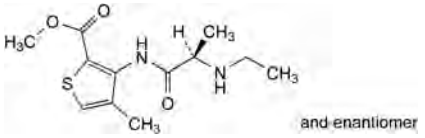
A. methyl 4-methyl-3-[[2-(propylamino)acetyl]amino]thiophene-2-carboxylate (acetamidoarticaine),



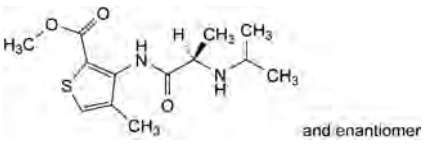
B. 4-methyl-3-[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxylic acid (articaine acid),



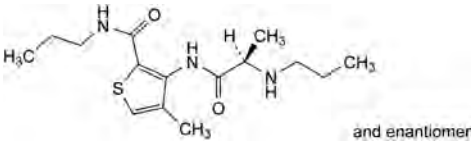
C. 1-methylethyl 4-methyl-3-[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxylate (articaine isopropyl ester),



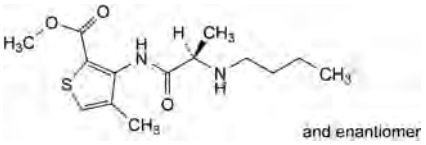
D. methyl 3-[[(2*RS*)-2-(ethylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate (ethylarticaine),



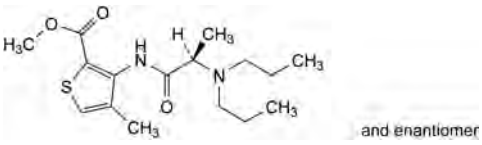
E. methyl 4-methyl-3-[[(2*RS*)-2-[(1-methylethyl)amino]propanoyl]amino]thiophene-2-carboxylate (isopropylarticaine),



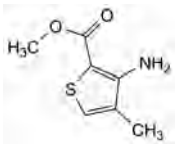
F. 4-methyl-*N*-propyl-3-[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxamide (articaine acid propionamide),



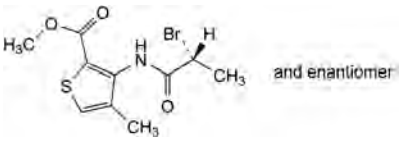
G. methyl 3-[[(2*RS*)-2-(butylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate (butylarticaine),



H. methyl 3-[[(2*RS*)-2-(dipropylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate (dipropylarticaine),



I. methyl 3-amino-4-methylthiophene-2-carboxylate (3-aminoarticaine),

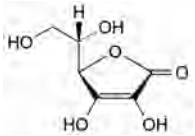


J. methyl 3-[[(2*RS*)-2-bromopropanoyl]amino]-4-methylthiophene-2-carboxylate (bromo compound).

**07/2019:0253**

# ASCORBIC ACID

## Acidum ascorbicum



$C_6H_8O_6$ $M_r$ 176.1
[50-81-7]

DEFINITION

(5*R*)-5-[(1*S*)-1,2-Dihydroxyethyl]-3,4-dihydroxyfuran-2(5*H*)-one.

*Content*: 99.0 per cent to 100.5 per cent.

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals, becoming discoloured on exposure to air and moisture.

*Solubility*: freely soluble in water, sparingly soluble in ethanol (96 per cent).

mp: about 190 °C, with decomposition.

IDENTIFICATION

*First identification: B, C.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 0.10 g in *water R* and dilute immediately to 100.0 mL with the same solvent. Add 1.0 mL of the solution to 10 mL of a 10.3 g/L solution of *hydrochloric acid R* and dilute to 100.0 mL with *water R*.

*Absorption maximum*: at 243 nm, determined immediately after dissolution.

*Specific absorbance at the absorption maximum*: 545 to 585.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ascorbic acid CRS*.

C. pH (*2.2.3*): 2.1 to 2.6 for solution S (see Tests).

D. To 1 mL of solution S add 0.2 mL of *dilute nitric acid R* and 0.2 mL of *silver nitrate solution R2*. A grey precipitate is formed.

TESTS

**Solution S**. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): + 20.5 to + 21.5.

Dissolve 2.50 g in *water R* and dilute to 25.0 mL with the same solvent.

**Impurity E**: maximum 0.2 per cent.

*Test solution.* Dissolve 0.25 g in 5 mL of *water R*. Neutralise using *dilute sodium hydroxide solution R*, then add 1 mL of *dilute acetic acid R* and 0.5 mL of *calcium chloride solution R*.

*Reference solution.* Dissolve 70 mg of *oxalic acid R* (dihydrate of impurity E) in *water R* and dilute to 500 mL with the same solvent; to 5 mL of the solution add 1 mL of *dilute acetic acid R* and 0.5 mL of *calcium chloride solution R*.

Allow the solutions to stand for 1 h. Any opalescence in the test solution is not more intense than that in the reference solution.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Phosphate buffer solution.* Dissolve 6.8 g of *potassium dihydrogen phosphate R* in *water for chromatography R* and dilute to about 175 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm) and dilute to 1000 mL with *water for chromatography R*.

*Test solution.* Dissolve 0.500 g of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 10.0 mg of *ascorbic acid impurity C CRS* in the mobile phase and dilute to 5.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 5.0 mg of *ascorbic acid impurity D CRS* and 5.0 mg of *ascorbic acid CRS* in the mobile phase, add 2.5 mL of reference solution (a) and dilute to 100.0 mL with the mobile phase.

*Reference solution (c).* Dilute 1 mL of the test solution to 200 mL with the mobile phase. Mix 1 mL of this solution and 1 mL of reference solution (a).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 45 °C.

*Mobile phase*: phosphate buffer solution, *acetonitrile R1* (25:75 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: 2.5 times the retention time of ascorbic acid.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities C and D.

*Relative retention* with reference to ascorbic acid (retention time = about 11 min): impurity D = about 0.4; impurity C = about 1.7.

*System suitability*:

- *resolution*: minimum 3.0 between the peaks due to ascorbic acid and impurity C in the chromatogram obtained with reference solution (c);
- *signal-to-noise ratio*: minimum 20 for the peak due to impurity C in the chromatogram obtained with reference solution (b).

*Limits*:

- *impurities C, D*: for each impurity, not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the peak due to ascorbic acid in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *sum of impurities other than C and D*: not more than twice the area of the peak due to ascorbic acid in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *disregard limit*: 0.5 times the area of the peak due to ascorbic acid in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Copper**: maximum 5 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 2.0 g in *0.1 M nitric acid* and dilute to 25.0 mL with the same acid.

*Reference solutions.* Prepare the reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) using *copper standard solution (10 ppm Cu) R*, diluting with *0.1 M nitric acid*.

*Source*: copper hollow-cathode lamp.

*Wavelength*: 324.8 nm.

*Atomisation device*: air-acetylene flame.

Adjust the zero of the apparatus using *0.1 M nitric acid*.

**Iron**: maximum 2 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 5.0 g in *0.1 M nitric acid* and dilute to 25.0 mL with the same acid.

*Reference solutions.* Prepare the reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) using *iron standard solution (20 ppm Fe) R*, diluting with *0.1 M nitric acid*.

*Source*: iron hollow-cathode lamp.

*Wavelength*: 248.3 nm.

*Atomisation device*: air-acetylene flame.

Adjust the zero of the apparatus using *0.1 M nitric acid*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in a mixture of 10 mL of *dilute sulfuric acid R* and 80 mL of *carbon dioxide-free water R*. Add 1 mL of *starch solution R*. Titrate with *0.05 M iodine* until a persistent violet-blue colour is obtained.

1 mL of *0.05 M iodine* is equivalent to 8.81 mg of $C_6H_8O_6$.

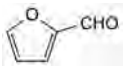
STORAGE

In a non-metallic container, protected from light.

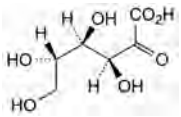
IMPURITIES

*Specified impurities: C, D, E.*

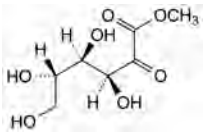
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, F, G, H.*



A. furan-2-carbaldehyde,

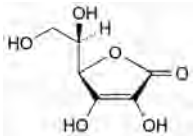


C. L-*xylo*-hex-2-ulosonic acid (L-sorbosonic acid),

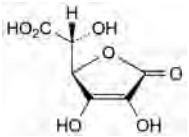


D. methyl L-*xylo*-hex-2-ulosonate (methyl L-sorbosonate),

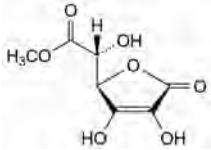
E. oxalic acid,



F. (5*R*)-5-[(1*R*)-1,2-dihydroxyethyl]-3,4-dihydroxyfuran-2(5*H*)-one,



G. (*R*)-[(2*R*)-3,4-dihydroxy-5-oxo-2,5-dihydrofuran-2-yl]hydroxyacetic acid,

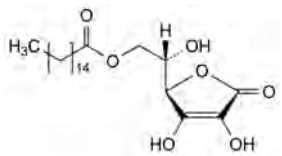


H. methyl (*R*)-[(2*R*)-3,4-dihydroxy-5-oxo-2,5-dihydrofuran-2-yl]hydroxyacetate.

**01/2017:0807**

# ASCORBYL PALMITATE

## Ascorbylis palmitas



$C_{22}H_{38}O_7$ $M_r$ 414.5

[137-66-6]

DEFINITION

(2*S*)-2-[(2*R*)-3,4-Dihydroxy-5-oxo-2,5-dihydrofuran-2-yl]-2-hydroxyethyl hexadecanoate.

*Content*: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or yellowish-white powder.

*Solubility*: practically insoluble in water, freely soluble in ethanol (96 per cent) and in methanol, practically insoluble in methylene chloride and in fatty oils.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ascorbyl palmitate CRS*.

C. Dissolve about 10 mg in 5 mL of *methanol R*. The solution decolourises *dichlorophenolindophenol standard solution R*.

TESTS

**Solution S**. Dissolve 2.50 g in *methanol R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_4$ (*2.2.2, Method I*).

**Specific optical rotation** (*2.2.7*): + 21 to + 24 (dried substance), determined on solution S.

**Related substances**. The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 5 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 mL of *ethanol (96 per cent) R*. Add 30 mL of *water R* and titrate with *0.05 M iodine* until a yellow colour is obtained.

1 mL of *0.05 M iodine* is equivalent to 20.73 mg of $C_{22}H_{38}O_7$.

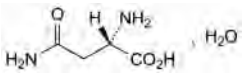
STORAGE

In an airtight container, protected from light.

07/2019:2086

# ASPARAGINE MONOHYDRATE

## Asparaginum monohydricum



$C_4H_8N_2O_3,H_2O$ $M_r$ 150.1
[5794-13-8]

DEFINITION

(2*S*)-2,4-Diamino-4-oxobutanoic acid monohydrate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: slightly soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

*First identification*: *A, B, D.*

*Second identification*: *A, C, D.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *asparagine monohydrate CRS.*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 10 mg of *asparagine monohydrate CRS* in *water R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R, water R, butanol R* (25:25:50 *V/V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: at 110 °C for 15 min.

