– *disregard limit for any other impurity*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

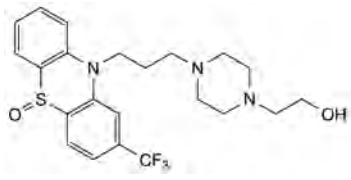
Dissolve 0.250 g in 30 mL of *glacial acetic acid R*. Using 0.05 mL of *crystal violet solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from violet to green.

1 mL of *0.1 M perchloric acid* is equivalent to 29.59 mg of $C_{32}H_{44}F_3N_3O_2S$.

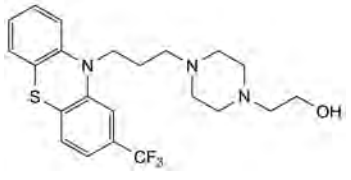
STORAGE

Protected from light.

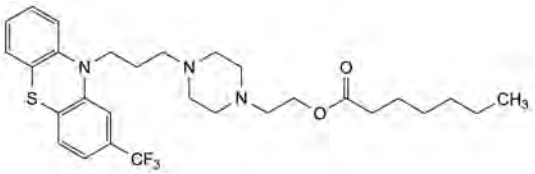
IMPURITIES



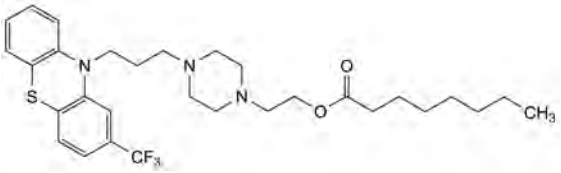
A. fluphenazine *S*-oxide,



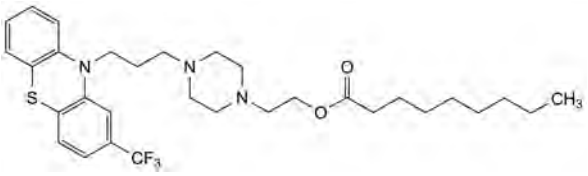
B. fluphenazine,



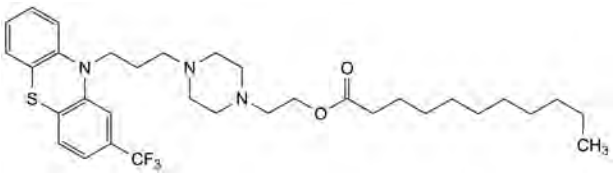
C. fluphenazine enantate,



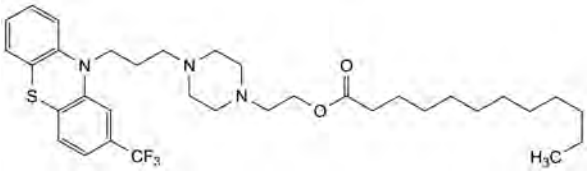
D. fluphenazine octanoate,



E. fluphenazine nonanoate,



F. fluphenazine undecanoate,

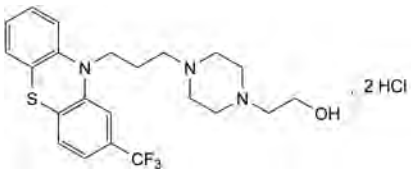


G. fluphenazine dodecanoate.

**01/2017:0904**

# FLUPHENAZINE DIHYDROCHLORIDE

## Fluphenazini dihydrochloridum



$C_{22}H_{28}Cl_2F_3N_3OS$ $M_r$ 510.4
[146-56-5]

DEFINITION

2-[4-[3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]-propyl]piperazin-1-yl]ethanol dihydrochloride.

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, slightly soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 2.0 mL of the solution to 100.0 mL with *methanol R*.

*Spectral range*: 230-350 nm.

*Absorption maxima*: at 260 nm and at about 310 nm (broad band).

*Specific absorbance at the absorption maximum at 260 nm*: 630 to 700.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fluphenazine dihydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 10 mg of *fluphenazine dihydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 5 mg of *perphenazine CRS* in reference solution (a) and dilute to 5 mL with reference solution (a).

*Plate*: *TLC octadecylsilyl silica gel $F_{254}$ plate R.*

*Mobile phase*: *concentrated ammonia R1*, *water R*, *methanol R* (1:4:95 *V/V/V*).

*Application*: 2 µL.

*Development*: over 2/3 of the plate.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**pH** (*2.2.3*): 1.9 to 2.4.

Dissolve 0.5 g in 10 mL of *water R*.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

*Solution A*: mix 4 mL of *acetic acid R* and 996 mL of a 4.33 g/L solution of *sodium octanesulfonate R*.

*Test solution.* Dissolve 25.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 5.0 mL of this solution to 25.0 mL with mobile phase A.

*Reference solution (b).* Dissolve the contents of a vial of *fluphenazine impurity mixture CRS* (impurities A, B, C and D) in 5 mL of the test solution and sonicate for 1 min. Mix 1.0 mL of this solution and 1.0 mL of the test solution.

*Reference solution (c).* Dissolve 5.0 mg of *fluphenazine sulfoxide CRS* (impurity A) in mobile phase A and dilute to 50.0 mL with mobile phase A. Dilute 1.0 mL of the solution to 100.0 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: *acetic acid R*, *methanol R*, *acetonitrile R*, solution A (0.2:15:40:45 *V/V/V/V*);
– *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 100 | 0 |
| 15 - 35 | 100 → 30 | 0 → 70 |
| 35 - 50 | 30 | 70 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 260 nm and at 274 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *fluphenazine impurity mixture CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C and D.

*Relative retention* with reference to fluphenazine (retention time = about 19 min): impurity A = about 0.2; impurity B = about 0.3; impurity D = about 2.0; impurity C = about 2.1.

*System suitability*: reference solution (b):

– *resolution at 274 nm*: minimum 2.5 between the peaks due to impurities A and B.

*Limits*:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.3; impurity C = 0.6;
– *impurity A at 274 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
– *impurity B at 274 nm*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *impurities C, D at 260 nm*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *unspecified impurities at 260 nm*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *sum of the impurities other than A and B at 260 nm and impurities A and B at 274 nm*: not more than 1.0 per cent;
– *disregard limit at 260 nm*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 65 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

*In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.*

Dissolve 0.220 g in a mixture of 10 mL of *anhydrous formic acid R* and 40 mL of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 25.52 mg of $C_{22}H_{28}Cl_2F_3N_3OS$.

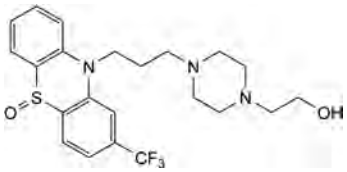
STORAGE

Protected from light.

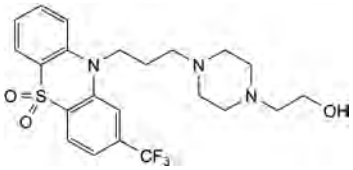
IMPURITIES

*Specified impurities*: *A, B, C, D.*

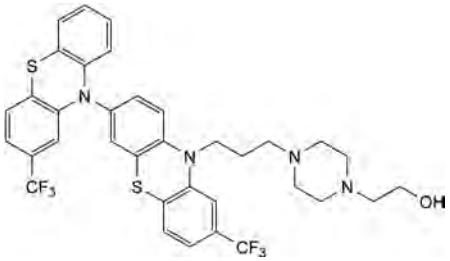
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F.*



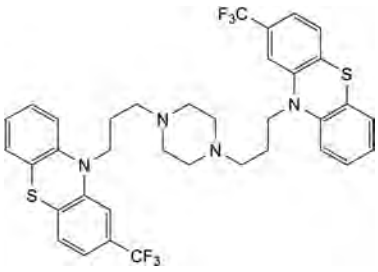
A. 2-[4-[3-[5-oxo-2-(trifluoromethyl)-10*H*-5λ⁴-phenothiazin-10-yl]propyl]piperazin-1-yl]ethanol (fluphenazine *S*-oxide),



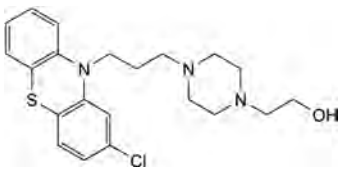
B. 2-[4-[3-[5,5-dioxo-2-(trifluoromethyl)-10*H*-5λ⁶-phenothiazin-10-yl]propyl]piperazin-1-yl]ethanol (fluphenazine *S,S*-dioxide),



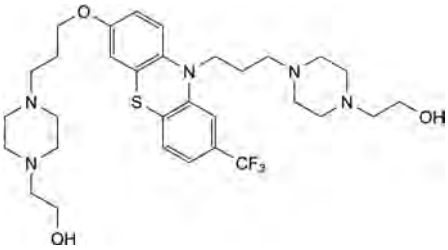
C. 2-[4-[3-[2′,8-bis(trifluoromethyl)-10*H*-3,10′-biphenothiazin-10-yl]propyl]piperazin-1-yl]ethanol,



D. 10,10′-[piperazine-1,4-diylbis(propane-3,1-diyl)]bis[2-(trifluoromethyl)-10*H*-phenothiazine],



E. 2-[4-[3-[2-chloro-10*H*-phenothiazin-10-yl]propyl]-piperazin-1-yl]ethanol (perphenazine),

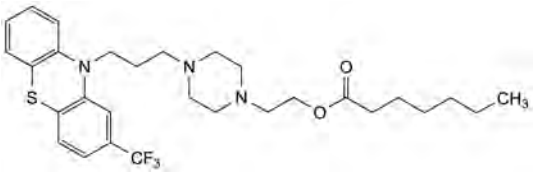


F. 2-[4-[3-[7-[3-[4-(2-hydroxyethyl)piperazin-1-yl]propoxy]-2-(trifluoromethyl)-10*H*-phenothiazin-10-yl]propyl]-piperazin-1-yl)ethanol.

**01/2017:1015**

# FLUPHENAZINE ENANTATE

## Fluphenazini enantas



$C_{29}H_{38}F_3N_3O_2S$ $M_r$ 549.7
[2746-81-8]

DEFINITION

2-[4-[3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]propyl]piperazin-1-yl]ethyl heptanoate.

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: pale yellow, viscous liquid or yellow solid.

*Solubility*: practically insoluble in water, very soluble in ethanol and in methylene chloride, freely soluble in methanol.

IDENTIFICATION

*First identification: B, C.*

*Second identification: A, C.*

A. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL to 50.0 mL with *methanol R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 260 nm and a broad absorption maximum at about 310 nm. The specific absorbance at the maximum at 260 nm is 610 to 670.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: apply 50 µL of a 25 g/L solution in *methylene chloride R* to a disc of *potassium bromide R*. Dry the discs at 60 °C for 1 h before use.

*Comparison*: *fluphenazine enantate CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (a)*. Dissolve 10 mg of *fluphenazine enantate CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (b)*. Dissolve 5 mg of *fluphenazine decanoate CRS* in reference solution (a) and dilute to 5 mL with the same solution.

*Plate*: *TLC octadecylsilyl silica gel $F_{254}$ plate R.*

*Mobile phase*: *concentrated ammonia R1*, *water R*, *methanol R* (1:4:95 *V/V/V*).

*Application*: 2 µL.

*Development*: over a path of 8 cm.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

*Test solution.* Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a).* Dissolve 5 mg of *fluphenazine octanoate CRS* and 5 mg of *fluphenazine enantate CRS* in *acetonitrile R* and dilute to 50 mL with the same solvent.

*Reference solution (b).* Dilute 5.0 mL of the test solution to 100.0 mL with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B. Dilute 1.0 mL of this solution to 10.0 mL with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B.

*Reference solution (c).* Dissolve 5.0 mg of *fluphenazine sulfoxide CRS* in *acetonitrile R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL to 50.0 mL with *acetonitrile R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: 10 g/L solution of *ammonium carbonate R* adjusted to pH 7.5 with *dilute hydrochloric acid R*,
– *mobile phase B*: mobile phase A, *acetonitrile R*, *methanol R* (7.5:45:45 *V/V/V*),

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 7 | 20 | 80 |
| 7 - 17 | 20 → 0 | 80 → 100 |
| 17 - 80 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 260 nm.

*Injection*: 10 µL.

*Relative retention* with reference to fluphenazine enantate (retention time = about 25 min): impurity A = about 0.2; impurity D = about 1.1.

*System suitability*: reference solution (a):

– *resolution*: minimum 6 between the peaks due to fluphenazine enantate and impurity D.

*Limits*:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
– *total*: not more than 1.6 per cent,
– *disregard limit for any other impurity*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

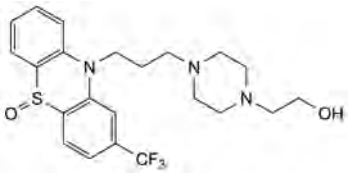
Dissolve 0.250 g in 30 mL of *glacial acetic acid R*. Using 0.05 mL of *crystal violet solution R* as indicator titrate with *0.1 M perchloric acid* until the colour changes from violet to green.

1 mL of *0.1 M perchloric acid* is equivalent to 27.49 mg of $C_{29}H_{38}F_3N_3O_2S$.

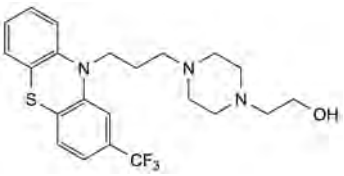
STORAGE

Protected from light.

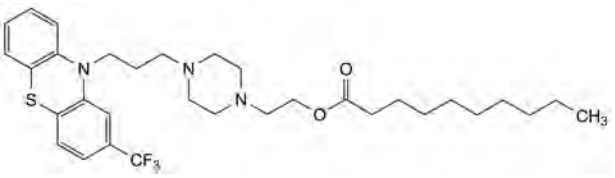
IMPURITIES



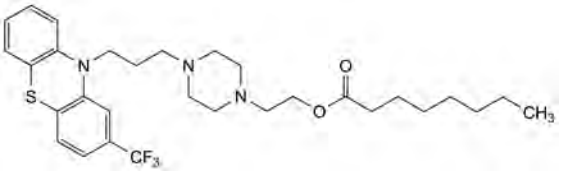
A. fluphenazine *S*-oxide,



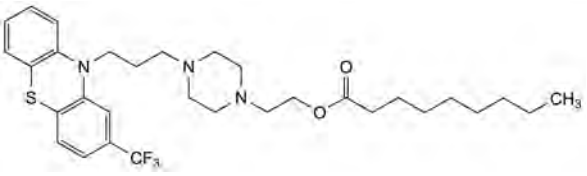
B. fluphenazine,



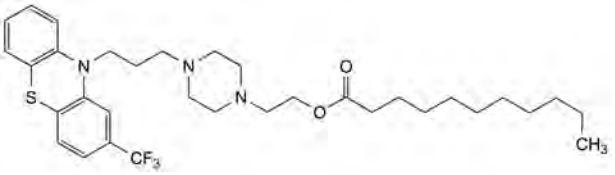
C. fluphenazine decanoate,



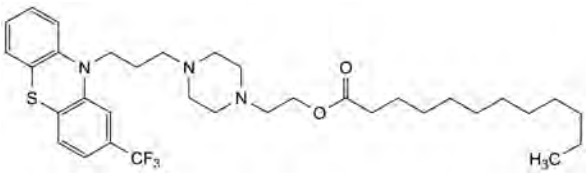
D. fluphenazine octanoate,



E. fluphenazine nonanoate,



F. fluphenazine undecanoate,

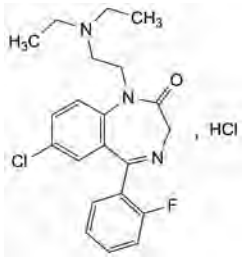


G. fluphenazine dodecanoate.

**01/2008:0905**
**corrected 6.0**

# FLURAZEPAM MONOHYDROCHLORIDE

## Flurazepami monohydrochloridum



$C_{21}H_{24}Cl_2FN_3O$ $M_r$ 424.3
[36105-20-1]

DEFINITION

7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one monohydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very soluble in water, freely soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *Ph. Eur. reference spectrum of flurazepam monohydrochloride.*

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**pH** (*2.2.3*): 5.0 to 6.0.

Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 50.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 5 mg of the substance to be examined and 5 mg of *oxazepam R* in 10 mL of *acetonitrile R* and dilute to 50.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 350 volumes of *acetonitrile R* and 650 volumes of a 10.5 g/L solution of *potassium dihydrogen phosphate R* and ajust to pH 6.1 with a 40 g/L solution of *sodium hydroxide R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 239 nm.

*Injection*: 20 µL.

Run time: 6 times the retention time of flurazepam.

*Relative retention* with reference to flurazepam (retention time = about 7 min): impurity C = about 1.5; impurity B = about 1.9; impurity A = about 2.4.

*System suitability*: reference solution (b):

– *resolution*: minimum of 4.5 between the peaks due to flurazepam and to oxazepam.

*Limits*:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.61; impurity C = 0.65,
– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Fluorides** (*2.4.5*): maximum 500 ppm.

0.10 g complies with the limit test for fluorides.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

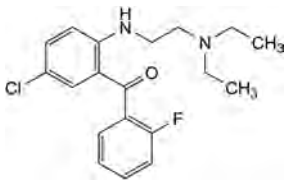
Dissolve 0.350 g in a mixture of 1.0 mL of *0.1 M hydrochloric acid* and 50 mL of *alcohol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 42.43 mg of $C_{21}H_{24}Cl_2FN_3O$.

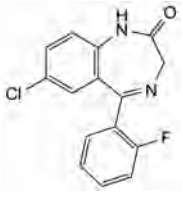
STORAGE

Protected from light.

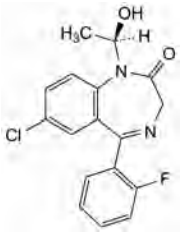
IMPURITIES



A. [5-chloro-2-[[2-(diethylamino)ethyl]amino]phenyl](2-fluorophenyl)methanone,



B. 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

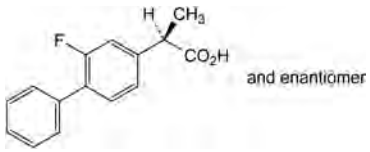


C. 7-chloro-5-(2-fluorophenyl)-1-[(1*RS*)-1-hydroxyethyl]-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

**01/2017:1519**

# FLURBIPROFEN

## Flurbiprofenum



$C_{15}H_{13}FO_2$ $M_r$ 244.3
[5104-49-4]

DEFINITION

(2*RS*)-2-(2-Fluorobiphenyl-4-yl)propanoic acid.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride. It dissolves in aqueous solutions of alkali hydroxides and carbonates.

IDENTIFICATION

*First identification: C, D.*

*Second identification: A, B, D.*

A. Melting point (*2.2.14*): 114 °C to 117 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution*. Dissolve 0.10 g in *0.1 M sodium hydroxide* and dilute to 100.0 mL with the same alkaline solution. Dilute 1.0 mL of this solution to 100.0 mL with *0.1 M sodium hydroxide*.

*Spectral range*: 230-350 nm.

*Absorption maximum*: at 247 nm.

*Specific absorbance at the absorption maximum*: 780 to 820.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *flurbiprofen CRS*.

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 mL of *water R*, 0.05 mL of *phenolphthalein solution R1* and about 1 mL of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 mL of *alizarin S solution R* and 0.1 mL of *zirconyl nitrate solution R* add 1.0 mL of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method I*).

Dissolve 1.0 g in *methanol R* and dilute to 10 mL with the same solvent.

**Optical rotation** (*2.2.7*): − 0.1° to + 0.1°.

Dissolve 0.50 g in *methanol R* and dilute to 20.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (45:55 *V/V*).

*Test solution*. Dissolve 0.20 g of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 50.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 10.0 mg of *flurbiprofen impurity A CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture. Dilute 10.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with reference solution (b).

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *glacial acetic acid R*, *acetonitrile R*, *water R* (5:35:60 *V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of flurbiprofen.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity A and flurbiprofen.

*Limits*:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *impurities B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *sum of impurities other than A*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

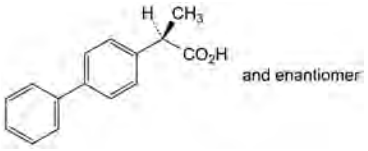
ASSAY

Dissolve 0.200 g in 50 mL of *ethanol (96 per cent) R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

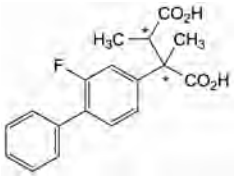
1 mL of *0.1 M sodium hydroxide* is equivalent to 24.43 mg of $C_{15}H_{13}FO_2$.

IMPURITIES

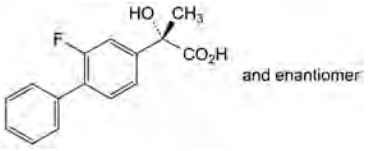
*Specified impurities*: *A, B, C, D, E.*



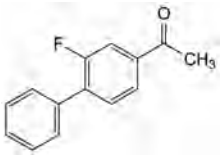
A. (2*RS*)-2-(biphenyl-4-yl)propanoic acid,



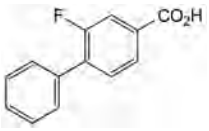
B. 2-(2-fluorobiphenyl-4-yl)-2,3-dimethylbutanedioic acid,



C. (2*RS*)-2-(2-fluorobiphenyl-4-yl)-2-hydroxypropanoic acid,



D. 1-(2-fluorobiphenyl-4-yl)ethanone,

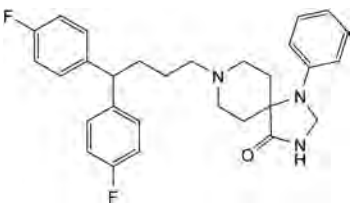


E. 2-fluorobiphenyl-4-carboxylic acid.

**01/2011:1723**

# FLUSPIRILENE

## Fluspirilenum



$C_{29}H_{31}F_2N_3O$ $M_r$ 475.6
[1841-19-6]

DEFINITION

8-[4,4-bis(4-Fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, soluble in methylene chloride, slightly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fluspirilene CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, gently evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.25 g in 25 mL of *methylene chloride R*.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 5.0 mg of *fluspirilene impurity C CRS* in *dimethylformamide R*, add 0.5 mL of the test solution and dilute to 100.0 mL with *dimethylformamide R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 20.0 mL with *dimethylformamide R*. Dilute 1.0 mL of this solution to 25.0 mL with *dimethylformamide R*.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

- *mobile phase A*: 13.6 g/L solution of *tetrabutylammonium hydrogen sulfate R*,
- *mobile phase B*: *acetonitrile R*,

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 75 → 70 | 25 → 30 |
| 15 - 20 | 70 | 30 |
| 20 - 22 | 70 → 0 | 30 → 100 |
| 22 - 30 | 0 | 100 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 250 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity C.

*Relative retention* with reference to fluspirilene (retention time = about 15 min): impurity A = about 0.8; impurity B = about 0.93; impurity C = about 0.97.

*System suitability*: reference solution (a):

- *resolution*: minimum 2.2 between the peaks due to impurity C and fluspirilene.

*Limits*:

- *impurities A, B, C*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.350 g in 50 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

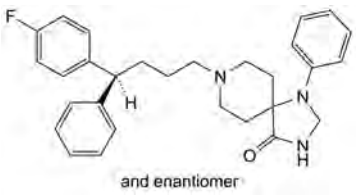
1 mL of *0.1 M perchloric acid* is equivalent to 47.56 mg of $C_{29}H_{31}F_2N_3O$.

STORAGE

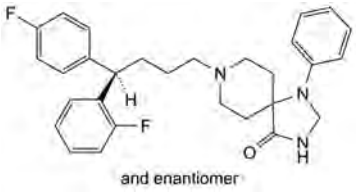
Protected from light.

IMPURITIES

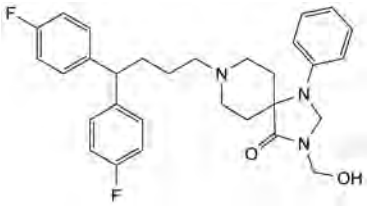
*Specified impurities: A, B, C.*



A. 8-[(4*RS*)-4-(4-fluorophenyl)-4-phenylbutyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one,



B. 8-[(4*RS*)-4-(2-fluorophenyl)-4-(4-fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one,

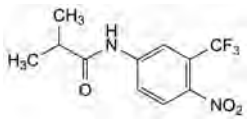


C. 8-[4,4-bis(4-fluorophenyl)butyl]-3-(hydroxymethyl)-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one.

**01/2017:1423**

# FLUTAMIDE

## Flutamidum



$C_{11}H_{11}F_3N_2O_3$ $M_r$ 276.2
[13311-84-7]

DEFINITION

2-Methyl-*N*-[4-nitro-3-(trifluoromethyl)phenyl]propanamide.

*Content*: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: pale yellow, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in acetone and in ethanol (96 per cent), practically insoluble in heptane.

mp: about 112 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *flutamide CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 mL with the mobile phase.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 10.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 5.0 mg of *flutamide for system suitability CRS* (containing impurities A, B and C) in the mobile phase and dilute to 5.0 mL with the mobile phase.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 20.0 mg of *flutamide CRS* in the mobile phase and dilute to 20.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *acetonitrile R*, *water R* (50:50 *V/V*).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (b).

*Run time*: 1.5 times the retention time of flutamide.

*Identification of impurities*: use the chromatogram supplied with *flutamide for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B and C.

*Relative retention* with reference to flutamide (retention time = about 19 min): impurity B = about 0.5; impurity A = about 0.6; impurity C = about 0.7.

*System suitability*: reference solution (a):

- *resolution*: minimum 2.0 between the peaks due to impurities B and A.

*Calculation of percentage contents*:

- for each impurity, use the concentration of flutamide in reference solution (b).

*Limits*:

- *impurities A, B, C*: for each impurity, maximum 0.2 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (b) and reference solution (c).

Calculate the percentage content of $C_{11}H_{11}F_3N_2O_3$ taking into account the assigned content of *flutamide CRS*.

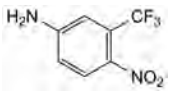
STORAGE

Protected from light.

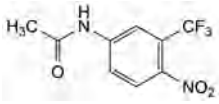
IMPURITIES

*Specified impurities: A, B, C.*

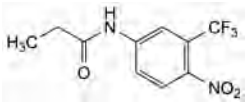
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, E, F.*



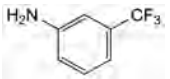
A. 4-nitro-3-(trifluoromethyl)aniline,



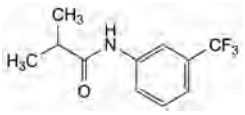
B. *N*-[4-nitro-3-(trifluoromethyl)phenyl]acetamide,



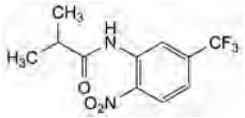
C. *N*-[4-nitro-3-(trifluoromethyl)phenyl]propanamide,



D. 3-(trifluoromethyl)aniline,



E. 2-methyl-*N*-[3-(trifluoromethyl)phenyl]propanamide,

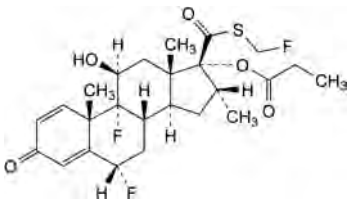


F. 2-methyl-*N*-[2-nitro-5-(trifluoromethyl)-phenyl]propanamide.

**01/2016:1750**

# FLUTICASONE PROPIONATE

## Fluticasoni propionas



$C_{25}H_{31}F_3O_5S$ $M_r$ 500.6
[80474-14-2]

DEFINITION

6α,9-Difluoro-17-[[(fluoromethyl)sulfanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fluticasone propionate CRS*.

TESTS

**Specific optical rotation** (*2.2.7*): + 32 to + 36 (anhydrous substance).

Dissolve 0.25 g in *methylene chloride R* and dilute to 50.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Solvent mixture*: mobile phase A, mobile phase B (50:50 *V/V*).

*Test solution.* Dissolve 20 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 1 mg of *fluticasone impurity D CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 25.0 mL with the test solution.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 20.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 2 mg of *fluticasone propionate for impurity G identification CRS* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (d).* Dissolve 2 mg of *fluticasone propionate for impurity C identification CRS* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: solution containing 0.05 per cent *V/V* of *phosphoric acid R* and 3.0 per cent *V/V* of *methanol R* in *water R*;
- *mobile phase B*: solution containing 0.05 per cent *V/V* of *phosphoric acid R* and 3.0 per cent *V/V* of *methanol R* in *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 57 | 43 |
| 2 - 42 | 57 → 45 | 43 → 55 |
| 42 - 62 | 45 → 10 | 55 → 90 |
| 62 - 72 | 10 | 90 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 239 nm.

*Injection*: 50 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity D; use the chromatogram supplied with *fluticasone propionate for impurity G identification CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity G; use the chromatogram supplied with *fluticasone propionate for impurity C identification CRS* and the chromatogram obtained with reference solution (d) to identify the peak due to impurity C.

*Relative retention* with reference to fluticasone propionate (retention time = about 32 min): impurity C = about 0.8; impurity D = about 0.95; impurity G = about 1.3.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurity D and fluticasone propionate.

*Limits*:

– *impurities D, G*: for each impurity, maximum 0.3 per cent;
– *impurity C*: maximum 0.2 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.8 per cent;
– *reporting threshold*: 0.05 per cent (reference solution (b)).

**Acetone**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dilute 0.5 mL of *tetrahydrofuran R* to 1000 mL with *dimethylformamide R*.

*Test solution.* Dissolve 0.50 g of the substance to be examined in the internal standard solution and dilute to 10.0 mL with the internal standard solution.

*Reference solution.* Dilute 0.40 g of *acetone R* to 100.0 mL with the internal standard solution. Dilute 1.0 mL of this solution to 10.0 mL with the internal standard solution.

*Column*:

– *material*: fused silica;
– *size*: *l* = 25 m, Ø = 0.53 mm;
– *stationary phase*: cross-linked *macrogol 20 000 R* (film thickness 2 µm).

*Carrier gas*: *nitrogen for chromatography R*.

*Flow rate*: 5.5 mL/min.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3.5 | 60 |
| | 3.5 - 7.5 | 60 → 180 |
| | 7.5 - 10.5 | 180 |
| Injection port | | 150 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 0.1 µL.

*Limit*:

– *acetone*: maximum 1.0 per cent *m/m*.

**Water** (*2.5.32*): maximum 0.5 per cent, determined on 0.100 g using the evaporation technique:

– *temperature*: 160 °C;
– *heating time*: 3 min.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve, using sonication, 20.0 mg of the substance to be examined in the mobile phase and dilute to 200.0 mL with the mobile phase. Dilute 4.0 mL of the solution to 10.0 mL with the mobile phase.

*Reference solution (a).* Dissolve, using sonication, 20.0 mg of *fluticasone propionate CRS* in the mobile phase and dilute to 200.0 mL with the mobile phase.

*Reference solution (b).* Dilute 4.0 mL of reference solution (a) to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 1 mg of *fluticasone impurity D CRS* in the mobile phase and dilute to 25.0 mL with the mobile phase. To 1.0 mL of the solution add 2.0 mL of reference solution (a) and dilute to 5.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*: mix 15 volumes of *acetonitrile R*, 35 volumes of a 1.15 g/L solution of *ammonium dihydrogen phosphate R* adjusted to pH 3.5 and 50 volumes of *methanol R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 239 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: twice the retention time of fluticasone propionate.

*Relative retention* with reference to fluticasone propionate (retention time = about 6 min): impurity D = about 1.1.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to fluticasone propionate and impurity D; if necessary, adjust the ratio of acetonitrile to methanol in the mobile phase.

Calculate the percentage content of $C_{25}H_{31}F_3O_5S$ using the chromatogram obtained with reference solution (b) and taking into account the assigned content of *fluticasone propionate CRS*.

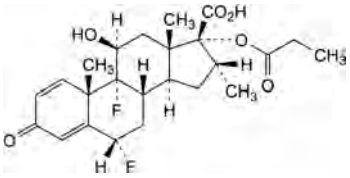
STORAGE

Protected from light.

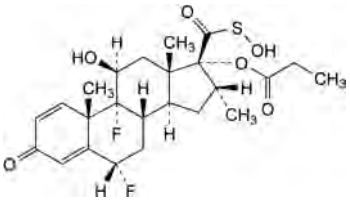
IMPURITIES

*Specified impurities: C, D, G.*

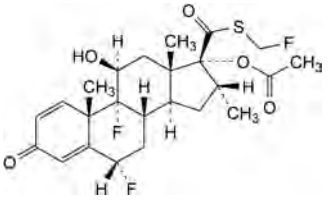
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, E, F, H, I.*



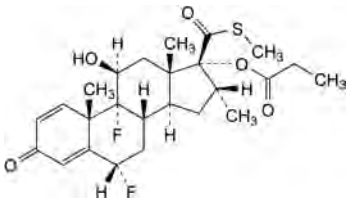
A. 6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxo-17-(propanoyloxy)androsta-1,4-diene-17β-carboxylic acid,



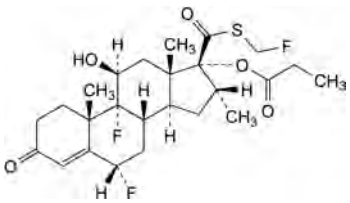
B. 6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxo-17-(propanoyloxy)androsta-1,4-dien-17β-carbo(thioperoxoic) *SO*-acid,



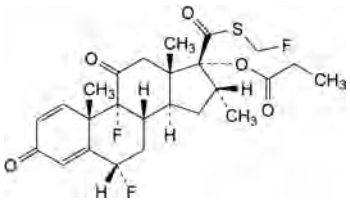
C. 6α,9-difluoro-17-[[(fluoromethyl)sulfanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl acetate,



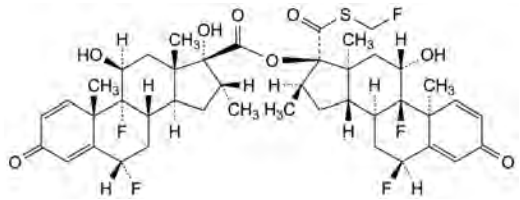
D. 6α,9-difluoro-11β-hydroxy-16α-methyl-17-[(methylsulfanyl)carbonyl]-3-oxoandrosta-1,4-dien-17α-yl propanoate,



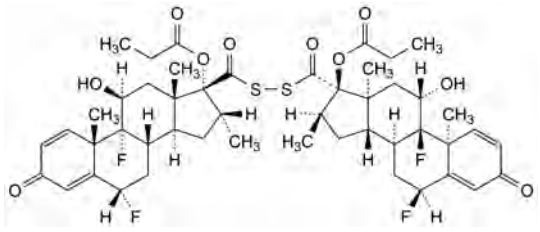
E. 6α,9-difluoro-17-[[(fluoromethyl)sulfanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrost-4-en-17α-yl propanoate,



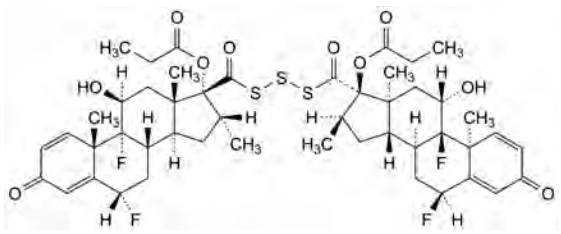
F. 6α,9-difluoro-17-[[(fluoromethyl)sulfanyl]carbonyl]-16α-methyl-3,11-dioxoandrosta-1,4-dien-17α-yl propanoate,



G. 6α,9-difluoro-17-[[(fluoromethyl)sulfanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl 6α,9-difluoro-11β,17-dihydroxy-16α-methyl-3-oxoandrosta-1,4-diene-17β-carboxylate,



H. 17,17′-(disulfanediyldicarbonyl)bis(6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl) dipropanoate,

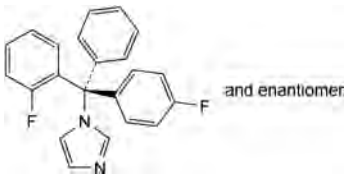


I. 17,17′-(trisulfanediyldicarbonyl)bis(6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl) dipropanoate.

**01/2017:1424**

# FLUTRIMAZOLE

## Flutrimazolum



$C_{22}H_{16}F_2N_2$ $M_r$ 346.4
[119006-77-8]

DEFINITION

(*RS*)-1-[(2-Fluorophenyl)(4-fluorophenyl)phenylmethyl]-1*H*-imidazole.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in tetrahydrofuran, soluble in methanol.

IDENTIFICATION

*First identification*: B.

*Second identification*: A, C, D.

A. Melting point (*2.2.14*): 161 °C to 166 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Preparation*: discs.
*Comparison*: *flutrimazole CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 20 mg of the substance to be examined in *acetone R* and dilute to 10 mL with the same solvent.
*Reference solution (a).* Dissolve 20 mg of *flutrimazole CRS* in *acetone R* and dilute to 10 mL with the same solvent.
*Reference solution (b).* Dissolve 20 mg of *flutrimazole CRS* and 10 mg of *metronidazole benzoate CRS* in *acetone R* and dilute to 10 mL with the same solvent.
*Plate*: *TLC silica gel $F_{254}$ plate R.*
*Pretreatment*: heat the plate at 110 °C for 1 h.
*Mobile phase*: *2-propanol R*, *ethyl acetate R* (10:90 *V/V*).
*Application*: 10 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: examine in ultraviolet light at 254 nm.
*System suitability*: reference solution (b):
– the chromatogram shows 2 clearly separated spots.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 mL of *water R*, 0.05 mL of *phenolphthalein solution R1* and about 1 mL of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 mL of the filtrate to a freshly prepared mixture of 0.1 mL of *alizarin S solution R* and 0.1 mL of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

**Solution S**. Dissolve 1.00 g in *methanol R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): – 0.05° to + 0.05°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 25.0 mg of *imidazole CRS* (impurity A) in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 10.0 mL of this solution to 50.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 30.0 mg of *flutrimazole impurity B CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (c).* Mix 2.0 mL of reference solution (a) and 2.0 mL of reference solution (b) and dilute to 50.0 mL with the mobile phase.

*Reference solution (d).* Dilute 10.0 mL of reference solution (c) to 50.0 mL with the mobile phase.

*Reference solution (e).* Mix 2.0 mL of the test solution and 10.0 mL of reference solution (c) and dilute to 50.0 mL with the mobile phase.

*Reference solution (f).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.2 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *0.03 M phosphate buffer solution pH 7.0 R*, *acetonitrile R* (40:60 *V/V*).

*Flow rate*: 1.3 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Run time*: 2.5 times the retention time of flutrimazole.

*System suitability*: reference solution (e):

– *resolution*: minimum 2.0 between the peaks due to impurity A (1st peak) and impurity B (2nd peak); minimum 1.5 between the peaks due to impurity B and flutrimazole (3rd peak);
– *symmetry factors*: maximum 2.0 for the peaks due to impurities A and B.

*Limits*:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.1 per cent);
– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.3 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.10 per cent);
– *sum of impurities other than B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (f) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (f) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 34.64 mg of $C_{22}H_{16}F_2N_2$.

STORAGE

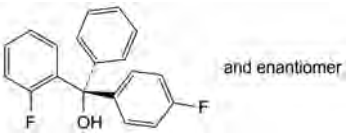
Protected from light.

IMPURITIES

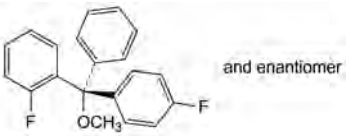
*Specified impurities*: *A, B.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C.*

A. imidazole,



B. (*RS*)-(2-fluorophenyl)(4-fluorophenyl)phenylmethanol,

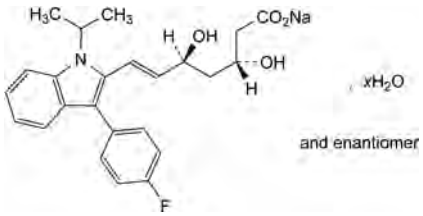


C. (*RS*)-(2-fluorophenyl)(4-fluorophenyl)methoxyphenylmethane.

**01/2017:2333**

# FLUVASTATIN SODIUM

## Fluvastatinum natricum



$C_{24}H_{25}FNNaO_4,xH_2O$ $M_r$ 433.5 (anhydrous substance)
Anhydrous fluvastatin sodium: [93957-55-2]

DEFINITION

Sodium (3*RS*,5*SR*,6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3,5-dihydroxyhept-6-enoate.

*Content*: 98.5 per cent to 101.5 per cent (anhydrous substance).

It may be anhydrous or contain a variable quantity of water.

CHARACTERS

*Appearance*: white or almost white, or pale yellow or pale reddish-yellow, very hygroscopic, amorphous or crystalline powder.

*Solubility*: soluble in water, freely soluble in methanol, practically insoluble in acetonitrile.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fluvastatin sodium CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness on a steam bath, protecting the solutions from light, and dry at 105 °C for 30 min. Cool and keep in a desiccator. Record new spectra using the residues.

B. 0.5 mL of solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**pH** (*2.2.3*): 8.0 to 10.0 for solution S.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Test solution*. Dissolve 25 mg of the substance to be examined in 20 mL of mobile phase B and dilute to 50.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 10.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 50.0 mL with mobile phase A.

*Reference solution (b)*. Dissolve the contents of a vial of *fluvastatin for system suitability CRS* (containing impurities A, B and D) in 1.0 mL of a mixture of equal volumes of mobile phase A and mobile phase B.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: to 880 mL of *water R* add 20 mL of a 250 g/L solution of *tetramethylammonium hydroxide R* and adjust quickly to pH 7.2 with *phosphoric acid R*; mix with 100 mL of a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *methanol R*;
- *mobile phase B*: to 80 mL of *water R* add 20 mL of a 250 g/L solution of *tetramethylammonium hydroxide R* and adjust quickly to pH 7.2 with *phosphoric acid R*; mix with 900 mL of a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 70 | 30 |
| 3 - 23 | 70 → 10 | 30 → 90 |
| 23 - 28 | 10 | 90 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 305 nm and at 365 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *fluvastatin for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B and D.

*Relative retention* with reference to fluvastatin (retention time = about 14 min): impurity A = about 1.05; impurity D = about 1.1; impurity B = about 1.6.

*System suitability*: reference solution (b) at 305 nm:

- *peak-to-valley ratio*: minimum 5, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to fluvastatin.

*Limits*:

- *impurity A at 305 nm*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent);
- *impurity B at 305 nm*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurity D at 365 nm*: not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) at 305 nm (0.15 per cent);
- *unspecified impurities at 305 nm*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *sum of impurities at 305 nm*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *disregard limit at 305 nm*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.12*): maximum 12.0 per cent, determined on 0.200 g.

ASSAY

Dissolve 0.325 g in 50 mL of *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 43.35 mg of $C_{24}H_{25}FNNaO_4$.

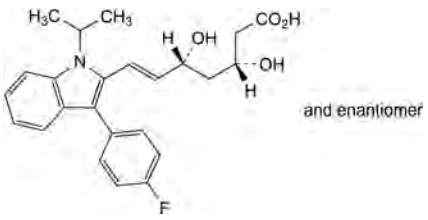
STORAGE

In an airtight container, protected from light.

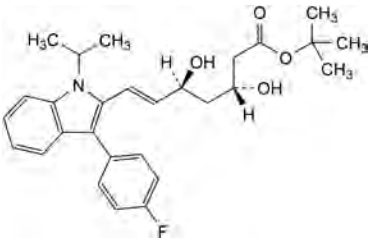
IMPURITIES

*Specified impurities: A, B, D.*

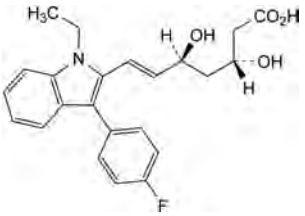
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E, F, G.*



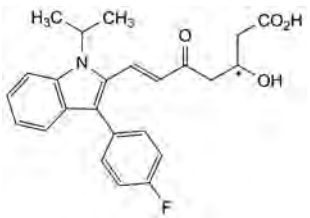
A. (3*RS*,5*RS*,6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3,5-dihydroxyhept-6-enoic acid,



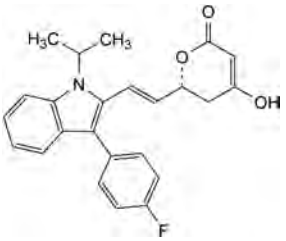
B. 1,1-dimethylethyl (3*R*,5*S*,6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3,5-dihydroxyhept-6-enoate,



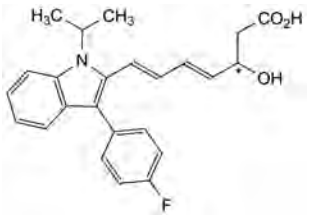
C. (3*R*,5*S*,6*E*)-7-[1-ethyl-3-(4-fluorophenyl)-1*H*-indol-2-yl]-3,5-dihydroxyhept-6-enoic acid,



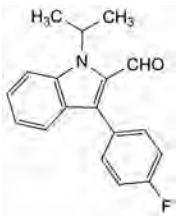
D. (6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3-hydroxy-5-oxohept-6-enoic acid,



E. (6*R*)-6-[(*E*)-2-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]ethenyl]-4-hydroxy-5,6-dihydro-2*H*-pyran-2-one,



F. (4*E*,6*E*)-7-[3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3-hydroxyhepta-4,6-dienoic acid,



G. 3-(4-fluorophenyl)-1-(1-methylethyl)-1*H*-indole-2-carbaldehyde.

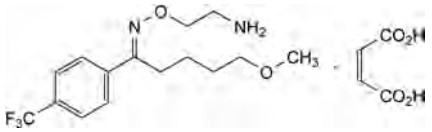
# FLUVOXAMINE MALEATE

## Fluvoxamini maleas



$C_{19}H_{25}F_3N_2O_6$ $M_r$ 434.4
[61718-82-9]

DEFINITION

2-[[[(1*E*)-5-Methoxy-1-[4-(trifluoromethyl)phenyl]pentylidene]amino]oxy]ethanamine (*Z*)-butenedioate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

PRODUCTION

The production method must be evaluated to determine the potential for formation of aziridine. Where necessary, a validated test for the substance is carried out or the production method is validated to demonstrate acceptable clearance.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: sparingly soluble in water, freely soluble in ethanol (96 per cent) and in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fluvoxamine maleate CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the test solution immediately before use.*

*Test solution.* Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 25 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dissolve the contents of a vial of *fluvoxamine for system suitability CRS* (containing impurities A, B, C and F) in 1.0 mL of the mobile phase.

*Reference solution (c).* Dissolve 3.0 mg of *fluvoxamine impurity D CRS* in 5 mL of the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 370 volumes of *acetonitrile R1* and 630 volumes of a buffer solution containing 1.1 g/L of *potassium dihydrogen phosphate R* and 1.9 g/L of *sodium pentanesulfonate R* in *water R*, previously adjusted to pH 3.0 with *phosphoric acid R*.

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 234 nm.

*Injection*: 20 µL.

*Run time*: 6 times the retention time of fluvoxamine.

*Identification of impurities*: use the chromatogram supplied with *fluvoxamine for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C and F.

*Relative retention* with reference to fluvoxamine (retention time = about 15 min): maleic acid = about 0.15; impurities F and G = about 0.5; impurity C = about 0.6; impurity B = about 0.8; impurity A = about 2.5; impurity D = about 5.4.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurities F and C.

*Limits*:

- *impurity B*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *impurity C*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent);
- *sum of impurities F and G*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard the peak due to maleic acid.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

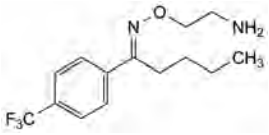
Dissolve 0.350 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 43.44 mg of $C_{19}H_{25}F_3N_2O_6$.

IMPURITIES

*Specified impurities: A, B, C, D, F, G.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, I, J.*



A. 2-[[[(1*E*)-1-[4-(trifluoromethyl)phenyl]pentylidene]-amino]oxy]ethanamine,

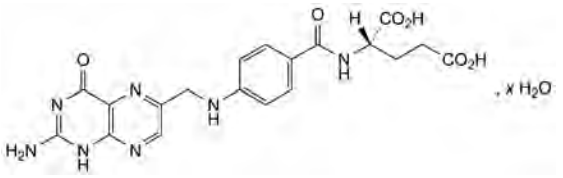
# FOLIC ACID HYDRATE

## Acidum folicum hydricum



$C_{19}H_{19}N_7O_6,xH_2O$ $M_r$ 441.4 (anhydrous substance)
Anhydrous folic acid: [59-30-3]

DEFINITION

(2*S*)-2-[4-[[(2-Amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzamido]pentanedioic acid hydrate.

*Content*: 96.0 per cent to 102.0 per cent (anhydrous substance).

It contains a variable quantity of water.

CHARACTERS

*Appearance*: yellowish or orange, crystalline powder.

*Solubility*: practically insoluble in water and in most organic solvents. It dissolves in dilute acids and in alkaline solutions.

IDENTIFICATION

*First identification*: *A, B, D.*

*Second identification*: *A, C.*

A. Specific optical rotation (*2.2.7*): + 18 to + 22 (anhydrous substance).
Dissolve 0.25 g in a 4.2 g/L solution of *sodium hydroxide R* and dilute to 25.0 mL with the same solution.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *folic acid CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 50 mg of the substance to be examined in a mixture of 2 volumes of *concentrated ammonia R* and 9 volumes of *methanol R*, and dilute to 100 mL with the same mixture of solvents.
*Reference solution*. Dissolve 50 mg of *folic acid CRS* in a mixture of 2 volumes of *concentrated ammonia R* and 9 volumes of *methanol R*, and dilute to 100 mL with the same mixture of solvents.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *concentrated ammonia R*, *propanol R*, *ethanol (96 per cent) R* (20:20:60 *V/V/V*).
*Application*: 2 µL.
*Development*: over 3/4 of the plate.
*Drying*: in air.
*Detection*: examine in ultraviolet light at 365 nm.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

D. Water (see Tests).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*: 28.6 g/L solution of *sodium carbonate R*.

*Test solution*. Dissolve 50.0 mg of the substance to be examined in 2.5 mL of solution A and dilute to 50.0 mL with the mobile phase. Dilute 2.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 50.0 mg of *folic acid CRS* in 2.5 mL of solution A and dilute to 50.0 mL with the mobile phase. Dilute 2.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 5 mg of *folic acid for system suitability CRS* (containing impurities C, E, G and H) in 1 mL of solution A and dilute to 25 mL with the mobile phase.

*Reference solution (c)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (d)*. Dissolve 10.0 mg of *folic acid impurity A CRS* in 1 mL of solution A and dilute to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (e)*. Dissolve 4.0 mg of *folic acid impurity D CRS* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (f)*. Dissolve 5 mg of *folic acid for impurity I identification CRS* in 1 mL of solution A and dilute to 25 mL with the mobile phase.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: spherical *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 12 volumes of *methanol R* and 88 volumes of a solution containing 11.16 g/L of *potassium dihydrogen phosphate R* and 5.50 g/L of *dipotassium hydrogen phosphate R*.

*Flow rate*: 0.6 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 5 µL of the test solution and reference solutions (b), (c), (d), (e) and (f).

*Run time*: 3.3 times the retention time of folic acid.

*Identification of impurities*: use the chromatogram obtained with reference solution (d) to identify the peak due to impurity A; use the chromatogram supplied with *folic acid for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities C, E, G and H; use the chromatogram obtained with reference solution (e) to identify the peak due to impurity D; use the chromatogram supplied with *folic acid for impurity I identification CRS* and the chromatogram obtained with reference solution (f) to identify the peak due to impurity I.

*Relative retention* with reference to folic acid (retention time = about 8.5 min): impurity A = about 0.5; impurity C = about 0.9; impurity E = about 1.3; impurity D = about 1.5; impurity I = about 2.15; impurity G = about 2.4; impurity H = about 2.5.

*System suitability*: reference solution (b):
- *resolution*: minimum 2.0 between the peaks due to folic acid and impurity E;
- *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to folic acid; minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity G and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity H.

*Calculation of percentage contents*:
- for impurity A, use the concentration of impurity A in reference solution (d);
- for impurity D, use the concentration of impurity D in reference solution (e);
- for impurities other than A and D, use the concentration of folic acid hydrate in reference solution (c).

*Limits*:
- *impurity A*: maximum 0.5 per cent;

- *impurity D*: maximum 0.4 per cent;
- *impurities C, E, G*: for each impurity, maximum 0.3 per cent;
- *impurities H, I*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 1.2 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): 5.0 per cent to 8.5 per cent, determined on 0.150 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

STORAGE

Protected from light, under inert gas.

IMPURITIES

*Specified impurities: A, C, D, E, G, H, I.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, F.*

$M_r$ approx. 30 000 - 40 000

DEFINITION

Freeze-dried preparation of a heterodimeric glycoprotein having the structure of human follicle-stimulating hormone (FSH). It consists of 2 subunits: a 92-amino-acid α-chain common to other glycoprotein hormones and a specific 111-amino-acid β-chain.

*Potency*: 9000 IU to 17 000 IU per milligram of protein.

PRODUCTION

Follitropin is produced in mammalian cells by a method based on recombinant DNA (rDNA) technology.

Follitropin complies with the following requirements.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority.

CHARACTERS

*Appearance*: white or almost white powder.

IDENTIFICATION

A. It complies with the requirements described under Assay.

B. Isoelectric focusing (*2.2.54*).

*Test solution.* Dissolve the substance to be examined in *water R* to obtain a concentration of about 2 mg/mL, then desalt and concentrate using a suitably validated procedure. Reconstitute the recovered material in *water R* to obtain a concentration of 5 mg/mL.

*Reference solution.* Dissolve the contents of a vial of *follitropin CRS* in *water R* to obtain a concentration of 5 mg/mL.

*Focusing*:

- *pH gradient*: a combination of ampholytes and electrode buffers giving a functional separation in the isoelectric point (pI) range of 3.5-5.5 is selected, as defined by the system suitability criteria; where pre-cast gels are employed, proprietary electrode solutions may be used in conjunction; otherwise, suitable dilute mineral or organic acids and bases are employed at pH levels respectively lower and higher than the functional range of the ampholytes;
- *catholyte*: 20.0 g/L solution of *glycine R*;
- *anolyte*: solution containing 3.4 g/L of *aspartic acid R* and 3.6 g/L of *glutamic acid R*, adjusted to pH 2.8-3.8;
- *application*: 10 µL.

*Detection*: as described in *2.2.54*.

*System suitability*:

- in the electropherogram obtained with the reference solution, the number of bands seen in the pI region 3.5-5.5 corresponds to that shown in the electropherogram supplied with *follitropin CRS*; the distribution of bands in the pI region 3.5-5.5 is qualitatively similar to that shown in the electropherogram supplied with *follitropin CRS*.

*Results*: examine the electropherogram obtained with the test solution; identify the bands observed by comparison with the electropherogram obtained with the reference solution; the pattern of bands is qualitatively similar to that seen with the reference solution.

C. Examine the chromatograms obtained in the test for follitropin oligomers.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

D. Peptide mapping (*2.2.55*).

*SEPARATION OF THE α- AND β-SUBUNITS.* Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve the substance to be examined in mobile phase A to obtain a concentration of about 0.4 mg/mL.

*Reference solution.* Dilute *follitropin for peptide mapping and glycan analysis CRS* with mobile phase A to obtain a concentration of about 0.4 mg/mL.

*Precolumn*:

- *size*: *l* = 0.012 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Mobile phase*:

- *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;
- *mobile phase B*: *trifluoroacetic acid R, water for chromatography R, acetonitrile for chromatography R* (0.9:50:950 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 100 | 0 |
| 2 - 8 | 100 → 76 | 0 → 24 |
| 8 - 17 | 76 | 24 |
| 17 - 36 | 76 → 70 | 24 → 30 |
| 36 - 41 | 70 → 25 | 30 → 75 |
| 41 - 46 | 25 | 75 |
| 46 - 47 | 25 → 100 | 75 → 0 |
| 47 - 57 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 226 nm.

*Injection*: 800 µL.

*Retention time*: β-subunit = about 14 min; α-subunit = about 30 min.

Collect the fractions containing the α- and β-subunits and freeze-dry them.

*REDUCTION, MODIFICATION AND DESALTING OF THE PURIFIED SUBUNITS*

**Reduction and modification**

*Solution A*. Dilute 10 µL of *tributylphosphine R* to 2 mL with *propanol R*. Saturate with nitrogen.

*Solution B*. Dilute 20 µL of *4-vinylpyridine R* to 200 µL with *propanol R*. Saturate with nitrogen.

*Test solutions.* Dissolve each of the α- and β-subunit fractions obtained from the test solution in the previous step in 300 µL of *guanidine-tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.5 R* and incubate at 37 °C for 60 min in a thermostatically controlled water-bath. Add 100 µL of solution A, mix and saturate with nitrogen. Incubate at 37 °C for 90 min. Add 10 µL of solution B, mix and saturate with nitrogen. Incubate at 37 °C for 45 min. Add 100 µL of a 10 per cent *V/V* solution of *trifluoroacetic acid R* and mix.

*Reference solutions.* Prepare at the same time and in the same manner as for the test solutions but using the α- and β-subunit fractions obtained from the reference solution in the previous step.

**Desalting**

Dilute the α- and β-subunit test and reference solutions to 840 µL with mobile phase A.

*Column*:

– *size*: *l* = 0.02 m, Ø = 4.6 mm;

– *stationary phase*: *butylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;

– *mobile phase B*: *trifluoroacetic acid R*, *water for chromatography R*, *acetonitrile for chromatography R* (1:300:700 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 7 | 100 | 0 |
| 7 - 27 | 100 → 0 | 0 → 100 |
| 27 - 27.01 | 0 → 100 | 100 → 0 |
| 27.01 - 32 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 226 nm.

*Injection*: 800 µL.

For each solution the chromatogram shows a principal peak due to the monovinylpyridine-modified subunit and several minor peaks due to the di- and oligovinylpyridine-modified subunits. Only the fraction containing the monovinylpyridine-modified subunit is used for digestion in the following step.

*Retention time*: *α-subunit solution*: monovinylpyridine-modified α-subunit = about 15 min; *β-subunit solution*: monovinylpyridine-modified β-subunit = about 16 min.

Collect the fractions containing the monovinylpyridine-modified subunits and freeze-dry them.

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Solution C* (8 M urea solution). Dissolve 480 g of *urea R* in 600 mL of *water for chromatography R* and dilute to 1000 mL with the same solvent. Add about 3-5 g of mixed-bed resin and stir for about 1 h. Filter through a glass filter before use.

*Solution D*. Dissolve 15.8 g of *ammonium hydrogen carbonate R* and 8.3 g of *sodium edetate R* in 800 mL of *water for chromatography R*. Adjust to pH 7.8 (*2.2.3*) with an 80 g/L solution of *sodium hydroxide R* and dilute to 1000 mL with *water for chromatography R*.

*Test solutions*. Dissolve each of the modified α- and β-subunits obtained from the test solutions in the previous step in 42.5 µL of solution C and incubate at room temperature for 30 min. Add 42.5 µL of solution D and mix. To 42.5 µL of these solutions add 35 µL of a solution containing about 23 mU/µL of endoproteinase Lys-C and mix. Incubate at 37 °C for 4 h, then add 35 µL of the same endoproteinase Lys-C solution and mix. Incubate at 37 °C overnight, then dilute to 420 µL with mobile phase A.

*Reference solutions*. Prepare at the same time and in the same manner as for the test solutions but using the fractions obtained from the reference solutions in the previous step.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Precolumn*:

– *size*: *l* = 0.02 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Mobile phase*:

– *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;

– *mobile phase B*: *trifluoroacetic acid R*, *water for chromatography R*, *acetonitrile R1* (1:300:700 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 7 | 100 | 0 |
| 7 - 77 | 100 → 30 | 0 → 70 |
| 77 - 82 | 30 → 0 | 70 → 100 |
| 82 - 87 | 0 | 100 |
| 87 - 92 | 0 → 100 | 100 → 0 |
| 92 - 107 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 400 µL.

*System suitability*:

*α-subunit*:

– the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of follitropin α-subunit digest supplied with *follitropin for peptide mapping and glycan analysis CRS*; both chromatograms show peaks due to the L4, L6, L3, L5 and L1-2/L1 fragments;

– retention times obtained with the test and reference solutions differ by not more than 5 per cent for fragments L4, L6 and L3, not more than 3 per cent for fragment L5 and not more than 2 per cent for fragments L1-2/L1;

*β-subunit*:

– the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of follitropin β-subunit digest supplied with *follitropin for peptide mapping and glycan analysis CRS*; both chromatograms show peaks due to the L5, L7, L6, and L1-4 fragments;

– retention times obtained with the test and reference solutions differ by not more than 5 per cent for fragment L5, not more than 2 per cent for fragments L7 and L6 and not more than 1 per cent for fragments L1-4.

*Results*: for each subunit, the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the corresponding reference solution.

E. Glycan analysis (*2.2.59*). Carry out either method A or method B.

METHOD A

*PROTEIN DENATURATION*

*Test solution*. Dissolve 500 µg of the substance to be examined in 60 µL of *0.05 M phosphate buffer solution pH 7.5 R*. Add 6 µL of a 10 mg/mL solution of *sodium dodecyl sulfate R* and 35 µL of a 1 per cent *V/V* solution of *2-mercaptoethanol R*. Mix using a vortex mixer, centrifuge and incubate at 37 °C for 15 min.

*Reference solution*. Freeze dry a sample of *follitropin for peptide mapping and glycan analysis CRS* that contains 500 µg of follitropin. Dissolve in 60 µL of *0.05 M phosphate buffer solution pH 7.5 R* and continue as for the test solution.

*SELECTIVE RELEASE OF THE GLYCANS*

*Test solution*. To the test solution obtained in the previous step add 0.75 µL of octylphenyl-polyethylene glycol and mix using a vortex mixer. Add 25 mU of *peptide N-glycosidase F R*, mix using a vortex mixer and centrifuge. Incubate at 37 °C for 24 h. Remove the protein fraction using a suitable, validated procedure. The following method has been found

to be appropriate. Add 600 µL of *anhydrous ethanol R*, previously cooled at – 20 °C for 45 min. Mix using a vortex mixer and centrifuge. Precipitate the proteins at – 20 °C for 15 min, then centrifuge at 10 600 *g* at 4 °C for 5 min. Transfer the supernatant to a separate tube and evaporate the ethanol for 15 min. Add 1 mL of *particle-free water R* and resume evaporating until the remaining volume is about 500-800 µL, then freeze-dry.

Label the liberated glycans contained in the sample with 2-aminobenzamide. The procedure employs a combination of reagents optimised and validated for the efficient labelling of glycans, and for the subsequent extraction and recovery of the labelled glycans from the reaction. Recover the sample in 1.5 mL of *particle-free water R*.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution but using the reference solution obtained in the previous step.

*CHROMATOGRAPHIC SEPARATION.* Liquid chromatography (*2.2.29*).

*Column*:

– *size*: *l* = 0.075 m, Ø = 7.5 mm;

– *stationary phase*: *weak anion-exchange resin R* (10 µm);

– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: *acetonitrile R*;

– *mobile phase B*: *0.5 M ammonium acetate buffer solution pH 4.5 R*; filter through a membrane filter (nominal pore size 0.22 µm);

– *mobile phase C*: *particle-free water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 5 | 20 | 0 | 80 |
| 5 - 21 | 20 | 0 → 4 | 80 → 76 |
| 21 - 61 | 20 | 4 → 25 | 76 → 55 |
| 61 - 62 | 20 | 25 → 50 | 55 → 30 |
| 62 - 71 | 20 | 50 | 30 |
| 71 - 72 | 20 | 50 → 0 | 30 → 80 |
| 72 - 117 | 20 | 0 | 80 |

*Flow rate*: 0.4 mL/min.

*Detection*: fluorimeter at 330 nm for excitation and at 420 nm for emission.

*Injection*: 50 µL.

*System suitability*: reference solution:

– the chromatogram obtained is qualitatively similar to the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*;

– by comparison with the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*, identify the peaks due to neutral, mono-, di-, tri- and tetra-sialylated forms; determine the area of each peak and express it as a percentage of the total; calculate the *Z* number using the following expression:

$$(A_0 \times 0) + (A_1 \times 1) + (A_2 \times 2) + (A_3 \times 3) + (A_4 \times 4)$$

$A_0$ = peak area percentage due to the neutral form;

$A_1$ = peak area percentage due to the mono-sialylated form;

$A_2$ = peak area percentage due to the di-sialylated form;

$A_3$ = peak area percentage due to the tri-sialylated form;

$A_4$ = peak area percentage due to the tetra-sialylated form.

The *Z* number obtained for the reference solution is in the range 177-233.

Examine the chromatogram obtained with the test solution and calculate the *Z* number as described above.

*Result*: *Z* = 177-233.

METHOD B

*PROTEIN DENATURATION*

*Solution A.* To 1.952 g of *2-[N-morpholino]ethanesulfonic acid R* and 57.32 g of *guanidine hydrochloride R*, add 1 mL of a 15.4 g/L solution of *dithiothreitol R*, 10 mL of an 18.61 g/L solution of *sodium edetate R* and 20 mL of *water for chromatography R*. Maintain in a water-bath at about 37 °C for 1 min to dissolve the components. Adjust to pH 8.1 (*2.2.3*) with an 80 g/L solution of *sodium hydroxide R* and dilute to 100.0 mL with *water for chromatography R*. Mix.

*Solution B.* Dissolve 37 mg of *iodoacetamide R* in 1 mL of *water for chromatography R* and mix. Protect from light.

*Solution C.* Dissolve 26.7 g of *disodium hydrogen phosphate dihydrate R* and 11.2 g of *sodium edetate R* in 3000 mL of *water for chromatography R* and mix. Adjust to pH 7.5 (*2.2.3*) with a 40 g/L solution of *sodium hydroxide R*.

*Test solution.* Dissolve 1 mg of the substance to be examined in 0.2 mL of solution A and incubate in a water-bath at 37 ± 1 °C for 2 h. Add 20 µL of freshly prepared solution B, mix and incubate at 37 ± 1 °C for a further 2 h, protected from light. Add 10 µL of *2-mercaptoethanol R* and mix. Dialyse against 1000 mL of solution C. Add 200 µL of solution C and mix. Determine the protein content of the solution.

*Reference solution (a).* To a volume of *follitropin for peptide mapping and glycan analysis CRS* that contains 1 mg of follitropin, add 0.2 mL of solution A. Incubate in a water-bath at 37 ± 1 °C for 2 h. Continue as for the test solution. Determine the protein content of the solution.

*Reference solution (b).* Prepare at the same time and in the same manner as for the test solution but using fetuin instead of the substance to be examined. Determine the protein content of the solution.

*SELECTIVE RELEASE OF THE GLYCANS*

*Test solution.* Dilute the test solution obtained in the previous step with solution C to obtain a concentration of 1.1 g/L. Add 1 U of *peptide N-glycosidase F R* to 500 µg of the solution, mix and incubate at 37 ± 1 °C for 24 h. Place the solution in ice. Precipitate the protein and salts with 3 volumes of ice-cold *anhydrous ethanol R* and allow to stand in ice for 10 min. Centrifuge at 16 000 *g* for about 5 min and transfer the supernatant to a separate tube. Add 3 µL of a 1 µg/µL solution of *maltotriose R*, then freeze-dry. Dissolve in 100 µL of *water for chromatography R*.

*Reference solution (a).* Prepare in the same manner as for the test solution but using the reference solution obtained with *follitropin for peptide mapping and glycan analysis CRS* in the previous step.

*Reference solution (b).* Prepare in the same manner as for the test solution but using the reference solution obtained with fetuin in the previous step.

*CHROMATOGRAPHIC SEPARATION.* Liquid chromatography (*2.2.29*).

*Precolumn*:

- *size*: *l* = 0.05 m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R*;

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R.*

*Mobile phase*:

- *mobile phase A*: 20 g/L solution of *sodium hydroxide R*; maintain under helium;
- *mobile phase B*: *water for chromatography R*; maintain under helium;
- *mobile phase C*: dissolve 41 g of *anhydrous sodium acetate R* in 800 mL of *water for chromatography R*, dilute to 1000 mL with the same solvent, then mix; filter through a membrane filter (nominal pore size 0.45 µm); maintain under helium;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 0.2 | 20 | 80 | 0 |
| 0.2 - 94.0 | 20 | 80 → 34 | 0 → 46 |
| 94.0 - 97.0 | 20 | 34 | 46 |
| 97.0 - 97.1 | 20 | 34 → 80 | 46 → 0 |
| 97.1 - 115.0 | 20 | 80 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: pulsed amperometric detector or equivalent with a gold indicator electrode, a silver-silver chloride reference electrode, and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and − 0.80 V reduction potentials, with pulse durations according to the instrument used.

*Injection*: 45 µL.

*System suitability*:

- the chromatogram obtained with reference solution (b) is qualitatively similar to the chromatogram for fetuin supplied with *follitropin for peptide mapping and glycan analysis CRS*;
- the chromatograms obtained with the test solution and reference solution (a) are qualitatively similar to the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*;
- by comparison with the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*, identify the peaks due to neutral, mono-, di-, tri- and tetra-sialylated forms in the chromatogram obtained with reference solution (b); determine the area of each peak and express it as a percentage of the total; calculate the *Z* number using the following expression:

$$(A_0 \times 0) + (A_1 \times 1) + (A_2 \times 2) + (A_3 \times 3) + (A_4 \times 4)$$

$A_0$ = peak area percentage due to the neutral form;

$A_1$ = peak area percentage due to the mono-sialylated form;

$A_2$ = peak area percentage due to the di-sialylated form;

$A_3$ = peak area percentage due to the tri-sialylated form;

$A_4$ = peak area percentage due to the tetra-sialylated form.

The *Z* number obtained for reference solution (b) is in the range 290-325.

Examine the chromatogram obtained with the test solution and calculate the *Z* number as described above.

*Result*: *Z* = 178-274.

TESTS

**Follitropin oligomers**. Size-exclusion chromatography (*2.2.30*). Use the normalisation procedure.

*Solution A*. Dissolve 118 mg of *sodium dihydrogen phosphate R*, 1.65 g of *disodium hydrogen phosphate dihydrate R* and 30.0 g of *sucrose R* in 40 mL of *water for chromatography R* and dilute to 100.0 mL with the same solvent.

*Solution B*. Dissolve 2.0 mg of *bovine albumin R* in 30 mL of solution A.

*Test solution.* Dissolve the substance to be examined in solution A to obtain a concentration of 0.25 mg/mL.

*Reference solution.* Dissolve the contents of a vial of *follitropin CRS* in solution A to obtain a concentration of 0.5 mg/mL and mix equal volumes of this solution and solution B to obtain a concentration of 0.25 mg/mL.

*Column*:

- *size*: *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 300 000 (5 µm).

*Mobile phase*: dissolve 28.4 g of *anhydrous sodium sulfate R* in 2000 mL of *0.1 M phosphate buffer solution pH 6.7 R* and filter through a membrane filter (nominal pore size 0.45 µm).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 100 µL.

*Retention time*: follitropin = 14-16 min.

*System suitability*: reference solution:

- *resolution*: minimum 1.2 between the peaks due to bovine albumin and follitropin;
- no peak is detected between 5 min and 16 min in blank injections.

*Limit*:

- *sum of the peaks with a retention time less than that of the principal peak*: maximum 0.5 per cent.

**Free subunits**. Polyacrylamide gel electrophoresis (*2.2.31*) under non-reducing conditions.

*Gel dimensions*: 1.5 mm thick.

*Resolving gel*: 12 per cent acrylamide.

*Sample buffer. Concentrated SDS-PAGE sample buffer R.*

*Test solution.* Dissolve the substance to be examined in *water R* to obtain a concentration of 2 µg/µL. To 55 µL of the solution add 55 µL of the sample buffer. Allow to stand for 4 h at room temperature.

Monographs F

*Reference solution (a).* Dissolve the contents of a vial of *follitropin CRS* in *water R* to obtain a concentration of 2 µg/µL. To 25 µL of the solution add 25 µL of the sample buffer. To 40 µL of this solution add 180 µL of the sample buffer and 180 µL of *water R*. Allow to stand for 4 h at room temperature, then boil for 5 min.

*Reference solution (b).* A solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 14.4-94 kDa.

*Application*:

| Well | Solution(s) | Volume (µL) |
|---|---|---|
| 1 | Reference solution (a) | 40 |
| 2 | Reference solution (a) | 30 |
| 3 | Reference solution (a) | 20 |
| 4 | Reference solution (a) | 15 |
| 5 | Reference solution (a) | 10 |
| 6 | Reference solution (a) | 5 |
| 7 | Test solution | 50 |
| 8 | Test solution + reference solution (a) | 50 + 25 |
| 9 | Reference solution (b) | 10 |

*Detection*: by Coomassie staining.

*System suitability*:

- reference solution (b): the validation criteria are met (*2.2.31*);
- test solution + reference solution (a): the bands corresponding to the follitropin heterodimer and subunits are clearly separated;
- reference solution (a): no bands corresponding to the follitropin heterodimer are seen.

*Limit*:

- *free subunits*: maximum 3 per cent.

**Oxidised follitropin**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve about 3.3 mg of *2,4-dichlorobenzoic acid R* in 10.0 mL of *ethanol (96 per cent) R*.

*Test solution.* Dissolve the substance to be examined in *water for chromatography R* to obtain a concentration of 300 µg/mL.

*Reference solution (a).* Dissolve the contents of a vial of *follitropin CRS* in *water for chromatography R* to obtain a concentration of 300 µg/mL.

*Reference solution (b).* Dilute 0.1 mL of *strong hydrogen peroxide solution R* to 30 mL with *water for chromatography R*. Dissolve the contents of a vial of *follitropin CRS* in this solution to obtain a concentration of 300 µg/mL. Incubate for 30-45 min. Add solution A to obtain a concentration in 2,4-dichlorobenzoic acid of about 17 µg/mL in the total volume and inject immediately.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *0.2 M phosphate buffer solution pH 2.5 R*;
- *mobile phase B*: *water for chromatography R, acetonitrile R1* (40:60 *V/V*);
- *mobile phase C*: *water for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 8.4 | 50 | 25 → 39 | 25 → 11 |
| 8.4 - 8.5 | 50 | 39 → 45 | 11 → 5 |
| 8.5 - 15 | 50 | 45 | 5 |
| 15 - 15.1 | 50 | 45 → 25 | 5 → 25 |
| 15.1 - 25 | 50 | 25 | 25 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 25 µL.

*System suitability*: reference solution (b):

- the peaks due to the oxidised follitropin α- and β-subunits are separated from the peaks due to the non-oxidised follitropin subunits and from the peak due to 2,4-dichlorobenzoic acid;
- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *follitropin CRS*.

Calculate the percentage of oxidation of the follitropin subunits using the following expression:

$$\frac{(A_2 + A_4) \times 100}{A_1 + A_2 + A_3 + A_4}$$

$A_1$ = area of the peak due to the follitropin α-subunit;

$A_2$ = area of the peaks due to the oxidised follitropin α-subunit;

$A_3$ = area of the peak due to the follitropin β-subunit;

$A_4$ = area of the peak due to the oxidised follitropin β-subunit.

*Limit*:

- *total oxidised forms*: maximum 6 per cent.

**Bacterial endotoxins** (*2.6.14*): less than 0.1 IU per International Unit of follitropin activity, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

**Protein**. Size-exclusion chromatography (*2.2.30*).

*Solution A*. Dissolve 100 mg of *poloxamer 188 R* in 900 mL of *water for chromatography R* and dilute to 1000 mL with the same solvent.

*Test solution.* Dissolve the substance to be examined in solution A to obtain a concentration of about 0.03 mg/mL.

*Reference solution.* Dissolve the contents of a vial of *follitropin CRS* in solution A to obtain a concentration of about 0.03 mg/mL.

*Column*:

- *size*: *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 300 000 (5 µm).

*Mobile phase*: mix 6.74 mL of *phosphoric acid R*, 14.2 g of *anhydrous sodium sulfate R* and 900 mL of *water for chromatography R*, adjust to pH 6.7 (*2.2.3*) with a 0.5 g/mL solution of *sodium hydroxide R* and dilute to 1000 mL with *water for chromatography R*; filter through a membrane filter (nominal pore size 0.45 µm).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 100 µL.

*System suitability*: reference solution:

- *number of theoretical plates*: minimum 1300, calculated for the peak due to follitropin.

Calculate the content of follitropin taking into account the assigned content of *follitropin CRS*.

**Potency**

The follicle-stimulating activity of follitropin is estimated by comparing under given conditions its effect in enlarging the ovaries of immature rats treated with chorionic gonadotrophin with the same effect of the International Standard preparation of human recombinant follicle-stimulating hormone or of a reference preparation calibrated in International Units. The International Unit of FSH is the activity contained in stated amounts of the International Standard of human recombinant follicle-stimulating hormone. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Use immature female rats of the same strain, 19-28 days old, differing in age by not more than 3 days and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 rats. If sets of 6 litter mates are available, assign 1 litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose produces a positive response in some of the rats and the largest dose does not produce a maximal response in all of the rats. Use doses in geometric progression and as an initial approximation total doses of 1.5 IU, 3.0 IU and 6.0 IU may be tried, although the dose will depend on the sensitivity of the rats used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 mL. The buffer solution shall contain in the daily dose not less than 14 IU of chorionic gonadotrophin to ensure complete luteinisation. Add a suitable antimicrobial preservative such as 4 g/L of phenol or 0.02 g/L of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group. Repeat the injection of each dose 24 h and 48 h after the 1st injection. About 24 h after the last injection, euthanise the rats and remove the ovaries from each rat. Remove any extraneous fluid and tissue from the ovaries and weigh the 2 combined ovaries of each rat immediately. Calculate the results by the usual statistical methods (for example, *5.3*), using the mass of the 2 combined ovaries as the response (a suitable correction of the organ mass with reference to the mass of the rat from which it was taken may be applied; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight container, at a temperature not exceeding – 20 °C.

LABELLING

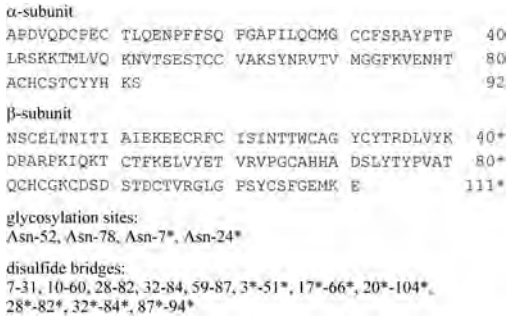
The label states:

- the potency in International Units per milligram of protein;
- where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

**01/2020:2286**

# FOLLITROPIN CONCENTRATED SOLUTION

## Follitropini solutio concentrata



$M_r$ approx. 30 000 - 40 000

DEFINITION

Solution of a heterodimeric glycoprotein having the structure of human follicle-stimulating hormone (FSH). It consists of 2 subunits: a 92-amino-acid α-chain common to other glycoprotein hormones and a specific 111-amino-acid β-chain.

*Content*: 0.4 mg to 0.8 mg of protein per millilitre.

*Potency*: 9000 IU to 17 000 IU per milligram of protein.

PRODUCTION

Follitropin is produced in mammalian cells by a method based on recombinant DNA (rDNA) technology.

Follitropin complies with the following requirements.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority.

CHARACTERS

*Appearance*: clear or slightly turbid, colourless liquid.

IDENTIFICATION

A. It complies with the requirements described under Assay.

B. Isoelectric focusing (*2.2.54*).

*Test solution.* Desalt and concentrate the preparation to be examined using a suitably validated procedure. Reconstitute the recovered material in *water R* to obtain a concentration of 5 mg/mL.

*Reference solution.* Dissolve the contents of a vial of *follitropin CRS* in *water R* to obtain a concentration of 5 mg/mL.

*Focusing*:

- *pH gradient*: a combination of ampholytes and electrode buffers giving a functional separation in the isoelectric point (pI) range of 3.5-5.5 is selected, as defined by the system suitability criteria; where pre-cast gels are employed, proprietary electrode solutions may be used in conjunction; otherwise, suitable dilute mineral or

Monographs F

organic acids and bases are employed at pH levels respectively lower and higher than the functional range of the ampholytes;

- *catholyte*: 20.0 g/L solution of *glycine R*;
- *anolyte*: solution containing 3.4 g/L of *aspartic acid R* and 3.6 g/L of *glutamic acid R*, adjusted to pH 2.8-3.8;
- *application*: 10 µL.

*Detection*: as described in *2.2.54*.

*System suitability*:

- in the electropherogram obtained with the reference solution, the number of bands seen in the pI region 3.5-5.5 corresponds to that shown in the electropherogram supplied with *follitropin CRS*; the distribution of bands in the pI region 3.5-5.5 is qualitatively similar to that shown in the electropherogram supplied with *follitropin CRS*.

*Results*: examine the electropherogram obtained with the test solution; identify the bands observed by comparison with the electropherogram obtained with the reference solution; the pattern of bands is qualitatively similar to that seen with the reference solution.

C. Examine the chromatograms obtained in the test for follitropin oligomers.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

D. Peptide mapping (*2.2.55*).

*SEPARATION OF THE α- AND β-SUBUNITS*. Liquid chromatography (*2.2.29*).

*Test solution*. Dilute the preparation to be examined with mobile phase A to obtain a concentration of about 0.4 mg/mL.

*Reference solution*. Dilute *follitropin for peptide mapping and glycan analysis CRS* with mobile phase A to obtain a concentration of about 0.4 mg/mL

*Precolumn*:

- *size*: *l* = 0.012 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Mobile phase*:

- *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;
- *mobile phase B*: *trifluoroacetic acid R*, *water for chromatography R*, *acetonitrile for chromatography R* (0.9:50:950 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 100 | 0 |
| 2 - 8 | 100 → 76 | 0 → 24 |
| 8 - 17 | 76 | 24 |
| 17 - 36 | 76 → 70 | 24 → 30 |
| 36 - 41 | 70 → 25 | 30 → 75 |
| 41 - 46 | 25 | 75 |
| 46 - 47 | 25 → 100 | 75 → 0 |
| 47 - 57 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 226 nm.

*Injection*: 800 µL.

*Retention time*: β-subunit = about 14 min; α-subunit = about 30 min.

Collect the fractions containing the α- and β-subunits and freeze-dry them.

*REDUCTION, MODIFICATION AND DESALTING OF THE PURIFIED SUBUNITS*

**Reduction and modification**

*Solution A*. Dilute 10 µL of *tributylphosphine R* to 2 mL with *propanol R*. Saturate with nitrogen.

*Solution B*. Dilute 20 µL of *4-vinylpyridine R* to 200 µL with *propanol R*. Saturate with nitrogen.

*Test solutions*. Dissolve each of the α- and β-subunit fractions obtained from the test solution in the previous step in 300 µL of *guanidine-tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.5 R* and incubate at 37 °C for 60 min in a thermostatically controlled water-bath. Add 100 µL of solution A, mix and saturate with nitrogen. Incubate at 37 °C for 90 min. Add 10 µL of solution B, mix and saturate with nitrogen. Incubate at 37 °C for 45 min. Add 100 µL of a 10 per cent *V/V* solution of *trifluoroacetic acid R* and mix.

*Reference solutions*. Prepare at the same time and in the same manner as for the test solutions but using the α- and β-subunit fractions obtained from the reference solution in the previous step.

**Desalting**

Dilute the α- and β-subunit test and reference solutions to 840 µL with mobile phase A.

*Column*:

- *size*: *l* = 0.02 m, Ø = 4.6 mm;
- *stationary phase*: *butylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;
- *mobile phase B*: *trifluoroacetic acid R*, *water for chromatography R*, *acetonitrile for chromatography R* (1:300:700 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 7 | 100 | 0 |
| 7 - 27 | 100 → 0 | 0 → 100 |
| 27 - 27.01 | 0 → 100 | 100 → 0 |
| 27.01 - 32 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 226 nm.

*Injection*: 800 µL.

For each solution the chromatogram shows a principal peak due to the monovinylpyridine-modified subunit and several minor peaks due to the di- and oligovinylpyridine-modified subunits. Only the fraction containing the monovinylpyridine-modified subunit is used for digestion in the following step.

*Retention time*: *α-subunit solution*: monovinylpyridine-modified α-subunit = about 15 min; *β-subunit solution*: monovinylpyridine-modified β-subunit = about 16 min.

Collect the fractions containing the monovinylpyridine-modified subunits and freeze-dry them.

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Solution C* (8 M urea solution). Dissolve 480 g of *urea R* in 600 mL of *water for chromatography R* and dilute to 1000 mL with the same solvent. Add about 3-5 g of mixed-bed resin and stir for about 1 h. Filter through a glass filter before use.

*Solution D*. Dissolve 15.8 g of *ammonium hydrogen carbonate R* and 8.3 g of *sodium edetate R* in 800 mL of *water for chromatography R*. Adjust to pH 7.8 (*2.2.3*) with an 80 g/L solution of *sodium hydroxide R* and dilute to 1000 mL with *water for chromatography R*.

*Test solutions*. Dissolve each of the modified α- and β-subunits obtained from the test solutions in the previous step in 42.5 µL of solution C and incubate at room temperature for 30 min. Add 42.5 µL of solution D and mix. To 42.5 µL of these solutions add 35 µL of a solution containing about 23 mU/µL of endoproteinase Lys-C and mix. Incubate at 37 °C for 4 h, then add 35 µL of the same endoproteinase Lys-C solution and mix. Incubate at 37 °C overnight, then dilute to 420 µL with mobile phase A.

*Reference solutions*. Prepare at the same time and in the same manner as for the test solutions but using the fractions obtained from the reference solutions in the previous step.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Precolumn*:

- *size*: *l* = 0.02 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Mobile phase*:

- *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;
- *mobile phase B*: *trifluoroacetic acid R*, *water for chromatography R*, *acetonitrile R1* (1:300:700 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 7 | 100 | 0 |
| 7 - 77 | 100 → 30 | 0 → 70 |
| 77 - 82 | 30 → 0 | 70 → 100 |
| 82 - 87 | 0 | 100 |
| 87 - 92 | 0 → 100 | 100 → 0 |
| 92 - 107 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 400 µL.

*System suitability*:

*α-subunit*:

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of follitropin α-subunit digest supplied with *follitropin for peptide mapping and glycan analysis CRS*; both chromatograms show peaks due to the L4, L6, L3, L5 and L1-2/L1 fragments;
- retention times obtained with the test and reference solutions differ by not more than 5 per cent for fragments L4, L6 and L3, not more than 3 per cent for fragment L5 and not more than 2 per cent for fragments L1-2/L1;

*β-subunit*:

- the chromatogram obtained with the reference solutions is qualitatively similar to the chromatogram of follitropin β-subunit digest supplied with *follitropin for peptide mapping and glycan analysis CRS*; both chromatograms show peaks due to the L5, L7, L6, and L1-4 fragments;
- retention times obtained with the test and reference solutions differ by not more than 5 per cent for fragment L5, not more than 2 per cent for fragments L7 and L6 and not more than 1 per cent for fragments L1-4.

*Results*: for each subunit, the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the corresponding reference solution.

E. Glycan analysis (*2.2.59*). Carry out either method A or method B.

METHOD A

*PROTEIN DENATURATION*

*Test solution*. Freeze-dry a sample of the preparation to be examined that contains 500 µg of follitropin. Dissolve in 60 µL of *0.05 M phosphate buffer solution pH 7.5 R*. Add 6 µL of a 10 mg/mL solution of *sodium dodecyl sulfate R* and 35 µL of a 1 per cent *V/V* solution of *2-mercaptoethanol R*. Mix using a vortex mixer, centrifuge and incubate at 37 °C for 15 min.

*Reference solution*. Prepare at the same time and in the same manner as for the test solution but using *follitropin for peptide mapping and glycan analysis CRS* instead of the freeze-dried preparation to be examined.

*SELECTIVE RELEASE OF THE GLYCANS*

*Test solution*. To the test solution obtained in the previous step add 0.75 µL of octylphenyl-polyethylene glycol and mix using a vortex mixer. Add 25 mU of *peptide N-glycosidase F R*, mix using a vortex mixer and centrifuge. Incubate at 37 °C for 24 h. Remove the protein fraction using a suitable, validated procedure. The following method has been found to be appropriate. Add 600 µL of *anhydrous ethanol R*, previously cooled at − 20 °C for 45 min. Mix using a vortex mixer and centrifuge. Precipitate the proteins at − 20 °C for 15 min, then centrifuge at 10 600 *g* at 4 °C for 5 min. Transfer the supernatant to a separate tube and evaporate the ethanol for 15 min. Add 1 mL of *particle-free water R* and resume evaporating until the remaining volume is about 500-800 µL, then freeze-dry.

Label the liberated glycans contained in the sample with 2-aminobenzamide. The procedure employs a combination of reagents optimised and validated for the efficient labelling of glycans, and for the subsequent extraction and recovery of the labelled glycans from the reaction. Recover the sample in 1.5 mL of *particle-free water R*.

*Reference solution*. Prepare at the same time and in the same manner as for the test solution but using the reference solution obtained in the previous step.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Column*:

- *size*: *l* = 0.075 m, Ø = 7.5 mm;
- *stationary phase*: *weak anion-exchange resin R* (10 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *acetonitrile R*;
- *mobile phase B*: *0.5 M ammonium acetate buffer solution pH 4.5 R*; filter through a membrane filter (nominal pore size 0.22 µm);
- *mobile phase C*: *particle-free water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 5 | 20 | 0 | 80 |
| 5 - 21 | 20 | 0 → 4 | 80 → 76 |
| 21 - 61 | 20 | 4 → 25 | 76 → 55 |
| 61 - 62 | 20 | 25 → 50 | 55 → 30 |
| 62 - 71 | 20 | 50 | 30 |
| 71 - 72 | 20 | 50 → 0 | 30 → 80 |
| 72 - 117 | 20 | 0 | 80 |

*Flow rate*: 0.4 mL/min.

*Detection*: fluorimeter at 330 nm for excitation and at 420 nm for emission.

*Injection*: 50 µL.

*System suitability*: reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*;
- by comparison with the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*, identify the peaks due to neutral, mono-, di-, tri- and tetra-sialylated forms; determine the area of each peak and express it as a percentage of the total; calculate the *Z* number using the following expression:

$$(A_0 \times 0) + (A_1 \times 1) + (A_2 \times 2) + (A_3 \times 3) + (A_4 \times 4)$$

$A_0$ = peak area percentage due to the neutral form;

$A_1$ = peak area percentage due to the mono-sialylated form;

$A_2$ = peak area percentage due to the di-sialylated form;

$A_3$ = peak area percentage due to the tri-sialylated form;

$A_4$ = peak area percentage due to the tetra-sialylated form.

The *Z* number obtained for the reference solution is in the range 177-233.

Examine the chromatogram obtained with the test solution and calculate the *Z* number as described above.

*Result*: *Z* = 177-233.

METHOD B

*PROTEIN DENATURATION*

*Solution A*. To 1.952 g of *2-[N-morpholino]ethanesulfonic acid R* and 57.32 g of *guanidine hydrochloride R*, add 1 mL of a 15.4 g/L solution of *dithiothreitol R*, 10 mL of an 18.61 g/L solution of *sodium edetate R* and 20 mL of *water for chromatography R*. Maintain in a water-bath at about 37 °C for 1 min to dissolve the components. Adjust to pH 8.1 (*2.2.3*) with an 80 g/L solution of *sodium hydroxide R* and dilute to 100.0 mL with *water for chromatography R*. Mix.

*Solution B*. Dissolve 37 mg of *iodoacetamide R* in 1 mL of *water for chromatography R* and mix. Protect from light.

*Solution C*. Dissolve 26.7 g of *disodium hydrogen phosphate dihydrate R* and 11.2 g of *sodium edetate R* in 3000 mL of *water for chromatography R* and mix. Adjust to pH 7.5 (*2.2.3*) with a 40 g/L solution of *sodium hydroxide R*.

*Test solution*. To a volume of the preparation to be examined that contains 1 mg of follitropin add 0.2 mL of solution A and incubate in a water-bath at 37 ± 1 °C for 2 h. Add 20 µL of freshly prepared solution B, mix and incubate at 37 ± 1 °C for a further 2 h, protected from light. Add 10 µL of *2-mercaptoethanol R* and mix. Dialyse against 1000 mL of solution C. Add 200 µL of solution C and mix. Determine the protein content of the solution.

*Reference solution (a)*. Prepare at the same time and in the same manner as for the test solution but using *follitropin for peptide mapping and glycan analysis CRS* instead of the preparation to be examined. Determine the protein content of the solution.

*Reference solution (b)*. Prepare at the same time and in the same manner as for the test solution but using fetuin instead of the preparation to be examined. Determine the protein content of the solution.

*SELECTIVE RELEASE OF THE GLYCANS*

*Test solution*. Dilute the test solution obtained in the previous step with solution C to obtain a concentration of 1.1 g/L. Add 1 U of *peptide N-glycosidase F R* to 500 µg of the solution, mix and incubate at 37 ± 1 °C for 24 h. Place the solution in ice. Precipitate the protein and salts with 3 volumes of ice-cold *anhydrous ethanol R* and allow to stand in ice for 10 min. Centrifuge at 16 000 *g* for about 5 min and transfer the supernatant to a separate tube. Add 3 µL of a 1 µg/µL solution of *maltotriose R* then freeze-dry. Dissolve in 100 µL of *water for chromatography R*.

*Reference solution (a)*. Prepare in the same manner as for the test solution but using the reference solution obtained with *follitropin for peptide mapping and glycan analysis CRS* in the previous step.

*Reference solution (b)*. Prepare in the same manner as for the test solution but using the reference solution obtained with fetuin in the previous step.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Precolumn*:

- *size*: *l* = 0.05 m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R*.

*Mobile phase*:

- *mobile phase A*: 20 g/L solution of *sodium hydroxide R*; maintain under helium;
- *mobile phase B*: *water for chromatography R*; maintain under helium;
- *mobile phase C*: dissolve 41 g of *anhydrous sodium acetate R* in 800 mL of *water for chromatography R*, dilute to 1000 mL with the same solvent, then mix; filter through a membrane filter (nominal pore size 0.45 µm); maintain under helium;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 0.2 | 20 | 80 | 0 |
| 0.2 - 94.0 | 20 | 80 → 34 | 0 → 46 |
| 94.0 - 97.0 | 20 | 34 | 46 |
| 97.0 - 97.1 | 20 | 34 → 80 | 46 → 0 |
| 97.1 - 115.0 | 20 | 80 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: pulsed amperometric detector or equivalent with a gold indicator electrode, a silver-silver chloride reference electrode, and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and − 0.80 V reduction potentials, with pulse durations according to the instrument used.

*Injection*: 45 µL.

*System suitability*:

- the chromatogram obtained with reference solution (b) is qualitatively similar to the chromatogram for fetuin supplied with *follitropin for peptide mapping and glycan analysis CRS*;
- the chromatograms obtained with the test solution and reference solution (a) are qualitatively similar to the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*;
- by comparison with the chromatogram supplied with *follitropin for peptide mapping and glycan analysis CRS*, identify the peaks due to neutral, mono-, di-, tri- and tetra-sialylated forms in the chromatogram obtained with reference solution (b); determine the area of each peak and express it as a percentage of the total; calculate the *Z* number using the following expression:

$$(A_0 \times 0) + (A_1 \times 1) + (A_2 \times 2) + (A_3 \times 3) + (A_4 \times 4)$$

$A_0$ = peak area percentage due to the neutral form;

$A_1$ = peak area percentage due to the mono-sialylated form;

$A_2$ = peak area percentage due to the di-sialylated form;

$A_3$ = peak area percentage due to the tri-sialylated form;

$A_4$ = peak area percentage due to the tetra-sialylated form.

The *Z* number obtained for reference solution (b) is in the range 290-325.

Examine the chromatogram obtained with the test solution and calculate the *Z* number as described above.

*Result*: *Z* = 178-274.

TESTS

**Follitropin oligomers**. Size-exclusion chromatography (*2.2.30*). Use the normalisation procedure.

*Solution A*. Dissolve 118 mg of *sodium dihydrogen phosphate R*, 1.65 g of *disodium hydrogen phosphate dihydrate R*, and 30.0 g of *sucrose R* in 40 mL of *water for chromatography R* and dilute to 100.0 mL with the same solvent.

*Solution B*. Dissolve 2.0 mg of *bovine albumin R* in 30 mL of solution A.

*Test solution*. Dilute the preparation to be examined with solution A to obtain a concentration of 0.25 mg/mL.

*Reference solution*. Dissolve the contents of a vial of *follitropin CRS* in solution A to obtain a concentration of 0.5 mg/mL and mix equal volumes of this solution and solution B to obtain a concentration of 0.25 mg/mL.

*Column*:

- *size*: *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 300 000 (5 µm).

*Mobile phase*: dissolve 28.4 g of *anhydrous sodium sulfate R* in 2000 mL of *0.1 M phosphate buffer solution pH 6.7 R* and filter through a membrane filter (nominal pore size 0.45 µm).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 100 µL.

*Retention time*: follitropin = 14-16 min.

*System suitability*: reference solution:

- *resolution*: minimum 1.2 between the peaks due to bovine albumin and follitropin;
- no peak is detected between 5 min and 16 min in blank injections.

*Limit*:

- *sum of the peaks with a retention time less than that of the principal peak*: maximum 0.5 per cent.

**Free subunits**. Polyacrylamide gel electrophoresis (*2.2.31*) under non-reducing conditions.

*Gel dimensions*: 1.5 mm thick.

*Resolving gel*: 12 per cent acrylamide.

*Sample buffer. Concentrated SDS-PAGE sample buffer R.*

*Test solution*. Dilute the preparation to be examined with *water R* to obtain a concentration of 2 µg/µL. To 55 µL of the solution add 55 µL of the sample buffer. Allow to stand for 4 h at room temperature.

*Reference solution (a)*. Dissolve the contents of a vial of *follitropin CRS* in *water R* to obtain a concentration of 2 µg/µL. To 25 µL of the solution add 25 µL of the sample buffer. To 40 µL of this solution add 180 µL of the sample buffer and 180 µL of *water R*. Allow to stand for 4 h at room temperature, then boil for 5 min.

*Reference solution (b)*. A solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 14.4-94 kDa.

*Application*:

| Well | Solution(s) | Volume (µL) |
|---|---|---|
| 1 | Reference solution (a) | 40 |
| 2 | Reference solution (a) | 30 |
| 3 | Reference solution (a) | 20 |
| 4 | Reference solution (a) | 15 |
| 5 | Reference solution (a) | 10 |
| 6 | Reference solution (a) | 5 |
| 7 | Test solution | 50 |
| 8 | Test solution + reference solution (a) | 50 + 25 |
| 9 | Reference solution (b) | 10 |

*Detection*: by Coomassie staining.

*System suitability*:

- reference solution (b): the validation criteria are met (*2.2.31*);
- test solution + reference solution (a): the bands corresponding to the follitropin heterodimer and subunits are clearly separated;
- reference solution (a): no bands corresponding to the follitropin heterodimer are seen.

*Limit*:

- *free subunits*: maximum 3 per cent.

**Oxidised follitropin**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve about 3.3 mg of *2,4-dichlorobenzoic acid R* in 10.0 mL of *ethanol (96 per cent) R*.

*Test solution*. Dilute the preparation to be examined in *water for chromatography R* to obtain a concentration of 300 µg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *follitropin CRS* in *water for chromatography R* to obtain a concentration of 300 µg/mL.

*Reference solution (b)*. Dilute 0.1 mL of *strong hydrogen peroxide solution R* to 30 mL with *water for chromatography R*. Dissolve the contents of a vial of *follitropin CRS* in this solution to obtain a concentration of 300 µg/mL. Incubate

for 30-45 min. Add solution A to obtain a concentration in 2,4-dichlorobenzoic acid of about 17 µg/mL in the total volume and inject immediately.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: *0.2 M phosphate buffer solution pH 2.5 R*;

– *mobile phase B*: *water for chromatography R*, *acetonitrile R1* (40:60 *V/V*);

– *mobile phase C*: *water for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) |
|---|---|---|---|
| 0 - 8.4 | 50 | 25 → 39 | 25 → 11 |
| 8.4 - 8.5 | 50 | 39 → 45 | 11 → 5 |
| 8.5 - 15 | 50 | 45 | 5 |
| 15 - 15.1 | 50 | 45 → 25 | 5 → 25 |
| 15.1 - 25 | 50 | 25 | 25 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 25 µL.

*System suitability*: reference solution (b):

– the peaks due to the oxidised follitropin α- and β-subunits are separated from the peaks due to the non-oxidised follitropin subunits and from the peak due to 2,4-dichlorobenzoic acid;

– the chromatogram obtained is qualitatively similar to the chromatogram supplied with *follitropin CRS*.

Calculate the percentage of oxidation of the follitropin subunits using the following expression:

$$\frac{(A_2 + A_4) \times 100}{A_1 + A_2 + A_3 + A_4}$$

$A_1$ = area of the peak due to the follitropin α-subunit;

$A_2$ = area of the peaks due to the oxidised follitropin α-subunit;

$A_3$ = area of the peak due to the follitropin β-subunit;

$A_4$ = area of the peak due to the oxidised follitropin β-subunit.

*Limit*:

– *total oxidised forms*: maximum 6 per cent.

**Bacterial endotoxins** (*2.6.14*): less than 0.1 IU per International Unit of follitropin activity, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

**Protein**. Size-exclusion chromatography (*2.2.30*).

*Solution A*. Dissolve 100 mg of *poloxamer 188 R* in 900 mL of *water for chromatography R* and dilute to 1000 mL with the same solvent.

*Test solution*. Dilute the preparation to be examined with solution A to obtain a concentration of about 0.03 mg/mL.

*Reference solution*. Dissolve the contents of a vial of *follitropin CRS* in solution A to obtain a concentration of about 0.03 mg/mL.

*Column*:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 300 000 (5 µm).

*Mobile phase*: mix 6.74 mL of *phosphoric acid R*, 14.2 g of *anhydrous sodium sulfate R* and 900 mL of *water for chromatography R*, adjust to pH 6.7 (*2.2.3*) with a 0.5 g/mL solution of *sodium hydroxide R* and dilute to 1000 mL with *water for chromatography R*; filter through a membrane filter (nominal pore size 0.45 µm).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 100 µL.

*System suitability*: reference solution:

– *number of theoretical plates*: minimum 1300, calculated for the peak due to follitropin.

Calculate the content of follitropin taking into account the assigned content of *follitropin CRS*.

**Potency**

The follicle-stimulating activity of follitropin is estimated by comparing under given conditions its effect in enlarging the ovaries of immature rats treated with chorionic gonadotrophin with the same effect of the International Standard preparation of human recombinant follicle-stimulating hormone or of a reference preparation calibrated in International Units. The International Unit of FSH is the activity contained in stated amounts of the International Standard of human recombinant follicle-stimulating hormone. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Use immature female rats of the same strain, 19-28 days old, differing in age by not more than 3 days and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 rats. If sets of 6 litter mates are available, assign 1 litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose produces a positive response in some of the rats and the largest dose does not produce a maximal response in all of the rats. Use doses in geometric progression and as an initial approximation total doses of 1.5 IU, 3.0 IU and 6.0 IU may be tried, although the dose will depend on the sensitivity of the rats used, which may vary widely.

Dilute and dissolve respectively the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 mL. The buffer solution shall contain in the daily dose not less than 14 IU of chorionic gonadotrophin to ensure complete luteinisation. Add a suitable antimicrobial preservative such as 4 g/L of phenol or 0.02 g/L of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group. Repeat the injection of each dose 24 h and 48 h after the 1st injection. About 24 h after the last injection, euthanise the rats and remove the ovaries from each rat. Remove any extraneous fluid and tissue from the ovaries and weigh the 2 combined ovaries of each rat immediately. Calculate the results by the usual statistical methods (for example, *5.3*), using the mass of the 2 combined ovaries as the response (a suitable correction of the organ mass with reference to the mass of the rat from which it was taken may be applied; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight container, at a temperature not exceeding − 20 °C.

LABELLING

The label states:

- the content of protein in milligrams per millilitre;
- the potency in International Units per milligram of protein;
- where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

**01/2008:0826**

# FORMALDEHYDE SOLUTION (35 PER CENT)

## Formaldehydi solutio (35 per centum)

[50-00-0]

DEFINITION

*Content*: 34.5 per cent *m/m* to 38.0 per cent *m/m* of formaldehyde ($CH_2O$; $M_r$ 30.03).

It contains methanol as stabiliser.

CHARACTERS

*Appearance*: clear, colourless liquid.

*Solubility*: miscible with water and with ethanol (96 per cent).

It may be cloudy after storage.

IDENTIFICATION

A. Dilute 1 mL of solution S (see Tests) to 10 mL with *water R*. To 0.05 mL of the solution add 1 mL of a 15 g/L solution of *chromotropic acid, sodium salt R*, 2 mL of *water R* and 8 mL of *sulfuric acid R*. A violet-blue or violet-red colour develops within 5 min.

B. To 0.1 mL of solution S add 10 mL of *water R*. Add 2 mL of a 10 g/L solution of *phenylhydrazine hydrochloride R*, prepared immediately before use, 1 mL of *potassium ferricyanide solution R* and 5 mL of *hydrochloric acid R*. An intense red colour is formed.

C. Mix 0.5 mL with 2 mL of *water R* and 2 mL of *silver nitrate solution R2* in a test-tube. Add *dilute ammonia R2* until slightly alkaline. Heat on a water-bath. A grey precipitate or a silver mirror is formed.

D. It complies with the limits of the assay.

TESTS

**Solution S**. Dilute 10 mL, filtered if necessary, to 50 mL with *carbon dioxide-free water R*.

**Appearance of solution**. Solution S is colourless (*2.2.2, Method II*).

**Acidity**. To 10 mL of solution S add 1 mL of *phenolphthalein solution R*. Not more than 0.4 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator to red.

**Methanol**. Gas chromatography (*2.2.28*).

*Internal standard solution*. Dilute 10 mL of *ethanol R1* to 100 mL with *water R*.

*Test solution*. To 10.0 mL of the solution to be examined add 10.0 mL of the internal standard solution and dilute to 100.0 mL with *water R*.

*Reference solution*. To 1.0 mL of *methanol R* add 10.0 mL of the internal standard solution and dilute to 100.0 mL with *water R*.

*Column*:

- *material*: glass,
- *size*: *l* = 1.5-2.0 m, Ø = 2-4 mm,
- *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R* (150-180 µm).

*Carrier gas*: *nitrogen for chromatography R*.

*Flow rate*: 30-40 mL/min.

*Temperature*:

- *column*: 120 °C,
- *injection port and detector*: 150 °C.

*Detection*: flame ionisation.

*Injection*: 1 µL of the test solution and the reference solution.

*System suitability*: reference solution:

- *resolution*: minimum 2.0 between the peaks due to methanol and ethanol.

*Limit*:

- *methanol*: 9.0 per cent *V/V* to 15.0 per cent *V/V*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Into a 100 mL volumetric flask containing 2.5 mL of *water R* and 1 mL of *dilute sodium hydroxide solution R*, introduce 1.000 g of the solution to be examined, shake and dilute to 100.0 mL with *water R*. To 10.0 mL of the solution add 30.0 mL of *0.05 M iodine*. Mix and add 10 mL of *dilute sodium hydroxide solution R*. After 15 min, add 25 mL of *dilute sulfuric acid R* and 2 mL of *starch solution R*. Titrate with *0.1 M sodium thiosulfate*.

1 mL of *0.05 M iodine* is equivalent to 1.501 mg of $CH_2O$.

STORAGE

Protected from light, at a temperature of 15 °C to 25 °C.

**04/2018:2809**

# FORMIC ACID

## Acidum formicum

$CH_2O_2$ $M_r$ 46.03

[64-18-6]

DEFINITION

*Content*: 98.0 per cent *m/m* to 100.5 per cent *m/m*.

CHARACTERS

*Appearance*: clear, colourless, volatile liquid.

*Solubility*: miscible with water, with ethanol (96 per cent) and with methylene chloride.

IDENTIFICATION

*First identification: A, B.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: films.

*Comparison*: *formic acid CRS*.

B. A 100 g/L solution is strongly acid (*2.2.4*).

C. To 2.0 mL of *dilute sodium hydroxide solution R* add 0.05 mL of *phenolphthalein solution R*. Mix, and add dropwise the substance to be examined until the solution becomes colourless. To 1 mL of this solution add 0.5 mL of *silver nitrate solution R2* and mix. Initially no change occurs. Slowly (quicker upon heating), the solution turns greyish and turbid due to the precipitation of metallic silver.

D. To the remainder of the neutralised solution obtained in identification test C, add 0.5 mL of *ferric chloride solution R1*. The solution turns orange-red or brownish-red.

TESTS

**Solution S**. Extract the residue obtained in the test for residue on evaporation by heating with 2 quantities, each of 15 mL, of *distilled water R*. After cooling, dilute the combined extracts to 50.0 mL with *distilled water R*.

**Appearance**. The substance to be examined is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Relative density** (*2.2.5*): 1.217 to 1.223.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dilute 0.500 g of the substance to be examined to 100.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 0.500 g of *anhydrous acetic acid R* (impurity A) to 100.0 mL with the mobile phase. Mix 2.0 mL of the solution and 1.0 mL of the test solution and dilute to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography compatible with 100 per cent aqueous mobile phases R* (4 µm).

*Mobile phase*: 2.72 g/L solution of *potassium dihydrogen phosphate R* adjusted to pH 2.9 with *dilute phosphoric acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Run time*: 3 times the retention time of formic acid.

*Relative retention* with reference to formic acid (retention time = about 3 min): impurity A = about 1.5.

*System suitability*: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to formic acid and impurity A.

*Limits*:

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 10 ppm.

Dilute 12.5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 50 ppm.

Dilute 7.5 mL of solution S to 15 mL with *distilled water R*.

**Sulfites**: maximum 300 ppm.

To 0.5 mL add 12.0 mL of a 42 g/L solution of *sodium hydroxide R* in *carbon dioxide-free water R* and mix. Upon addition of 0.5 mL of *iodine solution R1* and 0.2 mL of *starch solution R* the solution remains blue.

**Residue on evaporation**: maximum 0.01 per cent.

Condensing the vapour where possible, evaporate 20.0 g to dryness on a water-bath and dry at 105 °C. The residue weighs a maximum of 2.0 mg. The residue is used for the preparation of solution S.

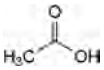
ASSAY

Weigh accurately a conical flask with a ground-glass stopper containing 20 mL of *water R*. Add 1.0 mL of the substance to be examined and weigh again accurately. Titrate with *1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *1 M sodium hydroxide* is equivalent to 46.03 mg of $CH_2O_2$.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.



A. acetic acid.

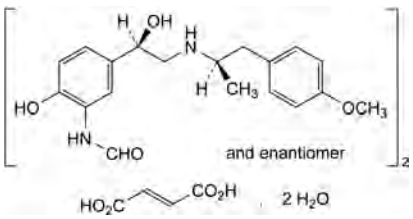
**corrected 8.4**

# FORMOTEROL FUMARATE DIHYDRATE

## Formoteroli fumaras dihydricus



$C_{42}H_{52}N_4O_{12},2H_2O$ $M_r$ 841

DEFINITION

*N*-[2-Hydroxy-5-[(1*RS*)-1-hydroxy-2-[[(1*RS*)-2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide (*E*)-butenedioate dihydrate.

*Content*: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white or slightly yellow powder.

*Solubility*: slightly soluble in water, soluble in methanol, slightly soluble in 2-propanol, practically insoluble in acetonitrile.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *formoterol fumarate dihydrate CRS*.

TESTS

**pH** (*2.2.3*): 5.5 to 6.5.

Dissolve 20 mg in *carbon dioxide-free water R* while heating to about 40 °C, allow to cool and dilute to 20 mL with the same solvent.

**Optical rotation** (*2.2.7*): − 0.10° to + 0.10°.

Dissolve 0.25 g in *methanol R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve 6.10 g of *sodium dihydrogen phosphate monohydrate R* and 1.03 g of *disodium hydrogen phosphate dihydrate R* in *water R* and dilute to 1000 mL with the same solvent. The pH is 6.0 ± 0.1.

*Solvent mixture*: *acetonitrile R*, solution A (16:84 *V/V*).

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture. *Inject within 4 h of preparation, or within 24 h if stored protected from light at 4 °C.*

*Reference solution (a).* Dissolve 5 mg of *formoterol fumarate for system suitability CRS* (containing impurities A, B, C, D, E, F and G) in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 25.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 20.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: spherical *octylsilyl silica gel for chromatography R3* (5 µm) with a pore size of 8 nm.

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*;
- *mobile phase B*: dissolve 3.73 g of *sodium dihydrogen phosphate monohydrate R* and 0.35 g of *phosphoric acid R* in *water R* and dilute to 1000 mL with the same solvent; the pH is 3.1 ± 0.1;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 16 | 84 |
| 10 - 37 | 16 → 70 | 84 → 30 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL; inject the solvent mixture until a repeatable profile is obtained.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) and the chromatogram supplied with *formoterol fumarate for system suitability CRS* to identify the peaks.

*Relative retention* with reference to formoterol (retention time = about 12 min): impurity G = about 0.4; impurity A = about 0.5; impurity B = about 0.7; impurity C = about 1.2; impurity D = about 1.3; impurity E = about 1.8; impurity F = about 2.0; impurity H = about 2.2.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to impurity G and impurity A.
- *peak-to-valley ratio*: minimum 2.5, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity A by 1.75;
- *impurity A*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurities B, C, D, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurity E*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Impurity I**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent. Sonicate if necessary.

*Reference solution (a).* Dissolve 5.0 mg of *formoterol for impurity I identification CRS* in *water R* and dilute to 50.0 mL with the same solvent. Sonicate if necessary.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 20.0 mL with *water R*. Dilute 1.0 mL of this solution to 25.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *octadecyl vinyl polymer for chromatography R*.

*Mobile phase*: mix 12 volumes of *acetonitrile R1* with 88 volumes of a 5.3 g/L solution of *tripotassium phosphate trihydrate R* previously adjusted to pH 12.0 ± 0.1 with a 280 g/L solution of *potassium hydroxide R* or *phosphoric acid R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 225 nm.

*Injection*: 20 µL.

*Elution order*: formoterol, impurity I.

*System suitability*: reference solution (a):

- *peak-to-valley ratio*: minimum 2.5, where $H_p$ = height above the baseline of the peak due to impurity I and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

*Limit*:

- *impurity I*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

**Water** (*2.5.12*): 4.0 per cent to 5.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.350 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 40.24 mg of $C_{42}H_{52}N_4O_{12}$.

STORAGE

Protected from light.

IMPURITIES

*Specified impurities: A, B, C, D, E, F, I.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or

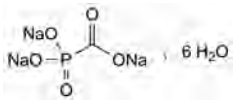
**corrected 10.0**

# FOSCARNET SODIUM HEXAHYDRATE

## Foscarnetum natricum hexahydricum



$CNa_3O_5P,6H_2O$ $M_r$ 300.0
[34156-56-4]

DEFINITION

Trisodium phosphonatoformate hexahydrate.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *foscarnet sodium hexahydrate CRS.*

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. Solution S is not more opalescent than reference suspension I (*2.2.1*) and is colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 9.0 to 11.0 for solution S.

**Impurity D**. Gas chromatography (*2.2.28*).

*Test solution.* Dissolve 0.250 g of the substance to be examined in 9.0 mL of a 6 g/L solution of *glacial acetic acid R* using a magnetic stirrer. Add 1.0 mL of *anhydrous ethanol R* and mix.

*Reference solution.* Dissolve 25.0 mg of *foscarnet impurity D CRS* in *anhydrous ethanol R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of this solution to 10.0 mL with *anhydrous ethanol R*.

*Column*:

– *material*: fused silica;

– *size*: *l* = 25 m, Ø = 0.31 mm;

– *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.5 µm).

*Carrier gas*: *helium for chromatography R*.

*Split ratio*: 1:20.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 8 | 100 → 180 |
| Injection port | | 200 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 3 µL

*Limit*:

– *impurity D*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 5 mg of *foscarnet impurity B CRS* in the mobile phase, add 2 mL of the test solution and dilute to 50 mL with the mobile phase.

*Reference solution (c).* Dissolve the contents of a vial of *foscarnet impurity mixture CRS* (impurities A and C) in 1 mL of mobile phase.

*Column*:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: dissolve 3.22 g of *sodium sulfate decahydrate R* in *water for chromatography R*, add 3 mL of *glacial acetic acid R* and 6 mL of a 44.61 g/L solution of *sodium pyrophosphate R* and dilute to 1000 mL with *water for chromatography R* (solution A); dissolve 3.22 g of *sodium sulfate decahydrate R* in *water for chromatography R*, add 6.8 g of *sodium acetate R* and 6 mL of a 44.61 g/L solution of *sodium pyrophosphate R* and dilute to 1000 mL with *water for chromatography R* (solution B). Mix about 700 mL of solution A and about 300 mL of solution B to obtain a solution of pH 4.4. To 1000 mL of this solution, add 0.25 g of *tetrahexylammonium hydrogen sulfate R* and 100 mL of *methanol R1*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 40 µL.

*Run time*: 2.5 times the retention time of foscarnet.

*Identification of impurities*: use the chromatogram supplied with *foscarnet impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and C; use the chromatogram obtained with reference solution (b) to identify the peak due to impurity B.

*Relative retention* with reference to foscarnet (retention time = about 5 min): impurity A = about 0.7; impurity B = about 1.5; impurity C = about 2.0.

*System suitability*: reference solution (b):

– *resolution*: minimum 7.0 between the peaks due to foscarnet and impurity B.

*Limits*:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.04 per cent); disregard any peak with a relative retention less than 0.6.

**Phosphate and phosphite**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 60.0 mg of the substance to be examined in *water R* and dilute to 25.0 mL with the same solvent.

*Reference solution (a).* Dissolve 28 mg of *sodium dihydrogen phosphate monohydrate R* in *water R* and dilute to 100 mL with the same solvent.

*Reference solution (b).* Dissolve 43 mg of *sodium phosphite pentahydrate R* in *water R* and dilute to 100 mL with the same solvent.

*Reference solution (c).* Dilute 1.0 mL of reference solution (a) and 1.0 mL of reference solution (b) to 25 mL with *water R*.

*Reference solution (d).* Dilute 3 mL of reference solution (a) and 3 mL of reference solution (b) to 25 mL with *water R*.

*Column*:

– *size*: *l* = 0.05 m, Ø = 4.6 mm;

– *stationary phase*: *anion-exchange resin R*.

*Mobile phase*: dissolve 0.102 g of *potassium hydrogen phthalate R* in *water for chromatography R*, add 2.5 mL of *1 M nitric acid* and dilute to 1000 mL with *water for chromatography R*.

*Flow rate*: 1.4 mL/min.

*Detection*: spectrophotometer at 290 nm (indirect detection).

*Injection*: 20 µL of the test solution and reference solutions (c) and (d).

*System suitability*: reference solution (d):

– *resolution*: minimum 2.0 between the peaks due to phosphate (1st peak) and phosphite;

– *signal-to-noise ratio*: minimum 10 for the principal peak.

*Limits*:

– *phosphate*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent);

– *phosphite*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent).

**Loss on drying** (*2.2.32*): 35.0 per cent to 37.0 per cent, determined on 1.000 g by drying in an oven at 150 °C.

**Bacterial endotoxins** (*2.6.14*): less than 83.3 IU/g, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.200 g in 50 mL of *water R*. Titrate with *0.05 M sulfuric acid*, determining the end-point potentiometrically (*2.2.20*) at the 1st point of inflexion.

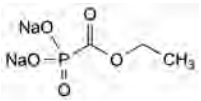
1 mL of *0.05 M sulfuric acid* is equivalent to 19.20 mg of $CNa_3O_5P$.

STORAGE

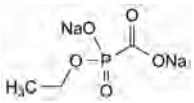
Protected from light.

IMPURITIES

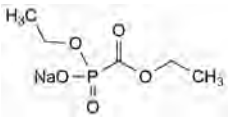
*Specified impurities: A, B, C, D.*



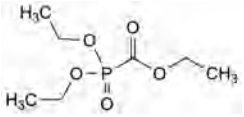
A. disodium (ethoxycarbonyl)phosphonate,



B. disodium (ethoxyoxydophosphanyl)formate,



C. ethyl sodium (ethoxycarbonyl)phosphonate,

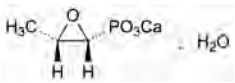


D. ethyl (diethoxyphosphoryl)formate.

**01/2017:1328**

# FOSFOMYCIN CALCIUM

## Fosfomycinum calcicum



$C_3H_5CaO_4P,H_2O$ $M_r$ 194.1

[26469-67-0]

DEFINITION

Calcium (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate monohydrate.

Substance produced by certain strains of *Streptomyces fradiae* or obtained by any other means.

*Content*: 95.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: slightly soluble in water, practically insoluble in acetone, in methanol and in methylene chloride.

IDENTIFICATION

*First identification: A, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fosfomycin calcium CRS*.

B. Dissolve about 0.1 g in 3 mL of a 25 per cent *V/V* solution of *perchloric acid R*. Add 1 mL of *0.1 M sodium periodate* and heat on a water-bath for 30 min. Allow to cool and add 50 mL of *water R*. Neutralise with a saturated solution of *sodium hydrogen carbonate R* and add 1 mL of a freshly prepared 400 g/L solution of *potassium iodide R*. Prepare a blank at the same time and in the same manner. The test solution remains colourless and the blank is orange.

C. To about 8 mg add 2 mL of *water R*, 1 mL of *perchloric acid R* and 2 mL of *0.1 M sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 mL of *ammonium molybdate solution R5* and 1 mL of *aminohydroxynaphthalenesulfonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

D. It gives reaction (a) of calcium (*2.3.1*).

TESTS

**pH** (*2.2.3*): 8.1 to 9.6.

Dissolve 20 mg in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): − 11.0 to − 13.0 (anhydrous substance), determined at 405 nm using a mercury lamp.

Dissolve 2.5 g in a 125 g/L solution of *sodium edetate R* previously adjusted to pH 8.5 with *strong sodium hydroxide solution R*, and dilute to 50.0 mL with the same solution.

**Impurity A**: maximum 1.5 per cent.

In a glass-stoppered flask, dissolve 0.200 g in 100.0 mL of *water R*. Add 50 mL of *0.5 M phthalate buffer solution pH 6.4 R* and 5.0 mL of *0.005 M sodium periodate*, close and shake. Allow to stand protected from light for 90 min. Add 10 mL of a freshly prepared 400 g/L solution of *potassium iodide R*, close and shake for 2 min. Titrate with *0.0025 M sodium arsenite* until the yellow colour almost disappears. Add 2 mL of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_7CaO_5P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 97 \times 100}{m(100 - H)} \times 100$$

$m$ = mass of the substance to be examined, in milligrams;

$n_1$ = volume of *0.0025 M sodium arsenite* used in the blank titration, in millilitres;

$n_2$ = volume of *0.0025 M sodium arsenite* used in the titration of the test solution, in millilitres;

$c$ = molarity of the sodium arsenite solution;

$H$ = percentage content of water.

**Chlorides** (*2.4.4*): maximum 0.2 per cent.

Dissolve 0.500 g in *water R*, add 2 mL of *nitric acid R* and dilute to 50 mL with the same acid. To 2.5 mL of this solution add 12.5 mL of *water R*.

**Water** (*2.5.12*): 8.5 per cent to 11.5 per cent, determined on 0.250 g. Use as the solvent a mixture of 1 volume of *pyridine R* and 3 volumes of *ethylene glycol R*.

ASSAY

In a glass-stoppered flask, dissolve 0.120 g in 20.0 mL of *0.1 M sodium periodate*. Add 5 mL of a 50 per cent *V/V* solution of *perchloric acid R* and shake. Heat in a water-bath at 37 °C for 105 min. Add 50 mL of *water R* and immediately adjust to pH 6.4 with a saturated solution of *sodium hydrogen carbonate R*. Add 10 mL of a freshly prepared 400 g/L solution of *potassium iodide R*, close and allow to stand for 2 min. Titrate with *0.1 M sodium arsenite* until the yellow colour almost disappears. Add 2 mL of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_5CaO_4P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 88 \times 100}{m(100 - H)} \times (100 - G)$$

$m$ = mass of the substance to be examined, in milligrams;

$n_1$ = volume of *0.1 M sodium arsenite* used in the blank titration, in millilitres;

$n_2$ = volume of *0.1 M sodium arsenite* used in the titration of the test solution, in millilitres;

$c$ = molarity of the sodium arsenite solution;

$G$ = percentage content of impurity A;

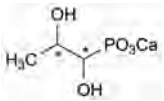
$H$ = percentage content of water.

STORAGE

In an airtight container, protected from light.

IMPURITIES

*Specified impurities*: *A*.

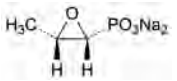


A. calcium (1,2-dihydroxypropyl)phosphonate.

**01/2017:1329**
**corrected 10.0**

# FOSFOMYCIN SODIUM

## Fosfomycinum natricum



$C_3H_5Na_2O_4P$ $M_r$ 182.0
[26016-99-9]

DEFINITION

Disodium (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate.

Substance produced by certain strains of *Streptomyces fradiae* or obtained by any other means.

*Content*: 95.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, very hygroscopic powder.

*Solubility*: very soluble in water, sparingly soluble in methanol, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

*First identification*: *A, D.*

*Second identification*: *B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Preparation*: discs of *potassium bromide R*.
*Comparison*: *Ph. Eur. reference spectrum of fosfomycin sodium*.

B. Dissolve about 0.1 g in 3 mL of a 25 per cent *V/V* solution of *perchloric acid R*. Add 1 mL of *0.1 M sodium periodate* and heat on a water-bath for 30 min. Allow to cool and add 50 mL of *water R*. Neutralise with a saturated solution of *sodium hydrogen carbonate R* and add 1 mL of a freshly prepared 400 g/L solution of *potassium iodide R*. Prepare a blank at the same time and in the same manner. The test solution remains colourless and the blank is orange.

C. To about 8 mg add 2 mL of *water R*, 1 mL of *perchloric acid R* and 2 mL of *0.1 M sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 mL of *ammonium molybdate solution R5* and 1 mL of *aminohydroxynaphthalenesulfonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

D. It gives reaction (a) of sodium (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $B_9$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 9.0 to 10.5.

Dilute 10 mL of solution S to 20 mL with *carbon dioxide-free water R*.

**Specific optical rotation** (*2.2.7*): − 13.0 to − 15.0 (anhydrous substance), determined at 405 nm using a mercury lamp.

Dissolve 2.5 g in *water R* and dilute to 50.0 mL with the same solvent.

**Impurity A**: maximum 1.0 per cent.

In a glass-stoppered flask, dissolve 0.200 g in 100.0 mL of *water R*. Add 50 mL of *0.5 M phthalate buffer solution pH 6.4 R* and 5.0 mL of *0.005 M sodium periodate*, close and shake. Allow to stand protected from light for 90 min. Add 10 mL of a freshly prepared 400 g/L solution of *potassium iodide R*, close and shake for 2 min. Titrate with *0.0025 M sodium arsenite* until the yellow colour almost disappears. Add 2 mL of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_7Na_2O_5P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 100 \times 100}{m(100 - H)} \times 100$$

$m$ = mass of the substance to be examined, in milligrams;

$n_1$ = volume of *0.0025 M sodium arsenite* used in the blank titration, in millilitres;

$n_2$ = volume of *0.0025 M sodium arsenite* used in the titration of the test solution, in millilitres;

$c$ = molarity of the sodium arsenite solution;

$H$ = percentage content of water.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g. Use as the solvent a mixture of 1 volume of *pyridine R* and 3 volumes of *ethylene glycol R*.

**Bacterial endotoxins** (*2.6.14*): less than 0.083 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

In a glass-stoppered flask, dissolve 0.120 g in 20.0 mL of *0.1 M sodium periodate*. Add 5 mL of a 50 per cent *V/V* solution of *perchloric acid R* and shake. Heat in a water-bath at 37 °C for 105 min. Add 50 mL of *water R* and immediately adjust to pH 6.4 with a saturated solution of *sodium hydrogen carbonate R*. Add 10 mL of a freshly prepared 400 g/L solution of *potassium iodide R*, close and allow to stand for 2 min. Titrate with *0.1 M sodium arsenite* until the yellow

colour almost disappears. Add 2 mL of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_5Na_2O_4P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 91 \times 100}{m(100 - H)} \times (100 - G)$$

$m$ = mass of the substance to be examined, in milligrams;

$n_1$ = volume of *0.1 M sodium arsenite* used in the blank titration, in millilitres;

$n_2$ = volume of *0.1 M sodium arsenite* used in the titration of the test solution, in millilitres;

$c$ = molarity of the sodium arsenite solution;

$G$ = percentage content of impurity A;

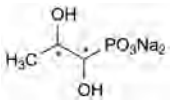
$H$ = percentage content of water.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

IMPURITIES

*Specified impurities*: *A*.

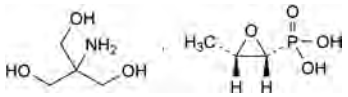


A. disodium (1,2-dihydroxypropyl)phosphonate.

**01/2017:1425**

# FOSFOMYCIN TROMETAMOL

## Fosfomycinum trometamolum



$C_7H_{18}NO_7P$ $M_r$ 259.2

[78964-85-9]

DEFINITION

2-Amino-2-(hydroxymethyl)propane-1,3-diol hydrogen (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: very soluble in water, slightly soluble in ethanol (96 per cent) and in methanol, practically insoluble in acetone.

IDENTIFICATION

*First identification*: *A*.

*Second identification*: *B, C*.

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fosfomycin trometamol CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 50 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 50 mg of *fosfomycin trometamol CRS* in *water R* and dilute to 10 mL with the same solvent.

*Plate*: *cellulose for chromatography R* as the coating substance.

*Mobile phase*: *concentrated ammonia R*, *water R*, *2-propanol R* (10:20:70 *V/V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in a current of warm air.

*Detection*: expose to iodine vapour until the spots appear.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. To about 15 mg add 2 mL of *water R*, 1 mL of *perchloric acid R* and 2 mL of *0.1 M sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 mL of *ammonium molybdate solution R5* and 1 mL of *aminohydroxynaphthalenesulfonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

TESTS

**Solution S**. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**pH** (*2.2.3*): 3.5 to 5.5 for solution S.

**Specific optical rotation** (*2.2.7*): – 13.5 to – 12.5 (anhydrous substance), determined on solution S at 365 nm using a mercury lamp.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 0.600 g of the substance to be examined in the mobile phase and dilute to 5.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 0.600 g of *fosfomycin trometamol CRS* in the mobile phase and dilute to 5.0 mL with the mobile phase.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 3.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (c).* Wet 0.3 g of the substance to be examined with 60 µL of *water R* and heat in an oven at 60 °C for 24 h. Dissolve the residue in the mobile phase and dilute to 20.0 mL with the mobile phase (solution A). Dissolve 0.6 g of the substance to be examined in solution A and dilute to 5.0 mL with the same solution (*in situ* degradation to obtain impurities A, B, C and D).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: 10.89 g/L solution of *potassium dihydrogen phosphate R* in *water for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Detection*: differential refractometer at 35 °C.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: twice the retention time of fosfomycin.

*Relative retention* with reference to fosfomycin (retention time = about 9 min): trometamol (2 peaks) = about 0.3; impurity B = about 0.48; impurity C = about 0.54; impurity A = about 0.88; impurity D = about 1.27.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity A and fosfomycin,

– *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B.

*Limits*:

– *impurities A, B*: for each impurity, not more than the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.3 per cent),
– *impurities C, D*: for each impurity, not more than 0.33 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *unspecified impurities*: for each impurity, not more than 0.33 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total*: not more than 1.67 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.17 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the 2 peaks due to trometamol.

**Phosphates**: maximum 500 ppm.

Dissolve 0.1 g in 3 mL of *dilute nitric acid R* and dilute to 10 mL with *water R*. To 5 mL of this solution add 5 mL of *water R* and 5 mL of *molybdovanadic reagent R*. Shake vigorously. After 5 min, any colour in the test solution is not more intense than that in a standard prepared at the same time in the same manner, using 5 mL of *phosphate standard solution (5 ppm $PO_4$) R*.

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 0.500 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: 5 µL of the test solution and reference solution (a).

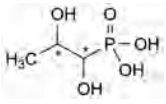
Calculate the percentage content of $C_7H_{18}NO_7P$ from the areas of the peaks due to fosfomycin and the declared content of *fosfomycin trometamol CRS*.

STORAGE

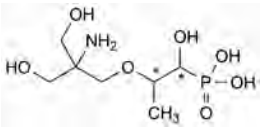
In an airtight container.

IMPURITIES

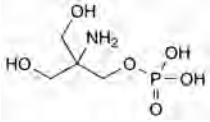
*Specified impurities: A, B, C, D.*



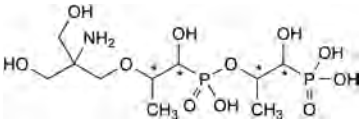
A. (1,2-dihydroxypropyl)phosphonic acid,



B. [2-[2-amino-3-hydroxy-2-(hydroxymethyl)propoxy]-1-hydroxypropyl]phosphonic acid,



C. 2-amino-3-hydroxy-2-(hydroxymethyl)propyl dihydrogen phosphate (trometamol phosphoric acid monoester),

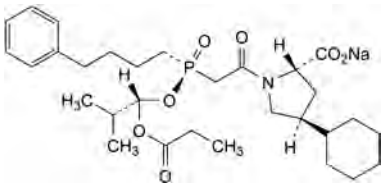


D. [2-[[[2-[2-amino-3-hydroxy-2-(hydroxymethyl)propoxy]-1-hydroxypropyl]hydroxyphosphoryl]oxy]-1-hydroxypropyl]phosphonic acid (trometamoyloxy fosfomycin dimer).

**01/2017:1751**

# FOSINOPRIL SODIUM

## Fosinoprilum natricum



$C_{30}H_{45}NNaO_7P$ $M_r$ 585.7
[88889-14-9]

DEFINITION

Sodium (2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-pyrrolidine-2-carboxylate.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, sparingly soluble in anhydrous ethanol, practically insoluble in hexane.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): – 6.7 to – 4.7 (anhydrous substance).
Dissolve 0.500 g in *methanol R* and dilute to 25.0 mL with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *fosinopril sodium CRS*.
If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in a 2 per cent *V/V* solution of *water R* in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. It gives reaction (a) of sodium (*2.3.1*).

TESTS

**Related substances**

A. Liquid chromatography (*2.2.29*).
*Test solution*. Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase. Sonicate until dissolution is complete.
*Reference solution (a)*. Dissolve 2 mg of the substance to be examined, 2 mg of *fosinopril impurity A CRS*, 2 mg of *fosinopril impurity B CRS*, 2 mg of *fosinopril impurity I CRS* and 2 mg of *fosinopril impurity K CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 50.0 mL with the mobile phase.
*Reference solution (b)*. Dilute 1.0 mL of the test solution to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (c).* Dilute 5.0 mL of reference solution (b) to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.15 m, Ø = 3.9 mm;
- *stationary phase*: *silica gel for chromatography R* (5 µm);
- *temperature*: 33 °C.

*Mobile phase*: *phosphoric acid R*, *water R*, *acetonitrile R1* (0.05:0.35:100 *V/V/V*).

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL.

*Run time*: 4 times the retention time of fosinopril.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, I and K.

*Relative retention* with reference to fosinopril (retention time = about 5 min): impurity K = about 0.3; impurity I = about 0.5; impurities B, E and H = about 0.7; impurity A = about 2.0.

*System suitability*:

- *resolution*: minimum 2.0 between the peaks due to impurity B and fosinopril in the chromatogram obtained with reference solution (a);
- *signal-to-noise ratio*: minimum 40 for the principal peak in the chromatogram obtained with reference solution (c).

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity I by 1.3;
- *sum of impurities B, E and H*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *impurity A*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *impurities I, K*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent).

B. Impurities C and D. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase. Sonicate until dissolution is complete.

*Reference solution (a).* Dissolve 5 mg of the substance to be examined and 5.0 mg of *fosinopril impurity C CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase. Dilute 10.0 mL of the solution to 50.0 mL with the mobile phase.

*Reference solution (b).* Dilute 5.0 mL of reference solution (a) to 50.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 5.0 mg of *fosinopril impurity D CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase. Dilute 10.0 mL of the solution to 50.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 50.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (5 µm);
- *temperature*: 45 °C.

*Mobile phase*: *phosphoric acid R*, *water R*, *acetonitrile R1* (0.2:1.5:400 *V/V/V*).

*Flow rate*: 0.9 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of fosinopril.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity C; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity D.

*Relative retention* with reference to fosinopril (retention time = about 10 min): impurity C = about 1.2; impurity D = about 1.3.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to fosinopril and impurity C.

*Limits*:

- *impurity C*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity D*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent).

C. Impurities E and F. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 50.0 mL with the mobile phase.

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 20.0 mL with the mobile phase.

*Reference solution (c).* Dissolve the contents of a vial of *fosinopril impurity mixture CRS* (containing impurities E and F) in 1.0 mL of reference solution (a).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *phenylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 45 °C.

*Mobile phase*: 0.2 per cent *V/V* solution of *phosphoric acid R*, *acetonitrile R1* (44:56 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 205 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: 3 times the retention time of fosinopril.

*Identification of impurities*: use the chromatogram supplied with *fosinopril impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities E and F.

*Relative retention* with reference to fosinopril (retention time = about 8 min): impurity E = about 0.8; impurity F = about 0.9.

*System suitability*: reference solution (c):

- *resolution*: minimum 1.5 between the peaks due to impurity F and fosinopril.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity E by 0.7;
- *impurity F*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity E*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

**2-Ethylhexanoic acid** (*2.4.28*): maximum 0.2 per cent *m/m*.

**Water** (*2.5.12*): maximum 0.2 per cent, determined on 1.00 g.

ASSAY

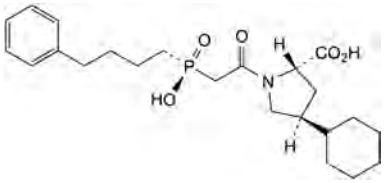
Dissolve 0.450 g in 50 mL of *water R*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M hydrochloric acid* is equivalent to 58.57 mg of $C_{30}H_{45}NNaO_7P$.

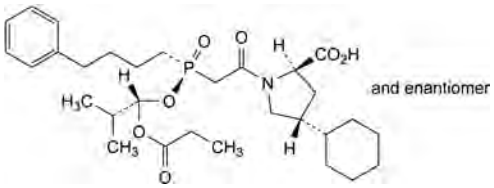
IMPURITIES

*Specified impurities*: *A, B, C, D, E, F, H, I, K.*

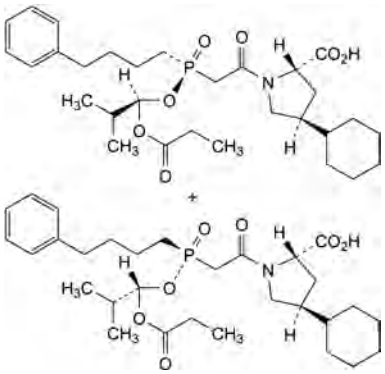
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *N.*



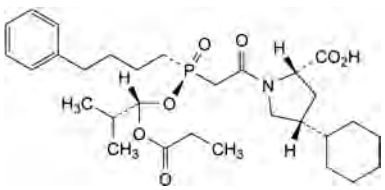
A. (2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-hydroxy(4-phenylbutyl)-phosphoryl]acetyl]pyrrolidine-2-carboxylic acid,



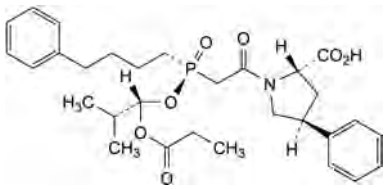
B. (2*RS*,4*RS*)-4-cyclohexyl-1-[[(*RS*)-[(1*SR*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-pyrrolidine-2-carboxylic acid,



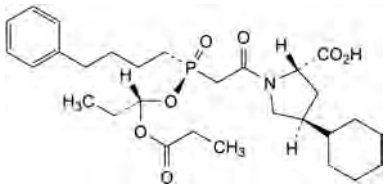
C. mixture of (2*S*,4*S*)-4-cyclohexyl-1-[[(*S*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)-phosphoryl]acetyl]pyrrolidine-2-carboxylic acid and (2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-[(1*R*)-2-methyl-1-(1-oxo-propoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-pyrrolidine-2-carboxylic acid,



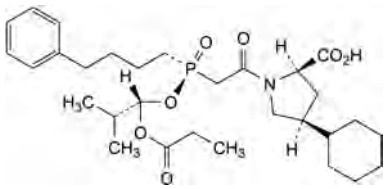
D. (2*S*,4*R*)-4-cyclohexyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxo-propoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-pyrrolidine-2-carboxylic acid,



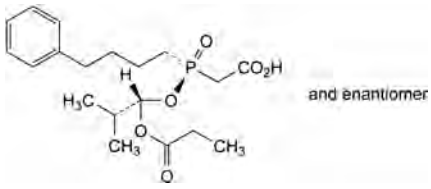
E. (2*S*,4*S*)-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)propoxy]-(4-phenylbutyl)phosphoryl]acetyl]-4-phenylpyrrolidine-2-carboxylic acid (phenylfosinopril),



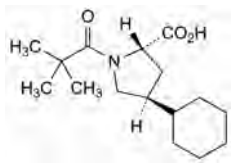
F. (2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-(4-phenylbutyl)[(1*S*)-1-(1-oxopropoxy)propoxy]phosphoryl]acetyl]pyrrolidine-2-carboxylic acid,



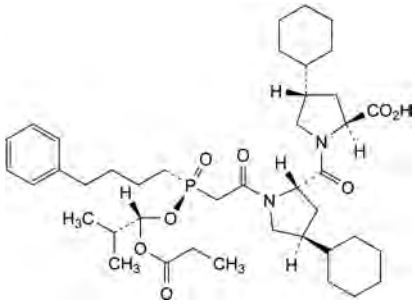
H. (2*R*,4*S*)-4-cyclohexyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxo-propoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]-pyrrolidine-2-carboxylic acid,



I. [(*RS*)-[(1*SR*)-2-methyl-1-(1-oxopropoxy)propoxy]-(4-phenylbutyl)phosphoryl]acetic acid,



K. (2*S*,4*S*)-4-cyclohexyl-1-(2,2-dimethyl-1-oxopropyl)-pyrrolidine-2-carboxylic acid,



N. (2*S*,4*S*)-4-cyclohexyl-1-[[(2*S*,4*S*)-4-cyclohexyl-1-[[(*R*)-[(1*S*)-2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphoryl]acetyl]pyrrolidin-2-yl]-carbonyl]pyrrolidine-2-carboxylic acid.

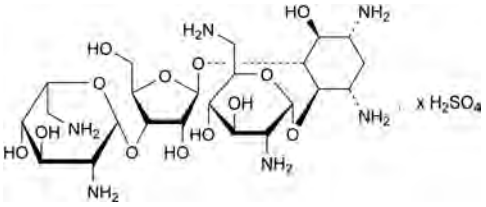
# FRAMYCETIN SULFATE

## Framycetini sulfas



$C_{23}H_{46}N_6O_{13},xH_2SO_4$ $M_r$ 615 (base)
[4146-30-9]

DEFINITION

Sulfate of 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin B).

Substance produced by the growth of selected strains of *Streptomyces fradiae* or *Streptomyces decaris* or obtained by any other means.

*Content*: minimum of 630 IU/mg (dried substance).

CHARACTERS

*Appearance*: white or yellowish-white powder, hygroscopic.

*Solubility*: freely soluble in water, very slightly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for related substances.

*Results*:

- the retention time of the principal peak in the chromatogram obtained with the test solution is approximately the same as that of the principal peak in the chromatogram obtained with reference solution (a),
- it complies with the limit given for impurity C.

B. It gives reaction (a) of sulfates (*2.3.1*).

TESTS

**pH** (*2.2.3*): 6.0 to 7.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 52.5 to + 55.5 (dried substance).

Dissolve 1.00 g in *water R* and dilute to 10.0 mL with the same solvent

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dissolve the contents of a vial of *framycetin sulfate CRS* in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.5 mg/mL.

*Reference solution (b).* Dilute 3.0 mL of reference solution (a) to 100.0 mL with the mobile phase.

*Reference solution (c).* Dilute 1.0 mL of reference solution (a) to 100.0 mL with the mobile phase.

*Reference solution (d).* Dissolve the contents of a vial of *neamine CRS* (corresponding to 0.5 mg) in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (e).* Dissolve 10 mg of *neomycin sulfate CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 25 °C.

*Mobile phase*: mix 20.0 mL of *trifluoroacetic acid R*, 6.0 mL of *carbonate-free sodium hydroxide solution R* and 500 mL of *water R*, allow to equilibrate, dilute to 1000 mL with *water R* and degas.

*Flow rate*: 0.7 mL/min.

*Post-column solution*: *carbonate-free sodium hydroxide solution R* diluted 1 in 25 previously degassed, which is added pulse-less to the column effluent using a 375 µL polymeric mixing coil.

*Flow rate*: 0.5 mL/min.

*Detection*: pulsed amperometric detector with a gold working electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively 0.00 V detection, + 0.80 V oxidation and – 0.60 V reduction potentials, with pulse durations according to the instrument used.

*Injection*: 10 µL.

*Run time*: 1.5 times the retention time of neomycin B.

*Relative retention* with reference to neomycin B (retention time = about 10 min): impurity A = about 0.65; impurity C = about 0.9; impurity G = about 1.1.

*System suitability*:

- *resolution*: minimum 2.0 between the peaks due to impurity C and to neomycin B in the chromatogram obtained with reference solution (e); if necessary, adjust the volume of the carbonate-free sodium hydroxide solution in the mobile phase,
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (c).

*Limits*:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) and taking into account the declared content of *neamine CRS* (1.0 per cent),
- *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- *total of other impurities*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

**Sulfate**: 27.0 per cent to 31.0 per cent (dried substance).

Dissolve 0.250 g in 100 mL of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 mL of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 mL of *alcohol R* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 mL of *0.1 M barium chloride* is equivalent to 9.606 mg of $SO_4$.

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

**Sulfated ash** (*2.4.14*): maximum 1.0 per cent, determined on 1.0 g.

**Sterility** (*2.6.1*). If intended for introduction into body cavities without a further appropriate sterilisation procedure, it complies with the test for sterility.

**Bacterial endotoxins** (*2.6.14, Method D*): less than 1.3 IU/mg if intended for introduction into body cavities without a further appropriate procedure for the removal of bacterial endotoxins.

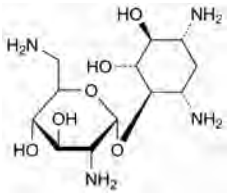
ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*). Use *framycetin sulfate CRS* as the reference substance.

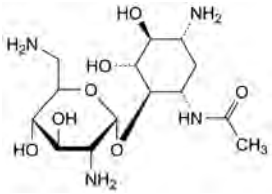
STORAGE

In an airtight container, protected from light. If the substance is intended for introduction into body cavities, store in a sterile, tamper-evident container.

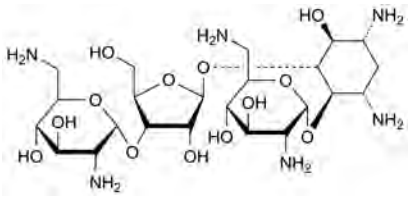
IMPURITIES



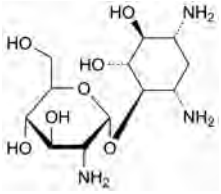
A. 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (neamine or neomycin A-LP),



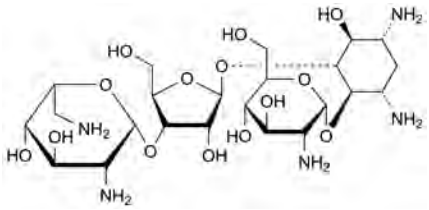
B. 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (3-acetylneamine),



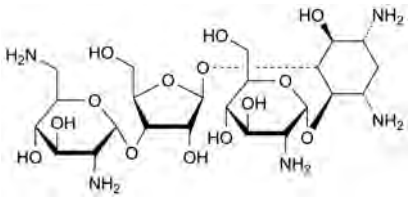
C. 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin C),



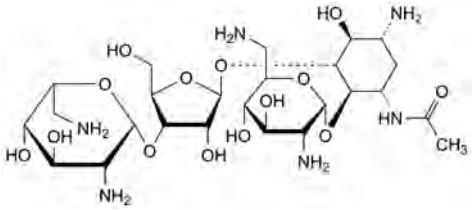
D. 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-D-streptamine (paromamine or neomycin D),



E. 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (paromomycin I or neomycin E),



F. 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-β-D-ribofuranosyl]-D-streptamine (paromomycin II or neomycin F),

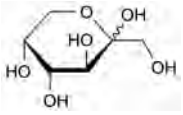


G. 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin B-LP).

**07/2019:0188**

# FRUCTOSE

## Fructosum



$C_6H_{12}O_6$ $M_r$ 180.2

[57-48-7]

DEFINITION

D-*arabino*-Hex-2-ulopyranose (levulose).

The substance described in this monograph is not necessarily suitable for parenteral administration.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *water R*, *methanol R* (2:3 *V/V*).

*Test solution*. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 10 mg of *fructose CRS* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (b)*. Dissolve 10 mg of *fructose R*, 10 mg of *glucose R*, 10 mg of *lactose monohydrate R* and 10 mg of *sucrose R* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *water R*, *methanol R*, *anhydrous acetic acid R*, *ethylene chloride R* (10:15:25:50 *V/V/V/V*). Measure the volumes accurately since a slight excess of water produces cloudiness.

*Application*: 2 µL; thoroughly dry the points of application.

*Development A*: over 3/4 of the plate.

*Drying A*: in a current of warm air.

*Development B*: immediately, over 3/4 of the plate, after renewing the mobile phase.

*Drying B*: in a current of warm air.

*Detection*: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol (96 per cent) R*. Heat at 130 °C for 10 min.

*System suitability*: reference solution (b):

– the chromatogram shows 4 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

B. Dissolve 0.1 g in 10 mL of *water R*. Add 3 mL of *cupri-tartaric solution R* and heat. A red precipitate is formed.

C. To 1 mL of solution S (see Tests) add 9 mL of *water R*. To 1 mL of the solution add 5 mL of *hydrochloric acid R* and heat to 70 °C. A brown colour develops.

D. Dissolve 5 g in *water R* and dilute to 10 mL with the same solvent. To 0.5 mL of the solution add 0.2 g of *resorcinol R* and 9 mL of *dilute hydrochloric acid R* and heat on a water-bath for 2 min. A red colour develops.

TESTS

**Solution S**. Dissolve 10.0 g in *distilled water R* and dilute to 100 mL with the same solvent.

**Appearance of solution**. Dissolve 5.0 g in *water R* and dilute to 10 mL with the same solvent. The solution is clear (*2.2.1*). Add 10 mL of *water R*. The solution is colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. Dissolve 6.0 g in 25 mL of *carbon dioxide-free water R* and add 0.3 mL of *phenolphthalein solution R*. The solution is colourless. Not more than 0.15 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Specific optical rotation** (*2.2.7*): – 93.5 to – 91.0 (anhydrous substance).

Dissolve 10.0 g in 80 mL of *water R*, add 0.2 mL of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 mL with *water R*.

**Foreign sugars**. Dissolve 5.0 g in *water R* and dilute to 10 mL with the same solvent. To 1 mL of the solution add 9 mL of *ethanol (96 per cent) R*. Any opalescence in the solution is not more intense than that in a mixture of 1 mL of the initial solution and 9 mL of *water R*.

**5-Hydroxymethylfurfural and related compounds**. To 5 mL of solution S add 5 mL of *water R*. The absorbance (*2.2.25*) measured at 284 nm is not greater than 0.32.

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

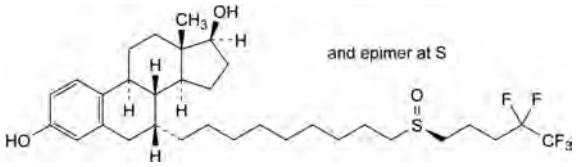
**Sulfated ash** : maximum 0.1 per cent.

Dissolve 5.0 g in 10 mL of *water R*, add 2 mL of *sulfuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass.

**01/2017:2443**
**corrected 10.0**

# FULVESTRANT

## Fulvestrantum



$C_{32}H_{47}F_5O_3S$ $M_r$ 607
[129453-61-8]

DEFINITION

7α-[9-[(*RS*)-(4,4,5,5,5-Pentafluoropentyl)sulfinyl]nonyl]estra-1,3,5(10)-triene-3,17β-diol.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

Carry out either tests A, B or tests B, C.

A. Specific optical rotation (*2.2.7*): + 108 to + 115 (anhydrous substance), measured at 365 nm at a temperature of 25 °C.
Dissolve 0.50 g in *methanol R* and dilute to 25.0 mL with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *fulvestrant CRS*.

C. Stereochemical purity (see Tests).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*).
Dissolve 0.1 g in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in *methanol R1* and dilute to 5.0 mL with the same solvent.

*Reference solution (a).* Dissolve 50.0 mg of *fulvestrant CRS* in *methanol R1* and dilute to 5.0 mL with the same solvent.

*Reference solution (b).* Dissolve 10 mg of *fulvestrant for system suitability CRS* (containing impurities A, B, C, D and F) in 1.0 mL of *methanol R1*.

*Reference solution (c).* Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R1*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R1*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (3.5 µm);
– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: *methanol R2*, *acetonitrile R1*, *water for chromatography R* (27:32:41 *V/V/V*);
– *mobile phase B*: *water for chromatography R*, *methanol R2*, *acetonitrile R1* (10:41:49 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 25 | 100 | 0 |
| 25 - 55 | 100 → 0 | 0 → 100 |
| 55 - 65 | 0 | 100 |

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 225 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram supplied with *fulvestrant for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C, D and F.

*Relative retention* with reference to fulvestrant (retention time = about 23 min): impurity F = about 0.4; impurity A = about 1.1; impurity B = about 1.2; impurity C = about 1.7; impurity D = about 1.9.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to fulvestrant and impurity A.

*Calculation of percentage contents*:

– *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 0.7; impurity F = 0.3;
– for each impurity, use the concentration of fulvestrant in reference solution (c).

*Limits*:

– *impurity D*: maximum 0.6 per cent;
– *impurity C*: maximum 0.3 per cent;
– *impurity B*: maximum 0.2 per cent;
– *impurity F*: maximum 0.15 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 1.0 per cent;
– *reporting threshold*: 0.05 per cent.

**Stereochemical purity**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 mL with the mobile phase.

*Reference solution.* Dissolve 5 mg of *fulvestrant CRS* in the mobile phase and dilute to 5 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *amylose derivative of silica gel for chiral separation R* (5 µm);
– *temperature*: 25 °C.

*Mobile phase*: *propanol R1*, *heptane R* (15:85 *V/V*).

*Flow rate*: 0.9 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of fulvestrant epimer B.

*Identification of peaks*: use the chromatogram supplied with *fulvestrant CRS* and the chromatogram obtained with the reference solution to identify the peaks due to fulvestrant epimers A and B.

*Relative retention* with reference to fulvestrant epimer B (retention time = about 18 min): fulvestrant epimer A = about 1.2.

*System suitability*: reference solution:

– *resolution*: minimum 2.0 between the peaks due to fulvestrant epimer B and fulvestrant epimer A.

*Limit*:

– *fulvestrant epimer A*: 42 per cent to 48 per cent;
– *fulvestrant epimer B*: 52 per cent to 58 per cent.

**Water** (*2.5.32*): maximum 0.5 per cent, determined on 50 mg.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

**Bacterial endotoxins** (*2.6.14*): less than 1.25 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

*Test solution.* Dissolve 0.1 g of the substance to be examined in 1 mL of *ethanol (96 per cent) R* and dilute to 80 mL with water for BET.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{32}H_{47}F_5O_3S$ taking into account the assigned content of *fulvestrant CRS*.

STORAGE

Protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

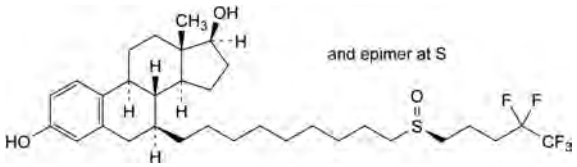
LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

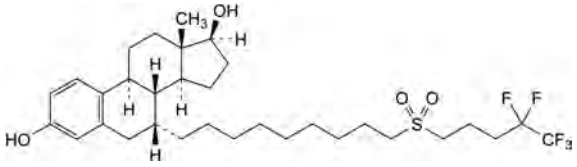
IMPURITIES

*Specified impurities: B, C, D, F.*

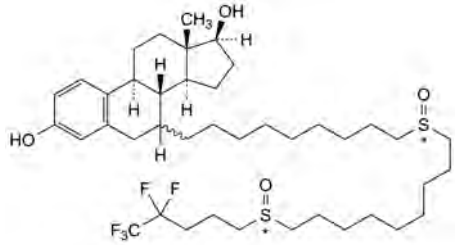
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, E.*



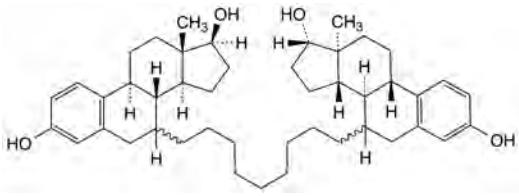
A. 7β-[9-[(*RS*)-(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-estra-1,3,5(10)-triene-3,17β-diol (7β-fulvestrant),



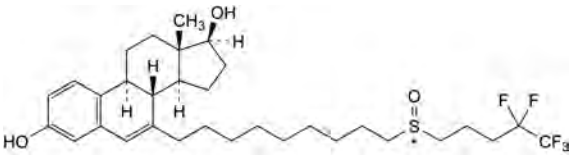
B. 7α-[9-[(4,4,5,5,5-pentafluoropentyl)sulfonyl]nonyl]estra-1,3,5(10)-triene-3,17β-diol,



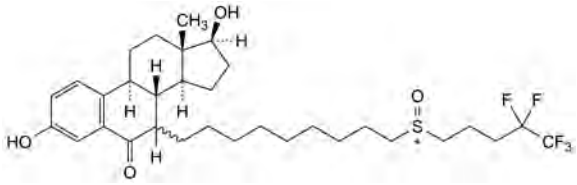
C. 7ξ-[9-[[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]-sulfinyl]nonyl]estra-1,3,5(10)-triene-3,17β-diol,



D. 7ξ,7′ξ-nonane-1,9-diylbis[estra-1,3,5(10)-triene-3,17β-diol],



E. 7-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]estra-1,3,5(10),6-tetraene-3,17β-diol (Δ6-fulvestrant),

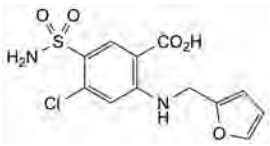


F. 3,17β-dihydroxy-7ξ-[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]estra-1,3,5(10)-trien-6-one (6-keto-fulvestrant).

**04/2018:0391**

# FUROSEMIDE

## Furosemidum



$C_{12}H_{11}ClN_2O_5S$ $M_r$ 330.7
[54-31-9]

DEFINITION

4-Chloro-2-[[(furan-2-yl)methyl]amino]-5-sulfamoylbenzoic acid.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, soluble in acetone, sparingly soluble in ethanol (96 per cent), practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification*: *B*.

*Second identification*: *A*.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 20 mg of the substance to be examined in 1 mL of *methanol R*.

*Reference solution*. Dissolve 20 mg of *furosemide CRS* in 1 mL of *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (5:45:50 *V/V/V*).

*Application*: 2 µL; the volume may be adapted according to the type of plate used.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

*Detection B*: treat with *ninhydrin solution R*, dry at 100-105 °C until the spots appear and examine in daylight.

*Results B*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *furosemide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ (*2.2.2, Method II*).

Dissolve 0.5 g in *0.5 M sodium hydroxide* and dilute to 10.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

*Test solution.* Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 2 mg of *furosemide impurity A CRS* in the mobile phase, add 2.0 mL of the test solution and dilute to 20.0 mL with the mobile phase. Dilute 0.5 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 2 mg of *furosemide for peak identification CRS* (containing impurities C and D) in 2.0 mL of the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 2.0 g of *potassium dihydrogen phosphate R* and 2.5 g of *cetrimide R* in 700 mL of *water for chromatography R*, adjust to pH 7.0 with *ammonia R* and add 300 mL of *propanol R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 238 nm.

*Injection*: 20 µL.

*Run time*: 3 times the retention time of furosemide.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity A; use the chromatogram supplied with *furosemide for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities C and D.

*Relative retention* with reference to furosemide (retention time = about 9 min): impurity C = about 0.5; impurity A = about 0.8; impurity D = about 1.5.

*System suitability*:

- *resolution*: minimum 4.0 between the peaks due to impurity A and furosemide in the chromatogram obtained with reference solution (a);
- *signal-to-noise ratio*: minimum 40 for the principal peak in the chromatogram obtained with reference solution (b).

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 1.4; impurity D = 2.0;
- *impurity C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurity D*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 200 ppm.

To 0.5 g add a mixture of 0.2 mL of *nitric acid R* and 30 mL of *water R* and shake for 5 min. Allow to stand for 15 min and filter.

**Sulfates** (*2.4.13*): maximum 300 ppm.

To 1.0 g add a mixture of 0.2 mL of *acetic acid R* and 30 mL of *distilled water R* and shake for 5 min. Allow to stand for 15 min and filter.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 40 mL of *dimethylformamide R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 33.07 mg of $C_{12}H_{11}ClN_2O_5S$.

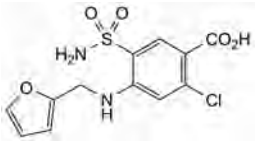
STORAGE

Protected from light.

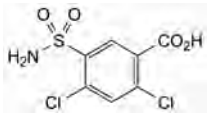
IMPURITIES

*Specified impurities: C, D.*

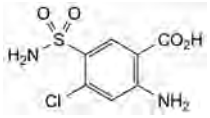
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, E, F.*



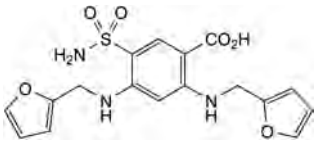
A. 2-chloro-4-[[(furan-2-yl)methyl]amino]-5-sulfamoylbenzoic acid,



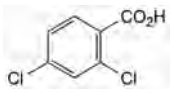
B. 2,4-dichloro-5-sulfamoylbenzoic acid,



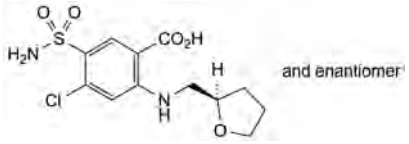
C. 2-amino-4-chloro-5-sulfamoylbenzoic acid,



D. 2,4-bis[[(furan-2-yl)methyl]amino]-5-sulfamoylbenzoic acid,



E. 2,4-dichlorobenzoic acid,



F. 4-chloro-5-sulfamoyl-2-[[[(2*RS*)-oxolan-2-yl]methyl]amino]benzoic acid.

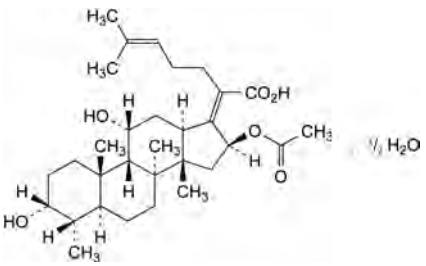
# FUSIDIC ACID

## Acidum fusidicum



$C_{31}H_{48}O_6,½H_2O$ $M_r$ 525.7

[6990-06-3]

DEFINITION

*ent*-(17*Z*)-16α-(Acetyloxy)-3β,11β-dihydroxy-4β,8,14-trimethyl-18-nor-5β,10α-cholesta-17(20),24-dien-21-oic acid hemihydrate.

Antimicrobial substance produced by fermentation of certain strains of *Fusidium coccineum* or by any other means.

*Content*: 97.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *fusidic acid CRS*.

B. Ignite 1 g. The residue does not give reaction (a) of sodium (*2.3.1*).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture*: *methanol R*, 5 g/L solution of *phosphoric acid R*, *acetonitrile R* (10:40:50 *V/V/V*).

*Test solution*. Dissolve 25 mg of the substance to be examined in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 2 mg of *fusidic acid for peak identification CRS* (containing impurities A, B, C, D, F, G, H and N) in the solvent mixture and dilute to 1.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 10.0 mL with the solvent mixture.

*Reference solution (d)*. Dissolve the contents of a vial of *fusidic acid impurity mixture CRS* (containing impurities I, K, L and M) in 1.0 mL of the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3.5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *methanol R*, *acetonitrile R*, 5 g/L solution of *phosphoric acid R* (20:40:40 *V/V/V*);
- *mobile phase B*: 5 g/L solution of *phosphoric acid R*, *methanol R*, *acetonitrile R* (10:20:70 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 100 | 0 |
| 3 - 28 | 100 → 0 | 0 → 100 |
| 28 - 33 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *fusidic acid for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, C, D, F, G, H and N; use the chromatogram supplied with *fusidic acid impurity mixture CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities I, K, L and M.

*Relative retention* with reference to fusidic acid (retention time = about 18 min): impurity A = about 0.4; impurity B = about 0.5; impurity C = about 0.6; impurity D = about 0.63; impurity N = about 0.65; impurity F = about 0.7; impurity G = about 0.82; impurity H = about 0.85; impurity I = about 0.96; impurity K = about 1.18; impurity L = about 1.23; impurity M = about 1.4.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to impurities G and H.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 0.7; impurity D = 0.7; impurity F = 0.3; impurity I = 0.6; impurity K = 0.6;
- *impurity M*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *impurity G*: not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent);
- *impurity L*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *impurity B*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.4 per cent);
- *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent);
- *impurities C, D, F, I, K, N*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

**Water** (*2.5.12*): 1.4 per cent to 2.0 per cent, determined on 0.50 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 10 mL of *ethanol (96 per cent) R*. Add 0.5 mL of *phenolphthalein solution R*. Titrate with *0.1 M sodium hydroxide* until a pink colour is obtained.

