Rubber closures for containers for aqueous parenteral preparations for powders and for freeze-dried powders are made of materials obtained by vulcanisation (cross-linking) of macromolecular organic substances (elastomers), with appropriate additives. The specification also applies to closures for containers for powders and freeze-dried products to be dissolved in water immediately before use. The specification does not apply to closures made from silicone elastomer (which are dealt with in *3.1.9. Silicone elastomer for closures and tubing*), to laminated closures or to lacquered closures. The elastomers are produced from natural or synthetic substances by polymerisation, polyaddition or polycondensation. The nature of the principal components and of the various additives (for example vulcanisers, accelerators, stabilisers, pigments) depends on the properties required for the finished article.

Rubber closures may be classified in 2 types: type I closures are those which meet the strictest requirements and which are to be preferred; type II closures are those which, having mechanical properties suitable for special uses (for example, multiple piercing), cannot meet requirements as severe as those for the first category because of their chemical composition.

The closures chosen for use with a particular preparation are such that:

– the components of the preparation in contact with the closure are not adsorbed onto the surface of the closure and do not migrate into or through the closure to an extent sufficient to affect the preparation adversely,
– the closure does not yield to the preparation substances in quantities sufficient to affect its stability or to present a risk of toxicity.

The closures are compatible with the preparation for which they are used throughout its period of validity.

The manufacturer of the preparation must obtain from the supplier an assurance that the composition of the closure does not vary and that it is identical to that of the closure used during compatibility testing. When the supplier informs the manufacturer of the preparation of changes in the composition, compatibility testing must be repeated, totally or partly, depending on the nature of the changes.

The closures are washed and may be sterilised before use.

CHARACTERS

Rubber closures are elastic; they are translucent or opaque and have no characteristic colour, the latter depending on the additives used. They are practically insoluble in tetrahydrofuran, in which, however, a considerable reversible swelling may occur. They are homogeneous and practically free from flash and adventitious materials (for example fibres, foreign particles, waste rubber).

Identification of the type of rubber used for the closures is not within the scope of this specification. The identification test given below distinguishes elastomer and non-elastomer closures but does not differentiate the various types of rubber. Other identity tests may be carried out with the aim of detecting differences in a batch compared to the closures used for compatibility testing. One or more of the following analytical methods may be applied for this purpose: determination of relative density, determination of sulphated ash, determination of sulphur content, thin-layer chromatography carried out on an extract, ultraviolet absorption spectrophotometry of an extract, infrared absorption spectrophotometry of a pyrolysate.

IDENTIFICATION

A. The elasticity is such that a strip of material with a cross-section of 1 mm^2 to 5 mm^2 can be stretched by hand to at least twice its original length. Having been stretched to twice its length for l min, it contracts to less than 1.2 times its original length within 30 s.
B. Heat 1 g to 2 g in a heat-resistant test-tube over an open flame to dry the sample and continue heating until pyrolysate vapours are condensed near the top edge of the test-tube. Deposit a few drops of the pyrolysate on a potassium bromide disc and examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with the type sample.
C. The total ash (*2.4.16*) is within ± 10 per cent of the result obtained with the type sample.

TESTS

The samples to be analysed may be washed and sterilised before use.

Solution S. Introduce a number of uncut closures corresponding to a surface area of about 100 cm^2 in a suitable glass container, cover with *water for injections R*, boil for 5 min and rinse 5 times with cold *water for injections R*. Place the washed closures in a wide-necked flask (glass type I, *3.2.1*), add 200 ml of *water for injections R* and weigh. Cover the mouth of the flask with a borosilicate-glass beaker. Heat in an autoclave so that a temperature of 121 ± 2 °C is reached within 20 min to 30 min and maintain at this temperature for 30 min. Cool to room temperature over about 30 min. Make up to the original mass with *water for injections R*. Shake and immediately separate the solution from the rubber by decantation. Shake solution S before each test

Blank. Prepare a blank in the same manner using 200 ml of *water for injections R*.

Appearance of solution. Solution S is not more opalescent than reference suspension II for type I closures and is not more opalescent than reference suspension III for type II closures (*2.2.1*). Solution S is not more intensely coloured than reference solution GY_5 (*2.2.2, Method II*).

Acidity or alkalinity. To 20 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.3 ml of *0.01 M sodium hydroxide* or 0.8 ml of *0.01 M hydrochloric acid* is required to obtain either a blue or a yellow colour, respectively.

Absorbance. *Carry out the test within 5 h of preparation of solution S.* Filter solution S on a membrane filter having approximately 0.45 μm pores rejecting the first few millilitres of filtrate. Measure the absorbance (*2.2.25*) of the filtrate at wavelengths from 220 nm to 360 nm using the blank (see solution S) as compensation liquid. At these wavelengths, the absorbance does not exceed 0.2 for type I closures or 4.0 for type II closures. If necessary, dilute the filtrate before measurement of the absorbance and correct the result for the dilution.

Reducing substances. *Carry out the test within 4 h of preparation of solution S.* To 20.0 ml of solution S add 1 ml of *dilute sulphuric acid R* and 20.0 ml of *0.002 M*

potassium permanganate. Boil for 3 min. Cool. Add 1 g of *potassium iodide R* and titrate immediately with *0.01 M sodium thiosulphate*, using 0.25 ml of *starch solution R* as indicator. Carry out a titration using 20.0 ml of the blank. The difference between the titration volumes is not greater than 3.0 ml for type I closures and 7.0 ml for type II closures.

Ammonium (*2.4.1*): maximum 2 ppm.

Dilute 5 ml of solution S to 14 ml with *water R*. The solution complies with limit test A.

Extractable zinc: maximum of 5.0 µg of extractable Zn per millilitre of solution S.

Atomic absorption spectrophotometry (*2.2.23, Method I*).

Test solution. Dilute 10.0 ml of solution S to 100 ml with *0.1 M hydrochloric acid*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (10 ppm Zn) R* diluted with *0.1 M hydrochloric acid*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Flame: air-acetylene.

Extractable heavy metals (*2.4.8*): maximum 2 ppm.

Solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Residue on evaporation. Evaporate 50.0 ml of solution S to dryness on a water-bath and dry at 100 °C to 105 °C. The residue weighs not more than 2.0 mg for type I rubber and not more than 4.0 mg for type II rubber.

Volatile sulphides. Place closures, cut if necessary, with a total surface area of 20 ± 2 cm^2 in a 100 ml conical flask and add 50 ml of a 20 g/l solution of *citric acid R*. Place a piece of *lead acetate paper R* over the mouth of the flask and maintain the paper in position by placing over it an inverted weighing bottle. Heat in an autoclave at 121 ± 2 °C for 30 min. Any black stain on the paper is not more intense than that of a standard prepared at the same time in the same manner using 0.154 mg of *sodium sulphide R* and 50 ml of a 20 g/l solution of *citric acid R*.

For the tests for penetrability, fragmentation and self-sealing, use the closures treated as described for the preparation of solution S and allowed to dry.

Penetrability. For closures intended to be pierced by a hypodermic needle, carry out the following test. Fill 10 suitable vials to the nominal volume with *water R*, fit the closures to be examined and secure with a cap. Using for each closure a new, lubricated long-bevel(1) (bevel angle 12 ± 2°) hypodermic needle with an external diameter of 0.8 mm, pierce the closures with the needle perpendicular to the surface. The force required for piercing, determined with an accuracy of ± 0.25 N (25 gf), is not greater than 10 N (1 kgf) for each closure.

Fragmentation. For closures intended to be pierced by a hypodermic needle, carry out the following test. If the closures are to be used for aqueous preparations, place in 12 clean vials a volume of *water R* corresponding to the nominal volume minus 4 ml, close the vials with the closures to be examined, secure with a cap and allow to stand for 16 h. If the closures are to be used with dry preparations, close 12 clean vials with the closures to be examined. Using a lubricated long-bevel(1) (bevel angle 12 ± 2°) hypodermic needle with an external diameter of 0.8 mm fitted to a clean syringe, inject into the vial 1 ml of *water R* and remove 1 ml of air; carry out this operation 4 times for each closure, piercing each time at a different site. Use a new needle for each closure and check that the needle is not blunted during the test. Pass the liquid in the vials through a filter having approximately 0.5 µm pores. Count the fragments of rubber visible to the naked eye. The total number of fragments does not exceed 5. This limit is based on the assumption that fragments with a diameter equal to or greater than 50 µm are visible to the naked eye; in cases of doubt or dispute, the fragments are examined with a microscope to verify their nature and size.

Self-sealing test. For closures intended to be used with multidose containers, carry out the following test. Fill 10 suitable vials to the nominal volume with *water R*, fit the closures to be examined and secure with a cap. Using for each closure a new hypodermic needle with an external diameter of 0.8 mm, pierce each closure 10 times, piercing each time at a different site. Immerse the vials upright in a 1 g/l solution of *methylene blue R* and reduce the external pressure by 27 kPa for 10 min. Restore atmospheric pressure and leave the vials immersed for 30 min. Rinse the outside of the vials. None of the vials contains any trace of coloured solution.

Additional information for reagents that can only be fully identified by a trademark or whose availability is limited may be found in the KNOWLEDGE database on the EDQM website. This information is given only to make it easier to obtain such reagents and this does not suggest in any way that the mentioned suppliers are especially recommended or certified by the European Pharmacopoeia Commission or the Council of Europe. It is therefore acceptable to use reagents from another source provided that they comply with the standards of the Pharmacopoeia.

01/2008:40100

4.1. REAGENTS, STANDARD SOLUTIONS, BUFFER SOLUTIONS

Where the name of substance or a solution is followed by the letter R (the whole in italics), this indicates a reagent included in the following list. The specifications given for reagents do not necessarily guarantee their quality for use in medicines.

Within the description of each reagent there is a seven-figure reference code in italics (for example, *1002501*). This number, which will remain unchanged for a given reagent during subsequent revisions of the list, is used for identification purposes by the Secretariat, and users of the Pharmacopoeia may also find it useful, for example in the management of reagent stocks. The description may also include a CAS number (Chemical Abstract Service Registry Number) recognisable by its typical format, for example 9002-93-1.

Some of the reagents included in the list are toxic and are to be handled in conformity with good quality control laboratory practice.

Reagents in aqueous solution are prepared using *water R*. Where a reagent solution is described using an expression such as "hydrochloric acid (10 g/l HCl)", the solution is prepared by an appropriate dilution with *water R* of a more concentrated reagent solution specified in this chapter. Reagent solutions used in the limit tests for barium, calcium and sulphates are prepared using *distilled water R*. Where the name of the solvent is not stated, an aqueous solution is intended.

The reagents and reagent solutions are to be stored in well-closed containers. The labelling should comply with the relevant national legislation and international agreements.

01/2008:40101

4.1.1. REAGENTS

Acacia. *1000100.*

See *Acacia (0307)*.

Acacia solution. *1000101.*

Dissolve 100 g of *acacia R* in 1000 ml of *water R*. Stir with a mechanical stirrer for 2 h. Centrifuge at about 2000 *g* for 30 min to obtain a clear solution.

Storage: in polyethylene containers of about 250 ml capacity at 0 °C to – 20 °C.

Acebutolol hydrochloride. *1148900.* [34381-68-5].

See *Acebutolol hydrochloride (0871)*.

Acetal. $C_6H_{14}O_2$. (M_r 118.2). *1112300.* [105-57-7].
Acetaldehyde diethyl acetal. 1,1-Diethoxyethane.

A clear, colourless, volatile liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.824.

n_D^{20}: about 1.382.

bp: about 103 °C.

Acetaldehyde. C_2H_4O. (M_r 44.1). *1000200.* [75-07-0].
Ethanal.

A clear, colourless flammable liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.788.

n_D^{20}: about 1.332.

bp: about 21 °C.

Acetaldehyde ammonia trimer trihydrate.
$C_6H_{15}N_3,3H_2O$. (M_r 183.3). *1133500.* [58052-80-5].
2,4,6-Trimethylhexahydro-1,3,5-triazine trihydrate.

mp: 95 °C to 97 °C.

Acetic acid, anhydrous. $C_2H_4O_2$. (M_r 60.1). *1000300.* [64-19-7].

Content: minimum 99.6 per cent *m/m* of $C_2H_4O_2$.

A colourless liquid or white or almost white, shining, fern-like crystals, miscible with or very soluble in water, in alcohol, in glycerol (85 per cent), and in most fatty and essential oils.

d_{20}^{20}: 1.052 to 1.053.

bp: 117 °C to 119 °C.

A 100 g/l solution is strongly acid (*2.2.4*).

A 5 g/l solution neutralised with *dilute ammonia R2* gives reaction (b) of acetates (*2.3.1*).

Freezing point (*2.2.18*): minimum 15.8 °C.

Water (*2.5.12*): maximum 0.4 per cent. If the water content is more than 0.4 per cent it may be adjusted by adding the calculated amount of *acetic anhydride R*.

Storage: protected from light.

Acetic acid, glacial. $C_2H_4O_2$. (M_r 60.1). *1000400.* [64-19-7].

See *Acetic acid, glacial (0590)*.

Acetic acid. *1000401.*

Content: 290 g/l to 310 g/l of $C_2H_4O_2$ (M_r 60.1).

Dilute 30 g of *glacial acetic acid R* to 100 ml with *water R*.

Acetic acid, dilute. *1000402.*

Content: 115 g/l to 125 g/l of $C_2H_4O_2$ (M_r 60.1).

Dilute 12 g of *glacial acetic acid R* to 100 ml with *water R*.

Acetic anhydride. $C_4H_6O_3$. (M_r 102.1). *1000500.* [108-24-7].

Content: minimum 97.0 per cent *m/m* of $C_4H_6O_3$.

A clear, colourless liquid.

bp: 136 °C to 142 °C.

Assay. Dissolve 2.00 g in 50.0 ml of *1 M sodium hydroxide* in a ground-glass-stoppered flask and boil under a reflux condenser for 1 h. Titrate with *1 M hydrochloric acid*, using 0.5 ml of *phenolphthalein solution R* as indicator. Calculate the number of millilitres of *1 M sodium hydroxide* required for 1 g (n_1). Dissolve 2.00 g in 20 ml of *cyclohexane R* in a ground-glass-stoppered flask, cool in ice and add a cold mixture of 10 ml of *aniline R* and 20 ml of *cyclohexane R*. Boil the mixture under a reflux condenser for 1 h, add 50.0 ml of *1 M sodium hydroxide* and shake vigorously. Titrate with

1 M hydrochloric acid, using 0.5 ml of *phenolphthalein solution R* as indicator. Calculate the number of millilitres of *1 M sodium hydroxide* required for 1 g (n_2). Calculate the percentage of $C_4H_6O_3$ from the expression:

$$10.2\,(n_1 - n_2)$$

Acetic anhydride solution R1. *1000501.*

Dissolve 25.0 ml of *acetic anhydride R* in *anhydrous pyridine R* and dilute to 100.0 ml with the same solvent.

Storage: protected from light and air.

Acetic anhydride - sulphuric acid solution. *1000502.*

Carefully mix 5 ml of *acetic anhydride R* with 5 ml of *sulphuric acid R*. Add dropwise and with cooling to 50 ml of *ethanol R*.

Prepare immediately before use.

Acetone. *1000600.* [67-64-1].

See *Acetone (0872)*.

Acetonitrile. C_2H_3N. (M_r 41.05). *1000700.* [75-05-8]. Methyl cyanide. Ethanenitrile.

A clear, colourless liquid, miscible with water, with acetone and with methanol.

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.344.

A 100 g/l solution is neutral to litmus paper.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 80 °C and 82 °C.

Acetonitrile used in spectrophotometry complies with the following additional requirement.

Minimum transmittance (*2.2.25*): 98 per cent from 255 nm to 420 nm, using *water R* as compensation liquid.

Acetonitrile for chromatography. *1000701.*

See *Acetonitrile R*.

Acetonitrile used in chromatography complies with the following additional requirements.

Minimum transmittance (*2.2.25*): 98 per cent from 240 nm, using *water R* as compensation liquid.

Minimum purity (*2.2.28*): 99.8 per cent.

Acetonitrile R1. *1000702.*

Complies with the requirements prescribed for *acetonitrile R* and with the following additional requirements.

Content: minimum 99.9 per cent of C_2H_3N.

Absorbance (*2.2.25*). The absorbance at 200 nm using *water R* as the compensation liquid is not more than 0.10.

Acetoxyvalerenic acid. $C_{17}H_{24}O_4$. (M_r 292.4). *1165800.* [81397-67-3]. (2*E*)-3-[(1*RS*,4*S*,7*R*,7a*R*)-1-(Acetyloxy)-3,7-dimethyl-2,4,5,6,7,7a-hexahydro-1*H*-inden-4-yl]-2-methylprop-2-enoic acid.

Colourless or pale yellow viscous oil.

Absorbance (*2.2.25*): absorption maximum at about 216 nm, determined in *methanol R*.

Acetylacetamide. $C_4H_7NO_2$. (M_r 101.1). *1102600.* [5977-14-0]. 3-Oxobutanamide.

mp: 53 °C to 56 °C.

Acetylacetone. $C_5H_8O_2$. (M_r 100.1). *1000900.* [123-54-6]. 2,4-Pentanedione.

A colourless or slightly yellow, easily flammable liquid, freely soluble in water, miscible with acetone, with alcohol and with glacial acetic acid.

n_D^{20}: 1.452 to 1.453.

bp: 138 °C to 140 °C.

Acetylacetone reagent R1. *1000901.*

To 100 ml of *ammonium acetate solution R* add 0.2 ml of *acetylacetone R*.

***N*-Acetyl-ϵ-caprolactam.** $C_8H_{13}NO_2$. (M_r 155.2). *1102700.* [1888-91-1]. *N*-Acetylhexane-6-lactam.

Colourless liquid, miscible with ethanol.

d_{20}^{20}: about 1.100.

n_D^{20}: about 1.489.

bp: about 135 °C.

Acetyl chloride. C_2H_3ClO. (M_r 78.5). *1000800.* [75-36-5].

A clear, colourless liquid, flammable, decomposes in contact with water and with alcohol, miscible with ethylene chloride.

d_{20}^{20}: about 1.10.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 49 °C and 53 °C.

Acetylcholine chloride. $C_7H_{16}ClNO_2$. (M_r 181.7). *1001000.* [60-31-1].

A crystalline powder, very soluble in cold water and in alcohol; it decomposes in hot water and in alkalis.

Storage: at – 20 °C.

Acetyleugenol. $C_{12}H_{14}O_3$. (M_r 206.2). *1100700.* [93-28-7]. 2-Methoxy-4-(2-propenyl)phenylacetate.

A yellow coloured, oily liquid, freely soluble in alcohol, practically insoluble in water.

n_D^{20}: about 1.521.

bp: 281 °C to 282 °C.

Acetyleugenol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Clove oil (1091)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

***N*-Acetylglucosamine.** $C_8H_{15}NO_6$. (M_r 221.2). *1133600.* [7512-17-6]. 2-(Acetylamino)-2-deoxy-D-glucopyranose.

mp: about 202 °C.

Acetyl-11-keto-β-boswellic acid. $C_{32}H_{48}O_5$. (M_r 512.7). *1167700.* [67416-61-9]. 3α-(Acetyloxy)-11-oxours-12-en-24-oic acid. (4β)-3α-(Acetyloxy)-11-oxours-12-en-23-oic acid.

White or almost white powder, insoluble in water, soluble in acetone, in anhydrous ethanol and in methanol.

mp: 271 °C to 274 °C.

Acetyl-11-keto-β-boswellic acid used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph on *Indian frankincense (2310)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

_N_-Acetylneuraminic acid. $C_{11}H_{19}NO_9$. (M_r 309.3). *1001100.* [131-48-6]. *O*-Sialic acid.

White or almost white acicular crystals, soluble in water and in methanol, slightly soluble in ethanol, practically insoluble in acetone.

$[\alpha]_D^{20}$: about – 36, determined on a 10 g/l solution.

mp: about 186 °C, with decomposition.

_N_-Acetyltryptophan. $C_{13}H_{14}N_2O_3$. (M_r 246.3). *1102800.* [1218-34-4]. 2-Acetylamino-3-(indol-3-yl)propanoic acid.

A white or almost white powder or colourless crystals, slightly soluble in water. It dissolves in dilute solutions of alkali hydroxides.

mp: about 205 °C.

Assay. Dissolve 10.0 mg in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Examine as prescribed in the monograph on *Tryptophan (1272)* under "1,1′-Ethylidenebis(tryptophan) and other related substances". The area of the principal peak in the chromatogram obtained is not less than 99.0 per cent of the areas of all the peaks.

Acetyltyrosine ethyl ester. $C_{13}H_{17}NO_4,H_2O$. (M_r 269.3). *1001200.* [36546-50-6]. *N*-Acetyl-L-tyrosine ethyl ester monohydrate. Ethyl (*S*)-2-acetamido-3-(4-hydroxyphenyl)propionate monohydrate.

A white or almost white, crystalline powder suitable for the assay of chymotrypsin.

$[\alpha]_D^{20}$: + 21 to + 25, determined on a 10 g/l solution in *alcohol R*.

$A_{1\,cm}^{1\%}$: 60 to 68, determined at 278 nm in *alcohol R*.

Acetyltyrosine ethyl ester 0.2 M. *1001201.*

Dissolve 0.54 g of *acetyltyrosine ethyl ester R* in *alcohol R* and dilute to 10.0 ml with the same solvent.

Acid blue 83. $C_{45}H_{44}N_3NaO_7S_2$. (M_r 826). *1012200.* [6104-59-2].

Colour Index No. 42660.
Brilliant blue R. Coomassie brilliant blue R 250.

Brown powder insoluble in cold water, slightly soluble in boiling water and in ethanol, soluble in sulphuric acid, glacial acetic acid and in dilute solutions of alkali hydroxides.

Acid blue 90. $C_{47}H_{48}N_3NaO_7S_2$. (M_r 854). *1001300.* [6104-58-1].

Colour Index No. 42655.
Sodium [4-[[4-[(4-ethoxyphenyl)amino]phenyl][[4-(ethyl)(3-sulphonatobenzyl)amino]phenyl]methylene]cyclo-hexa-2,5-dien-1-ylidene](ethyl)-(3-sulphonatobenzyl)ammonium.

A dark brown powder, with a violet sheen and some particles having a metallic lustre, soluble in water and in ethanol.

$A_{1\,cm}^{1\%}$: greater than 500, determined at 577 nm using a 0.01 g/l solution in buffer solution pH 7.0 and calculated with reference to the dried substance.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 0.500 g by drying in an oven at 105 °C.

Acid blue 92. $C_{26}H_{16}N_3Na_3O_{10}S_3$. ($M_r$ 696). *1001400.* [3861-73-2].

Colour Index No. 13390.
Coomassie blue. Anazolene sodium. Trisodium 8-hydroxy-4′-(phenylamino)azonaphthalene-3,5′,6-trisulphonate.

Dark blue crystals slightly soluble in alcohol, soluble in water, in acetone and in ethylene glycol monoethylether.

Acid blue 92 solution. *1001401.*

Dissolve 0.5 g of *acid blue 92 R* in a mixture of 10 ml of *glacial acetic acid R*, 45 ml of *alcohol R* and 45 ml of *water R*.

Acid blue 93. $C_{37}H_{27}N_3Na_2O_9S_3$. ($M_r$ 800). *1134200.* [28983-56-4].

Colour Index No. 42780.
Methyl blue. Poirrier blue.

Mixture of triphenylrosaniline di- and trisulfonate and of triphenylpararosaniline.

Dark blue powder.

Colour change: pH 9.4 to pH 14.0.

Acid blue 93 solution. *1134201.*

Dissolve 0.2 g of *acid blue 93 R* in *water R* and dilute to 100 ml with the same solvent.

Acrylamide. C_3H_5NO. (M_r 71.1). *1001500.* [79-06-1]. Propenamide.

Colourless or white flakes or a white or almost white, crystalline powder, very soluble in water and in methanol, freely soluble in ethanol.

mp: about 84 °C.

30 per cent acrylamide/bisacrylamide (29:1) solution. *1001501.*

Prepare a solution containing 290 g of *acrylamide R* and 10 g of *methylenebisacrylamide R* per litre of *water R*. Filter.

30 per cent acrylamide/bisacrylamide (36.5:1) solution. *1001502.*

Prepare a solution containing 292 g of *acrylamide R* and 8 g of *methylenebisacrylamide R* per litre of *water R*. Filter.

Acrylic acid. $C_3H_4O_2$. (M_r 72.1). *1133700.* [79-10-7]. Prop-2-enoic acid. Vinylformic acid.

Content: minimum 99 per cent of $C_3H_4O_2$.

It is stabilised with 0.02 per cent of hydroquinone monomethyl ether.

Corrosive liquid, miscible with water and alcohol. It polymerises readily in the presence of oxygen.

d_{20}^{20}: about 1.05.

n_D^{20}: about 1.421.

bp: about 141 °C.

mp: 12 °C to 15 °C.

Acteoside. $C_{29}H_{36}O_{15}$. (M_r 624.6). *1145100.* [61276-17-3]. 2-(3,4-Dihydroxyphenyl)ethyl 3-*O*-(6-deoxy-α-L-mannopyranosyl)-4-*O*-[(2*E*)-3-(3,4-dihydroxyphenyl)prop-2-enoyl]-β-D-glucopyranoside.

Light yellowish powder, freely soluble in water and in methanol.

mp: about 140 °C, with decomposition.

Adenosine. $C_{10}H_{13}N_5O_4$. (M_r 267.2). *1001600.* [58-61-7]. 6-Amino-9-β-D-ribofuranosyl-9*H*-purine.

A white or almost white, crystalline powder, slightly soluble in water, practically insoluble in acetone and in alcohol. It dissolves in dilute solutions of acids.

mp: about 234 °C.

Adipic acid. $C_6H_{10}O_4$. (M_r 146.1). *1095600.* [124-04-9].

Prisms, freely soluble in methanol, soluble in acetone, practically insoluble in light petroleum.

mp: about 152 °C.

Adrenaline. $C_9H_{13}NO_3$. (M_r 183.2). *1155000.* [51-43-4]. (1*R*)-1-(3,4-Dihydroxyphenyl)-2-(methylamino)ethanol. 4-[(1*R*)-1-hydroxy-2-(methylamino)ethyl]benzene-1,2-diol.

White or almost white powder, gradually becoming brown on exposure to light and air, very slightly soluble in water and in ethanol (96 per cent), insoluble in acetone. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

mp: about 215 °C.

Adrenalone hydrochloride. $C_9H_{12}ClNO_3$. (M_r 217.7). *1155100.* [62-13-5]. 1-(3,4-Dihydroxyphenyl)-2-(methylamino)ethanone hydrochloride. 3′,4′-Dihydroxy-2-(methylamino)acetophenone hydrochloride.

Pale yellow crystals, freely soluble in water, soluble in ethanol (96 per cent).

mp: about 244 °C.

Aescin. *1001700.* [11072-93-8].

A mixture of related saponins obtained from the seeds of *Aesculus hippocastanum* L.

A fine, almost white or slightly reddish or yellowish, amorphous powder.

Chromatography. Examine as prescribed in the monograph on *Senega root (0202)* but apply 20 µl of the solution. After spraying with *anisaldehyde solution R* and heating, the chromatogram shows a principal band with an R_F of about 0.4.

Aflatoxin B_1. $C_{17}H_{12}O_6$. (M_r 312.3). *1166000.* [1162-65-8]. (6a*R*,9a*S*)-4-Methoxy-2,3,6a,9a-tetrahydrocyclopenta[*c*]furo[3′,2′:4,5]furo[2,3-*h*][1]benzopyran-1,11-dione.

White or faint yellow crystals.

Agarose/cross-linked polyacrylamide. *1002200.*

Agarose trapped within a cross-linked polyacrylamide network; it is used for the separation of globular proteins with relative molecular masses of 2×10^4 to 35×10^4.

Agarose-DEAE for ion-exchange chromatography. *1002100.* [57407-08-6].

Cross-linked agarose substituted with diethylaminoethyl groups, presented as beads.

Agarose for chromatography. *1001800.* [9012-36-6].

Swollen beads 60 µm to 140 µm in diameter presented as a 4 per cent suspension in *water R*. It is used in size-exclusion chromatography for the separation of proteins with relative molecular masses of 6×10^4 to 20×10^6 and of polysaccharides with relative molecular masses of 3×10^3 to 5×10^6.

Agarose for chromatography, cross-linked. *1001900.* [61970-08-9].

Prepared from agarose by reaction with 2,3-dibromopropanol in strongly alkaline conditions.

It occurs as swollen beads 60 µm to 140 µm in diameter and is presented as a 4 per cent suspension in *water R*. It is used in size-exclusion chromatography for the separation of proteins with relative molecular masses of 6×10^4 to 20×10^6 and of polysaccharides with relative molecular masses of 3×10^3 to 5×10^6.

Agarose for chromatography, cross-linked R1. *1001901.* [65099-79-8].

Prepared for agarose by reaction with 2,3-dibromopropanol in strongly alkaline conditions.

It occurs as swollen beads 60 µm to 140 µm in diameter and is presented as a 4 per cent suspension in *water R*. It is used in size-exclusion chromatography for the separation of proteins with relative molecular masses of 7×10^4 to 40×10^6 and of polysaccharides with relative molecular masses of 1×10^5 to 2×10^7.

Agarose for electrophoresis. *1002000.* [9012-36-6].

A neutral, linear polysaccharide, the main component of which is derived from agar.

A white or almost white powder, practically insoluble in cold water, very slightly soluble in hot water.

Agnuside. $C_{22}H_{26}O_{11}$. (M_r 466.4). *1162000.* [11027-63-7]. (1*RS*,4a*SR*,5*RS*,7a*RS*)-5-Hydroxy-7-[[(4-hydroxybenzoyl)oxy]methyl]-1,4a,5,7a-tetrahydrocyclopenta[*c*]pyran-1-yl β-D-glucopyranoside.

White or almost white crystals.

Alanine. *1102900.* [56-41-7].

See *Alanine (0752).*

β-Alanine. *1004500.* [107-95-9].

See *3-aminopropionic acid R.*

Albumin, bovine. *1002300.* [9048-46-8].

Bovine serum albumin containing about 96 per cent of protein.

A white to light-yellowish-brown powder.

Water (*2.5.12*): maximum 3.0 per cent, determined on 0.800 g.

Bovine albumin used in the assay of tetracosactide should be pyrogen-free, free from proteolytic activity, when examined by a suitable means, for example using chromogenic substrate, and free from corticosteroid activity determined by measurement of fluorescence as described in the biological assay of Tetracosactide (0644).

Albumin, human. *1133800.*

Human serum albumin containing not less than 96 per cent of albumin.

Albumin solution, human. *1002400.* [9048-46-8].

See *Human albumin solution (0255).*

Albumin solution, human R1. *1002401.*

Dilute *human albumin solution R* with a 9 g/l solution of *sodium chloride R* to a concentration of 1 g/l of protein. Adjust the pH to 3.5-4.5 with *glacial acetic acid R*.

Alcohol. *1002500.* [64-17-5].

See *Ethanol (96 per cent) R.*

Alcohol (*x* per cent *V/V*). *1002502.*

See *Ethanol (x per cent V/V) R.*

Alcohol, aldehyde-free. *1002501.*

Mix 1200 ml of *alcohol R* with 5 ml of a 400 g/l solution of *silver nitrate R* and 10 ml of a cooled 500 g/l solution of *potassium hydroxide R*. Shake, allow to stand for a few days and filter. Distil the filtrate immediately before use.

Aldehyde dehydrogenase. *1103000.*

Enzyme obtained from baker's yeast which oxidises acetaldehyde to acetic acid in the presence of nicotinamide-adenine dinucleotide, potassium salts and thiols, at pH 8.0.

Aldehyde dehydrogenase solution. *1103001.*

Dissolve in *water R* a quantity of *aldehyde dehydrogenase R*, equivalent to 70 units and dilute to 10 ml with the same solvent. This solution is stable for 8 h at 4 °C.

Aldrin. $C_{12}H_8Cl_6$. (M_r 364.9). *1123100.* [309-00-2].

bp: about 145 °C.

mp: about 104 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Aleuritic acid. $C_{16}H_{32}O_5$. (M_r 304.4). *1095700.* [533-87-9]. (9*RS*,10*SR*)-9,10,16-Trihydroxyhexadecanoic acid.

A white or almost white powder, greasy to the touch, soluble in methanol.

mp: about 101 °C.

Alizarin S. $C_{14}H_7NaO_7S,H_2O$. (M_r 360.3). *1002600.* [130-22-3].

Schultz No. 1145.

Colour Index No. 58005.
Sodium 1,2-dihydroxyanthraquinone-3-sulphonate monohydrate. Sodium 3,4-dihydroxy-9,10-dioxo-9,10-dihydroanthracene-2-sulphonate monohydrate.

An orange-yellow powder, freely soluble in water and in alcohol.

Alizarin S solution. *1002601.*

A 1 g/l solution.

Test for sensitivity. If alizarin S solution is used for the standardisation of *0.05 M barium perchlorate*, it shows a colour change from yellow to orange-red when it is tested according to the standardisation of *0.05 M barium perchlorate* (*4.2.2*).

Colour change: pH 3.7 (yellow) to pH 5.2 (violet).

Aluminium. Al. (A_r 26.98). *1118200.* [7429-90-5].

A white or almost white, malleable, flexible, bluish metal, available as bars, sheets, powder, strips or wire. In moist air an oxide film forms which protects the metal from corrosion.

Analytical grade.

Aluminium chloride. $AlCl_3,6H_2O$. (M_r 241.4). *1002700.* [7784-13-6]. Aluminium chloride hexahydrate.

Content: minimum 98.0 per cent of $AlCl_3,6H_2O$.

A white to slightly yellowish, crystalline powder, hygroscopic, freely soluble in water and in alcohol.

Storage: in an airtight container.

Aluminium chloride reagent. *1002702.*

Dissolve 2.0 g of *aluminium chloride R* in 100 ml of a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Aluminium chloride solution. *1002701.*

Dissolve 65.0 g of *aluminium chloride R* in *water R* and dilute to 100 ml with the same solvent. Add 0.5 g of *activated charcoal R*, stir for 10 min, filter and add to the filtrate, with continuous stirring, sufficient of a 10 g/l solution of *sodium hydroxide R* (about 60 ml) to adjust the pH to about 1.5.

Aluminium nitrate. $Al(NO_3)_3,9H_2O$. (M_r 375.1). *1002800.* [7784-27-2]. Aluminium nitrate nonahydrate.

Crystals, deliquescent, very soluble in water and alcohol, very slightly soluble in acetone.

Storage: in an airtight container.

Aluminium oxide, anhydrous. *1002900.* [1344-28-1].

An aluminium oxide, consisting of γ-Al_2O_3, dehydrated and activated by heat treatment. Particle size 75 µm to 150 µm.

Aluminium oxide, basic. *1118300.*

A basic grade of *anhydrous aluminium oxide R* suitable for column chromatography.

pH (*2.2.3*). Shake 1 g with 10 ml of *carbon dioxide-free water R* for 5 min. The pH of the suspension is 9 to 10.

Aluminium oxide, neutral. Al_2O_3. (M_r 102.0). *1118400.*

See *Aluminium oxide, hydrated (0311)*.

Aluminium potassium sulphate. *1003000.* [7784-24-9].

See *Alum (0006)*.

Americium-243 spiking solution. *1167500.*

Contains 50 Bq/l ^{243}Pu and a 134 g/l solution of *lanthanum chloride heptahydrate R* in a 103 g/l solution of *hydrochloric acid R*.

Amido black 10B. $C_{22}H_{14}N_6Na_2O_9S_2$. ($M_r$ 617). *1003100.* [1064-48-8].

Schultz No. 299.

Colour Index No. 20470.
Disodium 5-amino-4-hydroxy-6-[(4-nitrophenyl)azo]-3-(phenylazo)naphthalene-2,7-disulphonate.

A dark-brown to black powder, sparingly soluble in water, soluble in alcohol.

Amido black 10B solution. *1003101.*

A 5 g/l solution of *amido black 10B R* in a mixture of 10 volumes of *acetic acid R* and 90 volumes of *methanol R*.

Aminoazobenzene. $C_{12}H_{11}N_3$. (M_r 197.2). *1003200.* [60-09-3].

Colour Index No. 11000.
4-(Phenylazo)aniline.

Brownish-yellow needles with a bluish tinge, slightly soluble in water, freely soluble in alcohol.

mp: about 128 °C.

2-Aminobenzoic acid. $C_7H_7NO_2$. (M_r 137.1). *1003400.* [118-92-3]. Anthranilic acid.

A white to pale-yellow, crystalline powder, sparingly soluble in cold water, freely soluble in hot water, in alcohol and in glycerol. Solutions in alcohol or in ether and, particularly, in glycerol show a violet fluorescence.

mp: about 145 °C.

3-Aminobenzoic acid. $C_7H_7NO_2$. (M_r 137.1). *1147400.* [99-05-8].

White or almost white crystals. An aqueous solution turns brown on standing in air.

mp: about 174 °C.

Storage: in an airtight container, protected from light.

4-Aminobenzoic acid. $C_7H_7NO_2$. (M_r 137.1). *1003300.* [150-13-0].

A white or almost white, crystalline powder, slightly soluble in water, freely soluble in alcohol, practically insoluble in light petroleum.

mp: about 187 °C.

Chromatography. Examine as prescribed in the monograph on *Procaine hydrochloride (0050)*; the chromatogram shows only one principal spot.

Storage: protected from light.

4-Aminobenzoic acid solution. *1003301.*

Dissolve 1 g of *4-aminobenzoic acid R* in a mixture of 18 ml of *anhydrous acetic acid R*, 20 ml of *water R* and 1 ml of *phosphoric acid R*. Immediately before use, mix 2 volumes of the solution with 3 volumes of *acetone R*.

***N*-(4-Aminobenzoyl)-L-glutamic acid.** $C_{12}H_{14}N_2O_5$. (M_r 266.3). *1141700.* [4271-30-1]. ABGA. (2*S*)-2-[(4-Aminobenzoyl)amino]pentanedioic acid.

White or almost white, crystalline powder.

mp: about 175 °C, with decomposition.

4-Aminobutanoic acid. $C_4H_9NO_2$. (M_r 103.1). *1123200.* [56-12-2]. γ-Aminobutyric acid. GABA.

Leaflets from methanol and ether, needles from water and alcohol. Freely soluble in water, practically insoluble or slightly soluble in other solvents.

mp: about 202 °C (decreases on rapid heating).

Aminobutanol. $C_4H_{11}NO$. (M_r 89.1). *1003500.* [5856-63-3]. 2-Aminobutanol.

Oily liquid, miscible with water, soluble in alcohol.

d_{20}^{20}: about 0.94.

n_D^{20}: about 1.453.

bp: about 180 °C.

Aminochlorobenzophenone. $C_{13}H_{10}ClNO$. (M_r 231.7). *1003600.* [719-59-5]. 2-Amino-5-chlorobenzophenone.

A yellow, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in alcohol.

mp: about 97 °C.

Chromatography. Examine as prescribed in the monograph on *Chlordiazepoxide hydrochloride (0474)* but apply 5 µl of a 0.5 g/l solution in *methanol R*; the chromatogram shows only one principal spot, at an R_F of about 0.9.

Storage: protected from light.

4-Aminofolic acid. $C_{19}H_{20}N_8O_5$. (M_r 440.4). *1163700.* [54-62-6]. (2*S*)-2-[[4-[[(2,4-Diaminopteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid. *N*-[4-[[(2,4-Diaminopteridin-6-yl)methyl]amino]benzoyl]-L-glutamic acid. Aminopterine.

Yellowish powder.

mp: about 230 °C.

6-Aminohexanoic acid. $C_6H_{13}NO_2$. (M_r 131.2). *1103100.* [60-32-2].

Colourless crystals, freely soluble in water, sparingly soluble in methanol, practically insoluble in ethanol.

mp: about 205 °C.

Aminohippuric acid. $C_9H_{10}N_2O_3$. (M_r 194.2). *1003700.* [61-78-9]. (4-Aminobenzamido)acetic acid.

A white or almost white powder, sparingly soluble in water, soluble in alcohol.

mp: about 200 °C.

Aminohippuric acid reagent. *1003701.*

Dissolve 3 g of *phthalic acid R* and 0.3 g of *aminohippuric acid R* in *alcohol R* and dilute to 100 ml with the same solvent.

Aminohydroxynaphthalenesulphonic acid. $C_{10}H_9NO_4S$. (M_r 239.3). *1112400.* [116-63-2]. 4-Amino-3-hydroxynaphthalene-1-sulphonic acid.

White or grey needles, turning pink on exposure to light, especially when moist, practically insoluble in water and in alcohol, soluble in solutions of alkali hydroxides and in hot solutions of sodium metabisulphite.

Storage: protected from light.

Aminohydroxynaphthalenesulphonic acid solution. *1112401.*

Mix 5.0 g of *anhydrous sodium sulphite R* with 94.3 g of *sodium hydrogensulphite R* and 0.7 g of *aminohydroxynaphthalenesulphonic acid R*. Dissolve 1.5 g of the mixture in *water R* and dilute to 10.0 ml with the same solvent. Prepare the solution daily.

***cis*-Aminoindanol.** $C_9H_{11}NO$. (M_r 149.2). *1168300.* [126456-43-7]. (1*S*,2*R*)-1-Amino-2,3-dihydro-1*H*-inden-2-ol. (–)-*cis*-1-Aminoindan-2-ol.

Content: minimum 98.0 per cent (sum of enantiomers, determined by gas chromatography).

$[\alpha]_D^{20}$: – 69 to – 59, determined on a 2 g/l solution in *chloroform R*.

mp: 118 °C to 122 °C.

Aminomethylalizarindiacetic acid. $C_{19}H_{15}NO_8,2H_2O$. (M_r 421.4). *1003900.* [3952-78-1]. 2,2′-[(3,4-dihydroxy-anthraquinon-3-yl)methylenenitrilo]diacetic acid dihydrate. Alizarin complexone dihydrate.

A fine, pale brownish-yellow to orange-brown powder, practically insoluble in water, soluble in solutions of alkali hydroxides.

mp: about 185 °C.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g.

Aminomethylalizarindiacetic acid reagent. *1003901.*

Solution I. Dissolve 0.36 g of *cerous nitrate R* in *water R* and dilute to 50 ml with the same solvent.

Solution II. Suspend 0.7 g of *aminomethylalizarindiacetic acid R* in 50 ml of *water R*. Dissolve with the aid of about 0.25 ml of *concentrated ammonia R*, add 0.25 ml of *glacial acetic acid R* and dilute to 100 ml with *water R*.

Solution III. Dissolve 6 g of *sodium acetate R* in 50 ml of *water R*, add 11.5 ml of *glacial acetic acid R* and dilute to 100 ml with *water R*.

To 33 ml of *acetone R* add 6.8 ml of solution III, 1.0 ml of solution II and 1.0 ml of solution I and dilute to 50 ml with *water R*.

Test for sensitivity. To 1.0 ml of *fluoride standard solution (10 ppm F) R* add 19.0 ml of *water R* and 5.0 ml of the aminomethylalizarindiacetic acid reagent. After 20 min, the solution assumes a blue colour.

Storage: use within 5 days.

Aminomethylalizarindiacetic acid solution. *1003902.*

Dissolve 0.192 g of *aminomethylalizarindiacetic acid R* in 6 ml of freshly prepared *1 M sodium hydroxide*. Add 750 ml of *water R*, 25 ml of *succinate buffer solution pH 4.6 R* and, dropwise, *0.5 M hydrochloric acid* until

the colour changes from violet-red to yellow (pH 4.5 to 5). Add 100 ml of *acetone R* and dilute to 1000 ml with *water R*.

4-Aminomethylbenzoic acid. $C_8H_9NO_2$. (M_r 151.2). *1167800.* [56-91-7].

Aminonitrobenzophenone. $C_{13}H_{10}N_2O_3$. (M_r 242.2). *1004000.* [1775-95-7]. 2-Amino-5-nitrobenzophenone.

A yellow, crystalline powder, practically insoluble in water, soluble in tetrahydrofuran, slightly soluble in methanol.

mp: about 160 °C.

$A_{1\,cm}^{1\%}$: 690 to 720, determined at 233 nm using a 0.01 g/l solution in *methanol R*.

6-Aminopenicillanic acid. $C_8H_{12}N_2O_3S$. (M_r 216.3). *1162100.* [551-16-6]. (2*S*,5*R*,6*R*)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

Appearance: white or almost white powder.

mp: about 205 °C, with decomposition.

Aminophenazone. $C_{13}H_{17}N_3O$. (231.3). *1133900.* [58-15-1]. 4-(Dimethylamino)-1,5-dimethyl-2-phenyl-1,2-dihydro-3*H*-pyrazol-3-one.

White or almost white, crystalline powder or colourless crystals, soluble in water, freely soluble in alcohol.

mp: about 108 °C.

2-Aminophenol. C_6H_7NO. (M_r 109.1). *1147500.* [95-55-6].

Pale yellowish-brown crystals which rapidly become brown, sparingly soluble in water, soluble in alcohol.

mp: about 172 °C.

Storage: in an airtight container, protected from light.

3-Aminophenol. C_6H_7NO. (M_r 109.1). *1147600.* [591-27-5].

Pale yellowish-brown crystals, sparingly soluble in water.

mp: about 122 °C.

4-Aminophenol. C_6H_7NO. (M_r 109.1). *1004300.* [123-30-8].

Content: minimum 95 per cent of C_6H_7NO.

A white or slightly coloured, crystalline powder, becoming coloured on exposure to air and light, sparingly soluble in water, soluble in ethanol.

mp: about 186 °C, with decomposition.

Storage: protected from light.

Aminopolyether. $C_{18}H_{36}N_2O_6$. (M_r 376.5). *1112500.* [23978-09-8]. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8,8,8]hexacosane.

mp: 70 °C to 73 °C.

3-Aminopropanol. C_3H_9NO. (M_r 75.1). *1004400.* [156-87-6]. 3-Aminopropan-1-ol. Propanolamine.

A clear, colourless, viscous liquid.

d_{20}^{20}: about 0.99.

n_D^{20}: about 1.461.

mp: about 11 °C.

3-Aminopropionic acid. $C_3H_7NO_2$. (M_r 89.1). *1004500.* [107-95-9]. β-Alanine.

Content: minimum 99 per cent of $C_3H_7NO_2$.

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol, practically insoluble in acetone.

mp: about 200 °C, with decomposition.

Aminopyrazolone. $C_{11}H_{13}N_3O$. (M_r 203.2). *1004600.* [83-07-8]. 4-Amino-2,3-dimethyl-1-phenylpyrazolin-5-one.

Light-yellow needles or powder, sparingly soluble in water, freely soluble in alcohol.

mp: about 108 °C.

Aminopyrazolone solution. *1004601.*

A 1 g/l solution in *buffer solution pH 9.0 R*.

Ammonia, concentrated. *1004700.*

See *Concentrated ammonia solution (0877)*.

Ammonia. *1004701.*

Content: 170 g/l to 180 g/l of NH_3 (M_r 17.03).

Dilute 67 g of *concentrated ammonia R* to 100 ml with *water R*.

d_{20}^{20}: 0.931 to 0.934.

When used in the limit test for iron, *ammonia R* complies with the following additional requirement. Evaporate 5 ml of ammonia to dryness on a water-bath, add 10 ml of *water R*, 2 ml of a 200 g/l solution of *citric acid R* and 0.1 ml of *thioglycollic acid R*. Make alkaline by adding *ammonia R* and dilute to 20 ml with *water R*. No pink colour develops.

Storage: protected from atmospheric carbon dioxide, at a temperature below 20 °C.

Ammonia, dilute R1. *1004702.*

Content: 100 g/l to 104 g/l of NH_3 (M_r 17.03).

Dilute 41 g of *concentrated ammonia R* to 100 ml with *water R*.

Ammonia, dilute R2. *1004703.*

Content: 33 g/l to 35 g/l of NH_3 (M_r 17.03).

Dilute 14 g of *concentrated ammonia R* to 100 ml with *water R*.

Ammonia, dilute R3. *1004704.*

Content: 1.6 g/l to 1.8 g/l of NH_3 (M_r 17.03).

Dilute 0.7 g of *concentrated ammonia R* to 100 ml with *water R*.

Ammonia, dilute R4. *1004706.*

Content: 8.4 g/l to 8.6 g/l of NH_3 (M_r 17.03).

Dilute 3.5 g of *concentrated ammonia R* to 100 ml with *water R*.

Ammonia, lead-free. *1004705.*

Complies with the requirements prescribed for *dilute ammonia R1* and with the following additional test: to 20 ml of lead-free ammonia, add 1 ml of *lead-free potassium cyanide solution R*, dilute to 50 ml with *water R* and add 0.10 ml of *sodium sulphide solution R*. The solution is not more intensely coloured than a reference solution prepared without sodium sulphide.

Ammonia, concentrated R1. *1004800.*

Content: minimum 32.0 per cent *m/m* of NH_3 (M_r 17.03).

A clear, colourless liquid.

d_{20}^{20}: 0.883 to 0.889.

Assay. Weigh accurately a ground-glass-stoppered flask containing 50.0 ml of *1 M hydrochloric acid*. Introduce 2 ml of the concentrated ammonia and weigh again. Titrate the solution with *1 M sodium hydroxide*, using 0.5 ml of *methyl red mixed solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 17.03 mg of NH_3.

Storage: protected from atmospheric carbon dioxide, at a temperature below 20 °C.

Ammonium acetate. $C_2H_7NO_2$. (M_r 77.1). *1004900.* [631-61-8].

Colourless crystals, very deliquescent, very soluble in water and in alcohol.

Storage: in an airtight container.

Ammonium acetate solution. *1004901.*

Dissolve 150 g of *ammonium acetate R* in *water R*. Add 3 ml of *glacial acetic acid R* and dilute to 1000 ml with *water R*.

Storage: use within 1 week.

Ammonium and cerium nitrate. $(NH_4)_2Ce(NO_3)_6$. (M_r 548.2). *1005000.* [16774-21-3].

An orange-yellow, crystalline powder, or orange transparent crystals, soluble in water.

Ammonium and cerium sulphate. $(NH_4)_4Ce(SO_4)_4,2H_2O$. (M_r 633). *1005100.* [10378-47-9].

Orange-yellow, crystalline powder or crystals, slowly soluble in water.

(1*R*)-(−)-Ammonium 10-camphorsulphonate. $C_{10}H_{19}NO_4S$. (M_r 249.3). *1103200.*

Content: minimum 97.0 per cent of (1*R*)-(−)-ammonium 10-camphorsulphonate.

$[\alpha]_D^{20}$: − 18 ± 2 (50 g/l solution in *water R*).

Ammonium carbamate. $CH_6N_2O_2$. (M_r 78.1). *1168400.* [1111-78-0]. Carbamic acid ammonium salt.

Ammonium carbonate. *1005200.* [506-87-6]. A mixture of varying proportions of ammonium hydrogen carbonate (NH_4HCO_3, M_r 79.1) and ammonium carbamate (NH_2COONH_4, M_r 78.1).

A white or almost white translucent mass, slowly soluble in about 4 parts of water. It is decomposed by boiling water. Ammonium carbonate liberates not less than 30 per cent *m/m* of NH_3 (M_r 17.03).

Assay. Dissolve 2.00 g in 25 ml of *water R*. Slowly add 50.0 ml of *1 M hydrochloric acid*, titrate with *1 M sodium hydroxide*, using 0.1 ml of *methyl orange solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 17.03 mg of NH_3.

Storage: at a temperature below 20 °C.

Ammonium carbonate solution. *1005201.*

A 158 g/l solution.

Ammonium chloride. *1005300.* [12125-02-9].

See *Ammonium chloride (0007)*.

Ammonium chloride solution. *1005301.*

A 107 g/l solution.

Ammonium citrate. $C_6H_{14}N_2O_7$. (M_r 226.2). *1103300.* [3012-65-5]. Diammonium hydrogen citrate.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

pH (*2.2.3*): about 4.3 for a 22.6 g/l solution.

Ammonium dihydrogen phosphate. $(NH_4)H_2PO_4$. (M_r 115.0). *1005400.* [7722-76-1]. Monobasic ammonium phosphate.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water.

pH (*2.2.3*): about 4.2 for a 23 g/l solution.

Ammonium formate. CH_5NO_2. (M_r 63.1). *1112600.* [540-69-2].

Deliquescent crystals or granules, very soluble in water, soluble in alcohol.

mp: 119 °C to 121 °C.

Storage: in an airtight container.

Ammonium hexafluorogermanate (IV). $(NH_4)_2GeF_6$. (M_r 222.7). *1134000.* [16962-47-3].

White or almost white crystals, freely soluble in water.

Ammonium hydrogen carbonate. NH_4HCO_3. (M_r 79.1). *1005500.* [1066-33-7].

Content: minimum 99 per cent of NH_4HCO_3.

Ammonium molybdate. $(NH_4)_6Mo_7O_{24},4H_2O$. (M_r 1236). *1005700.* [12054-85-2].

Colourless or slightly yellow or greenish crystals, soluble in water, practically insoluble in alcohol.

Ammonium molybdate reagent. *1005701.*

Mix, in the given order, 1 volume of a 25 g/l solution of *ammonium molybdate R*, 1 volume of a 100 g/l solution of *ascorbic acid R* and 1 volume of *sulphuric acid R* (294.5 g/l H_2SO_4). Add 2 volumes of *water R*.

Storage: use within 1 day.

Ammonium molybdate reagent R1. *1005706.*

Mix 10 ml of a 60 g/l solution of *disodium arsenate R*, 50 ml of *ammonium molybdate solution R*, 90 ml of *dilute sulphuric acid R* and dilute to 200 ml in *water R*.

Storage: in amber flasks at 37 °C for 24 h.

Ammonium molybdate reagent R2. *1005708.*

Dissolve 50 g of *ammonium molybdate R* in 600 ml of *water R*. To 250 ml of cold *water R* add 150 ml of *sulphuric acid R* and cool. Mix the 2 solutions together.

Storage: use within 1 day.

Ammonium molybdate solution. *1005702.*

A 100 g/l solution.

Ammonium molybdate solution R2. *1005703.*

Dissolve 5.0 g of *ammonium molybdate R* with heating in 30 ml of *water R*. Cool, adjust the pH to 7.0 with *dilute ammonia R2* and dilute to 50 ml with *water R*.

Ammonium molybdate solution R3. *1005704.*

Solution I. Dissolve 5 g of *ammonium molybdate R* in 20 ml of *water R* with heating.

Solution II. Mix 150 ml of *alcohol R* with 150 ml of *water R*. Add with cooling 100 ml of *sulphuric acid R*.

Immediately before use add 80 volumes of solution II to 20 volumes of solution I.

Ammonium molybdate solution R4. *1005705.*

Dissolve 1.0 g of *ammonium molybdate R* in *water R* and dilute to 40 ml with the same solvent. Add 3 ml of *hydrochloric acid R* and 5 ml of *perchloric acid R* and dilute to 100 ml with *acetone R*.

Storage: protected from light; use within 1 month.

Ammonium molybdate solution R5. *1005707.*

Dissolve 1.0 g of *ammonium molybdate R* in 40.0 ml of a 15 per cent *V/V* solution of *sulphuric acid R*. Prepare the solution daily.

Ammonium molybdate solution R6. *1005709.*

Slowly add 10 ml of *sulphuric acid R* to about 40 ml of *water R*. Mix and allow to cool. Dilute to 100 ml with *water R* and mix. Add 2.5 g of *ammonium molybdate R* and 1 g of *cerium sulphate R*, and shake for 15 min to dissolve.

Ammonium nitrate. NH_4NO_3. (M_r 80.0). *1005800.* [6484-52-2].

A white or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, freely soluble in methanol, soluble in alcohol.

Storage: in an airtight container.

Ammonium nitrate R1. *1005801.* [6484-52-2].

Complies with the requirements prescribed for *ammonium nitrate R* and with the following additional requirements.

Acidity. The solution of the substance is faintly acid (*2.2.4*).

Chlorides (*2.4.4*). 0.50 g complies with the limit test for chlorides (100 ppm).

Sulphates (*2.4.13*). 1.0 g complies with the limit test for sulphates (150 ppm).

Sulphated ash (*2.4.14*): maximum 0.05 per cent, determined on 1.0 g.

Ammonium oxalate. $C_2H_8N_2O_4,H_2O$. (M_r 142.1). *1005900.* [6009-70-7].

Colourless crystals, soluble in water.

Ammonium oxalate solution. *1005901.*

A 40 g/l solution.