*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 10 min.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Loss on drying (see Tests).

TESTS

**Solution S**. Dissolve with heating 2.0 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.0 to 6.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 33.7 to + 36.0 (dried substance).

Dissolve 2.50 g in a 309.0 g/L solution of *hydrochloric acid R* and dilute to 25.0 mL with the same acid.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with *water R.*

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 10.0 mL with *water R.*

*Reference solution (c).* Dissolve 5.0 mg of *aspartic acid R* (impurity A) in *water R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *water R.*

*Reference solution (d).* Dissolve 3.0 mg of *asparagine impurity C CRS* in 40 mL of *water R* using sonification and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *water R.*

*Reference solution (e).* Mix 5.0 mL of reference solution (c) with 2.5 mL of reference solution (a) and dilute to 10.0 mL with *water R.*

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*: dissolve 13.6 g of *potassium dihydrogen phosphate R* and 2.16 g of *sodium octanesulfonate R* in about 900 mL of *water for chromatography R.* Adjust to pH 2.2 with *phosphoric acid R* and dilute to 1000 mL with *water for chromatography R.* Add 5 mL of *acetonitrile R1.*

*Flow rate*: 0.7 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of asparagine.

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peak due to impurity A; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity C.

*Relative retention* with reference to asparagine (retention time = about 6.6 min): impurity C = about 0.6; impurity A = about 1.2.

*System suitability*: reference solution (e):

- *resolution*: minimum 5.0 between the peaks due to asparagine and impurity A.

*Calculation of percentage contents*:

- for impurity A, use the concentration of impurity A in reference solution (c);
- for impurity C, use the concentration of impurity C in reference solution (d);
- for impurities other than A and C, use the concentration of asparagine monohydrate in reference solution (b).

*Limits*:

- *impurity A*: maximum 0.5 per cent;
- *impurity C*: maximum 0.1 per cent;
- *unspecified impurities*: for each impurity, maximum 0.05 per cent;
- *total*: maximum 0.8 per cent;
- *reporting threshold*: 0.03 per cent.

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dilute 12.5 mL of solution S to 15 mL with *water R.*

**Sulfates** (*2.4.13*): maximum 200 ppm.

To 0.75 g add 2.5 mL of *dilute hydrochloric acid R* and dilute to 15 mL with *distilled water R.* Examine after 30 min.

**Ammonium** (*2.4.1, Method B*): maximum 0.1 per cent, determined on 10 mg.

Prepare the standard using 0.1 mL of *ammonium standard solution (100 ppm $NH_4$) R.*

**Iron** (*2.4.9*): maximum 10 ppm.

Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 10 mL with the same acid. Shake 3 times with 10 mL of *methyl isobutyl ketone R1* for 3 min. Wash the combined organic

phases with 10 mL of *water R* for 3 min. The aqueous phase complies with the limit test for iron.

**Loss on drying** (*2.2.32*): 10.5 per cent to 12.5 per cent, determined on 1.000 g by drying in an oven at 130 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

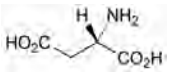
Dissolve 0.110 g in 5 mL of *anhydrous formic acid R*. Add 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 13.21 mg of $C_4H_8N_2O_3$.

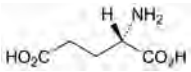
IMPURITIES

*Specified impurities: A, C.*

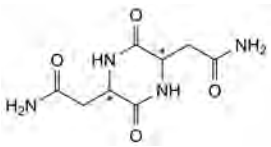
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, D, E, F, G, H.*



A. (2*S*)-2-aminobutanedioic acid (aspartic acid),

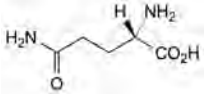


B. (2*S*)-2-aminopentanedioic acid (glutamic acid),

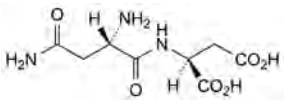


C. 2,2′-[(2Ξ,5Ξ)-3,6-dioxopiperazine-2,5-diyl]diacetamide,

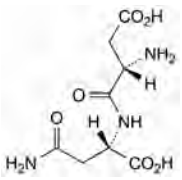
D. (2*E*)-but-2-enedioic acid (fumaric acid),



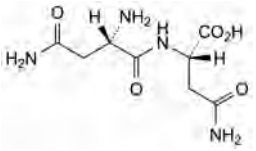
E. (2*S*)-2,5-diamino-5-oxopentanoic acid (glutamine),



F. (2*S*)-2-[[(2*S*)-2,4-diamino-4-oxobutanoyl]amino]butanedioic acid (asparaginylaspartic acid),



G. (2*S*)-4-amino-2-[[(2*S*)-2-amino-3-carboxypropanoyl]amino]-4-oxobutanoic acid (α-aspartylasparagine),

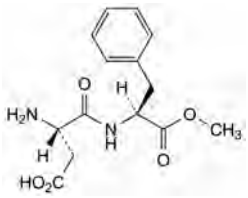


H. (2*S*)-4-amino-2-[[(2*S*)-2,4-diamino-4-oxobutanoyl]amino]-4-oxobutanoic acid (asparaginylasparagine).

**01/2017:0973**

# ASPARTAME

## Aspartamum



$C_{14}H_{18}N_2O_5$ $M_r$ 294.3
[22839-47-0]

DEFINITION

(3*S*)-3-Amino-4-[[(2*S*)-1-methoxy-1-oxo-3-phenylpropan-2-yl]amino]-4-oxobutanoic acid (methyl α-L-aspartyl-L-phenylalaninate).

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, slightly hygroscopic, crystalline powder.

*Solubility*: sparingly soluble or slightly soluble in water and in ethanol (96 per cent), practically insoluble in hexane and in methylene chloride.

IDENTIFICATION

*First identification: B.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 0.1 g in *ethanol (96 per cent) R* and dilute to 100 mL with the same solvent.

*Spectral range*: 230-300 nm.

*Absorption maxima*: at 247 nm, 252 nm, 258 nm and 264 nm.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *aspartame CRS.*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 15 mg of the substance to be examined in 2.5 mL of *water R* and dilute to 10 mL with *acetic acid R.*

*Reference solution.* Dissolve 15 mg of *aspartame CRS* in 2.5 mL of *water R* and dilute to 10 mL with *acetic acid R.*

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *water R, anhydrous formic acid R, methanol R, methylene chloride R* (2:4:30:64 *V/V/V/V*).

*Application*: 20 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

*Results*: the spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with the reference solution.

D. Dissolve about 20 mg in 5 mL of *methanol R* and add 1 mL of *alkaline hydroxylamine solution R1*. Heat on a water-bath for 15 min. Allow to cool and adjust to about pH 2 with *dilute hydrochloric acid R*. Add 0.1 mL of *ferric chloride solution R1*. A brownish-red colour is produced.

TESTS

**Solution S**. Dissolve 0.8 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_6$ (*2.2.2, Method II*).

**Conductivity** (*2.2.38*): maximum 30 µS·cm$^{-1}$.

Dissolve 0.80 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 mL with the same solvent. Measure the conductivity of the solution ($C_1$) and that of the water used for preparing the solution ($C_2$). The readings must be stable within 1 per cent over a period of 30 s.
Calculate the conductivity of the solution of the substance to be examined using the following expression:

$$C_1 - 0.992\ C_2$$

**Specific optical rotation** (*2.2.7*): + 14.5 to + 16.5 (dried substance).

Dissolve 2.00 g in a 690 g/L solution of *anhydrous formic acid R* and dilute to 50.0 mL with the same solution. Measure within 30 min of preparation.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.60 g of the substance to be examined in a mixture of 1.5 volumes of *glacial acetic acid R* and 98.5 volumes of *water R* and dilute to 100.0 mL with the same mixture of solvents.

*Reference solution (a)*. Dissolve 4.5 mg of *aspartame impurity A CRS* in a mixture of 1.5 volumes of *glacial acetic acid R* and 98.5 volumes of *water R* and dilute to 50.0 mL with the same mixture of solvents.

*Reference solution (b)*. Dissolve 30.0 mg of *phenylalanine R* (impurity C) in a mixture of 15 volumes of *glacial acetic acid R* and 85 volumes of *water R* and dilute to 100.0 mL with the same mixture of solvents. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (c)*. Dilute 5.0 mL of the test solution to 10.0 mL with *water R*. Dilute 3.0 mL of this solution to 100.0 mL with *water R*.

*Reference solution (d)*. Dissolve 30.0 mg of *L-aspartyl-L-phenylalanine R* (impurity B) in a mixture of 15 volumes of *glacial acetic acid R* and 85 volumes of *water R* and dilute to 100.0 mL with the same mixture of solvents. Dilute 1.0 mL of the solution to 10.0 mL with *water R*. Mix 1.0 mL of this solution with 1.0 mL of reference solution (b).

*Column*

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 µm).

*Mobile phase*: mix 10 volumes of *acetonitrile R* and 90 volumes of a 6.8 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.7 with *phosphoric acid R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of aspartame.

*System suitability*: reference solution (d):

- *resolution*: minimum 3.5 between the peaks due to impurities B and C.

*Limits*:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent);
- *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *sum of impurities other than A and C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.5 per cent);
- *disregard limit*: disregard any peak due to the solvent.

**Loss on drying** (*2.2.32*): maximum 4.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 1.5 mL of *anhydrous formic acid R* and 60 mL of *anhydrous acetic acid R*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 29.43 mg of $C_{14}H_{18}N_2O_5$.

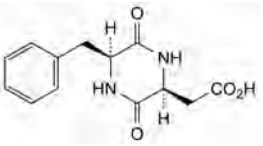
STORAGE

In an airtight container.

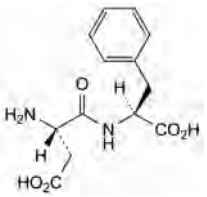
IMPURITIES

*Specified impurities*: *A, C.*

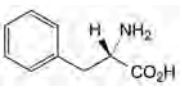
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*



A. 2-[(2*S*,5*S*)-5-benzyl-3,6-dioxopiperazin-2-yl]acetic acid,



B. (3*S*)-3-amino-4-[[(1*S*)-1-carboxy-2-phenylethyl]amino]-4-oxobutanoic acid (α-L-aspartyl-L-phenylalanine),

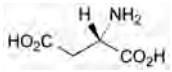


C. (2*S*)-2-amino-3-phenylpropanoic acid (L-phenylalanine).

**01/2018:0797**

# ASPARTIC ACID

## Acidum asparticum



$C_4H_7NO_4$ $M_r$ 133.1
[56-84-8]

DEFINITION

(2*S*)-2-Aminobutanedioic acid (L-aspartic acid).

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: slightly soluble in water, practically insoluble in ethanol (96 per cent). It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification: carry out either tests A, C or tests C, D.*

*Second identification: A, B, E.*

A. Specific optical rotation (*2.2.7*): + 24.0 to + 26.0 (dried substance).
Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 mL with the same acid.

B. A suspension of 1 g in 10 mL of *water R* is strongly acid (*2.2.4*).

C. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *aspartic acid CRS*.