1 mL of *0.1 M sodium hydroxide* is equivalent to 51.67 mg of $C_{31}H_{48}O_6$.

STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

IMPURITIES

*Specified impurities: A, B, C, D, F, G, I, K, L, M, N.*

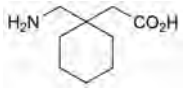
# GABAPENTIN

## Gabapentinum



$C_9H_{17}NO_2$ $M_r$ 171.2
[60142-96-3]

DEFINITION

[1-(Aminomethyl)cyclohexyl]acetic acid.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: sparingly soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride. It dissolves in dilute acids and dilute solutions of alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *gabapentin CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.50 g in a mixture of 0.5 mL of *acetic acid R*, 19.5 mL of *methanol R* and 30 mL of *water R*.

**pH** (*2.2.3*): 6.5 to 7.5.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Related substances**

A. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solution A*. Dissolve 2.32 g of *ammonium dihydrogen phosphate R* in 950 mL of *water R*, adjust to pH 2.0 with *phosphoric acid R*, and dilute to 1000 mL with *water R*.

*Buffer solution*. Dissolve 0.58 g of *ammonium dihydrogen phosphate R* and 1.83 g of *sodium perchlorate R* in 950 mL of *water for chromatography R*, adjust to pH 1.8 with *perchloric acid R*, and dilute to 1000 mL with *water for chromatography R*.

*Test solution*. Dissolve 0.140 g of the substance to be examined in solution A and dilute to 10.0 mL with solution A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 7.0 mg of *gabapentin impurity A CRS* and 10 mg of *gabapentin impurity B CRS* in *methanol R1* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with solution A.

*Reference solution (c)*. Dissolve 0.140 g of *gabapentin CRS* in solution A and dilute to 10.0 mL with solution A.

*Reference solution (d)*. Dissolve 7.0 mg of *gabapentin impurity D CRS* in 25 mL of *methanol R1* and dilute to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: *acetonitrile R1*, buffer solution (24:76 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (b).

*Run time*: 4 times the retention time of gabapentin.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A and B.

*Relative retention* with reference to gabapentin (retention time = about 4 min): impurity A = about 2.4; impurity B = about 2.8.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.3 between the peaks due to impurities A and B.

To avoid memory effects between 2 chromatograms, the column may be washed using *acetonitrile R1*.

*Limits*:

- *impurity A*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply for this test.

B. Liquid chromatography (*2.2.29*) as described in test A for related substances with the following modifications.

*Mobile phase*: *methanol R2*, *acetonitrile R1*, buffer solution (30:35:35 *V/V/V*).

*Injection*: 20 µL of the test solution and reference solution (d).

*Run time*: 1.2 times the retention time of impurity D.

*Retention time*: impurity D = about 10 min.

*Limits*:

- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent);
- *disregard limit*: 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.03 per cent); disregard any peak with a relative retention of not more than 0.4 with reference to impurity D.

*Limit*:

- *total for tests A and B*: maximum 0.5 per cent.

**Chlorides**: maximum 100 ppm.

Dissolve 1.5 g in a mixture of 0.5 mL of *acetic acid R*, 19.5 mL of *methanol R* and 30 mL of *water R*. Titrate with *0.001 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.001 M silver nitrate* is equivalent to 0.03545 mg of chlorides.

**Water** (*2.5.32*): maximum 0.3 per cent, determined on 1.000 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in test A for related substances with the following modification.

*Injection*: 20 µL of the test solution and reference solution (c).

*System suitability*: reference solution (c):

– *symmetry factor*: maximum 5.0 for the peak due to gabapentin.

Calculate the percentage content of $C_9H_{17}NO_2$ taking into account the assigned content of *gabapentin CRS*.

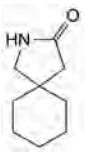
IMPURITIES

**Test A for related substances**: A, B, E, G.

**Test B for related substances**: D.

*Specified impurities: A.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, D, E, G.*



A. 2-azaspiro[4.5]decan-3-one,

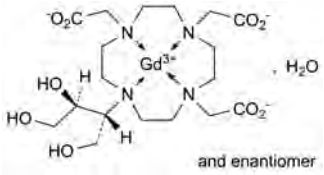
# GADOBUTROL MONOHYDRATE

## Gadobutrolum monohydricum



$C_{18}H_{31}GdN_4O_9,H_2O$ $M_r$ 623
[198637-52-4]

DEFINITION

Gadolinium 2,2′,2″-[10-[(1*RS*,2*SR*)-2,3-dihydroxy-1-(hydroxymethyl)propyl]-1,4,7,10-tetraazacyclododecane-1,4,7-triyl]triacetate monohydrate.

*Content*:

– *gadobutrol*: 97.5 per cent to 102.5 per cent (anhydrous substance);
– *gadolinium*: 98.0 per cent to 102.0 per cent, calculated as gadobutrol (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: freely soluble in water, practically insoluble in anhydrous ethanol and in heptane.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *gadobutrol monohydrate CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in 0.5 mL of *water R*, then add 5 mL of *anhydrous ethanol R*; evaporate to dryness and record new spectra using the residues.

B. Inductively coupled plasma-atomic emission spectrometry (*2.2.57*) as described in the assay for gadolinium.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*).

Dissolve 6.0 g in *water R* and dilute to 10.0 mL with the same solvent. Sonicate if necessary.

**Specific optical rotation** (*2.2.7*): – 0.05 to + 0.05 (anhydrous substance), using an instrument with a minimum sensitivity of ± 0.002°.

Dissolve 6.00 g in *water R* and dilute to 20.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Use suitable plastic labware for the preparation of the solutions and plastic vials. Store the solutions at 10 °C and use them within 42 h.*

*Test solution (a).* Dissolve 50.0 mg of the substance to be examined in mobile phase A and dilute to 5.0 mL with mobile phase A.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 10.0 mL with mobile phase A.

*Reference solution (a).* Dissolve 10 mg of *gadobutrol for peak identification CRS* (containing impurity C) in 1 mL of mobile phase A.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 20.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 100.0 mL with mobile phase A.

*Reference solution (c).* Dissolve 50.0 mg of *gadobutrol monohydrate CRS* in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped phenylhexylsilyl silica gel for chromatography R* (3 µm) with a pore size of 10 nm.

*Temperature*:

– *autosampler*: 10 °C;

– *column*: 50 °C.

*Mobile phase*:

– *mobile phase A*: mix 5 volumes of *acetonitrile R1* and 995 volumes of *water for chromatography R* previously adjusted to pH 3.6 with a 50 per cent *V/V* solution of *anhydrous formic acid R* in *water for chromatography R*;

– *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 100 | 0 |
| 15 - 30 | 100 → 75 | 0 → 25 |

*Flow rate*: 1.0 mL/min.

*Detection*: charged aerosol detector at 100 pA.

*Injection*: 40 µL of test solution (a) and reference solutions (a) and (b).

*Identification of impurities*: use the chromatogram supplied with *gadobutrol for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peak due to impurity C.

*Relative retention* with reference to gadobutrol (retention time = about 11 min): impurity C = about 1.2.

*System suitability*: reference solution (a):

– *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to gadobutrol.

*Calculation of percentage contents*:

– for each impurity, use the concentration of gadobutrol monohydrate in reference solution (b).

*Limits*:

– *unspecified impurities*: for each impurity, maximum 0.05 per cent;

– *total*: maximum 0.3 per cent;

– *reporting threshold*: 0.03 per cent.

**Free gadolinium**: maximum 0.01 per cent (anhydrous substance).

*Solution A*. To 30.0 mL of *sodium acetate buffer solution pH 5.0 R* add 3.0 mL of *xylenol orange solution R* and dilute to 200.0 mL with *water R*.

*Gadolinium sulfate solution.* Dissolve 93.35 mg of *gadolinium sulfate octahydrate R* in *water R* and dilute to 1000.0 mL with the same solvent.

*Test solution.* Dissolve 0.250 g of the substance to be examined in 5.0 mL of the gadolinium sulfate solution and 30 mL of *water R* with the aid of ultrasound. Add 10.0 mL of solution A and adjust to pH 5.0 with a 10.3 g/L solution of *hydrochloric acid R*. Titrate with *0.00025 M sodium edetate*, determining the end-point photometrically using a suitable autotitrator equipped with a photometric sensor at a wavelength of 570-574 nm ($V_1$ mL).

*Standard solution.* Prepare a solution in the same manner as for the test solution but omitting the substance to be examined ($V_2$ mL).

Determine the free gadolinium content from the difference in the volumes of titrant consumed ($V_1$ - $V_2$).

1 mL of *0.00025 M sodium edetate* is equivalent to 0.03931 mg of gadolinium.

**Water** (*2.5.32*): 2.0 per cent to 7.0 per cent, determined on 0.100 g using the evaporation technique at 220 °C.

ASSAY

**Gadobutrol**. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Detection*: spectrophotometer at 195 nm.

*Injection*: test solution (b) and reference solution (c).

Calculate the percentage content of $C_{18}H_{31}GdN_4O_9$ taking into account the assigned content of *gadobutrol monohydrate CRS*.

**Gadolinium**. Inductively coupled plasma-atomic emission spectrometry (*2.2.57*).

*Yttrium standard solution.* To 100.0 mL of a certified reference solution containing 1000 mg/L of Y add 50 mL of *nitric acid R* and dilute to 1000.0 mL with *water R*.

*Zero solution.* To 1.5 mL of the yttrium standard solution add 0.5 mL of *nitric acid R* and dilute to 50.0 mL with *water R*.

*Test solution.* Dissolve 50.0 mg in 150.0 mL of *water R*, add 7.5 mL of yttrium standard solution and 2.0 mL of *nitric acid R* and dilute to 250.0 mL with *water R*.

*Reference solutions.* Into 3 volumetric flasks introduce respectively 2.0 mL, 2.5 mL and 3.0 mL of a certified reference solution containing 1000 mg/L of Gd. To each flask add 1.5 mL of the yttrium standard solution and 0.5 mL of *nitric acid R* and dilute to 50.0 mL with *water R*.

*Wavelengths*: 217.069 nm, 217.774 nm, 219.103 nm, 226.109 nm (gadolinium), 224.306 nm (yttrium).

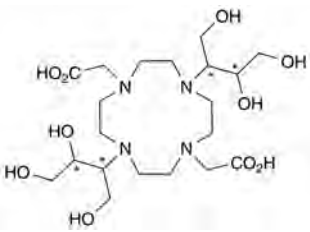
From the calibration curve obtained with the reference solutions, calculate the percentage content of gadolinium in the substance to be examined, using the mean of the results obtained with the different wavelengths and applying a conversion factor of 3.846.

STORAGE

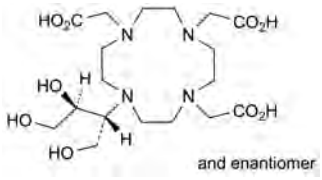
In an airtight container, protected from light.

IMPURITIES

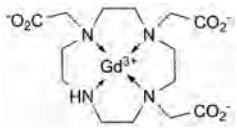
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C.*



A. 2,2′-[4,10-bis[2,3-dihydroxy-1-(hydroxymethyl)propyl]-1,4,7,10-tetraazacyclododecane-1,7-diyl]diacetic acid,



B. 2,2′,2″-[10-[(1*RS*,2*SR*)-2,3-dihydroxy-1-(hydroxymethyl)-propyl]-1,4,7,10-tetraazacyclododecane-1,4,7-triyl]triacetic acid,



C. gadolinium 2,2′,2″-(1,4,7,10-tetraazacyclododecane-1,4,7-triyl)triacetate.

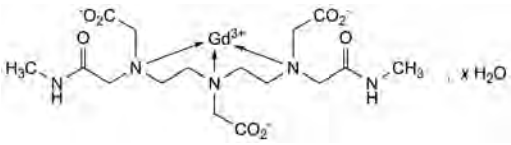
**corrected 10.0**

# GADODIAMIDE HYDRATE

## Gadodiamidum hydricum



$C_{16}H_{26}GdN_5O_8,xH_2O$ with $x$ = 2 to 5 — $M_r$ 573.7 (anhydrous substance)

Anhydrous gadodiamide: [131410-48-5]

DEFINITION

6-(Carboxylatomethyl)-3,9-bis[(methylcarbamoyl)methyl]-3,6,9-triazaundecanedioato-κ$^3N^3$,$N^6$,$N^9$-gadolinium(III) hydrate (Gd-DTPA-BMA).

*Content*:

– *gadolinium* (Gd; $M_r$ 157.3): 26.0 per cent to 29.0 per cent (anhydrous substance);
– *gadodiamide* ($C_{16}H_{26}GdN_5O_8$; $M_r$ 573.7): 96.5 per cent to 102.0 per cent (anhydrous substance).

It contains a variable quantity of water.

CHARACTERS

*Appearance*: white or almost white powder, slightly hygroscopic.

*Solubility*: freely soluble in water and in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *gadodiamide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *methanol R*, evaporate to dryness and record new spectra using the residues.

B. Gadolinium (see Assay).

*Results*: the test solution exhibits the characteristic emission of gadolinium at 342.247 nm.

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*). If this is not the case, heat the solution at 60-70 °C for 2-3 min, cool to room temperature and compare the solutions again.

Dissolve 7.5 g (anhydrous substance) in *water R* and dilute to 25 mL with the same solvent.

**pH** (*2.2.3*): 4.0 to 6.5.

Dissolve 0.50 g (anhydrous substance) in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 0.200 g of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

*Test solution (b)*. Dissolve 60.0 mg of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 5.0 mg of *gadodiamide impurity A CRS* and 5.0 mg of *gadodiamide impurity B CRS* in *water R* and dilute to 25.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 20 mg of *gadodiamide CRS* in *water R*, add 0.5 mL of reference solution (a) and dilute to 10 mL with *water R*.

*Reference solution (c)*. Dissolve 60.0 mg of *gadodiamide CRS* in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (d)*. Dilute 1.0 mL of test solution (a) to 50.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (e)*. Dilute 1.0 mL of reference solution (a) to 20.0 mL with *water R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

*Mobile phase*: to 980 mL of *water for chromatography R* add 287 µL of *glacial acetic acid R* and 700 µL of *triethylamine R*, adjust to pH 6.8 with a 0.6 g/L solution of *acetic acid R* or with a 42 g/L solution of *sodium hydroxide R*, then dilute to 1000 mL with *water for chromatography R*; use within 2 days.

*Flow rate*: 1.5 mL/min.

*Post-column solution*: dissolve 0.120 g of *arsenazo III R* in about 400 mL of *water for chromatography R*, add 0.650 g of *urea R* and mix to dissolve; add 6.3 mL of *nitric acid R* and sonicate for 15 min, filter through a membrane filter (nominal pore size 0.45 µm) and wash the filter with about 550 mL of *water for chromatography R*; dilute the filtrate and washings to 1000 mL with *water for chromatography R*; use within 1 week.

*Flow rate of post-column solution*: 1.5 mL/min.

*Detection*: spectrophotometer at 658 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (b), (d) and (e).

*Run time*: 5 times the retention time of gadodiamide.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A and B.

*Relative retention* with reference to gadodiamide (retention time = about 5 min): impurity A = about 2.6; impurity B = about 4.0. The peak due to gadodiamide shows a shoulder due to an isomer that is to be integrated with the main peak.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.5 between the peaks due to gadodiamide and impurity A; minimum 2.5 between the peaks due to impurities A and B.

*Calculation of percentage contents*:

- for impurities A and B, use the concentration of each substance in reference solution (e);
- for impurities other than A and B, use the concentration of gadodiamide hydrate in reference solution (d).

*Limits*:

- *impurity A*: maximum 1.0 per cent;
- *impurity B*: maximum 0.2 per cent;
- *unspecified impurities*: for each impurity, maximum 0.2 per cent;
- *sum of unspecified impurities*: maximum 0.3 per cent;
- *total*: maximum 1.5 per cent;
- *reporting threshold*: 0.10 per cent.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Excess of gadolinium or DTPA-BMA**: maximum 20 ppm (anhydrous substance) for the excess of gadolinium and maximum 0.1 per cent (anhydrous substance) for the excess of diethylenetriaminepentaacetic acid bis-(methylamide) (DTPA-BMA).

*Test solution.* Dissolve 2.0 g of the substance to be examined in 25.0 mL of *1 M morpholinoethanesulfonate buffer solution pH 6.0 R*. Add 50 µL of a 1.5 g/L solution of *arsenazo III R*.

*Blank solution.* To 25.0 mL of *1 M morpholinoethanesulfonate buffer solution pH 6.0 R*, add 50 µL of a 1.5 g/L solution of *arsenazo III R*. The solution is violet-pink.

*Standard solution.* Dissolve 18.6 g of *gadolinium chloride hexahydrate R* in a 10.3 g/L solution of *hydrochloric acid R* and dilute to 1000.0 mL with the same acid solution. Dilute 20.0 mL of this solution to 1000.0 mL with *water R* (0.001 M solution). Standardise 10.0 mL of *0.001 M sodium edetate*, using a mixture of 25.0 mL of *1 M morpholinoethanesulfonate buffer solution pH 6.0 R* and 50 µL of a 1.5 g/L solution of *arsenazo III R*. Titrate with the standard solution until a greenish-blue colour is obtained.

*Excess of DTPA-BMA*. If the test solution is violet-pink, there is no excess of gadolinium. Determine the excess of DTPA-BMA by titrating the test solution and the blank solution with the standard solution until a greenish-blue colour is obtained. Calculate the excess of DTPA-BMA, in per cent, using the following expression:

$$\frac{(V_1 - V_0) \times M_1 \times 419.43 \times 100}{m}$$

$V_0$ = volume of standard solution used in the blank titration, in millilitres;

$V_1$ = volume of standard solution used in the titration of the test solution, in millilitres;

$M_1$ = molarity of the gadolinium solution, in moles per litre;

$m$ = mass of the substance to be examined (anhydrous substance) used to prepare the test solution, in milligrams.

*Excess of gadolinium.* If the test solution is greenish-blue, there is no excess of DTPA-BMA. Determine the excess of gadolinium by titrating the test solution with *0.001 M sodium edetate* until a violet-pink colour is obtained. Calculate the excess of gadolinium, in parts per million, using the following expression:

$$\frac{V_2 \times M_2 \times 157.25 \times 10^6}{m}$$

$V_2$ = volume of *0.001 M sodium edetate* used in the titration of the test solution, in millilitres;

$M_2$ = molarity of the sodium edetate solution, in moles per litre;

$m$ = mass of the substance to be examined (anhydrous substance) used to prepare the test solution, in milligrams.

**Impurity C**: maximum 0.02 per cent (anhydrous substance).

*Phthalaldehyde solution.* Introduce 0.100 g of *phthalaldehyde R* into a brown-glass vessel and dissolve in 3 mL of *methanol R*. Add 220 mL of *borate buffer solution pH 10.0 R* and 100 µL of *2-mercaptoethanol R* and mix. Keep refrigerated and use within 24 h.

*Test solution.* Dissolve 1.5 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solutions.* Prepare a series of reference solutions for calibration in the range of 1 µg/mL to 35 µg/mL of methylamine (impurity C) from a 0.220 g/L solution of *methylamine hydrochloride R*. Calculate the concentrations of methylamine by multiplying the concentrations of methylamine hydrochloride by 0.46.

*Blank solution.* A recently prepared mixture of 3.0 mL of phthalaldehyde solution and 3.0 mL of *water R*.

Introduce 3.0 mL of the test solution and of each reference solution into separate test tubes. Add 3.0 mL of phthalaldehyde solution to each tube and mix. Immediately transfer each solution to a cell and immediately measure the absorbance (*2.2.25*) at 335 nm using the blank solution as compensation liquid. Calculate the linear regression curve from the absorbances obtained with the reference solutions: the coefficient of determination $r^2$ is not less than 0.99. If the absorbance obtained with the test solution is outside the calibration range, dilute the test solution with *water R* and repeat the procedure.

**Water** (*2.5.12*): 6.0 per cent to 13.0 per cent, determined on 0.150 g.

**Microbial contamination**

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

**Bacterial endotoxins** (*2.6.14*): less than 3.50 IU/g.

ASSAY

**Gadolinium**. Inductively coupled plasma-atomic emission spectrometry (*2.2.57*). An external calibration curve is used for quantification.

*Test solution.* Dissolve 0.600 g of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent. Dilute 10.0 mL of the solution to 100.0 mL with a 20 g/L solution of *nitric acid R*.

*Reference solutions.* Into 3 volumetric flasks, introduce 10.0 mL, 15.0 mL and 20.0 mL of a certified reference solution containing 1000 µg/mL of gadolinium. Dilute each flask to 100.0 mL with a 20 g/L solution of *nitric acid R*. Mix to obtain reference solutions containing respectively 100 µg/mL, 150 µg/mL and 200 µg/mL of gadolinium.

The standard operating conditions prescribed by the manufacturer of the apparatus are to be followed. The following operating conditions are cited as an example of conditions found suitable for a given apparatus:

- *flush time*: 15 s;
- *pure gas ($N_2$) flow*: 1 mL/min;
- *plasma flow*: 15 L/min;
- *auxiliary flow*: 1.0 mL/min;
- *nebuliser flow*: 1.0 mL/min;
- *pump rate*: 1.0 mL/min;
- *power*: 1160 W;
- *read delay*: 25 s;
- *wavelength*: 342.247 nm;

– *viewing height*: 14.0 mm;
– *background correction*: none;
– *nebuliser*: cross-flow nebuliser.

*System suitability*:
– the correlation coefficient of the calibration curve is not less than 0.999.

**Gadodiamide**. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: 10 µL of test solution (b) and reference solution (c).

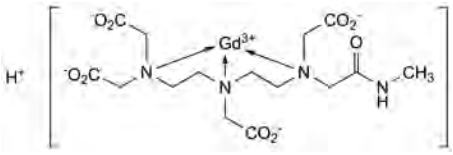
Calculate the percentage content of $C_{16}H_{26}GdN_5O_8$ taking into account the assigned content of *gadodiamide CRS*.

STORAGE

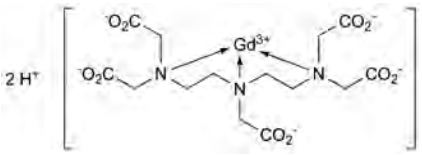
In an airtight container.

IMPURITIES

*Specified impurities*: *A, B, C.*



A. hydrogen[3,6-bis(carboxylatomethyl)-9-[(methylcarbamoyl)methyl]-3,6,9-triazaundecanedioato-$\kappa^3N^3,N^6,N^9$-gadolinate](1-) (Gd-DTPA-MMA),



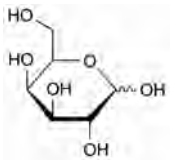
B. dihydrogen[3,6,9-tris(carboxylatomethyl)-3,6,9-triazaundecanedioato-$\kappa^3N^3,N^6,N^9$-gadolinate](2-) (Gd-DTPA),

C. methanamine (methylamine).

**01/2020:1215**

# GALACTOSE

## Galactosum



$C_6H_{12}O_6$ $M_r$ 180.2
[59-23-4]

DEFINITION

D-Galactopyranose.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline or finely granulated powder.

*Solubility*: freely soluble or soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A.*

*Second identification: B, C.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *galactose CRS*.

B. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.
*Reference solution (a)*. Dissolve 10 mg of *galactose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.
*Reference solution (b)*. Dissolve 10 mg each of *galactose R*, *glucose R* and *lactose monohydrate R* (impurity A) in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *water R*, *propanol R* (15:85 *V/V*).
*Application*: 2 µL; thoroughly dry the points of application.
*Development*: in an unsaturated tank over 3/4 of the plate.
*Drying*: in a current of warm air.
*Detection*: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol (96 per cent) R*. Heat in an oven at 130 °C for 10 min.
*System suitability*: reference solution (b):
– the chromatogram shows 3 clearly separated spots.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 10 mL of *water R*. Add 3 mL of *cupri-tartaric solution R* and heat. An orange or red precipitate is formed.

TESTS

**Solution S**. Dissolve, with heating in a water-bath at 50 °C, 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $B_8$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 30 mL of solution S add 0.3 mL of *phenolphthalein solution R*. The solution is colourless. Not more than 1.5 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Proteins**: maximum 0.1 mg/mL.

Dissolve 1.000 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent. Measure the absorbance (*2.2.25*) of the solution at 260 nm and at 280 nm and calculate the protein content, in milligrams per millilitre, using the following expression:

$$(A_{280} \times 1.45) - (A_{260} \times 0.74)$$

$A_{280}$ = absorbance at 280 nm;

$A_{260}$ = absorbance at 260 nm.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Test solution (b)*. Dilute 1.0 mL of test solution (a) to 50.0 mL with *water R*.

*Reference solution (a)*. Dilute 1.0 mL of test solution (a) to 100.0 mL with *water R*.

*Reference solution (b).* Dissolve 3 mg each of *1,6-galactosylgalactose R* (impurity B), *galacturonic acid R* (impurity C) and *lactose monohydrate R* (impurity A) in *water R* and dilute to 10 mL with the same solvent. To 100 µL of the solution add 900 µL of test solution (a).

*Reference solution (c).* Dissolve 25.0 mg of *galactose CRS* in *water R* and dilute to 50.0 mL with the same solvent.

*Column*: 2 columns to be connected in series:

- *size*: *l* = 0.30 m, Ø = 6.5 mm;
- *stationary phase*: *strong cation-exchange resin (calcium form) R* (10 µm);
- *temperature*: 75 °C.

*Mobile phase*: dissolve 50 mg of *sodium calcium edetate R* in 900 mL of *water for chromatography R*, add 1.0 mL of *sulfuric acid R* and dilute to 1000 mL with *water for chromatography R*.

*Flow rate*: 0.4 mL/min.

*Detection*: differential refractometer maintained at a constant temperature (about 40 °C).

*Injection*: 10 µL of test solution (a) and reference solutions (a) and (b).

*Run time*: twice the retention time of galactose.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A + B and C.

*Relative retention* with reference to galactose (retention time = about 24 min): impurities A and B = about 0.8; impurity C = about 0.9.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to impurity C and galactose.

*Calculation of percentage contents*:

- for each impurity, use the concentration of galactose in reference solution (a).

*Limits*:

- *sum of impurities A and B*: maximum 1.0 per cent;
- *unspecified impurities*: for each impurity, maximum 0.3 per cent;
- *total*: maximum 2.0 per cent;
- *reporting threshold*: 0.2 per cent.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

**Sulfated ash**: maximum 0.1 per cent.

To 5 mL of solution S add 2 mL of *sulfuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass. The residue weighs a maximum of 1 mg.

**Microbial contamination**

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

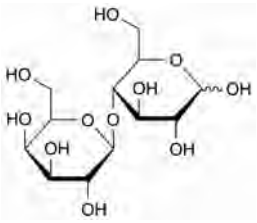
*Injection*: 10 µL of test solution (b) and reference solution (c).

Calculate the percentage content of $C_6H_{12}O_6$ taking into account the assigned content of *galactose CRS*.

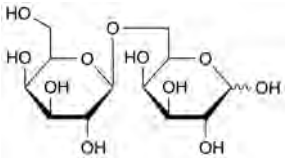
IMPURITIES

*Specified impurities: A, B.*

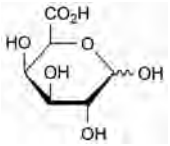
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E.*



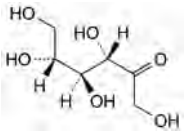
A. 4-*O*-β-D-galactopyranosyl-D-glucopyranose (lactose),



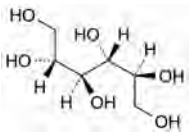
B. 6-*O*-β-D-galactopyranosyl-D-galactopyranose (1,6-galactosylgalactose),



C. D-galactopyranuronic acid (galacturonic acid),



D. D-tagatose,

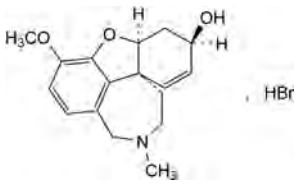


E. galactitol (dulcitol).

**01/2020:2366**

# GALANTAMINE HYDROBROMIDE

## Galantamini hydrobromidum



$C_{17}H_{22}BrNO_3$ $M_r$ 368.3

[1953-04-4]

DEFINITION

(4a*S*,6*R*,8a*S*)-3-Methoxy-11-methyl-5,6,9,10,11,12-hexahydro-4a*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol hydrobromide.

It is isolated from natural sources or produced by a synthetic process.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline or amorphous powder.

*Solubility*: sparingly soluble in water, very slightly soluble in anhydrous ethanol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *galantamine hydrobromide CRS*.

B. Specific optical rotation or enantiomeric purity (see Tests).

C. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.60 g in *carbon dioxide-free water R* and dilute to 30.0 mL with the same solvent.

**pH** (*2.2.3*): 4.0 to 5.5 for solution S.

**Specific optical rotation** (*2.2.7*) for galantamine from natural sources: − 100 to − 90 (dried substance), determined on Solution S.

**Enantiomeric purity** for galantamine produced by a synthetic process. Capillary electrophoresis (*2.2.47*). *Prepare the solutions immediately before use.*

*Buffer electrolyte*: 8.9 g/L solution of *disodium hydrogen phosphate dihydrate R*.

*Test solution*. Dissolve 25.0 mg of the substance to be examined in 50.0 mL of *water R* and filter through a membrane filter (nominal pore size 0.22 µm).

*Reference solution (a)*. Dissolve 5 mg of *galantamine racemic mixture CRS* in *water R* and dilute to 10 mL with the same solvent. Dilute 1 mL of the solution to 100 mL with *water R* and filter through a membrane filter (nominal pore size 0.22 µm).

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R* and filter through a membrane filter (nominal pore size 0.22 µm).

*Blank solution*. Filter *water R* through a membrane filter (nominal pore size 0.22 µm).

*Capillary*:

– *material*: uncoated fused silica;

– *size*: effective length = about 0.50 m, Ø = 75 µm.

*Temperature*: 20 °C.

*CZE buffer*. Dissolve 0.196 g of *α-cyclodextrin R* in 10.0 mL of buffer electrolyte and filter through a membrane filter (nominal pore size 0.22 µm).

*Detection*: spectrophotometer at 214 nm.

*Preconditioning of the capillary*: at 137.9 kPa, rinse the capillary for 5 min with *water R* and for 5 min with CZE buffer.

*Injection*: under pressure (3.45 kPa) for 4 s.

*Migration*: apply a voltage of 15kV.

*Run time*: 35 min.

*Relative migration times* with reference to galantamine (migration time = about 18 min): impurity F = about 1.05.

*System suitability*: reference solution (a):

– *resolution*: minimum 2.5 between the peaks due to galantamine and impurity F.

*Limit*:

– *impurity F*: not more than 1.5 times the area of the principal peak in the electropherogram obtained with reference solution (b) (0.15 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

A. Galantamine from natural sources

*Solvent mixture*: mobile phase B, mobile phase A (10:90 *V/V*).

*Test solution*. Dissolve 12 mg of the substance to be examined in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve 5 mg of *galantamine natural for system suitability CRS* (containing impurities A and E) in the solvent mixture and dilute to 5 mL with the solvent mixture.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: dissolve 3.15 g of *ammonium formate R* in 900 mL of *water for chromatography R*, adjust to pH 3.8 with *anhydrous formic acid R* and dilute to 1000 mL with *water for chromatography R*;

– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 95 | 5 |
| 5 - 20 | 95 → 80 | 5 → 20 |
| 20 - 23 | 80 → 50 | 20 → 50 |
| 23 - 31 | 50 → 20 | 50 → 80 |
| 31 - 35 | 20 | 80 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 287 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *galantamine natural for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A and E.

*Relative retention* with reference to galantamine (retention time = about 12 min): impurity E = about 0.8; impurity A = about 1.5.

*System suitability*: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to impurity E and galantamine.

*Limits*:

– *impurity E*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);

– *impurity A*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

B. Galantamine produced by a synthetic process

*Solvent mixture*. Dilute 50 mL of *methanol R* to 1000 mL with *water R*.

*Test solution*. Dissolve 0.10 g of the substance to be examined in 50.0 mL of the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 5.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 2.5 mg of *galantamine synthetic for system suitability CRS* (containing impurities C and D) in the solvent mixture and dilute to 5 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl amorphous organosilica polymer for chromatography R* (3.5 µm);
- *temperature*: 55 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 0.79 g of *disodium hydrogen phosphate dihydrate R* and 2.46 g of *sodium dihydrogen phosphate R* in *water for chromatography R* and dilute to 1000 mL with the same solvent; to 950 mL of the solution add 50 mL of *methanol R1*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 6 | 100 | 0 |
| 6 - 20 | 100 → 95 | 0 → 5 |
| 20 - 35 | 95 → 85 | 5 → 15 |
| 35 - 50 | 85 → 80 | 15 → 20 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *galantamine synthetic for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities C and D.

*Relative retention* with reference to galantamine (retention time = about 16 min): impurity C = about 0.8; impurity D = about 2.1.

*System suitability*: reference solution (b):

- *resolution*: minimum 4.5 between the peaks due to impurity C and galantamine.

*Limits*:

- *impurities C, D*: for each impurity, not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);
- *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.275 g in 40 mL of *water R*. Add 40 mL of *ethanol (96 per cent) R*. Add 5 mL of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 36.83 mg of $C_{17}H_{22}BrNO_3$.

LABELLING

The label states the origin of the substance:

- isolated from natural sources;
- produced by a synthetic process.

IMPURITIES

**Test A for related substances**: A, B, E.

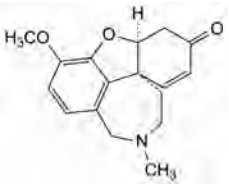
*Specified impurities: A, E.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*

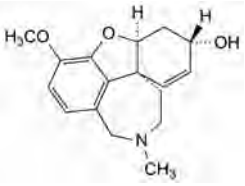
**Test B for related substances**: A, B, C, D, E, F.

*Specified impurities: C, D, F.*

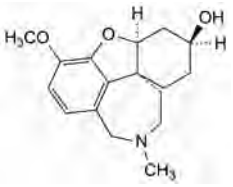
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, E.*



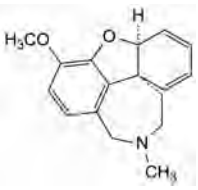
A. (4a*S*,8a*S*)-3-methoxy-11-methyl-4a,5,9,10,11,12-hexahydro-6*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepin-6-one (narwedine),



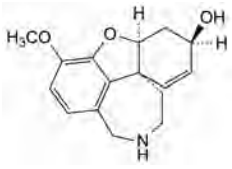
B. (4a*S*,6*S*,8a*S*)-3-methoxy-11-methyl-5,6,9,10,11,12-hexahydro-4a*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol (*epi*-galantamine),



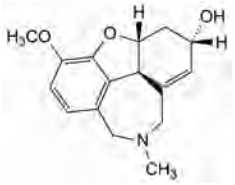
C. (4a*S*,6*S*,8a*R*)-3-methoxy-11-methyl-5,6,7,8,9,10,11,12-octahydro-4a*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol (dihydrogalantamine),



D. (4a*S*,8a*S*)-3-methoxy-11-methyl-9,10,11,12-tetrahydro-4a*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepine (anhydrogalantamine),



E. (4aS,6*R*,8a*S*)-3-methoxy-5,6,9,10,11,12-hexahydro-4a*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol (*N*-demethylgalantamine),

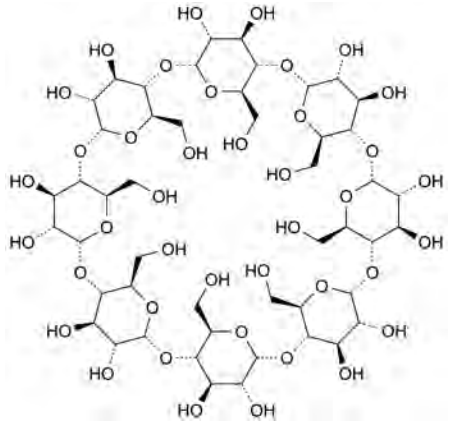


F. (4a*R*,6*S*,8a*R*)-3-methoxy-11-methyl-5,6,9,10,11,12-hexahydro-4a*H*-[1]benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol (*ent*-galantamine).

**04/2018:2769**

# GAMMADEX

## Gammadexum



$[C_6H_{10}O_5]_8$ $M_r$ 1297
[17465-86-0]

DEFINITION

Cyclooctakis-(1→4)-(α-D-glucopyranosyl) (cyclomaltooctaose or γ-cyclodextrin).

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, amorphous or crystalline, hygroscopic powder.

*Solubility*: freely soluble in water, very slightly soluble in propylene glycol, practically insoluble in anhydrous ethanol and in methylene chloride. When dissolved in water, it forms a colloidal dispersion over time.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *gammacyclodextrin CRS*.

TESTS

**Solution S**. Dissolve 1.000 g in *carbon dioxide-free water R* and dilute to 100.0 mL with the same solvent.

**pH** (*2.2.3*): 5.0 to 8.0.
Mix 1 mL of a 223.6 g/L solution of *potassium chloride R* and 30 mL of solution S.

**Specific optical rotation** (*2.2.7*): + 174 to + 180 (dried substance), determined on solution S after filtration through a membrane filter (nominal pore size 0.45 µm).

**Reducing sugars**: maximum 0.2 per cent.

*Test solution*. To 1 mL of solution S add 1 mL of *cupri-tartaric solution R4*. Heat on a water-bath for 10 min and allow to cool to room temperature. Add 10 mL of *ammonium molybdate reagent R1* and allow to stand for 15 min.

*Reference solution*. Prepare at the same time and in the same manner as for the test solution, using 1 mL of a 0.02 g/L solution of *glucose R*.

Measure the absorbances (*2.2.25*) of the 2 solutions at the absorption maximum at 740 nm using *water R* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

**Light-absorbing impurities**. Examine solution S after filtration through a membrane filter (nominal pore size 0.45 µm). The absorbance (*2.2.25*) is not greater than 0.10 between 230 nm and 350 nm and not greater than 0.05 between 350 nm and 750 nm.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 0.250 g of the substance to be examined in *water R* with heating, cool and dilute to 25.0 mL with the same solvent.

*Test solution (b)*. Dissolve 25.0 mg of the substance to be examined in *water R* and dilute to 25.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 25.0 mg of *alfadex CRS* (impurity A), 25.0 mg of *betadex CRS* (impurity B) and 25.0 mg of *gammacyclodextrin CRS* (gammadex) in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solution (b)*. Dilute 5.0 mL of reference solution (a) to 50.0 mL with *water R*.

*Reference solution (c)*. Dissolve 25.0 mg of *gammacyclodextrin CRS* in *water R* and dilute to 25.0 mL with the same solvent.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*: *methanol R*, *water for chromatography R* (5:95 *V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: differential refractometer maintained at a constant temperature (e.g. 35 °C).

*Equilibration*: with the mobile phase for about 3 h.

*Injection*: 50 µL of test solution (a) and reference solutions (a) and (b).

*Run time*: 4 times the retention time of gammadex.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A and B.

*Relative retention* with reference to gammadex (retention time = about 7 min): impurity A = about 1.5; impurity B = about 3.2.

*System suitability*: reference solution (a):
- *resolution*: minimum 2.5 between the peaks due to gammadex and impurity A;
- *symmetry factor*: 0.8 to 1.8 for the peak due to gammadex.

*Calculation of percentage contents*:
- for impurities A and B, use the concentration of the corresponding impurity in reference solution (b);

– for impurities other than A and B, use the concentration of gammadex in reference solution (b).

*Limits*:

– *impurities A, B*: for each impurity, maximum 0.5 per cent;

– *sum of impurities other than A and B*: maximum 0.5 per cent;

– *reporting threshold*: 0.15 per cent.

**Loss on drying** (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g by drying in an oven at 120 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution (b) and reference solution (c).

*System suitability*: reference solution (c):

– *symmetry factor*: 0.8 to 1.8 for the peak due to gammadex;

– *repeatability*: maximum relative standard deviation of 2.0 per cent determined on 5 injections.

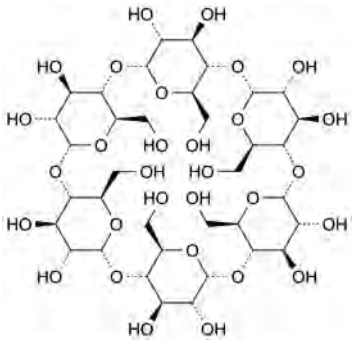
Calculate the percentage content of $[C_6H_{10}O_5]_8$ taking into account the assigned content of *gammacyclodextrin CRS*.

STORAGE

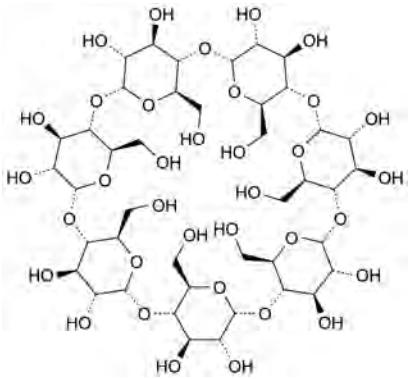
In an airtight container.

IMPURITIES

*Specified impurities: A, B.*



A. cyclohexakis-(1→4)-(α-D-glucopyranosyl) (alfadex or cyclomaltohexaose or α-cyclodextrin),

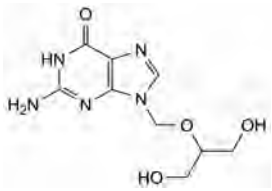


B. cycloheptakis-(1→4)-(α-D-glucopyranosyl) (betadex or cyclomaltoheptaose or β-cyclodextrin).

**01/2017:1752**

# GANCICLOVIR

## Ganciclovirum



$C_9H_{13}N_5O_4$ $M_r$ 255.2

[82410-32-0]

DEFINITION

2-Amino-9-[[2-hydroxy-1-(hydroxymethyl)ethoxy]methyl]-1,9-dihydro-6*H*-purin-6-one.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic, crystalline powder.

*Solubility*: slightly soluble in water, very slightly soluble in ethanol (96 per cent). It dissolves in dilute solutions of mineral acids and alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ganciclovir CRS*.

If the spectra obtained in the solid state show differences, dissolve 0.10 g of the substance to be examined and the reference substance separately in about 3.6 mL of *water R* at 80 °C. Allow to cool in an ice-bath and filter the precipitate. Dry in an oven at 105 °C for 3 h and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_5$ (*2.2.2, Method II*).

Dissolve 1.25 g in a 40 g/L solution of *sodium hydroxide R* and dilute to 25 mL with the same solution.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 30 mg of the substance to be examined in the mobile phase with the aid of ultrasound and dilute to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 3 mg of *ganciclovir CRS* in the mobile phase with the aid of ultrasound and dilute to 5.0 mL with the mobile phase.

*Reference solution (c)*. Dissolve the contents of a vial of *ganciclovir impurity mixture CRS* (impurities A, B, C, D, E and F) in 1.0 mL of reference solution (b).

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *strong cation-exchange silica gel for chromatography R* (10 µm);

– *temperature*: 40 °C.

*Mobile phase*: mix equal volumes of *acetonitrile R* and a 0.05 per cent *V/V* solution of *trifluoroacetic acid R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectophotometer at 254 nm.

*Injection*: 20 µL.

*Run time*: 2.5 times the retention time of ganciclovir.

*Identification of impurities*: use the chromatogram supplied with *ganciclovir impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, C, D, E and F.

*Relative retention* with reference to ganciclovir (retention time = about 14 min): impurity A = about 0.6; impurity B = about 0.67; impurity C = about 0.71; impurity D = about 0.8; impurity E = about 0.9; impurity F = about 2.0.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 5, where $H_p$ = height above the baseline of the peak due to impurity E and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to ganciclovir.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 1.3; impurity F = 0.7;
- *impurity F*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);
- *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurities A, C, D, E*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);
- *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);
- *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

**Water** (*2.5.12*): maximum 4.0 per cent, determined on 0.300 g. Use *methanol R* as solvent. The substance to be examined has limited solubility in methanol. The sample will appear as a slurry. Replace the solvent after each titration.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 0.84 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.200 g in 10 mL of *anhydrous formic acid R* and dilute to 60 mL with *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 25.52 mg of $C_9H_{13}N_5O_4$.

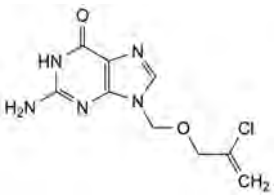
STORAGE

In an airtight container.

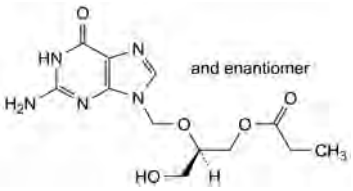
IMPURITIES

*Specified impurities: A, B, C, D, E, F.*

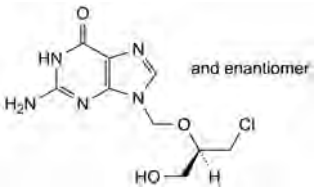
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *H, I, J.*



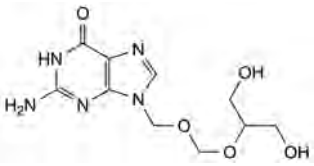
A. 2-amino-9-[[(2-chloroprop-2-en-1-yl)oxy]methyl]-1,9-dihydro-6*H*-purin-6-one,



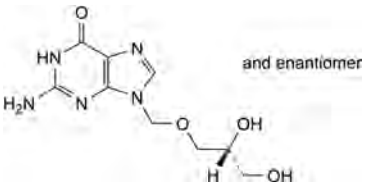
B. (2*RS*)-2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]-3-hydroxypropyl propionate,



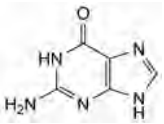
C. 2-amino-9-[[(1*RS*)-2-chloro-1-(hydroxymethyl)ethoxy]-methyl]-1,9-dihydro-6*H*-purin-6-one,



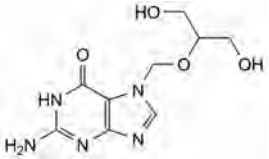
D. 2-amino-9-[[[2-hydroxy-1-(hydroxymethyl)ethoxy]-methoxy]methyl]-1,9-dihydro-6*H*-purin-6-one,



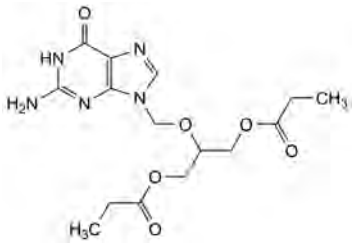
E. 2-amino-9-[[(2*RS*)-2,3-dihydroxypropoxy]methyl]-1,9-dihydro-6*H*-purin-6-one,



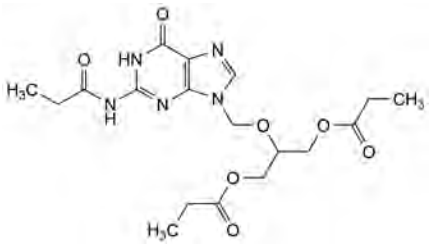
F. 2-amino-1,9-dihydro-6*H*-purin-6-one (guanine),



H. 2-amino-7-[[2-hydroxy-1-(hydroxymethyl)ethoxy]-methyl]-1,7-dihydro-6*H*-purin-6-one,



I. 2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]propane-1,3-diyl dipropanoate,

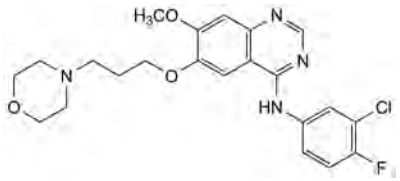


J. 2-[2-(propanoylamino)-6-oxo-1,6-dihydro-9*H*-purin-9-yl]methoxy]propane-1,3-diyl dipropanoate.

**01/2018:2866**

# GEFITINIB

## Gefitinibum



$C_{22}H_{24}ClFN_4O_3$ $M_r$ 446.9
[184475-35-2]

DEFINITION

*N*-(3-Chloro-4-fluorophenyl)-7-methoxy-6-[3-(morpholin-4-yl)propoxy]quinazolin-4-amine.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, slightly soluble in anhydrous ethanol, practically insoluble in heptane.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *gefitinib CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, 0.2 per cent *V/V* solution of *trifluoroacetic acid R* (40:60 *V/V*).

*Test solution.* Dissolve 35.0 mg of the substance to be examined in 85 mL of the solvent mixture, with the aid of ultrasound, and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 35.0 mg of *gefitinib CRS* in 85 mL of the solvent mixture, with the aid of ultrasound, and dilute to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve the contents of a vial of *gefitinib for system suitability CRS* (containing impurity B) in 1.0 mL of the solvent mixture with the aid of ultrasound.

*Column*:

– *size*: *l* = 0.10 m, Ø = 3 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 60 °C.

*Mobile phase*: *acetonitrile R*, 9.68 g/L solution of *ammonium acetate R* (38:62 *V/V*).

*Flow rate*: 0.9 mL/min.

*Detection*: spectrophotometer at 247 nm.

*Injection*: 5 µL of the test solution and reference solutions (b) and (c).

*Run time*: 5 times the retention time of gefitinib.

*Identification of impurities*: use the chromatogram supplied with *gefitinib for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity B.

*Relative retention* with reference to gefitinib (retention time = about 5.5 min): impurity B = about 1.3.

*System suitability*: reference solution (c):

– *resolution*: minimum 3.0 between the peaks due to gefitinib and impurity B.

*Calculation of percentage contents*:

– for each impurity, use the concentration of gefitinib in reference solution (b).

*Limits*:

– *impurity B*: maximum 0.2 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.4 per cent;
– *reporting threshold*: 0.05 per cent.

**Water** (*2.5.32*): maximum 0.5 per cent, determined on 0.100 g by direct sample introduction.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

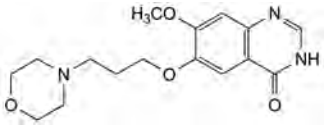
*Injection*: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{24}ClFN_4O_3$ taking into account the assigned content of *gefitinib CRS*.

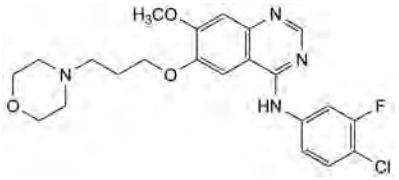
IMPURITIES

*Specified impurities*: *B*.

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.



A. 7-methoxy-6-[3-(morpholin-4-yl)propoxy]quinazolin-4(3*H*)-one,



B. *N*-(4-chloro-3-fluorophenyl)-7-methoxy-6-[3-(morpholin-4-yl)propoxy]quinazolin-4-amine.

01/2020:0330

# GELATIN(1)

## Gelatina

DEFINITION

Purified protein obtained from collagen of animals by partial alkaline and/or acid hydrolysis♦ and/or enzymatic hydrolysis,♦ or by thermal hydrolysis.

The hydrolysis leads to gelling or non-gelling product grades. This monograph covers both grades.

♦CHARACTERS

*Appearance*:

- *gelling grade*: faintly yellow or light yellowish-brown solid, usually occurring as translucent sheets, shreds, granules or powder;
- *non-gelling grade*: faintly yellow or white granules or powder.

*Solubility*:

- *gelling grade*: practically insoluble in common organic solvents; gelling grades swell in cold water and give on heating a colloidal solution which on cooling forms a more or less firm gel;
- *non-gelling grade*: soluble in cold or warm water, practically insoluble in common organic solvents.

Different gelatins form aqueous solutions that vary in clarity and colour. For a particular application, a suitable specification for clarity and colour may be required.♦

IDENTIFICATION

*Gelling grade: A, B.*

*Non-gelling grade: A, B, C.*

A. To 2 mL of solution S (see Tests) add 0.05 mL of *copper sulfate solution R*. Mix and add 0.5 mL of *dilute sodium hydroxide solution R*. A violet colour is produced.

B. In a test-tube about 15 mm in internal diameter, place 0.5 g of the substance to be examined and add 10 mL of *water R*. Allow to stand for 10 min, heat at 60 °C for 15 min and keep the tube upright at 2-8 °C for 6 h. Invert the tube; the contents flow out immediately for non-gelling grades and do not flow out immediately for gelling grades.

C. To 0.5 g in a 250 mL bottle, add 10 mL of *water R* and 5 mL of *sulfuric acid R*. Place the bottle, partly but not completely closed (for example, using a watch glass), in an oven at 105 °C for 4 h. Allow to cool and add 200 mL of *water R*. Adjust to pH 6.0-8.0 using a 200 g/L solution of *sodium hydroxide R*. Place 2 mL of the solution in a test-tube and add 2 mL of a solution prepared immediately before use containing 14 g/L of *chloramine R* in *phosphate buffer solution pH 6.8 R*. Mix and allow to stand for 20 min. Add 2 mL of *dimethylaminobenzaldehyde solution R9*. Mix and place in a water-bath at 60 °C for 15 min. A red to violet colour develops.

TESTS

**Solution S**. Dissolve 1.00 g in *carbon dioxide-free water R* at about 55 °C, dilute to 100 mL with the same solvent and keep the solution at this temperature to carry out the tests.

**pH** (*2.2.3*): 3.8 to 7.6 for solution S, measured at 55 °C.

**Conductivity** (*2.2.38*): maximum 1 $mS \cdot cm^{-1}$, determined on a 10.0 g/L solution at 30 ± 1.0 °C (without the use of a temperature compensation device).

**Sulfur dioxide** (*2.5.29*): maximum 50 ppm.

**Peroxides**: maximum 10 ppm, determined using *peroxide test strips R*.

Peroxidase transfers oxygen from peroxides to an organic redox indicator which is converted to a blue oxidation product. The intensity of the colour obtained is proportional to the quantity of peroxide and can be compared with a colour scale provided with the test strips, to determine the peroxide concentration.

*Suitability test.* Dip a test strip for 1 s into *hydrogen peroxide standard solution (2 ppm $H_2O_2$) R*, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and after 15 s compare the reaction zone with the colour scale provided. The test strips are suitable if the colour matches that of the 2 ppm concentration.

*Test.* Weigh 20.0 ± 0.1 g of the substance to be examined in a beaker and add 80.0 ± 0.2 mL of *water R*. Stir to moisten all the gelatin and allow the sample to stand at room temperature for 1-3 h. Cover the beaker with a watch-glass. If dissolution is not complete, place the beaker for 20 ± 5 min in a water-bath at 65 ± 2 °C to dissolve the sample. Stir the contents of the beaker with a glass rod to achieve a homogeneous solution. Dip a test strip for 1 s into the test solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and after 15 s compare the reaction zone with the colour scale provided. Multiply the concentration read from the colour scale by a factor of 5 to calculate the concentration in parts per million of peroxide in the substance to be examined.

**Gel strength (Bloom value)**: 80 per cent to 120 per cent of the nominal value stated on the label for the gelling grade.

The gel strength is expressed as the mass in grams necessary to produce the force which, applied to a plunger 12.7 mm in diameter, makes a depression 4 mm deep in a gel having a concentration of 6.67 per cent *m/m* and matured at 10 °C.

*Apparatus.* Texture analyser or gelometer with:

- a cylindrical piston 12.7 ± 0.1 mm in diameter with a plane pressure surface with a sharp bottom edge;
- a bottle 59 ± 1 mm in internal diameter and 85 mm high.

Adjust the apparatus according to the manufacturer's manual. Settings are: distance 4 mm, test speed 0.5 mm/s.

*Method.* Place 7.5 g of the substance to be examined in a bottle. Add 105 mL of *water R*, close the bottle and allow to stand for 1-4 h. Heat in a water-bath at 65 ± 2 °C for 15 min. While heating, stir gently with a glass rod. Ensure that the solution is uniform and that any condensed water on the inner walls of the bottle is incorporated. Allow to cool at room temperature for 15 min and transfer the bottle to a thermostatically controlled bath at 10.0 ± 0.1 °C, fitted with a device to ensure that the platform on which the bottle stands is perfectly horizontal. Close the bottle with a rubber stopper and allow to stand for 17 ± 1 h. Remove the bottle from the bath and quickly wipe the water from the exterior of the bottle. Centre the bottle on the platform of the apparatus so that the plunger contacts the sample as near to its midpoint as possible and start the measurement.

**Iron**: maximum 30 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

(1) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8. Pharmacopoeial harmonisation*.

*Test solution.* To 5.00 g of the substance to be examined, in a conical flask, add 10 mL of *hydrochloric acid R*. Close the flask and place in a water-bath at 75-80 °C for 2 h (if necessary for proper solubilisation, the gelatin may be allowed to swell after addition of the acid and before heating, the heating time may be prolonged, and a higher temperature may be used). Allow to cool and adjust the contents of the flask to 100.0 g with *water R*.

*Reference solutions.* Prepare the reference solutions using *iron standard solution (8 ppm Fe) R*, diluting with *water R*.

*Wavelength*: 248.3 nm.

**Chromium**: maximum 10 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

*Test solution.* Test solution described in the test for iron.

*Reference solutions.* Prepare the reference solutions using *chromium standard solution (100 ppm Cr) R*, diluting with *water R*.

*Wavelength*: 357.9 nm.

**Zinc**: maximum 30 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

*Test solution.* Test solution described in the test for iron.

*Reference solutions.* Prepare the reference solutions using *zinc standard solution (10 ppm Zn) R*, diluting with *water R*.

*Wavelength*: 213.9 nm.

**Loss on drying** (*2.2.32*): maximum 15.0 per cent, determined on 5.000 g by drying in an oven at 105 °C for 16 h.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

STORAGE

Protected from heat and moisture.

LABELLING

The label states the gel strength (Bloom value) or that it is a non-gelling grade.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristic may be relevant for gelling grade gelatin used as viscosity-increasing agent, binder or used for microencapsulation.*

**Gel strength (Bloom value)** (see Tests).

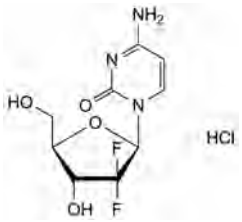
# GEMCITABINE HYDROCHLORIDE

## Gemcitabini hydrochloridum



$C_9H_{12}ClF_2N_3O_4$ $M_r$ 299.7
[122111-03-9]

DEFINITION

4-Amino-1-(2-deoxy-2,2-difluoro-β-D-*erythro*-pentofuranosyl)pyrimidin-2(1*H*)-one hydrochloride.

*Content*: 98.0 per cent to 102.0 per cent.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: soluble in water, slightly soluble in methanol, practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *gemcitabine hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 100.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 2.0 to 3.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 43.0 to + 50.0, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 25.0 mL with the same solvent.

*Test solution (b).* Dissolve 20.0 mg of the substance to be examined in *water R* and dilute to 200.0 mL with the same solvent.

*Reference solution (a).* Dissolve 10.0 mg of the substance to be examined and 10.0 mg of *gemcitabine impurity A CRS* in *water R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 100.0 mL with *water R*.

*Reference solution (b).* Dissolve 20.0 mg of *gemcitabine hydrochloride CRS* in *water R* and dilute to 200.0 mL with the same solvent.

*Reference solution (c).* Place 10 mg of the substance to be examined in a small vial. Add 4 mL of a 168 g/L solution of *potassium hydroxide R* in *methanol R*, sonicate for 5 min then seal with a cap. The mixture may be cloudy. Heat at 55 °C for a minimum of 6 h to produce impurity B. Allow to cool, then transfer the entire contents of the vial to a 100 mL volumetric flask by successively washing with a 1 per cent *V/V* solution of *phosphoric acid R*. Dilute to 100 mL with a 1 per cent *V/V* solution of *phosphoric acid R* and mix.

*Reference solution (d).* Dissolve 2 mg of *gemcitabine impurity C CRS* in *water R* and dilute to 5.0 mL with the same solvent.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:
- *mobile phase A*: 13.8 g/L solution of *sodium dihydrogen phosphate monohydrate R* adjusted to pH 2.5 ± 0.1 with *phosphoric acid R*;
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 8 | 97 | 3 |
| 8 - 13 | 97 → 50 | 3 → 50 |
| 13 - 20 | 50 | 50 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 275 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a), (c) and (d).

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity A; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity B; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity C.

*Relative retention* with reference to gemcitabine (retention time = about 7 min): impurity A = about 0.4; impurity B = about 0.7; impurity C = about 1.7.

*System suitability*: reference solution (c):
- *resolution*: minimum 8.0 between the peaks due to impurity B and gemcitabine.

*Limits*:
- *correction factor*: for the calculation of content, multiply the peak area of impurity C by 2.4;
- *impurity C*: not more than twice the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurity A*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 4 times the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.4 per cent);
- *disregard limit*: 0.5 times the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

**Bacterial endotoxins** (*2.6.14*): less than 0.05 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: *methanol R*, mobile phase A (3:97 *V/V*).

*Injection*: test solution (b) and reference solutions (b) and (c).

*Relative retention* with reference to gemcitabine (retention time = about 8 min): impurity B = about 0.5.

*System suitability*: reference solution (c):
- *resolution*: minimum 8.0 between the peaks due to impurity B and gemcitabine.

Calculate the percentage content of $C_9H_{12}ClF_2N_3O_4$ taking into account the assigned content of *gemcitabine hydrochloride CRS*.

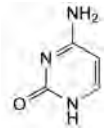
STORAGE

If the substance is sterile, store in a sterile, airtight, tamper-evident container.

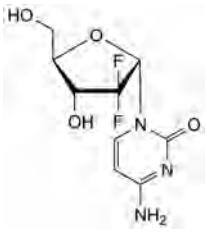
IMPURITIES

*Specified impurities: A, C.*

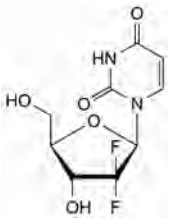
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*



A. 4-aminopyrimidin-2(1*H*)-one (cytosine),



B. 4-amino-1-(2-deoxy-2,2-difluoro-α-D-*erythro*-pentofuranosyl)pyrimidin-2(1*H*)-one (gemcitabine α-anomer),

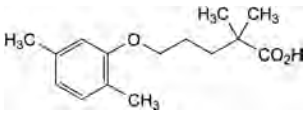


C. 1-(2-deoxy-2,2-difluoro-β-D-*erythro*-pentofuranosyl)pyrimidin-2,4(1*H*,3*H*)-dione (2′-deoxy-2′,2′-difluorouridine) (β-uridine).

**07/2018:1694**

# GEMFIBROZIL

## Gemfibrozilum



$C_{15}H_{22}O_3$ $M_r$ 250.3

[25812-30-0]

DEFINITION

5-(2,5-Dimethylphenoxy)-2,2-dimethylpentanoic acid.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, waxy, crystalline powder.

*Solubility*: practically insoluble in water, very soluble in methylene chloride, freely soluble in anhydrous ethanol and in methanol.

IDENTIFICATION

A. Melting point (*2.2.14*): 58 °C to 61 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *gemfibrozil CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 40.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A.

*Reference solution (a)*. Dissolve the contents of a vial of *gemfibrozil for system suitability CRS* (containing impurities C, D and E) in 2.0 mL of *acetonitrile R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (c)*. Dissolve 5 mg of *2,5-dimethylphenol R* (impurity A) in mobile phase A and dilute to 10.0 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: dissolve 0.49 g of *potassium acetate R* in 400 mL of *water for chromatography R*, adjust to pH 4.0 with *phosphoric acid R* and add 600 mL of *acetonitrile R*;
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 20 | 100 → 0 | 0 → 100 |
| 20 - 25 | 0 | 100 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *gemfibrozil for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities C, D and E; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity A.

*Relative retention* with reference to gemfibrozil (retention time = about 7 min): impurity A = about 0.4; impurity C = about 1.3; impurity D = about 1.5; impurity E = about 1.7; impurity I = about 2.0; impurity H = about 2.9.

*System suitability*: reference solution (a):

- *resolution*: minimum 6.0 between the peaks due to gemfibrozil and impurity C, and minimum 2.0 between the peaks due to impurities D and E.

*Limits*:

- *correction factors*: for the calculation of content multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.5; impurity D = 1.8; impurity E = 0.2; impurity H = 0.6;
- *impurities E, I*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities A, D, H*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.12*): maximum 0.25 per cent, determined on 2.000 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g. Allow to stand for 1 h after the first moistening before heating.

ASSAY

Dissolve 0.200 g in 40 mL of *methanol R*. Add 10 mL of *water R* and 1 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*) using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 25.03 mg of $C_{15}H_{22}O_3$.

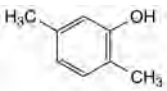
STORAGE

Protected from light.

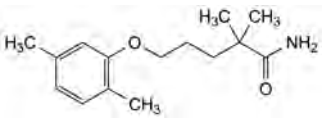
IMPURITIES

*Specified impurities: A, D, E, H, I.*

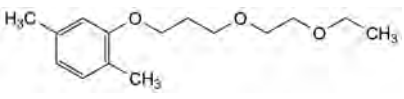
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, F, G.*



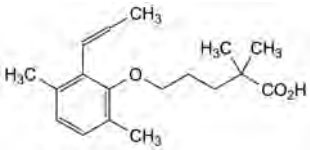
A. 2,5-dimethylphenol (*p*-xylenol),



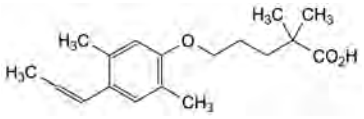
B. 5-(2,5-dimethylphenoxy)-2,2-dimethylpentanamide,



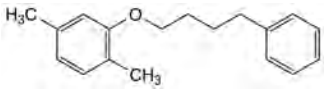
C. 2-[3-(2-ethoxyethoxy)propoxy]-1,4-dimethylbenzene,



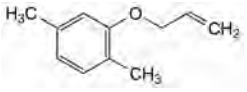
D. 5-[3,6-dimethyl-2-(prop-1-en-1-yl)phenoxy]-2,2-dimethylpentanoic acid,



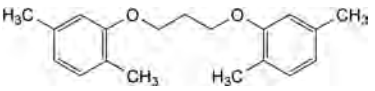
E. 5-[2,5-dimethyl-4-(prop-1-en-1-yl)phenoxy]-2,2-dimethylpentanoic acid,



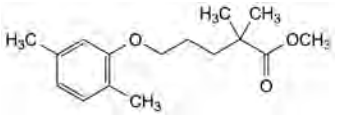
F. 1,4-dimethyl-2-(4-phenylbutoxy)benzene,



G. 1,4-dimethyl-2-(prop-2-en-1-yloxy)benzene,



H. 1,1′-[propane-1,3-diylbis(oxy)]bis(2,5-dimethylbenzene),

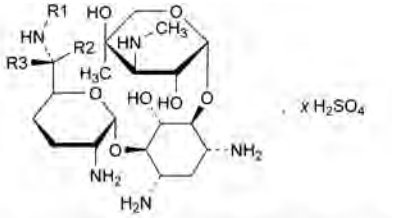


I. methyl 5-(2,5-dimethylphenoxy)-2,2-dimethylpentanoate.

**07/2012:0331**
**corrected 10.0**

# GENTAMICIN SULFATE

## Gentamicini sulfas



| Gentamicin | Mol. Formula | R1 | R2 | R3 |
|---|---|---|---|---|
| C1 | $C_{21}H_{43}N_5O_7$ | $CH_3$ | $CH_3$ | H |
| C1a | $C_{19}H_{39}N_5O_7$ | H | H | H |
| C2 | $C_{20}H_{41}N_5O_7$ | H | $CH_3$ | H |
| C2a | $C_{20}H_{41}N_5O_7$ | H | H | $CH_3$ |
| C2b | $C_{20}H_{41}N_5O_7$ | $CH_3$ | H | H |

[1405-41-0]

DEFINITION

Mixture of the sulfates of antimicrobial substances produced by *Micromonospora purpurea*, the main components being gentamicins C1, C1a, C2, C2a and C2b.

*Content*: minimum 590 IU/mg (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

*First identification*: B, C.

*Second identification*: A, C.

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 5 mL with the same solvent.

*Reference solution*. Dissolve the contents of a vial of *gentamicin sulfate CRS* in *water R* and dilute to 5 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: the lower layer of a mixture of equal volumes of *concentrated ammonia R*, *methanol R* and *methylene chloride R*.

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

*Results*: the 3 principal spots in the chromatogram obtained with the test solution are similar in position, colour and size to the 3 principal spots in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the test for composition.

*Results*: the chromatogram obtained with test solution (b) shows 5 principal peaks having the same retention times as the 5 principal peaks in the chromatogram obtained with reference solution (a).

C. It gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.8 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

**pH** (*2.2.3*): 3.5 to 5.5 for solution S.

**Specific optical rotation** (*2.2.7*): + 107 to + 121 (anhydrous substance).

Dissolve 2.5 g in *water R* and dilute to 25.0 mL with the same solvent.

**Composition**. Liquid chromatography (*2.2.29*): use the normalisation procedure taking into account only the peaks due to gentamicins C1, C1a, C2, C2a and C2b.

*Test solution (a)*. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 mL with the mobile phase.

*Test solution (b)*. Dilute 5.0 mL of test solution (a) to 25.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 5 mg of *gentamicin for peak identification CRS* (containing impurity B) in the mobile phase and dilute to 25 mL with the mobile phase.

*Reference solution (b)*. Dissolve 20.0 mg of *sisomicin sulfate CRS* (impurity A) in the mobile phase and dilute to 20.0 mL with the mobile phase.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 100.0 mL with the mobile phase.

*Reference solution (d)*. To 1 mL of reference solution (b), add 5 mL of test solution (a) and dilute to 50 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*. To 900 mL of *carbon dioxide-free water R*, add 7.0 mL of *trifluoroacetic acid R*, 250.0 µL of *pentafluoropropanoic acid R* and 4.0 mL of *carbonate-free*

*sodium hydroxide solution R*, allow to equilibrate and adjust to pH 2.6 using *carbonate-free sodium hydroxide solution R* diluted 1 to 25. Add 15 mL of *acetonitrile R* and dilute to 1000.0 mL with *carbon dioxide-free water R*.

*Flow rate*: 1.0 mL/min.

*Post-column solution*: *carbonate-free sodium hydroxide solution R* diluted 1 to 25, previously degassed, which is added pulse-less to the column effluent using a 375 µL polymeric mixing coil.

*Flow rate of post-column solution*: 0.3 mL/min.

*Detection*: pulsed amperometric detector or equivalent with a gold indicator electrode, a silver-silver chloride reference electrode, and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and – 0.15 V reduction potentials, with pulse durations according to the instrument used.

*Injection*: 20 µL of test solution (b) and reference solutions (a), (c) and (d).

*Run time*: 1.2 times the retention time of gentamicin C1.

*Identification of peaks*: use the chromatogram supplied with *gentamicin for peak identification CRS* to identify the peaks due to gentamicins C1, C1a, C2, C2a and C2b.

*Relative retention* with reference to impurity A (retention time = about 23 min): gentamicin C1a = about 1.1; gentamicin C2 = about 1.8; gentamicin C2b = about 2.0; gentamicin C2a = about 2.3; gentamicin C1 = about 3.0.

*System suitability*:

- *resolution*: minimum 1.2 between the peaks due to impurity A and gentamicin C1a and minimum 1.5 between the peaks due to gentamicin C2 and gentamicin C2b in the chromatogram obtained with reference solution (d); if necessary, adjust the volume of *acetonitrile R* in the mobile phase, a total volume of up to 50 mL may be added per litre of mobile phase;
- *signal-to-noise ratio*: minimum 20 for the principal peak in the chromatogram obtained with reference solution (c).

*Limits*:

- *gentamicin C1*: 25.0 per cent to 45.0 per cent;
- *gentamicin C1a*: 10.0 per cent to 30.0 per cent;
- *sum of gentamicins C2, C2a and C2b*: 35.0 per cent to 55.0 per cent.

**Related substances**. Liquid chromatography (*2.2.29*) as described in the test for composition with the following modifications; use reference solution (c) to calculate the percentage content of each impurity.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peak due to impurity A; use the chromatogram supplied with *gentamicin for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peak due to impurity B.

*Limits*:

- *impurities A, B*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.0 per cent);
- *any other impurity*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.0 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (c) (10 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

**Methanol** (*2.4.24, System B*): maximum 1.0 per cent.

**Sulfate**: 32.0 per cent to 35.0 per cent (anhydrous substance).

Dissolve 0.250 g in 100 mL of *distilled water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 mL of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate*, adding 50 mL of *ethanol (96 per cent) R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 mL of *0.1 M barium chloride* is equivalent to 9.606 mg of $SO_4$.

**Water** (*2.5.12*): maximum 15.0 per cent, determined on 0.300 g.

**Sulfated ash** (*2.4.14*): maximum 1.0 per cent, determined on 0.50 g.

**Bacterial endotoxins** (*2.6.14*): less than 0.71 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

## ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*).

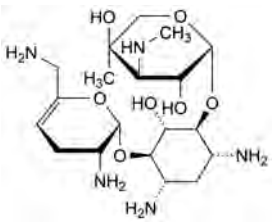
## STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

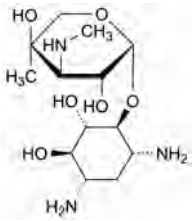
## IMPURITIES

*Specified impurities*: *A, B.*

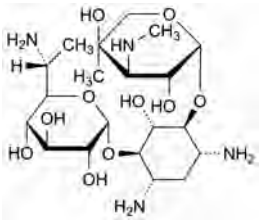
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E.*



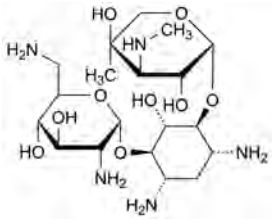
A. 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-6-*O*-(2,6-diamino-2,3,4,6-tetradeoxy-α-D-*glycero*-hex-4-enopyranosyl)-L-streptamine (sisomicin),



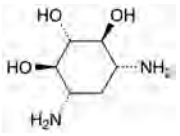
B. 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-L-streptamine (garamine),



C. 4-*O*-(6-amino-6,7-dideoxy-D-*glycero*-α-D-*gluco*-heptopyranosyl)-2-deoxy-6-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-D-streptamine (gentamicin $B_1$),



D. 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-6-*O*-(2,6-diamino-2,6-dideoxy-α-D-*gluco*-hexopyranosyl)-L-streptamine,



E. 2-deoxystreptamine.

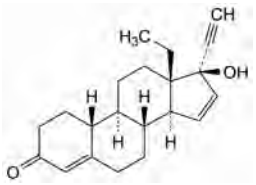
# GESTODENE

## Gestodenum



$C_{21}H_{26}O_2$ $M_r$ 310.4
[60282-87-3]

DEFINITION

13-Ethyl-17-hydroxy-18,19-dinor-17α-pregna-4,15-dien-20-yn-3-one.

*Content*: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or yellowish, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, soluble in methanol, sparingly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *gestodene CRS*.
If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Specific optical rotation** (*2.2.7*): − 188 to − 198 (dried substance).

Dissolve 0.100 g in *methanol R* and dilute to 10.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R1*, *water R* (50:50 *V/V*).

*Test solution (a)*. Dissolve 30.0 mg of the substance to be examined in 5 mL of *acetonitrile R1* and dilute to 10.0 mL with *water R*.

*Test solution (b)*. Dilute 1.0 mL of test solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 3 mg of *gestodene for system suitability CRS* (containing impurities A, B, C and L) in 0.5 mL of *acetonitrile R1* and dilute to 1.0 mL with *water R*.

*Reference solution (b)*. Dilute 1.0 mL of test solution (a) to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve 30.0 mg of *gestodene CRS* in 5 mL of *acetonitrile R1* and dilute to 10.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (d)*. Dissolve the contents of a vial of *gestodene impurity I CRS* in 1.0 mL of the solvent mixture.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: spherical *end-capped octylsilyl silica gel for chromatography R* (3.5 µm).

*Mobile phase*:
- *mobile phase A*: *water R*;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 62 | 38 |
| 2 - 20 | 62 → 58 | 38 → 42 |
| 20 - 24 | 58 → 30 | 42 → 70 |
| 24 - 32 | 30 | 70 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 205 nm and at 254 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (a), (b) and (d).

*Identification of impurities*: use the chromatogram supplied with *gestodene for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, C and L; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity I.

*Relative retention* with reference to gestodene (retention time = about 12.5 min): impurity A = about 0.9; impurity C = about 1.1; impurity I = about 1.2; impurity L = about 1.46; impurity B = about 1.53.

*System suitability*: reference solution (a):
- *resolution*: minimum 2.0 between the peaks due to impurity A and gestodene.

*Limits*:
- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 2.2; impurity I = 1.3;

- *impurity A at 254 nm*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity B at 205 nm*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurity C at 254 nm*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities I, L at 205 nm*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities at 254 nm*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total at 254 nm*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit at 254 nm*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution (b) and reference solution (c).

*Detection*: spectrophotometer at 254 nm.

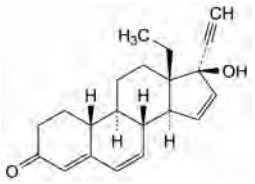
Calculate the percentage content of $C_{21}H_{26}O_2$ from the declared content of *gestodene CRS*.

IMPURITIES

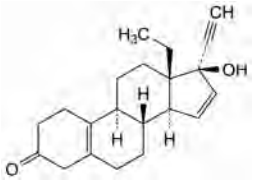
*Specified impurities*: *A, B, C, I, L.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*):

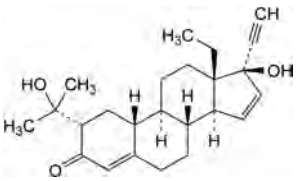
- *at 205 nm*: *G, J, K*;
- *at 254 nm*: *D, E, F, H.*



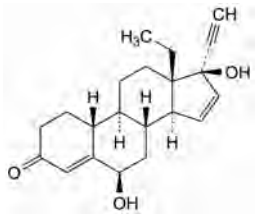
A. 13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-4,6,15-trien-20-yn-3-one (Δ6-gestodene),



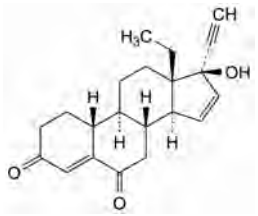
B. 13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-5(10),15-dien-20-yn-3-one (Δ5(10)-gestodene),



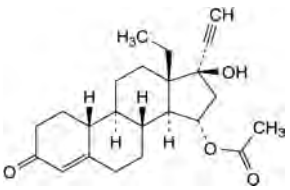
C. 13-ethyl-17-hydroxy-2α-(1-hydroxy-1-methylethyl)-18,19-dinor-17α-pregna-4,15-dien-20-yn-3-one (2-isopropanol-gestodene),



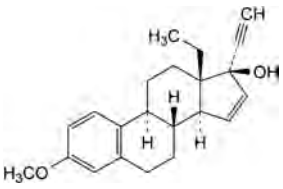
D. 13-ethyl-6β,17-dihydroxy-18,19-dinor-17α-pregna-4,15-dien-20-yn-3-one (6β-hydroxy-gestodene),



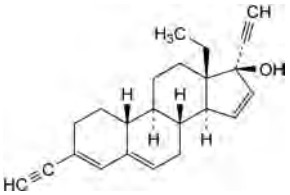
E. 13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-4,15-dien-20-yne-3,6-dione (6-keto-gestodene),



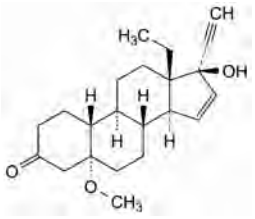
F. 13-ethyl-17-hydroxy-3-oxo-18,19-dinor-17α-pregn-4-en-20-yn-15α-yl acetate (15α-acetoxy-gestodene),



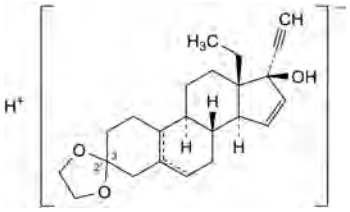
G. 13-ethyl-3-methoxy-18,19-dinor-17α-pregna-1,3,5(10),15-tetraen-20-yn-17-o1 (*A*-aromatic-gestodene),



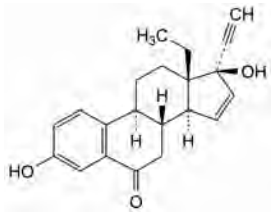
H. 13-ethyl-3-ethynyl-18,19-dinor-17α-pregna-3,5,15-trien-20-yn-17-o1 (diethynyl-gestodene),



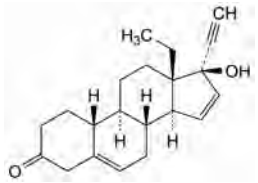
I. 13-ethyl-17-hydroxy-5-methoxy-18,19-dinor-5α,17α-pregn-15-en-20-yn-3-one (5-methoxy-gestodene),



J. 13-ethylspiro(18,19-dinor-17α-pregna-5,15-dien-20-yne-3,2′-[1,3]dioxolan)-17-ol and 13-ethylspiro(18,19-dinor-17α-pregna-5(10),15-dien-20-yne-3,2′-[1,3]dioxolan)-17-ol (gestodene ketal),



K. 13-ethyl-3,17-dihydroxy-18,19-dinor-17α-pregna-1,3,5(10),15-tetraen-20-yn-6-one (aromatic 6-keto-gestodene),



L. 13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-5,15-dien-20-yn-3-one (Δ5(6)-gestodene).

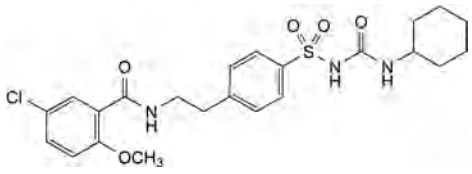
# GLIBENCLAMIDE

## Glibenclamidum



$C_{23}H_{28}ClN_3O_5S$ $M_r$ 494.0
[10238-21-8]

DEFINITION

1-[[4-[2-[(5-Chloro-2-methoxybenzoyl)amino]ethyl]phenyl]-sulfonyl]-3-cyclohexylurea.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in ethanol (96 per cent) and in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: C.*

*Second identification: A, B, D, E.*

A. Melting point (*2.2.14*): 169 °C to 174 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in *methanol R*, with the aid of ultrasound if necessary, and dilute to 50.0 mL with the same solvent. To 10.0 mL of the solution add 1.0 mL of a 103 g/L solution of *hydrochloric acid R* and dilute to 100.0 mL with *methanol R*.

*Spectral range*: 230-350 nm.

*Absorption maxima*: at 300 nm and a less intense maximum at 275 nm.

*Specific absorbance at the absorption maxima*:
- at 300 nm: 61 to 65;
- at 275 nm: 27 to 32.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *glibenclamide CRS*.

If the spectra obtained show differences, moisten separately the substance to be examined and the reference substance with *methanol R*, triturate, dry at 100-105 °C and record the spectra again.

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 mL with the same mixture of solvents.

*Reference solution.* Dissolve 10 mg of *glibenclamide CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 mL with the same mixture of solvents.

*Plate*: *TLC silica gel $GF_{254}$ plate R*.

*Mobile phase*: *ethanol (96 per cent) R*, *glacial acetic acid R*, *cyclohexane R*, *methylene chloride R* (5:5:45:45 *V/V/V/V*).

*Application*: 10 µL.

*Development*: over 1/2 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve 20 mg in 2 mL of *sulfuric acid R*. The solution is colourless and shows blue fluorescence in ultraviolet light at 365 nm. Dissolve 0.1 g of *chloral hydrate R* in the solution. After about 5 min, the colour changes to deep yellow and, after about 20 min, develops a brownish tinge.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use or store them at 5 °C for not more than 40 h.*

*Test solution.* Dissolve 25.0 mg of the substance to be examined in *methanol R*, with the aid of ultrasound if necessary, and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 3.0 mg of *glibenclamide impurity A CRS* and 3 mg of *glibenclamide impurity B CRS* in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of the solution to 20.0 mL with *methanol R*.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

*Reference solution (c).* Dissolve 12.5 mg of *glibenclamide for peak identification CRS* (containing impurity C) in *methanol R*, with the aid of ultrasound if necessary, and dilute to 5.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: mix 20 mL of a 100.0 g/L solution of *triethylamine R2* previously adjusted to pH 3.0 using *phosphoric acid R*, and 50 mL of *acetonitrile R*; dilute to 1000 mL with *water R*;
- *mobile phase B*: mobile phase A, *water R*, *acetonitrile R* (2:6.5:91.5 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 45 | 55 |
| 15 - 30 | 45 → 5 | 55 → 95 |
| 30 - 40 | 5 | 95 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A and B; use the chromatogram supplied with *glibenclamide for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity C.

*Relative retention* with reference to glibenclamide (retention time = about 5 min): impurity A = about 0.5; impurity B = about 0.6; impurity C = about 0.7.

*System suitability*: reference solution (a):

- *resolution*: minimum 2.0 between the peaks due to impurities A and B.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity C by 1.8;
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity C*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: 0.8 per cent;
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

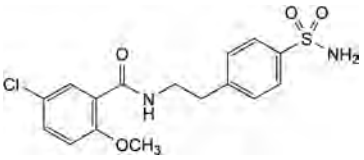
Dissolve 0.400 g with heating in 100 mL of *ethanol (96 per cent) R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 49.40 mg of $C_{23}H_{28}ClN_3O_5S$.

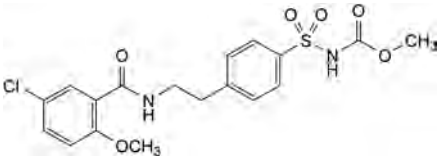
IMPURITIES

*Specified impurities*: *A, C.*

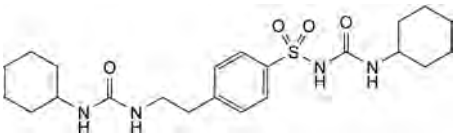
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, D, E.*



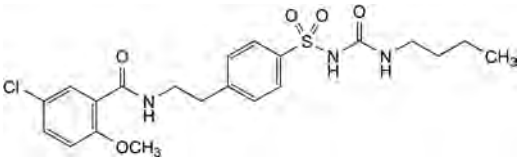
A. 5-chloro-2-methoxy-*N*-[2-(4-sulfamoylphenyl)ethyl]-benzamide,



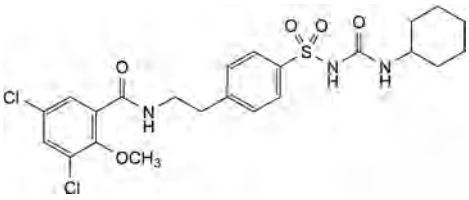
B. methyl [[4-[2-[(5-chloro-2-methoxybenzoyl)amino]-ethyl]phenyl]sulfonyl]carbamate,



C. 1-cyclohexyl-3-[[4-[2-[(cyclohexylcarbamoyl)amino]-ethyl]phenyl]sulfonyl]urea,



D. 1-butyl-3-[[4-[2-[(5-chloro-2-methoxybenzoyl)amino]-ethyl]phenyl]sulfonyl]urea,

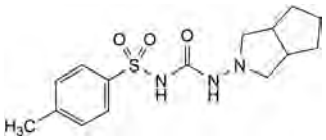


E. 1-cyclohexyl-3-[[4-[2-[(3,5-dichloro-2-methoxybenzoyl)-amino]ethyl]phenyl]sulfonyl]urea.

**01/2017:1524**

# GLICLAZIDE

## Gliclazidum



$C_{15}H_{21}N_3O_3S$ $M_r$ 323.4

[21187-98-4]

DEFINITION

1-(Hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)-3-[(4-methylphenyl)sulfonyl]urea.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *gliclazide CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture*: *acetonitrile R*, *water R* (45:55 *V/V*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in 23 mL of *acetonitrile R* and dilute to 50.0 mL with *water R*.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 10.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 5 mg of the substance to be examined and 15 mg of *gliclazide impurity F CRS* in 23 mL of *acetonitrile R* and dilute to 50 mL with *water R*. Dilute 1 mL of the solution to 20 mL with the solvent mixture.

*Reference solution (c).* Dissolve 15.0 mg of *gliclazide impurity F CRS* in 45 mL of *acetonitrile R* and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 100.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *triethylamine R*, *trifluoroacetic acid R*, *acetonitrile R*, *water R* (0.1:0.1:45:55 *V/V/V/V*).

*Flow rate*: 0.9 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of gliclazide.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity F.

*Relative retention* with reference to gliclazide (retention time = about 16 min): impurity F = about 0.9.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.8 between the peaks due to impurity F and gliclazide.

*Limits*:

- *impurity F*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *sum of impurities other than F*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Impurity B**. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Test solution.* Dissolve 0.400 g of the substance to be examined in 2.5 mL of *dimethyl sulfoxide R* and dilute to 10.0 mL with *water R*. Stir for 10 min, store at 4 °C for 30 min and filter.

*Reference solution.* Dissolve 20.0 mg of *gliclazide impurity B CRS* in *dimethyl sulfoxide R* and dilute to 100.0 mL with the same solvent. To 1.0 mL of the solution, add 12 mL of *dimethyl sulfoxide R* and dilute to 50.0 mL with *water R*. To 1.0 mL of this solution, add 12 mL of *dimethyl sulfoxide R* and dilute to 50.0 mL with *water R*.

*Injection*: 50 µL.

*Identification of impurities*: use the chromatogram obtained with the reference solution to identify the peak due to impurity B.

*Retention time*: impurity B = about 8 min.

*Limit*:

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (2 ppm).

**Loss on drying** (*2.2.32*): maximum 0.25 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

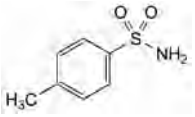
Dissolve 0.250 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 32.34 mg of $C_{15}H_{21}N_3O_3S$.

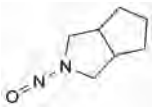
IMPURITIES

*Specified impurities: B, F.*

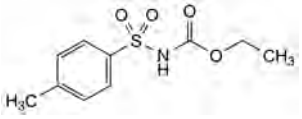
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C, D, E, G.*



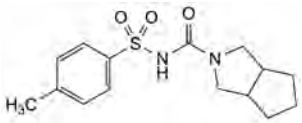
A. 4-methylbenzenesulfonamide,



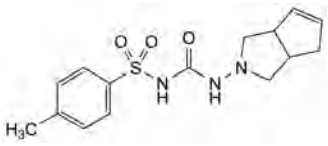
B. 2-nitroso-octahydrocyclopenta[*c*]pyrrole,



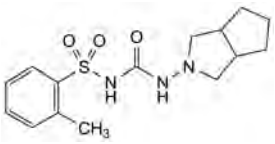
C. ethyl [(4-methylphenyl)sulfonyl]carbamate,



D. *N*-[(4-methylphenyl)sulfonyl]hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-carboxamide,



E. 1-[(4-methylphenyl)sulfonyl]-3-(3,3a,4,6a-tetrahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)urea,



F. 1-(hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)-3-[(2-methylphenyl)sulfonyl]urea,

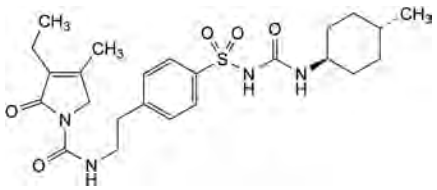
# GLIMEPIRIDE

## Glimepiridum



$C_{24}H_{34}N_4O_5S$ $M_r$ 490.6
[93479-97-1]

DEFINITION

1-[[4-[2-(3-Ethyl-4-methyl-2-oxo-3-pyrroline-1-carboxamido)ethyl]phenyl]sulfonyl]-3-*trans*-(4-methylcyclohexyl)urea.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, soluble in dimethylformamide, slightly soluble in methylene chloride, very slightly soluble in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *glimepiride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *dimethylformamide R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Store the solutions at a temperature not exceeding 12 °C and for not more than 15 h.*

*Solvent mixture*: *water for chromatography R*, *acetonitrile for chromatography R* (1:4 *V/V*).

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve the contents of a vial of *glimepiride for system suitability CRS* (containing impurities B, C and D) in 2.0 mL of the test solution.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 20.0 mg of *glimepiride CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (4 µm).

*Mobile phase*: dissolve 0.5 g of *sodium dihydrogen phosphate R* in 500 mL of *water for chromatography R* and adjust to pH 2.5 with *phosphoric acid R*. Add 500 mL of *acetonitrile for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 228 nm.

*Injection*: 20 µL of the test solution and reference solutions (a) and (b).

*Run time*: 2.5 times the retention time of glimepiride.

*Relative retention* with reference to glimepiride (retention time = about 17 min): impurity B = about 0.2; impurity C = about 0.3; impurity D = about 1.1.

*System suitability*: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurities B and C.

*Limits*:

– *impurity B*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
– *impurity D*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent),
– *sum of impurities other than B*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Impurity A**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 10.0 mg of the substance to be examined in 5 mL of *methylene chloride R* and dilute to 20.0 mL with the mobile phase.

*Reference solution (a).* Dilute 0.8 mL of the test solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 2.0 mg of *glimepiride for impurity A identification CRS* in 1 mL of *methylene chloride R* and dilute to 4.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 3 mm;
– *stationary phase*: *diol silica gel for chromatography R* (5 µm).

Monographs G

*Mobile phase*: *anhydrous acetic acid R, 2-propanol R, heptane R* (1:100:899 *V/V/V*).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 228 nm.

*Injection*: 10 µL.

*Run time*: 1.5 times the retention time of glimepiride.

*Identification of impurities*: use the chromatogram supplied with *glimepiride for impurity A identification CRS* and the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to glimepiride (retention time = about 14 min): impurity A = about 0.9.

*System suitability*: reference solution (b):

– *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to glimepiride.

*Limit*:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent).

**Water** (*2.5.32*): maximum 0.5 per cent.

Dissolve 0.250 g in *dimethylformamide R* and dilute to 5.0 mL with the same solvent. Carry out the test on 1.0 mL of solution. Carry out a blank test.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (c).

Calculate the percentage content of $C_{24}H_{34}N_4O_5S$ from the areas of the peaks and the assigned content of *glimepiride CRS*.

IMPURITIES

*Specified impurities*: *A, B, D.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E, F, G, H, I, J.*

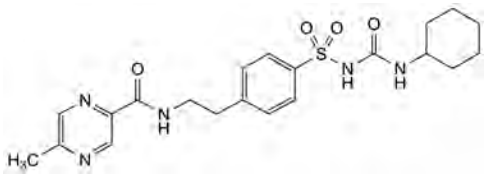
# GLIPIZIDE

## Glipizidum



$C_{21}H_{27}N_5O_4S$ $M_r$ 445.5
[29094-61-9]

DEFINITION

*N*-[2-[4-[(Cyclohexylcarbamoyl)sulfamoyl]phenyl]ethyl]-5-methylpyrazine-2-carboxamide.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, very slightly soluble in acetone and in methylene chloride, practically insoluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification*: B.

*Second identification*: A, C.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve about 2 mg in *methanol R* and dilute to 100 mL with the same solvent.

*Spectral range*: 220-350 nm.

*Absorption maxima*: 226 nm and 274 nm.

*Absorbance ratio*: $A_{226}/A_{274}$ = 2.0 to 2.4.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *glipizide CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 mL with the same mixture of solvents.

*Reference solution.* Dissolve 10 mg of *glipizide CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 mL with the same mixture of solvents.

*Plate*: *TLC silica gel $GF_{254}$ plate R*.

*Mobile phase*: *anhydrous formic acid R*, *ethyl acetate R*, *methylene chloride R* (25:25:50 *V/V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture.* Mix 40 volumes of *acetonitrile R* and 60 volumes of *water R* previously adjusted to pH 3.5 with *acetic acid R*.

*Test solution.* Dissolve 20.0 mg of the substance to be examined in 20.0 mL of *methanol R* using sonication and dilute to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 6.0 mg of *glipizide impurity A CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 50.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 2 mg of *glipizide impurity C CRS* in the solvent mixture and dilute to 100 mL with the solvent mixture. Dilute 1 mL of the solution to 100 mL with the solvent mixture.

*Reference solution (d).* Dissolve 2 mg of *glipizide impurity D CRS* in the solvent mixture and dilute to 250 mL with the solvent mixture. Dilute 1 mL of the solution to 20 mL with reference solution (b).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *water for chromatography R* adjusted to pH 3.5 with *acetic acid R*;
- *mobile phase B*: *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 75 | 25 |
| 5 - 12 | 75 → 65 | 25 → 35 |
| 12 - 20 | 65 | 35 |
| 20 - 25 | 65 → 50 | 35 → 50 |
| 25 - 30 | 50 | 50 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 225 nm.

*Injection*: 50 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A; use the chromatogram obtained with reference

Monographs G

solution (c) to identify the peak due to impurity C; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity D.

*Relative retention* with reference to glipizide (retention time = about 22 min): impurity A = about 0.25; impurity D = about 0.27; impurity C = about 1.2.

*System suitability*: reference solution (d):

- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to impurity D and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity C by 1.7;
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity C*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: maximum 0.5 per cent;
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Impurity B**. Gas chromatography (*2.2.28*).

*Internal standard solution*. Dissolve 25.0 mg of *decane R* in *methylene chloride R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of the solution to 100.0 mL with *methylene chloride R*.

*Test solution (a)*. Dissolve 1.000 g of the substance to be examined in 50 mL of a 12 g/L solution of *sodium hydroxide R* and shake with 2 quantities, each of 5.0 mL, of *methylene chloride R*. Use the combined lower layers.

*Test solution (b)*. Dissolve 1.000 g of the substance to be examined in 50 mL of a 12 g/L solution of *sodium hydroxide R* and shake with 2 quantities, each of 5.0 mL, of the internal standard solution. Use the combined lower layers.

*Reference solution*. Dissolve 10.0 mg of *cyclohexylamine R* (impurity B) in a 17.5 g/L solution of *hydrochloric acid R* and dilute to 100.0 mL with the same acid. To 1.0 mL of this solution add 50 mL of a 12 g/L solution of *sodium hydroxide R* and shake with 2 quantities, each of 5.0 mL, of the internal standard solution. Use the combined lower layers.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.32 mm;
- *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.5 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.8 mL/min.

*Split ratio*: 1:11.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 4 | 40 |
| | 4 - 20 | 40 → 200 |
| | 20 - 25 | 200 |
| Injection port | | 250 |
| Detector | | 270 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: impurity B, decane.

*System suitability*:

- *resolution*: minimum 7 between the peaks due to impurity B and the internal standard in the chromatogram obtained with the reference solution;
- there is no peak with the same retention time as that of the internal standard in the chromatogram obtained with test solution (a).

Calculate the ratio (*R*) of the area of the peak due to impurity B to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with test solution (b), calculate the ratio of the area of any peak due to impurity B to the area of the peak due to the internal standard.

*Limit*:

- *impurity B*: not more than *R* (100 ppm).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

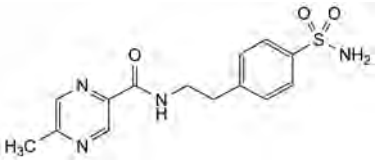
Dissolve 0.400 g in 50 mL of *dimethylformamide R*. Add 0.2 mL of *quinaldine red solution R*. Titrate with *0.1 M lithium methoxide* until the colour changes from red to colourless.

1 mL of *0.1 M lithium methoxide* is equivalent to 44.55 mg of $C_{21}H_{27}N_5O_4S$.

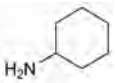
IMPURITIES

*Specified impurities: A, B, C.*

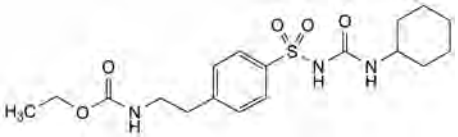
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, E, F, G, H, I, J.*



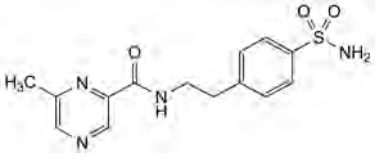
A. 5-methyl-*N*-[2-(4-sulfamoylphenyl)ethyl]pyrazine-2-carboxamide,



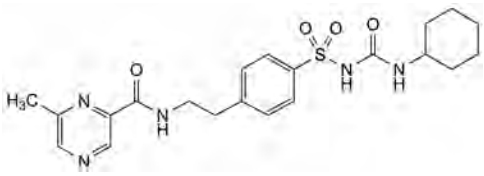
B. cyclohexanamine (cyclohexylamine),



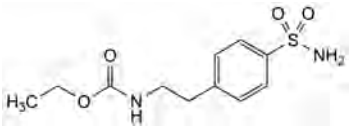
C. ethyl [2-[4-[(cyclohexylcarbamoyl)sulfamoyl]phenyl]-ethyl]carbamate,



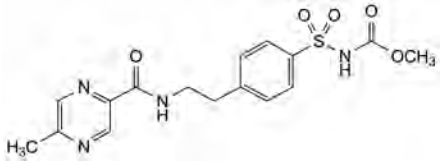
D. 6-methyl-*N*-[2-(4-sulfamoylphenyl)ethyl]pyrazine-2-carboxamide,



E. *N*-[2-[4-[(cyclohexylcarbamoyl)sulfamoyl]phenyl]ethyl]-6-methylpyrazine-2-carboxamide,



F. ethyl [2-(4-sulfamoylphenyl)ethyl]carbamate,



G. methyl [4-[2-(5-methylpyrazine-2-carboxamido)ethyl]-benzene-1-sulfonyl]carbamate,

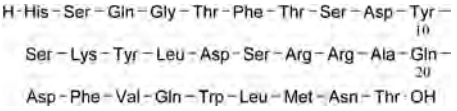
**corrected 10.0**

# GLUCAGON, HUMAN

## Glucagonum humanum



$C_{153}H_{225}N_{43}O_{49}S$ $M_r$ 3483

DEFINITION

Polypeptide having the same structure (29 amino acids) as the hormone produced by the α-cells of the human pancreas, which increases the blood-glucose concentration by promoting rapid breakdown of liver glycogen.

*Content*: 92.5 per cent to 105.0 per cent (anhydrous substance).

PRODUCTION

Human glucagon is produced by a method based on recombinant DNA (rDNA) technology. During the course of product development it must be demonstrated that the manufacturing process produces a product having a biological activity of not less than 1 IU/mg using a suitable validated bioassay.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water and in most organic solvents. It is soluble in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Peptide mapping. Liquid chromatography (*2.2.29*).

*Test solution*. Prepare a 5 mg/mL solution of the substance to be examined in *0.01 M hydrochloric acid*. Mix 200 µL of this solution with 800 µL of *0.1 M ammonium carbonate buffer solution pH 10.3 R* (diluted stock solution). Prepare a 2 mg/mL solution of *α-chymotrypsin for peptide mapping R* in *0.1 M ammonium carbonate buffer solution pH 10.3 R* and add 25 µL of this solution to the diluted stock solution. Place the solution in a closed vial at 37 °C for 2 h. Remove the vial and stop the reaction immediately by adding 120 µL of *glacial acetic acid R*.

*Reference solution*. Prepare a 1 mg/mL solution of *human glucagon CRS* in *0.1 M ammonium carbonate buffer solution pH 10.3 R* (diluted stock solution) and continue as described for the test solution.

*Column*:

– *size*: *l* = 0.05 m, Ø = 4 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

– *mobile phase A*: mix 500 µL of *trifluoroacetic acid R* and 1000 mL of *water R*;
– *mobile phase B*: mix 500 µL of *trifluoroacetic acid R* with 600 mL of *anhydrous ethanol R* and add 400 mL of *water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 35 | 100 → 53 | 0 → 47 |
| 35 - 45 | 53 → 0 | 47 → 100 |
| 45 - 46 | 0 → 100 | 100 → 0 |
| 46 - 75 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Equilibration*: with mobile phase A for at least 15 min.

*Injection*: 20 µL.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human glucagon CRS*.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

Monographs G

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Related proteins and deamidated forms**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution*. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 0.5 mg/mL. *Maintain the solution at 2-8 °C.*

*Reference solution (a)*. Dissolve the contents of a vial of *human glucagon CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 0.5 mg/mL. *Maintain the solution at 2-8 °C.*

*Reference solution (b)*. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of about 0.5 mg/mL. Heat at 50 °C for 48 h (*in situ* preparation of all 4 deamidated forms of glucagon at a total concentration of not less than 7 per cent).

*Column*:

- *size*: *l* = 0.15 m, Ø = 3 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 45 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 16.3 g of *potassium dihydrogen phosphate R* in 800 mL of *water R*, adjust to pH 2.7 with *phosphoric acid R* and add 200 mL of *acetonitrile for chromatography R*;
- *mobile phase B*: *acetonitrile for chromatography R*, *water R* (40:60 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 25 | 61 | 39 |
| 25 - 29 | 61 → 12 | 39 → 88 |
| 29 - 30 | 12 | 88 |
| 30 - 31 | 12 → 61 | 88 → 39 |

*NOTE*: the end time of the isocratic elution may be adjusted so that the gradient begins after elution of the peak due to deamidated glucagon 4 (see relative retention below).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 15 µL.

*Relative retention* with reference to glucagon (retention time = about 21 min): deamidated glucagon 1 = about 1.1; deamidated glucagon 4 = about 1.4.

*System suitability*:

- *resolution*: minimum 1.5 between the peaks due to glucagon and deamidated glucagon 1 in the chromatogram obtained with reference solution (b);
- *symmetry factor*: maximum 1.8 for the peak due to glucagon in the chromatogram obtained with reference solution (a);
- *repeatability*: maximum relative standard deviation of 2.0 per cent after 5 injections of reference solution (a);
- 4 peaks eluting after the principal peak, that correspond to the deamidated forms, are clearly visible in the chromatogram obtained with reference solution (b).

*Limits*:

- *deamidated forms*: maximum 0.8 per cent;
- *total*: maximum 3.0 per cent.

**Water** (*2.5.32*): maximum 10 per cent, determined on 50 mg.

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/mg.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related proteins and deamidated forms with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of human glucagon ($C_{153}H_{225}N_{43}O_{49}S$) taking into account the assigned content of $C_{153}H_{225}N_{43}O_{49}S$ in *human glucagon CRS*.

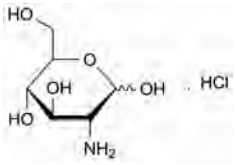
STORAGE

In an airtight container, protected from light, at a temperature lower than – 15 °C.

**07/2018:2446**

# GLUCOSAMINE HYDROCHLORIDE

## Glucosamini hydrochloridum



$C_6H_{14}ClNO_5$ $M_r$ 215.6
[66-84-2]

DEFINITION

2-Amino-2-deoxy-D-glucopyranose hydrochloride.

Isolated from natural sources or produced by fermentation.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

PRODUCTION

The animals from which glucosamine hydrochloride is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, slightly soluble in methanol, practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *glucosamine hydrochloride CRS*.

B. 1 mL of solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

C. Specific optical rotation (see Tests).

TESTS

**Solution S**. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dilute 5.0 mL of solution S to 25.0 mL with *water R*.

**pH** (*2.2.3*): 3.0 to 5.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 70.0 to + 74.0 (dried substance), determined on solution S.

Examine 3 h after preparation of solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. To 0.300 g of the substance to be examined add 80 mL of the mobile phase and sonicate for 10 min. Cool to room temperature and dilute to 100.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 25.0 mg of *2-methylpyrazine CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dissolve the contents of a vial of *glucosamine for system suitability CRS* (containing impurities B and C) in 1.0 mL of the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);

– *temperature*: 30 °C.

*Mobile phase*: dissolve 0.5 g of *sodium heptanesulfonate R* in *water for chromatography R*, add 0.5 mL of *phosphoric acid R* and 4 mL of a 56 g/L solution of *potassium hydroxide R* and dilute to 1000 mL with *water for chromatography R*; to 1000 mL of this solution add 50 mL of *acetonitrile R1*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 195 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of 2-methylpyrazine.

*Retention time*: 2-methylpyrazine = about 9 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurities B and C.

*Limits*:

– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

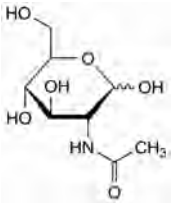
ASSAY

Dissolve 0.200 g in 50 mL of *water R* and add 1.0 mL of *0.1 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

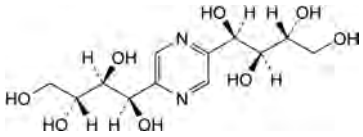
1 mL of *0.1 M sodium hydroxide* is equivalent to 21.56 mg of $C_6H_{14}ClNO_5$.

IMPURITIES

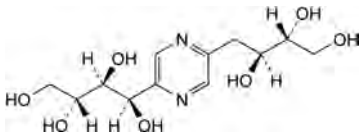
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, E.*



A. 2-(acetylamino)-2-deoxy-D-glucopyranose (*N*-acetylglucosamine),



B. (1*R*,1′*R*,2*S*,2′*S*,3*R*,3′*R*)-1,1′-pyrazine-2,5-diylbis(butane-1,2,3,4-tetrol) (fructosazine),



C. (1*R*,2*S*,3*R*)-1-[5-[(2*S*,3*R*)-2,3,4-trihydroxybutyl]pyrazin-2-yl]butane-1,2,3,4-tetrol (deoxyfructosazine),

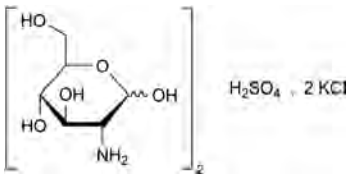
# GLUCOSAMINE SULFATE POTASSIUM CHLORIDE

## Glucosamini sulfas kalii chloridum



$C_{12}H_{28}Cl_2K_2N_2O_{14}S$ $M_r$ 606

[216699-44-4]

DEFINITION

Bis(2-amino-2-deoxy-D-glucopyranose) sulfate bis(potassium chloride).

Substance prepared from glucosamine hydrochloride isolated from natural sources or produced by fermentation, and potassium sulfate.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

PRODUCTION

The animals from which glucosamine sulfate potassium chloride is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, sparingly soluble in methanol, practically insoluble in acetone.

Monographs G

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *glucosamine sulfate potassium chloride CRS*.

C. It gives reaction (a) of chlorides (*2.3.1*).

D. It gives reaction (a) of sulfates (*2.3.1*).

E. 1 mL of solution S (see Tests) gives reaction (a) of potassium (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dilute 5.0 mL of solution S to 25.0 mL with *water R*.

**pH** (*2.2.3*): 3.0 to 5.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 47.0 to + 53.0 (dried substance), determined on solution S.

Examine 3 h after preparation of solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. To 0.42 g of the substance to be examined add 80 mL of the mobile phase and sonicate for 10 min. Cool to room temperature and dilute to 100.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 25.0 mg of *2-methylpyrazine CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve the contents of a vial of *glucosamine for system suitability CRS* (containing impurities B and C) in 1 mL of the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm) (3 µm);

– *temperature*: 30 °C.

*Mobile phase*: dissolve 0.5 g of *sodium heptanesulfonate R* in *water for chromatography R*, add 0.5 mL of *phosphoric acid R*, 4 mL of a 56 g/L solution of *potassium hydroxide R* and dilute to 1000 mL with *water for chromatography R*, then add 50 mL of *acetonitrile R1*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 195 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of 2-methylpyrazine.

*Retention time*: 2-methylpyrazine = about 9 min.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurities B and C.

*Calculation of percentage contents*:

– for each impurity, use the concentration of 2-methylpyrazine in reference solution (a).

*Limits*:

– *unspecified impurities*: for each impurity, maximum 0.05 per cent;

– *total*: maximum 0.2 per cent;

– *reporting threshold*: 0.03 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): 27.0 per cent to 31.0 per cent, determined on 1.0 g.

Ignite first at 600 ± 50 °C for 2 h. Do not repeat the moistening with *sulfuric acid R* between any re-ignition.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

ASSAY

Dissolve 0.280 g in 50 mL of *water R* and add 1.0 mL of *0.1 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 30.28 mg of $C_{12}H_{28}Cl_2K_2N_2O_{14}S$.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. # GLUCOSAMINE SULFATE SODIUM CHLORIDE

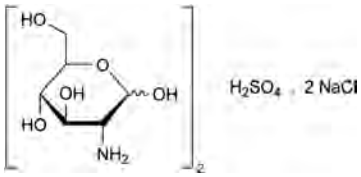
## Glucosamini sulfas natrii chloridum



$C_{12}H_{28}Cl_2N_2Na_2O_{14}S$ $M_r$ 573.3
[216447-62-0]

DEFINITION

Bis(2-amino-2-deoxy-D-glucopyranose) sulfate bis(sodium chloride).

Substance prepared from glucosamine hydrochloride isolated from natural sources or produced by fermentation, and sodium sulfate.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

PRODUCTION

The animals from which glucosamine sulfate sodium chloride is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, sparingly soluble in methanol, practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *glucosamine sulfate sodium chloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

C. 1 mL of solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

D. It gives reaction (a) of sulfates (*2.3.1*).

E. Specific optical rotation (see Tests).

TESTS

**Solution S**. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dilute 5.0 mL of solution S to 25.0 mL with *water R*.

**pH** (*2.2.3*): 3.0 to 5.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 50.0 to + 55.0 (dried substance), determined on solution S.

Examine 3 h after preparation of solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. To 0.40 g of the substance to be examined add 80 mL of the mobile phase and sonicate for 10 min. Cool to room temperature and dilute to 100.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 25.0 mg of *2-methylpyrazine CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve the contents of a vial of *glucosamine for system suitability CRS* (containing impurities B and C) in 1 mL of the mobile phase.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 30 °C.

*Mobile phase*: dissolve 0.5 g of *sodium heptanesulfonate R* in *water for chromatography R*, add 0.5 mL of *phosphoric acid R* and 4 mL of a 56 g/L solution of *potassium hydroxide R* and dilute to 1000 mL with *water for chromatography R*; to 1000 mL of this solution add 50 mL of *acetonitrile R1*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 195 nm.

*Injection*: 20 µL.

*Run time*: twice the retention time of 2-methylpyrazine.

*Retention time*: 2-methylpyrazine = about 9 min.

*System suitability*: reference solution (b):
- *resolution*: minimum 1.5 between the peaks due to impurities B and C.

*Limits*:
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): 23.5 per cent to 26.0 per cent, determined on 1.0 g.

Ignite first at 600 ± 50 °C for 2 h. Do not repeat the moistening with *sulfuric acid R* between any re-ignition.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

ASSAY

Dissolve 0.250 g in 50 mL of *water R* and add 1.0 mL of *0.1 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 28.67 mg of $C_{12}H_{28}Cl_2N_2Na_2O_{14}S$.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. # GLUCOSE(2)

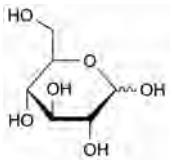
## Glucosum



$C_6H_{12}O_6$ $M_r$ 180.2
[50-99-7]

DEFINITION

D-Glucopyranose.

It is derived from starch.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

◆CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).◆

IDENTIFICATION

*First identification: ◊A◊, B, E.*

*◊Second identification: C, D.◊*

◊A. Specific optical rotation (*2.2.7*): + 52.5 to + 53.3 (anhydrous substance).

Dissolve 10.0 g in 80 mL of *water R*, add 0.2 mL of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 mL with *water R*.◊

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

◊C. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *water R*, *methanol R* (2:3 *V/V*).

*Test solution.* Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (a).* Dissolve 10 mg of *glucose monohydrate CRS* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (b).* Dissolve 10 mg each of *fructose R*, *glucose R*, *lactose monohydrate R* and *sucrose R* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *water R*, *methanol R*, *anhydrous acetic acid R*, *ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

*Application*: 2 µL; thoroughly dry the points of application.

*Development A*: over 3/4 of the plate.

*Drying A*: in a current of warm air.

*Development B*: immediately, over 3/4 of the plate, after renewing the mobile phase.

*Drying B*: in a current of warm air.

*Detection*: treat with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol (96 per cent) R*; heat at 130 °C for 10 min.

*System suitability*: reference solution (b):

– the chromatogram shows 4 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve 0.1 g in 10 mL of *water R*. Add 3 mL of *cupri-tartaric solution R* and heat. A red precipitate is formed.◊

E. Water (see Tests).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

Dissolve 10.0 g in 15 mL of *water R*, heating on a water-bath.

**Conductivity** (*2.2.38*): maximum 20 µS·cm$^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 mL with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 0.300 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 0.330 g of *glucose monohydrate CRS* in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 250.0 mL with *water R*.

*Reference solution (c).* Dilute 25.0 mL of reference solution (b) to 200.0 mL with *water R*.

(2) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8 Pharmacopoeial harmonisation*.

*Reference solution (d).* Dissolve 5 mg of *fructose R* (impurity D), 5 mg of *maltose monohydrate R* (impurity A) and 5 mg of *maltotriose R* (impurity C) in *water R* and dilute to 50 mL with the same solvent.

*Column*:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;
– *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);
– *temperature*: 85 ± 1 °C.

*Mobile phase*: degassed *water R*.

*Flow rate*: 0.3 mL/min.

*Detection*: refractometer maintained at a constant temperature (40 °C for example).

*Injection*: 20 µL of the test solution and reference solutions (b), (c) and (d).

*Run time*: 1.5 times the retention time of glucose.

*Relative retention* with reference to glucose (retention time = about 21 min): impurity C = about 0.7; impurities A and B = about 0.8; impurity D = about 1.3.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.3 between the peaks due to impurities C and A.

*Limits*:

– *sum of impurities A and B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);
– *impurity C*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *impurity D*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.15 per cent);
– *unspecified impurities*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
– *total*: not more than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Dextrin**. To 1 g of the finely powdered substance to be examined add 20 mL of *ethanol (96 per cent) R* and heat under a reflux condenser. The substance dissolves completely.

**Soluble starch, sulfite**: maximum 15 ppm.

Dissolve 6.7 g in 15.0 mL of *water R*, heating on a water-bath. Allow to cool and add 25 µL of *iodine solution R5*. The solution is yellow.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

◊**Pyrogens** (*2.6.8*). If intended for use in the manufacture of large-volume parental preparations without a further appropriate procedure for the removal of pyrogens, the competent authority may require that it comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 mL of a solution in *water for injections R* containing 50 mg of the substance to be examined per millilitre.◊

ASSAY

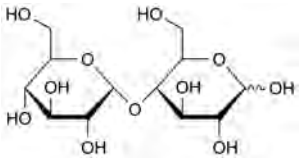
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

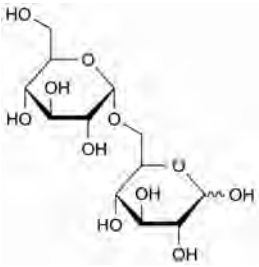
Calculate the percentage content of $C_6H_{12}O_6$ taking into account the assigned content of *glucose monohydrate CRS*.

IMPURITIES

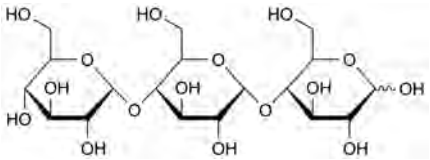
*Specified impurities: A, B, C, D.*



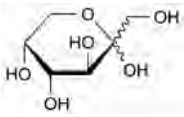
A. 4-*O*-α-D-glucopyranosyl-D-glucopyranose (maltose),



B. 6-*O*-α-D-glucopyranosyl-D-glucopyranose (isomaltose),



C. α-D-glucopyranosyl-(1→4)-α-D-glucopyranosyl-(1→4)-D-glucopyranose (maltotriose),



D. D-*arabino*-hex-2-ulopyranose (fructose).

**01/2017:1330**

# GLUCOSE, LIQUID

## Glucosum liquidum

DEFINITION

Aqueous solution containing a mixture of glucose, oligosaccharides and polysaccharides obtained by hydrolysis of starch.

It contains a minimum of 70.0 per cent dry matter.

The degree of hydrolysis, expressed as dextrose equivalent (DE), is not less than 20 (nominal value).

CHARACTERS

*Appearance*: clear, colourless or brown, viscous liquid.

*Solubility*: miscible with water.

It may partly or totally solidify at room temperature and liquefies again when heated to 50 °C.

IDENTIFICATION

A. Dissolve 0.1 g in 2.5 mL of *water R* and heat with 2.5 mL of *cupri-tartaric solution R*. A red precipitate is formed.
B. Dip, for 1 s, a suitable stick with a reactive pad containing glucose-oxidase, peroxidase and a hydrogen-donating substance, such as tetramethylbenzidine, in a 5 g/L solution of the substance to be examined. Observe the colour of the reactive pad; within 60 s the colour changes from yellow to green or blue.

C. It is a clear, colourless or brown, viscous liquid, miscible with water. The substance may partly or totally solidify at room temperature and liquefies again when heated to 50 °C.

D. Dextrose equivalent (see Tests).

TESTS

**Solution S**. Dissolve 25.0 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**pH** (*2.2.3*): 4.0 to 6.0.

Mix 1 mL of a 223.6 g/L solution of *potassium chloride R* and 30 mL of solution S.

**Sulfur dioxide** (*2.5.29*): maximum 20 ppm; maximum 400 ppm if intended for the production of lozenges or pastilles obtained by high boiling techniques, provided that the final product contains maximum 50 ppm of sulfur dioxide.

**Loss on drying** (*2.2.32*): maximum 30.0 per cent, determined on 1.000 g. Triturate the sample with 3.000 g of *kieselguhr G R*, previously dried at 80 °C under high vacuum for 2 h, and dry at 80 °C under high vacuum for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

**Dextrose equivalent** (DE): within 10 per cent of the nominal value.

Weigh an amount of the substance to be examined equivalent to 2.85-3.15 g of reducing carbohydrates, calculated as dextrose equivalent, into a 500 mL volumetric flask. Dissolve in *water R* and dilute to 500.0 mL with the same solvent. Transfer the solution to a 50 mL burette.

Pipette 25.0 mL of *cupri-tartaric solution R* into a 250 mL flask and add 18.5 mL of the test solution from the burette, mix and add a few glass beads. Place the flask on a hot plate, previously adjusted so that the solution begins to boil after 2 min ± 15 s. Allow to boil for exactly 120 s, add 1 mL of a 1 g/L solution of *methylene blue R* and titrate with the test solution ($V_1$) until the blue colour disappears. Maintain the solution at boiling throughout the titration.

Standardise the cupri-tartaric solution using a 6.00 g/L solution of *glucose R* ($V_0$).

Calculate the dextrose equivalent using the following expression:

$$\frac{300 \times V_0 \times 100}{V_1 \times M \times D}$$

$V_0$ = total volume of glucose standard solution, in millilitres,

$V_1$ = total volume of test solution, in millilitres,

$M$ = mass of the sample, in grams,

$D$ = percentage content of dry matter in the substance.

LABELLING

The label states the dextrose equivalent (DE) (= nominal value).

**01/2017:1525**

# GLUCOSE, LIQUID, SPRAY-DRIED

## Glucosum liquidum dispersione desiccatum

DEFINITION

Mixture of glucose, oligosaccharides and polysaccharides, obtained by the partial hydrolysis of starch.

The degree of hydrolysis, expressed as dextrose equivalent (DE), is not less than 20 (nominal value).

CHARACTERS

*Appearance*: white or almost white, slightly hygroscopic powder or granules.

*Solubility*: freely soluble in water.

IDENTIFICATION

A. Dissolve 0.1 g in 2.5 mL of *water R* and heat with 2.5 mL of *cupri-tartaric solution R*. A red precipitate is formed.

B. Dip, for 1 s, a suitable stick with a reactive pad containing glucose-oxidase, peroxidase and a hydrogen-donating substance, such as tetramethylbenzidine, in a 5 g/L solution of the substance to be examined. Observe the colour of the reactive pad; within 60 s the colour changes from yellow to green or blue.

C. It is a powder or granules.

D. Dextrose equivalent (see Tests).

TESTS

**Solution S**. Dissolve 12.5 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**pH** (*2.2.3*): 4.0 to 7.0.

Mix 1 mL of a 223.6 g/L solution of *potassium chloride R* and 30 mL of solution S.

**Sulfur dioxide** (*2.5.29*): maximum 20 ppm.

**Loss on drying** (*2.2.32*): maximum 6.0 per cent, determined on 10.00 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

**Dextrose equivalent** (DE): within 10 per cent of the nominal value.

Weigh an amount of the substance to be examined equivalent to 2.85-3.15 g of reducing carbohydrates, calculated as dextrose equivalent, into a 500 mL volumetric flask. Dissolve in *water R* and dilute to 500.0 mL with the same solvent. Transfer the solution to a 50 mL burette.

Pipette 25.0 mL of *cupri-tartaric solution R* into a 250 mL flask and add 18.5 mL of the test solution from the burette, mix and add a few glass beads. Place the flask on a hot plate, previously adjusted so that the solution begins to boil after 2 min ± 15 s. Allow to boil for exactly 120 s, add 1 mL of a 1 g/L solution of *methylene blue R* and titrate with the test solution ($V_1$) until the blue colour disappears. Maintain the solution at boiling throughout the titration.

Standardise the cupri-tartaric solution using a 6.00 g/L solution of *glucose R* ($V_0$).

Calculate the dextrose equivalent using the following expression:

$$\frac{300 \times V_0 \times 100}{V_1 \times M \times D}$$

$V_0$ = total volume of glucose standard solution, in millilitres;

$V_1$ = total volume of test solution, in millilitres;

$M$ = mass of the sample, in grams;

$D$ = percentage content of dry matter in the substance.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

LABELLING

The label states the dextrose equivalent (DE) (= nominal value).

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for spray-dried liquid glucose used as filler or binder for wet granulation.*

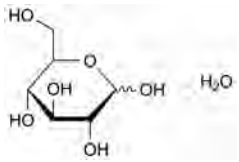
**Dextrose equivalent** (see Tests).

**Particle-size distribution** (*2.9.31* or *2.9.38*).

**01/2016:0178**
**corrected 9.1**

# GLUCOSE MONOHYDRATE(3)

## Glucosum monohydricum



$C_6H_{12}O_6,H_2O$ $M_r$ 198.2
[77938-63-7]

DEFINITION

D-Glucopyranose monohydrate.

It is derived from starch.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

◆CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).◆

IDENTIFICATION

*First identification: ◊A◊, B, E.*

*◊Second identification: C, D.◊*

◊A. Specific optical rotation (*2.2.7*): + 52.5 to + 53.3 (anhydrous substance).

Dissolve 10.0 g in 80 mL of *water R*, add 0.2 mL of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 mL with *water R*.◊

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

◊C. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *water R*, *methanol R* (2:3 *V/V*).

*Test solution*. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 10 mg of *glucose monohydrate CRS* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (b)*. Dissolve 10 mg each of *fructose R*, *glucose R*, *lactose monohydrate R* and *sucrose R* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *water R*, *methanol R*, *anhydrous acetic acid R*, *ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

*Application*: 2 µL; thoroughly dry the points of application.

*Development A*: over 3/4 of the plate.

*Drying A*: in a current of warm air.

*Development B*: immediately, over 3/4 of the plate, after renewing the mobile phase.

*Drying B*: in a current of warm air.

*Detection*: treat with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol (96 per cent) R*; heat at 130 °C for 10 min.

*System suitability*: reference solution (b):

– the chromatogram shows 4 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve 0.1 g in 10 mL of *water R*. Add 3 mL of *cupri-tartaric solution R* and heat. A red precipitate is formed.◊

E. Water (see Tests).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

Dissolve 10.0 g in 15 mL of *water R*.

**Conductivity** (*2.2.38*): maximum 20 µS·cm$^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 mL with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.330 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 0.330 g of *glucose monohydrate CRS* in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 250.0 mL with *water R*.

*Reference solution (c)*. Dilute 25.0 mL of reference solution (b) to 200.0 mL with *water R*.

*Reference solution (d)*. Dissolve 5 mg of *fructose R* (impurity D), 5 mg of *maltose monohydrate R* (impurity A) and 5 mg of *maltotriose R* (impurity C) in *water R* and dilute to 50 mL with the same solvent.

*Column*:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;
– *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);
– *temperature*: 85 ± 1 °C.

*Mobile phase*: degassed *water R*.

(3) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8 Pharmacopoeial harmonisation*.

*Flow rate*: 0.3 mL/min.

*Detection*: refractometer maintained at a constant temperature (40 °C for example).

*Injection*: 20 µL of the test solution and reference solutions (b), (c) and (d).

*Run time*: 1.5 times the retention time of glucose.

*Relative retention* with reference to glucose (retention time = about 21 min): impurity C = about 0.7; impurities A and B = about 0.8; impurity D = about 1.3.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.3 between the peaks due to impurities C and A.

*Limits*:

– *sum of impurities A and B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);
– *impurity C*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *impurity D*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.15 per cent);
– *unspecified impurities*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
– *total*: not more than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Dextrin**. To 1 g of the finely powdered substance to be examined add 20 mL of *ethanol (96 per cent) R* and heat under a reflux condenser. The substance dissolves completely.

**Soluble starch, sulfite**: maximum 15 ppm.

Dissolve 7.4 g in 15.0 mL of *water R*, heating on a water-bath. Allow to cool and add 25 µL of *iodine solution R5*. The solution is yellow.

**Water** (*2.5.12*): 7.5 per cent to 9.5 per cent, determined on 0.25 g.

◊**Pyrogens** (*2.6.8*). If intended for use in the manufacture of large-volume parenteral preparations without a further appropriate procedure for the removal of pyrogens, the competent authority may require that it comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 mL of a solution in *water for injections R* containing 50 mg of the substance to be examined per millilitre.◊

ASSAY

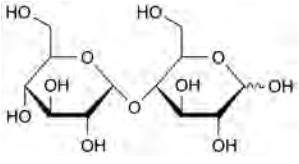
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

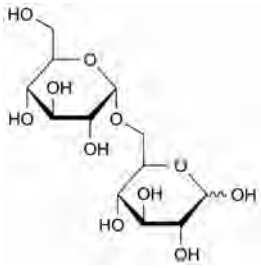
Calculate the percentage content of $C_6H_{12}O_6$ taking into account the assigned content of *glucose monohydrate CRS*.

IMPURITIES

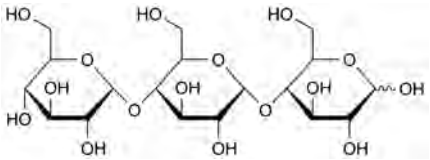
*Specified impurities: A, B, C, D.*



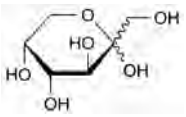
A. 4-*O*-α-D-glucopyranosyl-D-glucopyranose (maltose),



B. 6-*O*-α-D-glucopyranosyl-D-glucopyranose (isomaltose),



C. α-D-glucopyranosyl-(1→4)-α-D-glucopyranosyl-(1→4)-D-glucopyranose (maltotriose),

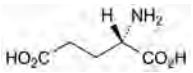


D. D-*arabino*-hex-2-ulopyranose (fructose).

**01/2017:0750**

# GLUTAMIC ACID

## Acidum glutamicum



$C_5H_9NO_4$ $M_r$ 147.1

[56-86-0]

DEFINITION

Glutamic acid contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of (2*S*)-2-aminopentanedioic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in boiling water, slightly soluble in cold water, practically insoluble in acetic acid, in acetone and in alcohol.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *glutamic acid CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *water R*, evaporate to dryness at 60 °C and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 2.0 mL of solution S (see Tests) add 0.1 mL of *phenolphthalein solution R* and 3.0 mL to 3.5 mL of *1 M sodium hydroxide* to change the colour of the indicator to red. Add a mixture of 3 mL of *formaldehyde solution R*, 3 mL of *carbon dioxide-free water R* and 0.1 mL of *phenolphthalein solution R*, to which sufficient *1 M sodium hydroxide* has been added to produce a pink colour. The solution is decolourised. Add *1 M sodium hydroxide* until a red colour is produced. The total volume of *1 M sodium hydroxide* used is 4.0 mL to 4.7 mL.

TESTS

**Solution S**. Dissolve 5.00 g in *1 M hydrochloric acid* with gentle heating, and dilute to 50.0 mL with the same acid.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): + 30.5 to + 32.5, determined on solution S and calculated with reference to the dried substance.

**Ninhydrin-positive substances**. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

*Test solution (a)*. Dissolve 0.10 g of the substance to be examined in 5 mL of *dilute ammonia R2* and dilute to 10 mL with *water R*.

*Test solution (b)*. Dilute 1 mL of test solution (a) to 50 mL with *water R*.

*Reference solution (a)*. Dissolve 10 mg of *glutamic acid CRS* in *water R* and dilute to 50 mL with the same solvent.

*Reference solution (b)*. Dilute 5 mL of test solution (b) to 20 mL with *water R*.

*Reference solution (c)*. Dissolve 10 mg of *glutamic acid CRS* and 10 mg of *aspartic acid CRS* in *water R* and dilute to 25 mL with the same solvent.

Apply to the plate 5 µL of each solution. Dry the plate in a current of air for 15 min. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

**Chlorides** (*2.4.4*). Dissolve 0.25 g in 3 mL of *dilute nitric acid R* and dilute to 15 mL with *water R*. The solution, to which 1 mL of *water R* is added instead of *dilute nitric acid R*, complies with the limit test for chlorides (200 ppm).

**Sulfates** (*2.4.13*). Dilute 5 mL of solution S to 15 mL with *distilled water R*. The solution complies with the limit test for sulfates (300 ppm).

**Ammonium** (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 mL of *ammonium standard solution (100 ppm $NH_4$) R*.

**Iron** (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 50 mL of *carbon dioxide-free water R* with gentle heating. Cool. Using 0.1 mL of *bromothymol blue solution R1* as indicator, titrate with *0.1 M sodium hydroxide* until the colour changes from yellow to blue.

1 mL of *0.1 M sodium hydroxide* is equivalent to 14.71 mg of $C_5H_9NO_4$.

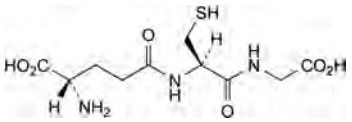
STORAGE

Protected from light.

**01/2017:1670**

# GLUTATHIONE

## Glutathionum



$C_{10}H_{17}N_3O_6S$ $M_r$ 307.3
[70-18-8]

DEFINITION

L-γ-Glutamyl-L-cysteinylglycine.

Fermentation product.

*Content*: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *glutathione CRS*.

TESTS

**Solution S**. Dissolve 5.0 g in *distilled water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): − 17.5 to − 15.5 (dried substance).

Dissolve 1.0 g in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Capillary electrophoresis (*2.2.47*).
*Prepare the solutions immediately before use.*

*Internal standard solution (a)*. Dissolve 0.100 g of *phenylalanine R* in the electrolyte solution and dilute to 50.0 mL with the same solution.

*Internal standard solution (b)*. Dilute 10.0 mL of internal standard solution (a) to 100.0 mL with the electrolyte solution.

*Test solution (a)*. Dissolve 0.200 g of the substance to be examined in the electrolyte solution and dilute to 10.0 mL with the same solution.

*Test solution (b)*. Dissolve 0.200 g of the substance to be examined in internal standard solution (b) and dilute to 10.0 mL with the same solution.

*Reference solution (a)*. Dissolve 20.0 mg of the substance to be examined in internal standard solution (a) and dilute to 10.0 mL with the same solution.

*Reference solution (b).* Dilute 5.0 mL of reference solution (a) to 50.0 mL with the electrolyte solution.

*Reference solution (c).* Dissolve 0.200 g of the substance to be examined in 5 mL of the electrolyte solution. Add 1.0 mL of internal standard solution (a), 0.5 mL of a 2 mg/mL solution of *L-cysteine R* (impurity B) in the electrolyte solution, 0.5 mL of a 2 mg/mL solution of *oxidised L-glutathione R* (impurity C) in the electrolyte solution and 0.5 mL of a 2 mg/mL solution of *L-γ-glutamyl-L-cysteine R* (impurity D) in the electrolyte solution. Dilute to 10.0 mL with the electrolyte solution.

*Capillary*:

- *material*: uncoated fused silica;
- *size*: length to the detector cell = 0.5 m; total length = 0.6 m; Ø = 75 µm.

*Temperature*: 25 °C.

*Electrolyte solution.* Dissolve 1.50 g of *anhydrous sodium dihydrogen phosphate R* in 230 mL of *water R* and adjust to pH 1.80 with *phosphoric acid R*. Dilute to 250.0 mL with *water R*. Check the pH and, if necessary, adjust with *phosphoric acid R* or *dilute sodium hydroxide solution R*.

*Detection*: spectrophotometer at 200 nm.

*Preconditioning of a new capillary*: rinse the new capillary before the first injection with *0.1 M hydrochloric acid* at 138 kPa for 20 min and with *water R* at 138 kPa for 10 min; for complete equilibration, condition the capillary with the electrolyte solution at 350 kPa for 40 min, and subsequently at a voltage of 20 kV for 60 min.

*Preconditioning of the capillary*: rinse the capillary with the electrolyte solution at 138 kPa for 40 min.

*Between-run rinsing*: rinse the capillary with *water R* at 138 kPa for 1 min, with *0.1 M sodium hydroxide* at 138 kPa for 2 min, with *water R* at 138 kPa for 1 min, with *0.1 M hydrochloric acid* at 138 kPa for 3 min and with the electrolyte solution at 138 kPa for 10 min.

*Injection*: test solutions (a) and (b), reference solutions (b) and (c) and the electrolyte solution (blank): under pressure (3.45 kPa) for 5 s.

*Migration*: apply a voltage of 20 kV.

*Run time*: 45 min.

*Relative migration* with reference to the internal standard (about 14 min): impurity A = about 0.77; impurity B = about 1.04; impurity E = about 1.2; impurity C = about 1.26; impurity D = about 1.3.

*System suitability*:

- *resolution*: minimum 1.5 between the peaks due to the internal standard and impurity B in the electropherogram obtained with reference solution (c); if necessary, increase the pH with *dilute sodium hydroxide solution R*;
- *peak-to-valley ratio*: minimum 2.5, where $H_p$ = height above the baseline of the peak due to impurity D and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to glutathione in the electropherogram obtained with reference solution (c); if necessary, lower the pH with *phosphoric acid R*;
- check that in the electropherogram obtained with test solution (a) there is no peak with the same migration time as the internal standard (in such case correct the area of the phenylalanine peak).

*Limits*: test solution (b):

- *corrected areas*: divide all the peak areas by the corresponding migration times;
- *correction factors*: for the calculation of content, multiply the ratio of time-corrected peak areas of impurity and the internal standard by the corresponding correction factor: impurity B = 3.0; impurity D = 1.4;
- *impurity C*: not more than 1.5 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (1.5 per cent);
- *impurity D*: not more than the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (1.0 per cent);
- *impurities A, B, E*: for each impurity, not more than 0.5 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (0.5 per cent);
- *any other impurity*: for each impurity, not more than 0.2 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (0.2 per cent);
- *total*: not more than 2.5 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (2.5 per cent);
- *disregard limit*: 0.05 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (0.05 per cent).

**Chlorides**: maximum 200 ppm.
Dissolve 0.5 g in 5 mL of *dilute nitric acid R* and dilute to 10 mL with the same solvent. Add 10 mL of *strong hydrogen peroxide solution R* and heat on a water-bath for 30 min. Cool and dilute to 50 mL with *water R*. Add 1 mL of *silver nitrate solution R2* and mix. Allow to stand for 5 min protected from light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 2 mL of *chloride standard solution (50 ppm Cl) R*. Examine the tubes laterally against a black background.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

**Ammonium** (*2.4.1, Method B*): maximum 200 ppm, determined on 50 mg.

Prepare the standard using 0.1 mL of *ammonium standard solution (100 ppm $NH_4$) R*.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers, add 10 mL of *water R* and shake for 3 min. The aqueous layer complies with the test.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In a ground-glass-stoppered flask, dissolve 0.500 g of the substance to be examined and 2 g of *potassium iodide R* in 50 mL of *water R*. Cool the solution in iced water and add 10 mL of *hydrochloric acid R1* and 20.0 mL of *0.05 M iodine*. Stopper the flask and allow to stand in the dark for 15 min. Titrate with *0.1 M sodium thiosulfate* using 1 mL of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration.

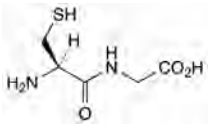
1 mL of *0.05 M iodine* is equivalent to 30.73 mg of $C_{10}H_{17}N_3O_6S$.

STORAGE

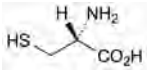
Protected from light.

IMPURITIES

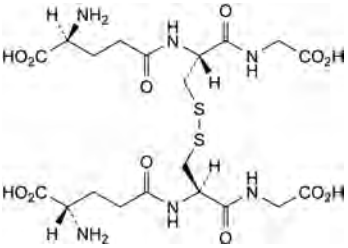
*Specified impurities: A, B, C, D, E.*



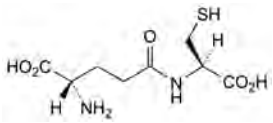
A. L-cysteinylglycine,



B. (2*R*)-2-amino-3-sulfanylpropanoic acid (cysteine),



C. bis(L-γ-glutamyl-L-cysteinylglycine) disulfide (L-glutathione oxidised),



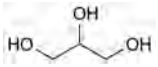
D. L-γ-glutamyl-L-cysteine,

E. unknown structure (product of degradation).

**01/2019:0496**
**corrected 10.0**

# GLYCEROL

## Glycerolum



$C_3H_8O_3$ $M_r$ 92.1
[56-81-5]

DEFINITION

Propane-1,2,3-triol.

*Content*: 98.0 per cent *m/m* to 101.0 per cent *m/m* (anhydrous substance).

CHARACTERS

*Aspect*: syrupy liquid, unctuous to the touch, colourless or almost colourless, clear, very hygroscopic.

*Solubility*: miscible with water and with ethanol (96 per cent), slightly soluble in acetone, practically insoluble in fatty oils and in essential oils.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C.*

A. Refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Preparation*: to 5 mL add 1 mL of *water R* and mix carefully.
*Comparison*: *Ph. Eur. reference spectrum of glycerol (85 per cent)*.

C. Relative density (*2.2.5*): 1.258 to 1.268.

TESTS

**Solution S**. Dilute 100.0 g to 200.0 mL with *carbon dioxide-free water R*.

**Appearance of solution**. Solution S is clear (*2.2.1*). Dilute 10 mL of solution S to 25 mL with *water R*. The solution is colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 50 mL of solution S add 0.5 mL of *phenolphthalein solution R*. The solution is colourless. Not more than 0.2 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Refractive index** (*2.2.6*): 1.470 to 1.475.

**Aldehydes**: maximum 10 ppm.

Place 7.5 mL of solution S in a ground-glass-stoppered flask and add 7.5 mL of *water R* and 1.0 mL of *decolorised pararosaniline solution R*. Close the flask and allow to stand for 1 h at a temperature of 25 ± 1 °C. The absorbance (*2.2.25*) of the solution measured at 552 nm is not greater than that of a standard prepared at the same time and in the same manner using 7.5 mL of *formaldehyde standard solution (5 ppm $CH_2O$) R* and 7.5 mL of *water R*. The test is not valid unless the standard is pink.

**Esters**. Add 10.0 mL of *0.1 M sodium hydroxide* to the final solution obtained in the test for acidity or alkalinity. Boil under a reflux condenser for 5 min. Cool. Add 0.5 mL of *phenolphthalein solution R* and titrate with *0.1 M hydrochloric acid*. Not less than 8.0 mL of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

**Impurity A and related substances**. Gas chromatography (*2.2.28*).

*Test solution*. Dilute 10.0 mL of solution S to 100.0 mL with *water R*.

*Reference solution (a)*. Dilute 10.0 g of *glycerol R1* to 20.0 mL with *water R*. Dilute 10.0 mL of the solution to 100.0 mL with *water R*.

*Reference solution (b)*. Dissolve 1.000 g of *diethylene glycol R* in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 10.0 mL with reference solution (a). Dilute 1.0 mL of this solution to 20.0 mL with reference solution (a).

*Reference solution (d)*. Mix 1.0 mL of the test solution and 5.0 mL of reference solution (b) and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (e)*. Dilute 5.0 mL of reference solution (b) to 100.0 mL with *water R*.

*Column:*

– *size*: *l* = 30 m, Ø = 0.53 mm;
– *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94)polysiloxane R*.

*Carrier gas*: *helium for chromatography R*.

*Split ratio*: 1:10.

*Linear velocity*: 38 cm/s.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 | 100 |
| | 0 - 16 | 100 → 220 |
| | 16 - 20 | 220 |
| Injection port | | 220 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 0.5 µL.

*Elution order*: impurity A, glycerol.

*System suitability*: reference solution (d):

– *resolution*: minimum 7.0 between the peaks due to impurity A and glycerol.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *any other impurity with a retention time less than the retention time of glycerol*: not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *total of all impurities with retention times greater than the retention time of glycerol*: not more than 5 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *disregard limit*: 0.05 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.05 per cent).

**Halogenated compounds**: maximum 35 ppm.

To 10 mL of solution S add 1 mL of *dilute sodium hydroxide solution R*, 5 mL of *water R* and 50 mg of *halogen-free nickel-aluminium alloy R*. Heat on a water-bath for 10 min, allow to cool and filter. Rinse the flask and the filter with *water R* until 25 mL of filtrate is obtained. To 5 mL of the filtrate add 4 mL of *ethanol (96 per cent) R*, 2.5 mL of *water R*, 0.5 mL of *nitric acid R* and 0.05 mL of *silver nitrate solution R2* and mix. Allow to stand for 2 min. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 7.0 mL of *chloride standard solution (5 ppm Cl) R*, 4 mL of *ethanol (96 per cent) R*, 0.5 mL of *water R*, 0.5 mL of *nitric acid R* and 0.05 mL of *silver nitrate solution R2*.

**Sugars**. To 10 mL of solution S add 1 mL of *dilute sulfuric acid R* and heat on a water-bath for 5 min. Add 3 mL of carbonate-free *dilute sodium hydroxide solution R* (prepared by the method described for carbonate-free *1 M sodium hydroxide*), mix and add dropwise 1 mL of freshly prepared *copper sulfate solution R*. The solution is clear and blue. Continue heating on the water-bath for 5 min. The solution remains blue and no precipitate is formed.

**Chlorides** (*2.4.4*): maximum 10 ppm.

Dilute 1 mL of solution S to 15 mL with *water R*. Prepare the standard using 1 mL of *chloride standard solution (5 ppm Cl) R* diluted to 15 mL with *water R*.

**Water** (*2.5.12*): maximum 2.0 per cent, determined on 1.000 g.

**Sulfated ash** (*2.4.14*): maximum 0.01 per cent, determined on 5.0 g after heating to boiling and ignition.

ASSAY

Thoroughly mix 0.075 g with 45 mL of *water R*. Add 25.0 mL of a mixture of 1 volume of *0.1 M sulfuric acid* and 20 volumes of *0.1 M sodium periodate*. Allow to stand protected from light for 15 min. Add 5.0 mL of a 500 g/L solution of *ethylene glycol R* and allow to stand protected from light for 20 min. Using 0.5 mL of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide*. Carry out a blank titration.

1 mL of *0.1 M sodium hydroxide* is equivalent to 9.21 mg of $C_3H_8O_3$.

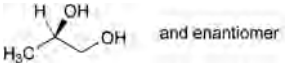
STORAGE

In an airtight container.

IMPURITIES

A. 2,2′-oxydi(ethan-1-ol) (diethylene glycol),

B. ethane-1,2-diol (ethylene glycol),



C. (2*RS*)-propane-1,2-diol (propylene glycol).

**01/2019:0497**
**corrected 10.0**

# GLYCEROL (85 PER CENT)

## Glycerolum (85 per centum)

DEFINITION

Aqueous solution of propane-1,2,3-triol.

*Content*: 83.5 per cent *m/m* to 88.5 per cent *m/m* of propane-1,2,3-triol ($C_3H_8O_3$; $M_r$ 92.1).

CHARACTERS

*Aspect*: syrupy liquid, unctuous to the touch, colourless or almost colourless, clear, very hygroscopic.

*Solubility*: miscible with water and with ethanol (96 per cent), slightly soluble in acetone, practically insoluble in fatty oils and in essential oils.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C.*

A. Refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *Ph. Eur. reference spectrum of glycerol (85 per cent)*.

C. Relative density (*2.2.5*): 1.221 to 1.232.

TESTS

**Solution S**. Dilute 117.6 g to 200.0 mL with *carbon dioxide-free water R*.

**Appearance of solution**. Solution S is clear (*2.2.1*). Dilute 10 mL of solution S to 25 mL with *water R*. The solution is colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 50 mL of solution S add 0.5 mL of *phenolphthalein solution R*. The solution is colourless. Not more than 0.2 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Refractive index** (*2.2.6*): 1.449 to 1.455.

**Aldehydes**: maximum 10 ppm.

Place 7.5 mL of solution S in a ground-glass-stoppered flask and add 7.5 mL of *water R* and 1.0 mL of *decolorised pararosaniline solution R*. Close the flask and allow to stand for 1 h at a temperature of 25 ± 1 °C. The absorbance (*2.2.25*) of the solution measured at 552 nm is not greater than that of a standard prepared at the same time and in the same manner using 7.5 mL of *formaldehyde standard solution (5 ppm $CH_2O$) R* and 7.5 mL of *water R*. The test is not valid unless the standard is pink.

**Esters**. Add 10.0 mL of *0.1 M sodium hydroxide* to the final solution obtained in the test for acidity or alkalinity. Boil under a reflux condenser for 5 min. Cool. Add 0.5 mL of *phenolphthalein solution R* and titrate with *0.1 M hydrochloric acid*. Not less than 8.0 mL of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

**Impurity A and related substances**. Gas chromatography (*2.2.28*).

*Test solution*. Dilute 10.0 mL of solution S to 100.0 mL with *water R*.

*Reference solution (a).* Dilute 11.8 g of *glycerol (85 per cent) R1* to 20.0 mL with *water R*. Dilute 10.0 mL of the solution to 100.0 mL with *water R*.

*Reference solution (b).* Dissolve 1.000 g of *diethylene glycol R* in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (c).* Dilute 1.0 mL of reference solution (b) to 10.0 mL with reference solution (a). Dilute 1.0 mL of this solution to 20.0 mL with reference solution (a).

*Reference solution (d).* Mix 1.0 mL of the test solution and 5.0 mL of reference solution (b) and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (e).* Dilute 5.0 mL of reference solution (b) to 100.0 mL with *water R*.

*Column*:

- *size*: *l* = 30 m, Ø = 0.53 mm;
- *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94)polysiloxane R*.

*Carrier gas*: *helium for chromatography R*.

*Split ratio*: 1:10.

*Linear velocity*: 38 cm/s.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 | 100 |
| | 0 - 16 | 100 → 220 |
| | 16 - 20 | 220 |
| Injection port | | 220 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 0.5 µL.

*Elution order*: impurity A, glycerol.

*System suitability*: reference solution (d):

- *resolution*: minimum 7.0 between the peaks due to impurity A and glycerol.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *any other impurity with a retention time less than the retention time of glycerol*: not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *total of all impurities with retention times greater than the retention time of glycerol*: not more than 5 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *disregard limit*: 0.05 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.05 per cent).

**Halogenated compounds**: maximum 30 ppm.

To 10 mL of solution S add 1 mL of *dilute sodium hydroxide solution R*, 5 mL of *water R* and 50 mg of *halogen-free nickel-aluminium alloy R*. Heat on a water-bath for 10 min, allow to cool and filter. Rinse the flask and the filter with *water R* until 25 mL of filtrate is obtained. To 5 mL of the filtrate add 4 mL of *ethanol (96 per cent) R*, 2.5 mL of *water R*, 0.5 mL of *nitric acid R* and 0.05 mL of *silver nitrate solution R2* and mix. Allow to stand for 2 min. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 7.0 mL of *chloride standard solution (5 ppm Cl) R*, 4 mL of *ethanol (96 per cent) R*, 0.5 mL of *water R*, 0.5 mL of *nitric acid R* and 0.05 mL of *silver nitrate solution R2*.

**Sugars**. To 10 mL of solution S add 1 mL of *dilute sulfuric acid R* and heat on a water-bath for 5 min. Add 3 mL of carbonate-free *dilute sodium hydroxide solution R* (prepared by the method described for carbonate-free *1 M sodium hydroxide*), mix and add dropwise 1 mL of freshly prepared *copper sulfate solution R*. The solution is clear and blue. Continue heating on the water-bath for 5 min. The solution remains blue and no precipitate is formed.

**Chlorides** (*2.4.4*): maximum 10 ppm.

Dilute 1 mL of solution S to 15 mL with *water R*. Prepare the standard using 1 mL of *chloride standard solution (5 ppm Cl) R* diluted to 15 mL with *water R*.

**Water** (*2.5.12*): 12.0 per cent to 16.0 per cent, determined on 0.200 g.

**Sulfated ash** (*2.4.14*): maximum 0.01 per cent, determined on 5.0 g after heating to boiling and ignition.

ASSAY

Thoroughly mix 0.075 g with 45 mL of *water R*. Add 25.0 mL of a mixture of 1 volume of *0.1 M sulfuric acid* and 20 volumes of *0.1 M sodium periodate*. Allow to stand protected from light for 15 min. Add 5.0 mL of a 500 g/L solution of *ethylene glycol R* and allow to stand protected from light for 20 min. Using 0.5 mL of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide*. Carry out a blank titration.

1 mL of *0.1 M sodium hydroxide* is equivalent to 9.21 mg of $C_3H_8O_3$.

STORAGE

In an airtight container.

IMPURITIES

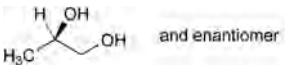
B. ethane-1,2-diol (ethylene glycol),



C. (2*RS*)-propane-1,2-diol (propylene glycol).

**01/2020:1427**

# GLYCEROL DIBEHENATE

## Glyceroli dibehenas

DEFINITION

Mixture of diacylglycerols, mainly dibehenoylglycerol, together with variable quantities of mono- and triacylglycerols, obtained by esterification of *Glycerol (0496)* with behenic (docosanoic) acid.

*Content*:

- *monoacylglycerols*: 15.0 per cent to 23.0 per cent;
- *diacylglycerols*: 40.0 per cent to 60.0 per cent;
- *triacylglycerols*: 21.0 per cent to 35.0 per cent.

CHARACTERS

*Appearance*: hard, waxy mass, or powder or white or almost white, unctuous flakes.

*Solubility*: practically insoluble in water, soluble in methylene chloride, partly soluble in hot ethanol (96 per cent).

IDENTIFICATION

A. Melting point (*2.2.14*): 65 °C to 77 °C.

B. Composition of fatty acids (see Tests).

C. It complies with the assay (content of diacylglycerols).

TESTS

**Acid value** (*2.5.1*): maximum 4.0, determined on 1.0 g using a mixture of equal volumes of *ethanol (96 per cent) R* and *toluene R* as solvent and with gentle heating.

**Iodine value** (*2.5.4, Method A*): maximum 3.0.

**Saponification value** (*2.5.6*): 145 to 165.

Carry out the titration with heating.

**Free glycerol**: maximum 1.0 per cent, determined as described under Assay.

**Composition of fatty acids**. Gas chromatography (*2.4.22, Method C*) with the following modifications. Raise the temperature of the column to 240 °C and use the mixture of calibrating substances in Table 2.4.22.-3.

*Composition of the fatty acid fraction of the substance*:

- *palmitic acid*: maximum 3.0 per cent;
- *stearic acid*: maximum 5.0 per cent;
- *arachidic acid*: maximum 10.0 per cent;
- *behenic acid*: minimum 83.0 per cent;
- *erucic acid*: maximum 3.0 per cent;
- *lignoceric acid*: maximum 3.0 per cent.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use *pyridine R* as the solvent.

**Total ash** (*2.4.16*): maximum 0.1 per cent, determined on 1.00 g.

ASSAY

Size-exclusion chromatography (*2.2.30*).

*Stock solution*. Place 0.100 g of *glycerol R* in a flask and dilute to 25.0 mL with *tetrahydrofuran R*.

*Test solution*. In a 15 mL flask, weigh 0.200 g ($m$) of the substance to be examined and add 5.0 mL of *tetrahydrofuran R*. Heat gently, at about 35 °C, and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance ($M$); use immediately.

*Reference solutions*. Into four 15 mL flasks, introduce respectively 0.25 mL, 0.5 mL, 1.0 mL and 2.5 mL of the stock solution and add 5.0 mL of *tetrahydrofuran R*. Weigh each flask and calculate the concentration of glycerol in milligrams per gram of each reference solution.

*Column*:

- *size*: $l$ = 0.6 m, Ø = 7 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

*Mobile phase*: *tetrahydrofuran R*.

*Flow rate*: 1 mL/min.

*Detection*: differential refractive index.

*Injection*: 40 µL; when injecting the test solution, maintain the flask at about 35 °C to avoid precipitation.

*Relative retention* with reference to glycerol (retention time = about 15 min): triacylglycerols = about 0.73; diacylglycerols = about 0.76; monoacylglycerols = about 0.82.

*Calculations*:

- *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration ($C$) in milligrams per gram in the test solution and calculate the percentage content ($A$) in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

- *free fatty acids*: calculate the percentage content of free fatty acids ($D$) using the following expression:

$$\frac{I_A \times 340}{561.1}$$

$I_A$ = acid value;

- *monoacylglycerols*: calculate the percentage content of monoacylglycerols using the following expression:

$$\left[\frac{X}{X+Y+Z}(100 - A - B)\right] - D$$

$A$ = percentage content of free glycerol (see Tests);

$B$ = percentage content of water (see Tests);

$D$ = percentage content of free fatty acids;

$X$ = area of the peak due to monoacylglycerols;

$Y$ = area of the peak due to diacylglycerols;

$Z$ = area of the peak due to triacylglycerols;

- *diacylglycerols*: calculate the percentage content of diacylglycerols using the following expression:

$$\frac{Y}{X+Y+Z}(100 - A - B)$$

- *triacylglycerols*: calculate the percentage content of triacylglycerols using the following expression:

$$\frac{Z}{X+Y+Z}(100 - A - B)$$

**01/2020:1428**

# GLYCEROL DISTEARATE

## Glyceroli distearas

DEFINITION

Mixture of diacylglycerols, mainly distearoylglycerol, together with variable quantities of mono- and triacylglycerols. It is obtained by partial glycerolysis of vegetable oils containing triacylglycerols of palmitic (hexadecanoic) and stearic (octadecanoic) acids or by esterification of glycerol with stearic acid. The fatty acids may be of vegetable or animal origin.

*Content*:

- *monoacylglycerols*: 8.0 per cent to 22.0 per cent;
- *diacylglycerols*: 40.0 per cent to 60.0 per cent;
- *triacylglycerols*: 25.0 per cent to 35.0 per cent.

CHARACTERS

*Appearance*: hard, waxy mass or powder, or white or almost white, unctuous flakes.

*Solubility*: practically insoluble in water, soluble in methylene chloride, partly soluble in hot ethanol (96 per cent).

IDENTIFICATION

A. Melting point (*2.2.14*): 50 °C to 60 °C (types I and II), 50 °C to 70 °C (type III).

B. Composition of fatty acids (see Tests) according to the type stated on the label.

C. It complies with the limits of the assay (diacylglycerol content).

TESTS

**Acid value** (*2.5.1*): maximum 6.0, determined on 1.0 g.

Use a mixture of equal volumes of *ethanol (96 per cent) R* and *toluene R* as solvent and heat gently.

**Iodine value** (*2.5.4, Method A*): maximum 3.0.

**Saponification value** (*2.5.6*): 165 to 195, determined on 2.0 g.

Carry out the titration with heating.

**Free glycerol**: maximum 1.0 per cent, determined as described under Assay.

**Composition of fatty acids** (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-1.

*Composition of the fatty-acid fraction of the substance:*

| Glycerol distearate | Composition of fatty acids |
|---|---|
| Type I | *Stearic acid*: 40.0 per cent to 60.0 per cent |
| | *Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent |
| Type II | *Stearic acid*: 60.0 per cent to 80.0 per cent |
| | *Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent |
| Type III | *Stearic acid*: 80.0 per cent to 99.0 per cent |
| | *Sum of the contents of palmitic and stearic acids*: minimum 96.0 per cent |

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use *pyridine R* as the solvent.

**Total ash** (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

*Test solution.* Into a 15 mL flask, weigh 0.200 g (*m*) of the substance to be examined. Add 5.0 mL of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

*Reference solutions.* Into three 15 mL flasks, respectively weigh 2.0 mg, 5.0 mg and 10.0 mg of *glycerol R* and add 5.0 mL of *tetrahydrofuran R* to each flask. Into a 4th flask, weigh 2.0 mg of *glycerol R* and add 10.0 mL of *tetrahydrofuran R*. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

*Column*:

- *size*: *l* = 0.6 m, Ø = 7 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

*Mobile phase*: *tetrahydrofuran R*.

*Flow rate*: 1 mL/min.

*Detection*: differential refractometer.

*Injection*: 40 µL.

*Relative retention* with reference to glycerol (retention time = about 15 min): triacylglycerols = about 0.75; diacylglycerols = about 0.80; monoacylglycerols and free fatty acids = about 0.85.

*Calculations*:

- *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content (*A*) in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

- *free fatty acids*: calculate the percentage content of free fatty acids (*D*) using the following expression:

$$\frac{I_A \times 340}{561.1}$$

$I_A$ = acid value;

- *monoacylglycerols*: calculate the percentage content of monoacylglycerols using the following expression:

$$\left[\frac{X}{X+Y+Z}(100-A-B)\right]-D$$

$B$ = percentage content of water (see Tests);

$X$ = area of the peak due to monoacylglycerols and free fatty acids;

$Y$ = area of the peak due to diacylglycerols;

$Z$ = area of the peak due to triacylglycerols;

- *diacylglycerols*: calculate the percentage content of diacylglycerols using the following expression:

$$\frac{Y}{X+Y+Z}(100-A-B)$$

- *triacylglycerols*: calculate the percentage content of triacylglycerols using the following expression:

$$\frac{Z}{X+Y+Z}(100-A-B)$$

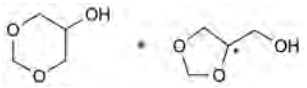
LABELLING

The label states the type of glycerol distearate.

**01/2017:1671**

# GLYCEROL FORMAL

## Glycerol-formalum



$C_4H_8O_3$ $M_r$ 104.1

DEFINITION

Mixture of 1,3-dioxan-5-ol and (1,3-dioxolan-4-yl)methanol.

CHARACTERS

*Appearance*: clear, colourless liquid.

*Solubility*: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. Relative density (see Tests).

B. Refractive index (see Tests).

C. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *glycerol formal CRS*.

TESTS

**Appearance**. The substance to be examined is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.0 to 6.5.

Dilute 1 mL to 10 mL with *carbon dioxide-free water R*.

**Relative density** (*2.2.5*): 1.210 to 1.220.

**Refractive index** (*2.2.6*): 1.445 to 1.455.

**Peroxide value** (*2.5.5*): maximum 15.

**Formaldehyde**: maximum 200 ppm.

Dilute 0.250 g to 10 mL with *water R*. Add 2.0 mL of *acetylacetone reagent R2*, mix and heat on a water-bath at 60 °C for 20 min. Cool and dilute to 20.0 mL with *water R*. The absorbance (*2.2.25*) of the solution measured at 412 nm is not greater than that of a standard prepared at the same time and in the same manner using 5.0 mL of a dilution of *formaldehyde solution R* containing 10 µg of formaldehyde ($CH_2O$) per millilitre.

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 5.000 g.

IMPURITIES

*Specified impurities: A*.

Monographs G

A. formaldehyde.

STORAGE

Under nitrogen, in an airtight container.

**01/2008:2213**
**corrected 10.0**

# GLYCEROL MONOCAPRYLATE

## Glyceroli monocaprylas

DEFINITION

Mixture of monoacylglycerols, mainly mono-*O*-octanoylglycerol, containing variable quantities of di- and triacylglycerols, obtained by direct esterification of glycerol with caprylic (octanoic) acid, followed by a distillation step in the case of glycerol monocaprylate (type II).

*Content*:

- *glycerol monocaprylate (type I)*:
  - *monoacylglycerols*: 45.0 per cent to 75.0 per cent;
  - *diacylglycerols*: 20.0 per cent to 50.0 per cent;
  - *triacylglycerols*: maximum 10.0 per cent;
- *glycerol monocaprylate (type II)*:
  - *monoacylglycerols*: minimum 80.0 per cent;
  - *diacylglycerols*: maximum 20.0 per cent;
  - *triacylglycerols*: maximum 5.0 per cent.

CHARACTERS

*Appearance*: colourless or slightly yellow, oily liquid or soft mass.

*Solubility*: practically insoluble in water, very soluble in ethanol (96 per cent) and freely soluble in methylene chloride.

IDENTIFICATION

A. Composition of fatty acids (see Tests).

B. It complies with the limits of the assay (monoacylglycerols).

TESTS

**Acid value** (*2.5.1*): maximum 3.0.

**Composition of fatty acids** (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-2.

*Composition of the fatty acid fraction of the substance*:

- *caproic acid*: maximum 1.0 per cent;
- *caprylic acid*: minimum 90.0 per cent;
- *capric acid*: maximum 10.0 per cent;
- *lauric acid*: maximum 1.0 per cent;
- *myristic acid*: maximum 0.5 per cent.

**Free glycerol**: maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 mL of *methylene chloride R*. Heat to about 50 °C then allow to cool. Add 100 mL of *water R*. Shake and add 25.0 mL of *periodic acetic acid solution R*. Shake again and allow to stand for 30 min. Add 40 mL of a 75 g/L solution of *potassium iodide R* and allow to stand for 1 min. Add 1 mL of *starch solution R*. Titrate with *0.1 M sodium thiosulfate* until the aqueous phase becomes colourless. Carry out a blank titration.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 2.3 mg of glycerol.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

**Total ash** (*2.4.16*): maximum 0.5 per cent.

ASSAY

Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* To 0.25 g of the substance to be examined, add 5.0 mL of *tetrahydrofuran R* and shake to dissolve.

*Reference solution (a).* To 0.25 g of *glycerol monocaprylate CRS*, add 5.0 mL of *tetrahydrofuran R* and shake to dissolve.