Ammonium persulphate. $(NH_4)_2S_2O_8$. (M_r 228.2). *1006000.* [7727-54-0].

White or almost white, crystalline powder or granular crystals, freely soluble in water.

Ammonium phosphate. $(NH_4)_2HPO_4$. (M_r 132.1). *1006100.* [7783-28-0]. Diammonium hydrogen phosphate.

White or almost white crystals or granules, hygroscopic, very soluble in water, practically insoluble in alcohol.

pH (*2.2.3*): about 8 for a 200 g/l solution.

Storage: in an airtight container.

Ammonium pyrrolidinedithiocarbamate. $C_5H_{12}N_2S_2$. (M_r 164.3). *1006200.* [5108-96-3]. Ammonium 1-pyrrolidinyl-dithioformate.

A white to pale yellow, crystalline powder, sparingly soluble in water, very slightly soluble in alcohol.

Storage: in a bottle containing a piece of ammonium carbonate in a muslin bag.

Ammonium reineckate. $NH_4[Cr(NCS)_4(NH_3)_2],H_2O$. ($M_r$ 354.4). *1006300.* [13573-16-5]. Ammonium diamine-tetrakis(isothiocyanato)chromate(III) monohydrate.

Red powder or crystals, sparingly soluble in cold water, soluble in hot water and in alcohol.

Ammonium reineckate solution. *1006301.*

A 10 g/l solution. Prepare immediately before use.

Ammonium sulphamate. $NH_2SO_3NH_4$. (M_r 114.1). *1006400.* [7773-06-0].

A white or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, slightly soluble in alcohol.

mp: about 130 °C.

Storage: in an airtight container.

Ammonium sulphate. $(NH_4)_2SO_4$. (M_r 132.1). *1006500.* [7783-20-2].

Colourless crystals or white or almost white granules, very soluble in water, practically insoluble in acetone and in alcohol.

pH (*2.2.3*): 4.5 to 6.0 for a 50 g/l solution in *carbon dioxide-free water R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent.

Ammonium sulphide solution. *1123300.*

Saturate 120 ml of *dilute ammonia R1* with *hydrogen sulphide R* and add 80 ml of *dilute ammonia R1*. Prepare immediately before use.

Ammonium thiocyanate. NH_4SCN. (M_r 76.1). *1006700.* [1762-95-4].

Colourless crystals, deliquescent, very soluble in water, soluble in alcohol.

Storage: in an airtight container.

Ammonium thiocyanate solution. *1006701.*

A 76 g/l solution.

Ammonium vanadate. NH_4VO_3. (M_r 117.0). *1006800.* [7803-55-6]. Ammonium trioxovanadate(V).

A white to slightly yellowish, crystalline powder, slightly soluble in water, soluble in *dilute ammonia R1*.

Ammonium vanadate solution. *1006801.*

Dissolve 1.2 g of *ammonium vanadate R* in 95 ml of *water R* and dilute to 100 ml with *sulphuric acid R*.

Amoxicillin trihydrate. *1103400.*

See *Amoxicillin trihydrate (0260).*

α-Amylase. *1100800.* 1,4-α-D-glucane-glucanohydrolase (EC *3.2.1.1*).

A white to light brown powder.

α-Amylase solution. *1100801.*

A solution of *α-amylase R* with an activity of 800 FAU/g.

β-Amyrin. $C_{30}H_{50}O$. (M_r 426.7). *1141800.* [559-70-6]. Olean-12-en-3β-ol.

White or almost white powder.

mp: 187 °C to 190 °C.

Anethole. $C_{10}H_{12}O$. (M_r 148.2). *1006900.* [4180-23-8]. 1-Methoxy-4-(propen-1-yl)benzene.

A white or almost white, crystalline mass up to 20 °C to 21 °C, liquid above 23 °C, practically insoluble in water, freely soluble in ethanol, soluble in ethyl acetate and in light petroleum.

n_D^{25}: about 1.56.

bp: about 230 °C.

Anethole used in gas chromatography complies with the following test.

Assay. Examine by gas chromatography (*2.2.28*) under the conditions described in the monograph on *Anise oil (0804)* using the substance to be examined as the test solution.

The area of the principal peak, corresponding to *trans*-anethole, with a retention time of about 41 min, is not less than 99.0 per cent of the total area of the peaks.

Aniline. C_6H_7N. (M_r 93.1). *1007100.* [62-53-3]. Benzeneamine.

A colourless or slightly yellowish liquid, soluble in water, miscible with alcohol.

d_{20}^{20}: about 1.02.

bp: 183 °C to 186 °C.

Storage: protected from light.

Aniline hydrochloride. C_6H_8ClN. (M_r 129.6). *1147700.* [142-04-1]. Benzenamine hydrochloride.

Crystals. It darkens on exposure to air and light.

mp: about 198 °C.

Storage: protected from light.

Anion exchange resin. *1007200.*

A resin in chlorinated form containing quaternary ammonium groups [$CH_2N^+(CH_3)_3$] attached to a polymer lattice consisting of polystyrene cross-linked with 2 per cent of divinylbenzene. It is available as spherical beads and the particle size is specified in the monograph.

Wash the resin with *1 M sodium hydroxide* on a sintered-glass filter (40) (*2.1.2*) until the washings are free from chloride, then wash with *water R* until the washings are neutral. Suspend in freshly prepared *ammonium-free water R* and protect from atmospheric carbon dioxide.

Anion exchange resin R1. *1123400.*

A resin containing quaternary ammonium groups [$CH_2N^+(CH_3)_3$] attached to a lattice consisting of methacrylate.

Anion exchange resin R2. *1141900.*

A conjugate of homogeneous 10 µm hydrophilic polyether particles, and a quaternary ammonium salt, providing a matrix suitable for strong anion-exchange chromatography of proteins.

Anion exchange resin for chromatography, strongly basic. *1112700.*

A resin with quaternary amine groups attached to a lattice of latex cross linked with divinylbenzene.

Anion exchange resin, strongly basic. *1026600.*

A gel-type resin in hydroxide form containing quaternary ammonium groups [$CH_2N^+(CH_3)_3$, type 1] attached to a polymer lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene.

Brown transparent beads.

Particle size: 0.2-1.0 mm.

Moisture content: about 50 per cent.

Total exchange capacity: minimum 1.2 meq/ml.

Anion exchange resin, weak. *1146700.*

A resin with diethylaminoethyl groups attached to a lattice consisting of poly(methyl methacrylate).

Anisaldehyde. $C_8H_8O_2$. (M_r 136.1). *1007300.* [123-11-5]. 4-Methoxybenzaldehyde.

An oily liquid, very slightly soluble in water, miscible with alcohol.

bp: about 248 °C.

Anisaldehyde used in gas chromatography complies with the following test.

Assay. Examine by gas chromatography (*2.2.28*) in the conditions described in the monograph on *Anise oil (0804)* the substance to be examined as the test solution.

The area of the principal peak is not less than 99.0 per cent of the total area of the peaks.

Anisaldehyde solution. *1007301.*

Mix in the following order, 0.5 ml of *anisaldehyde R*, 10 ml of *glacial acetic acid R*, 85 ml of *methanol R* and 5 ml of *sulphuric acid R*.

Anisaldehyde solution R1. *1007302.*

To 10 ml of *anisaldehyde R* add 90 ml of *alcohol R*, mix, add 10 ml of *sulphuric acid R* and mix again.

***p*-Anisidine.** C_7H_9NO. (M_r 123.2). *1103500.* [104-94-9]. 4-Methoxyaniline.

White or almost white crystals, sparingly soluble in water, soluble in ethanol.

Content: minimum 97.0 per cent of C_7H_9NO.

Caution: skin irritant, sensitiser.

Storage: protected from light, at 0 °C to 4 °C.

On storage, *p*-anisidine tends to darken as a result of oxidation. A discoloured reagent can be reduced and decolorised in the following way: dissolve 20 g of *p-anisidine R* in 500 ml of *water R* at 75 °C. Add 1 g of *sodium sulphite R* and 10 g of *activated charcoal R* and stir for 5 min. Filter, cool the filtrate to about 0 °C and allow to stand at this temperature for at least 4 h. Filter, wash the crystals with a small quantity of *water R* at about 0 °C and dry the crystals in vacuum over *diphosphorus pentoxide R*.

Anolyte for isoelectric focusing pH 3 to 5. *1112800.*
0.1 M Glutamic acid, 0.5 M phosphoric acid.

Dissolve 14.71 g of *glutamic acid R* in *water R*. Add 33 ml of *phosphoric acid R* and dilute to 1000 ml with *water R*

Anthracene. $C_{14}H_{10}$. (M_r 178.2). *1007400.* [120-12-7].

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in chloroform.

mp: about 218 °C.

Anthrone. $C_{14}H_{10}O$. (M_r 194.2). *1007500.* [90-44-8]. 9(10*H*)-Anthracenone.

A pale yellow, crystalline powder.

mp: about 155 °C.

Antimony potassium tartrate. $C_4H_4KO_7Sb,{}^1/_2H_2O$. (M_r 333.9). *1007600.* Potassium aqua[tartrato(4−)-O^1,O^2,O^3]-antimoniate(III) hemihydrate.

A white or almost white, granular powder or colourless, transparent crystals, soluble in water and in glycerol, freely soluble in boiling water, practically insoluble in alcohol. The aqueous solution is slightly acid.

Antimony trichloride. $SbCl_3$. (M_r 228.1). *1007700.* [10025-91-9].

Colourless crystals or a transparent crystalline mass, hygroscopic, freely soluble in ethanol. Antimony trichloride is hydrolysed by water.

Storage: in an airtight container, protected from moisture.

Antimony trichloride solution. *1007701.*

Rapidly wash 30 g of *antimony trichloride R* with two quantities, each of 15 ml, of *ethanol-free chloroform R*, drain off the washings, and dissolve the washed crystals immediately in 100 ml of *ethanol-free chloroform R*, warming slightly.

Storage: over a few grams of *anhydrous sodium sulphate R*.

Antimony trichloride solution R1. *1007702.*

Solution I. Dissolve 110 g of *antimony trichloride R* in 400 ml of *ethylene chloride R*. Add 2 g of *anhydrous aluminium oxide R*, mix and filter through a sintered-glass filter (40) (*2.1.2*). Dilute to 500.0 ml with *ethylene chloride R* and mix. The absorbance (*2.2.25*) of the solution, determined at 500 nm in a 2 cm cell, is not greater than 0.07.

Solution II. Under a hood, mix 100 ml of freshly distilled *acetyl chloride R* and 400 ml of *ethylene chloride R*.

Mix 90 ml of solution I and 10 ml of solution II.

Storage: in brown ground-glass-stoppered bottle for 7 days. Discard any reagent in which colour develops.

Antithrombin III. *1007800.* [90170-80-2].

Antithrombin III is purified from human plasma by heparin agarose chromatography and should have a specific activity of at least 6 IU/mg.

Antithrombin III solution R1. *1007801.*

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* to 1 IU/ml.

Antithrombin III solution R2. *1007802.*

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* to 0.5 IU/ml.

Antithrombin III solution R3. *1007803.*

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute to 0.3 IU/ml with *phosphate buffer solution pH 6.5 R*.

Antithrombin III solution R4. *1007804.*

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute to 0.1 IU/ml with *tris(hydroxymethyl)aminomethane EDTA buffer solution pH 8.4 R*.

Apigenin. $C_{15}H_{10}O_5$. (M_r 270.2). *1095800.* [520-36-5]. 4′,5,7-Trihydroxyflavone.

Light yellowish powder; practically insoluble in water, sparingly soluble in alcohol.

mp: about 310 °C, with decomposition.

Chromatography. Examine as prescribed in the monograph on *Roman chamomile flower (0380)*, applying 10 µl of a 0.25 g/l solution in *methanol R*. The chromatogram shows in the upper third a principal zone of yellowish-green fluorescence.

Apigenin 7-glucoside. $C_{21}H_{20}O_{10}$. (M_r 432.4). *1095900.* [578-74-5]. Apigetrin. 7-(β-D-Glucopyranosyloxy)-5-hydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one.

Light yellowish powder, practically insoluble in water, sparingly soluble in alcohol.

mp: 198 °C to 201 °C.

Chromatography. Examine as prescribed in the monograph on *Roman chamomile flower (0380)*, applying 10 µl of a 0.25 g/l solution in *methanol R*. The chromatogram shows in the middle third a principal zone of yellowish fluorescence. *Apigenin-7-glucoside used in liquid chromatography complies with the following additional test.*

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Matricaria flower (0404)*.

Test solution. Dissolve 10.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent.

The content of apigenin-7-glucoside is not less than 95.0 per cent, calculated by the normalisation procedure.

Aprotinin. *1007900.* [9087-70-1].

See *Aprotinin (0580)*.

Arabinose. $C_5H_{10}O_5$. (M_r 150.1). *1008000.* [87-72-9]. L-(+)-Arabinose.

A white or almost white, crystalline powder, freely soluble in water.

$[\alpha]_D^{20}$: + 103 to + 105, determined on a 50 g/l solution in *water R* containing about 0.05 per cent of NH_3.

Arachidyl alcohol. $C_{20}H_{42}O$. (M_r 298.5). *1156300.* [629-96-9]. 1-Eicosanol.

mp: about 65 °C.

Content: minimum 96 per cent of $C_{20}H_{42}O$.

Arbutin. $C_{12}H_{16}O_7$. (M_r 272.3). *1008100.* [497-76-7]. Arbutoside. 4-Hydroxyphenyl-β-D-glucopyranoside.

Fine, white or almost white, shiny needles, freely soluble in water, very soluble in hot water, soluble in alcohol.

$[\alpha]_D^{20}$: about – 64, determined on a 20 g/l solution.

mp: about 200 °C.

Chromatography. Examine by thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Bearberry leaf (1054)*; the chromatogram shows only one principal spot.

Arbutin used in the arbutin assay in the monograph Bearberry leaf (1054) complies with the following additional requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph *Bearberry leaf (1054)*.

The content of arbutin is not less than 95 per cent, calculated by the normalisation procedure.

Arginine. *1103600.* [74-79-3].

See *Arginine (0806)*.

Argon. Ar. (A_r 39.95). *1008200.* [7440-37-1].

Content: minimum 99.995 per cent *V/V* of Ar.

Carbon monoxide. When used as described in the test *Carbon monoxide in gases* (*2.5.25, Method I*), after passage of 10 litres of *argon R* at a flow rate of 4 litres per hour, not more than 0.05 ml of *0.002 M sodium thiosulphate* is required for the titration (0.6 ppm *V/V*).

Argon for chromatography. Ar. (A_r 39.95). *1166200.* [7440-37-1].

Content: minimum 99.95 per cent *V/V* of Ar.

Aromadendrene. $C_{15}H_{24}$. (M_r 204.4). *1139100.* [489-39-4]. (1*R*,2*S*,4*R*,8*R*,11*R*)-3,3,11-Trimethyl-7-methylenetricyclo-[6.3.0.0^{2,4}]undecane.

Clear, almost colourless liquid.

d_4^{20}: about 0.911.

n_D^{20}: about 1.497.

$[\alpha]_D^{20}$: about + 12.

bp: : about 263 °C.

Aromadendrene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Tea tree oil (1837).*

The content is not less than 92 per cent, calculated by the normalisation procedure.

Arsenious trioxide. As_2O_3. (M_r 197.8). *1008300.* [1327-53-3]. Arsenious anhydride. Diarsenic trioxide.

A crystalline powder or a white or almost white mass, slightly soluble in water, soluble in boiling water.

Arsenite solution. *1008301.*

Dissolve 0.50 g of *arsenious trioxide R* in 5 ml of *dilute sodium hydroxide solution R*, add 2.0 g of *sodium hydrogen carbonate R* and dilute to 100.0 ml with *water R*.

Ascorbic acid. *1008400.* [50-81-7].

See *Ascorbic acid (0253).*

Ascorbic acid solution. *1008401.*

Dissolve 50 mg in 0.5 ml of *water R* and dilute to 50 ml with *dimethylformamide R*.

Asiaticoside. $C_{48}H_{78}O_{19}$. (M_r 959). *1123500.* [16830-15-2]. *O*-6-Deoxy-α-L-mannopyranosyl-(1→4)-*O*-β-D-glucopyranosyl-(1→6)-β-D-glucopyranosyl 2α,3β,23-trihydroxy-4α-urs-12-en-28-oate.

A white or almost white powder, hygroscopic, soluble in methanol, slightly soluble in ethanol, insoluble in acetonitrile.

mp: about 232 °C, with decomposition.

Water (*2.5.12*): 6.0 per cent.

Storage: protected from humidity.

Asiaticoside used in liquid chromatography complies with the following additional test.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Centella (1498).*

The content is not less than 97.0 per cent calculated by the normalisation procedure.

Aspartic acid. *1134100.* [56-84-8].

See *Aspartic acid (0797).*

L-Aspartyl-L-phenylalanine. $C_{13}H_{16}N_2O_5$. (M_r 280.3). *1008500.* [13433-09-5]. (*S*)-3-Amino-*N*-[(*S*)-1-carboxy-2-phenylethyl]-succinamic acid.

A white or almost white powder.

mp: about 210 °C, with decomposition.

Atropine sulphate. *1159000.* [5908-99-6]. See *Atropine sulphate (0068).*

Aucubin. $C_{15}H_{22}O_9$. (M_r 346.3). *1145200.* [479-98-1]. [1*S*,4a*R*,5*S*,7a*S*)-5-Hydroxy-7-(hydroxymethyl)-1,4a,5,7a-tetrahydrocyclopenta[*c*]pyran-1-yl β-D-glucopyranoside.

Crystals, soluble in water, in alcohol and in methanol, practically insoluble in light petroleum.

$[\alpha]_D^{20}$: about – 163.

mp: about 181 °C.

Azomethine H. $C_{17}H_{12}NNaO_8S_2$. (M_r 445.4). *1008700.* [5941-07-1]. Sodium hydrogeno-4-hydroxy-5-(2-hydroxybenzylideneamino)-2,7-naphthalenedisulphonate.

Azomethine H solution. *1008701.*

Dissolve 0.45 g of *azomethine H R* and 1 g of *ascorbic acid R* with gentle heating in *water R* and dilute to 100 ml with the same solvent.

Barbaloin. $C_{21}H_{22}O_9,H_2O$. (M_r 436.4). *1008800.* [1415-73-2]. Aloin. 1,8-Dihydroxy-3-hydroxymethyl-10-β-D-glucopyranosyl-10*H*-anthracen-9-one.

A yellow to dark-yellow, crystalline powder, or yellow needles, darkening on exposure to air and light, sparingly soluble in water and in alcohol, soluble in acetone, in ammonia and in solutions of alkali hydroxides.

$A_{1\,cm}^{1\%}$: about 192 at 269 nm, about 226 at 296.5 nm, about 259 at 354 nm, determined on a solution in *methanol R* and calculated with reference to the anhydrous substance.

Chromatography. Examine as prescribed in the monograph on *Frangula bark (0025)*; the chromatogram shows only one principal spot.

Barbital. *1008900.* [57-44-3].

See *Barbital (0170).*

Barbital sodium. $C_8H_{11}N_2NaO_3$. (M_r 206.2). *1009000.* [144-02-5].

Content: minimum 98.0 per cent of the sodium derivative of 5,5-diethyl-1*H*,3*H*,5*H*-pyrimidine-2,4,6-trione.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

Barbituric acid. $C_4H_4N_2O_3$. (M_r 128.1). *1009100.* [67-52-7]. 1*H*,3*H*,5*H*-Pyrimidine-2,4,6-trione.

A white or almost white powder, slightly soluble in water, freely soluble in boiling water and in dilute acids.

mp: about 253 °C.

Barium acetate. $C_4H_6BaO_4$. (M_r 255.4). *1162700.* [543-80-6]. Barium diacetate.

White or almost white powder, soluble in water.

d_{20}^{20}: 2.47.

Barium carbonate. $BaCO_3$. (M_r 197.3). *1009200.* [513-77-9].

A white or almost white powder or friable masses, practically insoluble in water.

Barium chloride. $BaCl_2,2H_2O$. (M_r 244.3). *1009300.* [10326-27-9]. Barium dichloride.

Colourless crystals, freely soluble in water, slightly soluble in alcohol.

Barium chloride solution R1. *1009301.*

A 61 g/l solution.

Barium chloride solution R2. *1009302.*

A 36.5 g/l solution.

Barium hydroxide. $Ba(OH)_2,8H_2O$. (M_r 315.5). *1009400.* [12230-71-6]. Barium dihydroxide.

Colourless crystals, soluble in water.

Barium hydroxide solution. *1009401.*

A 47.3 g/l solution.

Barium nitrate. $Ba(NO_3)_2$. (M_r 261.3). *1163800.* [10022-31-8].

Crystals or crystalline powder, freely soluble in water, very slightly soluble in ethanol (96 per cent) and in acetone.

mp: about 590 °C.

Barium sulphate. *1009500.* [7727-43-7].

See *Barium sulphate (0010).*

Benzalacetone. $C_{10}H_{10}O$. (M_r 146.2). *1168500.* [122-57-6]. (3*E*)-4-phenylbut-3-en-2-one.

White or pale yellow mass.

Content: minimum 98.0 per cent.

bp: about 261 °C.

mp: about 39 °C.

Benzaldehyde. C_7H_6O. (M_r 106.1). *1009600.* [100-52-7].

A colourless or slightly yellow liquid, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: about 1.05.

n_D^{20}: about 1.545.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 177 °C and 180 °C.

Storage: protected from light.

Benzene. C_6H_6. (M_r 78.1). *1009800.* [71-43-2].

A clear, colourless, flammable liquid, practically insoluble in water, miscible with alcohol.

bp: about 80 °C.

Benzethonium chloride. $C_{27}H_{42}ClNO_2,H_2O$. (M_r 466.1). *1009900.* [121-54-0]. Benzyldimethyl[2-[2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]ammonium chloride monohydrate.

A fine, white or almost white powder or colourless crystals, soluble in water and in alcohol.

mp: about 163 °C.

Storage: protected from light.

Benzidine. $C_{12}H_{12}N_2$. (M_r 184.2). *1145300.* [92-87-5]. Biphenyl-4,4′-diamine.

Content: minimum 95 per cent of $C_{12}H_{12}N_2$.

White or slightly yellowish or reddish powder, darkening on exposure to air and light.

mp: about 120 °C.

Storage: protected from light.

Benzil. $C_{14}H_{10}O_2$. (M_r 210.2). *1117800.* [134-81-6]. Diphenylethanedione.

A yellow, crystalline powder, practically insoluble in water, soluble in alcohol, ethyl acetate and toluene.

mp: 95 °C.

Benzocaine. $C_9H_{11}NO_2$. (M_r 165.2). *1123600.* [94-09-7].

See *Benzocaine (0011).*

Benzoic acid. *1010100.* [65-85-0].

See *Benzoic acid (0066).*

Benzoin. $C_{14}H_{12}O_2$. (M_r 212.3). *1010200.* [579-44-2]. 2-Hydroxy-1,2-diphenylethanone.

Slightly yellowish crystals, very slightly soluble in water, freely soluble in acetone, soluble in hot alcohol.

mp: about 137 °C.

Benzophenone. $C_{13}H_{10}O$. (M_r 182.2). *1010300.* [119-61-9]. Diphenylmethanone.

Prismatic crystals, practically insoluble in water, freely soluble in alcohol.

mp: about 48 °C.

1,4-Benzoquinone. $C_6H_4O_2$. (M_r 108.1). *1118500.* [106-51-4]. Cyclohexa-2,5-diene-1,4-dione.

Content: minimum 98.0 per cent of $C_6H_4O_2$.

Benzoylarginine ethyl ester hydrochloride. $C_{15}H_{23}ClN_4O_3$. (M_r 342.8). *1010500.* [2645-08-1]. *N*-Benzoyl-L-arginine ethyl ester hydrochloride. Ethyl (*S*)-2-benzamido-5-guanidinovalerate hydrochloride.

A white or almost white, crystalline powder, very soluble in water and in ethanol.

$[\alpha]_D^{20}$: – 15 to – 18, determined on a 10 g/l solution.

mp: about 129 °C.

$A_{1\text{ cm}}^{1\%}$: 310 to 340, determined at 227 nm using a 0.01 g/l solution.

Benzoyl chloride. C_7H_5ClO. (M_r 140.6). *1010400.* [98-88-4].

A colourless, lachrymatory liquid, decomposed by water and by alcohol.

d_{20}^{20}: about 1.21.

bp: about 197 °C.

***N*-Benzoyl-L-prolyl-L-phenylalanyl-L-arginine 4-nitroanilide acetate.** $C_{35}H_{42}N_8O_8$. (M_r 703). *1010600.*

2-Benzoylpyridine. $C_{12}H_9NO$. (M_r 183.2). *1134300.* [91-02-1]. Phenyl(pyridin-2-yl)methanone.

Colourless crystals, soluble in alcohol.

mp: about 43 °C.

Benzyl alcohol. *1010700.* [100-51-6].

See *Benzyl alcohol (0256).*

Benzyl benzoate. *1010800.* [120-51-4].

See *Benzyl benzoate (0705).*

Chromatography. Examine as prescribed in the monograph on *Peru balsam (0754)* applying 20 µl of a 0.3 per cent *V/V* solution in *ethyl acetate R*. After spraying and heating, the chromatogram shows a principal band with an R_F of about 0.8.

Benzyl cinnamate. $C_{16}H_{14}O_2$. (M_r 238.3). *1010900.* [103-41-3]. Benzyl 3-phenylprop-2-enoate.

Colourless or yellowish crystals, practically insoluble in water, soluble in alcohol.

mp: about 39 °C.

Chromatography. Examine as prescribed in the monograph on *Peru balsam (0754)* applying 20 µl of a 3 g/l solution in *ethyl acetate R*. After spraying and heating, the chromatogram shows a principal band with an R_F of about 0.6.

Benzyl ether. $C_{14}H_{14}O$. (M_r 198.3). *1140900.* [103-50-4]. Dibenzyl ether.

Clear, colourless liquid, practically insoluble in water, miscible with acetone and with ethanol.

d_{20}^{20}: about 1.043.

n_D^{20}: about 1.562.

bp: about 296 °C, with decomposition.

Benzylpenicillin sodium. *1011000.* [69-57-8].

See *Benzylpenicillin sodium (0114).*

2-Benzylpyridine. $C_{12}H_{11}N$. (M_r 169.2). *1112900.* [101-82-6]. *Content*: minimum 98.0 per cent of $C_{12}H_{11}N$.

A yellow liquid.

mp: 13 °C to 16 °C.

Benzyltrimethylammonium chloride. $C_{10}H_{16}ClN$. (M_r 185.7). *1155700.* [56-93-9]. *N,N,N*-Trimethylphenylmethanaminium chloride. *N,N,N*-Trimethylbenzenemethanaminium chloride.

White or almost white powder, soluble in water.

mp: about 230 °C, with decomposition.

Berberine chloride. $C_{20}H_{18}ClNO_4,2H_2O$. (M_r 407.8). *1153400.* [5956-60-5]. 9,10-Dimethoxy-5,6-dihydrobenzo[*g*]-1,3-benzodioxolo[5,6-*a*]quinolizinium chloride.

Yellow crystals, slightly soluble in water, practically insoluble in alcohol.

mp: 204 °C to 206 °C.

Berberine chloride used in liquid chromatography complies with the following additional requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Goldenseal rhizome (1831).* The content is not less than 95 per cent, calculated by the normalisation procedure.

Bergapten. $C_{12}H_8O_4$. (M_r 216.2). *1103700.* [484-20-8]. 5-Methoxypsoralen.

Colourless crystals, practically insoluble in water, sparingly soluble in alcohol and slightly soluble in glacial acetic acid.

mp: about 188 °C.

Betulin. $C_{30}H_{50}O_2$. (M_r 442.7). *1011100.* [473-98-3]. Lup-20(39)-ene-3β,28-diol.

A white or almost white, crystalline powder.

mp: 248 °C to 251 °C.

Bibenzyl. $C_{14}H_{14}$. (M_r 182.3). *1011200.* [103-29-7]. 1,2-Diphenylethane.

A white or almost white, crystalline powder, practically insoluble in water, very soluble in methylene chloride, freely soluble in acetone, soluble in alcohol.

mp: 50 °C to 53 °C.

Biphenyl. $C_{12}H_{10}$. (M_r 154.2). *1168600.* [92-52-4].

mp: 68 °C to 70 °C.

Biphenyl-4-ol. $C_{12}H_{10}O$. (M_r 170.2). *1011300.* [90-43-7]. 4-Phenylphenol.

A white or almost white, crystalline powder, practically insoluble in water.

mp: 164 °C to 167 °C.

(–)-α-Bisabolol. $C_{15}H_{26}O$. (M_r 222.4). *1128800.* [23089-26-1]. (2*S*)-6-Methyl-2-[(1*S*)-4-methylcyclohex-3-enyl]hept-5-en-2-ol. Levomenol.

Colourless, viscous liquid with a slight, characteristic odour, practically insoluble in water, freely soluble in ethanol (96 per cent), in methanol, in toluene, in fatty oils and in essential oils.

d_{20}^{20}: 0.925 to 0.935.

n_D^{20}: 1.492 to 1.500.

$[\alpha]_D^{20}$: –54.5 to –58.0, determined on a 50 mg/ml solution in *ethanol (96 per cent) R*.

(–)-α-Bisabolol used for gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph on *Matricaria oil (1836)* using a 4 g/l solution in *cyclohexane R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Bisbenzimide. $C_{25}H_{27}Cl_3N_6O,5H_2O$. ($M_r$ 624). *1103800.* [23491-44-3]. 4-[5-[5-(4-Methylpiperazin-1-yl)benzimidazol-2-yl]benzimidazol-2-yl]phenol trihydrochloride pentahydrate.

Bisbenzimide stock solution. *1103801.*

Dissolve 5 mg of *bisbenzimide R* in *water R* and dilute to 100 ml with the same solvent.

Storage: in the dark.

Bisbenzimide working solution. *1103802.*

Immediately before use, dilute 100 µl of *bisbenzimide stock solution R* to 100 ml with *phosphate-buffered saline pH 7.4 R*.

Bismuth nitrate pentahydrate. $Bi(NO_3)_3,5H_2O$. (M_r 485.1). *1165600.* [10035-06-0].

mp: about 30 °C.

Bismuth subnitrate. $[4BiNO_3(OH)_2,BiO(OH)]$. (M_r 1462). *1011500.* [1304-85-4].

A white or almost white powder, practically insoluble in water.

Bismuth subnitrate R1. *1011501.*

Content: 71.5 per cent to 74.0 per cent of bismuth (Bi), and 14.5 per cent to 16.5 per cent of nitrate, calculated as nitrogen pentoxide (N_2O_5).

Bismuth subnitrate solution. *1011502.*

Dissolve 5 g of *bismuth subnitrate R1* in a mixture of 8.4 ml of *nitric acid R* and 50 ml of *water R* and dilute to 250 ml with *water R*. Filter if necessary.

Acidity. To 10 ml add 0.05 ml of *methyl orange solution R*. 5.0 ml to 6.25 ml of *1 M sodium hydroxide* is required to change the colour of the indicator.

Biuret. $C_2H_5N_3O_2$. (M_r 103.1). *1011600.* [108-19-0].

White or almost white crystals, hygroscopic, soluble in water, sparingly soluble in alcohol.

mp: 188 °C to 190 °C, with decomposition.

Storage: in an airtight container.

Biuret reagent. *1011601.*

Dissolve 1.5 g of *copper sulphate R* and 6.0 g of *sodium potassium tartrate R* in 500 ml of *water R*. Add 300 ml of a carbonate-free 100 g/l solution of *sodium hydroxide R*, dilute to 1000 ml with the same solution and mix.

Blocking solution. *1122400.*

A 10 per cent *V/V* solution of *acetic acid R*.

Blue dextran 2000. *1011700.* [9049-32-5].

Prepared from dextran having an average relative molecular mass of 2×10^6 by introduction of a polycyclic chromophore that colours the substance blue. The degree of substitution is 0.017. It is freeze-dried and dissolves rapidly and completely in water and aqueous saline solutions.

A 1 g/l solution in a *phosphate buffer solution pH 7.0 R* shows an absorption maximum (*2.2.25*) at 280 nm.

Boldine. $C_{19}H_{21}NO_4$. (M_r 327.3). *1118800.* [476-70-0]. 1,10-Dimethoxy-6aα-aporphine-2,9-diol.

A white or almost white crystalline powder, very slightly soluble in water, soluble in ethanol (96 per cent) and in dilute solutions of acids.

$[\alpha]_D^{25}$: about + 127, determined on a 1 g/l solution in *anhydrous ethanol R*.

mp: about 163 °C.

Boric acid. *1011800.* [10043-35-3].

See *Boric acid (0001).*

Boric acid solution, saturated, cold. *1011801.*

To 3 g of *boric acid R* add 50 ml of *water R* and shake for 10 min. Place the solution for 2 h in the refrigerator.

Borneol. $C_{10}H_{18}O$. (M_r 154.3). *1011900.* [507-70-0]. *endo*-1,7,7-Trimethylbicyclo[2.2.1]heptan-2-ol.

Colourless crystals, readily sublimes, practically insoluble in water, freely soluble in alcohol and in light petroleum.

mp: about 208 °C.

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance. Apply to the plate 10 µl of a 1 g/l solution in *toluene R*. Develop over a path of 10 cm using *chloroform R*. Allow the plate to dry in air, spray with *anisaldehyde solution R*, using 10 ml for a plate 200 mm square, and heat at 100 °C to 105 °C for 10 min. The chromatogram obtained shows only one principal spot.

Bornyl acetate. $C_{12}H_{20}O_2$. (M_r 196.3). *1012000.* [5655-61-8]. *endo*-1,7,7-Trimethylbicyclo[2.2.1]hept-2-yl acetate.

Colourless crystals or a colourless liquid, very slightly soluble in water, soluble in alcohol.

mp: about 28 °C.

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance. Apply to the plate 10 µl of a 2 g/l solution in *toluene R*. Develop over a path of 10 cm using *chloroform R*. Allow the plate to dry in air, spray with *anisaldehyde solution R*, using 10 ml for a plate 200 mm square, and heat at 100 °C to 105 °C for 10 min. The chromatogram obtained shows only one principal spot.

Boron trichloride. BCl_3. (M_r 117.2). *1112000.* [10294-34-5].

Colourless gas. Reacts violently with water. Available as solutions in suitable solvents (2-chloroethanol, methylene chloride, hexane, heptane, methanol).

n_D^{20}: about 1.420.

bp: about 12.6 °C.

Caution: toxic, corrosive.

Boron trichloride-methanol solution. *1112001.*

A 120 g/l solution of BCl_3 in *methanol R*.

Storage: protected from light at – 20 °C, preferably in sealed tubes.

Boron trifluoride. BF_3. (M_r 67.8). *1012100.* [7637-07-2].

Colourless gas.

Boron trifluoride-methanol solution. *1012101.*

A 140 g/l solution of *boron trifluoride R* in *methanol R*.

Brilliant blue. *1012200.* [6104-59-2].

See *acid blue 83 R.*

Bromelains. *1012300.* [37189-34-7].

A concentrate of proteolytic enzymes derived from *Ananas comosus* Merr.

A dull-yellow powder.

Activity. 1 g liberates about 1.2 g of amino-nitrogen from a solution of *gelatin R* in 20 min at 45 °C and pH 4.5.

Bromelains solution. *1012301.*

A 10 g/l solution of *bromelains R* in a mixture of 1 volume of *phosphate buffer solution pH 5.5 R* and 9 volumes of a 9 g/l solution of *sodium chloride R*.

Bromine. Br_2. (M_r 159.8). *1012400.* [7726-95-6].

A brownish-red fuming liquid, slightly soluble in water, soluble in alcohol.

d_{20}^{20}: about 3.1.

Bromine solution. *1012401.*

Dissolve 30 g of *bromine R* and 30 g of *potassium bromide R* in *water R* and dilute to 100 ml with the same solvent.

Bromine water. *1012402.*

Shake 3 ml of *bromine R* with 100 ml of *water R* to saturation.

Storage: over an excess of *bromine R*, protected from light.

Bromine water R1. *1012403.*

Shake 0.5 ml of *bromine R* with 100 ml of *water R*.

Storage: protected from light; use within 1 week.

Bromocresol green. $C_{21}H_{14}Br_4O_5S$. (M_r 698). *1012600.* [76-60-8]. 3′,3″,5′,5″-Tetrabromo-*m*-cresol-sulfonphthalein. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2,6-dibromo-3-methylphenol)-*S,S*-dioxide.

A brownish-white powder, slightly soluble in water, soluble in alcohol and in dilute solutions of alkali hydroxides.

Bromocresol green-methyl red solution. *1012602.*

Dissolve 0.15 g of *bromocresol green R* and 0.1 g of *methyl red R* in 180 ml of *ethanol R* and dilute to 200 ml with *water R*.

Bromocresol green solution. *1012601.*

Dissolve 50 mg of *bromocresol green R* in 0.72 ml of *0.1 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.2 ml of the bromocresol green solution add 100 ml of *carbon dioxide-free water R*. The solution is blue. Not more than 0.2 ml of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 3.6 (yellow) to pH 5.2 (blue).

Bromocresol purple. $C_{21}H_{16}Br_2O_5S$. (M_r 540.2). *1012700.* [115-40-2]. 3′,3″-Dibromo-*o*-cresolsulfonphthalein. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2-bromo-6-methylphenol)-*S,S*-dioxide.

A pinkish powder, practically insoluble in water, soluble in alcohol and in dilute solutions of alkali hydroxides.

Bromocresol purple solution. *1012701.*

Dissolve 50 mg of *bromocresol purple R* in 0.92 ml of *0.1 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.2 ml of the bromocresol purple solution add 100 ml of *carbon dioxide-free water R* and 0.05 ml of *0.02 M sodium hydroxide*. The solution is bluish-violet. Not more than 0.2 ml of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 5.2 (yellow) to pH 6.8 (bluish-violet).

5-Bromo-2′-deoxyuridine. $C_9H_{11}BrN_2O_5$. (M_r 307.1). *1012500.* [59-14-3]. 5-Bromo-1-(2-deoxy-β-d-*erythro*-pentofuranosyl)-1*H*,3*H*-pyrimidine-2,4-dione.

mp: about 194 °C.

Chromatography. Examine as prescribed in the monograph on *Idoxuridine (0669)*, applying 5 µl of a 0.25 g/l solution. The chromatogram obtained shows only one principal spot.

Bromomethoxynaphthalene. $C_{11}H_9BrO$. (M_r 237.1). *1159100.* [5111-65-9]. 2-Bromo-6-methoxynaphthalene.

mp: about 109 °C.

Bromophenol blue. $C_{19}H_{10}Br_4O_5S$. (M_r 670). *1012800.* [115-39-9]. 3′,3″,5′,5″-Tetrabromophenolsulfonphthalein. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2,6-dibromophenol) *S,S*-dioxide.

A light orange-yellow powder, very slightly soluble in water, slightly soluble in alcohol, freely soluble in solutions of alkali hydroxides.

Bromophenol blue solution. *1012801.*

Dissolve 0.1 g of *bromophenol blue R* in 1.5 ml of *0.1 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.05 ml of the bromophenol blue solution add 20 ml of *carbon dioxide-free water R* and 0.05 ml of *0.1 M hydrochloric acid*. The solution is yellow. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour to bluish-violet.

Colour change: pH 2.8 (yellow) to pH 4.4 (bluish-violet).

Bromophenol blue solution R1. *1012802.*

Dissolve 50 mg of *bromophenol blue R* with gentle heating in 3.73 ml of *0.02 M sodium hydroxide* and dilute to 100 ml with *water R*.

Bromophenol blue solution R2. *1012803.*

Dissolve with heating 0.2 g of *bromophenol blue R* in 3 ml of *0.1 M sodium hydroxide* and 10 ml of *alcohol R*. After solution is effected, allow to cool and dilute to 100 ml with *alcohol R*.

Bromophos. $C_8H_8BrCl_2O_3PS$. (M_r 366.0). *1123700.* [2104-96-3].

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Bromophos-ethyl. $C_{10}H_{12}BrCl_2O_3PS$. (M_r 394.0). *1123800.* [4824-78-6].

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Bromothymol blue. $C_{27}H_{28}Br_2O_5S$. (M_r 624). *1012900.* [76-59-5]. 3′,3″-Dibromothymolsulfonphthalein. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2-bromo-6-isopropyl-3-methylphenol) *S,S*-dioxide.

A reddish-pink or brownish powder, practically insoluble in water, soluble in alcohol and in dilute solutions of alkali hydroxides.

Bromothymol blue solution R1. *1012901.*

Dissolve 50 mg of *bromothymol blue R* in a mixture of 4 ml of *0.02 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.3 ml of *bromothymol blue solution R1* add 100 ml of *carbon dioxide-free water R*. The solution is yellow. Not more than 0.1 ml of *0.02 M sodium hydroxide* is required to change the colour to blue.

Colour change: pH 5.8 (yellow) to pH 7.4 (blue).

Bromothymol blue solution R2. *1012902.*

A 10 g/l solution in *dimethylformamide R*.

Bromothymol blue solution R3. *1012903.*

Warm 0.1 g of *bromothymol blue R* with 3.2 ml of *0.05 M sodium hydroxide* and 5 ml of *alcohol (90 per cent V/V) R*. After solution is effected, dilute to 250 ml with *alcohol (90 per cent V/V) R*.

BRP indicator solution. *1013000.*

Dissolve 0.1 g of *bromothymol blue R*, 20 mg of *methyl red R* and 0.2 g of *phenolphthalein R* in *alcohol R* and dilute to 100 ml with the same solvent. Filter.

Brucine. $C_{23}H_{26}N_2O_4,2H_2O$. (M_r 430.5). *1013100.* [357-57-3]. 10,11-Dimethoxystrychnine.

Colourless crystals, slightly soluble in water, freely soluble in alcohol.

mp: about 178 °C.

Butanal. C_4H_8O. (M_r 72.1). *1134400.* [123-72-8]. Butyraldehyde.

d_{20}^{20}: 0.806.

n_D^{20}: 1.380.

bp: 75 °C.

Butanol. $C_4H_{10}O$. (M_r 74.1). *1013200.* [71-36-3]. *n*-Butanol. 1-Butanol.

A clear, colourless liquid, miscible with alcohol.

d_{20}^{20}: about 0.81.

bp: 116 °C to 119 °C.

2-Butanol R1. $C_4H_{10}O$. (M_r 74.1). *1013301.* [78-92-2]. *sec*-Butyl alcohol.

Content: minimum 99.0 per cent of $C_4H_{10}O$.

A clear, colourless liquid, soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.81.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 99 °C and 100 °C.

Assay. By gas chromatography as described in the monograph on *Isopropyl alcohol (0970)*.

Butyl acetate. $C_6H_{12}O_2$. (M_r 116.2). *1013400.* [123-86-4].

A clear, colourless liquid, flammable, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.88.

n_D^{20}: about 1.395.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 123 °C and 126 °C.

Butyl acetate R1. *1013401.*

A clear, colourless liquid, flammable, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.883.

n_D^{20}: about 1.395.

Butanol: maximum 0.2 per cent, determined by gas chromatography.

n-Butyl formate: maximum 0.1 per cent, determined by gas chromatography.

n-Butyl propionate: maximum 0.1 per cent, determined by gas chromatography.

Water: maximum 0.1 per cent.

Assay: minimum 99.5 per cent of $C_6H_{12}O_2$, determined by gas chromatography.

Butylamine. $C_4H_{11}N$. (M_r 73.1). *1013600.* [109-73-9]. 1-Butanamine.

Distil and use within one month.

A colourless liquid, miscible with water, with alcohol.

n_D^{20}: about 1.401.

bp: about 78 °C.

***tert*-Butylamine.** *1100900.* [75-64-9].

See *1,1-dimethylethylamine R*.

Butylated hydroxytoluene. *1013800.* [128-37-0].

See *Butylhydroxytoluene R*.

Butylboronic acid. $C_4H_{11}BO_2$. (M_r 101.9). *1013700.* [4426-47-5].

Content: minimum 98 per cent of $C_4H_{11}BO_2$.

mp: 90 °C to 92 °C.

***tert*-Butylhydroperoxide.** $C_4H_{10}O_2$. (M_r 90.1). *1118000.* [75-91-2]. 1,1-Dimethylethylhydroperoxide.

Flammable liquid, soluble in organic solvents.

d_{20}^{20}: 0.898.

n_D^{20}: 1.401.

bp: 35 °C.

Butyl 4-hydroxybenzoate. *1103900.* [94-26-8].

See *Butyl parahydroxybenzoate R*.

Butylhydroxytoluene. *1013800.* [128-37-0].

See *Butylhydroxytoluene (0581)*.

Butyl methacrylate. $C_8H_{14}O_2$. (M_r 142.2). *1145400.* [97-88-1]. Butyl 2-methylpropenoate.

Clear, colourless solution.

d_4^{20}: about 0.894.

n_D^{20}: about 1.424.

bp: about 163 °C.

***tert*-Butyl methyl ether.** *1013900.* [1634-04-4].

See *1,1-dimethylethyl methyl ether R*.

Butyl parahydroxybenzoate. *1103900.* [94-26-8].

See *Butyl parahydroxybenzoate (0881)*.

Butyric acid. $C_4H_8O_2$. (M_r 88.1). *1014000.* [107-92-6]. Butanoic acid.

Content: minimum 99.0 per cent of $C_4H_8O_2$.

An oily liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.96.

n_D^{20}: about 1.398.

bp: about 163 °C.

Butyrolactone. $C_4H_6O_2$. (M_r 86.1). *1104000.* [96-48-0]. Dihydro-2(3*H*)-furanone. γ-Butyrolactone.

Oily liquid, miscible with water, soluble in methanol.

n_D^{25}: about 1.435.

bp: about 204 °C.

Cadmium. Cd. (A_r 112.4). *1014100.* [10108-64-2].

A silvery-white, lustrous metal, practically insoluble in water, freely soluble in nitric acid and in hot hydrochloric acid.

Caesium chloride. CsCl. (M_r 168.4). *1014200.* [7647-17-8].

A white or almost white powder, very soluble in water, freely soluble in methanol, practically insoluble in acetone.

Caffeic acid. $C_9H_8O_4$. (M_r 180.2). *1014300.* [331-39-5]. (*E*)-3-(3,4-Dihydroxyphenyl)propenoic acid.

White or almost white crystals or plates, freely soluble in hot water and in alcohol, sparingly soluble in cold water.

mp: about 225 °C, with decomposition.

A freshly prepared solution at pH 7.6 shows 2 absorption maxima (*2.2.25*), at 293 nm and 329 nm.

Caffeine. *1014400.* [58-08-2].

See *Caffeine (0267)*.

Calcium carbonate. *1014500.* [471-34-1].

See *Calcium carbonate (0014)*.

Calcium carbonate R1. *1014501.*

It complies with the requirements of *calcium carbonate R* and with the following additional requirement:

Chlorides (*2.4.4*): maximum 50 ppm.

Calcium chloride. *1014600.* [10035-04-8].

See *Calcium chloride (0015)*.

Calcium chloride solution. *1014601.*

A 73.5 g/l solution.

Calcium chloride solution 0.01 M. *1014602.*

Dissolve 0.147 g of *calcium chloride R* in *water R* and dilute to 100.0 ml with the same solvent.

Calcium chloride solution 0.02 M. *1014603.*

Dissolve 2.94 g of *calcium chloride R* in 900 ml of *water R*, adjust to pH 6.0 to 6.2 and dilute to 1000.0 ml with *water R*.

Storage: at 2 °C to 8 °C.

Calcium chloride R1. $CaCl_2,4H_2O$. (M_r 183.1). *1014700.* Calcium chloride tetrahydrate.

Content: maximum 0.05 ppm of Fe.

Calcium chloride, anhydrous. $CaCl_2$. (M_r 111.0). *1014800.* [10043-52-4].

Content: minimum 98.0 per cent of $CaCl_2$, calculated with reference to the dried substance.

White or almost white granules, deliquescent, very soluble in water, freely soluble in alcohol and in methanol.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined by drying in an oven at 200 °C.

Storage: in an airtight container, protected from moisture.

Calcium hydroxide. $Ca(OH)_2$. (M_r 74.1). *1015000.* [1305-62-0]. Calcium dihydroxide.

A white or almost white powder, almost completely soluble in 600 parts of water.

Calcium hydroxide solution. *1015001.*

A freshly prepared saturated solution.

Calcium lactate. *1015100.* [41372-22-9].

See *Calcium lactate pentahydrate (0468)*.

Calcium phosphate monobasic monohydrate. $CaH_4O_8P_2,H_2O$. (M_r 252.1). *1157200.* [10031-30-8]. Calcium tetrahydrogen bisphosphate monohydrate. Phosphoric acid calcium salt (2:1) monohydrate.

White or almost white, crystalline powder, soluble in water.

Calcium sulphate. $CaSO_4,{}^1/_2H_2O$. (M_r 145.1). *1015200.* [10034-76-1]. Calcium sulphate hemihydrate.

A white or almost white powder, soluble in about 1500 parts of water, practically insoluble in alcohol. When mixed with half its mass of water it rapidly solidifies to a hard and porous mass.

Calcium sulphate solution. *1015201.*

Shake 5 g of *calcium sulphate R* with 100 ml of *water R* for 1 h and filter.

Calconecarboxylic acid. $C_{21}H_{14}N_2O_7S,3H_2O$. ($M_r$ 492.5). *1015300.* [3737-95-9]. 2-Hydroxy-1-(2-hydroxy-4-sulpho-1-naphthylazo)naphthalene-3-carboxylic acid.

A brownish-black powder, slightly soluble in water, very slightly soluble in acetone and in alcohol, sparingly soluble in dilute solutions of sodium hydroxide.

Calconecarboxylic acid triturate. *1015301.*

Mix 1 part of *calconecarboxylic acid R* with 99 parts of *sodium chloride R.*

Test for sensitivity. Dissolve 50 mg of calconecarboxylic acid triturate in a mixture of 2 ml of *strong sodium hydroxide solution R* and 100 ml of *water R*. The solution is blue but becomes violet on addition of 1 ml of a 10 g/l solution of *magnesium sulphate R* and 0.1 ml of a 1.5 g/l solution of *calcium chloride R* and turns pure blue on addition of 0.15 ml of *0.01 M sodium edetate.*

Camphene. $C_{10}H_{16}$. (M_r 136.2). *1139200.* [79-92-5]. 2,2-Dimethyl-3-methylenebicyclo[2.2.1]heptane.

Camphene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Rosemary Oil (1846).*

The content is not less than 90 per cent calculated by the normalisation procedure.

Camphor. *1113000.* [76-22-2]. See *Camphor, racemic (0655).*

Camphor used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Lavender oil (1338).*

Test solution. A 10 g/l solution of the substance to be examined in *hexane R.*

The area of the principal peak is not less than 95.0 per cent of the area of all the peaks in the chromatogram obtained. Disregard the peak due to hexane.

(1*S*)-(+)-10-Camphorsulphonic acid. $C_{10}H_{16}O_4S$. (M_r 232.3). *1104100.* [3144-16-9]. (1*S*,4*R*)-(+)-2-Oxo-10-bornenesulphonic acid. [(1*S*)-7,7-Dimethyl-2-oxobicyclo[2.2.1]heptan-1-yl]methanesulphonic acid. Reychler's acid.

Prismatic crystals, hygroscopic, soluble in water.

Content: minimum 99.0 per cent of (1*S*)-(+)-10-camphorsulphonic acid.

$[\alpha]_D^{20}$: +20 ± 1 (43 g/l solution in *water R*).

mp: about 194 °C, with decomposition.

ΔA (*2.2.41*): 10.2 × 10^3 determined at 290.5 nm on a 1.0 g/l solution.

Capric acid. $C_{10}H_{20}O_2$. (M_r 172.3). *1142000.* [334-48-5]. Decanoic acid.

Crystalline solid, very slightly soluble in water, soluble in ethanol.

bp: about 270 °C.

mp: about 31.4 °C.

Capric acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of capric acid is not less than 98 per cent, calculated by the normalisation procedure.

Capric alcohol. *1024700.*

See *Decanol R.*

Caproic acid. $C_6H_{12}O_2$. (M_r 116.2). *1142100.* [142-62-1]. Hexanoic acid.

Oily liquid, sparingly soluble in water.

d_4^{20}: about 0.926.

n_D^{20}: about 1.417.

bp: about 205 °C.

Caproic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of caproic acid is not less than 98 per cent, calculated by the normalisation procedure.

ε-Caprolactam. $C_6H_{11}NO$. (M_r 113.2). *1104200.* [105-60-2]. Hexane-6-lactam.

Hygroscopic flakes, freely soluble in water, in ethanol and in methanol.

mp: about 70 °C.

Caprylic acid. $C_8H_{16}O_2$. (M_r 144.2). *1142200.* [124-07-2]. Octanoic acid.

Slightly yellow, oily liquid.

d_4^{20}: about 0.910.

n_D^{20}: about 1.428.

bp: about 239.7 °C.

mp: about 16.7 °C.

Caprylic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of caprylic acid is not less than 98 per cent, calculated by the normalisation procedure.

Capsaicin. $C_{18}H_{27}NO_3$. (M_r 305.4). *1147900.* [404-86-4]. (*E*)-*N*-[(4-Hydroxy-3-methoxyphenyl)methyl]-8-methylnon-6-enamide.

White or almost white, crystalline powder, practically insoluble in water, freely soluble in ethanol.

mp: about 65 °C.

Capsaicin used in the assay in Capsicum (1859) complies with the following additional requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Capsicum (1859).* The content of capsaicin is not less than 95.0 per cent, calculated by the normalisation procedure.

Carbazole. $C_{12}H_9N$. (M_r 167.2). *1015400.* [86-74-8]. Dibenzopyrrole.

Crystals, practically insoluble in water, freely soluble in acetone, slightly soluble in ethanol.

mp: about 245 °C.

Carbomer. *1015500.* [9007-20-9].

A cross-linked polymer of acrylic acid; it contains a large proportion (56 per cent to 68 per cent) of carboxylic acid (CO_2H) groups after drying at 80 °C for 1 h. Average relative molecular mass about 3×10^6.

pH (*2.2.3*): about 3 for a 10 g/l suspension.

Carbon dioxide. *1015600.* [124-38-9].

See *Carbon dioxide (0375).*

Carbon dioxide R1. CO_2. (M_r 44.01). *1015700.*

Content: minimum 99.995 per cent *V/V* of CO_2.

Carbon monoxide: less than 5 ppm.

Oxygen: less than 25 ppm.

Nitric oxide: less than 1 ppm.

Carbon dioxide R2. CO_2. (M_r 44.01). *1134500.*

Content: minimum 99 per cent *V/V* of CO_2.

Carbon disulphide. CS_2. (M_r 76.1). *1015800.* [75-15-0].

A colourless or yellowish, flammable liquid, practically insoluble in water, miscible with ethanol.

d_{20}^{20}: about 1.26.

bp: 46 °C to 47 °C.

Carbon for chromatography, graphitised. *1015900.*

Carbon chains having a length greater than C_9 with a particle size of 400 µm to 850 µm.

Relative density: 0.72.

Surface area: 10 m^2/g.

Do not use at a temperature higher than 400 °C.

Carbon for chromatography, graphitised R1. *1153500.*

Porous spherical carbon particles comprised of flat sheets of hexagonally arranged carbon atoms.

Particle size: 5-7 µm.

Pore volume: 0.7 cm^3/g.

Carbon monoxide. CO. (M_r 28.01). *1016000.* [630-08-0].

Content: minimum 99.97 per cent *V/V* of CO.

Carbon monoxide R1. CO. (M_r 28.01). *1134600.* [630-08-0].

Content: minimum 99 per cent *V/V* of CO.

Carbon tetrachloride. CCl_4. (M_r 153.8). *1016100.* [56-23-5]. Tetrachloromethane.

A clear, colourless liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: 1.595 to 1.598.

bp: 76 °C to 77 °C.

Carbophenothion. $C_{11}H_{16}ClO_2PS_3$. (M_r 342.9). *1016200.* [786-19-6]. *O,O*-Diethyl *S*-[[(4-chlorophenyl)thio]methyl]-phosphorodithioate.

Yellowish liquid, practically insoluble in water, miscible with organic solvents.

d_4^{25}: about 1.27.

For the monograph *Wool Fat (0134),* a suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Car-3-ene. $C_{10}H_{16}$. (M_r 136.2). *1124000.* [498-15-7]. 3,7,7-Trimethylbicyclo[4.1.0]hept-3-ene. 4,7,7-Trimethyl-3-norcarene.