D. Enantiomeric purity (see Tests).

E. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 10 mg of the substance to be examined in 2 mL of *dilute ammonia R1* and dilute to 50 mL with *water R*.
*Reference solution*. Dissolve 10 mg of *aspartic acid CRS* in 2 mL of *dilute ammonia R1* and dilute to 50 mL with *water R*.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 *V/V/V*).
*Application*: 5 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

Dissolve 0.5 g in a 103 g/L solution of *hydrochloric acid R* and dilute to 10 mL with the same acid.

**Enantiomeric purity**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 0.100 g of D-*aspartic acid R* (impurity I) in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 0.100 g of the substance to be examined in 90 mL of *water R*, add 0.3 mL of reference solution (a) and dilute to 100.0 mL with *water R*.

*Reference solution (c)*. Dilute 0.3 mL of reference solution (a) to 100.0 mL with *water R*.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: L-*penicillamine coated silica gel for chiral separations R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*: *2-propanol R*, 0.5 g/L solution of *copper sulfate pentahydrate R* (5:95 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL.

*Relative retention* with reference to aspartic acid (retention time = about 12 min): impurity I = about 0.85.

*System suitability*: reference solution (b):
- *resolution*: minimum 2.0 between the peaks due to impurity I and aspartic acid.

*Calculation of percentage content*:
- for impurity I, use the concentration of impurity I in reference solution (c).

*Limit*:
- *impurity I*: maximum 0.3 per cent.

**Other dicarboxylic acids**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.500 g of the substance to be examined in 2.0 mL of a 618 g/L solution of *hydrochloric acid R* and dilute to 10.0 mL with *water R*.

*Reference solution (a)*. Dissolve 20.0 mg of *malic acid R* (impurity A) in *water R* and dilute to 20.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 10.0 mg of *maleic acid R* (impurity H) in *water R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *water R*.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 10.0 mL with reference solution (a).

*Reference solution (d)*. Dilute 1.0 mL of reference solution (a) to 10.0 mL with *water R*.

*Reference solution (e)*. Dissolve 10.0 mg of *fumaric acid R* (impurity B) in *water R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 100.0 mL with *water R*.

*Column*:
- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *cation-exchange resin R* (9 µm);
- *temperature*: 30 °C.

*Mobile phase*: 0.39 g/L solution of *sulfuric acid R*.

*Flow rate*: 0.6 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 10 µL.

*Run time*: 4 times the retention time of impurity H.

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and H; use the chromatogram obtained with reference solution (e) to identify the peak due to impurity B.

*Relative retention* with reference to impurity H (retention time = about 7.5 min): impurity A = about 1.2; impurity B = about 2.0.

*System suitability*: reference solution (c):
- *resolution*: minimum 1.5 between the peaks due to impurities H and A.

*Calculation of percentage contents*:
- for impurity A, use the concentration of impurity A in reference solution (d);
- for impurities B and H, use the concentration of impurity H in reference solution (b);
- for impurities other than B and H, use the concentration of impurity A in reference solution (d).

*Limits*:
- *impurity A*: maximum 0.2 per cent;
- *impurity B*: maximum 0.10 per cent;
- *impurity H*: maximum 0.10 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.3 per cent;
- *reporting threshold*: 0.05 per cent.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test and reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *dilute hydrochloric acid R1* or a sample preparation buffer suitable for the apparatus used.

*Test solution.* Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b).* Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 250.0 mL with solution A.

*Reference solution (c).* Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d).* Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50.0 mL with solution A. Dilute 1.0 mL of the solution to 200.0 mL with solution A.

*Reference solution (e).* Dissolve 30.0 mg of *alanine R* (impurity D), 60.0 mg of *asparagine R* (impurity G) and 30.0 mg of *glutamic acid R* (impurity C) in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test solution, blank solution and reference solutions (a), (b), (d) and (e) into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):
- *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:
- for impurities C, D and G, use the concentration of each impurity in reference solution (e);
- for any ninhydrin-positive substance detected at 570 nm, use the concentration of aspartic acid in reference solution (a);
- for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:
- *impurities C, D, G*: for each impurity, maximum 0.2 per cent;
- *any ninhydrin-positive substance*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 1.0 per cent;
- *reporting threshold*: 0.05 per cent.

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dissolve 0.25 g in 3 mL of *dilute nitric acid R* and dilute to 15 mL with *water R*. Add 1 mL of *water R* instead of 1 mL of *dilute nitric acid R*.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dissolve 0.5 g in 4 mL of *hydrochloric acid R* and dilute to 15 mL with *distilled water R*. Carry out the evaluation of the test after 30 min.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modification.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit:*
- *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 50 mL of *carbon dioxide-free water R*, with slight heating if necessary. Cool and titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 13.31 mg of $C_4H_7NO_4$.

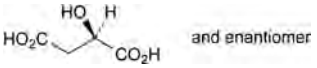
STORAGE

Protected from light.

IMPURITIES

*Specified impurities: A, B, C, D, H, G, I.*

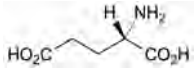
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F.*



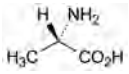
and enantiomer

A. (2*RS*)-2-hydroxybutanedioic acid (malic acid),

B. (2*E*)-but-2-enedioic acid (fumaric acid),

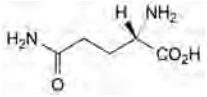


C. (2*S*)-2-aminopentanedioic acid (glutamic acid),

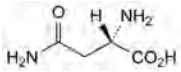


D. (2*S*)-2-aminopropanoic acid (alanine),

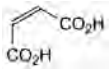
E. butanedioic acid (succinic acid),



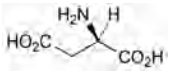
F. (2*S*)-2,5-diamino-5-oxopentanoic acid (L-glutamine),



G. (2*S*)-2,4-diamino-4-oxobutanoic acid (asparagine),



H. (2*Z*)-but-2-enedioic acid (maleic acid),



I. (2*R*)-2-aminobutanedioic acid (D-aspartic acid).

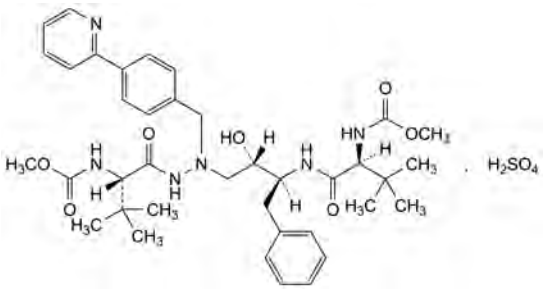
# ATAZANAVIR SULFATE

## Atazanaviri sulfas



$C_{38}H_{54}N_6O_{11}S$ $M_r$ 803
[229975-97-7]

DEFINITION

Methyl [(5*S*,10*S*,11*S*,14*S*)-11-benzyl-5-*tert*-butyl-10-hydroxy-15,15-dimethyl-3,6,13-trioxo-8-[[4-(pyridin-2-yl)phenyl]methyl]-2-oxa-4,7,8,12-tetraazahexadecan-14-yl]carbamate sulfate.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or pale yellow, slightly hygroscopic, crystalline powder that may contain agglomerates.

*Solubility*: slightly soluble in water, freely soluble in ethanol (96 per cent), practically insoluble in heptane.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *atazanavir sulfate CRS*.

C. It gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Specific optical rotation** (*2.2.7*): − 44 to − 40 (anhydrous substance), measured at 25 °C.

Dissolve 0.100 g in 8 mL of *methanol R*, using sonication if necessary, and dilute to 10.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture.* Mix equal volumes of *acetonitrile R1* and a freshly prepared 2.73 g/L solution of *potassium dihydrogen phosphate R* in *water for chromatography R* previously adjusted to pH 3.5 with *dilute phosphoric acid R*.

*Test solution (a).* Dissolve 20.0 mg of the substance to be examined in 40 mL of the solvent mixture, sonicate for 3 min and dilute to 50.0 mL with the solvent mixture.

*Test solution (b).* Dissolve 50.0 mg of the substance to be examined in 40 mL of the solvent mixture, sonicate for 3 min and dilute to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 20.0 mg of *atazanavir sulfate CRS* in 40 mL of the solvent mixture, sonicate for 3 min and dilute to 50.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 4 mg of *atazanavir for system suitability CRS* (containing impurity F) in 8 mL of the solvent mixture, sonicate for 3 min and dilute to 10 mL with the solvent mixture.

*Reference solution (d).* Dissolve 2.0 mg of *atazanavir impurity K CRS* in 9 mL of the solvent mixture, sonicate for 3 min and dilute to 10.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 100.0 mL with the solvent mixture. Dilute 3.0 mL of this solution to 20.0 mL with the solvent mixture.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3.0 µm);
- *temperature*: 25 °C.

*Mobile phase*:
- *mobile phase A*: mix 25 volumes of *acetonitrile R1* and 75 volumes of a freshly prepared 2.73 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.5 with *dilute phosphoric acid R*;
- *mobile phase B*: mix 25 volumes of a freshly prepared 2.73 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.5 with *dilute phosphoric acid R*, and 75 volumes of *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 45 | 100 → 0 | 0 → 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram supplied with *atazanavir for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity F.

*Relative retention* with reference to atazanavir (retention time = about 30 min): impurity F = about 0.99.

*System suitability*: reference solution (c):
- *resolution*: minimum 1.5 between the peaks due to impurity F and atazanavir.

*Calculation of percentage contents*:
- for each impurity, use the concentration of atazanavir sulfate in reference solution (b).

*Limits*:

- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent; disregard any peak with a relative retention with reference to atazanavir of less than 0.2.

**Impurity K**. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*:

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 95 | 5 |
| 5 - 8 | 95 → 0 | 5 → 100 |
| 8 - 14 | 0 | 100 |

*Injection*: 20 µL of test solution (b) and reference solution (d).

*Identification of impurities*: use the chromatogram obtained with reference solution (d) to identify the peak due to impurity K.

*Relative retention* with reference to atazanavir (retention time = about 10 min): impurity K = about 0.4.

*Calculation of percentage content*:

- for impurity K, use the concentration of impurity K in reference solution (d).

*Limit*:

- *impurity K*: maximum 0.15 per cent.

**Water** (*2.5.32*): maximum 2.5 per cent, determined on 0.100 g by direct sample introduction.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: solvent mixture.

*Injection*: test solution (a) and reference solutions (a) and (c).

*Run time*: 1.6 times the retention time of atazanavir.

*Relative retention* with reference to atazanavir (retention time = about 9.5 min): impurity F = about 0.94.

*System suitability*: reference solution (c):

- *resolution*: minimum 1.5 between the peaks due to impurity F and atazanavir.

Calculate the percentage content of $C_{38}H_{54}N_6O_{11}S$ using the chromatogram obtained with reference solution (a) and taking into account the assigned content of *atazanavir sulfate CRS*.

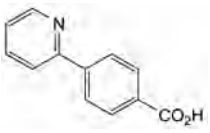
STORAGE

In an airtight container.