*Reference solution (b).* To 50 mg of *glycerol 1-octanoate R* and 50 mg of *glycerol 1-decanoate R*, add 2.5 mL of *tetrahydrofuran R* and shake to dissolve.

*Column*:

- *size*: *l* = 10 m, Ø = 0.32 mm;
- *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.1 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 2.3 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 60 |
| | 3 - 38 | 60 → 340 |
| | 38 - 50 | 340 |
| Injection port | | 350 |
| Detector | | 370 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of peaks*: use the chromatogram supplied with *glycerol monocaprylate CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to mono-, di- and triacylglycerols.

*System suitability*: reference solution (b):

- *resolution*: minimum 5 between the peaks due to glycerol 1-octanoate and glycerol 1-decanoate.

For the calculation of the contents of mono-, di- and triacylglycerols, disregard the peaks with a retention time less than that of the monoacylglycerols, which are due to impurities of the solvent and to the free fatty acids.

Calculate the percentage content of free fatty acids (*C*) using the following expression:

$$\frac{I_A \times 144}{561.1}$$

$I_A$ = acid value of glycerol monocaprylate.

Calculate the content of mono-, di- and triacylglycerols using the following equations:

$$\text{Monoacylglycerols content} = \frac{X \times (100 - A - B - C)}{100}$$

$$\text{Diacylglycerols content} = \frac{Y \times (100 - A - B - C)}{100}$$

$$\text{Triacylglycerols content} = \frac{Z \times (100 - A - B - C)}{100}$$

$A$ = percentage content of free glycerol (see Tests);

$B$ = percentage content of water;

$X$ = monoacylglycerols content obtained by normalisation;

$Y$ = diacylglycerols content obtained by normalisation;

$Z$ = triacylglycerols content obtained by normalisation.

LABELLING

The label states the type of glycerol monocaprylate (type I or II).

**01/2011:2392**
**corrected 10.0**

# GLYCEROL MONOCAPRYLOCAPRATE

## Glyceroli monocaprylocapras

DEFINITION

Mixture of monoacylglycerols, mainly mono-*O*-octanoylglycerol and mono-*O*-decanoylglycerol, containing variable quantities of di- and triacylglycerols, obtained by direct esterification of glycerol with caprylic (octanoic) and capric (decanoic) acids, followed by a distillation step in the case of glycerol monocaprylocaprate (type II).

*Content*:

- *glycerol monocaprylocaprate (type I)*:
  - *monoacylglycerols*: 45.0 per cent to 75.0 per cent;
  - *diacylglycerols*: 20.0 per cent to 50.0 per cent;
  - *triacylglycerols*: maximum 10.0 per cent;
- *glycerol monocaprylocaprate (type II)*:
  - *monoacylglycerols*: minimum 80.0 per cent;
  - *diacylglycerols*: maximum 20.0 per cent;
  - *triacylglycerols*: maximum 5.0 per cent.

CHARACTERS

*Appearance*: colourless or slightly yellow, oily liquid or soft mass.

*Solubility*: practically insoluble in water, very soluble in ethanol (96 per cent) and freely soluble in methylene chloride.

IDENTIFICATION

A. Composition of fatty acids (see Tests).

B. It complies with the limits of the assay (monoacylglycerols).

TESTS

**Acid value** (*2.5.1*): maximum 3.0.

**Composition of fatty acids** (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-2.

*Composition of the fatty acid fraction of the substance*:

- *caproic acid*: maximum 3.0 per cent;
- *caprylic acid*: 50.0 per cent to 90.0 per cent;
- *capric acid*: 10.0 per cent to 50.0 per cent;
- *lauric acid*: maximum 3.0 per cent;
- *myristic acid*: maximum 1.0 per cent.

**Free glycerol** : maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 mL of *methylene chloride R*. Heat to about 50 °C and allow to cool. Add 100 mL of *water R*, shake and add 25.0 mL of *periodic acetic acid solution R*. Shake again and allow to stand for 30 min. Add 40 mL of a 75 g/L solution of *potassium iodide R* and allow to stand for 1 min. Add 1 mL of *starch solution R*. Titrate with *0.1 M sodium thiosulfate* until the aqueous phase becomes colourless. Carry out a blank titration.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 2.3 mg of glycerol.

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

**Total ash** (*2.4.16*): maximum 0.5 per cent.

ASSAY

Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* To 0.25 g of the substance to be examined, add 5.0 mL of *tetrahydrofuran R* and shake to dissolve.

*Reference solution (a).* To 0.25 g of *glycerol monocaprylocaprate CRS*, add 5.0 mL of *tetrahydrofuran R* and shake to dissolve.

*Reference solution (b).* To 50 mg of *glycerol 1-octanoate R* and 50 mg of *glycerol 1-decanoate R*, add 2.5 mL of *tetrahydrofuran R* and shake to dissolve.

*Column*:

- *size*: *l* = 10 m, Ø = 0.32 mm;
- *stationary phase*: *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.1 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 2.3 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 60 |
| | 3 - 38 | 60 → 340 |
| | 38 - 50 | 340 |
| Injection port | | 350 |
| Detector | | 370 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Identification of peaks*: use the chromatogram supplied with *glycerol monocaprylocaprate CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to mono-, di- and triacylglycerols.

*System suitability*: reference solution (b):

- *resolution*: minimum 5 between the peaks due to glycerol 1-octanoate and glycerol 1-decanoate.

For the calculation of the contents of mono-, di- and triacylglycerols, disregard the peaks with a retention time less than that of the monoacylglycerols, which are due to the impurities of the solvent and to the free fatty acids.

Calculate the percentage content of free fatty acids *(C)* using the following equations:

$$\frac{I_A \times 144}{561.1}$$

$I_A$ = acid value of the glycerol monocaprylocaprate.

Calculate the content of mono-, di- and triacylglycerols using the following equations:

$$\text{Monoacylglycerols content} = \frac{X \times (100 - A - B - C)}{X + Y + Z}$$

$$\text{Diacylglycerols content} = \frac{Y \times (100 - A - B - C)}{X + Y + Z}$$

$$\text{Triacylglycerols content} = \frac{Z \times (100 - A - B - C)}{X + Y + Z}$$

$A$ = percentage content of free glycerol (see Tests);

$B$ = percentage content of water;

$X$ = area of the peak due to monoacylglycerols;

$Y$ = area of the peak due to diacylglycerols;

$Z$ = area of the peak due to triacylglycerols.

LABELLING

The labelling states the type of glycerol monocaprylocaprate (type I or II).

01/2017:1429

# GLYCEROL MONOLINOLEATE

## Glyceroli monolinoleas

DEFINITION

Mixture of monoacylglycerols, mainly mono-oleoyl- and monolinoleoylglycerol, together with variable quantities of di- and triacylglycerols, obtained by partial glycerolysis of vegetable oils mainly containing triacylglycerols of linoleic ((9*Z*,12*Z*)-octadeca-9,12-dienoic) acid. A suitable antioxidant may be added.

*Content*:

– *monoacylglycerols*: 32.0 per cent to 52.0 per cent;
– *diacylglycerols*: 40.0 per cent to 55.0 per cent;
– *triacylglycerols*: 5.0 per cent to 20.0 per cent.

CHARACTERS

*Appearance*: amber, oily liquid which may be partially solidified at room temperature.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride.

IDENTIFICATION

A. Iodine value (see Tests).

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 mL with the same solvent.

*Reference solution.* Dissolve 1.0 g of *glycerol monolinoleate CRS* in *methylene chloride R* and dilute to 20 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *hexane R*, *ether R* (30:70 *V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with a 0.1 g/L solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

*Results*: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. Composition of fatty acids (see Tests).

TESTS

**Acid value** (*2.5.1*): maximum 6.0, determined on 1.0 g.

**Iodine value** (*2.5.4, Method A*): 100 to 140.

**Peroxide value** (*2.5.5, Method A*): maximum 12.0, determined on 2.0 g.

**Saponification value** (*2.5.6*): 160 to 180, determined on 2.0 g.

**Free glycerol**: maximum 6.0 per cent, determined as described in the assay.

**Composition of fatty acids** (*2.4.22, Method C*).

*Composition of the fatty acid fraction of the substance:*

– *palmitic acid*: 4.0 per cent to 20.0 per cent;
– *stearic acid*: maximum 6.0 per cent;
– *oleic acid*: 10.0 per cent to 35.0 per cent;
– *linoleic acid*: minimum 50.0 per cent;
– *linolenic acid*: maximum 2.0 per cent;
– *arachidic acid*: maximum 1.0 per cent;
– *eicosenoic acid*: maximum 1.0 per cent.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use as the solvent a mixture of equal volumes of *anhydrous methanol R* and *methylene chloride R*.

**Total ash** (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

*Test solution.* Into a 15 mL flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5 mL of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

*Reference solutions.* Into four 15 mL flasks, respectively weigh, to the nearest 0.1 mg, about 2.5 mg, 5 mg, 10 mg and 20 mg of *glycerol R*. Add 5 mL of *tetrahydrofuran R* and shake until well mixed. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

*Column*:

– *size*: *l* = 0.6 m, Ø = 7 mm,
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

*Mobile phase*: *tetrahydrofuran R*.

*Flow rate*: 1 mL/min.

*Detection*: differential refractometer.

*Injection*: 40 µL.

*Relative retention* with reference to glycerol (retention time = about 15.6 min): triacylglycerols = about 0.76; diacylglycerols = about 0.80; monoacylglycerols = about 0.86.

*Calculations*:

– *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration of glycerol (*C*) in milligrams per gram in the test solution and calculate the percentage content of free glycerol (*A*) in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *free fatty acids*: calculate the percentage content of free fatty acids (*D*) using the following expression:

$$\frac{I_A \times 280}{56.11 \times 10}$$

$I_A$ = acid value (see Tests);
280 = rounded molar mass of linoleic acid, in grams per mole;
56.11 = molar mass of potassium hydroxide, in grams per mole.

– *monoacylglycerols*: calculate the percentage content of monoacylglycerols using the following expression:

$$\left[\frac{X}{X+Y+Z}\ (100 - A - B)\right] - D$$

$A$ = percentage content of free glycerol;
$B$ = percentage content of water (see Tests);
$D$ = percentage content of free fatty acids;
$X$ = area of the peak due to monoacylglycerols and free fatty acids;
$Y$ = area of the peak due to diacylglycerols;
$Z$ = area of the peak due to triacylglycerols.

– *diacylglycerols*: calculate the percentage content of diacylglycerols using the following expression:

$$\frac{Y}{X+Y+Z}\ (100 - A - B)$$

– *triacylglycerols*: calculate the percentage content of triacylglycerols using the following expression:

$$\frac{Z}{X+Y+Z}\ (100 - A - B)$$

STORAGE

In an airtight container, protected from light.

**01/2017:1430**

# GLYCEROL MONO-OLEATE

## Glyceroli mono-oleas

DEFINITION

Mixture of monoacylglycerols, mainly mono-oleoylglycerol, together with variable quantities of di- and triacylglycerols. It is defined by the nominal content of monoacylglycerols and obtained by partial glycerolysis of vegetable oils mainly containing triacylglycerols of oleic ((9*Z*)-octadec-9-enoic) acid or by esterification of glycerol by oleic acid, this fatty acid being of vegetable or animal origin. A suitable antioxidant may be added.

*Content*:

| | Nominal content of acylglycerol (per cent) | | |
|---|---|---|---|
| | **40** | **60** | **90** |
| Monoacylglycerols | 32.0 - 52.0 | 55.0 - 65.0 | 90.0 - 101.0 |
| Diacylglycerols | 30.0 - 50.0 | 15.0 - 35.0 | < 10.0 |
| Triacylglycerols | 5.0 - 20.0 | 2.0 - 10.0 | < 2.0 |

CHARACTERS

*Appearance*: amber, oily liquid which may be partially solidified at room temperature.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride.

IDENTIFICATION

A. Iodine value (see Tests).

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 mL with the same solvent.

*Reference solution.* Dissolve 1.0 g of *glycerol mono-oleate CRS* in *methylene chloride R* and dilute to 20 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *hexane R*, *ether R* (30:70 *V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with a 0.1 g/L solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

*Results*: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. It complies with the limits of the assay (monoacylglycerol content).

TESTS

**Acid value** (*2.5.1*): maximum 6.0, determined on 1.0 g.

**Iodine value** (*2.5.4, Method A*): 65.0 to 95.0.

**Peroxide value** (*2.5.5, Method A*): maximum 12.0, determined on 2.0 g.

**Saponification value** (*2.5.6*): 150 to 175, determined on 2.0 g.

**Free glycerol**: maximum 6.0 per cent, determined as described in the assay.

**Composition of fatty acids** (*2.4.22, Method C*).

*Composition of the fatty acid fraction of the substance:*

– *palmitic acid*: maximum 12.0 per cent;
– *stearic acid*: maximum 6.0 per cent;
– *oleic acid*: minimum 60.0 per cent;
– *linoleic acid*: maximum 35.0 per cent;
– *linolenic acid*: maximum 2.0 per cent;
– *arachidic acid*: maximum 2.0 per cent;
– *eicosenoic acid*: maximum 2.0 per cent.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use as the solvent a mixture of equal volumes of *anhydrous methanol R* and *methylene chloride R*.

**Total ash** (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

*Test solution.* Into a 15 mL flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5 mL of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

*Reference solutions.* Into four 15 mL flasks, respectively weigh, to the nearest 0.1 mg, about 2.5 mg, 5 mg, 10 mg and 20 mg of *glycerol R*. Add 5 mL of *tetrahydrofuran R* and shake until well mixed. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

*Column*:

– *size*: *l* = 0.6 m, Ø = 7 mm;
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

*Mobile phase*: *tetrahydrofuran R*.

*Flow rate*: 1 mL/min.

*Detection*: differential refractometer.

*Injection*: 40 µL.

*Relative retention* with reference to glycerol (retention time = about 15.6 min): triacylglycerols = about 0.76; diacylglycerols = about 0.79; monoacylglycerols = about 0.85.

*Calculations*:

– *free glycerol*: from the calibration curve obtained with the reference solutions determine the concentration of glycerol (*C*) in milligrams per gram in the test solution and calculate the percentage content of free glycerol (*A*) in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *free fatty acids*: calculate the percentage content of free fatty acids (*D*) using the following expression:

$$\frac{I_A \times 282}{56.11 \times 10}$$

$I_A$ = acid value (see Tests);

282 = rounded molar mass of oleic acid, in grams per mole;

56.11 = molar mass of potassium hydroxide, in grams per mole.

Monographs G

– *monoacylglycerols*: calculate the percentage content of monoacylglycerols using the following expression:

$$\left[\frac{X}{X+Y+Z}\ (100-A-B)\right]-D$$

$A$ = percentage content of free glycerol;

$B$ = percentage content of water (see Tests);

$D$ = percentage content of free fatty acids;

$X$ = area of the peak due to monoacylglycerols and free fatty acids;

$Y$ = area of the peak due to diacylglycerols;

$Z$ = area of the peak due to triacylglycerols.

– *diacylglycerols*: calculate the percentage content of diacylglycerols using the following expression:

$$\frac{Y}{X+Y+Z}\ (100-A-B)$$

– *triacylglycerols*: calculate the percentage content of triacylglycerols using the following expression:

$$\frac{Z}{X+Y+Z}\ (100-A-B)$$

STORAGE

In an airtight container, protected from light.

LABELLING

The label states the nominal content of monoacylglycerol.

**01/2020:0495**

# GLYCEROL MONOSTEARATE 40-55

## Glyceroli monostearas 40-55

DEFINITION

Mixture of monoacylglycerols, mainly monostearoylglycerol, together with variable quantities of di- and triacylglycerols. It is obtained by partial glycerolysis of vegetable oils mainly containing triacylglycerols of palmitic (hexadecanoic) or stearic (octadecanoic) acid or by esterification of glycerol with stearic acid. The fatty acids may be of vegetable or animal origin.

*Content*:

– *monoacylglycerols*: 40.0 per cent to 55.0 per cent;

– *diacylglycerols*: 30.0 per cent to 45.0 per cent;

– *triacylglycerols*: 5.0 per cent to 15.0 per cent.

CHARACTERS

*Appearance*: hard, waxy mass or unctuous powder or flakes, white or almost white.

*Solubility*: practically insoluble in water, soluble in ethanol (96 per cent) at 60 °C.

IDENTIFICATION

*First identification: C, D.*

*Second identification: A, B.*

A. Melting point (*2.2.15*): 54 °C to 66 °C.

Introduce the melted substance into the capillary tubes and allow to stand for 24 h in a well-closed container.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.5 g of the substance to be examined in *methylene chloride R*, with gentle heating, and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 0.5 g of *glycerol monostearate 40-55 CRS* in *methylene chloride R*, with gentle heating, and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *hexane R*, *ether R* (30:70 *V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Detection*: spray with a 0.1 g/L solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

*Suitability system*: reference solution:

– the chromatogram shows 4 clearly separated spots.

*Results*: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. Composition of fatty acids (see Tests) according to the type stated on the label.

D. It complies with the limits of the assay (monoacylglycerol content).

TESTS

**Acid value** (*2.5.1*): maximum 3.0, determined on 1.0 g.

Use a mixture of equal volumes of *ethanol (96 per cent) R* and *toluene R* as solvent and heat gently.

**Iodine value** (*2.5.4, Method A*): maximum 3.0.

**Saponification value** (*2.5.6*): 158 to 177, determined on 2.0 g. Carry out the titration with heating.

**Free glycerol**: maximum 6.0 per cent, determined as described under Assay.

**Composition of fatty acids** (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-1.

*Composition of the fatty-acid fraction of the substance*:

| Glycerol monostearate 40-55 | Composition of fatty acids |
|---|---|
| Type I | *Stearic acid*: 40.0 per cent to 60.0 per cent<br>*Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent |
| Type II | *Stearic acid*: 60.0 per cent to 80.0 per cent<br>*Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent |
| Type III | *Stearic acid*: 80.0 per cent to 99.0 per cent<br>*Sum of the contents of palmitic and stearic acids*: minimum 96.0 per cent |

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use *pyridine R* as the solvent and heat gently.

**Total ash** (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

*Test solution.* Into a 15 mL flask, weigh 0.200 g (*m*). Add 5.0 mL of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

*Reference solutions.* Into four 15 mL flasks, respectively weigh 2.5 mg, 5.0 mg, 10.0 mg and 20.0 mg of *glycerol R*, and add 5.0 mL of *tetrahydrofuran R* to each flask. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

*Column*:

– *size*: *l* = 0.6 m, Ø = 7 mm;

– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

*Mobile phase*: *tetrahydrofuran R*.

*Flow rate*: 1 mL/min.

*Detection*: differential refractometer.

*Injection*: 40 µL.

*Relative retention* with reference to glycerol (retention time = about 15 min): triacylglycerols = about 0.75; diacylglycerols = about 0.80; monoacylglycerols = about 0.85.

*Calculations*:

– *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration of glycerol (*C*) in milligrams per gram in the test solution and calculate the percentage content of free glycerol (*A*) in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *free fatty acids*: calculate the percentage content of free fatty acids (*D*) using the following expression:

$$\frac{I_A \times 270}{56.11 \times 10}$$

$I_A$ = acid value (see Tests);

270 = average rounded molar mass of stearic acid and palmitic acid, in grams per mole;

56.11 = molar mass of potassium hydroxide, in grams per mole;

– *monoacylglycerols*: calculate the percentage content of monoacylglycerols using the following expression:

$$\left[\frac{X}{X+Y+Z}\ (100 - A - B)\right] - D$$

*A* = percentage content of free glycerol;

*B* = percentage content of water (see Tests);

*D* = percentage content of free fatty acids;

*X* = area of the peak due to monoacylglycerols and free fatty acids;

*Y* = area of the peak due to diacylglycerols;

*Z* = area of the peak due to triacylglycerols;

– *diacylglycerols*: calculate the percentage content of diacylglycerols using the following expression:

$$\frac{Y}{X+Y+Z}\ (100 - A - B)$$

– *triacylglycerols*: calculate the percentage content of triacylglycerols using the following expression:

$$\frac{Z}{X+Y+Z}\ (100 - A - B)$$

LABELLING

The label states the type of glycerol monostearate 40-55.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for glycerol monostearate 40-55 used as matrix former in prolonged-release oral solid dosage forms.*

**Composition of fatty acids** (see Tests).

**Particle-size distribution** (*2.9.31* or *2.9.38*).

**Powder flow** (*2.9.36*).

**Thermal analysis** (*2.2.34*). The melting behaviour of the substance as is and after melting followed by solidification when cooling may be considered.

*The following characteristics may be relevant for glycerol monostearate 40-55 used as consistency agent in dosage forms for cutaneous application.*

**Composition of fatty acids** (see Tests).

**Thermal analysis** (*2.2.34*). The melting behaviour of the substance as is and after melting followed by solidification when cooling may be considered.

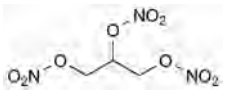
# GLYCERYL TRINITRATE SOLUTION

## Glyceroli trinitratis solutio



$C_3H_5N_3O_9$ $M_r$ 227.1

DEFINITION

Ethanolic solution of glyceryl trinitrate containing 1 per cent *m/m* to 10 per cent *m/m* of propane-1,2,3-triyl trinitrate.

*Content*: 96.5 per cent to 102.5 per cent of the declared content of glyceryl trinitrate stated on the label.

CHARACTERS

*Appearance*: clear, colourless or slightly yellow solution.

*Solubility*: miscible with acetone and with anhydrous ethanol.

*Solubility of pure glyceryl trinitrate*: practically insoluble in water, freely soluble in anhydrous ethanol, miscible with acetone.

IDENTIFICATION

*First identification: A, C.*

*Second identification: B, C.*

*Upon diluting glyceryl trinitrate solution, care must be taken to always use anhydrous ethanol, otherwise droplets of pure glyceryl trinitrate may precipitate from the solution.*

*After examination, the residues and the solutions obtained in both the identification and the test sections must be heated on a water-bath for 5 min with dilute sodium hydroxide solution R.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: place 50 µL of a solution diluted, if necessary, with *anhydrous ethanol R*, to contain 10 g/L of glyceryl trinitrate, on a disc of *potassium bromide R* and evaporate the solvent *in vacuo*.

*Comparison*: *Ph. Eur. reference spectrum of glyceryl trinitrate*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dilute a quantity of the substance to be examined corresponding to 50 mg of glyceryl trinitrate to 100 mL with *acetone R*.

Monographs G

*Reference solution.* Dilute 0.05 mL of *glyceryl trinitrate solution CRS* to 1 mL with *acetone R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *ethyl acetate R, toluene R* (20:80 *V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It complies with the limits of the assay.

TESTS

*Upon diluting glyceryl trinitrate solution, care must be taken to always use anhydrous ethanol, otherwise droplets of pure glyceryl trinitrate may precipitate from the solution.*

*After examination, the residues and the solutions obtained in both the identification and the test sections must be heated on a water-bath for 5 min with dilute sodium hydroxide solution R.*

**Appearance of solution**. If necessary, dilute the solution to be examined to a concentration of 10 g/L with *anhydrous ethanol R*. The solution is not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Impurity A (inorganic nitrates)**. Thin-layer chromatography (*2.2.27*).

*Test solution.* If necessary, dilute the solution to be examined to a concentration of 10 g/L with *anhydrous ethanol R.*

*Reference solution.* Dissolve 5 mg of *potassium nitrate R* in 1 mL of *water R* and dilute to 100 mL with *ethanol (96 per cent) R.*

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R, acetone R, toluene R* (15:30:60 *V/V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in a current of air until the acetic acid is completely removed.

*Detection*: spray intensively with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

*Limit*:

– *nitrate ion*: any spot due to the nitrate ion in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent of the content of glyceryl trinitrate calculated as potassium nitrate).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dilute a quantity of the substance to be examined equivalent to 5.0 mg of glyceryl trinitrate to 10.0 mL with *water for chromatography R. NOTE*: for glyceryl trinitrate solutions of more than 1 per cent *m/m*, dilute first to a 1 per cent solution with *anhydrous ethanol R.*

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with *water for chromatography R.*

*Reference solution (b).* Dilute 25 µL of *glyceryl trinitrate for system suitability CRS* (containing impurities B, C, D and E) to 0.5 mL with *water for chromatography R.*

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: *water for chromatography R*;
– *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 90 | 10 |
| 2 - 10 | 90 → 50 | 10 → 50 |
| 10 - 20 | 50 | 50 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *glyceryl trinitrate for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities B, C, D and E.

*Relative retention* with reference to glyceryl trinitrate (retention time = about 15.5 min): impurity C = about 0.19; impurity B = about 0.21; impurity E = about 0.63; impurity D = about 0.65.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurities C and B; minimum 1.5 between the peaks due to impurities E and D.

*Calculation of percentage contents*:

– for each impurity, use the concentration of glyceryl trinitrate in reference solution (a).

*Limits*:

– *impurities B, C, D, E*: for each impurity, maximum 0.5 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 1.5 per cent;
– *reporting threshold*: 0.05 per cent.

ASSAY

*Test solution.* Prepare a solution containing 1.0 mg of glyceryl trinitrate in 250.0 mL of *methanol R.*

*Reference solution.* Dissolve 70.0 mg of *sodium nitrite R* in *methanol R* and dilute to 250.0 mL with the same solvent. Dilute 5.0 mL of the solution to 500.0 mL with *methanol R.*

Into three 50 mL volumetric flasks introduce 10.0 mL of the test solution, 10.0 mL of the reference solution and 10 mL of *methanol R* as a blank. To each flask add 5 mL of *dilute sodium hydroxide solution R*, close the flask, mix and allow to stand at room temperature for 30 min. Add 10 mL of *sulfanilic acid solution R* and 10 mL of *dilute hydrochloric acid R* and mix. After exactly 4 min, add 10 mL of *naphthylethylenediamine dihydrochloride solution R*, dilute to volume with *water R* and mix. After 10 min read the absorbance (*2.2.25*) of the test solution and the reference solution at 540 nm using the blank solution as the compensation liquid.

Calculate the percentage content of glyceryl trinitrate using the following expression:

$$\frac{A_T \times m_S \times C}{A_R \times m_T \times 60.8}$$

$A_T$ = absorption of the test solution;

$m_S$ = mass of sodium nitrite, in milligrams.

$C$ = percentage content of sodium nitrite used as reference;

$A_R$ = absorption of the reference solution;

$m_T$ = mass of the substance to be examined, in milligrams;

STORAGE

Store the diluted solutions (1 per cent *m/m*) protected from light, at a temperature of 2 °C to 15 °C.

Store the other solutions protected from light, at a temperature of 15 °C to 20 °C.

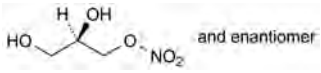
LABELLING

The label states the declared content of glyceryl trinitrate.

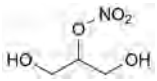
IMPURITIES

*Specified impurities: A, B, C, D, E.*

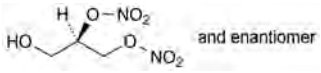
A. inorganic nitrates,



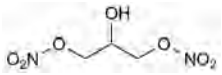
B. (2*RS*)-2,3-dihydroxypropyl nitrate,



C. 2-hydroxy-1-(hydroxymethyl)ethyl nitrate,



D. (2*RS*)-3-hydroxypropane-1,2-diyl dinitrate,



E. 2-hydroxypropane-1,3-diyl dinitrate.

**01/2017:0614**

# GLYCINE

## Glycinum

$C_2H_5NO_2$ $M_r$ 75.1
[56-40-6]

DEFINITION

2-Aminoacetic acid.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: A.*

*Second identification: B, C.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *glycine CRS.*

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethanol (60 per cent V/V) R*, evaporate to dryness and record new spectra using the residues.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution.* Dissolve 10 mg of *glycine CRS* in *water R* and dilute to 10.0 mL with the same solvent.

*Plate*: *cellulose for chromatography R* as the coating substance.

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 *V/V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: at 80 °C for 30 min.

*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 50 mg in 5 mL of *water R*, add 1 mL of *strong sodium hypochlorite solution R* and boil for 2 min. Add 1 mL of *hydrochloric acid R* and boil for 4-5 min. Add 2 mL of *hydrochloric acid R* and 1 mL of a 20 g/L solution of *resorcinol R*, boil for 1 min and cool. Add 10 mL of *water R* and mix. To 5 mL of the solution add 6 mL of *dilute sodium hydroxide solution R*. The solution is violet with greenish-yellow fluorescence. After a few minutes, the colour becomes orange and then yellow and an intense fluorescence remains.

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 5.9 to 6.4.

Dilute 10 mL of solution S to 20 mL with *carbon dioxide-free water R*.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture.* To 500 mL of the mobile phase add 1.5 mL of *phosphoric acid R*.

*Test solution.* Dissolve 0.200 g of the substance to be examined in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 80 mg of *iminodiacetic acid R* (impurity A) and 80 mg of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 50.0 mg of *glycine anhydride R* (impurity B), 50.0 mg of *diglycine R* (impurity H) and 50.0 mg of *triglycine R* (impurity I) in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 100.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*: dissolve 1.4 g of *sodium pentanesulfonate R* in 900 mL of *water R*, adjust to pH 2.2 with *phosphoric acid R* and dilute to 1 L with *water R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL.

*Run time*: 4 times the retention time of glycine.

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities B, H and I.

*Relative retention* with reference to glycine (retention time = about 5.5 min): impurity A = about 0.7; impurity B = about 0.75; impurity H = about 1.7; impurity I = about 2.0.

*System suitability*: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to impurity A and glycine.

*Calculation of percentage contents*:

– for each impurity, use the concentration of glycine in reference solution (a);
– for impurities B, H and I, use the concentration of the corresponding impurity in reference solution (c).

*Limits*:

– *impurities B, H, I*: for each impurity, maximum 0.10 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 0.2 per cent;
– *reporting threshold*: 0.05 per cent.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *water R* or a sample preparation buffer suitable for the apparatus used.

*Test solution*. Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c)*. Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d)*. Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50.0 mL with solution A. Dilute 1.0 mL of the solution to 200.0 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test, blank and reference solutions (a), (b) and (d) into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:

– for any ninhydrin-positive substance detected at 570 nm, use the concentration of glycine in reference solution (a);
– for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:

– *any ninhydrin-positive substance*: for each impurity, maximum 0.10 per cent;
– *total*: maximum 1.0 per cent;
– *reporting threshold*: 0.05 per cent.

**Chlorides** (*2.4.4*): maximum 75 ppm.

Dissolve 0.67 g in *water R* and dilute to 15 mL with the same solvent.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit*:

– *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 70.0 mg in 5 mL of *anhydrous formic acid R*. Add 50 mL of *anhydrous acetic acid R*. Immediately after dissolution, titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

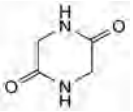
1 mL of *0.1 M perchloric acid* is equivalent to 7.51 mg of $C_2H_5NO_2$.

IMPURITIES

*Specified impurities: B, H, I.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C, D, E, F, G.*

A. 2,2′-iminodiacetic acid,



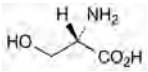
B. piperazine-2,5-dione (glycine anhydride),

C. 2-chloroacetic acid,

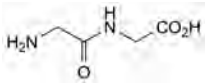
D. 1,3,5,7-tetraazatricyclo[3.3.1.1$^{3,7}$]decane,

E. 3-aminopropanoic acid (β-alanine),

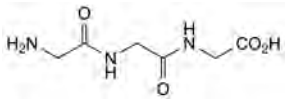
F. 2-(methylamino)acetic acid (sarcosine),



G. (2*S*)-2-amino-3-hydroxypropanoic acid (serine),



H. 2-[(2-aminoacetyl)amino]acetic acid (diglycine),

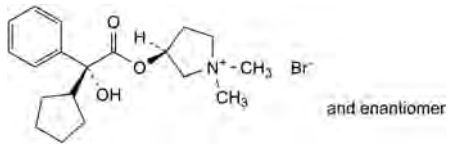


I. 2-[[2-[(2-aminoacetyl)amino]acetyl]amino]acetic acid (triglycine).

**04/2011:1783**

# GLYCOPYRRONIUM BROMIDE

## Glycopyrronii bromidum



$C_{19}H_{28}BrNO_3$ $M_r$ 398.3
[51186-83-5]

DEFINITION

(3*RS*)-3-[(2*SR*)-(2-Cyclopentyl-2-hydroxy-2-phenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, soluble in ethanol (96 per cent), very slightly soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *glycopyrronium bromide CRS*.

B. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.05 mL of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink. Add 0.4 mL of *0.01 M hydrochloric acid* and 0.05 mL of *methyl red solution R*. The solution is red or orange.

**Impurity N**. Liquid chromatography (*2.2.29*).

*Solution A*. Dissolve 3.2 g of *sodium dihydrogen phosphate monohydrate R* in 900 mL of *water R*, adjust to pH 6.5 with *dilute sodium hydroxide solution R* and dilute to 1000 mL with *water R*.

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 2.0 mg of *glycopyrronium impurity N CRS* in 10.0 mL of the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 100.0 mL with the mobile phase.

*Reference solution (c)*. Dilute 1.0 mL of the test solution and 5.0 mL of reference solution (a) to 25.0 mL with the mobile phase.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *silica gel BC for chiral chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*: *acetonitrile R1*, solution A, *methanol R2* (10:40:50 *V/V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 222 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: 1.5 times the retention time of glycopyrronium.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity N.

*Relative retention* with reference to glycopyrronium (retention time = about 30 min): impurity N = about 0.9.

*System suitability*:
- *resolution*: minimum 1.25 between the peaks due to impurity N and glycopyrronium in the chromatogram obtained with reference solution (c);
- *signal-to-noise ratio*: minimum 5 for the peak due to impurity N in the chromatogram obtained with reference solution (b).

*Limit*:
- *impurity N*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (b)*. Dissolve 5 mg of *glycopyrronium for peak identification CRS* (containing impurities E and I) in 5.0 mL of mobile phase A.

*Reference solution (c)*. Dissolve 10 mg of *benzaldehyde R* (impurity F) in mobile phase A and dilute to 10.0 mL with mobile phase A. Dilute 1.0 mL of this solution and 1.0 mL of the test solution to 100.0 mL with mobile phase A.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:
- *mobile phase A*: dissolve 0.25 g of *sodium heptanesulfonate R* in 615 mL of a 1.63 g/L solution of *anhydrous sodium sulfate R*; add 3 mL of a 5.15 g/L solution of *sulfuric acid R*, 150 mL of *methanol R2* and 235 mL of *acetonitrile R1*;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 100 | 0 |
| 20 - 30 | 100 → 50 | 0 → 50 |
| 30 - 45 | 50 | 50 |

*Flow rate*: 1.0 mL/min.

Monographs G

*Detection*: spectrophotometer at 215 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *glycopyrronium for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities E and I; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity F.

*Relative retention* with reference to glycopyrronium (retention time = about 11 min): impurity E = about 0.7; impurity F = about 0.8; impurity I = about 2.3.

*System suitability*: reference solution (c):

- *resolution*: minimum 5.0 between the peaks due to impurity F and glycopyrronium.

*Limits*:

- *impurity I*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity E*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard the peak due to the bromide ion appearing close to the peak due to the solvent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

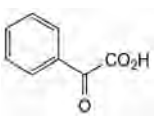
Dissolve 0.300 g in a mixture of 10 mL of *anhydrous acetic acid R* and 40 mL of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 39.83 mg of $C_{19}H_{28}BrNO_3$.

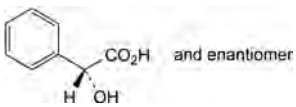
IMPURITIES

*Specified impurities: E, I, N.*

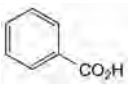
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, F, G, H, J, K, L, M, O.*



B. oxophenylacetic acid (benzoylformic acid),

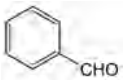


C. (2*RS*)-2-hydroxy-2-phenylacetic acid (mandelic acid),

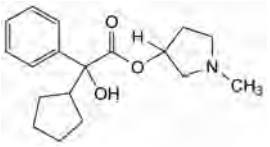


D. benzoic acid,

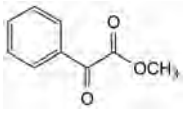
E. unknown structure,



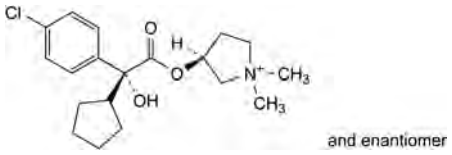
F. benzaldehyde,



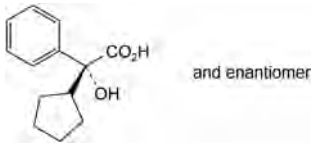
G. 1-methylpyrrolidin-3-yl 2-cyclopentyl-2-hydroxy-2-phenylacetate,



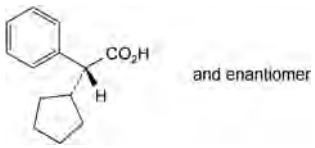
H. methyl 2-oxo-2-phenylacetate,



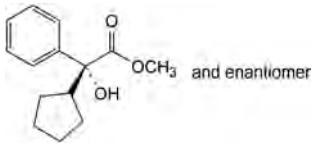
I. (3*RS*)-3-[(2*SR*)-(2-(4-chlorophenyl)-2-cyclopentyl-2-hydroxyacetyl)oxy]-1,1-dimethylpyrrolidinium,



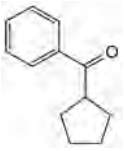
J. (2*RS*)-2-cyclopentyl-2-hydroxy-2-phenylacetic acid,



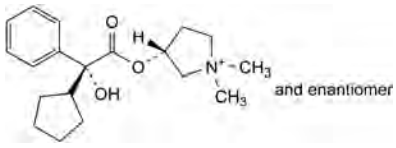
K. (2*RS*)-2-cyclopentyl-2-phenylacetic acid,



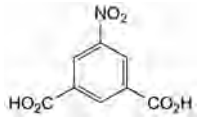
L. methyl (2*RS*)-2-cyclopentyl-2-hydroxy-2-phenylacetate,



M. cyclopentylphenylmethanone,



N. (3*RS*)-3-[(2*RS*)-(2-cyclopentyl-2-hydroxy-2-phenylacetyl)oxy]-1,1-dimethylpyrrolidinium,



O. 5-nitroisophtalic acid.

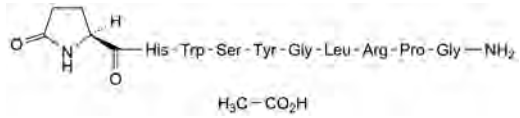
# GONADORELIN ACETATE

## Gonadorelini acetas



$C_{57}H_{79}N_{17}O_{15}$ $M_r$ 1242
[499785-55-6]

DEFINITION

5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosylglycyl-L-leucyl-L-arginyl-L-prolylglycinamide acetate.

Acetate form of a synthetic hypothalamic peptide that stimulates the release of follicle-stimulating hormone and luteinising hormone from the pituitary gland.

*Content*: 95.0 per cent to 102.0 per cent of the peptide $C_{55}H_{75}N_{17}O_{13}$ (anhydrous and acetic acid-free substance).

CHARACTERS

*Appearance*: white or slightly yellowish powder, hygroscopic.

*Solubility*: soluble in water, sparingly soluble in methanol. It dissolves in a 1 per cent *V/V* solution of glacial acetic acid.

IDENTIFICATION

Carry out either tests A, B or tests A, C.

A. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

B. Nuclear magnetic resonance spectrometry (*2.2.64*).

*Preparation*: 4 mg/mL solution in a mixture of 20 volumes of *deuterated acetic acid R* and 80 volumes of *deuterium oxide R*.

*Comparison*: dissolve the contents of a vial of *gonadorelin for NMR identification CRS* in a mixture of 20 volumes of *deuterated acetic acid R* and 80 volumes of *deuterium oxide R* to obtain a concentration of 4 mg/mL.

*Operating conditions*:

– *field strength*: minimum 300 MHz;
– *temperature*: 27 °C.

*Results*: examine the $^1$H NMR spectrum from 0 to 9 ppm. The $^1$H NMR spectrum obtained is qualitatively similar to the $^1$H NMR spectrum obtained with *gonadorelin for NMR identification CRS*.

C. Amino acid analysis (*2.2.56*). Method 1 for hydrolysis and method 1 for analysis are suitable.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking 1/8 of the sum of the number of moles of histidine, glutamic acid, leucine, proline, glycine, tyrosine and arginine as equal to 1. The values fall within the following limits: serine and tyrosine 0.7 to 1.05; glutamic acid, proline, leucine, histidine and arginine 0.9 to 1.1; glycine 1.8 to 2.2. Lysine and isoleucine are absent, and not more than traces of other amino acids are present.

TESTS

**Specific optical rotation** (*2.2.7*): – 65 to – 58 (anhydrous and acetic acid-free substance).

Dissolve 10.0 mg in 1.0 mL of a 1 per cent *V/V* solution of *glacial acetic acid R*.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve the substance to be examined in *water R* to obtain a concentration of 1.0 mg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *gonadorelin CRS* in *water R* to obtain a concentration of 1.0 mg/mL.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*.

*Reference solution (c)*. Dissolve the contents of a vial of *gonadorelin for system suitability CRS* (containing impurities C, D, E, F and G) in 1.0 mL of *water R*.

*Column*:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 13 volumes of *acetonitrile R1* and 87 volumes of a 1.18 per cent *V/V* solution of *phosphoric acid R* previously adjusted to pH 2.3 with *triethylamine R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: twice the retention time of gonadorelin.

*Relative retention* with reference to gonadorelin (retention time = about 12-16 min): impurities C and D = about 0.7; impurity E = about 0.8; impurities F and G = about 1.2.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurities C + D, and impurity E.

*Limits*:

– *impurity E*: maximum 2.0 per cent;
– *sum of impurities F and G*: maximum 1.5 per cent;
– *sum of impurities C and D*: maximum 1.0 per cent;
– *unspecified impurities*: for each impurity, maximum 0.5 per cent;
– *total*: maximum 5.0 per cent;
– *reporting threshold*: 0.1 per cent.

**Acetic acid** (*2.5.34*): 4.0 per cent to 7.5 per cent.

*Test solution*. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 mL with the same mixture of solvents.

**Water** (*2.5.32*): maximum 7.0 per cent, determined on 20.0 mg.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of gonadorelin ($C_{55}H_{75}N_{17}O_{13}$) taking into account the assigned content of $C_{55}H_{75}N_{17}O_{13}$ in *gonadorelin CRS*.

STORAGE

In an airtight container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, the container is also sterile and tamper-evident.

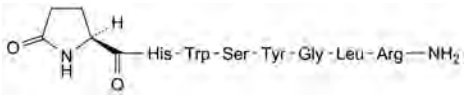
LABELLING

The label states:

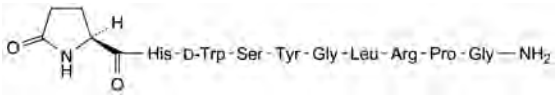
- the gonadorelin peptide content;
- where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

IMPURITIES

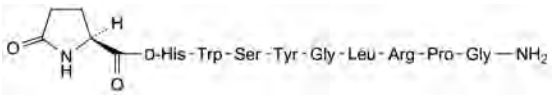
*Specified impurities: C, D, E, F, G.*



C. des-9-L-proline,10-L-glycine-gonadorelin,

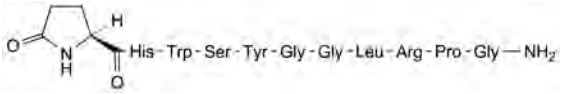


D. [3-D-tryptophan]gonadorelin,



E. [2-D-histidine]gonadorelin,

F. [10-glycine]gonadorelin,



G. endo-5a-glycine-gonadorelin.

**01/2020:0498**

# GONADOTROPHIN, CHORIONIC

## Gonadotrophinum chorionicum

DEFINITION

Dried preparation containing placental glycoproteins obtained from the urine of pregnant women. It has luteinising activity.

*Potency*: minimum 2500 IU/mg.

PRODUCTION

It is prepared by suitable collection and extraction procedures followed by purification steps.

The method of preparation includes steps that have been shown to remove and/or inactivate extraneous agents. In addition, the process is designed to minimise microbial contamination.

It is either dried under reduced pressure or freeze-dried.

CHARACTERS

*Appearance*: white or yellowish-white, amorphous powder.

*Solubility*: soluble in water.

IDENTIFICATION

When administered to immature rats as prescribed in the assay, it causes an increase in the mass of the seminal vesicles and of the prostate gland.

TESTS

**Water** (*2.5.32*): maximum 5.0 per cent.

**Bacterial endotoxins** (*2.6.14*): less than 0.02 IU per International Unit of chorionic gonadotrophin, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The potency of chorionic gonadotrophin is estimated by comparing under given conditions its effect in increasing the mass of the seminal vesicles (or the prostate gland) of immature rats with the same effect of the International Standard of chorionic gonadotrophin or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a mixture of a freeze-dried extract of chorionic gonadotrophin from the urine of pregnant women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Use immature male rats of the same strain, 19-28 days old, differing in age by not more than 3 days and having body masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression and as an initial approximation total doses of 4 IU, 8 IU and 16 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 mL. Add a suitable antimicrobial preservative such as 4 g/L of phenol or 0.02 g/L of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group, on 4 consecutive days at the same time each day. On the 5$^{th}$ day, about 24 h after the last injection, euthanise the rats and remove the seminal vesicles. Remove any extraneous fluid and tissue and weigh the vesicles immediately. Calculate the results by the usual statistical methods (for example, *5.3*) using the mass of the vesicles as the response (a suitable correction of the organ mass with reference to the body mass of the animal from which it was taken may be applied; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:

- the number of International Units per container;
- the potency, in International Units per milligram.

**01/2008:0719**
**corrected 10.0**

# GONADOTROPHIN, EQUINE SERUM, FOR VETERINARY USE

## Gonadotropinum sericum equinum ad usum veterinarium

DEFINITION

Equine serum gonadotrophin for veterinary use is a dry preparation of a glycoprotein fraction obtained from the serum or plasma of pregnant mares. It has follicle-stimulating and luteinising activities. The potency is not less than 1000 IU of gonadotrophin activity per milligram, calculated with reference to the anhydrous substance.

PRODUCTION

Equine serum gonadotrophin may be prepared by precipitation with alcohol (70 per cent *V/V*) and further purification by a suitable form of chromatography. It is prepared in conditions designed to minimise microbial contamination.

CHARACTERS

*Appearance*: white or pale grey, amorphous powder.

*Solubility*: soluble in water.

IDENTIFICATION

When administered as prescribed in the assay it causes an increase in the mass of the ovaries of immature female rats.

TESTS

**Water** (*2.5.12*): maximum 10.0 per cent, determined on 80 mg.

**Bacterial endotoxins** (*2.6.14, method C*): less than 0.035 IU per IU of equine serum gonadotrophin, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The potency of equine serum gonadotrophin is estimated by comparing under given conditions its effect of increasing the mass of the ovaries of immature female rats with the same effect of the International Standard of equine serum gonadotrophin or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a mixture of a freeze-dried extract of equine serum gonadotrophin from the serum of pregnant mares with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Use immature female rats of the same strain, 21 to 28 days old, differing in age by not more than 3 days and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of not fewer than 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression: as an initial approximation total doses of 8 IU, 12 IU and 18 IU may be tried, although the dose will depend on the sensitivity of the animals used and may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the doses to be used in sufficient of a sterile 9 g/L solution of *sodium chloride R* containing 1 mg/mL of *bovine albumin R* such that each single dose is administered in a volume of about 0.2 mL. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the dose allocated to its group. Repeat the injections 18 h, 21 h, 24 h, 42 h and 48 h after the first injection. Not less than 40 h and not more than 72 h after the last injection, euthanise the rats and remove the ovaries. Remove any extraneous fluid and tissue and weigh the 2 ovaries immediately. Calculate the results by the usual statistical methods, using the combined mass of the 2 ovaries of each animal as the response.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight container, protected from light, at a temperature not exceeding 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

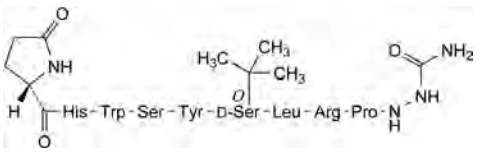
LABELLING

The label states the potency in International Units per milligram.

**01/2013:1636**
**corrected 9.6**

# GOSERELIN

## Goserelinum



$C_{59}H_{84}N_{18}O_{14}$ $M_r$ 1269
[65807-02-5]

DEFINITION

1-Carbamoyl-2-[5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O*-(1,1-dimethylethyl)-D-seryl-L-leucyl-L-arginyl-L-prolyl]hydrazine.

Synthetic nonapeptide analogue of the hypothalamic decapeptide gonadorelin. It is obtained by chemical synthesis and is available as an acetate.

*Content*: 94.5 per cent to 103.0 per cent of the peptide $C_{59}H_{84}N_{18}O_{14}$ (anhydrous and acetic acid-free substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: soluble in water, freely soluble in glacial acetic acid. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

Carry out either tests A and B or tests B and C.

A. Nuclear magnetic resonance spectrometry (*2.2.64*).
*Preparation*: 13 mg/mL solution in *0.2 M deuterated sodium phosphate buffer solution pH 5.0 R* containing 20 µg/mL of *deuterated sodium trimethylsilylpropionate R*.

*Comparison*: 13 mg/mL solution of *goserelin for NMR identification CRS* in *0.2 M deuterated sodium phosphate buffer solution pH 5.0 R* containing 20 µg/mL of *deuterated sodium trimethylsilylpropionate R* (dissolve the contents of a vial of *goserelin for NMR identification CRS* in this solvent to obtain the desired concentration).

*Operating conditions*:

– *field strength*: minimum 300 MHz;

– *temperature*: 25 °C.

*Results*: examine the $^1$H NMR spectrum from 0 ppm to 9 ppm; the $^1$H NMR spectrum obtained is qualitatively similar to the $^1$H NMR spectrum obtained with *goserelin for NMR identification CRS*.

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

C. Amino acid analysis (*2.2.56*). Method 1 for hydrolysis and method 1 for analysis are suitable.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking 1/6 of the sum of the number of moles of glutamic acid, histidine, tyrosine, leucine, arginine, proline as equal to 1. The values fall within the following limits: glutamic acid, histidine, tyrosine, leucine, arginine and proline 0.9 to 1.1; serine 1.6 to 2.2. Not more than traces of other amino acids are present, with the exception of tryptophan.

TESTS

**Specific optical rotation** (*2.2.7*): – 56 to – 52 (anhydrous and acetic acid-free substance).

Dissolve the substance to be examined in *water R* to obtain a concentration of 2 mg/mL.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve the substance to be examined in *water R* to obtain a concentration of 1.0 mg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *goserelin CRS* in *water R* to obtain a concentration of 1.0 mg/mL.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100 mL with *water R*.

*Reference solution (c)*. Dilute 1.0 mL of the test solution to 10.0 mL with *water R*.

*Resolution solution (a)*. Dissolve the contents of a vial of *4-D-Ser-goserelin CRS* in *water R* to obtain a concentration of 0.1 mg/mL. Mix equal volumes of this solution and reference solution (c).

*Resolution solution (b)*. Dissolve the contents of a vial of *goserelin validation mixture CRS* in 1.0 mL of *water R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl amorphous organosilica polymer for chromatography R* (3.5 µm) with a pore size of 12.5 nm;

– *temperature*: 50-55 °C.

*Mobile phase*: *trifluoroacetic acid R*, *acetonitrile for chromatography R*, *water for chromatography R* (0.05:20:80 *V/V/V*).

*Flow rate*: 0.7-1.2 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL of the test solution, reference solution (b) and resolution solutions (a) and (b).

*Run time*: 90 min.

*Relative retention* with reference to goserelin: impurity A = about 0.67; impurity C = about 0.78; impurity B = about 0.79; impurity D = about 0.85; impurity E = about 0.89; impurity F = about 0.92; impurity G = about 0.94; impurity H = about 0.98; impurity I = about 1.43; impurity J = about 1.53; impurity K = about 1.67; impurity L = about 1.77.

*System suitability*:

– *retention time*: goserelin = 40 min to 50 min in the chromatogram obtained with resolution solution (b); adjust the flow rate of the mobile phase if necessary; if adjusting the flow rate does not result in a correct retention time of the principal peak, change the proportion of acetonitrile in the mobile phase to obtain the requested retention time for goserelin;

– *resolution*: minimum 7.0 between the peaks due to impurity A and goserelin in the chromatogram obtained with resolution solution (a);

– *symmetry factor*: 0.8 to 2.5 for the peaks due to impurity A and goserelin in the chromatogram obtained with resolution solution (a);

– the chromatogram obtained with resolution solution (b) is similar to the chromatogram supplied with *goserelin validation mixture CRS*; 2 peaks eluting prior to the principal peak and corresponding to impurities E and G are clearly visible.

*Limits*:

– *impurity E*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent);

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Acetic acid** (*2.5.34*): 4.5 per cent to 15.0 per cent.

*Test solution*. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 mL with the same mixture of mobile phases.

**Water** (*2.5.32*): maximum 10.0 per cent.

**Bacterial endotoxins** (*2.6.14*): less than 16 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution and reference solution (a).

*Run time*: 60 min.

Calculate the content of goserelin ($C_{59}H_{84}N_{18}O_{14}$) taking into account the assigned content of $C_{59}H_{84}N_{18}O_{14}$ in *goserelin CRS*.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

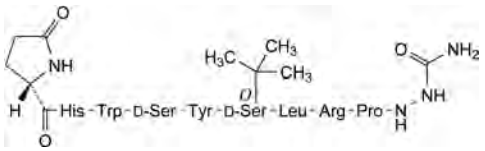
The label states:

– the mass of peptide in the container;

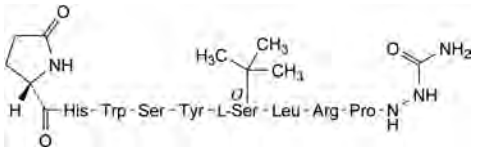
– where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

IMPURITIES

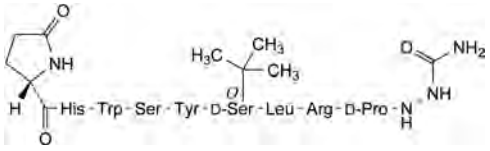
*Specified impurities: A, B, C, D, E, F, G, H, I, J, K, L.*



A. [4-D-serine]goserelin,



B. [6-[*O*-(1,1-dimethylethyl)-L-serine]]goserelin,



C. [9-D-proline]goserelin,

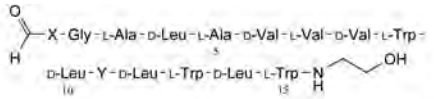
# GRAMICIDIN

## Gramicidinum



| Gramicidin | X | Y | Mol. formula | $M_r$ |
|---|---|---|---|---|
| A1 | L-Val | L-Trp | $C_{99}H_{140}N_{20}O_{17}$ | 1882 |
| A2 | L-Ile | L-Trp | $C_{100}H_{142}N_{20}O_{17}$ | 1896 |
| B1 | L-Val | L-Phe | $C_{97}H_{139}N_{19}O_{17}$ | 1843 |
| C1 | L-Val | L-Tyr | $C_{97}H_{139}N_{19}O_{18}$ | 1859 |
| C2 | L-Ile | L-Tyr | $C_{98}H_{141}N_{19}O_{18}$ | 1873 |

DEFINITION

Gramicidin consists of a family of antimicrobial linear polypeptides, usually obtained by extraction from tyrothricin, the complex isolated from the fermentation broth of *Brevibacillus brevis* Dubos. The main component is gramicidin A1, together with gramicidins A2, B1, C1 and C2 in particular.

*Content*: minimum 900 IU/mg (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder, slightly hygroscopic.

*Solubility*: practically insoluble in water, soluble in methanol, sparingly soluble in alcohol.

mp: about 230 °C.

IDENTIFICATION

*First identification: A, C.*

*Second identification: A, B.*

A. Dissolve 0.100 g in *alcohol R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of this solution to 100.0 mL with *alcohol R*. Examined between 240 nm and 320 nm (*2.2.25*), the solution shows 2 absorption maxima,

Monographs G

at 282 nm and 290 nm, a shoulder at about 275 nm and an absorption minimum at 247 nm. The specific absorbance at the maximum at 282 nm is 105 to 125.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 5 mg of the substance to be examined in 6.0 mL of *alcohol R*.

*Reference solution (a)*. Dissolve 5 mg of *gramicidin CRS* in 6.0 mL of *alcohol R*.

*Reference solution (b)*. Dissolve 5 mg of *tyrothricin CRS* in 6.0 mL of *alcohol R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *methanol R*, *butanol R*, *water R*, *glacial acetic acid R*, *butyl acetate R* (3:9:15:24:49 *V/V/V/V/V*).

*Application*: 1 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: dip the plate into *dimethylaminobenzaldehyde solution R2*. Heat at 90 °C until the spots appear.

*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots or 2 clearly separated groups of spots.

*Results*: the principal spot or group of principal spots in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot or group of principal spots in the chromatogram obtained with reference solution (a) and to the spot or group of spots with the highest $R_F$ value in the chromatogram obtained with reference solution (b).

C. Examine the chromatograms obtained in the test for composition.

*Results*: the 3 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 3 principal peaks in the chromatogram obtained with reference solution (a).

TESTS

**Composition**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution*. Dissolve 25 mg of the substance to be examined in 10 mL of *methanol R* and dilute to 25 mL with the mobile phase.

*Reference solution (a)*. Dissolve 25 mg of *gramicidin CRS* in 10 mL of *methanol R* and dilute to 25 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 50 °C.

*Mobile phase*: *water R*, *methanol R* (29:71 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 282 nm.

*Injection*: 20 µL.

*Run time*: 2.5 times the retention time of gramicidin A1.

*Relative retention* with reference to gramicidin A1 (retention time = about 22 min): gramicidin C1 = about 0.7; gramicidin C2 = about 0.8; gramicidin A2 = about 1.2; gramicidin B1 = about 1.9.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to gramicidin A1 and gramicidin A2,
- the chromatogram obtained is concordant with the chromatogram supplied with *gramicidin CRS*.

*Limits*:

- *sum of gramicidins A1, A2, B1, C1 and C2*: minimum 95.0 per cent,
- *ratio of gramicidin A1 to the sum of gramicidins A1, A2, B1, C1 and C2*: minimum 0.60,
- *disregard limit*: the area of the peak due to gramicidin A1 in the chromatogram obtained with reference solution (b).

**Related substances**. Liquid chromatography (*2.2.29*) as described in the test for composition.

*Limit*:

- *any impurity*: maximum 2.0 per cent and not more than 1 peak is more than 1.0 per cent; disregard the peaks due to gramicidins A1, A2, B1, C1 and C2.

**Loss on drying** (*2.2.32*): maximum 3.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C at a pressure not exceeding 0.1 kPa for 3 h.

**Sulfated ash** (*2.4.14*): maximum 1.0 per cent, determined on 1.0 g.

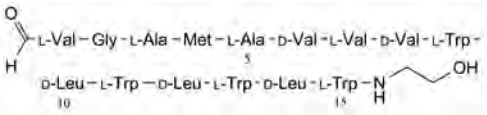
ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*), using the turbidimetric method. Use *gramicidin CRS* as the reference substance.

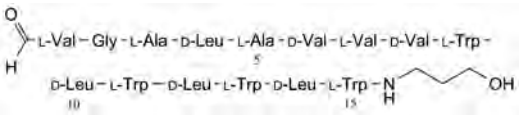
STORAGE

In an airtight container, protected from light.

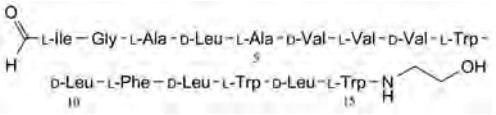
IMPURITIES



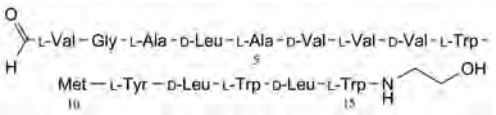
A. [4-methionine]gramicidin A1,



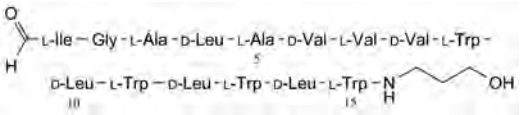
B. gramicidin A1 3-hydroxypropyl,



C. gramicidin B2,



D. [10-methionine]gramicidin C1,



E. gramicidin A2 3-hydroxypropyl.

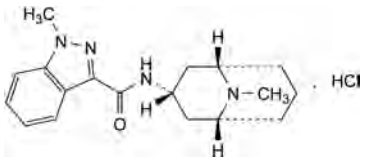
# GRANISETRON HYDROCHLORIDE

## Granisetroni hydrochloridum



$C_{18}H_{25}ClN_4O$ $M_r$ 348.9
[107007-99-8]

DEFINITION

1-Methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide hydrochloride.

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: freely soluble in water, sparingly soluble in methylene chloride, slightly soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *granisetron hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.0 to 6.5 for solution S.

**Impurity E**. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *water R*, *acetonitrile R* (20:80 *V/V*).

*Test solution*. Dissolve 0.25 g of the substance to be examined in the solvent mixture and dilute to 5 mL with the solvent mixture.

*Reference solution*. Dissolve 5.0 mg of *granisetron impurity E CRS* in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *concentrated ammonia R*, *2-propanol R*, *ethyl acetate R* (6.5:30:50 *V/V/V*).

*Application*: 2 µL.

*Development*: over half of the plate.

*Drying*: in air.

*Detection*: expose to iodine vapour for 30 min.

*Limit*:

– *impurity E*: any spot due to impurity E is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent).

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 50.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (b)*. Transfer 2 mL of the test solution to a colourless glass vial, stopper and expose the solution either to sunlight for 4 h or place under a UV lamp for 16 h (partial degradation of granisetron to impurity C). A degradation of at least about 0.3 per cent of granisetron to impurity C must be obtained as shown by appearance of a corresponding peak in the chromatogram. If not, expose the solution once again to sunlight or place under a UV lamp.

*Reference solution (c)*. Dissolve 50.0 mg of *granisetron hydrochloride CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (d)*. Dissolve the contents of a vial of *granisetron impurity A CRS* in 1 mL of the mobile phase.

*Reference solution (e)*. Dissolve the contents of a vial of *granisetron impurity B CRS* in 1 mL of the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*: dilute 1.6 mL of *phosphoric acid R* to 800 mL with *water for chromatography R*, add 200 mL of *acetonitrile R* and mix. Add 1.0 mL of *hexylamine R* and mix. Adjust to pH 7.5 ± 0.05 with freshly distilled *triethylamine R* (about 4 mL).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 305 nm.

*Injection*: 10 µL of the test solution and reference solutions (a), (b), (d) and (e).

*Run time*: twice the retention time of granisetron.

*Relative retention* with reference to granisetron (retention time = about 7 min): impurity D = about 0.4; impurity B = about 0.5; impurity A = about 0.7; impurity C = about 0.8.

*System suitability*:

– *resolution*: minimum 3.5 between the peaks due to impurity C and granisetron in the chromatogram obtained with reference solution (b);
– *symmetry factor*: maximum 2.0 for the peak due to granisetron in the chromatogram obtained with reference solution (a).

*Limits*:

– *correction factor*: for the calculation of content, multiply the peak area of impurity B by 1.7;
– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *impurity C*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
– *impurity D*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Monographs G

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

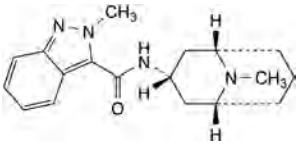
*Injection*: test solution and reference solution (c).

Calculate the percentage content of $C_{18}H_{25}ClN_4O$ taking into account the assigned content of *granisetron hydrochloride CRS*.

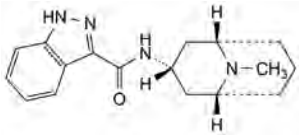
IMPURITIES

*Specified impurities*: *A, B, C, D, E.*

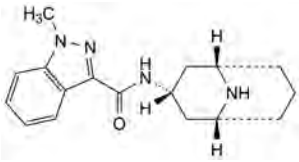
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G, H, I.*



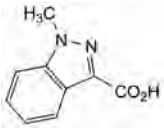
A. 2-methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide,



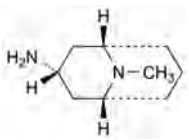
B. *N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide,



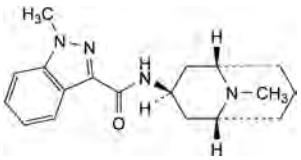
C. *N*-[(1*R*,3*r*,5*S*)-9-azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide,



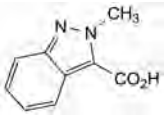
D. 1-methyl-1*H*-indazole-3-carboxylic acid,



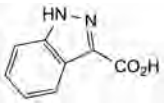
E. (1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]nonan-3-amine,



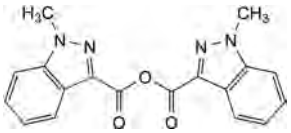
F. 1-methyl-*N*-[(1*R*,3*s*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide (*exo*-granisetron),



G. 2-methyl-2*H*-indazole-3-carboxylic acid,



H. 1*H*-indazole-3-carboxylic acid,



I. 1-methyl-1*H*-indazole-3-carboxylic anhydride.

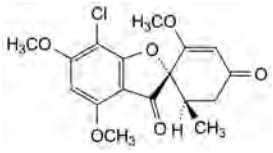
# GRISEOFULVIN

## Griseofulvinum



$C_{17}H_{17}ClO_6$ $M_r$ 352.8

[126-07-8]

DEFINITION

(1′*S*,6′*R*)-7-Chloro-2′,4,6-trimethoxy-6′-methyl-3*H*-spiro[1-benzofuran-2,1′-cyclohex[2]ene]-3,4′-dione.

Substance produced by the growth of certain strains of *Penicillium griseofulvum*.

*Content*: 94.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or yellowish-white powder.

*Solubility*: practically insoluble in water, freely soluble in dimethylformamide, slightly soluble in anhydrous ethanol and in methanol.

It shows polymorphism (*5.9*).

mp: about 220 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *griseofulvin for LC assay and identification CRS.*

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_4$ (*2.2.2, Method II*).

Dissolve 0.75 g in *dimethylformamide R* and dilute to 10 mL with the same solvent.

**Acidity**. Suspend 0.25 g in 20 mL of *ethanol (96 per cent) R* and add 0.1 mL of *phenolphthalein solution R*. Not more than 1.0 mL of *0.02 M sodium hydroxide* is required to change the colour of the indicator.

**Specific optical rotation** (*2.2.7*): + 354 to + 364 (dried substance).

Dissolve 0.250 g in *dimethylformamide R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 25.0 mg of the substance to be examined in mobile phase B and dilute to 50.0 mL with mobile phase B.

*Reference solution (a)*. Dissolve 25.0 mg of *griseofulvin for LC assay and identification CRS* in mobile phase B and dilute to 50.0 mL with mobile phase B.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase B.

*Reference solution (c)*. Dissolve 5 mg of *griseofulvin for system suitability CRS* (containing impurities A, B and C) in mobile phase B and dilute to 10 mL with mobile phase B.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: mix 20 volumes of a 0.1 per cent *V/V* solution of *anhydrous formic acid R* previously adjusted to pH 4.5 with *dilute ammonia R2* and 80 volumes of *water for chromatography R*;
- *mobile phase B*: mix 15 volumes of *water for chromatography R*, 20 volumes of a 0.1 per cent *V/V* solution of *anhydrous formic acid R* previously adjusted to pH 4.5 with *dilute ammonia R2* and 65 volumes of *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 50 | 50 |
| 3 - 13 | 50 → 40 | 50 → 60 |
| 13 - 16 | 40 → 10 | 60 → 90 |
| 16 - 24 | 10 | 90 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 290 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B and C.

*Relative retention* with reference to griseofulvin (retention time = about 16 min): impurity A = about 0.4; impurity B = about 0.7; impurity C = about 1.1.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 3.0, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to griseofulvin.

*Calculation of percentage contents*:

- *correction factor*: multiply the peak area of impurity A by 0.6;
- for each impurity, use the concentration of griseofulvin in reference solution (b).

*Limits*:

- *impurity B*: maximum 3.0 per cent;
- *impurity A*: maximum 2.0 per cent;
- *impurity C*: maximum 0.75 per cent;
- *unspecified impurities*: for each impurity, maximum 0.15 per cent;
- *total*: maximum 5.0 per cent;
- *reporting threshold*: 0.10 per cent.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution and reference solution (a).

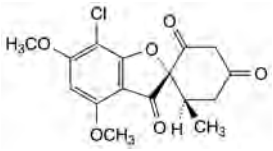
*System suitability*: reference solution (a):

- *repeatability*: maximum relative standard deviation of 2.0 per cent determined on 6 injections.

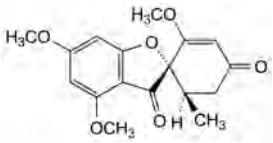
Calculate the percentage content of $C_{17}H_{17}ClO_6$ taking into account the assigned content of *griseofulvin for LC assay and identification CRS*.

IMPURITIES

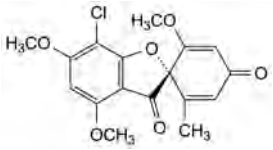
*Specified impurities*: *A, B, C*.



A. (1′*S*,6′*R*)-7-chloro-4,6-dimethoxy-6′-methyl-3*H*-spiro[1-benzofuran-2,1′-cyclohexane]-2′,3,4′-trione,



B. (1′*S*,6′*R*)-2′,4,6-trimethoxy-6′-methyl-3*H*-spiro[1-benzofuran-2,1′-cyclohex[2]ene]-3,4′-dione,

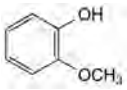


C. (1′*S*)-7-chloro-2′,4,6-trimethoxy-6′-methyl-3*H*-spiro[1-benzofuran-2,1′-cyclohexa[2,5]diene]-3,4′-dione.

**07/2009:1978**
**corrected 10.0**

# GUAIACOL

## Guaiacolum



$C_7H_8O_2$ $M_r$ 124.1
[90-05-1]

DEFINITION

2-Methoxyphenol.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: crystalline mass or colourless or yellowish liquid, hygroscopic.

*Solubility*: sparingly soluble in water, very soluble in methylene chloride, freely soluble in ethanol (96 per cent).

mp: about 28 °C.

IDENTIFICATION

*First identification: A.*

*Second identification: B.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *guaiacol CRS*.

B. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 0.5 g of the substance to be examined in *methanol R* and dilute to 25 mL with the same solvent.
*Reference solution.* Dissolve 0.5 g of *guaiacol CRS* in *methanol R* and dilute to 25 mL with the same solvent.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *anhydrous acetic acid R*, *methanol R*, *toluene R* (6:14:80 *V/V/V*).
*Application*: 5 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: spray with *ferric chloride solution R1*.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Solution S**. Dissolve 1.00 g in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method I*).

**Acidity or alkalinity**. To 5.0 mL of solution S, add 10 mL of *carbon dioxide-free water R* and 0.1 mL of *methyl red mixed solution R*. Not more than 0.05 mL of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

**Impurity A**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *phosphoric acid R*, *water R*, *methanol R* (1:499:500 *V/V/V*).

*Test solution (a).* Dissolve 1.0 g of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Test solution (b).* Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 20.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 0.20 g of *pyrocatechol R* (impurity A) and 0.20 g of *phenol R* (impurity B) in the solvent mixture and dilute to 100 mL with the solvent mixture. Dilute 1 mL of this solution to 10 mL with the solvent mixture.

*Reference solution (c).* Dissolve 20.0 mg of *guaiacol CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Column*:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:
- *mobile phase A*: *phosphoric acid R*, *methanol R*, *water R* (1:150:849 *V/V/V*);
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 28 | 100 | 0 |
| 28 - 30 | 100 → 35 | 0 → 65 |
| 30 - 40 | 35 | 65 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (b).

*Retention time*: guaiacol = about 20 min.

*System suitability*: reference solution (b):
- *resolution*: minimum 5.0 between the peaks due to impurities A (1st peak) and B (2nd peak).

*Limit*:
- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Related substances**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Test solution.* Dissolve 1.00 g of the substance to be examined in *acetonitrile R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 0.20 g of *phenol R* (impurity B) and 0.40 g of *methyl benzoate R* (impurity E) in *acetonitrile R* and dilute to 50 mL with the same solvent. Dilute 1 mL of this solution to 20 mL with *acetonitrile R*.

*Reference solution (b).* Dilute 0.5 mL of the test solution to 100.0 mL with *acetonitrile R*. Dilute 1.0 mL of this solution to 10.0 mL with *acetonitrile R*.

*Reference solution (c).* Dissolve 10 mg of *veratrole R* (impurity C) in *acetonitrile R* and dilute to 10 mL with the same solvent.

*Column*:
- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.53 mm;
- *stationary phase*: *cyanopropyl(7)phenyl(7)methyl(86)polysiloxane R* (film thickness 2 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 5 mL/min.

*Split ratio*: 1:5.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 15 | 90 |
| | 15 - 45 | 90 → 180 |
| Injection port | | 200 |
| Detector | | 220 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Relative retention* with reference to guaiacol (retention time = about 25 min): impurity E = about 0.88; impurity B = about 0.92; impurity C = about 1.1.

*System suitability*: reference solution (a):
- *resolution*: minimum 2.0 between the peaks due to impurities E (1st peak) and B (2nd peak).

*Limits*:
- *impurity C*: maximum 0.4 per cent;
- *impurity E*: maximum 0.2 per cent;
- *impurity B*: maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 1.0 per cent;

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 2.000 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurity A with the following modification.

*Injection*: test solution (b) and reference solution (c).

Calculate the percentage content of $C_7H_8O_2$ from the declared content of *guaiacol CRS*.

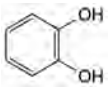
STORAGE

In an airtight container, protected from light.

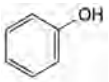
IMPURITIES

*Specified impurities: A, B, C, E.*

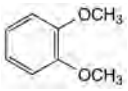
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, F, G, H.*



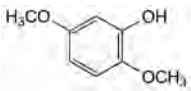
A. benzene-1,2-diol (pyrocatechol),



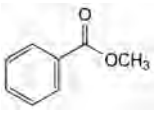
B. phenol,



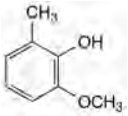
C. 1,2-dimethoxybenzene (veratrole),



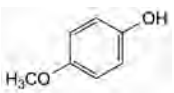
D. 2,5-dimethoxyphenol,



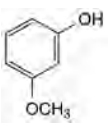
E. methyl benzoate,



F. 2-methoxy-6-methylphenol (6-methylguaiacol),



G. 4-methoxyphenol,

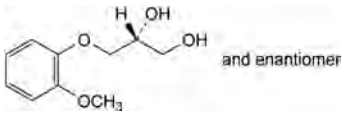


H. 3-methoxyphenol.

**04/2018:0615**
**corrected 9.6**

# GUAIFENESIN

## Guaifenesinum



$C_{10}H_{14}O_4$ $M_r$ 198.2
[93-14-1]

DEFINITION

(2*RS*)-3-(2-Methoxyphenoxy)propane-1,2-diol.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: sparingly soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Melting point (*2.2.14*): 79 °C to 83 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *guaifenesin CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution*. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.
*Reference solution*. Dissolve 30 mg of *guaifenesin CRS* in *methanol R* and dilute to 10 mL with the same solvent.
*Plate*: *TLC silica gel plate R*.
*Mobile phase*: *methylene chloride R*, *2-propanol R* (20:80 *V/V*).
*Application*: 10 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: spray with a solution, prepared immediately before use, containing 0.4 g of *dimethylaminobenzaldehyde R* in an ice-cooled mixture of 10 mL of *water R* and 10 mL of *hydrochloric acid R*; allow to dry in air and heat at 105 °C for 10 min; examine under white light.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Solution S**. Dissolve 1.0 g in *carbon dioxide-free water R*, heating gently if necessary, and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.05 mL of *phenolphthalein solution R1*. Not more than 0.1 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator. To 10 mL of solution S add 0.15 mL of *methyl red solution R*. Not more than 0.1 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent.

*Test solution (b).* Dissolve 25.0 mg of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 50.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (b).* Dissolve 50.0 mg of *guaiacol R* (impurity A) in *water R* and dilute to 50.0 mL with the same solvent. Dilute 5.0 mL of the solution to 10.0 mL with test solution (a).

*Reference solution (c).* Dissolve 5.0 mg of *guaifenesin for peak identification CRS* (containing impurities B, C and D) in *water R* and dilute to 5.0 mL with the same solvent.

*Reference solution (d).* Dissolve 25.0 mg of *guaifenesin CRS* in *water R* and dilute to 50.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *glacial acetic acid R*, *water for chromatography R* (1:99 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 80 | 20 |
| 2 - 34 | 80 → 50 | 20 → 50 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (a), (b) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities B, C and D.

*Relative retention* with reference to guaifenesin (retention time = about 8 min): impurity B = about 0.9; impurity A = about 1.4; impurity C = about 3.1; impurity D = about 3.7.

*System suitability*: reference solution (b):

- *resolution*: minimum 3.0 between the peaks due to guaifenesin and impurity A.

*Calculation of percentage contents*:

- *correction factor*: multiply the peak area of impurity D by 0.7;
- for each impurity, use the concentration of guaifenesin in reference solution (a).

*Limits*:

- *impurity B*: maximum 0.5 per cent;
- *impurities C, D*: for each impurity, maximum 0.1 per cent;
- *unspecified impurities*: for each impurity, maximum 0.05 per cent;
- *total:* maximum 0.7 per cent;
- *reporting threshold*: 0.03 per cent.

**Chlorides and monochlorhydrins**: maximum 250 ppm.

To 10 mL of solution S add 2 mL of *dilute sodium hydroxide solution R* and heat on a water-bath for 5 min. Cool and add 3 mL of *dilute nitric acid R*. The resulting solution complies with the limit test for chlorides (*2.4.4*).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

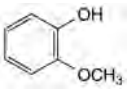
*Injection*: test solution (b) and reference solution (d).

Calculate the percentage content of $C_{10}H_{14}O_4$ taking into account the assigned content of *guaifenesin CRS*.

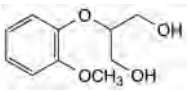
IMPURITIES

*Specified impurities: B, C, D.*

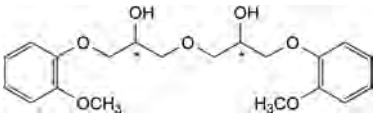
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.



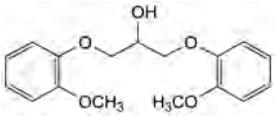
A. 2-methoxyphenol (guaiacol),



B. 2-(2-methoxyphenoxy)propane-1,3-diol (B-isomer),



C. 1,1′-oxybis[3-(2-methoxyphenoxy)propan-2-ol] (bisether),



D. 1,3-bis(2-methoxyphenoxy)propan-2-ol.

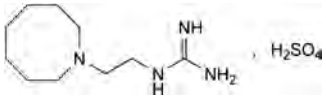
# GUANETHIDINE MONOSULFATE

## Guanethidini monosulfas



$C_{10}H_{24}N_4O_4S$ $M_r$ 296.4

[645-43-2]

DEFINITION

1-[2-(Hexahydroazocin-1(2*H*)-yl)ethyl]guanidine monosulfate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: colourless, crystalline powder.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

mp: about 250 °C, with decomposition.

IDENTIFICATION

A. Dissolve about 25 mg in 25 mL of *water R*, add 20 mL of *picric acid solution R* and filter. The precipitate, washed with *water R* and dried at 100-105 °C, melts (*2.2.14*) at about 154 °C.

B. Dissolve about 25 mg in 5 mL of *water R*. Add 1 mL of *strong sodium hydroxide solution R*, 1 mL of *α-naphthol solution R* and, dropwise with shaking, 0.5 mL of *strong sodium hypochlorite solution R*. A bright pink precipitate is formed and becomes violet-red on standing.

C. It gives the reactions of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.4 g in *carbon dioxide-free water R* and dilute to 20 mL with the same solvent.

**Appearance of solution**. Solution S is not more intensely coloured than reference solution $GY_6$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.7 to 5.5 for solution S.

**Oxidisable substances**. In a conical, ground-glass-stoppered flask, dissolve 1.0 g in 25 mL of *water R* and add 25 mL of *dilute sodium hydroxide solution R*. Allow to stand for 10 min and add 1 g of *potassium bromide R* and 1 mL of *0.0083 M potassium bromate*. Acidify with 30 mL of *dilute hydrochloric acid R*. Mix and allow to stand in the dark for 5 min. Add 2 g of *potassium iodide R* and shake. Allow to stand for 2 min and titrate the liberated iodine with *0.05 M sodium thiosulfate*, using *starch solution R* as indicator. Not less than 0.3 mL of *0.05 M sodium thiosulfate* is required to decolorise the solution.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g, warming if necessary, in 30 mL of *anhydrous acetic acid R* and add 15 mL of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 29.64 mg of $C_{10}H_{24}N_4O_4S$.

STORAGE

Protected from light.

**01/2010:0908**
**corrected 9.0**

# GUAR GALACTOMANNAN

## Guar galactomannanum

DEFINITION

Guar galactomannan is obtained from the seeds of *Cyamopsis tetragonolobus* (L.) Taub. by grinding of the endosperms and subsequent partial hydrolysis. The main components are polysaccharides composed of D-galactose and D-mannose at molar ratios of 1:1.4 to 1:2. The molecules consist of a linear main chain of β-(1→4)-glycosidically linked mannopyranoses and single α-(1→6)-glycosidically linked galactopyranoses.

CHARACTERS

*Appearance*: yellowish-white powder.

*Solubility*: soluble in cold water and in hot water, practically insoluble in organic solvents.

IDENTIFICATION

A. Mix 5 g of solution S (see Tests) with 0.5 mL of a 10 g/L solution of *disodium tetraborate R*. A gel forms within a short time.

B. Heat 20 g of solution S in a water-bath for 10 min. Allow to cool and adjust to the original mass with *water R*. The solution does not gel.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* To 10 mg of the substance to be examined in a thick-walled centrifuge tube add 2 mL of a 230 g/L solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant carefully into a 50 mL flask, add 10 mL of *water R* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 mL of *water R* and evaporate again to dryness under reduced pressure. To the resulting clear film, which has no odour of acetic acid, add 0.1 mL of *water R* and 1 mL of *methanol R*. Centrifuge to separate the amorphous precipitate. Dilute the supernatant, if necessary, to 1 mL with *methanol R*.

*Reference solution.* Dissolve 10 mg of *galactose R* and 10 mg of *mannose R* in 2 mL of *water R* and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *water R*, *acetonitrile R* (15:85 *V/V*).

*Application*: 5 µL, as bands of 20 mm by 3 mm.

*Development*: over a path of 15 cm.

*Detection*: spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min.

*Results*: the chromatogram obtained with the reference solution shows in the lower part 2 clearly separated brownish zones due to galactose and mannose in order of increasing $R_F$ value; the chromatogram obtained with the test solution shows 2 zones due to galactose and mannose.

TESTS

**Solution S**. Moisten 1.0 g with 2 mL of *2-propanol R*. While stirring, dilute to 100 g with *water R* and stir until the substance is uniformly dispersed. Allow to stand for at least 1 h. If the apparent viscosity is below 200 mPa·s, use 3.0 g of substance instead of 1.0 g.

**pH** (*2.2.3*): 5.5 to 7.5 for solution S.

**Apparent viscosity** (*2.2.10*): 75 per cent to 140 per cent of the value stated on the label.

Moisten a quantity of the substance to be examined equivalent to 2.00 g of the dried substance with 2.5 mL of *2-propanol R* and, while stirring, dilute to 100.0 mL with *water R*. After 1 h, determine the viscosity at 20 °C using a rotating viscometer and a shear rate of 100 $s^{-1}$.

**Insoluble matter**: maximum 7.0 per cent.

In a 250 mL flask disperse, while stirring, 1.50 g in a mixture of 1.6 mL of *sulfuric acid R* and 150 mL of *water R* and weigh. Immerse the flask in a water-bath and heat under a reflux condenser for 6 h. Adjust to the original mass with *water R*. Filter the hot solution through a tared, sintered-glass filter (160) (*2.1.2*). Rinse the filter with hot *water R* and dry at 100-105 °C. The residue weighs a maximum of 105 mg.

**Protein**: maximum 5.0 per cent.

Carry out the determination of nitrogen by sulfuric acid digestion (*2.5.9*), using 0.400 g. Multiply the result by 6.25.

**Tragacanth, sterculia gum, agar, alginates and carrageenan**. To a small amount of the substance to be examined add 0.2 mL of freshly prepared *ruthenium red solution R*. Examined under a microscope, none of the structures are red.

**Loss on drying** (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 5 h.

**Total ash** (*2.4.16*): maximum 1.8 per cent, determined on 1.00 g after wetting with 10 mL of *water R*.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

LABELLING

The label states the apparent viscosity in millipascal seconds for a 20 g/L solution.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristic may be relevant for guar galactomannan used as viscosity-increasing agent or binder.*

**Apparent viscosity**: see Tests.

# HAEMODIALYSIS SOLUTIONS, CONCENTRATED, WATER FOR DILUTING

## Aqua ad dilutionem solutionum concentratarum ad haemodialysim

*The following monograph is given for information.*

*The analytical methods described and the limits proposed are intended to be used for validating the procedure for obtaining the water.*

DEFINITION

Water for diluting concentrated haemodialysis solutions is obtained from potable water by distillation, by reverse osmosis, by ion exchange or by any other suitable method. The conditions of preparation, transfer and storage are designed to minimise the risk of chemical and microbial contamination.

When water obtained by one of the methods described above is not available, potable water may be used for home dialysis. Because the chemical composition of potable water varies considerably from one locality to another, consideration must be given to its chemical composition to enable adjustments to be made to the content of ions so that the concentrations in the diluted solution correspond to the intended use.

Attention has also to be paid to the possible presence of residues from water treatment (for example, chloramines) and volatile halogenated hydrocarbons.

For the surveillance of the quality of water for diluting concentrated haemodialysis solutions, the following methods may be used to determine the chemical composition and/or to detect the presence of possible contaminants together with suggested limits to be obtained.

CHARACTERS

Clear, colourless, liquid.

TESTS

**Acidity or alkalinity**. To 10 mL of the water to be examined, freshly boiled and cooled in a borosilicate glass flask, add 0.05 mL of *methyl red solution R*. The solution is not red. To 10 mL of the water to be examined add 0.1 mL of *bromothymol blue solution R1*. The solution is not blue.

**Oxidisable substances**. To 100 mL of the water to be examined add 10 mL of *dilute sulfuric acid R* and 0.1 mL of *0.02 M potassium permanganate* and boil for 5 min. The solution remains faintly pink.

**Total available chlorine**: maximum 0.1 ppm.

In a 125 mL test-tube (A), place successively 5 mL of *buffer solution pH 6.5 R*, 5 mL of *diethylphenylenediamine sulfate solution R* and 1 g of *potassium iodide R*. In a second 125 mL test-tube (B), place successively 5 mL of *buffer solution pH 6.5 R* and 5 mL of *diethylphenylenediamine sulfate solution R*. Add as simultaneously as possible to tube A 100 mL of the water to be examined and to tube B a reference solution prepared as follows: to 1 mL of a 10 mg/L solution of *potassium iodate R*, add 1 g of *potassium iodide R* and 1 mL of *dilute sulfuric acid R*; allow to stand for 1 min, add 1 mL of *dilute sodium hydroxide solution R* and dilute to 100 mL with *water R*. Any colour in the mixture obtained with the water to be examined is not more intense than that in the mixture obtained with the reference solution.

**Chlorides** (*2.4.4*): maximum 50 ppm.

Dilute 1 mL of the water to be examined to 15 mL with *water R*.

**Fluorides**: maximum 0.2 ppm.

Potentiometry (*2.2.36, Method I*): use as indicator electrode a fluoride-selective solid-membrane electrode and as reference electrode a silver-silver chloride electrode.

*Test solution*. The water to be examined.

*Reference solutions*. Dilute 2.0 mL, 4.0 mL and 10.0 mL of *fluoride standard solution (1 ppm F) R* respectively to 20.0 mL with *total-ionic-strength-adjustment buffer R1*.

Carry out the measurement of each solution.

**Nitrates**: maximum 2 ppm.

Dilute 2 mL of the water to be examined to 100 mL with *nitrate-free water R*. Place 5 mL of the dilution in a test-tube immersed in iced water, add 0.4 mL of a 100 g/L solution of *potassium chloride R* and 0.1 mL of *diphenylamine solution R* and then, dropwise and with shaking, 5 mL of *sulfuric acid R*. Transfer the tube to a water-bath at 50 °C. Allow to stand for 15 min. Any blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 0.1 mL of *nitrate standard solution (2 ppm $NO_3$) R* and 4.9 mL of *nitrate-free water R*.

**Sulfates** (*2.4.13*): maximum 50 ppm.

Dilute 3 mL of the water to be examined to 15 mL with *distilled water R*.

**Aluminium** (*2.4.17*): maximum 10 µg/L.

*Prescribed solution*. To 400 mL of the water to be examined add 10 mL of *acetate buffer solution pH 6.0 R* and 100 mL of *water R*.

*Reference solution*. Mix 2 mL of *aluminium standard solution (2 ppm Al) R*, 10 mL of *acetate buffer solution pH 6.0 R* and 98 mL of *water R*.

*Blank solution*. Mix 10 mL of *acetate buffer solution pH 6.0 R* and 100 mL of *water R*.

**Ammonium**: maximum 0.2 ppm.

To 20 mL of the water to be examined in a flat-bottomed and transparent tube, add 1 mL of *alkaline potassium tetraiodomercurate solution R*. Allow to stand for 5 min. The solution is not more intensely coloured than a standard prepared at the same time and in the same manner using a mixture of 4 mL of *ammonium standard solution (1 ppm $NH_4$) R* and 16 mL of *ammonium-free water R*. Examine the solutions along the vertical axis of the tube.

**Calcium**: maximum 2 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. The water to be examined.

*Reference solutions*. Prepare reference solutions (1 ppm to 5 ppm) using *calcium standard solution (400 ppm Ca) R*.

*Source*: calcium hollow-cathode lamp.

*Wavelength*: 422.7 nm.

*Atomisation device*: oxidising air-acetylene flame.

**Magnesium**: maximum 2 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. Dilute 10 mL of the water to be examined to 100 mL with *distilled water R*.

*Reference solutions*. Prepare reference solutions (0.1 ppm to 0.5 ppm) using *magnesium standard solution (100 ppm Mg) R*.

*Source*: magnesium hollow-cathode lamp.

*Wavelength*: 285.2 nm.

*Atomisation device*: oxidising air-acetylene flame.

**Mercury**: maximum 0.001 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. Add 5 mL of *nitric acid R* per litre of the water to be examined. In a 50 mL borosilicate glass flask with a ground-glass-stopper, place 20 mL of the water to be examined and add 1 mL of *dilute nitric acid R* and shake. Add 0.3 mL of *bromine water R1*. Stopper the flask, shake and heat the stoppered flask at 45 °C for 4 h. Allow to cool. If the solution

does not become yellow, add 0.3 mL of *bromine water R1* and re-heat at 45 °C for 4 h. Add 0.5 mL of a freshly prepared 10 g/L solution of *hydroxylamine hydrochloride R*. Shake. Allow to stand for 20 min.

*Reference solutions.* Use freshly prepared reference solutions (0.0005 ppm to 0.002 ppm) obtained by diluting *mercury standard solution (1000 ppm Hg) R* with a 5 per cent *V/V* solution of *dilute nitric acid R* and treat as described for the test solution.

To a volume of solution suitable for the instrument to be used, add *stannous chloride solution R2* equal to 1/5 of this volume. Fit immediately the device for the entrainment of the mercury vapour. Wait 20 s and pass through the device a stream of *nitrogen R* as the carrier gas.

*Source*: mercury hollow-cathode tube or a discharge lamp.

*Wavelength*: 253.7 nm.

*Atomisation device*: flameless system whereby the mercury can be entrained in the form of cold vapour.

**Potassium**: maximum 2 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

*Test solution (a).* Dilute 50.0 mL of the water to be examined to 100 mL with *distilled water R*. Carry out a determination using this solution. If the potassium content is more than 0.75 mg/L, further dilute the water to be examined with *distilled water R*.

*Test solution (b).* Take 50.0 mL of the water to be examined or, if necessary, the water to be examined diluted as described in the preparation of test solution (a). Add 1.25 mL of *potassium standard solution (20 ppm K) R* and dilute to 100.0 mL with *distilled water R*.

*Reference solutions.* Prepare reference solutions (0 ppm; 0.25 ppm; 0.50 ppm; 0.75 ppm; 1 ppm) using *potassium standard solution (20 ppm K) R*.

*Wavelength*: 766.5 nm.

Calculate the potassium content of the water to be examined in parts per million from the expression:

$$\frac{p \times n_1 \times 0.5}{n_2 - n_1}$$

$p$ = dilution factor used for the preparation of test solution (a);

$n_1$ = measured value of test solution (a);

$n_2$ = measured value of test solution (b).

**Sodium**: maximum 50 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

*Test solution.* The water to be examined. If the sodium content is more than 10 mg/L, dilute with *distilled water R* to obtain a concentration suitable for the apparatus used.

*Reference solutions.* Prepare reference solutions (0 ppm; 2.5 ppm; 5.0 ppm; 7.5 ppm; 10 ppm) using *sodium standard solution (200 ppm Na) R*.

*Wavelength*: 589 nm.

**Zinc**: maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*): use sampling and analytical equipment free from zinc or not liable to yield zinc under the conditions of use.

*Test solution.* The water to be examined.

*Reference solutions.* Prepare reference solutions (0.05 ppm to 0.15 ppm) using *zinc standard solution (100 ppm Zn) R*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Atomisation device*: oxidising air-acetylene flame.

**Heavy metals** (*2.4.8*): maximum 0.1 ppm.

Heat 200 mL of the water to be examined in a glass evaporating dish on a water-bath until the volume is reduced to 20 mL. 12 mL of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

**Microbial contamination**

TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

**Bacterial endotoxins** (*2.6.14*): less than 0.25 IU/mL.

**01/2019:0128**

# HAEMODIALYSIS, SOLUTIONS FOR

## Solutiones ad haemodialysem

DEFINITION

Solutions of electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Because of the large volumes used, haemodialysis solutions are usually prepared by diluting a concentrated solution with water of suitable quality (see the monograph *Haemodialysis solutions, concentrated, water for diluting (1167)*), using for example an automatic dosing device.

## Concentrated solutions for haemodialysis

Concentrated haemodialysis solutions are prepared and stored using materials and methods designed to produce solutions having as low a degree of microbial contamination as possible. In certain circumstances, it may be necessary to use sterile solutions.

During dilution and use, precautions are taken to avoid microbial contamination. Diluted solutions are to be used immediately after preparation.

Concentrated solutions for haemodialysis are supplied in:

- rigid, semi-rigid or flexible plastic containers;
- glass containers.

3 types of concentrated solutions are used:

**1. Concentrated solutions with acetate or lactate**

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that, after dilution to the stated volume, the concentrations of the components per litre are usually in the following ranges (see Table 0128.-1):

Table 0128.-1.

| | Concentration (mmol/L) | Concentration (mEq/L) |
|---|---|---|
| Sodium | 130 - 145 | 130 - 145 |
| Potassium | 0 - 3.0 | 0 - 3.0 |
| Calcium | 0 - 2.0 | 0 - 4.0 |
| Magnesium | 0 - 1.2 | 0 - 2.4 |
| Acetate or lactate | 32 - 45 | 32 - 45 |
| Chloride | 90 - 120 | 90 - 120 |
| Glucose | 0 - 12.0 | |

Concentrated solutions with acetate or lactate are diluted before use.

**2. Concentrated acid solutions**

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that, after dilution to the stated volume and before neutralisation with sodium hydrogen carbonate, the

concentrations of the components per litre are usually in the following ranges (see Table 0128.-2):

Table 0128.-2.

| | Concentration (mmol/L) | Concentration (mEq/L) |
|---|---|---|
| Sodium | 80 - 110 | 80 - 110 |
| Potassium | 0 - 3.0 | 0 - 3.0 |
| Calcium | 0 - 2.0 | 0 - 4.0 |
| Magnesium | 0 - 1.2 | 0 - 2.4 |
| Acetic acid | 2.5 - 10 | 2.5 - 10 |
| Chloride | 90 - 120 | 90 - 120 |
| Glucose | 0 - 12.0 | |

Sodium hydrogen carbonate must be added immediately before use to a final concentration of not more than 45 mmol/L. The concentrated solution of sodium hydrogen carbonate is supplied in a separate container. The concentrated acid solutions and the concentrated solutions of sodium hydrogen carbonate are diluted and mixed immediately before use using a suitable device. Alternatively, sodium hydrogen carbonate in powder form may be used to prepare the solution.

**3. Concentrated solutions without buffer**

Several formulations of concentrated solutions without buffer are used. The concentrations of the components in the solutions are such that, after dilution to the stated volume, the concentrations of the components per litre are usually in the following ranges (see Table 0128.-3):

Table 0128.-3.

| | Concentration (mmol/L) | Concentration (mEq/L) |
|---|---|---|
| Sodium | 130 - 145 | 130 - 145 |
| Potassium | 0 - 3.0 | 0 - 3.0 |
| Calcium | 0 - 2.0 | 0 - 4.0 |
| Magnesium | 0 - 1.2 | 0 - 2.4 |
| Chloride | 130 - 155 | 130 - 155 |
| Glucose | 0 - 12.0 | |

Concentrated solutions without buffer are used together with parenteral administration of suitable hydrogen carbonate solutions.

*The following tests are carried out on the diluted, ready-to-use solutions.*

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

- potassium: reaction (b);
- calcium: reaction (a);
- sodium: reaction (b);
- chlorides: reaction (a);
- lactates;
- carbonates and hydrogen carbonates;
- acetates:
  - if the solution is free from glucose, use reaction (b);
  - if the solution contains glucose, use the following method: to 5 mL of the solution to be examined add 1 mL of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
- magnesium: to 0.1 mL of *titan yellow solution R* add 10 mL of *water R*, 2 mL of the solution to be examined and 1 mL of a 4.2 g/L solution of *sodium hydroxide R*; a pink colour is produced;
- glucose: to 5 mL of the solution to be examined add 2 mL of *dilute sodium hydroxide solution R* and 0.05 mL of *copper sulfate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

**Appearance of solution**. The solution to be examined is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method I*).

**Aluminium**: maximum 10 µg/L.

Atomic absorption spectrometry (*2.2.23, Method I or II*). Use a matrix modifier (for example, *nitric acid R* and *magnesium nitrate R* in *water R*) in the same quantity for the test solution, the reference solutions and the blank solution.

*Test solution.* If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions. Method I – direct calibration.*

Prepare the reference solutions by diluting, for example *aluminium standard solution (10 ppm Al) R* with acidified *water R*.

*Reference solutions. Method II – standard additions.*

Prepare at least 3 reference solutions in the test solution, in a range spanning the expected aluminium concentration of the test solution, for example by diluting *aluminium standard solution (10 ppm Al) R* with the test solution.

*Blank solution*: *water R*.

*Source*: aluminium hollow-cathode lamp.

*Wavelength*: 309.3 nm.

*Atomisation device*: graphite furnace.

**Extractable volume** (*2.9.17*). The volume measured is not less than the nominal volume stated on the label.

**Microbial contamination**

TAMC: acceptance criterion $10^2$ CFU/mL (*2.6.12*).

**Sterility** (*2.6.1*). If the label states that the concentrated haemodialysis solution is sterile, it complies with the test for sterility.

**Bacterial endotoxins** (*2.6.14*): less than 0.25 IU/mL in the solution diluted for use.

**Pyrogens** (*2.6.8*). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Dilute the solution to be examined with *water for injections R* to the concentration prescribed for use. Inject 10 mL of the solution per kilogram of the rabbit's mass.

ASSAY

*Determine the density (2.2.5) of the concentrated solution and calculate the content in grams per litre and in millimoles per litre.*

**Sodium**: 97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

*Test solution.* If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions.* Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

*Wavelengths*: 589.0 nm or 589.6 nm (sodium emits as a doublet).

**Potassium**: 95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dilute with *water R* an accurately weighed quantity of the solution to be examined to a concentration suitable for the instrument to be used. To 100 mL of this solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

*Reference solutions.* Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 mL of each reference solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

*Source*: potassium hollow-cathode lamp.

*Wavelength*: 766.5 nm.

*Atomisation device*: air-acetylene flame.

**Calcium**: 95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dilute 5.0 mL of the solution to be examined to 100.0 mL with *water R*. To 3.0 mL of this solution add 5 mL of *lanthanum chloride solution R* and dilute to 50.0 mL with *water R*.

*Reference solutions.* Into 4 identical volumetric flasks each containing 5 mL of *lanthanum chloride solution R*, introduce respectively 2.5 mL, 5.0 mL, 7.0 mL and 10.0 mL of *calcium standard solution (10 ppm Ca) R* and dilute to 50.0 mL with *water R*.

*Source*: calcium hollow-cathode lamp.

*Wavelength*: 422.7 nm.

*Atomisation device*: air-acetylene flame.

**Magnesium**: 95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dilute 5.0 mL of the solution to be examined to 100.0 mL with *water R*. To 2.0 mL of this solution add 5 mL of *lanthanum chloride solution R* and dilute to 50.0 mL with *water R*.

*Reference solutions.* Into 4 identical volumetric flasks each containing 5 mL of *lanthanum chloride solution R*, introduce respectively 1.0 mL, 2.0 mL, 3.0 mL and 4.0 mL of *magnesium standard solution (10 ppm Mg) R* and dilute to 50.0 mL with *water R*.

*Source*: magnesium hollow-cathode lamp.

*Wavelength*: 285.2 nm.

*Atomisation device*: air-acetylene flame.

**Total chloride**: 95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute an accurately measured volume of the solution to be examined containing the equivalent of about 0.68 mEq of chloride with an appropriate volume of *water R* in order to immerse the electrode. Carry out a potentiometric titration (*2.2.20*), using *0.1 M silver nitrate*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

**Acetate**: 95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

**Lactate**: 95.0 per cent to 105.0 per cent of the content of lactate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 mL of *0.1 M hydrochloric acid*. Then add 50 mL of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

**Sodium hydrogen carbonate**: 95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label.

Titrate with *0.1 M hydrochloric acid* a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

**Reducing sugars** (expressed as glucose): 95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 mL conical flask with a ground-glass neck and add 25.0 mL of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and maintain boiling for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Carefully add, in small amounts, 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R*. Titrate with *0.1 M sodium thiosulfate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 mL of *water R*.

Calculate the content of reducing sugars, expressed as glucose ($C_6H_{12}O_6$), using Table 0128.-4.

Table 0128.-4.

| Volume of *0.1 M sodium thiosulfate* (mL) | Glucose (mg) |
|---|---|
| 8 | 19.8 |
| 9 | 22.4 |
| 10 | 25.0 |
| 11 | 27.6 |
| 12 | 30.3 |
| 13 | 33.0 |
| 14 | 35.7 |
| 15 | 38.5 |
| 16 | 41.3 |

STORAGE

At 4 °C or above.

LABELLING

The label states:

- the formula of the concentrated solution for haemodialysis expressed in grams per litre and in millimoles per litre;
- the nominal volume of the solution in the container;
- where applicable, that the concentrated solution is sterile;
- the storage conditions;
- that the concentrated solution is to be diluted immediately before use;
- the dilution to be made;
- that the volume taken for use is to be measured accurately;
- the ionic formula for the diluted solution ready for use in millimoles per litre;
- that any unused portion of solution is to be discarded;
- where applicable, that sodium hydrogen carbonate is to be added before use;
- that the solution is not to be used for intraveneous infusion.

**01/2019:2770**

# HAEMOFILTRATION AND HAEMODIAFILTRATION, CONCENTRATED SOLUTIONS FOR

## Solutiones concentratae ad haemocolaturam haemodiacolaturamque

DEFINITION

Concentrated solutions containing electrolytes that are diluted to the required concentration prior to administration. Dilutions are performed with specialist equipment using an automatic dosing device equipped with ultrafilters. The final solution is used for parenteral administration and contains electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Concentrated solutions for haemofiltration and haemodiafiltration are supplied in rigid, semi-rigid or flexible plastic containers.

The containers and closures comply with the requirements for containers for preparations for parenteral administration (*3.2*).

Several formulations of concentrated solutions are used and the concentrations of the components per litre of solution are typically in the following ranges (see Table 2770.-1):

Table 2770.-1.

| | Concentration (mmol/L) | Concentration (mEq/L) |
|---|---|---|
| Sodium | 0 - 4900 | 0 - 4900 |
| Potassium | 0 - 400 | 0 - 400 |
| Calcium | 35 - 300 | 70 - 600 |
| Magnesium | 8.75 - 100 | 17.5 - 200 |
| Chloride | 325 - 5180 | 325 - 5180 |
| Glucose | 0 - 1100 | - |
| Acetate | 0 - 600 | 0 - 600 |
| Citrate | 0 - 45 | 0 - 135 |

The concentrated solution is diluted according to the manufacturer's instructions.

The concentrations of components in the solutions are such that, after dilution to the stated volume and before neutralisation with sodium hydrogen carbonate, the concentrations of the components per litre are compliant with the monograph *Haemofiltration and haemodiafiltration, solutions for (0861)*.

When hydrogen carbonate is used or is required to be present, sodium hydrogen carbonate must be added immediately before use in accordance with the manufacturer's instructions.

Antioxidants are not added to the solutions.

IDENTIFICATION

According to the stated composition, and after dilution where applicable, the solution to be examined gives the following identification reactions (*2.3.1*):

- potassium: reaction (b);
- calcium: reaction (a);
- sodium: reaction (b);
- chlorides: reaction (a);
- acetates:
  - if the solution is free from glucose, use reaction (b);
  - if the solution contains glucose, use the following method: to 5 mL of the solution to be examined add 1 mL of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
- citrates;
- carbonates and hydrogen carbonates;
- magnesium: to 0.1 mL of *titan yellow solution R* add 10 mL of *water R*, 2 mL of the solution to be examined and 1 mL of *1 M sodium hydroxide*; a pink colour is produced;
- glucose: to 5 mL of the solution to be examined, add 2 mL of *dilute sodium hydroxide solution R* and 0.05 mL of *copper sulfate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

**Appearance of solution**. The solution to be examined is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, dilute the solution to be examined with *water R* to the concentration prescribed for use. The diluted solution is not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method I*).

**pH** (*2.2.3*): 5.0 to 7.5. If the solution to be examined contains glucose, the pH is 4.5 to 6.5.

**Hydroxymethylfurfural**. Carry out the test only if glucose is added to the preparation. To a volume of the solution to be examined containing the equivalent of 25 mg of glucose, add 5.0 mL of a 100 g/L solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R*, then add 1.0 mL of a 5 g/L solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2-3 min, is not greater than that of a standard prepared at the same time and in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined (400 ppm expressed with reference to the glucose concentration). If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R* (800 ppm expressed with reference to the glucose concentration).

**Aluminium**: maximum 10 µg/L.

Atomic absorption spectrometry (*2.2.23, Method I or II*). Use a matrix modifier (for example, *nitric acid R* and *magnesium nitrate R* in *water R*) in the same quantity for the test solution, the reference solutions and the blank solution.

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions. Method I – direct calibration*.

Prepare the reference solutions by diluting, for example *aluminium standard solution (10 ppm Al) R* with acidified *water R*.

*Reference solutions. Method II – standard additions*.

Prepare at least 3 reference solutions in the test solution, in a range spanning the expected aluminium concentration of the test solution, for example by diluting *aluminium standard solution (10 ppm Al) R* with the test solution.

*Blank solution*: *water R*.

*Source*: aluminium hollow-cathode lamp.

*Wavelength*: 309.3 nm.

*Atomisation device*: graphite furnace.

**Particulate contamination** (*2.9.19, Method I*). Dilute the solution to be examined with *particle-free water R* to the concentration prescribed for use. Use 50 mL of the diluted solution to be examined.

**Extractable volume** (*2.9.17*). The solution complies with the test prescribed for parenteral infusions.

**Sterility** (*2.6.1*). If the label states that the concentrated solution for haemofiltration or haemodiafiltration is sterile, it complies with the test for sterility.

ASSAY

**Sodium**: 97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions*. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

*Wavelengths*: 589.0 nm or 589.6 nm (sodium emits as a doublet).

**Potassium**: 95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 mL of the solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

*Reference solutions*. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 mL of each reference solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

*Source*: potassium hollow-cathode lamp.

*Wavelength*: 766.5 nm.

*Atomisation device*: air-propane or air-acetylene flame.

**Calcium**: 95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions*. Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

*Source*: calcium hollow-cathode lamp.

*Wavelength*: 422.7 nm.

*Atomisation device*: air-propane or air-acetylene flame.

**Magnesium**: 95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions*. Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

*Source*: magnesium hollow-cathode lamp.

*Wavelength*: 285.2 nm.

*Atomisation device*: air-propane or air-acetylene flame.

**Total chloride**: 95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute an accurately measured volume of the solution to be examined containing the equivalent of about 0.68 mEq of chloride with an appropriate volume of *water R* to immerse the electrode. Carry out a potentiometric titration (*2.2.20*), using *0.1 M silver nitrate*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

**Acetate**: 95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

**Citrate**: 95.0 per cent to 105.0 per cent of the content of citrate stated on the label.

*Test solution*. Use the preparation to be examined, diluted if necessary.

Using 0.2 mL of *phenolphthalein solution R* as indicator, titrate 10 mL of the test solution with *0.1 M sodium hydroxide* until the colour changes from colourless to pink.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.33 mmol of citrate.

**Reducing sugars** (expressed as glucose): 95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 mL conical flask with a ground-glass neck and add 25.0 mL of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Carefully add, in small amounts, 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R*. Titrate with *0.1 M sodium thiosulfate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 mL of *water R*.

Calculate the content of reducing sugars expressed as glucose ($C_6H_{12}O_6$), using Table 2770.-2.

Table 2770.-2.

| Volume of *0.1 M sodium thiosulfate* (mL) | Glucose (mg) |
|---|---|
| 8 | 19.8 |
| 9 | 22.4 |
| 10 | 25.0 |
| 11 | 27.6 |
| 12 | 30.3 |
| 13 | 33.0 |
| 14 | 35.7 |
| 15 | 38.5 |
| 16 | 41.3 |

STORAGE

At 4 °C or above.

LABELLING

The label states:

- the formula of the concentrated solution for haemofiltration or haemodiafiltration, expressed in grams per litre and in millimoles per litre;
- the nominal volume of the concentrated solution for haemofiltration or haemodiafiltration in the container;
- where applicable, that the concentrated solution is sterile;
- that the concentrated solution is to be diluted immediately before use;
- that the volume taken for use is to be measured accurately;
- the dilution to be made;
- the ionic formula for the diluted solution ready for use in millimoles per litre;
- the calculated osmolarity, expressed in milliosmoles per litre;
- the storage conditions;
- that any unused portion of solution is to be discarded;

– where applicable, that sodium hydrogen carbonate is to be added before use.

**01/2019:0861**

# HAEMOFILTRATION AND HAEMODIAFILTRATION, SOLUTIONS FOR

## Solutiones ad haemocolaturam haemodiacolaturamque

DEFINITION

Preparations for parenteral administration containing electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Solutions for haemofiltration and haemodiafiltration are supplied in:

– rigid or semi-rigid plastic containers;
– flexible plastic containers inside closed protective envelopes;
– glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral administration (*3.2*).

In haemofiltration and haemodiafiltration, the following formulations are used. The concentrations of the components per litre of solution are usually in the following range (see Table 0861.-1):

Table 0861.-1.

| | Concentration (mmol/L) | Concentration (mEq/L) |
|---|---|---|
| Sodium | 125 - 150 | 125 - 150 |
| Potassium | 0 - 4.5 | 0 - 4.5 |
| Calcium | 1.0 - 2.5 | 2.0 - 5.0 |
| Magnesium | 0.25 - 1.5 | 0.50 - 3.0 |
| Acetate and/or lactate and/or hydrogen carbonate | 30 - 60 | 30 - 60 |
| Chloride | 90 - 120 | 90 - 120 |
| Glucose | 0 - 25 | |

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

In haemofiltration and haemodiafiltration, the following formulations may also be used (see Table 0861.-2):

Table 0861.-2.

| | Concentration (mmol/L) | Concentration (mEq/L) |
|---|---|---|
| Sodium | 130 - 167 | 130 - 167 |
| Potassium | 0 - 4.0 | 0 - 4.0 |
| Hydrogen carbonate | 20 - 167 | 20 - 167 |
| Chloride | 0 - 147 | 0 - 147 |

Antioxidants are not added to the solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

– potassium: reaction (b);
– calcium: reaction (a);
– sodium: reaction (b);
– chlorides: reaction (a);
– acetates:
  – if the solution is free from glucose, use reaction (b);
  – if the solution contains glucose, use the following method: to 5 mL of the solution to be examined add 1 mL of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
– lactates;
– carbonates and hydrogen carbonates;
– magnesium: to 0.1 mL of *titan yellow solution R* add 10 mL of *water R*, 2 mL of the solution to be examined and 1 mL of *1 M sodium hydroxide*; a pink colour is produced;
– glucose: to 5 mL of the solution to be examined, add 2 mL of *dilute sodium hydroxide solution R* and 0.05 mL of *copper sulfate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method I*).

**pH** (*2.2.3*): 5.0 to 7.5. If the solution contains glucose, the pH is 4.5 to 6.5. If the solution contains hydrogen carbonate, the pH is 7.0 to 8.5.

**Hydroxymethylfurfural**. Carry out the test only if glucose is added to the preparation. To a volume of the solution to be examined containing the equivalent of 25 mg of glucose, add 5.0 mL of a 100 g/L solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R*, then add 1.0 mL of a 5 g/L solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2-3 min, is not greater than that of a standard prepared at the same time and in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined (400 ppm expressed with reference to the glucose concentration). If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R* (800 ppm expressed with reference to the glucose concentration).

**Aluminium**: maximum 10 µg/L.

Atomic absorption spectrometry (*2.2.23, Method I or II*). Use a matrix modifier (for example, *nitric acid R* and *magnesium nitrate R* in *water R*) in the same quantity for the test solution, the reference solutions and the blank solution.

*Test solution.* If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions. Method I – direct calibration.*

Prepare the reference solutions by diluting, for example *aluminium standard solution (10 ppm Al) R* with acidified *water R*.

*Reference solutions. Method II – standard additions.*

Prepare at least 3 reference solutions in the test solution, in a range spanning the expected aluminium concentration of the test solution, for example by diluting *aluminium standard solution (10 ppm Al) R* with the test solution.

*Blank solution*: *water R*.

*Source*: aluminium hollow-cathode lamp.

*Wavelength*: 309.3 nm.

*Atomisation device*: graphite furnace.

**Particulate contamination** (*2.9.19, Method I*). Use 50 mL of the solution to be examined.

**Extractable volume** (*2.9.17*). The solution complies with the test prescribed for parenteral infusions.

**Sterility** (*2.6.1*). The solution complies with the test.

**Bacterial endotoxins** (*2.6.14*): less than 0.05 IU/mL.

**Pyrogens** (*2.6.8*). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 mL of the solution.

ASSAY

**Sodium**: 97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions*. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

*Wavelengths*: 589.0 nm or 589.6 nm (sodium emits as a doublet).

**Potassium**: 95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 mL of the solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

*Reference solutions*. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 mL of each reference solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

*Source*: potassium hollow-cathode lamp.

*Wavelength*: 766.5 nm.

*Atomisation device*: air-propane or air-acetylene flame.

**Calcium**: 95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions*. Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

*Source*: calcium hollow-cathode lamp.

*Wavelength*: 422.7 nm.

*Atomisation device*: air-propane or air-acetylene flame.

**Magnesium**: 95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

*Reference solutions*. Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

*Source*: magnesium hollow-cathode lamp.

*Wavelength*: 285.2 nm.

*Atomisation device*: air-propane or air-acetylene flame.

**Total chloride**: 95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute an accurately measured volume of the solution to be examined containing the equivalent of about 0.68 mEq of chloride with an appropriate volume of *water R* to immerse the electrode. Carry out a potentiometric titration (*2.2.20*), using *0.1 M silver nitrate*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

**Acetate**: 95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

**Lactate**: 95.0 per cent to 105.0 per cent of the content of lactate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 mL of *0.1 M hydrochloric acid*. Add 50 mL of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

**Sodium hydrogen carbonate**: 95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label.

Titrate with *0.1 M hydrochloric acid*, a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

**Lactate and hydrogen carbonate**: 95.0 per cent to 105.0 per cent of the content of lactates and hydrogen carbonates stated on the label.

Liquid chromatography (*2.2.29*).

*Test solution*. The solution to be examined.

*Reference solution*. Dissolve in 100 mL of *water for chromatography R* quantities of lactates and hydrogen carbonates, accurately weighed, in order to obtain solutions having concentrations representing about 90 per cent, 100 per cent and 110 per cent of the concentrations stated on the label.

*Column*:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *cation-exchange resin R* (9 µm);
- *temperature*: 60 °C.

*Mobile phase*: *0.005 M sulfuric acid* previously degassed with *helium for chromatography R*.

*Flow rate*: 0.6 mL/min.

*Detection*: differential refractometer.

*Injection*: 20 µL, twice.

*Order of elution*: lactates, hydrogen carbonates.

Determine the concentration of lactates and hydrogen carbonates in the test solution by interpolating the peak area for lactate and the peak height for hydrogen carbonate from the linear regression curve obtained with the reference solutions.

**Reducing sugars** (expressed as glucose): 95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 mL conical flask with a ground-glass neck and add 25.0 mL of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Carefully add, in small amounts, 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R*. Titrate with *0.1 M sodium thiosulfate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 mL of *water R*.

Calculate the content of reducing sugars expressed as glucose ($C_6H_{12}O_6$), using Table 0861.-3.

Table 0861.-3.

| Volume of *0.1 M sodium thiosulfate* (mL) | Glucose (mg) |
|---|---|
| 8 | 19.8 |
| 9 | 22.4 |
| 10 | 25.0 |
| 11 | 27.6 |
| 12 | 30.3 |
| 13 | 33.0 |
| 14 | 35.7 |
| 15 | 38.5 |
| 16 | 41.3 |

STORAGE

At 4 °C or above.

LABELLING

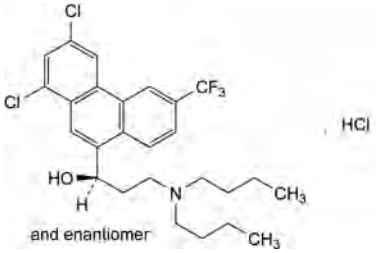
The label states:

- the formula of the solution for haemofiltration or haemodiafiltration, expressed in grams per litre and in millimoles per litre;
- the calculated osmolarity, expressed in milliosmoles per litre;
- the nominal volume of the solution for haemofiltration or haemodiafiltration in the container;
- that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic;
- the storage conditions;
- that any unused portion of solution is to be discarded.

**01/2017:1979**

# HALOFANTRINE HYDROCHLORIDE

## Halofantrini hydrochloridum



$C_{26}H_{31}Cl_3F_3NO$ $M_r$ 536.9

[36167-63-2]

DEFINITION

(1*RS*)-3-(Dibutylamino)-1-[1,3-dichloro-6-(trifluoromethyl)-phenanthren-9-yl]propan-1-ol hydrochloride.

*Content*: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in methanol, sparingly soluble in alcohol.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *halofantrine hydrochloride CRS*.
If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methyl ethyl ketone R*, evaporate to dryness and record new spectra using the residues.

B. It gives reaction (b) of chlorides (*2.3.1*).

TESTS

**Optical rotation** (*2.2.7*): − 0.10° to + 0.10°.

Dissolve 1.00 g in *alcohol R* and dilute to 100.0 mL with the same solvent.

**Absorbance** (*2.2.25*): maximum 0.085 at 450 nm.

Dissolve 0.200 g in *methanol R* and dilute to 10.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Test solution (b)*. Dilute 5.0 mL of test solution (a) to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 40.0 mg of *halofantrine hydrochloride CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 5.0 mL of reference solution (a) to 50.0 mL with the mobile phase.

*Reference solution (c)*. Dilute 1.0 mL of test solution (a) to 100.0 mL with the mobile phase. Dilute 5.0 mL of the solution to 50.0 mL with the mobile phase.

*Reference solution (d)*. Dissolve 10.0 mg of *halofantrine impurity C CRS* in the mobile phase and dilute to 25 mL with the mobile phase. To 5.0 mL of the solution, add 5.0 mL of reference solution (a) and dilute to 50.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.30 m, Ø = 3.9 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (10 µm) of irregular type, with a specific surface of 330 $m^2$/g, a pore size of 12.5 nm and a carbon loading of 9.8 per cent .

*Mobile phase*: mix 250 mL of a 2.0 g/L solution of *sodium hydroxide R*, previously adjusted to pH 2.5 with *perchloric acid R* and 750 mL of *acetonitrile R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 260 nm.

*Injection*: 20 µL; inject the test solution (a) and reference solutions (c) and (d).

*Run time*: 5 times the retention time of halofantrine which is about 6 min.

*System suitability*:

- *resolution*: minimum 3.3 between the peaks due to halofantrine and impurity C in the chromatogram obtained with reference solution (d).

*Limits*:

- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances.

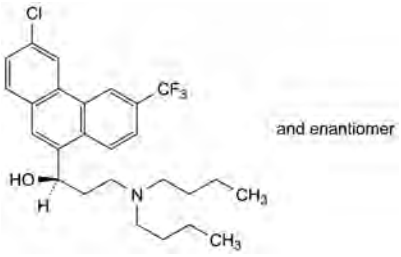
*Injection*: test solution (b) and reference solution (b).

Calculate the percentage content of halofantrine hydrochloride.

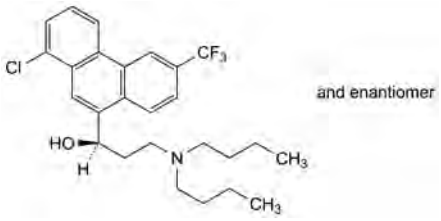
STORAGE

Protected from light.

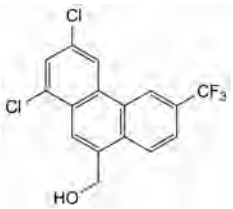
IMPURITIES



A. (1*RS*)-1-[3-chloro-6-(trifluoromethyl)phenanthren-9-yl]-3-(dibutylamino)propan-1-ol (1-dechlorohalofantrine),



B. (1*RS*)-1-[1-chloro-6-(trifluoromethyl)phenanthren-9-yl]-3-(dibutylamino)propan-1-ol (3-dechlorohalofantrine),

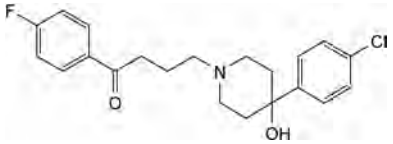


C. [1,3-dichloro-6-(trifluoromethyl)phenanthren-9-yl]methanol.

**01/2013:0616**

# HALOPERIDOL

## Haloperidolum



$C_{21}H_{23}ClFNO_2$ $M_r$ 375.9

[52-86-8]

DEFINITION

4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, slightly soluble in ethanol (96 per cent), in methanol and in methylene chloride.

IDENTIFICATION

*First identification: B, E.*

*Second identification: A, C, D, E.*

A. Melting point (*2.2.14*): 150 °C to 153 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *haloperidol CRS*.

C. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.
*Reference solution (a).* Dissolve 10 mg of *haloperidol CRS* in *methanol R* and dilute to 10 mL with the same solvent.
*Reference solution (b).* Dissolve 10 mg of *haloperidol CRS* and 10 mg of *bromperidol CRS* in *methanol R* and dilute to 10 mL with the same solvent.
*Plate*: *TLC octadecylsilyl silica gel plate R.*
*Mobile phase*: *tetrahydrofuran R*, *methanol R*, 58 g/L solution of *sodium chloride R* (10:45:45 *V/V/V*).
*Application*: 1 µL.
*Development*: in an unsaturated tank, over 2/3 of the plate.
*Drying*: in air.
*Detection*: examine in ultraviolet light at 254 nm.
*System suitability*: reference solution (b):
– the chromatogram shows 2 spots which may, however, not be completely separated.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 5 mL of *anhydrous ethanol R*. Add 0.5 mL of *dinitrobenzene solution R* and 0.5 mL of *2 M alcoholic potassium hydroxide R*. A violet colour is produced and becomes brownish-red after 20 min.

E. To 0.1 g in a platinum crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 mL of *dilute nitric acid R* and filter. To 1 mL of the filtrate add 1 mL of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

Dissolve 0.2 g in 20 mL of a 1 per cent *V/V* solution of *lactic acid R*.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

*Test solution.* Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 10 mg of *haloperidol for system suitability CRS* (containing impurities B and D) in 1.0 mL of *methanol R*.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

*Reference solution (c).* Dissolve 10 mg of *haloperidol for peak identification CRS* (containing impurities G and H) in 1.0 mL of *methanol R*.

*Column*:
– *size*: *l* = 0.1 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

– *mobile phase A*: 17 g/L solution of *tetrabutylammonium hydrogen sulfate R1*;

– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 90 | 10 |
| 2 - 17 | 90 → 50 | 10 → 50 |
| 17 - 22 | 50 | 50 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *haloperidol for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B and D; use the chromatogram supplied with *haloperidol for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities G and H.

*Relative retention* with reference to haloperidol (retention time = about 8 min): impurity B = about 0.9; impurity D = about 1.6; impurity G = about 1.8; impurity H = about 2.0.

*System suitability*: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to impurity B and haloperidol.

*Limits*:

– *correction factor*: for the calculation of content, multiply the peak area of impurity B by 0.7;

– *impurity D*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *impurity B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *impurities G, H*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, using 0.2 mL of *naphtholbenzein solution R* as indicator.

1 mL of *0.1 M perchloric acid* is equivalent to 37.59 mg of $C_{21}H_{23}ClFNO_2$.

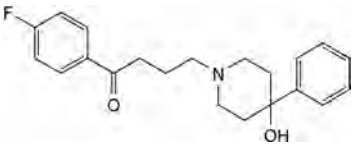
STORAGE

Protected from light.

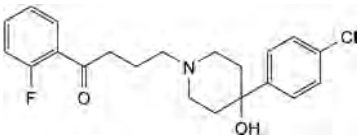
IMPURITIES

*Specified impurities: B, D, G, H.*

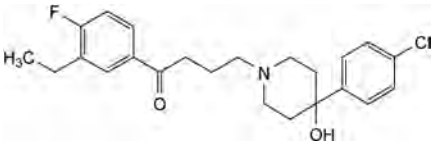
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C, E, F.*



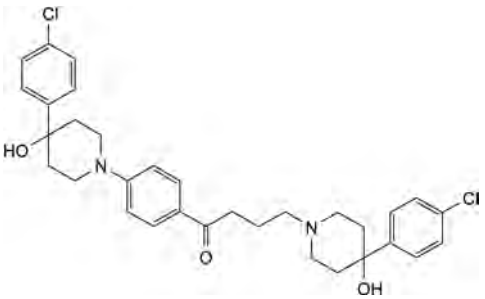
A. 1-(4-fluorophenyl)-4-(4-hydroxy-4-phenylpiperidin-1-yl)butan-1-one,



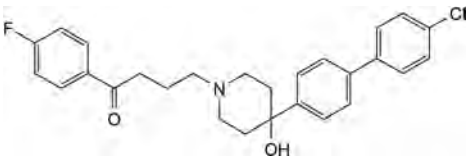
B. 4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(2-fluorophenyl)butan-1-one,



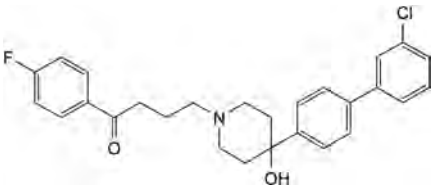
C. 4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(3-ethyl-4-fluorophenyl)butan-1-one,



D. 4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-1-[4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]phenyl]butan-1-one,



E. 4-[4-(4′-chlorobiphenyl-4-yl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one,



F. 4-[4-(3′-chlorobiphenyl-4-yl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one,

G. unknown structure,

H. unknown structure.

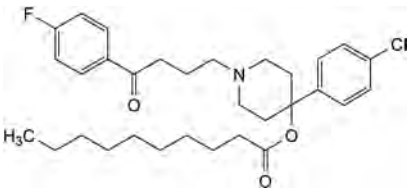
# HALOPERIDOL DECANOATE

## Haloperidoli decanoas



$C_{31}H_{41}ClFNO_3$ $M_r$ 530.1
[74050-97-8]

DEFINITION

4-(4-Chlorophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, very soluble in ethanol (96 per cent), in methanol and in methylene chloride.

mp: about 42 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *haloperidol decanoate CRS*.

B. To 0.1 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 mL of *dilute nitric acid R* and filter. To 1 mL of the filtrate add 1 mL of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $B_5$ (*2.2.2, Method II*).

Dissolve 2.0 g in *methylene chloride R* and dilute to 20 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

*Test solution.* Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 2.5 mg of *bromperidol decanoate CRS* and 2.5 mg of *haloperidol decanoate CRS* in *methanol R* and dilute to 50.0 mL with the same solvent.

*Reference solution (b).* Dilute 5.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

*Column*:

– *size*: *l* = 0.1 m, Ø = 4.0 mm;

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

– *mobile phase A*: 27 g/L solution of *tetrabutylammonium hydrogen sulfate R*;

– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 80 → 40 | 20 → 60 |
| 30 - 35 | 40 | 60 |
| 35 - 40 | 40 → 80 | 60 → 20 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 10 µL.

*Relative retention* with reference to haloperidol decanoate (retention time = about 24 min): impurity G = about 0.1; impurity L = about 0.2; impurity H = about 0.8; impurity I = about 0.88; impurity A = about 0.9; impurity B = about 0.98; bromperidol decanoate = about 1.02; impurity J = about 1.1; impurity C = about 1.15; impurity D = about 1.2; impurity K = about 1.22; impurity F = about 1.26; impurity E = about 1.28.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to haloperidol decanoate and bromperidol decanoate.

*Limits*:

– *impurities A, B, C, D, E, F, G, H, I, J, K*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 30 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.425 g in 50 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, using 0.2 mL of *naphtholbenzein solution R* as indicator.

1 mL of *0.1 M perchloric acid* is equivalent to 53.01 mg of $C_{31}H_{41}ClFNO_3$.

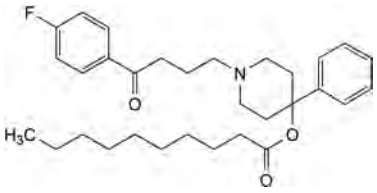
STORAGE

Protected from light, at a temperature below 25 °C.

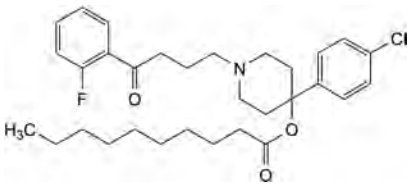
IMPURITIES

*Specified impurities: A, B, C, D, E, F, G, H, I, J, K.*

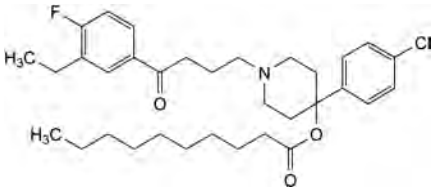
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *L.*



A. 1-[4-(4-fluorophenyl)-4-oxobutyl]-4-phenylpiperidin-4-yl decanoate,



B. 4-(4-chlorophenyl)-1-[4-(2-fluorophenyl)-4-oxobutyl]-piperidin-4-yl decanoate,



C. 4-(4-chlorophenyl)-1-[4-(3-ethyl-4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

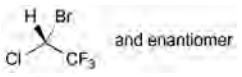
**corrected 10.0**

# HALOTHANE

## Halothanum



$C_2HBrClF_3$ $M_r$ 197.4
[151-67-7]

DEFINITION

(*RS*)-2-Bromo-2-chloro-1,1,1-trifluoroethane to which 0.01 per cent *m/m* of thymol has been added.

CHARACTERS

*Appearance*: clear, colourless, mobile, heavy, non-flammable liquid.

*Solubility*: slightly soluble in water, miscible with anhydrous ethanol.

IDENTIFICATION

*First identification*: B.

*Second identification*: A, C.

A. Distillation range (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: examine the substance in a 0.1 mm cell.

*Comparison*: *Ph. Eur. reference spectrum of halothane.*

C. Add 0.1 mL to 2 mL of *2-methyl-2-propanol R* in a test-tube. Add 1 mL of *copper edetate solution R*, 0.5 mL of *concentrated ammonia R* and a mixture of 0.4 mL of *strong hydrogen peroxide solution R* and 1.6 mL of *water R* (solution A). Prepare a blank at the same time (solution B). Place both tubes in a water-bath at 50 °C for 15 min, cool and add 0.3 mL of *glacial acetic acid R*. To 1 mL of each of solutions A and B add 0.5 mL of a mixture of equal volumes of freshly prepared *alizarin S solution R* and *zirconyl nitrate solution R*. Solution A is yellow and solution B is red.

To 1 mL of each of solutions A and B add 1 mL of *buffer solution pH 5.2 R*, 1 mL of *phenol red solution R* diluted 1 to 10 with *water R* and 0.1 mL of *chloramine solution R*. Solution A is bluish-violet and solution B is yellow.

To 2 mL of each of solutions A and B add 0.5 mL of a mixture of 25 volumes of *sulfuric acid R* and 75 volumes of *water R*, 0.5 mL of *acetone R* and 0.2 mL of a 50 g/L solution of *potassium bromate R* and shake. Warm the tubes in a water-bath at 50 °C for 2 min, cool and add 0.5 mL of a mixture of equal volumes of *nitric acid R* and *water R* and 0.5 mL of *silver nitrate solution R2*. Solution A is opalescent and a white precipitate is formed after a few minutes; solution B remains clear.

TESTS

**Acidity or alkalinity**. To 20 mL add 20 mL of *carbon dioxide-free water R*, shake for 3 min and allow to stand. Separate the aqueous layer and add 0.2 mL of *bromocresol purple solution R*. Not more than 0.1 mL of *0.01 M sodium hydroxide* or 0.6 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

**Relative density** (*2.2.5*): 1.872 to 1.877.

**Distillation range** (*2.2.11*): it distils completely between 49.0 °C and 51.0 °C and 95 per cent distills within a range of 1.0 °C.

**Volatile related substances**. Gas chromatography (*2.2.28*).

*Internal standard*: *trichlorotrifluoroethane CRS*.

*Test solution (a).* The substance to be examined.

*Test solution (b).* Dilute 1.0 mL of *trichlorotrifluoroethane CRS* to 20.0 mL with the substance to be examined. Dilute 1.0 mL of the solution to 100.0 mL with the substance to be examined. Dilute 1.0 mL of this solution to 10.0 mL with the substance to be examined.

*Column*:

- *size*: *l* = 2.75 m, Ø = 5 mm;
- *stationary phase*: *silanised diatomaceous earth for gas chromatography R* (180-250 µm), the first 1.8 m being impregnated with 30 per cent *m/m* of *macrogol 400 R* and the remainder with 30 per cent *m/m* of *dinonyl phthalate R*;
- *temperature*: 50 °C.

*Carrier gas*: *nitrogen for chromatography R*.

*Flow rate*: 30 mL/min.

*Detection*: flame ionisation.

*Injection*: 5 µL.

*Limit*: test solution (b):

- *total*: not more than the area of the peak due to the internal standard, corrected if necessary for any impurity with the same retention time as the internal standard (0.005 per cent).

**Thymol**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dissolve 0.10 g of *menthol R* in *methylene chloride R* and dilute to 100.0 mL with the same solvent.

*Test solution.* To 20.0 mL of the substance to be examined add 5.0 mL of the internal standard solution.

*Reference solution.* Dissolve 20.0 mg of *thymol R* in *methylene chloride R* and dilute to 100.0 mL with the same solvent. To 20.0 mL of this solution, add 5.0 mL of the internal standard solution.

*Column*:

- *material*: fused silica;
- *size*: *l* = 15 m, Ø = 0.53 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 1.5 µm).

*Carrier gas*: *nitrogen for chromatography R*.

*Flow rate*: 15 mL/min.

*Temperature*:

- *column*: 150 °C;
- *injection port*: 170 °C;
- *detector*: 200 °C.

*Detection*: flame ionisation.

*Injection*: 1.0 µL.

*Limit*:

- *thymol*: 0.75 times to 1.15 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.008 per cent *m/m* to 0.012 per cent *m/m*).

**Bromides and chlorides**. To 10 mL add 20 mL of *water R* and shake for 3 min. To 5 mL of the aqueous layer add 5 mL of *water R*, 0.05 mL of *nitric acid R* and 0.2 mL of *silver nitrate solution R1*. The solution is not more opalescent than a mixture of 5 mL of the aqueous layer and 5 mL of *water R*.

**Bromine and chlorine**. To 10 mL of the aqueous layer obtained in the test for bromides and chlorides add 1 mL of *potassium iodide and starch solution R*. No blue colour is produced.

**Non-volatile matter**: maximum 20 mg/L.

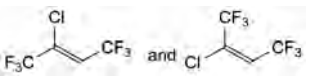
Evaporate 50 mL to dryness on a water-bath and dry the residue in an oven at 100-105 °C for 2 h. The residue weighs a maximum of 1 mg.

STORAGE

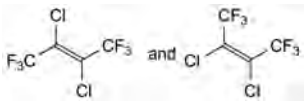
In an airtight container, protected from light, at a temperature not exceeding 25 °C. The choice of material for the container is made taking into account the particular reactivity of halothane with certain metals.

IMPURITIES

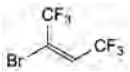
A. (*E*)-1,1,1,4,4,4-hexafluorobut-2-ene,



B. (*EZ*)-2-chloro-1,1,1,4,4,4-hexafluorobut-2-ene (*cis* and *trans*),

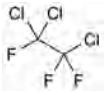


C. (*EZ*)-2,3-dichloro-1,1,1,4,4,4-hexafluorobut-2-ene (*cis* and *trans*),

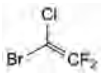


D. (*E*)-2-bromo-1,1,1,4,4,4-hexafluorobut-2-ene,

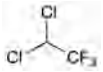
E. 2-chloro-1,1,1-trifluoroethane,



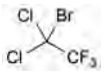
F. 1,1,2-trichloro-1,2,2-trifluoroethane,



G. 1-bromo-1-chloro-2,2-difluoroethene,



H. 2,2-dichloro-1,1,1-trifluoroethane,



I. 1-bromo-1,1-dichloro-2,2,2-trifluoroethane,

J. 1,2-dichloro-1,1-difluoroethane.

**01/2020:0462**

# HARD FAT

## Adeps solidus

DEFINITION

Mixture of triglycerides, diglycerides and monoglycerides, which may be obtained either by esterification of hydrogenated fatty acids of vegetable origin with glycerol or by interesterification of hydrogenated vegetable oils.

Each type of hard fat is characterised by its melting point, its hydroxyl value and its saponification value.

It does not contain additives.

CHARACTERS

*Appearance*: white or almost white, waxy, brittle mass.

*Solubility*: practically insoluble in water, slightly soluble in anhydrous ethanol and in methylene chloride.

When heated to 50 °C it melts, giving a colourless or slightly yellowish liquid.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *ether R*, *methylene chloride R* (10:90 *V/V*).

*Application*: 2 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*Results*: the chromatogram shows a spot due to triglycerides with an $R_F$ value of about 0.7 ($R_{st}$ 1) and may show spots due to 1,3-diglycerides ($R_{st}$ 0.6), to 1,2-diglycerides ($R_{st}$ 0.4) and to 1-monoglycerides ($R_{st}$ 0.07). For substances with a low hydroxyl value, the spots due to monoglycerides and diglycerides may be faint or absent. In this case, the test for hydroxyl value (see Tests) is also carried out to confirm identification.

B. Soya bean lecithin, macrogol cetostearyl ether and polysorbate 65. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 0.100 g of *soya bean lecithin R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 0.100 g of *macrogol cetostearyl ether R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution (c).* Dissolve 0.100 g of *polysorbate 65 R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plates*: *TLC silica gel G plate R* (2 plates).

*Mobile phase*: *water R*, *methanol R*, *methylene chloride R* (4:25:65 *V/V/V*).

Plate 1

*Application*: 4 µL of the test solution and reference solution (a).

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*Results*:

– the chromatogram obtained with the test solution shows no spots corresponding to those of soya bean lecithin ($R_F$ = about 0.3 and 0.5) in the chromatogram obtained with reference solution (a);

– the chromatogram obtained with the test solution shows a spot due to triglycerides with an $R_F$ value of about 1.0.

Plate 2

*Application*: 4 µL of the test solution and reference solutions (b) and (c).

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: spray with *potassium iodobismuthate solution R4* and examine in daylight.

*Results*:

– the chromatogram obtained with the test solution shows no orange spot corresponding to that of macrogol cetostearyl ether ($R_F$ = about 0.85) in the chromatogram obtained with reference solution (b);

– the chromatogram obtained with the test solution shows no orange spot corresponding to that of polysorbate 65 ($R_F$ = about 1.0) in the chromatogram obtained with reference solution (c).

C. Beeswax. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 8 mL with the same solvent.

*Reference solution.* Dissolve 0.100 g of *white beeswax R* in *methylene chloride R* and dilute to 8 mL with the same solvent.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *ethyl acetate R*, *cyclohexane R* (10:90 *V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: spray with a freshly prepared 100 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 120 °C for 3 min; examine in daylight.

*Results*: the chromatogram obtained with the test solution shows no black spot corresponding to that of white beeswax ($R_F$ = about 0.9) in the chromatogram obtained with the reference solution.

TESTS

**Alkaline impurities**. Melt 10.00 g and while maintaining the temperature at about 50 °C, dissolve the melted mass in 40.0 mL of *ethanol (96 per cent) R*, mix and add 0.05 mL of *bromophenol blue solution R*. Not more than 0.75 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

**Melting point** (*2.2.15*): 30 °C to 45 °C, and within 2 °C of the nominal value.

Introduce the melted substance into a capillary tube and allow to stand at a temperature below 10 °C for 24 h.

**Acid value** (*2.5.1*): maximum 0.5.

Melt 5.0 g and dissolve in 20 mL of the prescribed mixture of solvents.

**Hydroxyl value** (*2.5.3, Method A*): maximum 50, and within 5 units of the nominal value; maximum 5 if the nominal value is less than 5.

**Iodine value** (*2.5.4, Method A*): maximum 3.0.

**Peroxide value** (*2.5.5, Method A*): maximum 3.0.

**Saponification value** (*2.5.6*): 210 to 260, and within 5 per cent of the nominal value, determined on 2.0 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent.

Heat a silica crucible to redness for 30 min, allow to cool in a desiccator and weigh. Evenly distribute 1.0 g in the crucible and weigh. Dry at 100-105 °C for 1 h and ignite in a muffle furnace at 600 ± 25 °C until the substance is thoroughly charred. Carry out the test for sulfated ash (*2.4.14*) on the residue obtained, starting from "Moisten the substance to be examined...".

STORAGE

Protected from light, at a temperature at least 5 °C below the nominal melting point.

LABELLING

The label states:

- the nominal melting point;
- the nominal hydroxyl value;
- the nominal saponification value.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for hard fat used as basis for solid dosage forms.*

**Melting point** (see Tests).

**Hydroxyl value** (see Tests).

**Saponification value** (see Tests).

**01/2020:2731**

# HARD FAT WITH ADDITIVES

## Adeps solidus cum additamentis

DEFINITION

Mixture of triglycerides, diglycerides and monoglycerides, which may be obtained either by esterification of hydrogenated fatty acids of vegetable origin with glycerol or by interesterification of hydrogenated vegetable oils.

Each type of hard fat with additives is characterised by its melting point, its hydroxyl value and its saponification value.

It contains additives such as lecithin, surfactants, beeswax or a mixture thereof.

CHARACTERS

*Appearance*: white or pale yellow, waxy, brittle mass.

*Solubility*: practically insoluble in water, slightly soluble in anhydrous ethanol and in methylene chloride.

When heated to 50 °C it melts, giving a colourless or slightly yellowish liquid.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *ether R*, *methylene chloride R* (10:90 *V/V*).

*Application*: 2 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*Results*: the chromatogram shows a spot due to triglycerides with an $R_F$ value of about 0.7 ($R_{st}$ 1) and may show spots due to 1,3-diglycerides ($R_{st}$ 0.6), to 1,2-diglycerides ($R_{st}$ 0.4) and to 1-monoglycerides ($R_{st}$ 0.07). For substances with a low hydroxyl value, the spots due to monoglycerides and diglycerides may be faint or absent. In this case, the test for hydroxyl value (see Tests) is also carried out to confirm identification.

B. Soya bean lecithin, macrogol cetostearyl ether and polysorbate 65. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 0.100 g of *soya bean lecithin R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 0.100 g of *macrogol cetostearyl ether R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution (c).* Dissolve 0.100 g of *polysorbate 65 R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plates*: *TLC silica gel G plate R* (2 plates).

*Mobile phase*: *water R*, *methanol R*, *methylene chloride R* (4:25:65 *V/V/V*).

Plate 1

*Application*: 4 µL of the test solution and reference solution (a).

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*Results*:

– in the presence of soya bean lecithin, the chromatogram obtained with the test solution shows 2 spots ($R_F$ = about 0.3 and 0.5) similar in position to the spots in the chromatogram obtained with reference solution (a);

– the chromatogram obtained with the test solution shows a spot due to triglycerides with an $R_F$ value of about 1.0.

Plate 2

*Application*: 4 µL of the test solution and reference solutions (b) and (c).

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: spray with *potassium iodobismuthate solution R4* and examine in daylight.

*Results*:

– in the presence of macrogol cetostearyl ether, the chromatogram obtained with the test solution shows an orange spot ($R_F$ = about 0.85) similar in position to the spot in the chromatogram obtained with reference solution (b);

– in the presence of polysorbate 65, the chromatogram obtained with the test solution shows an orange spot ($R_F$ = about 1.0) similar in position to the spot in the chromatogram obtained with reference solution (c).

C. Beeswax. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 8 mL with the same solvent.

*Reference solution.* Dissolve 0.100 g of *white beeswax R* in *methylene chloride R* and dilute to 8 mL with the same solvent.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *ethyl acetate R*, *cyclohexane R* (10:90 *V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: spray with a freshly prepared 100 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 120 °C for 3 min; examine in daylight.

*Results*: in the presence of beeswax, the chromatogram obtained with the test solution shows a black spot ($R_F$ = about 0.9) similar in position to the spot in the chromatogram obtained with the reference solution.

TESTS

**Alkaline impurities**. Melt 10.00 g and while maintaining the temperature at about 50 °C, dissolve the melted mass in 40.0 mL of *ethanol (96 per cent) R*, mix and add 0.05 mL of *bromophenol blue solution R*. Not more than 0.75 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

If the substance to be examined contains lecithins, not more than 3.75 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

**Melting point** (*2.2.15*): 30 °C to 45 °C, and within 2 °C of the nominal value.

Introduce the melted substance into a capillary tube and allow to stand at a temperature below 10 °C for 24 h.

**Acid value** (*2.5.1*): maximum 1.0.

Melt 5.0 g and dissolve in 20 mL of the prescribed mixture of solvents.

**Hydroxyl value** (*2.5.3, Method A*): maximum 70, and within 5 units of the nominal value.

**Iodine value** (*2.5.4, Method A*): maximum 3.0.

**Peroxide value** (*2.5.5, Method A*): maximum 3.0.

**Saponification value** (*2.5.6*): 210 to 260, and within 5 per cent of the nominal value, determined on 2.0 g.

**Sulfated ash** (*2.4.14*): maximum 0.4 per cent.

Heat a silica crucible to redness for 30 min, allow to cool in a desiccator and weigh. Evenly distribute 1.0 g in the crucible and weigh. Dry at 100-105 °C for 1 h and ignite in a muffle furnace at 600 ± 25 °C until the substance is thoroughly charred. Carry out the test for sulfated ash (*2.4.14*) on the residue obtained, starting from "Moisten the substance to be examined...".

STORAGE

Protected from light, at a temperature at least 5 °C below the nominal melting point.

LABELLING

The label states:

– the nominal melting point;

– the nominal hydroxyl value;

– the nominal saponification value.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. **Saponification value** (see Tests).

01/2008:2155

# HELIUM

## Helium

He $A_r$ 4.00

DEFINITION

*Content*: minimum 99.5 per cent *V/V* of He.

This monograph applies to helium obtained by separation from natural gas and intended for medicinal use.

CHARACTERS

*Appearance*: colourless, inert gas.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The retention time of the principal peak in the chromatogram obtained with the substance to be examined is approximately the same as that of the principal peak in the chromatogram obtained with the reference gas.

TESTS

**Methane**: maximum 50.0 ppm *V/V*.

Infrared analyser.

*Gas to be examined*. The substance to be examined. It must be filtered to avoid stray light phenomena (3 µm filter).

*Reference gas (a)*: *helium for chromatography R*.

*Reference gas (b)*: mixture containing 50.0 ppm *V/V* of *methane R* in *helium for chromatography R*.

The infrared analyser generally comprises an infrared source emitting broadband infrared radiation, an optical device, a sample cell, a detector and in some analysers a reference cell. The optical device may be positioned either before or after the sample cell. It consists of one or more optical filters, through which the broadband radiation is passed. The optical device is selected for methane determination. The measurement light beam passes through the sample cell and may also pass through a reference cell if the analyser integrates such a feature. When methane is present in the sample cell, absorption of energy in the measurement light beam will occur according to the Beer-Lambert law, and this produces a change in the detector signal. This measurement signal is compared to a reference signal to generate an output related to the concentration of methane. The generated signal is linearised in order to determine the methane content.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the methane content in the gas to be examined.

**Oxygen**: maximum 50.0 ppm *V/V*, determined using an oxygen analyser equipped with an electrochemical cell and a detector scale ranging from 0-100 ppm *V/V*.

The gas to be examined passes through a detection cell containing an aqueous solution of an electrolyte, generally potassium hydroxide. The presence of oxygen in the gas to be examined produces a variation in the electric signal recorded at the outlet of the cell that is proportional to the oxygen content.

Calibrate the analyser according to the instructions of the manufacturer. Pass the gas to be examined through the analyser using a suitable pressure regulator and airtight metal tubes and operating at the prescribed flow rates until constant readings are obtained.

**Water** (*2.5.28*): maximum 67 ppm *V/V*.

ASSAY

Gas chromatography (*2.2.28*).

*Gas to be examined*. The substance to be examined.

*Reference gas*: *helium for chromatography R*.

*Column*:

- *size*: *l* = 2 m, Ø = 4.5 mm;
- *stationary phase*: *molecular sieve for chromatography R* (0.5 nm).

*Carrier gas*: *argon for chromatography R*.

*Flow rate*: 60 mL/min.

*Temperature*:

- *column*: 50 °C;
- *detector*: 150 °C.

*Detection*: thermal conductivity.

*Injection*: 0.5 mL.

Inject the reference gas. Adjust the injected volumes and operating conditions so that the height of the peak due to helium in the chromatogram obtained is at least 35 per cent of the full scale of the recorder.

*System suitability*: reference gas:

- *symmetry factor*: minimum 0.6.

Calculate the content of He in the gas to be examined.

STORAGE

As compressed gas or liquid at cryogenic temperature, in appropriate containers, complying with the legal regulations.

IMPURITIES

*Specified impurities*: *A, B, C.*

A. $CH_4$: methane,

B. $O_2$: oxygen,

C. $H_2O$: water.

01/2020:0332

# HEPARIN CALCIUM

## Heparinum calcicum

DEFINITION

Preparation containing the calcium salt of a sulfated glycosaminoglycan present in mammalian tissues. It is prepared from the intestinal mucosae of pigs. On complete hydrolysis, it liberates D-glucosamine, D-glucuronic acid, L-iduronic acid, acetic acid and sulfuric acid. It has the property of delaying the clotting of blood by catalysing the inhibition of thrombin and factor Xa by antithrombin.

*Potency*: minimum 180 IU/mg (dried substance), determined by the assay of anti-factor IIa activity as described under Assay.

PRODUCTION

The animals from which heparin calcium is derived must fulfil the requirements for the health of animals suitable for human consumption. All stages of production and sourcing are subjected to a suitable quality management system. The identity of the source species and the absence of material from possible contaminant species such as cattle, sheep and goats, is verified by appropriate testing during production. The method used to confirm identity of the source species, and the point of application in the process, have been validated and shown to be capable of identifying the presence of material of other species at the level of 0.1 per cent (*m/m*). Species verification by methods based on polymerase chain reaction (PCR) amplification of species-specific DNA sequences has been widely shown to be an appropriate surrogate. If such a method

has been chosen, it is also used to test for porcine DNA and to determine that it is present at a consistent level, in line with the manufacturing process used.

It is produced by methods of manufacturing designed to minimise or eliminate substances lowering blood pressure.

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: freely soluble in water.

IDENTIFICATION

A. It complies with the requirements described under Assay.

B. Carry out the assay of anti-factor Xa activity of heparin (*2.7.5*). The ratio of anti-factor Xa activity to anti-factor IIa activity determined as described under Assay, ranges between 0.9 and 1.1.

C. Nuclear magnetic resonance spectrometry (*2.2.33*).

*Preparation*: dissolve 20 mg of the substance to be examined in 0.7 mL of a 20 µg/mL solution of *deuterated sodium trimethylsilylpropionate R* in *deuterium oxide R*.

*Comparison*: dissolve 20 mg of *heparin calcium for NMR identification CRS* in 0.7 mL of a 20 µg/mL solution of *deuterated sodium trimethylsilylpropionate R* in *deuterium oxide R*.

*Apparatus*: spectrometer operating at minimum 300 MHz.

*Acquisition of $^1$H-NMR spectra*:

- *number of transients*: minimum 16; it is adjusted until the signal-to-noise ratio is at least 1000:1 for the heparin methyl signal at 2.04 ppm;
- *temperature*: about 25 °C; test sample and reference spectra have to be obtained at the same temperature;
- *acquisition time*: minimum 2 s;
- *repetition time* (acquisition time plus delay): minimum 4 s;
- *spectral width*: 10-12 ppm, centred at around 4.5 ppm;
- *pulse width*: to give a flip angle between 30° and 90°.

*Processing*:

- *exponential line-broadening window function*: 0.3 Hz;
- Fourier transformation;
- trimethylsilylpropionate reference signal set at 0.00 ppm.

*Results*:

- the large heparin calcium signals must be present: 2.05 ppm, 3.29 ppm (doublet), 4.37 ppm, 5.35 ppm and 5.43 ppm, all within ± 0.03 ppm;
- the $^1$H-NMR spectrum obtained with the test sample and that obtained with *heparin calcium for NMR identification CRS* are compared qualitatively after the 2 spectra have been normalised so as to have a similar intensity; dermatan sulfate with a methyl signal at 2.08 ± 0.02 ppm may be observed; no unidentified signals larger than 4 per cent compared to the height of the heparin signal at 5.43 ppm are present in the ranges 0.10-2.00 ppm, 2.10-3.10 ppm and 5.70-8.00 ppm; signals from the solvent or process-related substances may be present and have to be identified to be accepted.

D. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution (a) and reference solution (c).

*Relative retention* with reference to heparin (retention time = about 26 min): dermatan sulfate and chondroitin sulfate = about 0.9; over-sulfated chondroitin sulfate = about 1.3.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 1.3, where $H_p$ = height above the baseline of the peak due to dermatan sulfate and chondroitin sulfate and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to heparin.

*Results*: the principal peak in the chromatogram obtained with test solution (a) is similar in retention time and shape to the principal peak in the chromatogram obtained with reference solution (c).

E. It gives the reactions of calcium (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dissolve a quantity equivalent to 50 000 IU in *water R* and dilute to 10 mL with the same solvent.

**pH** (*2.2.3*): 5.5 to 8.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Nucleotidic impurities**. Dissolve 40 mg in 10 mL of *water R*. The absorbance (*2.2.25*) measured at 260 nm is not greater than 0.15.

**Protein**: maximum 0.5 per cent (dried substance).

*Solution A*. Mix 2 volumes of a 10 g/L solution of *sodium hydroxide R* and 2 volumes of a 50 g/L solution of *sodium carbonate R* and dilute to 5 volumes with *water R*.

*Solution B*. Mix 2 volumes of a 12.5 g/L solution of *copper sulfate pentahydrate R* and 2 volumes of a 29.8 g/L solution of *sodium tartrate R* and dilute to 5 volumes with *water R*.

*Solution C*. Mix 1 volume of solution B and 50 volumes of solution A.

*Solution D*. Dilute a phosphomolybdotungstic reagent in *water R*. Suitable dilutions produce solutions of pH 10.25 ± 0.25 after addition of solutions C and D to the test and reference solutions.

*Test solution*. Dissolve the substance to be examined in *water R* to obtain a concentration of 5 mg/mL.

*Reference solutions*. Dissolve *bovine albumin R1* in *water R* to obtain a concentration of 100 mg/mL. Prepare dilutions of the solution in *water R* as prescribed in general chapter *2.5.33, method 2*.

*Blank*: *water R*.

*Procedure*. To 1 mL of each reference solution, of the test solution and of the blank, add 5 mL of solution C. Allow to stand for 10 min. Add 0.5 mL of solution D, mix and allow to stand at room temperature for 30 min. Filter through a membrane filter (nominal pore size 0.45 µm). Determine the absorbances (*2.2.25*) of the solutions at 750 nm, using the solution prepared from the blank as compensation liquid.

*Calculations*. As prescribed in general chapter *2.5.33, method 2*.

**Related substances**. Liquid chromatography (*2.2.29*).
*Reference solutions are stable at room temperature for 24 h.*

*Test solution (a)*. Dissolve an accurately weighed quantity of about 50 mg of the substance to be examined in 5.0 mL of *water for chromatography R*. Mix using a vortex mixer until dissolution is complete.

*Test solution (b)*. Dissolve an accurately weighed quantity of about 0.1 g of the substance to be examined in 1.0 mL of *water for chromatography R*. Mix using a vortex mixer until dissolution is complete. Mix 500 µL of the solution and 250 µL of *1 M hydrochloric acid*, then add 50 µL of a 250 mg/mL solution of *sodium nitrite R*. Mix gently and allow to stand at room temperature for 40 min before adding 200 µL of *1 M sodium hydroxide* to stop the reaction.

*Reference solution (a)*. Dissolve 250 mg of *heparin for physico-chemical analysis CRS* in *water for chromatography R* and dilute to 2.0 mL with the same solvent. Mix using a vortex mixer until dissolution is complete.

*Reference solution (b).* Add 1200 µL of reference solution (a) to 300 µL of *dermatan sulfate and over-sulfated chondroitin sulfate CRS*. Mix using a vortex mixer to homogenise.

*Reference solution (c).* Add 100 µL of reference solution (b) to 900 µL of *water for chromatography R*. Mix using a vortex mixer to homogenise.

*Reference solution (d).* Add 400 µL of reference solution (a) to 100 µL of *water for chromatography R* and mix using a vortex mixer. Add 250 µL of *1 M hydrochloric acid*, then add 50 µL of a 250 mg/mL solution of *sodium nitrite R*. Mix gently and allow to stand at room temperature for 40 min before adding 200 µL of *1 M sodium hydroxide* to stop the reaction.

*Reference solution (e).* To 500 µL of reference solution (b), add 250 µL of *1 M hydrochloric acid*, then add 50 µL of a 250 mg/mL solution of *sodium nitrite R*. Mix gently and allow to stand at room temperature for 40 min before adding 200 µL of *1 M sodium hydroxide* to stop the reaction.

*Precolumn*:
- *size*: *l* = 0.05 m, Ø = 2 mm;
- *stationary phase*: *anion-exchange resin R* (13 µm).

*Column*:
- *size*: *l* = 0.25 m, Ø = 2 mm;
- *stationary phase*: *anion-exchange resin R* (9 µm);
- *temperature*: 40 °C.

*Mobile phase*:
- *mobile phase A*: dissolve 0.40 g of *sodium dihydrogen phosphate R* in 1000 mL of *water for chromatography R* and adjust to pH 3.0 with *dilute phosphoric acid R*;
- *mobile phase B*: dissolve 0.40 g of *sodium dihydrogen phosphate R* in 1000 mL of *water for chromatography R*, add 140 g of *sodium perchlorate R* and adjust to pH 3.0 with *dilute phosphoric acid R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 75 | 25 |
| 10 - 35 | 75 → 0 | 25 → 100 |
| 35 - 40 | 0 | 100 |

*Flow rate*: 0.22 mL/min.

*Detection*: spectrophotometer at 202 nm.

*Equilibration*: at least 15 min.

*Injection*: 20 µL of test solution (b) and reference solutions (d) and (e).

*Relative retention* with reference to heparin (retention time = about 26 min): dermatan sulfate and chondroitin sulfate = about 0.9; over-sulfated chondroitin sulfate = about 1.3.

*System suitability*:
- the chromatogram obtained with reference solution (d) shows no peak at the retention time of heparin;
- *resolution*: minimum 3.0 between the peak due to dermatan sulfate and chondroitin sulfate and the peak due to over-sulfated chondroitin sulfate in the chromatogram obtained with reference solution (e).

*Limits*:
- *sum of dermatan sulfate and chondroitin sulfate*: not more than the area of the peak due to dermatan sulfate and chondroitin sulfate in the chromatogram obtained with reference solution (e) (2.0 per cent);
- *any other impurity*: no peak with an area greater than 0.01 times the area of the peak due to dermatan sulfate and chondroitin sulfate in the chromatogram obtained with reference solution (e) is detected (corresponding to a disregard limit of 0.02 per cent). Disregard any peaks that appear during the initial isocratic step.

**Nitrogen** (*2.5.9*): 1.5 per cent to 2.5 per cent (dried substance), determined on 0.100 g.

**Calcium**: 9.5 per cent to 11.5 per cent (dried substance), determined on 0.200 g by complexometric titration (*2.5.11*).

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

**Bacterial endotoxins** (*2.6.14*): less than 0.01 IU per International Unit of heparin, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. The addition of divalent cations may be necessary in order to fulfil the validation criteria.

ASSAY

Carry out the assay of anti-factor IIa activity of heparin (*2.7.5*). The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits of the estimated potency (*P* = 0.95) are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

In an airtight container. If the substance is sterile, the container is also sterile and tamper-evident.

LABELLING

The label states the number of International Units per milligram.

**01/2020:0333**

# HEPARIN SODIUM

## Heparinum natricum

DEFINITION

Preparation containing the sodium salt of a sulfated glycosaminoglycan present in mammalian tissues. It is prepared from the intestinal mucosae of pigs. On complete hydrolysis, it liberates D-glucosamine, D-glucuronic acid, L-iduronic acid, acetic acid and sulfuric acid. It has the property of delaying the clotting of blood by catalysing the inhibition of thrombin and factor Xa by antithrombin.

*Potency*: minimum 180 IU/mg (dried substance), determined by the assay of anti-factor IIa activity as described under Assay.

PRODUCTION

The animals from which heparin sodium is derived must fulfil the requirements for the health of animals suitable for human consumption. All stages of production and sourcing are subjected to a suitable quality management system. The identity of the source species and the absence of material from possible contaminant species such as cattle, sheep and goats, is verified by appropriate testing during production. The method used to confirm identity of the source species, and the point of application in the process, have been validated and shown to be capable of identifying the presence of material of other species at the level of 0.1 per cent (*m/m*). Species verification by methods based on polymerase chain reaction (PCR) amplification of species-specific DNA sequences has been widely shown to be an appropriate surrogate. If such a method has been chosen, it is also used to test for porcine DNA and to determine that it is present at a consistent level, in line with the manufacturing process used.

It is produced by methods of manufacturing designed to minimise or eliminate substances lowering blood pressure.

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: freely soluble in water.

IDENTIFICATION

A. It complies with the requirements described under Assay.

B. Carry out the assay of anti-factor Xa activity of heparin (*2.7.5*). The ratio of anti-factor Xa activity to anti-factor IIa activity determined as described under Assay, ranges between 0.9 and 1.1.

C. Nuclear magnetic resonance spectrometry (*2.2.33*).

*Solution A*. A solution in *deuterium oxide R* containing 20 µg/mL of *deuterated sodium trimethylsilylpropionate R* and if the signal at 5.22 ppm is smaller than 80 per cent of the signal at 5.44 ppm, 12 µg/mL of *sodium edetate R*.

*Preparation*: dissolve 20 mg of the substance to be examined in 0.7 mL of solution A.

*Comparison*: dissolve 20 mg of *heparin sodium for NMR identification CRS* in 0.7 mL of solution A.

*If stored, the sodium edetate and deuterated sodium trimethylsilylpropionate solutions must be kept in high-density, natural polyethylene bottles.*

*Apparatus*: spectrometer operating at minimum 300 MHz.

*Acquisition of $^1$H-NMR spectra*:

- *number of transients*: minimum 16; it is adjusted until the signal-to-noise ratio is at least 1000:1 for the heparin methyl signal at 2.04 ppm;
- *temperature*: about 25 °C; test sample and reference spectra have to be obtained at the same temperature;
- *acquisition time*: minimum 2 s;
- *repetition time* (acquisition time plus delay): minimum 4 s;
- *spectral width*: 10-12 ppm, centred at around 4.5 ppm;
- *pulse width*: to give a flip angle between 30° and 90°.

*Processing*:

- *exponential line-broadening window function*: 0.3 Hz;
- Fourier transformation;
- trimethylsilylpropionate reference signal set at 0.00 ppm.