A liquid with a pungent odour, slightly soluble in water, soluble in organic solvents.

d_{20}^{20}: about 0.864.

n_D^{20}: 1.473 to 1.474.

$[\alpha]_D^{20}$: + 15 to + 17.

bp: 170 °C to 172 °C.

Car-3-ene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Nutmeg oil (1552).*

The content is not less than 95.0 per cent, calculated by the normalisation procedure.

Carminic acid. $C_{22}H_{20}O_{13}$. (M_r 492.4). *1156700.* [1260-17-9]. 7-α-D-Glucopyranosyl-3,5,6,8-tetrahydroxy-1-methyl-9,10-dioxo-9,10-dihydroanthracene-2-carboxylic acid.

Dark red powder, very slightly soluble in water, soluble in dimethyl sulphoxide, very slightly soluble in ethanol (96 per cent).

Carob bean gum. *1104500.*

The ground endosperm of the fruit kernels of *Ceratonia siliqua* L. Taub.

A white or almost white powder containing 70 per cent to 80 per cent of a water-soluble gum consisting mainly of galactomannoglycone.

Carvacrol. $C_{10}H_{14}O$. (M_r 150.2). *1016400.* [499-75-2]. 5-Isopropyl-2-methylphenol.

Brownish liquid, practically insoluble in water, very soluble in alcohol.

d_{20}^{20}: about 0.975.

n_D^{20}: about 1.523.

bp: about 237 °C.

Carvacrol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405).*

Test solution. Dissolve 0.1 g in about 10 ml of *acetone R.*

The area of the principal peak is not less than 95.0 per cent of the area of all the peaks in the chromatogram obtained. Disregard the peak due to acetone.

Carveol. $C_{10}H_{16}O$. (M_r 152.2). *1160400.* [99-48-9]. *p*-Mentha-1(6),8-dien-2-ol. 2-Methyl-5-(1-methylethenyl)cyclohex-2-enol.

The substance contains a variable content of *trans*- and *cis*-carveol.

Carveol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chromatographic profile in the monograph on *Caraway oil (1817).*

Content: minimum 97 per cent, calculated by the normalisation procedure.

Carvone. $C_{10}H_{14}O$. (M_r 150.2). *1016500.* [2244-16-8]. (+)-*p*-Mentha-6,8-dien-2-one. (5*S*)-2-Methyl-5-(1-methylethenyl)-cyclohex-2-enone.

A liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.965

n_D^{20}: about 1.500.

$[\alpha]_D^{20}$: about + 61.

bp: about 230 °C.

Carvone used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Carvone R1. *1016501.* [2244-16-8].

Complies with the requirements described for *carvone R* with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chiral purity in the monograph on *Caraway oil (1817).*

Content: minimum 98 per cent.

(–)-Carvone. $C_{10}H_{14}O$. (M_r 150.2). *1160500.* [6485-40-1]. (−)-*p*-Mentha-1(6),8-dien-2-one. (5*R*)-2-Methyl-5-(1-methylethenyl)cyclohex-2-enone.

Liquid.

d_{20}^{20}: about 0.965.

n_D^{20}: about 1.4988.

$[\alpha]_D^{20}$: about – 62.

bp: about 230 °C.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chiral purity in the monograph on *Caraway oil (1817).*

Content: minimum 99 per cent.

β-Caryophyllene. $C_{15}H_{24}$. (M_r 204.4). *1101000.* [87-44-5]. (*E*)-(1*R*,9*S*)-4,11,11-Trimethyl-8-methylenebicyclo[7.2.0]undec-4-ene.

An oily liquid, practically insoluble in water, miscible with alcohol.

β-Caryophyllene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Clove oil (1091)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 90.0 per cent of the total area of the peaks.

Caryophyllene oxide. $C_{15}H_{24}O$. (M_r 220.4). *1149000.* [1139-30-6]. (-)-β-Caryophyllene epoxide. (1*R*,4*R*,6*R*,10*S*)-4,12,12-Trimethyl-9-methylene-5-oxatricyclo[8.2.0.$0^{4,6}$]dodecane.

Colourless, fine crystals with lumps.

mp: 62 °C to 63 °C.

Caryophyllene oxide used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Turpentine oil, Pinus pinaster type (1627).*

The content is not less than 99.0 per cent, calculated by the normalisation procedure.

Casein. *1016600.* [9000-71-9].

A mixture of related phosphoproteins obtained from milk.

White or almost white, amorphous powder or granules, very slightly soluble in water and in non-polar organic solvents. It dissolves in concentrated hydrochloric acid giving a pale-violet solution. It forms salts with acids and bases. Its isoelectric point is at about pH 4.7. Alkaline solutions are laevorotatory.

Casticin. $C_{19}H_{18}O_8$. (M_r 374.3). *1162200.* [479-91-4]. 5-Hydroxy-2-(3-hydroxy-4-methoxyphenyl)-3,6,7-trimethoxy-4*H*-1-benzopyran-4-one.

Yellow crystals.

Catalpol. $C_{15}H_{22}O_{10}$. (M_r 362.3). *1142300.* [2415-24-9]. (1a*S*,1b*S*,2*S*,5a*R*,6*S*,6a*S*)-6-Hydroxy-1a-(hydroxymethyl)-1a,1b,2,5a,6,6a-hexahydrooxireno[4,5]cyclopenta[1,2-*c*]pyran-2-yl β-D-glucopyranoside.

mp: 203 °C to 205 °C.

Catechin. $C_{15}H_{14}O_6,xH_2O$. (M_r 290.3 for the anhydrous substance). *1119000.* [154-23-4]. (+)-(2*R*,3*S*)-2-(3,4-Dihydroxyphenyl)-3,4-dihydro-2*H*-chromene-3,5,7-triol. Catechol. Cianidanol. Cyanidol.

Catholyte for isoelectric focusing pH 3 to 5. *1113100.*
0.1 M β-Alanine.

Dissolve 8.9 g of *β-alanine R* in *water R* and dilute to 1000 ml with the same solvent.

Cation exchange resin. *1016700.*

A resin in protonated form with sulphonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene. It is available as beads and the particle size is specified after the name of the reagent in the tests where it is used.

Cation exchange resin R1. *1121900.*

A resin in protonated form with sulphonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with 4 per cent of divinylbenzene. It is available as beads and the particle size is specified after the name of the reagent in the tests where it is used.

Cation-exchange resin, strong. *1156800.*

A strong cation-exchange resin in protonated form with sulphonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with divinylbenzene. The particle size is specified after the name of the reagent in the tests where it is used.

Cation exchange resin (calcium form), strong. *1104600.*

A resin in calcium form with sulphonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene. The particle size is specified after the name of the reagent in the tests where it is used.

Cellulose for chromatography. *1016800.* [9004-34-6].

A fine, white or almost white, homogeneous powder with an average particle size less than 30 µm.

Preparation of a thin layer. Suspend 15 g in 100 ml of *water R* and homogenise in an electric mixer for 60 s. Coat carefully cleaned plates with a layer 0.1 mm thick using a spreading device. Allow to dry in air.

Cellulose for chromatography R1. *1016900.*

Microcrystalline cellulose. A fine, white or almost white homogeneous powder with an average particle size less than 30 µm.

Preparation of a thin layer. Suspend 25 g in 90 ml of *water R* and homogenise in an electric mixer for 60 s. Coat carefully cleaned plates with a layer 0.1 mm thick using a spreading device. Allow to dry in air.

Cellulose for chromatography F_{254}. *1017000.*

Microcrystalline cellulose F_{254}. A fine, white or almost white, homogeneous powder with an average particle size less than 30 µm, containing a fluorescent indicator having an optimal intensity at 254 nm.

Preparation of a thin layer. Suspend 25 g in 100 ml of *water R* and homogenise using an electric mixer for 60 s. Coat carefully cleaned plates with a layer 0.1 mm thick using a spreading device. Allow to dry in air.

Cerium sulphate. $Ce(SO_4)_2,4H_2O$. (M_r 404.3). *1017300.* [123333-60-8]. Cerium(IV) sulphate. Ceric sulphate.

Yellow or orange-yellow, crystalline powder or crystals, very slightly soluble in water, slowly soluble in dilute acids.

Cerous nitrate. $Ce(NO_3)_3,6H_2O$. (M_r 434.3). *1017400.* [10294-41-4]. Cerium trinitrate hexahydrate.

A colourless or pale yellow, crystalline powder, freely soluble in water and in alcohol.

Cetostearyl alcohol. *1017500.* [67762-27-0].

See *Cetostearyl alcohol (0702).*

Cetrimide. *1017600.* [8044-71-1].

See *Cetrimide (0378).*

Cetyl alcohol. $C_{16}H_{34}O$. (M_r 242.4). *1160600.* [36653-82-4]. Hexadecan-1-ol.

Content: minimum 95.0 per cent of $C_{16}H_{34}O$.

mp: about 48 °C.

Cetylpyridinium chloride monohydrate. $C_{21}H_{38}ClN,H_2O$. (M_r 358.0). *1162800.* [6004-24-6]. 1-Hexadecylpyridinium chloride monohydrate.

White or almost white powder, freely soluble in water and in ethanol (96 per cent).

mp: 80 °C to 83 °C.

Cetyltrimethylammonium bromide. $C_{19}H_{42}BrN$. (M_r 364.5). *1017700.* [57-09-0]. Cetrimonium bromide. *N*-Hexadecyl-*N,N,N*-trimethylammonium bromide.

A white or almost white, crystalline powder, soluble in water, freely soluble in alcohol.

mp: about 240 °C.

Chamazulene. $C_{14}H_{16}$. (M_r 184.3). *1148000.* [529-05-5]. 7-Ethyl-1,4-dimethylazulene.

A blue liquid, very slightly soluble in water, soluble in alcohol, miscible with fatty oils, with essential oils and with liquid paraffin, soluble with discolouration in phosphoric acid (85 per cent *m/m*) and sulphuric acid (50 per cent *V/V*).

Appearance of solution. 50 mg is soluble in 2.5 ml of *hexane R*. The blue solution is clear in a thin-layer obtained by tilting the test-tube.

Chamazulene used for gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Matricaria oil (1836)*, using a 4 g/l solution in *cyclohexane R*.

The content of chamazulene is not less than 95.0 per cent, calculated by the normalisation procedure.

Charcoal, activated. *1017800.* [64365-11-3].

See *Activated charcoal (0313).*

Chloral hydrate. *1017900.* [302-17-0].

See *Choral hydrate (0265).*

Chloral hydrate solution. *1017901.*

A solution of 80 g in 20 ml of *water R*.

Chloramine. *1018000.* [7080-50-4].

See *Tosylchloramide sodium (0381).*

Chloramine solution. *1018001.*

A 20 g/l solution. Prepare immediately before use.

Chloramine solution R1. *1018002.*

A 0.1 g/l solution of *chloramine R*. Prepare immediately before use.

Chloramine solution R2. *1018003.*

A 0.2 g/l solution. Prepare immediately before use.

Chlordane. $C_{10}H_6Cl_8$. (M_r 409.8). *1124100.* [12789-03-6].

bp: about 175 °C.

mp: about 106 °C.

A suitable certified reference solution of technical grade (10 ng/µl in iso-octane) may be used.

Chlordiazepoxide. *1113200.* [58-25-3].

See *Chlordiazepoxide (0656).*

Chlorfenvinphos. $C_{12}H_{14}Cl_3O_4P$. (M_r 359.6). *1124200.* [470-90-6].

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Chloroacetanilide. C_8H_8ClNO. (M_r 169.6). *1018100.* [539-03-7]. 4′-Chloroacetanilide.

Content: minimum 95 per cent of C_8H_8ClNO.

A crystalline powder, practically insoluble in water, soluble in alcohol.

mp: about 178 °C.

Chloroacetic acid. $C_2H_3ClO_2$. (M_r 94.5). *1018200.* [79-11-8].

Colourless or white or almost white crystals, deliquescent, very soluble in water, soluble in alcohol.

Storage: in an airtight container.

Chloroaniline. C_6H_6ClN. (M_r 127.6). *1018300.* [106-47-8]. 4-Chloroaniline.

Crystals, soluble in hot water, freely soluble in alcohol.

mp: about 71 °C.

4-Chlorobenzenesulphonamide. $C_6H_6ClNO_2S$. (M_r 191.6). *1097400.* [98-64-6].

White or almost white powder.

mp: about 145 °C.

2-Chlorobenzoic acid. $C_7H_5ClO_2$. (M_r 156.6). *1139300.* [118-91-2].

Soluble in water, slightly soluble in ethanol.

bp: about 285 °C.

mp: about 140 °C.

Chlorobutanol. *1018400.* [57-15-8].

See *Anhydrous chlorobutanol (0382).*

2-Chloro-2-deoxy-D-glucose. $C_6H_{11}ClO_5$. (M_r 198.6). *1134700.* [14685-79-1].

A white or almost white crystalline, very hygroscopic powder, soluble in water and in dimethyl sulphoxide, practically insoluble in alcohol.

2-Chloroethanol. C_2H_5ClO. (M_r 80.5). *1097500.* [107-07-3].

Colourless liquid, soluble in alcohol.

d_{20}^{20}: about 1.197.

n_D^{20}: about 1.442.

bp: about 130 °C.

mp: about – 89 °C.

2-Chloroethanol solution. *1097501.*

Dissolve 125 mg of *2-chloroethanol R* in *2-propanol R* and dilute to 50 ml with the same solvent. Dilute 5 ml of the solution to 50 ml with *2-propanol R*.

Chloroethylamine hydrochloride. $C_2H_7Cl_2N$. (M_r 116.0). *1124300.* [870-24-6]. 2-Chloroethanamine hydrochloride.

mp: about 145 °C.

(2-Chloroethyl)diethylamine hydrochloride. $C_6H_{15}Cl_2N$. (M_r 172.1). *1018500.* [869-24-9].

A white or almost white, crystalline powder, very soluble in water and in methanol, freely soluble in methylene chloride, practically insoluble in hexane.

mp: about 211 °C.

Chloroform. $CHCl_3$. (M_r 119.4). *1018600.* [67-66-3]. Trichloromethane.

A clear, colourless liquid, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: 1.475 to 1.481.

bp: about 60 °C.

Chloroform contains 0.4 per cent *m/m* to 1.0 per cent *m/m* of ethanol.

Ethanol. Introduce 1.00 g (*m* g) into a ground-glass-stoppered flask. Add 15.0 ml of *nitrochromic reagent R*, close the flask, shake vigorously for 2 min and allow to stand for 15 min. Add 100 ml of *water R* and 5 ml of a 200 g/l solution of *potassium iodide R*. After 2 min titrate with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator, until a light green colour is obtained (n_1 ml of *0.1 M sodium thiosulphate*). Carry out a blank assay (n_2 ml of *0.1 M sodium thiosulphate*). Calculate the percentage of ethanol using the expression:

$$\frac{(n_2 - n_1)\,0.115}{m}$$

Chloroform, acidified. *1018601.*

To 100 ml of *chloroform R* add 10 ml of *hydrochloric acid R*. Shake, allow to stand and separate the 2 layers.

Chloroform, ethanol-free. *1018602.*

Shake 200 ml of *chloroform R* with four quantities, each of 100 ml, of *water R*. Dry over 20 g of *anhydrous sodium sulphate R* for 24 h. Distil the filtrate over 10 g of *anhydrous sodium sulphate R*. Discard the first 20 ml of distillate. Prepare immediately before use.

Chloroform stabilised with amylene. $CHCl_3$. (M_r 119.4). *1018700.*

A clear, colourless liquid, slightly soluble in water, miscible with alcohol.

Water: maximum 0.05 per cent.

Residue on evaporation: maximum 0.001 per cent.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 50 per cent at 255 nm, 80 per cent at 260 nm, 98 per cent at 300 nm.

Assay: minimum 99.8 per cent of $CHCl_3$, determined by gas chromatography.

Chlorogenic acid. $C_{16}H_{18}O_9$. (M_r 354.3). *1104700.* [327-97-9]. (1*S*,3*R*,4*R*,5*R*)-3-[(3,4-Dihydroxycinnamoyl)oxy]-1,4,5-trihydroxycyclohexanecarboxylic acid.

White or almost white, crystalline powder or needles, freely soluble in boiling water, in acetone and in ethanol (96 per cent).

$[\alpha]_D^{26}$: about – 35.2.

mp: about 208 °C.

Chromatography. Examined under the conditions described on Identification A in the monograph on *Belladonna leaf dry extract, standardised (1294)*, the chromatogram shows only one principal zone.

Chlorogenic acid used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph on *Artichoke Leaf (1866)*.

Content: minimum 97.0 per cent.

3-Chloro-2-methylaniline. C_7H_8ClN. (M_r 141.6). *1139400.* [87-60-5]. 6-Chloro-2-toluidine.

Not miscible with water, slightly soluble in ethanol.

d_{20}^{20}: : about 1.171.

n_D^{20}: : about 1.587.

bp: about 115 °C.

mp: about 2 °C.

2-Chloro-*N*-(2,6-dimethylphenyl)acetamide. $C_{10}H_{12}ClNO$. (M_r 197.7). *1168700.* [1131-01-7].

2-Chloronicotinic acid. $C_6H_4ClNO_2$. (M_r 157.6). *1157300.* [2942-59-8]. 2-Chloropyridine-3-carboxylic acid.

White or almost white powder.

mp: about 177 °C.

Content: minimum 95 per cent.

2-Chloro-4-nitroaniline. $C_6H_5ClN_2O_2$. (M_r 172.6). *1018800.* [121-87-9].

A yellow, crystalline powder, freely soluble in methanol.

mp: about 107 °C.

Storage: protected from light.

Chlorophenol. C_6H_5ClO. (M_r 128.6). *1018900.* [106-48-9]. 4-Chlorophenol.

Colourless or almost colourless crystals, slightly soluble in water, very soluble in alcohol and in solutions of alkali hydroxides.

mp: about 42 °C.

Chloroplatinic acid. $H_2Cl_6Pt,6H_2O$. (M_r 517.9). *1019000.* [18497-13-7]. Hydrogen hexachloroplatinate(IV) hexahydrate.

Content: minimum 37.0 per cent *m/m* of platinum (A_r 195.1).

Brownish-red crystals or a crystalline mass, very soluble in water, soluble in alcohol.

Assay. Ignite 0.200 g to constant mass at 900 ± 50 °C and weigh the residue (platinum).

Storage: protected from light.

3-Chloropropane-1,2-diol. $C_3H_7ClO_2$. (M_r 110.5). *1097600.* [96-24-2].

Colourless liquid, soluble in water and alcohol.

d_{20}^{20}: about 1.322.

n_D^{20}: about 1.480

bp: about 213 °C.

5-Chloroquinolin-8-ol. C_9H_6ClNO. (M_r 179.6). *1156900.* [130-16-5]. 5-Chlorooxine.

Sparingly soluble in cold dilute hydrochloric acid.

mp: about 123 °C.

Content: minimum 95.0 per cent of C_9H_6ClNO.

5-Chlorosalicylic acid. $C_7H_5ClO_3$. (M_r 172.6). *1019100.* [321-14-2].

A white or almost white, crystalline powder, soluble in methanol.

mp: about 173 °C.

Chlorothiazide. *1112100.* [58-94-6].

See *Chlorothiazide (0385).*

Chlorotrimethylsilane. C_3H_9ClSi. (M_r 108.6). *1019300.* [75-77-4].

A clear, colourless liquid, fuming in air.

d_{20}^{20}: about 0.86.

n_D^{20}: about 1.388.

bp: about 57 °C.

Chlorpyriphos. $C_9H_{11}Cl_3NO_3PS$. (M_r 350.6). *1124400.* [2921-88-2].

bp: about 200 °C.

mp: 42 °C to 44 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Chlorpyriphos-methyl. $C_7H_7Cl_3NO_3PS$. (M_r 322.5). *1124500.* [5598-13-0].

mp: 45 °C to 47 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Chlortetracycline hydrochloride. *1145500.*

See *Chlortetracycline hydrochloride (0173).*

(5α)-Cholestane. $C_{27}H_{48}$. (M_r 372.7). *1167900.* [481-21-0].

Slightly soluble in anhydrous ethanol.

mp: about 81 °C.

Cholesterol. *1019400.* [57-88-5].

See *Cholesterol (0993).*

Choline chloride. $C_5H_{14}ClNO$. (M_r 139.6). *1019500.* [67-48-1]. (2-Hydroxyethyl)trimethylammonium chloride.

Deliquescent crystals, very soluble in water and in alcohol.

Chromatography. Examine as prescribed in the monograph *Suxamethonium chloride (0248)*, applying 5 µl of a 0.2 g/l solution in *methanol R*. The chromatogram shows one principal spot.

Storage: in an airtight container.

Chondroitinase ABC. *1162900.*

A pectin lyase-like enzyme secreted by *Flavobacterium heparinum*. Available in vials containing 5-10 units. It cleaves both glucuronate-containing disaccharides, e.g. chondroitin sulphate, and iduronate-containing disaccharides, e.g. dermatan sulphate.

Chondroitinase AC. *1163000.*

A pectin lyase-like enzyme secreted by *Flavobacterium heparinum*. Available in vials containing 5-10 units. It cleaves only glucuronate-containing disaccharides, e.g. chondroitin sulphate.

Chromazurol S. $C_{23}H_{13}Cl_2Na_3O_9S$. (M_r 605). *1019600.* [1667-99-8].

Schultz No. 841.

Colour Index No. 43825.
Trisodium 5-[(3-carboxylato-5-methyl-4-oxocyclohexa-2,5-dien-1-ylidene)(2,6-dichloro-3-sulphonatophenyl)methyl]-2-hydroxy-3-methylbenzoate.

A brownish-black powder, soluble in water, slightly soluble in alcohol.

Chromic acid cleansing mixture. *1019700.*

A saturated solution of *chromium trioxide R* in *sulphuric acid R*.

Chromic potassium sulphate. $CrK(SO_4)_2,12H_2O$. (M_r 499.4). *1019800.* [7788-99-0]. Chrome alum.

Large, violet-red to black crystals, freely soluble in water, practically insoluble in alcohol.

Chromium(III) trichloride hexahydrate. $[Cr(H_2O)_4Cl_2]Cl, 2H_2O$. ($M_r$ 266.5). *1104800.* [10060-12-5].

A dark green crystalline powder, hygroscopic.

Storage: protected from humidity and oxidising agents.

Chromium trioxide. CrO_3. (M_r 100.0). *1019900.* [1333-82-0].

Dark brownish-red needles or granules, deliquescent, very soluble in water.

Storage: in an airtight glass container.

Chromogenic substrate R1. *1020000.*

Dissolve *N*-α-benzyloxycarbonyl-D-arginyl-L-glycyl-L-arginine-4-nitroanilide dihydrochloride in *water R* to give a 0.003 M solution. Dilute in *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R* to 0.0005 M before use.

Chromogenic substrate R2. *1020100.*

Dissolve D-phenylalanyl-L-pipecolyl-L-arginine-4-nitroanilide dihydrochloride in *water R* to give a 0.003 M solution. Dilute before use in titrating in *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R* to give a 0.0005 M solution.

Chromogenic substrate R3. *1149100.*

Dissolve D-valyl-leucyl-lysyl-4-nitroanilide dihydrochloride in *water R* to give a 0.003 M solution.

Chromogenic substrate R4. *1163100.*

Dissolve D-phenylalanyl-L-pipecolyl-L-arginine-4-nitroanilide dihydrochloride in *water R* to give a 0.008 M solution. Dilute to 0.0025 M with *phosphate buffer solution pH 8.5 R* before use.

Chromogenic substrate R5. *1163200.*

Dissolve *N*-benzoyl-L-isoleucyl-L-glutamyl-glycyl-L-arginine-4-nitroanilide hydrochloride in *water R* to give a 0.003 M solution.

Chromotrope II B. $C_{16}H_9N_3Na_2O_{10}S_2$. ($M_r$ 513.4). *1020200.* [548-80-1].

Schultz No. 67.

Colour Index No. 16575.
Disodium 4,5-dihydroxy-3-(4-nitrophenylazo)naphthalene-2,7-disulphonate.

A reddish-brown powder, soluble in water giving a yellowish-red colour, practically insoluble in alcohol.

Chromotrope II B solution. *1020201.*

A 0.05 g/l solution in *sulphuric acid R*.

Chromotropic acid, sodium salt. $C_{10}H_6Na_2O_8S_2,2H_2O$. ($M_r$ 400.3). *1020300.* [5808-22-0].

Schultz No. 1136.
Disodium 4,5-dihydroxynaphthalene-2,7-disulphonate dihydrate. Disodium 1,8-dihydroxynaphthalene-3,6-disulphonate dihydrate.

A yellowish-white powder, soluble in water, practically insoluble in alcohol.

Chromotropic acid, sodium salt solution. *1020301.*

Dissolve 0.60 g of *chromotropic acid, sodium salt R* in about 80 ml of *water R* and dilute to 100 ml with the same solvent. Use this solution within 24 h.

Chromotropic acid-sulphuric acid solution. *1020302.*

Dissolve 5 mg of *chromotropic acids sodium salt R* in 10 ml of a mixture of 9 ml of *sulphuric acid R* and 4 ml of *water R*.

Chrysanthemin. $C_{21}H_{21}ClO_{11}$. (M_r 485.5). *1134800.* [7084-24-4]. Kuromanin chloride. 2-(3,4-Dihydroxyphenyl)-3-(β-D-glucopyranosyl)oxy-5,7-dihydroxy-1-benzopyrylium chloride.

A reddish-brown crystalline powder, soluble in water and in alcohol.

Absorbance (*2.2.25*). A 0.01 g/l solution in a mixture of 1 volume of *hydrochloric acid R* and 999 volumes of *methanol R* shows a maximum at 528 nm.

α-Chymotrypsin for peptide mapping. *1142400.*

α-Chymotrypsin of high purity, treated to eliminate tryptic activity.

Cinchonidine. $C_{19}H_{22}N_2O$. (M_r 294.4). *1020400.* [485-71-2]. (*R*)-(Quinol-4-yl)[(2*S*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol.

A white or almost white, crystalline powder, very slightly soluble in water and in light petroleum, soluble in alcohol.

$[\alpha]_D^{20}$: – 105 to – 110, determined on a 50 g/l solution in *alcohol R*.

mp: about 208 °C, with decomposition.

Storage: protected from light.

Cinchonine. $C_{19}H_{22}N_2O$. (M_r 294.4). *1020500.* [118-10-5]. (*S*)-(Quinol-4-yl)[(2*R*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol.

A white or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in alcohol and in methanol.

$[\alpha]_D^{20}$: + 225 to + 230, determined on a 50 g/l solution in *alcohol R*.

mp: about 263 °C.

Storage: protected from light.

Cineole. $C_{10}H_{18}O$. (M_r 154.3). *1020600.* [470-82-6]. 1,8-Cineole. Eucalyptol. 1,8-Epoxy-*p*-menthane.

A colourless liquid, practically insoluble in water, miscible with ethanol.

d_{20}^{20}: 0.922 to 0.927.

n_D^{20}: 1.456 to 1.459.

Freezing point (*2.2.18*): 0 °C to 1 °C.

Distillation range (*2.2.11*): 174 °C to 177 °C.

Phenol. Shake 1 g with 20 ml of *water R*. Allow to separate and add to 10 ml of the aqueous layer 0.1 ml of *ferric chloride solution R1*. No violet colour develops.

Turpentine oil. Dissolve 1 g in 5 ml of *alcohol (90 per cent V/V) R*. Add dropwise freshly prepared *bromine water R*. Not more than 0.5 ml is required to give a yellow colour lasting for 30 min.

Residue on evaporation: maximum 0.05 per cent. To 10.0 ml add 25 ml of *water R*, evaporate on a water-bath and dry the residue to constant mass at 100-105 °C.

Cineole used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

1,4-Cineole. $C_{10}H_{18}O$. (M_r 154.3). *1142500.* [470-67-7]. 1-Methyl-4-(1-methylethyl)-7-oxabicyclo[2.2.1]heptane. 1-Isopropyl-4-methyl-7-oxabicyclo[2.2.1]heptane.

A colourless liquid.

d_4^{20}: about 0.900.

n_D^{20}: about 1.445.

bp: about 173 °C.

Cinnamamide. C_9H_9NO. (M_r 147.2). *1154800.* [621-79-4]. (*E*)-3-Phenylprop-2-enamide.

White or almost white powder.

mp: about 149 °C.

***trans*-Cinnamic acid.** $C_9H_8O_2$. (M_r 148.2). *1159200.* [140-10-3]. *trans*-3-Phenylacrylic acid. (2*E*)-3-Phenylprop-2-enoic acid.

Colourless crystals, very slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: 133 °C.

Cinnamic aldehyde. C_9H_8O. (M_r 132.2). *1020700.* [104-55-2]. 3-Phenylpropenal.

A yellowish to greenish-yellow, oily liquid, slightly soluble in water, very soluble in alcohol.

d_{20}^{20}: 1.048 to 1.051.

n_D^{20}: about 1.620.

Storage: protected from light.

***trans*-Cinnamic aldehyde.** C_9H_8O. (M_r 132.2). *1124600.* [14371-10-9]. *(E)*-3-Phenylprop-2-enal.

trans-Cinnamic aldehyde used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Cassia oil (1496).*

The content is not less than 99.0 per cent, calculated by the normalisation procedure.

Cinnamyl acetate. $C_{11}H_{12}O_2$. (M_r 176.2). *1124700.* [103-54-8]. 3-Phenylprop-2-en-1-yl acetate.

n_D^{20}: about 1.542.

bp: about 262 °C.

Cinnamyl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Cassia oil (1496).*

The content is not less than 99.0 per cent, calculated by the normalisation procedure.

Citral. $C_{10}H_{16}O$. (M_r 152.2). *1020800.* [5392-40-5]. Mixture of (2*E*)- and (2*Z*)-3,7-Dimethylocta-2,6-dienal.

A light yellow liquid, practically insoluble in water, miscible with alcohol and with glycerol.

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance. Apply to the plate 10 µl of a 1 g/l solution in *toluene R*. Develop over a path of 15 cm using a mixture of 15 volumes of *ethyl acetate R* and 85 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained shows only one principal spot.

Citral used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Citronella oil (1609).*

The content of citral (neral + geranial) is not less than 95.0 per cent calculated by the normalisation procedure.

Citrated rabbit plasma. *1020900.*

Collect blood by intracardiac puncture from a rabbit kept fasting for 12 h, using a plastic syringe with a No. 1 needle containing a suitable volume of 38 g/l solution of *sodium citrate R* so that the final volume ratio of citrate solution to blood is 1: 9. Separate the plasma by centrifugation at 1500 *g* to 1800 *g* at 15 °C to 20 °C for 30 min.

Storage: at 0 °C to 6 °C; use within 4 h of collection.

Citric acid. *1021000.* [5949-29-1]. See *Citric acid monohydrate (0456).*

When used in the limit test for iron, it complies with the following additional requirement.

Dissolve 0.5 g in 10 ml of *water R*, add 0.1 ml of *thioglycollic acid R*, mix and make alkaline with *ammonia R*. Dilute to 20 ml with *water R*. No pink colour appears in the solution.

Citric acid, anhydrous. *1021200.* [77-92-9].

See *Anhydrous citric acid (0455).*

Citronellal. $C_{10}H_{18}O$. (M_r 154.3). *1113300.* [106-23-0]. 3,7-Dimethyl-6-octenal.

Very slightly soluble in water, soluble in alcohols.

d_{20}^{20}: 0.848 to 0.856.

n_D^{20}: about 1.446.

Citronellal used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Citronella oil (1609).*

The content is not less than 95.0 per cent calculated by the normalisation procedure.

Citronellol. $C_{10}H_{20}O$. (M_r 156.3). *1134900.* [106-22-9]. 3,7-Dimethyloct-6-en-1-ol.

A clear, colourless liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: 0.857.

n_D^{20}: 1.456.

bp: 220 °C to 222 °C.

Citronellol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Citronella oil (1609).*

The content is not less than 95.0 per cent calculated by the normalisation procedure.

Storage: in an airtight container, protected from light.

Citronellyl acetate. $C_{12}H_{22}O_2$. (M_r 198.3). *1135000.* [150-84-5]. 3,7-Dimethyl-6-octen-1-yl acetate.

d_{20}^{20}: 0.890.

n_D^{20}: 1.443.

bp: 229 °C.

Citronellyl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Citronella oil (1609).*

The content is not less than 97.0 per cent calculated by the normalisation procedure.

Storage: in an airtight container, protected from light.

Citropten. $C_{11}H_{10}O_4$. (M_r 206.2). *1021300.* [487-06-9]. Limettin. 5,7-Dimethoxy-2*H*-1-benzopyran-2-one.

Needle-shaped crystals, practically insoluble in water and in light petroleum, freely soluble in acetone and in alcohol.

mp: about 145 °C.

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254}*R* as the coating substance. Apply to the plate 10 µl of a 1 g/l solution in *toluene R*. Develop over a path of 15 cm using a mixture of 15 volumes of *ethyl acetate R* and 85 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained shows only one principal spot.

Clobetasol propionate. $C_{25}H_{32}ClFO_5$. (M_r 467.0). *1097700.* [25122-46-7]. 21-Chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-propionate.

A white or almost white crystalline powder, insoluble in water, soluble in alcohol and in acetone.

$[\alpha]_D^{20}$: about + 104 (in dioxan).

mp: about 196 °C.

Coagulation factor V solution. *1021400.*

Coagulation factor V solution may be prepared by the following method or by any other method which excludes factor VIII.

Prepare the factor V reagent from fresh oxalated bovine plasma, by fractionation at 4 °C with a saturated solution of *ammonium sulphate R* prepared at 4 °C. Separate the fraction which precipitates between 38 per cent and 50 per cent of saturation, which contains factor V without significant contamination with factor VIII. Remove the ammonium sulphate by dialysis and dilute the solution with a 9 g/l solution of *sodium chloride R* to give a solution containing between 10 per cent and 20 per cent of the quantity of factor V present in fresh human normal plasma.

Determination of factor V content. Prepare two dilutions of the preparation of factor V in *imidazole buffer solution pH 7.3 R* containing 1 volume of the preparation in 10 volumes and in 20 volumes of the buffer solution respectively. Test each dilution as follows: mix 0.1 ml of *plasma substrate deficient in factor V R*, 0.1 ml of the solution to be examined, 0.1 ml of *thromboplastin R* and 0.1 ml of a 3.5 g/l solution of *calcium chloride R* and measure the coagulation times, i.e. the interval between the moment at which the calcium chloride solution is added and the first indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus.

In the same manner, determine the coagulation time (in duplicate) of four dilutions of human normal plasma in *imidazole buffer solution pH 7.3 R*, containing respectively, 1 volume in 10 (equivalent to 100 per cent of factor V), 1 volume in 50 (20 per cent), 1 volume in 100 (10 per cent), and 1 volume in 1000 (1 per cent). Using two-way logarithmic paper plot the average coagulation times for each dilution of human plasma against the equivalent percentage of factor V and read the percentage of factor V for the two dilutions of

the factor V solution by interpolation. The mean of the two results gives the percentage of factor V in the solution to be examined.

Storage: in the frozen state at a temperature not higher than – 20 °C.

Cobalt chloride. $CoCl_2,6H_2O$. (M_r 237.9). *1021600.* [7791-13-1].

A red, crystalline powder or deep-red crystals, very soluble in water, soluble in alcohol.

Cobalt nitrate. $Co(NO_3)_2,6H_2O$. (M_r 291.0). *1021700.* [10026-22-9].

Small garnet-red crystals, very soluble in water.

Codeine. *1021800.* [6059-47-8].

See *Codeine (0076).*

Codeine phosphate. *1021900.* [52-28-8].

See *Codeine phosphate hemihydrate (0074).*

Congo red. $C_{32}H_{22}N_6Na_2O_6S_2$. ($M_r$ 697). *1022000.* [573-58-0].

Schultz No. 360.

Colour Index No. 22120.
Disodium (biphenyl-4,4′-diyl-bis-2,2′-azo)bis(1-aminonaphthalene-4-sulphonate).

A brownish-red powder, soluble in water.

Congo red paper. *1022002.*

Immerse strips of filter paper for a few minutes in *congo red solution R*. Allow to dry.

Congo red solution. *1022001.*

Dissolve 0.1 g of *congo red R* in a mixture of 20 ml of *alcohol R* and *water R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.2 ml of the congo red solution add 100 ml of *carbon dioxide-free water R* and 0.3 ml of *0.1 M hydrochloric acid.* The solution is blue. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour to pink.

Colour change: pH 3.0 (blue) to pH 5.0 (pink).

Coomassie blue. *1001400.* [3861-73-2].

See *acid blue 92 R.*

Coomassie blue solution. *1001401.*

See *acid blue 92 solution R.*

Coomassie staining solution. *1012201.*

A 1.25 g/l solution of *acid blue 83 R* in a mixture consisting of 1 volume of *glacial acetic acid R*, 4 volumes of *methanol R* and 5 volumes of *water R*. Filter.

Copper. Cu. (A_r 63.55). *1022100.* [7440-50-8].

Cleaned foil, turnings, wire or powder of the pure metal of electrolytic grade.

Copper acetate. $C_4H_6CuO_4,H_2O$. (M_r 199.7). *1022200.* [142-71-2].

Blue-green crystals or powder, freely soluble in boiling water, soluble in water and in alcohol, slightly soluble in glycerol (85 per cent).

Copper edetate solution. *1022300.*

To 2 ml of a 20 g/l solution of *copper acetate R* add 2 ml of *0.1 M sodium edetate* and dilute to 50 ml with *water R*.

Copper nitrate. $Cu(NO_3)_2,3H_2O$. (M_r 241.6). *1022400.* [10031-43-3]. Chloride dinitrate trihydrate.

Dark blue crystals, hygroscopic, very soluble in water giving a strongly acid reaction, freely soluble in alcohol and in dilute nitric acid.

Storage: in an airtight container.

Copper sulphate. $CuSO_4,5H_2O$. (M_r 249.7). *1022500.* [7758-99-8].

A blue powder or deep-blue crystals, slowly efflorescent, very soluble in water, slightly soluble in alcohol.

Copper sulphate solution. *1022501.*

A 125 g/l solution.

Copper tetrammine, ammoniacal solution of. *1022600.*

Dissolve 34.5 g of *copper sulphate R* in 100 ml of *water R* and, whilst stirring, add dropwise *concentrated ammonia R* until the precipitate which forms dissolves completely. Keeping the temperature below 20 °C, add dropwise with continuous shaking 30 ml of *strong sodium hydroxide solution R*. Filter through a sintered-glass filter (40) (*2.1.2*), wash with *water R* until the filtrate is clear and take up the precipitate with 200 ml of *concentrated ammonia R*. Filter through a sintered-glass filter (*2.1.2*) and repeat the filtration to reduce the residue to a minimum.

Cortisone acetate. *1097800.* [50-04-4].

See *Cortisone acetate (0321).*

Coumaphos. $C_{14}H_{16}ClO_5PS$. (M_r 362.8). *1124800.* [56-72-4].

mp: 91 °C to 92 °C.

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

***o*-Coumaric acid.** $C_9H_8O_3$. (M_r 164.2). *1157400.* [614-60-8]. (*E*)-2-Hydroxycinnamic acid. (2*E*)-3-(2-Hydroxyphenyl)prop-2-enoic acid.

White or almost white powder.

mp: about 217 °C.

***p*-Coumaric acid.** $C_9H_8O_3$. (M_r 164.2). *1157500.* [7400-08-0]. 4-Hydroxycinnamic acid. 3-(4-Hydroxyphenyl)-prop-2-enoic acid.

White or almost white needles, practically insoluble in water, soluble in acetone and in methanol.

mp: 214 °C to 217 °C.

p-Coumaric acid used in the assay in Nettle leaf (1897) complies with the following additional requirements.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 2 h.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph on *Nettle leaf (1897).*

Content: minimum 95 per cent, calculated by the normalisation procedure.

Coumarin. $C_9H_6O_2$. (M_r 146.1). *1124900.* [91-64-5]. 2*H*-Chromen-2-one. 2*H*-1-Benzopyran-2-one.

A colourless, crystalline powder or orthorhombic or rectangular crystals, very soluble in boiling water, soluble in alcohol. It dissolves in solutions of alkali hydroxides.

mp: 68 °C to 70 °C.

Coumarin used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Cassia oil (1496).*

The content is not less than 98.0 per cent, calculated by the normalisation procedure.

Cresol. C_7H_8O. (M_r 108.1). *1022700.* [95-48-7]. *o*-Cresol. 2-Methylphenol.

Crystals or a super-cooled liquid becoming dark on exposure to light and air, miscible with ethanol, soluble in about 50 parts of water and soluble in solutions of alkali hydroxides.

d_{20}^{20}: about 1.05.

n_D^{20}: 1.540 to 1.550.

bp: about 190 °C.

Freezing point (*2.2.18*): minimum 30.5 °C.

Residue on evaporation: maximum 0.1 per cent *m/m*, determined by evaporating on a water-bath and drying in an oven at 100-105 °C.

Storage: protected from light, moisture and oxygen.

Distil before use.

***p*-Cresol.** C_7H_8O. (M_r 108.1). *1153100.* [106-44-5]. 4-Methylphenol.

Colourless or white or almost white crystals or crystalline mass.

d_{20}^{20}: about 1.02.

bp: about 202 °C.

***m*-Cresol purple.** $C_{21}H_{18}O_5S$. (M_r 382.44). *1121700.* [2303-01-7]. *m*-Cresolsulphonphthalein.

An olive-green, crystalline powder, slightly soluble in water, soluble in alcohol, in glacial acetic acid and in methanol.

_m_-Cresol purple solution. *1121701.*

Dissolve 0.1 g of *m-cresol purple R* in 13 ml of *0.01 M sodium hydroxide*, dilute to 100 ml with *water R* and mix.

Colour change: pH 1.2 (red) to pH 2.8 (yellow); pH 7.4 (yellow) to pH 9.0 (purple).

Cresol red. $C_{21}H_{18}O_5S$. (M_r 382.4). *1022800.* [1733-12-6]. Cresolsulfonphthalein. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis-(2-methylphenol) *S*,*S*-dioxide.

A reddish-brown crystalline powder, slightly soluble in water, soluble in alcohol and in dilute solutions of alkali hydroxides.

Cresol red solution. *1022801.*

Dissolve 0.1 g of *cresol red R* in a mixture of 2.65 ml of *0.1 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. A mixture of 0.1 ml of the cresol red solution and 100 ml of *carbon dioxide-free water R* to which 0.15 ml of *0.02 M sodium hydroxide* has been added is purple-red. Not more than 0.15 ml of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 7.0 (yellow) to pH 8.6 (red).

Crystal violet. $C_{25}H_{30}ClN_3$. (M_r 408.0). *1022900.* [548-62-9].

Schultz No. 78.

Colour Index No. 42555.

Hexamethyl-pararosanilinium chloride.

Dark-green powder or crystals, soluble in water and in alcohol.

Crystal violet solution. *1022901.*

Dissolve 0.5 g of *crystal violet R* in *anhydrous acetic acid R* and dilute to 100 ml with the same solvent.

Test for sensitivity. To 50 ml of *anhydrous acetic acid R* add 0.1 ml of the crystal violet solution. On addition of 0.1 ml of *0.1 M perchloric acid* the bluish-purple solution turns bluish-green.

Cupric chloride. $CuCl_2,2H_2O$. (M_r 170.5). *1023000.* [10125-13-0]. Cupric chloride dihydrate.

Greenish-blue powder or crystals, deliquescent in moist air, efflorescent in dry air, freely soluble in water, in alcohol and in methanol, sparingly soluble in acetone.

Storage: in an airtight container.

Cupri-citric solution. *1023100.*

Dissolve 25 g of *copper sulphate R*, 50 g of *citric acid R* and 144 g of *anhydrous sodium carbonate R* in *water R* and dilute to 1000 ml with the same solvent.

Cupri-citric solution R1. *1023200.*

Dissolve 25 g of *copper sulphate R*, 50 g of *citric acid R* and 144 g of *anhydrous sodium carbonate R* in *water R* and dilute to 1000 ml with the same solvent.

Adjust the solution so that it complies with the following requirements.

a) To 25.0 ml add 3 g of *potassium iodide R*. Add 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R* with precaution and in small quantities. Titrate with *0.1 M sodium thiosulphate* using 0.5 ml of *starch solution R*, added towards the end of the titration, as indicator.

24.5 ml to 25.5 ml of *0.1 M sodium thiosulphate* is used in the titration.

b) Dilute 10.0 ml to 100.0 ml with *water R* and mix. To 10.0 ml of the solution, add 25.0 ml of *0.1 M hydrochloric acid* and heat for 1 h on a water-bath. Cool, adjust with *water R* to the initial volume and titrate with *0.1 M sodium hydroxide*, using 0.1 ml of *phenolphthalein solution R1* as indicator.

5.7 ml to 6.3 ml of *0.1 M sodium hydroxide* is used in the titration.

c) Dilute 10.0 ml to 100.0 ml with *water R* and mix. Titrate 10.0 ml of the solution with *0.1 M hydrochloric acid*, using 0.1 ml of *phenolphthalein solution R1* as indicator.

6.0 ml to 7.5 ml of *0.1 M hydrochloric acid* is used in the titration.

Cupriethylenediamine hydroxide solution. *3008700.* [14552-35-3].

The molar ratio of ethylenediamine to copper is 2.00 ± 0.04.

This solution is commercially available.

Cupri-tartaric solution. *1023300.*

Solution I. Dissolve 34.6 g of *copper sulphate R* in *water R* and dilute to 500 ml with the same solvent.

Solution II. Dissolve 173 g of *sodium potassium tartrate R* and 50 g of *sodium hydroxide R* in 400 ml of *water R*. Heat to boiling, allow to cool and dilute to 500 ml with *carbon dioxide-free water R*.

Mix equal volumes of the 2 solutions immediately before use.

Cupri-tartaric solution R2. *1023302.*

Add 1 ml of a solution containing 5 g/l of *copper sulphate R* and 10 g/l of *potassium tartrate R* to 50 ml of *sodium carbonate solution R1*. Prepare immediately before use.

Cupri-tartaric solution R3. *1023303.*

Prepare a solution containing 10 g/l of *copper sulphate R* and 20 g/l of *sodium tartrate R*. To 1.0 ml of the solution add 50 ml of *sodium carbonate solution R2*. Prepare immediately before use.

Cupri-tartaric solution R4. *1023304.*

Solution I. 150 g/l *copper sulphate R*.

Solution II. Dissolve 2.5 g of *anhydrous sodium carbonate R*, 2.5 g of *potassium sodium tartrate R*, 2.0 g of *sodium hydrogen carbonate R*, and 20.0 g of *anhydrous sodium sulphate R* in *water R* and dilute to 100 ml with the same solvent.

Mix 1 part of solution I with 25 parts of solution II immediately before use.

Curcumin. $C_{21}H_{20}O_6$. (M_r 368.4). *1023500.* [458-37-7]. 1,7-bis(4-Hydroxy-3-methoxyphenyl)hepta-1,6-diene-3,5-dione.

An orange-brown, crystalline powder, practically insoluble in water, soluble in glacial acetic acid.

mp: about 183 °C.

Cyanoacetic acid. $C_3H_3NO_2$. (M_r 85.1). *1097900.* [372-09-8].

White to yellowish-white, hygroscopic crystals, very soluble in water.

Storage: in an airtight container.

Cyanocobalamin. *1023600.* [68-19-9].

See *Cyanocobalamin (0547)*.

Cyanogen bromide solution. *1023700.* [506-68-3].

Add dropwise, with cooling *0.1 M ammonium thiocyanate* to *bromine water R* until the yellow colour disappears. Prepare immediately before use.

β-Cyclodextrin for chiral chromatography, modified. *1154600.*

30 per cent of 2,3-di-*O*-ethyl-6-*O*-*tert*-butyldimethylsilyl-β-cyclodextrin dissolved in *poly(dimethyl)(85)(diphenyl)(15)siloxane R*.

β-Cyclodextrin for chiral chromatography, modified R1. *1160700.*

30 per cent of 2,3-di-*O*-acetyl-6-*O*-*tert*-butylsilyl-β-cyclodextrin dissolved in *poly(dimethyl)(85)(diphenyl)(15)siloxane R*.

Cyanoguanidine. $C_2H_4N_4$. (M_r 84.1). *1023800.* [461-58-5]. Dicyandiamide. 1-Cyanoguanidine.

A white or almost white, crystalline powder, sparingly soluble in water and in alcohol, practically insoluble in methylene chloride.

mp: about 210 °C.

Cyclohexane. C_6H_{12}. (M_r 84.2). *1023900.* [110-82-7].

A clear, colourless, flammable liquid, practically insoluble in water, miscible with organic solvents.

d_{20}^{20}: about 0.78.

bp: about 80.5 °C.

Cyclohexane used in spectrophotometry complies with the following additional requirements.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 45 per cent at 220 nm, 70 per cent at 235 nm, 90 per cent at 240 nm, 98 per cent at 250 nm.

Cyclohexane R1. *1023901.*

Complies with the requirements prescribed for *cyclohexane R* and with the following additional requirement.

The fluorescence, measured at 460 nm, under illumination with an excitant light beam at 365 nm, is not more intense than that of a solution containing 0.002 ppm of *quinine R* in *0.05 M sulphuric acid*.

Cyclohexylamine. $C_6H_{13}N$. (M_r 99.2). *1024000.* [108-91-8].

A colourless liquid, soluble in water, miscible with usual organic solvents.

n_D^{20}: about 1.460.

bp: 134 °C to 135 °C.

Cyclohexylenedinitrilotetra-acetic acid. $C_{14}H_{22}N_2O_8,H_2O$. (M_r 364.4). *1024100. trans*-Cyclohexylene-1,2-dinitrilo-*N,N,N',N'*-tetra-acetic acid.

A white or almost white, crystalline powder.

mp: about 204 °C.

Cyclohexylmethanol. $C_7H_{14}O$. (M_r 114.2). *1135200.* [100-49-2]. Cyclohexylcarbinol.

A liquid with a slight odour of camphor, soluble in alcohol.

n_D^{25}: about 1.464.

bp: about 185 °C.

3-Cyclohexylpropionic acid. $C_9H_{16}O_2$. (M_r 156.2). *1119200.* [701-97-3].

A clear liquid.

d_{20}^{20}: about 0.998.

n_D^{20}: about 1.4648.

bp: about 130 °C.

Cyhalothrin. $C_{23}H_{19}ClF_3NO_3$. (M_r 449.9). *1125000.* [91465-08-6].

bp: 187 °C to 190 °C.

mp: about 49 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

***p*-Cymene.** $C_{10}H_{14}$. (M_r 134.2). *1113400.* [99-87-6]. 1-Isopropyl-4-methylbenzene.

A colourless liquid, practically insoluble in water, soluble in alcohol.

d_{20}^{20}: about 0.858.

n_D^{20}: about 1.4895.

bp: 175 °C to 178 °C.

p-Cymene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

The area of the principal peak is not less than 96.0 per cent of the area of all the peaks in the chromatogram obtained.

Cynarin. $C_{25}H_{24}O_{12}$. (M_r 516.4). *1159300.* [30964-13-7]. (1α,3α,4α,5β)-1,3-Bis[[3-(3,4-Dihydroxyphenyl)-1-oxo-2-propenyl]oxy]-4,5-dihydroxycyclohexanecarboxylic acid.

White or almost white amorphous mass, odourless.

Cypermethrin. $C_{22}H_{19}Cl_2NO_3$. (M_r 416.3). *1125100.* [52315-07-8].

bp: 170 °C to 195 °C.

mp: 60 °C to 80 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

L-Cysteine. $C_3H_7NO_2S$. (M_r 121.1). *1024200.* [52-90-4].

A powder, freely soluble in water, in alcohol and in acetic acid, practically insoluble in acetone.

Cysteine hydrochloride. *1024300.* [7048-04-6].

See *Cysteine hydrochloride monohydrate (0895)*.

L-Cystine. $C_6H_{12}N_2O_4S_2$. (M_r 240.3). *1024400.* [56-89-3].
A white or almost white, crystalline powder, practically insoluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides. It decomposes at 250 °C.
$[\alpha]_D^{20}$: −218 to −224, determined in *1 M hydrochloric acid.*

Cytosine. $C_4H_5N_3O$. (M_r 111.1). *1160800.* [71-30-7].
Content: minimum 95.0 per cent.

Dantron. $C_{14}H_8O_4$. (M_r 240.2). *1024500.* [117-10-2]. 1,8-Dihydroxyanthraquinone. 1,8-Dihydroxyanthracene-9, 10-dione.
A crystalline orange powder, practically insoluble in water, slightly soluble in alcohol, soluble in solutions of alkali hydroxides.
mp: about 195 °C.
Dantron used in the sesquiterpenic acids assay in Valerian root (0453) complies with the following additional requirements.
$A_{1\,cm}^{1\%}$: 355 to 375, determined at 500 nm in *1 M potassium hydroxide.*
Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Valerian Root (0453)* at the concentration of the reference solution. The content of dantron is not less than 95 per cent calculated by the normalisation procedure

***o,p′*-DDD.** $C_{14}H_{10}Cl_4$. (M_r 320.0). *1125200.* [53-19-0]. 1-(2-Chlorophenyl)-1-(4-chlorophenyl)-2,2-dichloroethane.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

***p,p′*-DDD.** $C_{14}H_{10}Cl_4$. (M_r 320.0). *1125300.* [72-54-8]. 1,1-bis(4-Chlorophenyl)-2,2-dichloroethane.
bp: about 193 °C.
mp: about 109 °C.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

***o,p′*-DDE.** $C_{14}H_8Cl_4$. (M_r 318.0). *1125400.* [3424-82-6].
1-(2-Chlorophenyl)-1-(4-chlorophenyl)-2,2-dichloroethylene.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

***p,p′*-DDE.** $C_{14}H_8Cl_4$. (M_r 318.0). *1125500.* [72-55-9]. 1,1-bis(4-Chlorophenyl)-2,2-dichloroethylene.
bp: 316 °C to 317 °C.
mp: 88 °C to 89 °C.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

***o,p′*-DDT.** $C_{14}H_9Cl_5$. (M_r 354.5). *1125600.* [789-02-6]. 1-(2-Chlorophenyl)-1-(4-chlorophenyl)-2,2,2-trichloroethane.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

***p,p′*-DDT.** $C_{14}H_9Cl_5$. (M_r 354.5). *1125700.* [50-29-3]. 1,1-bis(4-Chlorophenyl)-2,2,2-trichloroethane.
bp: about 260 °C.
mp: 108 °C to 109 °C.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Decanal. $C_{10}H_{20}O$. (M_r 156.3). *1149200.* [112-31-2]. Decyl aldehyde.
Oily, colourless liquid, with a characteristic odour of orange, practically insoluble in water, soluble in chloroform.
d_4^{20}: 0.825 to 0.829.
n_D^{20}: 1.420 to 1.430.
bp: 207 °C to 209 °C.
Decanal used in gas chromatography complies with the following additional test.
Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Sweet orange oil (1811).*
The content is not less than 99 per cent, calculated by the normalisation procedure.

Decane. $C_{10}H_{22}$. (M_r 142.3). *1024600.* [124-18-5].
A colourless liquid, practically insoluble in water.
n_D^{20}: about 1.411.
bp: about 174 °C.

Decanol. $C_{10}H_{22}O$. (M_r 158.3). *1024700.* [112-30-1]. *n*-Decyl alcohol.
A viscous liquid, solidifying at about 6 °C, practically insoluble in water, soluble in alcohol.
n_D^{20}: about 1.436.
bp: about 230 °C.

Deltamethrin. $C_{22}H_{19}Br_2NO_3$. (M_r 505.2). *1125800.* [52918-63-5].
bp: about 300 °C.
mp: about 98 °C.
A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Demeclocycline hydrochloride. *1145600.*
See *Demeclocycline hydrochloride (0176).*

Demethylflumazenil. $C_{14}H_{12}FN_3O_3$. (M_r 289.3). *1149300.* [79089-72-8].
Ethyl 8-fluoro-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1, 4]benzodiazepine-3-carboxylate.
mp: about 288 °C.
Colourless needles, soluble in dimethyl sulphoxide and in hot methanol.

2-Deoxy-D-ribose. $C_5H_{10}O_4$. (M_r 134.1). *1163900.* [533-67-5]. Thyminose. 2-Deoxy-D-*erythro*-pentose.