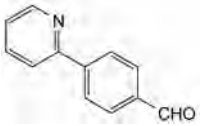
IMPURITIES

*Specified impurities: K.*

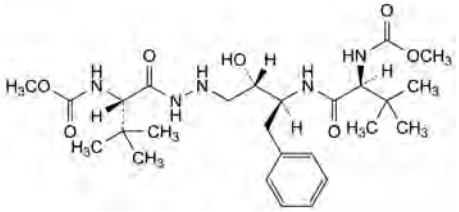
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, F, G, H, I, J.*



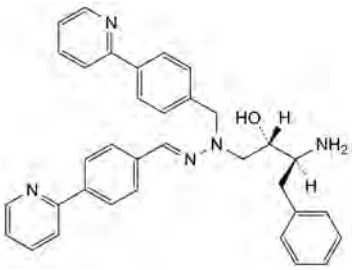
A. 4-(pyridin-2-yl)benzoic acid,



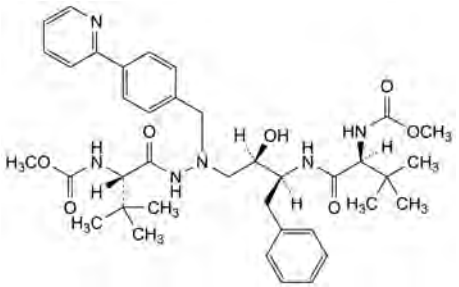
B. 4-(pyridin-2-yl)benzaldehyde,



C. methyl [(5*S*,10*S*,11*S*,14*S*)-11-benzyl-5-*tert*-butyl-10-hydroxy-15,15-dimethyl-3,6,13-trioxo-2-oxa-4,7,8,12-tetraazahexadecan-14-yl]carbamate,



D. (2*S*,3*S*)-3-amino-4-phenyl-1-[(*E*)-1-[[4-(pyridin-2-yl)phenyl]methyl]-2-[[4-(pyridin-2-yl)phenyl]methylidene]hydrazin-1-yl]butan-2-ol,



E. methyl [(5*S*,10*R*,11*S*,14*S*)-11-benzyl-5-*tert*-butyl-10-hydroxy-15,15-dimethyl-3,6,13-trioxo-8-[[4-(pyridin-2-yl)phenyl]methyl]-2-oxa-4,7,8,12-tetraazahexadecan-14-yl]carbamate,

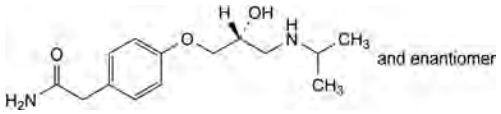
# ATENOLOL

## Atenololum



$C_{14}H_{22}N_2O_3$ $M_r$ 266.3
[29122-68-7]

DEFINITION

2-[4-[(2*RS*)-2-Hydroxy-3-[(propan-2-yl)amino]propoxy]-phenyl]acetamide.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: sparingly soluble in water, soluble in anhydrous ethanol, slightly soluble in methylene chloride.

IDENTIFICATION

*First identification: C.*

*Second identification: A, B, D.*

A. Melting point (*2.2.14*): 152 °C to 155 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 0.100 g in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 10.0 mL of the solution to 100.0 mL with *methanol R.*

*Spectral range*: 230-350 nm.

*Absorption maxima*: at 275 nm and 282 nm.

*Absorbance ratio*: $A_{275}/A_{282}$ = 1.15 to 1.20.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *atenolol CRS.*

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in 1.0 mL of *methanol R.*

*Reference solution.* Dissolve 10 mg of *atenolol CRS* in 1.0 mL of *methanol R.*

*Plate*: *TLC silanised silica gel $F_{254}$ plate R.*

*Mobile phase*: *concentrated ammonia R1*, *methanol R* (1:99 *V/V*).

*Application*: 10 µL.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Solution S**. Dissolve 0.10 g in *water R* and dilute to 10 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than degree 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): + 0.10° to − 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50 mg of the substance to be examined in 20 mL of the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 2 mg of *atenolol for system suitability CRS* (containing impurities B, F, G, I and J) in 1.0 mL of the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.125 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 1.0 g of *sodium octanesulfonate R* and 0.4 g of *tetrabutylammonium hydrogen sulfate R* in 1 L of a mixture of 20 volumes of *tetrahydrofuran R*, 180 volumes of *methanol R2* and 800 volumes of a 3.4 g/L solution of *potassium dihydrogen phosphate R*; adjust the apparent pH to 3.0 with *phosphoric acid R*.

*Flow rate*: 0.6 mL/min.

*Detection*: spectrophotometer at 226 nm.

*Injection*: 10 µL.

*Run time*: 5 times the retention time of atenolol.

*Identification of impurities*: use the chromatogram supplied with *atenolol for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B, F, G, I and J.

*Relative retention* with reference to atenolol (retention time = about 8 min): impurity B = about 0.3; impurity J = about 0.7; impurity I = about 0.8; impurity F = about 2.0 (pair of peaks); impurity G = about 3.5.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.4 between the peaks due to impurities J and I.

*Limits*:

- *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities F, G, I, J*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 0.1 per cent.

Dissolve 50 mg in a mixture of 1 mL of *dilute nitric acid R* and 15 mL of *water R*. The solution, without further addition of *dilute nitric acid R*, complies with the test.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

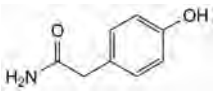
Dissolve 0.200 g in 80 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 26.63 mg of $C_{14}H_{22}N_2O_3$.

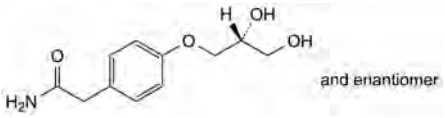
IMPURITIES

*Specified impurities: B, F, G, I, J.*

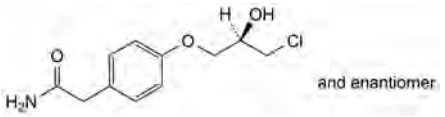
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, D, E, H.*



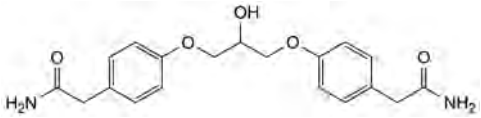
A. 2-(4-hydroxyphenyl)acetamide,



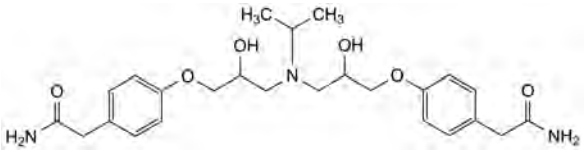
B. 2-[4-[(2*RS*)-2,3-dihydroxypropoxy]phenyl]acetamide,



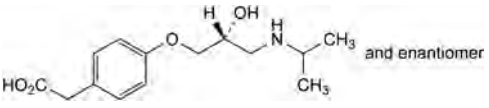
D. 2-[4-[(2*RS*)-3-chloro-2-hydroxypropoxy]phenyl]-acetamide,



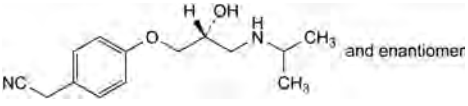
E. 2,2′-[(2-hydroxypropane-1,3-diyl)bis(oxy-4,1-phenylene)]diacetamide,



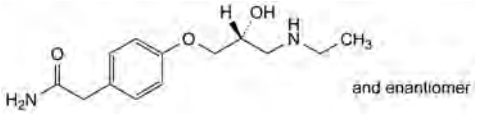
F. 2,2′-[[(propan-2-yl)azanediyl]bis[(2-hydroxypropane-3,1-diyl)oxy-4,1-phenylene]]diacetamide,



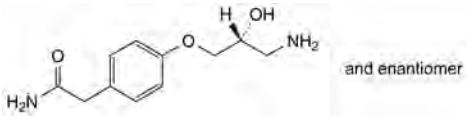
G. [4-[(2*RS*)-2-hydroxy-3-[(propan-2-yl)amino]-propoxy]phenyl]acetic acid,



H. [4-[(2*RS*)-2-hydroxy-3-[(propan-2-yl)amino]-propoxy]phenyl]acetonitrile,



I. 2-[4-[(2*RS*)-3-(ethylamino)-2-hydroxypropoxy]-phenyl]acetamide,

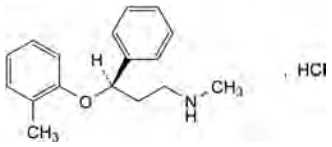


J. 2-[4-[(2*RS*)-3-amino-2-hydroxypropoxy]phenyl]-acetamide.

**01/2017:2640**

# ATOMOXETINE HYDROCHLORIDE

## Atomoxetini hydrochloridum



$C_{17}H_{22}ClNO$ $M_r$ 291.8
[82248-59-7]

DEFINITION

(3*R*)-*N*-Methyl-3-(2-methylphenoxy)-3-phenylpropan-1-amine hydrochloride.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: sparingly soluble in water, soluble in anhydrous ethanol, practically insoluble in heptane.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *atomoxetine hydrochloride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness and record new spectra using the residues.

B. Isomeric purity (see Tests).

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Isomeric purity**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dissolve 35.0 mg of the substance to be examined in 2.5 mL of *anhydrous ethanol R*, sonicate until dissolution is complete and dilute to 10.0 mL with *heptane R*.

*Reference solution (a).* Dissolve 3.5 mg of *atomoxetine impurity B CRS* and 1 mg of *atomoxetine impurity D CRS* in 5 mL of *anhydrous ethanol R*, sonicate until dissolution is complete and dilute to 20.0 mL with *heptane R*.

*Reference solution (b).* Dissolve 35.0 mg of the substance to be examined in 2.5 mL of *anhydrous ethanol R*. Add 1.0 mL of reference solution (a) and dilute to 10.0 mL with *heptane R*.

*Reference solution (c).* Dilute 1.0 mL of reference solution (a) to 100.0 mL with *heptane R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *cellulose derivative of silica gel for chiral separation R* (5 µm).

*Mobile phase*: mix 1.5 mL of *diethylamine R*, 2.0 mL of *trifluoroacetic acid R* and 150.0 mL of *2-propanol R* and dilute to 1000 mL with *heptane R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 273 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: 1.3 times the retention time of atomoxetine.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities B and D.

*Relative retention* with reference to atomoxetine (retention time = about 12 min): impurity B = about 0.5; impurity D = about 0.6.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.8 between the peaks due to impurities B and D.

*Limits*:

– *impurity B*: maximum 0.5 per cent;
– *impurity D*: maximum 0.15 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *disregard limit*: the area of the peak due to impurity B in the chromatogram obtained with reference solution (c) (0.05 per cent); disregard any peak with a relative retention with reference to atomoxetine of about 0.7 (impurity A).

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve 5.9 g of *sodium octanesulfonate monohydrate R* in 1000 mL of a 2.9 g/L solution of *phosphoric acid R* previously adjusted to pH 2.5 with a 280 g/L solution of *potassium hydroxide R*.

*Test solution (a).* Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Test solution (b).* Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 7.5 mg of *3-(methylamino)-1-phenylpropan-1-ol R* (impurity H) and 5 mg of *mandelic acid R* (impurity E) in test solution (b) and dilute to 50 mL with test solution (b).

*Reference solution (c).* Dissolve 5 mg of *atomoxetine for impurity A identification CRS* in the mobile phase and dilute to 20 mL with the mobile phase.