*Results*:

- the large heparin sodium signals must be present: 2.04 ppm, 3.27 ppm (doublet), 4.34 ppm, 5.22 ppm and 5.42 ppm, all within ± 0.03 ppm;
- the $^1$H-NMR spectrum obtained with the test sample and that obtained with *heparin sodium for NMR identification CRS* are compared qualitatively after the 2 spectra have been normalised so as to have a similar intensity; dermatan sulfate with a methyl signal at 2.08 ± 0.02 ppm may be observed; no unidentified signals larger than 4 per cent compared to the height of the heparin signal at 5.42 ppm are present in the ranges 0.10-2.00 ppm, 2.10-3.10 ppm and 5.70-8.00 ppm; signals from the solvent or process-related substances may be present and have to be identified to be accepted; variations in the intensity of some signal regions of the spectrum of heparin may occur: the intensity-variable regions are between 3.35 ppm and 4.55 ppm, where the signal pattern is approximately kept but intensity varies.

D. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution (a) and reference solution (c).

*Relative retention* with reference to heparin (retention time = about 26 min): dermatan sulfate and chondroitin sulfate = about 0.9; over-sulfated chondroitin sulfate = about 1.3.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 1.3, where $H_p$ = height above the baseline of the peak due to dermatan sulfate and chondroitin sulfate and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to heparin.

*Results*: the principal peak in the chromatogram obtained with test solution (a) is similar in retention time and shape to the principal peak in the chromatogram obtained with reference solution (c).

E. It complies with the test for sodium (see Tests).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dissolve a quantity equivalent to 50 000 IU in *water R* and dilute to 10 mL with the same solvent.

**pH** (*2.2.3*): 5.5 to 8.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Nucleotidic impurities**. Dissolve 40 mg in 10 mL of *water R*. The absorbance (*2.2.25*) measured at 260 nm is not greater than 0.15.

**Protein**: maximum 0.5 per cent (dried substance).

*Solution A*. Mix 2 volumes of a 10 g/L solution of *sodium hydroxide R* and 2 volumes of a 50 g/L solution of *sodium carbonate R* and dilute to 5 volumes with *water R*.

*Solution B*. Mix 2 volumes of a 12.5 g/L solution of *copper sulfate pentahydrate R* and 2 volumes of a 29.8 g/L solution of *sodium tartrate R* and dilute to 5 volumes with *water R*.

*Solution C*. Mix 1 volume of solution B and 50 volumes of solution A.

*Solution D*. Dilute a phosphomolybdotungstic reagent in *water R*. Suitable dilutions produce solutions of pH 10.25 ± 0.25 after addition of solutions C and D to the test and reference solutions.

*Test solution*. Dissolve the substance to be examined in *water R* to obtain a concentration of 5 mg/mL.

*Reference solutions*. Dissolve *bovine albumin R1* in *water R* to obtain a concentration of 100 mg/mL. Prepare dilutions of the solution in *water R* as prescribed in general chapter *2.5.33, method 2*.

*Blank*: *water R*.

*Procedure*. To 1 mL of each reference solution, of the test solution and of the blank, add 5 mL of solution C. Allow to stand for 10 min. Add 0.5 mL of solution D, mix and allow to stand at room temperature for 30 min. Determine the absorbances (*2.2.25*) of the solutions at 750 nm, using the solution prepared from the blank as compensation liquid.

*Calculations*. As prescribed in general chapter *2.5.33, method 2*.

**Related substances**. Liquid chromatography (*2.2.29*).

*Reference solutions are stable at room temperature for 24 h.*

*Test solution (a)*. Dissolve an accurately weighed quantity of about 50 mg of the substance to be examined in 5.0 mL of *water for chromatography R*. Mix using a vortex mixer until dissolution is complete.

*Test solution (b)*. Dissolve an accurately weighed quantity of about 0.1 g of the substance to be examined in 1.0 mL of *water for chromatography R*. Mix using a vortex mixer until dissolution is complete. Mix 500 µL of the solution and 250 µL of *1 M hydrochloric acid*, then add 50 µL of a 250 mg/mL solution of *sodium nitrite R*. Mix gently and allow to stand at room temperature for 40 min before adding 200 µL of *1 M sodium hydroxide* to stop the reaction.

*Reference solution (a)*. Dissolve 250 mg of *heparin for physico-chemical analysis CRS* in *water for chromatography R* and dilute to 2.0 mL with the same solvent. Mix using a vortex mixer until dissolution is complete.

*Reference solution (b)*. Add 1200 µL of reference solution (a) to 300 µL of *dermatan sulfate and over-sulfated chondroitin sulfate CRS*. Mix using a vortex mixer to homogenise.

*Reference solution (c).* Add 100 µL of reference solution (b) to 900 µL of *water for chromatography R*. Mix using a vortex mixer to homogenise.

*Reference solution (d).* Add 400 µL of reference solution (a) to 100 µL of *water for chromatography R* and mix using a vortex mixer. Add 250 µL of *1 M hydrochloric acid*, then add 50 µL of a 250 mg/mL solution of *sodium nitrite R*. Mix gently and allow to stand at room temperature for 40 min before adding 200 µL of *1 M sodium hydroxide* to stop the reaction.

*Reference solution (e).* To 500 µL of reference solution (b), add 250 µL of *1 M hydrochloric acid*, then add 50 µL of a 250 mg/mL solution of *sodium nitrite R*. Mix gently and allow to stand at room temperature for 40 min before adding 200 µL of *1 M sodium hydroxide* to stop the reaction.

*Precolumn*:

- *size*: *l* = 0.05 m, Ø = 2 mm;
- *stationary phase*: *anion-exchange resin R* (13 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 2 mm;
- *stationary phase*: *anion-exchange resin R* (9 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 0.40 g of *sodium dihydrogen phosphate R* in 1000 mL of *water for chromatography R* and adjust to pH 3.0 with *dilute phosphoric acid R*;
- *mobile phase B*: dissolve 0.40 g of *sodium dihydrogen phosphate R* in 1000 mL of *water for chromatography R*, add 140 g of *sodium perchlorate R* and adjust to pH 3.0 with *dilute phosphoric acid R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 75 | 25 |
| 10 - 35 | 75 → 0 | 25 → 100 |
| 35 - 40 | 0 | 100 |

*Flow rate*: 0.22 mL/min.

*Detection*: spectrophotometer at 202 nm.

*Equilibration*: at least 15 min.

*Injection*: 20 µL of test solution (b) and reference solutions (d) and (e).

*Relative retention* with reference to heparin (retention time = about 26 min): dermatan sulfate and chondroitin sulfate = about 0.9; over-sulfated chondroitin sulfate = about 1.3.

*System suitability*:

- the chromatogram obtained with reference solution (d) shows no peak at the retention time of heparin;
- *resolution*: minimum 3.0 between the peak due to dermatan sulfate and chondroitin sulfate and the peak due to over-sulfated chondroitin sulfate in the chromatogram obtained with reference solution (e).

*Limits*:

- *sum of dermatan sulfate and chondroitin sulfate*: not more than the area of the peak due to dermatan sulfate and chondroitin sulfate in the chromatogram obtained with reference solution (e) (2.0 per cent);
- *any other impurity*: no peak with an area greater than 0.01 times the area of the peak due to dermatan sulfate and chondroitin sulfate in the chromatogram obtained with reference solution (e) is detected (corresponding to a disregard limit of 0.02 per cent). Disregard any peaks that appear during the initial isocratic step.

**Nitrogen** (*2.5.9*): 1.5 per cent to 2.5 per cent (dried substance), determined on 0.100 g.

**Sodium**: 10.5 per cent to 13.5 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 50 mg of the substance to be examined in a 1.27 mg/mL solution of *caesium chloride R* in *0.1 M hydrochloric acid* and dilute to 100.0 mL with the same solvent.

*Reference solutions.* Prepare reference solutions containing 25 ppm, 50 ppm and 75 ppm of Na, using *sodium standard solution (200 ppm Na) R* diluted with a 1.27 mg/mL solution of *caesium chloride R* in *0.1 M hydrochloric acid*.

*Source*: sodium hollow-cathode lamp.

*Wavelength*: 330.3 nm.

*Atomisation device*: flame of suitable composition (for example 11 L of air and 2 L of acetylene per minute).

**Loss on drying** (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

**Bacterial endotoxins** (*2.6.14*): less than 0.01 IU per International Unit of heparin, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Carry out the assay of anti-factor IIa activity of heparin (*2.7.5*). The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits of the estimated potency (*P* = 0.95) are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

In an airtight container. If the substance is sterile, the container is also sterile and tamper-evident.

LABELLING

The label states the number of International Units per milligram.

**07/2019:0828**
**corrected 10.0**

# HEPARINS, LOW-MOLECULAR-MASS

## Heparina massae molecularis minoris

DEFINITION

Salts of sulfated glycosaminoglycans having a mass-average relative molecular mass less than 8000 and for which at least 60 per cent of the total mass has a relative molecular mass less than 8000. Low-molecular-mass heparins display different chemical structures at the reducing, or the non-reducing end of the polysaccharide chains.

The potency is not less than 70 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 1.5.

PRODUCTION

Low-molecular-mass heparins are obtained by fractionation or depolymerisation of heparin of natural origin that complies with the monograph *Heparin sodium (0333)* or *Heparin calcium (0332)*, whichever is appropriate, unless otherwise justified and authorised. For each type of low-molecular-mass heparin the batch-to-batch consistency is ensured by demonstrating, for example, that the mass-average relative molecular mass and the mass percentage within defined relative molecular-mass ranges lower than 8000 are not less than 75 per cent and not more than 125 per cent of the mean value stated as type specification. The same limits apply also to the ratio of anti-factor Xa activity to anti-factor IIa activity.

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: freely soluble in water.

IDENTIFICATION

A. Nuclear magnetic resonance spectrometry (*2.2.33*).

*Preparation*: dissolve 0.200 g of the substance to be examined in a mixture of 0.2 mL of *deuterium oxide R* and 0.8 mL of *water R*.

*Comparison*: dissolve 0.200 g of the appropriate specific low-molecular-mass heparin reference standard in a mixture of 0.2 mL of *deuterium oxide R* and 0.8 mL of *water R*.

*Operating conditions*:

- *field strength*: 75 MHz;
- *temperature*: 40 °C;
- *cell diameter*: 5 mm.

*Processing*:

- Fourier transformation;
- deuterated methanol reference signal set at 50.0 ppm.

*Results*: the $^{13}C$ NMR spectrum obtained is similar to that obtained with the appropriate specific low-molecular-mass heparin reference standard.

B. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 1.5.

C. Size-exclusion chromatography (*2.2.30*).

*Test solution*. Dissolve 20 mg of the substance to be examined in 2 mL of the mobile phase.

*Reference solution*. Dissolve 20 mg of *heparin low-molecular-mass for calibration CRS* in 2 mL of the mobile phase.

*Column*:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: appropriate porous silica beads (5 µm) with a fractionation range for proteins of approximately 15 000 to 100 000;
- *number of theoretical plates*: minimum of 20 000 per metre.

*Mobile phase*: 7.7 g/L solution of *ammonium acetate R*.

*Flow rate*: 0.5 mL/min.

*Detection*: differential refractometer.

*Injection*: 25 µL.

*Calibration*. Inject 25 µL of the reference solution and record the chromatogram for a period of time, ensuring complete elution of sample, salt and solvent peaks.

Calculate the total area under the RI curve (designated ΣRI) by numerical integration over the range of interest (i.e. excluding salt and solvent peaks at the end of the chromatogram as well as the artefact peak (designated * on the chromatogram), that if present elutes at the same retention time as the peak that would be obtained after injection of sodium sulfate) as shown in Figure 0828.-1.

Calculate the area under the curve up to each point as a percentage of the total area.

Using the Broad Standard Table provided in the leaflet supplied with *heparin low-molecular-mass for calibration CRS*, identify those points in the chromatogram for which the percentage of the total area under the curve is closest to the percentage mass fractions listed in the Broad Standard Table, and assign the molecular mass in the table to the corresponding retention time in the chromatogram. A calibration curve for the chromatographic system is derived by fitting a suitable mathematical relationship to the set of retention times and logarithms of the molecular masses. A polynomial of the 3rd degree is recommended.

Inject 25 µL of the test solution and record the chromatogram for a period of time, ensuring complete elution of sample, salt and solvent peaks.

The mass-average relative molecular mass is defined by the following expression:

$$\frac{\sum(RI_i M_i)}{\sum RI_i}$$

$RI_i$ = refractive index of the substance eluting in the fraction *i* (proportional to the mass of the substance);

$M_i$ = relative molecular mass corresponding to fraction *i*.

Any low-molecular-mass heparin covered by an individual monograph complies with the requirements for molecular mass parameters assessed in identification test C in the corresponding monograph.

Where no individual monograph exists for the low-molecular-mass heparin to be examined, the mass-average relative molecular mass is not greater than 8000 and at least 60 per cent of the total mass has a relative molecular mass lower than 8000. In addition, the molecular mass parameters (mass-average molecular mass and mass percentages of chains comprised between specified values) correspond to those of the manufacturer's reference preparation.

D. It gives reaction (a) of sodium or the reactions of calcium (as appropriate) (*2.3.1*).

TESTS

**pH** (*2.2.3*): 5.5 to 8.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

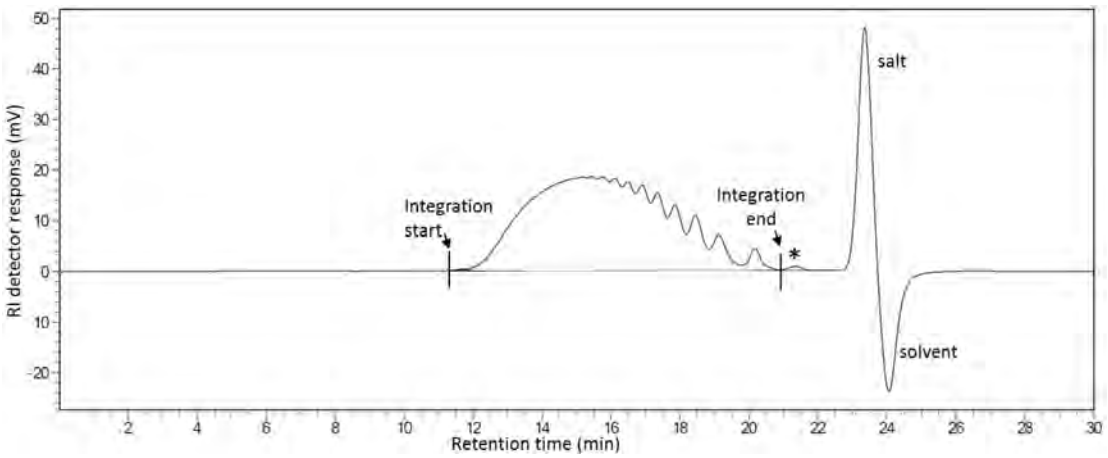

Figure 0828.-1. – *Example chromatogram of a low-molecular-mass heparin sample analysed using the method described in identification test C indicating peak integration*

**Nitrogen** (*2.5.9*): 1.5 per cent to 2.5 per cent (dried substance).

**Calcium** (*2.5.11*): 9.5 per cent to 11.5 per cent (dried substance), if prepared from heparin complying with the monograph *Heparin calcium (0332)*. Use 0.200 g.

**Sodium**: 10.5 per cent to 13.5 per cent (dried substance), if prepared from heparin complying with the monograph *Heparin sodium (0333)*.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. Dissolve 50 mg in *0.1 M hydrochloric acid* containing 1.27 mg of *caesium chloride R* per millilitre and dilute to 100.0 mL with the same solvent.

*Reference solutions*. Prepare reference solutions (25 ppm, 50 ppm and 75 ppm) using *sodium standard solution (200 ppm Na) R* diluted with *0.1 M hydrochloric acid* containing 1.27 mg of *caesium chloride R* per millilitre.

*Source*: sodium hollow-cathode lamp.

*Wavelength*: 330.3 nm.

*Atomisation device*: flame of suitable composition (for example, 11 L of air and 2 L of acetylene per minute).

**Molar ratio of sulfate ions to carboxylate ions** (*2.2.38*): minimum 1.8.

*The sample of heparin used in this titration must be free from ionisable impurities, particularly salts*.

Weigh 0.100 g of the substance to be examined taking the necessary measures to avoid the problems linked to hygroscopicity.

Take up into about 20 mL of double-glass-distilled *water R*. Cool to 4 °C and apply 2.0 mL of this solution to a pre-cooled column (approximately 10 × 1 cm), packed with a suitable *cation-exchange resin R*. Wash through with double-glass-distilled *water R* into the titration vessel up to a final volume of about 10-15 mL (*the titration vessel must be just large enough to hold the electrodes from the conductivity meter, a small stirrer bar and a fine flexible tube from the outlet of a 2 mL burette)*. Stir magnetically. When the conductivity reading is constant, note it and titrate with *0.05 M sodium hydroxide* added in approximately 50 µL portions. Record the burette level and the conductivity meter reading a few seconds after each addition until the end-point is reached.

For each measured figure, calculate the number of milliequivalents of sodium hydroxide added from the volume and the known concentration of the sodium hydroxide solution. Plot on a graph the figures for conductivity (as *y*-axis) against the figures of milliequivalent of sodium hydroxide (as *x*-axis). The graph will have 3 approximately linear sections: an initial steep downward slope, a middle slight rise and a final steep rise. Estimate the best straight lines through these 3 parts of the graph. At the points where the 1st and 2nd lines intersect, and where the 2nd and 3rd lines intersect, draw perpendiculars to the *x*-axis to estimate the milliequivalents of sodium hydroxide taken up by the sample at those points. The point where the 1st and 2nd lines intersect will give the number of milliequivalents of sodium hydroxide taken up by the sulfate groups, and the point where the 2nd and 3rd lines intersect will give the number of milliequivalents taken up by the sulfate and carboxylate groups together. The difference between the 2 will therefore give the number of milliequivalents taken up by the carboxylate groups.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.67 kPa for 3 h.

**Bacterial endotoxins** (*2.6.14*): less than 0.01 IU per International Unit of anti-Xa activity, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. The addition of divalent cations may be necessary to fulfil the validation criteria.

ASSAY

The anticoagulant activity of low-molecular-mass heparins is determined *in vitro* by 2 assays which determine its ability to accelerate the inhibition of factor Xa (anti-Xa assay) and thrombin, factor IIa (anti-IIa assay), by antithrombin III.

The International Units for anti-Xa and anti-IIa activity are the activities contained in a stated amount of the International Standard for low-molecular-mass heparin.

*Heparin low-molecular-mass for assay BRP*, calibrated in International Units by comparison with the International Standard using the 2 assays given below, is used as reference preparation.

*ANTI-FACTOR Xa ACTIVITY*

**Reference and test solutions**

Prepare 4 independent series of 4 dilutions each, of the substance to be examined and of the reference preparation of low-molecular-mass heparin in *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R*; the concentration range should be within 0.025 IU to 0.2 IU of anti-factor Xa activity per millilitre and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

**Procedure**

Label 16 tubes for the dilutions of the substance to be examined and 16 tubes for the dilutions of the reference preparation: $T_1$, $T_2$, $T_3$, $T_4$ for each of the 4 series of dilutions of the substance to be examined and $S_1$, $S_2$, $S_3$, $S_4$ for each of the 4 series of dilutions of the reference preparation. To each of the 32 tubes add 50 µL of *antithrombin III solution R1* and 50 µL of the appropriate dilution of the substance to be examined, or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in 2 subsequent series in the order $S_1$, $S_2$, $S_3$, $S_4$, $T_1$, $T_2$, $T_3$, $T_4$, $T_1$, $T_2$, $T_3$, $T_4$, $S_1$, $S_2$, $S_3$, $S_4$, allow to equilibrate at 37 °C (water-bath or heating block) for 1 min and add to each tube 100 µL of *bovine factor Xa solution R*. Incubate for exactly 1 min and add 250 µL of *chromogenic substrate R1*. Stop the reaction after exactly 4 min by adding 375 µL of *acetic acid R*. Transfer the mixtures to semi-micro cuvettes and measure the absorbance (*2.2.25*) at 405 nm. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* instead of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of low-molecular-mass heparins and calculate the potency of the substance to be examined in International Units of anti-factor Xa activity per millilitre using the usual statistical methods for parallel-line assays.

*ANTI-FACTOR IIa ACTIVITY*

**Reference and test solutions**

Prepare 4 independent series of 4 dilutions each, of the substance to be examined and of the reference preparation of low molecular-mass heparin in *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R*; the concentration range should be within 0.015 IU to 0.075 IU of anti-factor IIa activity per millilitre and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

**Procedure**

Label 16 tubes for the dilutions of the substance to be examined and 16 tubes for the dilutions of the reference preparation: $T_1$, $T_2$, $T_3$, $T_4$ for each of the 4 series of dilutions of the substance to be examined and $S_1$, $S_2$, $S_3$, $S_4$ for each of the 4 series of dilutions of the reference preparation. To each of the 32 tubes add 50 µL of *antithrombin III solution R2* and 50 µL of the appropriate dilution of the substance to be examined or the reference

preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in 2 subsequent series in the order $S_1$, $S_2$, $S_3$, $S_4$, $T_1$, $T_2$, $T_3$, $T_4$, $T_1$, $T_2$, $T_3$, $T_4$, $S_1$, $S_2$, $S_3$, $S_4$, allow to equilibrate at 37 °C (water-bath or heating block) for 1 min and add to each tube 100 µL of *human thrombin solution R*. Incubate for exactly 1 min and add 250 µL of *chromogenic substrate R2*. Stop the reaction after exactly 4 min by adding 375 µL of *acetic acid R*. Transfer the mixtures to semi-micro cuvettes and measure the absorbance (*2.2.25*) at 405 nm. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* instead of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of low-molecular-mass heparins, and calculate the potency of the substance to be examined in International Units of anti-factor IIa activity per millilitre using the usual statistical methods for parallel-line assays.

LABELLING

The label states:

- the number of International Units of anti-factor Xa activity per milligram;
- the number of International Units of anti-factor IIa activity per milligram;
- the mass-average molecular mass and the percentage of molecules within defined molecular mass ranges;
- where applicable, that the contents are the sodium salt;
- where applicable, that the contents are the calcium salt.

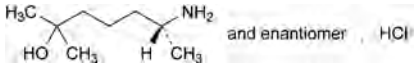
STORAGE

In an airtight tamper-evident container. If the product is sterile and free of bacterial endotoxins, store in a sterile and apyrogenic container.

**01/2017:1980**
**corrected 10.0**

# HEPTAMINOL HYDROCHLORIDE

## Heptaminoli hydrochloridum



$C_8H_{20}ClNO$ $M_r$ 181.7
[543-15-7]

DEFINITION

(6*RS*)-6-Amino-2-methylheptan-2-ol hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. To 1 mL of solution S (see Tests) add 4 mL of *water R* and 2 mL of a 200 g/L solution of *ammonium and cerium nitrate R* in *dilute nitric acid R1*. An orange-brown colour develops.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *heptaminol hydrochloride CRS*.

C. Examine the chromatograms obtained in the test for related substances.

*Detection*: examine in daylight.

*Results*: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 0.1 mL of *methyl red solution R* and 0.3 mL of *0.01 M hydrochloric acid*. The solution is red. Add 0.6 mL of *0.01 M sodium hydroxide*. The solution is yellow.

**Related substances**. Thin-layer chromatography (*2.2.27*).

*Test solution (a)*. Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 5.0 mL with the same solvent.

*Test solution (b)*. Dilute 1.0 mL of test solution (a) to 10 mL with *methanol R*.

*Reference solution (a)*. Dilute 3.0 mL of test solution (a) to 10.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 50.0 mL with *methanol R*.

*Reference solution (b)*. Dissolve 0.10 g of *heptaminol hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution (c)*. Dissolve 10.0 mg of *heptaminol impurity A CRS* in *methanol R* and dilute to 5.0 mL with the same solvent.

*Reference solution (d)*. Dilute 1.0 mL of reference solution (c) to 10.0 mL with *methanol R*.

*Reference solution (e)*. To 2.5 mL of reference solution (c) add 0.5 mL of test solution (b) and dilute to 5 mL with *methanol R*.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *concentrated ammonia R*, *dioxan R*, *2-propanol R* (10:50:50 *V/V/V*).

*Application*: 10 µL; apply test solutions (a) and (b) and reference solutions (a), (b), (d) and (e).

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: expose the plate to iodine vapour for at least 15 h.

*System suitability*: the chromatogram obtained with reference solution (e) shows 2 clearly separated principal spots and the chromatogram obtained with reference solution (a) shows a single principal spot.

*Limits*: in the chromatogram obtained with test solution (a):

- *impurity A*: any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.2 per cent),
- *any other impurity*: any spot, apart from the principal spot and any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.6 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

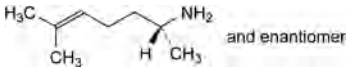
**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 50 mL of *alcohol R* and add 5.0 mL of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 18.17 mg of $C_8H_{20}ClNO$.

IMPURITIES

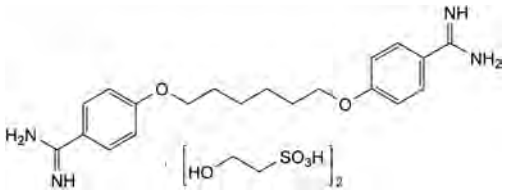


A. (2*RS*)-6-methylhept-5-en-2-amine.

**04/2016:1436**

# HEXAMIDINE DIISETHIONATE

## Hexamidini diisetionas



$C_{24}H_{38}N_4O_{10}S_2$ $M_r$ 607
[659-40-5]

DEFINITION

4,4′-[Hexane-1,6-diylbis(oxy)]dibenzimidamide bis(2-hydroxyethanesulfonate).

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

PRODUCTION

It is considered that alkyl 2-hydroxyethanesulfonate esters are potential impurities in hexamidine diisetionate. The manufacturing process should be developed taking into consideration the principles of quality risk management, together with considerations of the quality of starting materials, process capability and validation including, where necessary, demonstration that alkyl 2-hydroxyethanesulfonate esters are not detectable in the final product.

CHARACTERS

*Appearance*: white or slightly yellow powder, hygroscopic.

*Solubility*: sparingly soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *hexamidine diisetionate CRS*.

B. Dissolve about 40 mg in 5 mL of *water R* and add dropwise with shaking 1 mL of a 100 g/L solution of *sodium chloride R*. Allow to stand for 5 min. An abundant, shimmering white precipitate is slowly formed.

TESTS

**Appearance of solution**. Dissolve 0.50 g in *carbon dioxide-free water R*, heating at about 70 °C and dilute to 10 mL with the same solvent. Allow to cool to room temperature for 10-15 min. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

**Acidity or alkalinity**. Dissolve 2.0 g in *water R* heating at about 50 °C and dilute to 20 mL with *water R* heating at about 50 °C. Allow to cool to about 35 °C, add 0.1 mL of *methyl red solution R*. Not more than 0.25 mL of *0.05 M hydrochloric acid* or *0.05 M sodium hydroxide* is required to change the colour of the indicator.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 100.0 mL with mobile phase A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 10.0 mL with mobile phase A.

*Reference solution (c)*. Dissolve 5 mg of the substance to be examined and 5 mg of *pentamidine diisetionate CRS* in mobile phase A and dilute to 100 mL with mobile phase A. Dilute 2 mL of the solution to 5 mL with mobile phase A.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm).

*Mobile phase*:
- *mobile phase A*: mix 20 volumes of *acetonitrile R* and 80 volumes of a 6.8 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *phosphoric acid R*,
- *mobile phase B*: mix equal volumes of *acetonitrile R* and of a 6.8 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *phosphoric acid R*,

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 100 → 0 | 0 → 100 |
| 30 - 35 | 0 | 100 |
| 35 - 40 | 0 → 100 | 100 → 0 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 263 nm.

*Injection*: 20 µL.

*Relative retention* with reference to hexamidine (retention time = about 6 min): impurity B = about 1.7; impurity A = about 2.0; impurity C = about 3.7; impurity D = about 4.7.

*System suitability*: reference solution (c):
- *resolution*: minimum 5.0 between the peaks due to hexamidine and pentamidine.

*Limits*:
- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *impurity B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurities C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *any other impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 mL of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide* under a current of *nitrogen R*, determining the end-point potentiometrically (*2.2.20*).

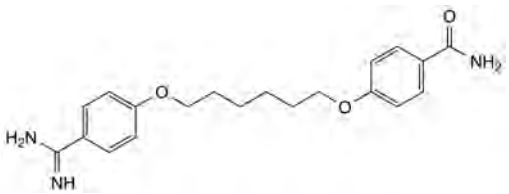
1 mL of *0.1 M tetrabutylammonium hydroxide* is equivalent to 30.35 mg of $C_{24}H_{38}N_4O_{10}S_2$.

STORAGE

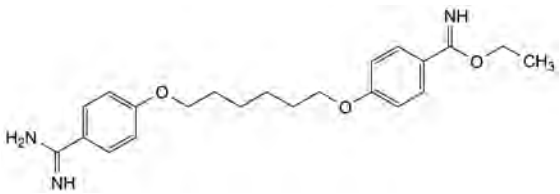
In an airtight container.

IMPURITIES

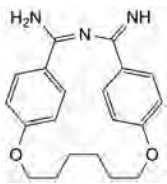
*Specified impurities: A, B, C, D.*



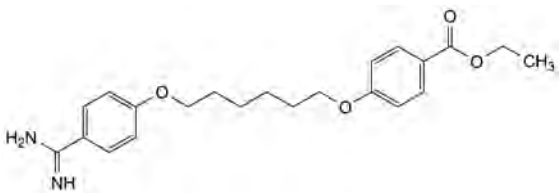
A. 4-[[6-(4-carbamimidoylphenoxy)hexyl]oxy]benzamide,



B. ethyl 4-[[6-(4-carbamimidoylphenoxy)hexyl]oxy]-benzimidoate,



C. 4-imino-9,16-dioxa-3-azatricyclo[15.2.2.2$^{5,8}$]tricosa-1(19),2,5,7,17,20,22-heptaen-2-amine,

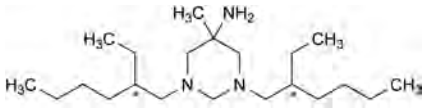


D. ethyl 4-[[6-(4-carbamimidoylphenoxy)hexyl]oxy]benzoate.

**01/2017:1221**

# HEXETIDINE

## Hexetidinum



$C_{21}H_{45}N_3$ $M_r$ 339.6
[141-94-6]

DEFINITION

Hexetidine contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 1,3-bis(2-ethylhexyl)]-5-methylhexahydropyrimidin-5-amine.

CHARACTERS

An oily liquid, colourless or slightly yellow, very slightly soluble in water, very soluble in acetone, in alcohol and in methylene chloride. It dissolves in dilute mineral acids.

IDENTIFICATION

*First identification: A.*

*Second identification: B, C, D.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *hexetidine CRS*.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 0.2 mL add 2 mL of *sulfuric acid R* and 2 mg of *chromotropic acid, sodium salt R*. Heat in a water-bath at 60 °C. A violet colour develops.

D. Dissolve 0.2 mL in 1 mL of *methylene chloride R*. Add 0.5 mL of *copper sulfate solution R*, 0.05 mL of *0.25 M alcoholic sulfuric acid R* and 5 mL of *water R*. Shake, then allow to stand. The lower layer becomes deep blue.

TESTS

**Appearance**. The substance to be examined is clear (*2.2.1*)and not more intensely coloured than reference solution $Y_5$ or reference solution $GY_5$ (*2.2.2, Method II*).

**Relative density** (*2.2.5*): 0.864 to 0.870.

**Refractive index** (*2.2.6*): 1.461 to 1.467.

**Optical rotation** (*2.2.7*). Dissolve 1.0 g in *ethanol R* and dilute to 10.0 mL with the same solvent. The angle of optical rotation is − 0.10° to + 0.10°.

**Absorbance** (*2.2.25*). Dissolve 0.50 g in *heptane R* and dilute to 50.0 mL with the same solvent. At wavelengths from 270 nm to 350 nm, the absorbance of the solution is not greater than 0.1.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel H R* as the coating substance. *Prepare the solutions immediately before use.*

*Test solution (a).* Dissolve 2.0 g of the substance to be examined in *heptane R* and dilute to 20 mL with the same solvent.

*Test solution (b).* Dilute 1 mL of test solution (a) to 10 mL with *heptane R*.

*Reference solution (a).* Dissolve 20 mg of *hexetidine CRS* in *heptane R* and dilute to 2 mL with the same solvent.

*Reference solution (b).* Dilute 1 mL of test solution (a) to 100 mL with *heptane R*.

*Reference solution (c).* Dilute 5 mL of reference solution (b) to 10 mL with *heptane R*.

*Reference solution (d).* Dissolve 10 mg of *dehydrohexetidine CRS* in test solution (a) and dilute to 10 mL with the same solution.

Apply separately to the plate 1 µL of each solution. At the bottom of a chromatographic tank, place an evaporating dish containing *concentrated ammonia R1*. Place the dried plate in the tank and close the tank. Leave the plate in contact with the ammonia vapour for 15 min. Withdraw the plate and place it in a current of air to remove the ammonia vapour. Develop over a path of 15 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *toluene R*. Allow the plate to dry in air. Expose the plate to iodine vapour for 30 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

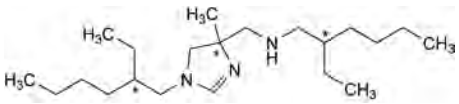
Dissolve 0.150 g in 80 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 16.98 mg of $C_{21}H_{45}N_3$.

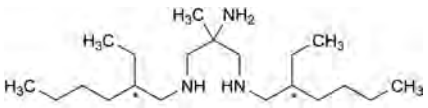
STORAGE

Store protected from light.

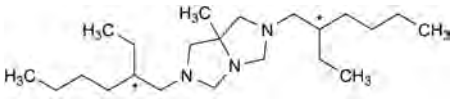
IMPURITIES



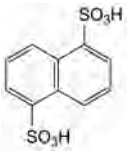
A. 2-ethyl-*N*-[[1-(2-ethylhexyl)-4-methyl-4,5-dihydro-1*H*-imidazol-4-yl]methyl]hexan-1-amine (dehydrohexetidine),



B. $N^1$,$N^3$-bis(2-ethylhexyl)-2-methylpropane-1,2,3-triamine (triamine),



C. 2,6-bis(2-ethylhexyl)-7a-methylhexahydro-1*H*-imidazo-[1,5-*c*]imidazole (hexedine),

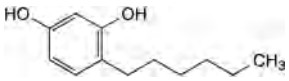


D. naphthalene-1,5-disulfonic acid.

**01/2016:1437**

# HEXYLRESORCINOL

## Hexylresorcinolum



$C_{12}H_{18}O_2$ $M_r$ 194.3
[136-77-6]

DEFINITION

4-Hexylbenzene-1,3-diol.

*Content*: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: colourless, yellowish or reddish, crystalline powder or needles, turning brownish-pink on exposure to light or air.

*Solubility*: very slightly soluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: B.*

*Second identification: A, C, D.*

A. Melting point (*2.2.14*): 66 °C to 68 °C, melting may occur at about 60 °C, followed by solidification and a second melting between 66 °C and 68 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hexylresorcinol CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dilute 0.1 mL of solution S (see Tests) to 10 mL with *ethanol (96 per cent) R*.

*Reference solution (a).* Dissolve 10 mg of *hexylresorcinol CRS* in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 10 mg of *hexylresorcinol CRS* and 10 mg of *resorcinol R* in *ethanol (96 per cent) R*, then dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *methyl ethyl ketone R*, *pentane R* (50:50 *V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air for 5 min.

*Detection*: spray with 3 mL of *anisaldehyde solution R* and heat at 100-105 °C for 5 min.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve 0.1 g in 1 mL of *ethanol (96 per cent) R*. Add one drop of *ferric chloride solution R1*. A green colour is produced. Add *dilute ammonia R1*. The solution changes to brown.

TESTS

**Solution S**. Dissolve 1.0 g in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*).

**Acidity**. Dissolve 0.5 g in a mixture of 25 mL of *carbon dioxide-free water R* and 25 mL of *ether R* previously neutralised to *phenolphthalein solution R1* and titrate with *0.1 M sodium hydroxide*, shaking vigorously after each addition. Not more than 0.4 mL is required to change the colour of the solution.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve the contents of a vial of *hexylresorcinol for system suitability CRS* (containing impurities C and D) in 1.0 mL of the mobile phase.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 30 °C.

*Mobile phase*: mix 30 volumes of a 3.0 g/L solution of *glacial acetic acid R* previously adjusted to pH 5.9 with *dilute ammonia R1*, and 70 volumes of *methanol R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 281 nm.

*Injection*: 20 µL.

*Run time*: 2.5 times the retention time of hexylresorcinol.

*Identification of impurities*: use the chromatogram supplied with *hexylresorcinol for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities C and D.

*Relative retention* with reference to hexylresorcinol (retention time = about 10 min): impurity C = about 0.7; impurity D = about 1.1.

*System suitability*: reference solution (b):

- *peak-to-valley ratio*: minimum 3.0, where $H_p$ = height above the baseline of the peak due to impurity D and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to hexylresorcinol.

*Calculation of percentage contents*:

- *correction factor*: multiply the peak area of impurity D by 0.3;
- for each impurity, use the concentration of hexylresorcinol in reference solution (a).

*Limits*:

- *impurities C, D*: for each impurity, maximum 0.2 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 10 mL of *methanol R* in a ground-glass-stoppered flask, add 30.0 mL of *0.0167 M potassium bromate* and 2 g of *potassium bromide R*. Shake to dissolve the substance and add 15 mL of *dilute sulfuric acid R*. Stopper the flask, shake and allow to stand in the dark for 15 min, stirring continuously. Add 5 mL of *methylene chloride R* and a solution of 1 g of *potassium iodide R* in 10 mL of *water R*, allow to stand in the dark for 15 min, stirring continuously. Titrate with *0.1 M sodium thiosulfate*, using 1 mL of *starch solution R*, shaking thoroughly. Carry out a blank titration under the same conditions.

1 mL of *0.0167 M potassium bromate* is equivalent to 4.857 mg of $C_{12}H_{18}O_2$.

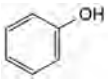
STORAGE

In an airtight container, protected from light.

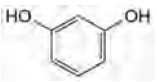
IMPURITIES

*Specified impurities: C, D.*

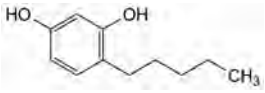
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B.*



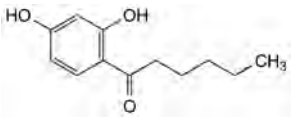
A. phenol,



B. benzene-1,3-diol (resorcinol),



C. 4-pentylbenzene-1,3-diol,

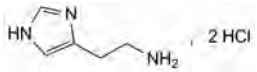


D. 1-(2,4-dihydroxyphenyl)hexan-1-one.

**01/2008:0143**
**corrected 6.0**

# HISTAMINE DIHYDROCHLORIDE

## Histamini dihydrochloridum



$C_5H_{11}Cl_2N_3$ $M_r$ 184.1
[56-92-8]

DEFINITION

Histamine dihydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2-(1*H*-imidazol-4-yl)ethan-1-amine dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, soluble in alcohol.

IDENTIFICATION

*First identification: A, D.*

*Second identification*: *B, C, D.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *histamine dihydrochloride CRS*. Examine as discs prepared using 1 mg of substance.

B. Examine the chromatograms obtained in the test for histidine. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 7 mL of *water R* and add 3 mL of a 200 g/L solution of *sodium hydroxide R*. Dissolve 50 mg of *sulfanilic acid R* in a mixture of 0.1 mL of *hydrochloric acid R* and 10 mL of *water R* and add 0.1 mL of *sodium nitrite solution R*. Add the second solution to the first and mix. A red colour is produced.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 10 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*). The pH of solution S is 2.85 to 3.60.

**Histidine**. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

*Test solution (a).* Dissolve 0.5 g of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Test solution (b).* Dilute 2 mL of test solution (a) to 10 mL with *water R*.

*Reference solution (a).* Dissolve 0.1 g of *histamine dihydrochloride CRS* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 50 mg of *histidine monohydrochloride R* in *water R* and dilute to 100 mL with the same solvent.

*Reference solution (c).* Mix 1 mL of test solution (a) and 1 mL of reference solution (b).

Apply to the plate 1 µL of test solution (a), 1 µL of test solution (b), 1 µL of reference solution (a), 1 µL of reference solution (b) and 2 µL of reference solution (c). Develop over a path of 15 cm using a mixture of 5 volumes of *concentrated ammonia R*, 20 volumes of *water R* and 75 volumes of *acetonitrile R*. Dry the plate in a current of air. Repeat the development in the same direction, dry the plate in a current of air and spray with *ninhydrin solution R1*. Heat the plate at 110 °C for 10 min. Any spot corresponding to histidine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

**Sulfates** (*2.4.13*). 3 mL of solution S diluted to 15 mL with *distilled water R* complies with the limit test for sulfates (0.1 per cent).

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 0.20 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 0.5 g.

ASSAY

Dissolve 0.080 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *alcohol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the first and third points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 9.203 mg of $C_5H_{11}Cl_2N_3$.

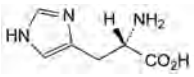
STORAGE

Store in an airtight container, protected from light.

**01/2017:0911**

# HISTIDINE

## Histidinum



$C_6H_9N_3O_2$ $M_r$ 155.2

[71-00-1]

DEFINITION

(2*S*)-2-Amino-3-(1*H*-imidazol-4-yl)propanoic acid.

Product of fermentation or of protein hydrolysis.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification*: *A, B.*

*Second identification*: *A, C, D.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *histidine CRS.*

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *water R*, evaporate to dryness at 60 °C and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *water R* and dilute to 50 mL with the same solvent.

*Reference solution.* Dissolve 10 mg of *histidine CRS* in *water R* and dilute to 50 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 *V/V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 0.1 g in 7 mL of *water R* and add 3 mL of a 200 g/L solution of *sodium hydroxide R*. Dissolve 50 mg of *sulfanilic acid R* in a mixture of 0.1 mL of *hydrochloric acid R* and 10 mL of *water R* and add 0.1 mL of *sodium nitrite solution R*. Add the second solution to the first and mix. An orange-red colour develops.

TESTS

**Solution S**. Dissolve 2.5 g in *distilled water R*, heating in a water-bath, and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

**Specific optical rotation** (*2.2.7*): + 11.4 to + 12.4 (dried substance).

Dissolve 2.75 g in 12.0 mL of *hydrochloric acid R1* and dilute to 25.0 mL with *water R*.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *water R* or a sample preparation buffer suitable for the apparatus used.

*Test solution*. Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b)*. Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c)*. Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d)*. Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50.0 mL with solution A. Dilute 1.0 mL of the solution to 200.0 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test, blank and reference solutions into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:

– for any ninhydrin-positive substance detected at 570 nm, use the concentration of histidine in reference solution (a);
– for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:

– *any ninhydrin-positive substance*: for each impurity, maximum 0.2 per cent;
– *total*: maximum 0.5 per cent;
– *reporting threshold*: 0.05 per cent.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dilute 10 mL of solution S to 15 mL with *distilled water R*.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit*:

– *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 50 mL of *water R*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*).

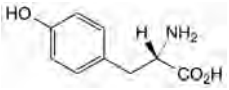
1 mL of *0.1 M hydrochloric acid* is equivalent to 15.52 mg of $C_6H_9N_3O_2$.

STORAGE

Protected from light.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.

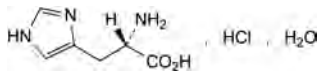


A. (2*S*)-2-amino-3-(4-hydroxyphenyl)propanoic acid (tyrosine).

**01/2017:0910**
**corrected 10.0**

# HISTIDINE HYDROCHLORIDE MONOHYDRATE

## Histidini hydrochloridum monohydricum



$C_6H_{10}ClN_3O_2,H_2O$ $M_r$ 209.6
[5934-29-2]

DEFINITION

(2*S*)-2-Amino-3-(1*H*-imidazol-4-yl)propanoic acid hydrochloride monohydrate.

Product of fermentation or of protein hydrolysis.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification*: *A, B, C, F.*

*Second identification*: *A, B, D, E, F.*

A. Specific optical rotation (see Tests).

B. pH (see Tests).

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *histidine hydrochloride monohydrate CRS.*

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *water R* and dilute to 50 mL with the same solvent.

*Reference solution.* Dissolve 10 mg of *histidine hydrochloride monohydrate CRS* in *water R* and dilute to 50 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 *V/V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve 0.1 g in 7 mL of *water R* and add 3 mL of a 200 g/L solution of *sodium hydroxide R*. Dissolve 50 mg of *sulfanilic acid R* in a mixture of 0.1 mL of *hydrochloric acid R* and 10 mL of *water R* and add 0.1 mL of *sodium nitrite solution R*. Add the second solution to the first and mix. An orange-red colour develops.

F. About 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 3.0 to 5.0 for solution S.

**Specific optical rotation** (*2.2.7*): + 9.2 to + 10.6 (dried substance).

Dissolve 2.75 g in 12.0 mL of *hydrochloric acid R1* and dilute to 25.0 mL with *water R*.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *water R* or a sample preparation buffer suitable for the apparatus used.

*Test solution.* Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b).* Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c).* Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (d).* Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* in solution A and dilute to 50 mL with solution A. Dilute 1 mL of the solution to 200 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test, blank and reference solutions into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (d):

– *resolution*: minimum 1.5 between the peaks due to isoleucine and leucine.

*Calculation of percentage contents*:

– for any ninhydrin-positive substance detected at 570 nm, use the concentration of histidine hydrochloride monohydrate in reference solution (a);

– for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (b); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:

– *any ninhydrin-positive substance*: for each impurity, maximum 0.2 per cent;

– *total*: maximum 0.5 per cent;

– *reporting threshold*: 0.05 per cent.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dilute 10 mL of solution S to 15 mL with *distilled water R*.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (c) and blank solution.

*Limit*:

– *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): 7.0 per cent to 10.0 per cent, determined on 1.000 g by drying in an oven at 145-150 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g in 50 mL of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 19.16 mg of $C_6H_{10}ClN_3O_2$.

STORAGE

Protected from light.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general

acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.

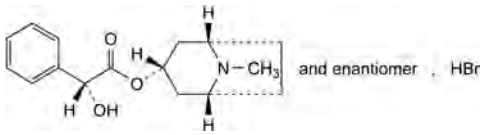
**corrected 6.0**

# HOMATROPINE HYDROBROMIDE

## Homatropini hydrobromidum



$C_{16}H_{22}BrNO_3$ $M_r$ 356.3
[51-56-9]

DEFINITION

(1*R*,3*r*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-2-hydroxy-2-phenylacetate hydrobromide.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, sparingly soluble in alcohol.

mp: about 215 °C, with decomposition.

IDENTIFICATION

*First identification*: *A, C.*

*Second identification*: *B, C.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *homatropine hydrobromide CRS.*

B. Dissolve 50 mg in 1 mL of *water R* and add 2 mL of *dilute acetic acid R*. Heat and add 4 mL of *picric acid solution R*. Allow to cool, shaking occasionally. Collect the crystals, wash with 2 quantities, each of 3 mL, of iced *water R* and dry at 100-105 °C. The crystals melt (*2.2.14*) at 182 °C to 186 °C.

C. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 5.0 to 6.5 for solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 5.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 50.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 5.0 mL of reference solution (a) to 25.0 mL with the mobile phase.

*Reference solution (c)*. Dissolve 5.0 mg of *hyoscine hydrobromide CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of this solution add 0.5 mL of the test solution and dilute to 100.0 mL with the mobile phase.

*Column*:
- *size*: *l* = 0.1 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm),
- *temperature*: 40 °C.

*Mobile phase*: mix 33 volumes of *methanol R2* and 67 volumes of a solution prepared as follows: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 7.0 g of *sodium heptanesulfonate monohydrate R* in 1000 mL of *water R* and adjust to pH 2.7 with a 330 g/L solution of *phosphoric acid R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL.

*Run time*: 3 times the retention time of homatropine.

*Relative retention* with reference to homatropine (retention time = about 6.8 min): impurity C = about 0.2; impurity A = about 0.9; impurity B = about 1.1; impurity D = about 1.9.

*System suitability*: reference solution (c):
- *resolution*: minimum 1.5 between the peaks due to homatropine and impurity B,
- *symmetry factor*: maximum 2.5 for the peak due to homatropine.

*Limits*:
- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *impurities B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); disregard the peak due to the bromide ion which appears close to the peak due to the solvent,
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *alcohol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

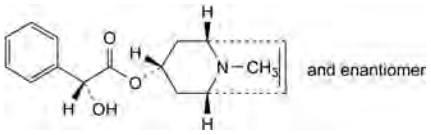
1 mL of *0.1 M sodium hydroxide* is equivalent to 35.63 mg of $C_{16}H_{22}BrNO_3$.

STORAGE

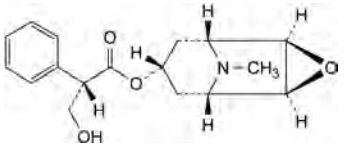
Protected from light.

IMPURITIES

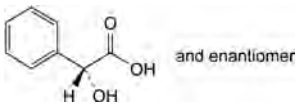
*Specified impurities*: *A, B, C, D.*



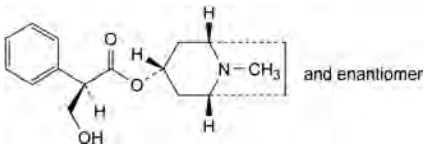
A. (1*R*,3*s*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-6-en-3-yl (2*RS*)-2-hydroxy-2-phenylacetate (dehydrohomatropine),



B. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo-[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscine),



C. (2*RS*)-2-hydroxy-2-phenylacetic acid (mandelic acid),

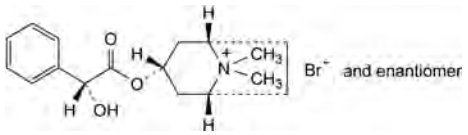


D. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate (atropine).

**01/2012:0720**

# HOMATROPINE METHYLBROMIDE

## Homatropini methylbromidum



$C_{17}H_{24}BrNO_3$ $M_r$ 370.3

[80-49-9]

DEFINITION

(1*R*,3*r*,5*S*)-3-[[(2*RS*)-2-Hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]octane bromide.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, soluble in ethanol 96 per cent.

mp: about 190 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *homatropine methylbromide CRS*.

B. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.5 to 6.5 for solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R1*, mobile phase A (9:41 *V/V*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 5.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 5.0 mL of this solution to 50.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 5.0 mL of reference solution (a) to 25.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve 5.0 mg of *homatropine hydrobromide CRS* (impurity B) in the solvent mixture and dilute to 50.0 mL with the solvent mixture. To 10.0 mL of the solution add 0.5 mL of the test solution and dilute to 100.0 mL with the solvent mixture.

*Reference solution (d)*. Dissolve 2.0 mg of *homatropine methylbromide for system suitability CRS* (containing impurity A) in 1.0 mL of the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 25 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 3.4 g of *potassium dihydrogen phosphate R* and 5.0 g of *sodium pentanesulfonate monohydrate R* in 980 mL of *water for chromatography R*, adjust to pH 3.0 with a 330 g/L solution of *phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*;
- *mobile phase B*: mix 400 mL of mobile phase A and 600 mL of *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 70 | 30 |
| 2 - 15 | 70 → 30 | 30 → 70 |

*Flow rate*: 1.4 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL.

*Relative retention* with reference to homatropine methylbromide (retention time = about 5 min): impurity A = about 0.9; impurity B = about 1.2.

*Identification of impurities*: use the chromatogram supplied with *homatropine methylbromide for system suitability CRS* and the chromatogram obtained with reference solution (d) to identify the peak due to impurity A; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity B.

*System suitability*:

- *resolution*: minimum 2.5 between the peaks due to homatropine methylbromide and impurity B in the chromatogram obtained with reference solution (c);
- *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to homatropine methylbromide in the chromatogram obtained with reference solution (d).

*Limits*:

- *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); disregard the peak due to the bromide ion which appears close to the peak due to the solvent;
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 10 mL of *water R*. Titrate with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and a silver-silver chloride reference electrode.

1 mL of *0.1 M silver nitrate* is equivalent to 37.03 mg of $C_{17}H_{24}BrNO_3$.

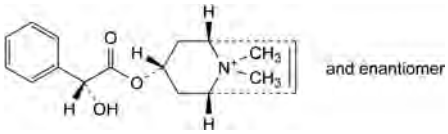
STORAGE

Protected from light.

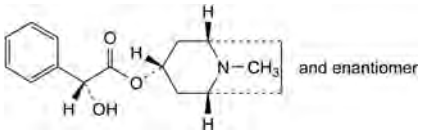
IMPURITIES

*Specified impurities: A, B.*

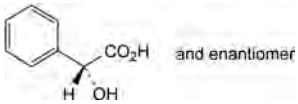
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, F.*



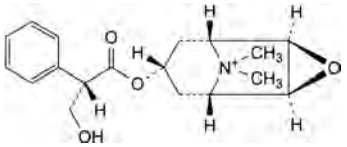
A. (1*R*,3*s*,5*S*)-3-[[(2*RS*)-2-hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]oct-6-ene (methyldehydrohomatropine),



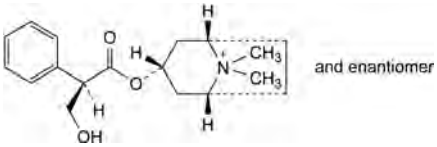
B. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-2-hydroxy-2-phenylacetate (homatropine),



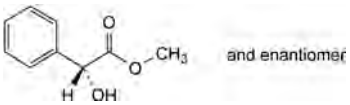
C. (2*RS*)-2-hydroxy-2-phenylacetic acid (mandelic acid),



D. (1*R*,2*R*,4*S*,5*S*,7*s*)-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]-oxy]-9,9-dimethyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane (methylhyoscine),



E. (1*R*,3*r*,5*S*)-3-[[(2*RS*)-3-hydroxy-2-phenylpropanoyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]octane (methylatropine),



F. methyl (2*RS*)-2-hydroxy-2-phenylacetate (methyl mandelate).

**01/2008:2051**

# HONEY

## Mel

DEFINITION

Honey is produced by bees (*Apis mellifera* L.) from the nectar of plants or from secretions of living parts of plants which the bees collect, transform by combining with specific substances of their own, deposit, dehydrate, store and leave in the honey comb to ripen and mature.

PRODUCTION

If the bee has been exposed to treatment to prevent or cure diseases or to any substance intended for preventing, destroying or controlling any pest, unwanted species of plants or animals, appropriate measures are taken to ensure that the levels of residues are as low as possible.

CHARACTERS

*Appearance*: viscous liquid which may be partly crystalline, almost white to dark brown.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.6 g of the substance to be examined in 50 mL of *ethanol (30 per cent V/V) R*.

*Reference solution.* Dissolve 0.5 g of *fructose R*, 0.5 g of *glucose R* and 0.1 g of *sucrose R* in 100 mL of *ethanol (30 per cent V/V) R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *water R*, *acetonitrile R* (13:87 *V/V*).

*Application*: 5 µL as bands.

*Development*: 3 times over a path of 15 cm.

*Drying*: in warm air.

*Detection*: spray with a solution prepared as follows: dissolve 2 g of *diphenylamine R* and 2 mL of *aniline R* in 100 mL of *acetone R*. Add a 850 g/L solution of *phosphoric acid R* until the precipitate formed dissolves again (about 15-20 mL). Examine in daylight after heating at 100-105 °C for 5-10 min.

*Results*: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, the weak brown zone due to sucrose in the chromatogram obtained with the reference solution may be present in the chromatogram obtained with the test solution. One or more other weak zones may be present in the chromatogram obtained with the test solution.

| Top of the plate | |
|---|---|
| ——— | ——— |
| Fructose: an intense brown zone | An intense brown zone (fructose) |
| Glucose: an intense greyish-blue zone | An intense greyish-blue zone (glucose) |
| ——— | ——— |
| Sucrose: a brown zone | |
| | 2 to 3 brownish-grey zones |
| **Reference solution** | **Test solution** |

TESTS

**Refractive index** (*2.2.6*): minimum 1.487 (equivalent to a maximum water content of 20 per cent).

Homogenise 100 g and transfer into a flask. Close tightly and place in a water-bath at 50 ± 0.2 °C until all sugar crystals have dissolved. Cool the solution to 20 °C and rehomogenise. Immediately after rehomogenisation, cover the surface of the refractometer prism evenly with the sample. Determine the refractive index after 2 min if using an Abbe refractometer and after 4 min if using a digital refractometer. Use the average value of 2 determinations.

**Conductivity** (*2.2.38*): maximum 800 $\mu S \cdot cm^{-1}$.

Using the value obtained for the refractive index, determine the water content of the substance to be examined from Table 2051.-1. Using this information, dissolve an amount of the substance to be examined equivalent to 20.0 g of honey dry solids, in *water R* to produce 100.0 mL.

**Optical rotation** (*2.2.7*): maximum + 0.6°.

Using the value obtained for the refractive index, determine the water content of the substance to be examined from Table 2051.-1. Using this information, dissolve an amount of the substance to be examined, equivalent to 20.0 g of honey dry solids, in 50 mL of *water R*. Add 0.2 mL of *concentrated ammonia R* and dilute to 100.0 mL with *water R*. If necessary decolourise the solution with *activated charcoal R*.

Table 2051.-1. – *Relationship of water content of honey to refractive index*

| Water content (per cent *m/m*) | Refractive index at 20 °C |
|---|---|
| 15.0 | 1.4992 |
| 15.2 | 1.4987 |
| 15.4 | 1.4982 |
| 15.6 | 1.4976 |
| 15.8 | 1.4971 |
| 16.0 | 1.4966 |
| 16.2 | 1.4961 |
| 16.4 | 1.4956 |
| 16.6 | 1.4951 |
| 16.8 | 1.4946 |
| 17.0 | 1.4940 |
| 17.2 | 1.4935 |
| 17.4 | 1.4930 |
| 17.6 | 1.4925 |
| 17.8 | 1.4920 |
| 18.0 | 1.4915 |
| 18.2 | 1.4910 |
| 18.4 | 1.4905 |
| 18.6 | 1.4900 |
| 18.8 | 1.4895 |
| 19.0 | 1.4890 |
| 19.2 | 1.4885 |
| 19.4 | 1.4880 |
| 19.6 | 1.4875 |
| 19.8 | 1.4870 |
| 20.0 | 1.4865 |

**5-Hydroxymethylfurfural**: maximum 80 ppm, calculated on dry solids.

Using the value obtained for the refractive index, determine the water content of the substance to be examined from Table 2051.-1. Using this information, dissolve an amount of the substance to be examined, equivalent to 5.0 g of honey dry solids, in 25 mL of *water R* and transfer to a 50.0 mL volumetric flask with the same solvent. Add 0.5 mL of a 150 g/L solution of *potassium ferrocyanide R* and mix. Add 0.5 mL of a 300 g/L solution of *zinc acetate R*, mix and dilute to 50.0 mL with *water R* (a drop of *anhydrous ethanol R* may be added to avoid foaming). Filter. Transfer 5.0 mL of the filtered solution into each of 2 tubes. To one tube add 5.0 mL of *water R* (test solution). To the other tube add 5.0 mL of a 2.0 g/L solution of *sodium hydrogensulfite R* (reference solution). Determine the absorbance (*2.2.25*) of the test solution against the reference solution at 284 nm and 336 nm within 60 min. If the absorbance at 284 nm is greater than 0.8, dilute to the same extent the test solution with *water R* and the reference solution with a 2.0 g/L solution of *sodium hydrogensulfite R* so as to obtain an absorbance of less than 0.8.

Calculate the content of 5-hydroxymethylfurfural from the expression:

$$(A_1 - A_2) \times D \times 149.7$$

$A_1$ = absorbance at 284 nm,

$A_2$ = absorbance at 336 nm,

$D$ = dilution factor, where applicable.

**Chlorides** (*2.4.4*): maximum 350 ppm, determined on 15 mL of a 10 g/L solution.

**Sulfates** (*2.4.13*): maximum 250 ppm, determined on 15 mL of a 40 g/L solution.

**01/2013:0255**
**corrected 8.0**

# HUMAN ALBUMIN SOLUTION

## Albumini humani solutio

DEFINITION

Sterile liquid preparation of a plasma protein fraction containing human albumin. It is obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*. The preparation may contain excipients such as sodium caprylate (sodium octanoate) or *N*-acetyltryptophan or a combination of the two.

PRODUCTION

Separation of the albumin is carried out under controlled conditions, particularly of pH, ionic strength and temperature so that in the final product not less than 95 per cent of the total protein is albumin. Human albumin solution is prepared as a concentrated solution containing 150-250 g/L of total protein or as an isotonic solution containing 35-50 g/L of total protein. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter and distributed aseptically into sterile containers which are then closed so as to prevent contamination. The solution in its final container is heated to 60 ± 1.0 °C and maintained at this temperature for not less than 10 h. The containers are then incubated at 30-32 °C for not less than 14 days or at 20-25 °C for not less than 4 weeks and examined visually for evidence of microbial contamination.

CHARACTERS

*Appearance*: clear, slightly viscous liquid, almost colourless, yellow, amber or green.

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/L of protein. The main component of the preparation to be examined corresponds to the main component of normal human serum. The preparation may show the presence of small quantities of other plasma proteins.

TESTS

**pH** (*2.2.3*): 6.7 to 7.3.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing 10 g/L of protein.

**Total protein**. If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the quantity of protein by multiplying by 6.25. The protein content is not less than 95 per cent and not more than 105 per cent of the stated content.

**Protein composition**. Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

*Test solution*. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a protein concentration of 20 g/L.

*Reference solution*. Dilute *human albumin for electrophoresis BRP* with a 9 g/L solution of *sodium chloride R* to a protein concentration of 20 g/L.

To a strip apply 2.5 µL of the test solution as a 10 mm band or apply 0.25 µL per millimetre if a narrower strip is used. To another strip, apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the most rapid band migrates at least 30 mm. Treat the strips with *amido black 10B solution R* for 5 min. Decolorise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* until the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

*System suitability*: in the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

*Results*: in the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 5 per cent of the protein has a mobility different from that of the principal band.

**Molecular-size distribution**. Size exclusion chromatography (*2.2.30*).

*Test solution*. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

*Column*:

- *size*: *l* = 0.6 m, Ø = 7.5 mm, or *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

*Mobile phase*: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 L of *water R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

The peak due to polymers and aggregates is located in the part of the chromatogram representing the void volume. Disregard the peak due to the stabiliser. The area of the peak due to polymers and aggregates is not greater than 10 per cent of the total area of the chromatogram. This represents not more than 5 per cent when expressed in percentage of protein considering the difference in response factor between the albumin monomer and the polymers and aggregates.

**Haem**. Dilute the preparation to be examined using a 9 g/L solution of *sodium chloride R* to obtain a solution containing 10 g/L of protein. The absorbance (*2.2.25*) of the solution measured at 403 nm using *water R* as the compensation liquid is not greater than 0.15.

**Prekallikrein activator** (*2.6.15*): maximum 35 IU/mL.

**Aluminium**: maximum 200 µg/L.

Atomic absorption spectrometry (*2.2.23, Method I or II*).

Use a furnace as atomic generator.

*Use plastic containers for preparation of the solutions and use plastic equipment where possible. Wash glassware (or equipment) in nitric acid (200 g/L $HNO_3$) before use.*

*Test solution*. Use the preparation to be examined, diluted if necessary.

*Reference solutions*. Prepare at least 3 reference solutions in a range spanning the expected aluminium concentration of the test solution, for example by diluting *aluminium standard solution (10 ppm Al) R* with a 1 g/L solution of *octoxinol 10 R*.

*Monitor solution*. Add *aluminium standard solution (10 ppm Al) R* or a suitable certified reference material to the test solution in a sufficient amount to increase the aluminium concentration by 20 µg/L.

*Blank solution*. 1 g/L solution of *octoxinol 10 R*.

*Wavelength*: 309.3 nm or other suitable wavelength.

*Slit width*: 0.5 nm.

*Tube*: pyrolytically coated, with integrated platform.

*Background corrector*: off.

*Atomisation device*: furnace; fire between readings.

The operating conditions in Table 0255.-1 are cited as an example of conditions found suitable for a given apparatus; they may be modified to obtain optimum conditions.

Table 0255.-1. – *Operating conditions found suitable, cited as an example*

| Step | Final temperature (°C) | Ramp time (s) | Hold time (s) | Gas |
|---|---|---|---|---|
| 1 | 120 | 10 | 80 | argon |
| 2 | 200 | 5 | 20 | argon |
| 3 | 650 | 5 | 10 | argon |
| 4 | 1300 | 5 | 10 | argon |
| 5 | 1300 | 1 | 10 | no gas |
| 6 | 2500 | 0.7 | 4 | no gas |
| 7 | 2600 | 0.5 | 3 | argon |
| 8 | 20 | 12.9 | 3 | no gas |

*Injection*: each of the following solutions 3 times: blank solution, reference solutions, test solution and monitor solution.

*System suitability*:

– the recovery of aluminium added in preparation of the monitor solution is within the range 80-120 per cent.

Prepare a calibration curve from the mean of the readings obtained with the reference solutions and determine the aluminium content of the preparation to be examined using the calibration curve.

**Potassium**: maximum 0.05 mmol of K per gram of protein.

Atomic emission spectrometry (*2.2.22, Method I*).

*Wavelength*: 766.5 nm.

**Sodium**: maximum 160 mmol/L and 95 per cent to 105 per cent of the content of Na stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

*Wavelength*: 589 nm.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens (*2.6.8*) or Bacterial endotoxins (*2.6.14*)**. It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, for a solution with a protein content of 35-50 g/L, inject 10 mL per kilogram of the rabbit's mass; for a solution with a protein content of 150-250 g/L, inject 5 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.5 IU of endotoxin per millilitre for solutions with a protein content not greater than 50 g/L, less than 1.3 IU of endotoxin per millilitre for solutions with a protein content greater than 50 g/L but not greater than 200 g/L, and less than 1.7 IU of endotoxin per millilitre for solutions with a protein content greater than 200 g/L but not greater than 250 g/L.

STORAGE

Protected from light.

LABELLING

The label states:

– the name of the preparation;
– the volume of the preparation;
– the content of protein expressed in grams per litre;
– the content of sodium expressed in millimoles per litre;
– that the product is not to be used if it is cloudy or if a deposit has formed;
– the name and quantity of any added substance.

**01/2015:0557**

# HUMAN ANTI-D IMMUNOGLOBULIN

## Immunoglobulinum humanum anti-D

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It contains specific antibodies against erythrocyte D-antigen and may also contain small quantities of other blood-group antibodies. *Human normal immunoglobulin for intramuscular administration (0338)* and/or *Human albumin solution (0255)* may be added.

It complies with the monograph *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

The assay of human anti-D immunoglobulin (*2.7.13*) is carried out, as prescribed below under Potency.

For products prepared by a method that eliminates immunoglobulins with specificities other than anti-D, where authorised, the test for antibodies to hepatitis B surface antigen is not required.

PRODUCTION

Human anti-D immunoglobulin is preferably obtained from the plasma of donors with a sufficient titre of previously acquired anti-D antibodies. Where necessary, in order to ensure an adequate supply of human anti-D immunoglobulin, it is obtained from plasma derived from donors immunised with D-positive erythrocytes that are compatible in relevant blood group systems in order to avoid formation of undesirable antibodies.

*ERYTHROCYTE DONORS*

Erythrocyte donors comply with the requirements for donors prescribed in the monograph *Human plasma for fractionation (0853)*.

*IMMUNISATION*

Immunisation of the plasma donor is carried out under proper medical supervision. Recommendations concerning donor immunisation, including testing of erythrocyte donors, have been formulated by the World Health Organization (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

*POOLED PLASMA*

To limit the potential B19 virus burden in plasma pools used for the manufacture of anti-D immunoglobulin, the plasma pool is tested for B19 virus using validated nucleic acid amplification techniques (*2.6.21*).

**B19 virus DNA**: maximum 10.0 IU/µL.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

*B19 virus DNA for NAT testing BRP* is suitable for use as a positive control.

If *Human normal immunoglobulin for intramuscular administration (0338)* and/or *Human albumin solution (0255)* are added to the preparation, the plasma pool or pools from which they are derived comply with the above requirement for B19 virus DNA.

POTENCY

**Human anti-D immunoglobulin** (*2.7.13, Method A*). The estimated potency is not less than 90 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Method B or C (*2.7.13*) may be used for potency determination if a satisfactory correlation with the results obtained by Method A has been established for the particular product.

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

**01/2008:1527**
**corrected 7.6**

# HUMAN ANTI-D IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

## Immunoglobulinum humanum anti-D ad usum intravenosum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It contains specific antibodies against erythrocyte D-antigen and may also contain small quantities of other blood-group antibodies. *Human normal immunoglobulin for intravenous administration (0918)* and/or *Human albumin solution (0255)* may be added.

It complies with the monograph *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content, the limit for osmolality and the limit for prekallikrein activator.

The test for anti-D antibodies (*2.6.26*) prescribed in the monograph *Human normal immunoglobulin for intravenous administration (0918)* is not carried out, since it is replaced by the assay of human anti-D immunoglobulin (*2.7.13*) as prescribed below under Potency.

For products prepared by a method that eliminates immunoglobulins with specificities other than anti-D, where authorised, the test for antibodies to hepatitis B surface antigen is not required; a suitable test for Fc function is carried out instead of that described in general chapter *2.7.9*, which is not applicable to such a product.

PRODUCTION

Human anti-D immunoglobulin is preferably obtained from the plasma of donors with a sufficient titre of previously acquired anti-D antibodies. Where necessary, in order to ensure an adequate supply of human anti-D immunoglobulin, it is obtained from plasma derived from donors immunised with D-positive erythrocytes that are compatible in relevant blood group systems in order to avoid formation of undesirable antibodies.

*ERYTHROCYTE DONORS*

Erythrocyte donors comply with the requirements for donors prescribed in the monograph *Human plasma for fractionation (0853)*.

*IMMUNISATION*

Immunisation of the plasma donor is carried out under proper medical supervision. Recommendations concerning donor immunisation, including testing of erythrocyte donors, have been formulated by the World Health Organization (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

*POOLED PLASMA*

To limit the potential B19 virus burden in plasma pools used for the manufacture of anti-D immunoglobulin, the plasma pool is tested for B19 virus using validated nucleic acid amplification techniques (*2.6.21*).

**B19 virus DNA**: maximum 10.0 IU/µL.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

*B19 virus DNA for NAT testing BRP* is suitable for use as a positive control.

If *Human normal immunoglobulin for intravenous administration (0918)* and/or *Human albumin solution (0255)* are added to the preparation, the plasma pool or pools from which they are derived comply with the above requirement for B19 virus DNA.

ASSAY

**Human anti-D immunoglobulin** (*2.7.13, Method A*). The estimated potency is not less than 90 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Method B or C (*2.7.13*) may be used for potency determination if a satisfactory correlation with the results obtained by Method A has been established for the particular product.

STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the number of International Units per container.

**01/2012:0878**
**corrected 8.6**

# HUMAN ANTITHROMBIN III CONCENTRATE

## Antithrombinum III humanum densatum

DEFINITION

Sterile, freeze-dried preparation of a plasma glycoprotein fraction that inactivates thrombin in the presence of an excess of heparin. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers.

When reconstituted in the volume of solvent stated on the label, the potency is not less than 25 IU of antithrombin III per millilitre.

PRODUCTION

The method of preparation is designed to maintain functional integrity of antithrombin III. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 3 IU of antithrombin III per milligram of total protein, excluding albumin.

The antithrombin III is purified and concentrated. No antimicrobial preservative or antibiotic is added. The antithrombin III concentrate is passed through a bacteria-retentive filter, distributed aseptically into its final, sterile containers and immediately frozen. It is then freeze-dried and the containers are closed under vacuum or in an atmosphere of inert gas.

It shall be demonstrated that the manufacturing process yields a product with a consistent fraction of antithrombin III able to bind to heparin. It is evaluated by a suitable analytical procedure which is determined during process development, such as:

*Heparin-binding fraction*. Examine by agarose gel electrophoresis (*2.2.31*). Prepare a 10 g/L solution of *agarose for electrophoresis R* containing 15 IU of *heparin R* per millilitre in *barbital buffer solution pH 8.4 R*. Pour 5 mL of this solution onto a glass plate 5 cm square. Cool at 4 °C for 30 min. Cut 2 wells 2 mm in diameter 1 cm and 4 cm from the side of the plate and 1 cm from the cathode. Introduce into one well 5 µL of the preparation to be examined, diluted to an activity of about 1 IU of antithrombin III per millilitre. Introduce into the other well 5 µL of a solution of a marker dye such as *bromophenol blue R*. Allow the electrophoresis to proceed at 4 °C, using a constant electric field of 7 V/cm, until the dye reaches the anode.

Cut across the agarose gel 1.5 cm from that side of the plate on which the preparation to be examined was applied and remove the larger portion of the gel leaving a band 1.5 cm wide containing the material to be examined. Replace the removed portion with an even layer consisting of 3.5 mL of a 10 g/L solution of *agarose for electrophoresis R* in *barbital buffer solution pH 8.4 R*, containing a rabbit anti-human antithrombin III antiserum at a suitable concentration, previously determined, to give adequate peak heights of at least 1.5 cm. Place the plate with the original gel at the cathode so that a 2nd electrophoretic migration can occur at right angles to the 1st. Allow this 2nd electrophoresis to proceed using a constant electric field of 2 V/cm for 16 h. Cover the plates with filter paper and several layers of thick lint soaked in a 9 g/L solution of *sodium chloride R* and compress for 2 h, renewing the saline several times. Rinse with *water R*, dry the plates and stain with *acid blue 92 solution R*.

Calculate the fraction of antithrombin III bound to heparin, which is the peak closest to the anode, with respect to the total amount of antithrombin III, by measuring the area defined by the 2 precipitation peaks.

The fraction of antithrombin III able to bind to heparin is not less than 60 per cent.

CHARACTERS

*Appearance*: white or almost white, hygroscopic, friable solid or powder.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility, total protein and water) and assay.*

IDENTIFICATION

It complies with the limits of the assay.

TESTS

**Solubility**. To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves completely under gentle swirling within 10 min in the volume of the solvent stated on the label, forming a clear or slightly turbid, colourless or almost colourless solution.

**pH** (*2.2.3*): 6.0 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

**Heparin**: maximum 0.1 IU of heparin per International Unit of antithrombin III.

The anticoagulant activity of heparin is determined *in vitro* by comparing its ability in given conditions to delay the clotting of recalcified citrated sheep plasma with the same ability of a reference preparation of heparin calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a quantity of freeze-dried heparin sodium from pork intestinal mucosa. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Heparin sodium BRP* is calibrated in International Units by comparison with the International Standard by means of the assay given below.

Carry out the assay using one of the following methods for determining the onset of clotting and using tubes and other equipment appropriate to the chosen method:

a) direct visual inspection, preferably using indirect illumination and viewing against a matt black background;
b) spectrophotometric recording of the change in optical density at a wavelength of approximately 600 nm;
c) visual detection of the change in fluidity on manual tilting of the tubes;
d) mechanical recording of the change in fluidity on stirring, care being taken to cause the minimum disturbance of the solution during the earliest phase of clotting.

It is necessary to validate the method for assay of heparin for each preparation to be examined to allow for interference by antithrombin III.

ASSAY PROCEDURE

*The volumes are given as examples and may be adapted to the apparatus used provided that the ratios between the different volumes are respected.*

Dilute *heparin sodium BRP* with a 9 g/L solution of *sodium chloride R* to contain a precisely known number of International Units per millilitre and prepare a similar solution of the preparation to be examined which is expected to have the same activity. Using a 9 g/L solution of *sodium chloride R*, prepare from each solution a series of dilutions in geometric progression such that the clotting time obtained with the lowest concentration is not less than 1.5 times the blank recalcification time, and that obtained with the highest concentration is such as to give a satisfactory log dose-response curve, as determined in a preliminary test.

Place 12 tubes in a bath of iced water, labelling them in duplicate: $T_1$, $T_2$ and $T_3$ for the dilutions of the preparation to be examined and $S_1$, $S_2$ and $S_3$ for the dilutions of the reference preparation. To each tube add 1.0 mL of thawed *plasma substrate R1* and 1.0 mL of the appropriate dilution of the preparation to be examined or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order $S_1$, $S_2$, $S_3$, $T_1$, $T_2$, $T_3$, transfer each tube to a water-bath at 37 °C, allow to equilibrate at 37 °C for about 15 min and add to each tube 1 mL of a suitable APTT (Activated Partial Thromboplastin Time) reagent containing phospholipid and a contact activator, at a dilution giving a suitable blank recalcification time not exceeding 60 s. After exactly 2 min add 1 mL of a 3.7 g/L solution of *calcium chloride R* previously heated to 37 °C and record as the clotting time the interval in seconds between this last addition and the onset of clotting determined by the chosen technique. Determine the blank recalcification time at the beginning and at the end of the procedure in a similar manner, using 1 mL of a 9 g/L solution of *sodium chloride R* in place of one of the heparin dilutions; the 2 blank values obtained should not differ significantly. Transform the clotting times to logarithms, using the mean value for the duplicate tubes. Repeat the procedure using fresh dilutions and carrying out the incubation in the order $T_1$, $T_2$, $T_3$, $S_1$, $S_2$, $S_3$. Calculate the results by the usual statistical methods (*5.3*).

Carry out not fewer than 3 independent assays. For each such assay prepare fresh solutions of the reference preparation and the preparation to be examined and use another, freshly thawed portion of plasma substrate.

Calculate the potency of the preparation to be examined, combining the results of these assays, by the usual statistical methods (*5.3*). When the variance due to differences between assays is significant at $P = 0.01$, a combined estimate of potency may be obtained by calculating the non-weighted mean of potency estimates.

**Water**. Determined by a suitable method, such as semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 50 IU of antithrombin III.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.1 IU of endotoxin per International Unit of antithrombin III.

ASSAY

**Human antithrombin III** (*2.7.17*). The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 90 per cent and not more than 110 per cent of the estimated potency.

STORAGE

Protected from light, in an airtight container.

LABELLING

The label states:

- the number of International Units of antithrombin III in the container;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, the amount of albumin added as a stabiliser.

**04/2016:2818**

# HUMAN C1-ESTERASE INHIBITOR

## C1-esterasi inhibitor humanus

DEFINITION

Plasma protein fraction containing mainly human C1-esterase inhibitor (also known as C1-inhibitor or C1-INH). Human C1-esterase inhibitor is a soluble, single-chain glycoprotein containing 478 amino-acid residues. Human C1-esterase inhibitor belongs to the group of serine protease inhibitors. It is obtained from human plasma that complies with the monograph *Human plasma for fractionation (0853)*, using a suitable fractionation process and further purification steps. Other plasma proteins may be present.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

Human C1-esterase inhibitor is purified. The method of preparation is designed to maintain the functional integrity of human C1-esterase inhibitor. Buffers and other auxiliary substances such as a stabiliser may be included. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas. No antimicrobial preservative is added at any stage of production.

*CONSISTENCY OF THE METHOD OF PRODUCTION*

It shall be demonstrated that the manufacturing process yields a product having a consistent composition. This is evaluated by suitable analytical procedures that are determined during process development and that normally include:

- assay of human C1-esterase inhibitor (*2.7.34*);
- determination of specific human C1-esterase inhibitor activity, expressed as the ratio of active human C1-esterase inhibitor content to total protein content;
- determination of molecular-size distribution by size-exclusion chromatography (*2.2.30*);
- molecular identification of human C1-esterase inhibitor, characterisation of accompanying plasma proteins that might be present, by a set of suitable methods such as SDS-PAGE, cellulose acetate electrophoresis or capillary zone electrophoresis (*2.2.31*, *2.2.47*) and quantitative determination of relevant accompanying plasma proteins.

CHARACTERS

*Appearance*: white, pale yellow, pale blue or greenish, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assay.

TESTS

**Solubility**. To the contents of a container of the preparation to be examined add the volume of the solvent stated on the label at the recommended temperature. The preparation dissolves

completely with gentle swirling within the limits approved by the competent authority, giving a clear, colourless, pale yellow, pale blue or greenish solution.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 200 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the protein content by multiplying the result by 6.25. The protein content is within the limits approved by the competent authority.

**Specific activity**: minimum 4 IU/mg.

Calculate the ratio of active human C1-esterase inhibitor content (as determined under Assay) to total protein content.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 50 IU of human C1-esterase inhibitor.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.25 IU of endotoxin per International Unit of human C1-esterase inhibitor.

ASSAY

Carry out the assay of human C1-esterase inhibitor (*2.7.34*).

The estimated potency is not less than 75 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

In an airtight and sterile container, protected from light, at a temperature not exceeding 25 °C, unless otherwise justified and authorised.

LABELLING

The label states:

- the number of International Units of human C1-esterase inhibitor per container;
- the quantity of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the solvent to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

**01/2011:1224**
**corrected 7.6**

# HUMAN COAGULATION FACTOR VII

## Factor VII coagulationis humanus

DEFINITION

Sterile, liquid or freeze-dried preparation of a plasma protein fraction containing the single-chain glycoprotein human coagulation factor VII and may also contain small amounts of the activated form, the 2-chain derivative human coagulation factor VIIa. It may also contain human coagulation factors II, IX and X, protein C and protein S. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers, heparin and antithrombin.

The potency of the preparation, reconstituted as stated on the label, is not less than 15 IU of human coagulation factor VII per millilitre.

PRODUCTION

*GENERAL PROVISIONS*

The method of preparation is designed to maintain functional integrity of human coagulation factor VII and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 2 IU of human coagulation factor VII per milligram of total protein, before the addition of any protein stabiliser.

The human coagulation factor VII fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

*CONSISTENCY OF THE METHOD OF PRODUCTION*

It shall be demonstrated that the manufacturing process yields a product with consistent activities of human coagulation factors II, IX and X, expressed in International Units relative to the activity of human coagulation factor VII. This is evaluated by suitable analytical procedure(s) that is (are) determined during process development.

It shall be demonstrated that the manufacturing process yields a product with a consistent activity of human coagulation factor VIIa. This is evaluated by suitable analytical procedure(s) that is (are) determined during process development.

**Activity of human coagulation factor VIIa**. It may be determined, for example, using a recombinant soluble tissue factor that does not activate human coagulation factor VII but possesses a cofactor function specific for human coagulation factor VIIa; after incubation of a mixture of the recombinant soluble tissue factor with phospholipids reagent and the dilution of the test sample in human coagulation factor VII-deficient plasma, calcium chloride is added and the clotting time determined; the clotting time is inversely related to the human coagulation factor VIIa activity of the test sample.

## CHARACTERS

*Appearance*: white or almost white, pale yellow, green or blue, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

## IDENTIFICATION

It complies with the limits of the assay.

## TESTS

**Solubility**. To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent solution that may be coloured.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

**Activated coagulation factors** (*2.6.22*). For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin** (*2.7.12*). If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in any case not more than 0.5 IU of heparin per International Unit of human coagulation factor VII.

**Thrombin**. If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise the heparin by addition of *protamine sulfate R* (10 µg of protamine sulfate neutralises 1 IU of heparin). In each of 2 test-tubes, mix equal volumes of the reconstituted preparation and of a 3 g/L solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a 3rd tube, mix equal volumes of the fibrinogen solution and of a solution of *human thrombin R* (1 IU/mL) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

**Human coagulation factor II** (*2.7.18*). The estimated content is not more than 125 per cent of the stated content. The confidence limits ($P$ = 0.95) are not less than 90 per cent and not more than 111 per cent of the estimated potency.

**Human coagulation factor IX** (*2.7.11*). The estimated content is not more than 125 per cent of the stated content. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**Human coagulation factor X** (*2.7.19*). The estimated content is not more than 125 per cent of the stated content. The confidence limits ($P$ = 0.95) are not less than 90 per cent and not more than 111 per cent of the estimated potency.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectrometry (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 IU of human coagulation factor VII.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.1 IU of endotoxin per International Unit of human coagulation factor VII.

## ASSAY

**Human coagulation factor VII** (*2.7.10*). The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

## STORAGE

In an airtight container, protected from light.

## LABELLING

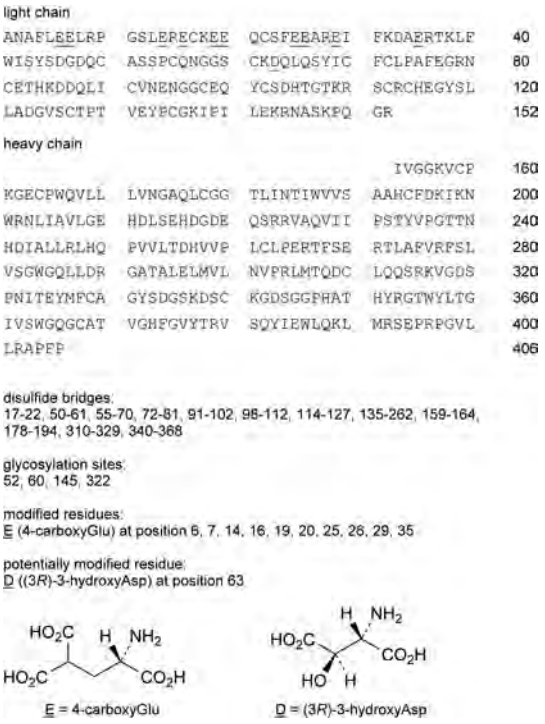
The label states:

- the number of International Units of human coagulation factor VII per container;
- the maximum content of human coagulation factor II, human coagulation factor IX and human coagulation factor X per container, in International Units;
- the amount of protein per container;
- the name and quantity of any added substances, including, where applicable, heparin;
- the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

**01/2015:2534**
**corrected 10.0**

# HUMAN COAGULATION FACTOR VIIa (rDNA) CONCENTRATED SOLUTION

## Factoris VIIa coagulationis humani (ADNr) solutio concentrata



$C_{1982}H_{3054}N_{560}O_{618}S_{28}$ $M_r$ approx. 50 000

DEFINITION

Solution containing closely related glycoproteins, which have the same amino acid sequence (406 amino acids) and disulfide bridges as the naturally occurring analogue (plasma-derived activated coagulation factor VII). Human coagulation factor VIIa (rDNA) (eptacog alfa, activated) is a 2-chain molecule, obtained by proteolytic cleavage of the peptide bond between Arg 152 and Ile 153 of single-chain coagulation factor VII, consisting of a 20 kDa light chain (*N*-terminal) and a 30 kDa heavy chain (*C*-terminal) connected by a disulfide bond.

Human coagulation factor VIIa (rDNA) is distinguishable from the naturally occurring analogue in terms of its post-translational modifications, including glycosylation pattern.

*Content*: 1.11 mg to 1.78 mg of protein per millilitre.

*Potency*: 44 000 IU to 64 000 IU per milligram of protein.

PRODUCTION

Human coagulation factor VIIa (rDNA) is produced in mammalian cells by a method based on recombinant DNA technology (rDNA).

Prior to release, the following tests are carried out on each batch of human coagulation factor VIIa (rDNA) concentrated solution, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority.

**Glycan analysis**.

Use a suitable method developed according to general chapter *2.2.59. Glycan analysis of glycoproteins*.

Glycan analysis includes the following steps:

- after desalting, release of the glycans (see *2.2.59* section 2-3);
- labelling of the glycans with a suitable fluorescent label (Table 2.2.59.-2);
- analysis of the labelled glycans by liquid chromatography (*2.2.29*) with fluorometric detection.

The following procedures may be used.

*Test solution*. Dilute the preparation to be examined in *water R* to obtain a concentration of about 1.5 mg/mL.

*Reference solution*. Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of 1.5 mg/mL.

*DESALTING*

Desalt the test solution and the reference solution as described under Identification B. The buffer used for desalting and elution is a 1.21 g/L solution of *tris(hydroxymethyl)aminomethane R*, adjusted to pH 7.5 with *hydrochloric acid R*. After desalting, the concentration of the solutions is about 1.0 mg/mL.

*SELECTIVE RELEASE OF GLYCANS*

Transfer 500 µL of the desalted test solution and 500 µL of the desalted reference solution to separate centrifuge tubes, and add 10 µL of a 200 U/mL solution of *peptide N-glycosidase F R*. Cap the tubes and incubate for 16-24 h at 37 °C. Remove the protein fraction by adding 1.5 mL of *ethanol (96 per cent) R* at − 20 °C to the tubes. Mix and allow to stand at − 20 °C for 20-30 min. Centrifuge the tubes at 10 000 r/min for 10 min. Collect the supernatant and evaporate to dryness, using for example a rotary evaporator.

*LABELLING OF GLYCANS*

Label the liberated glycans with 2-aminobenzamide using a suitable procedure. The procedure employs a combination of reagents optimised and validated for the efficient labelling of glycans, and for the subsequent extraction and recovery of the labelled glycans from the reaction.

*LIQUID CHROMATOGRAPHY (2.2.29)*

*Precolumn*:

- *size*: *l* = 0.05m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R*;
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: 6 g/L solution of *sodium hydroxide R*;
- *mobile phase B*: solution containing 6 g/L of *sodium hydroxide R* and 40.8 g/L of *sodium acetate R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 52 | 100 → 35 | 0 → 65 |
| 52.0 - 52.1 | 35 → 0 | 65 → 100 |
| 52.1 - 65 | 0 | 100 |
| 65 - 65.1 | 0 → 100 | 100 → 0 |
| 65.1 - 90 | 100 | 0 |

*Flow rate*: 0.5 mL/min.

*Detection*: fluorimeter at 330 nm for excitation and 420 nm for emission.

*Injection*: 100 µL, using an automatic injector maintained at 2-8 °C.

*System suitability*: reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram shown in Figure 2534.-1; peaks 1 to 12 are clearly visible;
- *peak width at half-height*: maximum 30 s for peak 8.

Calculate the percentage content of charged glycans in the reference solution using the following expression:

$$\frac{A}{A+B} \times 100$$

$A$ = sum of the areas of the peaks due to charged glycans (peaks 6 to 12);

$B$ = sum of the areas of the peaks due to uncharged glycans (peaks 1 to 5).

Calculate the percentage content of charged glycans in the test solution accordingly.

*Limit*:

- *percentage of charged glycans*: as authorised by the competent authority.

CHARACTERS

*Appearance*: colourless liquid.

IDENTIFICATION

A. It forms a clot when examined in the conditions described under Assay (Potency).

B. Peptide mapping (*2.2.55*).

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Solution A*. Dissolve 0.74 g of *calcium chloride R* and 6.06 g of *tris(hydroxymethyl)aminomethane R* in 1000 mL of *water R* and adjust to pH 7.5 with *hydrochloric acid R*.

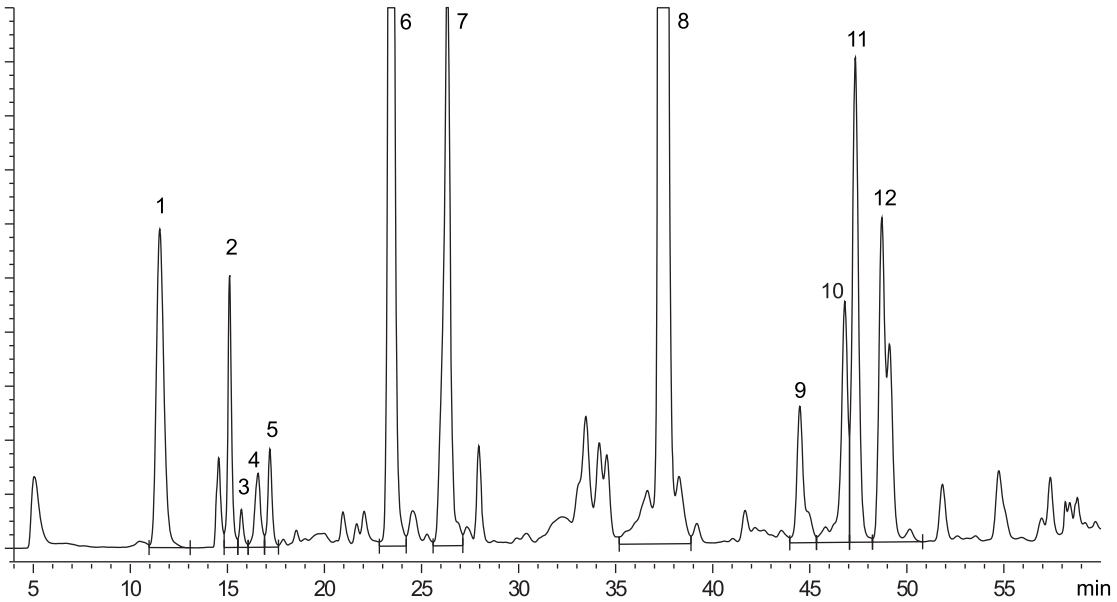
*Test solution*. Dilute the preparation to be examined with solution A to obtain a concentration of about 1.5 mg/mL. Desalt a volume of this solution by a suitable method (for example using a suitable centrifugal filter unit or gel-filtration column with solution A as elution buffer). After desalting, the concentration should be about 1.0 mg/mL. Transfer the desalted solution to a polypropylene tube. Prepare a 1 mg/mL solution of *trypsin for peptide mapping R* and add 10 µL to 1 mL of the desalted solution. Cap the tube and mix gently by inversion. Incubate at 37 °C for 24 h. At time 5.5 h, add 10 µL of the trypsin solution. Remove the sample from the incubator, place it at room temperature, add 9 µL of *glacial acetic acid R* and mix by inversion. Maintain the solution at − 15 °C or below until chromatographic separation; if analysed immediately using an automatic injector, maintain at 2-8 °C.

*Reference solution*. Dissolve *human coagulation factor VIIa (rDNA) CRS* in solution A to obtain a concentration of 1.5 mg/mL. Desalt and digest at the same time and in the same manner as for the test solution.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm;
- *temperature*: 30 °C.



| Peak | Charged | Structure | Peak | Charged | Structure |
|---|---|---|---|---|---|
| 1. | No | Core fucosylated biantennary – non sialylated (2 *N*-acetylgalactosamine terminals) | 7. | Yes | Core fucosylated biantennary – monosialylated (and 1 galactose terminal) |
| 2. | No | Core fucosylated biantennary – non sialylated (*N*-acetylgalactosamine and galactose terminals) | 8. | Yes | Core fucosylated biantennary – bisialylated |
| 3. | No | Structure not determined | 9. | Yes | High-mannose structure with 1 phosphate group |
| 4. | No | Core fucosylated biantennary – non sialylated (galactose and *N*-acetylglucosamine terminals) | 10. | Yes | Core fucosylated triantennary – trisialylated |
| 5. | No | Core fucosylated biantennary – non sialylated (2 galactose terminals) | 11. | Yes | Core fucosylated triantennary – trisialylated |
| 6. | Yes | Core fucosylated biantennary – monosialylated (and 1 *N*-acetylgalactosamine terminal) | 12. | Yes | Structure not determined |

Figure 2534.-1. – *Chromatogram for the test for glycan analysis of human coagulation factor VIIa (rDNA): reference solution*

*Mobile phase*:

– *mobile phase A*: add 0.65 mL of *trifluoroacetic acid R* to 1000 mL of *water for chromatography R* and degas;

– *mobile phase B*: mix 0.5 mL of *trifluoroacetic acid R*, 100 mL of *water for chromatography R* and 900 mL of *acetonitrile R1* and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 100 | 100 → 50 | 0 → 50 |
| 100 - 105 | 50 → 0 | 50 → 100 |
| 105 - 110 | 0 | 100 |
| 110 - 110.1 | 0 → 100 | 100 → 0 |
| 110.1 - 125 | 100 | 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 25 µL.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human coagulation factor VIIa (rDNA) CRS*.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution:

– all major peaks identified in the chromatogram obtained with the reference solution are present in the chromatogram obtained with the test solution;

– no new major peaks are observed in the chromatogram obtained with the test solution in comparison with the chromatogram obtained with the reference solution.

C. Examine the chromatograms obtained in the test for glycan analysis.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

TESTS

**Degraded heavy chain and oxidised forms of human coagulation factor VIIa (rDNA)**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined in *water R* to obtain a concentration of about 1.5 mg/mL.

*Reference solution.* Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of 1.5 mg/mL.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm;

– *temperature*: 60-70 °C.

*Mobile phase*:

– *mobile phase A*: mix 1 mL of *trifluoroacetic acid R* and 999 mL of *water for chromatography R* and degas;

– *mobile phase B*: mix 1 mL of *trifluoroacetic acid R*, 200 mL of *water for chromatography R* and 800 mL of *acetonitrile R1* and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 54 → 41 | 46 → 59 |
| 30 - 33 | 41 → 0 | 59 → 100 |
| 33 - 38 | 0 | 100 |
| 38 - 40 | 0 → 54 | 100 → 46 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: about 20 µL, using an automatic injector maintained at 2-8 °C.

*Retention time*: human coagulation factor VIIa (rDNA) = about 26 min.

*System suitability*:

– the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram shown in Figure 2534.-2; peaks 1 to 10 are clearly visible;

– *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of peak 6 and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from peak 7.

*Results*:

– the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

Calculate the individual percentage area (relative to the total peak area) of the peaks due to the degraded heavy chain human coagulation factor VIIa (rDNA) (peaks 1, 2 and 6) and oxidised forms of human coagulation factor VIIa (rDNA) (peaks 3, 4 and 5).

*Limits*:

– *sum of degraded heavy chain forms*: maximum 11 per cent;

– *sum of oxidised forms*: maximum 2.2 per cent.

**Gla-domainless human coagulation factor VIIa (rDNA) (gamma-carboxylation)**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined in *water R* to obtain a concentration of about 1.5 mg/mL.

*Reference solution.* Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of 1.5 mg/mL.

*Precolumn*:

– *stationary phase*: *styrene-divinylbenzene copolymer R* with iminodiacetic groups, for removal of calcium.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *strongly basic anion-exchange resin for chromatography R1*;

– *temperature*: 25 °C.

*Mobile phase*:

– *mobile phase A*: solution containing 1.2 g/L of *tris(hydroxymethyl)aminomethane R* and 2.8 g/L of *bis-tris propane R*, adjusted to pH 9.4 with *glacial acetic acid R* and degassed;

– *mobile phase B*: solution containing 1.2 g/L of *tris(hydroxymethyl)aminomethane R*, 2.8 g/L of *bis-tris propane R* and 107.9 g/L of *ammonium acetate R*, adjusted to pH 9.4 with *concentrated ammonia R* and degassed;

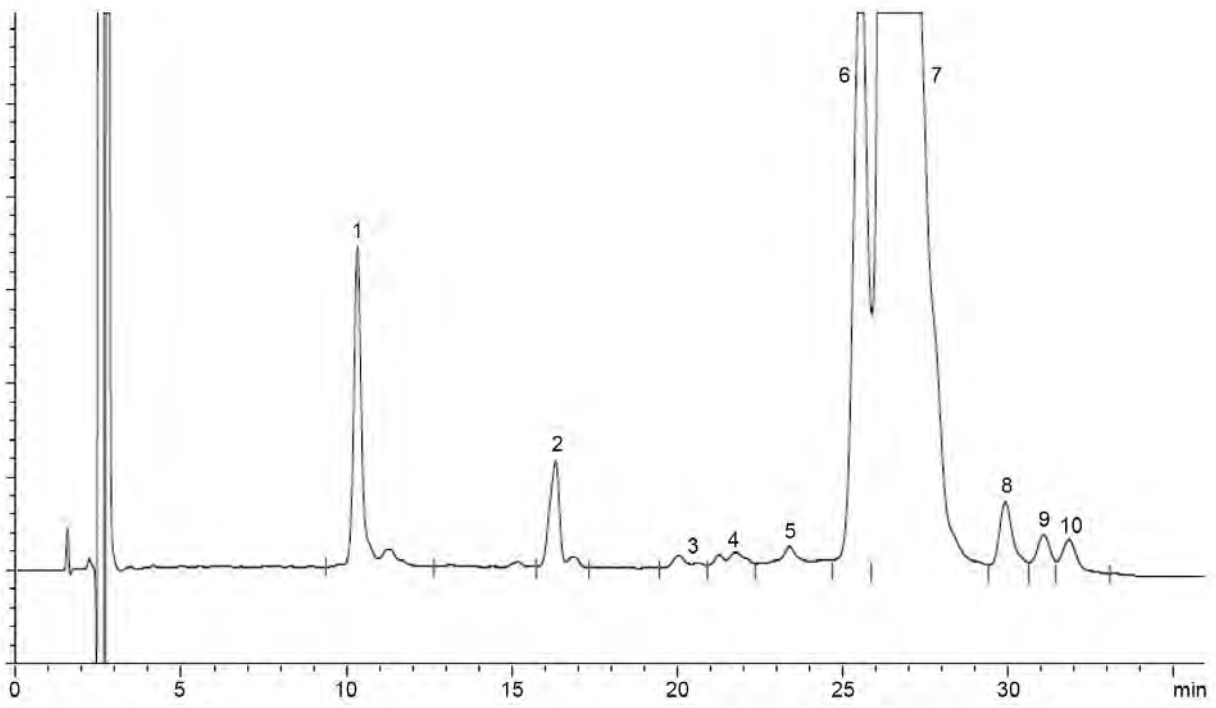
| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2.5 | 100 | 0 |
| 2.5 - 27.5 | 100 → 0 | 0 → 100 |
| 27.5 - 30.5 | 0 → 100 | 100 → 0 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: about 100 µL, using an automatic injector maintained at 2-8 °C.

*Relative retention* with reference to human coagulation factor VIIa (rDNA) (retention time = about 14 min): Gla-domainless human coagulation factor VIIa (rDNA) = about 0.7.



1. degraded heavy chain
2. degraded heavy chain
3. oxidised form
4. oxidised form
5. oxidised form
6. degraded heavy chain
7. human coagulation factor VIIa (rDNA)

10. unknown

Figure 2534.-2. – *Chromatogram for the test for degraded heavy chain and oxidised forms of human coagulation factor VIIa (rDNA): reference solution*

*System suitability*: reference solution:

– *resolution*: baseline separation between the peak due to Gla-domainless human coagulation factor VIIa (rDNA) and the peak cluster due to human coagulation factor VIIa (rDNA).

*Limit*:

– *Gla-domainless human coagulation factor VIIa (rDNA)*: maximum 6.1 per cent.

Integrate the peak cluster to baseline.

**Dimers and related substances of higher molecular mass**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined in *water R* to obtain a concentration of about 1.5 mg/mL.

*Reference solution.* Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of 1.5 mg/mL.

*Column*:

– *size*: *l* = 0.3 m, Ø = 7.5 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R* (10 µm) of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000;

– *temperature*: 21-25 °C.

*Mobile phase.* Dissolve 26.4 g of *ammonium sulfate R* in approximately 900 mL of *water for chromatography R*. Adjust first to pH 2.5 with *phosphoric acid R* and then to pH 7.0 with *triethylamine R*. Add 50 mL of *2-propanol R* and dilute to 1000 mL with *water for chromatography R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 20 µL, using an automatic injector maintained at 2-8 °C.

*System suitability*: reference solution:

– the chromatogram obtained is qualitatively similar to the chromatogram supplied with *human coagulation factor VIIa (rDNA) CRS*;

– *symmetry factor*: maximum 1.3 for the peak due to the monomer;

– *peak-to-valley ratio*: minimum 1.1, where $H_p$ = height above the baseline of the peak due to dimers and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

*Limit*:

– *sum of the areas of the peaks with a retention time less than that of the monomer*: maximum 2.7 per cent.

**Non-activated single-chain factor VII (rDNA)**. Polyacrylamide gel electrophoresis (*2.2.31*): use the normalisation procedure.

*Gel dimensions*: 1 mm thick.

*Resolving gel*: 12 per cent acrylamide.

*Sample buffer (reducing conditions)*: *concentrated SDS-PAGE sample buffer for reducing conditions R* containing *dithiothreitol R* as the reducing agent.

*Test solution.* Dilute the preparation to be examined in *water R* to obtain a concentration of about 800 µg/mL. Mix equal volumes of this solution and the sample buffer (reducing conditions).

*Reference solution (a).* Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of about 800 µg/mL. Mix equal volumes of this solution and the sample buffer (reducing conditions).

*Reference solution (b).* Solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 10-70 kDa.

*Sample treatment*: boil for 5 min or heat at 73 ± 3 °C for 10 min.

*Application*: 10 µL.

*Detection*: by Coomassie staining.

*Quantification*: integrating densitometer.

*System suitability*:

- the principal bands in the electropherogram obtained with the test solution correspond in position to the principal bands in the electropherogram obtained with reference solution (a) (30 kDa, heavy chain and 20-25 kDa, light chain);
- reference solution (b): the validation criteria are met (*2.2.31*);
- a band corresponding to non-activated single-chain factor VII (rDNA) (molecular mass of 51 kDa) is visible in the electropherogram obtained with reference solution (a).

*Limit*:

- *non-activated single-chain factor VII (rDNA)*: maximum 3 per cent.

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/mL.

ASSAY

**Protein**. Size-exclusion chromatography (*2.2.30*) as described in the test for dimers and related substances of higher molecular mass with the following modifications.

*Injection*: 10 µL, 20 µL and 30 µL of the reference solution.

Plot peak areas against injected protein content and perform a linear regression to create a standard curve.

Calculate the content of human coagulation factor VIIa (rDNA) using the monomer peak area in the chromatogram obtained with the test solution and taking into account the assigned content of *human coagulation factor VIIa (rDNA) CRS*.

*System suitability*:

- *repeatability*: maximum relative standard deviation of 2.0 per cent after 5 injections of 20 µL of the reference solution;
- the correlation coefficient calculated for the standard curve ($r^2$) is not less than 0.990.

**Potency**.

The principle of the assay is to measure the ability of a factor VIIa preparation to reduce the prolonged coagulation time of factor VII-deficient plasma.

The biological activity is assessed by comparing the dose-response curve of the preparation to be examined to that of a reference preparation calibrated in International Units. The International Unit is the activity contained in a stated amount of the International Reference Preparation.

The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

*Method*.

*Use a suitable coagulation analyser or carry out the assay with incubation tubes and reagents maintained in a water-bath at 37 °C.*

*Solution A*. Prepare a solution containing 15.12 g/L of *1,4-piperazinediethanesulfonic acid R*, 5.73 g/L of *sodium chloride R*, 0.74 g/L of *sodium edetate R* and 10 g/L of *bovine albumin R*; adjust to pH 7.2 with *sodium hydroxide R*.

Prepare 3 different solutions of the preparation to be examined and of the reference preparation, by diluting with solution A, to obtain concentrations within the linearity range (0.002-0.15 IU/mL). Prepare in duplicate and use the solutions immediately.

To 40 µL of each solution, add 40 µL of *factor VII-deficient plasma R*, incubate for an appropriate time at 37 °C, and add 40 µL of *human tissue factor solution R*.

Measure the coagulation time, i.e. the interval between the addition of the human tissue factor solution and the first indication of the formation of fibrin.

*The volumes given above and sequence of reagents may be adapted to the human tissue factor solution and apparatus used.*

Calculate the activity in International Units per millilitre using an appropriate statistical method, for example the parallel-line assay (*5.3*).

The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

LABELLING

The label states:

- the content of human coagulation factor VIIa (rDNA), in milligrams per millilitre;
- the specific activity, in International Units per milligram of protein.

**07/2013:0275**

# HUMAN COAGULATION FACTOR VIII

## Factor VIII coagulationis humanus

DEFINITION

Sterile, freeze-dried preparation of a plasma protein fraction containing the glycoprotein human coagulation factor VIII together with varying amounts of human von Willebrand factor, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of factor VIII:C per millilitre.

PRODUCTION

*GENERAL PROVISIONS*

The method of preparation is designed to maintain functional integrity of human coagulation factor VIII and to minimise potential neoantigenicity. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 1 IU of factor VIII:C per milligram of total protein before the addition of any protein stabiliser.

The human coagulation factor VIII fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

*CONSISTENCY OF THE METHOD OF PRODUCTION*

*Products stated to have human von Willebrand factor activity (products intended for treatment of von Willebrand's disease).* It shall be demonstrated by suitable analytical procedures determined during process development that the manufacturing process yields a product with a consistent composition with respect to human von Willebrand factor. This composition may be characterised in a number of ways. For example, the distribution of the different human von Willebrand factor multimers may be determined by sodium dodecyl sulfate (SDS) agarose gel electrophoresis (about 1 per cent agarose) with or without Western blot analysis, using a normal human plasma pool as reference. Visualisation of the multimeric pattern may be performed using, for example, an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis.

*Products that show flakes or particles after reconstitution for use*. If a few small flakes or particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter provided.

CHARACTERS

*Appearance*: white or pale yellow, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assay.

TESTS

**Solubility**. To a container of the preparation to be examined, add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless or slightly yellow solution.

Where the label states that the product may show a few small flakes or particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser such as albumin, this method may not be applicable and another validated method for protein determination must therefore be performed.*

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method A*). The 1 to 64 dilution does not show agglutination. Dilute the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to contain 3 IU of factor VIII:C per millilitre.

**Water**. Determined by a suitable method, such as semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 50 IU of factor VIII:C.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.03 IU of endotoxin per International Unit of factor VIII:C.

ASSAY

**Human coagulation factor VIII** (*2.7.4*). The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Human von Willebrand factor** (*2.7.21*). If preparations are intended for the treatment of von Willebrand's disease, the estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency.

*Pending the availability of an International Standard for human von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.*

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of factor VIII:C and, where applicable, of human von Willebrand factor in the container;
- the amount of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, that the preparation may show the presence of a few small flakes or particles after reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

**01/2008:1643**

# HUMAN COAGULATION FACTOR VIII (rDNA)

## Factor VIII coagulationis humanus (ADNr)

DEFINITION

Human coagulation factor VIII (rDNA) is a freeze-dried preparation of glycoproteins having the same activity as coagulation factor VIII in human plasma. It acts as a cofactor of the activation of factor X in the presence of factor IXa, phospholipids and calcium ions.

Human coagulation factor VIII circulates in plasma mainly as a two-chain glycosylated protein with 1 heavy (relative molecular mass of about 200 000) and 1 light (relative molecular mass 80 000) chain held together by divalent metal ions. Human coagulation factor VIII (rDNA) is prepared as full-length factor VIII (octocog alfa), or as a shortened two-chain structure (relative molecular mass 90 000 and 80 000), in which the B-domain has been deleted from the heavy chain (moroctocog alfa).

Full-length human rDNA coagulation factor VIII contains 25 potential *N*-glycosylation sites, 19 in the B domain of the heavy chain, 3 in the remaining part of the heavy chain (relative molecular mass 90 000) and 3 in the light chain (relative molecular mass 80 000). The different products are characterised by their molecular size and post-translational modification and/or other modifications.

PRODUCTION

Human coagulation factor VIII (rDNA) is produced by recombinant DNA technology in mammalian cell culture. It is produced under conditions designed to minimise microbial contamination.

Purified bulk factor VIII (rDNA) may contain added human albumin and/or other stabilising agents, as well as other auxiliary substances to provide, for example, correct pH and osmolality.

The specific activity is not less than 2000 IU of factor VIII:C per milligram of total protein before the addition of any protein stabiliser, and varies depending on purity and the type of modification of molecular structure of factor VIII.

The quality of the bulk preparation is controlled using one or more manufacturer's reference preparations as reference.

*MANUFACTURER'S REFERENCE PREPARATIONS*

During development, reference preparations are established for subsequent verification of batch consistency during production, and for control of bulk and final preparation. They are derived from representative batches of purified bulk factor VIII (rDNA) that are extensively characterised by tests including those described below and whose procoagulant and other relevant functional properties have been ascertained and compared, wherever possible, with the International Standard for factor VIII concentrate. The reference preparations are suitably characterised for their intended purpose and are stored in suitably sized aliquots under conditions ensuring their stability.

*PURIFIED BULK FACTOR VIII (rDNA)*

*The purified bulk complies with a suitable combination of the following tests for characterisation of integrity of the factor VIII (rDNA). Where any substance added during preparation of the purified bulk interferes with a test, the test is carried out before addition of that substance. Where applicable, the characterisation tests may alternatively be carried out on the finished product.*

**Specific biological activity or ratio of factor VIII activity to factor VIII antigen**. Carry out the assay of human coagulation factor VIII (*2.7.4*). The protein content, or where a protein stabiliser is present, the factor VIII antigen content, is determined by a suitable method and the specific biological activity or the ratio of factor VIII activity to factor VIII antigen is calculated.

**Protein composition**. The protein composition is determined by a selection of appropriate characterisation techniques which may include peptide mapping, Western blots, HPLC, gel electrophoresis, capillary electrophoresis, mass spectrometry or other techniques to monitor integrity and purity. The protein composition is comparable to that of the manufacturer's reference preparation.

**Molecular size distribution**. Using size-exclusion chromatography (*2.2.30*), the molecular size distribution is comparable to that of the manufacturer's reference preparation.

**Peptide mapping** (*2.2.55*). There is no significant difference between the test protein and the manufacturer's reference preparation.

**Carbohydrates/sialic acid**. To monitor batch-to-batch consistency, the monosaccharide content and the degree of sialylation or the oligosaccharide profile are monitored and correspond to those of the manufacturer's reference preparation.

*FINAL LOT*

It complies with the requirements under Identification, Tests and Assay.

**Excipients**: 80 per cent to 120 per cent of the stated content, determined by a suitable method, where applicable.

CHARACTERS

*Appearance*: white or slightly yellow powder or friable mass.

IDENTIFICATION

A. It complies with the limits of the assay.

B. The distribution of characteristic peptide bands corresponds with that of the manufacturer's reference preparation (SDS-PAGE or Western blot).

TESTS

*Reconstitute the preparation as stated on the label immediately before carrying out the tests (except those for solubility and water) and assay.*

**Solubility**. It dissolves within 5 min at 20-25 °C, giving a clear or slightly opalescent solution.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test for sterility.

**Bacterial endotoxins** (*2.6.14*): less than 3 IU in the volume that contains 100 IU of factor VIII activity.

ASSAY

Carry out the assay of human coagulation factor VIII (*2.7.4*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

Protected from light.

LABELLING

The label states:

- the factor VIII content in International Units,
- the name and amount of any excipient,
- the composition and volume of the liquid to be used for reconstitution.

**01/2011:1223**
**corrected 7.6**

# HUMAN COAGULATION FACTOR IX

## Factor IX coagulationis humanus

DEFINITION

Sterile freeze-dried preparation of a plasma protein fraction containing coagulation factor IX. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*, by a method that effectively separates human coagulation factor IX from other prothrombin complex factors (human coagulation factors II, VII and X). The preparation may contain excipients such stabilisers, heparin and antithrombin.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of human coagulation factor IX per millilitre.

PRODUCTION

*GENERAL PROVISIONS*

The method of preparation is designed to maintain functional integrity of human coagulation factor IX and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection;

if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 50 IU of human coagulation factor IX per milligram of total protein, before the addition of any protein stabiliser.

The human coagulation factor IX fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

*CONSISTENCY OF THE METHOD OF PRODUCTION*

It shall be demonstrated that the manufacturing process yields a product having a consistent composition. This is evaluated by suitable analytical procedures that are determined during process development and that normally include:

- assay of human coagulation factor IX;
- determination of activated coagulation factors;
- determination of activities of human coagulation factors II, VII and X, which shall be shown to be not more than 5 per cent of the activity of human coagulation factor IX.

## CHARACTERS

*Appearance*: white or pale yellow, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

## IDENTIFICATION

It complies with the limits of the assay.

## TESTS

**Solubility**. To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless solution.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser such as albumin, this method may not be applicable. Another validated method for protein determination must therefore be performed.*

**Activated coagulation factors** (*2.6.22*). If necessary, dilute the reconstituted preparation to contain 20 IU of human coagulation factor IX per millilitre. For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin** (*2.7.12*). If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per International Unit of human coagulation factor IX.

**Water**. Determined by a suitable method, such as semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 50 IU of human coagulation factor IX.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.03 IU of endotoxin per International Unit of human coagulation factor IX.

## ASSAY

**Human coagulation factor IX** (*2.7.11*). The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

## STORAGE

In an airtight container, protected from light.

## LABELLING

The label states:

- the number of International Units of human coagulation factor IX per container;
- the amount of protein per container;
- the name and quantity of any added substances including, where applicable, heparin;
- the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

DEFINITION

Solution containing closely related glycoproteins, which have the same amino acid sequence (415 amino acids) as the naturally occurring Ala 148 allelic form analogue (plasma-derived coagulation factor IX). It is a single-chain glycoprotein with structural and functional characteristics similar to those of the endogenous factor IX. It may contain buffer salts and/or non-proteinaceous stabilisers.

*Content*: minimum 150 IU per millilitre.

*Potency*: 200 to 360 IU per milligram of protein.

PRODUCTION

Human coagulation factor IX (rDNA) is produced in mammalian cells by a method based on recombinant DNA technology (rDNA). The method of preparation is designed to maintain the functional integrity of factor IX, and to minimise the activation of human coagulation factor IX (rDNA) (to minimise potential thrombogenicity).

No antibiotic or antimicrobial preservative is added.

Prior to release, the following tests are carried out on each batch of human coagulation factor IX (rDNA) concentrated solution, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority

**Glycan analysis**. Use a suitable method developed according to general chapter *2.2.59. Glycan analysis of glycoproteins*, Section 2-3.

- Release the glycans using one of the agents described in Table *2.2.59.*-1, for example peptide *N*-glycosidase F (PNGase F).
- Label the released glycans with one of the fluorescent labelling agents described in Table *2.2.59.*-2, for example 2-aminobenzamide.
- Analyse the labelled glycans by liquid chromatography (*2.2.29*) using a high-pH-resistant column with fluorescence detection.

*The following procedure is given as an example.*

*Test solution.* Dilute the preparation to be examined with the formulation buffer (see Tests) to obtain a concentration of about 2 mg/mL. Use 50 µL of this solution to proceed to glycan release and labelling. Resuspend or dilute the labelled glycans in 200 µL of *water R*.

*Reference solution (a).* Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer (see Tests) to obtain a concentration of about 2 mg/mL. Use 50 µL of this solution to proceed to glycan release and labelling. Resuspend or dilute the labelled glycans in 200 µL of *water R*.

*Reference solution (b).* Use a suitable human coagulation factor IX (rDNA) in-house reference preparation shown to be representative of batches tested clinically and batches used to demonstrate consistency of production. Dilute with the formulation buffer to obtain a concentration of about 2 mg/mL. Use 50 µL of this solution to proceed to glycan release and labelling. Resuspend or dilute the labelled glycans in 200 µL of *water R*.

*Blank solution.* Use 50 µL of the formulation buffer to proceed to glycan release and labelling.

Analyse the labelled glycans by liquid chromatography (*2.2.29*).

*Precolumn*:

- *size*: *l* = 0.01 m, Ø = 4.6 mm;
- *stationary phase*: *polyamine grafted poly(vinyl alcohol) copolymer R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *polyamine grafted poly(vinyl alcohol) copolymer R* (5 µm).
- *temperature*: 50 °C.

*Mobile phase*:

- *mobile phase A*: *water R*, *glacial acetic acid R*, *acetonitrile R* (1:2:97 *V/V/V*);
- *mobile phase B*: *concentrated ammonia R*, *glacial acetic acid R*, *water R* (1:3:96 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 70 | 30 |
| 2 - 67 | 70 → 0 | 30 → 100 |
| 67 - 70 | 0 | 100 |
| 70 - 70.1 | 0 → 70 | 100 → 30 |
| 70.1 - 95 | 70 | 30 |

*Flow rate*: 0.5 mL/min.

*Detection*: fluorimeter at 330 nm for excitation and 420 nm for emission.

*Injection*: 20 µL, using an automatic injector maintained at 2-8 °C.

If carry-over of material is observed, running a blank gradient after each injection may be appropriate.

*Identification of peak groups*: use the chromatogram in Figure 2522.-1 to identify the 5 groups of oligosaccharides corresponding to P0 neutral, P1 mono-, P2 di-, P3 tri- and P4 tetrasialylated oligosaccharides. Record the retention times of the most prominent peaks in groups P0 to P4. Calculate the relative retentions of the most prominent peaks in groups P0 to P3 with reference to the most prominent peak in group P4.

Calculate the tetrasialylated peak area ratio for the test solution using the following expression:

$$\frac{A_{P4}}{\Sigma_{i=0}^{3} A_{Pi}}$$

$A_{P4}$ = peak area of group P4;

$A_{Pi}$ = peak area of groups P0 to P3.

*System suitability*:

- the chromatogram obtained with reference solution (a) is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*; 5 groups of oligosaccharide peaks corresponding to P0 neutral, P1 mono-, P2 di-, P3 tri- and P4 tetrasialylated oligosaccharides are present; group P4 includes the highest peak, and P3 the second-highest peak;
- no significant peaks are observed in regions P0 to P4 in the chromatogram obtained with the blank solution.

*Results*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with reference solution (b);
- the relative retentions of the most prominent peaks in groups P0 to P3 in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with reference solution (b);
- the tetrasialylated peak area ratio for the test solution is within the limits authorised by the competent authority.

CHARACTERS

*Appearance*: clear, colourless liquid.

IDENTIFICATION

A. It forms a clot when examined in the conditions described under Assay (Potency).

B. Peptide mapping (*2.2.55*).

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Solution A*. Dissolve 143.3 g of *guanidine hydrochloride R*, 9.086 g of *tris(hydroxymethyl)aminomethane R* and 0.931 g of *sodium edetate R* in 250 mL of *water R* and adjust to pH 8.0 ± 0.1 with *hydrochloric acid R*.

*Test solution*. Dilute the preparation to be examined with the formulation buffer (see Tests) to obtain a concentration of about 1.5 mg/mL.

*Reference solution*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer (see Tests) to obtain a concentration of about 1.5 mg/mL.

*Reduction and alkylation*. To 67 µL of the test solution add 28 µL of *water R*, 100 µL of solution A, then 5 µL of a 30.85 g/L solution of *dithiothreitol R*, mix well and centrifuge briefly. Overlay with nitrogen. Incubate in a water-bath at 40 °C for 1 h. Add 6.6 µL of a freshly prepared 115.04 g/L solution of *iodoacetic acid R*, mix well and centrifuge briefly. Overlay with nitrogen. Incubate at room temperature for 1 h protected from light. Add 5.3 µL of a 30.85 g/L of solution of *dithiothreitol R* and mix well. Add 188.1 µL of *water R*.

*Digestion*. To the reduced solution prepared previously, add 10 µL of a freshly prepared 3.4 U/mL solution of *lysyl endopeptidase R*, mix well and centrifuge briefly. Overlay with nitrogen. Incubate at 30 °C for 4 h. Mix 90 µL of the digested solution and 180 µL of a 33.22 g/L solution of *sodium edetate R*.

Carry out the reduction/alkylation and digestion steps for the reference solution in the same manner as for the test solution.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

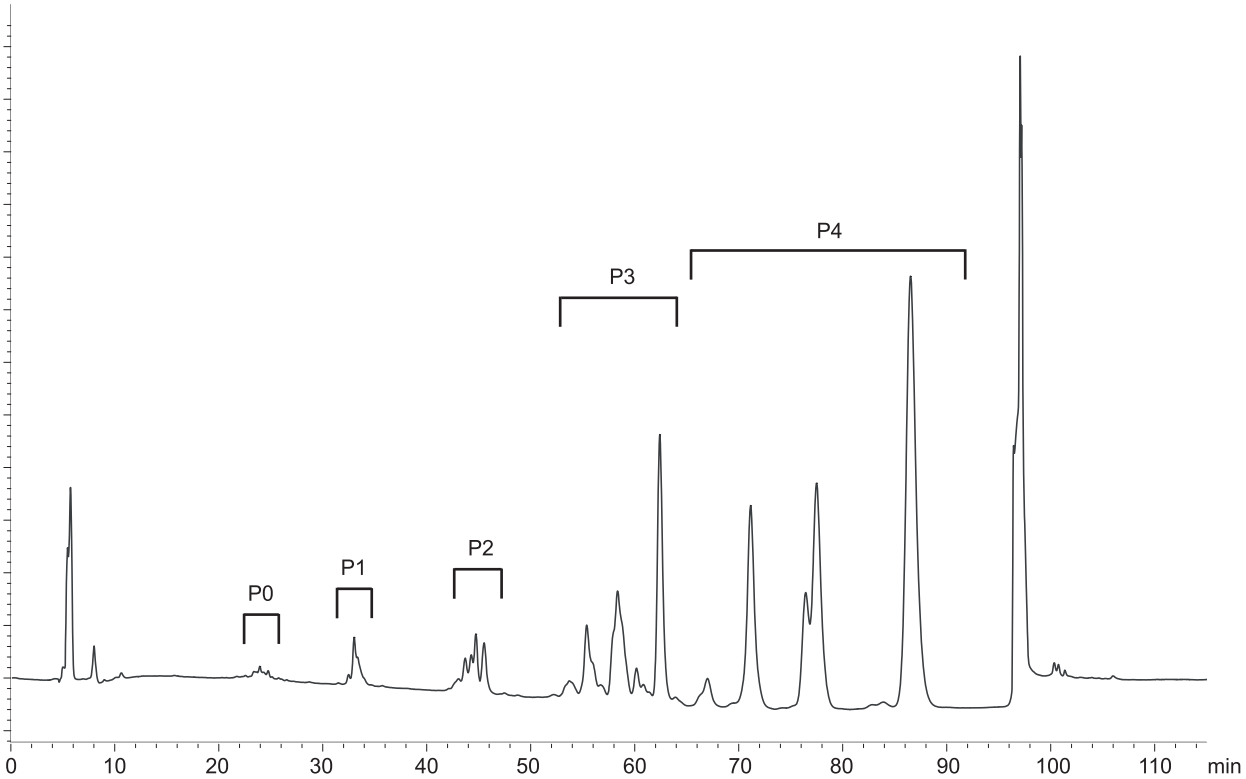

Figure 2522.-1. – *Chromatogram for the test for glycan analysis of human coagulation factor IX (rDNA)*

*Column*:
- *size*: *l* = 0.25 m, Ø = 2.1 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm;
- *temperature*: 25 °C.

*Mobile phase*:
- *mobile phase A*: add 0.5 mL of *trifluoroacetic acid R* to 1000 mL of *water R* and degas;
- *mobile phase B*: mix 0.5 mL of *trifluoroacetic acid R*, 50 mL of *water R* and 950 mL of *acetonitrile for chromatography R* and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 97 | 3 |
| 5 - 35 | 97 → 85 | 3 → 15 |
| 35 - 60 | 85 → 81 | 15 → 19 |
| 60 - 81 | 81 → 74 | 19 → 26 |
| 81 - 101 | 74 → 71 | 26 → 29 |
| 101 - 135 | 71 → 60 | 29 → 40 |
| 135 - 140 | 60 → 0 | 40 → 100 |
| 140 - 150 | 0 | 100 |
| 150 - 150.01 | 0 → 97 | 100 → 3 |
| 150.01 - 190 | 97 | 3 |
| 190 - 191 | 97 → 50 | 3 → 50 |
| 191 - 251 | 50 | 50 |

*Flow rate*: 0.25 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 240 µL, using an automatic injector maintained at 2-8 °C.

*System suitability*:
- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- all peaks identified in the chromatogram supplied with *human coagulation factor IX (rDNA) CRS* are visible in the chromatogram obtained with the reference solution.

*Results*:
- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution;
- no new major peaks are observed in the chromatogram obtained with the test solution in comparison to the chromatogram obtained with the reference solution.

C. Polyacrylamide gel electrophoresis (*2.2.31*).

Examine the electropherograms obtained in the test for impurities with molecular masses differing from that of human coagulation factor IX (rDNA).

Calculate the relative mobility (in per cent) of the main band in the electropherogram obtained with the test solution with reference to the mobility of the main band in the electropherogram obtained with reference solution (a), using the following expression:

$$\frac{M_1 - M_2}{M_2} \times 100$$

$M_1$ = molecular mass of the main band in the electropherogram obtained with the test solution;

$M_2$ = molecular mass of the main band in the electropherogram obtained with reference solution (a).

*Results*:
- the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (a);
- the mobility of the main band in the electropherogram obtained with the test solution is within 10 per cent of that of the main band in the electropherogram obtained with reference solution (a).

TESTS

**Formulation buffer**. Dissolve 19.53 g of *glycine R*, 1.55 g of *histidine R* and 10.00 g of *sucrose R* in 1000 mL of *water R*. Add 50 µL of *polysorbate 80 R* and adjust to pH 6.8 with *hydrochloric acid R*.

**Gamma-carboxyglutamic acid (Gla)**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution*. Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 1 mg/mL.

*Reference solution*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 1 mg/mL.

*Blank solution*. The formulation buffer.

*Column*:
- *size*: *l* = 0.05 m, Ø = 5 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (10 µm).

*Mobile phase*:
- *mobile phase A*: solution containing 2.42 g/L of *tris(hydroxymethyl)aminomethane R*, adjusted to pH 9.0 with *hydrochloric acid R*;
- *mobile phase B*: solution containing 2.42 g/L of *tris(hydroxymethyl)aminomethane R* and 58.45 g/L of *sodium chloride R*, adjusted to pH 9.0 with *hydrochloric acid R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 40 | 70 → 60 | 30 → 40 |
| 40 - 49 | 60 → 0 | 40 → 100 |
| 49 - 50 | 0 → 70 | 100 → 30 |
| 50 - 71 | 70 | 30 |

*Flow rate*: 0.75 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 50 µL; perform at least 3 injections using an automatic injector maintained at 2-8 °C.

*Relative retention* with reference to human coagulation factor IX (rDNA) containing 12 Gla residues per molecule (12 Gla, retention time = about 25 min): 9Gla = 0.60; 10Gla = 0.75; 11Gla = 0.85. *NOTE*: molecular species containing 9 or fewer Gla residues per molecule of human coagulation factor IX (rDNA) may not be present in the preparation.

*System suitability*: reference solution:
- *repeatability*: maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA), determined on 3 injections performed immediately before the run;
- the 10Gla peak is visible and is similar to the corresponding peak in the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- *peak-to-valley ratio*: minimum 1.2, where $H_p$ = height above the baseline of the peak due to 11Gla, and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to 12Gla.

*Results*:

- *repeatability*: maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA), determined on 3 injections of the test solution;
- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

Calculate the total Gla content using the following expression:

$$\sum_{i=9}^{12} \frac{A_{Pi}}{total\ peak\ area} \times i\ Gla.mol^{-1}$$

- $A_{Pi}$: area of the concerned peak (9Gla, 10Gla, 11Gla or 12Gla); any shoulder appearing on the descending part of the 12Gla peak is included in the area of the 12Gla peak;
- *total peak area*: sum of the areas of peaks 9Gla to 12Gla;
- *i Gla.mol*$^{-1}$: 9, 10, 11 or 12, corresponding to the theoretical number of Gla residues per mole of human coagulation factor IX (rDNA) for the concerned peak.

*Limit*:

- 11.0 to 12.0 moles of Gla per mole of human coagulation factor IX (rDNA).

**Related proteins and impurities**. Liquid chromatography (*2.2.29*).

*Test solution.* Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 0.5 mg/mL.

*Reference solution.* Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 0.5 mg/mL.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (10 µm) with a pore size of 400 nm;
- *temperature*: 37 °C.

*Mobile phase*:

- *mobile phase A*: add 1 mL of *trifluoroacetic acid R* to 1000 mL of *water R*;
- *mobile phase B*: mix 1 mL of *trifluoroacetic acid R*, 200 mL of *water R* and 800 mL of *acetonitrile for chromatography R*.

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 0.5 | 75 | 25 |
| 0.5 - 30 | 75 → 20 | 25 → 80 |
| 30 - 31 | 20 → 0 | 80 → 100 |
| 31 - 33 | 0 | 100 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 100 µL; perform at least 3 injections using an automatic injector.

*Relative retention* with reference to the 2nd peak of the double peak due to human coagulation factor IX (rDNA) (retention time = about 12-14 min): related protein A = about 0.75; related protein B = about 0.78; related protein C = about 0.80; related protein D = about 0.85; related protein E = about 0.93.

*System suitability*: reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- *repeatability*: maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA) after 3 injections performed immediately before the run;
- *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to related protein E and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to human coagulation factor IX (rDNA).

Report individual relative peak areas considering the peak area of the entire chromatogram. Individual relative per cent peak areas are calculated as the average of the 3 injections of the test solution.

*Results*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution, except for minor peaks due to impurities, that may be absent in the chromatogram obtained with the test solution.

*Limits*:

- *related protein C*: maximum 0.6 per cent;
- *total impurities (all peaks not eluted at the positions expected for human coagulation factor IX (rDNA) and its related proteins)*: maximum 1.0 per cent.

**Impurities with molecular masses differing from that of human coagulation factor IX (rDNA)**. Polyacrylamide gel electrophoresis (*2.2.31*) using a gradient gel with the following modifications.

*Gel dimensions*: 1.0 mm thick.

*Resolving gel*: 3-15 per cent acrylamide gradient gel.

*Acrylamide solution*: *30 per cent acrylamide/bisacrylamide (36.5:1) solution R*.

To prepare a 15 per cent acrylamide solution, add *sucrose R* to obtain a concentration of 142 g/L.

The following elements are provided as examples for loading the gel forming apparatus to prepare the stacking gel.

*Stacking gel.* The stacking gel solution is prepared by mixing:

- 100 volumes of *30 per cent acrylamide/bisacrylamide (36.5:1) solution R*;
- 125 volumes of *1 M tris-hydrochloride buffer solution pH 6.8 R*;
- 740.5 volumes of *water R*;
- 1.5 volumes of *tetramethylethylenediamine R*;
- 33 volumes of a 150 mg/mL solution of *ammonium persulfate R*.

Load the compartments of the gradient-forming apparatus with the acrylamide solutions and proceed as per the instructions of the equipment supplier to obtain the polymerised gradient gel.

After polymerisation is completed, rinse the gradient gel with *water R*. Remove any excess liquid. Pour the stacking gel solution into the equipment, insert a clean comb and allow for polymerisation.

Alternatively, commercially available gradient gels may be used.

*Test solution.* Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 1 mg/mL.

*Reference solution (a).* Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 1 mg/mL.

*Reference solution (b).* 0.01 mg/mL solution of *bovine albumin R* in the formulation buffer.

*Reference solution (c).* A solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 5-200 kDa.

*Sample buffer. Concentrated SDS-PAGE sample buffer for reducing conditions R* containing dithiothreitol as the reducing agent.

*Sample treatment*: incubate in a water-bath for 5 min.

*Application*: 35 µL.

Use *SDS-PAGE running buffer R* for running the gel.

For each gel, run 1 lane with reference solution (b), 2 lanes with reference solution (c), 2 lanes with the incubated reducing buffer (as blank) and at least 1 lane with reduced reference solution (a); use the remaining lanes for reduced test solutions.

*Detection*: by Coomassie staining.

*Identification of bands*: human coagulation factor IX (rDNA) has an approximate molecular mass of 55 kDa, and related protein bands with molecular masses of approximately 54 kDa, 44 kDa, 29-32 kDa, 27 kDa and 14 kDa are present.

*System suitability*:

- a clear background is obtained after destaining;
- the band in the electropherogram obtained with reference solution (b) is clearly visible;
- all expected bands in the electropherogram obtained with reference solution (c) are visible;
- the bands in the electropherogram obtained with reference solution (c) are clearly separated;
- no band is visible in the blank lanes.

*Results*:

- the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (a);
- no new band in the electropherogram obtained with the test solution has an intensity greater than that of the band in the electropherogram obtained with reference solution (b).

**Impurities with molecular masses greater than that of human coagulation factor IX (rDNA)**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution.* Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 400 µg/mL.

*Reference solution.* Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 400 µg/mL.

*Resolution solution.* Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 400 µg/mL. Desalt and concentrate the preparation to be examined using a suitably validated procedure. Reconstitute the recovered material in *0.1 M phosphate buffer solution pH 8.0 R* to obtain a concentration of 400 µg/mL. To 500 µL of this solution add 1.4 µL of a 250 mg/L solution of *glutaraldehyde R*. Mix and incubate at 37 °C for 120 min.

*Blank solution.* The formulation buffer.

*Precolumn*:

- *size*: *l* = 0.04 m, Ø = 6 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5 µm) of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

*Column*:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5 µm) of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

*Mobile phase.* Dissolve 7.10 g of *anhydrous disodium hydrogen phosphate R* and 8.77 g of *sodium chloride R* in 1 L of *water R*. Adjust to pH 7.00 ± 0.05 with *phosphoric acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 50 µL; perform 3 injections using an automatic injector maintained at 2-8 °C.

*Retention time*: human coagulation factor IX (rDNA) = about 9 min.

*System suitability*:

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the high molecular mass species and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to human coagulation factor IX (rDNA) in the chromatogram obtained with the resolution solution.

Calculate the relative area (in per cent) of the sum of the peaks with retention times less than that of human coagulation factor IX (rDNA), with reference to the area of the peak due to human coagulation factor IX (rDNA). Any shoulder appearing on the descending part of the peak due to human coagulation factor IX (rDNA) is included in its area.

*Result*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*Limit*:

- *sum of the peaks eluted before the principal peak*: maximum 1.3 per cent.

**Microbial contamination** (*2.6.12*): maximum 10 CFU/mL.

**Bacterial endotoxins** (*2.6.14*): less than 1 IU per 100 IU of factor IX activity.

ASSAY

The specific biological activity of the substance is determined before the addition of any protein stabiliser.

**Protein**. Size-exclusion chromatography (*2.2.30*) as described in the test for impurities with molecular masses greater than that of human coagulation factor IX (rDNA) with the following modifications.

Prepare triplicate dilutions of the test solution.

*Reference solutions.* Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of 1 mg/mL. Further dilute this solution to prepare a standard curve with concentrations in the range of 100-800 µg/mL (5 concentrations, typically 100 µg/mL, 200 µg/mL, 400 µg/mL, 600 µg/mL, 800 µg/mL).

Plot peak areas versus injected protein content and perform linear regression to create a standard curve.

*System suitability* (in addition to those described in the test for impurities with molecular masses greater than that of human coagulation factor IX (rDNA)):

- the correlation coefficient ($r^2$) calculated for the standard curve is not less than 0.995.

Calculate the protein concentration of each replicate of the preparation to be examined using the standard curve and the assigned content in *human coagulation factor IX (rDNA) CRS*.

**Potency**. Assay of human coagulation factor IX (*2.7.11*). The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

*Human coagulation factor IX concentrate BRP* is suitable for use as a reference preparation.

STORAGE

In an airtight container, under approved conditions.

LABELLING

The label states the factor IX content in International Units per millilitre and in International Units per milligram of protein.

**01/2018:2994**

# HUMAN COAGULATION FACTOR IX (rDNA) POWDER FOR SOLUTION FOR INJECTION

## Factoris IX coagulationis humani (ADNr) pulvis ad solutionem iniectabilem

DEFINITION

Sterile, freeze-dried preparation of closely related glycoproteins, which have the same amino acid sequence (415 amino acids) as the naturally occurring Ala 148 allelic form analogue (plasma-derived coagulation factor IX). The preparation is intended for intravenous injection.

*Potency*: 80 per cent to 125 per cent of the potency stated on the label when determined using the conditions described under Assay.

*Human coagulation factor IX (rDNA) powder for solution for injection complies with the monograph on Parenteral preparations (0520) and with the following additional requirements.*

PRODUCTION

Human coagulation factor IX (rDNA) powder for solution for injection is prepared from *Human coagulation factor IX (rDNA) concentrated solution (2522)*. The concentrated solution is diluted with a formulation buffer containing excipients such as histidine, sucrose, glycine and polysorbate 80. This preparation is passed through a bacteria-retentive filter, distributed aseptically into the final containers and freeze-dried. The containers are closed under vacuum or under an inert gas. Where excipients other than those mentioned above are used, their compatibility with the tests described hereafter must be confirmed.

CHARACTERS

*Appearance* (before reconstitution): white, hygroscopic powder or friable solid, free from visible foreign matter.

IDENTIFICATION

A. It complies with the limits of the assay.

B. Polyacrylamide gel electrophoresis (*2.2.31*).

Examine the electropherograms obtained in the test for impurities with molecular masses differing from that of human coagulation factor IX (rDNA).

Calculate the relative mobility (in per cent) of the main band in the electropherogram obtained with the test solution with reference to the mobility of the main band in the electropherogram obtained with reference solution (a), using the following expression:

$$\frac{M_1 - M_2}{M_2} \times 100$$

$M_1$ = molecular mass of the main band in the electropherogram obtained with the test solution;

$M_2$ = molecular mass of the main band in the electropherogram obtained with reference solution (a).

*Results*:

- the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (a);
- the mobility of the main band in the electropherogram obtained with the test solution is within 10 per cent of that of the main band in the electropherogram obtained with reference solution (a).

TESTS

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, test (except those for solubility and water) and assay.*

**Formulation buffer**. Dissolve 19.53 g of *glycine R*, 1.55 g of *histidine R* and 10.00 g of *sucrose R* in 1000 mL of *water R*. Add 50 µL of *polysorbate 80 R* and adjust to pH 6.8 with *hydrochloric acid R*.

**Appearance of solution**. After reconstitution, the solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*), without visible particles.

**Solubility**. To a vial of the preparation to be examined add the volume of the diluent stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 5 min.

**pH**(*2.2.3*). The limit is approved by the competent authority.

**Related proteins**. Liquid chromatography (*2.2.29*).

*Test solution*. Dilute the reconstituted preparation to be examined with the formulation buffer to obtain a concentration of 0.5 mg/mL.

*Reference solution*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 0.5 mg/mL.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (10 µm) with a pore size of 400 nm;
- *temperature*: 37 °C.

*Mobile phase*:

- *mobile phase A*: add 1 mL of *trifluoroacetic acid R* to 1000 mL of *water for chromatography R*;
- *mobile phase B*: mix 1 mL of *trifluoroacetic acid R*, 200 mL of *water for chromatography R* and 800 mL of *acetonitrile for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 0.5 | 75 | 25 |
| 0.5 - 30 | 75 → 20 | 25 → 80 |
| 30 - 31 | 20 → 0 | 80 → 100 |
| 31 - 33 | 0 | 100 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 100 µL; perform at least 3 injections using an automatic injector.

*Relative retention* with reference to the 2nd peak of the double peak due to human coagulation factor IX (rDNA) (retention time = about 12-14 min): related protein A = about 0.75; related protein B = about 0.78; related protein C = about 0.80; related protein D = about 0.85; related protein E = about 0.93.

*System suitability*: reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- *repeatability*: maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA), determined on 3 injections performed immediately before the run;

Monographs H

– *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to related protein E and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to human coagulation factor IX (rDNA).

Report individual relative peak areas considering the peak area of the entire chromatogram. Individual relative per cent peak areas are calculated as the average of the 3 injections of the test solution.

Peaks due to related proteins A and D are not always present.

*Results*:

– the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution, except for minor peaks due to impurities, that may be absent in the chromatogram obtained with the test solution.

*Limits*:

– *related protein C*: maximum 0.6 per cent.

**Impurities with molecular masses differing from that of human coagulation factor IX (rDNA)**. Polyacrylamide gel electrophoresis (*2.2.31*) using a gradient gel with the following modifications.

*Gel dimensions*: 1.0 mm thick.

*Resolving gel*: 3-15 per cent acrylamide gradient gel.

*Acrylamide solution*: *30 per cent acrylamide/bisacrylamide (36.5:1) solution R*.

To prepare a 15 per cent acrylamide solution, add *sucrose R* to obtain a concentration of 142 g/L.

The following elements are provided as examples for loading the gel-forming apparatus to prepare the stacking gel.

*Stacking gel*. The stacking gel solution is prepared by mixing:

– 100 volumes of *30 per cent acrylamide/bisacrylamide (36.5:1) solution R*;
– 125 volumes of *1 M tris-hydrochloride buffer solution pH 6.8 R*;
– 740.5 volumes of *water R*;
– 1.5 volumes of *tetramethylethylenediamine R*;
– 33 volumes of a 150 mg/mL solution of *ammonium persulfate R*.

Load the compartments of the gradient-forming apparatus with the acrylamide solutions and proceed as per the instructions of the equipment supplier to obtain the polymerised gradient gel.

After polymerisation is completed, rinse the gradient gel with *water R*. Remove any excess liquid. Pour the stacking gel solution into the equipment, insert a clean comb and allow for polymerisation.

Alternatively, commercially available gradient gels may be used.

*Test solution*. Dilute the reconstituted preparation to be examined with the formulation buffer to obtain a concentration of about 1 mg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 1 mg/mL.

*Reference solution (b)*. A 0.01 mg/mL solution of *bovine albumin R* in the formulation buffer.

*Reference solution (c)*. A solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 5-200 kDa.

*Sample buffer*. *Concentrated SDS-PAGE sample buffer for reducing conditions R* containing dithiothreitol as the reducing agent.

*Sample treatment*: incubate in a water-bath for 5 min.

*Application*: 35 µL.

Use *SDS-PAGE running buffer R* for running the gel.

For each gel, run 1 lane with reference solution (b), 2 lanes with reference solution (c), 2 lanes with the incubated reducing buffer (as blank) and at least 1 lane with reduced reference solution (a); use the remaining lanes for reduced test solutions.

*Detection*: by Coomassie staining.

*Identification of bands*: human coagulation factor IX (rDNA) has an approximate molecular mass of 55 kDa, and related protein bands with molecular masses of approximately 54 kDa, 44 kDa, 29-32 kDa, 27 kDa and 14 kDa are present.

*System suitability*:

– a clear background is obtained after destaining;
– the band in the electropherogram obtained with reference solution (b) is clearly visible;
– all expected bands in the electropherogram obtained with reference solution (c) are visible;
– the bands in the electropherogram obtained with reference solution (c) are clearly separated;
– no band is visible in the blank lanes.

*Results*:

– the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (a);
– no new band in the electropherogram obtained with the test solution has an intensity greater than that of the band in the electropherogram obtained with reference solution (b).

**Impurities with molecular masses greater than that of human coagulation factor IX (rDNA)**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution*. Dilute the reconstituted preparation to be examined with the formulation buffer to obtain a concentration of 400 µg/mL.

*Reference solution*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 400 µg/mL.

*Resolution solution*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 400 µg/mL. Desalt and concentrate the preparation to be examined using a suitably validated procedure. Reconstitute the recovered material in *0.1 M phosphate buffer solution pH 8.0 R* to obtain a concentration of 400 µg/mL. To 500 µL of this solution add 1.4 µL of a 250 mg/L solution of *glutaraldehyde R*. Mix and incubate at 37 °C for 120 min.

*Blank solution*. The formulation buffer.

*Precolumn*:

– *size*: *l* = 0.04 m, Ø = 6 mm;
– *stationary phase*: *hydrophilic silica gel for chromatography R* (5 µm) of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

*Column*:

– *size*: *l* = 0.30 m, Ø = 7.8 mm;
– *stationary phase*: *hydrophilic silica gel for chromatography R* (5 µm) of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

*Mobile phase*. Dissolve 7.10 g of *anhydrous disodium hydrogen phosphate R* and 8.77 g of *sodium chloride R* in 1 L of *water for chromatography R*. Adjust to pH 7.00 ± 0.05 with *phosphoric acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 50 µL; perform 3 injections using an automatic injector maintained at 2-8 °C.

*Retention time*: human coagulation factor IX (rDNA) = about 9 min.

*System suitability*:

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the high molecular mass species and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to human coagulation factor IX (rDNA) in the chromatogram obtained with the resolution solution.

Calculate the relative area (in per cent) of the sum of the peaks with retention times less than that of human coagulation factor IX (rDNA), with reference to the area of the peak due to human coagulation factor IX (rDNA). Any shoulder appearing on the descending part of the peak due to human coagulation factor IX (rDNA) is included in its area.

*Result*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*Limit*:

- *sum of the peaks eluted before the principal peak*: maximum 1.8 per cent.

**Activated human coagulation factor IX (rDNA)** (*2.6.22*). Dilute the reconstituted preparation to be examined with *tris(hydroxymethyl)aminomethane buffer solution pH 7.5 R* to obtain a concentration of human coagulation factor IX (rDNA) of 20 IU/mL. For each of the dilutions, the coagulation time is not less than 150 s.

**Osmolality** (*2.2.35*). The limit is approved by the competent authority.

**Water** (*2.5.32*): maximum 2.0 per cent.

**Sterility** (*2.6.1*). It complies with the test.

**Bacterial endotoxins** (*2.6.14*): less than 1 IU per 100 IU of factor IX activity.

ASSAY

**Protein**. Size-exclusion chromatography (*2.2.30*) as described in the test for impurities with molecular masses greater than that of human coagulation factor IX (rDNA) with the following modifications.

Prepare triplicate dilutions of the test solution.

*Reference solutions*. Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of 1 mg/mL. Further dilute the solution to prepare a standard curve with concentrations in the range of 100-800 µg/mL (5 concentrations, typically 100 µg/mL, 200 µg/mL, 400 µg/mL, 600 µg/mL and 800 µg/mL).

Plot peak areas versus injected protein content and perform linear regression to create a standard curve.

*System suitability* (in addition to those described in the test for impurities with molecular masses greater than that of human coagulation factor IX (rDNA)):

- the correlation coefficient ($r^2$) calculated for the standard curve is not less than 0.995.

Calculate the protein concentration of each replicate of the preparation to be examined using the standard curve and the assigned content in *human coagulation factor IX (rDNA) CRS*.

**Potency**. Assay of human coagulation factor IX (*2.7.11*). The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

*Human coagulation factor IX concentrate BRP* is suitable for use as a reference preparation.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

The label states:

- the factor IX content in International Units;
- the name of any excipient and added substance;
- the composition and volume of the liquid to be used for reconstitution.

**04/2016:1644**

# HUMAN COAGULATION FACTOR XI

## Factor XI coagulationis humanus

DEFINITION

Sterile plasma protein fraction containing coagulation factor XI. It is prepared from *Human plasma for fractionation (0853)*. The preparation may contain excipients such as heparin, C1-esterase inhibitor and antithrombin III.

The potency of the preparation, reconstituted as stated on the label, is not less than 50 units per millilitre.

PRODUCTION

The method of preparation is designed to maintain functional integrity of human coagulation factor XI and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

After preparation, the factor XI fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is distributed into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under inert gas.

CHARACTERS

*Appearance*: white or almost white powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assay.

TESTS

**Solubility**. To a container of the preparation to be examined, add the volume of liquid stated on the label at room temperature. The preparation dissolves completely with gentle swirling within 10 min.

**pH** (*2.2.3*): 6.8 to 7.4.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube

to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

**Activated coagulation factors** (*2.6.22*). For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin** (*2.7.12*). If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per unit of factor XI.

**Antithrombin III** (*2.7.17*). If antithrombin III has been added, the preparation to be examined contains not more than the amount of antithrombin III stated on the label.

**C1-esterase inhibitor** (*2.7.34*). If C1-esterase inhibitor has been added, the preparation to be examined contains not more than the amount of C1-esterase inhibitor stated on the label.

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method A*). The 1 to 64 dilution does not show agglutination.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 100 IU of factor XI.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.1 IU of endotoxin per International Unit of factor XI.

ASSAY

Carry out the assay of human coagulation factor XI (*2.7.22*).

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

The label states:

- the number of units per container;
- the maximum amount of protein per container;
- where applicable, the amount of heparin per container;
- where applicable, the amount of antithrombin III per container;
- where applicable, the amount of C1-esterase inhibitor per container;
- the name and volume of the liquid to be used for reconstitution.

**01/2011:0024**
**corrected 7.6**

# HUMAN FIBRINOGEN

## Fibrinogenum humanum

DEFINITION

Sterile, freeze-dried preparation of a plasma protein fraction containing the soluble constituent of human plasma that is transformed to fibrin on the addition of thrombin. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as salts, buffers and stabilisers.

When reconstituted as stated on the label, the solution contains not less than 10 g/L of fibrinogen.

PRODUCTION

The method of preparation is designed to maintain functional integrity of human fibrinogen. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

The specific activity (fibrinogen content with respect to total protein content) is not less than 80 per cent before addition of any protein stabiliser. The fibrinogen content is determined by a suitable method such as that described under Assay, and the total protein content is determined by a suitable method such as that described under Total protein in *Human albumin solution (0255)*. Albumin may also be obtained with fibrinogen during fractionation, in which case a specific determination of albumin is carried out by a suitable immunochemical method (*2.7.1*) and the quantity of albumin determined is subtracted from the total protein content for the calculation of the specific activity.

The protein fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

CHARACTERS

*Appearance*: white or pale yellow, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assay.

TESTS

**Solubility**. To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves within 30 min at 20-25 °C, forming an almost colourless, slightly opalescent solution.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Stability of solution**. No gel formation appears at 20-25 °C within 60 min following reconstitution.

**Water**. Determined by a suitable method, such as semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 mg of fibrinogen.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.03 IU of endotoxin per milligram of fibrinogen.

ASSAY

Mix 0.2 mL of the reconstituted preparation with 2 mL of a suitable buffer solution (pH 6.6-6.8) containing sufficient thrombin (approximately 3 IU/mL) and calcium (0.05 mol/L). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation (5000 *g*, 20 min) and wash thoroughly with a 9 g/L solution of *sodium chloride R*. Determine the nitrogen content by sulfuric acid digestion (*2.5.9*) and calculate the fibrinogen (clottable protein) content by multiplying the result by 6.0. The content is not less than 70 per cent and not more than 130 per cent of the stated content of fibrinogen.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the content of fibrinogen in the container;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, the name and amount of protein stabiliser added in the preparation.

**04/2019:2323**

# HUMAN HAEMATOPOIETIC STEM CELLS

## Cellulae stirpes haematopoieticae humanae

*This monograph provides a standard for the preparation and control of human haematopoietic stem cells for use in therapy. It does not exclude the use of alternative preparation and control methods that are acceptable to the competent authority.*

DEFINITION

Human haematopoietic stem cells are primitive multipotent cells capable of self-renewal as well as differentiation and maturation into all haematopoietic lineages. They are found in small numbers in bone marrow, in the mononuclear cell fraction of circulating blood and in umbilical cord blood. The preparation also contains haematopoietic progenitor cells, which are capable of differentiation but not self-renewal. The numbers of haematopoietic stem cells and haematopoietic progenitor cells are correlated.

This monograph applies to haematopoietic stem cells that have not undergone expansion or genetic modification, and that are intended to provide a successful engraftment leading to a permanent restoration of all lineages of blood cell production to a sufficient level and function in a recipient whose haematopoiesis has been compromised by, for example, disease or high doses of chemotherapy and/or radiation therapy, or has to be replaced in certain congenital diseases. The infused haematopoietic stem cells can originate from the recipient (autologous) or from another individual (allogeneic).

Haematopoietic stem cells are recognised by their ability to reconstitute human haematopoiesis *in vivo*. They also have the capacity to differentiate into colony-forming cells, which are able to give rise to colonies in the presence of various growth factors. The membrane marker CD34 is commonly used for the successful isolation/purification of haematopoietic stem cells from crude preparations and as an indicator of haematopoietic stem cell content in routine quality control.

PRODUCTION

*DONORS*

Where allogeneic cells are used, they are derived from carefully selected donors in accordance with donor selection criteria. Directive 2004/23/EC of the European Union deals with the criteria for donor selection.

*COLLECTION*

*Peripheral blood stem cells*. These are collected by cytapheresis after mobilisation from the bone marrow by administration of growth factors and/or treatment of autologous donors with cytotoxic substances. The cells may be processed to select a population of interest and may be cryopreserved.

*Bone marrow*. Bone marrow is harvested by aspirating the cells from the cavities of hollow bones, then removing bone fragments by filtration and, if necessary, separating the buffy coat cells after centrifugation or with commercial kits based on the cytapheresis principle. The cells may be processed to select a population of interest and may be cryopreserved.

*Umbilical cord blood*. Placental blood haematopoietic cells are collected from placentae via the vein of the umbilical cord. The cells are then cryopreserved.

*CRYOPRESERVATION*

Cryopreservation allows storage for long periods. The cells are suspended in a validated medium containing a suitable cryoprotectant (for example, dimethyl sulfoxide) and macromolecules (for example, autologous plasma/albumin) and are frozen in cryobags in a manner designed to maintain viability of the cells by controlled cooling according to a validated method. They are stored at a temperature of – 140 °C or lower. Where cryobags are stored under other conditions of temperature and duration, the functionality of the preparation must be validated. Cryobags from donors that test positive for any infectious disease marker must be stored in such a way as to avoid cross-contamination.

*SUBSTANCES USED IN PRODUCTION*

The quality of substances used in production may be critical with respect to the quality, safety and efficacy of the final product, particularly for substances of biological origin. This is of particular importance for:

- proteins, including enzymes and antibodies;
- cryopreservation reagents;
- purification reagents.

**Quality assurance**. All substances must be produced within a recognised quality management system using suitable production facilities.

**Quality specifications**. A suitable quality specification must be presented for each substance, including notably:

- identity;
- potency (where applicable);
- purity;
- determination of bacterial endotoxins (*2.6.14*) (where applicable);
- microbiological quality (total viable count, tests for specified micro-organisms);
- sterility (*2.6.1*) (where applicable).

**Viral safety**. The requirements of chapter *5.1.7* apply.

**Transmissible spongiform encephalopathies** (*5.2.8*). A risk assessment of the product with respect to transmissible spongiform encephalopathies is carried out, and suitable measures are taken to minimise any such risk.

**Water**. Water used in the preparation of cellular products complies with the relevant monograph (*Water for injections (0169)*, *Purified water (0008)*). Water incorporated into the final product complies with the section on Water for injections in bulk in the monograph *Water for injections (0169)*, and in addition is sterile.

TESTS

*Target specifications are established for the different tests, but these are not used as rigid acceptance criteria.*

Tests carried out include the following (further tests, such as purging, cell depletion, allogeneic application, may be necessary depending on any treatment applied to the cells and on the intended recipient):

**Nucleated cell count** (*2.7.29*).

**Viability** (*2.7.29*). Viability is assessed for products that are not infused within 24 h of collection.

**CD34+ cell count**. For peripheral blood stem cells, CD34+ cell count is determined using a validated automated apparatus to analyse cells labelled with anti-CD34 antibodies. The apparatus and method employed must be able to determine the number of CD34+ cells with a sensitivity, accuracy and reproducibility comparable with those of immunophenotyping (*2.7.23*), where cells are labelled using anti-CD34 and anti-CD45 antibodies conjugated to a fluorochrome and analysed by flow cytometry (*2.7.24*).

**Colony-forming cell (CFC) assay** (*2.7.28*). Proliferative capacity is established by a suitable assay. The test is not necessarily carried out on each unit. The correlation between the dose of CD34 and the number of CFCs in a given situation (pathology, packaging, mobilisation) is determined. The CFC assay is carried out periodically; whenever a change that could affect the quality of CD34+ cells is made to the protocol for packaging or mobilisation, it is carried out on a suitable number of units.

**Microbiological control**. Examine as prescribed in general chapter *2.6.27. Microbiological examination of cell-based preparations*. Where justified, the product may be released before completion of the test.

**01/2015:0769**

# HUMAN HEPATITIS A IMMUNOGLOBULIN

## Immunoglobulinum humanum hepatitidis A

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against hepatitis A virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis A immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 600 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

**01/2015:0722**

# HUMAN HEPATITIS B IMMUNOGLOBULIN

## Immunoglobulinum humanum hepatitidis B

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular or subcutaneous administration. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)* may be added.

Depending on the route of administration, it complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis B immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis B immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)*.

The label states the number of International Units per container.

**01/2015:1016**

# HUMAN HEPATITIS B IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

## Immunoglobulinum humanum hepatitidis B ad usum intravenosum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay (*2.7.1*) of suitable sensitivity and specificity.

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis B immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis B immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 50 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the minimum number of International Units of hepatitis B immunoglobulin per container.

**01/2020:0397**

# HUMAN MEASLES IMMUNOGLOBULIN

## Immunoglobulinum humanum morbillicum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against measles virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency of the liquid preparation and of the freeze-dried preparation after reconstitution as stated on the label is not less than 50 IU per millilitre of neutralising antibody against measles virus.

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using a challenge dose of measles virus in a suitable cell culture system. An alternative method may be used providing that the competent authority is satisfied that it correlates with the determination of neutralising activity for the measles virus by comparison with the reference preparation.

The International Unit is the specific neutralising activity for measles virus contained in a stated amount of the International Standard for human anti-measles serum. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

*Method*

Prepare serial 2-fold dilutions of the immunoglobulin to be examined and of the reference preparation. Mix each dilution with an equal volume of a suspension of measles virus containing about 100 $CCID_{50}$ in 0.1 mL and incubate protected from light at 37 °C for 2 h. Using not fewer than 6 cell cultures per mixture, inoculate 0.2 mL of each mixture into each of the cell cultures allocated to that mixture and incubate for not less than 10 days. Examine the cultures for viral activity and compare the dilution containing the smallest quantity of the immunoglobulin which neutralises the virus with that of the corresponding dilution of the reference preparation.

Calculate the potency of the immunoglobulin to be examined in International Units per millilitre of neutralising antibody against measles virus.

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

**01/2015:0338**

# HUMAN NORMAL IMMUNOGLOBULIN FOR INTRAMUSCULAR ADMINISTRATION

## Immunoglobulinum humanum normale ad usum intramusculum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for intramuscular administration contains the IgG antibodies of normal subjects and is intended for intramuscular administration. The preparation may contain excipients such as stabilisers. Multidose preparations contain an antimicrobial preservative.

This monograph does not apply to products intentionally prepared to contain fragments of IgG or chemically modified IgG.

Human normal immunoglobulin for intramuscular administration is obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intramuscularly. Any antimicrobial preservative or stabilising agent used shall have been shown to have no deleterious effect on the final product in the amount present.

Human normal immunoglobulin for intramuscular administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

- does not transmit infection;
- at a protein concentration of 50 g/L, contains at least 2 antibodies (1 viral and 1 bacterial) for which an International Standard or reference preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
- has a defined distribution of IgG subclasses.

Human normal immunoglobulin for intramuscular administration is prepared as a stabilised solution, for example in a 9 g/L solution of sodium chloride, a 22.5 g/L solution of glycine or, if the preparation is to be freeze-dried, a 60 g/L solution of glycine. No antibiotic is added to the plasma used. Single-dose preparations do not contain an antimicrobial preservative. The solution is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

*Appearance*:

- *liquid preparation*: clear or slightly opalescent, colourless or pale-yellow or light-brown liquid; during storage it may show formation of slight turbidity or a small amount of visible particulate matter;
- *freeze-dried preparation*: white or slightly yellow powder or solid friable mass, hygroscopic.

*For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to obtain a protein concentration of 10 g/L. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a component.

TESTS

**Solubility**. For the freeze-dried preparation, to a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely within 20 min at 20-25 °C.

**pH** (*2.2.3*): 5.0 to 7.2.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of 10 g/L.

**Total protein**. The preparation has a protein concentration of not less than 100 g/L and not more than 180 g/L and contains not less than 90 per cent and not more than 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying the result by 6.25.

**Protein composition**. Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

*Test solution*. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of 30 g/L.

*Reference solution*. Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of 30 g/L.

To a strip apply 4.0 µL of the test solution as a 10 mm band or apply 0.4 µL per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strip with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a

mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

*System suitability*: in the electropherogram obtained with the reference solution, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

*Results*: in the electropherogram obtained with the test solution, not more than 10 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

**Molecular-size distribution**. Size-exclusion chromatography (*2.2.30*).

*Test solution.* Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

*Reference solution.* Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/L solution of *sodium chloride R* to the same protein concentration as the test solution.

*Column*:

- *size*: *l* = 0.6 m, Ø = 7.5 mm [or *l* = 0.3 m, Ø = 7.8 mm];
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

*Mobile phase*: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 L of *water R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Identification of peaks*: in the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time less than that of the dimer corresponds to polymers and aggregates.

*Results*: in the chromatogram obtained with the test solution:

- *retention time*: for the monomer and for the dimer, the retention time relative to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;
- *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 85 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 10 per cent of the total area of the chromatogram. This requirement is not applicable if albumin has been added as a stabiliser; for such preparations, a test for molecular-size distribution is carried out during manufacture before addition of the stabiliser.

**Antibody to hepatitis B surface antigen**: minimum 0.5 IU per gram of immunoglobulin, determined by a suitable immunochemical method (*2.7.1*).

**Antibody to hepatitis A virus**. If intended for use in the prophylaxis of hepatitis A, it complies with the following additional requirement.

Determine the antibody content by comparison with a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis A immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**Immunoglobulin A**. As determined by a suitable immunochemical method (*2.7.1*), the content of immunoglobulin A is not greater than the maximum content stated on the label.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject 1 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 5 IU of endotoxin per millilitre.

STORAGE

In an airtight, colourless glass container, protected from light, at the temperature stated on the label.

LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- for freeze-dried preparations:
  - the quantity of protein in the container;
  - the name or composition and the volume of the reconstituting liquid to be added;
- the route of administration;
- the distribution of subclasses of IgG present in the preparation;
- where applicable, that the preparation is suitable for use in the prophylaxis of hepatitis A infection;
- where applicable, the anti-hepatitis A virus activity in International Units per millilitre;
- where applicable, the amount of albumin added as a stabiliser;
- where applicable, the name and amount of antimicrobial preservative in the preparation;
- the maximum content of immunoglobulin A.

**01/2012:0918**

# HUMAN NORMAL IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

## Immunoglobulinum humanum normale ad usum intravenosum

DEFINITION

Human normal immunoglobulin for intravenous administration is a sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for intravenous administration contains the IgG antibodies of normal subjects. This monograph does not apply to products intentionally prepared to contain fragments or chemically modified IgG.

Human normal immunoglobulin for intravenous administration is obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin. The method of preparation also includes a step or steps that have been shown to remove thrombosis-generating agents. Emphasis is given to the identification of activated coagulation factors and their zymogens and process steps that may cause their activation. Consideration is also to be given to other procoagulant agents that could be introduced by the manufacturing process.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intravenously.