2′-Deoxyuridine. $C_9H_{12}N_2O_5$. (M_r 228.2). *1024800.* [951-78-0]. 1-(2-Deoxy-β-d-*erythro*-pentofuranosyl)-1*H*,3*H*-pyrimidine-2,4-dione.
mp: about 165 °C.
Chromatography. Examine as prescribed in the monograph on *Idoxuridine (0669)*, applying 5 µl of a 0.25 g/l solution. The chromatogram obtained shows only one principal spot.

Destaining solution. *1012202.*
A mixture consisting of 1 volume of *glacial acetic acid R*, 4 volumes of *methanol R* and 5 volumes of *water R.*

Deuterated acetic acid. $C_2{}^2H_4O_2$. (M_r 64.1). *1101100.* [1186-52-3]. Tetradeuteroacetic acid. Acetic-d_3 acid-*d*.
The degree of deuteration is not less than 99.7 per cent.
d_{20}^{20}: about 1.12.
n_D^{20}: about 1.368.
bp: about 115 °C.
mp: about 16 °C.

Deuterated acetone. $C_3{}^2H_6O$. (M_r 64.1). *1024900.* [666-52-4]. Acetone-d_6. ($^2H_6$)-Acetone.
The degree of deuteration is not less than 99.5 per cent.
A clear, colourless liquid, miscible with water, with dimethylformamide, with ethanol and with methanol.
d_{20}^{20}: about 0.87.

n_D^{20}: about 1.357.

bp: about 55 °C.

Water and deuterium oxide. Not more than 0.1 per cent.

Deuterated chloroform. C^2HCl_3. (M_r 120.4). *1025000*. [865-49-6]. (^{2}H)-Chloroform. Chloroform-*d*.

The degree of deuteration is not less than 99.7 per cent.

A clear, colourless liquid, practically insoluble in water, miscible with acetone and with alcohol. It may be stabilised over silver foil.

d_{20}^{20}: about 1.51.

n_D^{20}: about 1.445.

bp: about 60 °C.

Water and deuterium oxide: maximum 0.05 per cent.

Deuterated dimethyl sulphoxide. $C_2{}^2H_6OS$. (M_r 84.2). *1025100*. [2206-27-1]. ($^2H_6$)-Dimethyl sulphoxide. Dimethyl sulphoxide-d_6.

The degree of deuteration is not less than 99.8 per cent.

A very hygroscopic liquid, practically colourless, viscous, soluble in water, in acetone and in ethanol.

d_{20}^{20}: about 1.18.

mp: about 20 °C.

Water and deuterium oxide: maximum 0.1 per cent.

Storage: in an airtight container.

Deuterated methanol. C^2H_4O. (M_r 36.1). *1025200*. [811-98-3]. (^{2}H)-Methanol. Methanol-*d*.

The degree of deuteriation is not less than 99.8 per cent.

Clear, colourless liquid miscible with water, with alcohol and with methylene chloride.

d_{20}^{20}: about 0.888.

n_D^{20}: about 1.326.

bp: 65.4 °C.

Deuterium oxide. ^2H_2O. (M_r 20.03). *1025300*. [7789-20-0]. Deuterated water.

The degree of deuteration is not less than 99.7 per cent.

d_{20}^{20}: about 1.11.

n_D^{20}: about 1.328.

bp: about 101 °C.

Deuterium oxide R1. ^2H_2O. (M_r 20.03). *1025301*. [7789-20-0]. Deuterated water.

The degree of deuteration is not less than 99.95 per cent.

Developer solution. *1122500*.

Dilute 2.5 ml of a 20 g/l solution of *citric acid R* and 0.27 ml of *formaldehyde R* to 500.0 ml with *water R*.

Dextran for chromatography, cross-linked R2. *1025500*.

A bead-form dextran with a fraction range suitable for the separation of peptides and proteins with relative molecular masses of 15×10^2 to 30×10^3. When dry, the beads have a diameter of 20 µm to 80 µm.

Dextran for chromatography, cross-linked R3. *1025600*.

A bead-form dextran with a fraction range suitable for the separation of peptides and proteins with relative molecular masses of 4×10^3 to 15×10^4. When dry, the beads have a diameter of 40 µm to 120 µm.

Dextrose. *1025700*. [50-99-7].

See *glucose R*.

3,3′-Diaminobenzidine tetrahydrochloride. $C_{12}H_{18}Cl_4N_4$, $2H_2O$. (M_r 396.1). *1098000*. [7411-49-6]. 3,3′,4,4′-Biphenyl-tetramine.

An almost white or slightly pink powder, soluble in water.

mp: about 280 °C, with decomposition.

Diammonium 2,2′-azinobis(3-ethylbenzothiazoline-6-sulphonate). $C_{18}H_{24}N_6O_6S_4$. (M_r 548.7). *1153000*. [30931-67-0]. ABTS. Diammonium 2,2′-(diazanediylidene)bis[3-ethyl-2,3-dihydrobenzothiazole-6-sulphonate].

Chromogenic substrate suitable for use in ELISA procedures.

Green tablets, freely soluble in water.

pH (*2.2.3*): 4.2 to 5.8 for a 0.1 g/l solution.

Diatomaceous earth. *1025900*. [91053-39-3].

A white or almost white, fine granular powder, made up of siliceous frustules of fossil diatoms or of debris of fossil diatoms, practically insoluble in water and in alcohol.

The substance may be identified by microscopic examination with a magnification of × 500.

Diatomaceous earth for gas chromatography. *1026000*.

A white or almost white, fine granular powder, made up of siliceous frustules of fossil diatoms or of debris of fossil diatoms, practically insoluble in water and in alcohol. The substance may be identified by microscopic examination with a magnification of × 500. The substance is purified by treating with *hydrochloric acid R* and washing with *water R*.

Particle size. Not more than 5 per cent is retained on a sieve No. 180. Not more than 10 per cent passes a sieve No. 125.

Diatomaceous earth for gas chromatography R1. *1026100*.

A white or almost white, fine granular powder, made up of siliceous frustules of fossil diatoms or of debris of fossil diatoms, practically insoluble in water and in alcohol. The substance may be identified by microscopic examination with a magnification of × 500. The substance is purified by treating with *hydrochloric acid R* and washing with *water R*.

Particle size. Not more than 5 per cent is retained on a sieve No. 250. Not more than 10 per cent passes a sieve No. 180.

Diatomaceous earth for gas chromatography R2. *1026200*.

A white or almost white, fine granular powder with a specific surface area of about 0.5 m^2/g, made up of siliceous frustules of fossil diatoms or of debris of fossil diatoms, practically insoluble in water and in alcohol. The substance may be identified by microscopic examination with a magnification of × 500. The substance is purified by treating with *hydrochloric acid R* and washing with *water R*.

Particle size. Not more than 5 per cent is retained on a sieve No. 180. Not more than 10 per cent passes a sieve No. 125.

Diatomaceous earth for gas chromatography, silanised. *1026300*.

Diatomaceous earth for gas chromatography R silanised with dimethyldichlorosilane or other suitable silanising agents.

Diatomaceous earth for gas chromatography, silanised R1. *1026400*.

Prepared from crushed pink firebrick and silanised with dimethyldichlorosilane or other suitable silanising agents. The substance is purified by treating with *hydrochloric acid R* and washing with *water R*.

Diazinon. $C_{12}H_{21}N_2O_3PS$. (M_r 304.3). *1125900.* [333-41-5].

bp: about 306 °C.

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Diazobenzenesulphonic acid solution R1. *1026500.*

Dissolve 0.9 g of *sulphanilic acid R* in a mixture of 30 ml of *dilute hydrochloric acid R* and 70 ml of *water R*. To 3 ml of the solution add 3 ml of a 50 g/l solution of *sodium nitrite R*. Cool in an ice-bath for 5 min, add 12 ml of the sodium nitrite solution and cool again. Dilute to 100 ml with *water R* and keep the reagent in an ice-bath. Prepare extemporaneously but allow to stand for 15 min before use.

Dibutylamine. $C_8H_{19}N$. (M_r 129.3). *1126000.* [111-92-2]. *N*-Butylbutan-1-amine.

Colourless liquid.

n_D^{20}: about 1.417.

bp: about 159 °C.

Dibutylammonium phosphate for ion-pairing. *1168800.*

A colourless solution of 10 per cent to 15 per cent *V/V* of di-*n*-butylamine and 12 per cent to 17 per cent *V/V* of phosphoric acid in water, suitable for ion-pairing in liquid chromatography.

Dibutyl ether. $C_8H_{18}O$. (M_r 130.2). *1026700.* [142-96-1].

A colourless, flammable liquid, practically insoluble in water, miscible with ethanol.

d_{20}^{20}: about 0.77.

n_D^{20}: about 1.399.

Do not distil if the dibutyl ether does not comply with the test for peroxides.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

The name and concentration of any added stabiliser are stated on the label.

Dibutyl phthalate. $C_{16}H_{22}O_4$. (M_r 278.3). *1026800.* [84-74-2]. Dibutyl benzene-1,2-dicarboxylate.

A clear, colourless or faintly coloured, oily liquid, very slightly soluble in water, miscible with acetone and with alcohol.

d_{20}^{20}: 1.043 to 1.048.

n_D^{20}: 1.490 to 1.495.

Dicarboxidine hydrochloride. $C_{20}H_{26}Cl_2N_2O_6$. (M_r 461.3). *1026900.* [56455-90-4]. 4,4′-[(4,4′-Diaminobiphenyl-3,3′-diyl)dioxy]dibutanoic acid dihydrochloride.

Dichlofenthion. $C_{10}H_{13}Cl_2O_3PS$. (M_r 315.2). *1126100.* [97-17-6].

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Dichloroacetic acid. $C_2H_2Cl_2O_2$. (M_r 128.9). *1027000.* [79-43-6].

Colourless liquid, miscible with water and alcohol.

d_{20}^{20}: about 1.566.

n_D^{20}: about 1.466.

bp: about 193 °C.

Dichloroacetic acid solution. *1027001.*

Dilute 67 ml of *dichloroacetic acid R* to 300 ml with *water R* and neutralise to *blue litmus paper R* using *ammonia R*. Cool, add 33 ml of *dichloroacetic acid R* and dilute to 600 ml with *water R*.

Dichlorobenzene. $C_6H_4Cl_2$. (M_r 147.0). *1027100.* [95-50-1]. 1,2-Dichlorobenzene.

A colourless, oily liquid, practically insoluble in water, soluble in ethanol.

d_{20}^{20}: about 1.31.

bp: about 180 °C.

2,3-Dichloro-5,6-dicyanobenzoquinone. $C_8Cl_2N_2O_2$. (M_r 227.0). *1153600.* [84-58-2]. 4,5-Dichloro-3,6-dioxocyclohexa-1,4-diene-1,2-dicarbonitrile.

Yellow or orange crystals, soluble in dioxan and in acetic acid, slightly soluble in methylene chloride. It decomposes in water.

mp: about 214 °C.

Storage: at a temperature of 2 °C to 8 °C.

(*S*)-3,5-Dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide. $C_{14}H_{19}BrCl_2N_2O_3$. (M_r 414.1). *1142600.* [113310-88-6].

White or almost white, crystalline powder.

$[\alpha]_D^{22}$: + 11.4, determined on a 15.0 g/l solution in *ethanol R*.

mp: about 212 °C.

Dichlorofluorescein. $C_{20}H_{10}Cl_2O_5$. (M_r 401.2). *1027200.* [76-54-0]. 2,7-Dichlorofluorescein. 2-(2,7-Dichloro-6-hydroxy-3-oxo-3*H*-xanthen-9-yl)benzoic acid.

A yellowish-brown to yellow-orange powder, slightly soluble in water, freely soluble in alcohol and in dilute solutions of alkali hydroxides giving a solution showing a yellowish-green fluorescence.

Dichlorophenolindophenol, sodium salt. $C_{12}H_6Cl_2NNaO_2,2H_2O$. ($M_r$ 326.1). *1027300.* [620-45-1]. The sodium derivative of 2,6-dichloro-*N*-(4-hydroxyphenyl)-1,4-benzoquinone monoimine dihydrate.

A dark-green powder, freely soluble in water and in ethanol. The aqueous solution is dark blue; when acidified it becomes pink.

Dichlorophenolindophenol standard solution. *1027301.*

Dissolve 50.0 mg of *dichlorophenolindophenol, sodium salt R* in 100.0 ml of *water R* and filter.

Standardisation. Dissolve 20.0 mg of *ascorbic acid R* in 10 ml of a freshly prepared 200 g/l solution of *metaphosphoric acid R* and dilute to 250.0 ml with *water R*. Titrate 5.0 ml rapidly with the dichloro-phenolindophenol standard solution, added from a microburette graduated in 0.01 ml, until the pink colour persists for 10 s, the titration occupying not more than 2 min. Dilute the dichlorophenolindophenol solution with *water R* to make 1 ml of the solution equivalent to 0.1 mg of ascorbic acid ($C_6H_8O_6$).

Storage: use within 3 days.

Standardise immediately before use.

5,7-Dichloroquinolin-8-ol. $C_9H_5Cl_2NO$. (M_r 214.1). *1157000.* [773-76-2]. 5,7-Dichlorooxine.

Yellow, crystalline powder, soluble in acetone, slightly soluble in ethanol (96 per cent).

mp: about 179 °C.

Content: minimum 95.0 per cent of $C_9H_5Cl_2NO$.

Dichloroquinonechlorimide. $C_6H_2Cl_3NO$. (M_r 210.4). *1027400.* [101-38-2]. 2,6-Dichloro-*N*-chloro-1,4-benzoquinone mono-imine.

A pale yellow or greenish-yellow crystalline powder, practically insoluble in water, soluble in alcohol and in dilute alkaline solutions.

mp: about 66 °C.

Dichlorvos. $C_4H_7Cl_2O_4P$. (M_r 221). *1101200.* [62-73-7]. 2,2-Dichlorovinyl dimethyl phosphate.

Colourless or brownish-yellow liquid, soluble in water, miscible with most organic solvents.

n_D^{25}: about 1.452.

Dicyclohexyl. $C_{12}H_{22}$. (M_r 166.3). *1135300.* [92-51-3]. Bicyclohexyl.

d_{20}^{20}: about 0.864.

bp: about 227 °C.

mp: about 4 °C.

Dicyclohexylamine. $C_{12}H_{23}N$. (M_r 181.3). *1027500.* [101-83-7]. *N,N*-Dicyclohexylamine.

Colourless liquid, sparingly soluble in water, miscible with the usual organic solvents.

n_D^{20}: about 1.484.

bp: about 256 °C.

Freezing point (*2.2.18*): 0 °C to 1 °C.

Dicyclohexylurea. $C_{13}H_{24}N_2O$. (M_r 224.4). *1027600.* [2387-23-7]. 1,3-Dicyclohexylurea.

A white or almost white, crystalline powder.

mp: about 232 °C.

Didocosahexaenoin. $C_{47}H_{68}O_5$. (M_r 713.0). *1142700.* [88315-12-2]. Diglyceride of docosahexaenoic acid (C22:6). Glycerol didocosahexaenoate. (*all-Z*)-Docosahexaenoic acid, diester with propane-1,2,3-triol.

Didodecyl 3,3′-thiodipropionate. $C_{30}H_{58}O_4S$. (M_r 514.8). *1027700.* [123-28-4].

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in light petroleum, slightly soluble in alcohol.

mp: about 39 °C.

Dieldrin. $C_{12}H_8Cl_6O$. (M_r 380.9). *1126200.* [60-57-1].

bp: about 385 °C.

mp: about 176 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Diethanolamine. $C_4H_{11}NO_2$. (M_r 105.1). *1027800.* [111-42-2]. 2,2′-Iminobisethanol.

A viscous, clear, slightly yellow liquid or deliquescent crystals melting at about 28 °C, very soluble in water, in acetone and in methanol.

d_{20}^{20}: about 1.09.

pH (*2.2.3*): 10.0 to 11.5 for a 50 g/l solution.

Diethanolamine used in the test for alkaline phosphatase complies with the following additional test.

Ethanolamine: maximum 1.0 per cent. Examine by gas chromatography (*2.2.28*), using *3-aminopropanol R* as the internal standard.

Internal standard solution. Dissolve 1.00 g of *3-aminopropanol R* in *acetone R* and dilute to 10.0 ml with the same solvent.

Test solution (a). Dissolve 5.00 g of the substance to be examined in *acetone R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 5.00 g of the substance to be examined in *acetone R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with the same solvent.

Reference solutions. Dissolve 0.50 g of *ethanolamine R* in *acetone R* and dilute to 10.0 ml with the same solvent. To 0.5 ml, 1.0 ml and 2.0 ml of this solution, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *acetone R*.

The chromatographic procedure may be carried out using:

- a column 1 m long and 4 mm in internal diameter packed with *diphenylphenylene oxide polymer R* (180 µm to 250 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 40 ml/min,
- a flame-ionisation detector.

Maintain the temperature of the column at 125 °C for 3 min and then raise to 300 °C at a rate of 12 °C/min. Maintain the temperature of the injection port at 250 °C and that of the detector at 280 °C. Inject 1.0 µl of each test solution and 1.0 µl of each reference solution.

Storage: in an airtight container.

Diethoxytetrahydrofuran. $C_8H_{16}O_3$. (M_r 160.2). *1027900.* [3320-90-9]. 2,5-Diethoxytetrahydrofuran. A mixture of the *cis* and *trans* isomers.

A clear, colourless or slightly yellowish liquid, practically insoluble in water, soluble in alcohol and in most other organic solvents.

d_{20}^{20}: about 0.98.

n_D^{20}: about 1.418.

Diethylamine. $C_4H_{11}N$. (M_r 73.1). *1028000.* [109-89-7].

A clear, colourless, flammable liquid, strongly alkaline, miscible with water and with alcohol.

d_{20}^{20}: about 0.71.

bp: about 55 °C.

Diethylaminoethyldextran. *1028200.*

Anion exchange resin presented as the hydrochloride.

A powder forming gels with water.

***N,N*-Diethylaniline.** $C_{10}H_{15}N$. (M_r 149.2). *1028400.* [91-66-7].

d_{20}^{20}: about 0.938.

bp: about 217 °C.

mp: about – 38 °C.

Diethylene glycol. $C_4H_{10}O_3$. (M_r 106.1). *1028300.* [111-46-6]. 2,2′-Oxydiethanol.

Content: minimum 99.5 per cent *m/m* of $C_4H_{10}O_3$.

A clear, colourless liquid, hygroscopic, miscible with water, with acetone and with alcohol.

d_{20}^{20}: about 1.118.

n_D^{20}: about 1.447.

bp: 244 °C to 246 °C.

Storage: in an airtight container.

***N,N*-Diethylethane-1,2-diamine.** *1028500.* [100-36-7].

See *N,N-diethylethylenediamine R*.

***N,N*-Diethylethylenediamine.** $C_6H_{16}N_2$. (M_r 116.2). *1028500.* [100-36-7].

Content: minimum 98.0 per cent of $C_6H_{16}N_2$.

A slightly oily liquid, colourless or slightly yellow, strong odour of ammonia, irritant to the skin, eyes and mucous membranes.

d_{20}^{20}: 0.827.

bp: 145 °C to 147 °C.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.500 g.

Di(2-ethylhexyl) phthalate. $C_{24}H_{38}O_4$. (M_r 390.5). *1028100.* Di(2-ethylhexyl) benzene-1,2-dicarboxylate.

A colourless, oily liquid, practically insoluble in water, soluble in organic solvents.

d_{20}^{20}: about 0.98.

n_D^{20}: about 1.486.

Viscosity (*2.2.9*): about 80 mPa·s.

Diethylphenylenediamine sulphate. $C_{10}H_{18}N_2O_4S$. (M_r 262.3). *1028600.* [6283-63-2]. *N,N'*-Diethyl-*p*-phenylenediamine sulphate. *N,N'*-Diethylbenzene-1,4-diamine sulphate.

A white or slightly yellow powder, soluble in water.

mp: about 185 °C, with decomposition.

Storage: protected from light.

Diethylphenylenediamine sulphate solution. *1028601.*

To 250 ml of *water R* add 2 ml of *sulphuric acid R* and 25 ml of *0.02 M sodium edetate.* Dissolve in this solution 1.1 g of *diethylphenylenediamine sulphate R* and dilute to 1000 ml with *water R.*

Do not use if the solution is not colourless.

Storage: protected from light and heat for 1 month.

Digitonin. $C_{56}H_{92}O_{29}$. (M_r 1229). *1028700.* [11024-24-1]. 3β-[*O*-β-D-Glucopyranosyl-(1→3)-*O*-β-D-galactopyranosyl-(1→2)-*O*-[β-D-xylopyranosyl-(1→3)]-*O*-β-D-galactopyranosyl-(1→4)-*O*-β-D-galactopyranosyloxy]-(25*R*)-5α-spirostan-2α, 15β-diol.

Crystals, practically insoluble in water, sparingly soluble in ethanol, slightly soluble in alcohol.

Digitoxin. *1028800.* [71-63-6].

See *Digitoxin (0078).*

Dihydrocapsaicin. $C_{18}H_{29}NO_3$. (M_r 307.4). *1148100.* [19408-84-5]. *N*-[(4-Hydroxy-3-methoxyphenyl)methyl]-8-methylnonanamide.

White or almost white, crystalline powder, practically insoluble in cold water, freely soluble in ethanol.

10,11-Dihydrocarbamazepine. $C_{15}H_{14}N_2O$. (M_r 238.3). *1028900.* [3564-73-6]. 10,11-Dihydro-5*H*-dibenzo[*b, f*]azepine-5-carboxamide.

mp: 205 °C to 210 °C.

Dihydrocarvone. $C_{10}H_{16}O$. (M_r 152.2). *1160900.* [7764-50-3]. *p*-Menth-8-en-2-one. 2-Methyl-5-(1-methylethenyl)cyclohexanone.

Dihydrocarvone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chromatographic profile in the monograph on *Caraway oil (1817).*

Content calculated by the normalisation procedure:

- *major component (trans-dihydrocarvone)*: minimum 70 per cent;
- *sum of cis- and trans-dihydrocarvone*: minimum 98 per cent.

2,5-Dihydroxybenzoic acid. $C_7H_6O_4$. (M_r 154.1). *1148200.* [490-79-9]. Gentisic acid.

Light yellow crystals.

mp: about 200 °C.

5,7-Dihydroxy-4-methylcoumarin. $C_{10}H_8O_4$. (M_r 192.2). *1149400.* [2107-76-8]. 5,7-Dihydroxy-4-methyl-2*H*-1-benzopyran-2-one.

Light yellowish powder, practically insoluble in water, sparingly soluble in alcohol.

mp: 295 °C to 303 °C.

Dihydroxynaphthalene. *1029000.* [132-86-5].

See *1,3-dihydroxynaphthalene R.*

1,3-Dihydroxynaphthalene. $C_{10}H_8O_2$. (M_r 160.2). *1029000.* [132-86-5]. Naphthalene-1,3-diol.

A crystalline, generally brownish-violet powder, freely soluble in water and in alcohol.

mp: about 125 °C.

2,7-Dihydroxynaphthalene. $C_{10}H_8O_2$. (M_r 160.2). *1029100.* [582-17-2]. Naphthalene-2,7-diol.

Needles, soluble in water and in alcohol.

mp: about 190 °C.

2,7-Dihydroxynaphthalene solution. *1029101.*

Dissolve 10 mg of *2,7-dihydroxynaphthalene R* in 100 ml of *sulphuric acid R* and allow to stand until decolorised.

Storage: use within 2 days.

5,7-Diiodoquinolin-8-ol. $C_9H_5I_2NO$. (M_r 397.0). *1157100.* [83-73-8]. 5,7-Diiodooxine.

Yellowish-brown powder, sparingly soluble in acetone and in ethanol (96 per cent).

Content: minimum 95.0 per cent of $C_9H_5I_2NO$.

Di-isobutyl ketone. $C_9H_{18}O$. (M_r 142.2). *1029200.* [108-83-8].

A clear, colourless liquid, slightly soluble in water, miscible with most organic solvents.

n_D^{20}: about 1.414

bp: about 168 °C.

Di-isopropyl ether. $C_6H_{14}O$. (M_r 102.2). *1029300.* [108-20-3].

A clear, colourless liquid, very slightly soluble in water, miscible with alcohol.

d_{20}^{20}: 0.723 to 0.728.

bp: 67 °C to 69 °C.

Do not distil if the di-isopropyl ether does not comply with the test for peroxides.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

The name and concentration of any added stabiliser are stated on the label.

Storage: protected from light.

***N,N'*-Diisopropylethylenediamine.** $C_8H_{20}N_2$. (M_r 144.3). *1140600.* [4013-94-9]. *N,N'*-bis(1-Methylethyl)-1,2-ethanediamine.

Colourless to yellowish, corrosive, flammable, hygroscopic liquid.

d_{20}^{20}: about 0.798.

n_D^{20}: about 1.429.

bp: about 170 °C.

4,4′-Dimethoxybenzophenone. $C_{15}H_{14}O_3$. (M_r 242.3). *1126300.* [90-96-0]. bis(4-Methoxyphenyl)methanone.

A white or almost white powder, practically insoluble in water and slightly soluble in alcohol.

mp: about 142 °C.

Dimethoxypropane. $C_5H_{12}O_2$. (M_r 104.1). *1105200.* [77-76-9]. 2,2-Dimethoxypropane.

A colourless liquid, decomposing on exposure to moist air or water.

d_{20}^{20}: about 0.847.

n_D^{20}: about 1.378.

bp: about 83 °C.

Dimethylacetamide. C_4H_9NO. (M_r 87.1). *1029700.* [127-19-5]. *N,N*-Dimethylacetamide.

Content: minimum 99.5 per cent of C_4H_9NO.

A colourless liquid, miscible with water and with many organic solvents.

d_{20}^{20}: about 0.94.

n_D^{20}: about 1.437.

bp: about 165 °C.

Dimethylamine. C_2H_7N. (M_r 45.08). *1168900.* [124-40-3]. *N*-methylmethanamine.

Colourless, flammable gas.

bp: about 7 °C.

mp: about –92.2 °C.

Dimethylamine solution. *1168901.*

A 400 g/l solution.

Clear, colourless solution.

Density: about 0.89.

bp: about 54 °C.

mp: about –37 °C.

Dimethylaminobenzaldehyde. $C_9H_{11}NO$. (M_r 149.2). *1029800.* [100-10-7]. 4-Dimethylaminobenzaldehyde.

White or yellowish-white crystals, soluble in alcohol and in dilute acids.

mp: about 74 °C.

Dimethylaminobenzaldehyde solution R1. *1029801.*

Dissolve 0.2 g of *dimethylaminobenzaldehyde R* in 20 ml of *alcohol R* and add 0.5 ml of *hydrochloric acid R*. Shake the solution with *activated charcoal R* and filter. The colour of the reagent is less intense than that of *iodine solution R3*. Prepare immediately before use.

Dimethylaminobenzaldehyde solution R2. *1029802.*

Dissolve 0.2 g of *dimethylaminobenzaldehyde R*, without heating, in a mixture of 4.5 ml of *water R* and 5.5 ml of *hydrochloric acid R*. Prepare immediately before use.

Dimethylaminobenzaldehyde solution R6. *1029803.*

Dissolve 0.125 g of *dimethylaminobenzaldehyde R* in a cooled mixture of 35 ml of *water R* and 65 ml of *sulphuric acid R*. Add 0.1 ml of a 50 g/l solution of *ferric chloride R*. Before use allow to stand for 24 h, protected from light.

Storage: when stored at room temperature it must be used within 1 week; when kept in a refrigerator, it may be stored for several months.

Dimethylaminobenzaldehyde solution R7. *1029804.*

Dissolve 1.0 g of *dimethylaminobenzaldehyde R* in 50 ml of *hydrochloric acid R* and add 50 ml of *alcohol R*.

Storage: protected from light; use within 4 weeks.

Dimethylaminobenzaldehyde solution R8. *1029805.*

Dissolve 0.25 g of *dimethylaminobenzaldehyde R* in a mixture of 5 g of *phosphoric acid R*, 45 g of *water R* and 50 g of *anhydrous acetic acid R*. Prepare immediately before use.

4-Dimethylaminocinnamaldehyde. $C_{11}H_{13}NO$. (M_r 175.2). *1029900.* [6203-18-5]. 3-(4-Dimethylaminophenyl)prop-2-enal.

Orange to orange-brown crystals or powder. Sensitive to light.

mp: about 138 °C.

4-Dimethylaminocinnamaldehyde solution. *1029901.*

Dissolve 2 g of *4-dimethylaminocinnamaldehyde R* in a mixture of 100 ml of *hydrochloric acid R1* and 100 ml of *ethanol R*. Dilute the solution to four times its volume with *ethanol R* immediately before use.

2-(Dimethylamino)ethyl methacrylate. $C_8H_{15}NO_2$. (M_r 157.2). *1147200.* [2867-47-2]. 2-(Dimethylamino)ethyl 2-methylpropenoate.

d_4^{20}: about 0.930.

bp: about 187 °C.

Dimethylaminonaphthalenesulphonyl chloride. $C_{12}H_{12}ClNO_2S$. (M_r 269.8). *1030000.* [605-65-2]. 5-Dimethyl-amino-1-naphthalenesulphonyl chloride.

A yellow, crystalline powder, slightly soluble in water, soluble in methanol.

mp: about 70 °C.

3-Dimethylaminophenol. $C_8H_{11}NO$. (M_r 137.2). *1156500.* [99-07-0]. 3-(Dimethylamino)phenol.

Grey powder, slightly soluble in water.

mp: about 80 °C.

Dimethylaniline. $C_8H_{11}N$. (M_r 121.2). *1030100.* [121-69-7]. *N,N*-Dimethylaniline.

A clear, oily liquid, almost colourless when freshly distilled, darkening on storage to reddish-brown, practically insoluble in water, freely soluble in alcohol.

n_D^{20}: about 1.558.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 192 °C and 194 °C.

***N,N*-Dimethylaniline.** *1030100.* [121-69-7].

See *Dimethylaniline R*.

2,3-Dimethylaniline. $C_8H_{11}N$. (M_r 121.2). *1105300.* [87-59-2]. 2,3-Xylidine.

A yellowish liquid, sparingly soluble in water, soluble in alcohol.

d_{20}^{20}: 0.993 to 0.995.

n_D^{20}: about 1.569.

bp: about 224 °C.

2,6-Dimethylaniline. $C_8H_{11}N$. (M_r 121.2). *1030200.* [87-62-7]. 2,6-Xylidine.

A colourless liquid, sparingly soluble in water, soluble in alcohol.

d_{20}^{20}: about 0.98.

2,6-Dimethylaniline hydrochloride. $C_8H_{12}ClN$. (M_r 157.6). *1169000.* [21436-98-6]. 2,6-Dimethylbenzenamide hydrochloride. 2,6-Xylidine hydrochloride.

Content: minimum 98.0 per cent.

2,4-Dimethyl-6-*tert*-butylphenol. $C_{12}H_{18}O$. (M_r 178.3). *1126500.* [1879-09-0].

Dimethyl carbonate. $C_3H_6O_3$. (M_r 90.1). *1119300.* [616-38-6]. Carbonic acid dimethyl ester.

Liquid, insoluble in water, miscible with alcohol.

d_4^{17}: 1.065.

n_D^{20}: 1.368.

bp: about 90 °C.

Dimethyl-β-cyclodextrin. $C_{56}H_{98}O_{35}$. (M_r 1331). *1169100.* [51166-71-3]. Heptakis(2,6-di-*O*-methyl)cyclomaltoheptaose. Cycloheptakis-(1→4)-(2,6-di-*O*-methyl-α-D-glucopyranosyl). $2^A,2^B,2^C,2^D,2^E,2^F,2^G,6^A,6^B,6^C,6^D,6^E,6^F,6^G$-Tetradeca-*O*-methyl-β-cyclodextrin.

White or almost white powder.

Dimethyldecylamine. $C_{12}H_{27}N$. (M_r 185.4). *1113500.* [1120-24-7]. *N,N*-dimethyldecylamine.

Content: minimum 98.0 per cent *m/m* of $C_{12}H_{27}N$.

bp: about 234 °C.

1,1-Dimethylethylamine. $C_4H_{11}N$. (M_r 73.1). *1100900.* [75-64-9]. 2-Amino-2-methylpropane. *tert*-Butylamine.

Liquid, miscible with alcohol.

d_{20}^{20}: about 0.694.

n_D^{20}: about 1.378.

bp: about 46 °C.

1,1-Dimethylethyl methyl ether. $C_5H_{12}O$. (M_r 88.1). *1013900.* [1634-04-4]. 2-Methoxy-2-methylpropane. *tert*-Butyl methyl ether.

A colourless, clear, flammable liquid.

n_D^{20}: about 1.376.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 50 per cent at 240 nm, 80 per cent at 255 nm, 98 per cent at 280 nm.

1,1-Dimethylethyl methyl ether R1. *1126400.*

Content: minimum 99.5 per cent of $C_5H_{12}O$.

d_{20}^{20}: about 0.741.

n_D^{20}: about 1.369.

bp: about 55 °C.

Dimethylformamide. C_3H_7NO. (M_r 73.1). *1030300.* [68-12-2].

A clear, colourless neutral liquid, miscible with water and with alcohol.

d_{20}^{20}: 0.949 to 0.952.

bp: about 153 °C.

Water (*2.5.12*): maximum 0.1 per cent.

Dimethylformamide diethylacetal. $C_7H_{17}NO_2$. (M_r 147.2). *1113600.* [1188-33-6]. *N,N*-Dimethylformamide diethylacetal.

n_D^{20}: about 1.40.

bp: 128 °C to 130 °C.

***N,N*-Dimethylformamide dimethylacetal.** $C_5H_{13}NO_2$. (M_r 119.2). *1140700.* [4637-24-5]. 1,1-Dimethoxytrimethylamine.

Clear, colourless liquid.

d_{20}^{20}: about 0.896.

n_D^{20}: about 1.396.

bp: about 103 °C.

Dimethylglyoxime. $C_4H_8N_2O_2$. (M_r 116.1). *1030400.* [95-45-4]. 2,3-Butanedione dioxime.

A white or almost white, crystalline powder or colourless crystals, practically insoluble in cold water, very slightly soluble in boiling water, soluble in alcohol.

mp: about 240 °C, with decomposition.

Sulphated ash (*2.4.14*): maximum 0.05 per cent.

1,3-Dimethyl-2-imidazolidinone. $C_5H_{10}N_2O$. (M_r 114.2). *1135400.* [80-73-9]. *N,N'*-Dimethylethylene urea. 1,3-Dimethyl-2-imidazolidone.

n_D^{20}: 1.4720.

bp: about 224 °C.

***N,N*-Dimethyloctylamine.** $C_{10}H_{23}N$. (M_r 157.3). *1030500.* [7378-99-6]. Octyldimethylamine.

Colourless liquid.

d_{20}^{20}: about 0.765.

n_D^{20}: about 1.424.

bp: about 195 °C.

2,5-Dimethylphenol. $C_8H_{10}O$. (M_r 122.2). *1162300.* [95-87-4]. *p*-Xylenol.

White or almost white crystals.

2,6-Dimethylphenol. $C_8H_{10}O$. (M_r 122.2). *1030600.* [576-26-1].

Colourless needles, slightly soluble in water, very soluble in alcohol.

bp: about 203 °C.

mp: 46 °C to 48 °C.

3,4-Dimethylphenol. $C_8H_{10}O$. (M_r 122.2). *1098100.* [95-65-8].

White or almost white crystals, slightly soluble in water, freely soluble in alcohol.

bp: about 226 °C.

mp: 25 °C to 27 °C.

***N,N*-Dimethyl-L-phenylalanine.** $C_{11}H_{15}NO_2$. (M_r 193.2). *1164000.* [17469-89-5]. (2*S*)-2-(Dimethylamino)-3-phenylpropanoic acid.

mp: about 226 °C.

Dimethylpiperazine. $C_6H_{14}N_2$. (M_r 114.2). *1030700.* [106-58-1]. 1,4-Dimethylpiperazine.

A colourless liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.85.

n_D^{20}: about 1.446.

bp: about 131 °C.

Dimethylstearamide. $C_{20}H_{41}NO$. (M_r 311.6). *1030800.* *N,N*-Dimethylstearamide.

A white or almost white solid mass, soluble in many organic solvents, including acetone.

mp: about 51 °C.

Dimethylstearylamide. *1030800.*

See *dimethylstearamide R*.

Dimethyl sulphone. $C_2H_6O_2S$. (M_r 94.1). *1030900.* [67-71-0].

A white or almost white, crystalline powder, freely soluble in water, soluble in acetone and alcohol.

mp: 108 °C to 110 °C.

Dimethyl sulphoxide. *1029500.* [67-68-5].

See *Dimethyl sulphoxide (0763).*

Dimethyl sulphoxide used in spectrophotometry complies with the following additional test.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 10 per cent at 262 nm, 35 per cent at 270 nm, 70 per cent at 290 nm, 98 per cent at 340 nm and at higher wavelengths.

Dimethyl sulphoxide R1. *1029501.*

Content: minimum 99.7 per cent of C_2H_6OS, determined by gas chromatography.

Dimeticone. *1105400.* [9016-00-6].

See *Dimeticone (0138).*

Dimidium bromide. $C_{20}H_{18}BrN_3$. (M_r 380.3). *1031100.* [518-67-2]. 3,8-Diamino-5-methyl-6-phenylphenanthridinium bromide.

Dark-red crystals, slightly soluble in water at 20 °C, sparingly soluble in water at 60 °C and in alcohol.

Dimidium bromide-sulphan blue mixed solution. *1031101.*

Dissolve separately 0.5 g of *dimidium bromide R* and 0.25 g of *sulphan blue R* in 30 ml of a hot mixture of 1 volume of *ethanol R* and 9 volumes of *water R*, stir, mix the two solutions, and dilute to 250 ml with the same mixture of solvents. Mix 20 ml of this solution with 20 ml of a 14.0 per cent *V/V* solution of *sulphuric acid R* previously diluted with about 250 ml of *water R* and dilute to 500 ml with *water R*.

Storage: protected from light.

Dinitrobenzene. $C_6H_4N_2O_4$. (M_r 168.1). *1031200.* [528-29-0]. 1,3-Dinitrobenzene.

Yellowish crystalline powder or crystals, practically insoluble in water, slightly soluble in alcohol.

mp: about 90 °C.

Dinitrobenzene solution. *1031201.*

A 10 g/l solution in *alcohol R*.

Dinitrobenzoic acid. $C_7H_4N_2O_6$. (M_r 212.1). *1031300.* [99-34-3]. 3,5-Dinitrobenzoic acid.

Almost colourless crystals, slightly soluble in water, very soluble in alcohol.

mp: about 206 °C.

Dinitrobenzoic acid solution. *1031301.*

A 20 g/l solution in *alcohol R*.

Dinitrobenzoyl chloride. $C_7H_3ClN_2O_5$. (M_r 230.6). *1031400.* [99-33-2]. 3,5-Dinitrobenzoyl chloride.

Translucent, yellow or greenish-yellow powder or yellowish crystals, soluble in acetone and in toluene.

mp: about 68 °C.

Suitability test. To 1 ml of *ethanol R* and 0.1 g of *dinitrobenzoyl chloride R* add 0.05 ml of *dilute sulphuric acid R* and boil under a reflux condenser for 30 min. After evaporation on a water-bath add 5 ml of *heptane R* to the residue and heat to boiling. Filter the hot solution. Wash the crystals formed on cooling to room temperature with a small quantity of *heptane R* and dry in a desiccator. The crystals melt (*2.2.14*) at 94 °C to 95 °C.

Dinitrophenylhydrazine. $C_6H_6N_4O_4$. (M_r 198.1). *1031500.* [119-26-6]. 2,4-Dinitrophenylhydrazine.

Reddish-orange crystals, very slightly soluble in water, slightly soluble in alcohol.

mp: about 203 °C (instantaneous method).

Dinitrophenylhydrazine-aceto-hydrochloric solution. *1031501.*

Dissolve 0.2 g of *dinitrophenylhydrazine R* in 20 ml of *methanol R* and add 80 ml of a mixture of equal volumes of *acetic acid R* and *hydrochloric acid R1*. Prepare immediately before use.

Dinitrophenylhydrazine-hydrochloric solution. *1031502.*

Dissolve by heating 0.50 g of *dinitrophenylhydrazine R* in *dilute hydrochloric acid R* and complete to 100 ml with the same solvent. Allow to cool and filter. Prepare immediately before use.

Dinitrophenylhydrazine-sulphuric acid solution. *1031503.*

Dissolve 1.5 g of *dinitrophenylhydrazine R* in 50 ml of a 20 per cent *V/V* solution of *sulphuric acid R*. Prepare immediately before use.

Dinonyl phthalate. $C_{26}H_{42}O_4$. (M_r 418.6). *1031600.* [28553-12-0].

A colourless to pale yellow, viscous liquid.

d_{20}^{20}: 0.97 to 0.98.

n_D^{20}: 1.482 to 1.489.

Acidity. Shake 5.0 g with 25 ml of *water R* for 1 min. Allow to stand, filter the separated aqueous layer and add 0.1 ml of *phenolphthalein solution R*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution (0.05 per cent, calculated as phthalic acid).

Water (*2.5.12*): maximum 0.1 per cent.

Dioctadecyl disulphide. $C_{36}H_{74}S_2$. (M_r 571.1). *1031700.* [2500-88-1].

A white or almost white powder, practically insoluble in water.

mp: 53 °C to 58 °C.

2,2′-Di(octadecyloxy)-5,5′-spirobi(1,3,2-dioxaphosphorinane). $C_{41}H_{82}O_6P_2$. (M_r 733). *1031800.*

White or almost white, waxy solid, practically insoluble in water, soluble in hydrocarbons.

mp: 40 °C to 70 °C.

Dioctadecyl 3,3′-thiodipropionate. $C_{42}H_{82}O_4S$. (M_r 683). *1031900.* [693-36-7].

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, in alcohol and in light petroleum.

mp: 58 °C to 67 °C.

Dioxan. $C_4H_8O_2$. (M_r 88.1). *1032000.* [123-91-1]. 1,4-Dioxan.

A clear, colourless liquid, miscible with water and with most organic solvents.

d_{20}^{20}: about 1.03.

Freezing-point (*2.2.18*): 9 °C to 11 °C.

Water (*2.5.12*): maximum 0.5 per cent.

Do not distil if the dioxan does not comply with the test for peroxides.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand in the dark for 30 min. No colour is produced.

Dioxan used for liquid scintillation is of a suitable analytical grade.

Dioxan solution. *1032002.*

Dilute 50.0 ml of *dioxan stock solution R* to 100.0 ml with *water R*. (0.5 mg/ml of dioxan).

Dioxan solution R1. *1032003.*

Dilute 10.0 ml of *dioxan solution R* to 50.0 ml with *water R*. (0.1 mg/ml of dioxan).

Dioxan stock solution. *1032001.*

Dissolve 1.00 g of *dioxan R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 50.0 ml with *water R* (1.0 mg/ml).

Diphenylamine. $C_{12}H_{11}N$. (M_r 169.2). *1032100.* [122-39-4].

White or almost white crystals, slightly soluble in water, soluble in alcohol.

mp: about 55 °C.

Storage: protected from light.

Diphenylamine solution. *1032101.*

A 1 g/l solution in *sulphuric acid R*.

Storage: protected from light.

Diphenylamine solution R1. *1032102.*

A 10 g/l solution in *sulphuric acid R*. The solution is colourless.

Diphenylamine solution R2. *1032103.*

Dissolve 1 g of *diphenylamine R* in 100 ml of *glacial acetic acid R* and add 2.75 ml of *sulphuric acid R*. Use immediately.

Diphenylanthracene. $C_{26}H_{18}$. (M_r 330.4). *1032200.* [1499-10-1]. 9,10-Diphenylanthracene.

Yellowish to yellow, crystalline powder, practically insoluble in water.

mp: about 248 °C.

Diphenylbenzidine. $C_{24}H_{20}N_2$. (M_r 336.4). *1032300.* [531-91-9]. *N,N'*-Diphenylbenzidine. *N,N'*-Diphenylbiphenyl-4,4′-diamine.

A white or faintly grey, crystalline powder, practically insoluble in water, slightly soluble in acetone and in alcohol.

mp: about 248 °C.

Nitrates. Dissolve 8 mg in a cooled mixture of 5 ml of *water R* and 45 ml of *nitrogen-free sulphuric acid R*. The solution is colourless or very pale blue.

Sulphated ash (*2.4.14*): maximum 0.1 per cent.

Storage: protected from light.

Diphenylboric acid aminoethyl ester. $C_{14}H_{16}BNO$. (M_r 225.1). *1032400.* [524-95-8].

A white or slightly yellow, crystalline powder, practically insoluble in water, soluble in alcohol.

mp: about 193 °C.

Diphenylcarbazide. $C_{13}H_{14}N_4O$. (M_r 242.3). *1032500.* [140-22-7]. 1,5-Diphenylcarbonodihydrazide.

A white or almost white, crystalline powder which gradually becomes pink on exposure to air, very slightly soluble in water, soluble in acetone, in alcohol and in glacial acetic acid.

mp: about 170 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent.

Storage: protected from light.

Diphenylcarbazide solution. *1032501.*

Dissolve 0.2 g of *diphenylcarbazide R* in 10 ml of *glacial acetic acid R* and dilute to 100 ml with *ethanol R*. Prepare immediately before use.

Diphenylcarbazone. $C_{13}H_{12}N_4O$. (M_r 240.3). *1032600.* [538-62-5]. 1,5-Diphenylcarbazone.

An orange-yellow, crystalline powder, practically insoluble in water, freely soluble in alcohol.

mp: about 157 °C, with decomposition.

Diphenylcarbazone mercuric reagent. *1032601.*

Solution I. Dissolve 0.1 g of *diphenylcarbazone R* in *ethanol R* and dilute to 50 ml with the same solvent.

Solution II. Dissolve 1 g of *mercuric chloride R* in *ethanol R* and dilute to 50 ml with the same solvent.

Mix equal volumes of the two solutions.

1,2-Diphenylhydrazine. $C_{12}H_{12}N_2$. (M_r 184.3). *1140800.* [122-66-7]. Hydrazobenzene. 1,2-Diphenyldiazane.

Orange powder.

mp: about 125 °C.

Diphenylmethanol. $C_{13}H_{12}O$. (M_r 184.2). *1145700.* [91-01-0]. Benzhydrol.

A white or almost white, crystalline powder.

mp: about 66 °C.

Diphenyloxazole. $C_{15}H_{11}NO$. (M_r 221.3). *1032700.* [92-71-7]. 2,5-Diphenyloxazole.

A white or almost white powder, practically insoluble in water, soluble in methanol, sparingly soluble in dioxan and in glacial acetic acid.

mp: about 70 °C.

$A_{1\ cm}^{1\%}$: about 1260 determined at 305 nm in *methanol R*.

Diphenyloxazole used for liquid scintillation is of a suitable analytical grade.

Diphenylphenylene oxide polymer. *1032800.* 2,6-Diphenyl-*p*-phenylene oxide polymer.

White or almost white, porous beads. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Diphosphorus pentoxide. P_2O_5. (M_r 141.9). *1032900.* [1314-56-3]. Phosphorus pentoxide. Phosphoric anhydride.

A white or almost white powder, amorphous, deliquescent. It is hydrated by water with the evolution of heat.

Storage: in an airtight container.

Dipotassium hydrogen phosphate. K_2HPO_4. (M_r 174.2). *1033000.* [7758-11-4].

A white or almost white, crystalline powder, hygroscopic, very soluble in water, slightly soluble in alcohol.

Storage: in an airtight container.

Dipotassium hydrogen phosphate trihydrate. $K_2HPO_4,3H_2O$. (M_r 228.2). *1157600.* [16788-57-1].

Colourless or white or almost white powder or crystals, freely soluble in water.

Dipotassium sulphate. K_2SO_4. (M_r 174.3). *1033100.* [7778-80-5].

Colourless crystals, soluble in water.

2,2′-Dipyridylamine. $C_{10}H_9N_3$. (M_r 171.2). *1157700.* [1202-34-2]. *N*-(Pyridin-2-yl)pyridin-2-amine.

mp: about 95 °C.

Disodium arsenate. $Na_2HAsO_4,7H_2O$. (M_r 312.0). *1102500.* [10048-95-0]. Disodium hydrogen arsenate heptahydrate. Dibasic sodium arsenate.

Crystals, efflorescent in warm air, freely soluble in water, soluble in glycerol, slightly soluble in alcohol. The aqueous solution is alcaline to litmus.

d_{20}^{20}: about 1.87.

mp: about 57 °C when rapidly heated.

Disodium bicinchoninate. $C_{20}H_{10}N_2Na_2O_4$. (M_r 388.3). *1126600.* [979-88-4]. Disodium 2,2′-biquinoline-4-4′-dicarboxylate.

Disodium hydrogen citrate. $C_6H_6Na_2O_7,1^1/_2H_2O$. (M_r 263.1). *1033200.* [144-33-2]. Sodium acid citrate. Disodium hydrogen 2-hydroxypropane-1,2,3-tricarboxylate sesquihydrate.

A white or almost white powder, soluble in less than 2 parts of water, practically insoluble in alcohol.

Disodium hydrogen phosphate. *1033300.* [10039-32-4].

See *Disodium phosphate dodecahydrate (0118).*

Disodium hydrogen phosphate solution. *1033301.*

A 90 g/l solution.

Disodium hydrogen phosphate, anhydrous. Na_2HPO_4. (M_r 142.0). *1033400.* [7558-79-4].

Disodium hydrogen phosphate dihydrate. *1033500.* [10028-24-7].

See *Disodium phosphate dihydrate (0602).*

Disodium tetraborate. *1033600.* [1303-96-4].

See *Borax (0013).*

Borate solution. *1033601.*

Dissolve 9.55 g of *disodium tetraborate R* in *sulphuric acid R*, heating on a water-bath, and dilute to 1 litre with the same acid.

Ditalimphos. $C_{12}H_{14}NO_4PS$. (M_r 299.3). *1126700.* [5131-24-8]. *O,O*-Diethyl (1,3-dihydro-1,3-dioxo-2*H*-isoindol-2-yl)phosphonothioate.

Very slightly soluble in water, in ethyl acetate and in ethanol.

A suitable certified reference solution may be used.

5,5′-Dithiobis(2-nitrobenzoic acid). $C_{14}H_8N_2O_8S_2$. (M_r 396.4). *1097300.* [69-78-3]. 3-Carboxy-4-nitrophenyldisulphide. Ellman's reagent. DTNB.

Yellow powder sparingly soluble in alcohol.

mp: about 242 °C.

Dithiol. $C_7H_8S_2$. (M_r 156.3). *1033800.* [496-74-2]. Toluene-3,4-dithiol. 4-Methylbenzene-1,2-dithiol.

White or almost white crystals, hygroscopic, soluble in methanol and in solutions of alkali hydroxides.

mp: about 30 °C.

Storage: in an airtight container.

Dithiol reagent. *1033801.*

To 1 g of *dithiol R* add 2 ml of *thioglycollic acid R* and dilute to 250 ml with a 20 g/l solution of *sodium hydroxide R*. Prepare immediately before use.

Dithiothreitol. $C_4H_{10}O_2S_2$. (M_r 154.2). *1098200.* [27565-41-9]. *threo*-1,4-Dimercaptobutane-2,3-diol.

Slightly hygroscopic needles, freely soluble in water, in acetone and in ethanol.

Storage: in an airtight container.

Dithizone. $C_{13}H_{12}N_4S$. (M_r 256.3). *1033900.* [60-10-6]. 1,5-Diphenylthiocarbazone.

A bluish-black, brownish-black or black powder, practically insoluble in water, soluble in alcohol.

Storage: protected from light.

Dithizone solution. *1033901.*

A 0.5 g/l solution in *chloroform R*. Prepare immediately before use.

Dithizone solution R2. *1033903.*

Dissolve 40.0 mg of *dithizone R* in *chloroform R* and dilute to 1000.0 ml with the same solvent. Dilute 30.0 ml of the solution to 100.0 ml with *chloroform R*.

Standardisation. Dissolve a quantity of *mercuric chloride R* equivalent to 0.1354 g of $HgCl_2$ in a mixture of equal volumes of *dilute sulphuric acid R* and *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 2.0 ml of this solution to 100.0 ml with a mixture of equal volumes of *dilute sulphuric acid R* and *water R*. (This solution contains 20 ppm of Hg). Transfer 1.0 ml of the solution to a separating funnel and add 50 ml of *dilute sulphuric acid R*, 140 ml of *water R* and 10 ml of a 200 g/l solution of *hydroxylamine hydrochloride R*. Titrate with the dithizone solution; after each addition, shake the mixture twenty times and towards the end of the titration allow to separate and discard the chloroform layer. Titrate until a bluish-green colour is obtained. Calculate the equivalent in micrograms of mercury per millilitre of the dithizone solution from the expression $20/V$, where V is the volume in millilitres of the dithizone solution used in the titration.

Dithizone R1. $C_{13}H_{12}N_4S$. (M_r 256.3). *1105500.* [60-10-6]. 1,5-Diphenylthiocarbazone.

Content: minimum 98.0 per cent of $C_{13}H_{12}N_4S$.

A bluish-black, brownish-black or black powder, practically insoluble in water, soluble in alcohol.

Storage: protected from light.

Divanadium pentoxide. V_2O_5. (M_r 181.9). *1034000.* [1314-62-1]. Vanadic anhydride.

Content: minimum 98.5 per cent of V_2O_5.

A yellow-brown to rust-brown powder, slightly soluble in water, soluble in strong mineral acids and in solutions of alkali hydroxides with formation of salts.

Appearance of solution. Heat 1 g for 30 min with 10 ml of *sulphuric acid R*. Allow to cool and dilute to 10 ml with the same acid. The solution is clear (*2.2.1*).

Sensitivity to hydrogen peroxide. Dilute 1.0 ml of the solution prepared for the test for appearance of solution cautiously to 50.0 ml with *water R*. To 0.5 ml of the solution add 0.1 ml of a solution of *hydrogen peroxide R* (0.1 g/l of H_2O_2). The solution has a distinct orange colour compared with a blank prepared from 0.5 ml of the solution to be examined and 0.1 ml of *water R*. After the addition of 0.4 ml of hydrogen peroxide solution (0.1 g/l H_2O_2), the orange solution becomes orange-yellow.

Loss on ignition: maximum 1.0 per cent, determined on 1.00 g at 700 ± 50 °C.

Assay. Dissolve 0.200 g with heating in 20 ml of a 70 per cent *m/m* solution of *sulphuric acid R*. Add 100 ml of *water R* and *0.02 M potassium permanganate* until a reddish colour is obtained. Decolorise the excess of potassium permanganate by the addition of a 30 g/l solution of *sodium nitrite R*. Add 5 g of *urea R* and 80 ml of a 70 per cent *m/m* solution of *sulphuric acid R*. Cool. Using 0.1 ml of *ferroin R* as indicator, titrate the solution immediately with *0.1 M ferrous sulphate* until a greenish-red colour is obtained.

1 ml of *0.1 M ferrous sulphate* is equivalent to 9.095 mg of V_2O_5.

Divanadium pentoxide solution in sulphuric acid. *1034001.*

Dissolve 0.2 g of *divanadium pentoxide R* in 4 ml of *sulphuric acid R* and dilute to 100 ml with *water R*.

Docosahexaenoic acid methyl ester. $C_{23}H_{34}O_2$. (M_r 342.5). *1142800.* [301-01-9]. DHA methyl ester. Cervonic acid methyl ester. (all-*Z*)-Docosa-4,7,10,13,16,19-hexaenoic acid methyl ester.

Content: minimum 90.0 per cent of $C_{23}H_{34}O_2$, determined by gas chromatography.

Docusate sodium. *1034100.* [577-11-7].

See *Docusate sodium (1418).*

Dodecyltrimethylammonium bromide. $C_{15}H_{34}BrN$. (M_r 308.4). *1135500.* [1119-94-4]. *N,N,N*-Trimethyldodecan-1-aminium bromide.

White or almost white crystals.

mp: about 246 °C.

D-Dopa. $C_9H_{11}NO_4$. (M_r 197.2). *1164100.* [5796-17-8]. (2*R*)-2-Amino-3-(3,4-dihydroxyphenyl)propanoic acid. 3-Hydroxy-D-tyrosine. 3,4-Dihydroxy-D-phenylalanine.

$[\alpha]_D^{20}$: + 9.5 to + 11.5, determined on a 10 g/l solution in *1 M hydrochloric acid*.

mp: about 277 °C.