*Reference solution (d).* Dissolve 25.0 mg of *atomoxetine hydrochloride CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (3.5 µm);
– *temperature*: 40 °C.

*Mobile phase*: *propanol R*, solution A (27:73 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (a), (b) and (c).

*Run time*: 2.5 times the retention time of atomoxetine.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities E and H; use the chromatogram supplied with *atomoxetine for impurity A identification CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity A.

*Relative retention* with reference to atomoxetine (retention time = about 10 min): impurity E = about 0.2; impurity H = about 0.3; impurity A = about 0.7.

*System suitability*: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to impurities E and H.

*Calculation of percentage contents*:

– for each impurity, use the concentration of atomoxetine hydrochloride in reference solution (a).

*Limits*:

– *impurity A*: maximum 0.3 per cent;

– *unspecified impurities*: for each impurity, maximum 0.10 per cent;

– *total*: maximum 0.5 per cent;

– *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

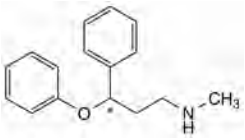
*Injection*: test solution (b) and reference solution (d).

Calculate the percentage content of $C_{17}H_{22}ClNO$ taking into account the assigned content of *atomoxetine hydrochloride CRS*.

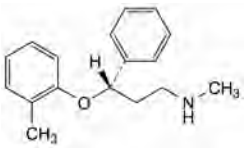
IMPURITIES

*Specified impurities: A, B, D.*

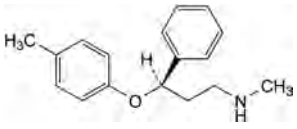
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E, F, G, H.*



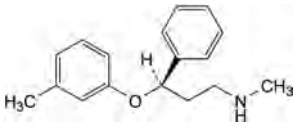
A. *N*-methyl-3-phenoxy-3-phenylpropan-1-amine,



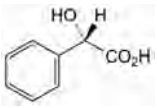
B. (3*S*)-*N*-methyl-3-(2-methylphenoxy)-3-phenylpropan-1-amine,



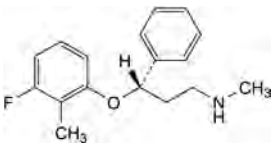
C. (3*R*)-*N*-methyl-3-(4-methylphenoxy)-3-phenylpropan-1-amine,



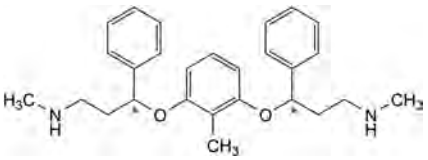
D. (3*R*)-*N*-methyl-3-(3-methylphenoxy)-3-phenylpropan-1-amine,



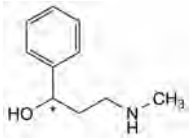
E. (2*S*)-2-hydroxy-2-phenylacetic acid (L-mandelic acid),



F. (3*S*)-3-(3-fluoro-2-methylphenoxy)-*N*-methyl-3-phenylpropan-1-amine,



G. 3,3′-[(2-methylbenzene-1,3-diyl)bis(oxy)]bis(*N*-methyl-3-phenylpropan-1-amine),



H. 3-(methylamino)-1-phenylpropan-1-ol.

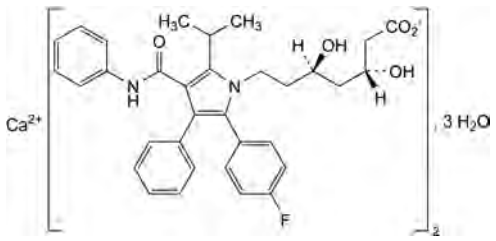
# ATORVASTATIN CALCIUM TRIHYDRATE

## Atorvastatinum calcicum trihydricum



$C_{66}H_{68}CaF_2N_4O_{10},3H_2O$ $M_r$ 1209

[344423-98-9]

DEFINITION

Calcium (3*R*,5*R*)-7-[2-(4-fluorophenyl)-5-(1-methylethyl)-3-phenyl-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoate trihydrate.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *atorvastatin calcium trihydrate CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

B. Enantiomeric purity (see Tests).

C. Water (see Tests).

D. Ignite. The residue gives reaction (b) of calcium (*2.3.1*). Filtration may be necessary in case the residue does not completely dissolve.

TESTS

**Enantiomeric purity**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *anhydrous ethanol R*, *methanol R* (50:50 *V/V*).

*Test solution.* Dissolve 10 mg of the substance to be examined in 4 mL of the solvent mixture and dilute to 10.0 mL with *hexane R*.

*Reference solution (a).* Dissolve 2 mg of *atorvastatin impurity E CRS* in *methanol R* and dilute to 20.0 mL with the same solvent (solution A). Dissolve 10 mg of the substance to be examined in 1.25 mL of *methanol R*, add 0.75 mL of solution A and 2 mL of *anhydrous ethanol R* and dilute to 10.0 mL with *hexane R*.

*Reference solution (b).* To 2.0 mL of the test solution add 40.0 mL of the solvent mixture and dilute to 100.0 mL with *hexane R*. To 3.0 mL of this solution add 5 mL of the solvent mixture and dilute to 20.0 mL with *hexane R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *amylose derivative of silica gel for chromatography R* (10 µm).

*Mobile phase*: *trifluoroacetic acid R*, *anhydrous ethanol R*, *hexane R* (0.1:6:94 *V/V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 244 nm.

*Injection*: 20 µL.

*Run time*: 1.2 times the retention time of atorvastatin.

*Relative retention* with reference to atorvastatin (retention time = about 44 min): impurity E = about 0.8.

*System suitability*: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurity E and atorvastatin.

*Limit*:

– *impurity E*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 40.0 mg of the substance to be examined in *dimethylformamide R* and dilute to 100.0 mL with the same solvent.

*Test solution (b).* Dissolve 50 mg of the substance to be examined in *dimethylformamide R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a).* Dissolve 40.0 mg of *atorvastatin calcium trihydrate CRS* in *dimethylformamide R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b).* Dilute 1.0 mL of test solution (b) to 100.0 mL with *dimethylformamide R*. Dilute 1.0 mL of this solution to 10.0 mL with *dimethylformamide R*.

*Reference solution (c).* Dissolve 2.5 mg of *atorvastatin impurity A CRS*, 2.5 mg of *atorvastatin impurity B CRS*, 2.5 mg of *atorvastatin impurity C CRS*, 2.5 mg of *atorvastatin impurity D CRS* and 2.5 mg of the substance to be examined in *dimethylformamide R* and dilute to 50.0 mL with the same solvent.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 35 °C.

*Mobile phase*:

– *mobile phase A*: *tetrahydrofuran R*, *acetonitrile R*, 3.9 g/L solution of *ammonium acetate R* adjusted to pH 5.0 with *glacial acetic acid R* (12:21:67 *V/V/V*);

– *mobile phase B*: *tetrahydrofuran R*, 3.9 g/L solution of *ammonium acetate R* adjusted to pH 5.0 with *glacial acetic acid R*, *acetonitrile R* (12:27:61 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 40 | 100 | 0 |
| 40 - 70 | 100 → 20 | 0 → 80 |
| 70 - 85 | 20 → 0 | 80 → 100 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 244 nm.

*Injection*: 20 µL of test solution (b) and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, C and D.

*Relative retention* with reference to atorvastatin (retention time = about 33 min): impurity A = about 0.8; impurity B = about 0.9; impurity C = about 1.2; impurity D = about 2.1.

If necessary, adjust the mobile phase by increasing or decreasing the percentage of acetonitrile or the pH of the ammonium acetate solution to achieve a retention time of about 33 min for atorvastatin. For example, raising the pH would decrease the retention time of atorvastatin.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity B and atorvastatin.

*Limits*:

– *impurities A, B*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *impurities C, D*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the peak due to dimethylformamide.

**Sodium**: maximum 0.4 per cent (anhydrous substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

*Solvent mixture*: *hydrochloric acid R*, *water R*, *methanol R* (2:25:75 *V/V/V*).

*Test solution.* Dissolve 5.0 mg in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solutions.* Prepare the reference solutions using *sodium standard solution (50 ppm Na) R*, diluting with the solvent mixture.

*Source*: sodium hollow-cathode lamp.

*Wavelength*: 589.0 nm.

*Atomisation device*: air-acetylene flame.

**Water** (*2.5.12*): 3.5 per cent to 5.5 per cent, determined on 0.130 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

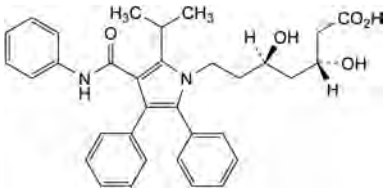
*Injection*: test solution (a) and reference solution (a).

Calculate the percentage content of $C_{66}H_{68}CaF_2N_4O_{10}$ from the declared content of *atorvastatin calcium trihydrate CRS*.

IMPURITIES

*Specified impurities*: *A, B, C, D, E.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G, H.*



A. (3*R*,5*R*)-3,5-dihydroxy-7-[5-(1-methylethyl)-2,3-diphenyl-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]heptanoic acid (desfluoroatorvastatin),

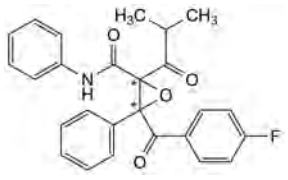
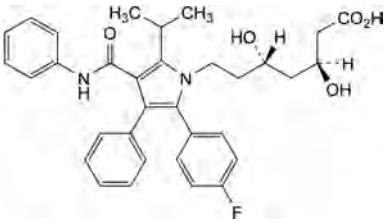
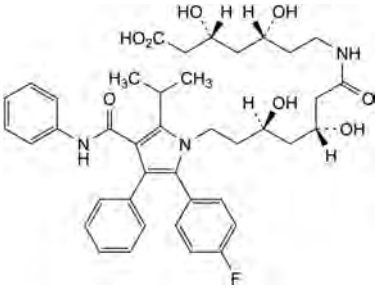
C. (3*R*,5*R*)-7-[2,3-bis(4-fluorophenyl)-5-(1-methylethyl)-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoic acid (fluoroatorvastatin),



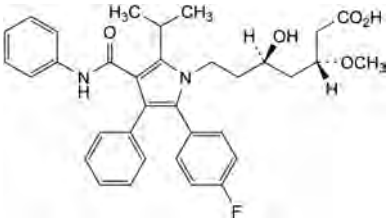
D. 3-[(4-fluorophenyl)carbonyl]-2-(2-methylpropanoyl)-*N*,3-diphenyloxirane-2-carboxamide,



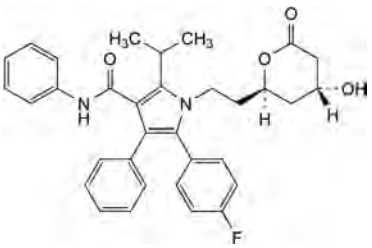
E. (3*S*,5*S*)-7-[2-(4-fluorophenyl)-5-(1-methylethyl)-3-phenyl-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoic acid (*ent*-atorvastatin),



F. (3*R*,5*R*)-7-[[(3*R*,5*R*)-7-[2-(4-fluorophenyl)-5-(1-methylethyl)-3-phenyl-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoyl]amino]-3,5-dihydroxyheptanoic acid,



G. (3*R*,5*R*)-7-[2-(4-fluorophenyl)-5-(1-methylethyl)-3-phenyl-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]-5-hydroxy-3-methoxyheptanoic acid (3-*O*-methylatorvastatin),

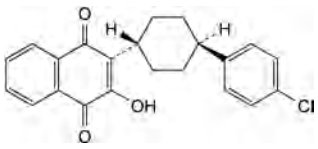


H. (4*R*,6*R*)-6-[2-[2-(4-fluorophenyl)-5-(1-methylethyl)-3-phenyl-4-(phenylcarbamoyl)-1*H*-pyrrol-1-yl]ethyl]-4-hydroxytetrahydro-2*H*-pyran-2-one.