Human normal immunoglobulin for intravenous administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

- does not transmit infection;
- at an immunoglobulin concentration of 50 g/L, contains antibodies for at least 2 of which (1 viral and 1 bacterial) an International Standard or Reference Preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
- has a defined distribution of immunoglobulin G subclasses;
- complies with the test for Fc function of immunoglobulin (*2.7.9*);
- does not exhibit thrombogenic (procoagulant) activity.

Human normal immunoglobulin for intravenous administration is prepared as a stabilised solution or as a freeze-dried preparation. In both cases the preparation is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas. No antibiotic is added to the plasma used. No antimicrobial preservative is added either during fractionation or at the stage of the final bulk solution.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

*Appearance*:

- *liquid preparation*: clear or slightly opalescent, colourless or pale yellow liquid;
- *freeze-dried preparation*: hygroscopic, white or slightly yellow powder or solid friable mass.

*For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/L of protein. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a major component.

TESTS

**Solubility**. For the freeze-dried preparation, add to the container the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely within 30 min at 20-25 °C.

**pH** (*2.2.3*): 4.0 to 7.4.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing 10 g/L of protein.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. The preparation contains not less than 30 g/L and between 90 per cent and 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying the result by 6.25.

**Protein composition**. Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

*Test solution*. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to an immunoglobulin concentration of 30 g/L.

*Reference solution*. Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/L solution of *sodium chloride R* to a protein concentration of 30 g/L.

To a strip apply 4.0 µL of the test solution as a 10 mm band or apply 0.4 µL per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strips with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a

mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

*System suitability*: in the electropherogram obtained with the reference solution, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

*Results*: in the electropherogram obtained with the test solution, not more than 5 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

**Molecular size distribution**. Size exclusion chromatography (*2.2.30*).

*Test solution.* Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

*Reference solution.* Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/L solution of *sodium chloride R* to the same protein concentration as the test solution.

*Column*:

- *size*: *l* = 0.6 m, Ø = 7.5 mm, or *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

*Mobile phase*: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 L of *water R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Identification of peaks*: in the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85; identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of the dimer corresponds to polymers and aggregates.

*Results*: in the chromatogram obtained with the test solution:

- *retention time*: for the monomer and for the dimer, the retention time relative to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;
- *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 90 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 3 per cent of the total area of the chromatogram. This requirement does not apply to products where albumin has been added as a stabiliser; for products stabilised with albumin, a test for distribution of molecular size is carried out during manufacture before addition of the stabiliser.

**Anticomplementary activity** (*2.6.17*). The consumption of complement is not greater than 50 per cent (1 $CH_{50}$ per milligram of immunoglobulin).

**Prekallikrein activator** (*2.6.15*): maximum 35 IU/mL, calculated with reference to a dilution of the preparation to be examined containing 30 g/L of immunoglobulin.

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method B*). It complies with the test for anti-A and anti-B haemagglutinins (direct method).

**Anti-D antibodies** (*2.6.26*). It complies with the test for anti-D antibodies in human immunoglobulin.

**Antibody to hepatitis B surface antigen**: minimum 0.5 IU per gram of immunoglobulin, determined by a suitable immunochemical method (*2.7.1*).

**Immunoglobulin A.** As determined by a suitable immunochemical method (*2.7.1*), the content of immunoglobulin A is not greater than the maximum content stated on the label.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 0.5 g of immunoglobulin, but not more than 10 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.5 IU of endotoxin per millilitre for solutions with a protein content not greater than 50 g/L, and less than 1.0 IU of endotoxin per millilitre for solutions with a protein content greater than 50 g/L but not greater than 100 g/L.

## STORAGE

Liquid preparation: in a colourless glass container, protected from light, at the temperature stated on the label.

Freeze-dried preparation: in an airtight colourless glass container, protected from light, at a temperature not exceeding 25 °C.

## LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- for freeze-dried preparations:
  - the quantity of protein in the container;
  - the name or composition and the volume of the reconstituting liquid to be added;
- the amount of immunoglobulin in the container;
- the route of administration;
- the distribution of subclasses of immunoglobulin G present in the preparation;
- where applicable, the amount of albumin added as a stabiliser;
- the maximum content of immunoglobulin A.

# HUMAN NORMAL IMMUNOGLOBULIN FOR SUBCUTANEOUS ADMINISTRATION

## Immunoglobulinum humanum normale ad usum subdermicum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for subcutaneous administration contains the IgG antibodies of normal subjects and is intended for subcutaneous administration. The preparation may contain excipients such as stabilisers.

This monograph does not apply to products intentionally prepared to contain fragments of IgG or chemically modified IgG.

Human normal immunoglobulin for subcutaneous administration is obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The method of preparation also includes a step or steps that have been shown to remove thrombosis-generating agents. Emphasis is given to the identification of activated coagulation factors and their zymogens and process steps that may cause their activation. Consideration is also to be given to other procoagulant agents that could be introduced by the manufacturing process.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered subcutaneously. Any stabilising agent used shall have been shown to have no deleterious effect on the final product in the amount present.

Human normal immunoglobulin for subcutaneous administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

- does not transmit infection;
- at a protein concentration of 50 g/L, contains at least 2 antibodies (1 viral and 1 bacterial) for which an International Standard or reference preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
- has a defined distribution of IgG subclasses;
- complies with the test for Fc function of immunoglobulin (*2.7.9*);
- does not exhibit thrombogenic (procoagulant) activity.

Human normal immunoglobulin for subcutaneous administration is prepared as a stabilised solution, for example in a 9 g/L solution of sodium chloride, a 22.5 g/L solution of glycine or, if the preparation is to be freeze-dried, a 60 g/L solution of glycine. No antibiotic is added to the plasma used. Preparations do not contain an antimicrobial preservative. The solution is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

*Appearance*:

- *liquid preparation*: clear or slightly opalescent, colourless or pale-yellow or light-brown liquid; during storage it may show formation of slight turbidity or a small amount of visible particulate matter;
- *freeze-dried preparation*: white or slightly yellow powder or solid friable mass, hygroscopic.

*For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to obtain a protein concentration of 10 g/L. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a component.

TESTS

**Solubility**. For the freeze-dried preparation, to a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely within 20 min at 20-25 °C.

**pH** (*2.2.3*): 4.6 to 7.2.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of 10 g/L.

**Total protein**. The preparation has a protein concentration of not less than 100 g/L and not more than 220 g/L and contains not less than 90 per cent and not more than 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying the result by 6.25.

**Protein composition**. Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

*Test solution*. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of 30 g/L.

*Reference solution*. Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of 30 g/L.

To a strip apply 4.0 µL of the test solution as a 10 mm band or apply 0.4 µL per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strip with *amido black 10B solution R* for 5 min. Decolourise

with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

*System suitability*: in the electropherogram obtained with the reference solution, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

*Results*: in the electropherogram obtained with the test solution, not more than 10 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

**Molecular-size distribution**. Size-exclusion chromatography (*2.2.30*).

*Test solution*. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

*Reference solution*. Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/L solution of *sodium chloride R* to the same protein concentration as the test solution.

*Column*:

- *size*: *l* = 0.6 m, Ø = 7.5 mm [or *l* = 0.3 m, Ø = 7.8 mm];
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

*Mobile phase*: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 L of *water R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Identification of peaks*: in the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time less than that of the dimer corresponds to polymers and aggregates.

*Results*: in the chromatogram obtained with the test solution:

- *retention time*: for the monomer and for the dimer, the retention time relative to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;
- *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 85 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 10 per cent of the total area of the chromatogram. This requirement is not applicable if albumin has been added as a stabiliser; for such preparations, a test for molecular-size distribution is carried out during manufacture before addition of the stabiliser.

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method B*). It complies with the test.

**Anti-D antibodies** (*2.6.26*). It complies with the test.

**Antibody to hepatitis B surface antigen**: minimum 0.5 IU per gram of immunoglobulin, determined by a suitable immunochemical method (*2.7.1*).

**Immunoglobulin A**. As determined by a suitable immunochemical method (*2.7.1*), the content of immunoglobulin A is not greater than the maximum content stated on the label.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject 1 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 5 IU of endotoxin per millilitre.

STORAGE

In an airtight, colourless glass container, protected from light, at the temperature stated on the label.

LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- for freeze-dried preparations:
  - the quantity of protein in the container;
  - the name or composition and the volume of the reconstituting liquid to be added;
- the route of administration;
- the distribution of subclasses of IgG present in the preparation;
- where applicable, the amount of albumin added as a stabiliser;
- the maximum content of immunoglobulin A.

**01/2020:0853**

# HUMAN PLASMA FOR FRACTIONATION

## Plasma humanum ad separationem

DEFINITION

Liquid part of human blood remaining after separation of the cellular elements from blood collected in a receptacle containing an anticoagulant, or separated by continuous filtration or centrifugation of anticoagulated blood in an apheresis procedure; it is intended for the manufacture of plasma-derived products.

PRODUCTION

*DONORS*

Only a carefully selected, healthy donor who, as far as can be ascertained after medical examination, laboratory blood tests and a study of the donor's medical history, is free from detectable agents of infection transmissible by plasma-derived products may be used. Recommendations in this field are made by the Council of Europe [*Recommendation No. R (95) 15 on the preparation, use and quality assurance of blood components,* or subsequent revision]; a directive of the European Union also deals with the matter: *Commission Directive 2004/33/EC of 22 March 2004 implementing*

*Directive 2002/98/EC of the European Parliament and of the Council as regards certain technical requirements for blood and blood components.*

**Immunisation of donors**. Immunisation of donors to obtain immunoglobulins with specific activities may be carried out when sufficient supplies of material of suitable quality cannot be obtained from naturally immunised donors. Recommendations for such immunisations are formulated by the World Health Organization (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

**Records**. Records of donors and donations made are kept in such a way that, while maintaining the required degree of confidentiality concerning the donor's identity, the origin of each donation in a plasma pool and the results of the corresponding acceptance procedures and laboratory tests can be traced.

**Laboratory tests**. Laboratory tests are carried out for each donation to detect the following viral markers:

1. antibodies against human immunodeficiency virus 1 (anti-HIV-1);
2. antibodies against human immunodeficiency virus 2 (anti-HIV-2);
3. hepatitis B surface antigen (HBsAg);
4. antibodies against hepatitis C virus (anti-HCV).

The test methods used are of suitable sensitivity and specificity and comply with the regulations in force. If a repeat-reactive result is found in any of these tests, the donation is not accepted.

*INDIVIDUAL PLASMA UNITS*

The plasma is prepared by a method that removes cells and cell debris as completely as possible. Whether prepared from whole blood or by plasmapheresis, the plasma is separated from the cells by a method designed to prevent the introduction of micro-organisms. No antibacterial or antifungal agent is added to the plasma. The containers comply with the requirements for glass containers (*3.2.1*) or for plastic containers for blood and blood components (*3.3.4*). The containers are closed so as to prevent any possibility of contamination.

If 2 or more units are pooled prior to freezing, the operations are carried out using sterile connecting devices or under aseptic conditions and using containers that have not previously been used.

When obtained by plasmapheresis or from whole blood (after separation from cellular elements), plasma intended for the recovery of proteins that are labile in plasma is frozen within 24 h of collection by cooling rapidly in conditions validated to ensure that a temperature of – 25 °C or below is attained at the core of each plasma unit within 12 h of placing in the freezing apparatus.

When obtained by plasmapheresis, plasma intended solely for the recovery of proteins that are not labile in plasma is frozen by cooling rapidly in a chamber at – 20 °C or below within 24 h of collection.

When obtained from whole blood, plasma intended solely for the recovery of proteins that are not labile in plasma is separated from cellular elements and frozen in a chamber at – 20 °C or below within 72 h of collection.

*It is not intended that the determination of total protein and human coagulation factor VIII shown below be carried out on each unit of plasma. They are rather given as guidelines for good manufacturing practice, the test for human coagulation factor VIII being relevant for plasma intended for use in the preparation of concentrates of labile proteins.*

*The total protein content of a unit of plasma depends on the serum protein content of the donor and the degree of dilution inherent in the donation procedure. When plasma is obtained from a suitable donor and using the intended proportion of anticoagulant solution, a total protein content complying with the limit of 50 g/L is obtained. If a volume of blood or plasma smaller than intended is collected into the anticoagulant solution, the resulting plasma is not necessarily unsuitable for pooling for fractionation. The aim of good manufacturing practice must be to achieve the prescribed limit for all normal donations.*

*Preservation of human coagulation factor VIII in the donation depends on the collection procedure and the subsequent handling of the blood and plasma. With good practice, 0.7 IU/mL can usually be achieved, but units of plasma with a lower activity may still be suitable for use in the production of coagulation factor concentrates. The aim of all steps taken during production of plasma is to obtain plasma of the intended quality and to conserve labile proteins as much as possible.*

**Total protein**. Carry out the test using a pool of not fewer than 10 units. Dilute an appropriate volume of the preparation with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the protein content by multiplying the quantity of nitrogen by 6.25. The total protein content is not less than 50 g/L.

**Human coagulation factor VIII** (*2.7.4*). Carry out the test using a pool of not fewer than 10 units. Thaw the samples to be examined, if necessary, at 37 °C. Carry out the assay using a reference plasma calibrated against the International Standard for human coagulation factor VIII in plasma. The activity is not less than 0.7 IU/mL.

*STORAGE AND TRANSPORT*

Frozen plasma is stored and transported in conditions designed to maintain the temperature at or below – 20 °C; for accidental reasons, the storage temperature may rise above – 20 °C on one or more occasions during storage and transport but the plasma is nevertheless considered suitable for fractionation if all the following conditions are fulfilled:

- the total period of time during which the temperature exceeds – 20 °C does not exceed 72 h;
- the temperature does not exceed – 15 °C on more than 1 occasion;
- the temperature at no time exceeds – 5 °C.

*POOLED PLASMA*

During the manufacture of plasma products, the first homogeneous pool of plasma (for example, after removal of cryoprecipitate) is tested for HBsAg and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

The plasma pool is also tested for hepatitis C virus RNA using a validated nucleic acid amplification technique (*2.6.21*). A positive control with 100 IU/mL of hepatitis C virus RNA and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The plasma pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

*Hepatitis C virus RNA for NAT testing BRP* is suitable for use as a positive control.

CHARACTERS

Before freezing: clear or slightly turbid liquid without visible signs of haemolysis; it may vary in colour from light yellow to green.

LABELLING

The label enables each individual unit to be traced to a specific donor.

**01/2020:1646**

# HUMAN PLASMA (POOLED AND TREATED FOR VIRUS INACTIVATION)

## Plasma humanum coagmentatum conditumque ad exstinguendum virum

DEFINITION

Sterile, frozen or freeze-dried, non-pyrogenic preparation obtained from human plasma derived from donors belonging to the same ABO blood group. The preparation is thawed or reconstituted before use to give a solution for infusion.

The human plasma used complies with the monograph *Human plasma for fractionation (0853)*.

PRODUCTION

The units of plasma to be used are cooled to − 30 °C or lower within 6 h of separation of cells and always within 24 h of collection.

The pool is prepared by mixing units of plasma belonging to the same ABO blood group.

*PLASMA POOL TESTS*

The pool of plasma is tested for hepatitis B surface antigen (HBsAg) and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

**Hepatitis A virus RNA**. The plasma pool is tested using a validated nucleic acid amplification technique (*2.6.21*). A positive control with $1.0 \times 10^2$ IU of hepatitis A virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis A virus RNA.

*Hepatitis A virus RNA for NAT testing BRP* is suitable for use as a positive control.

**Hepatitis C virus RNA**. The plasma pool is tested using a validated nucleic acid amplification technique (*2.6.21*). A positive control with $1.0 \times 10^2$ IU of hepatitis C virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

*Hepatitis C virus RNA for NAT testing BRP* is suitable for use as a positive control.

**Hepatitis E virus RNA**. The plasma pool is tested using a validated nucleic acid amplification technique (*2.6.21*). A positive control with $3.2 \times 10^2$ IU of hepatitis E virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis E virus RNA.

*Hepatitis E virus RNA for NAT testing BRP* is suitable for use as a positive control.

**B19 virus DNA**. The plasma pool contains not more than 10.0 IU/µL.

To limit the potential burden of B19 virus in plasma pools, the plasma pool is also tested for B19 virus using a validated nucleic acid amplification technique (*2.6.21*). A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

*B19 virus DNA for NAT testing BRP* is suitable for use as a positive control.

*METHOD OF PREPARATION*

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to inactivate known agents of infection; if substances are used for the inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

**Inactivation process**. The solvent-detergent process, which is one of the methods used to inactivate enveloped viruses, uses treatment with a combination of tributyl phosphate and octoxinol 10; these reagents are subsequently removed by oil extraction or by solid phase extraction so that the amount in the final product is less than 2 µg/mL for tributyl phosphate and less than 5 µg/mL for octoxinol 10.

No antimicrobial preservative is added.

The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen; it may subsequently be freeze-dried.

Plastic containers comply with the requirements for sterile plastic containers for human blood and blood components (*3.3.4*).

Glass containers comply with the requirements for glass containers for pharmaceutical use (*3.2.1*).

CHARACTERS

*Appearance*:

- *frozen preparation*: clear or slightly opalescent liquid, free from solid and gelatinous particles after thawing;
- *freeze-dried preparation*: almost white or slightly yellow powder or friable solid mass.

*Thaw or reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests and assay.*

IDENTIFICATION

A. Examine by electrophoresis (*2.2.31*) comparing with normal human plasma. The electropherograms show the same bands.

B. It complies with the test for anti-A and anti-B haemagglutinins (see Tests).

TESTS

**pH** (*2.2.3*): 6.5 to 7.6.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**: minimum 45 g/L.

Dilute if necessary with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube

and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the quantity of protein by multiplying the result by 6.25.

**Activated coagulation factors** (*2.6.22*). It complies with the test for activated coagulation factors. Carry out the test with 0.1 mL of the preparation to be examined instead of 10-fold and 100-fold dilutions. The coagulation time for the preparation to be examined is not less than 150 s.

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method A*). The presence of haemagglutinins (anti-A or anti-B) corresponds to the blood group stated on the label.

**Hepatitis A virus antibodies**: minimum 0.3 IU/mL, determined by a suitable immunochemical method (*2.7.1*).

*Human hepatitis A immunoglobulin BRP* is suitable for use as a reference preparation.

**Irregular erythrocyte antibodies**. The preparation to be examined does not show the presence of irregular erythrocyte antibodies when examined without dilution by an indirect antiglobulin test.

**Citrate**. Liquid chromatography (*2.2.29*).

*Test solution*. Dilute the preparation to be examined with an equal volume of a 9 g/L solution of *sodium chloride R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution*. Dissolve 0.300 g of *sodium citrate R* in *water R* and dilute to 100.0 mL with the same solvent.

*Column*:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *cation-exchange resin R* (9 µm).

*Mobile phase*: 0.51 g/L solution of *sulfuric acid R*.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Equilibration*: 15 min.

*Injection*: 10 µL.

*Retention time*: citrate = about 10 min.

*Limit*:

– *citrate*: maximum 25 mmol/L.

**Calcium**: maximum 5.0 mmol/L.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Source*: calcium hollow-cathode lamp using a transmission band preferably of 0.5 nm.

*Wavelength*: 622 nm.

*Atomisation device*: air-acetylene or acetylene-propane flame.

**Potassium**: maximum 5.0 mmol/L.

Atomic emission spectrometry (*2.2.22, Method I*).

*Wavelength*: 766.5 nm.

**Sodium**: maximum 200 mmol/L.

Atomic emission spectrometry (*2.2.22, Method I*).

*Wavelength*: 589 nm.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority (freeze-dried product).

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject 3 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.1 IU of endotoxin per millilitre.

ASSAY

**Assay of human coagulation factor VIII** (*2.7.4*). Use a reference plasma calibrated against the International Standard for blood coagulation factor VIII in plasma.

The estimated potency is not less than 0.5 IU/mL. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Assay of human coagulation factor V**. Carry out the assay of human coagulation factor V described below using a reference plasma calibrated against the International Standard for blood coagulation factor V in plasma.

Using *imidazole buffer solution pH 7.3 R*, prepare at least 3 twofold dilutions of the preparation to be examined, preferably in duplicate, from 1 in 10 to 1 in 40. Test each dilution as follows: mix 1 volume of *plasma substrate deficient in factor V R*, 1 volume of the dilution to be examined, 1 volume of *thromboplastin R* and 1 volume of a 3.5 g/L solution of *calcium chloride R*; measure the coagulation times, i.e. the interval between the moment at which the calcium chloride solution is added and the 1st indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus.

In the same manner, determine the coagulation time of 4 twofold dilutions (1 in 10 to 1 in 80) of human normal plasma in *imidazole buffer solution pH 7.3 R*.

Check the validity of the assay and calculate the potency of the test preparation by the usual statistical methods (for example, *5.3*).

The estimated potency is not less than 0.5 IU/mL. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Assay of human coagulation factor XI** (*2.7.22*). Use a reference plasma calibrated against the International Standard for blood coagulation factor XI in plasma.

The estimated potency is not less than 0.5 IU/mL. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

*Coagulation factors V, VIII, XI and XIII plasma BRP* is suitable for use as a reference preparation in the above assays.

**Assay of human protein C** (*2.7.30*). Use a reference plasma calibrated against the International Standard for human protein C in plasma.

The estimated potency is not less than 0.7 IU/mL. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Assay of human protein S** (*2.7.31*). Use a reference plasma calibrated against the International Standard for human protein S in plasma.

The estimated potency is within the limits approved for the particular product. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Assay of human plasmin inhibitor** (*2.7.25*) **($\alpha_2$-antiplasmin)**. Use a reference plasma calibrated against human normal plasma.

1 unit of human plasmin inhibitor is equal to the activity of 1 mL of human normal plasma. Human normal plasma is prepared by pooling plasma units from not fewer than 30 donors and storing at − 30 °C or lower.

The estimated potency is not less than 0.2 units/mL. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Activated partial thromboplastin time (APTT)**. Use an apparatus suitable for measurement of coagulation times or perform the assay with incubation tubes maintained in a water-bath at 37 °C. Place in each tube 0.1 mL of the preparation to be examined and 0.1 mL of a suitable APTT reagent (containing phospholipid and contact activator), both previously heated to 37 °C, and incubate the mixture for a recommended time at 37 °C. To each tube add 0.1 mL of a 3.7 g/L solution of *calcium chloride R* previously heated to 37 °C. Using a timer, measure the coagulation time, i.e. the interval between the moment of the addition of the calcium chloride and the 1st indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus. The volumes given above may be adapted to the APTT reagent and apparatus used. The coagulation time complies with the approved specification for the product.

LABELLING

The label states:

- the ABO blood group;
- the method used for virus inactivation.

**01/2014:2387**

# HUMAN α-1-PROTEINASE INHIBITOR

## α-1-Proteinasi inhibitor humanum

DEFINITION

Sterile liquid or freeze-dried preparation of a plasma protein fraction containing mainly human α-1-proteinase inhibitor (also known as human α-1-antitrypsin or α-1-antiproteinase). Human α-1-proteinase inhibitor is a glycoprotein existing in isoforms with different isoelectric points and is the most abundant multifunctional serine proteinase inhibitor in human plasma.

It is obtained from human plasma that complies with the monograph *Human plasma for fractionation (0853)*, using a suitable fractionation process and further purification steps. Other plasma proteins may be present. The preparation may contain excipients such as stabilisers.

PRODUCTION

*GENERAL PROVISIONS*

The method of preparation is designed to maintain functional integrity of α-1-proteinase inhibitor. It includes a step or steps that have been shown to remove or to inactivate known agents of infection. The subsequent purification procedure must be validated to demonstrate that the concentration of any substances used for inactivation of viruses during production is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.35 mg of active human α-1-proteinase inhibitor per milligram of total protein. The ratio of human α-1 proteinase inhibitor activity to human α-1-proteinase inhibitor antigen is not less than 0.7.

No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter and distributed aseptically into the final containers. It may be subsequently freeze-dried.

*CONSISTENCY OF THE METHOD OF PRODUCTION*

It shall be demonstrated that the manufacturing process yields a product with a consistent composition. It is evaluated by suitable analytical procedures that are determined during process development, and which include:

- assay of human α-1-proteinase inhibitor activity;
- determination of specific human α-1-proteinase inhibitor activity, expressed as the ratio of active human α-1-proteinase inhibitor to total protein;
- characterisation of isoform composition and protein structure by suitable methods such as isoelectric focusing (*2.2.54*), spectrometric methods (for example, mass spectrometry) or capillary electrophoresis (*2.2.47*);
- determination of the ratio of human α-1-proteinase inhibitor activity to human α-1-proteinase inhibitor antigen;
- characterisation of accompanying plasma proteins that might be present, by a set of suitable methods such as SDS-PAGE, cellulose acetate electrophoresis or capillary zone electrophoresis (*2.2.31*) and quantitative determination of relevant accompanying plasma proteins;
- determination of molecular-size distribution, used to quantify the polymeric forms of human α-1-proteinase inhibitor; consideration is given to the potential presence of accompanying proteins that might affect the results.

CHARACTERS

*Appearance*:

- *liquid preparations*: clear or slightly opalescent, colourless or pale yellow or pale green or pale brown;
- *freeze-dried preparations*: powders or solid friable masses, hygroscopic, white or pale yellow or pale brown.

*If the preparation to be examined is freeze-dried, reconstitute it as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assay.

TESTS

**pH** (*2.2.3*): 6.5 to 7.8.

**Solubility**. For freeze-dried preparations, add to a container of the preparation to be examined the volume of the liquid stated on the label at room temperature. The preparation dissolves completely, giving a clear, colourless or pale green or pale yellow or pale brown solution.

**Osmolality** (*2.2.35*): minimum 210 mosmol/kg.

**Total protein**. Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the protein content by multiplying by 6.25.

**Water**. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 60 mg of human α-1-proteinase inhibitor.
Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.08 IU of endotoxin per milligram of human α-1-proteinase inhibitor.

ASSAY

**Assay of human α-1-proteinase inhibitor** (*2.7.32*). The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

In an airtight and sterile container, at a temperature not exceeding 25 °C, unless otherwise justified and authorised.

LABELLING

The label states:

- the potency of active (functional) human α-1-proteinase inhibitor per container;
- the name and quantity of any added substances;
- the quantity of protein in the container;
- the route of administration;
- where applicable, the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

**01/2011:0554**
**corrected 7.6**

# HUMAN PROTHROMBIN COMPLEX

## Prothrombinum multiplex humanum

DEFINITION

Sterile plasma protein fraction containing human coagulation factor IX together with variable amounts of human coagulation factors II, VII and X; the presence and proportion of these additional factors depends on the method of fractionation. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers, heparin and antithrombin.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of human coagulation factor IX per millilitre.

If the content of any of the factors is stated as a single value, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency; if the content of any of the factors is stated as a range, the estimated potency is not less than the lower limit and not greater than the upper limit of the stated range.

PRODUCTION

The method of preparation is designed to maintain functional integrity of the relevant coagulation factors it contains and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.6 IU of human coagulation factor IX per milligram of total protein, before the addition of any protein stabiliser.

The prothrombin complex fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

CHARACTERS

*Appearance*: white or slightly coloured, very hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assays for human coagulation factors IX and II and, where applicable, those for human coagulation factors VII and X.

TESTS

**Solubility**. To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear solution that may be coloured.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

**Activated coagulation factors** (*2.6.22*). If necessary, dilute the reconstituted preparation to contain 20 IU of human coagulation factor IX per millilitre. For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin** (*2.7.12*). If heparin has been added during preparation, the preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per International Unit of human coagulation factor IX.

**Thrombin**. If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise it by addition of *protamine sulfate R* (10 µg of protamine sulfate neutralises 1 IU of heparin). In each of 2 test-tubes, mix equal volumes of the reconstituted preparation and of a 3 g/L solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a 3rd tube, mix equal volumes of the fibrinogen solution and of a solution of *human thrombin R* (1 IU/mL) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

**Water**. Determined by a suitable method, such as semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectrometry (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 IU of human coagulation factor IX.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.05 IU of endotoxin per International Unit of human coagulation factor IX.

ASSAY

**Human coagulation factor IX** (*2.7.11*). The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P$ = 0.95) is not greater than 80 per cent to 125 per cent of the estimated potency.

**Human coagulation factor II** (*2.7.18*). The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P$ = 0.95) is not greater than 90 per cent to 111 per cent of the estimated potency.

The estimated human coagulation factor II potency is not less than 70 per cent and not more than 165 per cent of the estimated human coagulation factor IX potency.

**Human coagulation factor VII** (*2.7.10*). If the label states that the preparation contains human coagulation factor VII, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P$ = 0.95) is not greater than 80 per cent to 125 per cent of the estimated potency.

**Human coagulation factor X** (*2.7.19*). If the label states that the preparation contains human coagulation factor X, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P$ = 0.95) is not greater than 90 per cent to 111 per cent of the estimated potency.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of human coagulation factor IX, and the number or range of International Units of human coagulation factor II per container;
- where applicable, the number or range of International Units of human coagulation factor VII and human coagulation factor X per container;
- the amount of protein per container;
- the name and quantity of any added substances, including, where applicable, heparin and antithrombin;
- the name and quantity of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

**01/2015:0723**

# HUMAN RABIES IMMUNOGLOBULIN

## Immunoglobulinum humanum rabicum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from donors immunised against rabies. It contains specific antibodies neutralising the rabies virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the dose of immunoglobulin required to neutralise the infectivity of a rabies virus suspension with the dose of a reference preparation, calibrated in International Units, required to produce the same degree of neutralisation (*2.7.1*). The test is performed in sensitive cell cultures and the presence of unneutralised virus is revealed by immunofluorescence.

The International Unit is the specific neutralising activity for rabies virus in a stated amount of the International Standard for anti-rabies immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human rabies immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

*Method*

Carry out the test in suitable sensitive cells. It is usual to use the BHK-21 cell line, grown in the medium described below, between the 18$^{th}$ and 30$^{th}$ passage levels counted from the ATCC seed lot. Harvest the cells after 2 to 4 days of growth, treat with trypsin and prepare a suspension containing 500 000 cells per millilitre (cell suspension). 10 min before using this suspension add 10 µg of *diethylaminoethyldextran R* per millilitre, if necessary, to increase the sensitivity of the cells.

Use a fixed virus strain grown in sensitive cells, such as the CVS strain of rabies virus adapted to growth in the BHK-21 cell line (seed virus suspension). Estimate the titre of the seed virus suspension as follows.

Prepare a series of dilutions of the viral suspension. In the chambers of cell-culture slides (8 chambers per slide), place 0.1 mL of each dilution and 0.1 mL of medium and add 0.2 mL of the cell suspension. Incubate in an atmosphere of carbon dioxide at 37 °C for 24 h. Carry out fixation, immunofluorescence staining and evaluation as described below. Determine the end-point titre of the seed virus suspension and prepare the working virus dilution corresponding to 100 $CCID_{50}$ per 0.1 mL.

For each assay, check the amount of virus used by performing a control titration: from the dilution corresponding to 100 $CCID_{50}$ per 0.1 mL, make 3 tenfold dilutions. Add 0.1 mL of each dilution to 4 chambers containing 0.1 mL of medium and add 0.2 mL of the cell suspension. The test is not valid unless the titre lies between 30 $CCID_{50}$ and 300 $CCID_{50}$.

Dilute the reference preparation to a concentration of 2 IU/mL using non-supplemented culture medium (stock reference dilution, stored below – 80 °C). Prepare 2 suitable predilutions (1:8 and 1:10) of the stock reference dilution so

that the dilution of the reference preparation that reduces the number of fluorescent fields by 50 per cent lies within the 4 dilutions of the cell-culture slide. Add 0.1 mL of the medium to each chamber, except the first in each of 2 rows, to which add respectively 0.2 mL of the 2 predilutions of the stock reference dilution transferring successively 0.1 mL to the other chambers.

Dilute the preparation to be examined 1 in 100 using non-supplemented medium (stock immunoglobulin dilution) – to reduce to a minimum errors due to viscosity of the undiluted preparation – and make 3 suitable predilutions so that the dilution of the preparation to be examined that reduces the number of fluorescent fields by 50 per cent lies within the 4 dilutions of the cell-culture slide. Add 0.1 mL of the medium to all the chambers except the first in each of 3 rows, to which add respectively 0.2 mL of the 3 predilutions of the stock immunoglobulin dilution. Prepare a series of 2-fold dilutions transferring successively 0.1 mL to the other chambers.

To all the chambers containing the dilutions of the reference preparation and the dilutions of the preparation to be examined, add 0.1 mL of the virus suspension corresponding to 100 $CCID_{50}$ per 0.1 mL (working virus dilution), shake manually, allow to stand in an atmosphere of carbon dioxide at 37 °C for 90 min, add 0.2 mL of the cell suspension, shake manually and allow to stand in an atmosphere of carbon dioxide at 37 °C for 24 h.

After 24 h, discard the medium and remove the plastic walls. Wash the cell monolayer with *phosphate buffered saline pH 7.4 R* and then with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* and fix in a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* at − 20 °C for 3 min. Spread on the slides *fluorescein-conjugated rabies antiserum R* ready for use. Allow to stand in an atmosphere with a high level of moisture at 37 °C for 30 min. Wash with *phosphate buffered saline pH 7.4 R* and dry. Examine 20 fields in each chamber at a magnification of 250 ×, using a microscope equipped for fluorescence readings. Note the number of fields with at least 1 fluorescent cell. Check the test dose used in the virus titration slide and determine the dilution of the reference preparation and the dilution of the preparation to be examined that reduce the number of fluorescent fields by 50 per cent, calculating the 2 or 3 dilutions together using probit analysis. The test is not valid unless the statistical analysis shows a significant slope of the dose-response curve and no evidence of deviation from linearity or parallelism.

The stated potency is not less than 150 IU/mL. The estimated potency is not less than the stated potency and is not greater than twice the stated potency. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

CULTURE MEDIUM FOR GROWTH OF BHK-21 CELLS

*Commercially available media that have a slightly different composition from that shown below may also be used.*

| | |
|---|---|
| Sodium chloride | 6.4 g |
| Potassium chloride | 0.40 g |
| Calcium chloride, anhydrous | 0.20 g |
| Magnesium sulfate, heptahydrate | 0.20 g |
| Sodium dihydrogen phosphate, monohydrate | 0.124 g |
| Glucose monohydrate | 4.5 g |
| Ferric nitrate, nonahydrate | 0.10 mg |
| L-Arginine hydrochloride | 42.0 mg |
| L-Cystine | 24.0 mg |

The label states the number of International Units per container.

**01/2015:0617**

# HUMAN RUBELLA IMMUNOGLOBULIN

## Immunoglobulinum humanum rubellae

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against rubella virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the activity of the preparation to be examined in a suitable haemagglutination-inhibition test with that of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard for anti-rubella immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

The estimated potency is not less than 4500 IU/mL. The confidence limits ($P$ = 0.95) of the estimated potency are not less than 50 per cent and not more than 200 per cent of the stated potency.

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per millilitre.

**01/2015:0398**

# HUMAN TETANUS IMMUNOGLOBULIN

## Immunoglobulinum humanum tetanicum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against the toxin of *Clostridium tetani*. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

PRODUCTION

During development, a satisfactory relationship shall be established between the potency determined by immunoassay as described under Potency and that determined by means of the following test for toxin-neutralising capacity in mice.

*Toxin-neutralising capacity in mice*. The potency is determined by comparing the quantity necessary to protect mice against the paralytic effects of a fixed quantity of tetanus toxin with the quantity of a reference preparation of human tetanus immunoglobulin, calibrated in International Units, necessary to give the same protection.

The International Unit of antitoxin is the specific neutralising activity for tetanus toxin contained in a stated amount of the International Standard, which consists of freeze-dried human immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human tetanus immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

**Method**

*Selection of animals*. Use mice weighing 16-20 g.

*Preparation of the test toxin*. Prepare the test toxin by a suitable method from the sterile filtrate of a culture in liquid medium of *C. tetani*. The 2 methods shown below are given as examples and any other suitable method may be used.

(1) To the filtrate of an approximately 9-day culture, add 1-2 volumes of *glycerol R* and store the mixture in the liquid state at a temperature slightly below 0 °C.

(2) Precipitate the toxin by addition to the filtrate of *ammonium sulfate R*, dry the precipitate *in vacuo* over *diphosphorus pentoxide R*, reduce to a powder and store dry, either in sealed ampoules or *in vacuo* over *diphosphorus pentoxide R*.

*Determination of test dose of toxin (Lp/10 dose)*. Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. If the test toxin is stored dry, reconstitute it using a suitable liquid. Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 mL of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the volume to 5.0 mL. Allow the mixtures to stand, protected from light, for 60 min. Using 6 mice for each mixture, inject a dose of 0.5 mL subcutaneously into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The test dose of toxin is the quantity in 0.5 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, paralysis in all 6 mice injected with the mixture, within the observation period.

*Determination of potency of the immunoglobulin*. Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. Prepare a solution of the test toxin in a suitable liquid such that it contains 5 test doses per millilitre. Prepare mixtures of the solution of the test toxin and the immunoglobulin to be examined such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the immunoglobulin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 mL) that contains 1 IU and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand, protected from light, for 60 min. Using 6 mice for each mixture, inject subcutaneously a dose of 0.5 mL into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The mixture that contains the largest volume of immunoglobulin that fails to protect the mice from paralysis contains 1 IU. This quantity is used to calculate the potency of the immunoglobulin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 mL or less of the solution of the reference preparation show paralysis and all those injected with mixtures containing more do not.

POTENCY

The potency is determined by comparing the antibody titre of the preparation to be examined with that of a reference preparation calibrated in International Units, using suitable immunochemical methods (*2.7.1*) such as enzyme-linked immunosorbent assay (ELISA) or toxoid inhibition assay (TIA).

The International Unit is the activity contained in a stated amount of the International Standard for anti-tetanus immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human tetanus immunoglobulin BRP* is calibrated in International Units and is suitable for use as a reference preparation.

The stated potency is not less than 100 IU/mL of tetanus antitoxin. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

The description of methods A and B below are provided as examples.

**Method A: direct enzyme immunoassay**

The amount of tetanus immunoglobulin bound to tetanus toxoid, which is coated to a microtitre plate, is determined by means of a peroxidase-conjugated polyclonal anti-human IgG antibody.

*Materials*

- *Phosphate-buffered saline pH 7.1 (PBS).* Dissolve 0.2 g of *potassium chloride R*, 0.2 g of *potassium dihydrogen phosphate R*, 1.15 g of *anhydrous disodium hydrogen phosphate R* and 8.0 g of *sodium chloride R* in *water R* and adjust the pH (*2.2.3*) if necessary. Dilute to 1000 mL with *water R*.
- *PBS-T.* PBS containing 0.05 per cent *V/V* of *polysorbate 20 R*.
- *Carbonate buffer pH 9.6.* Dissolve 1.4 g of *anhydrous sodium carbonate R* and 3.0 g of *sodium hydrogen carbonate R* in *water R* and adjust the pH (*2.2.3*) if necessary. Dilute to 1000 mL with *water R*.
- *Tetanus toxoid.* Purified and chemically inactivated tetanus toxin.
- *Microtitre plate.* Use a flat-bottomed microtitre plate with high protein-binding capacity.

*Method*

Distribute 100 µL of a 0.2 Lf/mL solution of tetanus toxoid in carbonate buffer pH 9.6 into each of the wells of the microtitre plate. Incubate at 4 °C for approximately 18 h. Wash the plate 5 times with PBS-T. To block unbound binding sites add 200 µL of PBS containing 5 g/L of *bovine albumin R* to each of the wells and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash 5 times with PBS-T.

Reconstitute the reference preparation and the preparation to be examined according to the instructions. For each preparation, prepare 2 independent predilutions of 0.004 IU/mL in PBS by applying several dilution steps. Using PBS, prepare from each predilution 5 serial dilutions with a dilution factor of 1.5 resulting in a dilution series of 6 dilutions in the range of 0.0005-0.004 IU/mL. Depending on the reagents used, a small modification of the dilution series might be necessary to meet the conditions of the statistical model used.

Apply 100 µL of each of the samples of the dilution series to the plate. Incubate for 2 h at 37 °C on a plate shaker set at 120 r/min and wash the plate 5 times with PBS-T. Apply 100 µL of a peroxidase-conjugated anti-human IgG antibody diluted to a suitable concentration with PBS-T containing 5 g/L of *bovine albumin R* to each of the wells and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T and apply 100 µL of a suitable 3,3′,5,5′-tetramethylbenzidine (TMB) substrate to each of the wells and incubate at room temperature for 10 min in the dark. To stop the reaction, add 100 µL of a 196.2 g/L solution of *sulfuric acid R* to each of the wells. Measure the absorbances at 450 nm and at the reference wavelength of 630 nm. Calculate the potencies of the preparations by the usual statistical methods (*5.3*).

**Method B: indirect determination by toxoid-binding inhibition assay**

The amount of unbound toxoid in a mixture of toxoid and tetanus immunoglobulin is determined by an enzyme immunoassay and is inversely proportional to the amount of tetanus immunoglobulin present. The method is performed over 2 consecutive days.

*Materials*

- *Phosphate-buffered saline pH 7.1 (PBS).* See under Method A.
- *PBS-T.* See under Method A.
- *Carbonate buffer pH 9.6.* See under Method A.
- *Tetanus toxoid.* See under Method A.
- *Mab.* Mouse monoclonal tetanus toxoid antibody. Use according to the instructions. Prepare a suitable dilution of Mab, e.g. 1/5000, in PBS.
- *Peroxidase-conjugated antibody.* Peroxidase-conjugated anti-mouse IgG (H+L) antibody, affinity-purified F(ab)2 fragment without cross-reactivity to human serum proteins. Use according to the instructions. Prepare a suitable dilution of the peroxidase-conjugated antibody in PBS-T containing 5 g/L of *bovine albumin R*.
- *Microtitre plate.* Use a round-bottomed microtitre plate with medium protein-binding capacity.
- *ELISA plate.* Use a flat-bottomed microtitre plate with high protein-binding capacity.

*Method*

Day 1

To block the protein-binding sites of the microtitre plate, add 200 µL of PBS containing 5 g/L of *bovine albumin R* to each of the wells of the microtitre plate and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T.

Reconstitute the reference preparation and the preparation to be examined according to the instructions. For each preparation, prepare 2 independent predilutions of 0.4 IU/mL in PBS by applying several dilution steps. Prepare from each predilution a dilution series of dilutions containing 0.04 IU/mL, 0.10 IU/mL, 0.12 IU/mL, 0.14 IU/mL, 0.16 IU/mL, 0.18 IU/mL and 0.20 IU/mL. Prepare each dilution directly from the 0.4 IU/mL predilution.

Transfer 100 µL of each dilution of the dilution series to a well of the blocked plate and add 50 µL of a 0.2 Lf/mL solution of tetanus toxoid in carbonate buffer pH 9.6 into each of the wells. Incubate for approximately 18 h at 37 °C on a plate shaker set at 120 r/min.

To coat the ELISA plate, distribute 100 µL of a solution of a human tetanus immunoglobulin diluted to 1 IU/mL in carbonate buffer pH 9.6 into each of the wells of the ELISA plate. Incubate for approximately 18 h at 37 °C on a plate shaker set at 120 r/min.

Day 2

Wash the coated ELISA plate 5 times with PBS-T. To block unbound binding sites add 200 µL of PBS containing 5 g/L of *bovine albumin R* to each of the wells and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T. Transfer 100 µL of each mixture of toxoid and tetanus immunoglobulin from the microtitre plate to the coated ELISA plate and incubate for 2 hours at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T. Add 100 µL of diluted Mab to each of the wells, incubate the plate for 1 h at 37 °C on a plate shaker set at 120 r/min and wash the plate 5 times with PBS-T. Add 100 µL of the diluted peroxidase-conjugated antibody to each of the wells, incubate the plate for 1 h at 37 °C on a plate shaker set at 120 r/min and wash the plate 5 times with PBS-T. Apply 100 µL of a suitable 3,3′,5,5′-tetramethylbenzidine (TMB) substrate to each of the wells and incubate at room temperature for 10 min in the dark. To stop the reaction, add 100 µL of a 196.2 g/L solution of *sulfuric acid R* to each of the wells. Measure the absorbances at 450 nm and at the reference wavelength of 630 nm. Calculate the potencies of the preparations by the usual statistical methods (*5.3*).

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

**01/2015:0724**

## HUMAN VARICELLA IMMUNOGLOBULIN

### Immunoglobulinum humanum varicellae

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against *Herpesvirus varicellae*. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)* except for the minimum number of donors, the minimum total protein content and, where authorised, the test for antibody to hepatitis B surface antigen.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster. The equivalence in International Units of the International Standard is stated by the World Health Organization.

The stated potency is not less than 100 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

**01/2008:1528 corrected 7.6**

## HUMAN VARICELLA IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

### Immunoglobulinum humanum varicellae ad usum intravenosum

DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected donors having antibodies against human herpesvirus 3 (varicella-zoster virus 1). *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

The stated potency is not less than 25 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the number of International Units per container.

## HUMAN VON WILLEBRAND FACTOR

### Factor humanus von Willebrandi

DEFINITION

Sterile, freeze-dried preparation of a plasma protein fraction containing the glycoprotein human von Willebrand factor with varying amounts of human coagulation factor VIII, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers.

This monograph applies to preparations formulated according to the human von Willebrand factor activity.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of human von Willebrand factor per millilitre.

## PRODUCTION

*GENERAL PROVISIONS*

The method of preparation is designed to maintain functional integrity of human von Willebrand factor. It includes steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients. The specific activity is not less than 1 IU of human von Willebrand factor per milligram of total protein, before the addition of any protein stabiliser.

The human von Willebrand factor fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

*CONSISTENCY OF THE METHOD OF PRODUCTION*

It shall be demonstrated that the manufacturing process yields a product having a consistent composition with respect to human von Willebrand factor, human coagulation factor VIII and the proportions of human von Willebrand factor and human coagulation factor VIII. This is evaluated by suitable analytical procedures that are determined during process development, and that include the following checks:

**Human von Willebrand factor multimers**. The distribution of the different human von Willebrand factor multimers is determined by a suitable method such as sodium dodecyl sulfate (SDS) agarose gel electrophoresis with or without Western blot analysis, using a suitable normal human plasma as standard. Visualisation of the multimeric pattern may be performed using, for example, an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis.

**Human von Willebrand factor activity** (*2.7.21*). The human von Willebrand factor activity is estimated by determining the ristocetin cofactor activity and by one or more other suitable assays such as determination of collagen-binding activity using a suitable reference preparation.

**Human von Willebrand factor activity/antigen ratio**. Consistency of the manufacturing process with respect to the ratio of human von Willebrand factor activity to human von Willebrand factor antigen content is demonstrated.

*PRODUCTS THAT SHOW PARTICLES AFTER RECONSTITUTION.* If a few particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter to be provided with the preparation.

## CHARACTERS

*Appearance*: hygroscopic, white or pale yellow, powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

## IDENTIFICATION

It complies with the limits of the assay.

## TESTS

**Solubility**. To a container of the preparation to be examined, add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, forming a clear or slightly opalescent, colourless or slightly yellow solution.

In addition, where the label states that the product may show a few particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

**pH** (*2.2.3*): 6.5 to 7.5.

**Osmolality** (*2.2.35*): minimum 240 mosmol/kg.

**Total protein**. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser, this method may not be applicable. Another validated method for protein determination must therefore be performed.*

**Anti-A and anti-B haemagglutinins** (*2.6.20, Method A*). The 1 to 64 dilution does not show agglutination. Dilute the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to contain 6 IU of human von Willebrand factor activity per millilitre.

**Water**. Determined by a suitable method, such as semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectroscopy (*2.2.40*), the water content is within the limits approved by the competent authority.

**Sterility** (*2.6.1*). It complies with the test.

**Pyrogens** (*2.6.8*) **or Bacterial endotoxins** (*2.6.14*). It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 100 IU of human von Willebrand factor.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.05 IU of endotoxin per International Unit of human von Willebrand factor.

## ASSAY

**Human von Willebrand factor** (*2.7.21*). The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

*Pending the availability of an International Standard for human von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.*

**Human coagulation factor VIII** (*2.7.4*). The assay is carried out where the human coagulation factor VIII content is greater than 10 IU of human coagulation factor VIII per 100 IU of human von Willebrand factor activity. The estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

## STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of human von Willebrand factor in the container;
- the number of International Units of human coagulation factor VIII in the container, or that the content of human coagulation factor VIII is less than or equal to 10 IU of human coagulation factor VIII per 100 IU of human von Willebrand factor activity;
- the amount of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, that the preparation may show the presence of a few particles after reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

**01/2008:0912**
**corrected 10.0**

# HYALURONIDASE

## Hyaluronidasum

[9001-54-1]

DEFINITION

Enzyme extracted from mammalian testes (for example bovine testes) and capable of hydrolysing mucopolysaccharides of the hyaluronic acid type. It may contain a suitable stabiliser.

*Potency*: minimum 300 IU of hyaluronidase activity per milligram (dried substance).

PRODUCTION

The animals from which hyaluronidase is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

*Appearance*: white or yellowish-white, amorphous powder.

*Solubility*: soluble in water, practically insoluble in acetone and in anhydrous ethanol.

IDENTIFICATION

A solution containing the equivalent of 100 IU of hyaluronidase in 1 mL of a 9 g/L solution of *sodium chloride R* depolymerises an equal volume of a 10 g/L solution of *sodium hyaluronate BRP* in 1 min at 20 °C as shown by a pronounced decrease in viscosity. This action is destroyed by heating the hyaluronidase at 100 °C for 30 min.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*).

Dissolve 0.10 g in *water R* and dilute to 10 mL with the same solvent.

**pH** (*2.2.3*): 4.5 to 7.5.

Dissolve 30 mg in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent.

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 0.500 g by drying at 60 °C at a pressure not exceeding 670 Pa for 2 h.

**Bacterial endotoxins** (*2.6.14*): less than 0.2 IU per IU of hyaluronidase.

ASSAY

The activity of hyaluronidase is determined by comparing the rate at which it hydrolyses *sodium hyaluronate BRP* with the rate obtained with the International Standard, or a reference preparation calibrated in International Units, using a slope-ratio assay.

*Substrate solution*. To 0.10 g of *sodium hyaluronate BRP* in a 25 mL conical flask add slowly 20.0 mL of *water R* at 4 °C. The rate of addition must be slow enough to allow the substrate particles to swell (about 5 min). Maintain at 4 °C and stir for at least 12 h. Store at 4 °C and use within 4 days.

*For the test solution and the reference solution, prepare the solution and carry out the dilution at 0 °C to 4 °C.*

*Test solution*. Dissolve a suitable amount of the substance to be examined in *hyaluronidase diluent R* so as to obtain a solution containing 0.6 ± 0.3 IU of hyaluronidase per millilitre.

*Reference solution*. Dissolve a suitable amount of *hyaluronidase BRP* in *hyaluronidase diluent R* so as to obtain a solution containing 0.6 IU of hyaluronidase per millilitre.

In a reaction vessel, mix 1.50 mL of *phosphate buffer solution pH 6.4 R* and 1.0 mL of the substrate solution and equilibrate at 37 ± 0.1 °C. At time $t_1 = 0$ (first chronometer) add 0.50 mL of the test solution containing $E_t$ mg of the enzyme to be examined, mix, measure the viscosity of the solution using a suitable viscometer maintained at 37 ± 0.1 °C and record the outflow time $t_2$ using a second chronometer (graduated in 0.1 second intervals), several times during about 20 min (read on the first chronometer). The following viscometer has been found suitable: Ubbelohde microviscometer (DIN 51 562, Part 2), capillary type MII, viscometer constant about 0.1 $mm^2/s^2$.

Repeat the procedure using 0.50 mL of the reference solution containing $E_r$ mg of *hyaluronidase BRP*.

Calculate the viscosity ratio from the expression:

$$\eta_r = \frac{k \times t_2}{0.6915}$$

$k$ = the viscometer constant in $mm^2/s^2$ (indicated on the viscometer);

$t_2$ = the outflow time (in seconds) of the solution;

0.6915 = the kinematic viscosity in $mm^2/s$ of the buffer solution at 37 °C.

Since the enzymatic reaction continues during the outflow time measurements, the real reaction time equals $t_1 + t_2/2$, half of the outflow time ($t_2/2$) for which a certain measurement is valid being added to the time $t_1$ at which the measurement is started. Plot $(\ln \eta_r)^{-1}$ as a function of the reaction time ($t_1 + t_2/2$) in seconds. A linear relationship is obtained. Calculate the slope for the substance to be examined ($b_t$) and the reference preparation ($b_r$).

Calculate the specific activity in International Units per milligram from the expression:

$$\frac{b_t}{b_r} \times \frac{E_r}{E_t} \times A$$

$A$ = the specific activity of *hyaluronidase BRP* in International Units per milligram.

Carry out the complete procedure at least three times and calculate the average activity of the substance to be examined.

STORAGE

Store in an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, tamper-evident container.

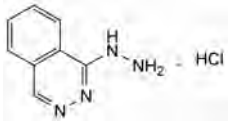
LABELLING

The label states the activity in International Units per milligram.

01/2017:0829
corrected 9.2

# HYDRALAZINE HYDROCHLORIDE

## Hydralazini hydrochloridum



$C_8H_9ClN_4$ $M_r$ 196.6
[304-20-1]

DEFINITION

1-Hydrazinophthalazine hydrochloride.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: soluble in water, slightly soluble in ethanol (96 per cent), very slightly soluble in methylene chloride.

mp: about 275 °C, with decomposition.

IDENTIFICATION

*First identification: B, E.*

*Second identification: A, C, D, E.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50 mg in *water R* and dilute to 100 mL with the same solvent. Dilute 2 mL of this solution to 100 mL with *water R*.

*Spectral range*: 220-350 nm.

*Absorption maxima*: at 240 nm, 260 nm, 303 nm and 315 nm.

*Absorbance ratio*: $A_{240}/A_{303}$ = 2.0 to 2.2.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *hydralazine hydrochloride CRS*.

C. Dissolve 0.5 g in a mixture of 8 mL of *dilute hydrochloric acid R* and 100 mL of *water R*. Add 2 mL of *sodium nitrite solution R*, allow to stand for 10 min and filter. The precipitate, washed with *water R* and dried at 100-105 °C, melts (*2.2.14*) at 209 °C to 212 °C.

D. Dissolve about 10 mg in 2 mL of *water R*. Add 2 mL of a 20 g/L solution of *nitrobenzaldehyde R* in *ethanol (96 per cent) R*. An orange precipitate is formed.

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_6$ (*2.2.2, Method II*).

Dilute 4 mL of solution S to 20 mL with *water R*.

**pH** (*2.2.3*): 3.5 to 4.2 for solution S.

**Hydrazine**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 0.12 g of the substance to be examined in 4 mL of *water R* and add 4 mL of a 150 g/L solution of *salicylaldehyde R* in *methanol R* and 0.2 mL of *hydrochloric acid R*. Mix and keep at a temperature not exceeding 25 °C for 2-4 h, until the precipitate formed has sedimented. Add 4 mL of *toluene R*, shake vigorously and centrifuge. Transfer the clear supernatant to a 100 mL separating funnel and shake vigorously, each time for 3 min, with 2 quantities, each of 20 mL, of a 200 g/L solution of *sodium metabisulfite R* and with 2 quantities, each of 50 mL, of *water R*. Separate the upper toluene layer which is the test solution.

*Reference solution (a).* Dissolve 12 mg of *hydrazine sulfate R* in *dilute hydrochloric acid R* and dilute to 100.0 mL with the same acid. Dilute 1.0 mL of this solution to 100.0 mL with *dilute hydrochloric acid R*.

*Reference solution (b).* Prepare the solution at the same time and in the same manner as for the test solution, using 1.0 mL of reference solution (a) and 3 mL of *water R*.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *ethanol (96 per cent) R*, *toluene R* (10:90 *V/V*).

*Application*: 20 µL of the test solution and reference solution (b).

*Development*: over a path of 10 cm.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 365 nm.

*Limit*:

– *hydrazine*: any yellow fluorescent spot due to hydrazine is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (10 ppm).

**Related substances**. Liquid chromatography (*2.2.29*). *The solutions must be injected within one working day.*

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dilute 10.0 mL of reference solution (a) to 50.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 25.0 mg of *phthalazine R* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 4.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (d).* Dilute a mixture of 4.0 mL of the test solution and 10.0 mL of reference solution (c) to 100.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *nitrile silica gel for chromatography R1* (10 µm).

*Mobile phase*: mix 22 volumes of *acetonitrile R* and 78 volumes of a solution containing 1.44 g/L of *sodium laurilsulfate R* and 0.75 g/L of *tetrabutylammonium bromide R*, then adjust to pH 3.0 with *dilute sulfuric acid R1*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL.

*Run time*: 3 times the retention time of hydralazine.

*Retention time*: hydralazine = about 10 min to 12 min; if necessary, adjust the concentration of acetonitrile in the mobile phase.

*System suitability*:

– the chromatogram obtained with reference solution (d) shows 2 principal peaks;
– *resolution*: minimum 2.5 between the peaks due to hydralazine and phtalazine in the chromatogram obtained with reference solution (d);
– *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (b).

*Limit*:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in 25 mL of *water R*. Add 35 mL of *hydrochloric acid R* and titrate with *0.05 M potassium iodate*, determining the end-point potentiometrically (*2.2.20*) using a platinum indicator electrode.

1 mL of *0.05 M potassium iodate* is equivalent to 9.832 mg of $C_8H_9ClN_4$.

STORAGE

Protected from light.

**01/2017:0002**

# HYDROCHLORIC ACID, CONCENTRATED

## Acidum hydrochloridum concentratum

HCl $M_r$ 36.46
[7647-01-0 ]

DEFINITION

*Content*: 35.0 per cent *m/m* to 39.0 per cent *m/m*.

CHARACTERS

*Appearance*: clear, colourless, fuming liquid.

*Solubility*: miscible with water.

*Relative density*: about 1.18.

IDENTIFICATION

A. Dilute with *water R*. The solution is strongly acid (*2.2.4*).

B. It gives the reactions of chlorides (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

**Appearance of solution**. To 2 mL add 8 mL of *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Free chlorine**: maximum 4 ppm.

To 15 mL add 100 mL of *carbon dioxide-free water R*, 1 mL of a 100 g/L solution of *potassium iodide R* and 0.5 mL of *iodide-free starch solution R*. Allow to stand in the dark for 2 min. Any blue colour disappears on the addition of 0.2 mL of *0.01 M sodium thiosulfate*.

**Sulfates** (*2.4.13*): maximum 20 ppm.

To 6.4 mL add 10 mg of *sodium hydrogen carbonate R* and evaporate to dryness on a water-bath. Dissolve the residue in 15 mL of *distilled water R*.

**Residue on evaporation**: maximum 0.01 per cent.

Evaporate 100.0 g to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 10 mg.

ASSAY

Weigh accurately a ground-glass-stoppered flask containing 30 mL of *water R*. Introduce 1.5 mL of the acid to be examined and weigh again. Titrate with *1 M sodium hydroxide*, using *methyl red solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 36.46 mg of HCl.

STORAGE

In a stoppered container made of glass or another inert material, at a temperature not exceeding 30 °C.

**01/2017:0003**

# HYDROCHLORIC ACID, DILUTE

## Acidum hydrochloridum dilutum

DEFINITION

*Content*: 9.5 per cent *m/m* to 10.5 per cent *m/m* of HCl ($M_r$ 36.46).

PREPARATION

To 726 g of *water R* add 274 g of concentrated hydrochloric acid and mix.

IDENTIFICATION

A. It is strongly acid (*2.2.4*).

B. It gives the reactions of chlorides (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

**Appearance**. It is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Free chlorine**: maximum 1 ppm.

To 60 mL add 50 mL of *carbon dioxide-free water R*, 1 mL of a 100 g/L solution of *potassium iodide R* and 0.5 mL of *iodide-free starch solution R*. Allow to stand in the dark for 2 min. Any blue colour disappears on the addition of 0.2 mL of *0.01 M sodium thiosulfate*.

**Sulfates** (*2.4.13*): maximum 5 ppm.

To 26 mL add 10 mg of *sodium hydrogen carbonate R* and evaporate to dryness on a water-bath. Dissolve the residue in 15 mL of *distilled water R*.

**Residue on evaporation**: maximum 0.01 per cent.

Evaporate 100.0 g to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 10 mg.

ASSAY

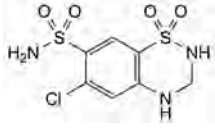
To 6.00 g add 30 mL of *water R*. Titrate with *1 M sodium hydroxide*, using *methyl red solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 36.46 mg of HCl.

**01/2013:0394**

# HYDROCHLOROTHIAZIDE

## Hydrochlorothiazidum



$C_7H_8ClN_3O_4S_2$ $M_r$ 297.7
[58-93-5]

DEFINITION

6-Chloro-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide.

*Content*: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very slightly soluble in water, soluble in acetone, sparingly soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification*: *B.*

*Second identification*: *A, C, D.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in 10 mL of *0.1 M sodium hydroxide* and dilute to 100.0 mL with *water R*. Dilute 2.0 mL of this solution to 100.0 mL with *0.01 M sodium hydroxide*.

*Spectral range*: 250-350 nm.

*Absorption maxima*: at 273 nm and 323 nm.

*Absorbance ratio*: $A_{273}/A_{323}$ = 5.4 to 5.7.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydrochlorothiazide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethanol R1*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 50 mg of the substance to be examined in *acetone R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 50 mg of *hydrochlorothiazide CRS* in *acetone R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 25 mg of *chlorothiazide R* in reference solution (a) and dilute to 5 mL with reference solution (a).

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: *ethyl acetate R.*

*Application*: 2 µL.

*Development*: over 1/2 of the plate.

*Drying*: in a current of air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Gently heat about 1 mg with 2 mL of a freshly prepared 0.5 g/L solution of *chromotropic acid, sodium salt R* in a cooled mixture of 35 volumes of *water R* and 65 volumes of *sulfuric acid R*. A violet colour develops.

TESTS

**Acidity or alkalinity**. Shake 0.5 g of the powdered substance to be examined with 25 mL of *water R* for 2 min and filter. To 10 mL of the filtrate, add 0.2 mL of *0.01 M sodium hydroxide* and 0.15 mL of *methyl red solution R*. The solution is yellow. Not more than 0.4 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture.* Dilute 50.0 mL of a mixture of equal volumes of *acetonitrile R1* and *methanol R2* to 200.0 mL with *phosphate buffer solution pH 3.2 R1*.

*Test solution (a).* Dissolve 30.0 mg of the substance to be examined in 5 mL of a mixture of equal volumes of *acetonitrile R1* and *methanol R2*, using sonication if necessary, and dilute to 20.0 mL with *phosphate buffer solution pH 3.2 R1*.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 20.0 mL with *phosphate buffer solution pH 3.2 R1*.

*Reference solution (a).* Dissolve 3 mg of *chlorothiazide CRS* (impurity A) and 3 mg of *hydrochlorothiazide CRS* in 5 mL of a mixture of equal volumes of *acetonitrile R1* and *methanol R2*, using sonication if necessary, and dilute to 20.0 mL with *phosphate buffer solution pH 3.2 R1*. Dilute 5.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 30.0 mg of *hydrochlorothiazide CRS* in 5 mL of a mixture of equal volumes of *acetonitrile R1* and *methanol R2*, using sonication if necessary, and dilute to 20.0 mL with *phosphate buffer solution pH 3.2 R1*. Dilute 1.0 mL of this solution to 20.0 mL with *phosphate buffer solution pH 3.2 R1*.

*Reference solution (d).* Dissolve 3 mg of *hydrochlorothiazide for peak identification CRS* (containing impurities B and C) in 0.5 mL of a mixture of equal volumes of *acetonitrile R1* and *methanol R2*, using sonication if necessary, and dilute to 2.0 mL with *phosphate buffer solution pH 3.2 R1*.

*Column*:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

– *mobile phase A*: to 940 mL of *phosphate buffer solution pH 3.2 R1* add 60.0 mL of *methanol R2* and 10.0 mL of *tetrahydrofuran R* and mix;
– *mobile phase B*: to a mixture of 500 mL of *methanol R2* and 500 mL of *phosphate buffer solution pH 3.2 R1* add 50.0 mL of *tetrahydrofuran R* and mix;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 17 | 100 → 55 | 0 → 45 |
| 17 - 30 | 55 | 45 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 224 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (a), (b) and (d).

*Identification of impurities*: use the chromatogram obtained with reference solution (a) to identify the peak due to impurity A; use the chromatogram supplied with *hydrochlorothiazide for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities B and C.

*Relative retention* with reference to hydrochlorothiazide (retention time = about 8 min): impurity B = about 0.7; impurity A = about 0.9; impurity C = about 2.8.

*System suitability*: reference solution (a):

– *resolution*: minimum 2.5 between the peaks due to impurity A and hydrochlorothiazide.

*Limits*:

– *impurities A, B, C*: for each impurity, not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dissolve 1.0 g in 25 mL of *acetone R* and dilute to 30 mL with *water R*. Prepare the standard using 5 mL of *acetone R* containing 15 per cent *V/V* of *water R* and 10 mL of *chloride standard solution (5 ppm Cl) R*.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*:

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 4 | 80 | 20 |
| 4 - 10 | 80 → 20 | 20 → 80 |

*Flow rate*: 1.6 mL/min.

*Injection*: test solution (b) and reference solutions (a) and (c).

*Relative retention* with reference to hydrochlorothiazide (retention time = about 2.2 min): impurity A = about 0.9.

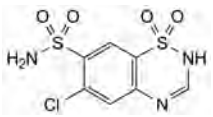
*System suitability*: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurity A and hydrochlorothiazide.

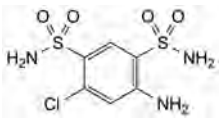
Calculate the percentage content of $C_7H_8ClN_3O_4S_2$ taking into account the assigned content of *hydrochlorothiazide CRS*.

IMPURITIES

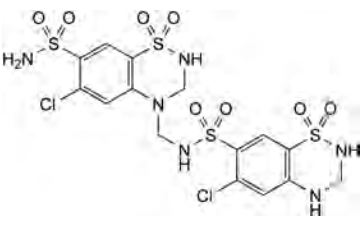
*Specified impurities*: *A, B, C.*



A. 6-chloro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide (chlorothiazide),



B. 4-amino-6-chlorobenzene-1,3-disulfonamide (salamide),

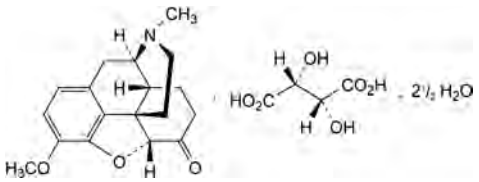


C. 6-chloro-*N*-[(6-chloro-7-sulfamoyl-2,3-dihydro-4*H*-1,2,4-benzothiadiazin-4-yl 1,1-dioxide)methyl]-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide.

**04/2009:1784 corrected 7.0**

# HYDROCODONE HYDROGEN TARTRATE 2.5-HYDRATE

## Hydrocodoni hydrogenotartras 2.5-hydricus



$C_{22}H_{27}NO_9,2.5H_2O$ $M_r$ 494.5

DEFINITION

4,5α-Epoxy-3-methoxy-17-methylmorphinan-6-one hydrogen (2*R*,3*R*)-2,3-dihydroxybutanedioate 2.5-hydrate.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic, crystalline powder.

*Solubility*: freely soluble or soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in cyclohexane.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydrocodone hydrogen tartrate 2.5-hydrate CRS*.

If the spectra obtained in the solid state show differences, dry the substance to be examined and the reference substance at 105 °C and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_5$ (*2.2.2, Method II*).

Dissolve 0.5 g in *water R* and dilute to 10 mL with the same solvent.

**pH** (*2.2.3*): 3.2 to 3.8.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): – 87 to – 91 (anhydrous substance).

Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A.

*Reference solution (a)*. Dissolve 5 mg of *oxycodone hydrochloride CRS* (impurity D) in mobile phase A, add 0.5 mL of the test solution and dilute to 5.0 mL with mobile phase A.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (c)*. Dissolve 20 mg of *benzophenone CRS* (impurity H) in 50.0 mL of *methanol R*. Dilute 1.0 mL of this solution to 20.0 mL with mobile phase A.

*Reference solution (d)*. Dissolve the contents of a vial of *hydrocodone for peak identification CRS* (containing impurities B, C, D, E, F and I) in 1.0 mL of mobile phase A.

*Reference solution (e)*. Dissolve 5 mg of *morphine sulfate CRS* (impurity A) in 5 mL of mobile phase A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: dissolve 1.08 g of *sodium octanesulfonate R* in *water R*, adjust to pH 2.0 with *phosphoric acid R* and dilute to 1000 mL with *water R*;

– *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 80 | 20 |
| 15 - 30 | 80 → 70 | 20 → 30 |
| 30 - 40 | 70 → 40 | 30 → 60 |
| 40 - 42 | 40 | 60 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 283 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *hydrocodone for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities B, C, D, E, F and I; use the chromatogram obtained with reference solution (e) to identify the peak due to impurity A.

*Relative retention* with reference to hydrocodone (retention time = about 14 min): impurity A = about 0.3; impurity K = about 0.43; impurity B = about 0.57; impurity C = about 0.61; impurity D = about 0.9; impurity E = about 1.1; impurity F = about 1.5; impurity I = about 2.0; impurity H = about 2.9.

*System suitability*: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to impurity D and hydrocodone.

*Limits*:

– *correction factor*: for the calculation of content, multiply the peak area of impurity I by 0.2;

– *impurity I*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *impurity H*: not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);

– *impurities A, B, C, D, E, F, K*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.12*): 7.0 per cent to 12.0 per cent, determined on 0.100 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 60 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 44.95 mg of $C_{22}H_{27}NO_9$.

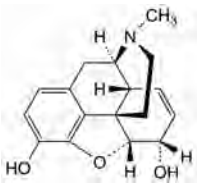
STORAGE

In an airtight container, protected from light.

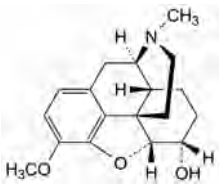
IMPURITIES

*Specified impurities: A, B, C, D, E, F, H, I, K.*

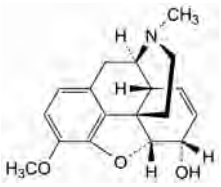
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, J.*



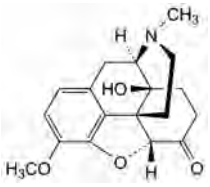
A. morphine,



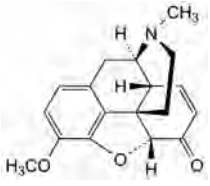
B. 4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol (dihydrocodeine),



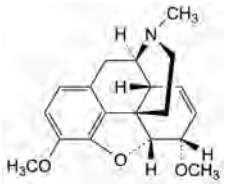
C. codeine,



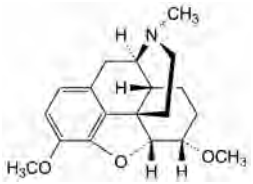
D. 4,5α-epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-6-one (oxycodone),



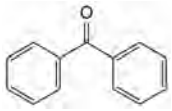
E. 7,8-didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6-one (codeinone),



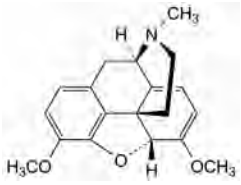
F. 7,8-didehydro-4,5α-epoxy-3,6α-dimethoxy-17-methylmorphinan (methylcodeine),



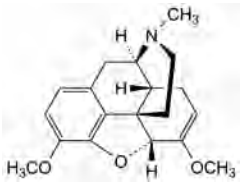
G. 4,5α-epoxy-3,6α-dimethoxy-17-methylmorphinan (tetrahydrothebaine),



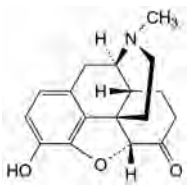
H. diphenylmethanone (benzophenone),



I. 6,7,8,14-tetradehydro-4,5α-epoxy-3,6-dimethoxy-17-methylmorphinan (thebaine),



J. 6,7-didehydro-4,5α-epoxy-3,6-dimethoxy-17-methylmorphinan,



K. 4,5α-epoxy-3-hydroxy-17-methylmorphinan-6-one.

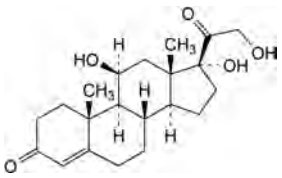
# HYDROCORTISONE

## Hydrocortisonum



$C_{21}H_{30}O_5$ $M_r$ 362.5
[50-23-7]

DEFINITION

11β,17,21-Trihydroxypregn-4-ene-3,20-dione.

*Content*: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in acetone and in ethanol (96 per cent), slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

*First identification: A, B.*

*Second identification: C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydrocortisone CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness on a water-bath and record new spectra using the residues.

B. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (c).

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (c).

C. Thin-layer chromatography (*2.2.27*).

*Solution A*. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 mL with the same solvent.

*Solution B*. Dissolve 25 mg of *hydrocortisone CRS* in *methanol R* and dilute to 5 mL with the same solvent.

*Test solution (a).* Dilute 2 mL of solution A to 10 mL with *methylene chloride R*.

*Test solution (b).* Transfer 0.4 mL of solution A to a glass tube 100 mm long and 20 mm in diameter and fitted with a ground-glass stopper or a polytetrafluoroethylene cap. Evaporate the solvent with gentle heating under a stream of *nitrogen R*. Add 2 mL of a 15 per cent *V/V* solution of *glacial acetic acid R* and 50 mg of *sodium bismuthate R*. Stopper the tube and shake the suspension in a mechanical shaker, protected from light, for 1 h. Add 2 mL of a 15 per cent *V/V* solution of *glacial acetic acid R* and filter into a 50 mL separating funnel, washing the filter with 2 quantities, each of 5 mL, of *water R*. Shake the clear filtrate with 10 mL of *methylene chloride R*. Wash the organic layer with 5 mL of *1 M sodium hydroxide* and then with 2 quantities, each of 5 mL, of *water R*. Dry over *anhydrous sodium sulfate R*.

*Reference solution (a).* Dilute 2 mL of solution B to 10 mL with *methylene chloride R*.

*Reference solution (b).* Transfer 0.4 mL of solution B to a glass tube 100 mm long and 20 mm in diameter and fitted with a ground-glass stopper or a polytetrafluoroethylene cap. Evaporate the solvent with gentle heating under a stream of *nitrogen R*. Add 2 mL of a 15 per cent *V/V* solution of *glacial acetic acid R* and 50 mg of *sodium bismuthate R*. Stopper the tube and shake the suspension in a mechanical shaker, protected from light, for 1 h. Add 2 mL of a 15 per cent *V/V* solution of *glacial acetic acid R* and filter into a 50 mL separating funnel, washing the filter with 2 quantities, each of 5 mL, of *water R*. Shake the clear filtrate with 10 mL of *methylene chloride R*. Wash the organic layer with 5 mL of *1 M sodium hydroxide* and then with 2 quantities, each of 5 mL, of *water R*. Dry over *anhydrous sodium sulfate R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase A*: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

*Mobile phase B*: *butanol R* saturated with *water R*, *toluene R*, *ether R* (5:15:80 *V/V/V*).

*Application*: 5 µL of test solution (a) and reference solution (a), 25 µL of test solution (b) and reference solution (b), applying the latter 2 in small quantities to obtain small spots.

*Development*: over a path of 15 cm with mobile phase A, and then over a path of 15 cm with mobile phase B.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the principal spot in each of the chromatograms obtained with test solutions (a) and (b) is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution.

*Detection B*: spray with *alcoholic solution of sulfuric acid R* and heat at 120 °C for 10 min or until the spots appear; allow to cool, and examine in daylight and in ultraviolet light at 365 nm.

*Results B*: the principal spot in each of the chromatograms obtained with test solutions (a) and (b) is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution; the principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an $R_F$ value distinctly higher than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 mL of *sulfuric acid R* and shake to dissolve. Within 5 min, an intense brownish-red colour develops with a green fluorescence that is particularly intense when examined in ultraviolet light at 365 nm. Add the solution to 10 mL of *water R* and mix. The colour fades and a clear solution remains. The fluorescence in ultraviolet light does not disappear.

TESTS

**Specific optical rotation** (*2.2.7*): + 162 to + 168 (dried substance).

Dissolve 0.200 g in *methanol R*, dilute to 25.0 mL with the same solvent and sonicate for 10 min.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (40:60 *V/V*).

*Test solution.* Dissolve 20 mg of the substance to be examined in the solvent mixture, dilute to 10.0 mL with the solvent mixture and sonicate for 10 min.

*Reference solution (a).* Dissolve 4 mg of *prednisolone CRS* (impurity A), 2 mg of *cortisone R* (impurity B), 8 mg of *hydrocortisone acetate CRS* (impurity C) and 6 mg of *Reichstein's substance S R* (impurity F) in 40 mL of *acetonitrile R* and dilute to 100.0 mL with *water R*. Dilute 0.5 mL of the solution to 5.0 mL with the test solution.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 2 mg of *hydrocortisone CRS* in 1.0 mL of the solvent mixture and sonicate for 10 min.

*Reference solution (d).* Dissolve 2 mg of *hydrocortisone for peak identification CRS* (containing impurities D, E, G, H, I and N) in 1.0 mL of the solvent mixture and sonicate for 10 min.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *water R*;
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 18 | 74 | 26 |
| 18 - 32 | 74 → 55 | 26 → 45 |
| 32 - 48 | 55 → 30 | 45 → 70 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL of the test solution and reference solutions (a), (b) and (d).

*Identification of impurities*: use the chromatogram supplied with *hydrocortisone for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities D, E, G, H, I and N; use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, C and F.

*Relative retention* with reference to hydrocortisone (retention time = about 24 min): impurity D = about 0.2; impurity H = about 0.3; impurity I = about 0.5; impurity G = about 0.8; impurity E = about 0.86; impurity A = about 0.96; impurity B = about 1.1; impurity F = about 1.4; impurity C = about 1.5; impurity N = about 1.7.

*System suitability*: reference solution (a):

- *peak-to-valley ratio*: minimum 3.0, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to hydrocortisone.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 1.8; impurity E = 2.7;
- *impurities C, D, E, I*: for each impurity, not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *impurity G*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);
- *impurity F*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurities A, B*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities H, N*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);

- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 20 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.100 g in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent. Dilute 2.0 mL of the solution to 100.0 mL with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 241.5 nm.

Calculate the content of $C_{21}H_{30}O_5$ taking the specific absorbance to be 440.

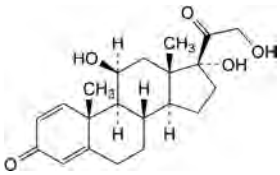
STORAGE

Protected from light.

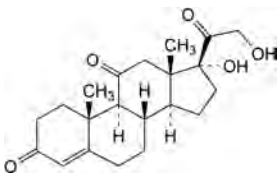
IMPURITIES

*Specified impurities*: *A, B, C, D, E, F, G, H, I, N.*

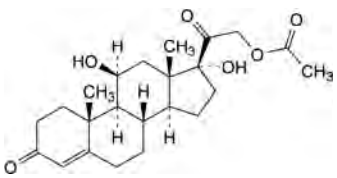
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *J, K, L, M, O.*



A. 11β,17,21-trihydroxypregna-1,4-diene-3,20-dione (prednisolone),



B. 17,21-dihydroxypregn-4-ene-3,11,20-trione (cortisone),



C. 11β,17-dihydroxy-3,20-dioxopregn-4-en-21-yl acetate (hydrocortisone acetate),

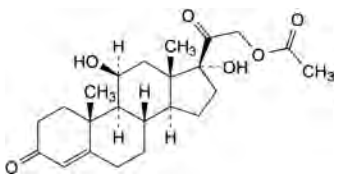
# HYDROCORTISONE ACETATE

## Hydrocortisoni acetas



$C_{23}H_{32}O_6$ $M_r$ 404.5
[50-03-3]

DEFINITION

11β,17-Dihydroxy-3,20-dioxopregn-4-en-21-yl acetate.

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, slightly soluble in anhydrous ethanol and in methylene chloride.

IDENTIFICATION

*First identification: A, B.*

*Second identification: C, D, E.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydrocortisone acetate CRS*.

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (d).

C. Thin-layer chromatography (*2.2.27*).

*Test solution (a).* Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 mL with the same solvent (solution A). Dilute 2 mL of the solution to 10 mL with *methylene chloride R*.

*Test solution (b).* Transfer 2 mL of solution A to a 15 mL glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 mL of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C protected from light for 2 h 30 min. Allow to cool.

*Reference solution (a).* Dissolve 25 mg of *hydrocortisone acetate CRS* in *methanol R* and dilute to 5 mL with the same solvent (solution B). Dilute 2 mL of the solution to 10 mL with *methylene chloride R*.

*Reference solution (b).* Transfer 2 mL of solution B to a 15 mL glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 mL of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C protected from light for 2 h 30 min. Allow to cool.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

*Application*: 5 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution.

*Detection B*: spray with *alcoholic solution of sulfuric acid R* and heat at 120 °C for 10 min or until the spots appear and allow to cool; examine in daylight and in ultraviolet light at 365 nm.

*Results B*: the principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an $R_F$ value distinctly lower than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 mL of *sulfuric acid R* and shake to dissolve. Within 5 min an intense brownish-red colour develops with a green fluorescence which is particularly intense when viewed in ultraviolet light at 365 nm. Add this solution to 10 mL of *water R* and mix. The colour fades and the fluorescence in ultraviolet light does not disappear.

E. About 10 mg gives the reaction of acetyl (*2.3.1*).

TESTS

**Specific optical rotation** (*2.2.7*): + 158 to + 167 (dried substance).

Dissolve 0.250 g in *dioxan R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetic acid R*, *water R*, *methanol R* (1:10:90 *V/V/V*).

*Test solution (a).* Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 2 mg of *hydrocortisone acetate CRS* and 2 mg of *prednisolone acetate CRS* (impurity C) in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 5 mg of *hydrocortisone acetate for peak identification CRS* (containing impurities A, B, D, E and G) in 5 mL of the solvent mixture.

*Reference solution (d).* Dissolve 25.0 mg of *hydrocortisone acetate CRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 400 mL of *acetonitrile R* with 550 mL of *water for chromatography R* and allow to equilibrate; dilute to 1000 mL with *water for chromatography R* and mix again.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a), (b) and (c).

*Run time*: 4 times the retention time of hydrocortisone acetate.

*Identification of impurities*: use the chromatogram supplied with *hydrocortisone acetate for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, D, E and G; use the chromatogram obtained with reference solution (a) to identify the peak due to impurity C.

*Relative retention* with reference to hydrocortisone acetate (retention time = about 10 min): impurity A = about 0.4; impurity B = about 0.7; impurity C = about 0.9; impurity D = about 1.2; impurity G = about 1.8; impurity E = about 2.3.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to impurity C and hydrocortisone acetate.

*Limits*:

- *impurity C*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent);
- *impurity A*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *impurities B, D, E*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity G*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution (b) and reference solution (d).

*Run time*: 1.5 times the retention time of hydrocortisone acetate.

*Retention time*: hydrocortisone acetate = about 10 min.

Calculate the percentage content of $C_{23}H_{32}O_6$ taking into account the assigned content of *hydrocortisone acetate CRS*.

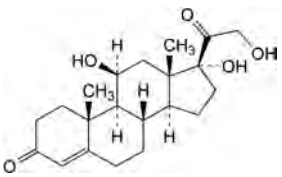
STORAGE

Protected from light.

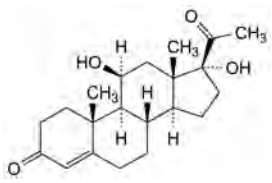
IMPURITIES

*Specified impurities: A, B, C, D, E, G.*

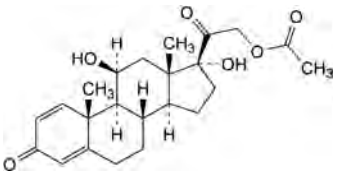
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F.*



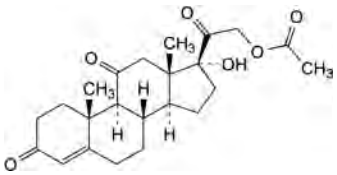
A. 11β,17,21-trihydroxypregn-4-ene-3,20-dione (hydrocortisone),



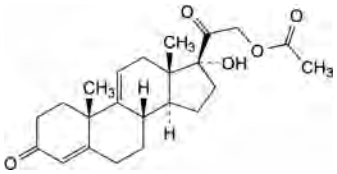
B. 11β,17-dihydroxypregn-4-ene-3,20-dione (oxenol),



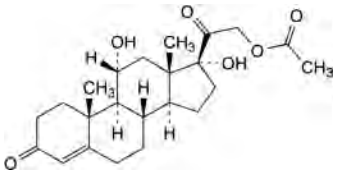
C. 11β,17-dihydroxy-3,20-dioxopregna-1,4-dien-21-yl acetate (prednisolone acetate),



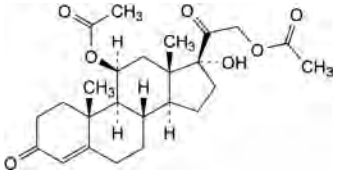
D. 17-hydroxy-3,11,20-trioxopregn-4-en-21-yl acetate (cortisone acetate),



E. 17-hydroxy-3,20-dioxopregna-4,9(11)-dien-21-yl acetate,



F. 11α,17-dihydroxy-3,20-dioxopregn-4-en-21-yl acetate (*epi*-hydrocortisone acetate),



G. 17-hydroxy-3,20-dioxopregn-4-ene-11β,21-diyl diacetate.

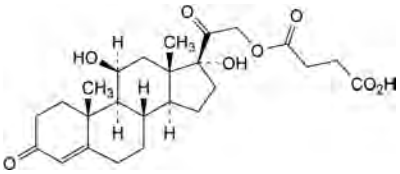
# HYDROCORTISONE HYDROGEN SUCCINATE

## Hydrocortisoni hydrogenosuccinas



$C_{25}H_{34}O_8$ $M_r$ 462.5
[2203-97-6]

DEFINITION

11β,17-Dihydroxy-3,20-dioxopregn-4-en-21-yl hydrogen butanedioate.

*Content*: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: practically insoluble in water, freely soluble in acetone and in anhydrous ethanol. It dissolves in dilute solutions of alkali carbonates and alkali hydroxides.

IDENTIFICATION

*First identification: A, B.*

*Second identification: C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: dry the substances before use at 100-105 °C for 3 h.

*Comparison*: *hydrocortisone hydrogen succinate CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *methanol R*, *methylene chloride R* (1:9 *V/V*).

*Test solution.* Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 10 mL with the solvent mixture.

*Reference solution (a).* Dissolve 20 mg of *hydrocortisone hydrogen succinate CRS* in the solvent mixture and dilute to 20 mL with the solvent mixture.

*Reference solution (b).* Dissolve 10 mg of *methylprednisolone hydrogen succinate CRS* in reference solution (a) and dilute to 10 mL with reference solution (a).

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: *anhydrous formic acid R*, *anhydrous ethanol R*, *methylene chloride R* (0.1:1:15 *V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

*Detection B*: spray with *alcoholic solution of sulfuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

*Results B*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a).

*System suitability*: reference solution (b):

– the chromatogram shows 2 spots which may, however, not be completely separated.

C. Thin-layer chromatography (*2.2.27*).

*Test solution (a).* Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 mL with the same solvent (solution A). Dilute 2 mL of this solution to 10 mL with *methylene chloride R*.

*Test solution (b).* Transfer 2 mL of solution A to a 15 mL glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 mL of a 0.8 g/L solution of *sodium hydroxide R* in *methanol R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 30 min. Allow to cool.

*Reference solution (a).* Dissolve 25 mg of *hydrocortisone hydrogen succinate CRS* in *methanol R* with gentle heating and dilute to 5 mL with the same solvent (solution B). Dilute 2 mL of this solution to 10 mL with *methylene chloride R*.

*Reference solution (b).* Transfer 2 mL of solution B to a 15 mL glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 mL of a 0.8 g/L solution of *sodium hydroxide R* in *methanol R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 30 min. Allow to cool.

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

*Application*: 5 µL.

*Developpement*: over a path of 15 cm.

*Drying*: in air.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution.

*Detection B*: spray with *alcoholic solution of sulfuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

*Results B*: the principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spot in each of the chromatograms obtained with test solution (b) and reference solution (b) has an $R_F$ value distinctly higher than that of the principal spot in each of the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 mL of *sulfuric acid R* and shake to dissolve. Within 5 min, an intense brownish-red colour develops with a green fluorescence which is particularly intense when viewed in ultraviolet light at 365 nm. Add this solution to 10 mL of *water R* and mix. The colour fades and a clear solution remains. The fluorescence in ultraviolet light does not disappear.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*).

Dissolve 0.10 g in 5 mL of *sodium hydrogen carbonate solution R*.

**Specific optical rotation** (*2.2.7*): + 147 to + 153 (dried substance).

Dissolve 0.250 g in *anhydrous ethanol R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 25.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10.0 mL with the same mixture of solvents.

*Reference solution (a)*. Dissolve 2 mg of *hydrocortisone hydrogen succinate CRS* and 2 mg of *dexamethasone CRS* in 50 mL of *acetonitrile R*, then dilute to 100.0 mL with *water R*.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with a mixture of equal volumes of *acetonitrile R* and *water R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: in a 1000 mL volumetric flask mix 330 mL of *acetonitrile R* with 600 mL of *water R* and 1.0 mL of *phosphoric acid R*, then allow to equilibrate; dilute to 1000 mL with *water R* and mix again.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Equilibration*: with the mobile phase for about 30 min.

*Injection*: 20 µL.

*Run time*: twice the retention time of hydrocortisone hydrogen succinate.

*Retention time*: dexamethasone = about 12.5 min; hydrocortisone hydrogen succinate = about 15 min.

*System suitability*: reference solution (a):

- *resolution*: minimum 5.0 between the peaks due to dexamethasone and hydrocortisone hydrogen succinate; if necessary, adjust the concentration of acetonitrile in the mobile phase.

*Limits*:

- *impurities A, B*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *total*: not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent);
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 4.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent. Dilute 2.0 mL of this solution to 100.0 mL with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 241.5 nm.

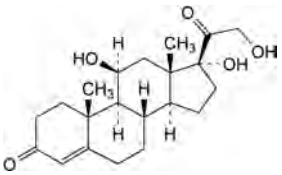
Calculate the content of $C_{25}H_{34}O_8$ taking the specific absorbance to be 353.

STORAGE

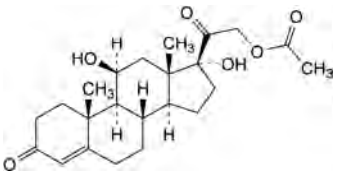
In an airtight container, protected from light.

IMPURITIES

*Specified impurities*: *A, B*.



A. 11β,17,21-trihydroxypregn-4-ene-3,20-dione (hydrocortisone),



B. 11β,17-dihydroxy-3,20-dioxopregn-4-en-21-yl acetate (hydrocortisone acetate).

**01/2013:0395**

# HYDROGEN PEROXIDE SOLUTION (3 PER CENT)

## Hydrogenii peroxidum 3 per centum

DEFINITION

*Content*: 2.5 per cent *m/m* to 3.5 per cent *m/m* of $H_2O_2$ ($M_r$ 34.01).

1 volume of hydrogen peroxide solution (3 per cent) corresponds to about 10 times its volume of oxygen. A suitable stabiliser may be added.

CHARACTERS

*Appearance*: colourless, clear liquid.

IDENTIFICATION

A. To 2 mL, add 0.2 mL of *dilute sulfuric acid R* and 0.2 mL of *0.02 M potassium permanganate*. The solution becomes colourless or slightly pink within 2 min.

B. To 1 mL, add 0.1 mL of *dilute hydrochloric acid R* and 0.1 mL of *potassium iodide solution R*. A brown colour appears. Black particles may be formed.

C. It complies with the requirement for the content of $H_2O_2$.

TESTS

**Acidity**. To 10 mL, add 20 mL of *water R* and 0.25 mL of *methyl red solution R*. Not less than 0.05 mL and not more than 1.0 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

**Organic stabilisers**: maximum 250 ppm.

Shake 20 mL with 10 mL of *chloroform R* and then with 2 quantities, each of 5 mL, of *chloroform R*. Evaporate the combined chloroform layers under reduced pressure at a temperature not exceeding 25 °C and dry in a desiccator. The residue weighs a maximum of 5 mg.

**Non-volatile residue**: maximum 2 g/L.

Allow 10 mL to stand in a platinum dish until all effervescence has ceased. Evaporate to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

ASSAY

Dilute 10.0 g to 100.0 mL with *water R*. To 10.0 mL of this solution add 20 mL of *dilute sulfuric acid R*. Titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

1 mL of *0.02 M potassium permanganate* is equivalent to 1.701 mg of $H_2O_2$ or 0.56 mL of oxygen.

STORAGE

Protected from light, and if the solution does not contain a stabiliser, at a temperature below 15 °C.

LABELLING

If the solution contains a stabiliser, the label states that the contents are stabilised. The competent authority may require that the name of the stabiliser be stated on the label.

CAUTION

It decomposes in contact with oxidisable organic matter and with certain metals and if allowed to become alkaline.

**01/2013:0396**

# HYDROGEN PEROXIDE SOLUTION (30 PER CENT)

## Hydrogenii peroxidum 30 per centum

[7722-84-1]

DEFINITION

*Content*: 29.0 per cent *m/m* to 31.0 per cent *m/m* of $H_2O_2$ ($M_r$ 34.01).

1 volume of hydrogen peroxide solution (30 per cent) corresponds to about 110 times its volume of oxygen. A suitable stabiliser may be added.

CHARACTERS

*Appearance*: colourless, clear liquid.

IDENTIFICATION

A. To 1 mL, add 0.2 mL of *dilute sulfuric acid R* and 0.25 mL of *0.02 M potassium permanganate*. The solution becomes colourless with evolution of gas.

B. To 1 mL, add 0.1 mL of *dilute hydrochloric acid R* and 0.1 mL of *potassium iodide solution R*. A brown colour appears. Black particles may be formed.

C. It complies with the requirement for the content of $H_2O_2$.

TESTS

**Acidity**. To 10 mL, add 100 mL of *water R* and 0.25 mL of *methyl red solution R*. Not less than 0.05 mL and not more than 0.5 mL of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

**Organic stabilisers**: maximum 500 ppm.

Shake 20 mL with 10 mL of *chloroform R* and then with 2 quantities, each of 5 mL, of *chloroform R*. Evaporate the combined chloroform layers under reduced pressure at a temperature not exceeding 25 °C and dry in a desiccator. The residue weighs a maximum of 10 mg.

**Non-volatile residue**: maximum 2 g/L.

Allow 10 mL to stand in a platinum dish until all effervescence has ceased, cooling if necessary. Evaporate to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

ASSAY

Dilute 1.00 g to 100.0 mL with *water R*. To 10.0 mL of this solution add 20 mL of *dilute sulfuric acid R*. Titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

1 mL of *0.02 M potassium permanganate* is equivalent to 1.701 mg of $H_2O_2$ or 0.56 mL of oxygen.

STORAGE

Protected from light, and if the solution does not contain a stabiliser, at a temperature below 15 °C.

LABELLING

If the solution contains a stabiliser, the label states that the contents are stabilised. The competent authority may require that the name of the stabiliser be stated on the label.

CAUTION

It decomposes vigorously in contact with oxidisable organic matter and with certain metals and if allowed to become alkaline.

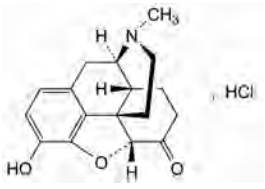
**corrected 6.0**

# HYDROMORPHONE HYDROCHLORIDE

## Hydromorphoni hydrochloridum



$C_{17}H_{20}ClNO_3$ $M_r$ 321.8
[71-68-1]

DEFINITION

4,5α-Epoxy-3-hydroxy-17-methylmorphinan-6-one hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *hydromorphone hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.250 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_5$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 2 mL of solution S add 0.1 mL of *methyl red solution R*. The solution is not yellow. To 2 mL of solution S add 0.05 mL of *bromocresol green solution R*. The solution is not yellow.

**Specific optical rotation** (*2.2.7*): − 136 to − 140 (dried substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in *water R*, sonicating if necessary and dilute to 100.0 mL with the same solvent.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (b)*. To 5 mL of the test solution add 5 mg of *naloxone hydrochloride dihydrate CRS* and dilute to 50 mL with *water R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 18.29 g of *diethylamine R* and 2.88 g of *sodium laurilsulfate R* in *water R* and dilute to 1000 mL with the same solvent. Adjust 800 mL of this solution to pH 3.0 with *phosphoric acid R*. Add 100 mL of *acetonitrile R* and 100 mL of *methanol R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 284 nm.

*Injection*: 20 µL.

*Run time*: 4 times the retention time of hydromorphone.

*Relative retention* with reference to hydromorphone (retention time = about 9 min): impurity D = about 0.72; impurity B = about 0.77; impurity C = about 0.82; impurity A = about 3.2.

*System suitability*: reference solution (b):

- *resolution*: minimum 4.0 between the peaks due to hydromorphone and naloxone.

*Limits*:

- *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurities B, C, D*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.250 g in 50 mL of *ethanol (96 per cent) R* and add 5.0 mL of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

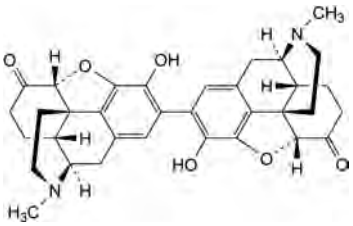
1 mL of *0.1 M sodium hydroxide* is equivalent to 32.18 mg of $C_{17}H_{20}ClNO_3$.

STORAGE

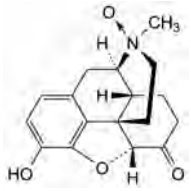
Protected from light.

IMPURITIES

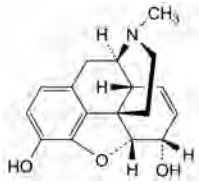
*Specified impurities: A, B, C, D.*



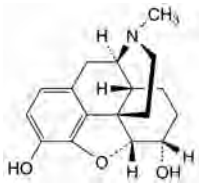
A. 4,5α:4′,5′α-diepoxy-3,3′-dihydroxy-17,17′-dimethyl-2,2′-bimorphinanyl-6,6′-dione (pseudohydromorphone),



B. 4,5α-epoxy-3-hydroxy-17-methylmorphinan-6-one 17-oxide (hydromorphone *N*-oxide),



C. 7,8-didehydro-4,5α-epoxy-17-methylmorphinan-3,6α-diol (morphine),



D. 4,5α-epoxy-17-methylmorphinan-3,6α-diol (dihydromorphine).

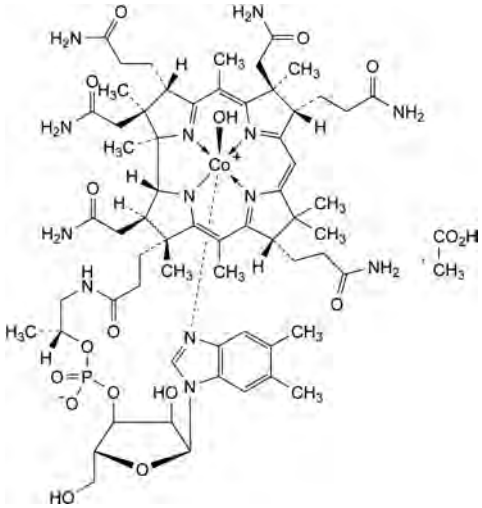
# HYDROXOCOBALAMIN ACETATE

## Hydroxocobalamini acetas



$C_{64}H_{93}CoN_{13}O_{17}P$ $M_r$ 1406
[22465-48-1]

DEFINITION

Coα-[α-(5,6-dimethylbenzimidazolyl)]-Coβ-hydroxocobamide acetate.

*Content*: 96.0 per cent to 102.0 per cent (dried substance).

This monograph applies to hydroxocobalamin acetate produced by fermentation.

CHARACTERS

*Appearance*: dark red, crystalline powder or dark red crystals, very hygroscopic.

*Solubility*: soluble in water.

Some decomposition may occur on drying.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 2.5 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/L of *sodium acetate R*, then dilute to 100 mL with the same solution.

*Spectral range*: 260-610 nm.

*Absorption maxima*: at 274 nm, 351 nm and 525 nm.

*Absorbance ratio*:

- $A_{274}/A_{351}$ = 0.75 to 0.83;
- $A_{525}/A_{351}$ = 0.31 to 0.35.

B. Thin-layer chromatography (*2.2.27*). *Carry out the test protected from light.*

*Test solution.* Dissolve 2 mg of the substance to be examined in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R*.

*Reference solution.* Dissolve 2 mg of *hydroxocobalamin CRS* in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R*.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *dilute ammonia R1*, *methanol R* (25:75 *V/V*).

*Application*: 10 µL.

*Development*: in an unlined tank, over a path of 12 cm.

*Drying*: in air.

*Detection*: examine in daylight.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of acetates (*2.3.1*).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions and protect them from bright light.*

*Test solution.* Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a).* Dilute 5.0 mL of the test solution to 100.0 mL with the mobile phase.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 25 mg of the substance to be examined in 10 mL of *water R*, warming if necessary. Allow to cool and add 1 mL of a 20 g/L solution of *chloramine R* and 0.5 mL of *0.05 M hydrochloric acid*. Dilute this solution to 25 mL with *water R*. Shake and allow to stand for 5 min. Inject immediately.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 19.5 volumes of *methanol R* and 80.5 volumes of a solution containing 15 g/L of *citric acid monohydrate R* and 8.1 g/L of *disodium hydrogen phosphate dodecahydrate R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 351 nm.

*Injection*: 20 µL.

*Run time*: 4 times the retention time of hydroxocobalamine.

*System suitability*:

- the chromatogram obtained with reference solution (c) shows 3 principal peaks;
- *resolution*: minimum 3.0 between each pair of adjacent peaks in the chromatogram obtained with reference solution (c);
- *signal-to-noise ratio*: minimum 5 for the principal peak in the chromatogram obtained with reference solution (b).

*Limits*:

- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (5 per cent);
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

**Loss on drying** (*2.2.32*): 8.0 per cent to 12.0 per cent, determined on 0.400 g by drying at 105 °C at a pressure not exceeding 0.7 kPa.

ASSAY

*Protect the solutions from light throughout the assay.* Dissolve 25.0 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/L of *sodium acetate R*, then dilute to 1000.0 mL with the same solution. Measure the absorbance (*2.2.25*) at the absorption maximum at 351 nm.

Calculate the content of $C_{64}H_{93}CoN_{13}O_{17}P$ taking the specific absorbance to be 187.

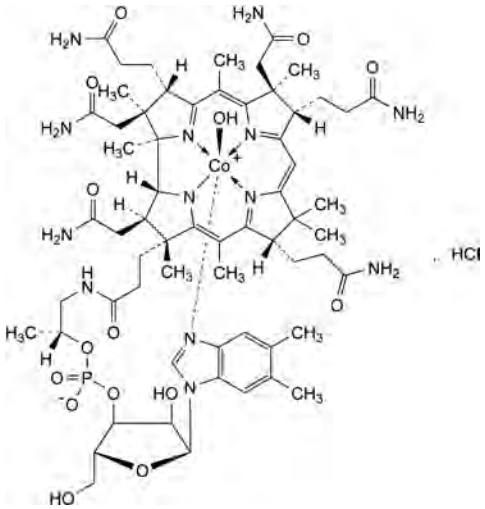
STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

**01/2008:0914**
**corrected 6.0**

# HYDROXOCOBALAMIN CHLORIDE

## Hydroxocobalamini chloridum



$C_{62}H_{90}ClCoN_{13}O_{15}P$ $M_r$ 1383
[58288-50-9]

DEFINITION

Coα-[α-(5,6-dimethylbenzimidazolyl)]-Coβ-hydroxocobamide chloride.

Fermentation product.

*Content*: 96.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: dark red crystalline powder or dark red crystals, very hygroscopic.

*Solubility*: soluble in water.

Some decomposition may occur on drying.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution*. Dissolve 2.5 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/L of *sodium acetate R*, then dilute to 100 mL with the same solution.

*Spectral range*: 260-610 nm.

*Absorption maxima*: at 274 nm, 351 nm and 525 nm.

*Absorbance ratio*:

- $A_{274}/A_{351}$ = 0.75 to 0.83;
- $A_{525}/A_{351}$ = 0.31 to 0.35.

B. Thin-layer chromatography (*2.2.27*). *Carry out the identification test protected from light.*

*Test solution*. Dissolve 2 mg of the substance to be examined in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R*.

*Reference solution*. Dissolve 2 mg of *hydroxocobalamin CRS* in 1 mL of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R*.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *dilute ammonia R1*, *methanol R* (25:75 *V/V*).

*Application*: 10 µL.

*Development*: in an unlined tank, over a path of 12 cm.

*Drying*: in air.

*Detection*: examine in daylight.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions and protect them from bright light.*

*Test solution*. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 5.0 mL of the test solution to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (c)*. Dissolve 25 mg of the substance to be examined in 10 mL of *water R*, warming if necessary. Allow to cool and add 1 mL of a 20 g/L solution of *chloramine R* and 0.5 mL of *0.05 M hydrochloric acid*. Dilute to 25 mL with *water R*. Shake and allow to stand for 5 min. Inject immediately.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: mix 19.5 volumes of *methanol R* and 80.5 volumes of a solution containing 15 g/L of *citric acid monohydrate R* and 8.1 g/L of *disodium hydrogen phosphate dodecahydrate R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 351 nm.

*Injection*: 20 µL.

*Run time*: 4 times the retention time of hydroxocobalamin.

*System suitability*:

- the chromatogram obtained with reference solution (c) shows 3 principal peaks;
- *resolution*: minimum 3.0 between each pair of adjacent peaks in the chromatogram obtained with reference solution (c);
- *signal-to-noise ratio*: minimum 5 for the principal peak in the chromatogram obtained with reference solution (b).

In an airtight container protected from light, at a temperature of 2 °C to 8 °C.

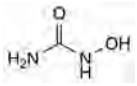
**01/2017:1616**

# HYDROXYCARBAMIDE

## Hydroxycarbamidum



$CH_4N_2O_2$ $M_r$ 76.1
[127-07-1]

DEFINITION

*N*-Hydroxyurea.

*Content*: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder, hygroscopic.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydroxycarbamide CRS*.

If the spectra obtained in the solid state show differences dissolve the substance to be examined and the reference substance separately in *ethanol (96 per cent) R*, evaporate to dryness and record new spectra using the residues.

B. Examine the chromatograms obtained in the test for urea.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).

TESTS

**Urea**. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 1.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 12.5 mg of *urea R* in *water R* and dilute to 50 mL with the same solvent.

*Reference solution (b)*. Dissolve 5 mg of the substance to be examined and 5 mg of *urea R* in *water R* and dilute to 20 mL with the same solvent.

*Reference solution (c)*. Dissolve 50 mg of *hydroxycarbamide CRS* in *water R* and dilute to 1 mL with the same solvent.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *pyridine R*, *water R*, *ethyl acetate R* (2:2:10 *V/V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with a 10 g/L solution of *dimethylaminobenzaldehyde R* in *1 M hydrochloric acid*.

*System suitability*: the test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

*Limit*:

– *urea*: any spot corresponding to urea in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (a) (0.5 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a)*. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 mL with the same mobile phase.

*Test solution (b)*. Dilute 5.0 mL of test solution (a) to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 0.100 g of *hydroxylamine hydrochloride R* and 5 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase. Prepare immediately before use.

*Reference solution (b)*. Dilute 0.1 mL of test solution (a) to 100.0 mL with the mobile phase.

*Reference solution (c)*. Dissolve 0.100 g of *hydroxycarbamide CRS* in the mobile phase and dilute to 10.0 mL with the same solvent. Dilute 5.0 mL to 50.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *methanol R*, *water R* (5:95 *V/V*).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL; inject test solution (a) and reference solutions (a) and (b).

*Run time*: 3 times the retention time of hydroxycarbamide which is about 5 min.

*System suitability*: reference solution (a):

– *resolution*: minimum of 1.0 between the peaks due to impurity A and to hydroxycarbamide.

*Limits*:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

**Chlorides** (*2.4.4*): maximum 50 ppm.

Dissolve 1.0 g in *water R* and dilute to 15 mL with the same solvent.

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 2.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances.

*Injection*: test solution (b) and reference solution (c).

STORAGE

In an airtight container, protected from light.

IMPURITIES

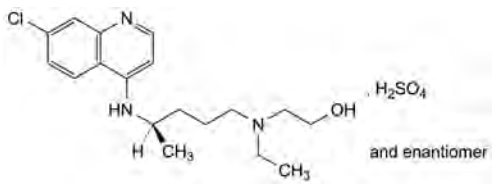
A. $H_2N$-OH: hydroxylamine.

Monographs H

01/2017:2849
corrected 10.0

# HYDROXYCHLOROQUINE SULFATE

## Hydroxychloroquini sulfas



$C_{18}H_{28}ClN_3O_5S$ $M_r$ 434.0
[747-36-4]

DEFINITION

2-[[(4*RS*)-4-[(7-Chloroquinolin-4-yl)amino]pentyl]-(ethyl)amino]ethan-1-ol sulfate.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or slightly yellowish, crystalline powder.

*Solubility*: freely soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *hydroxychloroquine sulfate CRS*.

B. It gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Appearance of solution**. The solution is clear and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method I*).

Dissolve 1.0 g in *water R* and dilute to 10.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*. Mix 500 mL of *water R*, 500 mL of *methanol R* and 4 mL of a 10 per cent *V/V* solution of *sulfuric acid R*.

*Buffer solution*. Dissolve 1.36 g of *potassium dihydrogen phosphate R* in 900 mL of *water for chromatography R*. Add 0.15 g of *sodium heptanesulfonate R*, adjust to pH 7.0 with *triethylamine R* and dilute to 1000 mL with *water for chromatography R*.

*Test solution (a)*. Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Test solution (b)*. Dilute 1.0 mL of test solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 5 mg of *hydroxychloroquine for system suitability CRS* (containing impurities B and C) in the solvent mixture and dilute to 10 mL with the solvent mixture.

*Reference solution (b)*. Dilute 1.0 mL of test solution (a) to 10.0 mL with the solvent mixture. Dilute 2.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve 25.0 mg of *hydroxychloroquine sulfate CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 10.0 mL with the solvent mixture.

*Column*:
- *size*: *l* = 0.05 m, Ø = 2.1 mm;
- *stationary phase*: *end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R* (1.7 µm);
- *temperature*: 40 °C.

*Mobile phase*:
- *mobile phase A*: *methanol R*, buffer solution (10:90 *V/V*);
- *mobile phase B*: buffer solution, *methanol R* (15:85 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 1 | 100 | 0 |
| 1 - 11 | 100 → 0 | 0 → 100 |

*Flow rate*: 0.7 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 4 µL of test solution (a) and reference solutions (a) and (b).

*Identification of impurities*: use the chromatogram supplied with *hydroxychloroquine for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B and C.

*Relative retention* with reference to hydroxychloroquine (retention time = about 6 min): impurity B = about 0.8; impurity C = about 0.9.

*System suitability*: reference solution (a):
- *resolution*: minimum 3.0 between the peaks due to impurity C and hydroxychloroquine; minimum 3.0 between the peaks due to impurities B and C.

*Calculation of percentage contents*:
- *correction factor*: multiply the peak area of impurity B by 1.6;
- for each impurity, use the concentration of hydroxychloroquine sulfate in reference solution (b).

*Limits*:
- *impurity C*: maximum 0.4 per cent;
- *impurity B*: maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.6 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

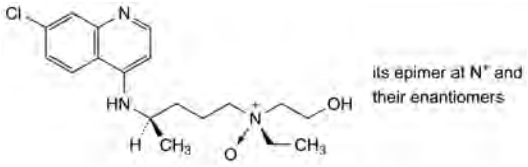
*Injection*: 4 µL of test solution (b) and reference solution (c).

Calculate the percentage content of $C_{18}H_{28}ClN_3O_5S$ taking into account the assigned content of *hydroxychloroquine sulfate CRS*.

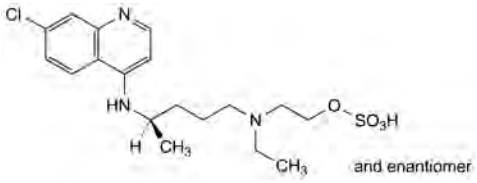
IMPURITIES

*Specified impurities: B, C.*

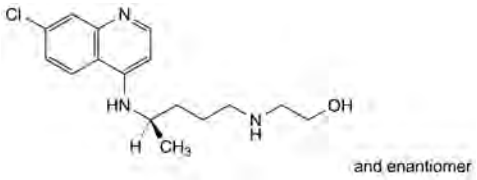
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, D, E, F, G.*



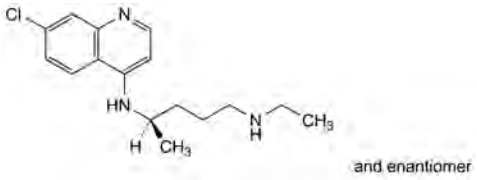
A. mixture of diastereoisomers of 4-[(7-chloroquinolin-4-yl)amino]-*N*-ethyl-*N*-(hydroxyethyl)pentan-1-amine *N*-oxide,



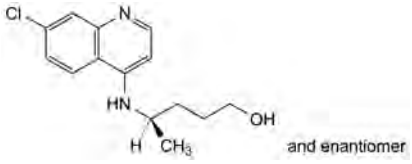
B. 2-[[(4*RS*)-4-[(7-chloroquinolin-4-yl)amino]pentyl]-(ethyl)amino]ethyl hydrogen sulfate,



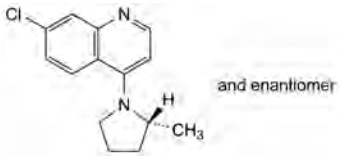
C. 2-[[(4*RS*)-4-[(7-chloroquinolin-4-yl)amino]pentyl]-amino]ethan-1-ol,



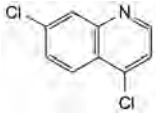
D. (4*RS*)-$N^4$-(7-chloroquinolin-4-yl)-$N^1$-ethylpentane-1,4-diamine,



E. (4*RS*)-4-[(7-chloroquinolin-4-yl)amino]pentan-1-ol,



F. 7-chloro-4-[(2*RS*)-2-methylpyrrolidin-1-yl]quinoline,



G. 4,7-dichloroquinoline.

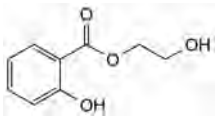
# HYDROXYETHYL SALICYLATE

## Hydroxyethylis salicylas



$C_9H_{10}O_4$ $M_r$ 182.2
[87-28-5]

DEFINITION

2-Hydroxyethyl 2-hydroxybenzoate.

*Content*: 98.0 per cent to 102.0 per cent.

CHARACTERS

*Appearance*: oily, colourless or almost colourless liquid, or colourless crystals.

*Solubility*: sparingly soluble in water, very soluble in acetone and in methylene chloride, freely soluble in ethanol (96 per cent).

Mp: about 21 °C.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D, E.*

A. Refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: thin films.

*Comparison*: *hydroxyethyl salicylate CRS.*

C. Examine the chromatograms obtained in the test for related substances.

*Results*: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 1 mL of solution S (see Tests), add 1 mL of *water R* and 0.2 mL of *ferric chloride solution R2*. A violet-red colour appears which disappears immediately after the addition of 2 mL of *dilute acetic acid R*. A very faint violet colour may remain.

E. In a test tube 160 mm long, mix 1.0 g with 2.0 g of finely powdered *manganese sulfate R*. Insert 2 cm into the test-tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 20 per cent *V/V* solution of *diethanolamine R* and 11 volumes of a 50 g/L solution of *sodium nitroprusside R* adjusted to pH 9.8 with *1 M hydrochloric acid*. Heat the test-tube over a naked flame for 1-2 min. The filter paper becomes blue.

TESTS

**Solution S**. Dissolve 2.5 g in 40 mL of *ethanol (96 per cent) R* and dilute to 50 mL with *distilled water R*.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. To 2 mL of solution S add 0.1 mL of *methyl red solution R* and 0.2 mL of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.3 mL of *0.01 M hydrochloric acid*. The solution is red.

**Relative density** (*2.2.5*): 1.252 to 1.257.

**Refractive index** (*2.2.6*): 1.548 to 1.551.

Monographs H

**Related substances**. Thin-layer chromatography (*2.2.27*).

*Test solution (a)*. Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Test solution (b)*. Dilute 2 mL of test solution (a) to 50 mL with *methanol R*.

*Reference solution (a)*. Dissolve 50.0 mg of *hydroxyethyl salicylate CRS* in *methanol R* and dilute to 25 mL with the same solvent.

*Reference solution (b)*. Dilute 2.5 mL of test solution (b) to 10 mL with *methanol R*.

*Reference solution (c)*. Dissolve 0.10 g of *ethylene glycol R* in *methanol R* and dilute to 50 mL with the same solvent. Dilute 1.25 mL of the solution to 10 mL with *methanol R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Mobile phase*: *ethyl acetate R*, *glacial acetic acid R*, *cyclohexane R* (20:20:60 *V/V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of cold air.

*Detection A*: in ultraviolet light at 254 nm.

*Limits A*:

– *any impurity*: any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent).

*Detection B*: spray the plate with *ammonium vanadate solution R* and heat at 100 °C for 10 min. Allow to cool for 10 min and examine in daylight.

*Limits B*: in the chromatogram obtained with test solution (a):

– *impurity B*: any spot corresponding to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent);

– *any other impurity*: any spot, apart from the principal spot and any spot corresponding to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent).

*System suitability*: the chromatogram obtained with reference solution (c) shows a clearly visible spot.

**Chlorides** (*2.4.4*): maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 250 ppm.

Dilute 12 mL of solution S to 15 mL with *distilled water R*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

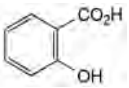
In a flask with a ground-glass stopper, dissolve 0.125 g in 30 mL of *glacial acetic acid R*. Add 10 mL of *dilute sulfuric acid R*, 1.5 g of *potassium bromide R* and 50.0 mL of *0.0167 M potassium bromate*. Immediately close the flask and allow to stand protected from light for 15 min. Add 1.5 g of *potassium iodide R* immediately after removing the stopper and titrate with *0.1 M sodium thiosulfate*, adding 1 mL of *starch solution R* towards the end of the titration. Carry out a blank titration.

1 mL of *0.0167 M potassium bromate* is equivalent to 4.555 mg of $C_9H_{10}O_4$.

STORAGE

Protected from light.

IMPURITIES



A. 2-hydroxybenzenecarboxylic acid (salicylic acid),

B. ethane-1,2-diol (ethylene glycol).

**01/2018:0336**
**corrected 10.0**

# HYDROXYETHYLCELLULOSE(1)

## Hydroxyethylcellulosum

[9004-62-0]

DEFINITION

Partly *O*-(2-hydroxyethylated) cellulose. Suitable pH-stabilisers, such as phosphates, may be added.

*Content*: 30.0 per cent to 70.0 per cent of hydroxyethoxy ($-OC_2H_4OH$) groups (dried substance).

◆CHARACTERS

*Appearance*: white, yellowish-white or greyish-white, hygroscopic powder or granules.

*Solubility*: soluble in hot and cold water giving a colloidal solution, practically insoluble in acetone, in ethanol (96 per cent) and in toluene.◆

IDENTIFICATION

*First identification: A, B.*

◊*Second identification: B, C, D, E.*◊

A. Infrared absorption spectrophotometry (*2.2.24*). Examine by attenuated total reflectance (ATR).
*Comparison*: *hydroxyethylcellulose CRS*.

B. Heat 10 mL of solution S (see Tests) to boiling. The solution remains clear.

◊C. To 10 mL of solution S add 0.3 mL of *dilute acetic acid R* and 2.5 mL of a 100 g/L solution of *tannic acid R*. A yellowish-white, flocculent precipitate is formed which dissolves in *dilute ammonia R1*.

D. In a test-tube about 160 mm in length, thoroughly mix 1 g with 2 g of finely powdered *manganese sulfate R*. Introduce to a depth of 2 cm into the upper part of the tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 200 g/L solution of *diethanolamine R* and 11 volumes of a 50 g/L solution of *sodium nitroprusside R*, adjusted to about pH 9.8 with *1 M hydrochloric acid*. Insert the tube 8 cm into a silicone-oil bath and heat at 190-200 °C. The filter paper becomes blue within 10 min. Carry out a blank test.

E. Dissolve 0.2 g completely, without heating, in 15 mL of a 700 g/L solution of *sulfuric acid R*. Pour the solution with stirring into 100 mL of iced *water R* and dilute to 250 mL with iced *water R*. In a test-tube, mix thoroughly while cooling in iced water 1 mL of the solution with 8 mL of *sulfuric acid R*, added dropwise. Heat on a water-bath for exactly 3 min and immediately cool in iced water. While the mixture is cold, carefully add 0.6 mL of *ninhydrin solution R2* and mix well. Allow to stand at 25 °C. A pink colour is produced immediately and does not become violet within 100 min.◊

(1) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8. Pharmacopoeial harmonisation*.

TESTS

**Solution S**. Disperse 1.0 g (dried substance) in 50 mL of *carbon dioxide-free water R*. After 10 min, dilute to 100 mL with *carbon dioxide-free water R* and stir until dissolution is complete.

**pH** (*2.2.3*): 5.5 to 8.5 for solution S.

♦**Viscosity** (*2.2.10*): 75 per cent to 140 per cent of the value stated on the label.

While stirring, introduce a quantity of the substance to be examined equivalent to 2.00 g of the dried substance into 50 g of *water R*. Dilute to 100.0 g with *water R* and stir until dissolution is complete. Determine the viscosity using a rotating viscometer at 25 °C and at a shear rate of 100 $s^{-1}$ for substances with an expected viscosity up to 100 mPa·s, at a shear rate of 10 $s^{-1}$ for substances with an expected viscosity between 100 mPa·s and 20 000 mPa·s and at a shear rate of 1 $s^{-1}$ for substances with an expected viscosity above 20 000 mPa·s. If it is impossible to obtain a shear rate of exactly 1 $s^{-1}$, 10 $s^{-1}$ or 100 $s^{-1}$ respectively, use a rate slightly higher and a rate slightly lower and interpolate.♦

**Chlorides** (*2.4.4*): maximum 1.0 per cent.

Dilute 1 mL of solution S to 30 mL with *water R*.

**Nitrates**: maximum 3.0 per cent (dried substance) if hydroxyethylcellulose has a viscosity of 1000 mPa·s or less and maximum 0.2 per cent (dried substance) if hydroxyethylcellulose has a viscosity greater than 1000 mPa·s.

Determine potentiometrically (*2.2.36, Method I*) using as indicator a nitrate-selective electrode and a silver-silver chloride electrode with a 13.2 g/L solution of *ammonium sulfate R* as reference electrolyte.

*Prepare the solutions immediately before use.*

*Buffer solution.* To a mixture of 50 mL of *dilute sulfuric acid R* and 800 mL of *water R*, add 135 g of *potassium dihydrogen phosphate R* and dilute to 1000 mL with *water R*.

*Buffered water.* Dilute 80 mL of the buffer solution to 2000 mL with *water R*.

*Nitrate standard solution (500 ppm $NO_3$).* Dissolve 0.8154 g of *potassium nitrate R* in 500 mL of the buffered water and dilute to 1000.0 mL with the same solvent.

*Test solution.* Dissolve 0.50 g of the substance to be examined in the buffered water and dilute to 100.0 mL with the same solvent.

*Reference solutions.* If hydroxyethylcellulose has a viscosity of 1000 mPa·s or less, dilute 10.0 mL, 20.0 mL and 40.0 mL of the nitrate standard solution (500 ppm $NO_3$) to 100.0 mL with the buffered water and mix.

If hydroxyethylcellulose has a viscosity greater than 1000 mPa·s, dilute 1.0 mL, 2.0 mL and 4.0 mL of the nitrate standard solution (500 ppm $NO_3$) to 100.0 mL with the buffered water and mix.

Carry out the measurements for each solution. Calculate the concentration of nitrates using the calibration curve.

**Aldehydes**: maximum 20 ppm, expressed as glyoxal.

Introduce 1.0 g into a test-tube with a ground-glass stopper and add 10.0 mL of *anhydrous ethanol R*. Stopper the tube and stir mechanically for 30 min. Centrifuge. To 2.0 mL of the supernatant add 5.0 mL of a 4 g/L solution of *methylbenzothiazolone hydrazone hydrochloride R* in an 80 per cent *V/V* solution of *glacial acetic acid R*. Shake to homogenise. After 2 h, the solution is not more intensely coloured than a standard prepared at the same time and in the same manner using 2.0 mL of *glyoxal standard solution (2 ppm $C_2H_2O_2$) R* instead of the 2.0 mL of supernatant.

◊**Ethylene oxide**. Head-space gas chromatography (*2.4.25*).

*Test preparation.* Place 1.00 g of the substance to be examined in a 5 mL vial (other sizes may be used depending on the operating conditions) and add 1 mL of *water R*. It swells in water but does not dissolve.

*Reference preparation (a).* Place 1.00 g of the substance to be examined in an identical 5 mL vial. Add 0.1 mL of cooled *ethylene oxide solution R2* and 0.9 mL of *water R*. It swells in water but does not dissolve.

*Reference preparation (b).* To 0.1 mL of *ethylene oxide solution R2* in a 5 mL vial add 0.1 mL of a freshly prepared 10 mg/L solution of *acetaldehyde R*.

*Close the vials immediately with a butyl rubber membrane stopper, coated with aluminium or polytetrafluoroethylene and secured with an aluminium crimped cap.*

*Limit*:

– *ethylene oxide*: maximum 1 ppm.

**2-Chloroethanol**. Head-space gas chromatography (*2.2.28*).

*Test preparation.* To 50 mg of the substance to be examined in a 10 mL vial (other sizes may be used depending on the operating conditions), add 2 µL of *2-propanol R*. Seal the flask and mix.

*Reference preparation (a).* Dissolve 0.125 g of *2-chloroethanol R* and dilute to 50.0 mL with *2-propanol R*. Dilute 1.0 mL of the solution to 10.0 mL with *2-propanol R*.

*Reference preparation (b).* To 50 mg of the substance to be examined in an identical 10 mL vial, add 2 µL of reference solution (a). Seal the flask and mix.

*Close the vials immediately with a butyl rubber membrane stopper, coated with aluminium or polytetrafluoroethylene and secured with an aluminium crimped cap.*

*Column*:

– *size*: *l* = 50 m, Ø = 0.32 mm,

– *stationary phase*: *methylpolysiloxane R* (1.2 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 25-35 cm/s.

*Split ratio*: 1:10.

*Static head-space conditions that may be used*:

– *equilibration temperature*: 110 °C,

– *equilibration time*: 20 min,

– *temperature of injection system*: 115 °C.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 6 | 60 |
| | 6 - 16 | 60 → 110 |
| | 16 - 31 | 110 → 230 |
| | 31 - 36 | 230 |
| Injection port | | 150 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 2 mL.

*Retention time*: 2-chloroethanol = about 7.8 min.

*Limit*:

– *2-chloroethanol*: not more than 0.5 times the area of the peak due to 2-chloroethanol in the chromatogram obtained with reference solution (b) (10 ppm).◊

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 4.0 per cent if hydroxyethylcellulose has a viscosity of 1000 mPa·s or less and maximum 1.0 per cent if hydroxyethylcellulose has a viscosity greater than 1000 mPa·s, determined on 1.0 g.

ASSAY

**Gas chromatography** (*2.2.28*).

*Internal standard solution.* To 10 mL of *o-xylene R* add 0.5 mL of *octane R* and dilute to 100.0 mL with *o-xylene R*.

*Test solution.* To 30.0 mg (dried substance) add 60 mg of *adipic acid R* in a 5 mL pressure-tight reaction vial equipped with a pressure-tight membrane stopper coated with polytetrafluoroethylene and secured with an aluminium crimped cap or another sealing system providing a sufficient air-tightness. Add 2.00 mL of the internal standard solution and 1.0 mL of *hydriodic acid R* and close immediately. Accurately weigh the vial (total mass before heating). Do not mix the contents of the vial by hand before placing in the oven or the heater. Place the vial in an oven or heat in a suitable heater with continuous mechanical agitation, maintaining an internal temperature of the vial of 165 ± 2 °C for 2.5 h. Allow to cool and weigh accurately the vial (total mass after heating). If the difference between the total mass before heating and the total mass after heating is more than 10 mg, prepare a new test solution. After phase separation, pierce through the septum of the vial with a cooled syringe and withdraw a sufficient volume of the upper layer as test solution.

*Reference solution.* Place 60 mg of *adipic acid R* and 2.00 mL of the internal standard solution in another 5 mL reaction vial, add 1.0 mL of *hydriodic acid R* and close immediately with a septum. Weigh accurately the vial then inject 55 µL of *iodoethane R* through the septum in the vial, weigh again accurately and mix. After phase separation, pierce through the septum of the vial with a cooled syringe and withdraw a sufficient volume of the upper layer as reference solution.

*Column*:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.53 mm;

– *stationary phase*: *methylpolysiloxane R* (3 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 4.2 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 50 |
| | 3 - 8 | 50 → 100 |
| | 8 - 12 | 100 → 250 |
| | 12 - 20 | 250 |
| Injection port | | 250 |
| Detector | | 280 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Relative retention* with reference to octane (retention time = about 10 min): iodoethane = about 0.6.

*System suitability*: reference solution:

– *resolution*: minimum 5.0 between the peaks due to iodoethane and octane;

– *repeatability*: maximum relative standard deviation of 2.0 per cent for the response factor of the principal peak determined on 6 injections.

Calculate the response factor (*R*) using the following expression:

$$\frac{A_1 \times m_1 \times C}{A_2 \times 100}$$

$A_1$ = area of the peak due to the internal standard in the chromatogram obtained with the reference solution;

$A_2$ = area of the peak due to iodoethane in the chromatogram obtained with the reference solution;

$m_1$ = mass of *iodoethane R* in the reference solution, in milligrams;

$C$ = percentage content of *iodoethane R*.

Calculate the percentage content *m/m* of the hydroxyethoxy groups using the following expression:

$$\frac{A_4 \times R \times M_1 \times 100}{A_3 \times m_2 \times M_2}$$

$A_3$ = area of the peak due to the internal standard in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to iodoethane in the chromatogram obtained with the test solution;

$R$ = response factor;

$M_1$ = molar mass of hydroxyethoxy group (61.1);

$M_2$ = molar mass of iodoethane (156.0);

$m_2$ = mass of the sample (dried substance) in the test solution, in milligrams.

♦LABELLING

The label states:

– the viscosity, in millipascal seconds for a 2 per cent *m/m* solution;

– the name and concentration of any added pH-stabiliser. ♦

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for hydroxyethylcellulose used as viscosity-increasing agent.*

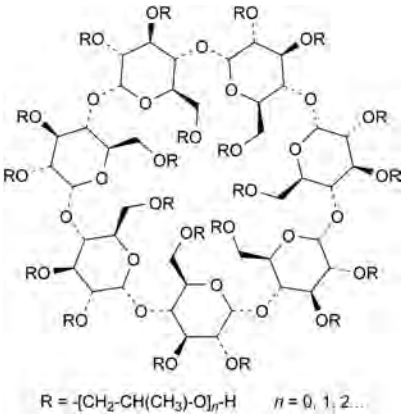
**Viscosity** (see Tests).

**Degree of substitution** (see Assay).

**01/2017:1804**

# HYDROXYPROPYLBETADEX

## Hydroxypropylbetadexum



$C_{42}H_{70}O_{35}(C_3H_6O)_x$ with $x = 7$ *MS*

DEFINITION

Hydroxypropylbetadex (β-cyclodextrin, 2-hydroxypropyl ether) is a partially substituted poly(hydroxypropyl) ether of betadex.

*Content*:

– *hydroxypropyl groups per anhydroglucose unit, expressed as molar substitution (MS)*: 0.40 to 1.50 and content within 10 per cent of the value stated on the label.

CHARACTERS

*Appearance*: white or almost white, amorphous or crystalline powder.

*Solubility*: freely soluble in water and in propylene glycol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydroxypropylbetadex CRS*.

*Results*: the spectrum obtained with the substance to be examined shows the same absorption bands as the spectrum obtained with *hydroxypropylbetadex CRS*. Due to differences in the substitution of the substance, the intensity of some absorption bands can vary.

B. Appearance of solution (see Tests).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*), and remains so after cooling to room temperature.

Dissolve 5.0 g in 10.0 mL of *water R*, with heating.

**Conductivity** (*2.2.38*): maximum 200 µS·cm$^{-1}$.

Measure the conductivity of solution S, while gently stirring with a magnetic stirrer.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.600 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 60.0 mg of *betadex CRS* (impurity A) in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solutions (b), (c), (d), (e), (f)*. Dilute reference solution (a) with *water R* to obtain 5 reference solutions containing respectively 0.03 mg/mL, 0.09 mg/mL, 0.45 mg/mL, 0.90 mg/mL and 1.20 mg/mL of *betadex CRS*.

*Reference solution (g)*. Dissolve 0.15 g of *hydroxypropylbetadex CRS* (containing impurity A) in *water R* and dilute to 10 mL with the same solvent.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *4-nitrophenylcarbamidesilyl silica gel for chromatography R* (5 µm);

– *temperature*: 30 °C.

*Mobile phase*:

– *mobile phase A*: *water for chromatography R*;

– *mobile phase B*: *water for chromatography R*, *methanol R* (10:90 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 52 | 48 |
| 5 - 15 | 52 → 0 | 48 → 100 |
| 15 - 20 | 0 | 100 |

*Flow rate*: 1.0 mL/min.

*Detection*: evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criteria. The use of a 2-port/6-way valve is advisable for 'heart-cutting' hydroxypropylbetadex peaks to save the detector from the huge amount of injected hydroxypropylbetadex:

– *carrier gas*: *nitrogen R*;

– *flow rate*: 1.5 L/min;

– *evaporator temperature*: 70 °C.

*Injection*: 20 µL.

*Retention time*: impurity A = about 4.2 min.

Hydroxypropylbetadex elutes as a very wide peak or as several peaks after impurity A. Other typical impurities elute together as a wide peak or as a group of several peaks before impurity A.

*System suitability*:

– *resolution*: minimum 2.0 between the peak due to impurity A and the 1st peak due to hydroxypropylbetadex in the chromatogram obtained with reference solution (g); if necessary, adjust the column temperature (decreasing the temperature improves the resolution);

– plot a curve representing the logarithm of the concentration of impurity A in reference solutions (b), (c), (d), (e) and (f) as the abscissa and the logarithm of the corresponding peak areas as ordinates taking the assigned content of *betadex CRS* into account; the coefficient of correlation is not less than 0.950.

Calculate the percentage content of impurities with reference to the dried substance using the curve.

*Limits*:

– *impurity A*: maximum 1.5 per cent;

– *sum of impurities other than A*: maximum 1.0 per cent;

– *reporting threshold*: 0.05 per cent; disregard any peak eluting after impurity A.

**Impurity B**. Gas chromatography (*2.2.28*).

*Internal standard solution*. To 62.5 mg of *ethylene glycol R*, add *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with *ethanol (96 per cent) R*.

*Test solution.* Dissolve 50.0 mg of the substance to be examined in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent. To 1.0 mL of the solution, add 1.0 mL of the internal standard solution and dilute to 10.0 mL with *ethanol (96 per cent) R*.

*Reference solution.* Dissolve 62.5 mg of *propylene glycol CRS* (impurity B) in *ethanol (96 per cent) R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *ethanol (96 per cent) R*. To 1.0 mL of this solution, add 1.0 mL of the internal standard solution and dilute to 10.0 mL with *ethanol (96 per cent) R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.32 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.4 mL/min.

*Split ratio*: 1:35.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 10 | 150 → 200 |
| | 10 - 11 | 200 → 240 |
| Injection port | | 220 |
| Detector | | 240 |

*Detection*: flame ionisation.

*Injection*: 2 µL; wash the syringe thoroughly with *ethanol (96 per cent) R* to avoid occlusion in the needle.

*Relative retention* with reference to ethylene glycol (retention time = about 7.5 min): impurity B = about 0.9.

*System suitability*: reference solution:

- *resolution*: minimum 4.0 between the peaks due to impurity B and ethylene glycol;
- *symmetry factor*: maximum 2.0 for the peak due to propylene glycol.

*Calculation of percentage contents*: use the internal standard method.

*Limit*:

- *impurity B*: maximum 2.5 per cent.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 120 °C for 2 h.

**Microbial contamination**

If intended for use in the manufacture of parenteral preparations:

- TAMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

If not intended for use in the manufacture of parenteral preparations:

- TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*);
- TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*);
- absence of *Escherichia coli* (*2.6.13*);
- absence of *Salmonella* (*2.6.13*).

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/g, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Nuclear magnetic resonance spectrometry (*2.2.33*).

The molar substitution (*MS*) is calculated from the ratio between the signal from the 3 protons of the methyl group that is part of the hydroxypropyl group and the signal from the proton attached to the C1 carbon (glycosidic proton) of the anhydroglucose units.

*Test solution.* Introduce not less than the equivalent of 10.0 mg of the substance to be examined, previously dried, into a 5 mm NMR tube equipped with a spinner in order to record the spectrum in rotation. Add approximately 0.75 mL of *deuterium oxide R1*. Cap the tube, mix thoroughly and adapt the spinner.

*Apparatus*: FT-NMR spectrometer operating at minimum 250 MHz, suited to record a proton spectrum and to carry out quantitative analysis, at a temperature of at least 25 °C.

*Acquisition of $^1$H NMR spectra.* Use the appropriate instrument settings (frequency, gain, digital resolution, sample rotation, shims, probe tuning, resolution/data point, receiver gain, etc.) so as to obtain a suitable spectrum for quantitative analysis (good FID (Free Induction Decay), no distortion of the spectrum after Fourier transform and phase corrections). The relaxation delay must be adapted to the pulse angle in order to have sufficient relaxation of the protons of interest between 2 pulses (for example: 10 s for a 90° pulse).

Record the FID signal with at least 8 scans so as to obtain a spectral window comprised, at least, between 0 ppm and + 6.2 ppm, referring to the signal of exchangeable protons (solvent) at + 4.8 ppm (25 °C).

Make a zero filling at least 3-fold in size relative to the acquisition data file and transform the FID to the spectrum without any correction of Gaussian broadening factor (GB = 0) and with a line broadening factor not greater than 0.2 Hz (LB ≤ 0.2).

Call the integration sub-routine after phase corrections and baseline correction between + 0.5 ppm and + 6.2 ppm.

Measure the peak areas of the doublet from the methyl groups at + 1.2 ppm ($A_1$), and of the signals of the glycosidic protons between + 5 ppm and + 5.4 ppm ($A_2$).

Calculate the molar substitution (*MS*) using the following expression:

$$\frac{A_1}{(3 \times A_2)}$$

$A_1$ = area of the signal due to the 3 protons of the methyl groups that are part of the hydroxypropyl groups;

$A_2$ = area of the signals due to the glycosidic protons (protons attached to the C1 carbon) of the anhydroglucose units.

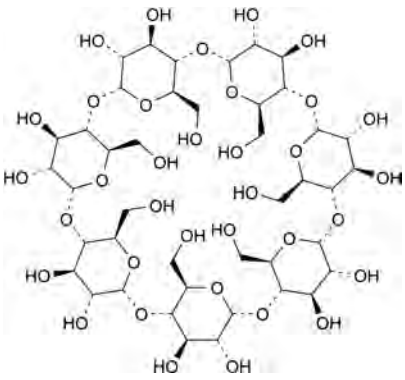
The degree of substitution is the number of hydroxypropyl groups per molecule of β-cyclodextrin and is obtained by multiplying the *MS* by 7.

LABELLING

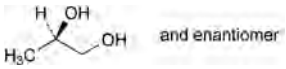
The label states:

- the molar substitution (*MS*);
- where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

IMPURITIES



A. cycloheptakis-(1→4)-(α-D-glucopyranosyl) (betadex or cyclomaltoheptaose or β-cyclodextrin),



B. (2*RS*)-propane-1,2-diol (propylene glycol).

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristic may be relevant for hydroxypropylbetadex used as solubility-increasing agent.*

**Degree of substitution** (see Assay).

**01/2017:0337**
**corrected 10.0**

# HYDROXYPROPYLCELLULOSE(2)

## Hydroxypropylcellulosum

[9004-64-2]

DEFINITION

Partly *O*-(2-hydroxypropylated) cellulose.

*Content*: 53.4 per cent to 80.5 per cent of hydroxypropoxy groups (dried substance).

It may contain suitable anticaking agents, such as silica.

♦CHARACTERS

*Appearance*: white or yellowish-white powder or granules, slightly hygroscopic.

*Solubility*: soluble in cold water, in ethanol (96 per cent) and in propylene glycol giving colloidal solutions, practically insoluble in hot water.♦

IDENTIFICATION

A. Dissolve 1 g in *water R* and dilute to 100 mL with the same solvent. Place 1 mL of this solution on a glass plate. After evaporation of the water a thin film is formed.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydroxypropylcellulose CRS*.

Disregard any peak at about 1719 $cm^{-1}$.

◊C. Evenly distribute 1.0 g into 100 mL of boiling *water R*, and stir the mixture using a magnetic stirrer with a bar about 25 mm long. Add 50 mL of this solution to 50 mL of *water R* in a beaker. Insert a thermometer into the solution. Stir the solution using a magnetic stirrer on a hot plate and heat at a rate of 2-5 °C/min. At a temperature above 40 °C the solution becomes cloudy or a flocculent precipitate is formed. The solution becomes clear again on cooling.◊

TESTS

**pH** (*2.2.3*): 5.0 to 8.0.

Evenly distribute 1.0 g into 100 mL of boiling *carbon dioxide-free water R*, and stir the mixture using a magnetic stirrer.

♦**Viscosity** (*2.2.10*): 75 per cent to 140 per cent of the value stated on the label.

While stirring, introduce a quantity of the substance to be examined equivalent to 6.00 g of the dried substance into 150 g of *water R* heated to 90 °C. Stir with a propeller-type stirrer for 10 min, place the flask in a bath of iced water, continue the stirring and allow to remain in the bath of iced water for 40 min to ensure that dissolution is complete. Adjust the mass of the solution to 300 g and centrifuge the solution to expel any entrapped air. Adjust the temperature of the solution to 20 ± 0.1 °C. Determine the viscosity with a rotating viscometer at 20 °C and a shear rate of 10 $s^{-1}$.

For a product of low viscosity, use a quantity of the substance to be examined sufficient to prepare a solution of the concentration stated on the label.♦

**Silica**: maximum 0.6 per cent.

If the addition of silica is stated on the label and if more than 0.2 per cent is found in the test for sulfated ash, moisten the residue obtained in the test for sulfated ash with *water R* and add 5 mL of *hydrofluoric acid R* in small portions. Evaporate to dryness at 95-105 °C, taking care to avoid loss from sputtering. Cool and rinse the wall of the platinum crucible with 5 mL of *hydrofluoric acid R*. Add 0.5 mL of *sulfuric acid R* and evaporate to dryness. Progressively increase the temperature until all the acids have been volatised and ignite at 1000 ± 25 °C. Allow to cool in a desiccator and weigh. The difference between the mass of the residue obtained in the test for sulfated ash and the mass of the final residue is equal to the amount of silica in the substance to be examined.

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.8 per cent, determined on 1.0 g using a platinum crucible.

ASSAY

Gas chromatography (*2.2.28*).

*Internal standard solution.* To 10 mL of *o-xylene R* add 1.0 mL of *methylcyclohexane R* and dilute to 50.0 mL with *o-xylene R*.

*Test solution.* To 30.0 mg (dried substance) add 60 mg of *adipic acid R* in a 5.0 mL reaction vial. Add 2.00 mL of the internal standard solution and 1.0 mL of *hydriodic acid R*. Close with a septum and weigh accurately the reaction vial (total mass before heating). Place the vial in an oven or heat in a suitable heater capable of maintaining an internal temperature of 115 ± 2 °C for 70 min with continuous stirring. Allow the vial to cool and weigh accurately the reaction vial (total mass after heating). If the difference of the total mass before heating to the total mass after heating is more than 10 mg, prepare a new solution. After phase separation, pierce through the septum of the vial with a cooled syringe and withdraw a sufficient volume of the upper phase as the test solution.

*Reference solution.* Place 60 mg of *adipic acid R* and 2.00 mL of the internal standard solution in a 5.0 mL reaction vial. Add 1.0 mL of *hydriodic acid R*, close with a septum and weigh accurately. Inject 25 µL of *isopropyl iodide R* through the septum and weigh again accurately. Mix well. After phase separation, pierce through the septum of the vial with a cooled syringe and withdraw a sufficient volume of the upper phase as the reference solution.

*Column*:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.53 mm;

(2) This monograph has undergone pharmacopoeial harmonisation. See chapter 5.8. *Pharmacopoeial harmonisation.*

Monographs H

– *stationary phase*: *methylpolysiloxane R* (3 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 7 mL/min.

*Split ratio*: 1:50.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 40 |
| | 3 - 9 | 40 → 100 |
| | 9 - 12 | 100 → 250 |
| | 12 - 15 | 250 |
| Injection port | | 180 |
| Detector | | 280 |

*Detection*: flame ionisation.

*Injection*: 2 µL.

*Relative retention* with reference to methylcyclohexane (retention time = about 8 min): isopropyl iodide = about 0.8.

*System suitability*: reference solution:

– *resolution*: minimum 2.0 between the peaks due to isopropyl iodide and methylcyclohexane in the chromatogram obtained with the reference solution;

– *repeatability*: maximum relative standard deviation of 2.0 per cent of the response factor of the principal peak determined on 6 injections.

Calculate the response factor $R$ using the following expression:

$$\frac{A_1 \times W_1 \times C}{A_2 \times 100}$$

$A_1$ = area of the peak due to the internal standard in the chromatogram obtained with the reference solution;

$A_2$ = area of the peak due to isopropyl iodide in the chromatogram obtained with the reference solution;

$W_1$ = mass of *isopropyl iodide R* in the reference solution, in milligrams;

$C$ = percentage content of *isopropyl iodide R*.

Calculate the percentage content *m/m* of the hydroxypropoxy groups using the following expression:

$$\frac{1.15 \times A_4 \times R \times M_1 \times 100}{A_3 \times W_2 \times M_2}$$

$A_3$ = area of the peak due to the internal standard in the chromatogram obtained with the test solution;

$A_4$ = area of the peak due to isopropyl iodide in the chromatogram obtained with the test solution;

$R$ = response factor;

$M_1$ = molar mass of hydroxypropoxy group (75.1);

$M_2$ = molar mass of isopropyl iodide (170.0);

$W_2$ = mass of sample (dried substance) in the test solution, in milligrams;

1.15 = conversion factor.

♦LABELLING

The label states:

– the viscosity in millipascal seconds for a 2 per cent *m/m* solution;

– for a product of low viscosity, the concentration of the solution to be used and the viscosity in millipascal seconds;

– where applicable, that the substance contains silica.♦

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for hydroxypropylcellulose used as binder, viscosity-increasing agent or film former:*

**Viscosity** (see Tests).

**corrected 10.0**

# HYDROXYPROPYLCELLULOSE, LOW-SUBSTITUTED(3)

## Hydroxypropylcellulosum substitutum humile

[9004-64-2]

DEFINITION

Low-substituted *O*-(2-hydroxypropylated) cellulose.

*Content*: 5.0 per cent to 16.0 per cent of hydroxypropoxy groups (dried substance).

♦CHARACTERS

*Appearance*: white or yellowish-white, hygroscopic powder or granules.

*Solubility*: practically insoluble in ethanol (96 per cent). It dissolves in a dilute solution of sodium hydroxide producing a viscous solution. It swells in water, in a 106 g/L solution of sodium carbonate and in a 206 g/L solution of *hydrochloric acid R*.♦

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *low-substituted hydroxypropylcellulose CRS*.

B. Shake thoroughly 0.1 g with 10 mL of *water R*. It does not dissolve.

(3) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8. Pharmacopoeial harmonisation*.

C. To the suspension obtained in Identification B add 1 g of *sodium hydroxide R* and shake until it becomes homogeneous. Transfer 5 mL of the solution to a suitable container, add 10 mL of a mixture of 1 volume of *methanol R* and 4 volumes of *acetone R* and shake; a white, flocculent precipitate is formed.

TESTS

**pH** (*2.2.3*): 5.0 to 7.5.

Evenly distribute 1.0 g onto the surface of 100 mL of *carbon dioxide-free water R* and stir using a magnetic stirrer.

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

**Sulfated ash** (*2.4.14*): not more than 0.8 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

*Apparatus*:

- *reaction vial*: a 5 mL pressure-tight vial, 50 mm in height, 20 mm in external diameter and 13 mm in internal diameter at the mouth, equipped with a pressure-tight butyl rubber membrane stopper coated with polytetrafluoroethylene and secured with an aluminium crimped cap or another sealing system providing a sufficient air-tightness;
- *heater*: a heating module with a square aluminium block having holes 20 mm in diameter and 32 mm in depth, so that the reaction vials fit; mixing of the contents of the vial is effected using a magnetic stirrer equipped in the heating module or using a reciprocal shaker that performs approximately 100 cycles/min.

*Internal standard solution.* 30 g/L solution of *octane R* in *o-xylene R*.

*Test solution.* Weigh 65.0 mg of the substance to be examined, place in a reaction vial, add 0.06-0.10 g of *adipic acid R*, 2.0 mL of the internal standard solution and 2.0 mL of *hydriodic acid R*, immediately cap and seal the vial, and weigh accurately. Mix the contents of the vial continuously for 60 min while heating the block so that the temperature of the contents is maintained at 130 ± 2 °C. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial thoroughly by hand at 5 min intervals during the initial 30 min of the heating time. Allow the vial to cool, and again weigh accurately. If the loss of mass is less than 26 mg and there is no evidence of a leak, use the upper layer of the mixture as the test solution.

*Reference solution.* Place 0.06-0.10 g of *adipic acid R*, 2.0 mL of the internal standard solution and 2.0 mL of *hydriodic acid R* in another reaction vial, cap and seal the vial, and weigh accurately. Add 15-22 µL of *isopropyl iodide R* through the septum with a syringe, and weigh accurately. Shake the reaction vial thoroughly and use the upper layer as the reference solution.

*Column*:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.53 mm;
- *stationary phase*: *methylpolysiloxane R* (3 µm).

Use a precolumn if needed.

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 4.3 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 50 |
| | 3 - 8 | 50 → 100 |
| | 8 - 12 | 100 → 250 |
| | 12 - 20 | 250 |
| Injection port | | 250 |
| Detector | | 280 |

*Detection*: flame ionisation or thermal conductivity.

*Injection*: 1-2 µL of the test solution and the reference solution.

*Relative retention* with reference to octane (retention time = about 8 min): isopropyl iodide = about 0.8.

*System suitability*: reference solution:

- *resolution*: minimum 5.0 between the peaks due to isopropyl iodide and octane;
- *repeatability*: maximum relative standard deviation of 2.0 per cent for the ratio of the area of the peak due to isopropyl iodide to that due to octane determined on 6 injections.

Calculate the ratio ($Q$) of the area of the peak due to isopropyl iodide to the area of the peak due to the internal standard from the chromatogram obtained with the test solution, and the ratio ($Q_1$) of the area of the peak due to isopropyl iodide to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution.

Calculate the percentage content of hydroxypropoxy groups using the following expression:

$$\frac{Q \times m_1}{Q_1 \times m} \times \frac{M_1}{M_2} \times 100$$

$m_1$ = mass of isopropyl iodide in the reference solution, in milligrams;

$m$ = mass of the sample (dried substance), in milligrams;

$M_1$ = molar mass of hydroxypropoxy group (75.1);

$M_2$ = molar mass of isopropyl iodide (170.0).

STORAGE

In an airtight container.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for low-substituted hydroxypropylcellulose used as disintegrant.*

**Settling volume**: 20.0 mL to 35.0 mL.

To 20 mL of *2-propanol R* in a 100 mL graduated cylinder add 5.0 g of the substance to be examined and shake vigorously. Dilute to 30 mL with *2-propanol R*, then dilute to 50 mL with *water R* and shake vigorously. Within 15 min, repeat the

shaking 3 times. Seal the cylinder to avoid evaporation of the solvent. Allow to stand for 2 h and determine the volume of the settled mass.

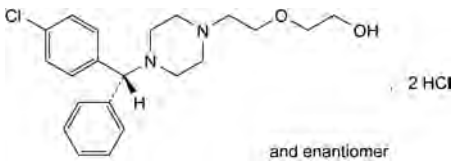
**Degree of substitution** (see Assay).

**Particle-size distribution** (*2.9.31*).

**01/2017:0916**
**corrected 9.5**

# HYDROXYZINE HYDROCHLORIDE

## Hydroxyzini hydrochloridum



$C_{21}H_{29}Cl_3N_2O_2$ $M_r$ 447.8
[2192-20-3]

DEFINITION

(*RS*)-2-[2-[4-[(4-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]ethanol dihydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic, crystalline powder.

*Solubility*: freely soluble in water and in ethanol (96 per cent), very slightly soluble in acetone.

mp: about 200 °C, with decomposition.

IDENTIFICATION

*First identification*: *A, D.*

*Second identification*: *B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hydroxyzine hydrochloride CRS.*

B. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *methanol R, methylene chloride R* (50:50 *V/V*).

*Test solution.* Dissolve 0.50 g of the substance to be examined in the solvent mixture and dilute to 10 mL with the solvent mixture.

*Reference solution (a).* Dissolve 0.50 g of *hydroxyzine hydrochloride CRS* in the solvent mixture and dilute to 10 mL with the solvent mixture.

*Reference solution (b).* Dissolve 0.50 g of *meclozine dihydrochloride R* in the solvent mixture and dilute to 10 mL with the solvent mixture. Dilute 1 mL of the solution to 2 mL with reference solution (a).

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *concentrated ammonia R, ethanol (96 per cent) R, toluene R* (1:24:75 *V/V/V*).

*Application*: 2 µL.

*Development*: over a path of 15 cm.

*Drying*: in air.

*Detection*: spray with *potassium iodobismuthate solution R2.*

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in *ethanol (96 per cent) R* and dilute to 15 mL with the same solvent. Add 15 mL of a saturated solution of *picric acid R* in *ethanol (96 per cent) R*. Allow to stand for 15 min. A precipitate is formed. Filter. Recrystallise from *ethanol (96 per cent) R*. Initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod. The crystals melt (*2.2.14*) at 189 °C to 192 °C.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.0 g in *water R* and dilute to 20.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 10.0 mg of *hydroxyzine hydrochloride CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (b).* Dilute 3.0 mL of the test solution to 200.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 25.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: dissolve 0.5 g of *sodium methanesulfonate R* in a mixture of 14 mL of *triethylamine R*, 300 mL of *acetonitrile for chromatography R* and 686 mL of *water for chromatography R*, then adjust to pH 2.7 with *sulfuric acid R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL.

*Run time*: 2.5 times the retention time of hydroxyzine.

*System suitability*: reference solution (a):

– *peak-to-valley ratio*: minimum 10, where $H_p$ = height above the baseline of the peak immediately before the peak due to hydroxyzine and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

*Limits*:

– *any impurity*: for each impurity, not more than 1/3 of the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

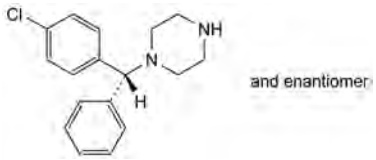
Dissolve 0.200 g in 10 mL of *anhydrous acetic acid R*. Add 40 mL of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 22.39 mg of $C_{21}H_{29}Cl_3N_2O_2$.

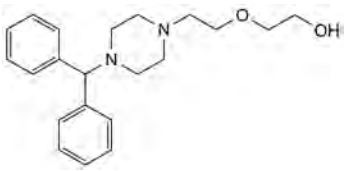
STORAGE

In an airtight container, protected from light.

IMPURITIES



A. (*RS*)-1-[(4-chlorophenyl)phenylmethyl]piperazine,

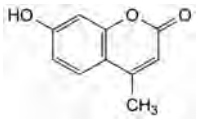


B. 2-[2-[4-(diphenylmethyl)piperazin-1-yl]ethoxy]ethanol (decloxizine).

**01/2017:1786**

# HYMECROMONE

## Hymecromonum



$C_{10}H_8O_3$ $M_r$ 176.2
[90-33-5]

DEFINITION

7-Hydroxy-4-methyl-2*H*-1-benzopyran-2-one.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: almost white crystalline powder.

*Solubility*: very slightly soluble in water, sparingly soluble in methanol, slightly soluble in methylene chloride. It dissolves in dilute solutions of ammonia.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hymecromone CRS*.

TESTS

**Absorbance** (*2.2.25*). Dissolve 50 mg in 10 mL of *ammonium chloride buffer solution pH 10.4 R* and dilute to 100.0 mL with *water R*. To 1.0 mL of the solution, add 10 mL of *ammonium chloride buffer solution pH 10.4 R* and dilute to 100.0 mL with *water R*. Examined between 200 nm and 400 nm, the solution shows 2 absorption maxima, at 229 nm and 360 nm, and an absorption minimum at 276 nm. The specific absorbance at the maximum at 360 nm is 1020 to 1120.

**Related substances**. Liquid chromatography (*2.2.29*).

*Buffer solution*. To 280 mL of a 1.56 g/L solution of *sodium dihydrogen phosphate R*, add 720 mL of a 3.58 g/L solution of *disodium hydrogen phosphate dodecahydrate R*. Adjust to pH 7 with a 100 g/L solution of *phosphoric acid R*.

*Test solution*. Dissolve 10 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 20 mg of *hymecromone CRS*, 10 mg of *hymecromone impurity A CRS* and 10 mg of *hymecromone impurity B CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 200.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (10 µm).

*Mobile phase*: *methanol R*, buffer solution (465:535 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 270 nm.

*Injection*: 20 µL.

*Run time*: 1.5 times the retention time of hymecromone.

*Relative retention* with reference to hymecromone (retention time = about 6 min): impurity A = about 0.5; impurity B = about 0.7.

*System suitability*: reference solution (a):

– *resolution*: minimum of 2 between the peaks due to impurity A and to impurity B and minimum of 3 between the peaks due to impurity B and to hymecromone.

*Limits*:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent),
– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent),
– *unspecified impurities*: for each impurity, not more than the area of the peak due to hymecromone in the chromatogram obtained with reference solution (b) (0.10 per cent),
– *total*: not more than twice the area of the peak due to hymecromone in the chromatogram obtained with reference solution (b) (0.2 per cent),
– *disregard limit*: 0.1 times the area of the peak due to hymecromone in the chromatogram obtained with reference solution (b) (0.01 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 80 mL of *2-propanol R*. Titrate with *0.1 M tetrabutylammonium hydroxide in 2-propanol* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

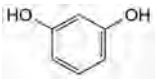
1 mL of *0.1 M tetrabutylammonium hydroxide in 2-propanol* is equivalent to 17.62 mg of $C_{10}H_8O_3$.

STORAGE

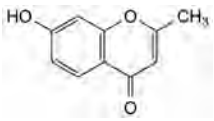
Protected from light.

IMPURITIES

*Specified impurities: A, B.*



A. benzene-1,3-diol (resorcinol),



B. 7-hydroxy-2-methyl-4*H*-1-benzopyran-4-one.

# HYMENOPTERA VENOMS FOR ALLERGEN PRODUCTS

## Hymenopteri venena ad producta allergenica

DEFINITION

Hymenoptera venoms for allergen products are obtained from stinging insects mainly belonging to the families Apidae or Vespidae. They contain soluble substances, including proteins from which they derive their antigenic and allergenic properties, e.g. phospholipase and hyaluronidase.

Hymenoptera venoms for allergen products are unprocessed liquid venom, the venom sac, or venom processed (e.g. by dissolution, filtration and/or drying) using qualified methods.

PRODUCTION

The species of Hymenoptera from which the venom is extracted is identified and specified e.g. by morphological features. The origin, quality and traceability of the source material must be demonstrated. The methods of insect collection and venom extraction are described and must ensure that the venom is of appropriate quality. Electrostimulation may be used to collect the venom.

Pesticides and/or chemical attractants are not used in the collection of insects.

Where major changes to the production of the Hymenoptera venom source material take place (e.g. when a new process or supplier of Hymenoptera venom source material is introduced), such changes are qualified for each Hymenoptera venom source material.

Microbial contamination of the Hymenoptera venom source material may be unavoidable and should be monitored on a representative number of batches of venom source material according to a justified sampling plan and each time a new supplier and/or a new process for the venom source material production is introduced; if a determination of microbial contamination is not applicable (e.g. when the source material is bactericidal), this must be justified. Microbial contamination values and potential increases in microbial contamination are monitored during stability studies, in order to assess this aspect along with the venom source material characteristics upon storage.

Control methods and acceptance criteria relating to identity and purity (e.g. absence of foreign matter) of the Hymenoptera venom source material are established. The acceptance criteria must ensure the consistency of the venom source material from a qualitative and quantitative point of view. The venom source material is stored under controlled conditions justified by stability data. The collection and production, as well as the handling of the venom source material, are such that consistent composition is ensured from batch to batch.

*HYMENOPTERA VENOMS FOR ALLERGEN PRODUCTS REFERENCE BATCH*

An appropriate reference batch is established for each Hymenoptera venom source material. The nature of the reference batch depends on the testing approach to verify batch-to-batch consistency and to establish acceptable quality. The reference batch may be, for example, an internal reference preparation (if available), a venom or venom sac source material, or a sample of a production batch. Its characterisation must be described. The extent of characterisation of the reference batch depends on the nature of the venom source material. The reference batch is stored under controlled conditions ensuring its stability.

*BATCH-TO-BATCH CONSISTENCY*

To establish batch-to-batch consistency, one or more of the following tests are performed on each batch. The choice of tests and the production step at which they are carried out must be justified.

**Total protein** (*2.5.33*).

**Protein profile**. Determined by using suitable electrophoresis methods (*2.2.31*, *2.2.54*).

**Enzyme activity** (e.g. hyaluronidase or phospholipase activity, as appropriate). Determined by using a suitable assay.

**Allergen profile**. Relevant allergenic components are identified by means of suitable techniques using allergen-specific antibodies.

**Major allergen content**. Determined by using suitable immunochemical methods (*2.7.1*) such as enzyme-linked immunosorbent assay (ELISA).

**Total allergenic activity**. Determined by testing inhibition of the binding capacity of specific immunoglobulin E antibodies or by a suitable equivalent *in vitro* method.

CHARACTERS

Hymenoptera venoms for allergen products are colourless or yellowish sacs or liquid, or white to yellowish powders.

IDENTIFICATION

Where possible, tests on identity are performed on each individual batch of venom using adequate methods, e.g. polyacrylamide gel electrophoresis analysis (*2.2.31*), liquid chromatography (*2.2.29*) and/or enzyme activity.

TESTS

**Foreign matter**. Foreign matter is defined as any particles that are not part of the venom or venom sac. Foreign matter is detected using appropriate methods (e.g. microscopic methods); a limit for the amount of foreign matter has to be established based on historical data.

**Water** (*2.5.12* or *2.5.32*) or **loss on drying** (*2.2.32*). The water content of dried material is determined; specification limits must be supported by batch analysis and stability data.

STORAGE

The Hymenoptera venom source material is stored under controlled conditions justified by stability data.

LABELLING

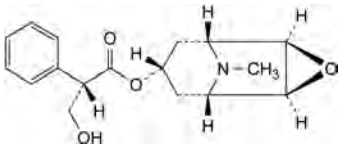
The label states the species of the source insect(s).

**01/2008:2167**

# HYOSCINE

## Hyoscinum

## Scopolaminum



$C_{17}H_{21}NO_4$ $M_r$ 303.4
[51-34-3]

DEFINITION

(1*R*,2*R*,4*S*,5*S*,7*s*)-9-Methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate.

*Content*: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: soluble in water, freely soluble in ethanol (96 per cent).

mp: 66 °C to 70 °C.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *hyoscine CRS*.

TESTS

**Specific optical rotation** (*2.2.7*): − 33 to − 39 (anhydrous substance).

Dissolve 1.00 g in *dilute hydrochloric acid R* and dilute to 25.0 mL with the same acid.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 mL with the mobile phase.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 5.0 mg of *hyoscine impurity A CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (c)*. Dilute 5.0 mL of reference solution (b) to 25.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 50.0 mL with the mobile phase.

*Reference solution (d)*. Mix 2.0 mL of reference solution (b) and 1.0 mL of the test solution and dilute to 10.0 mL with the mobile phase.

*Column*:
- *size*: *l* = 0.125 m, Ø = 4.0 mm,
- *stationary phase*: *octylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: mix 33 volumes of *acetonitrile R* and 67 volumes of a 2.5 g/L solution of *sodium dodecyl sulfate R* previously adjusted to pH 2.5 with a 346 g/L solution of *phosphoric acid R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 5 µL.

*Run time*: 3 times the retention time of hyoscine.

*Relative retention* with reference to hyoscine (retention time = about 5 min): impurity C = about 0.2; impurity A = about 0.9; impurity D = about 1.3; impurity B = about 2.5.

*System suitability*: reference solution (d):
- *resolution*: minimum 1.5 between the peaks due to impurity A and hyoscine.

*Limits*:
- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.6; impurity C = 0.3;
- *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *impurities B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.000 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

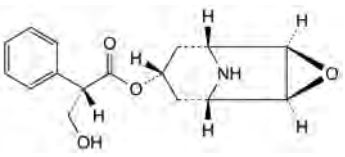
ASSAY

Dissolve 0.250 g in 60 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

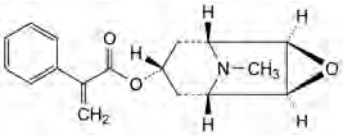
1 mL of *0.1 M perchloric acid* is equivalent to 30.34 mg of $C_{17}H_{21}NO_4$.