Dotriacontane. $C_{32}H_{66}$. (M_r 450.9). *1034200.* [544-85-4]. *n*-Dotriacontane.

White or almost white plates, practically insoluble in water, sparingly soluble in hexane.

mp: about 69 °C.

Impurities. Not more than 0.1 per cent of impurities with the same t_R value as α-tocopherol acetate, determined by the gas chromatographic method prescribed in the monograph on *α-Tocopherol acetate (0439).*

Doxycycline. *1145800.*

See *Doxycycline monohydrate (0820).*

Echinacoside. $C_{35}H_{46}O_{20}$. (M_r 786.5). *1159400.* [82854-37-3]. β-(3′,4′-Dihydroxyphenyl)-ethyl-*O*-α-L-rhamnopyranosyl (1→3)-*O*-β-D-[β-D-glucopyranosyl(1→6)]-(4-*O*-caffeoyl)-glucopyranoside.

Pale yellow powder, odourless.

Electrolyte reagent for the micro determination of water. *1113700.*

Commercially available anhydrous reagent or a combination of anhydrous reagents for the coulometric titration of water, containing suitable organic bases, sulphur dioxide and iodide dissolved in a suitable solvent.

Elementary standard solution for atomic spectrometry (1.000 g/l). *5004000.*

This solution is prepared, generally in acid conditions, from the element or a salt of the element whose minimum content is not less than 99.0 per cent. The quantity per litre of solution is greater than 0.995 g throughout the guaranteed period, as long as the vial has not been opened. The starting material (element or salt) and the characteristics of the final solvent (nature and acidity, etc.) are mentioned on the label.

Emetine dihydrochloride. *1034300.* [316-42-7].

See *Emetine hydrochloride pentahydrate (0081).*

Emodin. $C_{15}H_{10}O_5$. (M_r 270.2). *1034400.* [518-82-1]. 1,3,8-Trihydroxy-6-methylanthraquinone.

Orange-red needles, practically insoluble in water, soluble in alcohol and in solutions of alkali hydroxides.

Chromatography. Examine as prescribed in the monograph on *Rhubarb (0291)*; the chromatogram shows only one principal spot.

α-Endosulphan. $C_9H_6Cl_6O_3S$. (M_r 406.9). *1126800.* [959-98-8].

bp: about 200 °C.

mp: about 108 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

β-Endosulphan. $C_9H_6Cl_6O_3S$. (M_r 406.9). *1126900.* [33213-65-9].

bp: about 390 °C.

mp: about 207 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Endrin. $C_{12}H_8Cl_6O$. (M_r 380.9). *1127000.* [72-20-8].

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Erucamide. $C_{22}H_{43}NO$. (M_r 337.6). *1034500.* [112-84-5]. (*Z*)-Docos-13-enoamide.

Yellowish or white powder or granules, practically insoluble in water, very soluble in methylene chloride, soluble in ethanol.

mp: about 70 °C.

Erythritol. *1113800.* [149-32-6].

See *Erythritol (1803).*

Esculin. $C_{15}H_{16}O_9,1^1/_2H_2O$. ($M_r$ 367.3). *1119400.* [531-75-9]. 6-(β-D-Glucopyranosyloxy)-7-hydroxy-2*H*-chromen-2-one.

A white to almost white powder or colourless crystals, sparingly soluble in water and in alcohol, freely soluble in hot water and in hot alcohol.

Chromatography (*2.2.27*). Examine as prescribed in the monograph on *Eleutherococcus (1419)*. The chromatogram shows only one principal spot.

Estradiol. $C_{18}H_{24}O_2$. (M_r 272.4). *1135600.* [50-28-2]. Estra-1,3,5(10)-triène-3,17β-diol. β-Estradiol.

Prisms stable in air, practically insoluble in water, freely soluble in alcohol, soluble in acetone and in dioxane, sparingly soluble in vegetable oils.

mp: 173 °C to 179 °C.

17α-Estradiol. $C_{18}H_{24}O_2$. (M_r 272.4). *1034600.* [57-91-0].

A white or almost white, crystalline powder or colourless crystals.

mp: 220 °C to 223 °C.

Estragole. $C_{10}H_{12}O$. (M_r 148.2). *1034700.* [140-67-0]. 1-Methoxy-4-prop-2-enylbenzene.

Liquid, miscible with alcohol.

n_D^{20}: about 1.52.

bp: about 216 °C.

Estragole used in gas chromatography complies with the following test.

Assay. Examine by gas chromatography (*2.2.28*) under the conditions described in the monograph on *Anise oil (0804)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

Ethanol. *1034800.* [64-17-5].

See *Ethanol, anhydrous R*.

Ethanol, anhydrous. *1034800.* [64-17-5].

See *Ethanol, anhydrous (1318)*.

Ethanol R1. *1034801.*

Complies with the requirements prescribed for the monograph *Ethanol, anhydrous (1318)* and with the following requirement.

Methanol: maximum 0.005 per cent *V/V*, determined by gas chromatography (*2.2.28*).

Test solution. Use the substance to be examined.

Reference solution. Dilute 0.50 ml of *anhydrous methanol R* to 100.0 ml with the substance to be examined. Dilute 1.0 ml of this solution to 100.0 ml with the substance to be examined.

The chromatographic procedure may be carried out using:

– a glass column 2 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinyl-benzene copolymer R* (75 µm to 100 µm),

– *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,

– a flame-ionisation detector.

Maintain the temperature of the column at 130 °C, that of the injection port at 150 °C and that of the detector at 200 °C.

Inject 1 µl of the test solution and 1 µl of the reference solution, alternately, three times. After each chromatography, heat the column to 230 °C for 8 min. Integrate the methanol peak. Calculate the percentage methanol content from the expression:

$$\frac{a \times b}{c - b}$$

a = percentage *V/V* content of methanol in the reference solution,

b = area of the methanol peak in the chromatogram obtained with the test solution,

c = area of the methanol peak in the chromatogram obtained with the reference solution.

Ethanol (96 per cent). *1002500.* [64-17-5].

See *Ethanol (96 per cent) (1317)*.

Ethanol (*x* per cent *V/V*). *1002502.*

Mix appropriate volumes of *water R* and *ethanol (96 per cent) R*, allowing for the effects of warming and volume contraction inherent to the preparation of such a mixture, to obtain a solution whose final content of ethanol corresponds to the value of *x*.

Ethanolamine. C_2H_7NO. (M_r 61.1). *1034900.* [141-43-5]. 2-Aminoethanol.

A clear, colourless, viscous, hygroscopic liquid, miscible with water and with methanol.

d_{20}^{20}: about 1.04.

n_D^{20}: about 1.454.

mp: about 11 °C.

Storage: in an airtight container.

Ether. $C_4H_{10}O$. (M_r 74.1). *1035000.* [60-29-7].

A clear, colourless, volatile and very mobile liquid, very flammable, hygroscopic, soluble in water, miscible with alcohol.

d_{20}^{20}: 0.713 to 0.715.

bp: 34 °C to 35 °C.

Do not distil if the ether does not comply with the test for peroxides.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand in the dark for 30 min. No colour is produced.

The name and concentration of any added stabilisers are stated on the label.

Storage: in an airtight container, protected from light, at a temperature not exceeding 15 °C.

Ether, peroxide-free. *1035100.*

See *Anaesthetic ether (0367)*.

Ethion. $C_9H_{22}O_4P_2S_4$. (M_r 384.5). *1127100.* [563-12-2].

mp: – 24 °C to – 25 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Ethoxychrysoidine hydrochloride. $C_{14}H_{17}ClN_4O$. (M_r 292.8). *1035200.* [2313-87-3]. 4-[(4-Ethoxyphenyl)diazenyl]phenylene-1,3-diamine hydrochloride.

A reddish powder, soluble in alcohol.

Ethoxychrysoidine solution. *1035201.*

A 1 g/l solution in *alcohol R*.

Test for sensitivity. To a mixture of 5 ml of *dilute hydrochloric acid R* and 0.05 ml of the ethoxy-chrysoidine solution add 0.05 ml of *0.0167 M bromide-bromate*. The colour changes from red to light yellow within 2 min.

Ethyl acetate. $C_4H_8O_2$. (M_r 88.1). *1035300.* [141-78-6].

A clear, colourless liquid, soluble in water, miscible with alcohol.

d_{20}^{20}: 0.901 to 0.904.

bp: 76 °C to 78 °C.

Ethyl acetate, treated. *1035301.*

Disperse 200 g of *sulphamic acid R* in *ethyl acetate R* and make up to 1000 ml with the same solvent. Stir the suspension obtained for three days and filter through a filter paper.

Storage: use within 1 month.

Ethyl acrylate. $C_5H_8O_2$. (M_r 100.1). *1035400.* [140-88-5]. Ethyl prop-2-enoate.

A colourless liquid.

d_{20}^{20}: about 0.924.

n_D^{20}: about 1.406.

bp: about 99 °C.

mp: about – 71 °C.

4-[(Ethylamino)methyl]pyridine. $C_8H_{12}N_2$. (M_r 136.2). *1101300.* [33403-97-3].

A pale yellow liquid.

d_{20}^{20}: about 0.98.

n_D^{20}: about 1.516.

bp: about 98 °C.

Ethylbenzene. C_8H_{10}. (M_r 106.2). *1035800.* [100-41-4].

Content: minimum 99.5 per cent *m/m* of C_8H_{10}, determined by gas chromatography. A clear, colourless liquid, practically insoluble in water, soluble in acetone, and in alcohol.

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.496.

bp: about 135 °C.

Ethyl benzoate. $C_9H_{10}O_2$. (M_r 150.2). *1135700.* [93-89-0].

A clear, colourless, refractive liquid, practically insoluble in water, miscible with alcohol and with light petroleum.

d_4^{25}: about 1.050.

n_D^{20}: about 1.506.

bp: 211 °C to 213 °C.

Ethyl 5-bromovalerate. $C_7H_{13}BrO_2$. (M_r 209.1). *1142900.* [14660-52-7]. Ethyl 5-bromopentanoate.

Clear, colourless liquid.

d_{20}^{20}: about 1.321.

bp: 104 °C to 109 °C.

Ethyl cyanoacetate. $C_5H_7NO_2$. (M_r 113.1). *1035500.* [105-56-6].

A colourless to pale yellow liquid, slightly soluble in water, miscible with alcohol.

bp: 205 °C to 209 °C, with decomposition.

Ethylene chloride. $C_2H_4Cl_2$. (M_r 99.0). *1036000.* [107-06-2]. 1,2-Dichloroethane.

A clear, colourless liquid, soluble in about 120 parts of water and in 2 parts of alcohol.

d_{20}^{20}: about 1.25.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 82 °C and 84 °C.

Ethylenediamine. $C_2H_8N_2$. (M_r 60.1). *1036500.* [107-15-3]. Ethane-1,2-diamine.

A clear, colourless, fuming liquid, strongly alkaline, miscible with water and with alcohol.

bp: about 116 °C.

Ethylene bis[3,3-di(3-*tert*-butyl-4-hydroxyphenyl)butyrate]. *1035900.* [32509-66-3].

See *ethylene bis[3,3-di(3-(1,1-dimethylethyl)-4-hydroxyphenyl)butyrate] R*.

Ethylene bis[3,3-di(3-(1,1-dimethylethyl)-4-hydroxyphenyl)butyrate]. $C_{50}H_{66}O_8$. (M_r 795). *1035900.* [32509-66-3]. Ethylene bis[3,3-di(3-*tert*-butyl-4-hydroxyphenyl)butyrate].

A crystalline powder, practically insoluble in water and in light petroleum, very soluble in acetone and in methanol.

mp: about 165 °C.

(Ethylenedinitrilo)tetra-acetic acid. $C_{10}H_{16}N_2O_8$. (M_r 292.2). *1105800.* [60-00-4]. *N,N'*-1,2-Ethanediylbis[*N*-(carboxymethyl)glycine]. Edetic acid.

A white or almost white crystalline powder, very slightly soluble in water.

mp: about 250 °C, with decomposition.

Ethylene glycol. $C_2H_6O_2$. (M_r 62.1). *1036100.* [107-21-1]. Ethane-1,2-diol.

Content: minimum 99.0 per cent.

A colourless, slightly viscous liquid, hygroscopic, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: 1.113 to 1.115.

n_D^{20}: about 1.432.

bp: about 198 °C.

mp: about – 12 °C.

Acidity. To 10 ml add 20 ml of *water R* and 1 ml of *phenolphthalein solution R*. Not more than 0.15 ml of *0.02 M sodium hydroxide* is required to change the colour of the indicator to pink.

Water (*2.5.12*): maximum 0.2 per cent

Ethylene glycol monoethyl ether. $C_4H_{10}O_2$. (M_r 90.1). *1036200.* [110-80-5]. 2-Ethoxyethanol.

Content: minimum 99.0 per cent.

A clear, colourless liquid, miscible with water, with acetone and with ethanol (96 per cent).

d_{20}^{20}: about 0.93.

n_D^{25}: about 1.406

bp: about 135 °C.

Ethylene glycol monomethyl ether. $C_3H_8O_2$. (M_r 76.1). *1036300.* [109-86-4]. 2-Methoxyethanol.

Content: minimum 99.0 per cent.

A clear, colourless liquid, miscible with water, with acetone and with ethanol (96 per cent).

d_{20}^{20}: about 0.97.

n_D^{20}: about 1.403.

bp: about 125 °C.

Ethylene oxide. C_2H_4O. (M_r 44.05). *1036400.* [75-21-8]. Oxirane.

Colourless, flammable gas, very soluble in water and in ethanol.

Liquefaction point: about 12 °C.

Ethylene oxide solution. *1036402.*

Weigh a quantity of cool *ethylene oxide stock solution R* equivalent to 2.5 mg of ethylene oxide into a cool flask and dilute to 50.0 g with *macrogol 200 R1*. Mix well and dilute 2.5 g of this solution to 25.0 ml with *macrogol 200 R1* (5 µg of ethylene oxide per gram of solution). Prepare immediately before use.

Ethylene oxide solution R1. *1036403.*

Dilute 1.0 ml of cooled *ethylene oxide stock solution R* (check the exact volume by weighing) to 50.0 ml with *macrogol 200 R1*. Mix well and dilute 2.5 g of this solution to 25.0 ml with *macrogol 200 R1*. Calculate the exact amount of ethylene oxide in ppm from the volume determined by weighing and taking the relative density of *macrogol 200 R1* as 1.127. Prepare immediately before use.

Ethylene oxide solution R2. *1036404.*

Weigh 1.00 g of cold *ethylene oxide stock solution R* (equivalent to 2.5 mg of ethylene oxide) into a cold flask containing 40.0 g of cold *macrogol 200 R1*. Mix and determine the exact mass and dilute to a calculated mass to obtain a solution containing 50 µg of ethylene oxide per gram of solution. Weigh 10.00 g into a flask containing about 30 ml of *water R*, mix and dilute to 50.0 ml with *water R* (10 µg/ml of ethylene oxide). Prepare immediately before use.

Ethylene oxide solution R3. *1036405.*

Dilute 10.0 ml of *ethylene oxide solution R2* to 50.0 ml with *water R* (2 µg/ml of ethylene oxide). Prepare immediately before use.

Ethylene oxide solution R4. *1036407.*

Dilute 1.0 ml of *ethylene oxide stock solution R1* to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 25.0 ml with *water R*.

Ethylene oxide solution R5. *1036408.*

A 50 g/l solution of *ethylene oxide R* in *methylene chloride R*.

Either use a commercially available reagent or prepare the solution corresponding to the above-mentioned composition.

Ethylene oxide stock solution. *1036401.*

All operations carried out in the preparation of these solutions must be conducted in a fume-hood. The operator must protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask.

Store all solutions in an airtight container in a refrigerator at 4 °C to 8 °C. Carry out all determinations three times.

Into a dry, clean test-tube, cooled in a mixture of 1 part of *sodium chloride R* and 3 parts of crushed ice, introduce a slow current of *ethylene oxide R* gas, allowing condensation onto the inner wall of the test-tube. Using a glass syringe, previously cooled to – 10 °C, inject about 300 µl (corresponding to about 0.25 g) of liquid *ethylene oxide R* into 50 ml of *macrogol 200 R1*. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption (M_{eo}). Dilute to 100.0 ml with *macrogol 200 R1*. Mix well before use.

Assay. To 10 ml of a 500 g/l suspension of *magnesium chloride R* in *ethanol R* add 20.0 ml of *0.1 M alcoholic hydrochloric acid* in a flask. Stopper and shake to obtain a saturated solution and allow to stand overnight to equilibrate. Weigh 5.00 g of *ethylene oxide stock solution (2.5 g/l) R* into the flask and allow to stand for 30 min. Titrate with *0.1 M alcoholic potassium hydroxide* determining the end-point potentiometrically (*2.2.20*).

Carry out a blank titration, replacing the substance to be examined with the same quantity of *macrogol 200 R1*.

Ethylene oxide content in milligrams per gram is given by:

$$\frac{(V_0 - V_1) \times f \times 4.404}{m}$$

Where V_0 and V_1 are the volumes of alcoholic potassium hydroxide used respectively for the blank titration and the assay,

f = factor of the alcoholic potassium hydroxide solution,

m = mass of the sample taken (g).

Ethylene oxide stock solution R1. *1036406.*

A 50 mg/ml solution of *ethylene oxide R* in *methanol R*.

Ethyl formate. $C_3H_6O_2$. (M_r 74.1). *1035600.* [109-94-4]. Ethyl methanoate.

A clear, colourless, flammable liquid, freely soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.919.

n_D^{20}: about 1.36.

bp: about 54 °C.

2-Ethylhexane-1,3-diol. $C_8H_{18}O_2$. (M_r 146.2). *1105900.* [94-96-2].

A slightly oily liquid, soluble in ethanol, 2-propanol, propylene glycol and castor oil.

d_{20}^{20}: about 0.942.

n_D^{20}: about 1.451.

bp: about 244 °C.

2-Ethylhexanoic acid. $C_8H_{16}O_2$. (M_r 144.2). *1036600.* [149-57-5].

A colourless liquid.

d_{20}^{20}: about 0.91.

n_D^{20}: about 1.425.

Related substances. Examine by gas chromatography (*2.2.28*). Inject 1 µl of a solution prepared as follows: suspend 0.2 g of the 2-ethylhexanoic acid in 5 ml of *water R*, add 3 ml of *dilute hydrochloric acid R* and 5 ml of *hexane R*, shake for 1 min, allow the layers to separate and use the upper layer. Carry out the chromatographic procedure as prescribed in the test for 2-ethylhexanoic acid in the monograph on *Amoxicillin sodium (0577)*. The sum of the

area of any peaks, apart from the principal peak and the peak due to the solvent, is not greater than 2.5 per cent of the area of the principal peak.

Ethyl 4-hydroxybenzoate. *1035700.* [120-47-8].

See *Ethyl parahydroxybenzoate R*.

***N*-Ethylmaleimide.** $C_6H_7NO_2$. (M_r 125.1). *1036700.* [128-53-0]. 1-Ethyl-1*H*-pyrrole-2,5-dione.

Colourless crystals, sparingly soluble in water, freely soluble in alcohol.

mp: 41 °C to 45 °C.

Storage: at a temperature of 2 °C to 8 °C.

Ethyl methyl ketone. *1054100.* [78-93-3].

See *methyl ethyl ketone R*.

2-Ethyl-2-methylsuccinic acid. $C_7H_{12}O_4$. (M_r 160.2). *1036800.* [631-31-2]. 2-Ethyl-2-methylbutanedioic acid.

mp: 104 °C to 107 °C.

Ethyl parahydroxybenzoate. *1035700.* [120-47-8].

See *Ethyl parahydroxybenzoate (0900)*.

2-Ethylpyridine. C_7H_9N. (M_r 107.2). *1133400.* [100-71-0].

Colourless or brownish liquid.

d_{20}^{20}: about 0.939.

n_D^{20}: about 1.496.

bp: about 149 °C.

Ethylvinylbenzene-divinylbenzene copolymer. *1036900.*

Porous, rigid, cross-linked polymer beads. Several grades are available with different sizes of bead. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Ethylvinylbenzene-divinylbenzene copolymer R1. *1036901.*

Porous, rigid, cross-linked polymer beads, with a nominal specific surface area of 500 m^2/g to 600 m^2/g and having pores with a mean diameter of 7.5 nm. Several grades are available with different sizes of beads. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Eugenol. $C_{10}H_{12}O_2$. (M_r 164.2). *1037000.* [97-53-0]. 4-Allyl-2-methoxyphenol.

A colourless or pale yellow, oily liquid, darkening on exposure to air and light and becoming more viscous, practically insoluble in water, miscible with alcohol and with fatty and essential oils.

d_{20}^{20}: about 1.07.

bp: about 250 °C.

Eugenol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Clove oil (1091)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

Storage: protected from light.

Euglobulins, bovine. *1037100.*

Use fresh bovine blood collected into an anticoagulant solution (for example, sodium citrate solution). Discard any haemolysed blood. Centrifuge at 1500 *g* to 1800 *g* at 15 °C to 20 °C to obtain a supernatant plasma poor in platelets. To 1 litre of bovine plasma add 75 g of *barium sulphate R* and shake for 30 min. Centrifuge at not less than 1500 *g* to 1800 *g* at 15 °C to 20 °C and draw off the clear supernatant liquid. Add 10 ml of a 0.2 mg/ml solution of *aprotinin R* and shake to ensure mixing. In a container with a minimum capacity of 30 litres in a chamber at 4 °C introduce 25 litres of *distilled water R* at 4 °C and add about 500 g of solid carbon dioxide. Immediately add, while stirring, the supernatant liquid obtained from the plasma. A white precipitate is formed. Allow to settle at 4 °C for 10 h to 15 h. Remove the clear supernatant solution by siphoning. Collect the precipitate by centrifuging at 4 °C. Suspend the precipitate by dispersing mechanically in 500 ml of *distilled water R* at 4 °C, shake for 5 min and collect the precipitate by centrifuging at 4 °C. Disperse the precipitate mechanically in 60 ml of a solution containing 9 g/l of *sodium chloride R* and 0.9 g/l *sodium citrate R* and adjust to pH 7.2 to 7.4 by adding a 10 g/l solution of *sodium hydroxide R*. Filter through a sintered glass filter (*2.1.2*); to facilitate the dissolution of the precipitate crush the particles of the precipitate with a suitable instrument. Wash the filter and the instrument with 40 ml of the chloride-citrate solution described above and dilute to 100 ml with the same solution. Freeze-dry the solution. The yields are generally 6 g to 8 g of euglobulins per litre of bovine plasma.

Test for suitability. For this test, prepare the solutions using *phosphate buffer solution pH 7.4 R* containing 30 g/l of *bovine albumin R*.

Into a test-tube 8 mm in diameter placed in a water-bath at 37 °C introduce 0.2 ml of a solution of a reference preparation of urokinase containing 100 IU/ml and 0.1 ml of a solution of *human thrombin R* containing 20 IU/ml. Add rapidly 0.5 ml of a solution containing 10 mg of bovine euglobulins per millilitre. A firm clot forms in less than 10 s. Note the time that elapses between the addition of the solution of bovine euglobulins and the lysis of the clot. The lysis time does not exceed 15 min.

Storage: protected from moisture at 4 °C; use within 1 year.

Euglobulins, human. *1037200.*

For the preparation, use fresh human blood collected into an anticoagulant solution (for example sodium citrate solution) or human blood for transfusion that has been collected in plastic blood bags and which has just reached its expiry date. Discard any haemolysed blood. Centrifuge at 1500 *g* to 1800 *g* at 15 °C to obtain a supernatant plasma poor in platelets. Iso-group plasmas may be mixed.

To 1 litre of the plasma add 75 g of *barium sulphate R* and shake for 30 min. Centrifuge at not less than 15 000 *g* at 15 °C and draw off the clear supernatant liquid. Add 10 ml of a solution of *aprotinin R* containing 0.2 mg/ml and shake to ensure mixing. In a container with a minimum capacity of 30 litres in a chamber at 4 °C introduce 25 litres of *distilled water R* at 4 °C and add about 500 g of solid carbon dioxide. Immediately add while stirring the supernatant liquid obtained from the plasma. A white precipitate is formed. Allow to settle at 4 °C for 10 h to 15 h. Remove the clear supernatant solution by siphoning. Collect the precipitate by centrifuging at 4 °C. Suspend the precipitate by dispersing mechanically in 500 ml of *distilled water R* at 4 °C, shake for 5 min and collect the precipitate by centrifuging at 4 °C. Disperse the precipitate mechanically in 60 ml of a solution containing 9 g/l of *sodium chloride R* and 0.9 g/l of *sodium citrate R*, and adjust the pH to 7.2 to 7.4 by adding a 10 g/l solution of *sodium hydroxide R*. Filter through a sintered-glass filter (*2.1.2*); to facilitate the dissolution of the precipitate crush the particles of the precipitate with a suitable instrument. Wash the filter and the instrument

with 40 ml of the chloride-citrate solution described above and dilute to 100 ml with the same solution. Freeze-dry the solution. The yields are generally 6 g to 8 g of euglobulins per litre of human plasma.

Test for suitability. For this test, prepare the solutions using *phosphate buffer solution pH 7.2 R* containing 30 g/l of *bovine albumin R*. Into a test-tube 8 mm in diameter placed in a water-bath at 37 °C introduce 0.1 ml of a solution of a reference preparation of streptokinase containing 10 IU of streptokinase activity per millilitre and 0.1 ml of a solution of *human thrombin R* containing 20 IU/ml. Add rapidly 1 ml of a solution containing 10 mg of human euglobulins per millilitre. A firm clot forms in less than 10 s. Note the time that elapses between the addition of the solution of human euglobulins and the lysis of the clot. The lysis time does not exceed 15 min.

Storage: in an airtight container at 4 °C; use within 1 year.

Factor Xa, bovine, coagulation. *1037300.* [9002-05-5].

An enzyme which converts prothrombin to thrombin. The semi-purified preparation is obtained from liquid bovine plasma and it may be prepared by activation of the zymogen factor X with a suitable activator such as Russell's viper venom.

Store freeze-dried preparation at – 20 °C and frozen solution at a temperature lower than – 20 °C.

Factor Xa solution, bovine. *1037301.*

Reconstitute as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R*.

Any change in the absorbance of the solution, measured at 405 nm (*2.2.25*) against *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* and from which the blank absorbance has been substracted, is not more than 0.20 per minute.

Factor Xa solution, bovine R1. *1037302.*

Reconstitute as directed by the manufacturer and dilute to 1.4 nkat/ml with *tris(hydroxymethyl)aminomethane EDTA buffer solution pH 8.4 R*.

***(E,E)*-Farnesol.** $C_{15}H_{26}O$. (M_r 222.4). *1161000.* [106-28-5]. *trans,trans*-Farnesol. (2*E*,6*E*)-3,7,11-Trimethyldodeca-2,6,10-trien-1-ol.

Fast blue B salt. $C_{14}H_{12}Cl_2N_4O_2$. (M_r 339.2). *1037400.* [84633-94-3].

Schultz No. 490.

Colour Index No. 37235.
3,3′-Dimethoxy(biphenyl)-4,4′-bisdiazonium dichloride.

A dark green powder, soluble in water. It is stabilised by addition of zinc chloride.

Storage: in an airtight container, at a temperature between 2 °C and 8 °C.

Fast red B salt. $C_{17}H_{13}N_3O_9S_2$. (M_r 467.4). *1037500.* [56315-29-8].

Schultz No. 155.

Colour Index No. 37125.
2-Methoxy-4-nitrobenzenediazonium hydrogen naphthalene-1,5-disulphonate.

An orange-yellow powder, soluble in water, slightly soluble in alcohol.

Storage: in an airtight container, protected from light, at 2 °C to 8 °C.

Fenchlorphos. $C_8H_8Cl_3O_3PS$. (M_r 321.5). *1127200.* [299-84-3].

mp: about 35 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Fenchone. $C_{10}H_{16}O$. (M_r 152.2). *1037600.* [7787-20-4]. (1*R*)-1,3,3-Trimethylbicyclo[2.2.1]heptan-2-one.

Oily liquid, miscible with ethanol (96 per cent), practically insoluble in water.

n_D^{20}: about 1.46.

bp_{15mm}: 192 °C to 194 °C.

Fenchone used in gas chromatography complies with the following test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter fennel (0824)*.

Test solution. The substance to be examined.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

Fenvalerate. $C_{25}H_{22}ClNO_3$. (M_r 419.9). *1127300.* [51630-58-1].

bp: about 300 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Ferric ammonium sulphate. $FeNH_4(SO_4)_2,12H_2O$. (M_r 482.2). *1037700.* [7783-83-7]. Ammonium iron disulphate dodecahydrate.

Pale-violet crystals, efflorescent, very soluble in water, practically insoluble in alcohol.

Ferric ammonium sulphate solution R2. *1037702.*

A 100 g/l solution. If necessary filter before use.

Ferric ammonium sulphate solution R5. *1037704.*

Shake 30.0 g of *ferric ammonium sulphate R* with 40 ml of *nitric acid R* and dilute to 100 ml with *water R*. If the solution is turbid, centrifuge or filter it.

Storage: protected from light.

Ferric ammonium sulphate solution R6. *1037705.*

Dissolve 20 g of *ferric ammonium sulphate R* in 75 ml of *water R*, add 10 ml of a 2.8 per cent *V/V* solution of *sulphuric acid R* and dilute to 100 ml with *water R*.

Ferric chloride. $FeCl_3,6H_2O$. (M_r 270.3). *1037800.* [10025-77-1]. Iron trichloride hexahydrate.

Yellowish-orange or brownish crystalline masses, deliquescent, very soluble in water, soluble in alcohol. On exposure to light, ferric chloride and its solutions are partly reduced.

Storage: in an airtight container.

Ferric chloride solution R1. *1037801.*

A 105 g/l solution.

Ferric chloride solution R2. *1037802.*

A 13 g/l solution.

Ferric chloride solution R3. *1037803.*

Dissolve 2.0 g of *ferric chloride R* in *ethanol R* and dilute to 100.0 ml with the same solvent.

Ferric chloride-ferricyanide-arsenite reagent. *1037805.*

Immediately before use mix 10 ml of a 27 g/l solution of *ferric chloride R* in *dilute hydrochloric acid R*, 7 ml of *potassium ferricyanide solution R*, 3 ml of *water R* and 10 ml of *sodium arsenite solution R*.

Ferric chloride-sulphamic acid reagent. *1037804.*

A solution containing 10 g/l of *ferric chloride R* and 16 g/l of *sulphamic acid R*.

Ferric nitrate. $Fe(NO_3)_3,9H_2O$. (M_r 404). *1106100.* [7782-61-8].

Content: minimum 99.0 per cent *m/m* of $Fe(NO_3)_3,9H_2O$.

Light-purple crystals or crystalline mass, very soluble in water.

Free acid: not more than 0.3 per cent (as HNO_3).

Ferric sulphate. $Fe_2(SO_4)_3,xH_2O$. *1037900.* [10028-22-5]. Iron(III) trisulphate hydrated.

A yellowish-white powder, very hygroscopic, decomposes in air, slightly soluble in water and in alcohol.

Storage: in an airtight container, protected from light.

Ferric sulphate pentahydrate. $Fe_2(SO_4)_3,5H_2O$. (M_r 489.9). *1153700.* [142906-29-4].

White or yellowish powder.

Ferrocyphene. $C_{26}H_{16}FeN_6$. (M_r 468.3). *1038000.* [14768-11-7]. Dicyanobis(1,10-phenanthroline)iron(II).

A violet-bronze, crystalline powder, practically insoluble in water and in alcohol.

Storage: protected from light and moisture.

Ferroin. *1038100.* [14634-91-4].

Dissolve 0.7 g of *ferrous sulphate R* and 1.76 g of *phenanthroline hydrochloride R* in 70 ml of *water R* and dilute to 100 ml with the same solvent.

Test for sensitivity. To 50 ml of *dilute sulphuric acid R* add 0.15 ml of *osmium tetroxide solution R* and 0.1 ml of the ferroin. After the addition of 0.1 ml of *0.1 M ammonium and cerium nitrate* the colour changes from red to light blue.

Ferrous ammonium sulphate. $Fe(NH_4)_2(SO_4)_2,6H_2O$. (M_r 392.2). *1038200.* [7783-85-9]. Diammonium iron disulphate hexahydrate.

Pale bluish-green crystals or granules, freely soluble in water, practically insoluble in alcohol.

Storage: protected from light.

Ferrous sulphate. *1038300.* [7782-63-0].

See *Ferrous sulphate (0083).*

Ferrous sulphate solution R2. *1038301.*

Dissolve 0.45 g of *ferrous sulphate R* in 50 ml of *0.1 M hydrochloric acid* and dilute to 100 ml with *carbon dioxide-free water R*. Prepare immediately before use.

Ferulic acid. $C_{10}H_{10}O_4$. (M_r 194.2). *1149500.* [1135-24-6]. 4-Hydroxy-3-methoxycinnamic acid. 3-(4-Hydroxy-3-methoxyphenyl)propenoic acid.

Faint yellow powder, freely soluble in methanol.

mp: 172.9 °C to 173.9 °C.

Ferulic acid used in the assay of eleutherosides in Eleutherococcus (1419) complies with the following additional requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Eleutherococcus (1419).*

The content is not less than 99 per cent, calculated by the normalisation procedure.

Fibrin blue. *1101400.*

Mix 1.5 g of fibrin with 30 ml of a 5 g/l solution of *indigo carmine R* in 1 per cent *V/V dilute hydrochloric acid R*. Heat the mixture to 80 °C and maintain at this temperature whilst stirring for about 30 min. Allow to cool. Filter. Wash extensively by resuspension in 1 per cent *V/V dilute hydrochloric acid R* and mixing for about 30 min; filter. Repeat the washing operation three times. Dry at 50 °C. Grind.

Fibrin congo red. *1038400.*

Take 1.5 g of fibrin and leave overnight in 50 ml of a 20 g/l solution of *congo red R* in *alcohol (90 per cent V/V) R*. Filter, rinse the fibrin with *water R* and store under *ether R*.

Fibrinogen. *1038500.* [9001-32-5].

See *Human fibrinogen, freeze-dried (0024).*

Fixing solution. *1122600.*

To 250 ml of *methanol R*, add 0.27 ml of *formaldehyde R* and dilute to 500.0 ml with *water R*.

Fixing solution for isoelectric focusing in polyacrylamide gel. *1138700.*

A solution containing 35 g of *sulphosalicylic acid R* and 100 g of *trichloroacetic acid R* per litre of *water R*.

Flufenamic acid. $C_{14}H_{10}F_3NO_2$. (M_r 281.2). *1106200.* [530-78-9]. 2-[[3-(Trifluoromethyl)phenyl]amino]benzoic acid.

Pale yellow, crystalline powder or needles, practically insoluble in water, freely soluble in alcohol.

mp: 132 °C to 135 °C.

Flumazenil. *1149600.* [78755-81-4].

See *Flumazenil (1326).*

Flunitrazepam. *1153800.* [1622-62-4].

See *Flunitrazepam (0717).*

Fluoranthene. $C_{16}H_{10}$. (M_r 202.3). *1038600.* [206-44-0]. 1,2-(1,8-Naphtylene)benzene. 1,2-Benzacenaphtene.

Yellow or yellowish-brown crystals.

bp: about 384 °C.

mp: 109 °C to 110 °C.

Fluorene. $C_{13}H_{10}$. (M_r 166.2). *1127400.* [86-73-7]. Diphenylenemethane.

White or almost white crystals, freely soluble in anhydrous acetic acid, soluble in hot alcohol.

mp: 113 °C to 115 °C.

Fluorescamine. $C_{17}H_{10}O_4$. (M_r 278.3). *1135800.* [38183-12-9]. 4-Phenylspiro[furan-2(3*H*),1'(3'*H*)-isobenzofuran]-3,3'-dione.

mp: 154 °C to 155 °C.

Fluorescein. $C_{20}H_{12}O_5$. (M_r 332.3). *1106300.* [2321-07-5]. 3',6'-Dihydroxyspiro[isobenzofurane-1(3*H*),9'-[9*H*]xanthen]-3-one.

An orange-red powder, practically insoluble in water, soluble in warm alcohol, soluble in alkaline solutions. In solution, fluorescein displays a green fluorescence.

mp: about 315 °C.

Fluorescein-conjugated rabies antiserum. *1038700.*

Immunoglobulin fraction with a high rabies antibody titre, prepared from the sera of suitable animals that have been immunised with inactivated rabies virus; the immunoglobulin is conjugated with fluorescein isothiocyanate.

2-Fluoro-2-deoxy-D-glucose. $C_6H_{11}FO_5$. (M_r 182.2). *1113900.* [86783-82-6].

A white or almost white crystalline powder.

mp: 174 °C to 176 °C.

Fluorodinitrobenzene. $C_6H_3FN_2O_4$. (M_r 186.1). *1038800.* [70-34-8]. 1-Fluoro-2,4-dinitrobenzene.

Pale yellow crystals, soluble in propylene glycol.

mp: about 29 °C.

DL-6-Fluorodopa hydrochloride. $C_9H_{11}ClFNO_4$. (M_r 251.6). *1169200.* (2*RS*)-2-Amino-3-(2-fluoro-4, 5-dihydroxyphenyl)propanoic acid hydrochloride. 2-Fluoro-5-hydroxy-DL-tyrosine hydrochloride.

White or almost white powder.

6-Fluorolevodopa hydrochloride. $C_9H_{11}ClFNO_4$. (M_r 251.6). *1169300.* [144334-59-8]. (2*S*)-2-Amino-3-(2-fluoro-4,5-dihydroxyphenyl)propanoic acid hydrochloride. 2-Fluoro-5-hydroxy-L-tyrosine hydrochloride.

Colourless or almost colourless solid, soluble in water.

1-Fluoro-2-nitro-4-(trifluoromethyl)benzene. $C_7H_3F_4NO_2$. (M_r 209.1). *1038900.* [367-86-2].

mp: about 197 °C.

Folic acid. *1039000.* [75708-92-8].

See *Folic acid (0067).*

Formaldehyde. *1039100.* [50-00-0].

See *Formaldehyde solution R.*

Formaldehyde solution. *1039101.*

See *Formaldehyde solution (35 per cent) (0826).*

Formamide. CH_3NO. (M_r 45.0). *1039200.* [75-12-7].

A clear, colourless, oily liquid, hygroscopic, miscible with water and with alcohol. It is hydrolysed by water.

bp: about 103 °C, determined at a pressure of 2 kPa.

Storage: in an airtight container.

Formamide R1. *1039202.*

Complies with the requirements prescribed for *formamide R* and with the following additional test.

Water (*2.5.12*): maximum 0.1 per cent determined with an equal volume of *anhydrous methanol R*.

Formamide, treated. *1039201.*

Disperse 1.0 g of *sulphamic acid R* in 20.0 ml of *formamide R* containing 5 per cent *V/V* of *water R*.

Formic acid, anhydrous. CH_2O_2. (M_r 46.03). *1039300.* [64-18-6].

Content: minimum 98.0 per cent *m/m* of CH_2O_2.

A colourless liquid, corrosive, miscible with water and with alcohol.

d_{20}^{20}: about 1.22.

Assay. Weigh accurately a conical flask containing 10 ml of *water R*, quickly add about 1 ml of the acid and weigh again. Add 50 ml of *water R* and titrate with *1 M sodium hydroxide*, using 0.5 ml of *phenolphthalein solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 46.03 mg of CH_2O_2.

Fructose. *1106400.* [57-48-7].

See *Fructose (0188).*

Fuchsin, basic. *1039400.* [632-99-5].

A mixture of rosaniline hydrochloride ($C_{20}H_{20}ClN_3$; M_r 337.9; Colour Index No. 42510; Schultz No. 780) and *para*-rosaniline hydrochloride ($C_{19}H_{18}ClN_3$; M_r 323.8; Colour Index No. 42500; Schultz No. 779).

If necessary, purify in the following manner. Dissolve 1 g in 250 ml of *dilute hydrochloric acid R*. Allow to stand for 2 h at room temperature, filter and neutralise with *dilute sodium hydroxide solution R* and add 1 ml to 2 ml in excess. Filter the precipitate through a sintered-glass filter (40) (*2.1.2*) and wash with *water R*. Dissolve the precipitate in 70 ml of *methanol R*, previously heated to boiling, and add 300 ml of *water R* at 80 °C. Allow to cool to room temperature, filter and dry the crystals *in vacuo*.

Crystals with a greenish-bronze sheen, soluble in water and in alcohol.

Storage: protected from light.

Fuchsin solution, decolorised. *1039401.*

Dissolve 0.1 g of *basic fuchsin R* in 60 ml of *water R*. Add a solution containing 1 g of *anhydrous sodium sulphite R* or 2 g of *sodium sulphite R* in 10 ml of *water R*. Slowly and with continuous shaking add 2 ml of *hydrochloric acid R*. Dilute to 100 ml with *water R*. Allow to stand protected from light for at least 12 h, decolorise with *activated charcoal R* and filter. If the solution becomes cloudy, filter before use. If on standing the solution becomes violet, decolorise again by adding *activated charcoal R*.

Test for sensitivity. To 1.0 ml add 1.0 ml of *water R* and 0.1 ml of *aldehyde-free alcohol R*. Add 0.2 ml of a solution containing 0.1 g/l of formaldehyde (CH_2O, M_r 30.0). A pale-pink colour develops within 5 min.

Storage: protected from light.

Fuchsin solution, decolorised R1. *1039402.*

To 1 g of *basic fuchsin R* add 100 ml of *water R*. Heat to 50 °C and allow to cool with occasional shaking. Allow to stand for 48 h, shake and filter. To 4 ml of the filtrate add 6 ml of *hydrochloric acid R*, mix and dilute to 100 ml with *water R*. Allow to stand for at least 1 h before use.

Fucose. $C_6H_{12}O_5$. (M_r 164.2). *1039500.* [6696-41-9]. 6-Deoxy-L-galactose.

A white or almost white powder, soluble in water and in alcohol.

$[\alpha]_D^{20}$: about – 76, determined on a 90 g/l solution 24 h after dissolution.

mp: about 140 °C.

Fumaric acid. $C_4H_4O_4$. (M_r 116.1). *1153200.* [110-17-8]. (*E*)-Butenedioic acid.

White or almost white crystals, slightly soluble in water, soluble in alcohol, slightly soluble in acetone.

mp: about 300 °C.

Furfural. $C_5H_4O_2$. (M_r 96.1). *1039600.* [98-01-1]. 2-Furaldehyde. 2-Furanecarbaldehyde.

A clear, colourless to brownish-yellow, oily liquid, miscible in 11 parts of water, miscible with alcohol.

d_{20}^{20}: 1.155 to 1.161.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 159 °C and 163 °C.

Storage: in a dark place.

Galactose. $C_6H_{12}O_6$. (M_r 180.2). *1039700.* [59-23-4]. D-(+)-Galactose.

A white or almost white, crystalline powder, freely soluble in water.

$[\alpha]_D^{20}$: + 79 to + 81, determined on a 100 g/l solution in *water R* containing about 0.05 per cent of NH_3.

Gallic acid. $C_7H_6O_5,H_2O$. (M_r 188.1). *1039800.* [5995-86-8]. 3,4,5-Trihydroxybenzoic acid monohydrate.

A crystalline powder or long needles, colourless or slightly yellow, soluble in water, freely soluble in hot water, in alcohol and in glycerol.

It loses its water of crystallisation at 120 °C and it melts at about 260 °C, with decomposition.

Chromatography. Examine as prescribed in the monograph on *Bearberry leaf (1054)*; the chromatogram shows only one principal spot.

Gastric juice, artificial. *1039900.*

Dissolve 2.0 g of *sodium chloride R* and 3.2 g of *pepsin powder R* in *water R*. Add 80 ml of *1 M hydrochloric acid* and dilute to 1000 ml with *water R*.

GC concentrical column. *1135100.*

A commercially available system consisting of 2 concentrically arranged tubes. The outer tube is packed with molecular sieves and the inner tube is packed with a porous polymer mixture. The main application is the separation of gases.

Gelatin. *1040000.* [9000-70-8].

See *Gelatin (0330).*

Gelatin, hydrolysed. *1040100.*

Dissolve 50 g of *gelatin R* in 1000 ml of *water R*. Autoclave in saturated steam at 121 °C for 90 min and freeze dry.

Geraniol. $C_{10}H_{18}O$. (M_r 154.2). *1135900.* [106-24-1]. (*E*)-3,7-Dimethylocta-2,6-dien-1-ol.

An oily liquid, slight odour of rose, practically insoluble in water, miscible with alcohol.

Geraniol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Citronella oil (1609).*

The content is not less than 98.5 per cent calculated by the normalisation procedure.

Storage: in an airtight container, protected from light

Geranyl acetate. $C_{12}H_{20}O_2$. (M_r 196.3). *1106500.* [105-87-3]. (*E*)-3,7-Dimethylocta-2,6-dien-1-yl acetate.

A colourless or slightly yellow liquid, slight odour of rose and lavender.

d_{25}^{25}: 0.896 to 0.913.

n_D^{15}: about 1.463.

bp_{25}: about 138 °C.

Geranyl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution. The area of the principal peak is not less than 99.0 per cent of the total area of the peaks.

Ginsenoside Rb1. $C_{54}H_{92}O_{23},3H_2O$. (M_r 1163). *1127500.* [41753-43-9]. (20*S*)-3β-di-D-Glucopyranosyl-20-di-D-glucopyranosylprotopanaxadiol. (20*S*)-3β-[(2-*O*-β-D-Glucopyranosyl-β-D-glucopyranosyl)oxy]-20-[(6-*O*-β-D-glucopyranosyl-β-D-glucopyranosyl)oxy]-5α-dammar-24-en-12β-ol. (20*S*)-3β-[(2-*O*-β-D-Glucopyranosyl-β-D-glucopyranosyl)oxy]-20-[(6-*O*-β-D-glucopyranosyl-β-D-glucopyranosyl)oxy]-4,4,8,14-tetramethyl-18-nor-5α-cholest-24-en-12β-ol.

A colourless solid, soluble in water, in ethanol and in methanol.

$[\alpha]_D^{20}$: + 11.3 determined on a 10 g/l solution in *methanol R*.

mp: about 199 °C.

Water (2.5.12): maximum 6.8 per cent.

Assay. Examined by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Ginseng (1523).*

Test solution. Dissolve 3.0 mg, accurately weighted, of *ginsenoside Rb1* in 10 ml of *methanol R*.

The content is not less than 95.0 per cent calculated by the normalisation procedure.

Ginsenoside Re. $C_{48}H_{82}O_{18}$. (M_r 947.2). *1157800.* [52286-59-6]. (3β,6α,12β)-20-(β-D-Glucopyranosyloxy)-3,12-dihydroxydammar-24-en-6-yl 2-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranoside.

Colourless solid, soluble in water, in ethanol (96 per cent) and in methanol.

Ginsenoside Rf. $C_{42}H_{72}O_{14},2H_2O$. (M_r 837). *1127700.* [52286-58-5]. (20*S*)-6-*O*-[β-D-Glucopyranosyl-(1→2)-β-D-glycopyranoside]-dammar-24-ene-3β,6α,12β,20-tetrol.

A colourless solid, soluble in water, in ethanol and in methanol.

$[\alpha]_D^{20}$: + 12.8 determined on a 10 g/l solution in *methanol R*.

mp: about 198 °C.

Ginsenoside Rg1. $C_{42}H_{72}O_{14},2H_2O$. (M_r 837). *1127600.* [22427-39-0]. (20*S*)-6β-D-Glucopyranosyl-D-glucopyranosylprotopanaxatriol. (20*S*)-6α,20-bis(β-D-Glucopyranosyloxy)-5α-dammar-24-ene-3β,12β-diol. (20*S*)-6α,20-bis(β-D-Glucopyranosyloxy)-4,4,8,14-tetramethyl-18-nor-5α-cholest-24-ene-3β,12β-diol.

A colourless solid, soluble in water, in ethanol and in methanol.

$[\alpha]_D^{20}$: + 31.2 determined on a 10 g/l solution in *methanol R*.

mp: 188 °C to 191 °C.

Water (2.5.12): maximum 4.8 per cent.

Assay. Examined by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Ginseng (1523).*

Test solution. Dissolve 3.0 mg, accurately weighted, of *ginsenoside Rg1* in 10 ml of *methanol R*.

The content is not less than 95.0 per cent calculated by the normalisation procedure.

Gitoxin. $C_{41}H_{64}O_{14}$. (M_r 781). *1040200.* [4562-36-1]. Glycoside of *Digitalis purpurea* L. 3β-(*O*-2,6-Dideoxy-β-d-*ribo*-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-d-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-d-*ribo*-hexopyranosyloxy)-14,16β-dihydroxy-5β,14β-card-20(22)-enolide.

A white or almost white, crystalline powder, practically insoluble in water and in most common organic solvents, soluble in pyridine.

$[\alpha]_D^{20}$: + 20 to + 24, determined on a 5 g/l solution in a mixture of equal volumes of *chloroform R* and *methanol R*.

Chromatography. Examine as prescribed in the monograph on *Digitalis leaf (0117)*; the chromatogram shows only one principal spot.

Glucosamine hydrochloride. $C_6H_{14}ClNO_5$. (M_r 215.6). *1040300.* [66-84-2]. D-Glucosamine hydrochloride.

Crystals, soluble in water.

$[\alpha]_D^{20}$: + 100, decreasing to + 47.5 after 30 min, determined on a 100 g/l solution in *water R*.

Glucose. *1025700.* [50-99-7].

See *Anhydrous glucose (0177)*.

D-Glucuronic acid. $C_6H_{10}O_7$. (M_r 194.1). *1119700.* [6556-12-3].

Content: minimum 96.0 per cent of $C_6H_{10}O_7$, calculated with reference to the substance dried *in vacuo* (*2.2.32*).

Soluble in water and in alcohol.

Shows mutarotation: $[\alpha]_D^{24}$: + 11.7 → + 36.3

Assay. Dissolve 0.150 g in 50 ml of *anhydrous methanol R* while stirring under nitrogen. Titrate with *0.1 M tetrabutylammonium hydroxide*, protecting the solution from atmospheric carbon dioxide throughout solubilisation and titration. Determine the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 19.41 mg of $C_6H_{10}O_7$.

Glutamic acid. *1040400.* [56-86-0].

See *Glutamic acid (0750)*.

L-γ-Glutamyl-L-cysteine. $C_8H_{14}N_2O_5S$. (M_r 250.3). *1157900.* [636-58-8].

Glutaraldehyde. $C_5H_8O_2$. (M_r 100.1). *1098300.* [111-30-8].

An oily liquid, soluble in water.

n_D^{25}: about 1.434.

bp: about 188 °C.

Glutaric acid. $C_5H_8O_4$. (M_r 132.1). *1149700.* [110-94-1]. Pentanedioic acid.

White or almost white, crystalline powder.

L-Glutathione, oxidised. $C_{20}H_{32}N_6O_{12}S_2$. (M_r 612.6). *1158000.* [27025-41-8]. Bis(L-γ-glutamyl-L-cysteinylglycine) disulfide.

Glycerol. *1040500.* [56-81-5].

See *Glycerol (0496)*.

Glycerol R1. *1040501.*

Glycerol complying with the monograph *Glycerol (0496)* and free from diethylene glycol when examined as described in the test for Impurity A and related substances in that monograph.

Glycerol (85 per cent). *1040600.*

See *Glycerol (85 per cent) (0497)*.

Glycerol (85 per cent) R1. *1040601.*

Glycerol complying with the monograph *Glycerol 85 per cent (0497)* and free from diethylene glycol when examined as described in the test for Impurity A and related substances in that monograph.

Glycerol 1-decanoate. $C_{13}H_{26}O_4$. (M_r 246.3). *1169400.* [2277-23-8]. (2*RS*)-2,3-Dihydroxypropyl decanoate. α-Monocaprin. 1-Monodecanoyl-*rac*-glycerol.

Content: about 99 per cent.

Glycerol 1-octanoate. $C_{11}H_{22}O_4$. (M_r 218.3). *1169500.* [502-54-5]. (2*RS*)-2,3-Dihydroxypropyl octanoate. α-Monocaprylin. 1-Monooctanoyl-*rac*-glycerol.

Content: about 99 per cent.

Glycidol. $C_3H_6O_2$. (M_r 74.1). *1127800.* [556-52-5].

A slightly viscous liquid, miscible with water.

d_4^{20}: about 1.115.

n_D^{20}: about 1.432.

Glycine. *1040700.* [56-40-6].

See *Glycine (0614)*.

Glycollic acid. $C_2H_4O_3$. (M_r 76.0). *1040800.* [79-14-1]. 2-Hydroxyacetic acid.

Crystals, soluble in water, in acetone, in alcohol and in methanol.

mp: about 80 °C.

Glycyrrhetic acid. $C_{30}H_{46}O_4$. (M_r 470.7). *1040900.* [471-53-4]. Glycyrrhetinic acid. 12,13-Didehydro-3β-hydroxy-11-oxo-olean-30-oic acid.

A mixture of α- and β-glycyrrhetic acids in which the β-isomer is predominant.

A white or yellowish-brown powder, practically insoluble in water, soluble in ethanol and in glacial acetic acid.

$[\alpha]_D^{20}$: + 145 to + 155, determined on a 10.0 g/l solution in *ethanol R*.

Chromatography. Examine by thin-layer chromatography (*2.2.27*) using *silica gel* GF_{254} *R* as the coating substance; prepare the slurry using a 0.25 per cent *V/V* solution of *phosphoric acid R*. Apply to the plate 5 µl of a 5 g/l solution of the glycyrrhetic acid in a mixture of equal volumes of *chloroform R* and *methanol R*. Develop over a path of 10 cm using a mixture of 5 volumes of *methanol R* and 95 volumes of *chloroform R*. Examine the chromatogram in ultraviolet light at 254 nm. The chromatogram shows a dark spot (R_F about 0.3) corresponding to β-glycyrrhetic acid and a smaller spot (R_F about 0.5) corresponding to α-glycyrrhetic acid. Spray with *anisaldehyde solution R* and heat at 100 °C to 105 °C for 10 min. Both spots are coloured bluish-violet. Between them a smaller bluish-violet spot may be present.

18α-Glycyrrhetinic acid. $C_{30}H_{46}O_4$. (M_r 470.7). *1127900.* [1449-05-4]. (20β)-3β-Hydroxy-11-oxo-18α-olean-12-en-29-oic acid.

A white or almost white powder, practically insoluble in water, soluble in ethanol, sparingly soluble in methylene chloride.

Glyoxalhydroxyanil. $C_{14}H_{12}N_2O_2$. (M_r 240.3). *1041000.* [1149-16-2]. Glyoxal bis(2-hydroxyanil).

White or almost white crystals, soluble in hot alcohol.

mp: about 200 °C.

Glyoxal solution. *1098400.* [107-22-2].

Contains about 40 per cent (*m/m*) glyoxal.

Assay. In a ground-glass stoppered flask place 1.000 g of glyoxal solution, 20 ml of a 70 g/l solution of *hydroxylamine hydrochloride R* and 50 ml of *water R*. Allow to stand for 30 min and add 1 ml of *methyl red mixed solution R* and titrate with *1 M sodium hydroxide* until the colour changes from red to green. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 29.02 mg of glyoxal ($C_2H_2O_2$).

Gonadotrophin, chorionic. *1041100.* [9002-61-3].

See *Chorionic gonadotrophin (0498)*.

Gonadotrophin, serum. *1041200.*

See *Equine serum gonadotrophin for veterinary use (0719)*.

Guaiacol. $C_7H_8O_2$. (M_r 124.1). *1148300.* [90-05-1]. 2-Methoxyphenol. 1-Hydroxy-2-methoxybenzene.

Crystalline mass or colourless or yellowish liquid, hygroscopic, slightly soluble in water, very soluble in methylene chloride, freely soluble in alcohol.

bp: about 205 °C.

mp: about 28 °C.

Guaiacum resin. *1041400.*

Resin obtained from the heartwood of *Guaiacum officinale* L. and *Guaiacum sanctum* L.

Reddish-brown or greenish-brown, hard, glassy fragments; fracture shiny.

Guaiazulene. $C_{15}H_{18}$. (M_r 198.3). *1041500.* [489-84-9]. 1,4-Dimethyl-7-isopropylazulene.

Dark-blue crystals or blue liquid, very slightly soluble in water, miscible with fatty and essential oils and with liquid paraffin, sparingly soluble in alcohol, soluble in 500 g/l sulphuric acid and 80 per cent *m/m* phosphoric acid, giving a colourless solution.

mp: about 30 °C.

Storage: protected from light and air.