**07/2013:2192**

# ATOVAQUONE

## Atovaquonum



$C_{22}H_{19}ClO_3$ $M_r$ 366.8

[95233-18-4]

DEFINITION

2-[*trans*-4-(4-Chlorophenyl)cyclohexyl]-3-hydroxynaphthalene-1,4-dione.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: yellow, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in methylene chloride, very slightly soluble in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *atovaquone CRS*.

If the spectra obtained show differences, dissolve 0.1 g of the substance to be examined and 0.1 g of the reference substance separately in 2.5 mL of a 50 g/L solution of *potassium hydroxide R* in *methanol R*. Filter the solutions and add each filtrate dropwise to a mixture of 0.8 mL of *acetic acid R* and 1.5 mL of *methanol R*, stirring continuously. Filter, wash the residues with *methanol R* and then with *water R*, and dry under vacuum at 55 °C. Record new spectra using the residues.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Solvent mixture*: *water R*, *acetonitrile R1* (20:80 *V/V*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 25.0 mg of *atovaquone CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 2.5 mg of *atovaquone for system suitability CRS* (containing impurities B and C) in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *phosphoric acid R*, *methanol R2*, *water for chromatography R*, *acetonitrile R1* (0.5:17.5:30:52.5 *V/V/V/V*).

*Flow rate*: 2.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: twice the retention time of atovaquone.

*Identification of impurities*: use the chromatogram supplied with *atovaquone for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities B and C.

*Relative retention* with reference to atovaquone (retention time = about 15 min): impurity B = about 0.85; impurity C = about 0.90.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to impurity C and atovaquone;
- *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B.

*Calculation of percentage contents*:

- for each impurity, use the concentration of atovaquone in reference solution (c).

*Limits*:

- *impurity B*: maximum 0.5 per cent;
- *impurity C*: maximum 0.2 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.6 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.32*): maximum 0.3 per cent, determined on 0.100 g using the evaporation technique:

- *temperature*: 160 °C;
- *heating time*: 3 min;
- *flow rate*: 50 mL/min.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

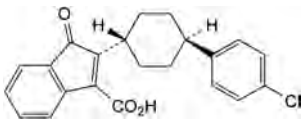
*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{19}ClO_3$ taking into account the assigned content of *atovaquone CRS*.

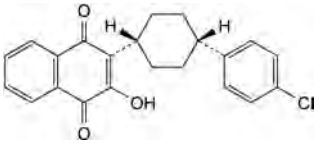
IMPURITIES

*Specified impurities: B, C.*

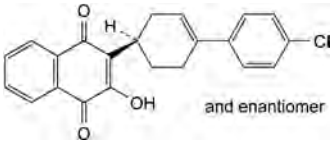
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, D*.



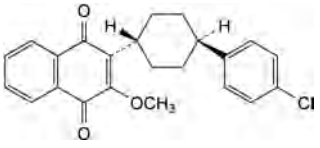
A. 2-[*trans*-4-(4-chlorophenyl)cyclohexyl]-1-oxo-1*H*-indene-3-carboxylic acid,



B. 2-[*cis*-4-(4-chlorophenyl)cyclohexyl]-3-hydroxynaphthalene-1,4-dione,



C. 2-[(1*RS*)-4-(4-chlorophenyl)cyclohex-3-en-1-yl]-3-hydroxynaphthalene-1,4-dione,



D. 2-[*trans*-4-(4-chlorophenyl)cyclohexyl]-3-methoxynaphthalene-1,4-dione.

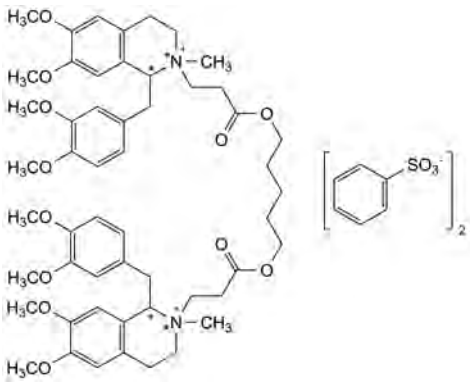
# ATRACURIUM BESILATE

## Atracurii besilas



$C_{65}H_{82}N_2O_{18}S_2$ $M_r$ 1243
[64228-81-5]

DEFINITION

Mixture of the *cis-cis*, *cis-trans* and *trans-trans* isomers of 2,2′-[pentane-1,5-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium] dibenzenesulfonate.

*Content*: 96.0 per cent to 102.0 per cent (anhydrous substance).

PRODUCTION

It is considered that alkyl benzenesulfonate esters are genotoxic and are potential impurities in atracurium besilate. The manufacturing process should be developed taking into consideration the principles of quality risk management, together with considerations of the quality of starting materials, process capability and validation. The general method *2.5.41. Methyl, ethyl and isopropyl benzenesulfonate in active substances* is available to assist manufacturers.

CHARACTERS

*Appearance*: white or yellowish-white, slightly hygroscopic powder.

*Solubility*: soluble in water, very soluble in acetonitrile, in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *atracurium besilate CRS*.

B. Examine the chromatograms obtained in the assay.
*Results*: the 3 principal isomeric peaks in the chromatogram obtained with test solution (a) are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 1.00 g in *water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 50.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Test solution (b).* Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A.

*Reference solution (a).* Dissolve 50.0 mg of *atracurium besilate CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with mobile phase A.

*Reference solution (c).* Dissolve 20.0 mg of *methyl benzenesulfonate R* in *acetonitrile R* and dilute to 100.0 mL with the same solvent. Dilute 50 µL of the solution to 100.0 mL with mobile phase A.

*Reference solution (d).* Dissolve 2.0 mg of *atracurium for peak identification CRS* (containing impurities A1, A2, B, C1, C2, D1, D2, E, G and K) in 2.0 mL of mobile phase A.

*Reference solution (e).* Dissolve 2.0 mg of *atracurium for impurity F identification CRS* in 2.0 mL of mobile phase A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: mix 5 volumes of *methanol R*, 20 volumes of *acetonitrile R* and 75 volumes of a 10.2 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.1 with *phosphoric acid R*;
– *mobile phase B*: mix 20 volumes of *acetonitrile R*, 30 volumes of *methanol R* and 50 volumes of a 10.2 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.1 with *phosphoric acid R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 80 | 20 |
| 5 - 15 | 80 → 40 | 20 → 60 |
| 15 - 25 | 40 | 60 |
| 25 - 30 | 40 → 0 | 60 → 100 |
| 30 - 45 | 0 | 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a), (b), (d) and (e).

*Identification of impurities*: use the chromatogram obtained with reference solution (d) and the chromatogram supplied with *atracurium for peak identification CRS* to identify the peaks due to impurities A1, A2, B, C1, C2, D1, D2, E, G and K; use the chromatogram obtained with reference solution (e) and the chromatogram supplied with *atracurium for impurity F identification CRS* to identify the peak due to impurity F.

*Relative retention* with reference to the atracurium *cis-cis* isomer (retention time = about 30 min): impurity E = about 0.2; impurity F = about 0.25; impurity G = about 0.3; impurity D1 = about 0.45; impurity D2 = about 0.5; atracurium *trans-trans* isomer = about 0.8; atracurium *cis-trans* isomer = about 0.9; impurity A1 = about 1.04; impurity I1 = about 1.07; impurity H1 = about 1.07 (shoulder on the front of peak A2); impurity A2 (major isomer) = about 1.08; impurity K1 = about 1.09 (shoulder on the tail of peak A2); impurity I2 (major isomer) = about 1.12; impurity H2 (major isomer) = about 1.12; impurity K2 (major isomer) = about 1.12; impurity B = about 1.15; impurity C1 = about 1.2; impurity C2 (major isomer) = about 1.3.

*System suitability*:

- *resolution*: minimum 1.5 between the peaks due to the atracurium *trans-trans* isomer and the atracurium *cis-trans* isomer, and minimum 1.5 between the peaks due to the atracurium *cis-trans* isomer and the atracurium *cis-cis* isomer in the chromatogram obtained with reference solution (a);
- *peak-to-valley ratio*: minimum 1.2, where $H_p$ = height above the baseline of the peak due to impurity A1 and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the atracurium *cis-cis* isomer in the chromatogram obtained with reference solution (d).

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity G by 0.5;
- *impurity E*: not more than 1.5 times the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (1.5 per cent);
- *impurities A, D*: for each impurity, for the sum of the areas of the 2 isomer peaks, not more than 1.5 times the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (1.5 per cent);
- *impurity C*: for the sum of the areas of the 2 isomer peaks, not more than the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *impurities F, G*: for each impurity, not more than the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *impurities H, I, K*: for the sum of the areas of the isomer peaks of these impurities, not more than the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *unspecified impurities*: for each impurity, not more than 0.1 times the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 3.5 times the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (3.5 per cent);
- *disregard limit*: 0.05 times the sum of the areas of the peaks due to the atracurium *cis-cis*, *trans-trans* and *cis-trans* isomers in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Impurity J**. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*:

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 80 | 20 |
| 5 - 15 | 80 → 75 | 20 → 25 |
| 15 - 25 | 75 | 25 |
| 25 - 30 | 75 → 55 | 25 → 45 |
| 30 - 38 | 55 → 0 | 45 → 100 |
| 38 - 45 | 0 | 100 |

*Detection*: spectrophotometer at 217 nm.

*Injection*: 100 µL of test solution (b) and reference solution (c).

*Retention time*: impurity J = about 25 min; atracurium *trans-trans* isomer = about 38 min.

*Limit*:

- *impurity J*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (10 ppm).

**Isomer composition**. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification. Use the normalisation procedure.

*Injection*: test solution (a).

*Limits*:

- *atracurium cis-cis isomer*: 55.0 per cent to 60.0 per cent,
- *atracurium cis-trans isomer*: 34.5 per cent to 38.5 per cent,
- *atracurium trans-trans isomer*: 5.0 per cent to 6.5 per cent.

**Water** (*2.5.12*): maximum 5.0 per cent, determined on 1.000 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

## ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (a) and reference solution (a).

Calculate the percentage content of $C_{65}H_{82}N_2O_{18}S_2$ from the sum of the areas of the peaks due to the 3 isomers.