IMPURITIES

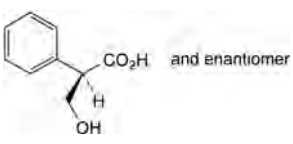
*Specified impurities: A, B, C, D.*



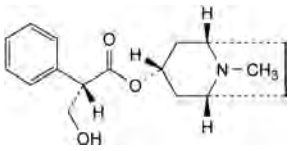
A. (1*R*,2*R*,4*S*,5*S*,7*s*)-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (norhyoscine),



B. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]-non-7-yl 2-phenylprop-2-enoate (apohyoscine),



C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),



D. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscyamine).

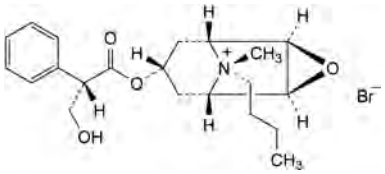
# HYOSCINE BUTYLBROMIDE

## Hyoscini butylbromidum

## Scopolamini butylbromidum



$C_{21}H_{30}BrNO_4$ $M_r$ 440.4
[149-64-4]

DEFINITION

(1*R*,2*R*,4*S*,5*S*,7*s*,9*r*)-9-Butyl-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9-methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]nonan-9-ium bromide.

*Content*: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water and in methylene chloride, sparingly soluble in anhydrous ethanol.

IDENTIFICATION

*First identification: A, C, F.*

*Second identification: A, B, D, E, F.*

A. Specific optical rotation (see Tests).

B. Melting point (*2.2.14*): 139 °C to 141 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *hyoscine butylbromide CRS*.

D. To about 1 mg add 0.2 mL of *nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 mL of *acetone R* and add 0.1 mL of a 30 g/L solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. To 5 mL of solution S (see Tests) add 2 mL of *dilute sodium hydroxide solution R*. No precipitate is formed.

F. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.25 g in *water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Acidity or alkalinity**. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 mL with the same solvent. Add 0.25 mL of *0.01 M sodium hydroxide* and 0.2 mL of *methyl red mixed solution R*. The solution is green. Not more than 0.5 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to reddish-violet.

**Specific optical rotation** (*2.2.7*): – 20 to – 18 (dried substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in mobile phase B and dilute to 10.0 mL with mobile phase B.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase B. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase B.

*Reference solution (b)*. Dissolve 5 mg of *hyoscine butylbromide for system suitability CRS* (containing impurities A and B) in mobile phase B and dilute to 10.0 mL with mobile phase B.

*Column*:
- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *silica gel for chromatography, alkyl-bonded for use with highly aqueous mobile phases R* (1.8 µm);
- *temperature*: 50 °C.

*Mobile phase*:
- *mobile phase A*: *acetonitrile R1*, 0.2 per cent *V/V* solution of *perchloric acid R* (5:95 *V/V*);
- *mobile phase B*: 0.2 per cent *V/V* solution of *perchloric acid R*, *acetonitrile R1* (30:70 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 1 | 91 | 9 |
| 1 - 4.2 | 91 → 75 | 9 → 25 |
| 4.2 - 5.5 | 75 → 66 | 25 → 34 |
| 5.5 - 10 | 66 → 15 | 34 → 85 |
| 10 - 11 | 15 | 85 |

*Flow rate*: 2.5 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 2 µL.

*Identification of impurities*: use the chromatogram supplied with *hyoscine butylbromide for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A and B.

*Relative retention* with reference to hyoscine butylbromide (retention time = about 6 min): bromide = about 0.1; impurity B = about 0.28; impurity A = about 0.37.

*System suitability*: reference solution (b):
- *resolution*: minimum 2.0 between the peaks due to impurities B and A.

*Calculation of percentage contents*:
- for each impurity, use the concentration of hyoscine butylbromide in reference solution (a).

*Limits*:
- *impurity A*: maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.4 per cent;
- *reporting threshold*: 0.05 per cent; disregard the peak due to bromide.

**Loss on drying** (*2.2.32*): maximum 2.5 per cent, determined on 0.500 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 0.5 g.

ASSAY

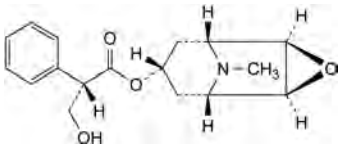
Dissolve 0.400 g in 50 mL of *water R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*) using a silver indicator electrode and a silver-silver chloride reference electrode.

1 mL of *0.1 M silver nitrate* is equivalent to 44.04 mg of $C_{21}H_{30}BrNO_4$.

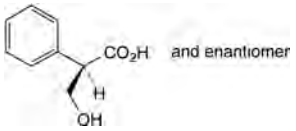
IMPURITIES

*Specified impurities: A.*

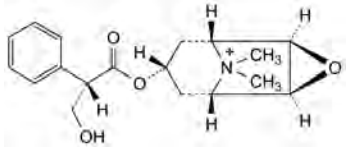
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G, H.*



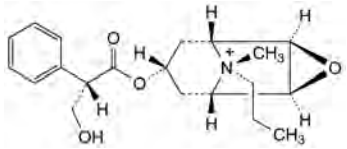
A. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]-nonan-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscine),



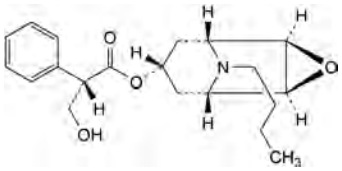
B. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),



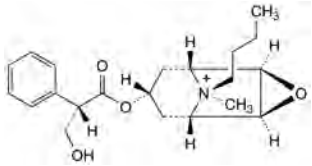
C. (1*R*,2*R*,4*S*,5*S*,7s)-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]-oxy]-9,9-dimethyl-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]nonan-9-ium (methylhyoscine),



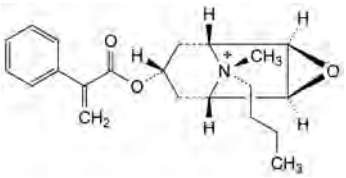
D. (1*R*,2*R*,4*S*,5*S*,7*s*,9*r*)-7-[[(2*S*)-3-hydroxy-2-phenyl-propanoyl]oxy]-9-methyl-9-propyl-3-oxa-9-azatricyclo-[3.3.1.0$^{2,4}$]nonan-9-ium (propylhyoscine),



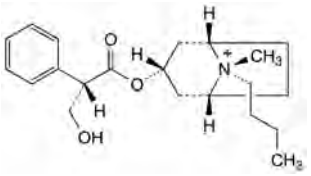
E. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-butyl-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]-nonan-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (*N*-butylnorhyoscine),



F. (1*R*,2*R*,4*S*,5*S*,7*s*,9*s*)-9-butyl-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9-methyl-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]nonan-9-ium,



G. (1*R*,2*R*,4*S*,5*S*,7*s*,9*r*)-9-butyl-9-methyl-7-[(2-phenylprop-2-enoyl)oxy]-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]nonan-9-ium (apo-*N*-butylhyoscine),



H. (1*R*,3*r*,5*S*,8*s*)-8-butyl-3-[[(2*S*)-3-hydroxy-2-phenyl-propanoyl]oxy]-8-methyl-8-azabicyclo[3.2.1]octan-8-ium (*N*-butylhyoscyamine).

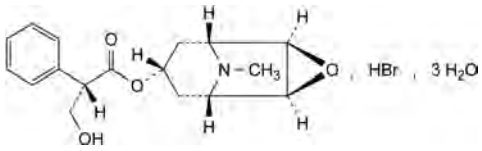
# HYOSCINE HYDROBROMIDE

## Hyoscini hydrobromidum

## Scopolamini hydrobromidum



$C_{17}H_{22}BrNO_4,3H_2O$ $M_r$ 438.3

[6533-68-2]

DEFINITION

(1*R*,2*R*,4*S*,5*S*,7*s*)-9-Methyl-3-oxa-9-azatricyclo[3.3.1.0$^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate hydrobromide trihydrate.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals, efflorescent.

*Solubility*: freely soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: B, E.*

*Second identification: A, C, D, E.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hyoscine hydrobromide CRS.*

If the spectra obtained in the solid state show differences, proceed as follows: dissolve 3 mg of the substance to be examined in 1 mL of *ethanol (96 per cent) R* and evaporate to dryness on a water-bath; dissolve the residue in 0.5 mL of *methylene chloride R* and add 0.2 g of *potassium bromide R* and 15 mL of *ether R*; allow to stand for 5 min shaking frequently; decant; dry the residue on a water-bath until the solvents have evaporated; using the residue prepare a disc and dry at 100-105 °C for 3 h. Repeat the procedure with *hyoscine hydrobromide CRS* and record the spectra.

C. Dissolve about 50 mg in 5 mL of *water R* and add 5 mL of *picric acid solution R* dropwise and with shaking. The precipitate, washed with *water R* and dried at 100-105 °C for 2 h, melts (*2.2.14*) at 188 °C to 193 °C.

D. To about 1 mg add 0.2 mL of *fuming nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 mL of *acetone R* and add 0.1 mL of a 30 g/L solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**pH** (*2.2.3*): 4.0 to 5.5 for solution S.

**Specific optical rotation** (*2.2.7*): − 24 to − 27 (anhydrous substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 70.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dilute 2.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (b).* Dilute 5.0 mL of reference solution (a) to 25.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 5.0 mg of *hyoscine hydrobromide impurity B CRS* in the mobile phase, add 5.0 mL of the test solution and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.125 m, Ø = 4.0 mm,

– *stationary phase*: *octylsilyl silica gel for chromatography R* (3 µm),

– *temperature*: 25 ± 1 °C.

*Mobile phase*: mix 330 mL of *acetonitrile R* with 670 mL of a 2.5 g/L solution of *sodium dodecyl sulfate R* previously adjusted to pH 2.5 with a 345 g/L solution of *phosphoric acid R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 5 µL.

*Run time*: 3 times the retention time of hyoscine.

*Relative retention* with reference to hyoscine (retention time = about 5.0 min): impurity D = about 0.2; impurity B = about 0.9; impurity A = about 1.3; impurity C = about 2.4.

*System suitability*: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity B and hyoscine,

– *symmetry factor*: maximum 2.5 for the peak due to hyoscine.

*Limits*:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 0.3; impurity C = 0.6;

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *impurities A, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *total*: not more than 1.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent); disregard any peak due to the bromide ion which appears close to the solvent peak;

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.12*): 10.0 per cent to 13.0 per cent, determined on 0.20 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide* free from carbonate. Read the volume added between the 2 points of inflexion.

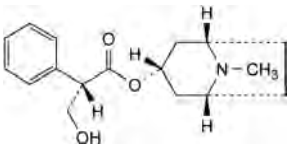
1 mL of *0.1 M sodium hydroxide* is equivalent to 38.43 mg of $C_{17}H_{22}BrNO_4$.

STORAGE

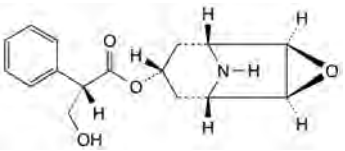
In a well-filled, airtight container of small capacity, protected from light.

IMPURITIES

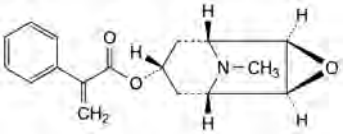
*Specified impurities: A, B, C, D.*



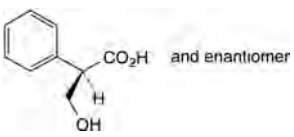
A. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscyamine),



B. (1*R*,2*R*,4*S*,5*S*,7*s*)-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (norhyoscine),



C. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]-non-7-yl 2-phenylprop-2-enoate (apohyoscine),



D. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid).

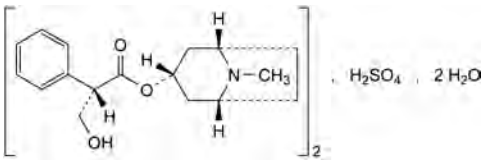
## Hyoscyamini sulfas



$C_{34}H_{48}N_2O_{10}S,2H_2O$ $M_r$ 713
[6835-16-1]

DEFINITION

Bis[(1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[*3.2.1*]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate] sulfate dihydrate.

*Content*: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless needles.

*Solubility*: very soluble in water, sparingly soluble or soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B, E.*

*Second identification: C, D, E.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *hyoscyamine sulfate CRS*.

C. To 0.5 mL of solution S (see Tests) add 2 mL of *dilute acetic acid R* and heat. To the hot solution add 4 mL of *picric acid solution R*. Allow to cool, shaking occasionally. Collect the crystals, wash with 2 quantities, each of 3 mL, of iced *water R* and dry at 100-105 °C. The crystals melt (*2.2.14*) at 164 °C to 168 °C.

D. To about 1 mg add 0.2 mL of *fuming nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 mL of *acetone R* and add 0.2 mL of a 30 g/L solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 2.50 g in *water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.5 to 6.2.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): – 29 to – 24 (anhydrous substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 60.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 mL with mobile phase A. Dilute 10.0 mL of the solution to 50.0 mL with mobile phase A.

*Reference solution (a).* Dilute 5.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 5.0 mL of this solution to 50.0 mL with mobile phase A.

*Reference solution (b).* Dilute 5.0 mL of reference solution (a) to 25.0 mL with mobile phase A.

*Reference solution (c).* Dissolve 5 mg of *hyoscyamine impurity E CRS* in the test solution and dilute to 20 mL with the test solution. Dilute 5 mL of this solution to 25 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;
– *stationary phase*: *polar end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 25 ± 1 °C.

*Mobile phase*:

– *mobile phase A*: dissolve 3.5 g of *sodium dodecyl sulfate R* in 606 mL of a 7.0 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.3 with a 0.58 g/L solution of *phosphoric acid R* and mix with 320 mL of *acetonitrile R1*;
– *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2.0 | 95 | 5 |
| 2.0 - 20.0 | 95 → 70 | 5 → 30 |
| 20.0 - 20.1 | 70 → 95 | 30 → 5 |
| 20.1 - 25.0 | 95 | 5 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Injection*: 10 µL.

*Relative retention* with reference to hyoscyamine (retention time = about 10.5 min): impurity A = about 0.2; impurity B = about 0.67; impurity C = about 0.72; impurity D = about 0.8; impurity E = about 0.9; impurity F = about 1.1; impurity G = about 1.8.

*System suitability*: reference solution (c):

– *resolution*: minimum 2.5 between the peaks due to hyoscyamine and impurity E;
– *symmetry factor*: maximum 2.5 for the peak due to hyoscyamine.

*Limits*:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.3; impurity G = 0.6;
– *impurity E*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *impurities A, B, C, D, F, G*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.12*): 2.0 per cent to 5.5 per cent, determined on 0.500 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 25 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

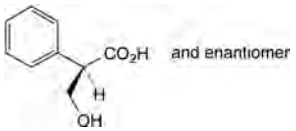
1 mL of *0.1 M perchloric acid* is equivalent to 67.7 mg of $C_{34}H_{48}N_2O_{10}S$.

STORAGE

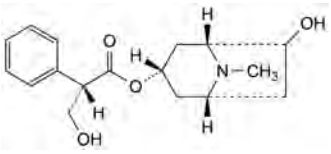
In an airtight container, protected from light.

IMPURITIES

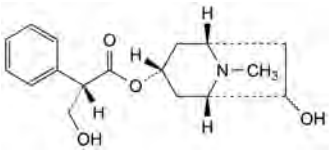
*Specified impurities: A, B, C, D, E, F, G.*



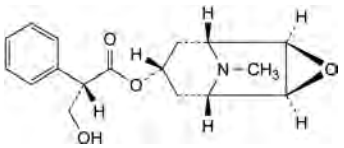
A. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),



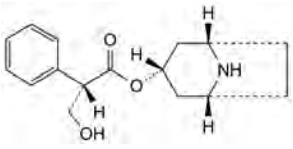
B. (1*R*,3*S*,5*R*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo-[*3.2.1*]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (7-hydroxyhyoscyamine),



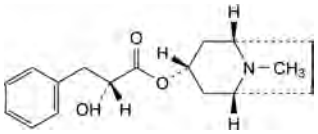
C. (1*S*,3*R*,5*S*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo-[*3.2.1*]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (6-hydroxyhyoscyamine),



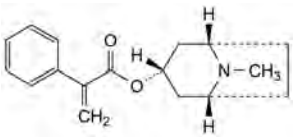
D. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo-[3.3.1.0$^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (hyoscine),



E. (1*R*,3*r*,5*S*)-8-azabicyclo[*3.2.1*]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (norhyoscyamine),



F. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[*3.2.1*]oct-3-yl (2*R*)-2-hydroxy-3-phenylpropanoate (littorine),



G. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[*3.2.1*]oct-3-yl 2-phenylprop-2-enoate (apoatropine).

**01/2019:0348**
**corrected 10.0**

# HYPROMELLOSE(4)

## Hypromellosum

[9004-65-3]

DEFINITION

Hydroxypropylmethylcellulose. Cellulose, 2-hydroxypropyl-methyl ether.

Partly *O*-methylated and *O*-(2-hydroxypropylated) cellulose.

*Content*: methoxy (-$OCH_3$; $M_r$ 31.03) and hydroxypropoxy (-$OC_3H_6OH$; $M_r$ 75.09) groups (dried substance) conforming to the types of hypromellose set forth in the accompanying table.

| Substitution type | Methoxy (per cent) | Hydroxypropoxy (per cent) |
|---|---|---|
| 1828 | 16.5 to 20.0 | 23.0 to 32.0 |
| 2208 | 19.0 to 24.0 | 4.0 to 12.0 |
| 2906 | 27.0 to 30.0 | 4.0 to 7.5 |
| 2910 | 28.0 to 30.0 | 7.0 to 12.0 |

♦CHARACTERS

*Appearance*: white, yellowish-white or greyish-white powder or granules, hygroscopic after drying.

*Solubility*: practically insoluble in hot water, in acetone, in anhydrous ethanol and in toluene. It dissolves in cold water giving a colloidal solution.♦

IDENTIFICATION

A. Evenly distribute 1.0 g onto the surface of 100 mL of *water R* in a beaker, tapping the top of the beaker gently if necessary to ensure a uniform layer on the surface. Allow to stand for 1-2 min: the powdered material aggregates on the surface.

B. Evenly distribute 1.0 g into 100 mL of boiling *water R*, and stir the mixture using a magnetic stirrer with a bar 25 mm long: a slurry is formed and the particles do not dissolve. Allow the slurry to cool to 10 °C and stir using a magnetic stirrer: a clear or slightly turbid solution occurs with its thickness dependent on the viscosity grade.

C. To 0.1 mL of the solution obtained in identification test B add 9 mL of a 90 per cent *V/V* solution of *sulfuric acid R*, shake, heat on a water-bath for exactly 3 min, immediately cool in an ice-bath, carefully add 0.6 mL of a 20 g/L solution of *ninhydrin R*, shake and allow to stand at 25 °C: a red colour develops at first and changes to purple within 100 min.

D. Place 2-3 mL of the solution obtained in identification test B onto a glass slide as a thin film and allow the water to evaporate: a coherent, clear film forms on the glass slide.

(4) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8. Pharmacopoeial harmonisation*.

E. Add 50.0 mL of the solution obtained in identification test B to 50.0 mL of *water R* in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate and begin heating, increasing the temperature at a rate of 2-5 °C per minute. Determine the temperature at which a turbidity increase begins to occur and designate the temperature as the flocculation temperature: the flocculation temperature is higher than 50 °C.

TESTS

◊**Appearance of solution**. The solution is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

While stirring, introduce a quantity of the substance to be examined equivalent to 1.0 g of the dried substance into 50 g of *carbon dioxide-free water R* heated to 90 °C. Allow to cool, adjust the mass of the solution to 100 g with *carbon dioxide-free water R* and stir until dissolution is complete.◊

**pH** (*2.2.3*): 5.0 to 8.0 for the solution prepared as described under Viscosity.

Read the indicated pH value after the probe has been immersed for 5 ± 0.5 min.

**Viscosity**: 80 per cent to 120 per cent of the nominal value for samples with a viscosity less than 600 mPa·s (Method 1); 75 per cent to 140 per cent of the nominal value for samples with a viscosity of 600 mPa·s or higher (Method 2).

*Method 1, to be applied to samples with a viscosity of less than 600 mPa·s.* Weigh a quantity of the substance to be examined equivalent to 4.000 g of the dried substance. Transfer into a wide-mouthed bottle, and adjust the total mass of the sample and the water to 200.0 g with hot *water R* (90-99 °C). Capping the bottle, stir by mechanical means at 400 ± 50 r/min for 10-20 min until the particles are thoroughly dispersed and wetted. Scrape down the insides of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water-bath maintained at a temperature below 10 °C for another 20-40 min. Adjust the solution mass if necessary to 200.0 g using cold *water R*. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula, remove any foam. Determine the kinematic viscosity ($\nu$) of this solution using the capillary viscometer method (*2.2.9*). Separately determine the density ($\rho$) (*2.2.5*) of the solution and calculate the dynamic viscosity ($\eta$), as $\eta = \rho\nu$.

*Method 2, to be applied to samples with a viscosity of 600 mPa·s or higher.* Weigh a quantity of the substance to be examined equivalent to 10.00 g of the dried substance. Transfer into a wide-mouthed bottle, and adjust the total mass of the sample and the water to 500.0 g with hot *water R* (90-99 °C). Capping the bottle, stir by mechanical means at 400 ± 50 r/min for 10-20 min until the particles are thoroughly dispersed and wetted. Scrape down the insides of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water-bath maintained at a temperature below 10 °C for another 20-40 min. Adjust the solution mass if necessary to 500.0 g using cold *water R*. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula, remove any foam. Determine the viscosity (*2.2.10*) of this solution at 20 ± 0.1 °C using a rotating viscometer.

*Apparatus*: single-cylinder type spindle viscometer.

*Rotor number, revolution and calculation multiplier*: apply the conditions specified in Table 0348.-1.

Table 0348.-1.

| Nominal viscosity* (mPa·s) | Rotor number | Revolution (r/min) | Calculation multiplier |
|---|---|---|---|
| 600 to less than 1400 | 3 | 60 | 20 |
| 1400 to less than 3500 | 3 | 12 | 100 |
| 3500 to less than 9500 | 4 | 60 | 100 |
| 9500 to less than 99 500 | 4 | 6 | 1000 |
| 99 500 or more | 4 | 3 | 2000 |

* the nominal viscosity is based on the manufacturer's specifications.

Allow the spindle to rotate for 2 min before taking the measurement. Allow a rest period of at least 2 min between subsequent measurements. Repeat the measurement twice and determine the mean of the 3 readings.

**Loss on drying** (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

**Sulfated ash** (*2.4.14*): maximum 1.5 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

*Apparatus*:

- *reaction vial*: a 5 mL pressure-tight vial, 50 mm in height, 20 mm in external diameter and 13 mm in internal diameter at the mouth, equipped with a pressure-tight butyl rubber membrane stopper coated with polytetrafluoroethylene and secured with an aluminium crimped cap or another sealing system providing a sufficient air-tightness;
- *heater*: a heating module with a square aluminium block having holes 20 mm in diameter and 32 mm in depth, so that the reaction vials fit; mixing of the contents of the vial is effected using a magnetic stirrer equipped in the heating module or using a reciprocal shaker that performs approximately 100 cycles/min.

*Internal standard solution*: 30 g/L solution of *octane R* in *o-xylene R*.

*Test solution*. Weigh 65.0 mg of the substance to be examined, place in a reaction vial, add 0.06-0.10 g of *adipic acid R*, 2.0 mL of the internal standard solution and 2.0 mL of *hydriodic acid R*, immediately cap and seal the vial, and weigh accurately. Mix the contents of the vial continuously for 60 min while heating the block so that the temperature of the contents is maintained at 130 ± 2 °C. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial thoroughly by hand at 5 min intervals during the initial 30 min of the heating time. Allow the vial to cool, and again weigh accurately. If the loss of mass is less than 26 mg and there is no evidence of a leak, use the upper layer of the mixture as the test solution.

*Reference solution*. Place 0.06-0.10 g of *adipic acid R*, 2.0 mL of the internal standard solution and 2.0 mL of *hydriodic acid R* in another reaction vial, cap and seal the vial, and weigh accurately. Add 15-22 µL of *isopropyl iodide R* through the septum with a syringe, weigh accurately, add 45 µL of *methyl iodide R* in the same manner, and weigh accurately. Shake the reaction vial thoroughly and use the upper layer as the reference solution.

Use a precolumn if needed.

*Column*:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.53 mm;
- *stationary phase*: *methylpolysiloxane R* (3 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 4.3 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 3 | 50 |
| | 3 - 8 | 50 → 100 |
| | 8 - 12.3 | 100 → 250 |
| | 12.3 - 20.3 | 250 |
| Injection port | | 250 |
| Detector | | 280 |

*Detection*: flame ionisation or thermal conductivity.

*Injection*: 1-2 µL.

*Relative retention* with reference to octane (retention time = about 10 min): methyl iodide = about 0.4; isopropyl iodide = about 0.7.

*System suitability*: reference solution:

- *resolution*: minimum 5.0 between the peaks due to methyl iodide and isopropyl iodide and between the peaks due to isopropyl iodide and octane;
- *repeatability*: maximum relative standard deviation of 2.0 per cent for the ratios of the areas of the peaks respectively due to methyl iodide and isopropyl iodide to the area of the peak due to octane, determined on 6 injections.

Calculate the ratios ($Q_1$ and $Q_2$) of the areas of the peaks due to methyl iodide and isopropyl iodide to the area of the peak due to the internal standard in the chromatogram obtained with the test solution, and the ratios ($Q_3$ and $Q_4$) of the areas of the peaks due to methyl iodide and isopropyl iodide to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution.

Calculate the percentage content of methoxy groups using the following expression:

$$\frac{Q_1}{Q_3} \times \frac{m_1}{m} \times 21.864$$

Calculate the percentage content of hydroxypropoxy groups using the following expression:

$$\frac{Q_2}{Q_4} \times \frac{m_2}{m} \times 44.17$$

$m_1$ = mass of methyl iodide in the reference solution, in milligrams;

$m_2$ = mass of isopropyl iodide in the reference solution, in milligrams;

$m$ = mass of the sample (dried substance), in milligrams.

LABELLING

The label states:

- the nominal viscosity in millipascal seconds (mPa·s);
- the substitution type.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for hypromellose used as binder, viscosity-increasing agent or film former.*

**Viscosity**: see Tests.

**Degree of substitution**: see Assay.

*The following characteristics may be relevant for hypromellose used as matrix former in prolonged-release tablets.*

**Viscosity**: see Tests.

**Degree of substitution**: see Assay.

**Molecular mass distribution** (*2.2.30*).

**Particle-size distribution** (*2.9.31* or *2.9.38*).

**Powder flow** (*2.9.36*).

**01/2017:0347**

# HYPROMELLOSE PHTHALATE

## Hypromellosi phthalas

DEFINITION

Hydroxypropylmethylcellulose phthalate.

Monophthalic acid ester of hypromellose, containing methoxy (-$OCH_3$), 2-hydroxypropoxy (-$OCH_2CHOHCH_3$) and phthaloyl (*o*-carboxybenzoyl $C_8H_5O_3$) groups.

CHARACTERS

*Appearance*: white or almost white, free-flowing flakes or granular powder.

*Solubility*: practically insoluble in water, soluble in a mixture of equal volumes of acetone and methanol and in a mixture of equal volumes of methanol and methylene chloride, very slightly soluble in acetone and in toluene, practically insoluble in anhydrous ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: dissolve 40 mg in 1 mL of a mixture of equal volumes of *methanol R* and *methylene chloride R*; spread 2 drops of this solution between 2 sodium chloride plates, then remove one of the plates to evaporate the solvent.

*Comparison*: *hypromellose phthalate CRS*.

TESTS

**Free phthalic acid**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 0.20 g of the substance to be examined in about 50 mL of *acetonitrile R* with the aid of ultrasound. Add 10 mL of *water R*, cool to room temperature, dilute to 100.0 mL with *acetonitrile R* and mix.

*Reference solution.* Dissolve 12.5 mg of *phthalic acid R* in 125 mL of *acetonitrile R*. Add 25 mL of *water R*, dilute to 250.0 mL with *acetonitrile R* and mix.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 µm).

*Mobile phase*: *acetonitrile R*, 1 g/L solution of *trifluoroacetic acid R* (1:9 *V/V*).

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Injection*: 10 µL.

*System suitability*: reference solution:

– *repeatability*: maximum relative standard deviation of 1.0 per cent after 2 injections.

*Limit*:

– *phthalic acid*: not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent).

**Chlorides**: maximum 0.07 per cent.

Dissolve 1.0 g in 40 mL of *0.2 M sodium hydroxide*, add 0.05 mL of *phenolphthalein solution R* and add *dilute nitric acid R* dropwise, with stirring, until the red colour disappears. Add an additional 20 mL of *dilute nitric acid R* with stirring. Heat on a water-bath with stirring until the gel-like precipitate formed becomes granular. Cool and centrifuge. Separate the liquid phase and wash the residue with 3 quantities, each of 20 mL, of *water R*, separating the washings by centrifugation. Combine the liquid phases, dilute to 200 mL with *water R*, mix and filter. To 50 mL of this solution, add 1 mL of *0.1 M silver nitrate*. The solution is not more opalescent than a standard prepared by mixing 0.5 mL of *0.01 M hydrochloric acid* with 10 mL of *0.2 M sodium hydroxide*, adding 7 mL of *dilute nitric acid R* and 1 mL of *0.1 M silver nitrate*, and diluting to 50 mL with *water R*.

**Water** (*2.5.12*): maximum 5.0 per cent, determined on 0.500 g.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). Some of the characteristics described in the Functionality-related characteristics section may also be present in the mandatory part of the monograph since they also represent mandatory quality criteria. In such cases, a cross-reference to the tests described in the mandatory part is included in the Functionality-related characteristics section. Control of the characteristics can contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for hypromellose phthalate used as a gastro-resistant coating agent.*

**Apparent viscosity** (*2.2.9*): 80 per cent to 120 per cent of the nominal value.

Dissolve 10 g, previously dried at 105 °C for 1 h, in 90 g of a mixture of equal masses of *methanol R* and *methylene chloride R* by mixing and shaking.

**Solubility**. 0.2 g does not dissolve in *0.1 M hydrochloric acid* but dissolves quickly and completely in 100 mL of *phosphate buffer solution pH 6.8 R* with stirring.

**Phthaloyl groups**: typically 21.0 per cent to 35.0 per cent (anhydrous substance).

Dissolve 1.000 g in 50 mL of a mixture of 1 volume of *water R*, 2 volumes of *acetone R* and 2 volumes of *ethanol (96 per cent) R*. Add 0.1 mL of *phenolphthalein solution R* and titrate with *0.1 M sodium hydroxide* until a faint pink colour is obtained. Carry out a blank titration.

Calculate the percentage content of phthaloyl groups using the following expression:

$$\frac{149n}{(100 - a)m} - 1.795S$$

$a$ = percentage content of water;

$m$ = mass of the substance to be examined, in grams;

$n$ = volume of *0.1 M sodium hydroxide* used, in millilitres;

$S$ = percentage content of free phthalic acid (see Tests).

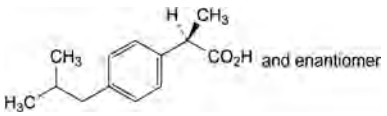
## Ibuprofenum



$C_{13}H_{18}O_2$ $M_r$ 206.3
[15687-27-1]

DEFINITION

(2*RS*)-2-[4-(2-Methylpropyl)phenyl]propanoic acid.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: practically insoluble in water, freely soluble in acetone, in methanol and in methylene chloride. It dissolves in dilute solutions of alkali hydroxides and carbonates.

IDENTIFICATION

*First identification*: *A, C.*

*Second identification*: *A, B, D.*

A. Melting point (*2.2.14*): 75 °C to 78 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in a 4 g/L solution of *sodium hydroxide R* and dilute to 100.0 mL with the same alkaline solution.

*Spectral range*: 240-300 nm, using a spectrophotometer with a band width of 1.0 nm and a scan speed of not more than 50 nm/min.

*Absorption maxima*: at 264 nm and 272 nm.

*Shoulder*: at 258 nm.

*Absorbance ratio*:

- $A_{264} / A_{258}$ = 1.20 to 1.30;
- $A_{272} / A_{258}$ = 1.00 to 1.10.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ibuprofen CRS.*

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 50 mg of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 50 mg of *ibuprofen CRS* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *anhydrous acetic acid R*, *ethyl acetate R*, *hexane R* (5:24:71 *V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 10 cm.

*Drying*: at 120 °C for 30 min.

*Detection*: lightly spray with a 10 g/L solution of *potassium permanganate R* in *dilute sulfuric acid R* and heat at 120 °C for 20 min; examine in ultraviolet light at 365 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Solution S**. Dissolve 2.0 g in *methanol R* and dilute to 20 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): – 0.05° to + 0.05°.

Dissolve 0.50 g in *methanol R* and dilute to 20.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 20 mg of the substance to be examined in 2 mL of *acetonitrile R* and dilute to 10.0 mL with mobile phase A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (b).* Dilute 1.0 mL of *ibuprofen impurity B CRS* to 10.0 mL with *acetonitrile R* (solution A). Dissolve 20 mg of *ibuprofen CRS* in 2 mL of *acetonitrile R*, add 1.0 mL of solution A and dilute to 10.0 mL with mobile phase A.

*Reference solution (c).* Dissolve the contents of a vial of *ibuprofen for peak identification CRS* (mixture of impurities A, J and N) in 1 mL of *acetonitrile R* and dilute to 5 mL with mobile phase A.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl amorphous organosilica polymer for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: mix 0.5 volumes of *phosphoric acid R*, 340 volumes of *acetonitrile R1* and 600 volumes of *water for chromatography R*; allow to equilibrate and dilute to 1000 volumes with *water for chromatography R*;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 25 | 100 | 0 |
| 25 - 55 | 100 → 15 | 0 → 85 |
| 55 - 70 | 15 | 85 |

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *ibuprofen for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, J and N.

*Relative retention* with reference to ibuprofen (retention time = about 21 min): impurity J = about 0.2; impurity N = about 0.3; impurity A = about 0.9; impurity B = about 1.1.

*System suitability*: reference solution (b):

- *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity B, and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to ibuprofen. If necessary, adjust the concentration of acetonitrile in mobile phase A.

*Limits*:

- *impurities A, J, N*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

**Impurity F**. Gas chromatography (*2.2.28*): use the normalisation procedure.

*Methylating solution*. Dilute 1 mL of *N,N-dimethylformamide dimethylacetal R* and 1 mL of *pyridine R* to 10 mL with *ethyl acetate R*.

*Test solution*. Weigh about 50.0 mg of the substance to be examined into a sealable vial, dissolve in 1.0 mL of *ethyl acetate R*, add 1 mL of the methylating solution, seal and heat at 100 °C in a block heater for 20 min. Allow to cool. Remove the reagents under a stream of nitrogen at room temperature. Dissolve the residue in 5 mL of *ethyl acetate R*.

*Reference solution (a)*. Dissolve 0.5 mg of *ibuprofen impurity F CRS* in *ethyl acetate R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Weigh about 50.0 mg of *ibuprofen CRS* into a sealable vial, dissolve in 1.0 mL of reference solution (a), add 1 mL of the methylating solution, seal and heat at 100 °C in a block heater for 20 min. Allow to cool. Remove the reagents under a stream of nitrogen at room temperature. Dissolve the residue in 5 mL of *ethyl acetate R*.

*Column*:
– *material*: fused silica;
– *size*: *l* = 25 m, Ø = 0.53 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 2 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 5.0 mL/min.

*Temperature*:
– *column*: 150 °C;
– *injection port*: 200 °C;
– *detector*: 250 °C.

*Detection*: flame ionisation.

*Injection*: 1 µL of the test solution and reference solution (b).

*Run time*: twice the retention time of ibuprofen.

*System suitability*:
– *relative retention* with reference to ibuprofen (retention time = about 17 min): impurity F = about 1.5.

*Limit*:
– *impurity F*: maximum 0.1 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

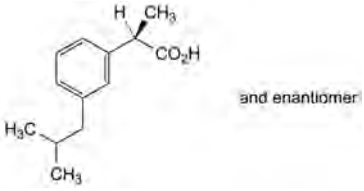
Dissolve 0.450 g in 50 mL of *methanol R*. Add 0.4 mL of *phenolphthalein solution R1*. Titrate with *0.1 M sodium hydroxide* until a red colour is obtained. Carry out a blank titration.

1 mL of *0.1 M sodium hydroxide* is equivalent to 20.63 mg of $C_{13}H_{18}O_2$.

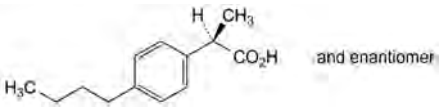
IMPURITIES

*Specified impurities: A, F, J, N.*

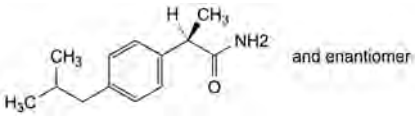
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, G, H, I, K, L, M, O, P, Q, R.*



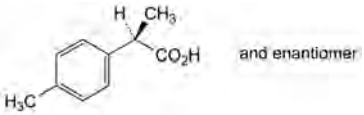
A. (2*RS*)-2-[3-(2-methylpropyl)phenyl]propanoic acid,



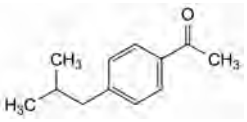
B. (2*RS*)-2-(4-butylphenyl)propanoic acid,



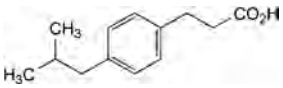
C. (2*RS*)-2-[4-(2-methylpropyl)phenyl]propanamide,



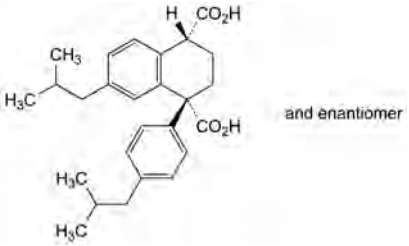
D. (2*RS*)-2-(4-methylphenyl)propanoic acid,



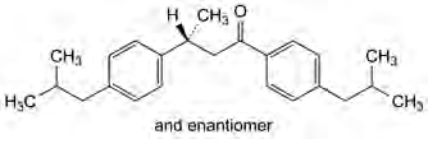
E. 1-[4-(2-methylpropyl)phenyl]ethanone,



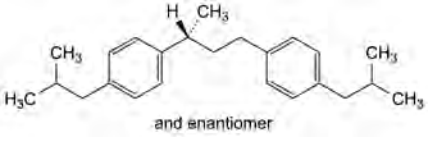
F. 3-[4-(2-methylpropyl)phenyl]propanoic acid,



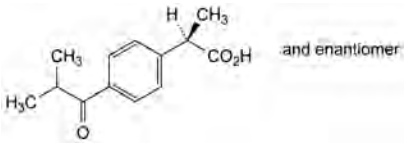
G. (1*RS*,4*RS*)-7-(2-methylpropyl)-1-[4-(2-methylpropyl)-phenyl]-1,2,3,4-tetrahydronaphthalene-1,4-dicarboxylic acid,



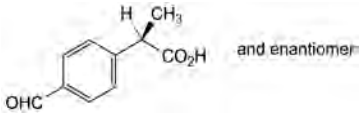
H. (3*RS*)-1,3-bis[4-(2-methylpropyl)phenyl]butan-1-one,



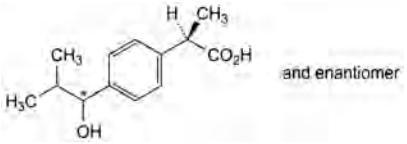
I. 1-(2-methylpropyl)-4-[(3*RS*)-3-[4-(2-methylpropyl)-phenyl]butyl]benzene,



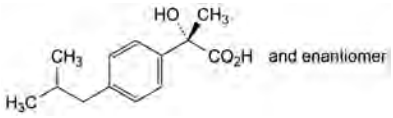
J. (2*RS*)-2-[4-(2-methylpropanoyl)phenyl]propanoic acid,



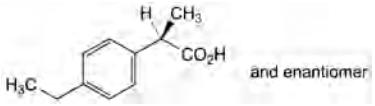
K. (2*RS*)-2-(4-formylphenyl)propanoic acid,



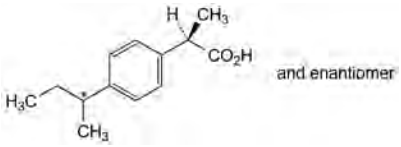
L. (2*RS*)-2-[4-(1-hydroxy-2-methylpropyl)phenyl]propanoic acid,



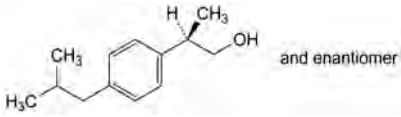
M. (2*RS*)-2-hydroxy-2-[4-(2-methylpropyl)phenyl]propanoic acid,



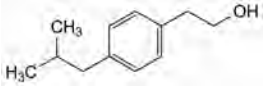
N. (2*RS*)-2-(4-ethylphenyl)propanoic acid,



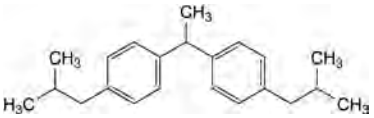
O. (2*RS*)-2-[4-(1-methylpropyl)phenyl]propanoic acid,



P. (2*RS*)-2-[4-(2-methylpropyl)phenyl]propan-1-ol,



Q. 2-[4-(2-methylpropyl)phenyl]ethanol,



R. 1,1′-(ethane-1,1-diyl)-4,4′-(2-methylpropyl)dibenzene.

**corrected 6.3**

# ICHTHAMMOL

## Ichthammolum

DEFINITION

Ichthammol is obtained by distillation from certain bituminous schists, sulfonation of the distillate and neutralisation of the product with ammonia.

*Content*:

- *dry matter*: 50.0 per cent *m/m* to 56.0 per cent *m/m*;
- *total ammonia* ($NH_3$; $M_r$ 17.03): 4.5 per cent *m/m* to 7.0 per cent *m/m* (dried substance);
- *organically combined sulfur*: minimum 10.5 per cent *m/m* (dried substance);
- *sulfur in the form of sulfate*: maximum 20.0 per cent *m/m* of the total sulfur.

CHARACTERS

*Appearance*: dense, blackish-brown liquid.

*Solubility*: miscible with water and with glycerol, slightly soluble in ethanol (96 per cent), in fatty oils and in liquid paraffin. It forms homogeneous mixtures with wool fat and soft paraffin.

IDENTIFICATION

A. Dissolve 1.5 g in 15 mL of *water R* (solution A). To 2 mL of solution A add 2 mL of *hydrochloric acid R*. A resinous precipitate is formed. Decant the supernatant. The precipitate is partly soluble in *ether R*.

B. 2 mL of solution A, obtained in identification test A, gives the reaction of ammonium salts and salts of volatile bases (*2.3.1*).

C. Evaporate and ignite the mixture of solution A and *dilute sodium hydroxide solution R* obtained in identification test B. Take up the residue with 5 mL of *dilute hydrochloric acid R*. Gas is evolved which turns *lead acetate paper R* brown or black. Filter the solution. The filtrate gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Acidity or alkalinity**. To 10.0 mL of the clear filtrate obtained in the assay of total ammonia add 0.05 mL of *methyl red solution R*. Not more than 0.2 mL of *0.02 M hydrochloric acid* or *0.02 M sodium hydroxide* is required to change the colour of the indicator.

**Relative density** (*2.2.5*): 1.040 to 1.085, determined on a mixture of equal volumes of the substance to be examined and *water R*.

**Sulfated ash** (*2.4.14*): maximum 0.3 per cent, determined on 1.00 g.

ASSAY

**Dry matter**. Weigh 1.000 g in a tared flask containing 2 g of *sand R*, previously dried to constant mass, and a small glass rod. Heat on a water-bath for 2 h with frequent stirring and dry in an oven at 100-105 °C until 2 consecutive weighings do not differ by more than 2.0 mg; the 2nd weighing is carried out after drying again for 1 h.

**Total ammonia**. Dissolve 2.50 g in 25 mL of warm *water R*. Rinse the solution into a 250 mL volumetric flask, add 200 mL of *sodium chloride solution R* and dilute to 250.0 mL with *water R*. Filter the solution, discarding the first 20 mL of filtrate. To 100.0 mL of the clear filtrate add 25 mL of

Monographs 1

*formaldehyde solution R*, neutralised to *phenolphthalein solution R1*. Titrate with *0.1 M sodium hydroxide* until a faint pink colour is obtained.

1 mL of *0.1 M sodium hydroxide* is equivalent to 1.703 mg of $NH_3$.

**Organically combined sulfur**. Mix 0.500 g with 4 g of *anhydrous sodium carbonate R* and 3 mL of *methylene chloride R* in a porcelain crucible of about 50 mL capacity, warm and stir until all the methylene chloride has evaporated. Add 10 g of coarsely powdered *copper nitrate R*, mix thoroughly and heat the mixture very gently using a small flame. When the initial reaction has subsided, increase the temperature slightly until most of the material has blackened. Cool, place the crucible in a large beaker, add 20 mL of *hydrochloric acid R* and, when the reaction has ceased, add 100 mL of *water R* and boil until all the copper oxide has dissolved. Filter the solution, add 400 mL of *water R*, heat to boiling and add 20 mL of *barium chloride solution R1*. Allow to stand for 2 h, filter, wash with *water R*, dry and ignite at about 600 ± 50 °C until 2 successive weighings do not differ by more than 0.2 per cent of the mass of the residue.

1 g of residue is equivalent to 0.1374 g of total sulfur.

Calculate the percentage content of total sulfur and subtract the percentage content of sulfur in the form of sulfate.

**Sulfur in the form of sulfate**. Dissolve 2.000 g in 100 mL of *water R*, add 2 g of *cupric chloride R* dissolved in 80 mL of *water R* and dilute to 200.0 mL with *water R*. Shake and filter. Heat 100.0 mL of the filtrate almost to boiling, add 1 mL of *hydrochloric acid R* and 5 mL of *barium chloride solution R1* dropwise and heat on a water-bath. Filter, wash the precipitate with *water R*, dry and ignite at about 600 ± 50 °C until 2 successive weighings do not differ by more than 0.2 per cent of the mass of the residue.

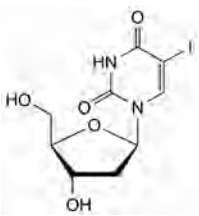
1 g of residue is equivalent to 0.1374 g of sulfur present in the form of sulfate.

Calculate the percentage content of sulfur in the form of sulfate.

**01/2008:0669**

# IDOXURIDINE

## Idoxuridinum



$C_9H_{11}IN_2O_5$ $M_r$ 354.1

[54-42-2]

DEFINITION

Idoxuridine contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 5-iodo-1-(2-deoxy-β-D-*erythro*-pentofuranosyl)pyrimidine-2,4(1*H*,3*H*)-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water and in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

It melts at about 180 °C, with decomposition.

IDENTIFICATION

*First identification: A.*

*Second identification: B, C, D.*

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *idoxuridine CRS*. Examine the substances as discs prepared using 1 mg of the substance to be examined and of the reference substance each in 0.3 g of *potassium bromide R*.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).

C. Heat about 5 mg in a test-tube over a naked flame. Violet vapour is evolved.

D. Disperse about 2 mg in 1 mL of *water R* and add 2 mL of *diphenylamine solution R2*. Heat in a water-bath for 10 min. A persistent light-blue colour develops.

TESTS

**Solution S**. Dissolve 0.500 g in *1 M sodium hydroxide* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*). Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent. The pH of the solution is 5.5 to 6.5.

**Specific optical rotation** (*2.2.7*): + 28 to + 32, determined on solution S and calculated with reference to the dried substance.

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using as coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

*Test solution (a).* Dissolve 0.20 g of the substance to be examined in a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R* and dilute to 5 mL with the same mixture of solvents.

*Test solution (b).* Dilute 1 mL of test solution (a) to 10 mL with a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R*.

*Reference solution (a).* Dissolve 20 mg of *5-iodouracil R*, 20 mg of *2′-deoxyuridine R* and 20 mg of *5-bromo-2′-deoxyuridine R* in a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R* and dilute to 100 mL with the same mixture of solvents.

*Reference solution (b).* Dissolve 0.20 g of the substance to be examined in 5 mL of reference solution (a).

*Reference solution (c).* Dissolve 20 mg of *idoxuridine CRS* in a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R* and dilute to 5 mL with the same mixture of solvents.

*Reference solution (d).* Dilute 1 mL of test solution (b) to 20 mL with a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R*.

Apply separately to the plate 5 µL of each solution. Develop twice over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 40 volumes of *chloroform R* and 50 volumes of *2-propanol R*, drying the plate in a current of cold air after each development. Examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spots corresponding to 5-iodouracil, 2′-deoxyuridine and 5-bromo-2′-deoxyuridine are not more intense than the corresponding spots in the chromatogram obtained with reference solution (a) (0.5 per cent); any spot, apart from the principal spot and the spots corresponding to 5-iodouracil, 2′-deoxyuridine and 5-bromo-2′-deoxyuridine, is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows four clearly separated spots.

**Iodide**. Dissolve 0.25 g in 25 mL of *0.1 M sodium hydroxide*, add 5 mL of *dilute hydrochloric acid R* and dilute to 50 mL with *water R*. Allow to stand for 10 min and filter. To 25 mL of the filtrate add 5 mL of *dilute hydrogen peroxide solution R* and 10 mL of *chloroform R* and shake. Any pink colour in the organic layer is not more intense than that in a standard prepared at the same time in the same manner using 1 mL of a 0.33 g/L solution of *potassium iodide R* instead of the substance to be examined (0.1 per cent).

**Loss on drying** (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.3000 g in 20 mL of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M tetrabutylammonium hydroxide* is equivalent to 35.41 mg of $C_9H_{11}IN_2O_5$.

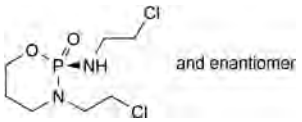
STORAGE

Store protected from light.

**01/2017:1529**

# IFOSFAMIDE

## Ifosfamidum



$C_7H_{15}Cl_2N_2O_2P$ $M_r$ 261.1
[3778-73-2]

DEFINITION

Ifosfamide contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (*RS*)-*N*,3-bis(2-chloroethyl)-1,3,2-oxazaphosphinan-2-amine 2-oxide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, fine, crystalline powder, hygroscopic, soluble in water, freely soluble in methylene chloride.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the *Ph. Eur. reference spectrum of ifosfamide*. Examine the substance prepared as a disc.

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Acidity or alkalinity**. Dilute 5 mL of solution S to 50 mL with *carbon dioxide-free water R*. To 10 mL of this solution add 0.1 mL of *methyl red solution R*. Not more than 0.1 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red. To another 10 mL of the solution add 0.1 mL of *phenolphthalein solution R*. Not more than 0.3 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Optical rotation** (*2.2.7*). The angle of optical rotation, determined on solution S, is − 0.10° to + 0.10°.

**Related substances**

A. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

*Test solution*. Dissolve 1.00 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10 mL with the same mixture of solvents.

*Reference solution (a)*. Dissolve 25 mg of *ifosfamide impurity A CRS* and 25 mg of *chloroethylamine hydrochloride R* (impurity C) ina mixture of equal volumes of *methanol R* and *water R* and dilute to 100 mL with the same mixture of solvents.

*Reference solution (b)*. Dissolve 15 mg of *ifosfamide impurity B CRS* ina mixture of equal volumes of *methanol R* and *water R* and dilute to 100 mL with the same mixture of solvents.

*Reference solution (c)*. Dissolve 5 mg of *ethanolamine R* (impurity D), 20 mg of *ifosfamide impurity A CRS* and 80 mg of *chloroethylamine hydrochloride R* (impurity C) in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100 mL with the same mixture of solvents.

Apply to the plate 10 µL of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *methylene chloride R*. Dry the plate at 115 °C for 45 min. At the bottom of a chromatographic tank, place an evaporating dish containing a 3.2 g/L solution of *potassium permanganate R* and add an equal volume of *dilute hydrochloric acid R*, close the tank and allow to stand for 10 min. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 min) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*. Avoid prolonged exposure to cold air. Immerse the plate in a 1 g/L solution of *tetramethylbenzidine R* in *alcohol R* for 5 s. Allow the plate to dry and examine. In the chromatogram obtained with the test solution: any spot corresponding to impurity A or impurity C is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent); any spot corresponding to impurity B is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.15 per cent); any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.15 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 3 clearly separated spots.

B. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

*Test solution*. Dissolve 0.200 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 mL with the same mixture of solvents.

*Reference solution (a)*. Dissolve 5 mg of *ifosfamide impurity E CRS* and 5 mg of *ifosfamide impurity F CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 100 mL with the same mixture of solvents.

*Reference solution (b)*. Dissolve 10 mg of *ifosfamide impurity E CRS* and 10 mg of *ifosfamide CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 100 mL with the same mixture of solvents.

Apply to the plate 5 µL of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *methylene chloride R* and 10 volumes of *acetone R*. Dry the plate at 115 °C for 45 min. Proceed as described in test A for

related substances. Any spot corresponding to impurity E or impurity F in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

**Chlorides** (*2.4.4*). Dilute 5 mL of solution S to 15 mL with *water R*. The freshly prepared solution complies with the limit test for chlorides (100 ppm).

**Water** (*2.5.12*). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (*2.2.29*). *Use the solutions within 24 h.*

*Solution A*. Dissolve 50.0 mg of *ethyl parahydroxybenzoate R* in 25 mL of *alcohol R*, dilute to 100.0 mL with *water R* and mix.

*Test solution*. To 0.150 g of the substance to be examined add 10.0 mL of solution A and dilute to 250.0 mL with *water R*.

*Reference solution*. To 15.0 mg of *ifosfamide CRS* add 1.0 mL of solution A and dilute to 25.0 mL with *water R*.

The chromatography may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
– as mobile phase at a flow rate of 1.5 mL/min a mixture of 30 volumes of *acetonitrile R* and 70 volumes of *water R*,
– as detector a spectrophotometer set at 195 nm.

Inject 1 µL of the reference solution six times. The assay is not valid unless the resolution between the peaks due to ifosfamide and to ethyl parahydroxybenzoate is not less than 6.0 and the relative standard deviation of the peak area for ifosfamide is at most 2.0 per cent.

Inject 1 µL of the test solution. Calculate the percentage content of $C_7H_{15}Cl_2N_2O_2P$ from the area of the corresponding peak in the chromatogram obtained and the declared content of *ifosfamide CRS*.

STORAGE

Store in an airtight container.

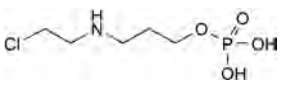
IMPURITIES

**Test A for related substances**: A, B, C, D.

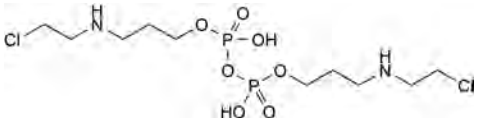
**Test B for related substances**: E, F.

*Specified impurities: A, B, C, E, F.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D.*



A. 3-[(2-chloroethyl)amino]propyl dihydrogen phosphate,

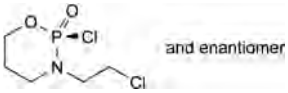


B. bis[3-[(2-chloroethyl)amino]propyl] dihydrogen diphosphate,

C. 2-chloroethanamine,

D. 2-aminoethanol.

E. 3-chloro-*N*-(2-chloroethyl)propan-1-amine,



F. (*RS*)-2-chloro-3-(2-chloroethyl)-1,3,2-oxazaphosphinane 2-oxide.

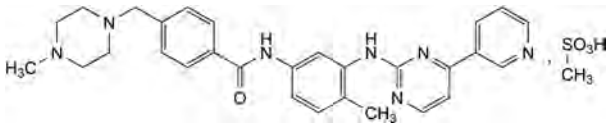
# IMATINIB MESILATE

## Imatinibi mesilas



$C_{30}H_{35}N_7SO_4$ $M_r$ 589.7
[220127-57-1]

DEFINITION

4-[(4-Methylpiperazin-1-yl)methyl]-*N*-[4-methyl-3-[[4-(pyridin-3-yl)pyrimidin-2-yl]amino]phenyl]benzamide methanesulfonate.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

PRODUCTION

It is considered that alkyl methanesulfonate esters are genotoxic and are potential impurities in imatinib mesilate. The manufacturing process should be developed taking into consideration the principles of quality risk management, together with considerations of the quality of starting materials, process capability and validation. The general methods *2.5.37. Methyl, ethyl and isopropyl methanesulfonate in methanesulfonic acid*, *2.5.38. Methyl, ethyl and isopropyl methanesulfonate in active substances* and *2.5.39. Methanesulfonyl chloride in methanesulfonic acid* are available to assist manufacturers.

CHARACTERS

*Appearance*: white or almost white, slightly brownish or yellowish powder; yellow or pale yellow, very hygroscopic, for the amorphous form.

*Solubility*: freely soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *imatinib mesilate CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Impurity F**. Liquid chromatography (*2.2.29*) coupled with mass spectrometry (*2.2.43*).

*Solvent mixture*: *acetonitrile R1*, *water for chromatography R* (30:70 *V/V*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution.* Dissolve 2.0 mg of *imatinib impurity F CRS* in the solvent mixture and dilute to 100.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 200.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 3.0 mm;
- *stationary phase*: *end-capped octadecylsilyl amorphous organosilica polymer for chromatography R* (3.5 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: 1.26 g/L solution of *ammonium formate R* in *water for chromatography R* adjusted to pH 3.4-3.5 with *anhydrous formic acid R*;
- *mobile phase B*: 0.05 per cent *V/V* solution of *anhydrous formic acid R* in *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 6 | 80 | 20 |
| 6 - 10 | 80 → 20 | 20 → 80 |
| 10 - 15 | 20 | 80 |

*NOTE: MS acquisition can be started at 3.5 min and stopped at 6 min; during non-acquisition the eluent is directed to waste.*

*Flow rate*: 0.5 mL/min.

*Detection*: mass detector: the following settings have been found to be suitable and are given as examples; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion:

- *ionisation*: ESI-positive;
- *detection m/z (SIM)*: 278.2;
- *gas temperature*: 350 °C;
- *drying gas flow*: 12 L/min;
- *nebuliser pressure*: 414 kPa;
- *capillary voltage (Vcap)*: 3 kV.

*Injection*: 10 µL.

*System suitability*: reference solution:

- *signal-to-noise ratio*: minimum 20 for the principal peak;
- *repeatability*: maximum relative standard deviation of 10 per cent determined on 6 injections.

*Calculation of percentage content*:

- for impurity F, use the concentration of impurity F in the reference solution.

*Limit*:

- *impurity F*: maximum 20 ppm.

**Impurity H**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R1*, *water for chromatography R* (30:70 *V/V*).

*Test solution.* Dissolve 75.0 mg of the substance to be examined in the solvent mixture and dilute to 5.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve the contents of a vial of *imatinib impurity A CRS* in 1.0 mL of the solvent mixture.

*Reference solution (b).* Dissolve 60.0 mg of *imatinib impurity H CRS* in the solvent mixture and dilute to 20.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 100.0 mL with the solvent mixture.

*Reference solution (c).* Dilute 5.0 mL of reference solution (b) to 50.0 mL with the solvent mixture.

*Reference solution (d).* Dissolve 0.150 g of the substance to be examined in the solvent mixture, add 1.0 mL each of reference solutions (a) and (b) and dilute to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 2.3 g of *sodium octanesulfonate monohydrate R* in 700 mL of *water for chromatography R* and add 300 mL of *acetonitrile R1* and 1.2 mL of *dilute phosphoric acid R*;
- *mobile phase B*: dissolve 2.3 g of *sodium octanesulfonate monohydrate R* in 100 mL of *water for chromatography R* and add 900 mL of *acetonitrile R1* and 1.2 mL of *dilute phosphoric acid R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 6 | 98 | 2 |
| 6 - 8 | 98 → 20 | 2 → 80 |
| 8 - 10 | 20 | 80 |

*Flow rate*: 2.3 mL/min.

*Detection*: spectrophotometer at 227 nm.

*Injection*: 10 µL of the test solution and reference solutions (c) and (d).

*Identification of impurities*: use the chromatogram obtained with reference solution (d) to identify the peaks due to impurities A and H.

*Relative retention* with reference to imatinib (retention time = about 8 min): impurity A = about 0.17; impurity H = about 0.2.

*System suitability*: reference solution (d):

- *resolution*: minimum 1.5 between the peaks due to impurities A and H.

*Calculation of percentage content*:

- for impurity H, use the concentration of impurity H in reference solution (c).

*Limit*:

- *impurity H*: maximum 0.02 per cent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R1*, *water for chromatography R* (30:70 *V/V*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 1 mg of *imatinib for system suitability CRS* (containing impurities A, B, C, D and J) in the solvent mixture and dilute to 2 mL with the solvent mixture.

*Reference solution (c).* Dissolve 25.0 mg of *imatinib mesilate CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 2.3 g of *sodium octanesulfonate monohydrate R* in 700 mL of *water for chromatography R* and add 300 mL of *acetonitrile R1* and 1.2 mL of *dilute phosphoric acid R*;
- *mobile phase B*: dissolve 2.3 g of *sodium octanesulfonate monohydrate R* in 100 mL of *water for chromatography R* and add 900 mL of *acetonitrile R1* and 1.2 mL of *dilute phosphoric acid R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 16 | 98 | 2 |
| 16 - 30 | 98 → 50 | 2 → 50 |

*Flow rate*: 2.3 mL/min.

*Detection*: spectrophotometer at 267 nm.

*Injection*: 10 µL of the test solution and reference solutions (a) and (b).

*Identification of impurities*: use the chromatogram supplied with *imatinib for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C, D and J.

*Relative retention* with reference to imatinib (retention time = about 11 min): impurity A = about 0.2; impurity B = about 0.6; impurity J = about 0.9; impurity C = about 1.2; impurity D = about 2.3.

*System suitability*:

- *resolution*: minimum 3.0 between the peaks due to imatinib and impurity C in the chromatogram obtained with reference solution (b);
- *signal-to-noise ratio*: minimum 45 for the principal peak in the chromatogram obtained with reference solution (a);
- *peak-to-valley ratio*: minimum 1.3, where $H_p$ = height above the baseline of the peak due to impurity J and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to imatinib in the chromatogram obtained with reference solution (b).

*Calculation of percentage contents*:

- *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 2.2; impurity B = 2.0;
- for each impurity, use the concentration of imatinib mesilate in reference solution (a).

*Limits*:

- *impurity C*: maximum 0.3 per cent;
- *impurity D*: maximum 0.2 per cent;
- *impurities A, B*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.8 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): maximum 3.0 per cent, determined on 1.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

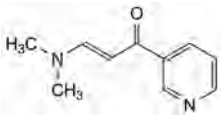
*Injection*: test solution and reference solution (c).

Calculate the percentage content of $C_{30}H_{35}N_7SO_4$ taking into account the assigned content of *imatinib mesilate CRS*.

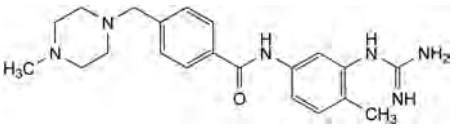
IMPURITIES

*Specified impurities: A, B, C, D, F, H.*

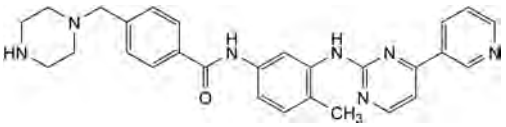
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *J.*



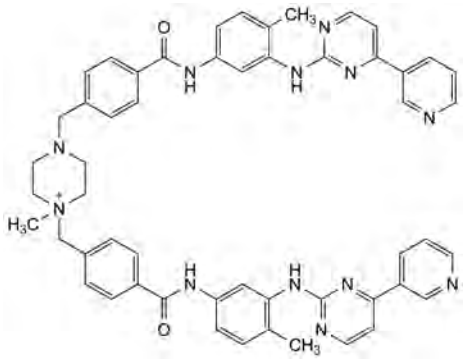
A. (2*E*)-3-(dimethylamino)-1-(pyridin-3-yl)prop-2-en-1-one,



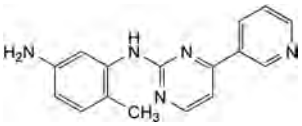
B. *N*-(3-carbamimidamido-4-methylphenyl)-4-[(4-methylpiperazin-1-yl)methyl]benzamide,



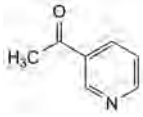
C. *N*-[4-methyl-3-[[4-(pyridin-3-yl)pyrimidin-2-yl]amino]phenyl]-4-(piperazin-1-ylmethyl)benzamide (desmethylimatinib),



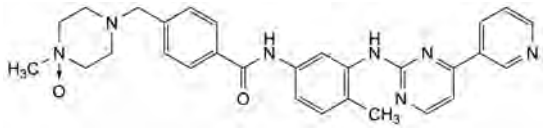
D. 1-methyl-1,4-bis[4-[[4-methyl-3-[[4-(pyridin-3-yl)-pyrimidin-2-yl]amino]phenyl]carbamoyl]benzyl]-piperazin-1-ium (imatinib dimer),



F. 4-methyl-$N^3$-[4-(pyridin-3-yl)pyrimidin-2-yl]benzene-1,3-diamine,



H. 1-(pyridin-3-yl)ethan-1-one,



J. 4-[(4-methyl-4-oxidopiperazin-1-yl)methyl]-*N*-[4-methyl-3-[[4-(pyridin-3-yl)pyrimidin-2-yl]amino]phenyl]benzamide.

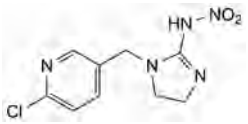
# IMIDACLOPRID FOR VETERINARY USE

## Imidaclopridum ad usum veterinarium



$C_9H_{10}ClN_5O_2$ $M_r$ 255.7
[138261-41-3]

DEFINITION

*N*-[1-[(6-Chloropyridin-3-yl)methyl]-4,5-dihydro-1*H*-imidazol-2-yl]nitramide.

*Content*: 96.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in methanol, practically insoluble in heptane.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *imidacloprid CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetonitrile R*, evaporate to dryness and record new spectra using the residues.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solution A*. Dissolve 7.5 g of *sodium hexanesulfonate R* in 900 mL of *water for chromatography R*, adjust to pH 2.5 with *phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*.

*Test solution (a).* Dissolve 40.0 mg of the substance to be examined in 2 mL of *acetonitrile R* and dilute to 20.0 mL with solution A.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 10.0 mL with solution A.

*Reference solution (a).* Dissolve 40.0 mg of *imidacloprid CRS* in 2 mL of *acetonitrile R* and dilute to 20.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b).* Dilute 1.0 mL of test solution (b) to 50.0 mL with solution A.

*Reference solution (c).* Dissolve 10 mg of *imidacloprid for system suitability CRS* (containing impurities A, B and D) in 0.5 mL of *acetonitrile R* and dilute to 5 mL with solution A.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: solution A;
- *mobile phase B*: solution A, *acetonitrile R* (50:50 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Flow rate (mL/min) |
|---|---|---|---|
| 0 - 3 | 90 | 10 | 1.0 |
| 3 - 9 | 90 → 80 | 10 → 20 | 1.0 |
| 9 - 9.5 | 80 | 20 | 1.5 |
| 9.5 - 15 | 80 → 55 | 20 → 45 | 1.5 |
| 15 - 21 | 55 → 40 | 45 → 60 | 1.5 |
| 21 - 28 | 40 → 0 | 60 → 100 | 1.5 |

*Detection*: spectrophotometer at 268 nm.

*Autosampler*: set at 25 °C.

*Injection*: 10 µL of test solution (a) and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram supplied with *imidacloprid for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B and D.

*Relative retention* with reference to imidacloprid (retention time = about 17 min): impurity A = about 0.19; impurity B = about 0.22; impurity D = 1.04.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 3.0, where $H_p$ = height above the baseline of the peak due to impurity D and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to imidacloprid.

*Calculation of percentage contents*:

- *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.5; impurity B = 0.4.
- for each impurity, use the concentration of imidacloprid in reference solution (b).

*Limits*:

- *impurity A*: maximum 0.7 per cent;
- *impurity B*: maximum 0.25 per cent;
- *unspecified impurities*: for each impurity, maximum 0.20 per cent;
- *total*: maximum 1.5 per cent;
- *reporting threshold*: 0.10 per cent.

**Chlorides**: maximum 0.5 per cent.

Dissolve 0.500 g in 30 mL of *acetone R*. Add 20 mL of *water R* and 2 mL of *dilute nitric acid R*.

Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

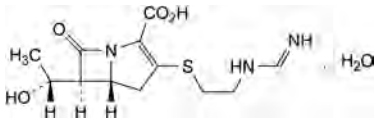
# IMIPENEM MONOHYDRATE

## Imipenemum monohydricum



$C_{12}H_{17}N_3O_4S,H_2O$ $M_r$ 317.4
[74431-23-5]

DEFINITION

(5*R*,6*S*)-6-[(*R*)-1-Hydroxyethyl]-3-[[2-[(iminomethyl)amino]-ethyl]sulfanyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid monohydrate.

Semi-synthetic product derived from a fermentation product or obtained by any other means.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white or pale yellow powder, slightly hygroscopic.

*Solubility*: slightly soluble in water and in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *imipenem CRS*.

TESTS

**Appearance of solution**. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than intensity 6 of the range of the reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dissolve 0.500 g in *phosphate buffer solution pH 7.0 R3* and dilute to 50 mL with the same solution.

**pH** (*2.2.3*): 4.5 to 7.5.

Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 100.0 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): + 90 to + 95 (anhydrous substance), measured at 25 °C. *Prepare the solutions immediately before use.*

Dissolve 0.125 g in *phosphate buffer solution pH 7.0 R3* and dilute to 25.0 mL with the same solution.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Buffer solution A*. Dissolve 0.32 g of *anhydrous sodium dihydrogen phosphate R* and 1.04 g of *anhydrous disodium hydrogen phosphate R* in 900 mL of *water for chromatography R*. Adjust to pH 7.3 with *dilute phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*.

*Buffer solution B*. Dissolve 0.11 g of *anhydrous disodium hydrogen phosphate R* in 900 mL of *water R*. Adjust to pH 6.8 with *dilute phosphoric acid R* and dilute to 1000 mL with *water R*.

*Solvent mixture*: *acetonitrile R*, buffer solution B (0.7:99.3 *V/V*).

*Test solution*. Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 25.0 mg of *imipenem CRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 5 mg of the substance to be examined in 8 mL of a mixture of 1 volume of *dilute sulfuric acid R* and 200 volumes of *water R*. After 5 min, add 10 mg of *sodium carbonate R* and dilute to 10.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*, buffer solution A (0.7:99.3 *V/V*);
- *mobile phase B*: *acetonitrile R1*, buffer solution A (25:75 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 9 | 100 | 0 |
| 9 - 24 | 100 → 68 | 0 → 32 |
| 24 - 24.5 | 68 → 50 | 32 → 50 |
| 24.5 - 29 | 50 | 50 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 210 nm.

*Autosampler*: set at 5 °C.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to the epimers of impurity B.

*Relative retention* with reference to imipenem (retention time = about 8 min): epimer I of impurity B = about 0.33; epimer II of impurity B = about 0.35; impurity A = about 0.8.

*System suitability*: reference solution (c):

- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to epimer I of impurity B and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to epimer II of impurity B.

*Calculation of percentage contents*:

- *correction factor*: multiply the peak area of impurity A by 2.4;
- for each impurity, use the concentration of imipenem monohydrate in reference solution (b).

*Limits*:

- *impurity A*: maximum 1.0 per cent;
- *impurity B*: for each epimer, maximum 0.3 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 1.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): 5.0 per cent to 8.0 per cent, determined on 0.100 g. Use an iodosulfurous reagent containing imidazole instead of pyridine and a clean container for each determination.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 0.17 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

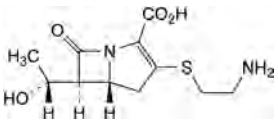
Calculate the percentage content of $C_{12}H_{17}N_3O_4S$ taking into account the assigned content of *imipenem CRS*.

STORAGE

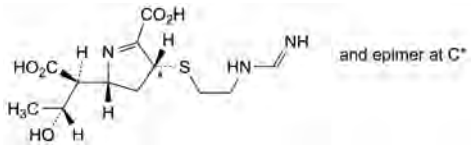
In an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

IMPURITIES

*Specified impurities: A, B.*



A. (5*R*,6*S*)-3-[(2-aminoethyl)sulfanyl]-6-[(*R*)-1-hydroxyethyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid (thienamycin),

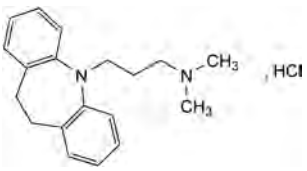


B. (2*R*,4*RS*)-2-[(1*S*,2*R*)-1-carboxy-2-hydroxypropyl]-4-[[2-[(iminomethyl)amino]ethyl]sulfanyl]-3,4-dihydro-2*H*-pyrrole-5-carboxylic acid (imipenemoic acid).

**01/2017:0029**

# IMIPRAMINE HYDROCHLORIDE

## Imipramini hydrochloridum



$C_{19}H_{25}ClN_2$ $M_r$ 316.9

[113-52-0]

DEFINITION

3-(10,11-Dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N*,*N*-dimethylpropan-1-amine hydrochloride.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or slightly yellow, crystalline powder.

*Solubility*: freely soluble in water and in ethanol (96 per cent).

IDENTIFICATION

*First identification: B, D.*

*Second identification: A, C, D.*

A. Melting point (*2.2.14*): 170 °C to 174 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *imipramine hydrochloride CRS*.

C. Dissolve about 5 mg in 2 mL of *nitric acid R*. An intense blue colour develops.

D. About 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. To 3.0 g add 20 mL of *carbon dioxide-free water R*, dissolve rapidly by shaking and triturating with a glass rod and dilute to 30 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*). Immediately after preparation, dilute solution S with an equal volume of *water R*. This solution is not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 3.6 to 5.0 for solution S, measured immediately after preparation.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 5.0 mg of *imipramine for system suitability CRS* (containing impurity B) in the mobile phase and dilute to 5.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mix 40 volumes of *acetonitrile R1* with 60 volumes of a 5.2 g/L solution of *dipotassium hydrogen phosphate R* previously adjusted to pH 7.0 with *phosphoric acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL.

*Run time*: 2.5 times the retention time of imipramine.

*Relative retention* with reference to imipramine (retention time = about 7 min): impurity B = about 0.7.

*System suitability*: reference solution (a):

- *resolution*: minimum 5.0 between the peaks due to impurity B and imipramine.

*Limits*:

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the peak due to imipramine in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 3 times the area of the peak due to imipramine in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *disregard limit*: 0.5 times the area of the peak due to imipramine in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 mL of *ethanol (96 per cent) R* and add 5.0 mL of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 31.69 mg of $C_{19}H_{25}ClN_2$.

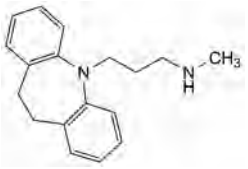
STORAGE

Protected from light.

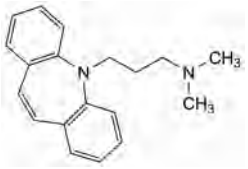
IMPURITIES

*Specified impurities: B.*

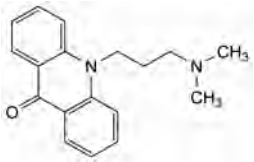
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C.*



A. 3-(10,11-dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N*-methylpropan-1-amine (desipramine),



B. 3-(5*H*-dibenzo[*b,f*]azepin-5-yl)-*N*,*N*-dimethylpropan-1-amine (depramine),

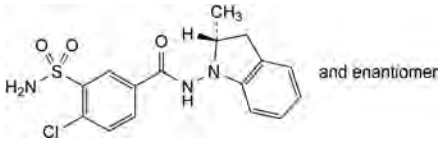


C. 10-[3-(dimethylamino)propyl]acridin-9(10*H*)-one.

**01/2017:1108**

# INDAPAMIDE

## Indapamidum



$C_{16}H_{16}ClN_3O_3S$ $M_r$ 365.8

[26807-65-8]

DEFINITION

4-Chloro-*N*-[(2*RS*)-2-methyl-2,3-dihydro-1*H*-indol-1-yl]-3-sulfamoylbenzamide.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent. Dilute 2.0 mL of the solution to 100.0 mL with *ethanol (96 per cent) R*.

*Spectral range*: 220-350 nm.

*Absorption maximum*: at 242 nm.

*Shoulders*: at 279 nm and 287 nm.

*Specific absorbance at the absorption maximum*: 590 to 630.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *indapamide CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 20 mg of the substance to be examined in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 20 mg of *indapamide CRS* in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 10 mg of *indometacin R* in 5 mL of reference solution (a) and dilute to 10 mL with *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel $GF_{254}$ plate R*.

*Mobile phase*: *glacial acetic acid R*, *acetone R*, *toluene R* (1:20:79 *V/V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Optical rotation** (*2.2.7*): − 0.02° to + 0.02°.

Dissolve 0.250 g in *anhydrous ethanol R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use or maintain them at 4 °C.*

*Solvent mixture*: *acetonitrile R*, *methanol R* (50:50 *V/V*).

*Test solution.* Dissolve 20.0 mg of the substance to be examined in 7 mL of the solvent mixture and dilute to 20.0 mL with a 0.2 g/L solution of *sodium edetate R*.

*Reference solution (a).* Dissolve 3.0 mg of *indapamide impurity B CRS* in 3.5 mL of the solvent mixture and dilute to 10.0 mL with a 0.2 g/L solution of *sodium edetate R*. To 1.0 mL of the solution add 35 mL of the solvent mixture and dilute to 100.0 mL with a 0.2 g/L solution of *sodium edetate R*.

*Reference solution (b).* To 1.0 mL of the test solution add 17.5 mL of the solvent mixture and dilute to 50.0 mL with a 0.2 g/L solution of *sodium edetate R*. To 1.0 mL of this solution add 7 mL of the solvent mixture and dilute to 20.0 mL with a 0.2 g/L solution of *sodium edetate R*.

*Reference solution (c).* Dissolve 20.0 mg of *indapamide CRS* in 7 mL of the solvent mixture and dilute to 20.0 mL with a 0.2 g/L solution of *sodium edetate R*.

*Reference solution (d).* Dissolve 25.0 mg of *indapamide CRS* and 45.0 mg of *methylnitrosoindoline CRS* (impurity A) in 17.5 mL of the solvent mixture and dilute to 50.0 mL with a 0.2 g/L solution of *sodium edetate R*.

*Column*:

– *size*: *l* = 0.20 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*: *glacial acetic acid R*, *acetonitrile R*, *methanol R*, 0.2 g/L solution of *sodium edetate R* (0.1:17.5:17.5:65 *V/V/V/V*).

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL of the test solution and reference solutions (a), (b) and (d).

*Run time*: 2.5 times the retention time of indapamide.

*Retention time*: indapamide = about 11 min.

*System suitability*:

– *resolution*: minimum 4.0 between the peaks due to indapamide and impurity A in the chromatogram obtained with reference solution (d).

*Limits*:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Impurity A**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Test solution.* Dissolve 25.0 mg of the substance to be examined in 1 mL of *acetonitrile R* and dilute to 10.0 mL with *water R*. Shake for 15 min. Allow to stand at 4 °C for 1 h and filter.

*Reference solution.* Dissolve 25.0 mg of the substance to be examined in 1.0 mL of a 0.125 mg/L solution of *methylnitrosoindoline CRS* (impurity A) in *acetonitrile R* and dilute to 10.0 mL with *water R*. Shake for 15 min. Allow to stand at 4 °C for 1 h and filter.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

*Mobile phase*: mix 7 volumes of *acetonitrile R*, 20 volumes of *tetrahydrofuran R* and 73 volumes of a 1.5 g/L solution of *triethylamine R* adjusted to pH 2.8 with *phosphoric acid R*.

*Flow rate*: 1.4 mL/min.

*Detection*: spectrophotometer at 305 nm.

*Injection*: 0.1 mL.

*System suitability*: reference solution:

– *signal-to-noise ratio*: minimum 3 for the peak due to impurity A appearing just before the peak due to indapamide;
– *peak-to-valley-ratio*: minimum 6.7, where $H_p$ = height above the baseline of the peak due to impurity A and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to indapamide.

*Limit*:

– *impurity A*: not more than the difference between the areas of the peaks due to impurity A in the chromatograms obtained with the reference solution and the test solution (5 ppm).

**Impurity C**. Liquid chromatography (*2.2.29*). *Maintain the solutions at 10 °C after preparation.*

*Solution A*. Dissolve 0.20 g of *sodium edetate R* in *water R*, add 1.5 mL of *anhydrous acetic acid R* and dilute to 1 L with *water R*.

*Test solution.* Dissolve 75.0 mg of the substance to be examined in 7.5 mL of *acetonitrile for chromatography R* and dilute to 25.0 mL with *water R*.

*Reference solution (a).* Dissolve 9.0 mg of *indapamide impurity C CRS* in 1.0 mL of *water R*, add 6.0 mL of *acetonitrile for chromatography R* and dilute to 20.0 mL with *water R*. To 1.0 mL of the solution add 7.5 mL of *acetonitrile for chromatography R* and dilute to 25.0 mL with *water R*.

*Reference solution (b).* To 1.0 mL of reference solution (a) add 3.0 mL of *acetonitrile for chromatography R* and dilute to 10.0 mL with *water R*.

*Reference solution (c).* To 1.0 mL of reference solution (a) add 3.0 mL of *acetonitrile for chromatography R* and dilute to 10.0 mL with the test solution.

*Column*:

- *size*: *l* = 0.05 m, Ø = 2.1 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (1.8 µm);
- *temperature*: 50 °C.

*Mobile phase*: *acetonitrile for chromatography R*, solution A (30:70 *V/V*).

*Flow rate*: 0.7 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Injection*: 2 µL of the test solution and reference solutions (b) and (c).

*Run time*: 3 times the retention time of indapamide.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity C.

*Relative retention* with reference to indapamide (retention time = about 1.3 min): impurity C = about 0.5.

*System suitability*: reference solution (c):

- *resolution*: minimum 4.0 between the peaks due to impurity C and indapamide;
- *signal-to-noise ratio*: minimum 20 for the peak due to impurity C.

*Calculation of content*:

- for impurity C, use the concentration of impurity C in reference solution (b).

*Limit*:

- *impurity C*: maximum 600 ppm.

**Water** (*2.5.12*): maximum 3.0 per cent, determined on 0.100 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (c).

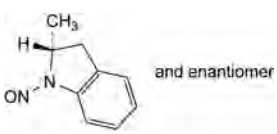
Calculate the percentage content of $C_{16}H_{16}ClN_3O_3S$ taking into account the assigned content of *indapamide CRS*.

STORAGE

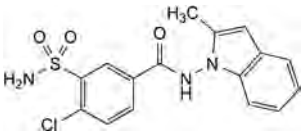
Protected from light.

IMPURITIES

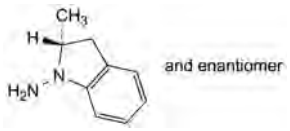
*Specified impurities*: *A, B, C.*



A. (2*RS*)-2-methyl-1-nitroso-2,3-dihydro-1*H*-indole,



B. 4-chloro-*N*-(2-methyl-1*H*-indol-1-yl)-3-sulfamoylbenzamide,



C. (2*RS*)-2-methyl-2,3-dihydro-1*H*-indol-1-amine.

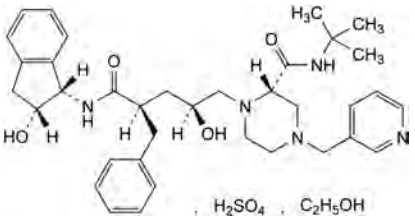
# INDINAVIR SULFATE

## Indinaviri sulfas



$C_{36}H_{49}N_5O_8S,C_2H_6O$ $M_r$ 758
[157810-81-6]

DEFINITION

(2*S*)-1-[(2*S*,4*R*)-4-Benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)-4-(pyridin-3-ylmethyl)piperazine-2-carboxamide sulfate ethanolate.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous and ethanol-free substance).

PRODUCTION

A test for enantiomeric purity is carried out unless it has been demonstrated that the manufacturing process is enantioselective for the substance.

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: freely soluble in water, soluble in methanol, practically insoluble in heptane.

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): + 122 to + 129 (anhydrous and ethanol-free substance), determined at 365 nm and at 25 °C.

Dissolve 0.500 g in *water R* and dilute to 50.0 mL with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *Ph. Eur. reference spectrum of indinavir sulfate.*

C. It gives reaction (a) of sulfates (*2.3.1*).

D. Ethanol (see Tests).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*. Thoroughly mix equal volumes of mobile phase A and *acetonitrile R1*.

*Test solution.* Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 100.0 mL with the same solution.

*Reference solution (a).* Dissolve 4 mg of *indinavir for system suitability CRS* (containing impurities B, C and E) in solution A and dilute to 10 mL with the same solution.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (c).* Dissolve 5.0 mg of *cis-aminoindanol R* (impurity A) in solution A and dilute to 10.0 mL with the same solution. Dilute 1.0 mL of the solution to 100.0 mL with solution A. Dilute 1.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (d).* To 30 mg of the substance to be examined add 0.25 mL of *2 M hydrochloric acid R* and allow to stand at room temperature for 1 h. Dilute to 100 mL with a mixture of 2 volumes of *acetonitrile R1* and 3 volumes of mobile phase A and mix (*in situ* degradation to obtain impurity D).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: solution containing 0.27 g/L of *potassium dihydrogen phosphate R* and 1.40 g/L of *dipotassium hydrogen phosphate R*; filter and degas;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 80 | 20 |
| 5 - 40 | 80 → 30 | 20 → 70 |
| 40 - 45 | 30 | 70 |
| 45 - 47 | 30 → 80 | 70 → 20 |
| 47 - 52 | 80 | 20 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *indinavir for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B, C and E; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity D.

*Relative retention* with reference to indinavir (retention time = about 25 min): impurity A = about 0.2; impurity B = about 0.8; impurity C = about 0.98; impurity D = about 1.1; impurity E = about 1.3.

*System suitability*: reference solution (a):

- *resolution*: minimum 1.8 between the peaks due to impurity C and indinavir.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity D by 1.8;
- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *impurity D*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities B, C, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

**Ethanol**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dilute 1.0 mL of *propanol R* to 200.0 mL with *water R*.

*Test solution.* Dissolve 0.400 g of the substance to be examined in 50.0 mL of *water R*, add 8.0 mL of the internal standard solution and dilute to 100.0 mL with *water R*.

*Reference solution.* Dilute 1.0 mL of *anhydrous ethanol R* to 200.0 mL. Dilute 2.0 mL of this solution and 2.0 mL of the internal standard solution to 25.0 mL with *water R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.53 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 1.0 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 10 mL/min.

*Split ratio*: 1:10.

*Temperature*:

- *column*: 35 °C;
- *injection port*: 140 °C;
- *detector*: 220 °C.

*Detection*: flame ionisation.

*Injection*: 1.0 µL.

*System suitability*: reference solution:

- *retention time*: ethanol = 2 min to 4 min;
- *resolution*: minimum 5.0 between the peaks due to ethanol and propanol.

Calculate the percentage content of ethanol taking the density (*2.2.5*) to be 0.790 g/mL.

*Limit*:

- *ethanol*: 5.0 per cent to 8.0 per cent *m/m*.

**Water** (*2.5.12*): maximum 1.5 per cent, determined on 0.500 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*).

*Solution B.* Add 20 mL of *dibutylammonium phosphate for ion-pairing R* to 1000 mL of *water R*. Adjust to pH 6.5 with *1 M sodium hydroxide*.

*Test solution.* Dissolve 60.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Reference solution.* Dissolve 50.0 mg of *indinavir CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: *acetonitrile R*, solution B (45:55 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 260 nm.

*Injection*: 10 µL.

*Run time*: twice the retention time of indinavir.

*Retention time*: indinavir = about 10 min.

Calculate the percentage content of $C_{36}H_{49}N_5O_8S$ using the declared content of *indinavir CRS* and multiplying by a correction factor of 1.1598.

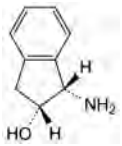
STORAGE

In an airtight container, protected from light.

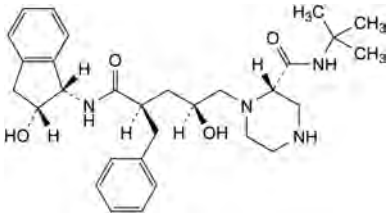
IMPURITIES

*Specified impurities: A, B, C, D, E.*

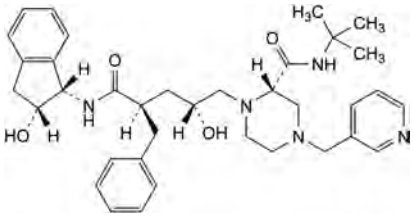
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F.*



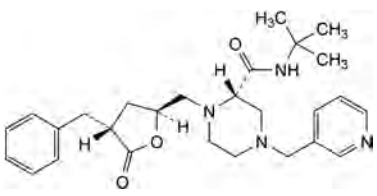
A. (1*S*,2*R*)-1-amino-2,3-dihydro-1*H*-inden-2-ol (*cis*-aminoindanol),



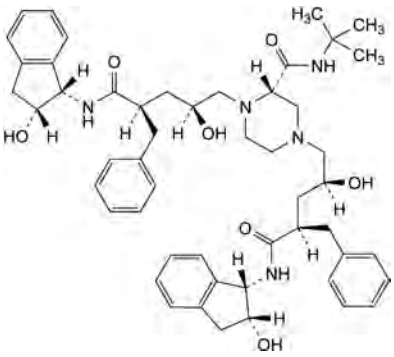
B. (2*S*)-1-[(2*S*,4*R*)-4-benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)piperazine-2-carboxamide,



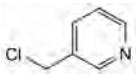
C. (2*S*)-1-[(2*R*,4*R*)-4-benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)-4-(pyridin-3-ylmethyl)piperazine-2-carboxamide,



D. (3*R*,5*S*)-3-benzyl-5-[[(2*S*)-2-[(1,1-dimethylethyl)-carbamoyl]-4-(pyridin-3-ylmethyl)piperazin-1-yl]methyl]-4,5-dihydrofuran-2(3*H*)-one,



E. (2*S*)-1,4-bis[(2*S*,4*R*)-4-benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)piperazine-2-carboxamide,

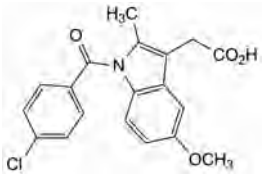


F. 3-(chloromethyl)pyridine (nicotinyl chloride).

**04/2019:0092**

# INDOMETACIN

## Indometacinum



$C_{19}H_{16}ClNO_4$ $M_r$ 357.8

[53-86-1]

DEFINITION

[1-(4-Chlorobenzoyl)-5-methoxy-2-methyl-1*H*-indol-3-yl]acetic acid.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or yellow, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*). The acceptable crystalline form corresponds to *indometacin CRS*.

IDENTIFICATION

*First identification: A, C.*

*Second identification: A, B, D, E.*

A. Melting point (*2.2.14*): 158 °C to 162 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 25 mg in a mixture of 1 volume of a 103.0 g/L solution of *hydrochloric acid R* and 9 volumes of *methanol R* and dilute to 100.0 mL with the same mixture of solvents. Dilute 10.0 mL of the solution to 100.0 mL with a mixture of 1 volume of a 103.0 g/L solution of *hydrochloric acid R* and 9 volumes of *methanol R*.

*Spectral range*: 300-350 nm.

*Absorption maximum*: at 318 nm.

*Specific absorbance at the absorption maximum*: 170 to 190.

C. Infrared absorption spectrophotometry (*2.2.24*), without recrystallisation.

*Comparison*: *indometacin CRS*.

D. Dissolve 0.1 g in 10 mL of *ethanol (96 per cent) R*, heating slightly if necessary. To 0.1 mL of the solution add 2 mL of a freshly prepared mixture of 1 volume of a 250 g/L solution of *hydroxylamine hydrochloride R* and 3 volumes of *dilute sodium hydroxide solution R*. Add 2 mL of *dilute hydrochloric acid R* and 1 mL of *ferric chloride solution R2* and mix. A violet-pink colour develops.

E. To 0.5 mL of the solution in ethanol (96 per cent) prepared in identification test D, add 0.5 mL of *dimethylaminobenzaldehyde solution R2*. A precipitate is formed that dissolves on shaking. Heat on a water-bath. A bluish-green colour is produced. Continue to heat for 5 min and cool in iced water for 2 min. A precipitate is formed and the colour changes to light greyish-green. Add 3 mL of *ethanol (96 per cent) R*. The solution is clear and violet-pink in colour.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Solvent mixture*: *acetonitrile R*, *water R* (50:50 *V/V*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the solvent mixture, using sonication if necessary, and dilute to 25.0 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve the contents of a vial of *indometacin impurity mixture CRS* (impurities I and J) in 1 mL of the solvent mixture.

*Column*:

- *size*: *l* = 0.10 m, Ø = 2.1 mm;
- *stationary phase*: *end-capped ethylene-bridged phenylsilyl silica gel for chromatography (hybrid material) R* (1.7 µm);
- *temperature*: 50 °C.

*Mobile phase*:

- *mobile phase A*: 5 g/L solution of *anhydrous formic acid R*;
- *mobile phase B*: 5 g/L solution of *anhydrous formic acid R* in *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5.5 | 60 | 40 |
| 5.5 - 5.6 | 60 → 30 | 40 → 70 |
| 5.6 - 9 | 30 | 70 |

*Flow rate*: 0.3 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 1.4 µL.

*Identification of impurities*: use the chromatogram supplied with *indometacin impurity mixture CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities I and J.

*Relative retention* with reference to indometacin (retention time = about 6 min): impurity I = about 1.3; impurity J = about 1.4.

*System suitability*: reference solution (b):

- *resolution*: minimum 3.0 between the peaks due to impurities I and J.

*Calculation of percentage contents*:

- for each impurity, use the concentration of indometacin in reference solution (a).

*Limits*:

- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.3 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (50:50 *V/V*).

*Test solution.* Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 10.0 mL with the solvent mixture.

*Reference solution.* Dissolve 25.0 mg of *indometacin CRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 10.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped solid core octadecylsilyl silica gel for chromatography R* (2.6 µm);
- *temperature*: 50 °C.

*Mobile phase*:

- *mobile phase A*: 10 g/L solution of *acetic acid R*;
- *mobile phase B*: 10 g/L solution of *acetic acid R* in *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 50 | 50 |
| 5 - 5.5 | 50 → 0 | 50 → 100 |
| 5.5 - 8 | 0 | 100 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Retention time*: indometacin = about 4 min.

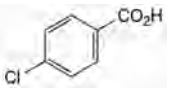
Calculate the percentage content of $C_{19}H_{16}ClNO_4$ taking into account the assigned content of *indometacin CRS*.

STORAGE

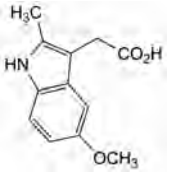
Protected from light.

IMPURITIES

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, F, G, H, I, J.*



A. 4-chlorobenzoic acid,



B. (5-methoxy-2-methyl-1*H*-indol-3-yl)acetic acid,

DEFINITION

Solution of a monoclonal antibody consisting of a bisdisulfide dimer of 1328 amino acid residues with a molecular weight of approximately 145 kDa, which binds with high affinity to both soluble and transmembrane forms of TNF-α.

Infliximab is a chimeric human-murine IgG1 kappa monoclonal antibody representing a glycosylated immunoglobulin with 1 *N*-linked glycosylation site (Asn 300) in the CH2 domain of each heavy chain. The detected oligosaccharides are mostly G0F (absence of terminal galactose) and G1F (1 terminal galactose) structures. Each heavy chain consists of 450 amino acids with 11 cysteine residues, and each light chain consists of 214 amino acids with 5 cysteine residues. All cysteine residues in heavy and light chains are involved in either intra- or inter-disulfide bonding.

*Content (milligrams of protein per millilitre)*: as approved by the competent authority.

*Potency*: $8 \times 10^3$ to $12 \times 10^3$ IU per milligram of protein.

PRODUCTION

Infliximab is produced in a suitable mammalian cell expression system by a method based on recombinant DNA (rDNA) technology. During the course of product development, it must be demonstrated that the manufacturing process consistently produces a product with the expected *N*-glycan occupancy and Fc-effector functions (antibody-dependent cellular cytotoxicity (ADCC), complement-dependent cytotoxicity (CDC)) using suitably qualified assay(s).

*Prior to release, the following tests are carried out on each batch of infliximab concentrated solution, unless an exemption has been granted by the competent authority.*

**Host-cell-derived proteins** (*2.6.34*). The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority.

**Residual Protein A**. Use a suitable immunochemical method (*2.7.1*) based on an enzyme-linked immunosorbent assay (ELISA). To determine residual Protein A, the preparation to be examined is transferred to an ELISA microplate coated with an anti-protein A capture antibody. Peroxidase-conjugated polyclonal anti-protein A antibody is added followed by a peroxidase substrate. Optical density is measured and the amount of residual Protein A is calculated using a standard curve and the usual statistical methods (for example, *5.3*).

*Limit*: as approved by the competent authority.

**Glycan analysis**. Use a suitable method developed according to general chapter *2.2.59. Glycan analysis of glycoproteins*, section 2-3:

- after desalting, release the glycans using 1 of the agents described in Table *2.2.59.*-1, for example peptide *N*-glycosidase F (PNGase F);
- if needed, label the released glycans with 1 of the fluorescent labelling agents described in Table *2.2.59.*-2;
- analyse the labelled or unlabelled glycans using a suitable technique.

*The following procedure is given as an example.*

*Solution A*. Dissolve 0.17 g of *anhydrous sodium dihydrogen phosphate R* and 0.53 g of *anhydrous disodium hydrogen phosphate R* in *water R*. Adjust to pH 7.6 with *sodium hydroxide solution R* or *hydrochloric acid R* and dilute to 1000.0 mL with *water R*.

*Test solution*. Desalt a volume of the preparation to be examined by a suitable method (for example, using a suitable centrifugal filter with *water for chromatography R* as elution buffer), and dilute with solution A to obtain a concentration of about 1 mg/mL. To 200 µL of this solution add 0.3 µL of a 500 000 U/mL solution of *peptide N-glycosidase F R*. Incubate at 37 °C for at least 16 hours.

*Reference solution (a)*. Dissolve the contents of a vial of *infliximab CRS* in *water R*. Desalt a volume of this preparation and carry out the glycan release at the same time and in the same manner as for the test solution.

*Reference solution (b)*. Use a suitable infliximab in-house reference preparation shown to be representative of batches tested clinically and batches used to demonstrate consistency of production. Desalt a volume of this preparation and carry out the glycan release at the same time and in the same manner as for the test solution.

*Blank solution*. Use 200 µL of solution A to proceed to glycan release.

Analyse the native glycans by liquid chromatography (*2.2.29*).

*Precolumn*:

- *size*: *l* = 0.05 m, Ø = 3.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R2* (5.5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 3.0 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R2* (5.5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: 2 g/L solution of *sodium hydroxide R*;
- *mobile phase B*: solution containing 2 g/L of *sodium hydroxide R* and 10.25 g/L of *anhydrous sodium acetate R*;
- *mobile phase C*: solution containing 2 g/L of *sodium hydroxide R* and 41 g/L of *anhydrous sodium acetate R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Mobile phase C (per cent *V/V*) | Flow rate (mL/min) |
|---|---|---|---|---|
| 0 - 5 | 99.2 | 0.8 | 0 | 0.35 |
| 5 - 45 | 99.2 → 95.2 | 0.8 → 4.8 | 0 | 0.35 |
| 45 - 50 | 95.2 → 72 | 4.8 → 28 | 0 | 0.35 |
| 50 - 77 | 72 → 4 | 28 → 96 | 0 | 0.35 |
| 77 - 77.1 | 4 → 0 | 96 → 0 | 0 → 100 | 0.35 |
| 77.1 - 87 | 0 | 0 | 100 | 0.40 |

*Detection*: electrochemical detector (pulsed amperometry).

*Autosampler*: set at 2-8 °C.

*Injection*: 25 µL.

*Identification of peaks*: use the chromatogram in Figure 2928.-1 to identify the 7 peaks corresponding to fucosylated (peaks 1, 4 and 5), afucosylated (peaks 2 and 3) and sialylated (peaks 6 and 7) glycans; record the retention time of each peak.

*System suitability*:

- the chromatogram obtained with reference solution (a) is qualitatively similar to the chromatogram supplied with *infliximab CRS* and peaks 1 to 7 are clearly visible;
- no significant peaks are observed in the chromatogram obtained with the blank solution.

*Results*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with reference solution (b);
- the retention times of the peaks in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with reference solution (b);
- no additional peaks are observed in the chromatogram obtained with the test solution in comparison with the chromatogram obtained with reference solution (b).

Calculate the relative peak areas of the individual peaks corresponding to fucosylated, afucosylated and sialylated glycans with reference to the sum of the areas of all retained glycan peaks.

Calculate the percentage contents of fucosylated, afucosylated and sialylated glycans, using the following expressions:

$$\frac{A}{A+B+C} \times 100$$

$$\frac{B}{A+B+C} \times 100$$

$$\frac{C}{A+B+C} \times 100$$

$A$ = sum of the areas of the peaks due to fucosylated glycans;

$B$ = sum of the areas of the peaks due to afucosylated glycans;

$C$ = sum of the areas of the peaks due to sialylated glycans.

*NOTE: sialylated glycans elute as peak clusters and are integrated as such.*

*Limits*:

- *percentage of fucosylated glycans*: as authorised by the competent authority;
- *percentage of afucosylated glycans*: as authorised by the competent authority;
- *percentage of sialylated glycans*: as authorised by the competent authority.

**Charged variants**.

A. Isoelectric focusing (*2.2.54*): use suitable agarose gels.

*The following procedure is given as an example.*

*Test solution*. Dilute the preparation to be examined with *water R* to obtain a concentration of 0.5 mg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *infliximab CRS* in *water R* to obtain a concentration of 0.5 mg/mL.

*Reference solution (b)*. Use a suitable infliximab in-house reference preparation shown to be representative of batches tested clinically and batches used to demonstrate consistency of production. Dilute with *water R* to obtain a concentration of 0.5 mg/mL.

*Reference solution (c)*. Use an isoelectric point (pI) calibration solution, in the pI range of 3-10, prepared according to the manufacturer's instructions. Adjust the concentration to allow detection of all marker proteins.

*Focusing*:

- *pH gradient*: 3-10;
- *catholyte*: 40 g/L solution of *sodium hydroxide R*;
- *anolyte*: 2.87 per cent *V/V* solution of *glacial acetic acid R*;
- *application*: 15 µL.

For each gel, run 2 lanes with reference solution (a), 2 lanes with reference solution (b) and 2 lanes with reference solution (c); use the remaining lanes for the test solution. Proceed with the isoelectric focusing by applying the electrical parameters according to the manufacturer's instructions (the following parameters have been found suitable: 1500 V, 7 mA, 25 W and 80 min).

*Detection*: as described in general chapter *2.2.54*, with the following modifications.

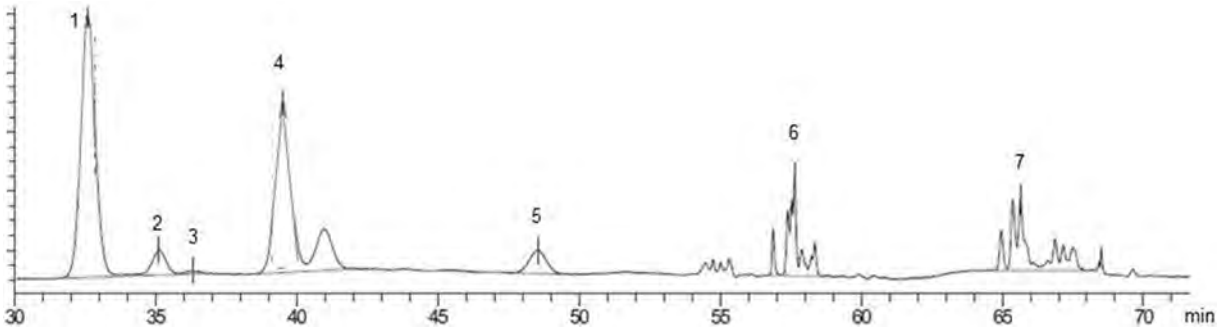
Immerse the gel in a solution containing 36 g/L of *sulfosalicylic acid R*, 60 g/L of *trichloroacetic acid R* and 285 g/L of *methanol R*. Incubate with gentle shaking at room temperature for 30 min. Drain off the solution and transfer the gel to a mixture of 80 volumes of *glacial acetic acid R*, 250 volumes of *ethanol R* and 670 volumes of *water R* (mixture A); while shaking, rinse for 10 min at room temperature. Immerse the gel in a staining solution (1 g/L solution of *acid blue 83 R* in mixture A) and incubate for 20 min at room temperature. Destain the gel by passive diffusion (for at least 6 h) with mixture A until the bands are well visualised against a clear background. Soak and wash the gel for 1 h with *water R*.

*System suitability*:

- in the electropherogram obtained with reference solution (a), 7 bands (4 major and 3 minor) in the pI region 7.35-8.30 are clearly visible;
- in the electropherogram obtained with reference solution (c), the relevant pI markers are distributed along the entire length of the gel.

*Results*:

- the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (b). Plot the migration distances of the relevant pI markers versus their pI and determine the isoelectric points of the principal components of the test solution and reference solution (b); they do not differ by more than 0.05 pI units;
- no additional bands are observed in the electropherogram obtained with the test solution in comparison to the electropherogram obtained with reference solution (b).



| *Peak* | *Charged* | *Glycoform* | *Peak* | *Charged* | *Glycoform* |
|---|---|---|---|---|---|
| 1. | No | Fucosylated G0F (absence of terminal galactose) | 5. | No | Fucosylated G2F (2 terminal galactoses) |
| 2. | No | Afucosylated Man5 (addition of 2 mannoses instead of terminal *N*-acetylglucosamine) | 6. | Yes | Sialylated SA1 (addition of 1 sialic acid) |
| 3. | No | Afucosylated G0 (absence of fucose) | 7. | Yes | Sialylated SA2 (addition of 2 sialic acids) |
| 4. | No | Fucosylated G1F (1 terminal galactose) | | | |

Figure 2928.-1. – *Chromatogram for glycan analysis of infliximab*

Alternatively, use a suitable capillary isoelectric focusing method developed according to general chapter *2.2.47. Capillary electrophoresis*.

B. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution*. Dilute the preparation to be examined with mobile phase A to obtain a concentration of about 1 mg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *infliximab CRS* in mobile phase A to obtain a concentration of about 1 mg/mL.

*Reference solution (b)*. Use a suitable infliximab in-house reference preparation shown to be representative of batches tested clinically and batches used to demonstrate consistency of production. Dilute with mobile phase A to obtain a concentration of about 1 mg/mL.

*Precolumn*:

- *size*: *l* = 0.05 m, Ø = 4 mm;
- *stationary phase*: *weak cation-exchange resin R* (10 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *weak cation-exchange resin R* (10 µm).

*Mobile phase*:

- *mobile phase A*: dissolve 0.56 g of *sodium dihydrogen phosphate R* and 1.14 g of *disodium hydrogen phosphate dihydrate R* in 800 mL of *water for chromatography R*, and adjust to pH 7.25, if necessary, with *sodium hydroxide solution R* or *hydrochloric acid R*; dilute to 1000.0 mL with *water for chromatography R* and degas;
- *mobile phase B*: dissolve 0.56 g of *sodium dihydrogen phosphate R*, 1.14 g of *disodium hydrogen phosphate dihydrate R* and 58.44 g of *sodium chloride R* in 800 mL of *water for chromatography R*, and adjust to pH 7.25, if necessary, with *sodium hydroxide solution R* or *hydrochloric acid R*; dilute to 1000.0 mL with *water for chromatography R* and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 15 | 100 → 92 | 0 → 8 |
| 15 - 16 | 92 → 60 | 8 → 40 |
| 16 - 21 | 60 | 40 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Autosampler*: set at 10 °C.

*Injection*: 50 µL.

*Relative retention* with reference to the peak due to isoform 6 (retention time = about 9.2 min): isoform 1 = 0.68; isoform 2 = 0.74; isoform 3 = 0.80; isoform 4 = 0.87; isoform 5 = 0.95.

*System suitability*: reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with *infliximab CRS*;
- *resolution*: minimum 1.5 between the peaks due to isoforms 3 and 4.

*Results*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with reference solution (b);
- the relative retentions of the peaks due to isoforms 2, 3 and 4 in the chromatogram obtained with the test solution are within 1 per cent of those of the corresponding peaks in the chromatogram obtained with reference solution (b).

Calculate the relative peak areas of the individual peaks due to isoforms with reference to the total area of all peaks eluting between 3 min and 11 min.

*Limits*:

- *sum of isoforms 1 and 2*: as authorised by the competent authority;
- *sum of isoforms 3, 4 and 6*: as authorised by the competent authority;
- *isoform 5*: as authorised by the competent authority.

CHARACTERS

*Appearance*: opalescent or slightly opalescent, colourless or light yellow liquid.

IDENTIFICATION

A. It complies with the limits of the assay (potency).

B. Peptide mapping (*2.2.55*).

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Dilution buffer*. Dissolve 50.00 g of *sucrose R*, 0.22 g of *sodium dihydrogen phosphate monohydrate R*, 0.61 g of *disodium hydrogen phosphate dihydrate R* and 0.05 g of *polysorbate 80 R* in *water R*. Adjust to pH 7.2, if necessary, and dilute to 500.0 mL with *water R*.

*Test solution*. Dilute the preparation to be examined with the dilution buffer to obtain a concentration of about 5 mg/mL.

*Reference solution*. Dissolve the contents of a vial of *infliximab CRS* in the dilution buffer to obtain a concentration of about 5 mg/mL.

*Reduction and alkylation*. Dilute the test solution with *guanidine-tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.6 R* to obtain a concentration of 2 mg/mL. To 1 mL of this solution add 10 µL of a 154 g/L solution of *dithiothreitol R* and incubate at 37 °C for 1 h. Add 20 µL of a freshly prepared 185 g/L solution of *iodoacetamide R* and incubate at room temperature for 15 min, protected from light. Add 10 µL of a 154 g/L of solution of *dithiothreitol R* and mix well.

*Digestion*. Desalt a volume of the reduced solution prepared previously by a suitable method (for example, using a suitable centrifugal filter unit with *tris(hydroxymethyl)aminomethane buffer solution pH 7.5 R1* as elution buffer), and adjust the concentration to 1 mg/mL with *tris(hydroxymethyl)aminomethane buffer solution pH 7.5 R1*. Prepare a 0.5 mg/mL solution of *trypsin for peptide mapping R*, and add 10 µL of the solution to 100 µL of the desalted solution. Incubate at 37 °C for 16 h. Add 2 µL of a 150 g/L solution of *trifluoroacetic acid R* and mix gently using a vortex mixer.

*NOTE: a protease/protein ratio of 1:20 (w/w) is recommended.*

Carry out the reduction/alkylation and digestion steps for the reference solution in the same manner as for the test solution.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm;
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: add 0.6 mL of *trifluoroacetic acid R* to 1000 mL of *water for chromatography R*; degas;
- *mobile phase B*: add 0.6 mL of *trifluoroacetic acid R* to a mixture of 100 mL of *water for chromatography R* and 900 mL of *acetonitrile R1*; degas;

Monographs 1

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 3 | 100 | 0 |
| 3 - 115 | 100 → 50 | 0 → 50 |
| 115 - 115.5 | 50 → 10 | 50 → 90 |
| 115.5 - 135 | 10 | 90 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Autosampler*: set at 2-8 °C.

*Injection*: 80 µL.

*Identification of peaks*: use the chromatogram supplied with *infliximab CRS* to identify peaks 1 to 20.

*System suitability*: reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *infliximab CRS* and peaks 1 to 20 are clearly visible;
- peaks 5 and 6 are separated as shown in the chromatogram supplied with *infliximab CRS*.

*Results*:

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution;
- no additional peak in the chromatogram obtained with the test solution has an area greater than 0.5 per cent of the sum of the areas of peaks 1 to 20.

TESTS

**pH** (*2.2.3*). As approved by the competent authority.

**Related proteins**. Capillary electrophoresis (*2.2.47*) under both reducing and non-reducing conditions.

*Sample buffer*. Dissolve 1 g of *sodium dodecyl sulfate R* in *tris(hydroxymethyl)aminomethane buffer solution pH 9.0 R1* and dilute to 100.0 mL with the same solution.

*Test solution*. Dilute the preparation to be examined with *water R* to obtain a concentration of 2 mg/mL. Mix 27 µL of this solution and 30 µL of sample buffer.

- *reducing conditions*: add 3 µL of *2-mercaptoethanol R* and incubate at 80 °C for 10 min; allow to cool for 5 min and transfer 60 µL to the autosampler vial;
- *non-reducing conditions*: add 3 µL of a 46.3 g/L solution of *iodoacetamide R* and incubate at 60-65 °C for 5 min; allow to cool for 5 min and transfer 60 µL to the autosampler vial.

*Reference solution*. Dissolve the contents of a vial of *infliximab CRS* in *water R* to obtain a concentration of 2 mg/mL. Mix 27 µL of the solution and 30 µL of sample buffer. Proceed at the same time and in the same manner as for the test solution.

*Capillary*:

- *material*: uncoated fused silica;
- *size*: total length = about 30 cm, effective length = 20 cm, Ø = 50 µm.

*Temperature*: 25 °C.

*Gel buffer*: use a formulation suitable for a sieving range of approximately 10-225 kDa.

*Acidic wash solution*: *dilute hydrochloric acid R3*.

*Basic wash solution*: 4 g/L solution of *sodium hydroxide R*.

*Detection*: spectrophotometer at 220 nm.

*Autosampler*: set at 25 °C.

*Preconditioning of the capillary*: rinse the capillary with the basic wash solution for 10 min at 138 kPa, with the acidic wash solution for 5 min at 138 kPa, with *water R* for 2 min at 138 kPa and with the gel buffer for 10 min at 483 kPa. Apply voltage for 10 min (15 kV reversed polarity).

*Between-run rinsing*: rinse the capillary with the basic wash solution for 3 min at 483 kPa, with the acidic wash solution for 1 min at 483 kPa, with *water R* for 1 min at 483 kPa and with the gel buffer for 10 min at 483 kPa.

*Injection*: electrokinetically at 5 kV reversed polarity for 20 s.

*Migration*: apply a voltage of 15 kV reversed polarity for 35 min using the gel buffer as the electrolyte in both buffer reservoirs.

*Migration time*:

- *reducing conditions*: light chain = 14 min to 17 min; non-glycosylated heavy chain = 17 min to 20 min; heavy chain = 18 min to 21 min;
- *non-reducing conditions*: intact IgG = 26 min to 32 min.

Calculate corrected areas of all peaks with a migration time greater than 11 min, using the following expression:

$$\frac{L_d \times A}{t}$$

$L_d$ = capillary length to detector;

$A$ = uncorrected peak area;

$t$ = migration time.

*System suitability*: reference solution:

- *reducing conditions*: the electropherogram obtained is qualitatively similar to the electropherogram supplied with *infliximab CRS*;
- *non-reducing conditions*: the electropherogram obtained is qualitatively similar to the electropherogram supplied with *infliximab CRS*.

*Result*:

- the profile of the electropherogram obtained with the test solution corresponds to that of the electropherogram obtained with the reference solution, except for minor peaks, that may be absent in the electropherogram obtained with the test solution.

Calculate individual peak areas expressed as a percentage of the sum of all corrected peak areas with a migration time greater than 11 min.

*Limits*:

*Reducing conditions*:

- *sum of all peaks other than heavy chain and light chain*: maximum 2 per cent;

*Non-reducing conditions*:

- *sum of all peaks other than the principal peak*: maximum 8 per cent.

**Impurities with molecular masses differing from that of infliximab**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution*. Dilute the preparation to be examined with the mobile phase to obtain a concentration of 8 mg/mL.

*Reference solution (a)*. Dissolve the contents of a vial of *infliximab CRS* in the mobile phase to obtain a concentration of 8 mg/mL.

*Reference solution (b)*. Reconstitute a mixture of thyroglobulin, gamma-globulin, ovalbumin, myoglobin and vitamin $B_{12}$ in *water R* to obtain an 18 mg/mL solution of molecular mass markers suitable for calibration in the range of 1350-670 000 Da. Further dilute 10 µL of the solution with *water for chromatography R* to obtain a concentration of 0.9 mg/mL.

*Column*:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5 µm) with a pore size of 25 nm and of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

*Mobile phase*. Dissolve 0.78 g of *anhydrous sodium dihydrogen phosphate R*, 1.92 g of *anhydrous disodium hydrogen phosphate R* and 8.77 g of *sodium chloride R* in 900 mL of *water for chromatography R* and dilute to 1000.0 mL with *water for chromatography R*; filter and degas.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Autosampler*: set at 10 °C.

*Injection*: 10 µL.

*Relative retention* with reference to infliximab monomer (retention time = about 8 min): high molecular weight species = about 0.88; low molecular weight species = about 1.28.

Calculate individual peak areas expressed as a percentage relative to the sum of all peak areas eluting between 5 min and 11 min. Individual relative per cent peak areas are calculated as the average of 3 injections.

*NOTE*: protein species that elute between 5 min and the monomer peak are classified as high molecular weight species, while those that elute after the monomer peak and before 11 min are classified as low molecular weight species.

*System suitability*:

- the chromatogram obtained with reference solution (a) is qualitatively similar to the chromatogram supplied with *infliximab CRS*;
- *resolution*: minimum 1.2 between the peaks due to gamma-globulin and ovalbumin in the chromatogram obtained with reference solution (b).

*Result*:

- the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with reference solution (a).

*Limit*:

- *sum of all peaks other than the monomer peak*: maximum 2 per cent.

ASSAY

**Protein** (*2.5.33, Method 1*).

*Test solution*. Dilute the preparation to be examined with a suitable buffer to obtain a concentration of about 1 mg/mL. Prepare and analyse each preparation in duplicate.

Record the UV spectrum between 280 nm and 350 nm. Measure the value at the absorbance maximum of 280 nm, after correction for any light scattering measured up to 350 nm. Calculate the protein content, taking the specific absorbance to be 14.5.

**Potency**. The potency of infliximab is determined by comparison of dilutions of the test preparation with dilutions of *infliximab BRP* using a suitable cell-based assay based on the inhibitory action of infliximab on the biological activity of TNF-α with a suitable readout for assessing this inhibitory effect.

*The following procedure is given as an example.*

Carry out a cell proliferation assay based on the ability of infliximab to block TNF-induced inhibition of murine fibrosarcoma WEHI-164 cell proliferation. The WEHI-164 cells (ATCC No. CRL-1751) are incubated with varying dilutions of test and reference preparations of infliximab in the presence of TNF-α. Cell growth is assessed by a staining method using the tetrazolium salt WST-8 ([2-(2-methoxy-4-nitrophenyl)-3-(4-nitrophenyl)-5-(2,4-disulfophenyl)-2*H*-tetrazolium, monosodium salt]), which is converted by cellular dehydrogenases to a coloured formazan product. The amount of released formazan is then measured spectrophotometrically and is directly proportional to the number of living cells.

*Assay medium*. RPMI 1640 containing 4.5 g/L *glucose R*, 1.5 g/L *sodium hydrogen carbonate R*, 0.11 g/L *sodium pyruvate R*, 2.4 g/L *HEPES R* (10 mM), 300 g/L *L-glutamine R*, heat-inactivated foetal bovine serum (10 per cent *V/V*) and a penicillin/streptomycin solution (1 per cent *V/V*) containing 10 000 U/mL of *benzylpenicillin sodium R* and 10 000 µg/mL of *streptomycin sulfate R* in an 8.5 g/L solution of *sodium chloride R*.

*Test solution*. Dilute the preparation to be examined with assay medium to obtain a concentration of about 640 ng/mL. Analyse in duplicate.

*Reference solution*. Reconstitute the contents of 1 ampoule of *infliximab BRP* with sterilised *water for injections R* to obtain a concentration of 500 IU/mL. Further dilute with assay medium to obtain a concentration of 6.4 IU/mL. Analyse in duplicate.

*TNF-α working solutions*. Dissolve the contents of a vial of TNF-α according to the supplier's instructions. Further dilute with assay medium to obtain 2 suitable working concentrations in the range of 400-50 000 pg/mL (working solution A and working solution B (dilution of A)). As the biological activity of TNF-α is likely to vary between different suppliers and also between different batches from the same supplier, this should be controlled by use of an appropriate standard (e.g. WHO International Standard for TNF-α).

*Method*.

*Plate preparation*. Add 150 µL of assay medium to the wells designated for 'cell only control' (columns 1-6, row H) and for blanks (columns 2-12, row A) on a 96-well microplate. Add 187.5 µL of TNF-α working solution A (column 1, row A) and further perform 5-fold dilutions (columns 2-12, row A) to generate the 'TNF-α control curve'. Add 100 µL of assay medium and 50 µL of TNF-α working solution B to the wells designated for 'cell + TNF-α control' (columns 7-12, row H). Add 100 µL of assay medium to the sample wells (columns 2-12, rows B-G) and 200 µL of the test or reference solutions (column 1, rows B-G). Further prepare a series of 2-fold dilutions (columns 2-12, rows B-G). Then, add 50 µL of TNF-α working solution B (columns 1-12, rows B-G). Incubate at 36.0-38.0 °C for 1 h in an incubator using 5 ± 2 per cent $CO_2$.

*Cell preparation*. Prepare a suspension of WEHI-164 cells containing $1 \times 10^6$ cells per millilitre, using assay medium containing 2 µg/mL of actinomycin D.

*Plating cells*. Add 50 µL of the cell suspension to each well maintaining the cells in a uniform suspension during addition. Incubate at 36.0-38.0 °C for 20-24 h in an incubator using 5 ± 2 per cent $CO_2$.

*Addition of tetrazolium salt*. Remove 100 µL of medium from each well, add 10 µL of reconstituted WST-8 mixture to each well and reincubate for 3-4 h. Estimate the quantity of formazan produced using a microtitre well plate reader at 450 nm and 650 nm. Subtract the reading at 650 nm from the reading at 450 nm.

Calculate the potency of the preparation to be examined using the four-parameter logistic curve model (see general chapter *5.3. Statistical analysis*).

*System suitability*:

- the 'TNF-α control curve' corresponds to a sigmoid curve;
- the coefficient of determination calculated for the 'TNF-α control curve' ($r^2$) is not less than 0.97;
- the standard curve corresponds to a sigmoid curve with upper and lower plateaus corresponding to 'cell only control' and 'cell + TNF-α control' respectively;
- the coefficient of determination calculated for the standard curve ($r^2$) is not less than 0.97;
- *maximum value (cell only) to minimum value (TNF-α control) ratio*: minimum 3.0.

Calculate the potency of the preparation to be examined using a suitable statistical method (see general chapter *5.3. Statistical analysis*).

*Result*: the estimated potency is not less than 80 per cent and not more than 120 per cent relative to the reference solution. The confidence limits ($P$ = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

In an airtight container, under approved conditions.

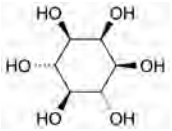
LABELLING

The label states the content in milligrams of protein per millilitre.

**07/2019:1805**

# *myo*-INOSITOL

## *myo*-Inositolum



$C_6H_{12}O_6$ $M_r$ 180.2
[87-89-8]

DEFINITION

Cyclohexane-1,2,3,5/4,6-hexol.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *myo-inositol CRS*.

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 10.0 g in *distilled water R* and dilute to 100.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**Conductivity** (*2.2.38*): maximum 30 µS·cm$^{-1}$.

Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, with gentle warming if necessary, and dilute to 50.0 mL with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.500 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 0.500 g of *myo-inositol CRS* in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)*. Dilute 2.0 mL of the test solution to 100.0 mL with *water R*. Dilute 5.0 mL of this solution to 100.0 mL with *water R*.

*Reference solution (c)*. Dissolve 0.5 g of *myo-inositol R* and 0.5 g of *mannitol R* in *water R* and dilute to 10 mL with the same solvent.

*Column*:

- *size*: *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);
- *temperature*: 85 ± 2 °C.

*Mobile phase*: *water for chromatography R*.

*Flow rate*: 0.5 mL/min.

*Detection*: differential refractometer maintained at a constant temperature (e.g. 35 °C).

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: twice the retention time of *myo*-inositol.

*Relative retention* with reference to *myo*-inositol (retention time = about 17.5 min): impurity A = about 1.3; impurity B = about 1.4.

*System suitability*: reference solution (c):

- *resolution*: minimum 4.0 between the peaks due to *myo*-inositol and impurity A.

*Limits*:

- *impurities A, B*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

ASSAY

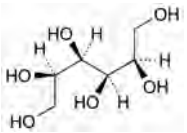
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

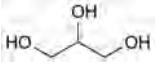
Calculate the percentage content of $C_6H_{12}O_6$ taking into account the assigned content of *myo-inositol CRS*.

IMPURITIES

*Specified impurities: A, B.*



A. D-mannitol,

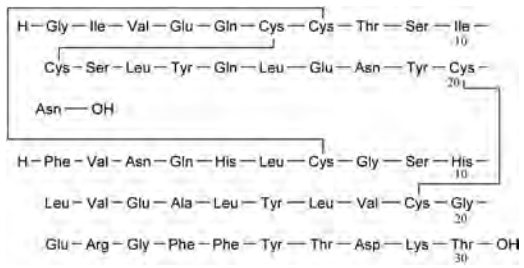


B. propane-1,2,3-triol (glycerol).

**01/2008:2084**
**corrected 10.0**

# INSULIN ASPART

## Insulinum aspartum



$C_{256}H_{381}N_{65}O_{79}S_6$ $M_r$ 5826

DEFINITION

$28^B$-L-Aspartate insulin (human).

Insulin aspart is a 2-chain peptide containing 51 amino acids. The A-chain is composed of 21 amino acids and the B-chain is composed of 30 amino acids. It is identical in primary structure to human insulin, except that it has aspartic acid instead of proline at position 28 of the B-chain. As in human insulin, insulin aspart contains 2 interchain disulfide bonds and 1 intrachain disulfide bond.

*Content*: 90.0 per cent to 104.0 per cent of insulin aspart $C_{256}H_{381}N_{65}O_{79}S_6$ plus A21Asp insulin aspart, B3Asp insulin aspart, B3isoAsp insulin aspart and B28isoAsp insulin aspart (dried substance).

By convention, for the purpose of labelling insulin aspart preparations, 0.0350 mg of insulin aspart is equivalent to 1 unit.

PRODUCTION

Insulin aspart is produced by a method based on recombinant DNA (rDNA) technology under conditions designed to minimise the degree of microbial contamination.

Prior to release, the following tests are carried out on each batch of insulin aspart, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Single-chain precursor**. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in ethanol (96 per cent), in methanol and in aqueous solutions with a pH around 5.1. In aqueous solutions below pH 3.5 or above pH 6.5, the solubility is greater than or equal to 25 mg/mL.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. Peptide mapping (*2.2.55*).

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Test solution.* Prepare a 2.0 mg/mL solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 25 µL of this solution to a clean tube. Add 100 µL of *HEPES buffer solution pH 7.5 R* and 20 µL of a 1 mg/mL solution of *Staphylococcus aureus strain V8 protease, type XVII-B R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 145 µL of *sulfate buffer solution pH 2.0 R*.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution, but using *insulin aspart CRS* instead of the substance to be examined.

*CHROMATOGRAPHIC SEPARATION.* Liquid chromatography (*2.2.29*).

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: mix 100 mL of *acetonitrile for chromatography R*, 200 mL of *sulfate buffer solution pH 2.0 R* and 700 mL of *water R*; filter and degas;
- *mobile phase B*: mix 200 mL of *sulfate buffer solution pH 2.0 R*, 400 mL of *acetonitrile for chromatography R* and 400 mL of *water R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 90 → 30 | 10 → 70 |
| 60 - 65 | 30 → 0 | 70 → 100 |
| 65 - 70 | 0 | 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Equilibration*: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

*Injection*: 50 µL.

*System suitability*:

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of insulin aspart digest supplied with *insulin aspart CRS*,
- in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III:

  *symmetry factor*: maximum 1.5, for the peaks due to fragments II and III,

  *resolution* minimum 8.0, between the peaks due to fragments II and III.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*NOTE: the retention times of fragments I, II and IV are the same as for human insulin. The retention time of fragment III differs from human insulin due to substitution of proline by aspartic acid.*

TESTS

**Impurities with molecular masses greater than that of insulin aspart**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution.* Prepare a solution containing 4 mg/mL of the substance to be examined in *0.01 M hydrochloric acid*. Maintain the solution at 2-8 °C and use within 48 h.

*Resolution solution.* Use a solution of insulin (about 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid* may be used. Insulin containing the indicated percentage of

Monographs

high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days. Maintain the solution at 2-8 °C and use within 7 days.

*Column*:

– *size*: *l* = 0.3 m, Ø = 7.8 mm,

– *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm) with a pore size of 12-12.5 nm, of a grade suitable for the separation of insulin monomer from dimer and polymers.

*Mobile phase*: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile for chromatography R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Equilibration*: at least 3 injections of the resolution solution; the column is equilibrated when repeatable results are obtained from 2 subsequent injections.

*Injection*: 100 µL.

*Run time*: about 35 min.

*Retention time*: insulin aspart polymers = 13-17 min; insulin aspart dimer = about 17.5 min; insulin aspart monomer = about 20 min; salts = about 22 min.

*System suitability*: resolution solution:

– *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the dimer and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

*Limits*: the sum of the areas of the peaks with a retention time less than that of the principal peak is not more than 0.5 per cent of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin aspart monomer.

**Related proteins**. Liquid chromatography (*2.2.29*) as described under Assay: use the normalisation procedure.

*Limits*:

– *B28isoAsp insulin aspart*: maximum 1.0 per cent,

– *total of the peaks due to A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart*: maximum 2.0 per cent,

– *total of other impurities*: maximum 1.5 per cent.

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

**Sulfated ash** (*2.4.14*): maximum 6.0 per cent, determined on 0.200 g (dried substance).

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL. Maintain the solution at 2-8 °C and use within 24 h.

*Reference solution*. Dissolve the contents of a vial of *insulin aspart CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL. Maintain the solution at 2-8 °C and use within 48 h.

*Resolution solution*. Use an appropriate solution with a content of B3Asp insulin aspart and A21Asp insulin aspart of not less than 1 per cent. This may be achieved by storing reference solution at room temperature for about 1-3 days. Maintain the solution at 2-8 °C and use within 72 h.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),

– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: dissolve 142.0 g of *anhydrous sodium sulfate R* in *water R*; add 13.5 mL of *phosphoric acid R* and dilute to 5000 mL with *water R*; adjust to pH 3.6, if necessary, with *strong sodium hydroxide solution R*; filter and degas; mix 9 volumes of the solution with 1 volume of *acetonitrile for chromatography R*; filter and degas;

– *mobile phase B*: mix equal volumes of *water R* and *acetonitrile for chromatography R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 35 | 58 | 42 |
| 35 - 40 | 58 → 20 | 42 → 80 |
| 40 - 45 | 20 | 80 |
| 45 - 46 | 20 → 58 | 80 → 42 |
| 46 - 60 | 58 | 42 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 10 µL.

*Relative retention* with reference to insulin aspart (retention time = 20-24 min): B28isoAsp insulin aspart = about 0.9; B3Asp insulin aspart plus A21Asp insulin aspart (generally coeluted) = about 1.3; B3isoAsp insulin aspart = about 1.5.

*System suitability*: resolution solution:

– *resolution*: minimum 2.0 between the peak due to insulin aspart and the peak due to A21Asp insulin aspart and to B3Asp insulin aspart.

Calculate the content of insulin aspart $C_{256}H_{381}N_{65}O_{79}S_6$, plus B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart using the areas of the corresponding peaks in the chromatograms obtained with the test solution and reference solution and the declared content of insulin aspart plus B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart in *insulin aspart CRS*.

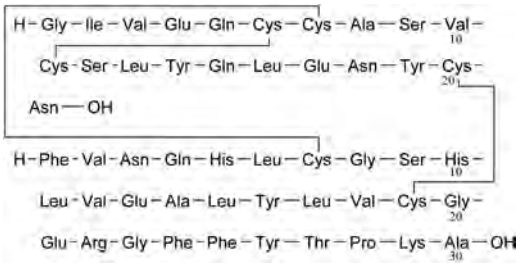
STORAGE

In an airtight container, protected from light, at or below − 18 °C until released by the manufacturer. When thawed, insulin aspart is stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, insulin aspart must be at room temperature before opening the container.

**01/2008:1637**
**corrected 10.0**

# INSULIN, BOVINE

## Insulinum bovinum



$C_{254}H_{377}N_{65}O_{75}S_6$ $M_r$ 5734

DEFINITION

Bovine insulin is the natural antidiabetic principle obtained from beef pancreas and purified.

*Content*:

– *sum of bovine insulin ($C_{254}H_{377}N_{65}O_{75}S_6$) and A21 desamido bovine insulin*: 93.0 per cent to 105.0 per cent (dried substance).

By convention, for the purpose of labelling insulin preparations, 0.0342 mg of bovine insulin is equivalent to 1 IU of insulin.

PRODUCTION

The animals from which bovine insulin is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

*Results*: the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with reference solution (c).

B. Peptide mapping

*Test solution.* Prepare a 2.0 mg/mL solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µL of this solution to a clean tube. Add 2.0 mL of *HEPES buffer solution pH 7.5 R* and 400 µL of a 1 mg/mL solution of *Staphylococcus aureus strain V8 protease, type XVII-B R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 mL of *sulfate buffer solution pH 2.0 R*.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution but using *bovine insulin CRS* instead of the substance to be examined.

Examine the digests by liquid chromatography (*2.2.29*).

*Column*:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);

– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: mix 100 mL of *acetonitrile for chromatography R*, 700 mL of *water for chromatography R* and 200 mL of *sulfate buffer solution pH 2.0 R*; filter and degas;

– *mobile phase B*: mix 400 mL of *acetonitrile for chromatography R*, 400 mL of *water for chromatography R* and 200 mL of *sulfate buffer solution pH 2.0 R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 90 → 30 | 10 → 70 |
| 60 - 65 | 30 → 0 | 70 → 100 |
| 65 - 70 | 0 | 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Equilibration*: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

*Injection*: 50 µL.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of bovine insulin digest supplied with *bovine insulin CRS*. In the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III. The symmetry factor of the peaks due to fragments II and III is not greater than 1.5, and the resolution between the 2 peaks is at least 1.9.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*NOTE: The retention time of fragment I is the same for porcine insulin and for human insulin. The retention times of fragments II and IV are the same for all insulins. The retention time of fragment III is the same for bovine insulin and for porcine insulin.*

TESTS

**Impurities with molecular masses greater than that of insulin**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure. *Maintain the solutions at 2-10 °C and use within 7 days. If an automatic injector is used, maintain the temperature at 2-10 °C.*

*Test solution.* Dissolve 4 mg of the substance to be examined in 1.0 mL of *0.01 M hydrochloric acid*.

*Resolution solution.* Use a solution of insulin (approximately 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days.

*Column*:

– *size*: *l* = 0.3 m, Ø = at least 7.5 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm), of a grade suitable for the separation of insulin monomer from dimer and polymers.

*Mobile phase*: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Equilibration*: before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least 3 injections of the resolution solution. The column is equilibrated when repeatable results are obtained from 2 subsequent injections.

*Injection*: 100 µL.

*Run time*: about 35 min.

*Retention times*: polymeric insulin complexes = 13 min to 17 min; covalent insulin dimer = about 17.5 min; insulin monomer = about 20 min; salts = about 22 min.

*System suitability*: resolution solution:

– *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the dimer and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

*Limits*: the sum of the areas of any peaks with a retention time less than that of the principal peak is not greater than 1.0 per cent of the total area of the peaks; disregard any peak with a retention time greater than that of the insulin peak.

**Related proteins**. Liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below.

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 42 | 58 |
| 30 - 44 | 42 → 11 | 58 → 89 |
| 44 - 50 | 11 | 89 |

*Maintain the solutions at 2-10 °C and use within 24 h.* Perform a system suitability test (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µL of reference solution (c) and 20 µL of the test solution. If necessary, adjust the injection volume to between 10 µL and 20 µL in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. In the chromatogram obtained with reference solution (c), A21 desamido bovine insulin appears as a small peak after the principal peak and has a relative retention of about 1.3 with reference to the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to A21 desamido bovine insulin is not greater than 3.0 per cent of the total area of the peaks; the sum of the areas of all the peaks, apart from those due to bovine insulin and A21 desamido bovine insulin, is not greater than 3.0 per cent of the total area of the peaks.

**Bovine proinsulin-like immunoreactivity (PLI)**: maximum 10 ppm (dried substance).

Use a suitably sensitive immunochemical method (*2.7.1*) such as radio-immunoassay, using the International Reference Reagent for bovine proinsulin to calibrate the method.

**Zinc**: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 mL with the same acid. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

*Reference solutions.* Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Flame*: air-acetylene flame of suitable composition (for example, 11 L of air and 2 L of acetylene per minute).

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

**Sulfated ash** (*2.4.14*): maximum 2.5 per cent, determined on 0.200 g (dried substance).

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve a suitable amount of the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (a).* Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (b).* Dissolve the contents of a vial of *insulin porcine for system suitability CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4 mg/mL.

*Reference solution (c).* Dissolve the contents of a vial of *bovine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (d).* Dilute 1.0 mL of reference solution (c) to 10.0 mL with *0.01 M hydrochloric acid*.

*Resolution solution.* Mix 1.0 mL of reference solution (a) and 1.0 mL of reference solution (b).

Maintain the solutions at 2-10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2-10 °C.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mix 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusting the composition of the mixture if necessary.

Prepare and maintain the following solutions at a temperature of at least 20 °C:

- *mobile phase A*: dissolve 28.4 g of *anhydrous sodium sulfate R* in *water for chromatography R* and dilute to 1000 mL with the same solvent; add 2.7 mL of *phosphoric acid R*; adjust to pH 2.3, if necessary, with *ethanolamine R*; filter and degas;
- *mobile phase B*: mix 550 mL of mobile phase A with 450 mL of *acetonitrile R*; warm the solution to a temperature of at least 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*System suitability*:

- *resolution*: inject 20 µL of the resolution solution and 20 µL of reference solution (b). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved;
- *linearity*: inject 20 µL each of reference solutions (c) and (d). The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (c) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d). If this test fails, adjust the injection volume to between 10 µL and 20 µL, in order that the responses are within the linearity range of the detector.

*Injection*: 20 µL of the test solution.

Calculate the content of bovine insulin $C_{254}H_{377}N_{65}O_{75}S_6$ plus A21 desamido bovine insulin from the area of the principal peak and the area of the peak due to A21 desamido bovine insulin in the chromatograms obtained with the test solution and reference solution (c) and the declared content of bovine insulin plus A21 desamido bovine insulin in *bovine insulin CRS*.

STORAGE

In an airtight container, protected from light, at – 20 °C until released by the manufacturer. When thawed, insulin may be stored at 5 ± 3 °C and used for manufacturing preparations

within a short period of time. To avoid absorption of humidity from the air during weighing, the insulin must be at room temperature.

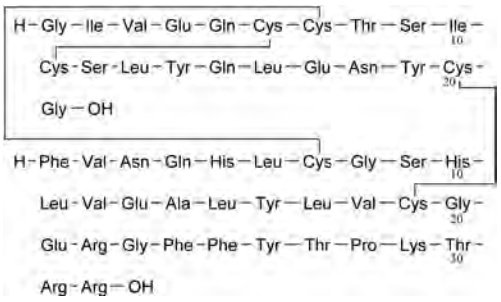
**corrected 10.0**

# INSULIN GLARGINE

## Insulinum glarginum



$C_{267}H_{404}N_{72}O_{78}S_6$ $M_r$ 6063

DEFINITION

21$^A$-Glycine-30$^B$a-L-arginine-30$^B$b-L-arginine-insulin (human).

2-chain peptide containing 53 amino acids. The A-chain is composed of 21 amino acids and the B-chain is composed of 32 amino acids. It is identical in primary structure to human insulin, only differing in amino acid sequence at position 21 in the A-chain and at the C-terminal end of the B-chain where it contains 2 additional amino acids. Human insulin is Asn(A21), whereas insulin glargine is Gly(A21), Arg(B31), Arg(B32). As in human insulin, insulin glargine contains 2 interchain disulfide bonds and 1 intrachain disulfide bond.

*Content*: 94.0 per cent to 105.0 per cent (anhydrous substance).

By convention, for the purpose of labelling insulin glargine preparations, 0.0364 mg of insulin glargine is equivalent to 1 unit.

PRODUCTION

Insulin glargine is produced by a method based on recombinant DNA (rDNA) technology under conditions designed to minimise the degree of microbial contamination.

Prior to release, the following tests are carried out on each batch of insulin glargine, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Single-chain precursor**. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: practically insoluble in water and in anhydrous ethanol, soluble in dilute mineral acids.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

B. Peptide mapping (*2.2.55*).

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Test solution.* Prepare a 10.0 mg/mL solution of the substance to be examined in a 1 g/L solution of *hydrochloric acid R* and transfer 5 µL of the solution to a clean tube. Add 1.0 mL of *1 M tris-hydrochloride buffer solution pH 7.5 R* and 100 µL of a 20 U/mL solution of *Staphylococcus aureus strain V8 protease, type XVII-B R* in *1 M tris-hydrochloride buffer solution pH 7.5 R*. Mix and incubate at 45 °C for about 2 h. Stop the reaction by adding 2 µL of *phosphoric acid R*.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution but using *insulin glargine CRS* instead of the substance to be examined.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Buffer solution.* Dissolve 11.6 g of *phosphoric acid R* and 42.1 g of *sodium perchlorate R* in 1600 mL of *water for chromatography R*, adjust to pH 2.3 with *triethylamine R* and dilute to 2000 mL with *water for chromatography R*.

*Column*:

- *size*: *l* = 0.125 m, Ø = 3.0 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (4 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: *acetonitrile R1*, buffer solution (7:93 *V/V*);
- *mobile phase B*: buffer solution, *acetonitrile R1* (43:57 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 90 → 20 | 10 → 80 |
| 30 - 35 | 20 | 80 |

*Flow rate*: 0.6 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Equilibration*: at initial conditions for at least 15 min.

*Injection*: 50 µL.

*Retention time*: insulin glargine fragment II = about 14 min; insulin glargine fragment III = about 15 min.

*System suitability*:

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of insulin glargine digest supplied with *insulin glargine CRS*;
- in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments II and III:

  *symmetry factor*: maximum 1.5 for the peaks due to fragments II and III;

  *resolution*: minimum 3.4 between the peaks due to fragments II and III.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*NOTE: the retention times of fragments I and IV are the same as for human insulin; the retention times of fragments II and III differ from human insulin due to the difference in the sequence at position 21 of the A-chain and to the 2 additional amino acids of the B-chain.*

TESTS

**Impurities with molecular masses greater than that of insulin glargine**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution.* Prepare a 4 mg/mL solution of the substance to be examined in a 1 g/L solution of *hydrochloric acid R*.

*Resolution solution.* Dry about 200 mg of the substance to be examined in an oven at 100 °C for 1.5-3 h. Dissolve 15.0 mg of the dried substance in 1.5 mL of a 1 g/L solution of *hydrochloric acid R* and dilute to 10.0 mL with *water R*.

*Reference solution.* Dilute 1.0 mL of the test solution to 100.0 mL with *water R*. Dilute 3.0 mL of this solution to 20.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* (10 µm) with a pore size of 12.5 nm, of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 5000 to 150 000.

*Mobile phase*: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Injection*: 100 µL.

*Run time*: about 35 min.

*Retention time*: insulin glargine = about 18 min.

*System suitability*:

- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with the reference solution;
- *symmetry factor*: maximum 2.0 for the peak due to insulin glargine in the chromatogram obtained with the resolution solution;
- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to high molecular mass proteins and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to insulin glargine in the chromatogram obtained with the resolution solution.

*Limits*:

- *total of impurities with a retention time less than that of insulin glargine*: maximum 0.3 per cent of the total area of the peaks; disregard any peak with a retention time greater than that of the peak due to insulin glargine.

**Related proteins**. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Maintain the solutions at 2-8 °C.*

*Test solution.* Dissolve 15.0 mg of the substance to be examined in 1.5 mL of a 1 g/L solution of *hydrochloric acid R* and dilute to 10.0 mL with *water R*.

*Reference solution.* Dissolve the contents of a vial of *insulin glargine CRS* in 1.5 mL of a 1 g/L solution of *hydrochloric acid R*, transfer the solution with *water R* to a 10 mL volumetric flask and dilute to 10.0 mL with *water R*.

*Resolution solution.* Dissolve the contents of a vial of *insulin glargine for peak identification CRS* (containing $0^A$-Arg-insulin glargine) in 0.3 mL of a 1 g/L solution of *hydrochloric acid R* and add 1.7 mL of *water R*.

*Buffer solution.* Dissolve 20.7 g of *anhydrous sodium dihydrogen phosphate R* in 900 mL of *water for chromatography R*, adjust to pH 2.5 with *phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 3.0 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (4 µm);
- *temperature*: 35 °C.

*Mobile phase*:

- *mobile phase A*: dissolve 18.4 g of *sodium chloride R* in 250 mL of the buffer solution, add 250 mL of *acetonitrile R1* and mix; dilute to 1000 mL with *water for chromatography R*;
- *mobile phase B*: dissolve 3.2 g of *sodium chloride R* in 250 mL of the buffer solution, add 650 mL of *acetonitrile R1* and mix; dilute to 1000 mL with *water for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 96 → 83 | 4 → 17 |
| 20 - 30 | 83 → 63 | 17 → 37 |
| 30 - 33 | 63 → 96 | 37 → 4 |
| 33 - 40 | 96 | 4 |

*Flow rate*: 0.6 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 5 µL of the test solution and the resolution solution.

*Retention time*: insulin glargine = about 20 min.

*System suitability*: resolution solution:

- *peak-to-valley ratio*: minimum 2, where $H_p$ = height above the baseline of the peak due to $0^A$-Arg-insulin glargine and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to insulin glargine.

*Limits*:

- *any impurity*: for each impurity, maximum 0.4 per cent;
- *total*: maximum 1.0 per cent.

**Zinc**: maximum 0.80 per cent.

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 45.0 mg of the substance to be examined in a 1 g/L solution of *hydrochloric acid R* and dilute to 50.0 mL with the same solution. Dilute 10.0 mL of the solution to 100.0 mL with a 1 g/L solution of *hydrochloric acid R*.

*Reference solutions.* Prepare reference solutions containing 0.2 µg, 0.4 µg and 0.6 µg of zinc per millilitre by diluting *zinc standard solution (10 ppm Zn) R* with a 1 g/L solution of *hydrochloric acid R*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Atomisation device*: air-acetylene flame of suitable composition (for example, 11 L of air and 2 L of acetylene per minute).

**Water** (*2.5.32*): maximum 8.0 per cent, determined on 30.0 mg.

**Bacterial endotoxins** (*2.6.14, Method D*): less than 10 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related proteins with the following modification.

*Injection*: 5 µL of the test solution and the reference solution.

Calculate the content of insulin glargine ($C_{267}H_{404}N_{72}O_{78}S_6$) taking into account the assigned content of *insulin glargine CRS*.

STORAGE

In an airtight container, protected from light, at a temperature of − 20 ± 5 °C.

**01/2011:0838**
**corrected 10.0**

# INSULIN, HUMAN

## Insulinum humanum

$C_{257}H_{383}N_{65}O_{77}S_6$ $M_r$ 5808

DEFINITION

Human insulin is a 2-chain peptide having the structure of the antidiabetic hormone produced by the human pancreas.

*Content*: 95.0 per cent to 105.0 per cent of human insulin $C_{257}H_{383}N_{65}O_{77}S_6$ plus A21 desamido human insulin (dried substance).

By convention, for the purpose of labelling insulin preparations, 0.0347 mg of human insulin is equivalent to 1 IU of insulin.

PRODUCTION

Human insulin is produced either by enzymatic modification and suitable purification of insulin obtained from the pancreas of the pig or by a method based on recombinant DNA (rDNA) technology.

Where applicable, the animals from which human insulin is derived must fulfil the requirements for the health of animals suitable for human consumption.

Human insulin is produced under conditions designed to minimise the degree of microbial contamination.

For human insulin produced by enzymatic modification of insulin obtained from the pancreas of the pig, the manufacturing process is validated to demonstrate removal of any residual proteolytic activity. The competent authority may require additional tests.

For human insulin produced by a method based on rDNA technology, prior to release the following tests are carried out on each batch of human insulin, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Single chain precursor**. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.
*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. Peptide mapping (*2.2.55*).
*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*
*Test solution.* Prepare a 2.0 mg/mL solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µL of this solution to a clean tube. Add 2.0 mL of *HEPES buffer solution pH 7.5 R* and 400 µL of a 1 mg/mL solution of *Staphylococcus aureus strain V8 protease, type XVII-B R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 mL of *sulfate buffer solution pH 2.0 R*.
*Reference solution.* Prepare at the same time and in the same manner as for the test solution but using *human insulin CRS* instead of the substance to be examined.
*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).
*Column*:
– *size*: *l* = 0.10 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm;
– *temperature*: 40 °C.
*Mobile phase*:
– *mobile phase A*: mix 100 mL of *acetonitrile for chromatography R*, 200 mL of *sulfate buffer solution pH 2.0 R* and 700 mL of *water R*; filter and degas;
– *mobile phase B*: mix 200 mL of *sulfate buffer solution pH 2.0 R*, 400 mL of *acetonitrile for chromatography R* and 400 mL of *water R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 90 → 30 | 10 → 70 |
| 60 - 65 | 30 → 0 | 70 → 100 |
| 65 - 70 | 0 | 100 |

*Flow rate*: 1 mL/min.
*Detection*: spectrophotometer at 214 nm.
*Equilibration*: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.
*Injection*: 50 µL.
*System suitability*:
– the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of human insulin digest supplied with *human insulin CRS*;
– in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III;
*symmetry factor*: maximum 1.5 for the peaks due to fragments II and III;
*resolution*: minimum 3.4 between the peaks due to fragments II and III;
*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.
*NOTE: the retention time of fragment I is the same for porcine insulin and for human insulin. The retention times of fragments II and IV are the same for all insulins. The retention time of fragment III is the same for bovine insulin and for porcine insulin.*

TESTS

**Impurities with molecular masses greater than that of insulin**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.
*Test solution.* Prepare a solution containing 4 mg/mL of the substance to be examined in *0.01 M hydrochloric acid*.
*Resolution solution.* Use a solution of insulin (about 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated

Monographs 1

percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days.

Maintain the solutions at 2-8 °C and use within 7 days. If an automatic injector is used, maintain the temperature at 2-8 °C.

*Column*:

- *size*: *l* = 0.3 m, Ø = minimum 7.5 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm) with a pore size of 12-12.5 nm, of a grade suitable for the separation of insulin monomer from dimer and polymers.

*Mobile phase*: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Equilibration*: before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least 3 injections of the resolution solution. The column is equilibrated when repeatable results are obtained from 2 subsequent injections.

*Injection*: 100 µL.

*Run time*: about 35 min.

*Retention time*: polymeric insulin complexes = 13-17 min; covalent insulin dimer = about 17.5 min; insulin monomer = about 20 min; salts = about 22 min.

*System suitability*: resolution solution:

- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the dimer and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

*Limits*: the sum of the areas of any peaks with a retention time less than that of the principal peak is not greater than 1.0 per cent of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin.

**Related proteins**. Liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described below:

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 42 | 58 |
| 30 - 44 | 42 → 11 | 58 → 89 |
| 44 - 50 | 11 | 89 |

Maintain the solutions at 2-8 °C and use within 24 h. Perform a system suitability test (resolution, linearity) as described in the assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µL of reference solution (a), 20 µL of reference solution (b), 20 µL of reference solution (c) and 20 µL of the test solution. If necessary, adjust the injection volume to a volume between 10 µL and 20 µL in accordance with the results obtained in the test for linearity as described in the assay. Record the chromatograms for approximately 50 min. In the chromatogram obtained with reference solution (a), A21 desamido human insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to A21 desamido human insulin is not greater than 2.0 per cent of the total area of the peaks; the sum of the areas of all peaks, apart from those due to human insulin and that due to A21 desamido human insulin, is not greater than 2.0 per cent of the total area of the peaks. For semi-synthetic human insulin only: in the chromatogram obtained with the test solution, the area of any peak corresponding to the peak due to porcine insulin in the chromatogram obtained with reference solution (c) is not greater than 1.0 per cent of the total area of the peaks.

*The following test applies only to human insulin produced by enzymatic modification of porcine insulin.*

**Proinsulin-like immunoreactivity (PLI)**: maximum 10 ppm, calculated with reference to the dried substance and determined by a suitably sensitive immunochemical method (*2.7.1*) such as radio-immunoassay. Use the International Reference Reagent for porcine proinsulin to calibrate the method.

**Zinc**: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 mL with the same acid. Dilute if necessary to a suitable concentration (for example, 0.4-1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

*Reference solutions.* Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Atomisation device*: air-acetylene flame of suitable composition (for example, 11 L of air and 2 L of acetylene per minute).

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

**Sulfated ash** (*2.4.14*): maximum 2.5 per cent, determined on 0.200 g (dried substance).

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 40.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (b).* Dissolve the contents of a vial of *insulin porcine for system suitability CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4 mg/mL.

*Reference solution (c).* Dilute 1.0 mL of reference solution (b) to 50.0 mL with *0.01 M hydrochloric acid.* To 1.0 mL of this solution add 1.0 mL of reference solution (a).

*Reference solution (d).* Dilute 1.0 mL of reference solution (a) to 10.0 mL with *0.01 M hydrochloric acid.*

*Resolution solution.* Mix 1.0 mL of reference solution (a) and 1.0 mL of reference solution (b).

Maintain the solutions at 2-8 °C and use within 48 h. If an automatic injector is used, maintain at 2-8 °C.

*Column*:

- *size*: *l* = 0.25, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mix 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusting the composition of the mixture if necessary.

Prepare and maintain the following solutions at a temperature of at least 20 °C:

– *mobile phase A*: dissolve 28.4 g of *anhydrous sodium sulfate R* in *water R* and dilute to 1000 mL with the same solvent; add 2.7 mL of *phosphoric acid R*; adjust to pH 2.3, if necessary, with *ethanolamine R*; filter and degas;
– *mobile phase B*: mix 550 mL of mobile phase A with 450 mL of *acetonitrile R*. Warm the solution to a temperature of at least 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*System suitability*:

– *resolution*: inject 20 µL of the resolution solution and 20 µL of reference solution (b). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.
– *linearity*: inject 20 µL each of reference solutions (a) and (d). The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (a) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d). If this test fails, adjust the injection volume to between 10 µL and 20 µL, in order that the responses are within the linearity range of the detector.

*Injection*: 20 µL of the test solution and reference solution (a).

Calculate the content of human insulin $C_{257}H_{383}N_{65}O_{77}S_6$ plus A21 desamido human insulin using the areas of the corresponding peaks in the chromatograms obtained with the test solution and reference solution (a) and the declared content of human insulin plus A21 desamido human insulin in *human insulin CRS*.

STORAGE

In an airtight container, protected from light, at – 18 °C or below, until released by the manufacturer. When thawed, insulin is stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, the insulin must be at room temperature.

LABELLING

The label states whether the substance is produced by enzymatic modification of porcine insulin or by rDNA technology.

**01/2008:0831**
**corrected 6.0**

# INSULIN INJECTION, BIPHASIC

## Insulinum biphasicum iniectabile

*Biphasic insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.*

DEFINITION

Biphasic insulin injection is a sterile suspension of crystals containing bovine insulin in a solution of porcine insulin.

CHARACTERS

A white or almost white suspension. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals, with a maximum dimension measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The position of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS

**pH** (*2.2.3*). The pH of the suspension to be examined is 6.6 to 7.2.

**Insulin in the supernatant**: 22.0 per cent to 28.0 per cent of insulin in solution. Determine by the method described in the test for insulin in the supernatant in the monograph on *Insulin preparations, injectable (0854)*.

**Total zinc**: 26.0 µg to 37.5 µg per 100 IU of insulin. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

**01/2008:0832**
**corrected 6.0**

# INSULIN INJECTION, BIPHASIC ISOPHANE

## Insulinum isophanum biphasicum iniectabile

*Biphasic isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the exception of the test for Insulin in the supernatant and with the amendments prescribed below for the other tests.*

DEFINITION

Biphasic isophane insulin injection is a sterile buffered suspension of either porcine or human insulin, complexed with protamine sulfate or another suitable protamine, in a solution of insulin of the same species.

PRODUCTION

Biphasic isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

Biphasic isophane insulin injection is produced by mixing, in defined ratios, soluble insulin injection and isophane insulin injection. The defined ratios shall be demonstrated by a test method which has been approved by the competent authority to comply with the label claim.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

**Total zinc**. Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

LABELLING

The label states in addition to the indications mentioned in the monograph on *Insulin preparations, injectable (0854)* the ratio of soluble insulin injection to isophane insulin injection used in the manufacturing process of biphasic isophane insulin injection.

**01/2008:0833**
**corrected 6.0**

# INSULIN INJECTION, ISOPHANE

## Insulinum isophanum iniectabile

*Isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the modifications prescribed below.*

DEFINITION

Isophane insulin injection is a sterile suspension of bovine, porcine or human insulin, complexed with protamine sulfate or another suitable protamine.

PRODUCTION

Isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

The amount of protamine is based on the known isophane ratio and is not less than the equivalent of 0.3 mg and not more than the equivalent of 0.6 mg of protamine sulfate for each 100 IU of insulin in the insulin-protamine complex.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

**Total zinc**. Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

**01/2008:0834**

# INSULIN INJECTION, SOLUBLE

## Insulinum solubile iniectabile

*Soluble insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.*

DEFINITION

Soluble insulin injection is a neutral, sterile solution of bovine, porcine or human insulin.

CHARACTERS

A colourless liquid, free from turbidity and foreign matter; during storage, traces of a very fine sediment may be deposited.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

**Total zinc**. Not more than 40.0 µg per 100 IU of insulin.

Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

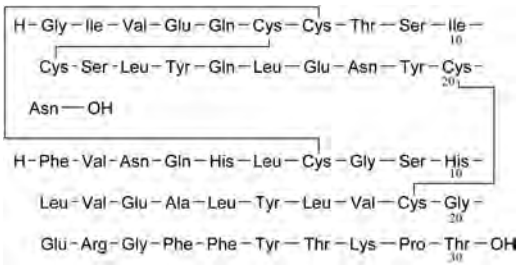
*Use the following test solution.*

*Test solution.* Dilute a volume of the gently shaken preparation containing 200 IU to 25.0 mL with *water R*. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

**01/2008:2085**
**corrected 10.0**

# INSULIN LISPRO

## Insulinum lisprum



$C_{257}H_{383}N_{65}O_{77}S_6$ $M_r$ 5808

DEFINITION

$28^B$-L-Lysine-$29^B$-L-proline insulin (human).

Insulin lispro is a 2-chain peptide containing 51 amino acids. The A-chain is composed of 21 amino acids and the B-chain is composed of 30 amino acids. It is identical in primary structure to human insulin, only differing in amino acid sequence at positions 28 and 29 of the B-chain. Human insulin is Pro(B28), Lys(B29), whereas insulin lispro is Lys(B28), Pro(B29). As in human insulin, insulin lispro contains 2 interchain disulfide bonds and 1 intrachain disulfide bond.

*Content*: 94.0 per cent to 104.0 per cent (dried substance).

By convention, for the purpose of labelling insulin lispro preparations, 0.0347 mg of insulin lispro is equivalent to 1 unit.

PRODUCTION

Insulin lispro is produced by a method based on recombinant DNA (rDNA) technology under conditions designed to minimise the degree of microbial contamination.

Prior to release, the following tests are carried out on each batch of insulin lispro, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Single-chain precursor**. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

B. Peptide mapping (*2.2.55*).

*SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS*

*Test solution*. Prepare a 2.0 mg/mL solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µL of this solution to a clean tube. Add 2.0 mL of *HEPES buffer solution pH 7.5 R* and 400 µL of a 1 mg/mL solution of *Staphylococcus aureus strain V8 protease, type XVII-B R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 mL of *sulfate buffer solution pH 2.0 R*.

*Reference solution*. Prepare at the same time and in the same manner as for the test solution but using *insulin lispro CRS* instead of the substance to be examined.

*CHROMATOGRAPHIC SEPARATION*. Liquid chromatography (*2.2.29*).

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: mix 100 mL of *acetonitrile for chromatography R*, 200 mL of *sulfate buffer solution pH 2.0 R* and 700 mL of *water R*; filter and degas;
- *mobile phase B*: mix 200 mL of *sulfate buffer solution pH 2.0 R*, 400 mL of *acetonitrile for chromatography R* and 400 mL of *water R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 90 → 30 | 10 → 70 |
| 60 - 65 | 30 → 0 | 70 → 100 |
| 65 - 70 | 0 | 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Equilibration*: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

*Injection*: 50 µL.

*System suitability*:

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of insulin lispro digest supplied with *insulin lispro CRS*,
- in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III:

  *symmetry factor*: maximum 1.5 for the peaks due to fragments II and III,

  *resolution*: minimum 8.0 between the peaks due to fragments II and III.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*NOTE: the retention times of fragments I, II and IV are the same as for human insulin. The retention time of fragment III differs from human insulin due to differences in sequence at positions 28 and 29 of the B-chain.*

TESTS

**Impurities with molecular masses greater than that of insulin lispro**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

*Test solution*. Prepare a solution containing 4 mg/mL of the substance to be examined in *0.01 M hydrochloric acid*. Maintain the solution at 2-8 °C and use within 48 h.

*Resolution solution*. Use a solution of insulin (about 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days. Maintain the solution at 2-8 °C and use within 8 days.

*Column*:

- *size*: *l* = 0.30 m, Ø = 7.8 mm,
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm) with a pore size of 12-12.5 nm, of a grade suitable for the separation of insulin monomer from dimer and polymers.

*Mobile phase*: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile for chromatography R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Equilibration*: at least 3 injections of the resolution solution; the column is equilibrated when repeatable results are obtained for 2 subsequent injections.

*Injection*: 100 µL.

*Run time*: about 35 min.

*Retention time*: insulin lispro polymers = 13-17 min; insulin lispro dimer = about 17.5 min; insulin lispro monomer = about 20 min; salts = about 22 min.

*System suitability*: resolution solution:

- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the dimer and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer,
- *symmetry factor*: maximum 2.0 for the peak due to insulin lispro.

*Limits*: the sum of the areas of the peaks with a retention time less than that of the principal peak is not more than 0.25 per cent of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin lispro monomer.

**Related proteins**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dissolve 3.5 mg of the substance to be examined in 1.0 mL of *0.01 M hydrochloric acid*. Maintain the solution at 2-8 °C and use within 56 h.

*Resolution solution.* Dissolve 3.5 mg of the substance to be examined in 1.0 mL of *0.01 M hydrochloric acid*. Allow to stand at room temperature to obtain a solution containing between 0.8 per cent and 11 per cent of A21 desamido insulin lispro.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm,
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: mix 82 volumes of a 28.4 g/L solution of *anhydrous sodium sulfate R* adjusted to pH 2.3 with *phosphoric acid R* and 18 volumes of *acetonitrile for chromatography R*; filter and degas;
- *mobile phase B*: mix equal volumes of a 28.4 g/L solution of *anhydrous sodium sulfate R* adjusted to pH 2.3 with *phosphoric acid R* and *acetonitrile for chromatography R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 81 | 19 |
| 60 - 83 | 81 → 51 | 19 → 49 |
| 83 - 84 | 51 → 81 | 49 → 19 |
| 84 - 94 | 81 | 19 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL.

*Retention time*: adjust the mobile phase composition to obtain a retention time of about 41 min for insulin lispro; A21 desamido insulin lispro elutes near the start of the gradient elution.

*System suitability*: resolution solution:

- *resolution*: minimum 1.5 between the 1st peak (insulin lispro) and the 2nd peak (A21 desamido insulin lispro),
- *symmetry factor*: maximum 2.0 for the peak due to insulin lispro.

*Limits*:

- *A21 desamido insulin lispro*: maximum 1.0 per cent,
- *any other impurity*: maximum 0.50 per cent,
- *total (excluding A21)*: maximum 2.0 per cent.

**Zinc**: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Dissolve at least 50 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25 mL with the same acid. Dilute if necessary to a suitable concentration (for example 0.4-0.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

*Reference solutions.* Use solutions of concentrations which bracket the expected zinc concentration of the samples, for example, 0.2-0.8 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Atomisation device*: air-acetylene flame of suitable composition (for example, 11 L of air and 2 L of acetylene per minute).

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 16 h.

**Sulfated ash** (*2.4.14*): maximum 2.5 per cent, determined on 0.200 g (dried substance).

**Bacterial endotoxins** (*2.6.14, Method D*): less than 10 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 0.8 mg/mL. Maintain the solution at 2-8 °C and use within 48 h.

*Reference solution.* Dissolve the contents of a vial of *insulin lispro CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 0.8 mg/mL. Maintain the solution at 2-8 °C and use within 48 h.