Guanidine hydrochloride. CH_5N_3HCl. (M_r 95.5). *1098500.* [50-01-1].

Crystalline powder, freely soluble in water and in alcohol.

Guanine. $C_5H_5N_5O$. (M_r 151.1). *1041600.* [73-40-5]. 2-Amino-1,7-dihydro-6*H*-purin-6-one.

An amorphous white or almost white powder, practically insoluble in water, slightly soluble in alcohol. It dissolves in ammonia and in dilute solutions of alkali hydroxides.

Haemoglobin. *1041700.* [9008-02-0].

Nitrogen: 15 per cent to 16 per cent.

Iron: 0.2 per cent to 0.3 per cent.

Loss on drying (*2.2.32*): maximum 2 per cent.

Sulphated ash (*2.4.14*): maximum 1.5 per cent.

Haemoglobin solution. *1041701.*

Transfer 2 g of *haemoglobin R* to a 250 ml beaker and add 75 ml of *dilute hydrochloric acid R2.* Stir until solution is complete. Adjust the pH to 1.6 ± 0.1 (*2.2.3*) using *1 M hydrochloric acid.* Transfer to a 100 ml flask with the aid of *dilute hydrochloric acid R2.* Add 25 mg of *thiomersal R.* Prepare daily, store at 5 ± 3 °C and readjust to pH 1.6 before use.

Storage: at 2 °C to 8 °C.

Harpagoside. $C_{24}H_{30}O_{11}$. (M_r 494.5). *1098600.*

A white or almost white, crystalline powder, very hygroscopic, soluble in water and in alcohol.

mp: 117 °C to 121 °C.

Storage: in an airtight container.

Hederacoside C. $C_{59}H_{96}O_{26}$. (M_r 1221). *1158100.* [14216-03-6]. *O*-6-Deoxy-α-L-mannopyranosyl-(1→4)-*O*-β-D-glucopyranosyl-(1→6)-β-D-glucopyranosyl (4*R*)-3β-[[2-*O*(-6-deoxy-α-L-mannopyranosyl)-α-L-arabinopyranosyl]oxy]-23-hydroxyolean-12-en-28-oate.

Colourless crystals or white or almost white powder.

mp: about 220 °C.

Hederacoside C used in liquid chromatography complies with the following additional test.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Ivy leaf (2148).*

Test solution. Dissolve 5.0 mg of hederacoside C in 5.0 ml of *methanol R.*

Content: minimum 95 per cent, calculated by the normalisation procedure.

α-Hederin. $C_{41}H_{66}O_{12}$. (M_r 751.0). *1158200.* [27013-91-8]. (+)-(4*R*)-3β-[[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-α-L-arabinopyranosyl]oxy]-23-hydroxyolean-12-en-28-oic acid.

White or almost white powder.

mp: about 256 °C.

Helium for chromatography. He. (A_r 4.003). *1041800.* [7440-59-7].

Content: minimum 99.995 per cent *V/V* of He.

Heparin. *1041900.* [9041-08-1].

See *Heparin sodium (0333).*

Heptachlor. $C_{10}H_5Cl_7$. (M_r 373.3). *1128000.* [76-44-8].

bp: about 135 °C.

mp: about 95 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Heptachlor epoxide. $C_{10}H_5Cl_7O$. (M_r 389.3). *1128100.* [1024-57-3].

bp: about 200 °C.

mp: about 160 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Heptafluorobutyric acid. $C_4HF_7O_2$. (M_r 214.0). *1162400.* [375-22-4]. HFBA.

Clear, colourless liquid. Corrosive.

d_{20}^{20}: about 1.645.

n_D^{20}: about 1.300.

bp: about 120 °C.

Content: minimum 99.5 per cent of $C_4HF_7O_2$.

Heptafluoro-*N*-methyl-*N*-(trimethylsilyl)butanamide. $C_8H_{12}F_7NOSi$. (M_r 299.3). *1139500.* [53296-64-3]. 2,2,3,3,4,4,4-Heptafluoro-*N*-methyl-*N*-(trimethylsilyl)butyramide.

Clear, colourless liquid, flammable.

n_D^{20}: about 1.351.

bp: about 148 °C.

Heptane. C_7H_{16}. (M_r 100.2). *1042000.* [142-82-5].

A colourless, flammable liquid, practically insoluble in water, miscible with ethanol.

d_{20}^{20}: 0.683 to 0.686.

n_D^{20}: 1.387 to 1.388.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 97 °C and 98 °C.

Hesperidin. $C_{28}H_{34}O_{15}$. (M_r 611). *1139000.* [520-26-3]. (*S*)-7-[[6-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-2,3-dihydro-4*H*-1-benzopyran-4-one.

Hygroscopic powder, slightly soluble in water and in methanol.

mp: 258 °C to 262 °C.

Hexachlorobenzene. C_6Cl_6. (M_r 284.8). *1128200.* [118-74-1].

bp: about 332 °C.

mp: about 230 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

α-Hexachlorocyclohexane. $C_6H_6Cl_6$. (M_r 290.8). *1128300.* [319-84-6].

bp: about 288 °C.

mp: about 158 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

β-Hexachlorocyclohexane. $C_6H_6Cl_6$. (M_r 290.8). *1128400.* [319-85-7].

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

δ-Hexachlorocyclohexane. $C_6H_6Cl_6$. (M_r 290.8). *1128500.* [319-86-8].

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Hexacosane. $C_{26}H_{54}$. (M_r 366.7). *1042200.* [630-01-3].

Colourless or white or almost white flakes.

mp: about 57 °C.

Hexadimethrine bromide. $(C_{13}H_{30}Br_2N_2)_n$. *1042300.* [28728-55-4]. 1,5-Dimethyl-1,5-diazaundecamethylene polymethobromide. Poly(1,1,5,5-tetramethyl-1,5-azonia-undecamethylene dibromide).

A white or almost white, amorphous powder, hygroscopic, soluble in water.

Storage: in an airtight container.

2,2′,2″,6,6′,6″-Hexa(1,1-dimethylethyl)-4,4′,4″-[(2,4,6-trimethyl-1,3,5-benzenetriyl)trismethylene]triphenol. $C_{54}H_{78}O_3$. (M_r 775). *1042100.* 2,2′,2″,6,6′,6″-Hexa-*tert*-butyl-4,4′,4″-[(2,4,6-trimethyl-1,3,5-benzenetriyl)trismethylene]triphenol.

A crystalline powder, practically insoluble in water, soluble in acetone, slightly soluble in alcohol.

mp: about 244 °C.

1,1,1,3,3,3-Hexafluoropropan-2-ol. $C_3H_2F_6O$. (M_r 168.0). *1136000.* [920-66-1].

Content: minimum 99.0 per cent of $C_3H_2F_6O$, determined by gas chromatography.

A clear, colourless liquid, miscible with water and with ethanol.

d_{20}^{20}: about 1.596.

bp: about 59 °C.

Hexamethyldisilazane. $C_6H_{19}NSi_2$. (M_r 161.4). *1042400.* [999-97-3].

A clear, colourless liquid.

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.408.

bp: about 125 °C.

Storage: in an airtight container.

Hexamethylenetetramine. $C_6H_{12}N_4$. (M_r 140.2). *1042500.* [100-97-0]. Hexamine. 1,3,5,7-Tetra-azatricyclo [3.3.1.1^{3,7}]decane.

A colourless, crystalline powder, very soluble in water.

Hexane. C_6H_{14}. (M_r 86.2). *1042600.* [110-54-3].

A colourless, flammable liquid, practically insoluble in water, miscible with ethanol.

d_{20}^{20}: 0.659 to 0.663.

n_D^{20}: 1.375 to 1.376.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 67 °C and 69 °C.

Hexane used in spectrophotometry complies with the following additional test.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 97 per cent from 260 nm to 420 nm.

Hexylamine. $C_6H_{15}N$. (M_r 101.2). *1042700.* [111-26-2]. Hexanamine.

A colourless liquid, slightly soluble in water, soluble in alcohol.

d_{20}^{20}: about 0.766.

n_D^{20}: about 1.418.

bp: 127 °C to 131 °C.

Histamine dihydrochloride. *1042800.* [56-92-8].

See *Histamine dihydrochloride (0143).*

Histamine phosphate. *1042900.* [23297-93-0].

See *Histamine phosphate (0144).*

Histamine solution. *1042901.*

A 9 g/l solution of *sodium chloride R* containing 0.1 µg per millilitre of histamine base (as the phosphate or dihydrochloride).

Histidine monohydrochloride. $C_6H_{10}ClN_3O_2,H_2O$. (M_r 209.6). *1043000.* [123333-71-1]. (*RS*)-2-Amino-3-(imidazol-4-yl)propionic acid hydrochloride monohydrate.

A crystalline powder or colourless crystals, soluble in water.

mp: about 250 °C, with decomposition.

Chromatography. Examine as prescribed in the monograph on *Histamine dihydrochloride (0143)*; the chromatogram shows only one principal spot.

Holmium oxide. Ho_2O_3. (M_r 377.9). *1043100.* [12055-62-8]. Diholmium trioxide.

A yellowish powder, practically insoluble in water.

Holmium perchlorate solution. *1043101.*

A 40 g/l solution of *holmium oxide R* in a solution of *perchloric acid R* containing 141 g/l of $HClO_4$.

DL-Homocysteine. $C_4H_9NO_2S$. (M_r 135.2). *1136100.* [454-29-5]. (2*RS*)-2-Amino-4-sulphanylbutanoic acid.

A white or almost white, crystalline powder.

mp: about 232 °C.

L-Homocysteine thiolactone hydrochloride. C_4H_8ClNOS. (M_r 153.6). *1136200.* [31828-68-9]. (3*S*)-3-Aminodihydrothiophen-2(3*H*)-one hydrochloride.

A white or almost white, crystalline powder.

mp: about 202 °C.

Hyaluronidase diluent. *1043300.*

Mix 100 ml of *phosphate buffer solution pH 6.4 R* with 100 ml of *water R*. Dissolve 0.140 g of *hydrolysed gelatin R* in the solution at 37 °C.

Storage: use within 2 h.

Hydrastine hydrochloride. $C_{21}H_{22}ClNO_6$. (M_r 419.9). *1154000.* [5936-28-7]. (3*S*)-6,7-Dimethoxy-3-[(5*R*)-6-methyl-5,6,7,8-tetrahydro-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]isobenzofuran-1(3*H*)-one hydrochloride.

A white or almost white powder, hygroscopic, very soluble in water and in alcohol.

$[\alpha]_D^{17}$: about + 127.

mp: about 116 °C.

Hydrastine hydrochloride used in liquid chromatography complies with the following additional test.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Goldenseal rhizome (1831)*. The content is not less than 98 per cent, calculated by the normalisation procedure.

Hydrazine. H_4N_2. (M_r 32.05). *1136300.* [302-01-2]. Diazane.

A slightly oily liquid, colourless, with a strong odour of ammonia, miscible with water. Dilute solutions in water are commercially available.

Caution: toxic and corrosive.

n_D^{20}: about 1.470.

bp: about 113 °C.

mp: about 1.5 °C.

Hydrazine sulphate. $H_6N_2O_4S$. (M_r 130.1). *1043400.* [10034-93-2].

Colourless crystals, sparingly soluble in cold water, soluble in hot water (50 °C) and freely soluble in boiling water, practically insoluble in alcohol.

Arsenic (*2.4.2*). 1.0 g complies with limit test A (1 ppm).

Sulphated ash (*2.4.14*): maximum 0.1 per cent.

Hydriodic acid. HI. (M_r 127.9). *1098900.* [10034-85-2].

Prepare by distilling hydriodic acid over red phosphorus, passing *carbon dioxide R* or *nitrogen R* through the apparatus during the distillation. Use the colourless or almost colourless, constant-boiling mixture (55 per cent to 58 per cent of HI) distilling between 126 °C and 127 °C.

Place the acid in small, amber, glass-stoppered bottles previously flushed with *carbon dioxide R* or *nitrogen R*, seal with paraffin.

Storage: in a dark place.

Hydrobromic acid, 30 per cent. *1098700.* [10035-10-6].

30 per cent hydrobromic acid in *glacial acetic acid R*.

Degas with caution the contents before opening.

Hydrobromic acid, dilute. *1098701.*

Place 5.0 ml of *30 per cent hydrobromic acid R* in amber vials equipped with polyethylene stoppers. Seal under *argon R* and store in the dark. Add 5.0 ml of *glacial acetic acid R* immediately before use. Shake.

Storage: in the dark.

Hydrobromic acid, 47 per cent. *1118900.*

A 47 per cent *m/m* solution of hydrobromic acid in *water R*.

Hydrobromic acid, dilute R1. *1118901.*

Contains 7,9 g/l of HBr.

Dissolve 16.81 g of *47 per cent hydrobromic acid R* in *water R* and dilute to 1000 ml with the same solvent.

Hydrochloric acid. *1043500.* [7647-01-0].

See *Concentrated hydrochloric acid (0002)*.

2 M Hydrochloric acid. *3001700.*

Dilute 206.0 g of *hydrochloric acid R* to 1000.0 ml with *water R*.

3 M Hydrochloric acid. *3001600.*

Dilute 309.0 g of *hydrochloric acid R* to 1000.0 ml with *water R*.

6 M Hydrochloric acid. *3001500.*

Dilute 618.0 g of *hydrochloric acid R* to 1000.0 ml with *water R*.

Hydrochloric acid R1. *1043501.*

Contains 250 g/l of HCl.

Dilute 70 g of *hydrochloric acid R* to 100 ml with *water R*.

Hydrochloric acid, brominated. *1043507.*

To 1 ml of *bromine solution R* add 100 ml of *hydrochloric acid R*.

Hydrochloric acid, dilute. *1043503.*

Contains 73 g/l of HCl.

Dilute 20 g of *hydrochloric acid R* to 100 ml with *water R*.

Hydrochloric acid, dilute, heavy metal-free. *1043509.*

Complies with the requirements prescribed for *dilute hydrochloric acid R* and with the following maximum contents of heavy metals:

As: 0.005 ppm;

Cd: 0.003 ppm;

Cu: 0.003 ppm;

Fe: 0.05 ppm;

Hg: 0.005 ppm;

Ni: 0.004 ppm;

Pb: 0.001 ppm;

Zn: 0.005 ppm.

Hydrochloric acid, dilute R1. *1043504.*

Contains 0.37 g/l of HCl.

Dilute 1.0 ml of *dilute hydrochloric acid R* to 200.0 ml with *water R*.

Hydrochloric acid, dilute R2. *1043505.*

Dilute 30 ml of *1 M hydrochloric acid* to 1000 ml with *water R*; adjust to pH 1.6 ± 0.1.

Hydrochloric acid, ethanolic. *1043506.*

Dilute 5.0 ml of *1 M hydrochloric acid* to 500.0 ml with *alcohol R*.

Hydrochloric acid, heavy metal-free. *1043510.*

Complies with the requirements prescribed for *hydrochloric acid R* and with the following maximum contents of heavy metals:

As: 0.005 ppm;

Cd: 0.003 ppm;

Cu: 0.003 ppm;

Fe: 0.05 ppm;

Hg: 0.005 ppm;

Ni: 0.004 ppm;

Pb: 0.001 ppm;

Zn: 0.005 ppm.

Hydrochloric acid, lead-free. *1043508.*

Complies with the requirements prescribed for *hydrochloric acid R* and with the following additional test.

Lead: maximum 20 ppb of Pb determined by atomic emission spectrometry (*2.2.22, Method I*).

Test solution. In a quartz crucible evaporate 200 g of the acid to be examined almost to dryness. Take up the residue in 5 ml of nitric acid prepared by sub-boiling distillation of *nitric acid R* and evaporate to dryness. Take up the residue in 5 ml of nitric acid prepared by sub-boiling distillation of *nitric acid R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 ppm Pb) R* diluted with nitric acid prepared by sub-boiling distillation of *nitric acid R*. Measure the emission intensity at 220.35 nm.

Hydrocortisone acetate. *1098800.* [50-03-3].
See *Hydrocortisone acetate (0334).*

Hydrofluoric acid. HF. (M_r 20.01). *1043600.* [7664-39-3].
Content: minimum 40.0 per cent *m/m* of HF.
A clear, colourless liquid.
Residue on ignition. Not more than 0.05 per cent *m/m*. Evaporate the hydrofluoric acid in a platinum crucible and gently ignite the residue to constant mass.
Assay. Weigh accurately a glass-stoppered flask containing 50.0 ml of *1 M sodium hydroxide*. Introduce 2 g of the hydrofluoric acid and weigh again. Titrate the solution with *0.5 M sulphuric acid,* using 0.5 ml of *phenolphthalein solution R* as indicator.
1 ml of *1 M sodium hydroxide* is equivalent to 20.01 mg of HF.
Storage: in a polyethylene container.

Hydrogen for chromatography. H_2. (M_r 2.016). *1043700.* [1333-74-0].
Content: minimum 99.95 per cent *V/V* of H_2.

Hydrogen peroxide solution, dilute. *1043800.* [7722-84-1].
See *Hydrogen peroxide solution (3 per cent) (0395).*

Hydrogen peroxide solution, strong. *1043900.* [7722-84-1].
See *Hydrogen peroxide solution (30 per cent) (0396).*

Hydrogen sulphide. H_2S. (M_r 34.08). *1044000.* [7783-06-4].
A gas, slightly soluble in water.

Hydrogen sulphide solution. *1136400.*
A recently prepared solution of *hydrogen sulphide R* in *water R*. The saturated solution contains about 0.4 per cent to 0.5 per cent of H_2S at 20 °C.

Hydrogen sulphide R1. H_2S. (M_r 34.08). *1106600.*
Content: minimum 99.7 per cent *V/V* of H_2S.

Hydroquinone. $C_6H_6O_2$. (M_r 110.1). *1044100.* [123-31-9]. Benzene-1,4-diol.
Fine, colourless or white or almost white needles, darkening on exposure to air and light, soluble in water and in alcohol.
mp: about 173 °C.
Storage: protected from light and air.

Hydroquinone solution. *1044101.*
Dissolve 0.5 g of *hydroquinone R* in *water R*, add 20 µl of *sulphuric acid R* and dilute to 50 ml with *water R*.

2-Hydroxybenzimidazole. $C_7H_6N_2O$. (M_r 134.1). *1169600.* [615-16-7]. 1*H*-benzimidazol-2-ol.

4-Hydroxybenzohydrazide. $C_7H_8N_2O_2$. (M_r 152.2). *1145900.* [5351-23-5]. *p*-Hydroxybenzohydrazide.

4-Hydroxybenzoic acid. $C_7H_6O_3$. (M_r 138.1). *1106700.* [99-96-7].
Crystals, slightly soluble in water, very soluble in alcohol, soluble in acetone.
mp: 214 °C to 215 °C.

4-Hydroxycoumarin. $C_9H_6O_3$. (M_r 162.2). *1169700.* [1076-38-6]. 4-Hydroxy-2*H*-1-benzopyran-2-one.
White or almost white powder, freely soluble in methanol.
Content: minimum 98.0 per cent.

6-Hydroxydopa. $C_9H_{11}NO_5$. (M_r 213.2). *1169800.* [21373-30-8]. (2*RS*)-2-Amino-3-(2,4,5-trihydroxyphenyl)propanoic acid. 2,5-Dihydroxy-DL-tyrosine.
mp: about 257 °C.

2-[4-(2-Hydroxyethyl)piperazin-1-yl]ethanesulphonic acid. $C_8H_{18}N_2O_4S$. (M_r 238.3). *1106800.* [7365-45-9]. HEPES.
A white or almost white powder.
mp: about 236 °C, with decomposition

4-Hydroxyisophthalic acid. $C_8H_6O_5$. (M_r 182.1). *1106900.* [636-46-4]. 4-Hydroxybenzene-1,3-dicarboxylic acid.
Needles or platelets, very slightly soluble in water, freely soluble in alcohol.
mp: about 314 °C, with decomposition.

Hydroxylamine hydrochloride. NH_4ClO. (M_r 69.5). *1044300.* [5470-11-1].
A white or almost white, crystalline powder, very soluble in water, soluble in alcohol.

Hydroxylamine hydrochloride solution R2. *1044304.*
Dissolve 2.5 g of *hydroxylamine hydrochloride R* in 4.5 ml of hot *water R* and add 40 ml of *alcohol R* and 0.4 ml of *bromophenol blue solution R2.* Add *0.5 M alcoholic potassium hydroxide* until a greenish-yellow colour is obtained. Dilute to 50.0 ml with *alcohol R*.

Hydroxylamine solution, alcoholic. *1044301.*
Dissolve 3.5 g of *hydroxylamine hydrochloride R* in 95 ml of *alcohol (60 per cent V/V) R,* add 0.5 ml of a 2 g/l solution of *methyl orange R* in *alcohol (60 per cent V/V) R* and sufficient *0.5 M potassium hydroxide in alcohol (60 per cent V/V)* to give a pure yellow colour. Dilute to 100 ml with *alcohol (60 per cent V/V) R*.

Hydroxylamine solution, alkaline. *1044302.*
Immediately before use, mix equal volumes of a 139 g/l solution of *hydroxylamine hydrochloride R* and a 150 g/l solution of *sodium hydroxide R*.

Hydroxylamine solution, alkaline R1. *1044303.*
Solution A. Dissolve 12.5 g of *hydroxylamine hydrochloride R* in *methanol R* and dilute to 100 ml with the same solvent.
Solution B. Dissolve 12.5 g of *sodium hydroxide R* in *methanol R* and dilute to 100 ml with the same solvent.
Mix equal volumes of solution A and solution B immediately before use.

Hydroxymethylfurfural. $C_6H_6O_3$. (M_r 126.1). *1044400.* [67-47-0]. 5-Hydroxymethylfurfural.
Acicular crystals, freely soluble in water, in acetone and in alcohol.
mp: about 32 °C.

Hydroxynaphthol blue, sodium salt. $C_{20}H_{11}N_2Na_3O_{11}S_3$. ($M_r$ 620). *1044500.* [63451-35-4]. Trisodium 2,2′-dihydroxy-1,1′-azonaphthalene-3′,4,6′-trisulphonate.

2-Hydroxypropylbetadex for chromatography R. *1146000.* Betacyclodextrin modified by the bonding of (*R*) or (*RS*) propylene oxide groups on the hydroxyl groups.

Hydroxypropyl-β-cyclodextrin. *1128600.* [94035-02-6].
See *Hydroxypropylbetadex (1804).*
pH (*2.2.3*): 5.0-7.5 (20 g/l solution).

Hydroxyquinoline. C_9H_7NO. (M_r 145.2). *1044600.* [148-24-3]. 8-Hydroxyquinoline. Quinolin-8-ol.

A white or slightly yellowish, crystalline powder, slightly soluble in water, freely soluble in acetone, in alcohol and in dilute mineral acids.

mp: about 75 °C.

Sulphated ash (*2.4.14*): maximum 0.05 per cent.

12-Hydroxystearic acid. $C_{18}H_{36}O_3$. (M_r 300.5). *1099000.* [106-14-9]. 12-Hydroxyoctadecanoic acid.

White or almost white powder.

mp: 71 °C to 74 °C.

5-Hydroxyuracil. $C_4H_4N_2O_3$. (M_r 128.1). *1044700.* [496-76-4]. Isobarbituric acid. Pyrimidine-2,4,5-triol.

A white or almost white, crystalline powder.

mp: about 310 °C, with decomposition.

Chromatography. Examined as prescribed in the monograph on *Fluorouracil (0611)*, the chromatogram shows a principal spot with an R_F of about 0.3.

Storage: in an airtight container.

Hyoscine hydrobromide. *1044800.* [6533-68-2].

See *Hyoscine hydrobromide (0106).*

Hyoscyamine sulphate. *1044900.* [620-61-1].

See *Hyoscyamine sulphate (0501).*

Hypericin. $C_{30}H_{16}O_8$. (M_r 504.4). *1149800.* [548-04-9]. 1,3,4,6,8,13-Hexahydroxy-10,11-dimethylphenanthro[1,10,9,8-*opqra*]perylene-7,14-dione.

Content: minimum 85 per cent of $C_{30}H_{16}O_8$.

Hyperoside. $C_{21}H_{20}O_{12}$. (M_r 464.4). *1045000.* 2-(3,4-Dihydroxyphenyl)-3-β-D-galactopyranosyloxy-5,7-dihydroxy-chromen-4-one.

Faint yellow needles, soluble in methanol.

$[\alpha]_D^{20}$: −8.3, determined on a 2 g/l solution in *pyridine R*.

mp: about 240 °C, with decomposition.

A solution in *methanol R* shows two absorption maxima (*2.2.25*), at 259 nm and at 364 nm.

Hypophosphorous reagent. *1045200.*

Dissolve with the aid of gentle heat, 10 g of *sodium hypophosphite R* in 20 ml of *water R* and dilute to 100 ml with *hydrochloric acid R*. Allow to settle and decant or filter through glass wool.

Hypoxanthine. $C_5H_4N_4O$. (M_r 136.1). *1045300.* [68-94-0]. 1*H*-Purin-6-one.

A white or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in boiling water, soluble in dilute acids and in dilute alkali hydroxide solutions, decomposes without melting at about 150 °C.

Chromatography. Examine as prescribed in the monograph on *Mercaptopurine (0096)*; the chromatogram shows only one principal spot.

Imidazole. $C_3H_4N_2$. (M_r 68.1). *1045400.* [288-32-4].

A white or almost white, crystalline powder, soluble in water and in alcohol.

mp: about 90 °C.

Iminodibenzyl. $C_{14}H_{13}N$. (M_r 195.3). *1045500.* [494-19-9]. 10,11-Dihydrodibenz[*b,f*]azepine.

A pale yellow, crystalline powder, practically insoluble in water, freely soluble in acetone.

mp: about 106 °C.

Indigo carmine. $C_{16}H_8N_2Na_2O_8S_2$. (M_r 466.3). *1045600.* [860-22-0].

Schultz No. 1309.

Colour Index No. 73015.
3,3′-Dioxo-2,2′-bisindolylidene-5,5′-disulphonate disodium.
E 132.

It usually contains sodium chloride.

A blue or violet-blue powder or blue granules with a coppery lustre, sparingly soluble in water, practically insoluble in alcohol. It is precipitated from an aqueous solution by sodium chloride.

Indigo carmine solution. *1045601.*

To a mixture of 10 ml of *hydrochloric acid R* and 990 ml of 200 g/l *nitrogen-free sulphuric acid R* add 0.2 g of *indigo carmine R*.

The solution complies with the following test.

Add 10 ml to a solution of 1.0 mg of *potassium nitrate R* in 10 ml of *water R*, rapidly add 20 ml of *nitrogen-free sulphuric acid R* and heat to boiling. The blue colour is discharged within 1 min.

Indigo carmine solution R1. *1045602.*

Dissolve 4 g of *indigo carmine R* in about 900 ml of *water R* added in several portions. Add 2 ml of *sulphuric acid R* and dilute to 1000 ml with *water R*.

Standardisation. Place in a 100 ml conical flask with a wide neck 10.0 ml of *nitrate standard solution (100 ppm NO_3) R*, 10 ml of *water R*, 0.05 ml of the *indigo carmine solution R1*, and then in a single addition, but with caution, 30 ml of *sulphuric acid R*. Titrate the solution immediately, using the *indigo carmine solution R1*, until a stable blue colour is obtained.

The number of millilitres used, *n*, is equivalent to 1 mg of NO_3.

Indometacin. *1101500.* [53-86-1].

See *Indometacin (0092).*

Inosine. $C_{10}H_{12}N_4O_5$. (M_r 268.2). *1169900.* [58-63-9]. 9-β-D-Ribofuranosylhypoxanthine. 9-β-D-Ribofuranosyl-1,9-dihydro-6*H*-purin-6-one.

mp: 222 °C to 226 °C.

***myo*-Inositol.** *1161100.*

See *myo-Inositol (1805).*

Iodine. *1045800.* [7553-56-2].

See *Iodine (0031).*

Iodine solution R1. *1045801.*

To 10.0 ml of *0.05 M iodine* add 0.6 g of *potassium iodide R* and dilute to 100.0 ml with *water R*. Prepare immediately before use.

Iodine solution R2. *1045802.*

To 10.0 ml of *0.05 M iodine* add 0.6 g of *potassium iodide R* and dilute to 1000.0 ml with *water R*. Prepare immediately before use.

Iodine solution R3. *1045803.*

Dilute 2.0 ml of *iodine solution R1* to 100.0 ml with *water R*. Prepare immediately before use.

Iodine solution R4. *1045806.*

Dissolve 14 g of *iodine R* in 100 ml of a 400 g/l solution of *potassium iodide R*, add 1 ml of *dilute hydrochloric acid R* and dilute to 1000 ml with *water R*.

Storage: protected from light.

Iodine solution, alcoholic. *1045804.*

A 10 g/l solution in *alcohol R*.

Storage: protected from light.

Iodine solution, chloroformic. *1045805.*

A 5 g/l solution in *chloroform R*.

Storage: protected from light.

Iodine-123 and ruthenium-106 spiking solution. *1166700.*

Prepare immediately before use. Mix 3.5 ml of an 18.5 kBq/ml solution of ruthenium-106 in the form of ruthenium trichloride in a mixture of equal volumes of *glacial acetic acid R* and *water R* with 200 µl of a 75 kBq/ml solution of iodine-123 in the form of sodium iodide in *water R*.

Iodine bromide. IBr. (M_r 206.8). *1045900.* [7789-33-5].

Bluish-black or brownish-black crystals, freely soluble in water, in alcohol and in glacial acetic acid.

bp: about 116 °C.

mp: about 40 °C.

Storage: protected from light.

Iodine bromide solution. *1045901.*

Dissolve 20 g of *iodine bromide R* in *glacial acetic acid R* and dilute to 1000 ml with the same solvent.

Storage: protected from light.

Iodine chloride. ICl. (M_r 162.4). *1143000.* [7790-99-0].

Black crystals, soluble in water, in acetic acid and in alcohol.

bp: about 97.4 °C.

Iodine chloride solution. *1143001.*

Dissolve 1.4 g of *iodine chloride R* in *glacial acetic acid R* and dilute to 100 ml with the same acid.

Storage: protected from light.

Iodine pentoxide, recrystallised. I_2O_5. (M_r 333.8). *1046000.* [12029-98-0]. Di-iodine pentoxide. Iodic anhydride.

Content: minimum 99.5 per cent of I_2O_5.

A white or almost white, crystalline powder, or white or greyish-white granules, hygroscopic, very soluble in water forming HIO_3.

Stability on heating. Dissolve 2 g, previously heated for 1 h at 200 °C, in 50 ml of *water R*. A colourless solution is obtained.

Assay. Dissolve 0.100 g in 50 ml of *water R*, add 3 g of *potassium iodide R* and 10 ml of *dilute hydrochloric acid R*. Titrate the liberated iodine with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 2.782 mg of I_2O_5.

Storage: in an airtight container, protected from light.

Iodoacetic acid. $C_2H_3IO_2$. (M_r 185.9). *1107000.* [64-69-7].

Colourless or white or almost white crystals, soluble in water and in alcohol.

mp: 82 °C to 83 °C.

2-Iodobenzoic acid. $C_7H_5IO_2$. (M_r 248.0). *1046100.* [88-67-5].

A white or slightly yellow, crystalline powder, slightly soluble in water, soluble in alcohol.

mp: about 160 °C.

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using cellulose for chromatography f_{254} R as the coating substance. Apply to the plate 20 µl of a solution of the 2-iodobenzoic acid, prepared by dissolving 40 mg in 4 ml of *0.1 M sodium hydroxide* and diluting to 10 ml with *water R*. Develop over a path of about 12 cm using as the mobile phase the upper layer obtained by shaking together 20 volumes of *water R*, 40 volumes of *glacial acetic acid R* and 40 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram shows only one principal spot.

3-Iodobenzylammonium chloride. C_7H_9ClIN. (M_r 269.5). *1168000.* [3718-88-5]. 1-(3-Iodophenyl)methanamine hydrochloride. 1-(3-Iodophenyl)methanaminium chloride. *m*-Iodobenzylamine hydrochloride.

White or almost white crystals.

mp: 188 °C to 190 °C.

Iodoethane. C_2H_5I. (M_r 155.9). *1099100.* [75-03-6].

Colourless to slightly yellowish liquid, darkening on exposure to air and light, miscible with alcohol and most organic solvents.

d_{20}^{20}: about 1.95.

n_D^{20}: about 1.513.

bp: about 72 °C.

Storage: in an airtight container.

2-Iodohippuric acid. $C_9H_8INO_3,2H_2O$. (M_r 341.1). *1046200.* [147-58-0]. 2-(2-Iodobenzamido)acetic acid.

A white or almost white, crystalline powder, sparingly soluble in water.

mp: about 170 °C.

Water (*2.5.12*): 9 per cent to 13 per cent, determined on 1.000 g.

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using *cellulose for chromatography F_{254} R* as the coating substance. Apply to the plate 20 µl of a solution of the 2-iodohippuric acid, prepared by dissolving 40 mg in 4 ml of *0.1 M sodium hydroxide* and diluting to 10 ml with *water R*. Develop over a path of about 12 cm using as the mobile phase the upper layer obtained by shaking together 20 volumes of *water R*, 40 volumes of *glacial acetic acid R* and 40 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram shows only one principal spot.

Iodoplatinate reagent. *1046300.*

To 3 ml of a 100 g/l solution of *chloroplatinic acid R* add 97 ml of *water R* and 100 ml of a 60 g/l solution of *potassium iodide R*.

Storage: protected from light.

Iodosulphurous reagent. *1046400.*

The apparatus, which must be kept closed and dry during the preparation, consists of a 3000 ml to 4000 ml round-bottomed flask with three inlets for a stirrer and a thermometer and fitted with a drying tube. To 700 ml of *anhydrous pyridine R* and 700 ml of *ethyleneglycol monomethyl ether R* add, with constant stirring, 220 g of finely powdered *iodine R*, previously dried over *diphosphorus pentoxide R*. Continue stirring until the iodine has completely dissolved (about 30 min). Cool to – 10 °C, and add quickly, still stirring, 190 g of *sulphur dioxide R*. Do not allow the temperature to exceed 30 °C. Cool.

Standardisation. Add about 20 ml of *anhydrous methanol R* to a titration vessel and titrate to the end-point with the iodosulphurous reagent (*2.5.12*). Introduce in an appropriate form a suitable amount of *water R*, accurately weighed, and repeat the determination of water. Calculate the water equivalent in milligrams per millilitre of iodosulphurous reagent.

The minimum water equivalent is 3.5 mg of water per millilitre of reagent.

Work protected from humidity. Standardise immediately before use.

Storage: in a dry container.

5-Iodouracil. $C_4H_3IN_2O_2$. (M_r 238.0). *1046500.* [696-07-1]. 5-Iodo-1*H*,3*H*-pyrimidine-2,4-dione.

mp: about 276 °C, with decomposition.

Chromatography. Examine as prescribed in the monograph on *Idoxuridine (0669)*, applying 5 µl of a 0.25 g/l solution. The chromatogram obtained shows only one principal spot.

Ion-exclusion resin for chromatography. *1131000.*

A resin with sulphonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with divinylbenzene.

Ion-exchange resin, strongly acidic. *1085400.*

A resin in protonated form with sulphonic acid groups attached to a lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene. It is available as spherical beads; unless otherwise prescribed, the particle size is 0.3 mm to 1.2 mm.

Capacity. 4.5 mmol to 5 mmol per gram, with a water content of 50 per cent to 60 per cent.

Preparation of a column. Unless otherwise prescribed, use a tube with a fused-in sintered glass disc having a length of 400 mm, an internal diameter of 20 mm and a filling height of about 200 mm. Introduce the resin, mixing it with *water R* and pouring the slurry into the tube, ensuring that no air bubbles are trapped between the particles. When in use, the liquid must not be allowed to fall below the surface of the resin. If the resin is in its protonated form, wash with *water R* until 50 ml requires not more than 0.05 ml of *0.1 M sodium hydroxide* for neutralisation, using 0.1 ml of *methyl orange solution R* as indicator.

If the resin is in its sodium form or if it requires regeneration, pass about 100 ml of a mixture of equal volumes of *hydrochloric acid R1* and *water R* slowly through the column and then wash with *water R* as described above.

Iron. Fe. (A_r 55.85). *1046600.* [7439-89-6].

Grey powder or wire, soluble in dilute mineral acids.

Iron salicylate solution. *1046700.*

Dissolve 0.1 g of *ferric ammonium sulphate R* in a mixture of 2 ml of *dilute sulphuric acid R* and 48 ml of *water R* and dilute to 100 ml with *water R*. Add 50 ml of a 11.5 g/l solution of *sodium salicylate R*, 10 ml of *dilute acetic acid R*, 80 ml of a 136 g/l solution of *sodium acetate R* and dilute to 500 ml with *water R*. The solution should be recently prepared.

Storage: in an airtight container, protected from light.

Isatin. $C_8H_5NO_2$. (M_r 147.1). *1046800.* [91-56-5]. Indoline-2,3-dione.

Small, yellowish-red crystals, slightly soluble in water, soluble in hot water and in alcohol, soluble in solutions of alkali hydroxides giving a violet colour becoming yellow on standing.

mp: about 200 °C, with partial sublimation.

Sulphated ash (*2.4.14*): maximum 0.2 per cent.

Isatin reagent. *1046801.*

Dissolve 6 mg of *ferric sulphate R* in 8 ml of *water R* and add cautiously 50 ml of *sulphuric acid R*. Add 6 mg of *isatin R* and stir until dissolved.

The reagent should be pale yellow, but not orange or red.

Isoamyl alcohol. $C_5H_{12}O$. (M_r 88.1). *1046900.* [123-51-3]. 3-Methylbutan-1-ol.

A colourless liquid, slightly soluble in water, miscible with alcohol.

bp: about 130 °C.

Isoamyl benzoate. $C_{12}H_{16}O_2$. (M_r 192.3). *1164200.* [94-46-2]. Isopentyl benzoate. 3-Methylbutyl benzoate.

n_D^{20}: about 1.494.

bp: about 261 °C.

A colourless or pale yellow liquid.

Isoandrosterone. $C_{19}H_{30}O_2$. (M_r 290.4). *1107100.* [481-29-8]. Epiandrosterone. 3β-Hydroxy-5α-androstan-17-one.

A white or almost white powder, practically insoluble in water, soluble in organic solvents.

$[\alpha]_D^{20}$: + 88, determined on 20 g/l solution in *methanol R*.

mp: 172 °C to 174 °C.

ΔA (*2.2.41*): 14.24×10^3, determined at 304 nm on a 1.25 g/l solution.

***N*-Isobutyldodecatetraenamide.** $C_{16}H_{25}NO$. (M_r 247.4). *1159500.* [75917-90-7]. (2*E*,4*E*,8*Z*,10*EZ*)-*N*-2-(Methylpropyl)dodeca-2,4,8,10-tetraenamide.

White or almost white to non coloured crystals.

mp: about 70 °C.

***N*-Isobutyldodecatetraenamide solution.** *1159501.*

A solution of *N-isobutyldodecatetraenamide R*, exactly weighed, in *methanol R* at a concentration of about 10 mg/ml.

Isodrin. $C_{12}H_8Cl_6$. (M_r 364.9). *1128700.* [465-73-6]. 1,2,3,4,10,10-Hexachloro-1,4,4a,5,8,8a-hexahydro-*endo*,*endo*-1,4:5,8-dimethanonaphthalene.

Practically insoluble in water, soluble in common organic solvents such as acetone.

A suitable certified reference solution may be used.

Isomalt. $C_{12}H_{24}O_{11}$. (M_r 344.3). *1164300.* [64519-82-0].

Mixture of 6-*O*-α-D-glucopyranosyl-D-glucitol and of 1-*O*-α-D-glucopyranosyl-D-mannitol.

White or almost white powder or granules, freely soluble in water.

Isomaltitol. $C_{12}H_{24}O_{11}$. (M_r 344.3). *1161200.* [534-73-6]. 6-*O*-α-D-Glucopyranosyl-D-glucitol.

White or almost white powder, freely soluble in water.

Isomenthol. $C_{10}H_{20}O$. (M_r 156.3). *1047000.* [23283-97-8]. (+)-*Isomenthol:* (1*S*,2*R*,5*R*)-2-isopropyl-5-methylcyclohexanol. (±)-*Isomenthol:* a mixture of equal parts of (1*S*,2*R*,5*R*)- and (1*R*,2*S*,5*S*)-2-isopropyl-5-methylcyclohexanol.

Colourless crystals, practically insoluble in water, very soluble in alcohol.

$[\alpha]_D^{20}$: (+)-*Isomenthol*: about + 24, determined on a 100 g/l solution in *alcohol R*.

bp: (+)-*Isomenthol*: about 218 °C. (±)-*Isomenthol*: about 218 °C.

mp: (+)-*Isomenthol*: about 80 °C. (±)-*Isomenthol*: about 53 °C.

(+)-Isomenthone. $C_{10}H_{18}O$. (M_r 154.2). *1047100.* (1*R*)-*cis-p*-Menthan-3-one. (1*R*)-*cis*-2-Isopropyl-5-methylcyclohexanone.

Contains variable amounts of menthone. A colourless liquid, very slightly soluble in water, soluble in alcohol.

d_{20}^{20}: about 0.904.

n_D^{20}: about 1.453.

$[\alpha]_D^{20}$: about + 93.2.

Isomenthone used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 80.0 per cent of the total area of the peaks.

Isopropylamine. C_3H_9N. (M_r 59.1). *1119800.* [75-31-0]. Propan-2-amine.

A colourless, highly volatile, flammable liquid.

n_D^{20}: about 1.374.

bp: 32 °C to 34 °C.

Isopropyl iodide. C_3H_7I. (M_r 170.0). *1166600.* [75-30-9]. 2-Iodopropane.

Isopropyl myristate. *1047200.* [110-27-0].

See *Isopropyl myristate (0725).*

4-Isopropylphenol. $C_9H_{12}O$. (M_r 136.2). *1047300.* [99-89-8].

Content: minimum 98 per cent of $C_9H_{12}O$.

bp: about 212 °C.

mp: 59 °C to 61 °C.

Isopulegol. $C_{10}H_{18}O$. (M_r 154.2). *1139600.* [89-79-2]. (–)-Isopulegol. (1*R*,2*S*,5*R*)-2-Isopropenyl-5-methylcyclohexanol.

d_4^{20}: about 0.911.

n_D^{20}: about 1.472.

bp: about 91 °C.

Isopulegol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Mint oil, partly dementholised (1838).*

The content is not less than 99 per cent, calculated by the normalisation procedure.

Isoquercitroside. $C_{21}H_{20}O_{12}$. (M_r 464.4). *1136500.* [21637-25-2]. Isoquercitrin. 2-(3,4-Dihydroxyphenyl)-3-(β-D-glucofuranosyloxy)-5,7-dihydroxy-4*H*-1-benzopyran-4-one. 3,3′,4′,5,7-Pentahydroxyflavone-3-glucoside.

Isosilibinin. $C_{25}H_{22}O_{10}$. (M_r 482.4). *1149900.* [72581-71-6]. 3,5,7-Trihydroxy-2-[2-(4-hydroxy-3-methoxyphenyl)-3-hydroxymethyl-2,3-dihydro-1,4-benzodioxin-6-yl]chroman-4-one.

White to yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Kaolin, light. *1047400.* [1332-58-7].

A purified native hydrated aluminium silicate. It contains a suitable dispersing agent.

A light, white or almost white powder free from gritty particles, unctuous to the touch, practically insoluble in water and in mineral acids.

Coarse particles. Place 5.0 g in a ground-glass-stoppered cylinder about 160 mm long and 35 mm in diameter and add 60 ml of a 10 g/l solution of *sodium pyrophosphate R*. Shake vigorously and allow to stand for 5 min. Using a pipette, remove 50 ml of the liquid from a point about 5 cm below the surface. To the remaining liquid add 50 ml of *water R*, shake, allow to stand for 5 min and remove 50 ml as before. Repeat the operations until a total of 400 ml has been removed. Transfer the remaining suspension to an evaporating dish. Evaporate to dryness on a water-bath and dry the residue to constant mass at 100 °C to 105 °C. The residue weighs not more than 25 mg (0.5 per cent).

Fine particles. Disperse 5.0 g in 250 ml of *water R* by shaking vigorously for 2 min. Immediately pour into a glass cylinder 50 mm in diameter and, using a pipette, transfer 20 ml to a glass dish, evaporate to dryness on a water-bath and dry to constant mass at 100 °C to 105 °C. Allow the remainder of the suspension to stand at 20 °C for 4 h and, using a pipette with its tip exactly 5 cm below the surface, withdraw a further 20 ml without disturbing the sediment, place in a glass dish, evaporate to dryness on a water-bath and dry to constant mass at 100 °C to 105 °C. The mass of the second residue is not less than 70 per cent of that of the first residue.

11-Keto-β-boswellic acid. $C_{30}H_{46}O_4$. (M_r 470.7). *1167600.* [17019-92-0]. 3α-Hydroxy-11-oxours-12-en-24-oic acid. (4β)-3α-Hydroxy-11-oxours-12-en-23-oic acid.

White or almost white powder, insoluble in water, soluble in acetone, in anhydrous ethanol and in methanol.

mp: 195 °C to 197 °C.

11-Keto-β-boswellic acid used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph on *Indian frankincense (2310).*

Content: minimum 90 per cent, calculated by the normalisation procedure.

Kieselguhr for chromatography. *1047500.*

A white or yellowish-white, light powder, practically insoluble in water, in dilute acids and in organic solvents.

Filtration rate. Use a chromatography column 0.25 m long and 10 mm in internal diameter with a sintered-glass (100) plate and two marks at 0.10 m and 0.20 m above the plate. Place sufficient of the substance to be examined in the column to reach the first mark and fill to the second mark with *water R*. When the first drops begin to flow from the column, fill to the second mark again with *water R* and measure the time required for the first 5 ml to flow from the column. The flow rate is not less than 1 ml/min.

Appearance of the eluate. The eluate obtained in the test for filtration rate is colourless (*Method I, 2.2.2*).

Acidity or alkalinity. To 1.00 g add 10 ml of *water R*, shake vigorously and allow to stand for 5 min. Filter the suspension on a filter previously washed with hot *water R* until the washings are neutral. To 2.0 ml of the filtrate add 0.05 ml of *methyl red solution R*; the solution is yellow. To 2.0 ml of the filtrate add 0.05 ml of *phenolphthalein solution R1*; the solution is at most slightly pink.

Water-soluble substances. Place 10.0 g in a chromatography column 0.25 m long and 10 mm in internal diameter and elute with *water R*. Collect the first 20 ml of eluate, evaporate to dryness and dry the residue at 100 °C to 105 °C. The residue weighs not more than 10 mg.

Iron (*2.4.9*). To 0.50 g add 10 ml of a mixture of equal volumes of *hydrochloric acid R1* and *water R*, shake vigorously, allow to stand for 5 min and filter. 1.0 ml of the filtrate complies with the limit test for iron (200 ppm).

Loss on ignition: maximum 0.5 per cent. During heating to red heat (600 ± 50 °C) the substance does not become brown or black.

Kieselguhr G. *1047600.*

Consists of kieselguhr treated with hydrochloric acid and calcined, to which is added about 15 per cent of calcium sulphate hemihydrate.

A fine greyish-white powder; the grey colour becomes more pronounced on triturating with water. The average particle size is 10 µm to 40 µm.

Calcium sulphate content. Determine by the method prescribed for *silica gel G R*.

pH (*2.2.3*). Shake 1 g with 10 ml of *carbon dioxide-free water R* for 5 min. The pH of the suspension is 7 to 8.

Chromatographic separation. Examine by thin-layer chromatography (*2.2.27*). Prepare plates using a slurry of the kieselguhr G with a 2.7 g/l solution of *sodium acetate R*. Apply 5 µl of a solution containing 0.1 g/l of lactose, sucrose, glucose and fructose in *pyridine R*. Develop over a path of 14 cm using a mixture of 12 volumes of *water R*, 23 volumes of *2-propanol R* and 65 volumes of *ethyl acetate R*. The migration time of the solvent is about 40 min. Dry, spray onto the plate about 10 ml of *anisaldehyde solution R* and heat for 5 min to 10 min at 100 °C to 105 °C. The chromatogram shows four well-defined spots without tailing and well separated from each other.

Lactic acid. *1047800.* [50-21-5].

See *Lactic acid (0458).*

Lactic reagent. *1047801.*

Solution A. To 60 ml of *lactic acid R* add 45 ml of previously filtered *lactic acid R* saturated without heating with *Sudan red G R*; as lactic acid saturates slowly without heating, an excess of colorant is always necessary.

Solution B. Prepare 10 ml of a saturated solution of *aniline R*. Filter.

Solution C. Dissolve 75 mg of *potassium iodide R* in water and dilute to 70 ml with the same solvent. Add 10 ml of *alcohol R* and 0.1 g of *iodine R*. Shake.

Mix solutions A and B. Add solution C.

Lactobionic acid. $C_{12}H_{22}O_{12}$. (M_r 358.3). *1101600.* [96-82-2].

A white or almost white, crystalline powder, freely soluble in water, practically insoluble in alcohol.

mp: about 115 °C.

Lactose. *1047900.* [5989-81-1].

See *Lactose (0187).*

β-Lactose. $C_{12}H_{22}O_{11}$. (M_r 342.3). *1150100.* [5965-66-2]. β-D-Lactose.

White or slightly yellowish powder.

The α-D-lactose content is not greater than 35 per cent.

Assay. Gas chromatography (*2.2.28*): use the normalisation procedure.

Inject an appropriate derivatised sample.

Column:

- *size*: *l* = 30 m, Ø = 0.25 mm,
- *stationary phase*: *poly[(cyanopropyl)(phenyl)][dimethyl] siloxane R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R.*

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 32.5	20 → 280
Injection port		250
Detector		250

Detection: flame ionisation.

The area of the peak due to β-lactose is not less than 99 per cent of the total peak area.

α-Lactose monohydrate. $C_{12}H_{22}O_{11},H_2O$. (M_r 360.3). *1150000.* [5989-81-1]. α-D-Lactose monohydrate.

White or almost white powder.

The β-D-lactose content is less than 3 per cent.

Assay. Gas chromatography (*2.2.28*): use the normalisation procedure.

Inject an appropriate derivatised sample.

Column:

- *size*: *l* = 30 m, Ø = 0.25 mm,
- *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R.*

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12.5	230 → 280
Injection port		250
Detector		280

Detection: flame ionisation.

The area of the peak due to α-lactose is not less than 97 per cent of the total peak area.

Lanatoside C. $C_{49}H_{76}O_2$. (M_r 985). *1163300.* [17575-22-3]. 3β-[(β-D-Glucopyranosyl-(1→4)-3-*O*-acetyl-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12β,14-dihydroxy-5β-card-20(22)-enolide.

Long flat prisms obtained after recrystallisation in ethanol (96 per cent).

Freely soluble in pyridine and in dioxane.

Lanthanum chloride heptahydrate. $LaCl_3,7H_2O$. (M_r 371.4). *1167200.*

White or almost white powder or colourless crystals, freely soluble in water.

Lanthanum nitrate. $La(NO_3)_3,6H_2O$. (M_r 433.0). *1048000.* [10277-43-7]. Lanthanum trinitrate hexahydrate.

Colourless crystals, deliquescent, freely soluble in water.

Storage: in an airtight container.

Lanthanum nitrate solution. *1048001.*

A 50 g/l solution.

Lanthanum trioxide. La_2O_3. (M_r 325.8). *1114000.* [1312-81-8].

An almost white, amorphous powder, practically insoluble in *water R*. It dissolves in dilute solutions of mineral acids and absorbs atmospheric carbon dioxide.

Calcium: maximum 5 ppm.

Lanthanum chloride solution. *1114001.*

To 58.65 g of *lanthanum trioxide R* slowly add 100 ml of *hydrochloric acid R*. Heat to boiling. Allow to cool and dilute to 1000.0 ml with *water R*.

Lauric acid. $C_{12}H_{24}O_2$. (M_r 200.3). *1143100.* [143-07-7]. Dodecanoic acid.

White or almost white, crystalline powder, practically insoluble in water, freely soluble in alcohol.

mp: about 44 °C.

Lauric acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848)*.

The content of lauric acid is not less than 98 per cent, calculated by the normalisation procedure.

Lauryl alcohol. $C_{12}H_{26}O$. (M_r 186.3). *1119900.* [112-53-8]. 1-Dodecanol.

d_{20}^{20}: about 0.820.

mp: 24 °C to 27 °C.

Lavandulol. $C_{10}H_{18}O$. (M_r 154.2). *1114100.* [498-16-8]. (*R*)-5-Methyl-2-(1-methylethenyl)-4-hexen-1-ol.

An oily liquid with a characteristic odour.

Lavandulol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Lavender oil (1338)*.

Test solution. The substance to be examined.

The area of the principal peak is not less than 90.0 per cent of the area of all the peaks in the chromatogram obtained.

Lavandulyl acetate. $C_{12}H_{20}O_2$. (M_r 196.3). *1114200.* [50373-59-6]. 2-Isopropenyl-5-methylhex-4-en-1-yl acetate.

A colourless liquid with a characteristic odour.

d_{20}^{20}: about 0.911.

n_D^{20}: about 1.454.

bp_{13}: 106 °C to 107 °C.

Lavandulyl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Lavender oil (1338)*.

Test solution. The substance to be examined.

The area of the principal peak is not less than 93.0 per cent of the area of all the peaks in the chromatogram obtained.

Lead acetate. $C_4H_6O_4Pb,3H_2O$. (M_r 379.3). *1048100.* [6080-56-4]. Lead di-acetate.

Colourless crystals, efflorescent, freely soluble in water, soluble in alcohol.

Lead acetate cotton. *1048101.*

Immerse absorbent cotton in a mixture of 1 volume of *dilute acetic acid R* and 10 volumes of *lead acetate solution R*. Drain off the excess of liquid, without squeezing the cotton, by placing it on several layers of filter paper. Allow to dry in air.

Storage: in an airtight container.

Lead acetate paper. *1048102.*

Immerse filter paper weighing about 80 g/m² in a mixture of 1 volume of *dilute acetic acid R* and 10 volumes of *lead acetate solution R*. After drying, cut the paper into strips 15 mm by 40 mm.

Lead acetate solution. *1048103.*

A 95 g/l solution in *carbon dioxide-free water R*.

Lead dioxide. PbO_2. (M_r 239.2). *1048200.* [1309-60-0].

A dark brown powder, evolving oxygen when heated, practically insoluble in water, soluble in hydrochloric acid with evolution of chlorine, soluble in dilute nitric acid in the presence of hydrogen peroxide, oxalic acid or other reducing agents, soluble in hot, concentrated alkali hydroxide solutions.

Lead nitrate. $Pb(NO_3)_2$. (M_r 331.2). *1048300.* [10099-74-8]. Lead dinitrate.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water.

Lead nitrate solution. *1048301.*

A 33 g/l solution.

Lead subacetate solution. *1048400.* [1335-32-6]. Basic lead acetate solution.

Content: 16.7 per cent *m/m* to 17.4 per cent *m/m* of Pb (A_r 207.2) in a form corresponding approximately to the formula $C_8H_{14}O_{10}Pb_3$.

Dissolve 40.0 g of *lead acetate R* in 90 ml of *carbon dioxide-free water R*. Adjust the pH to 7.5 with *strong sodium hydroxide solution R*. Centrifuge and use the clear colourless supernatant solution.

The solution remains clear when stored in a well-closed container.

Leiocarposide. $C_{27}H_{34}O_{16}$. (M_r 614.5). *1150200.* [71953-77-0]. 2-(β-D-Glucopyranosyloxy)benzyl 3-(β-D-glucopyranosyloxy)-6-hydroxy-2-methoxybenzoate. 2-[[[3-(β-D-Glucopyranosyloxy)-6-hydroxy-2-methoxybenzoyl]oxy]methyl]phenyl-β-D-glucopyranoside.

White or almost white powder, soluble in water, freely soluble in methanol, slightly soluble in alcohol.

mp: 190 °C to 193 °C.

Lemon oil. *1101700.*

See *Lemon oil (0620)*.

Leucine. *1048500.* [61-90-5].

See *Leucine (0771)*.

Levodopa. *1170000.* [59-92-7].

See *Levodopa (0038)*.

Limonene. $C_{10}H_{16}$. (M_r 136.2). *1048600.* [5989-27-5]. D-Limonene. (+)-*p*-Mentha-1,8-diene. (*R*)-4-Isopropenyl-1-methylcyclohex-1-ene.