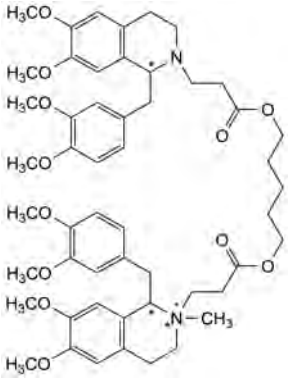
## STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

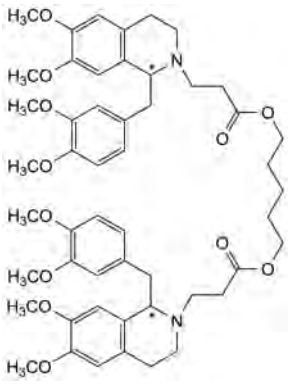
## IMPURITIES

*Specified impurities: A, C, D, E, F, G, H, I, J, K.*

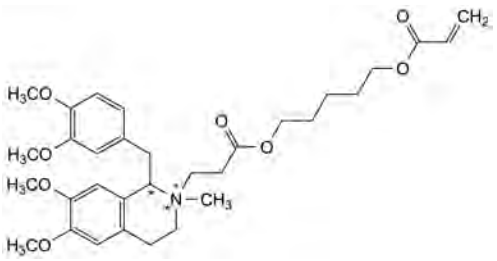
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*



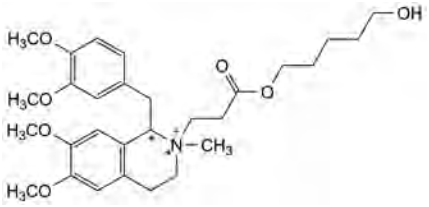
A. 1-(3,4-dimethoxybenzyl)-2-[13-[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-3,4-dihydroisoquinolin-2(1*H*)-yl]-3,11-dioxo-4,10-dioxatridecyl]-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium (A1 = *trans* isomer, A2 = *cis* isomer),



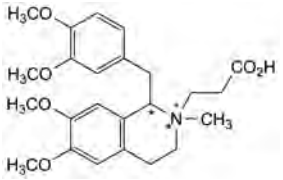
B. pentane-1,5-diyl bis[3-[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-3,4-dihydroisoquinolin-2(1*H*)-yl]propanoate],



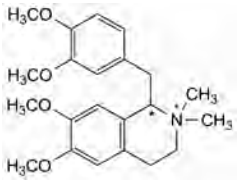
C. 1-(3,4-dimethoxybenzyl)-2-(3,11-dioxo-4,10-dioxatridec-12-enyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium (C1 = *trans* isomer, C2 = *cis* isomer),



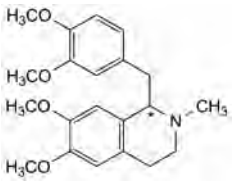
D. 1-(3,4-dimethoxybenzyl)-2-[3-[(5-hydroxypentyl)oxy]-3-oxopropyl]-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium (D1 = *trans* isomer, D2 = *cis* isomer),



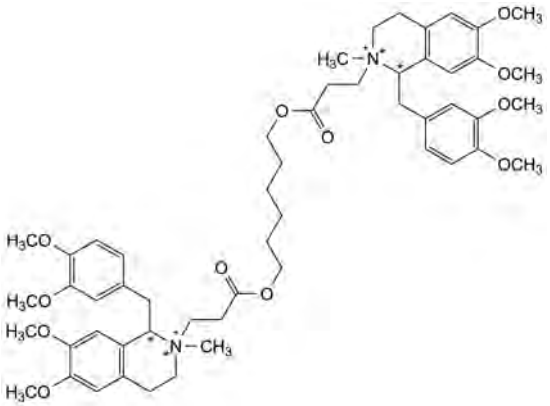
E. 2-(2-carboxyethyl)-1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium,



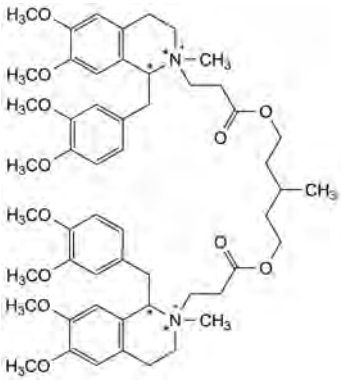
F. 1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2,2-dimethyl-1,2,3,4-tetrahydroisoquinolinium,



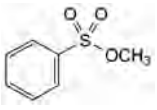
G. 1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinoline,



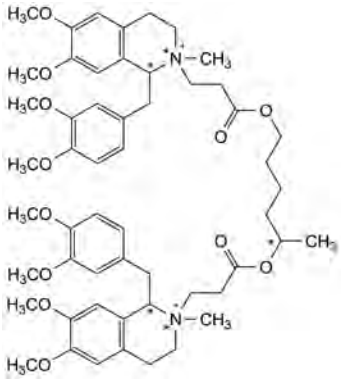
H. 2,2′-[hexane-1,6-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium] (H1 = *cis-trans* isomer, H2 = *cis-cis* isomer),



I. 2,2′-[(3-methylpentane-1,5-diyl)bis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium] (I1 = *cis-trans* isomer, I2 = *cis-cis* isomer),



J. methyl benzenesulfonate,

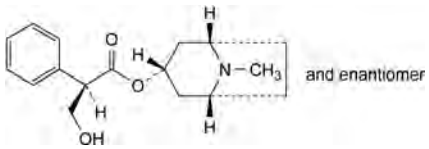


K. 2,2′-[hexane-1,5-diylbis[oxy(3-oxopropane-1,3-diyl)]]bis[1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium].

**07/2010:2056**
**corrected 10.0**

# ATROPINE

## Atropinum



$C_{17}H_{23}NO_3$ $M_r$ 289.4
[51-55-8]

DEFINITION

(1*R*,3*R*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: very slightly soluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

*First identification*: *A, B, E.*

*Second identification*: *A, C, D, E.*

A. Melting point (*2.2.14*): 115 °C to 119 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *atropine CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.
*Reference solution*. Dissolve 10 mg of *atropine CRS* in *methanol R* and dilute to 10 mL with the same solvent.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).
*Application*: 10 µL.
*Development*: over half of the plate.
*Drying*: at 100-105 °C for 15 min.
*Detection*: after cooling, spray with *dilute potassium iodobismuthate solution R*.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Place about 3 mg in a porcelain crucible and add 0.2 mL of *fuming nitric acid R*. Evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of a 30 g/L solution of *potassium hydroxide R* in *methanol R*; a violet colour develops.

E. Optical rotation (see Tests).

TESTS

**Optical rotation** (*2.2.7*): − 0.70° to + 0.05° (measured in a 2 dm tube).

Dissolve 1.25 g in *ethanol (96 per cent) R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 24 mg of the substance to be examined in mobile phase A and dilute to 100.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (b)*. Dissolve 5 mg of *atropine impurity B CRS* in the test solution and dilute to 20 mL with the test solution. Dilute 5 mL of this solution to 25 mL with mobile phase A.

*Reference solution (c)*. Dissolve the contents of a vial of *atropine for peak identification CRS* (containing impurities A, D, E, F, G and H) in 1 mL of mobile phase A.

*Reference solution (d)*. Dissolve 5 mg of *tropic acid R* (impurity C) in mobile phase A and dilute to 10 mL with mobile phase A. Dilute 1 mL of the solution to 100 mL with mobile phase A. Dilute 1 mL of this solution to 10 mL with mobile phase A.

*Column*:
- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *polar end-capped octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:
- *mobile phase A*: dissolve 3.5 g of *sodium dodecyl sulfate R* in 606 mL of a 7.0 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.3 with a 5.8 g/L solution of *phosphoric acid R*, and mix with 320 mL of *acetonitrile R1*;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 95 | 5 |
| 2 - 20 | 95 → 70 | 5 → 30 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *atropine for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, D, E, F, G and H; use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity C.

*Relative retention* with reference to atropine (retention time = about 11 min): impurity C = about 0.2; impurity E = about 0.67; impurity D = about 0.73; impurity F = about 0.8; impurity B = about 0.89; impurity H = about 0.93; impurity G = about 1.1; impurity A = about 1.7.

*System suitability*: reference solution (b):
- *resolution*: minimum 2.5 between the peaks due to impurity B and atropine.

*Limits*:
- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.6; impurity C = 0.6;
- *impurities E, H*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurities A, B, C, D, F, G*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

ASSAY

Dissolve 0.250 g in 40 mL of *anhydrous acetic acid R*, heating if necessary, and allow to cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

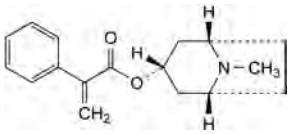
1 mL of *0.1 M perchloric acid* is equivalent to 28.94 mg of $C_{17}H_{23}NO_3$.

STORAGE

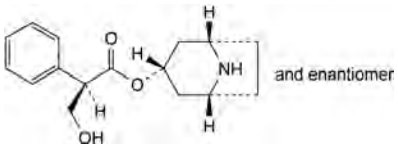
Protected from light.

IMPURITIES

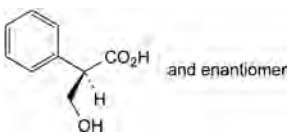
*Specified impurities: A, B, C, D, E, F, G, H.*



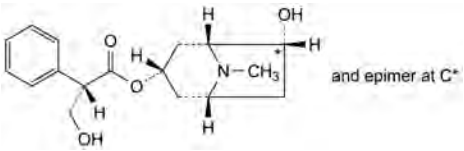
A. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl 2-phenylpropenoate (apoatropine),



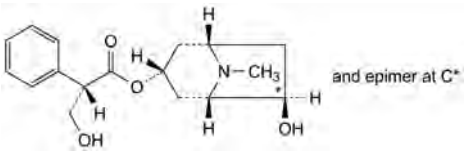
B. (1*R*,3*r*,5*S*)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate (noratropine),



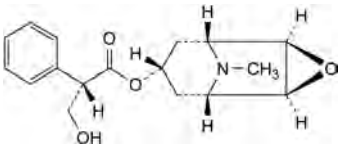
C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (tropic acid),



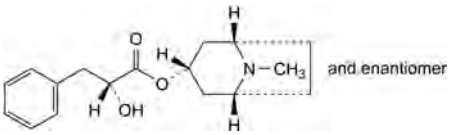
D. (1*R*,3*S*,5*R*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo-[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (6-hydroxyhyoscyamine),



E. (1*S*,3*R*,5*S*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo-[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (7-hydroxyhyoscyamine),



F. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo-[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscine),



G. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-2-hydroxy-3-phenylpropanoate (littorine),

H. unknown structure.

**04/2008:0068**

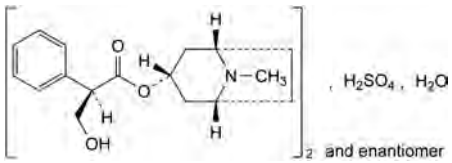
# ATROPINE SULFATE

## Atropini sulfas



$C_{34}H_{48}N_2O_{10}S,H_2O$ $M_r$ 695

[5908-99-6]

DEFINITION

Bis[(1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate] sulfate monohydrate.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B, E.*

*Second identification: C, D, E, F.*

A. Optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *atropine sulfate CRS*.

C. Dissolve about 50 mg in 5 mL of *water R* and add 5 mL of *picric acid solution R*. The precipitate, washed with *water R* and dried at 100-105 °C for 2 h, melts (*2.2.14*) at 174 °C to 179 °C.