*Resolution solution.* Dissolve about 10 mg of the substance to be examined in 10 mL of *0.01 M hydrochloric acid*. Allow to stand at room temperature to obtain a solution containing between 0.8 per cent and 11 per cent of A21 desamido insulin lispro. Maintain the solution at 2-8 °C and use within 14 days.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,
- *temperature*: 40 °C.

*Mobile phase*: mix 745 volumes of a 28.4 g/L solution of *anhydrous sodium sulfate R* adjusted to pH 2.3 with *phosphoric acid R* and 255 volumes of *acetonitrile for chromatography R*; filter and degas.

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 20 µL.

*Retention time*: insulin lispro = about 24 min.

*System suitability*:

- *resolution*: minimum 1.8 between the 1st peak (insulin lispro) and the 2nd peak (A21 desamido insulin lispro), in the chromatogram obtained with the resolution solution,
- *repeatability*: maximum relative standard deviation of 1.1 per cent after 3 injections of the reference solution.

Calculate the content of insulin lispro $C_{257}H_{383}N_{65}O_{77}S_6$ using the chromatograms obtained with the test solution and the reference solution and the declared content of $C_{257}H_{383}N_{65}O_{77}S_6$ in *insulin lispro CRS*.

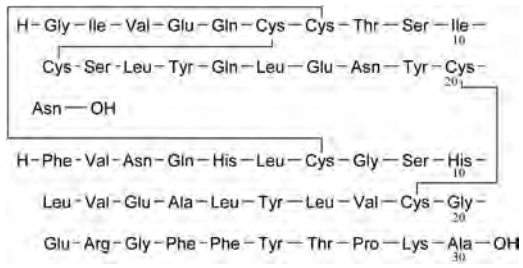
STORAGE

In an airtight container, protected from light, at or below – 18 °C. When thawed, insulin lispro is stored and weighed under conditions defined by the manufacturer to maintain the quality attributes of the drug substance and is used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, insulin lispro must be at room temperature before opening the container.

**01/2008:1638**
**corrected 10.0**

# INSULIN, PORCINE

## Insulinum porcinum



$C_{256}H_{381}N_{65}O_{76}S_6$ $M_r$ 5778

DEFINITION

Porcine insulin is the natural antidiabetic principle obtained from pork pancreas and purified.

*Content*:

– *sum of porcine insulin ($C_{256}H_{381}N_{65}O_{76}S_6$) and A21 desamido porcine insulin*: 95.0 per cent to 105.0 per cent (dried substance).

By convention, for the purpose of labelling insulin preparations, 0.0345 mg of porcine insulin is equivalent to 1 IU of insulin.

PRODUCTION

The animals from which porcine insulin is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

*Results*: the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with reference solution (b).

B. Peptide mapping.

*Test solution.* Prepare a 2.0 mg/mL solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µL of this solution to a clean tube. Add 2.0 mL of *HEPES buffer solution pH 7.5 R* and 400 µL of a 1 mg/mL solution of *Staphylococcus aureus strain V8 protease, type XVII-B R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 mL of *sulfate buffer solution pH 2.0 R*.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution but using *insulin porcine for system suitability CRS* instead of the substance to be examined.

Examine the digests by liquid chromatography (*2.2.29*).

*Column*:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);

– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: mix 100 mL of *acetonitrile for chromatography R*, 700 mL of *water for chromatography R* and 200 mL of *sulfate buffer solution pH 2.0 R*; filter and degas;

– *mobile phase B*: mix 400 mL of *acetonitrile for chromatography R*, 400 mL of *water for chromatography R* and 200 mL of *sulfate buffer solution pH 2.0 R*; filter and degas;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 90 → 30 | 10 → 70 |
| 60 - 65 | 30 → 0 | 70 → 100 |
| 65 - 70 | 0 | 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Equilibration*: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

*Injection*: 50 µL.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of porcine insulin digest supplied with *insulin porcine for system suitability CRS*. In the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III. The symmetry factor of the peaks due to fragments II and III is not greater than 1.5, and the resolution between the 2 peaks is at least 1.9.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

*NOTE: the retention time of fragment I is the same for porcine insulin and for human insulin. The retention times of fragments II and IV are the same for all insulins. The retention time of fragment III is the same for bovine insulin and for porcine insulin.*

TESTS

**Impurities with molecular masses greater than that of insulin**. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure. *Maintain the solutions at 2-10 °C and use within 7 days. If an automatic injector is used, maintain the temperature at 2-10 °C.*

*Test solution.* Dissolve 4 mg of the substance to be examined in 1.0 mL of *0.01 M hydrochloric acid*.

*Resolution solution.* Use a solution of insulin (approximately 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days.

*Column*:

– *size*: *l* = 0.3 m, Ø = at least 7.5 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm), of a grade suitable for the separation of insulin monomer from dimer and polymers.

*Mobile phase*: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas.

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 276 nm.

*Equilibration*: before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least 3 injections of the resolution solution. The column is equilibrated when repeatable results are obtained from 2 subsequent injections.

*Injection*: 100 µL.

*Run time*: about 35 min.

*Retention times*: polymeric insulin complexes = 13 min to 17 min; covalent insulin dimer = about 17.5 min; insulin monomer = about 20 min; salts = about 22 min.

*System suitability*: resolution solution:

- *peak-to-valley ratio*: minimum 2.0, where $H_p$ = height above the baseline of the peak due to the dimer and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

*Limits*: the sum of the areas of any peaks with a retention time less than that of the principal peak is not greater than 1.0 per cent of the total area of the peaks; disregard any peak with a retention time greater than that of the insulin peak.

**Related proteins**. Liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below.

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 42 | 58 |
| 30 - 44 | 42 → 11 | 58 → 89 |
| 44 - 50 | 11 | 89 |

*Maintain the solutions at 2-10 °C and use within 24 h.*

Perform a system suitability test (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µL of reference solution (b) and 20 µL of the test solution. If necessary, adjust the injection volume to between 10 µL and 20 µL in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. In the chromatogram obtained with reference solution (b), A21 desamido porcine insulin appears as a small peak after the principal peak and has a relative retention of about 1.3 with reference to the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to A21 desamido porcine insulin is not greater than 2.0 per cent of the total area of the peaks; the sum of the areas of all the peaks, apart from those due to porcine insulin and A21 desamido porcine insulin, is not greater than 2.0 per cent of the total area of the peaks.

**Porcine proinsulin-like immunoreactivity (PLI)**: maximum 10 ppm (dried substance).

Use a suitably sensitive immunochemical method (*2.7.1*) such as radio-immunoassay, using the International Reference Reagent for porcine proinsulin to calibrate the method.

**Zinc**: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 mL with the same acid. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

*Reference solutions*. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

*Source*: zinc hollow-cathode lamp.

*Wavelength*: 213.9 nm.

*Flame*: air-acetylene flame of suitable composition (for example, 11 L of air and 2 L of acetylene per minute).

**Loss on drying** (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

**Sulfated ash** (*2.4.14*): maximum 2.5 per cent, determined on 0.200 g (dried substance).

**Bacterial endotoxins** (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 40.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (b)*. Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 10.0 mL with *0.01 M hydrochloric acid*.

*Resolution solution*. Mix 1.0 mL of reference solution (a) and 1.0 mL of reference solution (b).

Maintain the solutions at 2-10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2-10 °C.

*Column*:

- *size*: *l* = 0.25, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mix 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusting the composition of the mixture if necessary.

Prepare and maintain the following solutions at a temperature of at least 20 °C:

- *mobile phase A*: dissolve 28.4 g of *anhydrous sodium sulfate R* in *water for chromatography R* and dilute to 1000 mL with the same solvent; add 2.7 mL of *phosphoric acid R*; adjust to pH 2.3, if necessary, with *ethanolamine R*; filter and degas;
- *mobile phase B*: mix 550 mL of mobile phase A with 450 mL of *acetonitrile R*; warm the solution to a temperature of at least 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 214 nm.

*System suitability*:

- *resolution*: inject 20 µL of the resolution solution and 20 µL of reference solution (b). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.
- *linearity*: inject 20 µL each of reference solutions (b) and (c). The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (b) is 10 ± 0.5 times the area of the principal peak

Monographs I

in the chromatogram obtained with reference solution (c). If this test fails, adjust the injection volume to between 10 µL and 20 µL, in order that the responses are within the linearity range of the detector.

*Injection*: 20 µL of the test solution.

Calculate the content of porcine insulin $C_{256}H_{381}N_{65}O_{76}S_6$ plus A21 desamido porcine insulin from the area of the principal peak and the area of the peak due to A21 desamido porcine insulin in the chromatograms obtained with the test solution and reference solution (b) and the declared content of porcine insulin plus A21 desamido porcine insulin in *porcine insulin CRS*.

STORAGE

In an airtight container, protected from light, at − 20 °C until released by the manufacturer. When thawed, insulin may be stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, the insulin must be at room temperature.

**01/2008:0854**
**corrected 10.0**

# INSULIN PREPARATIONS, INJECTABLE

## Praeparationes insulini iniectabiles

*Injectable insulin preparations comply with the requirements for Injections prescribed in the monograph on Parenteral preparations (0520).*

DEFINITION

Injectable insulin preparations are sterile preparations of *Insulin, human (0838)*, *Insulin, bovine (1637)* or *Insulin, porcine (1638)*. They contain not less than 90.0 per cent and not more than the equivalent of 110.0 per cent of the amount of insulin stated on the label. They are either solutions or suspensions or they are prepared by combining solutions and suspensions.

PRODUCTION

The methods of preparation are designed to confer suitable properties with respect to the onset and duration of therapeutic action.

The following procedures are carried out in a suitable sequence, depending on the method of preparation:

- addition of suitable antimicrobial preservatives;
- addition of a suitable substance or substances to render the preparation isotonic with blood;
- addition of a suitable substance or substances to adjust the pH to the appropriate value;
- determination of the strength of the insulin-containing component or components followed, where necessary, by adjustment so that the final preparation contains the requisite number of International Units per millilitre;
- sterilisation by filtration of the insulin-containing component or components; once this procedure has been carried out all subsequent procedures are carried out aseptically using materials that have been sterilised by a suitable method.

In addition, where appropriate, suitable excipients are added and suitable procedures carried out to confer the appropriate physical form on the insulin-containing component or components. The final preparation is distributed aseptically into sterile containers which are closed so as to exclude microbial contamination.

TESTS

**pH** (*2.2.3*). The pH of the solution or suspension is 6.9 to 7.8, unless otherwise prescribed in the specific monograph.

**Insulin in the supernatant**. For injectable insulin preparations that are suspensions, not more than 2.5 per cent of the total insulin content, unless otherwise stated. Centrifuge 10 mL of the suspension at 1500 *g* for 10 min and carefully separate the supernatant and the residue. Determine the insulin content of the supernatant (*S*) by a suitable method, for example using the chromatographic conditions described under Assay. Calculate the percentage of insulin in solution using the following expression:

$$\frac{100S}{T}$$

where *T* is the total insulin content determined as described under the Assay.

**Impurities with molecular masses greater than that of insulin**. Examine by size-exclusion chromatography (*2.2.30*).

*Test solution*. Add 4 µL of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear acid insulin solution. When sampling a suspension, agitate the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of hydrochloric acid, add small aliquots of acid (less than 4 µL per millilitre) until a solution is obtained. Preparations with concentrations higher than 100 IU/mL need to be diluted with *0.01 M hydrochloric acid* to avoid overloading the column with insulin monomer.

*Resolution solution*. Use a solution of insulin (approximately 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about ten days.

Maintain the solutions at 2 °C to 10 °C and use within 30 h (soluble insulin injection) or 7 days (other insulin preparations). If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

- a column 0.3 m long and at least 7.5 mm in internal diameter packed with *hydrophilic silica gel for chromatography R* (5 µm to 10 µm), of a grade suitable for the separation of insulin monomer from dimers and polymers;
- as mobile phase at a flow rate of 0.5 mL/min a mixture consisting of 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas;
- as detector a spectrophotometer set at 276 nm.

*Equilibration of the column*. Before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least three injections of the resolution solution. The column is equilibrated when repeatable results are obtained from two subsequent injections. If protamine-containing samples are to be analysed, the equilibration of the column is performed using a solution containing protamine.

Inject 100 µL of the resolution solution. When the chromatograms are recorded under the prescribed conditions, the retention times are: polymeric insulin complexes or covalent insulin-protamine complex: about 13 min to 17 min, covalent insulin dimer: about 17.5 min, insulin monomer: about 20 min, salts: about 22 min. If the sample solution

contains preservatives, for example methyl paraben, *m*-cresol or phenol, these compounds elute later. The test is not valid unless the resolution, defined by the ratio of the height of the dimer peak to the height above the baseline of the valley separating the monomer and dimer peaks, is at least 2.0.

Inject 100 µL of the test solution. Record the chromatogram for approximately 35 min. In the chromatogram obtained, the sum of the areas of any peak with a retention time less than that of the insulin peak is not greater than 3.0 per cent (protamine containing preparations) or 2.0 per cent (non-protamine containing preparations) of the total area of the peaks. Disregard any peak with a retention time greater than that of the insulin peak.

**Related proteins**. Examine by liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below:

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Comment |
|---|---|---|---|
| 0 - 30 | 42 | 58 | isocratic |
| 30 - 44 | 42 → 11 | 58 → 89 | linear gradient |
| 44 - 50 | 11 | 89 | isocratic |

Maintain the solutions at 2 °C to 10 °C and use within 24 h. Perform a system suitability check (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µL of the test solution and 20 µL of either reference solution (a), for insulin preparations containing 100 IU/mL, or reference solution (b), for insulin preparations containing 40 IU/mL. If necessary, adjust the injection volume to a volume between 10 µL and 20 µL in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. If necessary, make further adjustments to the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show a shorter retention time. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. In the chromatogram obtained with either reference solution (a), or reference solution (b), as appropriate, A21 desamido insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak, due to insulin. In the chromatogram obtained with the test solution the area of the peak due to A21 desamido insulin is not greater than 5.0 per cent of the total area of the peaks; the sum of the areas of any other peaks, apart from those due to insulin and A21 desamido insulin is not greater than 6.0 per cent of the total area of the peaks. Disregard the peaks due to the preservatives and protamine (early eluting peaks).

**Total zinc**. Not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry (*2.2.23, Method I*).

*Use the following method, unless otherwise prescribed in the specific monograph.*

*Test solution.* Shake the preparation gently and dilute a volume containing 200 IU of insulin to 25.0 mL with *0.01 M hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

*Reference solutions.* Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 L of air and 2 L of acetylene per minute).

**Zinc in solution**. Where applicable, not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry (*2.2.23, Method I*).

*Test solution.* Centrifuge the preparation to be examined and dilute 1 mL of the clear supernatant obtained to 25.0 mL with *water R*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

*Reference solutions.* Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 L of air and 2 L of acetylene per minute).

**Bacterial endotoxins** (*2.6.14*): less than 80 IU per 100 IU of insulin.

ASSAY

Examine by liquid chromatography (*2.2.29*).

*Test solution*. Add 4 µL of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear solution. When sampling a suspension, shake the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of acid, add small aliquots of acid (less than 4 µL per millilitre) until a solution is obtained. For a preparation containing more than 100 IU mL, an additional dilution with *0.01 M hydrochloric acid* is necessary to avoid overloading the column.

*Reference solution (a).* For a preparation containing a single species of insulin, dissolve in *0.01 M hydrochloric acid*, as appropriate, the contents of a vial of *human insulin CRS*, *porcine insulin CRS* or *bovine insulin CRS* to obtain a concentration of 4.0 mg/mL. For a preparation containing both bovine and porcine insulins, mix 1.0 mL of a solution containing 4.0 mg of *bovine insulin CRS* per millilitre of *0.01 M hydrochloric acid* and 1.0 mL of a solution containing 4.0 mg of *porcine insulin CRS* per millilitre of *0.01 M hydrochloric acid*. *Reference solution (a) is used for the assay of insulin preparations containing 100 IU/mL.*

*Reference solution (b).* Dilute 4.0 mL of reference solution (a) to 10.0 mL with *0.01 M hydrochloric acid*. *Reference solution (b) is used for the assay of insulin preparations containing 40 IU/mL.*

*Reference solution (c).* Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

*Reference solution (d).* Dissolve the contents of a vial of *insulin porcine for system suitability CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4 mg/mL.

*Reference solution (e).* Dilute 1.0 mL of reference solution (a) to 10.0 mL with *0.01 M hydrochloric acid*.

*Reference solution (f).* Dilute 1.0 mL of reference solution (b) to 10.0 mL with *0.01 M hydrochloric acid*.

*Resolution solution.* Mix 1.0 mL of reference solution (c) and 1.0 mL of reference solution (d).

Maintain the solutions at 2 °C to 10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm);

– as mobile phase at a flow rate of 1 mL/min the following solutions prepared and maintained at a temperature not lower than 20 °C:

*Mobile phase A.* Dissolve 28.4 g of *anhydrous sodium sulfate R* in *water R* and dilute to 1000 mL with the same solvent; add 2.7 mL of *phosphoric acid R*; adjust the pH to 2.3, if necessary, with *ethanolamine R*; filter and degas;

*Mobile phase B.* Mix 550 mL of mobile phase A with 450 mL of *acetonitrile R*. Warm the solution to a temperature not lower than 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas;

– as detector a spectrophotometer set at 214 nm;

maintaining the temperature of the column at 40 °C.

Elute with a mixture of 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusted if necessary.

Inject 20 µL of the resolution solution and 20 µL of reference solution (d). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (d) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.

Inject 20 µL of the test solution and 20 µL of either reference solutions (a) and (e), for insulin preparations containing 100 IU/mL, or 20 µL of reference solutions (b) and (f), for insulin preparations containing 40 IU/mL. If necessary, make further adjustments of the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show shorter retention times. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution wash the column with a mixture of equal volumes of *acetonitrile R* and *water R* for a sufficient time to ensure elution of any interfering substances before injecting the next solution. The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (a) or (b) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) or (f). If this test fails, adjust the injection volume between 10 µL and 20 µL, in order to be in the linearity range of the detector.

Calculate the content of insulin plus A21 desamido insulin from the area of the peak due to the bovine, porcine or human insulin and that of any peak due to the A21 desamido insulin, using the declared content of insulin plus A21 desamido insulin in *bovine insulin CRS*, *porcine insulin CRS* or *human insulin CRS*, as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of the peaks due to the A21 desamido insulin[(1)] derivatives.

STORAGE

Unless otherwise prescribed, store in a sterile, airtight, tamper-evident container, protected from light, at a temperature of 2 °C to 8 °C. Insulin preparations are not to be frozen.

LABELLING

The label states:

– the potency in International Units per millilitre;
– the concentration in terms of the number of milligrams of insulin per millilitre (for preparations containing both bovine insulin and porcine insulin the concentration is stated as the combined amount of both insulins);
– where applicable, that the substance is produced by enzymatic modification of porcine insulin;
– where applicable, that the substance is produced by recombinant DNA technology;
– where applicable, the animal species of origin;
– that the preparation must not be frozen;
– where applicable, that the preparation must be resuspended before use.

**01/2008:0837**
**corrected 6.0**

# INSULIN ZINC INJECTABLE SUSPENSION

## Insulini zinci suspensio iniectabilis

*Insulin zinc injectable suspension complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.*

DEFINITION

Insulin zinc injectable suspension is a sterile neutral suspension of bovine insulin and/or porcine insulin or of human insulin with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

PRODUCTION

Insulin zinc injectable suspension is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

Insulin zinc injectable suspension is produced by mixing insulin zinc injectable suspension (crystalline) and insulin zinc injectable suspension (amorphous) in a ratio of 7 to 3.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals with a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm; a considerable proportion of the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay.

For preparations made from a single species of insulin (bovine, porcine or human), the position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution. For preparations made from a mixture of bovine and porcine insulin, the positions of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

(1) 100 IU are equivalent to 3.47 mg of human insulin, to 3.45 mg of porcine insulin and to 3.42 mg of bovine insulin.

Monographs

TESTS

**Insulin not extractable with buffered acetone solution**: 63 per cent to 77 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant. Suspend the residue in 1.65 mL of *water R*, add 3.3 mL of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 mL. Determine the insulin content of the residue (*R*) and determine the total insulin content (*T*) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$

**Total zinc**: 0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

**Zinc in solution**: 20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

**01/2008:0835**
**corrected 6.0**

# INSULIN ZINC INJECTABLE SUSPENSION (AMORPHOUS)

## Insulini zinci amorphi suspensio iniectabilis

*Insulin zinc injectable suspension (amorphous) complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.*

DEFINITION

Insulin zinc injectable suspension (amorphous) is a sterile neutral suspension of bovine, porcine or human insulin complexed with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

**Total zinc**. 0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

**Zinc in solution**. 20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

**01/2008:0836**
**corrected 6.0**

# INSULIN ZINC INJECTABLE SUSPENSION (CRYSTALLINE)

## Insulini zinci cristallini suspensio iniectabilis

*Insulin zinc injectable suspension (crystalline) complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.*

DEFINITION

Insulin zinc injectable suspension (crystalline) is a sterile neutral suspension of bovine, porcine or human insulin, complexed with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rhombohedral crystals, the majority having a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

**Insulin not extractable with buffered acetone solution**. Not less than 90 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant. Suspend the residue in 1.65 mL of *water R*, add 3.3 mL of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 mL. Determine the insulin content of the residue (*R*) and determine the total insulin content (*T*) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$

**Total zinc**: 0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

**Zinc in solution**: 20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

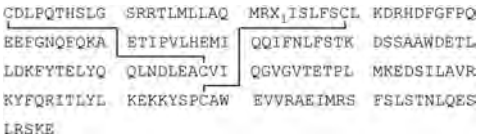
**corrected 10.0**

# INTERFERON ALFA-2 CONCENTRATED SOLUTION

## Interferoni alfa-2 solutio concentrata



DEFINITION

Interferon alfa-2 concentrated solution is a solution of a protein that is produced according to the information coded by the alfa-2 sub-species of interferon alfa gene and that exerts non-specific antiviral activity, at least in homologous cells, through cellular metabolic processes involving synthesis of both ribonucleic acid and protein. Interferon alfa-2 concentrated solution also exerts antiproliferative activity. Different types of alfa-2 interferon, varying in the amino acid residue at position 23, are designated by a letter in lower case.

| Designation | Residue at position 23 ($X_1$) |
|---|---|
| alfa-2a | Lys |
| alfa-2b | Arg |

This monograph applies to interferon alfa-2a and -2b concentrated solutions.

The potency of interferon alfa-2 concentrated solution is not less than $1.4 \times 10^8$ IU per milligram of protein. Interferon alfa-2 concentrated solution contains not less than $2 \times 10^8$ IU of interferon alfa-2 per millilitre.

PRODUCTION

Interferon alfa-2 concentrated solution is produced by a method based on recombinant DNA (rDNA) technology using bacteria as host cells. It is produced under conditions designed to minimise microbial contamination of the product.

Interferon alfa-2 concentrated solution complies with the following additional requirements.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell- or vector-derived DNA**. The limit is approved by the competent authority.

CHARACTERS

A clear, colourless or slightly yellowish liquid.

IDENTIFICATION

A. It shows the expected biological activity (see Assay).

B. Examine by isoelectric focusing.

*Test solution.* Dilute the preparation to be examined with *water R* to a protein concentration of 1 mg/mL.

*Reference solution.* Prepare a 1 mg/mL solution of *interferon alfa-2b CRS* in *water R*.

*Isoelectric point calibration solution pI range 3.0 to 10.0.* Prepare and use according to the manufacturer's instructions.

Use a suitable apparatus connected with a recirculating temperature controlled water-bath set at 10 °C and gels for isoelectric focusing with a pH gradient from 3.5 to 9.5. Operate the apparatus in accordance with the manufacturer's instructions. Use as the anode solution *phosphoric acid R* (98 g/L $H_3PO_4$) and as the cathode solution *1 M sodium hydroxide*. Samples are applied to the gel by filter papers. Place sample application filters on the gel close to the cathode.

Apply 15 µL of the test solution and 15 µL of the reference solution. Start the isoelectric focusing at 1500 V and 50 mA. Turn off the power after 30 min, remove the application filters and reconnect the power supply for 1 h. Keep the power constant during the focusing process. After focusing, immerse the gel in a suitable volume of a solution containing 115 g/L of *trichloroacetic acid R* and 34.5 g/L of *sulfosalicylic acid R* in *water R* and agitate the container gently for 60 min. Transfer the gel to a mixture of 32 volumes of *glacial acetic acid R*, 100 volumes of *anhydrous ethanol R* and 268 volumes of *water R*, and soak for 5 min. Immerse the gel for 10 min in a staining solution prewarmed to 60 °C in which 1.2 g/L of *acid blue 83 R* has been added to the previous mixture of glacial acetic acid, ethanol and water. Wash the gel in several containers with the previous mixture of glacial acetic acid, ethanol and water and keep the gel in this mixture until the background is clear (12 h to 24 h). After adequate destaining, soak the gel for 1 h in a 10 per cent *V/V* solution of *glycerol R* in the previous mixture of glacial acetic acid, ethanol and water.

The principal bands of the electropherogram obtained with the test solution correspond in position to the principal bands of the electropherogram obtained with the reference solution. Plot the migration distances of the isoelectric point markers versus their isoelectric points and determine the isoelectric points of the principal components of the test solution and the reference solution. They do not differ by more than 0.2 pI units. The test is not valid unless the isoelectric point markers are distributed along the entire length of the gel and the isoelectric points of the principal bands in the electropherogram obtained with the reference solution are between 5.8 and 6.3.

C. Examine the electropherograms obtained under reducing conditions in the test for impurities of molecular masses differing from that of interferon alfa-2. The principal band in the electropherogram obtained with test solution (a) corresponds in position to the principal band in the electropherogram obtained with reference solution (a).

D. Examine by peptide mapping.

*Test solution.* Dilute the preparation to be examined in *water R* to a protein concentration of 1.5 mg/mL. Transfer 25 µL to a polypropylene or glass tube of 1.5 mL capacity. Add 1.6 µL of *1 M phosphate buffer solution pH 8.0 R*, 2.8 µL of a freshly prepared 1.0 mg/mL solution of *trypsin for peptide mapping R* in *water R* and 3.6 µL of *water R* and mix vigorously. Cap the tube and place it in a water-bath at 37 °C for 18 h, then add 100 µL of a 573 g/L solution of *guanidine hydrochloride R* and mix well. Add 7 µL of 154.2 g/L solution of *dithiothreitol R* and mix well. Place the capped tube in boiling water for 1 min. Cool to room temperature.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution but use a 1.5 mg/mL solution of *interferon alfa-2b CRS* in *water R*.

Examine by liquid chromatography (*2.2.29*).

The chromatographic procedure may be carried out using:

– a stainless steel column 0.10 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm,

– as mobile phase at a flow rate of 1.0 mL/min:

*Mobile phase A*. Dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water R*,

*Mobile phase B*. To 100 mL of *water R* add 1 mL of *trifluoroacetic acid R* and dilute to 1000 mL with *acetonitrile for chromatography R*,

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Comment |
|---|---|---|---|
| 0 - 8 | 100 | 0 | isocratic |
| 8 - 68 | 100 → 40 | 0 → 60 | linear gradient |
| 68 - 72 | 40 | 60 | isocratic |
| 72 - 75 | 40 → 100 | 60 → 0 | linear gradient |
| 75 - 80 | 100 | 0 | re-equilibration |

– as detector a spectrophotometer set at 214 nm,

maintaining the temperature of the column at 30 °C.

Equilibrate the column with mobile phase A for at least 15 min.

Inject 100 µL of the test solution and 100 µL of the reference solution.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of interferon alfa-2 digest supplied with *interferon alfa-2b CRS*.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

TESTS

**Impurities of molecular masses differing from that of interferon alfa-2**. Examine by SDS polyacrylamide gel electrophoresis (*2.2.31*). The test is performed under both reducing and non-reducing conditions, using resolving gels of 14 per cent acrylamide and silver staining as the detection method.

*Sample buffer (non-reducing conditions).* Mix equal volumes of *water R* and *concentrated SDS-PAGE sample buffer R*.

*Sample buffer (reducing conditions).* Mix equal volumes of *water R* and *concentrated SDS-PAGE sample buffer for reducing conditions R* containing 2-mercaptoethanol as the reducing agent.

*Test solution (a).* Dilute the preparation to be examined in sample buffer to a protein concentration of 0.5 mg/mL.

*Test solution (b).* Dilute 0.20 mL of test solution (a) to 1 mL with sample buffer.

*Reference solution (a).* Prepare a 0.625 mg/mL solution of *interferon alfa-2b CRS* in sample buffer.

*Reference solution (b).* Dilute 0.20 mL of reference solution (a) to 1 mL with sample buffer.

*Reference solution (c).* Dilute 0.20 mL of reference solution (b) to 1 mL with sample buffer.

*Reference solution (d).* Dilute 0.20 mL of reference solution (c) to 1 mL with sample buffer.

*Reference solution (e).* Dilute 0.20 mL of reference solution (d) to 1 mL with sample buffer.

*Reference solution (f).* Use a solution of molecular mass standards suitable for calibrating SDS-PAGE gels in the range 15 kDa to 67 kDa.

Place test and reference solutions, contained in covered test-tubes, on a water-bath for 2 min.

Apply 10 µL of reference solution (f) and 50 µL of each of the other solutions to the stacking gel wells. Perform the electrophoresis under the conditions recommended by the manufacturer of the equipment. Detect proteins in the gel by silver staining.

The test is not valid unless: the validation criteria are met (*2.2.31*); a band is seen in the electropherogram obtained with reference solution (e); and a gradation of intensity of staining is seen in the electropherograms obtained, respectively, with test solution (a) and test solution (b) and with reference solutions (a) to (e).

The electropherogram obtained with test solution (a) under reducing conditions may show, in addition to the principal band, less intense bands with molecular masses lower than the principal band. No such band is more intense than the principal band in the electropherogram obtained with reference solution (d) (1.0 per cent) and not more than 3 such bands are more intense than the principal band in the electropherogram obtained with reference solution (e) (0.2 per cent).

The electropherogram obtained with test solution (a) under non-reducing conditions may show, in addition to the principal band, less intense bands with molecular masses higher than the principal band. No such band is more intense than the principal band in the electropherogram obtained with reference solution (d) (1.0 per cent) and not more than 3 such bands are more intense than the principal band in the electropherogram obtained with reference solution (e) (0.2 per cent).

**Related proteins**. Examine by liquid chromatography (*2.2.29*).

*Test solution.* Dilute the preparation to be examined with *water R* to a protein concentration of 1 mg/mL.

*0.25 per cent m/m hydrogen peroxide solution.* Dilute *dilute hydrogen peroxide solution R* in *water R* in order to obtain a 0.25 per cent *m/m* solution.

*Reference solution.* To a volume of the test solution, add a suitable volume of 0.25 per cent *m/m* hydrogen peroxide solution to give a final hydrogen peroxide concentration of 0.005 per cent *m/m*, and allow to stand at room temperature for 1 h, or for the length of time that will generate about 5 per cent oxidised interferon. Add 12.5 mg of *L-methionine R* per millilitre of solution. Allow to stand at room temperature for 1 h. Store the solutions for not longer than 24 h at a temperature of 2-8 °C.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm,

– as mobile phase at a flow rate of 1.0 mL/min:

*Mobile phase A*. To 700 mL of *water R* add 2 mL of *trifluoroacetic acid R* and 300 mL of *acetonitrile for chromatography R*,

*Mobile phase B*. To 200 mL of *water R* add 2 mL of *trifluoroacetic acid R* and 800 mL of *acetonitrile for chromatography R*,

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Comment |
|---|---|---|---|
| 0 - 1 | 72 | 28 | isocratic |
| 1 - 5 | 72 → 67 | 28 → 33 | linear gradient |
| 5 - 20 | 67 → 63 | 33 → 37 | linear gradient |
| 20 - 30 | 63 → 57 | 37 → 43 | linear gradient |
| 30 - 40 | 57 → 40 | 43 → 60 | linear gradient |
| 40 - 42 | 40 | 60 | isocratic |
| 42 - 50 | 40 → 72 | 60 → 28 | linear gradient |
| 50 - 60 | 72 | 28 | re-equilibration |

– as detector a spectrophotometer set at 210 nm.

Equilibrate the column with the mobile phases in the initial gradient ratio for at least 15 min. Inject 50 µL of each solution.

In the chromatograms obtained, interferon alfa-2 elutes at a retention time of about 20 min. In the chromatogram obtained with the reference solution a peak related to oxidised interferon appears at a relative retention of about 0.9 with reference to the principal peak. The test is not valid unless the resolution between the peaks due to oxidised interferon and interferon is at least 1.0. Consider only the peaks whose relative retention is 0.7 to 1.4 with reference to the principal

peak. In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than 3.0 per cent of the total area of all of the peaks. The sum of the areas of any peaks other than the principal peak is not greater than 5.0 per cent of the total area of all of the peaks.

**Bacterial endotoxins** (*2.6.14*): less than 100 IU in the volume that contains 1.0 mg of protein.

ASSAY

**Protein**

*Test solution.* Dilute the preparation to be examined with *water R* to obtain a concentration of about 0.5 mg/mL of interferon alfa-2.

*Reference solutions.* Prepare a stock solution of 0.5 mg/mL of *bovine albumin R*. Prepare 8 dilutions of the stock solution containing between 3 µg/mL and 30 µg/mL of *bovine albumin R*.

Prepare 30-fold and 50-fold dilutions of the test solution. Add 1.25 mL of a mixture prepared the same day by combining 2.0 mL of a 20 g/L solution of *copper sulfate pentahydrate R* in *water R*, 2.0 mL of a 40 g/L solution of *sodium tartrate R* in *water R* and 96.0 mL of a 40 g/L solution of *sodium carbonate R* in *0.2 M sodium hydroxide* to test-tubes containing 1.5 mL of *water R* (blank), 1.5 mL of the different dilutions of the test solution or 1.5 mL of the reference solutions. Mix after each addition. After approximately 10 min, add to each test-tube 0.25 mL of a mixture of equal volumes of *water R* and *phosphomolybdotungstic reagent R*. Mix after each addition. After approximately 30 min, measure the absorbance (*2.2.25*) of each solution at 750 nm using the blank as the compensation liquid. Draw a calibration curve from the absorbances of the 8 reference solutions and the corresponding protein contents and read from the curve the content of protein in the test solution.

**Potency**

The potency of interferon alfa-2 is estimated by comparing its effect to protect cells against a viral cytopathic effect with the same effect of the appropriate International Standard of human recombinant interferon alfa-2 or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Carry out the assay by a suitable method, based on the following design.

Use, in standard culture conditions, an established cell line sensitive to the cytopathic effect of a suitable virus (a human diploid fibroblast cell line, free of microbial contamination, responsive to interferon and sensitive to encephalomyocarditis virus, is suitable).

The following cell cultures and virus have been shown to be suitable: MDBK cells (ATCC No. CCL22), or Mouse L cells (NCTC clone 929; ATCC No. CCL 1) as the cell culture and vesicular stomatitis virus VSV, Indiana strain (ATCC No. VR-158) as the infective agent; or A-549 cells (ATCC No. CCL-185) responsive to interferon as the cell culture, and encephalomyocarditis virus (ATCC No. VR-129B) as the infective agent.

Incubate in at least 4 series, cells with 3 or more different concentrations of the preparation to be examined and the reference preparation in a microtitre plate and include in each series appropriate controls of untreated cells. Choose the concentrations of the preparations such that the lowest concentration produces some protection and the largest concentration produces less than maximal protection against the viral cytopathic effect. Add at a suitable time the cytopathic virus to all wells with the exception of a sufficient number of wells in all series, which are left with uninfected control cells. Determine the cytopathic effect of virus quantitatively with a suitable method. Calculate the potency of the preparation to be examined by the usual statistical methods for a parallel line assay.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits of the estimated potency ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store in an airtight container, protected from light, at or below – 20 °C.

LABELLING

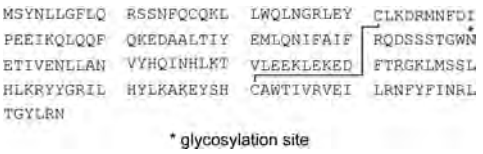
The label states:

- the type of interferon (alfa-2a or alfa-2b),
- the type of production.

**01/2009:1639**
**corrected 10.0**

# INTERFERON BETA-1a CONCENTRATED SOLUTION

## Interferoni beta-1a solutio concentrata



$C_{908}H_{1406}N_{246}O_{252}S_7$ $M_r$ approx. 22 500

DEFINITION

Solution of a glycosylated protein having the same amino acid sequence and disulfide bridge and a similar glycosylation pattern as interferon beta produced by human diploid fibroblasts in response to viral infections and various other inducers. It exerts antiviral, antiproliferative and immunomodulatory activity.

*Content*: minimum 0.20 mg of protein per millilitre.

*Potency*: minimum $1.5 \times 10^8$ IU per milligram of protein.

It may contain buffer salts.

PRODUCTION

Interferon beta-1a concentrated solution is produced by a method based on recombinant DNA (rDNA) technology, using mammalian cells in culture.

Prior to release, the following tests are carried out on each batch of interferon beta-1a concentrated solution, unless exemption has been granted by the competent authority.

**Host-cell-derived proteins**. The limit is approved by the competent authority.

**Host-cell or vector-derived DNA**. The limit is approved by the competent authority.

***N*-terminal truncated forms**. Examination for specific *N*-terminal truncated forms should be performed using a suitable technique such as *N*-terminal sequence determination. The limits are approved by the competent authority.

**Dimer and related substances of higher molecular mass**: not more than the amount approved by the competent authority, using an appropriate validated liquid chromatography method.

CHARACTERS

*Appearance*: clear or slightly opalescent, colourless or slightly yellowish liquid.

IDENTIFICATION

A. It shows the expected biological activity (see Assay).

B. Isoform distribution. Mass spectrometry (*2.2.43*).

*Introduction of the sample*: direct inflow of a desalted preparation to be examined or liquid chromatography-mass spectrometry combination.

*Mode of ionisation*: electrospray.

*Signal acquisition*: complete spectrum mode from 1100 to 2400.

*Calibration*: use myoglobin in the *m/z* range of 600-2400; set the instrument within validated instrumental settings and analyse the sample; the deviation of the measured mass does not exceed 0.02 per cent of the reported mass.

*Interpretation of results*: a typical spectrum consists of 6 major glycoforms (A to F), which differ in their degree of sialylation and/or antennarity type as shown in Table 1639.-1.

Table 1639.-1.

| MS peak | Glycoform* | Expected $M_r$ | Sialylation level |
|---|---|---|---|
| A | 2A2S1F | 22 375 | Disialylated |
| B | 2A1S1F | 22 084 | Monosialylated |
| C | 3A2S1F and/or 2A2S1F + 1 HexNacHex repeat | 22 739 | Disialylated |
| D | 3A3S1F | 23 031 | Trisialylated |
| E | 4A3S1F and/or 3A3S1F + 1 HexNacHex repeat | 23 400 | Trisialylated |
| F | 2A0S1F | 21 793 | Non-sialylated |

* 2A = biantennary complex type oligosaccharide; 3A = triantennary complex type oligosaccharide; 4A = tetraantennary complex type oligosaccharide; 0S = non-sialylated; 1S = monosialylated; 2S = disialylated; 3S = trisialylated; 1F = fucosylated.

*Results*: the mass spectrum obtained with the preparation to be examined corresponds, with respect to the 6 major peaks, to the mass spectrum obtained with *interferon beta-1a CRS*.

C. Peptide mapping (*2.2.55*) and liquid chromatography (*2.2.29*).

*Test solution.* Add 5 µL of a 242 g/L solution of *tris(hydroxymethyl)aminomethane R* and a volume of the preparation to be examined containing 20 µg of protein to a polypropylene tube of 0.5 mL capacity. Add 4 µL of a 1 mg/mL solution of *endoprotease LysC R* in *0.05 M tris-hydrochloride buffer solution pH 9.0 R*. Mix gently and incubate at 30 °C for 2 h. Add 10 µL of a 15.4 g/L solution of *dithiothreitol R*. Dilute the solution with the same volume of a 573 g/L solution of *guanidine hydrochloride R*. Incubate at 4 °C for 3-4 h.

*Reference solution.* Prepare at the same time and in the same manner as for the test solution but using *interferon beta-1a CRS* instead of the preparation to be examined.

*Precolumn*:

– *size*: *l* = 0.02 m, Ø = 2.1 mm;

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Column*:

– *size*: *l* = 0.25 m, Ø = 2.1 mm;

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Mobile phase*:

– *mobile phase A*: dilute 1 mL of *trifluoroacetic acid R* to 1000 mL with *water for chromatography R*;

– *mobile phase B*: dilute 1 mL of *trifluoroacetic acid R* in 700 mL of *acetonitrile R1*, then dilute to 1000 mL with *water for chromatography R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 100 → 64 | 0 → 36 |
| 30 - 45 | 64 → 55 | 36 → 45 |
| 45 - 50 | 55 → 40 | 45 → 60 |
| 50 - 70 | 40 → 0 | 60 → 100 |
| 70 - 83 | 0 | 100 |
| 83 - 85 | 0 → 100 | 100 → 0 |

*Flow rate*: 0.2 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: volume that contains 20 µg of digested protein.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of interferon beta-1a digest supplied with *interferon beta-1a CRS*.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

TESTS

**Impurities of molecular masses differing from that of interferon beta-1a**. Polyacrylamide gel electrophoresis (*2.2.31*) under reducing conditions.

*Resolving gel*: 12 per cent acrylamide.

*Concentrated sample buffer*: *concentrated SDS-PAGE sample buffer for reducing conditions R* containing 2-mercaptoethanol as the reducing agent.

*Sample buffer*: mixture of equal volumes of *concentrated SDS-PAGE sample buffer for reducing conditions R* and *water R*.

*Test solution (a).* Concentrate the preparation to be examined using a suitable method to obtain a protein concentration of 1.5 mg/mL.

*Test solution (b)*: mixture of equal volumes of test solution (a) and the concentrated sample buffer.

*Test solution (c).* Dilute test solution (a) to obtain a protein concentration of 0.6 mg/mL. Mix equal volumes of this solution and the concentrated sample buffer.

*Test solution (d).* Mix 8 µL of test solution (c) and 40 µL of the sample buffer.

*Test solution (e).* Mix 15 µL of test solution (d) and 35 µL of the sample buffer.

*Test solution (f).* Mix 18 µL of test solution (e) and 18 µL of the sample buffer.

*Test solution (g).* Mix 12 µL of test solution (f) and 12 µL of the sample buffer.

*Reference solution.* Solution of relative molecular mass markers suitable for calibrating SDS-PAGE gels in the range of 15-67 kDa. Dissolve in the sample buffer.

*Sample treatment*: boil for 3 min.

*Application*: 20 µL of test solutions (b) to (g) and the reference solution.

*Detection*: Coomassie staining, carried out as follows: immerse the gel in *Coomassie staining solution R1* at 33-37 °C for 90 min with gentle shaking, then remove the staining solution; destain the gel with a large excess of a mixture of 1 volume of *glacial acetic acid R*, 1 volume of *2-propanol R* and 8 volumes of *water R*.

*Apparent molecular masses*: interferon beta-1a = about 23 000; underglycosylated interferon beta-1a = about 21 000; deglycosylated interferon beta-1a = about 20 000; interferon beta-1a dimer = about 46 000.

*Identification of bands*: use the electropherogram provided with *interferon beta-1a CRS*.

*System suitability*:

- the validation criteria are met (*2.2.31*);
- a band is seen in the electropherogram obtained with test solution (g);
- a gradation of intensity of staining is seen in the electropherograms obtained with test solutions (b) to (g).

*Limits*:

- in the electropherogram obtained with test solution (c), the band corresponding to underglycosylated interferon beta-1a is not more intense than the principal band in the electropherogram obtained with test solution (e) (5 per cent);
- in the electropherogram obtained with test solution (b), the band corresponding to deglycosylated interferon beta-1a is not more intense than the principal band in the electropherogram obtained with test solution (e) (2 per cent); any other band corresponding to an impurity of a molecular mass lower than that of interferon beta-1a, apart from the band corresponding to underglycosylated interferon beta-1a is not more intense than the principal band in the electropherogram obtained with test solution (f) (1 per cent).

**Oxidised interferon beta-1a**: maximum 6 per cent.

Use the chromatogram obtained with the test solution in identification C. Locate the peaks due to the peptide fragment comprising amino acids 34-45 and its oxidised form using the chromatogram of oxidised interferon beta-1a digest supplied with *interferon beta-1a CRS*.

Calculate the percentage of oxidation of interferon beta-1a using the following expression:

$$\frac{A_{34-45ox}}{A_{34-45} + A_{34-45ox}} \times 100$$

$A_{34\text{-}45ox}$ = area of the peak due to the oxidised peptide fragment 34-45;

$A_{34\text{-}45}$ = area of the peak due to the peptide fragment 34-45.

**Bacterial endotoxins** (*2.6.14*): less than 0.7 IU in the volume that contains $1 \times 10^6$ IU of interferon beta-1a, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

**Protein**. Liquid chromatography (*2.2.29*). Prepare 3 independent dilutions for each solution.

*Test solution*. Dilute the preparation to be examined to obtain a concentration of 100 µg/mL.

*Reference solution*. Dissolve the contents of a vial of *interferon beta-1a CRS* to obtain a concentration of 100 µg/mL.

*Precolumn*:

- *size*: *l* = 0.02 m, Ø = 2.1 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Column*:

- *size*: *l* = 0.25 m, Ø = 2.1 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm.

*Mobile phase*:

- *mobile phase A*: 0.1 per cent *V/V* solution of *trifluoroacetic acid R*;
- *mobile phase B*: to 300 mL of *water for chromatography R*, add 1 mL of *trifluoroacetic acid R* and dilute to 1000 mL with *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 20 | 100 → 0 | 0 → 100 |
| 20 - 25 | 0 | 100 |
| 25 - 26 | 0 → 100 | 100 → 0 |
| 26 - 40 | 100 | 0 |

*Flow rate*: 0.2 mL/min.

*Detection*: spectrophotometer at 214 nm.

*Injection*: 50 µL.

*Retention time*: interferon beta-1a = about 20 min.

*System suitability*: reference solution:

- *symmetry factor*: 0.8 to 2.0 for the peak due to interferon beta-1a;
- *repeatability*: maximum relative standard deviation of 3.0 per cent between the peak areas obtained after injection of the 3 independent dilutions.

Calculate the content of interferon beta-1a ($C_{908}H_{1406}N_{246}O_{252}S_7$) taking into account the assigned content of $C_{908}H_{1406}N_{246}O_{252}S_7$ in *interferon beta-1a CRS*.

**Potency**

The potency of interferon beta-1a is estimated by comparing its ability to protect cells against a viral cytopathic effect with the same ability of the appropriate International Standard of human recombinant interferon beta-1a or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Carry out the assay using a suitable method, based on the following design.

Use, in standard culture conditions, an established cell line sensitive to the cytopathic effect of a suitable virus and responsive to interferon. The cell cultures and viruses that have been shown to be suitable include the following:

- WISH cells (ATCC No. CCL-25) and vesicular stomatitis virus VSV, Indiana strain (ATCC No. VR-158) as infective agent;
- A549 cells (ATCC No. CCL-185) and encephalomyocarditis virus EMC (ATCC No. VR-129B) as infective agent.

Incubate in at least 4 series, cells with 3 or more different concentrations of the preparation to be examined and the reference preparation in a microtitre plate and include in each series appropriate controls of untreated cells. Choose the concentrations of the preparations such that the lowest concentration produces some protection and the largest concentration produces less than maximal protection against the viral cytopathic effect. Add at a suitable time the cytopathic virus to all wells with the exception of a sufficient number of wells in all series, which are left with uninfected control cells. Determine the cytopathic effect of the virus quantitatively with a suitable method. Calculate the potency of the preparation to be examined by the usual statistical methods (for example, *5.3*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the estimated potency.

STORAGE

In an airtight container, protected from light, at a temperature below – 70 °C. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

LABELLING

The label states:

- the interferon beta-1a content, in milligrams per millilitre;

Monographs 1

– the antiviral activity, in International Units per millilitre;
– where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

**07/2014:1440**
**corrected 10.0**

# INTERFERON GAMMA-1b CONCENTRATED SOLUTION

## Interferoni gamma-1b solutio concentrata

$C_{734}H_{1166}N_{204}O_{216}S_5$ $M_r$ 16 465

DEFINITION

Interferon gamma-1b concentrated solution is a solution of the *N*-terminal methionyl form of interferon gamma, a protein which is produced and secreted by human antigen-stimulated T lymphocytes in response to viral infections and various other inducers. It has specific immunomodulatory properties, such as potent phagocyte-activating effects. The protein consists of non-covalent dimers of two identical monomers. The formula of the monomer is as follows:

```
                                                  M
QDPYVKEAEN  LKKYFNAGHS  DVADNGTLFL  GILKNWKEES
DRKIMQSQIV  SFYFKLFKNF  KDDQSIQKSV  ETIKEDMNVK
FFNSNKKKRD  DFEKLTNYSV  TDLNVQRKAI  HELIQVMAEL
SPAAKTGKRK  RSQMLFRGR
```

The potency of interferon gamma-1b is not less than $20 \times 10^6$ IU per milligram of protein. Interferon gamma-1b concentrated solution contains not less than $30 \times 10^6$ IU of interferon gamma-1b per millilitre.

PRODUCTION

Interferon gamma-1b concentrated solution is produced by a method based on recombinant DNA technology, using bacteria as host-cells. It is produced under conditions designed to minimise microbial contamination.

Interferon gamma-1b concentrated solution complies with the following additional requirements.

**Host-cell derived proteins**. The limit is approved by the competent authority.

**Host-cell- and vector-derived DNA**. The limit is approved by the competent authority.

CHARACTERS

A clear, colourless or slightly yellowish liquid.

IDENTIFICATION

A. It shows the expected biological activity when tested as prescribed in the assay.

B. Examine the electropherograms obtained in the test for impurities of molecular masses differing from that of interferon gamma-1b. The principal bands in the electropherogram obtained with the test solution correspond in position to the principal bands in the electropherogram obtained with reference solution (a).

C. Examine by peptide mapping.

*Solution A.* Prepare a solution containing 1.2 g/L of *tris(hydroxymethyl)aminomethane R*, 8.2 g/L of *anhydrous sodium acetate R*, 0.02 g/L of *calcium chloride R* and adjust to pH 8.3 with *dilute acetic acid R*. Add *polysorbate 20 R* to a concentration of 0.1 per cent *V/V*.

*Test solution.* Desalt a volume of the preparation to be examined containing 1 mg of protein by a suitable procedure. For example, filter in a microcentrifuge tube and reconstitute with 500 µL of solution A. Add 10 µL of a freshly prepared 1 mg/mL solution of *trypsin for peptide mapping R* in *water R* and mix gently by inversion. Incubate at 30 °C to 37 °C for 24 h, add 100 µL of *phosphoric acid R* per millilitre of digested sample and mix by inversion.

*Reference solution.* Dilute *interferon gamma-1b CRS* in *water R* to obtain a concentration of 1 mg/mL. Prepare as for the test solution, ensuring that all procedures are carried out simultaneously and under identical conditions.

Examine by liquid chromatography (*2.2.29*).

The chromatographic procedure may be carried out using:
– a stainless steel column, 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
– as mobile phase at a flow rate of 1.0 mL/min:

*Mobile phase A* (*0.05 M sodium phosphate buffer solution pH 3.3*). Solution I: dissolve 7.80 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent. Solution II: dilute 0.33 mL of *phosphoric acid R* to 100.0 mL with *water R*. Mix 920 mL of solution I and 80 mL of solution II. Adjust the pH if necessary,

*Mobile phase B. Acetonitrile for chromatography R*, with the following elution conditions (if necessary, the gradient may be modified to improve the separation of the digest):

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 30 | 100 → 80 | 0 → 20 |
| 30 - 50 | 80 → 60 | 20 → 40 |
| 50 - 51 | 60 → 30 | 40 → 70 |
| 51 - 59 | 30 | 70 |

– as detector a spectrophotometer set at 214 nm,

maintaining the temperature of the column at 40 °C.

Equilibrate the column for at least 15 min at the initial elution composition. Carry out a blank run using the above-mentioned gradient.

Inject 100 µL of the test solution and 100 µL of the reference solution.

*System suitability*: the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram of interferon gamma-1b digest supplied with *interferon gamma-1b CRS*.

*Results*: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

D. Examine by *N*-terminal sequence analysis.

Use an automated solid-phase sequencer, operated in accordance with the manufacturer's instructions.

Equilibrate by a suitable procedure the equivalent of 100 µg of interferon gamma-1b in a 10 g/L solution of *ammonium hydrogen carbonate R*, pH 9.0.

Identify the phenylthiohydantoin (PTH)-amino acids released at each sequencing cycle by reverse-phase liquid chromatography. The procedure may be carried out using the column and reagents recommended by the manufacturer of the sequencing equipment for the separation of PTH-amino acids.

The separation procedure is calibrated using:
– the mixture of PTH-amino acids provided by the manufacturer, with the gradient conditions adjusted as indicated to achieve optimum resolution of all amino acids,
– a sample from a blank sequencing cycle, obtained as recommended by the equipment manufacturer.

The first fifteen amino acids are:

Met-Gln-Asp-Pro-Tyr-Val-Lys-Glu-Ala-Glu-Asn-Leu-Lys-Lys-Tyr.

TESTS

**Appearance**. The preparation to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*). The pH of the preparation to be examined is 4.5 to 5.5.

**Covalent dimers and oligomers**. Not greater than 2 per cent, determined by size-exclusion chromatography (*2.2.30*).

*Test solution.* Dilute the preparation to be examined with the mobile phase to a protein concentration of 0.1 mg/mL.

*Reference solution (a).* Dilute *interferon gamma-1b CRS* with the mobile phase to a protein concentration of 0.1 mg/mL.

*Reference solution (b).* Prepare a mixture of the following molecular mass standards: bovine albumin, ovalbumin, trypsinogen, lysozyme, at a concentration of 0.1 mg/mL to 0.2 mg/mL for each standard.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.3 m long and 7.8 mm in internal diameter packed with *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the molecular weight range of 10 000 to 500 000 (5 µm),
- as mobile phase at a flow rate of 1.0 mL/min a mixture prepared as follows (0.2 M sodium phosphate buffer solution pH 6.8). Solution I: dissolve 31.2 g of *sodium dihydrogen phosphate R* and 1.0 g of *sodium dodecyl sulfate R* in *water R* and dilute to 1000.0 mL with the same solvent. Solution II: dissolve 28.4 g of *anhydrous disodium hydrogen phosphate R* and 1.0 g of *sodium dodecyl sulfate R* in *water R* and dilute to 1000.0 mL with the same solvent. Mix 450 mL of solution I and 550 mL of solution II. Adjust the pH if necessary,
- as detector a spectrophotometer set at 210 nm to 214 nm.

Inject 200 µL of each solution. The test is not valid unless: the molecular mass standards in reference solution (b) are well separated; the retention time of the principal peak in the chromatogram obtained with reference solution (a) is between the retention time of trypsinogen and lysozyme in the chromatogram obtained with reference solution (b).

Compare the chromatograms obtained with the test solution and with reference solution (a). There are no additional shoulders or peaks in the chromatogram obtained with the test solution compared with the chromatogram obtained with reference solution (a).

Calculate the percentage content of covalent dimers and oligomers.

**Monomer and aggregates**. Examine by size-exclusion chromatography (*2.2.30*). The content of monomer and aggregates is not greater than 2 per cent.

*Solution A.* Prepare a solution of the following composition: 0.59 g/L of *succinic acid R* and 40 g/L of *mannitol R*, adjusted to pH 5.0 with *sodium hydroxide solution R*.

*Test solution.* Dilute the preparation to be examined with solution A to a protein concentration of 1 mg/mL.

*Reference solution.* Dilute *interferon gamma-1b CRS* with solution A to a protein concentration of 1 mg/mL.

*Resolution solution.* Prepare 500 µL of a mixture consisting of 0.04 mg/mL of *bovine albumin R* and 0.2 mg/mL of *interferon gamma-1b CRS* in solution A. Use this solution within 24 h of preparation.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.3 m long and 7.8 mm in internal diameter packed with *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the molecular weight range of 10 000 - 300 000 (5 µm),
- as mobile phase at a flow rate of 0.8 mL/min a 89.5 g/L solution of *potassium chloride R* (1.2 M),
- as detector a spectrophotometer set at 214 nm.

Inject 20 µL of the resolution solution. In the chromatogram obtained, the retention time of the principal peak, corresponding to the native interferon gamma-1b dimer, is about 10 min. Bovine albumin elutes at a relative retention of about 0.85 with reference to the main peak. The test is not valid unless the resolution between the peaks due to bovine albumin and interferon gamma-1b is at least 1.5.

Inject 20 µL of the test solution and 20 µL of the reference solution. The chromatograms obtained show principal peaks with identical retention times. Calculate the percentage content of monomer and aggregates from the peak area of the monomer peak and of peaks which elute prior to the native interferon gamma-1b peak in the chromatogram obtained with the test solution, by the normalisation procedure, disregarding any peak due to the solvent.

**Deamidated and oxidised forms and heterodimers**. Examine by liquid chromatography (*2.2.29*). The content of deamidated and oxidised forms is not greater than 10 per cent. The content of heterodimers is not greater than 3 per cent.

*Test solution.* Dilute the preparation to be examined with *water R* to a protein concentration of 1 mg/mL.

*Reference solution (a).* Dilute *interferon gamma-1b CRS* with *water R* to a protein concentration of 1 mg/mL.

*Reference solution (b).* Dissolve the contents of a vial of *interferon gamma-1b for system suitability CRS* in *water R* to obtain a protein concentration of about 1 mg/mL.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.075 m long and 7.5 mm in internal diameter packed with an appropriate hydrophilic polymethacrylate, strong cation-exchange gel (10 µm, 100 nm),
- as mobile phase at a flow rate of 1.2 mL/min:

  *Mobile phase A* (*0.05 M ammonium acetate buffer pH 6.5*). A 3.86 g/L solution of *ammonium acetate R*, adjusted to pH 6.5 with *dilute acetic acid R*,

  *Mobile phase B* (*1.2 M ammonium acetate buffer pH 6.5*). A 92.5 g/L solution of *ammonium acetate R*, adjusted to pH 6.5 with *dilute acetic acid R*,

  with the following elution conditions (if necessary, the slope of the gradient may be modified to improve the separation).

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 1 | 100 | 0 |
| 2 - 30 | 100 → 0 | 0 → 100 |
| 31 - 35 | 0 | 100 |

- as detector a spectrophotometer set at 280 nm,

maintaining the temperature of the column at 35 °C.

Inject 25 µL of reference solution (b). In the chromatogram obtained, the retention time of the principal peak is about 26 min. Deamidated and oxidised forms co-elute at a relative retention of about 0.95 with reference to the principal peak. The test is not valid unless the resolution, defined by the ratio of the height of the peak corresponding to the deamidated and oxidised forms to the height above the baseline of the valley separating the two peaks, is at least 1.2.

Inject 25 µL of the test solution and 25 µL of reference solution (a). The chromatograms obtained show principal peaks with identical retention times. Calculate the percentage content of deamidated and oxidised interferon gamma-1b as a percentage of the area of the main peak. Heterodimers have relative retentions of 0.7 and 0.85 with reference to the main peak. Calculate the percentage of heterodimers as a percentage of the sum of the areas of all peaks.

**Impurities of molecular masses differing from that of interferon gamma-1b**. Examine by polyacrylamide gel electrophoresis (*2.2.31*). The test is performed under both

reducing and non-reducing conditions, using resolving gels of 15 per cent acrylamide and silver staining as the detection method.

*Sample buffer (non-reducing conditions).* Dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulfate R* and 0.100 g of *bromophenol blue R* in *water R*. Add 50.0 mL of *glycerol R* and dilute to 80 mL with *water R*. Adjust the pH to 6.8 with *hydrochloric acid R* and dilute to 100 mL with *water R*.

*Sample buffer (reducing conditions).* Dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulfate R* and 0.100 g of *bromophenol blue R* in *water R*. Add 50.0 mL of *glycerol R* and dilute to 80 mL with *water R*. Adjust the pH to 6.8 with *hydrochloric acid R* and dilute to 100 mL with *water R*. Immediately before use, add *dithiothreitol R* to a final concentration of 250 mM.

*Test solution.* Dilute the preparation to be examined in *water R* to a protein concentration of 1 mg/mL. Dilute 150 µL of the solution with 38 µL of sample buffer.

*Reference solution (a).* Prepare in the same manner as for the test solution, but using *interferon gamma-1b CRS* instead of the preparation to be examined.

*Reference solution (b) (5 ng control).* Mix 50 µL of a 0.01 mg/mL solution of *bovine albumin R* with 2000 µL of *water R* and 450 µL of sample buffer.

*Reference solution (c) (2 ng control).* Mix 20 µL of a 0.01 mg/mL solution of *bovine albumin R* with 2000 µL of *water R* and 450 µL of sample buffer.

*Reference solution (d).* Use a solution of molecular mass standards suitable for calibrating SDS-polyacrylamide gels in the range of 10 kDa to 70 kDa.

Leave each solution, contained in a test tube, at ambient temperature for 15 min, then store on ice.

Apply 25 µL of each solution to the stacking gel wells. Perform the electrophoresis under the conditions recommended by the manufacturer of the equipment. Detect proteins in the gel by silver staining.

The test is not valid unless: the validation criteria are met (*2.2.31*); a band is seen in the electropherograms obtained with reference solutions (b) and (c).

The principal band in the electropherogram obtained with the test solution is similar in intensity to the principal band in the electropherogram obtained with reference solution (a). In the electropherogram obtained with the test solution, no significant bands are observed that are not present in the electropherogram obtained with reference solution (a) (0.01 per cent). A significant band is defined as any band whose intensity is greater than or equal to that of the band in the electropherogram obtained with reference solution (c).

**Norleucine**. Not more than 0.2 mole of norleucine per mole of interferon gamma-1b, determined by amino acid analysis.

*Test solution.* Add 2.5 mL of the preparation to be examined onto a column suitable for the desalting of proteins previously equilibrated with 25 mL of a 10 per cent *V/V* solution of *acetic acid R*. Elute the sample with another 2.5 mL of a 10 per cent *V/V* solution of *acetic acid R*. Determine the protein content by measuring the absorbance of this solution as described under Protein, in the Assay section. Pipette a volume containing the equivalent of 100 µg of interferon gamma-1b into each of three reaction vials. Evaporate to dryness under reduced pressure.

Perform the hydrolysis of the three samples as follows. Add to each reaction vial 200 µL of a 50 per cent *V/V* solution of *hydrochloric acid R* containing 1 per cent *V/V* of *phenol R*, evacuate the samples, purge with nitrogen and hydrolyse in the gas phase. Heat the reaction vials at 110 °C for 22 h. After hydrolysis evaporate to dryness under reduced pressure.

Perform the derivatisation of the samples as follows. Prepare immediately before use a mixture consisting of two volumes of *ethanol R*, one volume of *water R* and one volume of *triethylamine R*. Add 50 µL of this solution to each reaction vial and shake lightly. Evaporate to dryness under reduced pressure. Add to each vial 50 µL of a mixture consisting of 7 volumes of *ethanol R*, one volume of *water R*, one volume of *triethylamine R* and one volume of *phenyl isothiocyanate R*. Shake lightly and allow to stand at room temperature for about 15 min. Evaporate to dryness under reduced pressure. Reconstitute the samples in 250 µL of mobile phase A.

*Norleucine stock solution.* Prepare a 250 nmol/mL solution of *DL-norleucine R* in *0.01 M hydrochloric acid. This solution may be kept for two months at 4 °C.*

*Leucine stock solution.* Prepare a 250 nmol/mL solution of *leucine R* in *0.01 M hydrochloric acid. This solution may be kept at 4 °C for two months.*

*Reference solution.* Mix 10 µL of norleucine stock solution with 100 µL of leucine stock solution in each of the three reaction vials. Evaporate to dryness under reduced pressure. Perform the derivatisation of the samples as described for the preparation of the test solution.

Examine by liquid chromatography (*2.2.29*).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in diameter packed with *octadecylsilyl silica gel for chromatography R* (4 µm),
- as mobile phase at a flow rate of 1.0 mL/min:

  *Mobile phase A*. Mix 70 volumes of a 19 g/L solution of *sodium acetate R* containing 0.05 per cent *V/V* of *triethylamine R* and adjusted to pH 6.4 with *dilute acetic acid R* and 30 volumes of mobile phase B,

  *Mobile phase B*. Mix 40 volumes of *water R* and 60 volumes of *acetonitrile R*,

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) | Comment |
|---|---|---|---|
| 0 - 7 | 100 | 0 | isocratic |
| 7 - 7.1 | 100 → 0 | 0 → 100 | linear gradient |
| 7.1 - 10 | 0 | 100 | washing step |
| 10 - 10.1 | 0 → 100 | 100 → 0 | linear gradient |
| 10.1 - 15 | 100 | 0 | re-equilibration |

- as detector a spectrophotometer set at 254 nm,

maintaining the temperature of the column at 43 °C.

Inject 50 µL of each solution.

In the chromatograms obtained with the test solution, identify the peaks corresponding to leucine and norleucine. The retention time of norleucine is 6.2 min to 7 min.

Calculate the content of norleucine (in moles of norleucine per mole of interferon gamma-1b) from the peak areas of leucine and norleucine in the chromatograms obtained with the reference and test solutions, considering that there are 10 moles of leucine per mole of interferon gamma-1b.

**Bacterial endotoxins** (*2.6.14*): less than 5 IU in the volume that contains $20 \times 10^6$ IU of interferon gamma-1b.

ASSAY

**Protein** (*2.2.25*). Dilute the substance to be examined in *water R* to obtain a concentration of 1 mg/mL. Record the absorbance spectrum between 220 nm and 340 nm. Measure the value at the absorbance maximum of 280 nm, after correction for any light scattering due to turbidity measured at 316 nm. Calculate the concentration of interferon gamma-1b using a specific absorbance value of 7.5.

**Potency**. The potency of interferon gamma-1b is estimated by evaluating the increase of the expression of human-leukocyte-antigen-DR (HLA-DR) due to the interferon gamma-1b present in test solutions during cultivation of the cells, and comparing this increase with the same effect of the

appropriate International Standard of human recombinant interferon gamma or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Carry out the assay by a suitable method, based on the following design.

Use COLO 205 cells under standard culture conditions. Trypsinise a 3- to 5-day-old flask of COLO 205 cells and prepare a cell suspension at a concentration of $1.0 \times 10^6$ cells/mL.

Add 100 µL of the dilution medium to all wells of a 96-well microtitre plate. Add an additional 100 µL of this solution to the wells designed for the blanks. Add 100 µL of each solution to be tested onto the plate and carry out a series of twofold dilution steps in order to obtain a standard curve. Then add 100 µL of the cell suspension to all wells and incubate the plate under appropriate conditions for cell cultivation.

After cultivation remove the growth medium and wash and fix cells to the plate. Add an antibody able to detect HLA-DR expressed due to the presence of interferon gamma-1b and incubate under appropriate conditions. After washing the plate, incubate with an antibody conjugated to a marker enzyme which is able to detect the anti-HLA-DR antibody. After this incubation step, wash the plate and add an appropriate substrate solution. Stop the reaction. Measure the absorbance of the solution and calculate the potency of the preparation to be examined by the usual statistical methods.

The estimated specific activity is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 70 per cent and not more than 140 per cent of the estimated potency.

STORAGE

Store in an airtight container, protected from light and at a temperature of − 70 °C.

**01/2008:0031**

# IODINE

## Iodum

$I_2$ $M_r$ 253.8
[7553-56-2]

DEFINITION

*Content*: 99.5 per cent to 100.5 per cent of I.

CHARACTERS

*Appearance*: greyish-violet, brittle plates or fine crystals with a metallic sheen.

*Solubility*: very slightly soluble in water, very soluble in concentrated solutions of iodides, soluble in ethanol (96 per cent), slightly soluble in glycerol.

It volatilises slowly at room temperature.

IDENTIFICATION

A. Heat a few fragments in a test-tube. Violet vapour is evolved and a bluish-black crystalline sublimate is formed.

B. To a saturated solution add *starch solution R*. A blue colour is produced. Heat until decolourised. On cooling, the colour reappears.

TESTS

**Solution S**. Triturate 3.0 g with 20 mL of *water R*, filter, wash the filter with *water R* and dilute the filtrate to 30 mL with the same solvent. To the solution add 1 g of *zinc powder R*. When the solution is decolourised, filter, wash the filter with *water R* and dilute to 40 mL with the same solvent.

**Bromides and chlorides**: maximum 250 ppm.

To 10 mL of solution S add 3 mL of *ammonia R* and 6 mL of *silver nitrate solution R2*. Filter, wash the filter with *water R* and dilute the filtrate to 20 mL with the same solvent. To 10 mL of the solution add 1.5 mL of *nitric acid R*. After 1 min, any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 10.75 mL of *water R*, 0.25 mL of *0.01 M hydrochloric acid*, 0.2 mL of *dilute nitric acid R* and 0.3 mL of *silver nitrate solution R2*.

**Non-volatile substances**: maximum 0.1 per cent.

Heat 1.00 g in a porcelain dish on a water-bath until the iodine has volatilised. Dry the residue at 100-105 °C. The residue weighs a maximum of 1 mg.

ASSAY

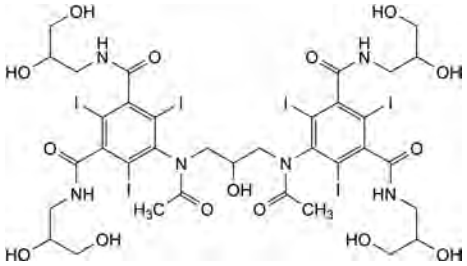
Introduce 0.200 g into a flask containing 1 g of *potassium iodide R* and 2 mL of *water R* and add 1 mL of *dilute acetic acid R*. When dissolution is complete, add 50 mL of *water R* and titrate with *0.1 M sodium thiosulfate*, using *starch solution R* as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 12.69 mg of I.

**01/2017:2215**

# IODIXANOL

## Iodixanolum



$C_{35}H_{44}I_6N_6O_{15}$ $M_r$ 1550
[92339-11-2]

DEFINITION

Mixture of stereoisomers of 5,5′-[(2-hydroxypropane-1,3-diyl)bis(acetylimino)]bis[*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide].

*Content*: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white powder, hygroscopic.

*Solubility*: freely soluble in water, sparingly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *iodixanol CRS*.

B. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.
*Injection*: test solution and reference solution (b).

*Results*: the 3 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 3 principal peaks in the chromatogram obtained with reference solution (b).

TESTS

**Solution S**. Dissolve 5.0 g in *water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Heat solution S at about 98 °C for 30 min without boiling then allow to cool to room temperature. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Impurities E and H**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*.

*Reference solution (b)*. Dissolve 5 mg of *iodixanol impurity E CRS* and 5 mg of *iodixanol impurity H CRS* in *water R* and dilute to 20.0 mL with the same solvent.

*Reference solution (c)*. Mix 5.0 mL of the test solution with 5.0 mL of reference solution (b) and dilute to 50.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *acetonitrile R*, *water R* (50:50 *V/V*);
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 30 | 70 |
| 2 - 27 | 30 → 68 | 70 → 32 |

*Flow rate*: 1.7 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL of the test solution and reference solutions (a) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities E and H.

*Relative retention* with reference to iodixanol (1st peak) (retention time = about 16 min): impurity E (1st peak) = about 0.7; impurity E (2nd peak) = about 0.8; impurity H = about 1.4.

*System suitability*: reference solution (c):

- *resolution*: minimum 5.0 between the 1st peak due to impurity E and the 1st peak due to iodixanol.

*Limits*:

- *correction factor*: for the calculation of total content of impurity E, multiply the peak area of the 1st peak due to impurity E by 1.7;
- *impurity H*: not more than 0.6 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (0.6 per cent);
- *impurity E*: not more than 0.3 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (0.3 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with *water R*.

*Reference solution (b)*. Dissolve 25 mg of *iodixanol CRS* in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (c)*. Dissolve 5 mg of *iodixanol impurity C CRS* and 5 mg of *iopentol CRS* in *water R* and dilute to 10.0 mL with the same solvent. Dilute 5.0 mL of this solution to 100.0 mL with *water R*.

*Reference solution (d)*. Mix 5.0 mL of the test solution with 5.0 mL of reference solution (c) and dilute to 50.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *water R*;
- *mobile phase B*: *acetonitrile R*, *water R* (50:50 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 94 | 6 |
| 2 - 32 | 94 → 80 | 6 → 20 |
| 32 - 72 | 80 → 0 | 20 → 100 |
| 72 - 82 | 0 | 100 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL of the test solution and reference solutions (a), (c) and (d).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurity C and iopentol.

*Relative retention* with reference to iodixanol (1st peak) (retention time = about 27 min): iopentol (1st peak) = about 0.8; iopentol (2nd peak) = about 0.9; impurity C (1st peak) = about 1.04; overalkylated impurities (a group of peaks) = 1.33-1.70.

*System suitability*: reference solution (d):

- *resolution*: baseline separation between the 2 peaks due to iopentol;
- *peak-to-valley ratio*: minimum 1.3, where $H_p$ = height above the baseline of the 1st peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the 1st peak due to iodixanol.

*Limits*:

- *correction factor*: for the calculation of total content of impurity C, multiply the peak area of the 1st peak due to impurity C by 1.3;
- *impurity C*: not more than 0.4 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (0.4 per cent);
- *overalkylated impurities (such as impurity I)*: not more than the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *unspecified impurities*: for each impurity, not more than 0.1 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 1.5 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (1.5 per cent);
- *disregard limit*: 0.05 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (a) (0.05 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Free aromatic amine**: maximum 500 ppm.

*Test solution.* Transfer 0.200 g of the substance to be examined to a 25 mL volumetric flask and dissolve in 15.0 mL of *water R*.

*Reference solution.* Dissolve 5.0 mg of *iohexol impurity J CRS* in *water R* and dilute to 5.0 mL with the same solvent. Dilute 1.0 mL of this solution to 100.0 mL with *water R*. Mix 10.0 mL of this solution with 5.0 mL of *water R* in a 25 mL volumetric flask.

*Blank solution.* Transfer 15.0 mL of *water R* to a 25 mL volumetric flask.

*In conducting the following steps, keep the flasks in iced water and protected as much as possible from light until all the reagents have been added.*

Place the 3 flasks containing respectively the test solution, the reference solution and the blank solution in iced water, protected from light, for 5 min. Add 1.5 mL of *hydrochloric acid R1* and mix by swirling. Add 1.0 mL of a 20 g/L solution of *sodium nitrite R*, mix and allow to stand for 4 min. Add 1.0 mL of a 40 g/L solution of *sulfamic acid R*, swirl gently until gas liberation has ceased and allow to stand for 1 min. (*CAUTION: considerable pressure is produced*). Add 1.0 mL of a freshly prepared 3 g/L solution of *naphthylethylenediamine dihydrochloride R* in a mixture of 30 volumes of *water R* and 70 volumes of *propylene glycol R* and mix. Remove the flasks from the iced water, dilute to 25.0 mL with *water R*, mix and examine the solutions after 5 min. The solution obtained from the test solution is less coloured than the solution obtained from the reference solution. If the solution obtained from the test solution is about the same colour or darker than the solution obtained from the reference solution, proceed as follows. Concomitantly determine the absorbance (*2.2.25*) at 495 nm of the solution obtained from the test solution and the reference solution in 5 cm cells, using the blank solution as the compensation liquid. The absorbance of the solution obtained from the test solution is not greater than that of the solution obtained from the reference solution.

**Free iodine**. Transfer 2.0 g to a glass-stoppered tube, add 20 mL of *water R*, 5 mL of *toluene R* and 5 mL of *dilute sulfuric acid R*, shake vigorously and allow the phases to separate: the toluene layer shows no red or pink colour.

**Iodide**: maximum 10 ppm.

Dissolve 5.000 g in *water R* and dilute to 20.0 mL with the same solvent. Titrate with *0.001 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*) using a silver indicator electrode and an appropriate reference electrode.

1 mL of *0.001 M silver nitrate* is equivalent to 126.9 µg of iodide.

**Ionic compounds** (*2.2.38*): maximum 0.02 per cent *m/m* calculated as sodium chloride.

*Rinse all glassware with distilled water R 5 times before use.*

*Test solution.* Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solution.* Dissolve 20.0 mg of *sodium chloride R* in *water R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of this solution to 100.0 mL with *water R*.

Measure the specific conductivity of the test solution and the reference solution using a suitable conductivity meter. The specific conductivity of the test solution is not greater than that of the reference solution.

**Water** (*2.5.12*): maximum 4.0 per cent, determined on 0.500 g.

ASSAY

In a 125 mL round-bottomed flask, dissolve 0.200 g in 25 mL of a 50 g/L solution of *sodium hydroxide R*, add 0.5 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 1 h. Allow to cool and rinse the condenser with 20 mL of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (40) (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 5 mL of *glacial acetic acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 25.84 mg of $C_{35}H_{44}I_6N_6O_{15}$.

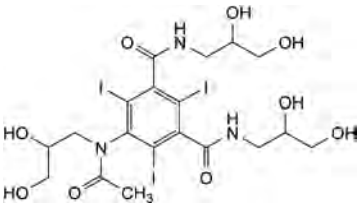
STORAGE

In an airtight container, protected from light.

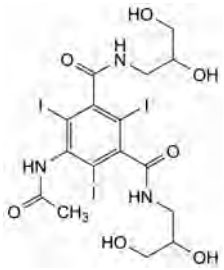
IMPURITIES

*Specified impurities: C, E, H, overalkylated impurities.*

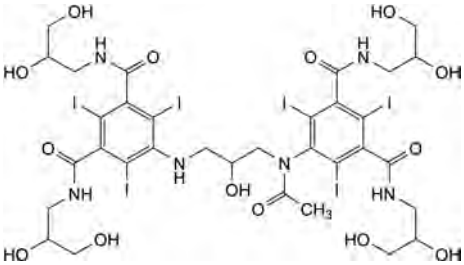
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use: A, B, F, G.*



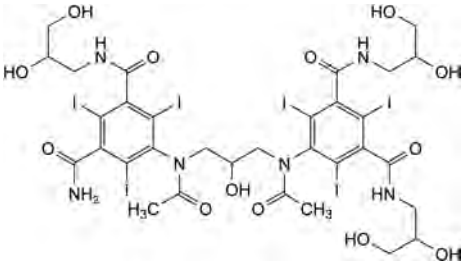
A. 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide (iohexol),



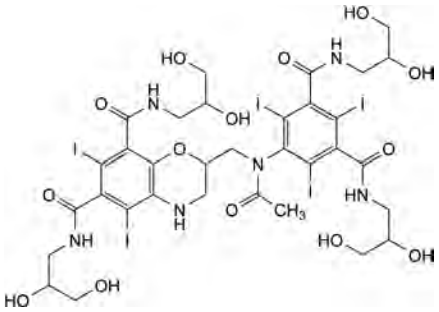
B. 5-acetamido-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



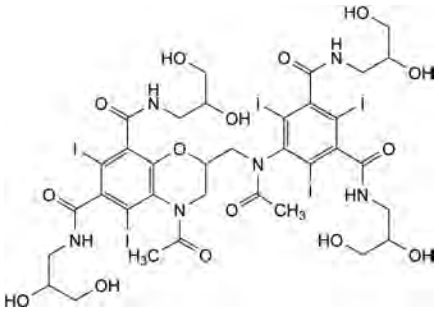
C. 5-[acetyl[3-[[3,5-bis[(2,3-dihydroxypropyl)carbamoyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



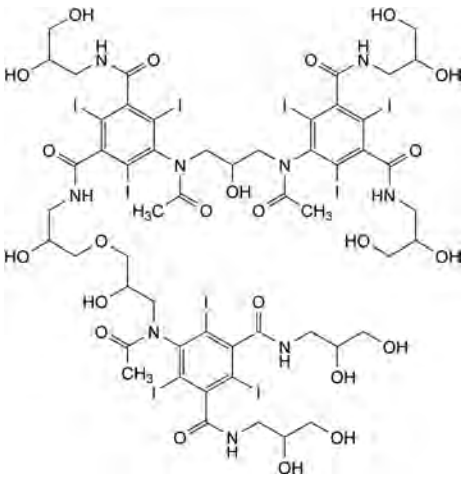
E. 5-[acetyl[3-[acetyl[3-carbamoyl-5-[(2,3-dihydroxypropyl)-carbamoyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]-amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



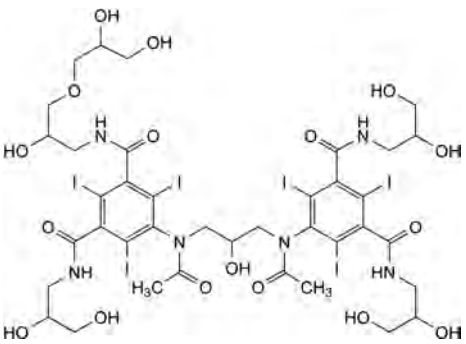
F. 2-[[acetyl[3,5-bis[(2,3-dihydroxypropyl)carbamoyl]-2,4,6-triiodophenyl]amino]methyl]-*N*,*N*′-bis(2,3-dihydroxypropyl)-5,7-diiodo-3,4-dihydro-2*H*-1,4-benzoxazine-6,8-dicarboxamide,



G. 4-acetyl-2-[[acetyl[3,5-bis[(2,3-dihydroxypropyl)-carbamoyl]-2,4,6-triiodophenyl]amino]methyl]-*N*,*N*′-bis(2,3-dihydroxypropyl)-5,7-diiodo-3,4-dihydro-2*H*-1,4-benzoxazine-6,8-dicarboxamide,



H. 5-[acetyl[3-[acetyl[3-[[3-[3-[acetyl[3,5-bis[(2,3-dihydroxypropyl)carbamoyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropoxy]-2-hydroxypropyl]carbamoyl]-5-[(2,3-dihydroxypropyl)carbamoyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide.



I. overalkylated impurities (an example): 5-[acetyl[3-[acetyl[3,5-bis[(2,3-dihydroxypropyl)carbamoyl]-2,4,6-triiodophenyl]amino]-2-hydroxypropyl]amino]-*N*-[3-(2,3-dihydroxypropoxy)-2-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide.

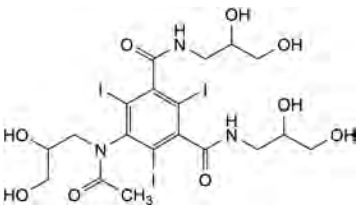
# IOHEXOL

## Iohexolum



$C_{19}H_{26}I_3N_3O_9$ $M_r$ 821
[66108-95-0]

DEFINITION

5-[Acetyl(2,3-dihydroxypropyl)amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide.

The substance is a mixture of diastereoisomers and atropisomers.

*Content*: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or greyish-white, hygroscopic powder.

*Solubility*: very soluble in water, freely soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *iohexol CRS*.

B. Examine the chromatograms obtained in test A for related substances.
*Results*: the principal peaks in the chromatogram obtained with reference solution (b) are similar in retention time and size to the peaks due to iohexol in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 5.0 g in *water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Related substances**

A. Liquid chromatography (*2.2.29*).

*NOTE: iohexol gives rise to 2 non-resolved peaks in the chromatogram due to endo-exo isomerism. In addition, a small peak (also due to iohexol) usually appears at the leading edge of the 1st principal peak. This small peak has a retention time about 1.2 min less than the 1st principal peak.*

*Test solution.* Dissolve 0.150 g of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a).* Dissolve 15.0 mg of *iohexol CRS* and 15.0 mg of *iohexol impurity A CRS* in a mixture of 0.05-0.1 mL of *dilute sodium hydroxide solution R* and 10 mL of *water R* and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with *water R*.

*Reference solution (c).* Dissolve 5.0 mg of *iohexol for peak identification CRS* (containing impurities B, C, D and E) in *water R* and dilute to 5.0 mL with the same solvent.

*Blank solution*: *water R*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:

- *mobile phase A*: *water R*;
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 60 | 99 → 87 | 1 → 13 |

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Retention time*: impurities A and H = about 17 min; iohexol (peaks corresponding to *endo-exo* isomerism) = about 20 min.

*System suitability*: reference solution (a):

- *resolution*: minimum 5.0 between the peak due to impurity A and the 2nd and greater peak due to iohexol.

*Limits*:

- *sum of impurities B, C, D and E* (relative retention with reference to the 2nd and greater peak due to iohexol between 1.1 and 1.4): not more than 0.6 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.6 per cent); use the chromatogram obtained with reference solution (c) to identify the corresponding peaks;
- *sum of impurities A and H*: not more than 0.5 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *unspecified impurities*: for each impurity, not more than 0.1 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 1.5 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (1.5 per cent);
- *disregard limit*: 0.03 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.03 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 50 mg of *iohexol impurity J CRS* and 50 mg of *iohexol CRS* in *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 10.0 mL with *water R*. Dilute 1.0 mL of this solution to 50.0 mL with *water R*.

*Plate*: *TLC silica gel $F_{254}$ plate R*.

*Pretreatment*: wash the plate with the mobile phase, dry at room temperature for 30 min, then at 90 °C for 1 h.

*Mobile phase*: *concentrated ammonia R*, *methanol R*, *2-propanol R*, *acetone R* (16:16:28:40 *V/V/V/V*).

*Application*: 10 µL.

*Development*: over 1/2 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (a):

- the chromatogram shows 2 clearly separated spots.

*Limits*:

- *any impurity*: any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**3-Chloropropane-1,2-diol**. Gas chromatography (*2.2.28*).

*Test solution.* Dissolve 1.0 g of the substance to be examined in 1.0 mL of *water R*. Shake with 4 quantities, each of 2 mL, of *methyl acetate R*. Dry the combined upper layers over *anhydrous sodium sulfate R*. Filter and concentrate to about 0.7 mL using a warm water-bath at 60 °C and a stream of nitrogen and dilute to 1.0 mL with *methyl acetate R*.

*Reference solution.* Dissolve 0.25 g of *3-chloropropane-1,2-diol R* in 100.0 mL of *methyl acetate R*. Dilute 1.0 mL of this solution to 100.0 mL with *methyl acetate R*.

*Column*:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.33 mm;
- *stationary phase*: *phenyl(50)methyl(50)polysiloxane R* (film thickness 1 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1 mL/min.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 2 | 80 |
| | 2 - 8 | 80 → 170 |
| | 8 - 10 | 170 |
| Injection port | | 230 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 2 µL (splitless for 30 s).

*System suitability*: reference solution:

- *retention time*: 3-chloropropane-1,2-diol = about 8 min.

*Limit*:

- *3-chloropropane-1,2-diol*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (25 ppm).

**Free aromatic amine**: maximum 500 ppm.

*Test solution.* Transfer 0.200 g of the substance to be examined to a 25 mL volumetric flask and dissolve in 15.0 mL of *water R*.

*Reference solution.* Dissolve 5.0 mg of *iohexol impurity J CRS* in *water R* and dilute to 5.0 mL with *water R*. Dilute 1.0 mL of the solution to 100.0 mL with *water R*. Mix 10.0 mL of this solution with 5.0 mL of *water R* in a 25 mL volumetric flask.

*Blank solution.* Transfer 15.0 mL of *water R* to a 25 mL volumetric flask.

*In conducting the following steps, keep the flasks in iced water and protected as much as possible from light until all of the reagents have been added.*

Place the 3 flasks containing respectively the test solution, the reference solution and the blank solution in iced water, protected from light, for 5 min. Add 1.5 mL of *hydrochloric acid R1* and mix by swirling. Add 1.0 mL of a 20 g/L solution of *sodium nitrite R*, mix and allow to stand for 4 min. Add 1.0 mL of a 40 g/L solution of *sulfamic acid R*, swirl gently until gas liberation has ceased and allow to stand for 1 min. *(CAUTION: considerable pressure is produced).* Add 1.0 mL of a freshly prepared 3 g/L solution of *naphthylethylenediamine dihydrochloride R* in a mixture of 30 volumes of *water R* and 70 volumes of *propylene glycol R* and mix. Remove the flasks from the iced water, dilute to 25.0 mL with *water R*, mix and allow to stand for 5 min. Simultaneously determine the absorbance (*2.2.25*) at 495 nm of the solutions obtained from the test solution and the reference solution in 5 cm cells, using the blank as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

**Iodide**: maximum 10 ppm.

Dissolve 6.000 g in *water R* and dilute to 20 mL with the same solvent. Add 2.0 mL of *0.001 M potassium iodide*. Titrate with *0.001 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 mL of *0.001 M potassium iodide*, determined by titrating a blank to which is added 2.0 mL of *0.001 M potassium iodide* and use the residual value to calculate the iodide content.

1 mL of *0.001 M silver nitrate* is equivalent to 126.9 µg of $I^-$.

**Ionic compounds** (*2.2.38*): maximum 0.01 per cent *m/m* calculated as sodium chloride.

*Rinse all glassware with distilled water R 5 times before use.*

*Test solution.* Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solution.* Dissolve 20.0 mg of *sodium chloride R* in *water R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of this solution to 100.0 mL with *water R*.

Measure the conductivity of the test solution and the reference solution using a suitable conductivity meter. The conductivity of the test solution is not greater than that of the reference solution.

**Water** (*2.5.12*): maximum 4.0 per cent, determined on 1.00 g.

ASSAY

To 0.500 g in a 125 mL round-bottomed flask add 25 mL of a 50 g/L solution of *sodium hydroxide R*, 0.5 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 mL of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 5 mL of *glacial acetic acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 27.37 mg of $C_{19}H_{26}I_3N_3O_9$.

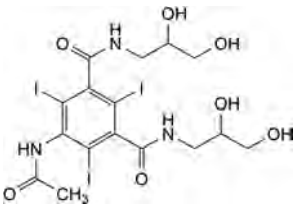
STORAGE

In an airtight container, protected from light and moisture.

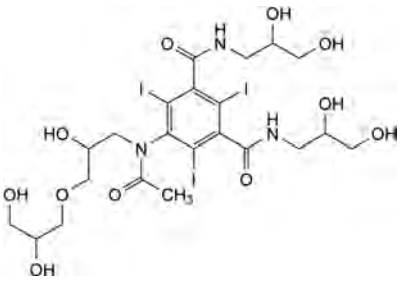
IMPURITIES

*Specified impurities: A, B, C, D, E, H.*

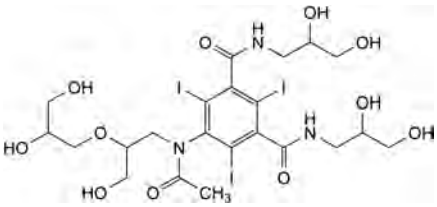
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G, I, J, K, L, M, N, O, P, Q.*



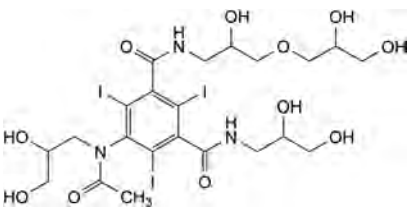
A. 5-(acetylamino)-*N,N′*-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



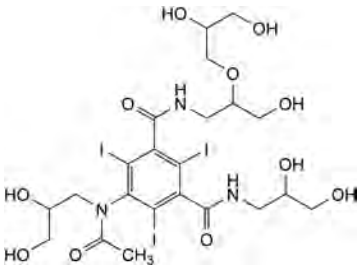
B. 5-[acetyl[3-(2,3-dihydroxypropoxy)-2-hydroxypropyl]-amino]-*N,N′*-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



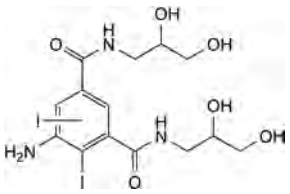
C. 5-[acetyl[2-(2,3-dihydroxypropoxy)-3-hydroxypropyl]-amino]-*N,N′*-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



D. 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*-[3-(2,3-dihydroxypropoxy)-2-hydroxypropyl]-*N′*-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



E. 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*-[2-(2,3-dihydroxypropoxy)-3-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



F. 5-amino-*N*,*N*′-bis(2,3-dihydroxypropyl)diiodobenzene-1,3-dicarboxamide,

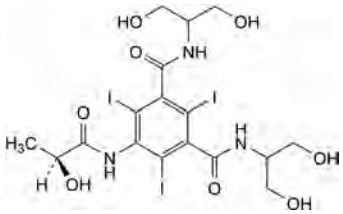
# IOPAMIDOL

## Iopamidolum



$C_{17}H_{22}I_3N_3O_8$ $M_r$ 777
[60166-93-0]

DEFINITION

*N*,*N*′-Bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzene-1,3-dicarboxamide.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: freely soluble in water, very slightly soluble in methanol, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *iopamidol CRS*.

B. Loss on drying (see Tests).

C. Specific optical rotation (see Tests).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1 g in *water R* and dilute to 50 mL with the same solvent.

**Acidity or alkalinity**. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent. Not more than 0.75 mL of *0.01 M hydrochloric acid* or 1.4 mL of *0.01 M sodium hydroxide* is required to adjust to pH 7.0 (*2.2.3*).

**Specific optical rotation** (*2.2.7*): − 4.6 to − 5.2 (dried substance), determined at 436 nm.

Dissolve 10.0 g, with heating if necessary, in *water R* and dilute to 25.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a).* Dissolve 5.0 mg of *iopamidol impurity H CRS* in *water R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b).* Dilute 2.0 mL of the test solution to 20.0 mL with *water R*. Dilute 1.0 mL of this solution to 50.0 mL with *water R*.

*Reference solution (c).* Add 0.1 mL of the test solution to 20 mL of reference solution (a) and dilute to 50 mL with *water R*.

*Column*: 2 columns coupled in series,

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *phenylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 60 °C.

*Mobile phase*:

- *mobile phase A*: *water R*,
- *mobile phase B*: *acetonitrile R*, *water R* (50:50 *V/V*),

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 18 | 100 | 0 |
| 18 - 40 | 100 - 62 | 0 - 38 |
| 40 - 45 | 62 - 50 | 38 - 50 |
| 45 - 50 | 50 - 100 | 50 - 0 |
| 50 - 60 | 100 | 0 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 240 nm.

*Injection*: 20 µL.

*Relative retention* with reference to iopamidol (retention time = about 14.6 min): impurity D = about 0.1; impurity B = about 0.6; impurities I and H = about 0.9; impurity G = about 1.1; impurity K = about 1.2; impurity C = about 1.3; impurity J = about 1.5; impurity A = about 1.8; impurity E = about 2.2; impurity F = about 2.3.

*System suitability*: reference solution (c):

- *resolution*: minimum 2.0 between the peaks due to impurity H and iopamidol.

*Limits*:

- *sum of impurities H and I*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *impurities A, B, C, D, E, F, G, J, K*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *sum of impurities other than H and I*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

**Free aromatic amines**: maximum 200 ppm.

*Keep the solutions and reagents in iced water, protected from bright light.*

*Test solution.* In a 25 mL volumetric flask, dissolve 0.500 g of the substance to be examined in 20.0 mL of *water R*.

*Reference solution.* In a 25 mL volumetric flask, mix 4.0 mL of a 25.0 mg/L solution of *iopamidol impurity A CRS* with 16.0 mL of *water R*.

*Blank solution.* Place 20.0 mL of *water R* in a 25 mL volumetric flask.

Place the flasks in iced water, protected from light, for 5 min. Add 1.0 mL of *hydrochloric acid R* to each flask, mix and allow to stand for 5 min. Add 1.0 mL of a 20 g/L solution of *sodium nitrite R* prepared immediately before use, mix and allow to stand for 5 min. Add 1.0 mL of a 120 g/L solution of *ammonium sulfamate R*, swirl gently until gas liberation has ceased, and allow to stand for 5 min. *(CAUTION: considerable pressure is produced).* Add 1.0 mL of a freshly prepared 1 g/L solution of *naphthylethylenediamine dihydrochloride R* and mix. Remove the flasks from the iced water and allow to stand for 10 min. Dilute to 25.0 mL with *water R* and mix. Measure immediately the absorbance (*2.2.25*) at 500 nm of the solutions obtained from the test solution and the reference solution using, as the compensation liquid, the solution obtained from the blank solution.

The absorbance of the test solution is not greater than that of the reference solution.

**Free iodine**: maximum 10 ppm.

Dissolve 2.0 g in 25 mL of *water R* in a ground-glass stoppered centrifuge tube. Add 5 mL of *toluene R* and 5 mL of *dilute sulfuric acid R*. Shake and centrifuge. Any red colour of the upper layer is not more intense than that of the upper phase obtained in the same way from 22 mL of *water R*, 2 mL of *iodide standard solution (10 ppm I) R*, 5 mL of *dilute sulfuric acid R*, 1 mL of *strong hydrogen peroxide solution R* and 5 mL of *toluene R*.

**Iodide**: maximum 10 ppm.

Dissolve 6.000 g in *water R* and dilute to 20 mL with the same solvent. Add 2.0 mL of *0.001 M potassium iodide*. Carry out a potentiometric titration (*2.2.20*) with *0.001 M silver nitrate* using a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 mL of *0.001 M potassium iodide*, determined by titrating a blank to which is added 2.0 mL of *0.001 M potassium iodide* and use the residual value to calculate the iodide content.

1 mL of *0.001 M silver nitrate* is equivalent to 126.9 µg of iodide.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 1.4 IU/g, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

To 0.300 g in a 250 mL round-bottomed flask add 5 mL of *strong sodium hydroxide solution R*, 20 mL of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 mL of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 5 mL of *glacial acetic acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*) using a suitable electrode system such as silver-silver chloride.

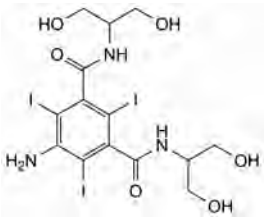
l mL of *0.1 M silver nitrate* is equivalent to 25.90 mg of $C_{17}H_{22}I_3N_3O_8$.

STORAGE

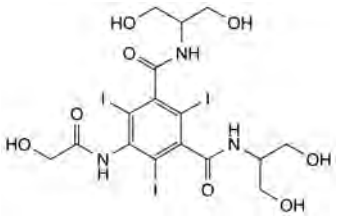
Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-evident container.

IMPURITIES

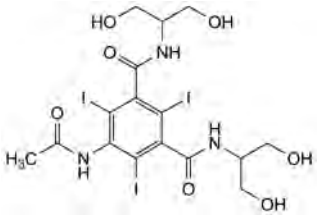
*Specified impurities: A, B, C, D, E, F, G, H, I, J, K.*



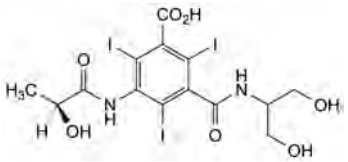
A. 5-amino-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodobenzene-1,3-dicarboxamide,



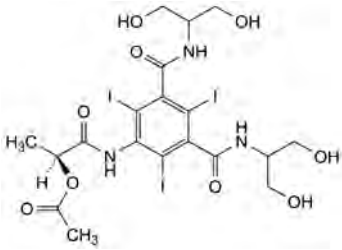
B. 5-[(hydroxyacetyl)amino]-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodobenzene-1,3-dicarboxamide,



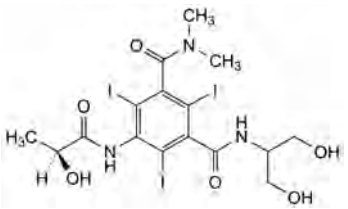
C. 5-(acetylamino)-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodobenzene-1,3-dicarboxamide,



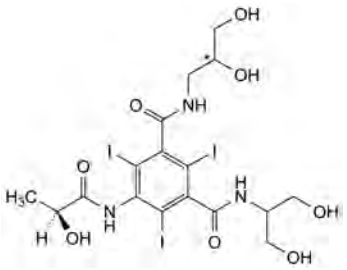
D. 3-[[2-hydroxy-1-(hydroxymethyl)ethyl]carbamoyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzoic acid,



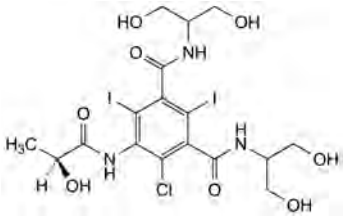
E. (1*S*)-2-[[3,5-bis[[2-hydroxy-1-(hydroxymethyl)ethyl]-carbamoyl]-2,4,6-triiodophenyl]amino]-1-methyl-2-oxoethyl acetate,



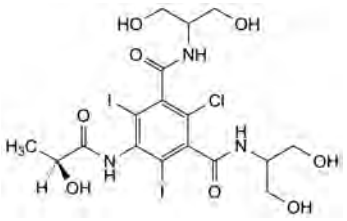
F. *N*'-[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodo-*N*,*N*-dimethylbenzene-1,3-dicarboxamide,



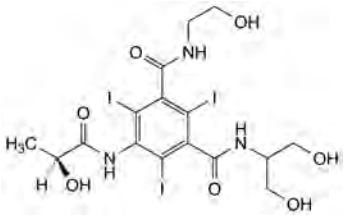
G. *N*-(2,3-dihydroxypropyl)-*N*'-[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]-amino]-2,4,6-triiodobenzene-1,3-dicarboxamide,



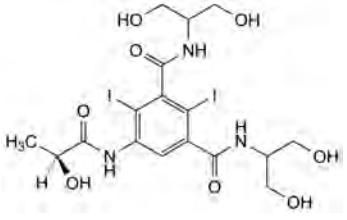
H. 4-chloro-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,6-diiodobenzene-1,3-dicarboxamide,



I. 2-chloro-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-4,6-diiodobenzene-1,3-dicarboxamide,



J. *N*-(2-hydroxyethyl)-*N*'-[2-hydroxy-1-(hydroxymethyl)-ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzene-1,3-dicarboxamide,

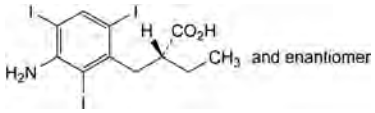


K. *N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4-diiodobenzene-1,3-dicarboxamide.

**01/2016:0700**

# IOPANOIC ACID

## Acidum iopanoicum



$C_{11}H_{12}I_3NO_2$ $M_r$ 571

[96-83-3]

DEFINITION

Iopanoic acid contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-2-(3-amino-2,4,6-tri-iodobenzyl)butanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, soluble in anhydrous ethanol and in methanol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification: B.*

*Second identification: A, C, D.*

A. Melting point (*2.2.14*): about 155 °C, with decomposition.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *iopanoic acid CRS*.

C. Examine the chromatograms obtained in the test for related substances (see Tests). Spray the plate with a 1 g/L solution of *4-dimethylaminocinnamaldehyde R* in a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *ethanol (96 per cent) R*. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Heat 50 mg carefully in a small porcelain dish over a flame. Violet vapour is evolved.

TESTS

**Appearance of solution**. Dissolve 1.0 g in *1 M sodium hydroxide* and dilute to 20 mL with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_3$ (*2.2.2, Method II*).

**Related substances**. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* $GF_{254}$ *R* as the coating substance.

*Test solution (a).* Dissolve 1.0 g of the substance to be examined in a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R* and dilute to 10 mL with the same mixture of solvents.

*Test solution (b).* Dilute 1 mL of test solution (a) to 10 mL with a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R*.

*Reference solution (a).* Dissolve 50 mg of *iopanoic acid CRS* in a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R* and dilute to 5 mL with the same mixture of solvents.

*Reference solution (b).* Dilute 1 mL of test solution (b) to 50 mL with a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R*.

Apply separately to the plate 5 µL of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *concentrated ammonia R*, 20 volumes of *methanol R*, 20 volumes of *toluene R* and 50 volumes of *dioxan R*. Examine

in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

**Halides**. To 0.46 g add 10 mL of *nitric acid R* and 15 mL of *water R*. Shake for 5 min and filter. 15 mL of the filtrate complies with the limit test for chlorides (*2.4.4*) (180 ppm, expressed as chloride).

**Loss on drying** (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

**Sulfated ash** (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.150 g in a 250 mL round-bottomed flask add 5 mL of *strong sodium hydroxide solution R*, 20 mL of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 60 min. Allow to cool and rinse the condenser with 20 mL of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 mL of *dilute sulfuric acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 19.03 mg of $C_{11}H_{12}I_3NO_2$.

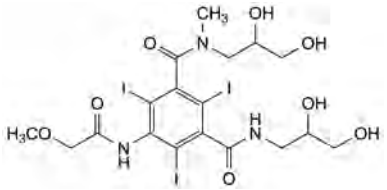
STORAGE

Store protected from light.

**01/2017:1753**

# IOPROMIDE

## Iopromidum



$C_{18}H_{24}I_3N_3O_8$ $M_r$ 791
[73334-07-3]

DEFINITION

*N*,*N*′-Bis(2,3-dihydroxypropyl)-2,4,6-triiodo-5-[(methoxyacetyl)amino]-*N*-methylbenzene-1,3-dicarboxamide.

Mixture of diastereoisomers and atropisomers.

*Content*: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or slightly yellowish powder.

*Solubility*: freely soluble in water and in dimethyl sulfoxide, practically insoluble in ethanol (96 per cent) and in acetone.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *iopromide CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solutions $BY_6$, $B_6$ and $Y_6$ (*2.2.2, Method I*).

Dissolve 16.5 g in 20 mL of *carbon dioxide-free water R* while heating on a water-bath at a temperature not exceeding 70 °C. Allow to cool to room temperature.

**Conductivity** (*2.2.38*): maximum 50 µS·cm$^{-1}$.

Dissolve 1.000 g in *water R* and dilute to 50.0 mL with the same solvent.

**Impurity A and related primary aromatic amines**: maximum 0.01 per cent.

*Protect the solutions from light throughout the test. All given times are critical for the test results. The test solution, reference solution and blank solution must be processed in parallel.*

*Test solution*. Dissolve 0.500 g of the substance to be examined in 20.0 mL of *water R* in a 25 mL volumetric flask.

*Reference solution*. Dissolve the contents of a vial of *iopromide impurity A CRS* in 5.0 mL of *water R*. Transfer 2.0 mL of this solution to a 25 mL volumetric flask and add 18.0 mL of *water R*.

*Blank solution*. Place 20.0 mL of *water R* in a 25 mL volumetric flask.

Cool the test solution, reference solution and blank solution in a bath of iced water for 5 min. Add 1.0 mL of *hydrochloric acid R1* to each solution and cool again for 5 min in a bath of iced water. Add 1.0 mL of a 20 g/L solution of *sodium nitrite R*, shake vigorously and cool for another 5 min in a bath of iced water. To each solution add 0.50 mL of an 80 g/L solution of *sulfamic acid R*. Over the next 5 min, shake vigorously several times, raising the stoppers to vent the gas that evolves. Afterwards, add to each solution 1.0 mL of a 1 g/L solution of *naphthylethylenediamine dihydrochloride R* in a mixture of 300 volumes of *water R* and 700 volumes of *propylene glycol R*, shake, allow to cool to room temperature for 10 min and dilute to 25.0 mL with *water R*. Degas the solutions in an ultrasonic bath for 1 min and measure the absorbance (*2.2.25*) of the test solution and the reference solution at 495 nm against the blank, within 5 min. The test is not valid unless the absorbance of the reference solution is at least 0.08. The absorbance of the test solution is not greater than the absorbance of the reference solution.

**Impurity B**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *methanol R*, *water R* (50:50 *V/V*).

*Test solution*. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 40.0 mg of *iopromide CRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

*Reference solution (b)*. Introduce several millilitres of reference solution (a) into a vial sealed with a crimp-top. Heat at 121 °C for 15 min.

*Reference solution (c)*. Dilute 1.5 mL of the test solution to 100.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 20 °C.

*Mobile phase*: mix 6 g of *chloroform R* with 59 g of *methanol R*. Add 900 g of *water for chromatography R* in small portions to the chloroform/methanol mixture and stir for at least 2 h to obtain a homogeneous solution.

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL of the test solution and reference solutions (a) and (c).

*Run time*: 50 min.

*Identification of impurities*: use the chromatogram supplied with *iopromide CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurity B isomers $Y_1$ and $Y_2$.

*Relative retention* with reference to iopromide isomer $Z_2$ (retention time = about 34 min): impurity B isomer $Y_1$ = about 0.28; impurity B isomer $Y_2$ = about 0.31.

*System suitability*: reference solution (a):

– the chromatogram obtained shows 2 peaks due to impurity B isomers $Y_1$ and $Y_2$.

*Limit*:

– *sum of impurity B isomers $Y_1$ and $Y_2$*: not more than the sum of the areas of the 2 principal peaks due to the iopromide in the chromatogram obtained with reference solution (c) (1.5 per cent).

**Related substances**. Thin-layer chromatography (*2.2.27*).

*Solvent mixture*: *methanol R*, *water R* (50:50 *V/V*).

*Test solution*. Dissolve 1.0 g of the substance to be examined in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 5.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (c)*. Dilute 2.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (d)*. Dilute 1.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (e)*. Dissolve the contents of a vial of *iopromide for system suitability 1 CRS* (containing impurities B and E) in 50 µL of the solvent mixture.

*Reference solution (f)*. Dissolve the contents of a vial of *iopromide for system suitability 2 CRS* (containing impurities B, C, D and F) in 50 µL of the solvent mixture.

*Plates*: *TLC silica gel $F_{254}$ plate R* (2 plates).

A. *Mobile phase*: *concentrated ammonia R*, *water R*, *dioxan R* (4:15:85 *V/V/V*).

*Application*: 2 µL of the test solution and reference solutions (b), (d) and (e).

*Development*: over 3/4 of the plate.

*Drying*: in a current of air, until complete evaporation of the solvents, then at 120 °C for 30 min.

*Detection*: examine immediately in ultraviolet light at 254 nm; expose to ultraviolet light for 2-5 min until the principal spots appear clearly as yellow spots, then spray with *ferric chloride-ferricyanide-arsenite reagent R* and examine immediately in daylight.

*Retardation factors*: impurity B = about 0.26; iopromide = about 0.34; impurity E = about 0.41.

*System suitability*: reference solution (e):

– the chromatogram shows 3 clearly separated spots.

*Limits*:

– *impurity E*: any spot due to impurity E is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *unspecified impurities*: any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (d) (0.10 per cent); disregard any spot due to impurity B.

B. *Mobile phase*: *anhydrous formic acid R*, *water R*, *methanol R*, *chloroform R* (2:6:32:62 *V/V/V/V*).

*Application*: 2 µL of the test solution and reference solutions (a), (b) ,(c), (d) and (f).

*Development*: over 3/4 of the plate.

*Drying*: in a current of air, until complete evaporation of the solvents, then at 120 °C for 30 min.

*Detection*: examine immediately in ultraviolet light at 254 nm; expose to an ammonia vapour for 30 min, dry in a current of air for 10 min, then expose to ultraviolet light for 2-5 min until the principal spots appear clearly as yellow spots, then spray with *ferric chloride-ferricyanide-arsenite reagent R* and examine immediately in daylight.

*Retardation factors*: impurity C = about 0.23; impurity D = about 0.29; impurity B = about 0.36; iopromide = about 0.43; impurity F = about 0.71.

*System suitability*: reference solution (f):

– the chromatogram shows 5 clearly separated spots.

*Limits*:

– *impurity D*: any spot due to impurity D is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (1.0 per cent);

– *impurity C*: any spot due to impurity C is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *impurity F*: any spot due to impurity F is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *unspecified impurities*: any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (d) (0.10 per cent); disregard any spot due to impurity B.

**Isomer distribution**. Liquid chromatography (*2.2.29*) as described in the test for impurity B with the following modifications.

Calculate the percentage content of the isomer groups with reference to the total area of all the peaks due to the 4 iopromide isomers, using the chromatogram obtained with the test solution.

*Limits*:

– *sum of iopromide isomers $E_1$ and $Z_1$*: 40.0 per cent to 51.0 per cent;

– *sum of iopromide isomers $E_2$ and $Z_2$*: 49.0 per cent to 60.0 per cent.

**Free iodine**. Dissolve 2.0 g in 20 mL of *water R* in a glass-stoppered test tube. Add 2 mL of *dilute sulfuric acid R* and 2 mL of *toluene R*, close and shake vigorously. The upper layer remains colourless (*2.2.2, Method II*).

**Iodide**: maximum 2 ppm.

Dissolve 10.0 g in 50 mL of *carbon dioxide-free water R*. Adjust to pH 3-4 adding about 0.15 mL of *0.1 M sulfuric acid*. Titrate with *0.001 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*) using a combined metal electrode. Not more than 0.15 mL of *0.001 M silver nitrate* is required to reach the end-point.

**Water** (*2.5.12*): maximum 1.5 per cent, determined on 1.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 1.0 IU/g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurity B with the following modifications.

*Injection*: test solution and reference solutions (a) and (b).

*Identification of the isomers*: the 2 principal peaks in the chromatogram obtained with reference solution (a) are due to iopromide isomers $Z_1$ and $Z_2$ . The 2 peaks that have an increased size in the chromatogram obtained with reference solution (b) in comparison to the chromatogram obtained with reference solution (a), are due to iopromide isomers $E_1$ and $E_2$.

*Relative retention* with reference to iopromide isomer $Z_2$ (retention time = about 34 min): iopromide isomer $E_1$ = about 0.70; iopromide isomer $E_2$ = about 0.75; iopromide isomer $Z_1$ = about 0.85.

*System suitability*: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to iopromide isomers $Z_1$ and $Z_2$.

Calculate the percentage content of iopromide from the declared content of *iopromide CRS* and from the sum of the areas of all of the peaks due to isomer groups E and Z.

STORAGE

Protected from light.

IMPURITIES

*Specified impurities*: *A, B, C, D, E, F.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, H.*

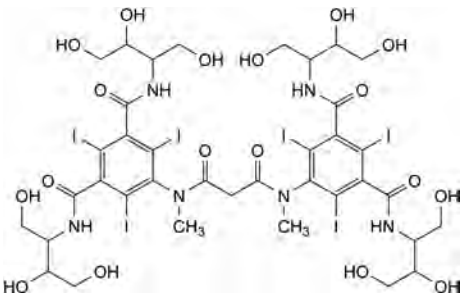
# IOTROLAN

## Iotrolanum



$C_{37}H_{48}I_6N_6O_{18}$ $M_r$ 1626

[79770-24-4]

DEFINITION

Mixture of stereoisomers of 5,5′-[propanedioylbis(methylimino)]bis[*N*,*N*′-bis[2,3-dihydroxy-1-(hydroxymethyl)propyl]2,4,6-triiodobenzene-1,3-dicarboxamide].

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or yellowish-white powder, hygroscopic.

*Solubility*: very soluble in water, freely soluble in dimethyl sulfoxide, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *iotrolan CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

Dissolve 18.0 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**Conductivity** (*2.2.38*): maximum 25 µS·cm$^{-1}$.

Dissolve 1.000 g in *water R* and dilute to 50.0 mL with the same solvent.

**Primary aromatic amines**. *Protect the solutions from light throughout the test. All given times are critical for the test results. The test solution, the reference solution and the blank solution must be processed in parallel.*

*Test solution.* Dissolve 0.500 g of the substance to be examined in 20.0 mL of *water R* in a 25 mL volumetric flask.

*Reference solution.* Dissolve 5.0 mg of *iopamidol impurity A CRS* in *water R* and dilute to 20.0 mL with the same solvent. Transfer 1.0 mL of this solution to a 25 mL volumetric flask and add 19.0 mL of *water R*.

*Blank solution.* Place 20.0 mL of *water R* in a 25 mL volumetric flask.

*Procedure.* Cool the test solution, reference solution and blank solution in a bath of iced water for 5 min. Add 1.0 mL of *hydrochloric acid R1* to each solution and cool again for 5 min in a bath of iced water. Add 1.0 mL of a 20 g/L solution of *sodium nitrite R*, shake vigorously and cool for another 5 min in a bath of iced water. To each solution add 0.50 mL of an 80 g/L solution of *sulfamic acid R*. Over the next 5 min, shake vigorously several times, raising the stoppers to vent the gas that evolves. Afterwards add to each solution 1.0 mL of a 1 g/L solution of *naphthylethylenediamine dihydrochloride R* in a mixture of 300 volumes of *water R* and 700 volumes of *propylene glycol R*, shake, allow to cool to room temperature for 10 min and dilute to 25.0 mL with *water R*. Degas the solutions in an ultrasonic bath for 1 min and measure the absorbance (*2.2.25*) of the test solution and the reference solution at 495 nm against the blank, within 5 min.

*System suitability*:

– *absorbance of the reference solution*: minimum 0.40.

*Limit*:

– *absorbance of the test solution*: not more than the absorbance of the reference solution (0.05 per cent).

**Related substances**. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 1.0 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10.0 mL with the same mixture of solvents.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 200.0 mL with a mixture of equal volumes of *methanol R* and *water R*.

*Reference solution (b).* Dilute 2.0 mL of reference solution (a) to 10.0 mL with a mixture of equal volumes of *methanol R* and *water R*.

*Reference solution (c).* Dissolve the contents of a vial of *iotrolan for system suitability CRS* (containing about 0.05 per cent of each of impurities A and B) in 50 µL of a mixture of equal volumes of *methanol R* and *water R*.

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Pretreatment*: over 3/4 of the plate with *methylene chloride R*.

*Mobile phase*: *concentrated ammonia R*, *water R*, *dioxan R* (4:20:80 *V/V/V*).

*Application*: 2 µL.

*Development*: over 3/4 of the plate.

*Drying*: in a current of air until the solvents have evaporated.

*Detection*: examine in ultraviolet light at 254 nm. Expose the plate to the ultraviolet light for 2-5 min until the principal spots appear clearly as yellow spots. Spray with *ferric chloride-ferricyanide-arsenite reagent R* and examine in daylight.

*$R_F$ values*: iotrolan = about 0.25; impurity A = about 0.4; impurity B = about 0.5.

*System suitability*: reference solution (c):

– the chromatogram shows 3 clearly separated spots.

*Limits*:

– *impurities A, B*: any spot due to impurity A or B is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *unspecified impurities*: any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.10 per cent).

**Isomer distribution**. Liquid chromatography (*2.2.29*) as described under Assay. Use the normalisation procedure.

*Identification of peaks*: use the chromatogram supplied with *iotrolan CRS* and the chromatogram obtained with the reference solution to identify the peaks due to the 3 isomer groups.

Calculate the percentage content of each of the isomer groups G1, G2 and G3, with reference to the total area of all of the peaks due to the 3 isomer groups, using the chromatogram obtained with the test solution.

*Limits*:

- *isomer group G1*: 53.0 per cent to 70.0 per cent;
- *isomer group G2*: 3.0 per cent to 11.0 per cent;
- *isomer group G3*: 25.0 per cent to 39.0 per cent.

**Free iodine**. Dissolve 0.20 g in 1 mL of *water R* in a glass-stoppered test tube. Add 4 mL of a 370 g/L solution of *sulfuric acid R* and 5 mL of *toluene R*, close and shake vigorously. The upper layer remains colourless (*2.2.2, Method II*).

**Iodide**: maximum 20 ppm.

Dissolve 10.0 g in 50 mL of *carbon dioxide-free water R*. Adjust to pH 3-4 adding about 0.15 mL of *dilute sulfuric acid R*. Titrate with *0.001 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*). Not more than 1.5 mL of *0.001 M silver nitrate* is required to reach the end-point.

**Water** (*2.5.12*): maximum 3.5 per cent, determined on 0.250 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 0.7 IU/g.

ASSAY

Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 40.0 mg of the substance to be examined in *water R* and dilute to 25.0 mL with the same solvent.

*Reference solution.* Dissolve 40.0 mg of *iotrolan CRS* in *water R* and dilute to 25.0 mL with the same solvent.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: *methanol R*, *water for chromatography R* (10:90 *V/V*).

*Flow rate*: 0.5 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 10 µL.

*Run time*: 40 min.

*Retention time*: isomer group G1 = about 8 min to 12 min; isomer group G2 = about 15 min to 22 min; isomer group G3 = about 22 min to 32 min.

*System suitability*: reference solution:

- the chromatogram obtained is similar to the chromatogram supplied with *iotrolan CRS*.

Calculate the percentage content of iotrolan from the total area of all of the peaks of the 3 isomer groups G1, G2 and G3 and the declared content of *iotrolan CRS*.

STORAGE

In an airtight container, protected from light.

IMPURITIES

*Specified impurities: A, B.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. # IOXAGLIC ACID

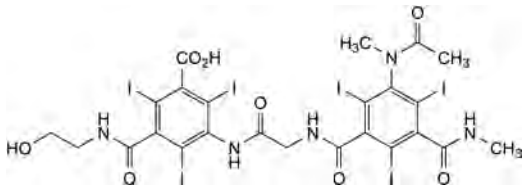
## Acidum ioxaglicum



$C_{24}H_{21}I_6N_5O_8$ $M_r$ 1269
[59017-64-0]

DEFINITION

3-[[[[3-(Acetylmethylamino)-2,4,6-triiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid.

*Content*: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, hygroscopic powder.

*Solubility*: very slightly soluble in water, slightly soluble in ethanol (96 per cent), very slightly soluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ioxaglic acid CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*).

Dissolve 1.0 g in a 40 g/L solution of *sodium hydroxide R* and dilute to 20 mL with the same solution.

**Absorbance** (*2.2.25*): maximum 0.18, calculated for a solution containing 40 per cent of anhydrous ioxaglic acid.

Dissolve 10.0 g in about 8 mL of a 40 g/L solution of *sodium hydroxide R*. Adjust to pH 7.2-7.6 with a 40 g/L solution of *sodium hydroxide R* or *1 M hydrochloric acid*. Dilute to 25 mL with *water R*. Filter through a membrane filter (nominal pore size 0.45 µm). Measure the absorbance at 450 nm using *water R* as the compensation liquid.

**Related substances**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Solvent mixture*: *acetonitrile R*, *water R* (5:95 *V/V*).

*Test solution.* Dissolve 0.10 g of the substance to be examined in about 40 mL of the solvent mixture. Add 0.5 ± 0.1 mL of a 4 g/L solution of *sodium hydroxide R* and dilute to 50.0 mL with the solvent mixture. Shake until dissolution is complete, using ultrasound if necessary.

*Reference solution (a).* Dissolve 0.10 g of *ioxaglic acid CRS* in about 40 mL of the solvent mixture. Add 0.5 ± 0.1 mL of a 4 g/L solution of *sodium hydroxide R* and dilute to 50.0 mL with the solvent mixture. Shake until dissolution is complete, using ultrasound if necessary.

*Reference solution (b).* Dissolve 5 mg of *ioxaglic acid impurity A CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 1.0 mL of the solution to 50.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

*Mobile phase*:

- *mobile phase A*: 0.136 g/L solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *phosphoric acid R*;
- *mobile phase B*: *acetonitrile R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 95 → 90 | 5 → 10 |
| 5 - 40 | 90 | 10 |
| 40 - 85 | 90 → 70 | 10 → 30 |
| 85 - 115 | 70 | 30 |
| 115 - 120 | 70 → 50 | 30 → 50 |
| 120 - 125 | 50 | 50 |

*Flow rate*: 0.8 mL/min.

*Detection*: spectrophotometer at 242 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *ioxaglic acid CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B, C, D1, D2, D3, D4, E and F; use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to ioxaglic acid (retention time = about 65 min): impurity A = about 0.3; impurity B = about 0.7; impurity C = about 0.9; impurity D1 = about 1.09; impurity E = about 1.12; impurity D2 = about 1.20; impurity D3 = about 1.26; impurity D4 = about 1.28; impurity F = about 1.6.

*System suitability*: reference solution (a):

- *peak-to-valley ratio*: minimum 1.3, where $H_p$ = height above the baseline of the peak due to impurity C and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to ioxaglic acid.

*Limits*:

- *impurity D (sum of the peaks due to impurities D1, D2, D3 and D4)*: maximum 0.7 per cent;
- *impurity E*: maximum 0.7 per cent;
- *impurity F*: maximum 0.4 per cent;
- *impurity B*: maximum 0.3 per cent;
- *impurity C*: maximum 0.3 per cent;
- *impurity A*: maximum 0.1 per cent;
- *unspecified impurities*: for each impurity, maximum 0.2 per cent;
- *total*: maximum 2.0 per cent;
- *reporting threshold*: 0.05 per cent; disregard any peak with a retention time greater than 125 min.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Iodides**: maximum 50 ppm.

Disperse 10.0 g in 50 mL of *water R*. Add 8 mL of *1 M sodium hydroxide*. After dissolution and homogenisation, add 1.0 mL of *glacial acetic acid R*. Immediately titrate with *0.001 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and a suitable reference electrode.

1 mL of *0.001 M silver nitrate* is equivalent to 0.1269 mg of iodides.

**Water** (*2.5.12*): maximum 5.0 per cent, determined on 0.100 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In a round-bottomed flask place 0.100 g of the substance to be examined and add 5 mL of *strong sodium hydroxide solution R*, 20 mL of *water R*, 1 g of *zinc powder R* and a few glass beads. Fit the flask with a reflux condenser and boil for 30 min. Cool and rinse the condenser with 20 mL of *water R*. Add the rinsings to the contents of the flask. Filter, wash the filter with 3 quantities, each of 15 mL, of *water R* and add the washings to the filtrate. Add 40 mL of *dilute sulfuric acid R* and titrate immediately with *0.05 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*).

1 mL of *0.05 M silver nitrate* is equivalent to 10.58 mg of $C_{24}H_{21}I_6N_5O_8$.

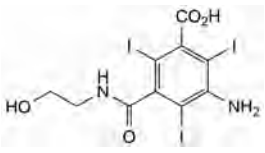
STORAGE

In an airtight container, protected from light.

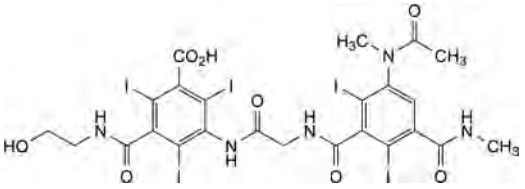
IMPURITIES

*Specified impurities: A, B, C, D, E, F.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, H.*

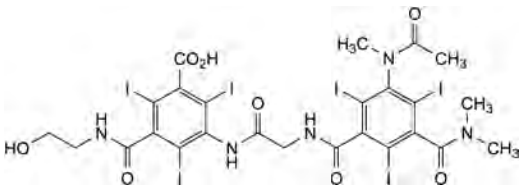


A. 3-amino-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

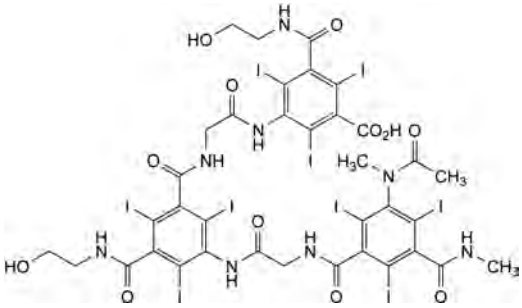


B. 3-[[[[3-(acetylmethylamino)-2,6-diiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

C. unknown structure,

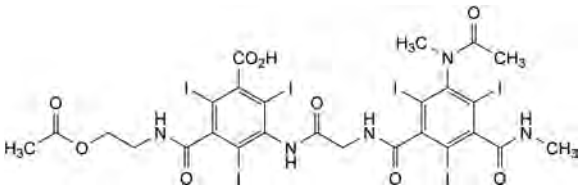


D. D1, D2, D3 and D4: 3-[[[[3-(acetylmethylamino)-5-(dimethylcarbamoyl)-2,4,6-triiodobenzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

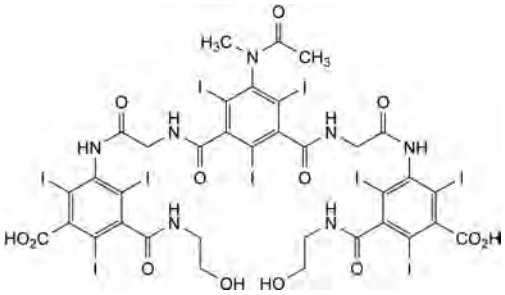


E. 3-[[[[3-[[[[3-(acetylmethylamino)-2,4,6-triiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

F. unknown structure,



G. 3-[[[[3-(acetylmethylamino)-2,4,6-triiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[[2-(acetyloxy)ethyl]carbamoyl]-2,4,6-triiodobenzoic acid,

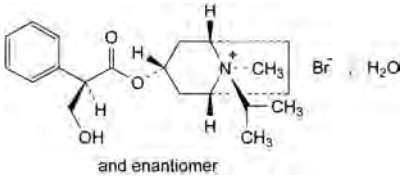


H. 3,3′-[[5-(acetylmethylamino)-2,4,6-triiodo-1,3-phenylene]bis(carbonyliminomethylenecarbonylimino)]bis[5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic] acid.

**01/2008:0919**
**corrected 9.6**

# IPRATROPIUM BROMIDE

## Ipratropii bromidum



$C_{20}H_{30}BrNO_3,H_2O$ $M_r$ 430.4
[66985-17-9]

DEFINITION

(1*R*,3*r*,5*S*,8*r*)-3-[[(2*RS*)-3-Hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane bromide monohydrate.

*Content*: 99.0 per cent to 100.5 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: soluble in water, freely soluble in methanol, slightly soluble in ethanol (96 per cent).

mp: about 230 °C, with decomposition.

IDENTIFICATION

*First identification: A, E.*

*Second identification: B, C, D, E.*

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *ipratropium bromide CRS*.

B. Examine the chromatograms obtained in the test for impurity A.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 5 mL of solution S (see Tests), add 2 mL of *dilute sodium hydroxide solution R*. No precipitate is formed.

D. To about 1 mg add 0.2 mL of *nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 mL of *acetone R* and add 0.1 mL of a 30 g/L solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives reaction (a) of bromides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 5.0 to 7.5 for solution S.

**Impurity A**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 1.0 mL with the same solvent.

*Reference solution (a).* Dissolve 20 mg of *ipratropium bromide CRS* in *methanol R* and dilute to 1.0 mL with the same solvent.

*Reference solution (b).* Dissolve 20 mg of *methylatropine bromide CRS* in 1.0 mL of reference solution (a).

*Reference solution (c).* Dissolve 5 mg of *ipratropium impurity A CRS* in 100.0 mL of *methanol R*. Dilute 2.0 mL of the solution to 5.0 mL with *methanol R*.

*Plate*: *TLC silica gel plate R* (2-10 µm).

*Mobile phase*: *anhydrous formic acid R*, *water R*, *ethanol (96 per cent) R*, *methylene chloride R* (1:3:18:18 *V/V/V/V*).

*Application*: 1 µL.

*Development*: over a path of 6 cm.

*Drying*: at 60 °C for 15 min.

*Detection*: spray with *potassium iodobismuthate solution R5*, allow the plate to dry in air, spray with a 50 g/L solution of *sodium nitrite R* and protect immediately with a sheet of glass.

*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

*Limit*:

– *impurity A*: any spot due to impurity A is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.200 g of the substance to be examined in the mobile phase and dilute to 20.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 10.0 mg of *ipratropium bromide CRS* in the mobile phase and dilute to 20.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 50.0 mL with the mobile phase.

*Reference solution (b)*. Dissolve 5 mg of *ipratropium bromide CRS* and 5 mg of *ipratropium impurity B CRS* in 1 mL of *methanol R* and dilute to 25.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 20.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

*Mobile phase*: dissolve 12.4 g of *sodium dihydrogen phosphate R* and 1.7 g of *tetrapropylammonium chloride R* in 870 mL of *water for chromatography R*; adjust to pH 5.5 with a 180 g/L solution of *disodium hydrogen phosphate dodecahydrate R* and add 130 mL of *methanol R1*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 5 µL.

*Run time*: 6 times the retention time of ipratropium.

*Relative retention* with reference to ipratropium (retention time = about 4.9 min): impurity C = about 0.7; impurity B = about 1.2; impurity D = about 1.8; impurity E = about 2.3; impurity F = about 5.1.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to impurity B and ipratropium;
– *symmetry factor*: maximum 2.5 for the principal peak.

*Limits*:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 0.3; impurity D = 0.2; impurity F = 0.5;
– *impurity D*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);
– *impurities B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent);
– *disregard limit*: one-third of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent); disregard the peak due to the bromide ion.

**Water** (*2.5.12*): 3.9 per cent to 4.4 per cent, determined on 0.50 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

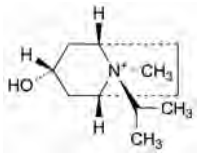
Dissolve 0.350 g in 50 mL of *water R* and add 3 mL of *dilute nitric acid R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 41.24 mg of $C_{20}H_{30}BrNO_3$.

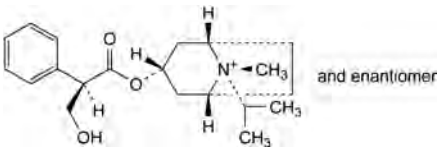
IMPURITIES

*Specified impurities*: *A, B, C, D*.

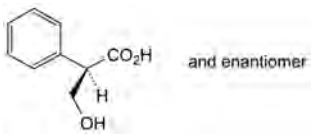
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F*.



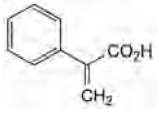
A. (1*R*,3*r*,5*S*,8*r*)-3-hydroxy-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,



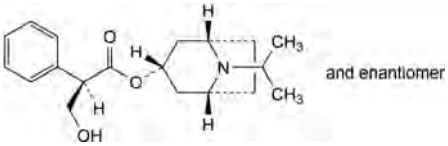
B. (1*R*,3*r*,5*S*,8*s*)-3-[[(2*RS*)-3-hydroxy-2-phenylpropanoyl]-oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo-[3.2.1]octane,



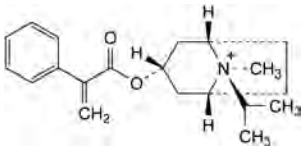
C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),



D. 2-phenylpropenoic acid (atropic acid),



E. (1*R*,3*r*,5*S*)-8-(1-methylethyl)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate,

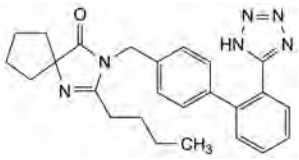


F. (1*R*,3*r*,5*S*,8*r*)-8-methyl-8-(1-methylethyl)-3-[(2-phenylpropenoyl)oxy]-8-azoniabicyclo[3.2.1]octane.

**01/2020:2465**

# IRBESARTAN

## Irbesartanum



$C_{25}H_{28}N_6O$ $M_r$ 428.5
[138402-11-6]

DEFINITION

2-Butyl-3-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]-1,3-diazaspiro[4.4]non-1-en-4-one.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

PRODUCTION

As *N*-nitrosodimethylamine (NDMA) and *N*-nitrosodiethylamine (NDEA) are classified as probable human carcinogens, manufacturers must ensure that their manufacturing process does not generate such impurities and develop appropriate control strategies. To allow manufacturers to make the necessary changes to their process, a transition period has been agreed by competent authorities and strict temporary limits on levels of these impurities introduced in the Test section.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, sparingly soluble in methanol, slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *irbesartan CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness at 60 °C and record new spectra using the residues.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $B_7$ (*2.2.2, Method II*).

Dissolve 0.50 g in a mixture of 1 volume of *2 M sodium hydroxide R* and 9 volumes of *methanol R2* and dilute to 10 mL with the same mixture of solvents.

**Impurity B**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution*. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 5.0 mL with the mobile phase.

*Reference solution*. Dissolve 25.0 mg of *sodium azide R* (sodium salt of impurity B) in the mobile phase and dilute to 100.0 mL with the mobile phase. Dilute 0.25 mL of the solution to 200.0 mL with the mobile phase.

*Precolumn* (used to prevent saturation of the column with irbesartan):

- *size*: *l* = 0.05 m, Ø = 4 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (8.5 µm).

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (8.5 µm).

*Mobile phase*: 4.2 g/L solution of *sodium hydroxide R* in *carbon dioxide-free water R*.

*Flow rate*: 1.0 mL/min.

*Detection*: conductivity detector with a sensitivity of 3 µS; use a self-regenerating anion suppressor.

*Neutralisation of the eluent*: either chemical or electrochemical:

- *chemical*: by continuous countercurrent circulation in a neutralising micromembrane, performed before detection:
  - *neutralising solvent*: *0.025 M sulfuric acid*;
  - *flow rate*: 10 mL/min;
  - *pressure*: about 100 kPa.
- *electrochemical*: 300 mA (for example).

*Injection*: 200 µL; after each injection of the test solution, rinse the precolumn with a mixture of mobile phase and *methanol R* (40:60 *V/V*) for 10 min; equilibrate to initial conditions as necessary; a switch valve can be used to avoid disconnecting the precolumn from the column.

*Run time*: 25 min.

*Retention time*: impurity B = about 14 min.

*System suitability*: reference solution:

- *signal-to-noise ratio*: minimum 10 for the peak due to impurity B.

*Limit*:

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm).

**Related substances**. Liquid chromatography (*2.2.29*).

*Buffer solution pH 3.2*. Mix 5.5 mL of *phosphoric acid R* and 950 mL of *water for chromatography R* and adjust to pH 3.2 with *triethylamine R*.

*Test solution*. Dissolve 50 mg of the substance to be examined in *methanol R2* and dilute to 50.0 mL with the same solvent.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R2*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R2*.

*Reference solution (b)*. Dissolve 5 mg of the substance to be examined and 5 mg of *irbesartan impurity A CRS* in *methanol R2* and dilute to 10 mL with the same solvent. Dilute 1 mL of the solution to 10 mL with *methanol R2*.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *acetonitrile R1*, buffer solution pH 3.2 (33:67 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL.

*Run time*: 1.4 times the retention time of irbesartan.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to irbesartan (retention time = about 23 min): impurity A = about 0.7.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to impurity A and irbesartan.

*Limits*:

– *impurity A*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water** (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Nitrosamines**. Carry out the test by a suitable method.

The substance to be examined does not contain either NDMA or NDEA above the limits provided below or both impurities at whatever level:

– *N-nitrosodimethylamine (NDMA)*: maximum 0.320 ppm;
– *N-nitrosodiethylamine (NDEA)*: maximum 0.088 ppm.

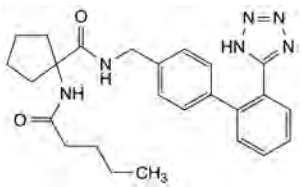
ASSAY

Dissolve 0.300 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 42.85 mg of $C_{25}H_{28}N_6O$.

IMPURITIES

*Specified impurities*: *A, B*.



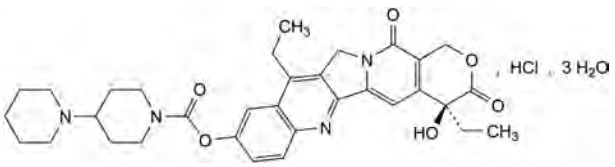
A. 1-(pentanoylamino)-*N*-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]cyclopentane-1-carboxamide,

B. $N_3^-$: trinitride (azide).

**01/2017:2675**
**corrected 10.0**

# IRINOTECAN HYDROCHLORIDE TRIHYDRATE

## Irinotecani hydrochloridum trihydricum



$C_{33}H_{39}ClN_4O_6,3H_2O$ $M_r$ 677
[136572-09-3]

DEFINITION

(4*S*)-4,11-Diethyl-4-hydroxy-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate hydrochloride trihydrate.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: pale yellow or yellow, crystalline powder.

*Solubility*: sparingly soluble in water, in ethanol (96 per cent) and in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *irinotecan hydrochloride trihydrate CRS*.
If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

B. Water (see Tests).

C. It gives reaction (a) of chlorides (*2.3.1*).
Dissolve 0.10 g in *water R* and dilute to 50 mL with the same solvent.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $GY_2$ (*2.2.2, Method II*).

Dissolve 0.200 g in *water R* with heating at 80 °C and dilute to 20 mL with the same solvent.

**Enantiomeric purity**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *diethylamine R*, *anhydrous ethanol R* (0.4:100 *V/V*).

*Test solution*. Dissolve 15.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve the contents of a vial of *irinotecan for system suitability 1 CRS* (containing impurity L) in 1 mL of the solvent mixture.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *cellulose derivative of silica gel for chiral separation R* (10 µm).

*Mobile phase*: *diethylamine R*, *anhydrous ethanol R*, *hexane R* (0.2:50:50 *V/V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 370 nm.

*Injection*: 20 µL.

*Run time*: 1.5 times the retention time of irinotecan.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity L.

*Relative retention* with reference to irinotecan (retention time = about 15 min): impurity L = about 0.7.

*System suitability*:

– *resolution*: minimum 1.5 between the peaks due to impurity L and irinotecan in the chromatogram obtained with reference solution (b).

*Calculation of percentage content*:

– for impurity L, use the concentration of irinotecan hydrochloride trihydrate in reference solution (a).

*Limit*:

– *impurity L*: maximum 0.15 per cent.

Monographs 1

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Solvent mixture*: *acetonitrile R*, *methanol R*, mobile phase A (25:25:50 *V/V/V*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (a).* Dissolve 50.0 mg of *irinotecan hydrochloride trihydrate CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve the contents of a vial of *irinotecan for peak identification CRS* (containing impurities C and E) in 1 mL of the solvent mixture.

*Reference solution (d).* Dissolve 5 mg of *irinotecan for system suitability 2 CRS* (containing impurity M) in the solvent mixture and dilute to 10 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography with polar incorporated groups R* (5 µm).

*Mobile phase*:

- *mobile phase A*: dissolve 2.72 g of *potassium dihydrogen phosphate R* in 950 mL of *water for chromatography R*, adjust to pH 3.5 with *dilute phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*;
- *mobile phase B*: *methanol R2*, *acetonitrile R1* (40:60 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 80 | 20 |
| 2 - 42 | 80 → 30 | 20 → 70 |
| 42 - 47 | 30 | 70 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Injection*: 10 µL of the test solution and reference solutions (b), (c) and (d).

*Identification of impurities*: use the chromatogram supplied with *irinotecan for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities C and E; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity M.

*Relative retention* with reference to irinotecan (retention time = about 17 min): impurity M = about 0.9; impurity C = about 1.3; impurity E = about 1.5.

*System suitability*:

- *resolution*: minimum 2.0 between the peaks due to impurity M and irinotecan in the chromatogram obtained with reference solution (d).

*Calculation of percentage contents*:

- *correction factor*: multiply the peak area of impurity M by 1.3;
- for each impurity, use the concentration of irinotecan hydrochloride trihydrate in reference solution (b).

*Limits*:

- *impurities C, E, M*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.12*): 7.0 per cent to 9.0 per cent, determined on 0.100 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: 10 µL of the test solution and reference solution (a).

Calculate the percentage content of $C_{33}H_{39}ClN_4O_6$ taking into account the assigned content of *irinotecan hydrochloride trihydrate CRS*.

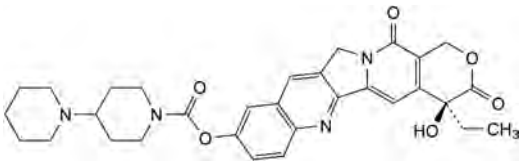
STORAGE

In an airtight container, protected from light.

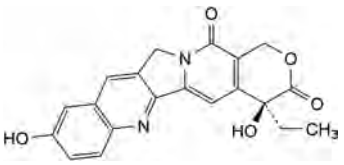
IMPURITIES

*Specified impurities: C, E, L, M.*

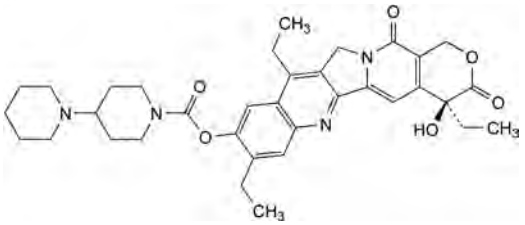
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, D, F, G, H, K.*



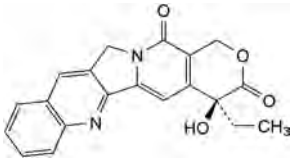
A. (4*S*)-4-ethyl-4-hydroxy-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate (11-desethyl irinotecan),



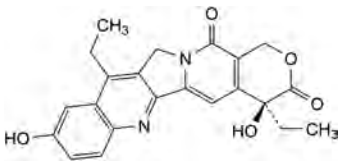
B. (4*S*)-4-ethyl-4,9-dihydroxy-1*H*-pyrano[3′,4′:6,7]-indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione (9-hydroxycamptothecin),



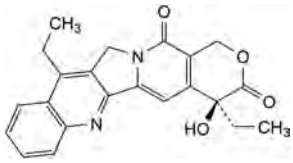
C. (4*S*)-4,8,11-triethyl-4-hydroxy-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate (8-ethyl irinotecan),



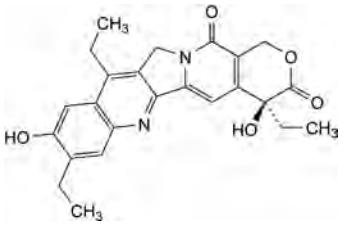
D. (4*S*)-4-ethyl-4-hydroxy-1*H*-pyrano[3′,4′:6,7]indolizino-[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione (camptothecin),



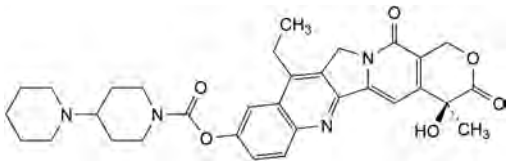
E. (4*S*)-4,11-diethyl-4,9-dihydroxy-1*H*-pyrano[3′,4′:6,7]-indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione (11-ethyl-9-hydroxycamptothecin),



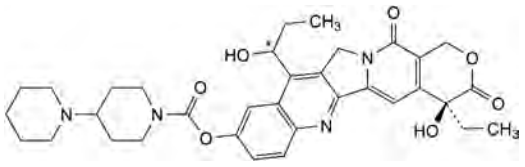
F. (4*S*)-4,11-diethyl-4-hydroxy-1*H*-pyrano[3′,4′:6,7]-indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione (11-ethylcamptothecin),



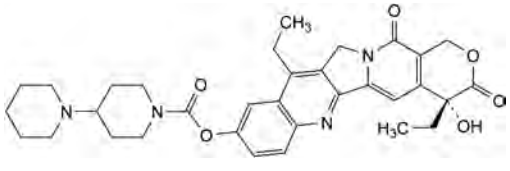
G. (4*S*)-4,8,11-triethyl-4,9-dihydroxy-1*H*-pyrano[3′,4′:6,7]-indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione (8,11-diethyl-9-hydroxycamptothecin),



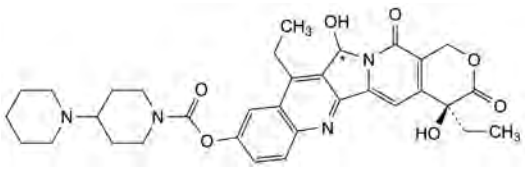
H. (4*S*)-11-ethyl-4-hydroxy-4-methyl-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate (4-methyl irinotecan analogue),



K. (4*S*)-4-ethyl-4-hydroxy-11-(1-hydroxypropyl)-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino-[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate,



L. (4*R*)-4,11-diethyl-4-hydroxy-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate (irinotecan enantiomer).

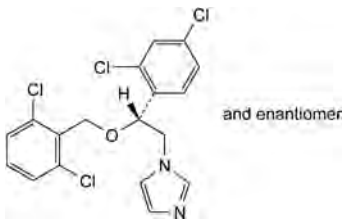


M. (4*S*)-4,11-diethyl-4,12-dihydroxy-3,14-dioxo-3,4,12,14-tetrahydro-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl 1,4′-bipiperidine-1′-carboxylate (12-hydroxy irinotecan).

**01/2008:1018**
**corrected 6.0**

# ISOCONAZOLE

## Isoconazolum



$C_{18}H_{14}Cl_4N_2O$ $M_r$ 416.1
[27523-40-6]

DEFINITION

1-[(2*RS*)-2-[(2,6-Dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, very soluble in methanol, freely soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Melting point (*2.2.14*): 111 °C to 115 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *isoconazole CRS.*

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 5 mL with the same solvent.

*Reference solution (a).* Dissolve 30 mg of *isoconazole CRS* in *methanol R* and dilute to 5 mL with the same solvent.

*Reference solution (b).* Dissolve 30 mg of *isoconazole CRS* and 30 mg of *econazole nitrate CRS* in *methanol R*, then dilute to 5 mL with the same solvent.

*Plate*: *TLC octadecylsilyl silica gel plate R.*

*Mobile phase*: *ammonium acetate solution R*, *dioxan R*, *methanol R* (20:40:40 *V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of warm air for 15 min.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Monographs 1

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 mL of *dilute nitric acid R* and filter. To 1 mL of the filtrate add 1 mL of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.20 g in *methanol R* and dilute to 20.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): − 0.10° to + 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in 3.2 mL of *methanol R*. Add 3.0 mL of *acetonitrile R* and dilute to 10.0 mL with a solution of *ammonium acetate R* (6.0 g in 380 mL of *water R*).

*Reference solution (a)*. Dissolve 2.5 mg of *isoconazole CRS* and 2.5 mg of *econazole nitrate CRS* in the mobile phase, then dilute to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 20.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: dissolve 6.0 g of *ammonium acetate R* in a mixture of 300 mL of *acetonitrile R*, 320 mL of *methanol R* and 380 mL of *water R*.

*Flow rate*: 2 ml/min.

*Detection*: spectrophotometer at 235 nm.

*Equilibration*: with the mobile phase for about 30 min.

*Injection*: 10 µL.

*Run time*: 1.5 times the retention time of isoconazole.

*Retention time*: econazole = about 10 min; isoconazole = about 14 min.

*System suitability*: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to econazole and isoconazole; if necessary, adjust the composition of the mobile phase.

*Limits*:

– *impurities B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Using 0.2 mL of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from orange-yellow to green.

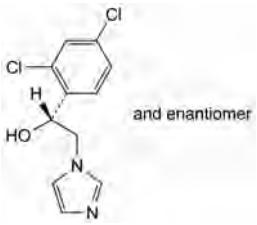
1 mL of *0.1 M perchloric acid* is equivalent to 41.61 mg of $C_{18}H_{14}Cl_4N_2O$.

STORAGE

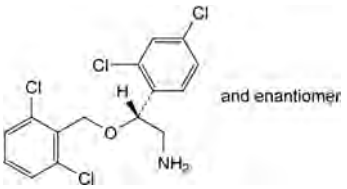
Protected from light.

IMPURITIES

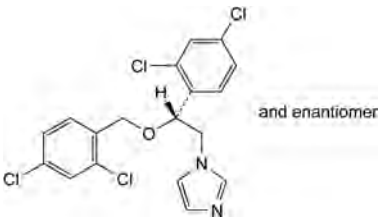
*Specified impurities*: *B, C, D*.



B. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,



C. (2*RS*)-2-[(2,6-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)-ethanamine,



D. 1-[(2*RS*)-2-[(2,4-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

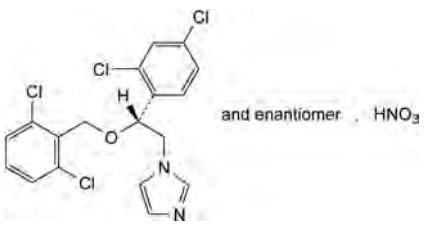
**corrected 6.7**

# ISOCONAZOLE NITRATE

## Isoconazoli nitras



$C_{18}H_{15}Cl_4N_3O_4$ $M_r$ 479.1
[24168-96-5]

DEFINITION

1-[(2*RS*)-2-[(2,6-Dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole nitrate.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: very slightly soluble in water, soluble in methanol, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C, D.*

A. Melting point (*2.2.14*): 178 °C to 182 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *isoconazole nitrate CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 5 mL with the same solvent.

*Reference solution (a)*. Dissolve 30 mg of *isoconazole nitrate CRS* in *methanol R* and dilute to 5 mL with the same solvent.

*Reference solution (b)*. Dissolve 30 mg of *isoconazole nitrate CRS* and 30 mg of *econazole nitrate CRS* in *methanol R*, then dilute to 5 mL with the same solvent.

*Plate*: *TLC octadecylsilyl silica gel plate R*.

*Mobile phase*: *ammonium acetate solution R*, *dioxan R*, *methanol R* (20:40:40 *V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of warm air for 15 min.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives the reaction of nitrates (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.20 g in *methanol R* and dilute to 20.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): − 0.10° to + 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a)*. Dissolve 2.5 mg of *isoconazole nitrate CRS* and 2.5 mg of *econazole nitrate CRS* in the mobile phase, then dilute to 100.0 mL with the mobile phase.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 20.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: dissolve 6.0 g of *ammonium acetate R* in a mixture of 300 mL of *acetonitrile R*, 320 mL of *methanol R* and 380 mL of *water R*.

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 235 nm.

*Equilibration*: with the mobile phase for about 30 min.

*Injection*: 10 µL.

*Run time*: 1.5 times the retention time of isoconazole.

*Retention time*: econazole = about 10 min; isoconazole = about 14 min.

*System suitability*: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to econazole and isoconazole; if necessary, adjust the composition of the mobile phase.

*Limits*:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the peak due to the nitrate ion.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 75 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

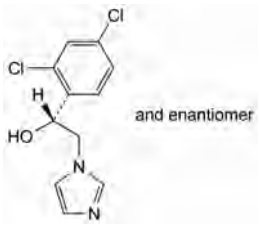
1 mL of *0.1 M perchloric acid* is equivalent to 47.91 mg of $C_{18}H_{15}Cl_4N_3O_4$.

STORAGE

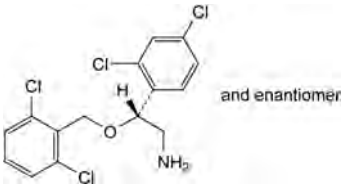
Protected from light.

IMPURITIES

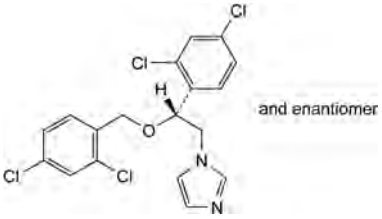
*Specified impurities*: *A, B, C.*



A. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,



B. (2*RS*)-2-[(2,6-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethanamine,



C. 1-[(2*RS*)-2-[(2,4-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

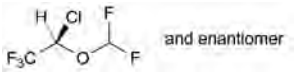
**corrected 9.0**

# ISOFLURANE

## Isofluranum



$C_3H_2ClF_5O$ $M_r$ 184.5
[26675-46-7]

DEFINITION

(2*RS*)-2-Chloro-2-(difluoromethoxy)-1,1,1-trifluoroethane.

CHARACTERS

*Appearance*: clear, colourless, mobile, heavy liquid.

*Solubility*: practically insoluble in water, miscible with ethanol.

bp: about 48 °C.

It is non-flammable.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: examine the substance in the gaseous state.

*Comparison*: *Ph. Eur. reference spectrum of isoflurane.*

TESTS

**Acidity or alkalinity**. To 20 mL add 20 mL of *carbon dioxide-free water R*, shake for 3 min and allow to stand. Collect the upper layer and add 0.2 mL of *bromocresol purple solution R*. Not more than 0.1 mL of *0.01 M sodium hydroxide* or 0.6 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

**Related substances**. Gas chromatography (*2.2.28*).

*Test solution*. The substance to be examined.

*Reference solution*. To 80 mL of *anhydrous ethanol R*, add 1.0 mL of the substance to be examined and 1.0 mL of *acetone R*, avoiding loss by evaporation. Dilute to 100.0 mL with *anhydrous ethanol R*. Dilute 1.0 mL of the solution to 100.0 mL with *anhydrous ethanol R*.

*Column*:

- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.32 mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 1.0 mL/min.

*Split ratio*: 1:25.

*Temperature*:

- *column*: 35 °C,
- *injection port*: 150 °C,
- *detector*: 250 °C.

*Detection*: flame ionisation.

*Injection*: 1.0 µL of each solution and 1.0 µL of *anhydrous ethanol R* as a blank.

*Run time*: until elution of the ethanol peak in the chromatogram obtained with the reference solution.

*Relative retention* with reference to isoflurane (retention time = about 3.8 min): acetone = about 0.75.

*System suitability*: reference solution:

- *resolution*: minimum of 5 between the peaks due to acetone and to isoflurane,
- *repeatability*: maximum relative standard deviation 15.0 per cent for the peak due to isoflurane after 3 injections.

*Limits*:

- *acetone*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.01 per cent),
- *any other impurity*: not more than the area of the peak due to isoflurane in the chromatogram obtained with the reference solution (0.01 per cent),
- *total*: not more than 3 times the area of the peak due to isoflurane in the chromatogram obtained with the reference solution (0.03 per cent),
- *disregard limit*: 0.1 times the area of the peak due to isoflurane in the chromatogram obtained with the reference solution (0.001 per cent).

**Chlorides** (*2.4.4*): maximum 10 ppm.

To 10 mL add 10 mL of *0.01 M sodium hydroxide* and shake for 3 min. To 5 mL of the upper layer add 10 mL of *water R*.

**Fluorides**: maximum 10 ppm.

Determine by potentiometry (*2.2.36, Method I*) using a fluoride-selective indicator-electrode and a silver-silver chloride reference electrode.

*Test solution*. To 10.0 mL in a separating funnel, add 10 mL of a mixture of 30.0 mL of *dilute ammonia R2* and 70.0 mL of *distilled water R*. Shake for 1 min and collect the upper layer. Repeat this extraction procedure twice collecting the upper layer each time. Adjust the combined upper layers to pH 5.2 using *dilute hydrochloric acid R*. Add 5.0 mL of *fluoride standard solution (1 ppm F) R* and dilute to 50.0 mL with *distilled water R*. To 20.0 mL of the solution add 20.0 mL of *total-ionic-strength-adjustment buffer R* and dilute to 50.0 mL with *distilled water R*.

*Reference solutions*. To each of 5.0 mL, 4.0 mL, 3.0 mL, 2.0 mL and 1.0 mL of *fluoride standard solution (10 ppm F) R* add 20.0 mL of *total-ionic-strength-adjustment buffer R* and dilute to 50.0 mL with *distilled water R*.

Carry out the measurements on 20 mL of each solution. Calculate the concentration of fluorides using the calibration curve, taking into account the addition of fluoride to the test solution.

**Non-volatile matter**: maximum 200 mg/L.

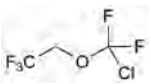
Evaporate 10.0 mL to dryness with the aid of a stream of cold air and dry the residue at 50 °C for 2 h. The residue weighs a maximum of 2.0 mg.

**Water** (*2.5.12*): maximum 1.0 mg/mL, determined on 10.0 mL.

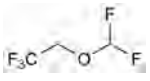
STORAGE

In an airtight container, protected from light.

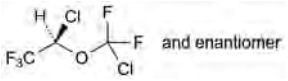
IMPURITIES



A. 2-(chlorodifluoromethoxy)-1,1,1-trifluoroethane,

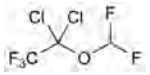


B. 2-(difluoromethoxy)-1,1,1-trifluoroethane,

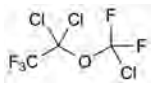


C. (2*RS*)-2-chloro-2-(chlorodifluoromethoxy)-1,1,1-trifluoroethane,

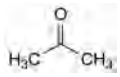
Monographs I



D. 1,1-dichloro-1-(difluoromethoxy)-2,2,2-trifluoroethane,



E. 1,1-dichloro-1-(chlorodifluoromethoxy)-2,2,2-trifluoroethane,



F. propanone (acetone).

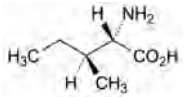
# ISOLEUCINE

## Isoleucinum



$C_6H_{13}NO_2$ $M_r$ 131.2
[73-32-5]

DEFINITION

(2*S*,3*S*)-2-Amino-3-methylpentanoic acid.

Product of fermentation or of protein hydrolysis.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or flakes.

*Solubility*: sparingly soluble in water, slightly soluble in ethanol (96 per cent). It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *isoleucine CRS.*

C. Thin-layer chromatography (*2.2.27*).
*Test solution.* Dissolve 10 mg of the substance to be examined in a 10.3 g/L solution of *hydrochloric acid R* and dilute to 50 mL with the same solution.
*Reference solution.* Dissolve 10 mg of *isoleucine CRS* in a 10.3 g/L solution of *hydrochloric acid R* and dilute to 50 mL with the same solution.
*Plate*: *TLC silica gel plate R.*
*Mobile phase*: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 *V/V/V*).
*Application*: 5 µL.
*Development*: over 2/3 of the plate.
*Drying*: in air.
*Detection*: spray with *ninhydrin solution R* and heat at 105 °C for 15 min.
*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_6$ (*2.2.2, Method II*).

Dissolve 0.5 g in a 103 g/L solution of *hydrochloric acid R* and dilute to 10 mL with the same solution.

**Specific optical rotation** (*2.2.7*): + 40.0 to + 43.0 (dried substance).

Dissolve 1.00 g in *hydrochloric acid R1* and dilute to 25.0 mL with the same acid.

**Ninhydrin-positive substances**. Amino acid analysis (*2.2.56*). For analysis, use Method 1.

The concentrations of the test solution and the reference solutions may be adapted according to the sensitivity of the equipment used. The concentrations of all solutions are adjusted so that the system suitability requirements described in general chapter *2.2.46* are fulfilled, keeping the ratios of concentrations between all solutions as described.

*Solution A*: *dilute hydrochloric acid R1* or a sample preparation buffer suitable for the apparatus used.

*Test solution.* Dissolve 30.0 mg of the substance to be examined in solution A and dilute to 50.0 mL with solution A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 2.0 mL of this solution to 10.0 mL with solution A.

*Reference solution (b).* Dissolve 30.0 mg of *valine R* (impurity A) in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (c).* Dissolve 30.0 mg of *proline R* in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (d).* Dissolve 30.0 mg of *leucine R* (impurity C) in solution A and dilute to 100.0 mL with solution A. Dilute 1.0 mL of the solution to 250.0 mL with solution A.

*Reference solution (e).* Dilute 6.0 mL of *ammonium standard solution (100 ppm $NH_4$) R* to 50.0 mL with solution A. Dilute 1.0 mL of this solution to 100.0 mL with solution A.

*Reference solution (f).* Dissolve 30 mg of *isoleucine R* and 30 mg of *leucine R* (impurity C) in solution A and dilute to 50.0 mL with solution A. Dilute 1.0 mL of the solution to 200.0 mL with solution A.

*Blank solution*: solution A.

Inject suitable, equal amounts of the test solution, blank solution and reference solutions (a), (b), (c), (d) and (f) into the amino acid analyser. Run a program suitable for the determination of physiological amino acids.

*System suitability*: reference solution (f):

– *resolution*: minimum 1.5 between the peaks due to isoleucine and impurity C.

*Calculation of percentage contents*:

– for impurity A, use the concentration of impurity A in reference solution (b);
– for impurity C, use the concentration of impurity C in reference solution (d);
– for any ninhydrin-positive substance detected at 570 nm, use the concentration of isoleucine in reference solution (a);
– for any ninhydrin-positive substance detected at 440 nm, use the concentration of proline in reference solution (c); if a peak is above the reporting threshold at both wavelengths, use the result obtained at 570 nm for quantification.

*Limits*:

– *impurities A and C at 570 nm*: for each impurity, maximum 0.3 per cent;
– *any ninhydrin-positive substance*: for each impurity, maximum 0.2 per cent;

– *total*: maximum 1.0 per cent;
– *reporting threshold*: 0.05 per cent.

The thresholds indicated under Related Substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

**Chlorides** (*2.4.4*): maximum 200 ppm.

Dissolve 0.25 g in *water R* and dilute to 15 mL with the same solvent.

**Sulfates** (*2.4.13*): maximum 300 ppm.

Dissolve 0.5 g in 3 mL of *dilute hydrochloric acid R* and dilute to 15 mL with *distilled water R*.

**Ammonium**. Amino acid analysis (*2.2.56*) as described in the test for ninhydrin-positive substances with the following modifications.

*Injection*: test solution, reference solution (e) and blank solution.

*Limit*:

– *ammonium at 570 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.02 per cent), taking into account the peak due to ammonium in the chromatogram obtained with the blank solution.

**Iron** (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 mL of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 mL, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 mL of *water R* and shake for 3 min. Use the aqueous layer.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 mL of *anhydrous formic acid R*. Add 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 13.12 mg of $C_6H_{13}NO_2$.

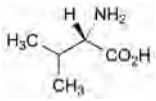
STORAGE

Protected from light.

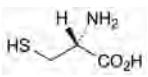
IMPURITIES

*Specified impurities*: *A, C.*

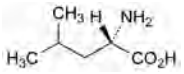
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, D.*



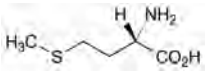
A. (2*S*)-2-amino-3-methylbutanoic acid (valine),



B. (2*R*)-2-amino-3-sulfanylpropanoic acid (cysteine),



C. (2*S*)-2-amino-4-methylpentanoic acid (leucine),

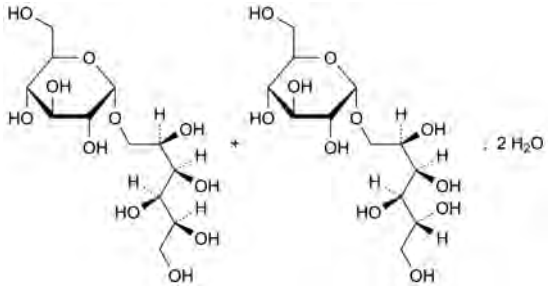


D. (2*S*)-2-amino-4-(methylsulfanyl)butanoic acid (methionine).

**07/2019:1531**

# ISOMALT[(2)]

## Isomaltum



$C_{12}H_{24}O_{11}$ $M_r$ 344.3

$C_{12}H_{24}O_{11},2H_2O$ $M_r$ 380.3

Anhydrous isomalt: [64519-82-0]

DEFINITION

Mixture of 6-*O*-α-D-glucopyranosyl-D-glucitol (6-*O*-α-D-glucopyranosyl-D-sorbitol; 1,6-GPS) and 1-*O*-α-D-glucopyranosyl-D-mannitol (1,1-GPM).