Colourless liquid, practically insoluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.84.

n_D^{20}: 1.471 to 1.474.

$[\alpha]_D^{20}$: about + 124.

bp: 175 °C to 177 °C.

Limonene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405).*

Test solution. The substance to be examined.

The area of the principal peak is not less than 99.0 per cent of the total area of the peaks.

Linalol. $C_{10}H_{18}O$. (M_r 154.2). *1048700.* [78-70-6]. (*RS*)-3,7-Dimethylocta-1,6-dien-3-ol.

Mixture of two stereoisomers (licareol and coriandrol).

Liquid, practically insoluble in water.

d_{20}^{20}: about 0.860.

n_D^{20}: about 1.462.

bp: about 200 °C.

Linalol used in gas chromatography complies with the following test.

Assay. Examine by gas chromatography (*2.2.28*) under the conditions described in the monograph on *Anise oil (0804)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

Linalyl acetate. $C_{12}H_{20}O_2$. (M_r 196.3). *1107200.* [115-95-7]. (*RS*)-1,5-Dimethyl-1-vinylhex-4-enyl acetate.

A colourless or slightly yellow liquid with a strong odour of bergamot and lavender.

d_{25}^{25}: : 0.895 to 0.912.

n_D^{20}: 1.448 to 1.451.

bp: about 215 °C.

Linalyl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution.

The area of the principal peak is not less than 95.0 per cent of the total area of the peaks.

Lindane. $C_6H_6Cl_6$. (M_r 290.8). *1128900.* [58-89-9]. γ-Hexachlorocyclohexane.

See *Lindane (0772).*

For the monograph *Wool fat (0134)*, a suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Linoleic acid. $C_{18}H_{32}O_2$. (M_r 280.5). *1143200.* [60-33-3]. (9*Z*,12*Z*)-Octadeca-9,12-dienoic acid.

Colourless, oily liquid.

d_4^{20}: about 0.903.

n_D^{20}: about 1.470.

Linoleic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of linoleic acid is not less than 98 per cent, calculated by the normalisation procedure.

Linolenic acid. $C_{18}H_{30}O_2$. (M_r 278.4). *1143300.* [463-40-1]. (9*Z*,12*Z*,15Z)-Octadeca-9,12,15-trienoic acid.

Colourless liquid, practically insoluble in water, soluble in organic solvents.

d_4^{20}: about 0.915.

n_D^{20}: about 1.480.

Linolenic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of linolenic acid is not less than 98 per cent, calculated by the normalisation procedure.

Linolenyl alcohol. $C_{18}H_{32}O$. (M_r 264.4). *1156200.* [24149-05-1]. (9*Z*,12*Z*,15*Z*)-octadeca-9,12,15-trien-1-ol.

Content: minimum 96 per cent of $C_{18}H_{32}O$.

Linoleyl alcohol. $C_{18}H_{34}O$. (M_r 266.5). *1155900.* [506-43-4]. (9*Z*,12*Z*)-octadeca-9,12-dien-1-ol.

Relative density: 0.830.

Content: minimum 85 per cent of $C_{18}H_{34}O$.

Liquid scintillation cocktail. *1167300.*

Commercially available solution for the determination of radioactivity by liquid scintillation counting. It contains one or more fluorescent agents and mostly one or more emulsifying agents in a suitable organic solvent or mixture of organic solvents.

Lithium. Li. (A_r 6.94). *1048800.* [7439-93-2].

A soft metal whose freshly cut surface is silvery-grey. It rapidly tarnishes in contact with air. It reacts violently with water, yielding hydrogen and giving a solution of lithium hydroxide; soluble in methanol, yielding hydrogen and a solution of lithium methoxide; practically insoluble in light petroleum.

Storage: under light petroleum or liquid paraffin.

Lithium carbonate. Li_2CO_3. (M_r 73.9). *1048900.* [554-13-2]. Dilithium carbonate.

A white or almost white, light powder, sparingly soluble in water, very slightly soluble in alcohol. A saturated solution at 20 °C contains about 13 g/l of Li_2CO_3.

Lithium chloride. LiCl. (M_r 42.39). *1049000.* [7447-41-8].

Crystalline powder or granules or cubic crystals, deliquescent, freely soluble in water, soluble in acetone and in alcohol. Aqueous solutions are neutral or slightly alkaline.

Storage: in an airtight container.

Lithium hydroxide. $LiOH,H_2O$. (M_r 41.96). *1049100.* [1310-66-3]. Lithium hydroxide monohydrate.

A white or almost white, granular powder, strongly alkaline, it rapidly absorbs water and carbon dioxide, soluble in water, sparingly soluble in alcohol.

Storage: in an airtight container.

Lithium metaborate, anhydrous. $LiBO_2$. (M_r 49.75). *1120000.* [13453-69-5].

Lithium sulphate. Li_2SO_4,H_2O. (M_r 128.0). *1049200.* [10102-25-7]. Dilithium sulphate monohydrate.

Colourless crystals, freely soluble in water, practically insoluble in alcohol.

Litmus. *1049300.* [1393-92-6].

Schultz No. 1386.

Indigo-blue fragments prepared from various species of Rocella, Lecanora or other lichens, soluble in water, practically insoluble in alcohol.

Colour change: pH 5 (red) to pH 8 (blue).

Litmus paper, blue. *1049301.*

Boil 10 parts of coarsely powdered *litmus R* for 1 h with 100 parts of *alcohol R*. Decant the alcohol and add to the residue a mixture of 45 parts of *alcohol R* and 55 parts of *water R*. After 2 days decant the clear liquid. Impregnate strips of filter paper with the solution and allow to dry.

Test for sensitivity. Immerse a strip measuring 10 mm by 60 mm in a mixture of 10 ml of *0.02 M hydrochloric acid* and 90 ml of *water R*. On shaking the paper turns red within 45 s.

Litmus paper, red. *1049302.*

To the blue litmus extract, add *dilute hydrochloric acid R* dropwise until the blue colour becomes red. Impregnate strips of filter paper with the solution and allow to dry.

Test for sensitivity. Immerse a strip measuring 10 mm by 60 mm in a mixture of 10 ml of *0.02 M sodium hydroxide* and 90 ml of *water R*. On shaking the paper turns blue within 45 s.

Loganin. $C_{17}H_{26}O_{10}$. (M_r 390.4). *1136700.* [18524-94-2]. Methyl (1*S*,4a*S*,6*S*,7*R*,7a*S*)-1-(β-D-glucopyranosyloxy)-6-hydroxy-7-methyl-1,4a,5,6,7,7a-hexahydrocyclopenta[*c*]pyran-4-carboxylate.

mp: 220 °C to 221 °C.

Longifolene. $C_{15}H_{24}$. (M_r 204.4). *1150300.* [475-20-7]. (1*S*,3a*R*,4*S*,8a*S*)-4,8,8-Trimethyl-9-methylenedecahydro-1,4-methanoazulene.

Oily, colourless liquid, practically insoluble in water, miscible with alcohol.

d_4^{18}: 0.9319.

n_D^{20}: 1.5050.

$[\alpha]_D^{20}$: + 42.7.

bp: 254 °C to 256 °C.

Longifolene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Turpentine oil, Pinus pinaster type (1627).*

The content is not less than 98.0 per cent, calculated by the normalisation procedure.

Low-vapour-pressure hydrocarbons (type L). *1049400.*

Unctuous mass, soluble in benzene and in toluene.

Lumiflavine. $C_{13}H_{12}N_4O_2$. (M_r 256.3). *1141000.* [1088-56-8]. 7,8,10-Trimethylbenzo[*g*]pteridine-2,4(3*H*,10*H*)-dione.

Yellow powder or orange crystals, very slightly soluble in water, freely soluble in methylene chloride.

Luteolin-7-glucoside. $C_{21}H_{20}O_{11}$. (M_r 448.4). *1163400.* [5373-11-5]. 2-(3,4-Dihydroxyphenyl)-7-(β-D-glucopyranosyloxy)-5-hydroxy-4*H*-1-benzopyran-4-one.

Yellow powder.

Absorbance (*2.2.25*). A solution in *methanol R* shows absorption maxima at 255 nm, 267 nm, 290 nm and 350 nm.

mp: about 247 °C.

Macrogol 23 lauryl ether. *1129000.*

Complies with the monograph *Macrogol lauryl ether (1124)*, the nominal value for the amount of ethylene oxide reacted with lauryl alcohol being 23.

Macrogol 200. *1099200.* [25322-68-3]. Polyethyleneglycol 200.

A clear, colourless or almost colourless viscous liquid, very soluble in acetone and in ethanol, practically insoluble in fatty oils.

d_{20}^{20}: about 1.127.

n_D^{20}: about 1.450.

Macrogol 200 R1. *1099201.*

Introduce 500 ml of *macrogol 200 R* into a 1000 ml round bottom flask. Using a rotation evaporator remove any volatile components applying for 6 h a temperature of 60 °C and a vacuum with a pressure of 1.5 kPa to 2.5 kPa.

Macrogol 300. *1067100.* [25322-68-3]. Polyethyleneglycol 300.

See *Macrogols (1444).*

Macrogol 400. *1067200.* [25322-68-3]. Polyethyleneglycol 400.

See *Macrogols (1444).*

Macrogol 1000. *1067300.* [25322-68-3]. Polyethyleneglycol 1000.

See *Macrogols (1444).*

Macrogol 1500. *1067400.* [25322-68-3]. Polyethyleneglycol 1500.

See *Macrogols (1444).*

Macrogol 20 000. *1067600.* Polyethyleneglycol 20 000.

See *Macrogols (1444).*

Macrogol 20 000 2-nitroterephthalate. *1067601.* Polyethyleneglycol 20 000 2-nitroterephthalate.

Macrogol 20 000 R modified by treating with 2-nitroterephthalate acid.

A hard, white or almost white, waxy solid, soluble in acetone.

Magnesium. Mg. (A_r 24.30). *1049500.* [7439-95-4].

Silver-white ribbon, turnings or wire, or a grey powder.

Magnesium acetate. $C_4H_6MgO_4,4H_2O$. (M_r 214.5). *1049600.* [16674-78-5]. Magnesium diacetate tetrahydrate.

Colourless crystals, deliquescent, freely soluble in water and in alcohol.

Storage: in an airtight container.

Magnesium chloride. *1049700.* [7791-18-6].

See *Magnesium chloride hexahydrate (0402).*

Magnesium nitrate. $Mg(NO_3)_2,6H_2O$. (M_r 256.4). *1049800.* [13446-18-9]. Magnesium nitrate hexahydrate.

Colourless, clear crystals, deliquescent, very soluble in water, freely soluble in alcohol.

Storage: in an airtight container.

Magnesium nitrate solution. *1049801.*

Dissolve 17.3 g of *magnesium nitrate R* in 5 ml of *water R* warming gently and add 80 ml of *alcohol R*. Cool and dilute to 100.0 ml with the same solvent.

Magnesium nitrate solution R1. *1049802.*

Dissolve 20 g of *magnesium nitrate R* ($Mg(NO_3)_2,6H_2O$) in *deionised distilled water R* and dilute to 100 ml with the same solvent. Immediately before use, dilute 10 ml to 100 ml with *deionised distilled water R*. A volume of 5 µl will provide 0.06 mg of Mg $(NO_3)_2$.

Magnesium oxide. *1049900.* [1309-48-4].

See *Light magnesium oxide (0040).*

Magnesium oxide R1. *1049901.*

Complies with the requirements prescribed for *magnesium oxide R* with the following modifications.

Arsenic (*2.4.2*). Dissolve 0.5 g in a mixture of 5 ml of *water R* and 5 ml of *hydrochloric acid R1*. The solution complies with limit test A for arsenic (2 ppm).

Heavy metals (*2.4.8*). Dissolve 1.0 g in a mixture of 3 ml of *water R* and 7 ml of *hydrochloric acid R1*. Add 0.05 ml of *phenolphthalein solution R* and *concentrated ammonia R* until a pink colour is obtained. Neutralise the excess of ammonia by the addition of *glacial acetic acid R*. Add 0.5 ml in excess and dilute to 20 ml with *water R*. Filter, if necessary. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using a mixture of 5 ml of *lead standard solution (1 ppm Pb) R* and 5 ml of *water R*.

Iron (*2.4.9*). Dissolve 0.2 g in 6 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. The solution complies with the limit test for iron (50 ppm).

Magnesium oxide, heavy. *1050000.* [1309-48-4].

See *Heavy magnesium oxide (0041).*

Magnesium silicate for pesticide residue analysis. *1129100.* [1343-88-0].

Magnesium silicate for chromatography (60-100 mesh).

Magnesium sulphate. *1050200.* [10034-99-8].

See *Magnesium sulphate heptahydrate (0044).*

Maize oil. *1050400.*

See *Maize oil, refined (1342).*

Malachite green. $C_{23}H_{25}ClN_2$. (M_r 364.9). *1050500.* [123333-61-9].

Schultz No. 754.

Colour Index No. 42000.

[4-[[4-(Dimethylamino)phenyl]phenylmethylene]cyclohexa-2,5-dien-1-ylidene]dimethylammonium chloride.

Green crystals with a metallic lustre, very soluble in water giving a bluish-green solution, soluble in alcohol and in methanol.

A 0.01 g/l solution in *alcohol R* shows an absorption maximum (*2.2.25*) at 617 nm.

Malachite green solution. *1050501.*

A 5 g/l solution in *anhydrous acetic acid R*.

Malathion. $C_{10}H_{19}O_6PS_2$. (M_r 330.3). *1129200.* [121-75-5].

bp: about 156 °C.

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Maleic acid. *1050600.* [110-16-7].

See *Maleic acid (0365).*

Maleic anhydride. $C_4H_2O_3$. (M_r 98.1). *1050700.* [108-31-6]. Butenedioic anhydride. 2,5-Furandione.

White or almost white crystals, soluble in water forming maleic acid, very soluble in acetone and in ethyl acetate, freely soluble in toluene, soluble in alcohol with ester formation, very slightly soluble in light petroleum.

mp: about 52 °C.

Any residue insoluble in toluene does not exceed 5 per cent (maleic acid).

Maleic anhydride solution. *1050701.*

Dissolve 5 g of *maleic anhydride R* in *toluene R* and dilute to 100 ml with the same solvent. Use within one month. If the solution becomes turbid, filter.

Maltitol. *1136800.* [585-88-6].

See *Maltitol (1235).*

Manganese sulphate. $MnSO_4,H_2O$. (M_r 169.0). *1050900.* [10034-96-5]. Manganese sulphate monohydrate.

Pale-pink, crystalline powder or crystals, freely soluble in water, practically insoluble in alcohol.

Loss on ignition: 10.0 per cent to 12.0 per cent, determined on 1.000 g at 500 ± 50 °C.

Mannitol. *1051000.* [69-65-8].

See *Mannitol (0559).*

Mannose. $C_6H_{12}O_6$. (M_r 180.2). *1051100.* [3458-28-4]. D-(+)-Mannose.

white or almost white, crystalline powder or small crystals, very soluble in water, slightly soluble in ethanol.

$[\alpha]_D^{20}$: + 13.7 + 14.7, determined on a 200 g/l solution in *water R* containing about 0.05 per cent of NH_3.

mp: about 132 °C, with decomposition.

Marrubiin. $C_{20}H_{28}O_4$. (M_r 332.4). *1158300.* [465-92-9]. (2a*S*,5a*S*,6*R*,7*R*,8a*R*,8b*R*)-6-[2-(Furan-3-yl)ethyl]-6-hydroxy-2a,5a,7-trimethyldecahydro-2*H*-naphtho[1,8-*bc*]furan-2-one.

Colourless, microcrystalline powder.

Marrubiin used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph on *White horehound (1835).*

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Meclozine hydrochloride. *1051200.* [1104-22-9].

See *Meclozine hydrochloride (0622).*

Melamine. $C_3H_6N_6$. (M_r 126.1). *1051300.* [108-78-1]. 1,3,5-Triazine-2,4,6-triamine.

A white or almost white, amorphous powder, very slightly soluble in water and in alcohol.

Menadione. *1051400.* [58-27-5].

See *Menadione (0507).*

Menthofuran. $C_{10}H_{14}O$. (M_r 150.2). *1051500.* [17957-94-7]. 3,9-Epoxy-*p*-mentha-3,8-diene. 3,6-Dimethyl-4,5,6,7-tetrahydro-benzofuran.

A slightly bluish liquid, very slightly soluble in water, soluble in alcohol.

d_{15}^{20}: about 0.965.

n_D^{20}: about 1.480.

$[\alpha]_D^{20}$: about + 93.

bp: 196 °C.

Menthofuran used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 97.0 per cent of the total area of the peaks.

Menthol. *1051600.* [2216-51-5]. See *Levomenthol (0619)* and *Racemic menthol (0623).*

Menthol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the Related substances test included in the monograph on *Racemic menthol (0623).*

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks, disregarding any peak due to the solvent.

Menthone. $C_{10}H_{18}O$. (M_r 154.2). *1051700.* [14073-97-3]. (2*S*,5*R*)-2-Isopropyl-5-methylcyclohexanone. (−)-*trans*-*p*-Menthan-3-one.

Contains variable amounts of isomenthone.

A colourless liquid, very slightly soluble in water, very soluble in alcohol.

d_{20}^{20}: about 0.897.

n_D^{20}: about 1.450.

Menthone used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 90.0 per cent of the total area of the peaks.

Menthyl acetate. $C_{12}H_{22}O_2$. (M_r 198.3). *1051800.* [2623-23-6]. 2-Isopropyl-5-methylcyclohexyl acetate.

A colourless liquid, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.92.

n_D^{20}: about 1.447.

bp: about 228 °C.

Menthyl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 97.0 per cent of the total area of the peaks.

2-Mercaptobenzimidazole. $C_7H_6N_2S$. (M_r 150.2). *1170100.* [583-39-1]. 1*H*-benzimidazole-2-thiol.

mp: about 302 °C.

2-Mercaptoethanol. C_2H_6OS. (M_r 78.1). *1099300.* [60-24-2].

A liquid, miscible with water.

d_{20}^{20}: about 1.116.

bp: about 157 °C.

Mercaptopurine. *1051900.* [6112-76-1].

See *Mercaptopurine (0096).*

Mercuric acetate. $C_4H_6HgO_4$. (M_r 318.7). *1052000.* [1600-27-7]. Mercury diacetate.

White or almost white crystals, freely soluble in water, soluble in alcohol.

Mercuric acetate solution. *1052001.*

Dissolve 3.19 g of *mercuric acetate R* in *anhydrous acetic acid R* and dilute to 100 ml with the same acid. If necessary, neutralise the solution with *0.1 M perchloric acid* using 0.05 ml of *crystal violet solution R* as indicator.

Mercuric bromide. $HgBr_2$. (M_r 360.4). *1052100.* [7789-47-1]. Mercury dibromide.

White or faintly yellow crystals or a crystalline powder, slightly soluble in water, soluble in alcohol.

Mercuric bromide paper. *1052101.*

In a rectangular dish place a 50 g/l solution of *mercuric bromide R* in *ethanol R* and immerse in it pieces of white filter paper weighing 80 g per square metre (speed of filtration = filtration time expressed in seconds for 100 ml of water at 20 °C with a filter surface of 10 cm^2 and constant pressure of 6.7 kPa: 40 s to 60 s), each measuring 1.5 cm by 20 cm and folded in two. Allow the excess liquid to drain and allow the paper to dry, protected from light, suspended over a non-metallic thread. Discard 1 cm from each end of each strip and cut the remainder into 1.5 cm squares or discs of 1.5 cm diameter.

Storage: in a glass-stoppered container wrapped with black paper.

Mercuric chloride. *1052200.* [7487-94-7].

See *Mercuric chloride (0120).*

Mercuric chloride solution. *1052201.*

A 54 g/l solution.

Mercuric iodide. HgI_2. (M_r 454.4). *1052300.* [7774-29-0]. Mercury di-iodide.

A dense, scarlet, crystalline powder, slightly soluble in water, sparingly soluble in acetone and in alcohol, soluble in an excess of *potassium iodide solution R*.

Storage: protected from light.

Mercuric nitrate. $Hg(NO_3)_2,H_2O$. (M_r 342.6). *1052400.* [7783-34-8]. Mercury dinitrate monohydrate.

Colourless or slightly coloured crystals, hygroscopic, soluble in water in the presence of a small quantity of nitric acid.

Storage: in an airtight container, protected from light.

Mercuric oxide. HgO. (M_r 216.6). *1052500.* [21908-53-2]. Yellow mercuric oxide. Mercury oxide.

A yellow to orange-yellow powder, practically insoluble in water and in alcohol.

Storage: protected from light.

Mercuric sulphate solution. *1052600.* [7783-35-9].

Dissolve 1 g of *mercuric oxide R* in a mixture of 20 ml of *water R* and 4 ml of *sulphuric acid R*.

Mercuric thiocyanate. $Hg(SCN)_2$. (M_r 316.7). *1052700.* [592-85-8]. Mercury di(thiocyanate).

A white or almost white, crystalline powder, very slightly soluble in water, slightly soluble in alcohol, soluble in solutions of sodium chloride.

Mercuric thiocyanate solution. *1052701.*

Dissolve 0.3 g of *mercuric thiocyanate R* in *ethanol R* and dilute to 100 ml with the same solvent.

Storage: use within 1 week.

Mercury. Hg. (A_r 200.6). *1052800.* [7439-97-6].

A silver-white liquid, breaking into spherical globules which do not leave a metallic trace when rubbed on paper.

d_{20}^{20}: about 13.5.

bp: about 357 °C.

Mercury, nitric acid solution of. *1052801.*

Carefully dissolve 3 ml of *mercury R* in 27 ml of *fuming nitric acid R*. Dilute the solution with an equal volume of *water R*.

Storage: protected from light; use within 2 months.

Mesityl oxide. $C_6H_{10}O$. (M_r 98.1). *1120100.* [141-79-7].
4-Methylpent-3-en-2-one.

Colourless, oily liquid, soluble in 30 parts of water, miscible with most organic solvents.

d_{20}^{20}: about 0.858.

bp: 129 °C to 130 °C.

Metanil yellow. $C_{18}H_{14}N_3NaO_3S$. (M_r 375.4). *1052900.* [587-98-4].

Schultz No. 169.

Colour Index No. 13065.
Sodium 3-[4-(phenylamino)phenylazo]benzenesulphonate.

A brownish-yellow powder, soluble in water and in alcohol.

Metanil yellow solution. *1052901.*

A 1 g/l solution in *methanol R*.

Test for sensitivity. To 50 ml of *anhydrous acetic acid R* add 0.1 ml of the metanil yellow solution. Add 0.05 ml of *0.1 M perchloric acid*; the colour changes from pinkish-red to violet.

Colour change: pH 1.2 (red) to pH 2.3 (orange-yellow).

Metaphosphoric acid. $(HPO_3)_x$. *1053000.* [37267-86-0].

Glassy lumps or sticks containing a proportion of sodium metaphosphate, hygroscopic, very soluble in water.

Nitrates. Boil 1.0 g with 10 ml of *water R*, cool, add 1 ml of *indigo carmine solution R*, 10 ml of *nitrogen-free sulphuric acid R* and heat to boiling. The blue colour is not entirely discharged.

Reducing substances: maximum 0.01 per cent, calculated as H_3PO_3. Dissolve 35.0 g in 50 ml of *water R*. Add 5 ml of a 200 g/l solution of *sulphuric acid R*, 50 mg of *potassium bromide R* and 5.0 ml of *0.02 M potassium bromate* and heat on a water-bath for 30 min. Allow to cool and add 0.5 g of *potassium iodide R*. Titrate the liberated iodine with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator. Carry out a blank test.

1 ml of *0.02 M potassium bromate* is equivalent to 4.10 mg of H_3PO_3.

Storage: in an airtight container.

Methacrylic acid. $C_4H_6O_2$. (M_r 86.1). *1101800.* [79-41-4].
2-Methylprop-2-enoic acid.

A colourless liquid.

n_D^{20}: about 1.431.

bp: about 160 °C.

mp: about 16 °C.

Methane. CH_4. (M_r 16). *1166300.* [74-82-8].

Content: minimum 99.0 per cent *V/V* of CH_4.

Methanesulphonic acid. CH_4O_3S. (M_r 96.1). *1053100.* [75-75-2].

A clear, colourless liquid, solidifying at about 20 °C, miscible with water, slightly soluble in toluene, practically insoluble in hexane.

d_{20}^{20}: about 1.48.

n_D^{20}: about 1.430.

Methanol. CH_4O. (M_r 32.04). *1053200.* [67-56-1].

A clear, colourless, flammable liquid, miscible with water and with alcohol.

d_{20}^{20}: 0.791 to 0.793.

bp: 64 °C to 65 °C.

Methanol R1. *1053201.*

Complies with the requirements prescribed for *methanol R* and the following additional requirement.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 20 per cent at 210 nm, 50 per cent at 220 nm, 75 per cent at 230 nm, 95 per cent at 250 nm, 98 per cent at 260 nm and at higher wavelengths.

Methanol R2. *1053202.*

Complies with the requirements prescribed for *methanol R* and the following additional requirements.

Content: minimum 99.8 per cent of CH_4O (M_r 32.04).

Absorbance (2.2.25). The absorbance at 225 nm using *water R* as the compensation liquid is not more than 0.17.

Methanol, hydrochloric. *1053203.*

Dilute 1.0 ml of *hydrochloric acid R1* to 100.0 ml with *methanol R*.

Methanol, aldehyde-free. *1053300.*

Dissolve 25 g of *iodine R* in 1 litre of *methanol R* and pour the solution, with constant stirring, into 400 ml of *1 M sodium hydroxide*. Add 150 ml of *water R* and allow to stand for 16h. Filter. Boil under a reflux condenser until the odour of iodoform disappears. Distil the solution by fractional distillation.

Content: maximum 0.001 per cent of aldehydes and ketones.

Methanol, anhydrous. *1053400.* [67-56-1].

Treat 1000 ml of *methanol R* with 5 g of *magnesium R*. If necessary initiate the reaction by adding 0.1 ml of *mercuric chloride solution R*. When the evolution of gas has ceased, distil the liquid and collect the distillate in a dry container protected from moisture.

Water (*2.5.12*): maximum 0.3 g/l.

DL-Methionine. *1129400.* [59-51-8].

See *DL-Methionine (0624)*.

L-Methionine. *1053500.* [63-68-3].

See *Methionine (1027)*.

(*RS*)-Methotrexate. *1120200.* [60388–6]. (*RS*)-2-[4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoylamino]pentanedioic acid.

Content: minimum 96.0 per cent of $C_{20}H_{22}N_8O_5$.

mp: about 195 °C.

Methoxychlor. $C_{16}H_{15}Cl_3O_2$. (M_r 345.7). *1129300.* [72-43-5].
1,1-(2,2,2-Trichloroethylidene)-bis(4-methoxybenzene).

Practically insoluble in water, freely soluble in most organic solvents.

bp: about 346 °C.

mp: 78 °C to 86 °C.

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

***trans*-2-Methoxycinnamaldehyde.** $C_{10}H_{10}O_2$. (M_r 162.2). *1129500.* [60125-24-8].

mp: 44 °C to 46 °C.

trans-2-Methoxycinnamaldehyde used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Cassia oil (1496).*

The content is not less than 96.0 per cent, calculated by the normalisation procedure.

(1*RS*)-1-(6-Methoxynaphthalen-2-yl)ethanol. $C_{13}H_{14}O_2$. (M_r 202.3). *1159600.* [77301-42-9]. 6-Methoxy-α-methyl-2-naphthalenemethanol.

White or almost white powder.

mp: about 113 °C.

1-(6-Methoxynaphthalen-2-yl)ethanone. $C_{13}H_{12}O_2$. (M_r 200.2). *1159700.* [3900-45-6]. 6′-Methoxy-2′-acetonaphthone.

White or almost white powder.

mp: about 108 °C.

Methoxyphenylacetic acid. $C_9H_{10}O_3$. (M_r 166.2). *1053600.* [7021-09-2]. (*RS*)-2-Methoxy-2-phenylacetic acid.

A white, crystalline powder or white or almost white crystals, sparingly soluble in water, freely soluble in alcohol.

mp: about 70 °C.

Methoxyphenylacetic reagent. *1053601.*

Dissolve 2.7 g of *methoxyphenylacetic acid R* in 6 ml of *tetramethylammonium hydroxide solution R* and add 20 ml of *ethanol R.*

Storage: in a polyethylene container.

3-Methoxy-L-tyrosine. $C_{10}H_{13}NO_4H_2O$. (M_r 229.2). *1164400.* [200630-46-2].

Off-white or yellow powder.

Methyl acetate. $C_3H_6O_2$. (M_r 74.1). *1053700.* [79-20-9].

A clear, colourless liquid, soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.933.

n_D^{20}: about 1.361

bp: 56 °C to 58 °C.

Methyl 4-acetylbenzoate. $C_{10}H_{10}O_3$. (M_r 178.2). *1154100.* [3609–8].

mp: about 94 °C.

Methyl 4-acetylbenzoate reagent. *1154101.*

Dissolve 0.25 g of *methyl 4-acetylbenzoate R* in a mixture of 5 ml of *sulphuric acid R* and 85 ml of cooled *methanol R.*

4-Methylaminophenol sulphate. $C_{14}H_{20}N_2O_6S$. (M_r 344.4). *1053800.* [55-55-0].

Colourless crystals, very soluble in water, slightly soluble in alcohol.

mp: about 260 °C.

Methyl anthranilate. $C_8H_9NO_2$. (M_r 151.2). *1107300.* [134-20-3]. Methyl 2-aminobenzoate.

Colourless crystals or a colourless or yellowish liquid, soluble in water, freely soluble in alcohol.

bp: 134 °C to 136 °C.

mp: 24 °C to 25 °C.

Methyl anthranilate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution. The area of the principal peak is not less than 95.0 per cent of the total area of the peaks.

Methyl arachidate. $C_{21}H_{42}O_2$. (M_r 326.6). *1053900.* [1120-28-1]. Methyl eicosanoate.

Content: minimum 98.0 per cent of $C_{21}H_{42}O_2$, determined by gas chromatography (*2.4.22*).

A white or yellow, crystalline mass, soluble in alcohol and in light petroleum.

mp: about 46 °C.

Methyl behenate. $C_{23}H_{46}O_2$. (M_r 354.6). *1107500.* [929-77-1]. Methyl docosanoate.

mp: 54 °C to 55 °C.

Methyl benzenesulphonate. $C_7H_8O_3S$. (M_r 172.2). *1159800.* [80-18-2].

A clear, colourless liquid.

bp: about 148 °C.

Methyl benzoate. $C_8H_8O_2$. (M_r 136.2). *1164500.* [93-58-3]. Benzoic acid, methyl ester.

Colourless liquid.

d_4^{20}: 1.088.

bp: about 200 °C.

Methylbenzothiazolone hydrazone hydrochloride. $C_8H_{10}ClN_3S,H_2O$. (M_r 233.7). *1055300.* [38894-11-0]. 3-Methylbenzothiazol-2(3*H*)-one hydrazone hydrochloride monohydrate.

An almost white or yellowish, crystalline powder.

mp: about 270 °C.

Suitability for determination of aldehydes. To 2 ml of *aldehyde-free methanol R* add 60 µl of a 1 g/l solution of *propionaldehyde R* in *aldehyde-free methanol R* and 5 ml of a 4 g/l solution of methylbenzothiazolone hydrazone hydrochloride. Mix. Allow to stand for 30 min. Prepare a blank omitting the propionaldehyde solution. Add 25.0 ml of a 2 g/l solution of *ferric chloride R* to the test solution and to the blank, dilute to 100.0 ml with *acetone R* and mix. The absorbance (*2.2.25*) of the test solution, measured at 660 nm using the blank as compensation liquid, is not less than 0.62.

(*S*)-(–)-α-Methylbenzyl isocyanate. C_9H_9NO. (M_r 147.2). *1170200.* [14649-03-7]. (–)-(*S*)-α-Methylbenzyl isocyanate. (–)-[(1*S*)-1-Isocyanatoethyl]benzene. (–)-(1*S*)-1-Phenylethyl isocyanate.

Content: minimum 99.0 per cent.

A colourless liquid.

d_{20}^{20}: about 1.045.

n_D^{20}: about 1.514.

bp: 55 °C to 56 °C at 2.5 mm Hg.

Enantiomeric purity: minimum 99.5 per cent.

Storage: at a temperature of 2 °C to 8 °C.

NOTE: do not use the reagent if it is coloured.

2-Methylbutane. C_5H_{12}. (M_r 72.2). *1099500.* [78-78-4]. Isopentane.

Content: minimum 99.5 per cent of C_5H_{12}.

A very flammable colourless liquid.

d_{20}^{20}: about 0.621.

n_D^{20}: about 1.354.

bp: about 29 °C.

Water (2.5.12): maximum 0.02 per cent.

Residue on evaporation: maximum 0.0003 per cent.

Minimum transmittance (2.2.25), determined using *water R* as compensation liquid: 50 per cent at 210 nm, 85 per cent at 220 nm, 98 per cent at 240 nm and at higher wavelengths.

2-Methylbut-2-ene. C_5H_{10}. (M_r 70.1). *1055400.* [513-35-9].

A very flammable liquid, practically insoluble in water, miscible with alcohol.

bp: 37.5 °C to 38.5 °C.

Methyl caprate. *1054000.*

See *Methyl decanoate R*.

Methyl caproate. $C_7H_{14}O_2$. (M_r 130.2). *1120300.* [106-70-7]. Methyl hexanoate.

d_{20}^{20}: about 0.885.

n_D^{20}: about 1.405.

bp: 150 °C to 151 °C.

Methyl caprylate. $C_9H_{18}O_2$. (M_r 158.2). *1120400.* [111-11-5]. Methyl octanoate.

d_{20}^{20}: about 0.876.

n_D^{20}: about 1.417.

bp: 193 °C to 194 °C.

Methylcellulose 450. *1055500.* [9004-67-5].

See *Methylcellulose (0345).*

The nominal viscosity is 450 mPa·s

Methyl cinnamate. $C_{10}H_{10}O_2$. (M_r 162.2). *1099400.* [103-26-4].

Colourless crystals practically insoluble in water, soluble in alcohol.

n_D^{20}: about 1.56.

bp: about 260 °C.

mp: 34 °C to 36 °C.

Methyl decanoate. $C_{11}H_{22}O_2$. (M_r 186.3). *1054000.* [110-42-9]. Methyl *n*-decanoate.

Content: minimum 99.0 per cent of $C_{11}H_{22}O_2$.

A clear, colourless or yellow liquid, soluble in light petroleum.

d_{20}^{20}: 0.871 to 0.876.

n_D^{20}: 1.425 to 1.426.

Foreign substances. Examine by gas chromatography (*2.2.28*), injecting equal volumes of each of the following:

(I) a 0.02 g/l solution of the substance to be examined in *carbon disulphide R*, (II) a 2 g/l solution of the substance to be examined in *carbon disulphide R*, and (III) *carbon disulphide R*. Carry out the chromatographic procedure under the conditions of the test for butylated hydroxytoluene prescribed in the monograph on *Wool fat (0134).* The total area of any peaks, apart from the solvent peak and the principal peak, in the chromatogram obtained with solution (II) is less than the area of the principal peak in the chromatogram obtained with solution (I).

3-*O*-Methyldopamine hydrochloride. $C_9H_{14}ClNO_2$. (M_r 203.7). *1055600.* [1477-68-5]. 4-(2-Aminoethyl)-2-methoxyphenol hydrochloride.

mp: 213 °C to 215 °C.

Chromatography. Examine as prescribed in the monograph on *Dopamine hydrochloride (0664),* applying 10 µl of a 0.075 g/l solution in *methanol R*. The chromatogram obtained shows only one principal spot.

4-*O*-Methyldopamine hydrochloride. $C_9H_{14}ClNO_2$. (M_r 203.7). *1055700.* [645-33-0]. 5-(2-Aminoethyl)-2-methoxyphenol hydrochloride.

mp: 207 °C to 208 °C.

Chromatography. Examine as prescribed in the monograph on *Dopamine hydrochloride (0664),* applying 10 µl of a 0.075 g/l solution in *methanol R*. The chromatogram obtained shows only one principal spot.

Methylenebisacrylamide. $C_7H_{10}N_2O_2$. (M_r 154.2). *1056000.* [110-26-9]. *N,N'*-Methylenebispropenamide.

A fine, white or almost white powder, slightly soluble in water, soluble in alcohol.

mp: It melts with decomposition at a temperature above 300 °C.

Methylene blue. $C_{16}H_{18}ClN_3S,xH_2O$. (M_r 319.9 for the anhydrous substance). *1055800.* [7220-79-3].

Schultz No. 1038.

Colour Index No. 52015.
3,7-Dimethylaminophenothiazin-5-ium chloride.

It occurs in different hydrated forms and may contain up to 22 per cent of water. A dark-green or bronze, crystalline powder, freely soluble in water, soluble in alcohol.

Methylene chloride. CH_2Cl_2. (M_r 84.9). *1055900.* [75-09-2]. Dichloromethane.

A colourless liquid, sparingly soluble in water, miscible with alcohol.

bp: 39 °C to 42 °C.

Methylene chloride used in fluorimetry complies with the following additional requirement.

Fluorescence. Under irradiation at 365 nm, the fluorescence (*2.2.21*) measured at 460 nm in a 1 cm cell is not more intense than that of a solution containing 0.002 ppm of *quinine R* in *0.5 M sulphuric acid* measured in the same conditions.

Methylene chloride, acidified. *1055901.*

To 100 ml of *methylene chloride R* add 10 ml of *hydrochloric acid R*, shake, allow to stand and separate the two layers. Use the lower layer.

Methyl eicosenoate. $C_{21}H_{40}O_2$. (M_r 324.5). *1120500.* [2390-09-2]. (11*Z*)-eicos-11-enoate.

Methyl erucate. $C_{23}H_{44}O_2$. (M_r 352.6). *1146100.* [1120-34-9]. Methyl *cis*-13-docosenoate.

d_{20}^{20}: about 0.871.

n_D^{20}: about 1.456.

3-*O*-Methylestrone. $C_{19}H_{24}O_2$. (M_r 284.4). *1137000.* [1624-62-0]. 3-Methoxy-1,3,5(10)-estratrien-17-one.

White to yellowish-white powder.

$[\alpha]_D^{20}$: about + 157.

mp: about 173 °C.

Methyl ethyl ketone. C_4H_8O. (M_r 72.1). *1054100.* [78-93-3]. Ethyl methyl ketone. 2-Butanone.

A clear, colourless, flammable liquid, very soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.81.

bp: 79 °C to 80 °C.

Methyl green. $C_{26}H_{33}Cl_2N_3$. (M_r 458.5). *1054200.* [7114-03-6].

Schultz No. 788.

Colour Index No. 42585.
4-[[4-(Dimethyl-amino)phenyl][4-(dimethyliminio)cyclohexa-2,5-dienylidene]-methylphenyl]trimethylammonium dichloride.

Green powder, soluble in water, soluble in sulphuric acid giving a yellow solution turning green on dilution with water.

Methyl green-iodomercurate paper. *1054201.*

Immerse thin strips of suitable filter paper in a 40 g/l solution of *methyl green R* and allow to dry in air. Immerse the strips for 1 h in a solution containing 140 g/l of *potassium iodide R* and 200 g/l of *mercuric iodide R*. Wash with *distilled water R* until the washings are practically colourless and allow to dry in air.

Storage: protected from light; use within 48 h.

Methyl 4-hydroxybenzoate. *1055000.* [99-76-3].

See *Methyl parahydroxybenzoate R*.

1-Methylimidazole. $C_4H_6N_2$. (M_r 82.1). *1139700.* [616-47-7]. 1-Methyl-1*H*-imidazole.

Colourless or slightly yellowish liquid.

n_D^{20}: about 1.495.

bp: 195 °C to 197 °C.

Storage: in an airtight container, protected from light.

1-Methylimidazole R1. *1139701.*

Complies with the requirements described for *1-methylimidazole R* with the following additional requirement.

Content: minimum 95.0 per cent.

2-Methylimidazole. $C_4H_6N_2$. (M_r 82.1). *1143400.* [693-98-1].

White or almost white, crystalline powder.

mp: about 145 °C.

Methyl iodide. CH_3I. (M_r 141.9). *1166400.* [74-88-4]. Iodomethane.

Methyl isobutyl ketone. $C_6H_{12}O$. (M_r 100.2). *1054300.* [108-10-1]. 4-Methyl-2-pentanone.

A clear, colourless liquid, slightly soluble in water, miscible with most organic solvents.

d_{20}^{20}: about 0.80.

bp: about 115 °C.

Distillation range (*2.2.11*). Distil 100 ml. The range of temperature of distillation from 1 ml to 95 ml of distillate does not exceed 4.0 °C.

Residue on evaporation: maximum 0.01 per cent, determined by evaporating on a water-bath and drying at 100-105 °C.

Methyl isobutyl ketone R1. *1054301.*

Shake 50 ml of freshly distilled *methyl isobutyl ketone R* with 0.5 ml of *hydrochloric acid R1* for 1 min. Allow the phases to separate and discard the lower phase. Prepare immediately before use.

Methyl isobutyl ketone R3. *1054302.*

Complies with the requirements for *methyl isobutyl ketone R* and with the following limits:

Chromium: maximum 0.02 ppm.

Copper: maximum 0.02 ppm.

Lead: maximum 0.1 ppm.

Nickel: maximum 0.02 ppm.

Tin: maximum 0.1 ppm.

Methyl laurate. $C_{13}H_{26}O_2$. (M_r 214.4). *1054400.* [111-82-0]. Methyl dodecanoate.

Content: minimum 98.0 per cent of $C_{13}H_{26}O_2$, determined by gas chromatography (*2.4.22*).

A colourless or yellow liquid, soluble in alcohol and in light petroleum.

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.431.

mp: about 5 °C.

Methyl lignocerate. $C_{25}H_{50}O_2$. (M_r 382.7). *1120600.* [2442-49-1]. Methyl tetracosanoate.

Flakes.

mp: about 58 °C.

Methyl linoleate. $C_{19}H_{34}O_2$. (M_r 294.5). *1120700.* [112-63-0]. Methyl (9*Z*,12*Z*)-octadeca-9,12-dienoate.

d_{20}^{20}: about 0.888.

n_D^{20}: about 1.466.

bp: 207 °C to 208 °C.

Methyl linolenate. $C_{19}H_{32}O_2$. (M_r 292.5). *1120800.* [301-00-8]. Methyl (9*Z*,12*Z*,15*Z*)-octadeca-9,12,15-trienoate.

d_{20}^{20}: about 0.901.

n_D^{20}: about 1.471.

bp: about 207 °C.

Methyl γ-linolenate. $C_{19}H_{32}O_2$. (M_r 292.5). *1158400.* [16326-32-2]. Methyl (6*Z*,9*Z*,12*Z*)-octadeca-6,9,12-trienoate.

Content: minimum 99.0 per cent of $C_{19}H_{32}O_2$, determined by gas chromatography.

Methyl margarate. $C_{18}H_{36}O_2$. (M_r 284.5). *1120900.* [1731-92-6]. Methyl heptadecanoate.

White or almost white powder.

mp: 32 °C to 34 °C.

Methyl margarate used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848)*.

The content of methyl margarate is not less than 97 per cent, calculated by the normalisation procedure.

Methyl methacrylate. $C_5H_8O_2$. (M_r 100.1). *1054500.* [80-62-6]. Methyl 2-methylprop-2-enoate.

A colourless liquid.

n_D^{20}: about 1.414.

bp: about 100 °C.

mp: about – 48 °C.

It contains a suitable stabilising reagent.

Methyl *N*-methylanthranilate. $C_9H_{11}NO_2$. (M_r 165.2). *1164600.* [85-91-6]. Methyl 2-(methylamino)benzoate.

Pale yellow liquid.

d_4^{20}: about 1.128.

n_D^{20}: about 1.579.

bp: 255 °C to 258 °C.

Methyl N-methylanthranilate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph on *Mandarin oil (2355).*

Test solution. The substance to be examined.

Content: minimum 97 per cent, calculated by the normalisation procedure.

Methyl myristate. $C_{15}H_{30}O_2$. (M_r 242.4). *1054600.* [124-10-7]. Methyl tetradecanoate.

Content: minimum 98.0 per cent of $C_{15}H_{30}O_2$, determined by gas chromatography (*2.4.22*).

A colourless or slightly yellow liquid, soluble in alcohol and in light petroleum.

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.437.

mp: about 20 °C.

Methyl nervonate. *1144800.* [2733-88-2].

See *Tetracos-15-enoic acid methyl ester R.*

2-Methyl-5-nitroimidazole. $C_4H_5N_3O_2$. (M_r 127.1). *1056100.* [88054-22-2].

White to light yellow powder.

mp: 252 °C to 254 °C.

Content: minimum 98.0 per cent of $C_4H_5N_3O_2$.

Methyl oleate. $C_{19}H_{36}O_2$. (M_r 296.4). *1054700.* [112-62-9]. Methyl (*Z*)-octadec-9-enoate.

Content: minimum 98.0 per cent of $C_{19}H_{36}O_2$, determined by gas chromatography (*2.4.22*).

A colourless or slightly yellow liquid, soluble in alcohol and in light petroleum.

d_{20}^{20}: about 0.88.

n_D^{20}: about 1.452.

Methyl orange. $C_{14}H_{14}N_3NaO_3S$. (M_r 327.3). *1054800.* [547-58-0].

Schultz No. 176.

Colour Index No. 13025.
Sodium 4′-(dimethylamino)azobenzene-4-sulphonate.

An orange-yellow, crystalline powder, slightly soluble in water, practically insoluble in alcohol.

Methyl orange mixed solution. *1054801.*

Dissolve 20 mg of *methyl orange R* and 0.1 g of *bromocresol green R* in 1 ml of *0.2 M sodium hydroxide* and dilute to 100 ml with *water R.*

Colour change: pH 3.0 (orange) to pH 4.4 (olive-green).

Methyl orange solution. *1054802.*

Dissolve 0.1 g of *methyl orange R* in 80 ml of *water R* and dilute to 100 ml with *alcohol R.*

Test for sensitivity. A mixture of 0.1 ml of the methyl orange solution and 100 ml of *carbon dioxide-free water R* is yellow. Not more than 0.1 ml of *1 M hydrochloric acid* is required to change the colour to red.

Colour change: pH 3.0 (red) to pH 4.4 (yellow).

Methyl palmitate. $C_{17}H_{34}O_2$. (M_r 270.5). *1054900.* [112-39-0]. Methyl hexadecanoate.

Content: minimum 98.0 per cent of $C_{17}H_{34}O_2$, determined by gas chromatography (*2.4.22*).

A white or yellow, crystalline mass, soluble in alcohol and in light petroleum.

mp: about 30 °C.

Methyl palmitoleate. $C_{17}H_{32}O_2$. (M_r 268.4). *1121000.* [1120-25-8]. Methyl (9*Z*)-hexadec-9-enoate.

d_{20}^{20}: about 0.876.

n_D^{20}: about 1.451.

Methyl parahydroxybenzoate. *1055000.* [99-76-3].

See *Methyl parahydroxybenzoate (0409).*

Methyl pelargonate. $C_{10}H_{20}O_2$. (M_r 172.3). *1143500.* [1731-84-6]. Methyl nonanoate.

Clear, colourless liquid.

d_4^{20}: about 0.873.

n_D^{20}: about 1.422.

bp: 91 °C to 92 °C.

Methyl pelargonate used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of methyl pelargonate is not less than 98 per cent, calculated by the normalisation procedure.

3-Methylpentan-2-one. $C_6H_{12}O$. (M_r 100.2). *1141100.* [565-61-7].

Colourless, flammable liquid.

d_{20}^{20}: about 0.815.

n_D^{20}: about 1.400.

bp: about 118 °C

4-Methylpentan-2-ol. $C_6H_{14}O$. (M_r 102.2). *1114300.* [108-11-2].

A clear, colourless, volatile liquid.

d_4^{20}: : about 0.802.

n_D^{20}: about 1.411.

bp: about 132 °C.

Methylphenyloxazolylbenzene. $C_{26}H_{20}N_2O_2$. (M_r 392.5). *1056200.* [3073-87-8]. 1,4-Bis[2-(4-methyl-5-phenyl)oxazolyl]benzene.

A fine, greenish-yellow powder with a blue fluorescence or small crystals, soluble in alcohol, sparingly soluble in xylene.

mp: about 233 °C.

Methylphenyloxazolylbenzene used for liquid scintillation is of a suitable analytical grade.

1-Methyl-4-phenyl-1,2,3,6-tetrahydropyridine. $C_{12}H_{15}N$. (173.3). *1137100.* [28289-54-5]. MPTP.

A white or almost white, crystalline powder, slightly soluble in water.

mp: about 41 °C.

Methylpiperazine. $C_5H_{12}N_2$. (M_r 100.2). *1056300.* [109-01-3]. 1-Methylpiperazine.

A colourless liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.90.

n_D^{20}: about 1.466.

bp: about 138 °C.

4-(4-Methylpiperidino)pyridine. $C_{11}H_{16}N_2$. (M_r 176.3). *1114400.* [80965-30-6].

A clear liquid.

n_D^{20}: about 1.565.

2-Methylpropanol. $C_4H_{10}O$. (M_r 74.1). *1056400.* [78-83-1]. Isobutyl alcohol. 2-Methylpropan-1-ol.

A clear colourless liquid, soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.80.

n_D^{15}: 1.397 to 1.399.

bp: about 107 °C.

Distillation range (*2.2.11*). Not less than 96 per cent distils between 107 °C and 109 °C.

2-Methyl-2-propanol. $C_4H_{10}O$. (M_r 74.1). *1056500.* [75-65-0]. 1,1-Dimethyl ethyl alcohol. *tert*-Butyl alcohol.

A clear, colourless liquid or crystalline mass, soluble in water, miscible with alcohol.

Freezing point (*2.2.18*): about 25 °C.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 81 °C and 83 °C.

(15*R*)-15-Methylprostaglandin $F_{2\alpha}$. $C_{21}H_{36}O_5$. (M_r 368.5). *1159900.* [35864-81-4]. (5*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-Dihydroxy-2-[(1*E*)-(3*R*)-3-hydroxy-3-methyloct-1-enyl]cyclopentyl]hept-5-enoic acid.

Available as a 10 mg/ml solution in *methyl acetate R*.

Storage: at a temperature below – 15 ° C.

***N*-Methylpyrrolidine.** $C_5H_{11}N$. (M_r 85.2). *1164700.* [120-94-5].

Content: minimum 97.0 per cent of $C_5H_{11}N$.

bp: about 80 °C.

***N*-Methylpyrrolidone.** C_5H_9NO. (M_r 99.1). *1164800.* [872-50-4]. 1-Methylpyrrolidin-2-one.

d_{20}^{20}: about 1.028.

bp: about 202 °C.

mp: about – 24 °C.

Methyl red. $C_{15}H_{15}N_3O_2$. (M_r 269.3). *1055100.* [493-52-7].

Schultz No. 250.

Colour Index No. 13020.

2-(4-Dimethylamino-phenylazo)benzoic acid.

A dark-red powder or violet crystals, practically insoluble in water, soluble in alcohol.

Methyl red mixed solution. *1055101.*

Dissolve 0.1 g of *methyl red R* and 50 mg of *methylene blue R* in 100 ml of *alcohol R*.

Colour change: pH 5.2 (red-violet) to pH 5.6 (green).

Methyl red solution. *1055102.*

Dissolve 50 mg in a mixture of 1.86 ml of *0.1 M sodium hydroxide* and 50 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.1 ml of the methyl red solution add 100 ml of *carbon dioxide-free water R* and 0.05 ml of *0.02 M hydrochloric acid*. The solution is red. Not more than 0.1 ml of *0.02 M sodium hydroxide* is required to change the colour to yellow.

Colour change: pH 4.4 (red) to pH 6.0 (yellow).

Methyl salicylate. *1146200.* [119-36-8].

See *Methyl salicylate (0230)*

Methyl stearate. $C_{19}H_{38}O_2$. (M_r 298.5). *1055200.* [112-61-8]. Methyl octadecanoate.

Content: minimum 98.0 per cent of $C_{19}H_{38}O_2$, determined by gas chromatography (*2.4.22*).

A white or yellow, crystalline mass, soluble in alcohol and in light petroleum.

mp: about 38 °C.

Methylthymol blue. $C_{37}H_{40}N_2Na_4O_{13}S$. ($M_r$ 845). *1158500.* [1945-77-3]. Tetrasodium 2,2′,2″,2‴-[3*H*-2,1-benzoxathiol-3-ylidenebis[(6-hydroxy-2-methyl-5-(1-methylethyl)-3,1-phenylene]methylenenitrilo]]tetraacetate *S,S*-dioxide.

Produces a blue colour with calcium in alkaline solution.

Methylthymol blue mixture. *1158501.*

A mixture of 1 part of *methylthymol blue R* and 100 parts of *potassium nitrate R*.

Methyl tricosanoate. $C_{24}H_{48}O_2$. (M_r 368.6). *1111500.* [2433-97-8]. Tricosanoic acid methyl ester.

Content: minimum 99.0 per cent of $C_{24}H_{48}O_2$.

White or almost white crystals, practically insoluble in water, soluble in hexane.

mp: 55 °C to 56 °C.

Methyl tridecanoate. $C_{14}H_{28}O_2$. (M_r 228.4). *1121100.* [1731-88-0].

A colourless or slightly yellow liquid, soluble in alcohol and in light petroleum.

d_{20}^{20}: about 0.86.

n_D^{20}: about 1.441.

mp: about 6 °C.

***N*-Methyltrimethylsilyl-trifluoroacetamide.** $C_6H_{12}F_3NOSi$. (M_r 199.3). *1129600.* [24589-78-4]. 2,2,2-Trifluoro-*N*-methyl-*N*-(trimethylsilyl)acetamide.

n_D^{20}: about 1.380.

bp: 130 °C to 132 °C.

Minocycline hydrochloride. *1146300.*

See *Minocycline hydrochloride (1030)*.

Molecular sieve. *1056600.*

Molecular sieve composed of sodium aluminosilicate. It is available as beads with a pore size of 0.4 nm and with a diameter of 2 mm.

Molecular sieve for chromatography. *1129700.*

A molecular sieve composed of sodium aluminosilicate. The pore size is indicated after the name of the reagent in the tests where it is used. If necessary, the particle size is also indicated.

Molybdovanadic reagent. *1056700.*

In a 150 ml beaker, mix 4 g of finely powdered *ammonium molybdate R* and 0.1 g of finely powdered *ammonium vanadate R*. Add 70 ml of *water R* and grind the particles

using a glass rod. A clear solution is obtained within a few minutes. Add 20 ml of *nitric acid R* and dilute to 100 ml with *water R*.

Monodocosahexaenoin. $C_{25}H_{38}O_4$. (M_r 402.6). *1143600.* [124516-13-8]. Monoglyceride of docosahexaenoic acid (C22:6). Glycerol monodocosahexaenoate. (*all-Z*)-Docosa-4,7,10,13,16,19-hexaenoic acid, monoester with propane-1,2,3-triol.

Mordant black 11. $C_{20}H_{12}N_3NaO_7S$. (M_r 461.4). *1056800.* [1787-61-7].

Schultz No. 241.

Colour Index No. 14645.

Sodium 2-hydroxy-1-[(1-hydroxynaphth-2-yl)azo]-6-nitronaphthalene-4-sulphonate. Eriochrome black.

A brownish-black powder, soluble in water and in alcohol.

Storage: in an airtight container, protected from light.

Mordant black 11 triturate. *1056801.*

Mix 1 g of *mordant black 11 R* with 99 g of *sodium chloride R*.

Test for sensitivity. Dissolve 50 mg in 100 ml of *water R*. The solution is brownish-violet. On addition of 0.3 ml of *dilute ammonia R1* the solution turns blue. On the subsequent addition of 0.1 ml of a 10 g/l solution of *magnesium sulphate R*, it turns violet.

Storage: in an airtight container, protected from light.

Mordant black 11 triturate R1. *1056802.*

Mix 1.0 g of *mordant black 11 R*, 0.4 g of *methyl orange R* and 0.1 g of *sodium chloride R*.

Morphine hydrochloride. *1056900.*

See *Morphine hydrochloride (0097).*

Morpholine. C_4H_9NO. (M_r 87.1). *1057000.* [110-91-8]. Tetrahydro-1,4-oxazine.

A colourless, hygroscopic liquid, flammable, soluble in water and in alcohol.

d_{20}^{20}: about 1.01.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 126 °C and 130 °C.