D. To about 1 mg add 0.2 mL of *fuming nitric acid R* and evaporate to dryness in a water-bath. Dissolve the residue in 2 mL of *acetone R* and add 0.1 mL of a 30 g/L solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives the reactions of sulfates (*2.3.1*).

F. It gives the reaction of alkaloids (*2.3.1*).

TESTS

**pH** (*2.2.3*): 4.5 to 6.2.

Dissolve 0.6 g in *carbon dioxide-free water R* and dilute to 30 mL with the same solvent.

**Optical rotation** (*2.2.7*): – 0.50° to + 0.05° (measured in a 2 dm tube).

Dissolve 2.50 g in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 24 mg of the substance to be examined in mobile phase A and dilute to 100.0 mL with mobile phase A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (b).* Dissolve 5 mg of *atropine impurity B CRS* in the test solution and dilute to 20 mL with the test solution. Dilute 5 mL of this solution to 25 mL with mobile phase A.

*Reference solution (c).* Dissolve the contents of a vial of *atropine for peak identification CRS* (containing impurities A, D, E, F, G and H) in 1 mL of mobile phase A.

*Reference solution (d).* Dissolve 5 mg of *tropic acid R* (impurity C) in mobile phase A and dilute to 10 mL with mobile phase A. Dilute 1 mL of the solution to 100 mL with mobile phase A. Dilute 1 mL of this solution to 10 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *polar end-capped octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

– *mobile phase A*: dissolve 3.5 g of *sodium dodecyl sulfate R* in 606 mL of a 7.0 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.3 with a 5.8 g/L solution of *phosphoric acid R*, and mix with 320 mL of *acetonitrile R1*;

– *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 95 | 5 |
| 2 - 20 | 95 → 70 | 5 → 30 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *atropine for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, D, E, F, G and H; use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity C.

*Relative retention* with reference to atropine (retention time = about 11 min): impurity C = about 0.2; impurity E = about 0.67; impurity D = about 0.73; impurity F = about 0.8; impurity B = about 0.89; impurity H = about 0.93; impurity G = about 1.1; impurity A = about 1.7.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.5 between the peaks due to impurity B and atropine.

*Limits*:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.6; impurity C = 0.6;

– *impurities E, H*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);

– *impurities A, B, C, D, F, G*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.12*): 2.0 per cent to 4.0 per cent, determined on 0.500 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 30 mL of *anhydrous acetic acid R*, warming if necessary. Cool the solution. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

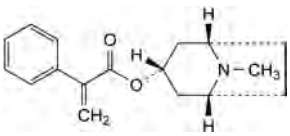
1 mL of *0.1 M perchloric acid* is equivalent to 67.68 mg of $C_{34}H_{48}N_2O_{10}S$.

STORAGE

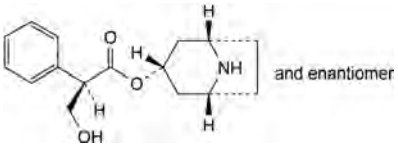
Protected from light.

IMPURITIES

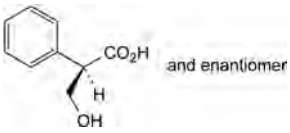
*Specified impurities: A, B, C, D, E, F, G, H.*



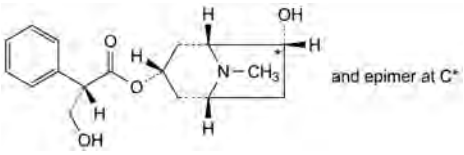
A. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl 2-phenylpropenoate (apoatropine),



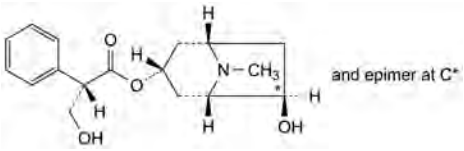
B. (1*R*,3*r*,5*S*)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate (noratropine),



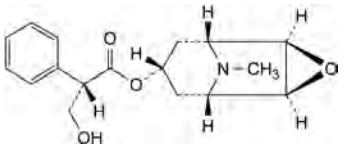
C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (tropic acid),



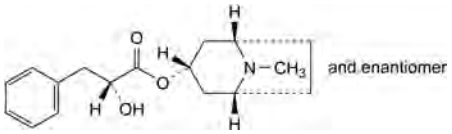
D. (1*R*,3*S*,5*R*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo-[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (6-hydroxyhyoscyamine),



E. (1*S*,3*R*,5*S*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (7-hydroxyhyoscyamine),



F. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscine),



G. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-2-hydroxy-3-phenylpropanoate (littorine),

H. unknown structure.

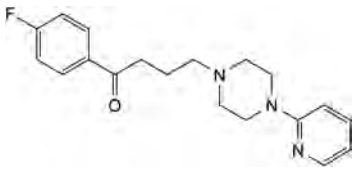
# AZAPERONE FOR VETERINARY USE

## Azaperonum ad usum veterinarium



$C_{19}H_{22}FN_3O$ $M_r$ 327.4
[1649-18-9]

DEFINITION

1-(4-Fluorophenyl)-4-[4-(pyridin-2-yl)piperazin-1-yl]butan-1-one.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in acetone and in methylene chloride, soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *azaperone CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

Dissolve 1.0 g in 25 mL of a 14 g/L solution of *tartaric acid R*.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 5.0 mg of *azaperone CRS* and 6.0 mg of *benperidol CRS* in *methanol R* and dilute to 200.0 mL with the same solvent.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 5.0 mL of the solution to 20.0 mL with *methanol R*.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 25 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 1.4 g of *anhydrous sodium sulfate R* in 900 mL of *water R*, add 16.0 mL of *0.01 M sulfuric acid* and dilute to 1000 mL with *water R*;
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 95 → 20 | 5 → 80 |
| 15 - 20 | 20 | 80 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 10 µL.

*Relative retention* with reference to azaperone (retention time = about 9 min): impurity A = about 0.9; impurity B = about 1.1; impurity C = about 1.15.

*System suitability*: reference solution (a):

- *resolution*: minimum 8.0 between the peaks due to azaperone and to benperidol.

*Limits*:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);
- *unspecified impurities*: for each impurity, not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.20 per cent);
- *sum of impurities B and C*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent);
- *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 70 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, using 0.2 mL of *naphtholbenzein solution R* as indicator.

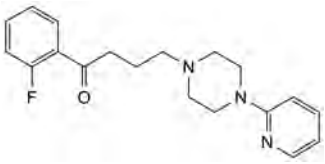
1 mL of *0.1 M perchloric acid* is equivalent to 16.37 mg of $C_{19}H_{22}FN_3O$.

STORAGE

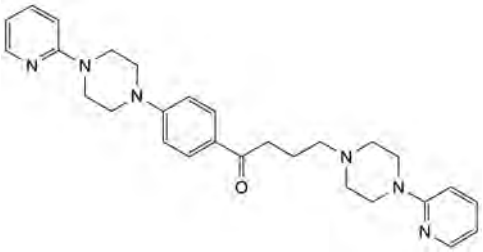
Protected from light.

IMPURITIES

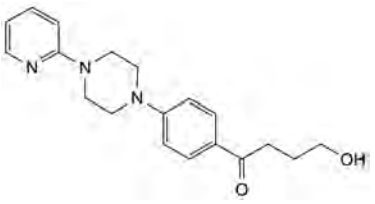
*Specified impurities: A, B, C.*



A. 1-(2-fluorophenyl)-4-[4-(pyridin-2-yl)piperazin-1-yl]butan-1-one,



B. 4-[4-(pyridin-2-yl)piperazin-1-yl]-1-[4-[4-(pyridin-2-yl)piperazin-1-yl]phenyl]butan-1-one,



C. 4-hydroxy-1-[4-[4-(pyridin-2-yl)piperazin-1-yl]phenyl]butan-1-one.

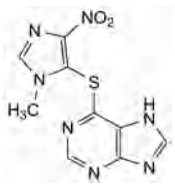
**corrected 7.0**

# AZATHIOPRINE

## Azathioprinum



$C_9H_7N_7O_2S$ $M_r$ 277.3
[446-86-6]

DEFINITION

6-[(1-Methyl-4-nitro-1*H*-imidazol-5-yl)sulfanyl]-7*H*-purine.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: pale-yellow powder.

*Solubility*: practically insoluble in water and in ethanol (96 per cent). It is soluble in dilute solutions of alkali hydroxides and sparingly soluble in dilute mineral acids.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *azathioprine CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*. 2.76 g/L solution of *sodium dihydrogen phosphate monohydrate R* adjusted to pH 2.5 with *phosphoric acid R*.

*Test solution.* Dissolve 10 mg of the substance to be examined in 35 mL of a 0.8 g/L solution of *sodium hydroxide R* and dilute to 100.0 mL with solution A.

*Reference solution (a).* Dissolve 5 mg of *azathioprine impurity A CRS* and 5 mg of *mercaptopurine R* (impurity B) in 8.75 mL of a 0.8 g/L solution of *sodium hydroxide R* and dilute to 25.0 mL with solution A. To 1.0 mL of this solution, add 35 mL of a 0.8 g/L solution of *sodium hydroxide R* and dilute to 100.0 mL with solution A.

*Reference solution (b).* Dissolve 2.5 mg of *azathioprine impurity G CRS* and 2.5 mg of the substance to be examined in 8.8 mL of a 0.8 g/L solution of *sodium hydroxide R* and dilute to 25.0 mL with solution A. To 1.0 mL of this solution, add 17.5 mL of a 0.8 g/L solution of *sodium hydroxide R* and dilute to 50.0 mL with solution A.

*Reference solution (c).* Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *phenylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *methanol R*, solution A (5:95 *V/V*);
- *mobile phase B*: solution A, *methanol R* (40:60 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 15 | 100 → 0 | 0 → 100 |
| 15 - 20 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A and B. Use the chromatogram obtained with reference solution (b) to identify the peak due to impurity G.

*Relative retention* with reference to azathioprine (retention time = about 15 min): impurity A = about 0.3; impurity B = about 0.4; impurity G = about 0.97.

*System suitability*:

- *resolution*: minimum 2.0 between the peaks due to impurities A and B in the chromatogram obtained with reference solution (a); minimum 2.0 between the peaks due to impurity G and azathioprine in the chromatogram obtained with reference solution (b).

*Limits*:

- *impurities A, B*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.15 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 mL of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M tetrabutylammonium hydroxide* is equivalent to 27.73 mg of $C_9H_7N_7O_2S$.

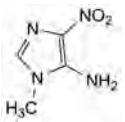
STORAGE

Protected from light.

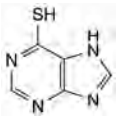
IMPURITIES

*Specified impurities: A, B.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, F, G.*



A. 1-methyl-4-nitro-1*H*-imidazol-5-amine,



B. 7*H*-purine-6-thiol (mercaptopurine),