*Content*: 98.0 per cent to 102.0 per cent for the mixture of 1,6-GPS and 1,1-GPM and neither of the 2 components is less than 3.0 per cent (anhydrous substance).

◆ CHARACTERS

*Appearance*: white or almost white powder or granules.

*Solubility*: freely soluble in water, practically insoluble in anhydrous ethanol. ◆

IDENTIFICATION

*First identification: A.*

◊*Second identification: B, C.*◊

A. Examine the chromatograms obtained in the assay.

*Results*: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 2 principal peaks in the chromatogram obtained with reference solution (a).

◊B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 50 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 50 mg of *isomalt CRS* in *water R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel $F_{254}$ plate R.*

*Mobile phase*: *acetic acid R*, *propionic acid R*, *water R*, *ethyl acetate R*, *pyridine R* (5:5:10:50:50 *V/V/V/V/V*).

*Application*: 1 µL; thoroughly dry the points of application in warm air.

*Development*: over 1/2 of the plate.

*Drying*: in a current of warm air.

*Detection*: dip for 3 s in a 1 g/L solution of *sodium periodate R* and dry in a current of hot air; dip for 3 s in a mixture of 1 volume of *acetic acid R*, 1 volume of

(2) This monograph has undergone pharmacopoeial harmonisation. See chapter *5.8. Pharmacopoeial harmonisation.*

*anisaldehyde R*, 5 volumes of *sulfuric acid R* and 90 volumes of *anhydrous ethanol R*; dry in a current of hot air until coloured spots become visible; the background colour may be brightened in warm steam; examine in daylight.

*Results*: the chromatogram obtained with the reference solution shows 2 blue-grey spots with $R_F$ values of about 0.13 (1,6-GPS) and 0.16 (1,1-GPM). The chromatogram obtained with the test solution shows principal spots similar in position and colour to the principal spots in the chromatogram obtained with the reference solution.

C. To 3 mL of a freshly prepared 100 g/L solution of *pyrocatechol R* add 6 mL of *sulfuric acid R* while cooling in iced water. To 3 mL of the cooled mixture add 0.3 mL of a 100 g/L solution of the substance to be examined. Heat gently over a naked flame for about 30 s. A pink colour develops.◊

TESTS

**Conductivity** (*2.2.38*): maximum 20 µS·cm$^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* with gentle heating (40-50 °C) and dilute to 100.0 mL with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

**Reducing sugars**: maximum 0.3 per cent, expressed as glucose equivalent.

Dissolve 3.3 g in 10 mL of *water R* with gentle heating. Cool and add 20 mL of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 mL of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 mL of *0.025 M iodine*. With continuous shaking, add 25 mL of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R*. When the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulfate* using 1 mL of *starch solution R* as indicator, added towards the end of the titration. Not less than 12.8 mL of *0.05 M sodium thiosulfate* is required.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 0.200 g of the substance to be examined in 4 mL of *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a).* Dissolve 0.200 g of *isomalt CRS* in 4 mL of *water R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b).* Dissolve 10.0 mg of *sorbitol CRS* (impurity C) and 10.0 mg of *mannitol CRS* (impurity B) in 20 mL of *water R* and dilute to 100.0 mL with the same solvent.

*Precolumn*:

- *size*: *l* = 30 mm, Ø = 4.6 mm;
- *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);
- *temperature*: 80 ± 3 °C.

*Column*:

- *size*: *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);
- *temperature*: 80 ± 3 °C.

*Mobile phase*: degassed *water for chromatography R*.

*Flow rate*: 0.5 mL/min.

*Detection*: differential refractometer maintained at a constant temperature (e.g. 40 °C).

*Injection*: 20 µL.

*Run time*: 2.5 times the retention time of 1,1-GPM.

*Relative retention* with reference to 1,1-GPM (retention time = about 14 min): 1,6-GPS = about 1.2; impurity B = about 1.6; impurity C = about 2.0.

*System suitability*: reference solution (a):

- *resolution*: minimum 2.0 between the peaks due to 1,1-GPM and 1,6-GPS.

*Limits*:

- *impurities B, C*: for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *total*: not more than 4 times the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) (2.0 per cent);
- *disregard limit*: 0.2 times the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) (0.1 per cent).

**Water** (*2.5.12*): maximum 7.0 per cent, determined on 0.300 g. As solvent, use a mixture of 20 mL of *anhydrous methanol R* and 20 mL of *formamide R1* at 50 ± 5 °C.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution and reference solution (a).

Calculate the percentage content of isomalt (1,1-GPM and 1,6-GPS) taking into account the assigned contents of 1,1-GPM and 1,6-GPS in *isomalt CRS*.

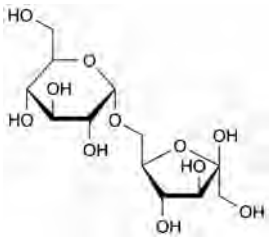
LABELLING

The label states the percentage contents of 1,1-GPM and 1,6-GPS.

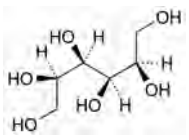
IMPURITIES

*Specified impurities: B, C.*

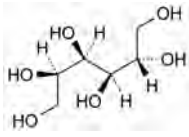
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, D.*



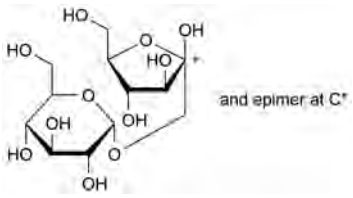
A. 6-*O*-α-D-glucopyranosyl-β-D-*arabino*-hex-2-ulofuranose (isomaltulose),



B. D-mannitol,



C. D-glucitol (D-sorbitol),

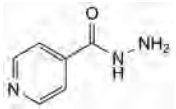


D. 1-*O*-α-D-glucopyranosyl-D-*arabino*-hex-2-ulofuranose (trehalulose).

**07/2018:0146**

# ISONIAZID

## Isoniazidum



$C_6H_7N_3O$ $M_r$ 137.1
[54-85-3]

DEFINITION

Pyridine-4-carbohydrazide.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder or colourless crystals.

*Solubility*: freely soluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: A, B.*

*Second identification: A, C.*

A. Melting point (*2.2.14*): 170 °C to 174 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *isoniazid CRS*.

C. Dissolve 0.1 g in 2 mL of *water R* and add 10 mL of a warm 10 g/L solution of *vanillin R*. Allow to stand and scratch the wall of the test tube with a glass rod. A yellow precipitate is formed, which, after recrystallisation from 5 mL of *ethanol (70 per cent V/V) R* and drying at 100-105 °C, melts (*2.2.14*) at 226 °C to 231 °C.

TESTS

**Solution S**. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 6.0 to 8.0 for solution S.

**Impurity E**. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions.*

*Solvent mixture*: *acetonitrile R*, *water R* (50:50 *V/V*).

*Solution A*. To 2.0 mL of *benzaldehyde R* add *acetonitrile R* and dilute to 100.0 mL with the same solvent. Use the solution within 4 h.

*Test solution.* Dissolve 50.0 mg of the substance to be examined in 1.0 mL of *water R*, add 5.0 mL of solution A and shake well. Wait for 45 min for completion of derivatisation and dilute to 10.0 mL with the solvent mixture.

*Reference solution.* Dissolve 20.0 mg of *hydrazine sulfate R* (equivalent to 4.925 mg of impurity E) in *water R* and dilute to 50.0 mL with the same solvent. Dilute 2.5 mL of the solution to 100.0 mL with *water R*. To 1.0 mL of this solution add 2.5 mL of solution A and shake well. Wait for 45 min for completion of derivatisation and dilute to 25.0 mL with the solvent mixture. Dilute 7.5 mL of this solution to 10.0 mL with the solvent mixture.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *water for chromatography R*, *acetonitrile R* (40:60 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 300 nm.

*Injection*: 10 µL.

*Run time*: 1.5 times the retention time of benzaldehyde azine.

*Retention time*: benzaldehyde azine = about 13 min.

*System suitability*: reference solution:
- *repeatability*: maximum relative standard deviation of 5.0 per cent determined on 6 injections.

*Calculation of percentage content*:
- for impurity E, use the concentration of hydrazine sulfate in the reference solution.

*Limit*:
- *impurity E*: maximum 15 ppm.

**Related substances**. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions.*

*Test solution.* Dissolve 25.0 mg of the substance to be examined in mobile phase A and dilute to 25.0 mL with mobile phase A.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (b).* Dissolve 5 mg of *isonicotinic acid R* (impurity A), 5 mg of *isonicotinamide R* (impurity B) and 5 mg of *nicotinoyl hydrazide R* (impurity D) in mobile phase A and dilute to 50.0 mL with mobile phase A. Dilute 1.0 mL of the solution to 10.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with the test solution.

*Column*:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*:
- *mobile phase A*: mix 3 volumes of *methanol R* and 97 volumes of a buffer solution prepared as follows: dissolve 13.6 g of *potassium dihydrogen phosphate R* in 950 mL of *water for chromatography R*, adjust to pH 6.9 with *strong sodium hydroxide solution R*, add 30 mg of *triethanolamine R* and dilute to 1000 mL with *water for chromatography R*;
- *mobile phase B*: *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 12 | 100 | 0 |
| 12 - 20 | 100 → 85 | 0 → 15 |
| 20 - 28 | 85 | 15 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 266 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B and D.

*Relative retention* with reference to isoniazid (retention time = about 8.4 min): impurity A = about 0.5; impurity D = about 1.15; impurity B = about 1.4.

*System suitability*: reference solution (b):

- *peak-to-valley ratio*: minimum 1.8, where $H_p$ = height above the baseline of the peak due to impurity D and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to isoniazid.

*Calculation of percentage contents*:

- *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.4; impurity B = 1.5;
- for each impurity, use the concentration of isoniazid in reference solution (a).

*Limits*:

- *impurities A, B*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

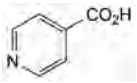
Dissolve 0.250 g in *water R* and dilute to 100.0 mL with the same solvent. To 20.0 mL of the solution add 100 mL of *water R*, 20 mL of *hydrochloric acid R*, 0.2 g of *potassium bromide R* and 0.05 mL of *methyl red solution R*. Titrate dropwise with *0.0167 M potassium bromate*, shaking continuously, until the red colour disappears.

1 mL of *0.0167 M potassium bromate* is equivalent to 3.429 mg of $C_6H_7N_3O$.

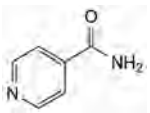
IMPURITIES

*Specified impurities: A, B, E.*

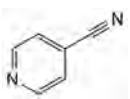
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D.*



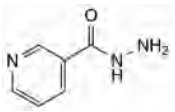
A. pyridine-4-carboxylic acid (isonicotinic acid),



B. pyridine-4-carboxamide (isonicotinamide),



C. pyridine-4-carbonitrile (isonicotinonitrile),



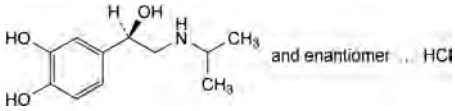
D. pyridine-3-carbohydrazide (nicotinoyl hydrazide),

E. hydrazine.

**07/2013:1332**

# ISOPRENALINE HYDROCHLORIDE

## Isoprenalini hydrochloridum



$C_{11}H_{18}ClNO_3$ $M_r$ 247.7

[51-30-9]

DEFINITION

(1*RS*)-1-(3,4-Dihydroxyphenyl)-2-[(1-methylethyl)amino]-ethanol hydrochloride.

*Content*: 98.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

*First identification: B, C, E.*

*Second identification: A, C, D, E.*

A. Melting point (*2.2.14*): 165 °C to 170 °C, with decomposition.

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *isoprenaline hydrochloride CRS.*

C. Optical rotation (see Tests).

D. To 0.1 mL of solution S (see Tests) add 0.05 mL of *ferric chloride solution R1* and 0.9 mL of *water R*. A green colour is produced. Add dropwise *sodium hydrogen carbonate solution R*. The colour becomes blue and then red.

E. To 0.5 mL of solution S add 1.5 mL of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

*Prepare the solutions immediately before use.*

**Solution S**. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $B_7$ or $BY_7$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.3 to 5.5.

Mix 5 mL of solution S and 5 mL of *carbon dioxide-free water R*.

**Optical rotation** (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 5.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 2.5 mg of *orciprenaline sulfate CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

Monographs

*Reference solution (c)*. To 5.0 mL of reference solution (a) add 5.0 mL of reference solution (b).

*Reference solution (d)*. Dissolve 6.0 mg of *isoprenaline impurity A CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 10.0 mL of the solution to 50.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.125 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *methanol R*, 11.5 g/L solution of *phosphoric acid R* (5:95 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 280 nm.

*Injection*: 20 µL.

*Run time*: 7 times the retention time of isoprenaline.

*Identification of impurities*: use the chromatogram obtained with reference solution (d) to identify the peak due to impurity A; use the chromatogram obtained with reference solution (b) to identify the peak due to orciprenaline.

*Relative retention* with reference to isoprenaline (retention time = about 3 min): orciprenaline = about 1.5; impurity A = about 1.8. If necessary, adjust the concentration of methanol in the mobile phase.

*System suitability*: reference solution (c):

- *resolution*: minimum 3.0 between the peaks due to isoprenaline and orciprenaline.

*Limits*:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.5 per cent);
- *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: maximum 1.0 per cent;
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 15-25 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

*In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.*

Dissolve 0.150 g in 10 mL of *anhydrous formic acid R* and add 50 mL of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

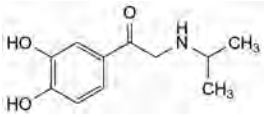
1 mL of *0.1 M perchloric acid* is equivalent to 24.77 mg of $C_{11}H_{18}ClNO_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

*Specified impurities: A.*

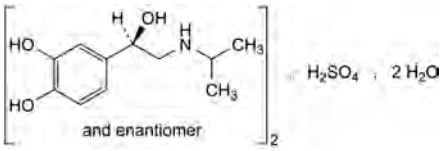


A. 1-(3,4-dihydroxyphenyl)-2-[(1-methylethyl)amino]-ethanone.

**01/2008:0502**
**corrected 10.0**

# ISOPRENALINE SULFATE

## Isoprenalini sulfas



$C_{22}H_{36}N_2O_{10}S,2H_2O$ $M_r$ 556.6
[6700-39-6]

DEFINITION

Bis[(1*RS*)-1-(3,4-dihydroxyphenyl)-2-[(1-methylethyl)-amino]ethanol] sulfate dihydrate.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, very slightly soluble in ethanol (96 per cent).

mp: about 128 °C, with decomposition.

IDENTIFICATION

*First identification: A, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

Dissolve 0.5 g in 1.5 mL of *water R* and add 3.5 mL of *2-propanol R*. Scratch the wall of the tube with a glass rod to initiate crystallisation. Collect the crystals and dry *in vacuo* (*2.2.32*) at 60 °C.

*Comparison*: repeat the operations using 0.5 g of *isoprenaline sulfate CRS*.

B. To 0.1 mL of solution S (see Tests) add 0.9 mL of *water R* and 0.05 mL of *ferric chloride solution R1*. A green colour is produced. Add dropwise *sodium hydrogen carbonate solution R*. The colour becomes blue and then red.

C. Dilute 1 mL of solution S to 10 mL with *water R* and add 0.25 mL of *silver nitrate solution R1*. A shining, grey, fine precipitate is formed within 10 min and the solution becomes pink.

D. Solution S gives reaction (a) of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent. Use within 2 h of preparation.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.3 to 5.5.

Dilute 5 mL of solution S to 10 mL with *carbon dioxide-free water R*.

**Isoprenalone**: the absorbance (*2.2.25*) is not greater than 0.20 at 310 nm.

Dissolve 0.20 g in *0.005 M sulfuric acid* and dilute to 100.0 mL with the same acid.

**Water** (*2.5.12*): 5.0 per cent to 7.5 per cent, determined on 0.200 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 20 mL of *anhydrous acetic acid R*, warming gently if necessary and add 20 mL of *methyl isobutyl ketone R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 52.06 mg of $C_{22}H_{36}N_2O_{10}S$.

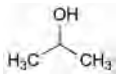
STORAGE

In an airtight container, protected from light.

**07/2015:0970**
**corrected 10.0**

# ISOPROPYL ALCOHOL

## Alcohol isopropylicus



$C_3H_8O$ $M_r$ 60.1
[67-63-0]

DEFINITION

Propan-2-ol.

CHARACTERS

*Appearance*: clear, colourless liquid.

*Solubility*: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

*First identification: B, C.*

*Second identification: A, B, D.*

A. Relative density (*2.2.5*): 0.785 to 0.789.

B. Refractive index (*2.2.6*): 1.376 to 1.379.

C. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *isopropyl alcohol CRS*.

D. To 1 mL add 4 mL of *water R* and mix. Carefully add 2 mL of a 10 g/L solution of *dimethylaminobenzaldehyde R* in *sulfuric acid R*, ensuring that the liquids do not mix; a bright reddish-violet ring forms immediately at the junction of the 2 liquids. After 2-5 min, the entire sulfuric acid layer turns violet.

TESTS

**Appearance**. The substance to be examined is clear (*2.2.1*) and colourless (*2.2.2, Method II*). Dilute 1 mL to 20 mL with *water R*. After 5 min, the solution is clear (*2.2.1*).

**Acidity or alkalinity**. Gently boil 25 mL for 5 min. Add 25 mL of *carbon dioxide-free water R* and allow to cool protected from carbon dioxide in the air. Add 0.1 mL of *phenolphthalein solution R*. The solution is colourless. Not more than 0.6 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pale pink.

**Absorbance** (*2.2.25*): maximum 0.30 at 230 nm, 0.10 at 250 nm, 0.03 at 270 nm, 0.02 at 290 nm and 0.01 at 310 nm.

The absorbance is measured between 230 nm and 310 nm using *water R* as the compensation liquid. The spectrum shows a steadily descending curve with no observable peaks or shoulders.

**Benzene and related substances**. Gas chromatography (*2.2.28*).

*Test solution (a).* The substance to be examined.

*Test solution (b).* Dilute 1.0 mL of *2-butanol R1* to 50.0 mL with test solution (a). Dilute 5.0 mL of this solution to 100.0 mL with test solution (a).

*Reference solution (a).* Dilute 0.5 mL of *2-butanol R1* and 0.5 mL of *propanol R* to 50.0 mL with test solution (a). Dilute 5.0 mL of this solution to 50.0 mL with test solution (a).

*Reference solution (b).* Dilute 100 µL of *benzene R* to 100.0 mL with test solution (a). Dilute 0.20 mL of this solution to 100.0 mL with test solution (a).

*Column*:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.32 mm;
- *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94)polysiloxane R* (film thickness 1.8 µm).

*Carrier gas*: *helium for chromatography R*.

*Auxiliary gas*: *nitrogen for chromatography R* or *helium for chromatography R*.

*Linear velocity*: 35 cm/s.

*Split ratio*: 1:5.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 12 | 40 |
| | 12 - 32 | 40 → 240 |
| | 32 - 42 | 240 |
| Injection port | | 280 |
| Detector | | 280 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Retention time*: benzene = about 10 min.

*System suitability*: reference solution (a):

- *resolution*: minimum 10 between the 1st peak (propanol) and the 2nd peak (2-butanol).

*Limits*:

- *benzene* (test solution (a)): not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (2 ppm), after the sensitivity has been adjusted so that the height of the peak due to benzene in the chromatogram obtained with reference solution (b) represents at least 10 per cent of the full scale of the recorder;
- *total of impurities apart from 2-butanol* (test solution (b)): not more than 3 times the area of the peak due to 2-butanol in the chromatogram obtained with test solution (b) (0.3 per cent), after the sensitivity has been adjusted so that the height of the 2 peaks following the principal peak in the chromatogram obtained with reference solution (a) represents at least 50 per cent of the full scale of the recorder.

**Peroxides**. In a 12 mL test-tube with a ground-glass stopper and a diameter of about 15 mm, introduce 8 mL of *potassium iodide and starch solution R*. Fill completely with the substance to be examined. Shake vigorously and allow to stand protected from light for 30 min. No colour develops.

**Non-volatile substances**: maximum 20 ppm.

Evaporate 100 g to dryness on a water-bath *after having verified that it complies with the test for peroxides* and dry in an oven at 100-105 °C. The residue weighs a maximum of 2 mg.

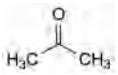
**Water** (*2.5.12*): maximum 0.5 per cent, determined on 5.0 g.

STORAGE

Protected from light.

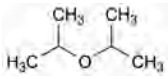
Monographs 1

IMPURITIES



A. propanone (acetone),

B. benzene,



C. 2-(1-methylethoxy)propane (diisopropyl ether),

D. ethoxyethane (diethyl ether),

E. methanol,

F. propan-1-ol (*n*-propanol).

**07/2017:2867**

# ISOPROPYL ISOSTEARATE

## Isopropylis isostearas

DEFINITION

Product obtained by esterification of isostearic acid (regioisomers mainly of octadecanoic acid, a complex mixture of branched and straight-chain fatty acids) with isopropyl alcohol. The monograph applies to isopropyl isostearate for cutaneous use.

CHARACTERS

*Appearance*: clear, colourless or pale yellow liquid.

*Solubility*: practically insoluble in water, miscible with ethanol (96 per cent) and with fatty oils.

*Viscosity*: about 11 mPa·s at 20 °C.

*Relative density*: about 0.866 at 20 °C.

*Refractive index*: about 1.447 at 20 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *isopropyl isostearate CRS*.
An additional weak absorption band at 1780 $cm^{-1}$ may be present.

B. Saponification value (see Tests).

C. Composition of fatty acids (see Tests).

TESTS

**Appearance of solution**. The solution is not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).
Dissolve 10.0 g in *ethanol (96 per cent) R* and dilute to 20 mL with the same solvent.

**Acid value** (*2.5.1*): maximum 1.0, determined on 20.0 g.

**Iodine value** (*2.5.4, Method B*): maximum 3.0, determined on 3.0 g.

**Peroxide value** (*2.5.5, Method B*): maximum 5.0.

**Saponification value** (*2.5.6*): 165 to 180, determined on 2.0 g.

**Composition of fatty acids** (*2.4.22, Method B*). Use the mixture of calibrating substances in Table 2.4.22.-1.
*Composition of the fatty-acid fraction of the substance*:
– *sum of the contents of the fatty acids eluting between palmitic acid and stearic acid*: minimum 65.0 per cent;
– *sum of the contents of myristic acid, palmitic acid and stearic acid*: maximum 11.0 per cent.

**Water** (*2.5.12*): maximum 0.1 per cent, determined on 5.00 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

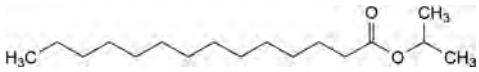
STORAGE

In an airtight container.

**01/2008:0725**
**corrected 10.0**

# ISOPROPYL MYRISTATE

## Isopropylis myristas



$C_{17}H_{34}O_2$ $M_r$ 270.5

DEFINITION

1-Methylethyl tetradecanoate together with variable amounts of other fatty acid isopropyl esters.
*Content*: minimum 90.0 per cent of $C_{17}H_{34}O_2$.

CHARACTERS

*Appearance*: clear, colourless, oily liquid.

*Solubility*: immiscible with water, miscible with ethanol (96 per cent), with methylene chloride, with fatty oils and with liquid paraffin.

*Relative density*: about 0.853.

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Saponification value (see Tests).

B. Examine the chromatograms obtained in the assay.
*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

C. Superpose 2 mL of a 1 g/L solution in *ethanol (96 per cent) R* on a freshly prepared solution of 20 mg of *dimethylaminobenzaldehyde R* in 2 mL of *sulfuric acid R*. After 2 min, a yellowish-red colour appears at the junction of the 2 liquids and gradually becomes red.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).
Dissolve 2.0 g in *methanol R* and dilute to 20 mL with the same solvent.

**Refractive index** (*2.2.6*): 1.434 to 1.437.

**Viscosity** (*2.2.9*): 5 mPa·s to 6 mPa·s.

**Acid value** (*2.5.1*): maximum 1.0.

**Iodine value** (*2.5.4*): maximum 1.0.

**Saponification value** (*2.5.6*): 202 to 212.

**Water** (*2.5.12*): maximum 0.1 per cent, determined on 5.0 g.

**Total ash** (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

*Internal standard solution.* Dissolve 50.0 mg of *tricosane R* in *heptane R* and dilute to 250.0 mL with the same solvent.

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the internal standard solution and dilute to 100.0 mL with the same solution.

*Reference solution.* Dissolve 20.0 mg of *isopropyl tetradecanoate CRS* in the internal standard solution and dilute to 100.0 mL with the same solution.

*Column*:

- *material*: fused silica;
- *size*: *l* = 50 m, Ø = 0.2 mm;
- *stationary phase*: *cyanopropylpolysiloxane R* (film thickness 0.2 µm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 1 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 6 | 125 → 185 |
| | 6 - 16 | 185 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 2 µL.

Calculate the percentage content of $C_{17}H_{34}O_2$ in the substance to be examined.

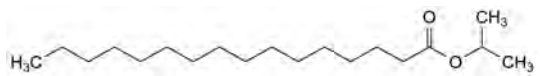
# ISOPROPYL PALMITATE

## Isopropylis palmitas



$C_{19}H_{38}O_2$ $M_r$ 298.5

DEFINITION

1-Methylethyl hexadecanoate together with varying amounts of other fatty acid isopropyl esters.

*Content*: minimum 90.0 per cent of $C_{19}H_{38}O_2$.

CHARACTERS

*Appearance*: clear, colourless, oily liquid.

*Solubility*: immiscible with water, miscible with ethanol (96 per cent), with methylene chloride, with fatty oils and with liquid paraffin.

*Relative density*: about 0.854.

IDENTIFICATION

*First identification*: *B.*

*Second identification*: *A, C.*

A. Saponification value (see Tests).

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

C. Superpose 2 mL of a 1 g/L solution in *ethanol (96 per cent) R* on a freshly prepared solution of 20 mg of *dimethylaminobenzaldehyde R* in 2 mL of *sulfuric acid R*. After 2 min, a yellowish-red colour appears at the junction of the 2 liquids which gradually becomes red.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_7$ (*2.2.2, Method II*).

Dissolve 2.0 g in *methanol R* and dilute to 20 mL with the same solvent.

**Refractive index** (*2.2.6*): 1.436 to 1.440.

**Viscosity** (*2.2.9*): 5 mPa·s to 10 mPa·s.

**Acid value** (*2.5.1*): maximum 1.0.

**Iodine value** (*2.5.4*): maximum 1.0.

**Saponification value** (*2.5.6*): 183 to 193.

**Water** (*2.5.12*): maximum 0.1 per cent, determined on 5.0 g.

**Total ash** (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

*Internal standard solution.* Dissolve 50.0 mg of *tricosane R* in *heptane R* and dilute to 250.0 mL with the same solvent.

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the internal standard solution and dilute to 100.0 mL with the same solution.

*Reference solution.* Dissolve 20.0 mg of *isopropyl hexadecanoate CRS* in the internal standard solution and dilute to 100.0 mL with the same solution.

*Column*:

- *material*: fused silica,
- *size*: *l* = 50 m, Ø = 0.2 mm,
- *stationary phase*: *cyanopropylpolysiloxane R* (film thickness 0.2 µm).

*Carrier gas*: *helium for chromatography R.*

*Flow rate*: 1 mL/min.

*Split ratio*: 1:40.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 6 | 125 → 185 |
| | 6 - 16 | 185 |
| Injection port | | 250 |
| Detector | | 250 |

*Detection*: flame ionisation.

*Injection*: 2 µL.

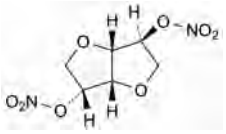
# ISOSORBIDE DINITRATE, DILUTED

## Isosorbidi dinitras dilutus



$C_6H_8N_2O_8$ $M_r$ 236.1

DEFINITION

Dry mixture of isosorbide dinitrate and *Lactose monohydrate (0187)* or *Mannitol (0559)*.

*Content*: 95.0 per cent *m/m* to 105.0 per cent *m/m* of the content of 1,4:3,6-dianhydro-D-glucitol 2,5-dinitrate stated on the label.

*CAUTION: undiluted isosorbide dinitrate may explode if subjected to percussion or excessive heat. Appropriate precautions must be taken and only very small quantities handled.*

CHARACTERS

*Appearance*: undiluted isosorbide dinitrate is a fine, white or almost white, crystalline powder.

*Solubility*: undiluted isosorbide dinitrate is very slightly soluble in water, very soluble in acetone, sparingly soluble in ethanol (96 per cent).

The solubility of the diluted product depends on the diluent and its concentration.

IDENTIFICATION

*First identification: A, C, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs prepared with the residue obtained in identification test D.

*Comparison*: *isosorbide dinitrate CRS*.

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake a quantity of the substance to be examined corresponding to 10 mg of isosorbide dinitrate with 10 mL of *ethanol (96 per cent) R* for 5 min and filter.

*Reference solution.* Shake a quantity of *isosorbide dinitrate CRS* corresponding to 10 mg of isosorbide dinitrate with 10 mL of *ethanol (96 per cent) R* for 5 min and filter.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *methanol R, methylene chloride R* (5:95 *V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of air.

*Detection*: spray with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake a quantity of the substance to be examined corresponding to 0.10 g of lactose or mannitol with 10 mL of *water R*. Filter if necessary.

*Reference solution (a).* Dissolve 0.10 g of *lactose monohydrate R* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 0.10 g of *mannitol R* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (c).* Mix equal volumes of reference solutions (a) and (b).

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

*Application*: 1 µL; thoroughly dry the points of application.

*Development A*: over a path of 15 cm.

*Drying A*: in a current of warm air.

*Development B*: immediately, over a path of 15 cm, after renewing the mobile phase.

*Drying B*: in a current of warm air.

*Detection*: spray with *4-aminobenzoic acid solution R*, dry in a current of cold air until the acetone is removed, then heat at 100 °C for 15 min; allow to cool, spray with a 2 g/L solution of *sodium periodate R*, dry in a current of cold air, and heat at 100 °C for 15 min.

*System suitability*: reference solution (c):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) for lactose or to the principal spot in the chromatogram obtained with reference solution (b) for mannitol.

D. Shake a quantity of the substance to be examined corresponding to 25 mg of isosorbide dinitrate with 10 mL of *acetone R* for 5 min. Filter, evaporate to dryness at a temperature below 40 °C and dry the residue over *diphosphorus pentoxide R* at a pressure of 0.7 kPa for 16 h. The melting point (*2.2.14*) of the residue is 69 °C to 72 °C.

TESTS

**Impurity A**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake a quantity of the substance to be examined corresponding to 0.10 g of isosorbide dinitrate with 5 mL of *ethanol (96 per cent) R* and filter.

*Reference solution.* Dissolve 10 mg of *potassium nitrate R* in 1 mL of *water R* and dilute to 100 mL with *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R.*

*Mobile phase*: *glacial acetic acid R, acetone R, toluene R* (15:30:60 *V/V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of air until the acetic acid is completely removed.

*Detection*: spray copiously with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

*Limit*:

– *impurity A*: any spot due to impurity A is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

**Impurities B and C**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Sonicate a quantity of the substance to be examined corresponding to 25.0 mg of isosorbide dinitrate with 20 mL of the mobile phase for 15 min and dilute to 25.0 mL with the mobile phase. Filter the solution through a suitable membrane filter.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 10.0 mL with the mobile phase.

*Reference solution (a).* Sonicate a quantity of *isosorbide dinitrate CRS* corresponding to 25.0 mg of isosorbide dinitrate with 20 mL of the mobile phase for 15 min and dilute to 25.0 mL with the mobile phase. Filter the solution through a suitable membrane filter.

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 10.0 mg of *isosorbide-2-nitrate CRS* (impurity B) in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 0.1 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (d).* Dissolve 10.0 mg of *isosorbide mononitrate CRS* (impurity C) in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 0.1 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (e).* Dissolve 5 mg of *isosorbide-2-nitrate CRS* (impurity B) in the mobile phase and dilute to 10 mL with the mobile phase. To 1 mL of this solution add 0.5 mL of reference solution (a) and dilute to 10 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *aminopropylmethylsilyl silica gel for chromatography R* (10 µm).

*Mobile phase*: *anhydrous ethanol R*, *trimethylpentane R* (15:85 *V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 210-215 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (c), (d) and (e).

*Retention time*: isosorbide dinitrate = about 5 min; impurity B = about 8 min; impurity C = about 11 min.

*System suitability*: reference solution (e):

– *resolution*: minimum 6.0 between the peaks due to isosorbide dinitrate and impurity B.

*Limits*:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurities B and C with the following modifications.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL of test solution (b) and reference solution (b).

If the areas of the peaks from 2 successive injections of reference solution (b) do not agree to within 1.0 per cent, then inject a further 4 times and calculate, for the 6 injections, the relative standard deviation.

*System suitability*: reference solution (b):

– *repeatability*: maximum relative standard deviation of 2.0 per cent after 6 injections.

Calculate the content of isosorbide dinitrate as a percentage of the declared content.

STORAGE

Protected from light.

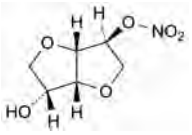
LABELLING

The label states the percentage content of isosorbide dinitrate.

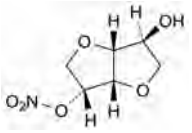
IMPURITIES

*Specified impurities: A, B, C.*

A. inorganic nitrates,



B. 1,4:3,6-dianhydro-D-glucitol 2-nitrate (isosorbide 2-nitrate),

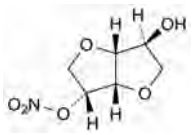


C. 1,4:3,6-dianhydro-D-glucitol 5-nitrate (isosorbide 5-nitrate, isosorbide mononitrate).

**01/2008:1118**
**corrected 6.0**

# ISOSORBIDE MONONITRATE, DILUTED

## Isosorbidi mononitras dilutus



$C_6H_9NO_6$ $M_r$ 191.1

DEFINITION

Dry mixture of isosorbide mononitrate and *Lactose monohydrate (0187)* or *Mannitol (0559)*.

*Content*: 95.0 per cent *m/m* to 105.0 per cent *m/m* of the content of 1,4:3,6-dianhydro-D-glucitol 5-nitrate stated on the label.

CHARACTERS

*Appearance*: undiluted isosorbide mononitrate is a white or almost white, crystalline powder.

*Solubility*: undiluted isosorbide mononitrate is freely soluble in water, in acetone, in ethanol (96 per cent) and in methylene chloride.

The solubility of the diluted product depends on the diluent and its concentration.

IDENTIFICATION

*First identification: A, C, D.*

*Second identification: B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs prepared with the residue obtained in identification test D.

*Comparison*: *isosorbide mononitrate CRS.*

B. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake a quantity of the substance to be examined corresponding to 10 mg of isosorbide mononitrate with 10 mL of *ethanol (96 per cent) R* for 5 min and filter.

*Reference solution.* Dissolve 10 mg of *isosorbide mononitrate CRS* in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *methanol R*, *methylene chloride R* (5:95 *V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of air.

*Detection*: spray with freshly prepared *potassium iodide and starch solution R*. Expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake a quantity of the substance to be examined corresponding to 0.10 g of lactose or mannitol with 10 mL of *water R*; filter if necessary.

*Reference solution (a).* Dissolve 0.10 g of *lactose monohydrate R* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 0.10 g of *mannitol R* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (c).* Mix equal volumes of reference solutions (a) and (b).

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *water R*, *methanol R*, *anhydrous acetic acid R*, *ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

*Application*: 1 µL; thoroughly dry the points of application.

*Development A*: over a path of 15 cm.

*Drying A*: in a current of warm air.

*Development B*: immediately, over a path of 15 cm, after renewing the mobile phase.

*Drying B*: in a current of warm air.

*Detection*: spray with *4-aminobenzoic acid solution R* and dry in a current of cold air until the acetone is removed; heat at 100 °C for 15 min and allow to cool; spray with a 2 g/L solution of *sodium periodate R* and dry in a current of cold air; heat at 100 °C for 15 min.

*System suitability*: reference solution (c):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) for lactose or to the principal spot in the chromatogram obtained with reference solution (b) for mannitol.

D. Shake a quantity of the substance to be examined corresponding to 25 mg of isosorbide mononitrate with 10 mL of *acetone R* for 5 min. Filter, evaporate to dryness at a temperature below 40 °C and dry the residue over *diphosphorus pentoxide R* at a pressure of 0.7 kPa for 16 h. The melting point (*2.2.14*) of the residue is 89 °C to 91 °C.

TESTS

**Impurity A**. Thin-layer chromatography (*2.2.27*).

*Test solution.* Shake a quantity of the substance to be examined corresponding to 0.10 g of isosorbide mononitrate with 5 mL of *ethanol (96 per cent) R* and filter.

*Reference solution.* Dissolve 10 mg of *potassium nitrate R* in 1 mL of *water R* and dilute to 100 mL with *ethanol (96 per cent) R*.

*Plate*: *TLC silica gel plate R*.

*Mobile phase*: *glacial acetic acid R*, *acetone R*, *toluene R* (15:30:60 *V/V/V*).

*Application*: 10 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of air until the acetic acid is completely removed.

*Detection*: spray copiously with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

*Limit*:

– *impurity A*: any spot due to impurity A is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

**Impurities B and C**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Sonicate a quantity of the substance to be examined corresponding to 25.0 mg of isosorbide mononitrate with 20 mL of the mobile phase for 15 min and dilute to 25.0 mL with the mobile phase. Filter the solution through a suitable membrane filter.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 10.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 25.0 mg of *isosorbide mononitrate CRS* in the mobile phase and dilute to 25.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 10.0 mg of *isosorbide-2-nitrate CRS* (impurity C) in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 0.1 mL of this solution to 20.0 mL with the mobile phase.

*Reference solution (c).* Sonicate a quantity of *isosorbide dinitrate CRS* (impurity B) corresponding to 10.0 mg of isosorbide dinitrate in 15 mL of the mobile phase for 15 min and dilute to 20.0 mL with the mobile phase. Filter the solution through a suitable membrane filter. Dilute 0.1 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (d).* Dissolve 5 mg of *isosorbide mononitrate CRS* and 5 mg of *isosorbide-2-nitrate CRS* (impurity C) in the mobile phase and dilute to 10 mL with the mobile phase. Dilute 1 mL of this solution to 10 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *aminopropylmethylsilyl silica gel for chromatography R* (10 µm).

*Mobile phase*: *anhydrous ethanol R*, *trimethylpentane R* (15:85 *V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 210-215 nm.

*Injection*: 10 µL of test solution (a) and reference solutions (b), (c) and (d).

*Retention time*: impurity B = about 5 min;
impurity C = about 8 min; isosorbide 5-nitrate = about 11 min.

*System suitability*: reference solution (d):

– *resolution*: minimum 4.0 between the peaks due to impurity C and isosorbide 5-nitrate.

*Limits*:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);

– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurities B and C with the following modifications.

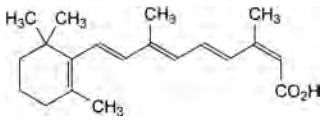
# ISOTRETINOIN

## Isotretinoinum



$C_{20}H_{28}O_2$ $M_r$ 300.4

[4759-48-2]

DEFINITION

(2*Z*,4*E*,6*E*,8*E*)-3,7-Dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: yellow or light orange, crystalline powder.

*Solubility*: practically insoluble in water, soluble in methylene chloride, slightly soluble in ethanol (96 per cent).

It is sensitive to air, heat and light, especially in solution.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *isotretinoin CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

*Test solution*. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 5.0 mg of *tretinoin CRS* (impurity A) in *methanol R* and dilute to 5.0 mL with the same solvent.

*Reference solution (b)*. Mix 0.5 mL of the test solution and 1 mL of reference solution (a) and dilute to 25 mL with *methanol R*.

*Reference solution (c)*. Dilute 1.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*: *glacial acetic acid R*, *water for chromatography R*, *methanol R* (5:225:770 *V/V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 355 nm.

*Injection*: 10 µL of the test solution and reference solutions (b) and (c).

*Run time*: 1.6 times the retention time of isotretinoin.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to isotretinoin (retention time = about 26 min): impurity A = about 1.3.

*System suitability*: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to isotretinoin and impurity A.

*Limits*:

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* for 16 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 70 mL of *acetone R*. Titrate with *0.1 M tetrabutylammonium hydroxide in 2-propanol*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M tetrabutylammonium hydroxide in 2-propanol* is equivalent to 30.04 mg of $C_{20}H_{28}O_2$.

STORAGE

Under an inert gas, in an airtight container, protected from light.

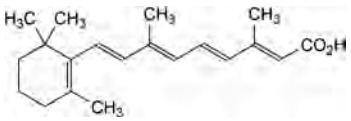
It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of inert gas.

IMPURITIES

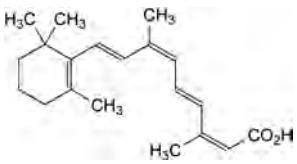
*Specified impurities: A.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these

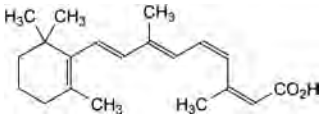
impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, F, G, H, I.*



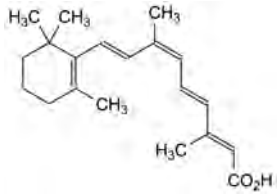
A. (2*E*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (tretinoin),



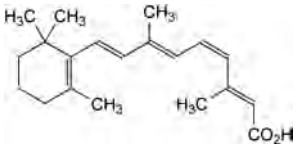
B. (2*Z*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (9,13-di*cis*-retinoic acid),



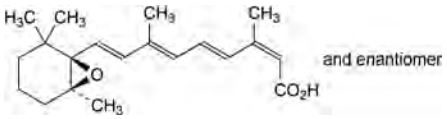
C. (2*Z*,4*Z*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (11,13-di*cis*-retinoic acid),



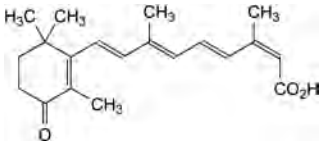
D. (2*E*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (9-*cis*-retinoic acid),



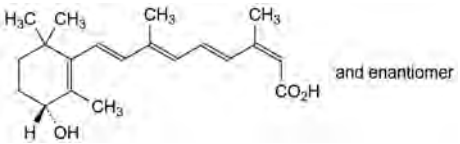
F. (2*E*,4*Z*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (11-*cis*-retinoic acid),



G. (2*Z*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-[(1*RS*,6*SR*)-2,2,6-trimethyl-7-oxabicyclo[4.1.0]heptan-1-yl]nona-2,4,6,8-tetraenoic acid (13-*cis*-5,6-dihydro-5,6-epoxyretinoic acid),



H. (2*Z*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethyl-3-oxocyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid (13-*cis*-4-oxoretinoic acid),



I. (2*Z*,4*E*,6*E*,8*E*)-9-[(3*RS*)-3-hydroxy-2,6,6-trimethylcyclohex-1-en-1-yl]-3,7-dimethylnona-2,4,6,8-tetraenoic acid (13-*cis*-4-hydroxyretinoic acid).

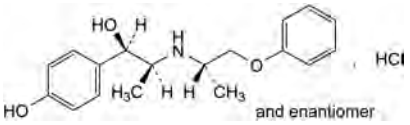
# ISOXSUPRINE HYDROCHLORIDE

## Isoxsuprini hydrochloridum



$C_{18}H_{24}ClNO_3$ $M_r$ 337.8
[579-56-6]

DEFINITION

(1*RS*,2*SR*)-1-(4-Hydroxyphenyl)-2-[[(1*SR*)-1-methyl-2-phenoxyethyl]amino]propan-1-ol hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: sparingly soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

mp: about 205 °C, with decomposition.

IDENTIFICATION

*First identification: B, E.*

*Second identification: A, C, D, E.*

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in *0.1 M hydrochloric acid* and dilute to 50.0 mL with the same acid. Dilute 10.0 mL of this solution to 100.0 mL with *0.1 M hydrochloric acid*.

*Spectral range*: 230-350 nm.

*Absorption maxima*: at 269 nm and 275 nm.

*Resolution* (*2.2.25*): minimum 1.7 for the absorbance ratio.

*Specific absorbance at the absorption maxima*:

– at 269 nm: 71 to 74;
– at 275 nm: 70 to 73.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *isoxsuprine hydrochloride CRS.*

If the spectra obtained show differences, dissolve 50 mg of the substance to be examined and of the reference substance separately in 2 mL of *methanol R*, add 15 mL of *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 mL with the same solvent.

*Reference solution.* Dissolve 20 mg of *isoxsuprine hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *concentrated ammonia R*, *methanol R*, *methylene chloride R* (0.25:15:85 *V/V/V*).

*Application*: 10 µL.

*Development*: over a path of 12 cm.

*Drying*: in a current of warm air.

*Detection*: spray with a 10 g/L solution of *potassium permanganate R*.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 1 mL of solution S (see Tests) add 0.05 mL of *copper sulfate solution R* and 0.5 mL of *strong sodium hydroxide solution R*. The solution becomes blue. Add 1 mL of *ether R* and shake. Allow to separate. The upper layer remains colourless.

E. 2 mL of solution S gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.50 g, with gentle heating if necessary, in *carbon dioxide-free water R*, cool and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.5 to 6.0 for solution S.

**Optical rotation** (*2.2.7*): − 0.05° to + 0.05°, determined on solution S.

**Phenones**: maximum 1.0 per cent, calculated as impurity B.

Dissolve 10.0 mg in *water R* and dilute to 100.0 mL with the same solvent. The absorbance (*2.2.25*) of the solution measured at the absorption maximum at 310 nm is not greater than 0.10.

**Related substances**. Gas chromatography (*2.2.28*). *Prepare the solutions immediately before use.*

*Internal standard solution (a).* Dissolve 0.1 g of *hexacosane R* in *trimethylpentane R* and dilute to 20 mL with the same solvent.

*Internal standard solution (b).* Dilute 1 mL of internal standard solution (a) to 50 mL with *trimethylpentane R*.

*Test solution.* To 10.0 mg of the substance to be examined, add 0.5 mL of *N-trimethylsilylimidazole R*. Heat to 65 °C for 10 min. Allow to cool, then add 2.0 mL of the internal standard solution (b) and 2.0 mL of *water R*. Shake. Use the upper layer.

*Reference solution (a).* To 10.0 mg of the substance to be examined, add 0.5 mL of *N-trimethylsilylimidazole R*. Heat to 65 °C for 10 min. Allow to cool, then add 2.0 mL of the internal standard solution (a) and 2.0 mL of *water R*. Shake. Dilute 1.0 mL of the upper layer to 50.0 mL with *trimethylpentane R*.

*Reference solution (b).* To 10.0 mg of the substance to be examined, add 0.5 mL of *N-trimethylsilylimidazole R*. Heat to 65 °C for 10 min. Allow to cool, then add 2.0 mL of *trimethylpentane R* and 2.0 mL of *water R*. Shake. Use the upper layer.

*Column*:

– *material*: glass;

– *size*: *l* = 1.5 m, Ø = 4 mm;

– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* (125-135 µm) impregnated with 3 per cent *m/m* of *methylpolysiloxane R*.

*Carrier gas*: *nitrogen for chromatography R*.

*Flow rate*: 30 mL/min.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 25 | 195 |
| | 25 - 29 | 195 → 215 |
| | 29 - 39 | 215 |
| Injection port | | 225 |
| Detector | | 225 |

*Detection*: flame ionisation.

*Injection*: 1 µL.

*Elution order*: isoxsuprine, hexacosane.

*System suitability*:

– *resolution*: minimum 5.0 between the peaks due to isoxsurpine and hexacosane in the chromatogram obtained with reference solution (a);

– in the chromatogram obtained with reference solution (b), there is no peak with the same retention time as the internal standard.

*Limit*:

– *total*: calculate the ratio (*R*) of the area of the peak due to the trimethylsilyl derivative of isoxsuprine to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (a); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than *R* (2.0 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 80 mL of *ethanol (96 per cent) R* and add 1.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 33.78 mg of $C_{18}H_{24}ClNO_3$.

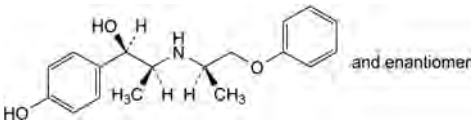
STORAGE

Protected from light.

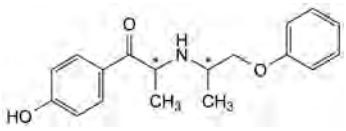
IMPURITIES

*Specified impurities*: *B*.

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.



A. (1*RS*,2*SR*)-1-(4-hydroxyphenyl)-2-[[(1*RS*)-1-methyl-2-phenoxyethyl]amino]propan-1-ol,

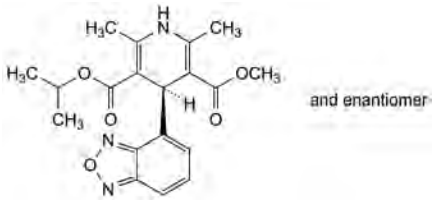


B. 1-(4-hydroxyphenyl)-2-[(1-methyl-2-phenoxyethyl)amino]propan-1-one.

**01/2008:2110**
**corrected 6.0**

# ISRADIPINE

## Isradipinum



$C_{19}H_{21}N_3O_5$ $M_r$ 371.4
[75695-93-1]

DEFINITION

Methyl 1-methylethyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate.

*Content*: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: yellow, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in acetone, soluble in methanol.

mp: about 168 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *isradipine CRS*.

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 50.0 mg of the substance to be examined in 1 mL of *methanol R*, using an ultrasonic bath if necessary, and dilute to 25.0 mL with the mobile phase.

*Test solution (b).* Dissolve 50.0 mg of the substance to be examined in 2 mL of *methanol R* and dilute to 250.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 2 mg of the substance to be examined and 2 mg of *isradipine impurity D CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 50.0 mg of *isradipine CRS* in 2 mL of *methanol R* and dilute to 250.0 mL with the mobile phase.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *acetonitrile R*, *tetrahydrofuran R*, *water R* (125:270:625 *V/V/V*).

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (b).

*Run time*: 5 times the retention time of isradipine.

*Identification of impurities*: use the chromatogram supplied with *isradipine CRS* to identify the peaks due to impurities A and B.

*Relative retention* with reference to isradipine (retention time = about 7 min): impurity A = about 0.8; impurity D = about 0.9; impurity B = about 1.8.

*System suitability*: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to isradipine and impurity D.

*Limits*:

- *correction factor*: for the calculation of content, multiply the peak area of impurity D by 1.4,
- *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *impurity B*: not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent),
- *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Detection*: spectrophotometer at 326 nm.

*Injection*: test solution (b) and reference solution (c).

*Run time*: twice the retention time of isradipine.

Calculate the percentage content of isradipine from the areas of the peaks and the declared content of *isradipine CRS*.

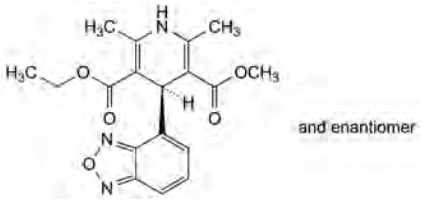
STORAGE

Protected from light.

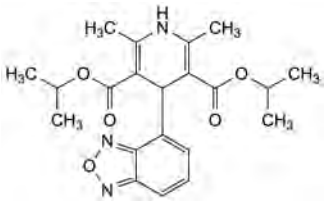
IMPURITIES

*Specified impurities*: *A, B, D.*

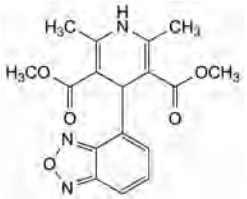
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E.*



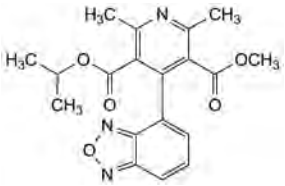
A. ethyl methyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,



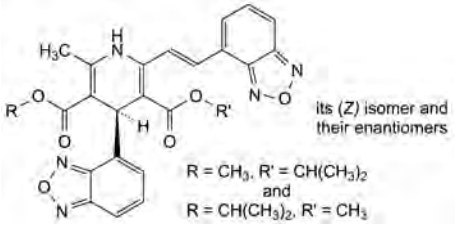
B. bis(1-methylethyl) (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,



C. dimethyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,



D. methyl 1-methylethyl 4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethylpyridine-3,5-dicarboxylate,

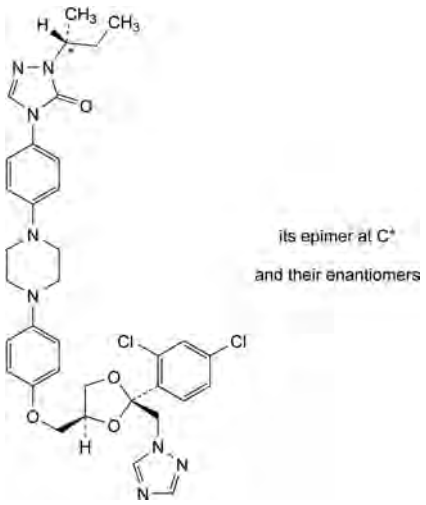


E. methyl 1-methylethyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2-[(*EZ*)-2-(2,1,3-benzoxadiazol-4-yl)ethenyl]-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate.

**01/2011:1335**

# ITRACONAZOLE

## Itraconazolum



$C_{35}H_{38}Cl_2N_8O_4$ $M_r$ 706
[84625-61-6]

DEFINITION

4-[4-[4-[4-[[*cis*-2-(2,4-Dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *itraconazole CRS*.

TESTS

**Solution S**. Dissolve 2.0 g in *methylene chloride R* and dilute to 20.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $R_6$ or $B_6$ (*2.2.2, Method II*).

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution*. Dissolve 0.100 g of the substance to be examined in *methanolic hydrochloric acid R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with *methanolic hydrochloric acid R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanolic hydrochloric acid R*.

*Reference solution (b)*. Dissolve 10 mg of *itraconazole for system suitability CRS* (containing impurities B, C, D, E, F and G) in 1.0 mL of *methanolic hydrochloric acid R*.

*Column*:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm or 3.5 µm);
- *temperature*: 30 °C.

*Mobile phase*:
- *mobile phase A*: 27.2 g/L solution of *tetrabutylammonium hydrogen sulfate R1*;
- *mobile phase B*: *acetonitrile R1*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 80 | 20 |
| 2 - 22 | 80 → 50 | 20 → 50 |
| 22 - 27 | 50 | 50 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 225 nm.

*Injection*: 10 µL.

*Identification of impurities*: use the chromatogram supplied with *itraconazole for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities B, C, D, E, F and G.

*Relative retention* with reference to itraconazole (retention time = about 14 min): impurity B = about 0.7; impurities C and D = about 0.8; impurity E = about 0.9; impurity F = about 1.05; impurity G = about 1.3.

*System suitability*: reference solution (b):
- *peak-to-valley ratio*: minimum 1.5, where $H_p$ = height above the baseline of the peak due to impurity F and $H_v$ = height above the baseline of the lowest point of the curve separating this peak from the peak due to itraconazole.

*Limits*:
- *impurities B, G*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurity E*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *sum of impurities C and D*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 70 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* by vigorous stirring for at least 10 min. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically at the second point of inflexion (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 35.3 mg of $C_{35}H_{38}Cl_2N_8O_4$.

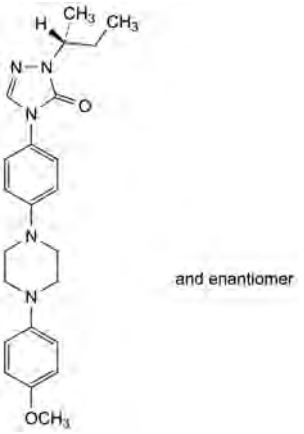
STORAGE

Protected from light.

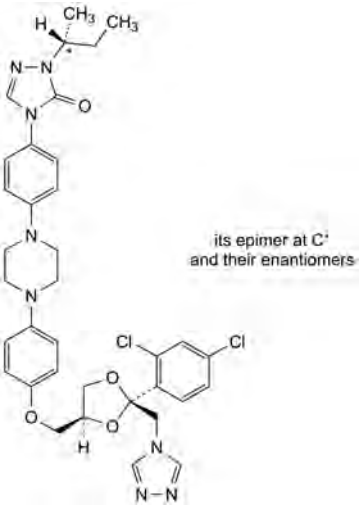
IMPURITIES

*Specified impurities: B, C, D, E, G.*

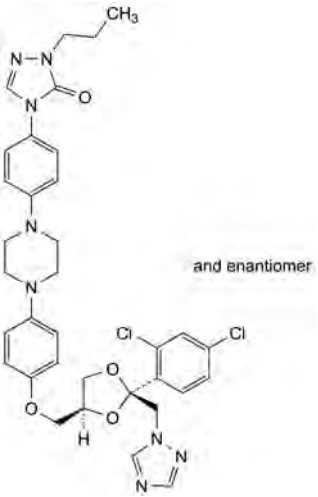
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, F.*



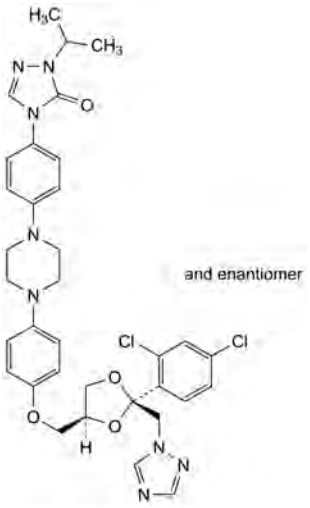
A. 4-[4-[4-(4-methoxyphenyl)piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



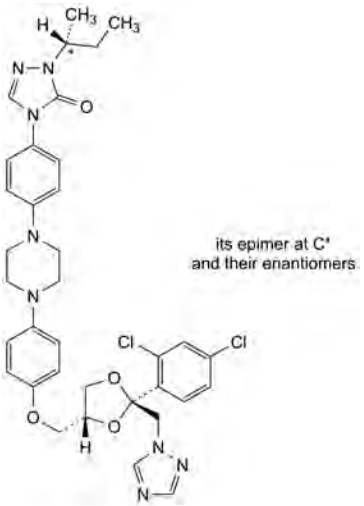
B. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(4*H*-1,2,4-triazol-4-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



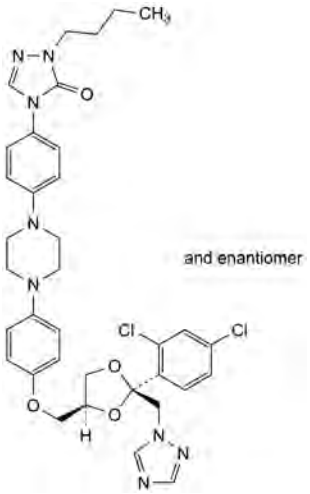
C. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-propyl-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



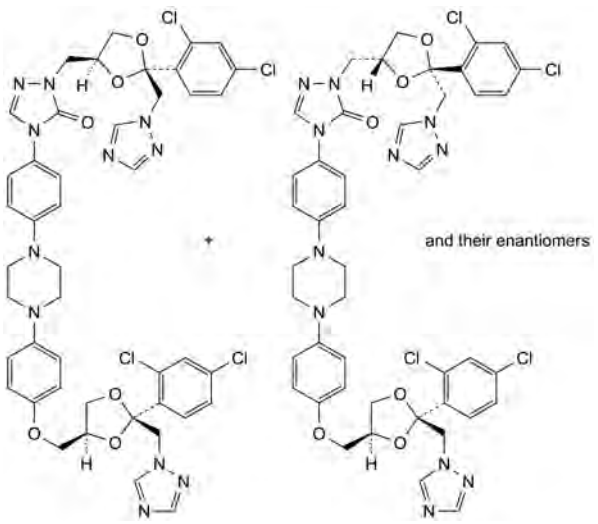
D. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-(1-methylethyl)-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



E. 4-[4-[4-[4-[[*trans*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol- 3-one,



F. 2-butyl-4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



G. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one.

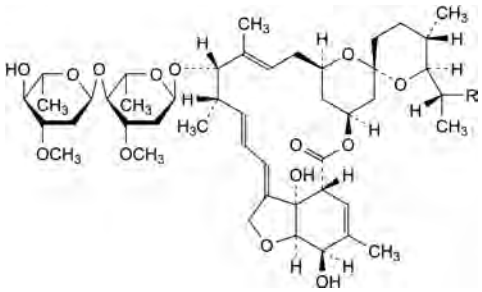
# IVERMECTIN

## Ivermectinum



| Component | R | Molecular formula | $M_r$ |
|---|---|---|---|
| $H_2B_{1a}$ | $CH_2$-$CH_3$ | $C_{48}H_{74}O_{14}$ | 875 |
| $H_2B_{1b}$ | $CH_3$ | $C_{47}H_{72}O_{14}$ | 861 |

Ivermectin B1a: [71827-03-7]
Ivermectin B1b: [70209-81-3]

DEFINITION

Mixture of (2a*E*,4*E*,5′*S*,6*S*,6′*R*,7*S*,8*E*,11*R*,13*R*,15*S*,17a*R*,20*R*,-20a*R*,20b*S*)-7-[[2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-3-*O*-methyl-α-L-*arabino*-hexopyranosyl]oxy]-20,20b-dihydroxy-5′,6,8,19-tetramethyl-6′-[(1*S*)-1-methylpropyl]-3′,4′,5′,6,6′,7,10,11,14,15,17a,20,20a,20b-tetradecahydrospiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]-benzodioxacyclooctadecene-13,2′-[2*H*]pyran]-17-one (or 5-*O*-demethyl-22,23-dihydroavermectin $A_{1a}$) (component $H_2B_{1a}$) and (2a*E*,4*E*,5′*S*,6*S*,6′*R*,7*S*,8*E*,11*R*,13*R*,15*S*,17a*R*,20*R*,20a*R*,-20b*S*)-7-[[2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-3-*O*-methyl-α-L-*arabino*-hexopyranosyl]oxy]-20,20b-dihydroxy-5′,6,8,19-tetramethyl-6′-(1-methylethyl)-3′,4′,5′,6,6′,7,10,11,14,15,17a,20,20a,20b-tetradecahydrospiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecene-13,2′-[2*H*]pyran]-17-one (or 5-*O*-demethyl-25-de(1-methylpropyl)-25-(1-methylethyl)-22,23-dihydroavermectin $A_{1a}$) (component $H_2B_{1b}$).

Semi-synthetic product derived from a fermentation product.

*Content*:

– *ivermectin* ($H_2B_{1a}$ + $H_2B_{1b}$): 95.0 per cent to 102.0 per cent (anhydrous substance);

– *ratio* $H_2B_{1a}/(H_2B_{1a} + H_2B_{1b})$ (areas by liquid chromatography): minimum 90.0 per cent.

CHARACTERS

*Appearance*: white or yellowish-white, crystalline powder, slightly hygroscopic.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, soluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ivermectin CRS*.

B. Examine the chromatograms obtained in the assay.

*Results*: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 2 principal peaks in the chromatogram obtained with reference solution (a).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

Dissolve 1.0 g in 50 mL of *toluene R*.

**Specific optical rotation** (*2.2.7*): − 20 to − 17 (anhydrous substance).

Dissolve 0.250 g in *methanol R* and dilute to 10.0 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 40.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 mL with the same solvent.

*Reference solution (a).* Dissolve 40.0 mg of *ivermectin CRS* in *methanol R* and dilute to 50.0 mL with the same solvent.

*Reference solution (b).* Dilute 1.0 mL of reference solution (a) to 100.0 mL with *methanol R*.

*Reference solution (c).* Dilute 5.0 mL of reference solution (b) to 100.0 mL with *methanol R*.

*Reference solution (d).* Dilute 5.0 mL of reference solution (a) to 100.0 mL with *methanol R*.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: *water R*, *methanol R*, *acetonitrile R* (15:34:51 *V/V/V*).

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 254 nm.

*Injection*: 20 µL.

*System suitability*:

– *resolution*: minimum 3.0 between the 1st peak (component $H_2B_{1b}$) and the 2nd peak (component $H_2B_{1a}$) in the chromatogram obtained with reference solution (a);

– *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (c);

– *symmetry factor*: maximum 2.5 for the principal peak in the chromatogram obtained with reference solution (a).

*Limits*:

– *impurity with a relative retention of 1.3 to 1.5* with reference to the principal peak: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent);

– *any other impurity* (apart from the 2 principal peaks): not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent);

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent);

**Ethanol and formamide**. Gas chromatography (*2.2.28*).

*Internal standard solution.* Dilute 0.5 mL of *propanol R* to 100 mL with *water R*.

*Test solution.* In a centrifuge tube, dissolve 0.120 g of the substance to be examined in 2.0 mL of *m-xylene R* (if necessary heat in a water-bath at 40-50 °C). Add 2.0 mL of *water R*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 mL of *water R*. Discard the upper layer and combine the aqueous layers. Add 1.0 mL of the internal standard solution. Centrifuge and discard any remaining *m*-xylene.

*Reference solution (a).* Dilute 3.0 g of *anhydrous ethanol R* to 100.0 mL with *water R*.

*Reference solution (b).* Dilute 1.0 g of *formamide R* to 100.0 mL with *water R*.

*Reference solution (c).* Dilute 5.0 mL of reference solution (a) and 5.0 mL of reference solution (b) to 50.0 mL with *water R*. Introduce 2.0 mL of this solution into a centrifuge tube, add 2.0 mL of *m-xylene R*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 mL of *water R*. Discard the upper layer and combine the aqueous layers. Add 1.0 mL of the internal standard solution. Centrifuge and discard any remaining *m*-xylene.

*Reference solution (d).* Dilute 10.0 mL of reference solution (a) and 10.0 mL of reference solution (b) to 50.0 mL with *water R*. Treat as prescribed for reference solution (c) (from "Introduce 2.0 mL of this solution...").

*Column*:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.53 mm;

– *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

*Carrier gas*: *helium for chromatography R*.

*Flow rate*: 7.5 mL/min.

*Split ratio*: 1:10.

*Temperature*:

| | Time (min) | Temperature (°C) |
|---|---|---|
| Column | 0 - 2 | 50 → 80 |
| | 2 - 8 | 80 → 240 |
| Injection port | | 220 |
| Detector | | 280 |

*Detection*: flame ionisation.

*Injection*: 1 µL of the test solution and reference solutions (c) and (d).

*Limits:*

– *ethanol*: maximum 5.0 per cent;

– *formamide*: maximum 3.0 per cent.

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances.

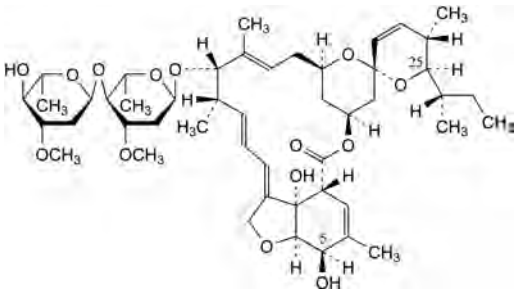
*Injection*: 20 µL of the test solution and reference solutions (a) and (d).

Calculate the percentage content of ivermectin ($H_2B_{1a}$ + $H_2B_{1b}$) and the ratio $H_2B_{1a}$/($H_2B_{1a}$ + $H_2B_{1b}$) taking into account the assigned content of component $H_2B_{1a}$ in *ivermectin CRS*. Determine the content of ivermectin component $H_2B_{1a}$ by comparing with the peak area due to component $H_2B_{1a}$ in the chromatogram obtained with reference solution (a). Determine the content of ivermectin component $H_2B_{1b}$ by comparing with the peak area due to component $H_2B_{1a}$ in the chromatogram obtained with reference solution (d).

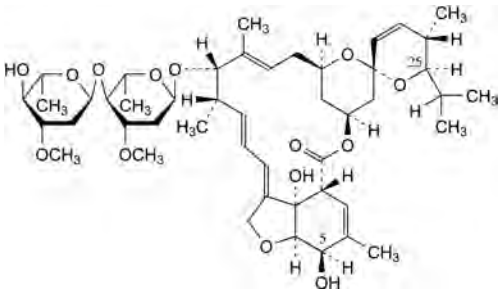
STORAGE

In an airtight container.

IMPURITIES



A. 5-*O*-demethylavermectin $A_{1a}$ (avermectin $B_{1a}$),



B. 5-*O*-demethyl-25-de(1-methylpropyl)-25-(1-methylethyl)avermectin $A_{1a}$ (avermectin $B_{1b}$),

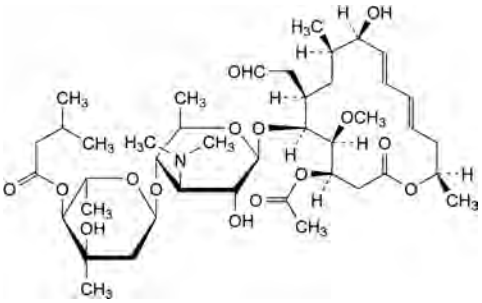
# JOSAMYCIN

## Josamycinum



$C_{42}H_{69}NO_{15}$ $M_r$ 828
[16846-24-5]

DEFINITION

Josamycin is a macrolide antibiotic obtained by fermentation using, for example, certain strains of *Streptomyces narbonensis* var. *josamyceticus* var. *nova*. The main component is (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-(acetyloxy)-6-[[3,6-dideoxy-4-*O*-[2,6-dideoxy-3-*C*-methyl-4-*O*-(3-methylbutanoyl)-α-L-*ribo*-hexopyranosyl]-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-10-hydroxy-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-dien-2-one.

*Content*: minimum 900 Ph. Eur. U./mg (dried substance).

CHARACTERS

*Appearance*: white or slightly yellowish powder, slightly hygroscopic.

*Solubility*: very slightly soluble in water, freely soluble in methanol and in methylene chloride, soluble in acetone.

IDENTIFICATION

*First identification*: A, C.

*Second identification*: A, B.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution*. Dissolve 0.10 g in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of this solution to 50.0 mL with *methanol R*.

*Spectral range*: 220-350 nm.

*Absorption maximum*: at 232 nm.

*Specific absorbance at the absorption maximum*: 330 to 370.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in 2.5 mL of *methanol R*.

*Reference solution (a)*. Dissolve 10 mg of *josamycin CRS* in 2.5 mL of *methanol R*.

*Reference solution (b)*. Dissolve 10 mg of *josamycin propionate CRS* in 2.5 mL of *methanol R*.

*Plate*: *TLC silica gel* $GF_{254}$ *plate R*.

*Mobile phase*: *methanol R*, *acetone R*, *ethyl acetate R*, *toluene R*, *hexane R* (8:10:20:25:30 *V/V/V/V/V*).

*Application*: 5 µL.

*Development*: over 2/3 of the plate.

*Drying*: at 100 °C for 10 min.

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) and different in position from the principal spot in the chromatogram obtained with reference solution (b).

C. Examine the chromatograms obtained in the test for related substances.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in position and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_4$ (*2.2.2, Method II*).

Dissolve 2.0 g in *methanol R* and dilute to 20 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): − 65 to − 75 (dried substance).

Dissolve 1.000 g in *methanol R* and dilute to 100.0 mL with the same solvent. Allow to stand for 30 min before measuring the angle of rotation.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (30:70 *V/V*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Reference solution (a)*. Dissolve 25.0 mg of *josamycin CRS* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 1.0 mL of reference solution (a) to 20.0 mL with the solvent mixture.

*Reference solution (c)*. Dilute 1.0 mL of reference solution (b) to 50.0 mL with the solvent mixture.

*Reference solution (d)*. To 10 mL of the test solution add 0.1 mL of *strong hydrogen peroxide solution R* and heat in a water-bath for 10 min. Mix 1.0 mL of this solution and 1.0 mL of the test solution.

*Reference solution (e)*. Dissolve 12.5 mg of *josamycin for peak identification CRS* (containing impurities A, B, C, D and E) in 5 mL of the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 45 °C.

*Mobile phase*:

- *mobile phase A*: mix 3 volumes of a 67.9 g/L solution of *tetrabutylammonium hydrogen sulfate R*, 5 volumes of a 27.6 g/L solution of *sodium dihydrogen phosphate monohydrate R* adjusted to pH 3.0 with *dilute phosphoric acid R*, and 21 volumes of *acetonitrile R*, and dilute to 100 volumes with *water R*;
- *mobile phase B*: mix 5 volumes of a 27.6 g/L solution of *sodium dihydrogen phosphate monohydrate R* adjusted to pH 3.0 with *dilute phosphoric acid R*, and 50 volumes of *acetonitrile R*, and dilute to 100 volumes with *water R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 38 | 100 | 0 |
| 38 - 55 | 100 → 0 | 0 → 100 |

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 232 nm.

*Injection*: 10 µL of the test solution and reference solutions (b), (c), (d) and (e).

*Identification of impurities*: use the chromatogram supplied with *josamycin for peak identification CRS* and the chromatogram obtained with reference solution (e) to identify the peaks due to impurities A, B, C, D and E.

*Relative retention* with reference to josamycin (retention time = about 35 min): impurity A = about 0.5; impurity B = about 0.8; impurity C = about 0.9; impurity D = about 1.2; impurity E = about 1.4.

*System suitability*: reference solution (d):

- *resolution*: minimum 1.7 between the 2 peaks due to josamycin and the peak eluted with a relative retention with reference to josamycin of about 1.1;
- *retention time of josamycin*: between 32 min and 38 min.

If necessary, adjust the concentration of acetonitrile in the mobile phases.

*Limits*:

- *impurities A, B, C, D, E* (any shoulder observed on the peak due to impurity A and/or the peak due to impurity B is not to be integrated separately): for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent);
- *any other impurity*: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent);
- *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (20.0 per cent);
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

## ASSAY

Dissolve 30.0 mg in 5 mL of *methanol R* and dilute to 100.0 mL with *water R*.

Carry out the microbiological assay of antibiotics (*2.7.2*).

## STORAGE

In an airtight container.

## IMPURITIES

*Specified impurities: A, B, C, D, E.*

*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G, H, I, J, K.*

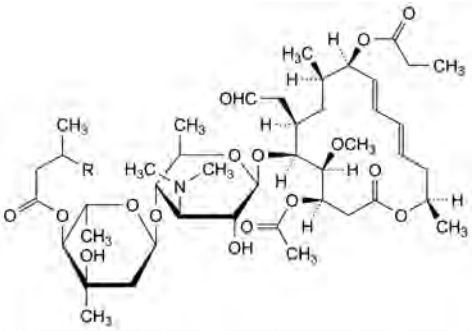
# JOSAMYCIN PROPIONATE

## Josamycini propionas



| Leucomycin propionate | R | Mol. Formula | $M_r$ |
|---|---|---|---|
| A3 | $CH_3$ | $C_{45}H_{73}NO_{16}$ | 884 |
| A4 | H | $C_{44}H_{71}NO_{16}$ | 870 |

DEFINITION

Propionyl ester of a macrolide antibiotic produced by certain strains of *Streptomyces narbonensis* var. *josamyceticus* var. *nova*, or obtained by any other means. The main component is (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-(acetyloxy)-6-[[3,6-dideoxy-4-*O*-[2,6-dideoxy-3-*C*-methyl-4-*O*-(3-methylbutanoyl)-α-L-*ribo*-hexopyranosyl]-

Monographs J

3-(dimethylamino)-β-D-glucopyranosyl]oxy]-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)-10-(propanoyloxy)oxacyclohexadeca-11,13-dien-2-one propionate (leucomycin A3 propionate).

Semi-synthetic product derived from a fermentation product.

*Content*:

– minimum 843 Ph. Eur. U./mg (dried substance).

CHARACTERS

*Appearance*: white or slightly yellowish, crystalline, slightly hygroscopic powder.

*Solubility*: practically insoluble in water, freely soluble in methanol and in methylene chloride, soluble in acetone.

IDENTIFICATION

*First identification: A, B.*

*Second identification: B, C.*

*Prepare solutions in methanol immediately before use.*

A. Dissolve 0.10 g in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with *methanol R*. Examined between 220 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 231 nm. The specific absorbance at the absorption maximum is 310 to 350.

B. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 1 mL with the same solvent.

*Reference solution (a)*. Dissolve 10 mg of *josamycin propionate CRS* in *methanol R* and dilute to 1 mL with the same solvent.

*Reference solution (b)*. Dissolve 10 mg of *josamycin CRS* in *methanol R* and dilute to 1 mL with the same solvent.

*Reference solution (c)*. Dissolve 10 mg of *spiramycin CRS* in *methylene chloride R* and dilute to 1 mL with the same solvent.

*Reference solution (d)*. Mix 0.5 mL of reference solution (a) with 0.5 mL of reference solution (b).

*Plate*: *TLC silica gel G plate R.*

*Mobile phase*: *methanol R*, *acetone R*, *ethyl acetate R*, *toluene R*, *hexane R* (8:10:20:25:30 *V/V/V/V/V*).

*Application*: 10 µL.

*Development*: over 2/3 of the plate.

*Drying*: at 100 °C for 10 min.

*Detection*: spray with *dilute sulfuric acid R* and heat at 100 °C for 10 min.

*System suitability*: the chromatogram obtained with reference solution (d) shows 2 clearly separated principal spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) and its position is different from that of the principal spot in the chromatograms obtained with reference solutions (b) and (c).

C. Dissolve about 10 mg in 5 mL of *hydrochloric acid R1* and allow to stand for 10-20 min. A pink colour develops, turning brown.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_4$ (*2.2.2, Method II*).

Dissolve 1 g in *methanol R* and dilute to 10 mL with the same solvent.

**Specific optical rotation** (*2.2.7*): – 65 to – 75 (dried substance).

Dissolve 1.000 g in *methanol R* and dilute to 100.0 mL with the same solvent. Allow to stand for 30 min before measuring the angle of rotation.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 50.0 mg of the substance to be examined in *acetonitrile for chromatography R* and dilute to 100.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 50.0 mg of *josamycin propionate CRS* in *acetonitrile for chromatography R* and dilute to 100.0 mL with the same solvent.

*Reference solution (b)*. Dissolve 5 mg of the substance to be examined in 10 mL of *methanol R* and add 40 µL of *dilute phosphoric acid R*. Mix, allow to stand for 5 min and inject.

*Reference solution (c)*. Dilute 2.0 mL of reference solution (a) to 100.0 mL with *acetonitrile for chromatography R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 30 °C.

*Mobile phase*: *acetonitrile R*, a 15.4 g/L solution of *ammonium acetate R* previously adjusted to pH 6.0 with *dilute phosphoric acid R* (60:40 *V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 232 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: 3 times the retention time of leucomycin A3 propionate.

*Relative retention* with reference to leucomycin A3 propionate (retention time = about 18 min): impurity E = about 0.2; impurity A = about 0.3; impurity B = about 0.5; leucomycin A4 propionate = about 0.7; impurity C = about 1.4; impurity D = about 2.0.

*System suitability*: reference solution (b):

– *resolution*: minimum 2.0 between the 2 peaks eluting with a relative retention with reference to leucomycin A3 propionate of about 0.5 and 0.7 respectively.

*Limits*:

– *impurity D*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c),
– *impurities A, B, C, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c),
– *total*: not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (c),
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c).

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 40.0 mg in 20 mL of *methanol R* and dilute to 100.0 mL with *phosphate buffer solution pH 5.6 R*.

Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE

In an airtight container.

IMPURITIES

# KANAMYCIN ACID SULFATE

## Kanamycini sulfas acidus

DEFINITION

Kanamycin acid sulfate is a form of kanamycin sulfate prepared by adding sulfuric acid to a solution of kanamycin monosulfate and drying by a suitable method. The potency is not less than 670 IU/mg, calculated with reference to the dried substance.

Fermentation product.

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

CHARACTERS

A white or almost white powder, hygroscopic, soluble in about 1 part of water, practically insoluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a plate coated with a 0.75 mm layer of the following mixture: mix 0.3 g of *carbomer R* with 240 mL of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

   Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

   *Test solution*. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

   *Reference solution (a)*. Dissolve 10 mg of *kanamycin monosulfate CRS* in *water R* and dilute to 10 mL with the same solvent.

   *Reference solution (b)*. Dissolve 10 mg of *kanamycin monosulfate CRS*, 10 mg of *neomycin sulfate CRS* and 10 mg of *streptomycin sulfate CRS* in *water R* and dilute to 10 mL with the same solvent.

   Apply separately to the plate 10 µL of each solution. Develop over a path of 12 cm using a 70 g/L solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with a mixture of equal volumes of a 2 g/L solution of *1,3-dihydroxynaphthalene R* in *ethanol (96 per cent) R* and a 460 g/L solution of *sulfuric acid R*. Heat at 150 °C for 5 min to 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

B. Dissolve 0.5 g in 10 mL of *water R*. Add 10 mL of *picric acid solution R*. Initiate crystallisation if necessary by scratching the wall of the tube with a glass rod and allow to stand. Collect the crystals, wash with 20 mL of *water R* and filter. Dry at 100 °C. The crystals melt (*2.2.14*) at about 235 °C, with decomposition.

C. Dissolve about 50 mg in 2 mL of *water R*. Add 1 mL of a 10 g/L solution of *ninhydrin R* and heat for a few minutes on a water-bath. A violet colour develops.

D. It gives the reactions of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**pH** (*2.2.3*). The pH of solution S is 5.5 to 7.5.

**Specific optical rotation** (*2.2.7*). +103 to +115, determined on solution S and calculated with reference to the dried substance.

**Kanamycin B**. Examine by thin-layer chromatography (*2.2.27*), using a plate prepared as prescribed under identification test A.

Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

*Test solution*. Dissolve 0.11 g of the substance to be examined in *water R* and dilute to 20 mL with the same solvent.

*Reference solution*. Dissolve 4 mg of *kanamycin B sulfate CRS* in *water R* and dilute to 20 mL with the same solvent.

Apply separately to the plate 4 µL of each solution. Develop over a path of 12 cm using a 70 g/L solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with *ninhydrin and stannous chloride reagent R*. Heat the plate at 110 °C for 15 min. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (4.0 per cent).

**Loss on drying** (*2.2.32*). Not more than 5.0 per cent, determined on 1.00 g by drying at 60 °C at a pressure not exceeding 670 Pa for 3 h.

**Sulfated ash** (*2.4.14*). Not more than 0.5 per cent, determined on 1.0 g.

**Sulfate**. 23.0 per cent to 26.0 per cent of sulfate ($SO_4$), calculated with reference to the dried substance. Dissolve 0.175 g in 100 mL of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 mL of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 mL of *ethanol (96 per cent) R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 mL of *0.1 M barium chloride* is equivalent to 9.606 mg of sulfate ($SO_4$).

**Pyrogens** (*2.6.8*). If intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 mL of a solution in *water for injections R* containing 10 mg per millilitre of the substance to be examined.

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*). Use *kanamycin monosulfate CRS* as the reference substance.

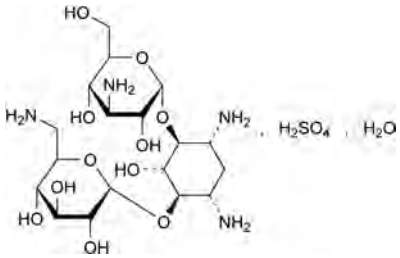
STORAGE

If the substance is sterile, store in a sterile, tamper-evident container.

**01/2019:0032**
**corrected 10.0**

# KANAMYCIN MONOSULFATE

## Kanamycini monosulfas



$C_{18}H_{38}N_4O_{15}S,H_2O$ $M_r$ 601
[5965-95-7]

DEFINITION

6-*O*-(3-Amino-3-deoxy-α-D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-2-deoxy-D-streptamine sulfate monohydrate.

Antimicrobial substance produced by the growth of certain strains of *Streptomyces kanamyceticus*.

*Content*: minimum 750 IU/mg (dried substance).

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, practically insoluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (a)*. Dissolve 10 mg of *kanamycin monosulfate CRS* in *water R* and dilute to 10 mL with the same solvent.

*Reference solution (b)*. Dissolve 10 mg of *kanamycin monosulfate CRS*, 10 mg of *neomycin sulfate CRS* and 10 mg of *streptomycin sulfate CRS* in *water R* and dilute to 10 mL with the same solvent.

*Plate*: suitable plate coated with a 0.75 mm layer of a mixture prepared as follows: mix 0.3 g of *carbomer R* with 240 mL of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

*Pretreatment*: heat the plate at 110 °C for 1 h, allow to cool and use immediately.

*Mobile phase*: 70 g/L solution of *potassium dihydrogen phosphate R*.

*Application*: 10 µL.

*Development*: over a path of 12 cm.

*Drying*: in a current of warm air.

*Detection*: spray with a mixture of equal volumes of a 2 g/L solution of *1,3-dihydroxynaphthalene R* in *ethanol (96 per cent) R* and a 460 g/L solution of *sulfuric acid R*. Heat at 150 °C for 5 min to 10 min.

*System suitability*: reference solution (b):

– the chromatogram shows 3 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

B. Dissolve 0.5 g in 10 mL of *water R*. Add 10 mL of *picric acid solution R*. Initiate crystallisation if necessary by scratching the wall of the tube with a glass rod and allow to stand. Collect the crystals, wash with 20 mL of *water R* and filter. Dry at 100 °C. The crystals melt (*2.2.14*) at about 235 °C, with decomposition.

C. Dissolve about 50 mg in 2 mL of *water R*. Add 1 mL of a 10 g/L solution of *ninhydrin R* and heat for a few minutes on a water-bath. A violet colour develops.

D. It gives the reactions of sulfates (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20.0 mL with the same solvent.

**pH** (*2.2.3*): 6.5 to 8.5 for solution S.

**Specific optical rotation** (*2.2.7*): + 112 to + 123 (dried substance), determined on solution S.

**Kanamycin B**. Thin-layer chromatography (*2.2.27*) as described under Identification A with the following modifications.

*Test solution*. Dissolve 0.1 g of the substance to be examined in *water R* and dilute to 20 mL with the same solvent.

*Reference solution*. Dissolve 4 mg of *kanamycin B sulfate CRS* in *water R* and dilute to 20 mL with the same solvent.

*Application*: 4 µL.

*Detection*: spray with *ninhydrin and stannous chloride reagent R*. Heat at 110 °C for 15 min.

*Limit*:

– *kanamycin B*: any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (4.0 per cent).

**Loss on drying** (*2.2.32*): maximum 1.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 670 Pa for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

**Sulfate**: 15.0 per cent to 17.0 per cent of sulfate (dried substance).

Dissolve 0.250 g in 100 mL of *water R* and adjust the solution to pH 11 with *concentrated ammonia R*. Add 10.0 mL of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 mL of *ethanol (96 per cent) R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 mL of *0.1 M barium chloride* is equivalent to 9.606 mg of $SO_4$.

**Pyrogens** (*2.6.8*). If intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 mL of a 10 mg/mL solution of the substance to be examined in *water for injections R*.

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE

If the substance is sterile, store in a sterile, tamper-evident container.

**01/2017:0503**

# KAOLIN, HEAVY

## Kaolinum ponderosum

DEFINITION

Purified, natural, hydrated aluminium silicate of variable composition.

CHARACTERS

*Appearance*: fine, white or greyish-white, unctuous powder.

*Solubility*: practically insoluble in water and in organic solvents.

IDENTIFICATION

A. To 0.5 g in a metal crucible add 1 g of *potassium nitrate R* and 3 g of *sodium carbonate R* and heat until the mixture melts. Allow to cool. To the residue add 20 mL of boiling *water R*, mix and filter. Wash the residue with 50 mL of *water R*. To the residue add 1 mL of *hydrochloric acid R* and 5 mL of *water R*. Filter. To the filtrate add 1 mL of *strong sodium hydroxide solution R* and filter. To the filtrate add 3 mL of *ammonium chloride solution R*. A gelatinous white precipitate is formed.

B. Add 2.0 g in 20 portions to 100 mL of a 10 g/L solution of *sodium laurilsulfate R* in a 100 mL graduated cylinder about 30 mm in diameter. Allow 2 min between additions for each portion to settle. Allow to stand for 2 h. The apparent volume of the sediment is not greater than 5 mL.

C. 0.25 g gives the reaction of silicates (*2.3.1*).

TESTS

**Solution S**. To 4 g add a mixture of 6 mL of *acetic acid R* and 34 mL of *distilled water R*, shake for 1 min and filter.

**Acidity or alkalinity**. To 1.0 g add 20 mL of *carbon dioxide-free water R*, shake for 2 min and filter. To 10 mL of the filtrate add 0.1 mL of *phenolphthalein solution R*. The solution is colourless. Not more than 0.25 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

**Organic impurities**. Heat 0.3 g to redness in a calcination tube. The residue is only slightly more coloured than the original substance.

**Adsorption power**. To 1.0 g in a ground-glass-stoppered test-tube add 10.0 mL of a 3.7 g/L solution of *methylene blue R* and shake for 2 min. Allow to settle. Centrifuge and dilute the solution 1 to 100 with *water R*. The solution is not more intensely coloured than a 0.03 g/L solution of *methylene blue R*.

**Swelling power**. Triturate 2 g with 2 mL of *water R*. The mixture does not flow.

**Substances soluble in dilute hydrochloric acid**: maximum 1 per cent.

To 5.0 g add 7.5 mL of *dilute hydrochloric acid R* and 27.5 mL of *water R* and boil for 5 min. Filter, wash the residue on the filter with *water R* and dilute the combined filtrate and washings to 50.0 mL with *water R*. To 10.0 mL of the solution add 1.5 mL of *dilute sulfuric acid R*, evaporate to dryness on a water-bath and ignite. The residue weighs a maximum of 10 mg.

**Chlorides** (*2.4.4*): maximum 250 ppm.

Dilute 2 mL of solution S to 15 mL with *water R*.

**Sulfates** (*2.4.13*): maximum 0.1 per cent.

Dilute 1.5 mL of solution S to 15 mL with *distilled water R*.

**Calcium** (*2.4.3*): maximum 250 ppm.

Dilute 4 mL of solution S to 15 mL with *distilled water R*.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

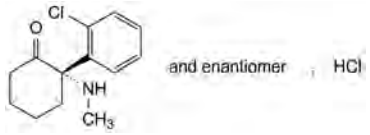
LABELLING

The label states, where applicable, that the substance is suitable for internal use.

**01/2017:1020**

# KETAMINE HYDROCHLORIDE

## Ketamini hydrochloridum



$C_{13}H_{17}Cl_2NO$ $M_r$ 274.2

[1867-66-9]

DEFINITION

(2*RS*)-2-(2-Chlorophenyl)-2-(methylamino)cyclohexanone hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water and in methanol, soluble in ethanol (96 per cent).

mp: about 260 °C, with decomposition.

IDENTIFICATION

A. Optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *ketamine hydrochloride CRS*.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

**pH** (*2.2.3*): 3.5 to 4.1.

Dilute 10 mL of solution S to 20 mL with *carbon dioxide-free water R*.

**Optical rotation** (*2.2.7*): − 0.2° to + 0.2°.

Dilute 2.5 mL of solution S to 25.0 mL with *water R*.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 5 mg of *ketamine impurity A CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase (using ultrasound if necessary). To 1.0 mL of the solution, add 0.5 mL of the test solution and dilute to 100.0 mL with the mobile phase.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 10.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 50.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

*Mobile phase*: dissolve 0.95 g of *sodium hexanesulfonate R* in 1 L of a mixture of 25 volumes of *acetonitrile R1* and 75 volumes of *water R* and add 4 mL of *acetic acid R*.

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 20 µL.

*Run time*: 10 times the retention time of ketamine.

*Relative retention* with reference to ketamine (retention time = about 3 min): impurity A = about 1.6; impurity B = about 3.3; impurity C = about 4.6.

*System suitability*: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to ketamine and impurity A.

*Limits*:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 mL of *methanol R* and add 1.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

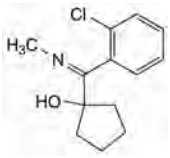
1 mL of *0.1 M sodium hydroxide* is equivalent to 27.42 mg of $C_{13}H_{17}Cl_2NO$.

STORAGE

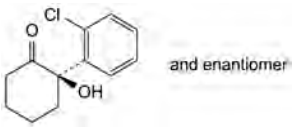
Protected from light.

IMPURITIES

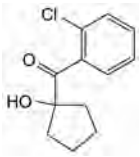
*Specified impurities: A, B, C.*



A. 1-(2-chloro-*N*-methylbenzimidoyl)cyclopentanol,



B. (2*RS*)-2-(2-chlorophenyl)-2-hydroxycyclohexanone,

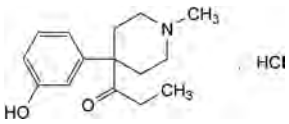


C. (2-chlorophenyl)(1-hydroxycyclopentyl)methanone.

**01/2008:1746**
**corrected 7.0**

# KETOBEMIDONE HYDROCHLORIDE

## Cetobemidoni hydrochloridum



$C_{15}H_{22}ClNO_2$ $M_r$ 283.8
[5965-49-1]

DEFINITION

1-[4-(3-Hydroxyphenyl)-1-methylpiperidin-4-yl]propan-1-one hydrochloride.

*Content*: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water, soluble in ethanol (96 per cent), very slightly soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *Ph. Eur. reference spectrum of ketobemidone hydrochloride*.

B. Solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $B_8$ (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.5 to 5.5 for solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Solution A*: 1.54 g/L solution of *ammonium acetate R* adjusted to pH 8.0 with *dilute ammonia R1*.

*Test solution*. Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 25.0 mL with the same solution.

*Reference solution (a)*. Dissolve 1 mg of *ketobemidone impurity B CRS* and 1 mg of *ketobemidone impurity C CRS* in solution A and dilute to 25 mL with the same solution.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with solution A. Dilute 20.0 mL of this solution to 100.0 mL with solution A.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *phenylhexylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

*Mobile phase*: *acetonitrile R*, solution A (20:80 *V/V*).

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 278 nm.

*Injection*: 20 µL.

*Run time*: 4.5 times the retention time of ketobemidone.

*Relative retention* with reference to ketobemidone (retention time = about 10 min): impurity A = about 0.4; impurity B = about 0.6; impurity C = about 0.7; impurity D = about 3.5.

*System suitability*: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurity B and impurity C.

*Limits*:

– *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent);

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Water** (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

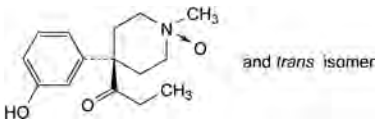
Dissolve 0.200 g in a mixture of 5.0 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*) using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 28.38 mg of $C_{15}H_{22}ClNO_2$.

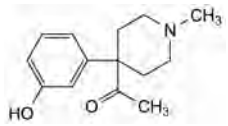
IMPURITIES

*Specified impurities*: *A, B, C, D.*

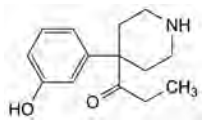
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E.*



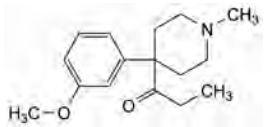
A. 1-[4-(3-hydroxyphenyl)-1-methyl-1-oxidopiperidin-4-yl]propan-1-one (*cis* and *trans* isomers),



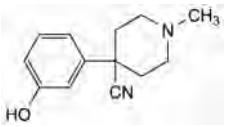
B. 1-[4-(3-hydroxyphenyl)-1-methylpiperidin-4-yl]ethanone,



C. 1-[4-(3-hydroxyphenyl)piperidin-4-yl]propan-1-one,



D. 1-[4-(3-methoxyphenyl)-1-methylpiperidin-4-yl]propan-1-one,

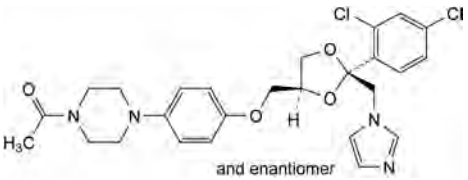


E. 4-(3-hydroxyphenyl)-1-methylpiperidin-4-carbonitrile.

**01/2017:0921**

# KETOCONAZOLE

## Ketoconazolum



$C_{26}H_{28}Cl_2N_4O_4$ $M_r$ 531.4
[65277-42-1]

DEFINITION

1-Acetyl-4-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)1,3-dioxolan-4-yl]methoxy]phenyl]-piperazine.

*Content*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: practically insoluble in water, freely soluble in methylene chloride, soluble in methanol, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

*First identification: B.*

*Second identification: A, C, D.*

A. Melting point (*2.2.14*): 148 °C to 152 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *ketoconazole CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 30 mg of the substance to be examined in the mobile phase and dilute to 5 mL with the mobile phase.

*Reference solution (a)*. Dissolve 30 mg of *ketoconazole CRS* in the mobile phase and dilute to 5 mL with the mobile phase.

*Reference solution (b)*. Dissolve 30 mg of *ketoconazole CRS* and 30 mg of *econazole nitrate CRS* in the mobile phase, then dilute to 5 mL with the mobile phase.

*Plate*: *TLC octadecylsilyl silica gel plate R.*

*Mobile phase*: *ammonium acetate solution R*, *dioxan R*, *methanol R* (20:40:40 *V/V/V*).

*Application*: 5 µL.

*Development*: over a path of 15 cm.

*Drying*: in a current of warm air for 15 min.

*Detection*: expose to iodine vapour until the spots appear and examine in daylight.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 mL of *dilute nitric acid R* and filter. To 1 mL of the filtrate add 1 mL of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 1.0 g in *methylene chloride R* and dilute to 10 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_4$ (*2.2.2, Method II*).

**Optical rotation** (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution*. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (a)*. Dissolve 2.5 mg of *ketoconazole CRS* and 2.5 mg of *loperamide hydrochloride CRS* in *methanol R*, then dilute to 50.0 mL with the same solvent.

*Reference solution (b)*. Dilute 5.0 mL of the test solution to 100.0 mL with *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

*Column*:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

*Mobile phase*:

– *mobile phase A*: *acetonitrile R1*, 3.4 g/L solution of *tetrabutylammonium hydrogen sulfate R* (5:95 *V/V*);

– *mobile phase B*: *acetonitrile R1*, 3.4 g/L solution of *tetrabutylammonium hydrogen sulfate R* (50:50 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 10 | 100 → 0 | 0 → 100 |
| 10 - 15 | 0 | 100 |

*Flow rate*: 2 mL/min.

*Detection*: spectrophotometer at 220 nm.

*Equilibration*: with *acetonitrile R* for at least 30 min and then with mobile phase A for at least 5 min.

*Injection*: 10 µL; inject *methanol R* as a blank.

*Retention time*: ketoconazole = about 6 min; loperamide = about 8 min.

*System suitability*: reference solution (a):

– *resolution*: minimum 15 between the peaks due to ketoconazole and loperamide; if necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

*Limits*:

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

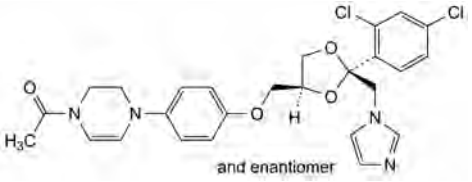
Dissolve 0.200 g in 70 mL of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 26.57 mg of $C_{26}H_{28}Cl_2N_4O_4$.

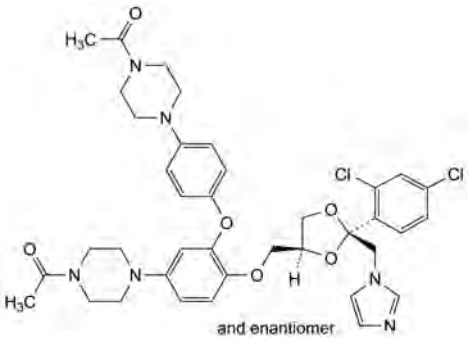
STORAGE

Protected from light.

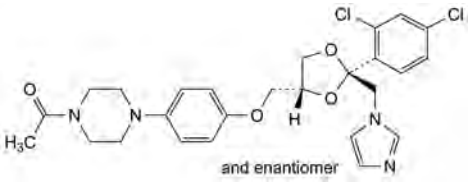
IMPURITIES



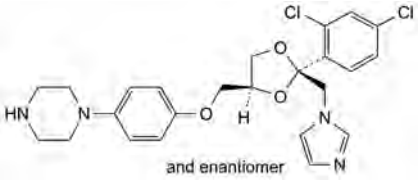
A. 1-acetyl-4-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-1,2,3,4-tetrahydropyrazine,



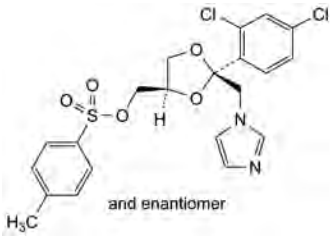
B. 1-acetyl-4-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]-3-[4-(4-acetylpiperazin-1-yl)phenoxy]phenyl]piperazine,



C. 1-acetyl-4-[4-[[(2*RS*,4*RS*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-piperazine,



D. 1-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazine,



E. [(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methyl 4-methylbenzenesulfonate.

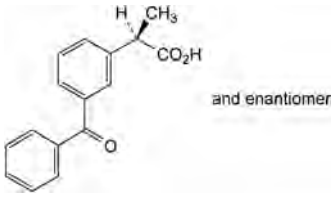
# KETOPROFEN

## Ketoprofenum



$C_{16}H_{14}O_3$ $M_r$ 254.3
[22071-15-4]

DEFINITION

(2*RS*)-2-(3-Benzoylphenyl)propanoic acid.

*Content*: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: practically insoluble in water, freely soluble in acetone, in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

*First identification*: C.

*Second identification*: A, B, D.

A. Melting point (*2.2.14*): 94 °C to 97 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of this solution to 50.0 mL with *ethanol (96 per cent) R*.

*Spectral range*: 230-350 nm.

*Absorption maximum*: at 255 nm.

*Specific absorbance at the absorption maximum*: 615 to 680.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ketoprofen CRS*.

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in *acetone R* and dilute to 10 mL with the same solvent.

*Reference solution (a).* Dissolve 10 mg of *ketoprofen CRS* in *acetone R* and dilute to 10 mL with the same solvent.

*Reference solution (b).* Dissolve 10 mg of *indometacin CRS* in *acetone R* and dilute to 10 mL with the same solvent. To 1 mL of this solution add 1 mL of reference solution (a).

*Plate*: *TLC silica gel* $GF_{254}$ *plate R*.

*Mobile phase*: *glacial acetic acid R*, *methylene chloride R*, *acetone R* (1:49:50 *V/V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

Dissolve 1.0 g in *acetone R* and dilute to 10 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

*Test solution.* Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 mL with the mobile phase.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 5.0 mg of *ketoprofen impurity A CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 50.0 mL with the mobile phase.

*Reference solution (c).* Dissolve 5.0 mg of *ketoprofen impurity C CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 50.0 mL with the mobile phase.

*Reference solution (d).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. To 1.0 mL of this solution add 1.0 mL of reference solution (b).

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 $m^2/g$ and a pore size of 10 nm.

*Mobile phase*: mix 2 volumes of freshly prepared *phosphate buffer solution pH 3.5 R*, 43 volumes of *acetonitrile R* and 55 volumes of *water R*.

*Flow rate*: 1 mL/min.

*Detection*: spectrophotometer at 233 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity C.

*Run time*: 7 times the retention time of ketoprofen.

*Relative retention* with reference to ketoprofen (retention time = about 7 min): impurity C = about 0.3; impurity E = about 0.69; impurity B = about 0.73; impurity D = about 1.35; impurity A = about 1.5; impurity F = about 2.0.

*System suitability*: reference solution (d):

– *resolution*: minimum 7.0 between the peaks due to ketoprofen and impurity A.

*Limits*:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);

- *impurities B, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *sum of impurities other than A and C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.67 kPa.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

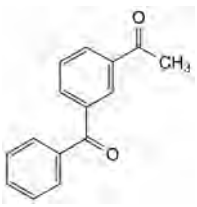
Dissolve 0.200 g in 25 mL of *ethanol (96 per cent) R*. Add 25 mL of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M sodium hydroxide* is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.

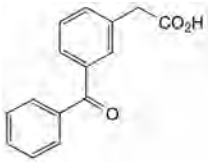
IMPURITIES

*Specified impurities: A, B, C, D, E, F.*

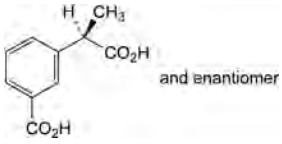
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, H, I, J, K, L.*



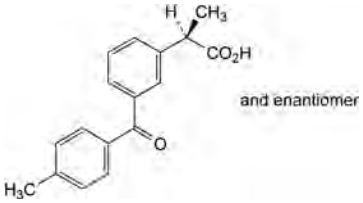
A. 1-(3-benzoylphenyl)ethanone,



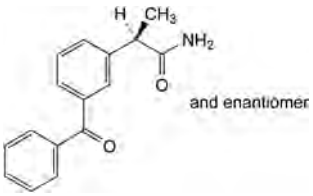
B. (3-benzoylphenyl)acetic acid,



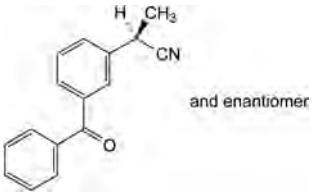
C. 3-[(1*RS*)-1-carboxyethyl]benzoic acid,



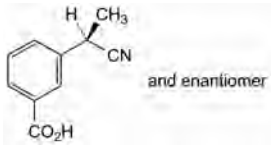
D. (2*RS*)-2-[3-(4-methylbenzoyl)phenyl]propanoic acid,



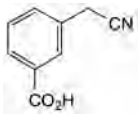
E. (2*RS*)-2-(3-benzoylphenyl)propanamide,



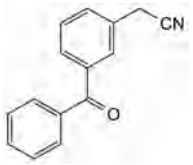
F. (2*RS*)-2-(3-benzoylphenyl)propanenitrile,



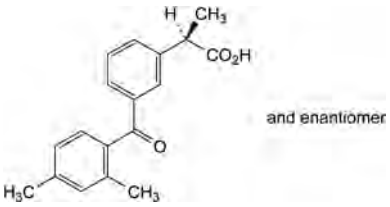
G. 3-[(1*RS*)-1-cyanoethyl]benzoic acid,



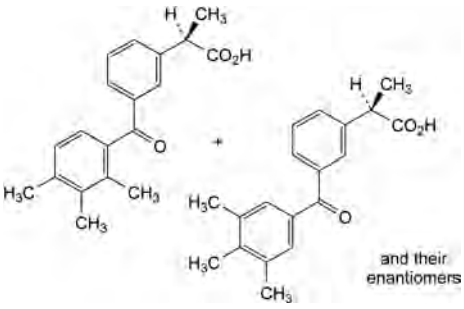
H. 3-(cyanomethyl)benzoic acid,



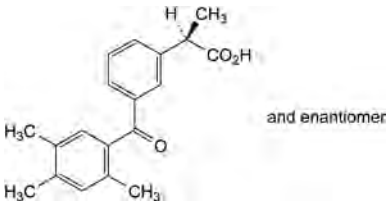
I. (3-benzoylphenyl)ethanenitrile,



J. (2*RS*)-2-[3-(2,4-dimethylbenzoyl)phenyl]propanoic acid,



K. mixture of (2*RS*)-2-[3-(2,3,4-trimethylbenzoyl)phenyl]-propanoic acid and (2*RS*)-2-[3-(3,4,5-trimethylbenzoyl)-phenyl]propanoic acid,

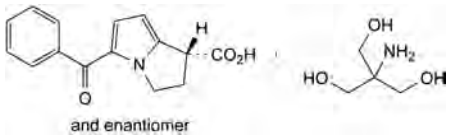


L. (2*RS*)-2-[3-(2,4,5-trimethylbenzoyl)phenyl]propanoic acid.

**01/2017:1755**

# KETOROLAC TROMETAMOL

## Ketorolacum trometamolum



$C_{19}H_{24}N_2O_6$ $M_r$ 376.4
[74103-07-4]

DEFINITION

2-Amino-2-(hydroxymethyl)propane-1,3-diol (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate.

*Content*: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: freely soluble in water and in methanol, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ketorolac trometamol CRS*.

TESTS

**Solution S**. Dissolve 0.75 g in *carbon dioxide-free water R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*).

**pH** (*2.2.3*): 5.7 to 6.7.

Dilute 5 mL of solution S to 15 mL with *carbon dioxide-free water R*.

**Absorbance** (*2.2.25*): maximum 0.10, determined at 430 nm for solution S.

**Related substances**. Liquid chromatography (*2.2.29*). *Protect the solutions from bright light.*

*Solvent mixture*: *tetrahydrofuran R*, *water R* (30:70 *V/V*).

*Test solution.* Dissolve 20 mg of the substance to be examined in the solvent mixture and dilute to 50 mL with the solvent mixture.

*Reference solution (a).* Dilute 1.0 mL of the test solution to 10.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 100.0 mL with the solvent mixture.

*Reference solution (b).* Dissolve 2 mg of *ketorolac trometamol for peak identification CRS* (containing impurities A, B, C and D) in 5 mL of the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

*Mobile phase*: mix 30 volumes of *tetrahydrofuran R* with 70 volumes of a solution prepared as follows: dissolve 5.75 g of *ammonium dihydrogen phosphate R* in 900 mL of *water R*, adjust to pH 3.0 with *phosphoric acid R* and dilute to 1000 mL with *water R*.

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 313 nm.

*Injection*: 10 µL.

*Run time*: 3 times the retention time of ketorolac.

*Identification of impurities*: use the chromatogram supplied with *ketorolac trometamol for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C and D.

*Relative retention* with reference to ketorolac (retention time = about 10 min): impurity C = about 0.5; impurity A = about 0.6; impurity D = about 0.7; impurity B = about 0.9.

*System suitability*: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurity B and ketorolac.

*Limits*:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.67; impurity B = 0.52; impurity C = 2.2;
- *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 60 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 37.64 mg of $C_{19}H_{24}N_2O_6$.

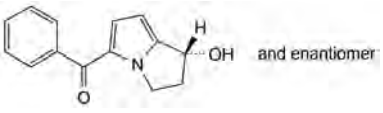
STORAGE

Protected from light.

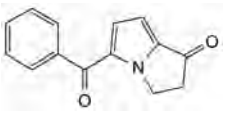
IMPURITIES

*Specified impurities: A, B, C, D.*

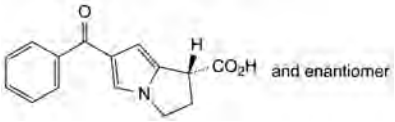
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F, G, H, I, J.*



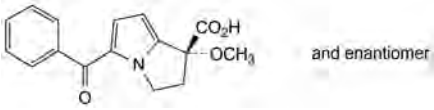
A. (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizin-1-ol,



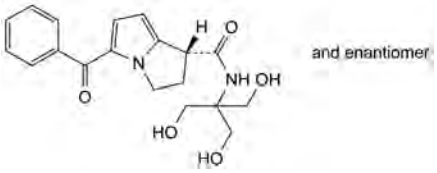
B. 5-benzoyl-2,3-dihydro-1*H*-pyrrolizin-1-one,



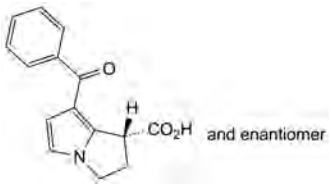
C. (1*RS*)-6-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid,



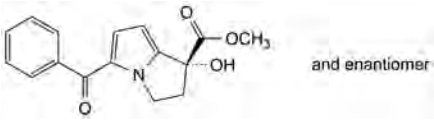
D. (1*RS*)-5-benzoyl-1-methoxy-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid,



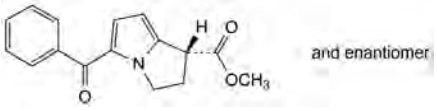
E. (1*RS*)-5-benzoyl-*N*-[2-hydroxy-1,1-bis(hydroxymethyl)-ethyl]-2,3-dihydro-1*H*-pyrrolizine-1-carboxamide,



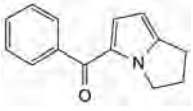
F. (1*RS*)-7-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid,



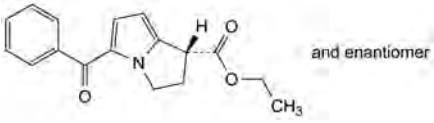
G. methyl (1*RS*)-5-benzoyl-1-hydroxy2,3-dihydro-1*H*-pyrrolizine-1-carboxylate,



H. methyl (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate,



I. phenyl(2,3-dihydro-1*H*-pyrrolizin-5-yl)methanone,

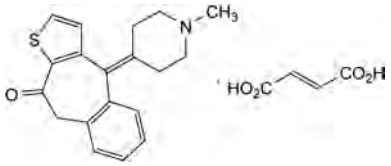


J. ethyl (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate.

**04/2014:1592**

# KETOTIFEN HYDROGEN FUMARATE

## Ketotifeni hydrogenofumaras



$C_{23}H_{23}NO_5S$ $M_r$ 425.5
[34580-14-8]

DEFINITION

4-(1-Methylpiperidin-4-ylidene)-4,9-dihydro-10*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-10-one hydrogen (*E*)-butenedioate.

*Content*: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or brownish-yellow, fine, crystalline powder.

*Solubility*: sparingly soluble in water, slightly soluble in methanol, practically insoluble in heptane.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *ketotifen hydrogen fumarate CRS*.

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution $Y_4$, $BY_4$ or $B_4$ (*2.2.2, Method II*).

Dissolve 0.2 g in *methanol R* and dilute to 10 mL with the same solvent.

**Related substances**. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

*Solvent mixture*: *methanol R*, *water R* (50:50 *V/V*).

*Test solution*. Dissolve 30.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 mL with the solvent mixture.

*Reference solution (a)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)*. Dissolve the contents of a vial of *ketotifen impurity G CRS* in 1.0 mL of a solution prepared as follows: mix 1.0 mL of the test solution with 9.0 mL of the solvent mixture. Sonicate until dissolution of impurity G is complete.

*Reference solution (c)*. Dissolve 5 mg of *ketotifen for peak identification CRS* (containing impurity A) in the solvent mixture and dilute to 5.0 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.0 mm;
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 40 °C.

*Mobile phase*:

- *mobile phase A*: mix 175 µL of *triethylamine R* and 500 mL of *water R*;
- *mobile phase B*: mix 175 µL of *triethylamine R* and 500 mL of *methanol R*;

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 12 | 40 | 60 |
| 12 - 20 | 40 → 10 | 60 → 90 |
| 20 - 25 | 10 | 90 |

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 297 nm.

*Injection*: 20 µL.

*Identification of impurities*: use the chromatogram supplied with *ketotifen for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peak due to impurity A; use the chromatogram obtained with reference solution (b) to identify the peak due to impurity G.

*Relative retention* with reference to ketotifen (retention time = about 11 min): fumaric acid = about 0.1; impurity G = about 0.8; impurity A = about 1.9.

*System suitability*: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurity G and ketotifen.

*Limits*:

– *correction factor*: for the calculation of content, multiply the peak area of impurity G by 1.4;

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *impurity G*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard the peak due to fumaric acid.

**Loss on drying** (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

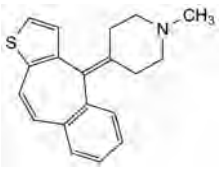
Dissolve 0.350 g in a mixture of 30 mL of *acetic anhydride R* and 30 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 42.55 mg of $C_{23}H_{23}NO_5S$.

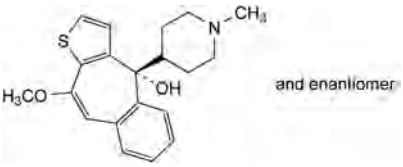
IMPURITIES

*Specified impurities: A, G.*

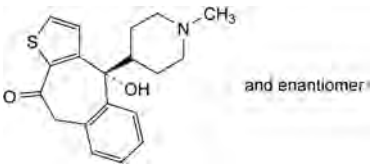
*Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph Substances for pharmaceutical use (2034). It is therefore not necessary to identify these impurities for demonstration of compliance. See also 5.10. Control of impurities in substances for pharmaceutical use): B, C, D, E, F.*



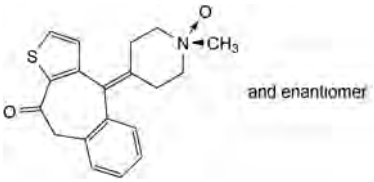
A. 4-(4*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-4-ylidene)-1-methylpiperidine,



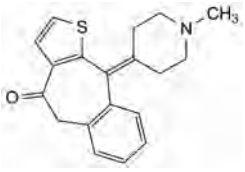
B. (4*RS*)-10-methoxy-4-(1-methylpiperidin-4-yl)-4*H*-benzo-[4,5]cyclohepta[1,2-*b*]thiophen-4-ol,



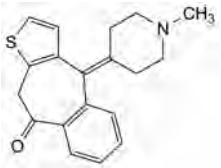
C. (4*RS*)-4-hydroxy-4-(1-methylpiperidin-4-yl)-4,9-dihydro-10*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-10-one,



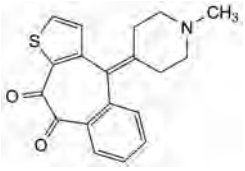
D. 4-[($R_aS_a$)-1-methylpiperidin-4-ylidene]-4,9-dihydro-10*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-10-one *N*-oxide (ketotifen *N*-oxide),



E. 10-(1-methylpiperidin-4-ylidene)-5,10-dihydro-4*H*-benzo-[5,6]cyclohepta[1,2-*b*]thiophen-4-one,



F. 4-(1-methylpiperidin-4-ylidene)-4,10-dihydro-9*H*-benzo-[4,5]cyclohepta[1,2-*b*]thiophen-9-one,



G. 4-(1-methylpiperidin-4-ylidene)-4*H*-benzo[4,5]cyclo-hepta[1,2-*b*]thiophen-9,10-dione.

**Members of the European Pharmacopoeia Commission**: Austria, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Republic of Moldova, Montenegro, Netherlands, North Macedonia, Norway, Poland, Portugal, Romania, Serbia, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, Ukraine, United Kingdom and the European Union.

**Observers to the European Pharmacopoeia Commission**: Albania, Algeria, Argentina, Armenia, Australia, Azerbaijan, Belarus, Brazil, Canada, China, Georgia, Guinea, India, Israel, Japan, Kazakhstan, Republic of Korea, Madagascar, Malaysia, Morocco, Russian Federation, Senegal, Singapore, South Africa, Syrian Arab Republic, Tunisia, United States of America, Uzbekistan, Taiwan Food and Drug Administration (TFDA) and the World Health Organization (WHO).

# EUROPEAN PHARMACOPOEIA – 10th EDITION

published July 2019

replaces the 9th Edition on 1 January 2020

## BOOK

Volumes I, II and III of this publication 10.0 constitute the 10th Edition of the European Pharmacopoeia. They will be complemented by **non-cumulative supplements** (see the publication schedule opposite) that are to be kept for the duration of the 10th Edition. Each new edition or supplement of the European Pharmacopoeia is usually published 6 months before its implementation date.

To use the 10th Edition correctly, make sure that you have all the published supplements and consult the index of the most recent supplement to ensure that you use the latest versions of the monographs and general chapters.

A cumulative list of reagents will be published in supplements 10.4 and 10.7. A list of new reagents published during the course of the 10th Edition is available under 'Useful information' in Pharmeuropa Online.

## ELECTRONIC VERSION

The 10th Edition is also available in an electronic format containing all of the monographs and general chapters found in the book. With the publication of each supplement the electronic version is replaced by a new, fully updated, cumulative version. Each update of the electronic version is usually available 6 months before its implementation date. A list of new reagents published during the course of the 10th Edition is available under 'Useful information' in Pharmeuropa Online.

## CORRECTIONS

Corrections are to be taken into account as soon as possible and not later than the end of the month following the month of publication (see the publication schedule opposite).

## PHARMACOPOEIAL HARMONISATION

See the information given in general chapter *5.8. Pharmacopoeial harmonisation*.

## ARCHIVES

http://pheur.edqm.eu

The European Pharmacopoeia Archives contain all obsolete editions and supplements in PDF format. They are available to all European Pharmacopoeia subscribers with an up-to-date subscription (book or electronic version) and a registered EPID code. To access the archives, register the EPID code which can be found on the inside-front cover. The registration page is accessible through the EDQM website (https://pheur.edqm.eu/user/register/).

European Pharmacopoeia's free online forum

http://pharmeuropa.edqm.eu

Pharmeuropa Online contains preliminary drafts of new and revised texts proposed for inclusion in the European Pharmacopoeia and gives an opportunity for all interested parties to comment on the specifications before they are finalised.

Pharmeuropa Online also contains information on the work programme or of general interest and articles published in Pharmeuropa Bio & Scientific Notes (containing scientific articles on pharmacopoeial matters).

**Archives** of Pharmeuropa and Pharmeuropa Bio & Scientific Notes can be accessed via this website.

# COMBISTATS

www.edqm.eu/combistats

CombiStats is a computer program for the statistical analysis of data from biological assays in agreement with general chapter 5.3. *Statistical analysis of results of biological assays and tests* of the 10th Edition of the European Pharmacopoeia.

# KEY TO MONOGRAPHS

*Version date of the text*

**01/2012:0884**
**corrected 10.0**

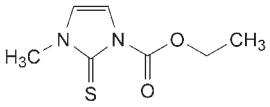
*Text reference number*

*Modification to be taken into account as soon as possible and not later than the end of the month following the month of publication of Ph. Eur. 10.0 (see section IV. Contents of the 10th Edition)*

*Link to further information on the text (e.g. Knowledge database) for smartphones/tablets with camera and barcode reader app*

## CARBIMAZOLE(1)

Carbimazolum



$C_7H_{10}N_2O_2S$

[22232-54-8] $M_r$ 186.2

*CAS number*

DEFINITION

Ethyl 3-methyl-2-thioxo-2,3-dihydro-1*H*-imidazole-1-carboxylate.

*Chemical name in accordance with IUPAC nomenclature rules*

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

*For the meaning of black and white diamonds see chapter 5.8. Pharmacopoeial harmonisation*

♦CHARACTERS

*Appearance*: white or yellowish-white, crystalline powder.

*Solubility*: slightly soluble in water, soluble in acetone and in ethanol (96 per cent). ♦

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

*Application of the first and second identification is defined in the General Notices (chapter 1)*

◊A. Melting point (*2.2.14*): 122 °C to 125 °C.◊

B. Infrared absorption spectrophotometry (*2.2.24*).

*Preparation*: discs.

*Comparison*: *carbimazole CRS*.

*Reference standard available from the EDQM (see http://crs.edqm.eu)*

C. Thin-layer chromatography (*2.2.27*).

*Test solution*. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Reagent described in chapter 4*

*Reference solution*. Dissolve 10 mg of *carbimazole CRS* in *methylene chloride R* and dilute to 10 mL with the same solvent.

*Plate*: *TLC silica gel GF254 plate R*.

*Further information on certain reagents available in the Knowledge database (http://go.edqm.eu/knowledge)*

*Mobile phase*: *acetone R*, *methylene chloride R* (20:80 *V/V*).

*Application*: 10 µL.

*Development*: over 3/4 of the plate.

*Drying*: in air for 30 min.

*Vertical line in the margin indicating where the text has been modified*

*Detection*: examine in ultraviolet light at 254 nm.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

*Horizontal line in the margin indicating where part of the text has been deleted*

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Reference to a general chapter*

*Test solution.* Dissolve 5.0 mg of the substance to be examined in 10.0 mL of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Use this solution within 5 min of preparation.

(1) This monograph has undergone pharmacopoeial harmonisation. See chapter 5.8. *Pharmacopoeial harmonisation*.

SPECIMEN

*IMPORTANT NOTICE*

# GENERAL MONOGRAPHS

The European Pharmacopoeia contains a number of general monographs covering classes of products. These general monographs give requirements that are applicable to all products in the given class or, in some cases, to any product in the given class for which there is a specific monograph in the Pharmacopoeia (see *1. General Notices*, General monographs). Where no restriction on scope of a general monograph is given in a preamble, it is applicable to all products in the class defined, irrespective of whether there is an individual monograph for the product in the Pharmacopoeia.

Whenever a monograph is used, it is essential to ascertain whether there is a general monograph applicable to the product in question. The general monographs listed below are published in the General Monographs section (unless otherwise stated). This list is updated where necessary and republished in each supplement.

Allergen products (1063)

Chemical precursors for radiopharmaceutical preparations (2902)

Dosage Forms monographs
*(published in the Dosage Forms section or the Homoeopathic Preparations section, as appropriate)*

Essential oils (2098)

Herbal drug extracts (0765)

Herbal drug preparations (1434)

Herbal drugs (1433)

Herbal drugs for homoeopathic preparations (2045)
*(published in the Homoeopathic Preparations section)*

Herbal teas (1435)

Herbal teas, instant (2620)

Homoeopathic preparations (1038)
*(published in the Homoeopathic Preparations section)*

Immunosera for human use, animal (0084)

Immunosera for veterinary use (0030)

Live biotherapeutic products for human use (3053)

Methods of preparation of homoeopathic stocks and potentisation (2371)
*(published in the Homoeopathic Preparations section)*

Monoclonal antibodies for human use (2031)

Mother tinctures for homoeopathic preparations (2029)
*(published in the Homoeopathic Preparations section)*

Pharmaceutical preparations (2619)

Products of fermentation (1468)

Products with risk of transmitting agents of animal spongiform encephalopathies (1483)

Radiopharmaceutical preparations (0125)

Recombinant DNA technology, products of (0784)

Substances for pharmaceutical use (2034)

Vaccines for human use (0153)

Vaccines for veterinary use (0062)

Vegetable fatty oils (1579)

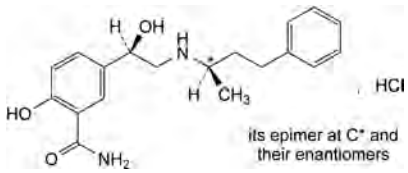
# LABETALOL HYDROCHLORIDE

## Labetaloli hydrochloridum



$C_{19}H_{25}ClN_2O_3$ $M_r$ 364.9
[32780-64-6]

DEFINITION

Mixture of 4 stereoisomers of 2-hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]ethyl]benzamide hydrochloride.

*Content*: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

*Appearance*: white or almost white powder.

*Solubility*: sparingly soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

*First identification*: *A, C, E.*

*Second identification*: *A, B, D, E.*

A. Optical rotation (*2.2.7*): – 0.05° to + 0.05°, determined on solution S (see Tests).

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

*Test solution.* Dissolve 25.0 mg in *0.1 M hydrochloric acid* and dilute to 250.0 mL with the same acid.

*Spectral range*: 230-350 nm.

*Absorption maximum*: at 302 nm.

*Specific absorbance at the absorption maximum*: 83 to 88.

C. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *labetalol hydrochloride CRS*.

D. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 10 mg of the substance to be examined in 1 mL of *ethanol (96 per cent) R*.

*Reference solution (a).* Dissolve 10 mg of *labetalol hydrochloride CRS* in 1 mL of *ethanol (96 per cent) R*.

*Reference solution (b).* Dissolve 10 mg of *labetalol hydrochloride CRS* and 10 mg of *propranolol hydrochloride CRS* in *ethanol (96 per cent) R* and dilute to 5 mL with the same solvent.

*Plate*: *TLC octadecylsilyl silica gel $F_{254}$ plate R.*

*Mobile phase*: *perchloric acid R*, *water R*, *methanol R* (0.5:50:80 *V/V/V*).

*Application*: 2 µL.

*Development*: place the plate in a chromatographic tank immediately after the addition of the mobile phase, close the tank and develop over 3/4 of the plate.

*Drying*: in air.

*Detection*: examine in ultraviolet light at 254 nm.

*System suitability*: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

**Solution S**. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 50 mL with the same solvent. *Solution S must be freshly prepared.*

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

**pH** (*2.2.3*): 4.0 to 5.0 for solution S.

**Diastereoisomer ratio**. Gas chromatography (*2.2.28*).

*Test solution.* Dissolve 2.0 mg of the substance to be examined in 1.0 mL of a 12.0 g/L solution of *butylboronic acid R* in *anhydrous pyridine R* and allow to stand for 20 min.

*Column*:

– *material*: glass;
– *size*: *l* = 1.5 m, Ø = 4 mm;
– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* (125-150 µm) impregnated with 3 per cent *m/m* of *phenyl(50)methyl(50)polysiloxane R*.

*Carrier gas*: *nitrogen for chromatography R.*

*Flow rate*: 40 mL/min.

*Temperature*:

– *column, injection port and detector*: 300 °C.

*Detection*: flame ionisation.

*Injection*: 2 µL.

*System suitability*:

– the height of the trough separating the 2 peaks due to the pairs of diastereoisomers is less than 5 per cent of the full scale of the recorder.

*Limit*:

– *each pair of diastereoisomers*: for the area of each peak, 45 per cent to 55 per cent of the total area of the 2 peaks.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 25.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 mL with mobile phase A.

*Test solution (b).* Dilute 1.0 mL of test solution (a) to 50.0 mL with mobile phase A.

*Reference solution (a).* Dilute 1.0 mL of test solution (a) to 100.0 mL with mobile phase A. Dilute 1.0 mL of this solution to 10.0 mL with mobile phase A.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with mobile phase A. Dissolve 5 mg of *labetalol impurity A CRS* in this solution.

*Reference solution (c).* Dissolve 25.0 mg of *labetalol hydrochloride CRS* in mobile phase A and dilute to 10.0 mL with mobile phase A. Dilute 1.0 mL of the solution to 50.0 mL with mobile phase A.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R* (3.5 µm);
– *temperature*: 40 °C.

*Mobile phase*:

– *mobile phase A*: *phosphoric acid R*, *water for chromatography R* (0.1:99.9 *V/V*);
– *mobile phase B*: *acetonitrile for chromatography R*, mobile phase A (50:50 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 5 | 100 | 0 |
| 5 - 40 | 100 → 0 | 0 → 100 |
| 40 - 45 | 0 | 100 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 230 nm.

*Injection*: 20 µL of test solution (a) and reference solutions (a) and (b).

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to labetalol (retention time = about 22 min): impurity A = about 1.1.

*System suitability*: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to labetalol and impurity A.

*Calculation of percentage contents*:

– for each impurity, use the concentration of labetalol in reference solution (a).

*Limits*:

– *unspecified impurities*: for each impurity, maximum 0.05 per cent;

– *total*: maximum 0.2 per cent;

– *reporting threshold*: 0.03 per cent.

**Loss on drying** (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C at a pressure not exceeding 0.7 kPa.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*: mobile phase A, mobile phase B (45:55 *V/V*).

*Injection*: test solution (b) and reference solution (c).

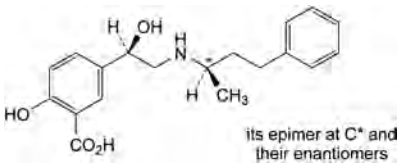
*Run time*: twice the retention time of labetalol.

*Retention time*: labetalol = about 2 min.

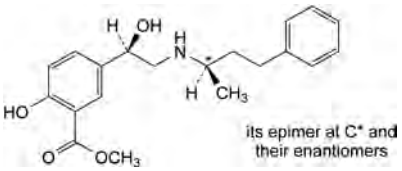
Calculate the percentage content of $C_{19}H_{25}ClN_2O_3$ taking into account the assigned content of *labetalol hydrochloride CRS*.

IMPURITIES

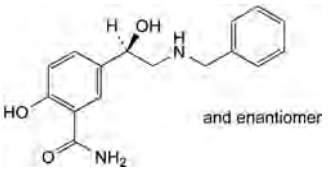
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, F, G.*



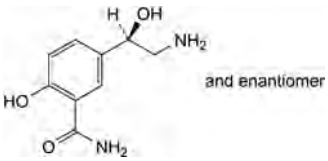
A. mixture of 4 stereoisomers of 2-hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]ethyl]benzoic acid,



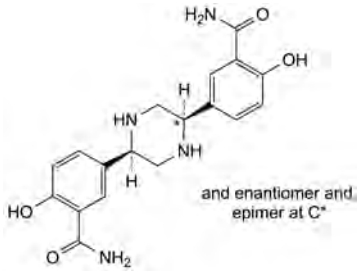
B. mixture of 4 stereoisomers of methyl 2-hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]-ethyl]benzoate,



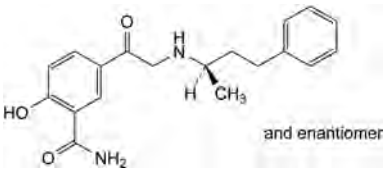
C. 5-[(1*RS*)-2-(benzylamino)-1-hydroxyethyl]-2-hydroxybenzamide,



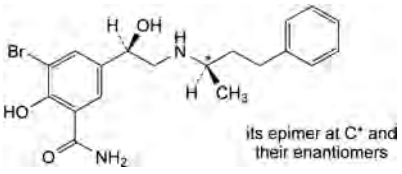
D. 5-[(1*RS*)-2-amino-1-hydroxyethyl]-2-hydroxybenzamide,



E. mixture of 3 stereoisomers of 5,5′-piperazine-2,5-diylbis(2-hydroxybenzamide),



F. 2-hydroxy-5-[2-[[(1*RS*)-1-methyl-3-phenylpropyl]amino]-acetyl]benzamide,

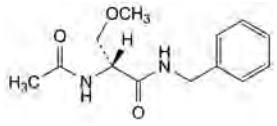


G. mixture of 4 stereoisomers of 3-bromo-2-hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]-ethyl]benzamide.

**07/2018:2992**

# LACOSAMIDE

## Lacosamidum



$C_{13}H_{18}N_2O_3$ $M_r$ 250.3
[175481-36-4]

DEFINITION

(2*R*)-2-Acetamido-*N*-benzyl-3-methoxypropanamide.

*Content*: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white or light yellow powder.

*Solubility*: sparingly soluble in water, freely soluble in methanol, practically insoluble in heptane.

It shows polymorphism (*5.9*).

IDENTIFICATION

Carry out either tests A, B or tests B, C.

A. Specific optical rotation (*2.2.7*): + 14 to + 18 (anhydrous substance), measured at 25 °C.

Dissolve 0.100 g in *methanol R* and dilute to 10.0 mL with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

*Comparison*: *lacosamide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. Enantiomeric purity (see Tests).

TESTS

**Appearance of solution**. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.500 g in *water R* and dilute to 50.0 mL with the same solvent.

**Enantiomeric purity**. Liquid chromatography (*2.2.29*): use the normalisation procedure.

*Test solution.* Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 mL with the mobile phase.

*Reference solution (a).* Dissolve 1 mg of *lacosamide impurity A CRS* in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (b).* Dissolve 20 mg of the substance to be examined in the mobile phase, add 1.0 mL of reference solution (a) and dilute to 20.0 mL with the mobile phase.

*Reference solution (c).* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 20.0 mL with the mobile phase.

*Column*:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *amylose derivative of silica gel for chiral separation R* (10 µm).

*Mobile phase*: *water for chromatography R*, *2-propanol R*, *heptane R* (3:100:900 *V/V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 20 µL of the test solution and reference solutions (b) and (c).

*Run time*: 1.7 times the retention time of lacosamide.

*Identification of impurities*: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* with reference to lacosamide (retention time = about 25 min): impurity A = about 0.8.

*System suitability*: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to impurity A and lacosamide.

*Limit*:

– *impurity A*: maximum 0.15 per cent;
– *reporting threshold*: 0.05 per cent (reference solution (c)).

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution.* Dissolve 50.0 mg of the substance to be examined in 1 mL of *methanol R* and dilute to 10.0 mL with *water R*.

*Reference solution (a).* Dissolve 50.0 mg of *lacosamide CRS* in 1 mL of *methanol R* and dilute to 10.0 mL with *water R*.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with a mixture of 10 volumes of *methanol R* and 90 volumes of *water R*. Dilute 1.0 mL of this solution to 10.0 mL with the same mixture of solvents.

*Reference solution (c).* Dissolve 5 mg of *lacosamide for system suitability CRS* (containing impurities B, C, G and I) in 0.1 mL of *methanol R* and dilute to 1.0 mL with *water R*.

*Reference solution (d).* Dissolve 1 mg of *lacosamide impurity F CRS* in 2 mL of *methanol R* and dilute to 10.0 mL with *water R*. Dilute 1.0 mL of the solution to 10.0 mL with *water R*.

*Column*:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped extra-dense bonded octylsilyl silica gel for chromatography R* (3.5 µm).

*Mobile phase*:

– *mobile phase A*: 0.1 per cent *V/V* solution of *trifluoroacetic acid R*;
– *mobile phase B*: *trifluoroacetic acid R*, *acetonitrile R*, *methanol R* (0.3:500:500 *V/V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 2 | 89 | 11 |
| 2 - 14.2 | 89 → 69 | 11 → 31 |
| 14.2 - 19.5 | 69 → 23 | 31 → 77 |
| 19.5 - 20 | 23 → 0 | 77 → 100 |
| 20 - 21 | 0 | 100 |

*Flow rate*: 1.2 mL/min.

*Detection*: spectrophotometer at 258 nm.

*Injection*: 20 µL of the test solution and reference solutions (b), (c) and (d).

*Identification of impurities*: use the chromatogram supplied with *lacosamide for system suitability CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities B, C, G and I; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity F.

*Relative retention* with reference to lacosamide (retention time = about 12 min): impurity F = about 0.7; impurity G = about 0.9; impurity B = about 1.2; impurity C = about 1.3; impurity I = about 1.6.

*System suitability*: reference solution (c):

- *resolution*: minimum 2.0 between the peaks due to impurity G and lacosamide; minimum 4.5 between the peaks due to lacosamide and impurity B.

*Calculation of percentage contents*:

- *correction factors*: multiply the peak areas of the following impurities by the corresponding correction factor: impurity G = 0.7; impurity I = 0.7;
- for each impurity, use the concentration of lacosamide in reference solution (b).

*Limits*:

- *impurities B, C, F, G, I*: for each impurity, maximum 0.15 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.5 per cent;
- *reporting threshold*: 0.05 per cent.

**Water** (*2.5.32*): maximum 0.2 per cent, determined on 0.150 g by direct sample introduction.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution and reference solution (a).

*System suitability*: reference solution (a):

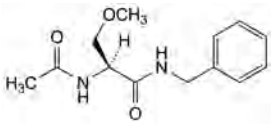
- *symmetry factor*: maximum 2.4 for the peak due to lacosamide.

Calculate the percentage content of $C_{13}H_{18}N_2O_3$ taking into account the assigned content of *lacosamide CRS*.

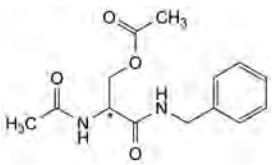
IMPURITIES

*Specified impurities*: *A, B, C, F, G, I.*

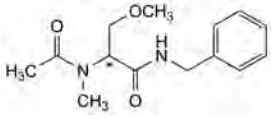
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, E, H, J, K.*



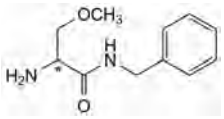
A. (2*S*)-2-acetamido-*N*-benzyl-3-methoxypropanamide,



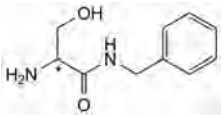
B. (2*Ξ*)-2-acetamido-3-(benzylamino)-3-oxopropyl acetate,



C. (2*Ξ*)-*N*-benzyl-3-methoxy-2-(*N*-methylacetamido)-propanamide,



D. (2*Ξ*)-2-amino-*N*-benzyl-3-methoxypropanamide,



E. (2*Ξ*)-2-amino-*N*-benzyl-3-hydroxypropanamide,

# LACOSAMIDE INFUSION

## Lacosamidi praeparatio ad infusionem

DEFINITION

Sterile solution for infusion of *Lacosamide (2992)*.

*It complies with the monograph Parenteral preparations (0520) and the following additional requirements.*

*Content*: 95.0 per cent to 105.0 per cent of the content of lacosamide ($C_{13}H_{18}N_2O_3$) stated on the label.

IDENTIFICATION

A. Record the UV spectrum of the principal peak in the chromatograms obtained with the solutions used in the assay with a diode array detector in the range of 210-400 nm.

*Results*: the UV spectrum of the principal peak in the chromatogram obtained with the test solution is similar to the UV spectrum of the principal peak in the chromatogram obtained with reference solution (a).

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (13:87 *V/V*).

*Test solution*. Mix the contents of 10 vials of the preparation to be examined and dilute a suitable volume of the solution with the solvent mixture to obtain a concentration of lacosamide of 1.0 mg/mL.

*Reference solution (a)*. Dissolve 20.0 mg of *lacosamide CRS* in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 2.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve 2 mg of *lacosamide impurity D CRS* and 3 mg of *lacosamide impurity F CRS* in the solvent mixture and dilute to 100 mL with the solvent mixture. Dilute 1 mL of the solution to 10 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped extra-dense bonded octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*: *methanesulfonic acid R*, *acetonitrile R1*, *water for chromatography R* (0.75:130:870 *V/V/V*).

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 5 µL of the test solution and reference solutions (b) and (c).

*Run time*: 2.5 times the retention time of lacosamide.

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D and F.

*Relative retention* with reference to lacosamide (retention time = about 6 min): impurity D = about 0.4; impurity F = about 0.5.

*System suitability*: reference solution (c):

- *resolution*: minimum 1.5 between the peaks due to impurities D and F.

*Calculation of percentage contents*:

- for each impurity, use the concentration of lacosamide in reference solution (b).

*Limits*:

- *impurity D*: maximum 0.8 per cent;
- *unspecified impurities*: for each impurity, maximum 0.2 per cent;
- *total*: maximum 2.0 per cent;
- *reporting threshold*: 0.1 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution and reference solution (a).

*System suitability*: reference solution (a):

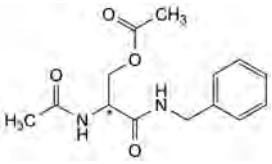
- *repeatability*: maximum relative standard deviation of 1.5 per cent determined on 6 injections.

Calculate the percentage content of lacosamide ($C_{13}H_{18}N_2O_3$) taking into account the assigned content of *lacosamide CRS*.

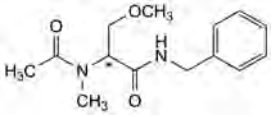
IMPURITIES

*Specified impurities: D.*

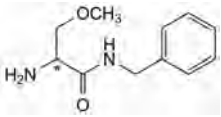
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph)*: B, C, E, F, J, K.*



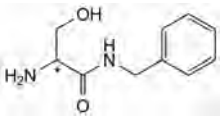
B. (2*Ξ*)-2-acetamido-3-(benzylamino)-3-oxopropyl acetate,



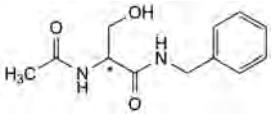
C. (2*Ξ*)-*N*-benzyl-3-methoxy-2-(*N*-methylacetamido)-propanamide,



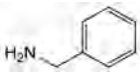
D. (2*Ξ*)-2-amino-*N*-benzyl-3-methoxypropanamide,



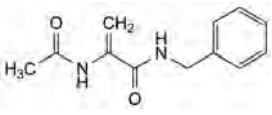
E. (2*Ξ*)-2-amino-*N*-benzyl-3-hydroxypropanamide,



F. (2*Ξ*)-2-acetamido-*N*-benzyl-3-hydroxypropanamide,



J. phenylmethanamine,



K. 2-acetamido-*N*-benzylprop-2-enamide.

**04/2019:2990**

# LACOSAMIDE ORAL SOLUTION

## Lacosamidi solutio peroralis

DEFINITION

Oral solution of *Lacosamide (2992)*.

*It complies with the monograph Liquid preparations for oral use (0672) and the following additional requirements.*

*Content*: 95.0 per cent to 105.0 per cent of the content of lacosamide ($C_{13}H_{18}N_2O_3$) stated on the label.

IDENTIFICATION

A. Record the UV spectrum of the principal peak in the chromatograms obtained with the solutions used in the assay, with a diode array detector in the range of 210-400 nm.

*Results*: the UV spectrum of the principal peak in the chromatogram obtained with the test solution is similar to the UV spectrum of the principal peak in the chromatogram obtained with reference solution (a).

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (13:87 *V/V*).

*Test solution*. Dilute a suitable volume of the preparation to be examined with the solvent mixture to obtain a concentration of lacosamide of 1.0 mg/mL.

*Reference solution (a)*. Dissolve 20.0 mg of *lacosamide CRS* in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Reference solution (b)*. Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 2.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c)*. Dissolve 2 mg of *lacosamide impurity D CRS* and 3 mg of *lacosamide impurity F CRS* in the solvent mixture and dilute to 100 mL with the solvent mixture. Dilute 1 mL of the solution to 10 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography compatible with 100 per cent aqueous mobile phases R* (5 µm);
- *temperature*: 30 °C.

*Mobile phase*:

- *mobile phase A*: *trifluoroacetic acid R*, *acetonitrile R1*, *water for chromatography R* (0.56:100:900 *V/V/V*);
- *mobile phase B*: *trifluoroacetic acid R*, *acetonitrile R1* (0.5:1000 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 31 | 100 | 0 |
| 31 - 33 | 30 | 70 |

*Flow rate*: 1.5 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 5 µL of the test solution and reference solutions (b) and (c).

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D and F; impurities D and F may be inverted in the elution order, but the peak area of each impurity is different, so a clear identification of the impurities is possible.

*Relative retention* with reference to lacosamide (retention time = about 27 min): impurity D = about 0.4; impurity F = about 0.5 (D and F may be inverted).

*System suitability*: reference solution (c):

- *resolution*: minimum 3.0 between the peaks due to impurities D and F.

*Calculation of percentage contents*:

- for each impurity, use the concentration of lacosamide in reference solution (b).

*Limits*:

- *impurity D*: maximum 0.6 per cent;
- *unspecified impurities*: for each impurity, maximum 0.2 per cent;
- *total*: maximum 2.0 per cent;
- *reporting threshold*: 0.1 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Mobile phase*:

- *mobile phase A*: 0.05 per cent *V/V* solution of *trifluoroacetic acid R*;
- *mobile phase B*: *trifluoroacetic acid R*, *acetonitrile R1* (0.5:1000 *V/V*);

| Time (min) | Mobile phase A (per cent *V/V*) | Mobile phase B (per cent *V/V*) |
|---|---|---|
| 0 - 9 | 75 | 25 |
| 9 - 12.5 | 45 | 55 |

*Injection*: 4 µL of the test solution and reference solution (a).

*System suitability*: reference solution (a):

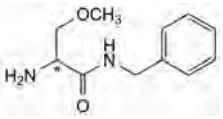
- *repeatability*: maximum relative standard deviation of 1.5 per cent determined on 6 injections.

Calculate the percentage content of lacosamide ($C_{13}H_{18}N_2O_3$) taking into account the assigned content of *lacosamide CRS*.

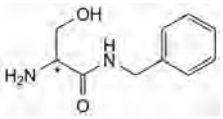
IMPURITIES

*Specified impurities*: *D*.

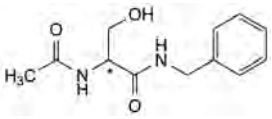
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph): *E, F, G, J, K*.



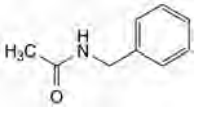
D. (2*Ξ*)-2-amino-*N*-benzyl-3-methoxypropanamide,



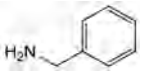
E. (2*Ξ*)-2-amino-*N*-benzyl-3-hydroxypropanamide,



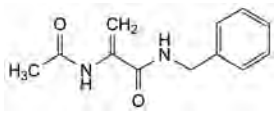
F. (2*Ξ*)-2-acetamido-*N*-benzyl-3-hydroxypropanamide,



G. *N*-benzylacetamide,



J. phenylmethanamine,



K. 2-acetamido-*N*-benzylprop-2-enamide.

**07/2019:2989**

# LACOSAMIDE TABLETS

## Lacosamidi compressi

DEFINITION

Tablets containing *Lacosamide (2992)*.

*They comply with the monograph Tablets (0478) and the following additional requirements.*

*Content*: 95.0 per cent to 105.0 per cent of the content of lacosamide ($C_{13}H_{18}N_2O_3$) stated on the label.

IDENTIFICATION

A. Record the UV spectrum of the principal peak in the chromatograms obtained with the solutions used in the assay, with a diode array detector in the range of 210-400 nm.

*Results*: the UV spectrum of the principal peak in the chromatogram obtained with the test solution is similar to the UV spectrum of the principal peak in the chromatogram obtained with reference solution (a).

B. Examine the chromatograms obtained in the assay.

*Results*: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

**Related substances**. Liquid chromatography (*2.2.29*).

*Solvent mixture*: *acetonitrile R*, *water R* (13:87 *V/V*).

*Test solution.* To 10 tablets add a suitable volume of the solvent mixture to obtain a concentration of lacosamide of 2-4 mg/mL. Shake vigorously for 30 min, sonicate for 10 min and allow to stand for 30 min. Dilute a suitable volume of the supernatant with the solvent mixture to obtain a concentration of lacosamide of 1.0 mg/mL.

*Reference solution (a).* Dissolve 20.0 mg of *lacosamide CRS* in the solvent mixture and dilute to 20.0 mL with the solvent mixture.

*Reference solution (b).* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 2.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (c).* Dissolve 2 mg of *lacosamide impurity D CRS* and 3 mg of *lacosamide impurity F CRS* in the solvent mixture and dilute to 100 mL with the solvent mixture. Dilute 1 mL of the solution to 10 mL with the solvent mixture.

*Column*:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped extra-dense bonded octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

*Mobile phase*: *methanesulfonic acid R*, *acetonitrile R1*, *water for chromatography R* (0.75:130:870 *V/V/V*).

*Flow rate*: 2.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 5 µL of the test solution and reference solutions (b) and (c).

*Run time*: 2.5 times the retention time of lacosamide.

*Identification of impurities*: use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D and F.

*Relative retention* with reference to lacosamide (retention time = about 6 min): impurity D = about 0.4; impurity F = about 0.5.

*System suitability*: reference solution (c):

- *resolution*: minimum 1.5 between the peaks due to impurities D and F.

*Calculation of percentage contents*:

- for each impurity, use the concentration of lacosamide in reference solution (b).

*Limits*:

- *unspecified impurities*: for each impurity, maximum 0.2 per cent;
- *total*: maximum 1.0 per cent;
- *reporting threshold*: 0.1 per cent.

**Dissolution** (*2.9.3*, Apparatus 2).

*The tablets comply with the test and the acceptance criterion described below, unless otherwise justified and authorised.*

*Dissolution medium*: 10.3 g/L solution of *hydrochloric acid R*. Use 900 mL of the medium.

*Rotation speed*: 50 r/min.

*Time*: 30 min.

*Analysis.* Liquid chromatography (*2.2.29*).

*Test solutions.* Samples withdrawn from the dissolution vessel and filtered.

*Reference solution.* Using sonication, dissolve a suitable quantity of *lacosamide CRS* in a suitable volume of the dissolution medium to obtain a concentration of lacosamide corresponding to the theoretical concentration of lacosamide in the test solution, based on the labelled content of the tablets.

*Column*:

- *size*: *l* = 0.05 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 35 °C.

*Mobile phase*: *trifluoroacetic acid R*, *acetonitrile R1*, *water for chromatography R* (1:300:700 *V/V/V*).

*Flow rate*: 1.0 mL/min.

*Detection*: spectrophotometer at 215 nm.

*Injection*: 2 µL.

*Run time*: 2.5 min.

*System suitability*: reference solution:

- *repeatability*: maximum relative standard deviation of 1.5 per cent determined on 6 injections.

Calculate the amount of dissolved lacosamide ($C_{13}H_{18}N_2O_3$), expressed as a percentage of the content stated on the label, taking into account the assigned content of *lacosamide CRS*.

*Acceptance criterion*:

- *Q* = 80 per cent after 30 min.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

*Injection*: test solution and reference solution (a).

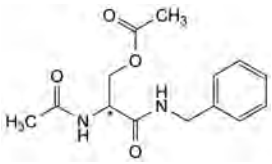
*System suitability*: reference solution (a):

- *repeatability*: maximum relative standard deviation of 1.5 per cent determined on 6 injections.

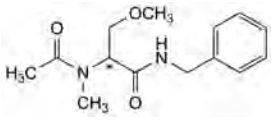
Calculate the percentage content of lacosamide ($C_{13}H_{18}N_2O_3$) taking into account the assigned content of *lacosamide CRS*.

IMPURITIES

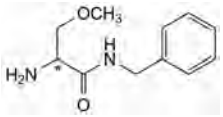
*Other detectable impurities* (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph): *B, C, D, E, F, J, K.*



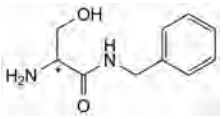
B. (2Ξ)-2-acetamido-3-(benzylamino)-3-oxopropyl acetate,



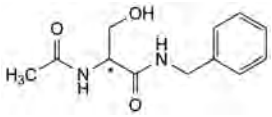
C. (2Ξ)-*N*-benzyl-3-methoxy-2-(*N*-methylacetamido)-propanamide,



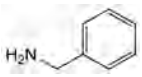
D. (2Ξ)-2-amino-*N*-benzyl-3-methoxypropanamide,



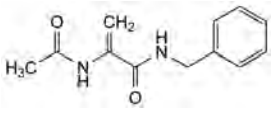
E. (2Ξ)-2-amino-*N*-benzyl-3-hydroxypropanamide,



F. (2Ξ)-2-acetamido-*N*-benzyl-3-hydroxypropanamide,



J. phenylmethanamine,

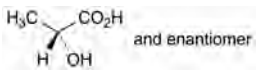


K. 2-acetamido-*N*-benzylprop-2-enamide.

**01/2017:0458**

# LACTIC ACID

## Acidum lacticum



$C_3H_6O_3$ $M_r$ 90.1

DEFINITION

Mixture of 2-hydroxypropanoic acid, its condensation products, such as lactoyl-lactic acid and polylactic acids, and water. The equilibrium between lactic acid and polylactic acids depends on the concentration and temperature. It is usually the racemate ((*RS*)-lactic acid).

*Content*: 88.0 per cent *m/m* to 92.0 per cent *m/m* of $C_3H_6O_3$.

CHARACTERS

*Appearance*: colourless or slightly yellow, syrupy liquid.

*Solubility*: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in 10 mL of *water R*. The solution is strongly acidic (*2.2.4*).

B. Relative density (*2.2.5*): 1.20 to 1.21.

C. It gives the reaction of lactates (*2.3.1*).

TESTS

**Solution S**. Dissolve 5.0 g in 42 mL of *1 M sodium hydroxide* and dilute to 50 mL with *distilled water R*.

**Appearance**. The substance to be examined is not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

**Ether-insoluble substances**. Dissolve 1.0 g in 25 mL of *ether R*. The solution is not more opalescent than the solvent used for the test.

**Sugars and other reducing substances**. To 1 mL of solution S add 1 mL of *1 M hydrochloric acid*, heat to boiling, allow to cool and add 1.5 mL of *1 M sodium hydroxide* and 2 mL of *cupri-tartaric solution R*. Heat to boiling. No red or greenish precipitate is formed.

**Methanol** (*2.4.24*): maximum 50 ppm, if intended for use in the manufacture of parenteral preparations.

**Citric, oxalic and phosphoric acids**. To 5 mL of solution S add *dilute ammonia R1* until slightly alkaline (*2.2.4*). Add 1 mL of *calcium chloride solution R*. Heat on a water-bath for 5 min. Both before and after heating, any opalescence in the solution is not more intense than that in a mixture of 1 mL of *water R* and 5 mL of solution S.

**Sulfates** (*2.4.13*): maximum 200 ppm.

Dilute 7.5 mL of solution S to 15 mL with *distilled water R*.

**Calcium** (*2.4.3*): maximum 200 ppm.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 5 IU/g, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. Before use, neutralise the test solution to pH 7.0-7.5 with *strong sodium hydroxide solution R* and shake vigorously.

ASSAY

Place 1.000 g in a ground-glass-stoppered flask and add 10 mL of *water R* and 20.0 mL of *1 M sodium hydroxide*. Close the flask and allow to stand for 30 min. Using 0.5 mL of *phenolphthalein solution R* as indicator, titrate with *1 M hydrochloric acid* until the pink colour is discharged.

1 mL of *1 M sodium hydroxide* is equivalent to 90.1 mg of $C_3H_6O_3$.

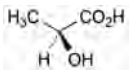
LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

**01/2017:1771**

# (*S*)-LACTIC ACID

## Acidum (*S*)-lacticum



$C_3H_6O_3$ $M_r$ 90.1

DEFINITION

Mixture of (*S*)-2-hydroxypropanoic acid, its condensation products, such as lactoyl-lactic acid and polylactic acids, and water. The equilibrium between lactic acid and polylactic acids depends on the concentration and temperature.

*Content*: 88.0 per cent *m/m* to 92.0 per cent *m/m* of $C_3H_6O_3$, not less than 95.0 per cent of which is the (*S*)-enantiomer.

CHARACTERS

*Appearance*: colourless or slightly yellow, syrupy liquid.

*Solubility*: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in 10 mL of *water R*. The solution is strongly acidic (*2.2.4*).

B. Relative density (*2.2.5*): 1.20 to 1.21.

C. It gives the reaction of lactates (*2.3.1*).

D. It complies with the limits of the assay.

TESTS

**Solution S**. Dissolve 5.0 g in 42 mL of *1 M sodium hydroxide* and dilute to 50 mL with *distilled water R*.

**Appearance**. The substance to be examined is not more intensely coloured than reference solution $Y_6$ (*2.2.2, Method II*).

**Ether-insoluble substances**. Dissolve 1.0 g in 25 mL of *ether R*. The solution is not more opalescent than the solvent used for the test.

**Sugars and other reducing substances**. To 1 mL of solution S add 1 mL of *1 M hydrochloric acid*, heat to boiling, allow to cool and add 1.5 mL of *1 M sodium hydroxide* and 2 mL of *cupri-tartaric solution R*. Heat to boiling. No red or greenish precipitate is formed.

**Methanol** (*2.4.24*): maximum 50 ppm, if intended for use in the manufacture of parenteral preparations.

**Citric, oxalic and phosphoric acids**. To 5 mL of solution S add *dilute ammonia R1* until slightly alkaline (*2.2.4*). Add 1 mL of *calcium chloride solution R*. Heat on a water-bath for 5 min. Both before and after heating, any opalescence in the solution is not more intense than that in a mixture of 1 mL of *water R* and 5 mL of solution S.

**Sulfates** (*2.4.13*): maximum 200 ppm.

Dilute 7.5 mL of solution S to 15 mL with *distilled water R*.

**Calcium** (*2.4.3*): maximum 200 ppm.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Bacterial endotoxins** (*2.6.14*): less than 5 IU/g if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. Before use, neutralise the test solution to pH 7.0-7.5 with *strong sodium hydroxide solution R* and shake vigorously.

ASSAY

Place 1.000 g in a ground-glass-stoppered flask and add 10 mL of *water R* and 20.0 mL of *1 M sodium hydroxide*. Close the flask and allow to stand for 30 min. Using 0.5 mL of *phenolphthalein solution R* as indicator, titrate with *1 M hydrochloric acid* until the pink colour is discharged.

1 mL of *1 M sodium hydroxide* is equivalent to 90.1 mg of $C_3H_6O_3$.

**(*S*)-enantiomer**

Transfer an amount of the substance to be examined equivalent to 2.00 g of lactic acid into a round-bottomed flask, add 25 mL of *1 M sodium hydroxide* and boil gently for 15 min. Cool down and adjust to pH 7.0 using *1 M hydrochloric acid*. Add 5.0 g of *ammonium molybdate R*, dissolve and dilute to 50.0 mL with *water R*. Filter and measure the angle of optical rotation (*2.2.7*). Calculate the percentage content of (*S*)-enantiomer using the expression:

$$50 + \left(24.18 \times \alpha \times \frac{2.222}{m} \times \frac{90}{c}\right)$$

$\alpha$ = angle of optical rotation (absolute value),

$m$ = mass of the substance to be examined, in grams,

$c$ = percentage content of $C_3H_6O_3$ in the substance to be examined.

The complex of (*S*)-lactic acid formed under these test conditions is laevorotatory.

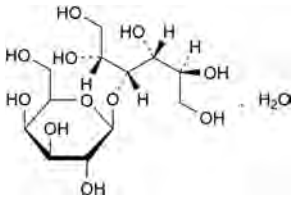
LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

**07/2019:1337**

# LACTITOL MONOHYDRATE

## Lactitolum monohydricum



$C_{12}H_{24}O_{11},H_2O$ $M_r$ 362.3

[81025-04-9]

DEFINITION

4-*O*-β-D-Galactopyranosyl-D-glucitol monohydrate.

*Content*: 96.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

*Appearance*: white or almost white, crystalline powder.

*Solubility*: very soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

*First identification: B.*

*Second identification: A, C.*

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
*Comparison*: *lactitol monohydrate CRS*.

C. Thin-layer chromatography (*2.2.27*).

*Test solution.* Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 20 mL with the same solvent.

*Reference solution (a).* Dissolve 5 mg of *lactitol monohydrate CRS* in *methanol R* and dilute to 2 mL with the same solvent.

*Reference solution (b).* Dissolve 2.5 mg of *sorbitol CRS* (impurity E) in 1 mL of reference solution (a) and dilute to 10 mL with *methanol R*.

*Plate*: *TLC silica gel G plate R*.

*Mobile phase*: *water R*, *acetonitrile R* (25:75 *V/V*).

*Application*: 2 µL.

*Development*: over 2/3 of the plate.

*Drying*: in air.

*Detection*: spray with *4-aminobenzoic acid solution R* and dry in a current of cold air until the acetone is removed; heat at 100 °C for 15 min and allow to cool; spray with a 2 g/L solution of *sodium periodate R* and dry in a current of cold air; heat at 100 °C for 15 min.

*System suitability*: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

*Results*: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

**Solution S**. Dissolve 5.000 g in *carbon dioxide-free water R* and dilute to 50.0 mL with the same solvent.

**Appearance of solution**. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution $BY_7$ (*2.2.2, Method II*).

**Acidity or alkalinity**. To 10 mL of solution S add 10 mL of *carbon dioxide-free water R*. To 10 mL of this solution add 0.05 mL of *phenolphthalein solution R*. Not more than 0.2 mL of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink. To a further 10 mL of the solution add 0.05 mL of *methyl red solution R*. Not more than 0.3 mL of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

**Specific optical rotation**(*2.2.7*): + 13.5 to + 15.5 (anhydrous substance), determined on solution S.

**Related substances**. Liquid chromatography (*2.2.29*).

*Test solution (a).* Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

*Test solution (b).* Dilute 2.0 mL of test solution (a) to 50.0 mL with *water R*.

*Reference solution (a).* Dissolve 5.0 mg of *lactitol monohydrate CRS* and 5 mg of *glycerol R* in *water R* and dilute to 25.0 mL with the same solvent.

*Reference solution (b).* Dilute 1.0 mL of test solution (a) to 100.0 mL with *water R*. Dilute 5.0 mL of this solution to 100.0 mL with *water R*.

*Reference solution (c).* Dilute 2.5 mL of reference solution (a) to 10.0 mL with *water R*.

*Column*:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *strong cation-exchange resin (calcium form) R*;
- *temperature*: 60 °C.

*Mobile phase*: *water for chromatography R*.

*Flow rate*: 0.6 mL/min.

*Detection*: differential refractometer maintained at a constant temperature (e.g. 35 °C).

*Injection*: 100 µL; inject test solution (a) and reference solutions (b) and (c).

*Run time*: 2.5 times the retention time of lactitol.

*Relative retention* with reference to lactitol (retention time = about 13 min): impurity A = about 0.7; impurity B = about 0.8; glycerol = about 1.3; impurity C = about 1.5; impurity D = about 1.8; impurity E = about 1.9.

*System suitability*: reference solution (c):

- *resolution*: minimum 5.0 between the peaks due to lactitol and glycerol.

*Limits*:

- *impurity B*: not more than the area of the peak due to lactitol in the chromatogram obtained with reference solution (c) (1.0 per cent);
- *total of other impurities*: not more than the area of the peak due to lactitol in the chromatogram obtained with reference solution (c) (1.0 per cent);
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Reducing sugars**: maximum 0.2 per cent.

Dissolve 5.0 g in 3 mL of *water R* with gentle heating. Cool and add 20 mL of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 mL of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 mL of *0.025 M iodine*. With continuous shaking, add 25 mL of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R*. When the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulfate* using 1 mL of *starch solution R* added towards the end of the titration, as indicator. Not less than 12.8 mL of *0.05 M sodium thiosulfate* is required.

**Water** (*2.5.12*): 4.5 per cent to 5.5 per cent, determined on 0.300 g.

**Sulfated ash** (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

**Microbial contamination**

TAMC: acceptance criterion $10^3$ CFU/g (*2.6.12*).

TYMC: acceptance criterion $10^2$ CFU/g (*2.6.12*).

Absence of *Escherichia coli* (*2.6.13*).

Absence of *Salmonella* (*2.6.13*).

Absence of *Pseudomonas aeruginosa* (*2.6.13*).

ASSAY

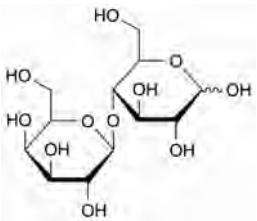
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

*Injection*: test solution (b) and reference solution (a).

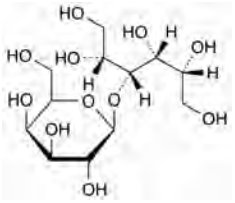
Calculate the percentage content of $C_{12}H_{24}O_{11}$ taking into account the assigned content of *lactitol monohydrate CRS*.

IMPURITIES

*Specified impurities: A, B, C, D, E.*



A. 4-*O*-β-D-galactopyranosyl-D-glucopyranose (lactose),



B. 3-*O*-β-D-galactopyranosyl-D-mannitol (lactulitol),