Storage: in an airtight container.

Morpholine for chromatography. *1057001.*

It complies with the requirements of *morpholine R* and with the following requirement.

Content: minimum 99.5 per cent of C_4H_9NO.

Murexide. $C_8H_8N_6O_6,H_2O$. (M_r 302.2). *1137200.* 5,5′-Nitrilobis(pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione) monoammonium salt.

Brownish-red crystalline powder, sparingly soluble in cold water, soluble in hot water, practically insoluble in alcohol, soluble in solutions of potassium hydroxide or sodium hydroxide giving a blue colour.

Myosmine. $C_9H_{10}N_2$. (M_r 146.2). *1121200.* [532-12-7]. 3-(4,5-Dihydro-3*H*-pyrrol-2-yl)pyridine.

Colourless crystals.

mp: about 45 °C.

β-Myrcene. $C_{10}H_{16}$. (M_r 136.2). *1114500.* [123-35-3]. 7-Methyl-3-methylenocta-1,6-diene.

An oily liquid with a pleasant odour, practically insoluble in water, miscible with alcohol, soluble in glacial acetic acid. It dissolves in solutions of alkali hydroxides.

d_4^{20}: about 0.794.

n_D^{20}: about 1.470.

β-Myrcene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405).*

Test solution. The substance to be examined.

The area of the principal peak is not less than 90.0 per cent of the area of all the peaks in the chromatogram obtained.

Myristic acid. $C_{14}H_{28}O_2$. (M_r 228.4). *1143700.* [544-63-8]. Tetradecanoic acid.

Colourless or white or almost white flakes.

mp: about 58.5 °C.

Myristic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of myristic acid is not less than 97 per cent, calculated by the normalisation procedure.

Myristicine. $C_{11}H_{12}O_3$. (M_r 192.2). *1099600.* [607-91-0]. 5-Allyl-1-methoxy-2,3-methylenedioxybenzene. 4-Methoxy-6-(prop-2-enyl)-1,3-benzodioxole.

An oily colourless liquid, practically insoluble in water, slightly soluble in ethanol, miscible with toluene and with xylene.

d_{20}^{20}: about 1.144.

n_D^{20}: about 1.540.

bp: 276 °C to 277 °C.

mp: about 173 °C.

Chromatography. Examined as prescribed in the monograph on *Star anise (1153)*, the chromatogram obtained shows only one principal spot.

Myristicine used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) under the conditions prescribed in the monograph on *Nutmeg oil (1552).*

The content is not less than 95.0 per cent, calculated by the normalisation procedure.

Storage: protected from light.

Myristyl alcohol. $C_{14}H_{30}O$. (M_r 214.4). *1121300.* [112-72-1]. 1-Tetradecanol.

d_{20}^{20}: about 0.823.

mp: 38 °C to 40 °C.

Naphthalene. $C_{10}H_8$. (M_r 128.2). *1057100.* [91-20-3].

White or almost white crystals, practically insoluble in water, soluble in alcohol.

mp: about 80 °C.

Naphthalene used for liquid scintillation is of a suitable analytical grade.

Naphtharson. $C_{16}H_{11}AsN_2Na_2O_{10}S_2$. ($M_r$ 576.3). *1121400.* [3688-92-4]. Thorin. Disodium 4-[(2-arsonophenyl)azo]-3-hydroxynaphthalene-2,7-disulphonate.

A red powder, soluble in water.

Naphtharson solution. *1121401.*

A 0.58 g/l solution.

Test for sensitivity. To 50 ml of *alcohol R*, add 20 ml of *water R*, 1 ml of *0.05 M sulphuric acid* and 1 ml of the naphtharson solution. Titrate with *0.025 M barium perchlorate*; the colour changes from orange-yellow to orange-pink.

Storage: protected from light; use within 1 week.

α-Naphthol. $C_{10}H_8O$. (M_r 144.2). *1057300.* [90-15-3]. 1-Naphthol.

A white or almost white, crystalline powder or colourless or white or almost white crystals, darkening on exposure to light, slightly soluble in water, freely soluble in alcohol.

mp: about 95 °C.

Storage: protected from light.

α-Naphthol solution. *1057301.*

Dissolve 0.10 g of *α-naphthol R* in 3 ml of a 150 g/l solution of *sodium hydroxide R* and dilute to 100 ml with *water R*. Prepare immediately before use.

β-Naphthol. $C_{10}H_8O$. (M_r 144.2). *1057400.* [135-19-3]. 2-Naphthol.

White or slightly pink plates or crystals, very slightly soluble in water, very soluble in alcohol.

mp: about 122 °C.

Storage: protected from light.

β-Naphthol solution. *1057401.*

Dissolve 5 g of freshly recrystallised *β-naphthol R* in 40 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*. Prepare immediately before use.

β-Naphthol solution R1. *1057402.*

Dissolve 3.0 mg of *β-naphthol R* in 50 ml of *sulphuric acid R* and dilute to 100.0 ml with the same acid. Use the recently prepared solution.

Naphtholbenzein. $C_{27}H_{20}O_3$. (M_r 392.5). *1057600.* [6948-88-5]. α-Naphtholbenzein. Phenylbis(4-hydroxy-naphthyl)methanol.

A brownish-red powder or shiny brownish-black crystals, practically insoluble in water, soluble in alcohol and in glacial acetic acid.

Naphtholbenzein solution. *1057601.*

A 2 g/l solution in *anhydrous acetic acid R*.

Test for sensitivity. To 50 ml of *glacial acetic acid R* add 0.25 ml of the naphtholbenzein solution. The solution is brownish-yellow. Not more than 0.05 ml of *0.1 M perchloric acid* is required to change the colour to green.

Naphthol yellow. $C_{10}H_5N_2NaO_5$. (M_r 256.2). *1136600.* 2,4-Dinitro-1-naphthol, sodium salt.

Orange-yellow powder or crystals, freely soluble in water, slightly soluble in ethanol.

Naphthol yellow S. $C_{10}H_4N_2Na_2O_8S$. (M_r 358.2). *1143800.* [846-70-8].

Colour Index No. 10316.
8-Hydroxy-5,7-dinitro-2-naphthalenesulphonic acid disodium salt. Disodium 5,7-dinitro-8-oxidonaphthalene-2-sulphonate.

Yellow or orange-yellow powder, freely soluble in water.

1-Naphthylacetic acid. $C_{12}H_{10}O_2$. (M_r 186.2). *1148400.* [86-87-3]. (Naphthalen-1-yl)acetic acid.

White to yellow crystalline powder, very slightly soluble in water, freely soluble in acetone.

mp: about 135 °C.

Naphthylamine. $C_{10}H_9N$. (M_r 143.2). *1057700.* [134-32-7]. 1-Naphthylamine.

A white or almost white, crystalline powder, turning pink on exposure to light and air, slightly soluble in water, freely soluble in alcohol.

mp: about 51 °C.

Storage: protected from light.

Naphthylethylenediamine dihydrochloride. $C_{12}H_{16}Cl_2N_2$. (M_r 259.2). *1057800.* [1465-25-4]. *N*-(1-Naphthyl)ethylene-diamine dihydrochloride.

It may contain methanol of crystallisation.

A white to yellowish-white powder, soluble in water, slightly soluble in alcohol.

Naphthylethylenediamine dihydrochloride solution. *1057801.*

Dissolve 0.1 g of *naphthylethylenediamine dihydrochloride R* in *water R* and dilute to 100 ml with the same solvent. Prepare immediately before use.

Naringin. $C_{27}H_{32}O_{14}$. (M_r 580.5). *1137300.* [10236-47-2]. 7-[[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(4-hydroxyphenyl)-2,3-dihydro-4*H*–chromen-4-one.

A white or almost white crystalline powder, slightly soluble in water, soluble in methanol and in dimethylformamide.

mp: about 171 °C.

Absorbance (*2.2.25*). Naringin dissolved in a 5 g/l solution of *dimethylformamide R* in *methanol R* shows an absorption maximum at 283 nm.

***trans*-Nerolidol.** $C_{15}H_{26}O$. (M_r 222.4). *1107900.* [40716-66-3]. 3,7,11-Trimethyldodeca-1,6,10-trien-3-ol.

A slightly yellow liquid, slight odour of lily and lily of the valley, practically insoluble in water and in glycerol, miscible with alcohol.

d_{20}^{20}: about 0.876.

n_D^{20}: about 1.479.

bp_{12}: 145 °C to 146 °C.

trans-Nerolidol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution. The area of the principal peak is not less than 90.0 per cent of the total area of the peaks.

Neryl acetate. $C_{12}H_{20}O_2$. (M_r 196.3). *1108000.* [141-12-8]. (*Z*)-3,7-Dimethylocta-2,6-dienyl acetate.

A colourless, oily liquid.

d_{20}^{20}: about 0.907.

n_D^{20}: about 1.460.

bp_{25}: 134 °C.

Neryl acetate used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution. The area of the principal peak is not less than 93.0 per cent of the total area of the peaks.

Nickel-aluminium alloy. *1058100.*

Contains 48 per cent to 52 per cent of aluminium (Al; A_r 26.98) and 48 per cent to 52 per cent of nickel (Ni; A_r 58.70).

Before use, reduce to a fine powder (180) (*2.9.12*).

It is practically insoluble in water and soluble in mineral acids.

Nickel-aluminium alloy (halogen-free). *1118100.*

Contains 48 per cent to 52 per cent of aluminium (Al; A_r 26.98) and 48 per cent to 52 per cent of nickel (Ni; A_r 58.71).

Fine, grey powder, practically insoluble in water, soluble in mineral acids with formation of salts.
Chlorides: maximum 10 ppm.

Dissolve 0.400 g in 40 ml of a mixture of 67 volumes of *sulphuric acid R* and 33 volumes of *dilute nitric acid R*. Evaporate the solution nearly to dryness, dissolve the residue in *water R* and dilute to 20.0 ml with the same solvent. To one half-aliquot of the solution, add 1.0 ml of *0.1 M silver nitrate*. Filter after 15 min and add 0.2 ml of sodium chloride solution (containing 10 µg of chlorides per millilitre) to the filtrate. After 5 min the solution is more opalescent than a mixture of the second half-aliquot of the solution with 1.0 ml of *0.1 M silver nitrate*.

Nickel chloride. $NiCl_2$. (M_r 129.6). *1057900.* [7718-54-9]. Nickel chloride, anhydrous.

A yellow, crystalline powder, very soluble in water, soluble in alcohol. It sublimes in the absence of air and readily absorbs ammonia. The aqueous solution is acid.

Nickel sulphate. $NiSO_4,7H_2O$. (M_r 280.9). *1058000.* [10101-98-1]. Nickel sulphate heptahydrate.

A green, crystalline powder or crystals, freely soluble in water, slightly soluble in alcohol.

Nicotinamide-adenine dinucleotide. $C_{21}H_{27}N_7O_{14}P_2$. (M_r 663). *1108100.* [-84-9]. NAD^+.

A white or almost white powder, very hygroscopic, freely soluble in water.

Nicotinamide-adenine dinucleotide solution. *1108101.*

Dissolve 40 mg of *nicotinamide-adenine dinucleotide R* in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Nicotinic acid. *1158600.* [59-67-6].

See *Nicotinic acid (0459)*.

Nile blue A. $C_{20}H_{21}N_3O_5S$. (M_r 415.5). *1058200.* [3625-57-8].

Schultz No. 1029.

Colour Index No. 51180.
5-Amino-9-(diethylamino)benzo[*a*]phenoxazinylium hydrogen sulphate.

A green, crystalline powder with a bronze lustre, sparingly soluble in alcohol, in glacial acetic acid and in pyridine.

A 0.005 g/l solution in *alcohol (50 per cent V/V) R* shows an absorption maximum (*2.2.25*) at 640 nm.

Nile blue A solution. *1058201.*

A 10 g/l solution in *anhydrous acetic acid R*.

Test for sensitivity. To 50 ml of *anhydrous acetic acid R* add 0.25 ml of the Nile blue A solution. The solution is blue. On the addition of 0.1 ml of *0.1 M perchloric acid*, the colour changes to blue-green.

Colour change: pH 9.0 (blue) to pH 13.0 (red).

Ninhydrin. $C_9H_4O_3,H_2O$. (M_r 178.1). *1058300.* [485-47-2]. 1,2,3-Indanetrione monohydrate.

A white or very pale yellow, crystalline powder, soluble in water and in alcohol.

Storage: protected from light.

Ninhydrin and stannous chloride reagent. *1058301.*

Dissolve 0.2 g of *ninhydrin R* in 4 ml of hot *water R*, add 5 ml of a 1.6 g/l solution of *stannous chloride R*, allow to stand for 30 min, then filter and store at a temperature of 2 °C to 8 °C. Immediately before use dilute 2.5 ml of the solution with 5 ml of *water R* and 45 ml of *2-propanol R*.

Ninhydrin and stannous chloride reagent R1. *1058302.*

Dissolve 4 g of *ninhydrin R* in 100 ml of *ethylene glycol monomethyl ether R*. Shake gently with 1 g of *cation exchange resin R* (300 µm to 840 µm) and filter (solution a). Dissolve 0.16 g of *stannous chloride R* in 100 ml of *buffer solution pH 5.5 R* (solution b). Immediately before use, mix equal volumes of each solution.

Ninhydrin solution. *1058303.*

A 2 g/l solution of *Ninhydrin R* in a mixture of 5 volumes of *dilute acetic acid R* and 95 volumes of *butanol R*.

Ninhydrin solution R1. *1058304.*

Dissolve 1.0 g of *ninhydrin R* in 50 ml of *alcohol R* and add 10 ml of *glacial acetic acid R*.

Ninhydrin solution R2. *1058305.*

Dissolve 3 g of *ninhydrin R* in 100 ml of a 45.5 g/l solution of *sodium metabisulphite R*.

Ninhydrin solution R3. *1058306.*

A 4 g/l solution in a mixture of 5 volumes of *anhydrous acetic acid R* and 95 volumes of *butanol R*.

Nitrazepam. *1143900.* [146-22-5].

See *Nitrazepam (0415)*.

Nitric acid. HNO_3. (M_r 63.0). *1058400.* [7697-37-2].

Content: 63.0 per cent *m/m* to 70.0 per cent *m/m* of HNO_3.

A clear, colourless or almost colourless liquid, miscible with water.

d_{20}^{20}: 1.384 to 1.416.

A 10 g/l solution is strongly acid and gives the reaction of nitrates (*2.3.1*).

Appearance. Nitric acid is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*Method II, 2.2.2*).

Chlorides (*2.4.4*). To 5 g add 10 ml of *water R* and 0.3 ml of *silver nitrate solution R2* and allow to stand for 2 min protected from light. Any opalescence is not more intense than that of a standard prepared in the same manner using 13 ml of *water R*, 0.5 ml of *nitric acid R*, 0.5 ml of *chloride standard solution (5 ppm Cl) R* and 0.3 ml of *silver nitrate solution R2* (0.5 ppm).

Sulphates (*2.4.13*). Evaporate 10 g to dryness with 0.2 g of *sodium carbonate R*. Dissolve the residue in 15 ml of *distilled water R*. The solution complies with the limit test for sulphates (2 ppm). Prepare the standard using a mixture of 2 ml of *sulphate standard solution (10 ppm SO_4) R* and 13 ml of *distilled water R*.

Arsenic (*2.4.2*). Gently heat 50 g with 0.5 ml of *sulphuric acid R* until white fumes begin to evolve. To the residue add 1 ml of a 100 g/l solution of *hydroxylamine hydrochloride R* and dilute to 2 ml with *water R*. The solution complies with limit test A for arsenic (0.02 ppm). Prepare the standard using 1.0 ml of *arsenic standard solution (1 ppm As) R*.

Heavy metals (*2.4.8*). Dilute 10 ml of the solution prepared for the limit test for iron to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (2 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Iron (*2.4.9*). Dissolve the residue from the determination of sulphated ash in 1 ml of *dilute hydrochloric acid R* and dilute to 50 ml with *water R*. 5 ml of the solution diluted to 10 ml with *water R* complies with the limit test for iron (1 ppm).

Sulphated ash. Carefully evaporate 100 g to dryness. Moisten the residue with a few drops of *sulphuric acid R* and heat to dull red. The residue does not exceed 0.001 per cent.

Assay. To 1.50 g add about 50 ml of *water R* and titrate with *1 M sodium hydroxide*, using 0.1 ml of *methyl red solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 63.0 mg of HNO_3.

Storage: protected from light.

Nitric acid, cadmium- and lead-free. *1058401.*

Complies with the requirements prescribed for Nitric acid R and with the following additional test.

Test solution. To 100 g add 0.1 g of *anhydrous sodium carbonate R* and evaporate to dryness. Dissolve the residue in *water R* heating slightly, and dilute to 50.0 ml with the same solvent.

Cadmium: maximum 0.1 ppm of cadmium (Cd) determined by atomic absorption spectrometry (*Method II, 2.2.23*) measuring the absorbance at 228.8 nm using a cadmium hollow-cathode lamp and an air-acetylene or air-propane flame.

Lead: maximum 0.1 ppm of lead (Pb) determined by atomic absorption spectrometry (*Method II, 2.2.23*) measuring the absorbance at 283.3 nm or 217.0 nm using a lead hollow-cathode lamp and an air-acetylene flame.

Nitric acid, dilute. *1058402.*

Contains about 125 g/l of HNO_3 (M_r 63.0).

Dilute 20 g of *nitric acid R* to 100 ml with *water R*.

Nitric acid, dilute R1. *1058407.*

Dilute 40 g of *nitric acid R* to 100 ml with *water R*.

Nitric acid, heavy metal-free. *1058404.*

Complies with the requirements prescribed for *nitric acid R* and with the following maximum contents of heavy metals:

As: 0.005 ppm;

Cd: 0.005 ppm;

Cu: 0.001 ppm;

Fe: 0.02 ppm;

Hg: 0.002 ppm;

Ni: 0.005 ppm;

Pb: 0.001 ppm;

Zn: 0.01 ppm.

Nitric acid, lead-free. *1058403.*

Complies with the requirements prescribed for *Nitric acid R* and with the following additional test:

To 100 g add 0.1 g of *anhydrous sodium carbonate R* and evaporate to dryness. Dissolve the residue in *water R*, heating slightly, and dilute to 50.0 ml with the same solvent. Determine the lead content by atomic absorption spectrometry (*Method II, 2.2.23*) measuring the absorbance at 283.3 nm or 217.0 nm using a lead hollow-cathode lamp and an air-acetylene flame. It contains not more than 0.1 ppm of lead (Pb).

Nitric acid, lead-free R1. *1058405.*

Nitric acid R containing not more than 1 µg/kg of lead.

Nitric acid, lead-free, dilute. *1058406.*

Dilute 5 g of *lead-free nitric acid R1* to 100 ml with *deionised distilled water R*.

Nitric acid, nickel-free. *1058408.*

It complies with the requirements described for *nitric acid R* with the following additional requirement.

Nickel: maximum 0.005 ppm.

Nitric acid, fuming. *1058500.* [52583-42-3].

A clear, slightly yellowish liquid, fuming on contact with air.

d_{20}^{20}: about 1.5.

Nitrilotriacetic acid. $C_6H_9NO_6$. (M_r 191.1). *1137400.* [139-13-9].

White or almost white crystalline powder, practically insoluble in water and in most organic solvents.

mp: about 240 °C, with decomposition.

Nitroaniline. $C_6H_6N_2O_2$. (M_r 138.1). *1058600.* [100-01-6]. 4-Nitroaniline.

A bright yellow, crystalline powder, very slightly soluble in water, sparingly soluble in boiling water, soluble in alcohol, forms water-soluble salts with strong mineral acids.

mp: about 147 °C.

Nitrobenzaldehyde. $C_7H_5NO_3$. (M_r 151.1). *1058700.* [552-89-6]. 2-Nitrobenzaldehyde.

Yellow needles, slightly soluble in water, freely soluble in alcohol, volatile in steam.

mp: about 42 °C.

Nitrobenzaldehyde paper. *1058701.*

Dissolve 0.2 g of *nitrobenzaldehyde R* in 10 ml of a 200 g/l solution of *sodium hydroxide R*. Use the solution within 1 h. Immerse the lower half of a slow filter paper strip 10 cm long and 0.8 cm to 1 cm wide. Absorb the excess reagent between two sheets of filter paper. Use within a few minutes of preparation.

Nitrobenzaldehyde solution. *1058702.*

Add 0.12 g of powdered *nitrobenzaldehyde R* to 10 ml of *dilute sodium hydroxide solution R*; allow to stand for 10 min shaking frequently and filter. Prepare immediately before use.

Nitrobenzene. $C_6H_5NO_2$. (M_r 123.1). *1058800.* [98-95-3].

A colourless or very slightly yellow liquid, practically insoluble in water, miscible with alcohol.

bp: about 211 °C.

Dinitrobenzene. To 0.1 ml add 5 ml of *acetone R,* 5 ml of *water R* and 5 ml of *strong sodium hydroxide solution R.* Shake and allow to stand. The upper layer is almost colourless.

4-Nitrobenzoic acid. $C_7H_5NO_4$. (M_r 167.1). *1144000.* [62-23-7].

Yellow crystals.

mp: about 240 °C.

Nitrobenzoyl chloride. $C_7H_4ClNO_3$. (M_r 185.6). *1058900.* [122-04-3]. 4-Nitrobenzoyl chloride.

Yellow crystals or a crystalline mass, decomposing in moist air, completely soluble in sodium hydroxide solution giving a yellowish-orange colour.

mp: about 72 °C.

Nitrobenzyl chloride. $C_7H_6ClNO_2$. (M_r 171.6). *1059000.* [100-14-1]. 4-Nitrobenzyl chloride.

Pale-yellow crystals, lachrymatory, practically insoluble in water, very soluble in alcohol.

4-(4-Nitrobenzyl)pyridine. $C_{12}H_{10}N_2O_2$. (M_r 214.2). *1101900.* [1083-48-3].

Yellow powder.

mp: about 70 °C.

Nitrochromic reagent. *1059100.*

Dissolve 0.7 g of *potassium dichromate R* in *nitric acid R* and dilute to 100 ml with the same acid.

Nitroethane. $C_2H_5NO_2$. (M_r 75.1). *1059200.* [79-24-3].

A clear, oily, colourless liquid.

bp: about 114 °C.

Nitrofurantoin. *1099700.* [67-20-9].

See *Nitrofurantoin (0101).*

(5-Nitro-2-furyl)methylene diacetate. $C_9H_9NO_7$. (M_r 243.2). *1099800.* [92-55-7]. Nitrofurfural diacetate. 5-Nitrofurfurylidene diacetate.

Yellow crystals.

mp: about 90 °C.

Nitrogen. N_2. (M_r 28.01). *1059300.* [7727-37-9].

Nitrogen, washed and dried.

Nitrogen R1. *1059400.*

Content: minimum 99.999 per cent *V/V* of N_2.

Carbon monoxide: less than 5 ppm.

Oxygen: less than 5 ppm.

Nitrogen for chromatography. *1059500.*

Content: minimum 99.95 per cent *V/V* of N_2.

Nitrogen gas mixture. *1136900.*

Nitrogen R containing 1 per cent *V/V* of each of the following gases: *carbon dioxide R2, carbon monoxide R1* and *oxygen R1.*

Nitrogen monoxide. NO. (M_r 30.01). *1108300.*

Content: minimum 98.0 per cent *V/V* of NO.

Nitrogen, oxygen-free. *1059600.*

Nitrogen R which has been freed from oxygen by passing it through *alkaline pyrogallol solution R.*

Nitromethane. CH_3NO_2. (M_r 61.0). *1059700.* [75-52-5].

A clear, colourless, oily liquid, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: 1.132 to 1.134.

n_D^{20}: 1.381 to 1.383.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 100 °C and 103 °C.

Nitro-molybdovanadic reagent. *1060100.*

Solution I. Dissolve 10 g of *ammonium molybdate R* in *water R,* add 1 ml of *ammonia R* and dilute to 100 ml with *water R.*

Solution II. Dissolve 2.5 g of *ammonium vanadate R* in hot *water R,* add 14 ml of *nitric acid R* and dilute to 500 ml with *water R.*

To 96 ml of *nitric acid R* add 100 ml of solution I and 100 ml of solution II and dilute to 500 ml with *water R.*

4-Nitrophenol. $C_6H_5NO_3$. (M_r 139.1). *1146400.* [100-02-7]. *p*-Nitrophenol.

Content: minimum 95 per cent of $C_6H_5NO_3$.

Colourless or slightly yellow powder, sparingly soluble in water and in methanol.

mp: about 114 °C.

***N*-Nitrosodiethanolamine.** $C_4H_{10}N_2O_3$. (M_r 134.1). *1129800.* [1116-54-7]. 2,2′-(Nitrosoimino)diethanol.

A yellow liquid, miscible with ethanol.

n_D^{20}: about 1.485.

bp: about 125 °C.

Nitrosodipropylamine. $C_6H_{14}N_2O$. (M_r 130.2). *1099900.* [621-64-7]. Dipropylnitrosamine.

Liquid, soluble in ethanol and in strong acids.

d_{20}^{20}: about 0.915.

bp: about 78 °C.

Appropriate grade for chemiluminescence determination.

Nitrosodipropylamine solution. *1099901.*

Inject 78.62 g of *ethanol R* through the septum of a vial containing *nitrosodipropylamine R.* Dilute 1/100 in *ethanol R* and place 0.5 ml aliquots in crimp-sealed vials.

Storage: in the dark at 5 °C.

Nitrotetrazolium blue. $C_{40}H_{30}Cl_2N_{10}O_6$. ($M_r$ 818). *1060000.* [298-83-9]. 3,3′-(3,3′-Dimethoxy-4,4′-diphenylene)di[2-(4-nitrophenyl)-5-phenyl-2*H*-tetrazolium] dichloride. *p*-Nitro-tetrazolium blue.

Crystals, soluble in methanol, giving a clear, yellow solution.

mp: about 189 °C, with decomposition.

Nitrous oxide. N_2O. (M_r 44.01). *1108500.*

Content: minimum 99.99 per cent *V/V* of N_2O.

Nitrogen monoxide: less than 1 ppm.

Carbon monoxide: less than 1 ppm.

Nonivamide. $C_{17}H_{27}NO_3$. (M_r 293.4). *1148500.* [2444-46-4]. *N*-[(4-Hydroxy-3-methoxyphenyl)methyl]nonanamide.

White or almost white, crystalline powder, practically insoluble in cold water, freely soluble in ethanol.

Nonivamide used in the test for nonivamide in Capsicum (1859) complies with the following additional requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Capsicum (1859).* The content of nonivamide is not less than 98.0 per cent, calculated by the normalisation procedure.

Nonylamine. $C_9H_{21}N$. (M_r 143.3). *1139800.* [112-20-9]. 1-Aminononane.

Corrosive, colourless, clear liquid.

d_4^{20}: about 0.788.

n_D^{20}: about 1.433.

Nordazepam. $C_{15}H_{11}ClN_2O$. (M_r 270.7). *1060200.* [1088-11-5]. 7-Chloro-2,3-dihydro-5-phenyl-1*H*-1,4-benzodiazepin-2-one.

A white or pale yellow, crystalline powder, practically insoluble in water, slightly soluble in alcohol.

mp: about 216 °C.

DL-Norleucine. $C_6H_{13}NO_2$. (M_r 131.2). *1060300.* [616-06-8]. (*RS*)-2-Aminohexanoic acid.

Shiny crystals, sparingly soluble in water and in alcohol, soluble in acids.

Noscapine hydrochloride. *1060500.* [912-60-7].

See *Noscapine hydrochloride (0515).*

Octadecyl [3-[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]-propionate]. $C_{35}H_{62}O_3$. (M_r 530.9). *1060600.* [2082-79-3]. Octadecyl 3-(3,5-di-*tert*-butyl-4-hydroxyphenyl)propionate.

A white or slightly yellowish, crystalline powder, practically insoluble in water, very soluble in acetone and in hexane, slightly soluble in methanol.

mp: 49 °C to 55 °C.

Octanal. $C_8H_{16}O$. (M_r 128.2). *1150400.* [124-13-0]. Octyl aldehyde.

Oily, colourless liquid. Practically insoluble in water.

Octanal used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Sweet orange oil (1811).*

The content is not less than 99 per cent, calculated by the normalisation procedure.

Octane. C_8H_{18}. (M_r 114.2). *1166500.* [111-65-9]. *n*-Octane.

Octanol. $C_8H_{18}O$. (M_r 130.2). *1060700.* [111-87-5]. 1-Octanol. Caprylic alcohol.

A colourless liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: about 0.828.

bp: about 195 °C.

3-Octanone. $C_8H_{16}O$. (M_r 128.2). *1114600.* [106-68-3]. Ethylpentylketone.

A colourless liquid with a characteristic odour.

d_{20}^{20}: about 0.822.

n_D^{20}: about 1.415.

bp: about 167 °C.

3-Octanone used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Lavender oil (1338).*

Test solution. The substance to be examined.

The area of the principal peak is not less than 98.0 per cent of the area of all the peaks in the chromatogram obtained.

Octoxinol 10. $C_{34}H_{62}O_{11}$ (average). (M_r 647). *1060800.* [9002-93-1]. α-[4-(1,1,3,3-Tetramethylbutyl)phenyl]-ω-hydroxypoly-(oxyethylene).

A clear, pale-yellow, viscous liquid, miscible with water, with acetone and with alcohol, soluble in toluene.

Storage: in an airtight container.

Octylamine. $C_8H_{19}N$. (M_r 129.2). *1150500.* [111-86-4]. Octan-1-amine.

Colourless liquid.

d_{20}^{20}: about 0.782.

bp: 175 °C to 179 °C.

Oleamide. $C_{18}H_{35}NO$. (M_r 281.5). *1060900.* (*Z*)-Octadec-9-enoamide.

Yellowish or white powder or granules, practically insoluble in water, very soluble in methylene chloride, soluble in ethanol.

mp: about 80 °C.

Oleic acid. $C_{18}H_{34}O_2$. (M_r 282.5). *1144100.* [112-80-1]. (9*Z*)-Octadec-9-enoic acid.

Clear, colourless liquid, practically insoluble in water.

d_4^{20}: about 0.891.

n_D^{20}: about 1.459.

mp: 13 °C to 14 °C.

Oleic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848).*

The content of oleic acid is not less than 98 per cent, calculated by the normalisation procedure.

Oleuropein. $C_{25}H_{32}O_{13}$. (M_r 540.5). *1152900.* [32619-42-4]. 2-(3,4-Dihydroxyphenyl)ethyl[(2*S*,3*E*,4*S*)-3-ethylidene-2-(b-d-glucopyranosyloxy)-5-(methoxycarbonyl)-3,4-dihydro-2*H*-pyran-4-yl]acetate.

Powder, soluble in methanol.

Oleuropein used in Olive leaf (1878) complies with the following requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Olive leaf (1878).*

The content of oleuropein is not less than 80 per cent, calculated by the normalisation procedure.

Oleyl alcohol. $C_{18}H_{36}O$. (M_r 268.5). *1156000.* [143-28-2]. (9*Z*)-octadec-9-en-1-ol.

bp: about 207 °C.

n_D^{20}: 1.460.

Content: minimum 85 per cent of $C_{18}H_{36}O$.

Olive oil. *1061000.* [8001-25-0].

See *Olive oil, virgin (0518).*

Oracet blue 2R. $C_{20}H_{14}N_2O_2$. (M_r 314.3). *1061100.* [4395-65-7].

Colour Index No. 61110.
1-Amino-4-(phenylamino)anthracene-9,10-dione.

mp: about 194 °C.

Orcinol. $C_7H_8O_2,H_2O$. (M_r 142.2). *1108700.* [6153-39-5].
5-Methylbenzene-1,3-diol monohydrate.

A crystalline powder, sensitive to light.

bp: about 290 °C.

mp: 58 °C to 61 °C.

Organosilica polymer, amorphous, octadecylsilyl. *1144200.*

Synthetic, spherical hybrid particles, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by trifunctionally bonded octadecylsilyl groups.

Organosilica polymer, amorphous, polar-embedded octadecylsilyl, end-capped. *1150600.*

Synthetic, spherical hybrid particles containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of polar embedded octadecylsilyl groups.

To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Organosilica polymer for mass spectrometry, amorphous, octadecylsilyl, end-capped. *1164900.*

Synthetic, spherical hybrid particles containing both inorganic (silica) and organic (organosiloxanes) components.

To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Osmium tetroxide. OsO_4. (M_r 254.2). *1061200.* [20816-12-0].

Light-yellow needles or a yellow, crystalline mass, hygroscopic, light sensitive, soluble in water and in alcohol.

Storage: in an airtight container.

Osmium tetroxide solution. *1061201.*

A 2.5 g/l solution in *0.05 M sulphuric acid*.

Oxalic acid. $C_2H_2O_4,2H_2O$. (M_r 126.1). *1061400.* [6153-56-6].
Ethanedioic acid dihydrate.

White or almost white crystals, soluble in water, freely soluble in alcohol.

Oxalic acid and sulphuric acid solution. *1061401.*

A 50 g/l solution of *oxalic acid R* in a cooled mixture of equal volumes of *sulphuric acid R* and *water R*.

Oxazepam. *1144300.* [604-75-1].

See *Oxazepam (0778)*.

Ox brain, acetone-dried. *1061300.*

Cut into small pieces a fresh ox brain previously freed from vascular and connective tissue. Place in *acetone R* for preliminary dehydration. Complete the dehydration by pounding in a mortar 30 g of this material with successive quantities, each of 75 ml, of *acetone R* until a dry powder is obtained after filtration. Dry at 37 °C for 2 h or until the odour of acetone is no longer present.

2,2′-Oxybis(*N*,*N*-dimethylethylamine). $C_8H_{20}N_2O$. (M_r 160.3). *1141200.* [3033-62-3]. bis(2-Dimethylaminoethyl) ether.

Colourless, corrosive liquid.

d_{20}^{20}: about 0.85.

n_D^{20}: about 1.430.

Oxygen. O_2. (M_r 32.00). *1108800.*

Content: minimum 99.99 per cent *V/V* of O_2.

Nitrogen and argon: less than 100 ppm.

Carbon dioxide: less than 10 ppm.

Carbon monoxide: less than 5 ppm.

Oxygen R1. O_2. (M_r 32.00). *1137600.*

Content: minimum 99 per cent *V/V* of O_2.

Oxytetracycline hydrochloride. *1146500.*

See *Oxytetracycline hydrochloride (0198)*.

Palladium. Pd. (A_r 106.4). *1114700.* [7440-05-3].

Grey white metal, soluble in hydrochloric acid.

Palladium chloride. $PdCl_2$. (M_r 177.3). *1061500.* [7647-10-1].

Red crystals.

mp: 678 °C to 680 °C.

Palladium chloride solution. *1061501.*

Dissolve 1 g of *palladium chloride R* in 10 ml of warm *hydrochloric acid R*. Dilute the solution to 250 ml with a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. Dilute this solution immediately before use with 2 volumes of *water R*.

Palmitic acid. $C_{16}H_{32}O_2$. (M_r 256.4). *1061600.* [57-10-3].
Hexadecanoic acid.

White or almost white, crystalline scales, practically insoluble in water, freely soluble in hot alcohol.

mp: about 63 °C.

Chromatography. Examine as prescribed in the monograph on *Chloramphenicol palmitate (0473)*. The chromatogram shows only one principal spot.

Palmitic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848)*.

The content of palmitic acid is not less than 98 per cent, calculated by the normalisation procedure.

Palmitoleic acid. $C_{16}H_{30}O_2$. (M_r 254.4). *1144400.* [373-49-9].
(9*Z*)-Hexadec-9-enoic acid.

Clear, colourless liquid.

bp: about 162 °C.

Palmitoleic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848)*.

The content of palmitoleic acid is not less than 98 per cent, calculated by the normalisation procedure.

Palmityl alcohol. $C_{16}H_{34}O$. (M_r 242.4). *1156100.* [36653-82-4]. Cetyl alcohol. 1-Hexadecanol.

mp: about 48 °C.

Content: minimum 96 per cent of $C_{16}H_{34}O$.

Pancreas powder. *1061700.*

See *Pancreas powder (0350)*.

Papain. *1150700.* [9001-73-4].

A proteolytic enzyme obtained from the latex of the green fruit and leaves of *Carica papaya* L.

Papaverine hydrochloride. *1061800.* [61-25-6].

See *Papaverine hydrochloride (0102).*

Paper chromatography performance test solutions. *1150800.*

Test solution (a). Sodium pertechnetate (^{99m}Tc) injection (fission) (0124) or *Sodium pertechnetate (^{99m}Tc) injection (non-fission) (0283).*

Test solution (b). In a closed vial mix 100 µl of a 5 g/l solution of *stannous chloride R* in *0.05 M hydrochloric acid* and 100 MBq to 200 MBq of *Sodium pertechnetate (^{99m}Tc) injection (fission) (0124)* or *Sodium pertechnetate (^{99m}Tc) injection (non-fission) (0283)* in a volume not exceeding 2 ml.

Paper for chromatography. *1150900.*

Pure cellulose grade thin paper with a smooth surface and a thickness of about 0.2 mm.

Chromatographic separation. To 2 strips of *paper for chromatography R* apply separately 2-5 µl of test solution (a) and test solution (b) of *paper chromatography performance test solutions R*. Develop over a pathlength of 3/4 of the paper height, using a mixture of equal volumes of *methanol R* and *water R*. Allow to dry and determine the distribution of radioactivity using a suitable detector. The paper is not satisfactory, unless the chromatogram obtained with test solution (a) shows a single radioactivity spot with an R_F value in the range 0.8-1.0 and the chromatogram obtained with test solution (b) shows a single radioactivity spot at the application point (R_F value in the range 0.0-0.1).

Paracetamol. *1061900.* [103-90-2].

See *Paracetamol (0049).*

Paracetamol, 4-aminophenol-free. *1061901.*

Recrystallise *paracetamol R* from *water R* and dry *in vacuo* at 70 °C; repeat the procedure until the product complies with the following test: dissolve 5 g of the dried substance in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100 ml with the same mixture of solvents. Add 1 ml of a freshly prepared solution containing 10 g/l of *sodium nitroprusside R* and 10 g/l of *anhydrous sodium carbonate R*, mix and allow to stand for 30 min protected from light. No blue or green colour is produced.

Paraffin, liquid. *1062000.* [8042-47-5].

See *Liquid paraffin (0239).*

Paraffin, white soft. *1062100.*

A semi-liquid mixture of hydrocarbons obtained from petroleum and bleached, practically insoluble in water and in alcohol, soluble in *light petroleum R1*, the solution sometimes showing a slight opalescence.

Paraldehyde. *1151000.* [123-63-7].

See *Paraldehyde (0351).*

Pararosaniline hydrochloride. $C_{19}H_{18}ClN_3$. (M_r 323.8). *1062200.* [569-61-9].

Schultz No. 779.

Colour Index No. 42500.

4-[bis(4-Aminophenyl)methylene]cyclohexa-2,5-dieniminium chloride.

A bluish-red, crystalline powder, slightly soluble in water, soluble in ethanol. Solutions in water and ethanol are deep-red; solutions in sulphuric acid and in hydrochloric acid are yellow.

mp: about 270 °C, with decomposition.

Decolorised pararosaniline solution. *1062201.*

To 0.1 g of *pararosaniline hydrochloride R* in a ground-glass-stoppered flask add 60 ml of *water R* and a solution of 1.0 g of *anhydrous sodium sulphite R* or 2.0 g of *sodium sulphite R* or 0.75 g of *sodium metabisulphite R* in 10 ml of *water R*. Slowly and with stirring add 6 ml of *dilute hydrochloric acid R*, stopper the flask and continue stirring until dissolution is complete. Dilute to 100 ml with *water R*. Allow to stand for 12 h before use.

Storage: protected from light.

Parthenolide. $C_{15}H_{20}O_3$. (M_r 248.3). *1129900.* [20554-84-1]. (4*E*)-(1a*R*,7a*S*,10a*S*,10b*S*)-1a,5-Dimethyl-8-methylene-2,3,6,7,7a,8,10a,10b-octahydro-oxireno[9,10]cyclodeca[1,2-*b*]furan-9(1a*H*)-one. (*E*)-(5*S*,6*S*)-4,5-Epoxygermacra-1(10),11(13)-dieno-12(6)-lactone.

A white or almost white, crystalline powder, very slightly soluble in water, very soluble in methylene chloride, soluble in methanol.

$[\alpha]_D^{22}$: – 71.4, determined on a 2.2 g/l solution in *methylene chloride R*.

mp: 115 °C to 116 °C.

Absorbance (*2.2.25*). A 0.01 g/l solution in *alcohol R* shows an absorption maximum at 214 nm.

Assay. Examine by liquid chromatography (*2.2.29*), as prescribed in the monograph on *Feverfew (1516)*, at the concentration of the reference solution. The content of parthenolide is not less than 90 per cent calculated by the normalisation procedure.

Penicillinase solution. *1062300.*

Dissolve 10 g of casein hydrolysate, 2.72 g of *potassium dihydrogen phosphate R* and 5.88 g of *sodium citrate R* in 200 ml of *water R*, adjust to pH 7.2 with a 200 g/l solution of *sodium hydroxide R* and dilute to 1000 ml with *water R*. Dissolve 0.41 g of *magnesium sulphate R* in 5 ml of *water R* and add 1 ml of a 1.6 g/l solution of *ferrous ammonium sulphate R* and sufficient *water R* to produce 10 ml. Sterilise both solutions by heating in an autoclave, cool, mix, distribute in shallow layers in conical flasks and inoculate with *Bacillus cereus* (NCTC 9946). Allow the flasks to stand at 18 °C to 37 °C until growth is apparent and then maintain at 35 °C to 37 °C for 16 h, shaking constantly to ensure maximum aeration. Centrifuge and sterilise the supernatant liquid by filtration through a membrane filter. 1.0 ml of penicillinase solution contains not less than 0.4 microkatals (corresponding to the hydrolysis of not less than 500 mg of benzylpenicillin to benzylpenicilloic acid per hour) at 30 °C and pH 7, provided that the concentration of benzylpenicillin does not fall below the level necessary for enzyme saturation.

The Michaelis constant for benzylpenicillin of the penicillinase in penicillinase solution is approximately 12 µg/ml.

Sterility (*2.6.1*). It complies with the test for sterility.

Storage: at a temperature between 0 °C and 2 °C for 2 to 3 days. When freeze-dried and kept in sealed ampoules, it may be stored for several months.

Pentaerythrityl tetrakis[3-(3,5-di(1,1-dimethylethyl)-4-hydroxyphenyl)propionate]. $C_{73}H_{108}O_{12}$. (M_r 1178). *1062400.* [6683-19-8]. Pentaerythrityl tetrakis[3-(3,5-di-*tert*-butyl-4-hydroxyphenyl) propionate]. 2,2′-bis(Hydroxymethyl)propane-1,3-diol tetrakis[3-[3,5-di(1, 1-dimethylethyl)-4-hydroxyphenyl]]propionate.

A white to slightly yellow, crystalline powder, practically insoluble in water, very soluble in acetone, soluble in methanol, slightly soluble in hexane.

mp: 110 °C to 125 °C.

α-form: 120 °C to 125 °C.

β-form: 110 °C to 115 °C.

Pentafluoropropanoic acid. $C_3HF_5O_2$. (M_r 164.0). *1151100.* [422-64-0].

Clear, colourless liquid.

d_{20}^{20}: about 1.561.

n_D^{20}: about 1.284.

bp: about 97 °C.

Pentane. C_5H_{12}. (M_r 72.2). *1062500.* [109-66-0].

A clear, colourless, flammable liquid, very slightly soluble in water, miscible with acetone and with ethanol.

d_{20}^{20}: about 0.63.

n_D^{20}: about 1.359.

bp: about 36 °C.

Pentane used in spectrophotometry complies with the following additional requirement.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 20 per cent at 200 nm, 50 per cent at 210 nm, 85 per cent at 220 nm, 93 per cent at 230 nm, 98 per cent at 240 nm.

1,2-Pentanediol. $C_5H_{12}O_2$. (M_r 104.2). *1155800.* [5343-92-0]. (2*RS*)-Pentane-1,2-diol.

d_4^{20}: about 0.971.

n_D^{20}: about 1.439.

bp: about 201 °C.

Pentanol. $C_5H_{12}O$. (M_r 88.1). *1062600.* [71-41-0]. 1-Pentanol.

Colourless liquid, sparingly soluble in water, miscible with alcohol.

n_D^{20}: about 1.410.

bp: about 137 °C.

***tert*-Pentyl alcohol.** $C_5H_{12}O$. (M_r 88.1). *1062700.* [75-85-4]. *tert*-Amyl alcohol. 2-Methyl-2-butanol.

A volatile, flammable liquid, freely soluble in water, miscible with alcohol and with glycerol.

d_{20}^{20}: about 0.81.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 100 °C and 104 °C.

Storage: protected from light.

Pepsin powder. *1062800.* [9001-75-6].

See *Pepsin powder (0682).*

Perchloric acid. $HClO_4$. (M_r 100.5). *1062900.* [7601-90-3].

Content: 70.0 per cent *m/m* to 73.0 per cent *m/m* of $HClO_4$.

A clear, colourless liquid, miscible with water.

d_{20}^{20}: about 1.7.

Assay. To 2.50 g add 50 ml of *water R* and titrate with *1 M sodium hydroxide,* using 0.1 ml of *methyl red solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 100.5 mg of $HClO_4$.

Perchloric acid solution. *1062901.*

Dilute 8.5 ml of *perchloric acid R* to 100 ml with *water R.*

Periodic acetic acid solution. *1063000.*

Dissolve 0.446 g of *sodium periodate R* in 2.5 ml of a 25 per cent *V/V* solution of *sulphuric acid R.* Dilute to 100.0 ml with *glacial acetic acid R.*

Periodic acid. H_5IO_6. (M_r 227.9). *1108900.* [10450-60-9].

Crystals, freely soluble in water and soluble in alcohol.

mp: about 122 °C.

Permethrin. $C_{21}H_{20}Cl_2O_3$. (M_r 391.3). *1130000.* [52645–1].

mp: 34 °C to 35 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Peroxide test strips. *1147800.*

Use commercial test strips with a suitable scale in the range from 0 ppm to 25 ppm peroxide.

Perylene. $C_{20}H_{12}$. (M_r 252.3). *1130100.* [198-55-0]. Dibenz(de,kl)anthracene.

Orange powder.

mp: about 279 °C.

Petroleum, light. *1063100.* [8032-32-4]. Petroleum ether 50-70 °C.

A clear, colourless, flammable liquid without fluorescence, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.661 to 0.664.

Distillation range (*2.2.11*): 50 °C to 70 °C.

Petroleum, light R1. *1063101.* Petroleum ether 40-60 °C.

Complies with the requirements prescribed for *light petroleum R,* with the following modifications.

d_{20}^{20}: 0.630 to 0.656.

Distillation range (*2.2.11*): 40 °C to 60 °C

It does not become cloudy at 0 °C.

Petroleum, light R2. *1063102.* Petroleum ether 30-40 °C.

Complies with the requirements prescribed for *light petroleum R,* with the following modifications.

d_{20}^{20}: 0.620 to 0.630.

Distillation range (*2.2.11*): 30 °C to 40 °C

It does not become cloudy at 0 °C.

Petroleum, light R3. *1063103.* Petroleum ether 100-120 °C.

Complies with the requirements prescribed for *light petroleum R,* with the following modifications.

d_{20}^{20}: about 0.720.

Distillation range (*2.2.11*): 100 °C to 120 °C.

Water (*2.5.12*): maximum 0.03 per cent.

Petroleum, light R4. *1063104.* Petroleum ether 80-100 °C.

Complies with the requirements prescribed for *light petroleum R,* with the following modifications.

Distillation range (*2.2.11*): 80 °C to 100 °C.

d_{20}^{20}: about 0.70.

α-Phellandrene. $C_{10}H_{16}$. (M_r 136.2). *1130400.* [4221-98-1]. (*R*)-5-Isopropyl-2-methyl-cyclohexa-1,3-diene. (–)-p-Mentha-1,5-diene.

n_D^{20}: about 1.471.

bp: 171 °C to 174 °C.

α-Phellandrene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Eucalyptus oil (0390)*.

Test solution. The substance to be examined.

Content: 95.0 per cent, calculated by the normalisation procedure.

Phenanthrene. $C_{14}H_{10}$. (M_r 178.2). *1063200.* [85-01-8].

White or almost white crystals, practically insoluble in water, sparingly soluble in alcohol.

mp: about 100 °C.

Phenanthroline hydrochloride. $C_{12}H_9ClN_2,H_2O$. (M_r 234.7). *1063300.* [3829-86-5]. 1,10-Phenanthroline hydrochloride monohydrate.

A white or almost white, crystalline powder, freely soluble in water, soluble in alcohol.

mp: about 215 °C, with decomposition.

Phenazone. *1063400.* [60-80-0].

See *Phenazone (0421)*.

Phenol. *1063500.* [108-95-2].

See *Phenol (0631)*.

Phenolphthalein. $C_{20}H_{14}O_4$. (M_r 318.3). *1063700.* [77-09-8]. 3,3-bis(4-Hydroxyphenyl)-3*H*-isobenzofuran-1-one.

A white to yellowish-white powder, practically insoluble in water, soluble in alcohol.

Phenolphthalein paper. *1063704.*

Immerse strips of filter paper for a few minutes in *phenolphthalein solution R*. Allow to dry.

Phenolphthalein solution. *1063702.*

Dissolve 0.1 g of *phenolphthalein R* in 80 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. To 0.1 ml of the phenolphthalein solution add 100 ml of *carbon dioxide-free water R*. The solution is colourless. Not more than 0.2 ml of *0.02 M sodium hydroxide* is required to change the colour to pink.

Colour change: pH 8.2 (colourless) to pH 10.0 (red).

Phenolphthalein solution R1. *1063703.*

A 10 g/l solution in *alcohol R*.

Phenol red. *1063600.* [143-74-8].

Bright red or dark red, crystalline powder, very slightly soluble in water, slightly soluble in alcohol.

Phenol red solution. *1063601.*

Dissolve 0.1 g of *phenol red R* in a mixture of 2.82 ml of *0.1 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R*.

Test for sensitivity. Add 0.1 ml of the phenol red solution to 100 ml of *carbon dioxide-free water R*. The solution is yellow. Not more than 0.1 ml of *0.02 M sodium hydroxide* is required to change the colour to reddish-violet.

Colour change: pH 6.8 (yellow) to pH 8.4 (reddish-violet).

Phenol red solution R2. *1063603.*

Solution I. Dissolve 33 mg of *phenol red R* in 1.5 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*.

Solution II. Dissolve 25 mg of *ammonium sulphate R* in 235 ml of *water R*; add 105 ml of *dilute sodium hydroxide solution R* and 135 ml of *dilute acetic acid R*.

Add 25 ml of solution I to solution II. If necessary, adjust the pH of the mixture to 4.7.

Phenol red solution R3. *1063604.*

Solution I. Dissolve 33 mg of *phenol red R* in 1.5 ml of *dilute sodium hydroxide solution R* and dilute to 50 ml with *water R*.

Solution II. Dissolve 50 mg of *ammonium sulphate R* in 235 ml of *water R*; add 105 ml of *dilute sodium hydroxide solution R* and 135 ml of *dilute acetic acid R*.

Add 25 ml of solution I to solution II; if necessary, adjust the pH of the mixture to 4.7.

Phenoxyacetic acid. $C_8H_8O_3$. (M_r 152.1). *1063800.* [122-59-8]. 2-Phenoxyethanoic acid.

Almost white crystals, sparingly soluble in water, freely soluble in alcohol, and in glacial acetic acid.

mp: about 98 °C.

Chromatography. Examine as prescribed in the monograph on *Phenoxymethylpenicillin (0148)*; the chromatogram shows only one principal spot.

2-Phenoxyaniline. $C_{12}H_{11}NO$. (M_r 185.2). *1165500.* [2688-84-8]. 2-Phenoxybenzenamine. 2-Aminophenyl phenyl ether.

Phenoxybenzamine hydrochloride. $C_{18}H_{23}Cl_2NO$. (M_r 340.3). *1063900. N*-(2-Chloroethyl)-*N*-(1-methyl-2-phenoxyethyl)-benzylamine hydrochloride.

Content: 97.0 per cent to the equivalent of 103.0 per cent of $C_{18}H_{23}Cl_2NO$, calculated with reference to the dried substance.

A white or almost white, crystalline powder, sparingly soluble in water, freely soluble in alcohol.

mp: about 138 °C.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined by drying over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 24 h.

Assay. Dissolve 0.500 g in 50.0 ml of *ethanol-free chloroform R* and extract with three quantities, each of 20 ml, of *0.01 M hydrochloric acid*. Discard the acid extracts, filter the chloroform layer through cotton and dilute 5.0 ml of the filtrate to 500.0 ml with *ethanol-free chloroform R*. Measure the absorbance of the resulting solution in a closed cell at the maximum at 272 nm.

Calculate the content of $C_{18}H_{23}Cl_2NO$, taking the specific absorbance to be 56.3.

Storage: protected from light.

Phenoxyethanol. $C_8H_{10}O_2$. (M_r 138.2). *1064000.* [122-99-6]. 2-Phenoxyethanol.

A clear, colourless, oily liquid, slightly soluble in water, freely soluble in alcohol.

d_{20}^{20}: about 1.11.

n_D^{20}: about 1.537.

Freezing point (*2.2.18*): minimum 12 °C.

Phenylacetic acid. $C_8H_8O_2$. (M_r 136.2). *1160000.* [103-82-2].

White or almost white powder, soluble in water.

bp: about 265 °C.

mp: about 75 °C.

Phenylalanine. *1064100.* [63-91-2].

See *Phenylalanine (0782).*

***p*-Phenylenediamine dihydrochloride.** $C_6H_{10}Cl_2N_2$. (M_r 181.1). *1064200.* [615-28-1]. 1,4-Diaminobenzene dihydrochloride.

A crystalline powder or white or slightly coloured crystals, turning reddish on exposure to air, freely soluble in water, slightly soluble in alcohol.

α-Phenylglycine. $C_8H_9NO_2$. (M_r 151.2). *1064300.* [2835-06-5]. (*RS*)-2-Amino-2-phenylacetic acid.

D-Phenylglycine. $C_8H_9NO_2$. (M_r 151.2). *1144500.* [875-74-1]. (2*R*)-2-Amino-2-phenylacetic acid.

Content: minimum 99 per cent of $C_8H_9NO_2$.

White or almost white, crystalline powder.

Phenylhydrazine hydrochloride. $C_6H_9ClN_2$. (M_r 144.6). *1064500.* [59-88-1].

A white or almost white, crystalline powder, becoming brown on exposure to air, soluble in water and in alcohol.

mp: about 245 °C, with decomposition.

Storage: protected from light.

Phenylhydrazine hydrochloride solution. *1064501.*

Dissolve 0.9 g of *phenylhydrazine hydrochloride R* in 50 ml of *water R*. Decolorise with *activated charcoal R* and filter. To the filtrate add 30 ml of *hydrochloric acid R* and dilute to 250 ml with *water R*.

Phenylhydrazine-sulphuric acid solution. *1064502.*

Dissolve 65 mg of *phenylhydrazine hydrochloride R*, previously recrystallised from *alcohol (85 per cent V/V) R*, in a mixture of 80 volumes of *water R* and 170 volumes of *sulphuric acid R* and dilute to 100 ml with the same mixture of solvents. Prepare immediately before use.

Phenyl isothiocyanate. C_7H_5NS. (M_r 135.2). *1121500.* [103-72-0].

A liquid, insoluble in water, soluble in alcohol.

d_{20}^{20}: about 1.13.

n_D^{20}: about 1.65.

bp: about 221 °C.

mp: about – 21 °C.

Use a grade suitable for protein sequencing.

1-Phenylpiperazine. $C_{10}H_{14}N_2$. (M_r 162.2). *1130500.* [92-54-6].

Slightly viscous, yellow liquid, not miscible with water.

d_4^{20}: about 1.07.

n_D^{20}: about 1.588.

Phloroglucinol. $C_6H_6O_3,2H_2O$. (M_r 162.1). *1064600.* [6099-90-7]. Benzene-1,3,5-triol.

White or yellowish crystals, slightly soluble in water, soluble in alcohol.

mp: about 223 °C (instantaneous method).

Phloroglucinol solution. *1064601.*

To 1 ml of a 100 g/l solution of *phloroglucinol R* in *alcohol R*, add 9 ml of *hydrochloric acid R*.

Storage: protected from light.

Phosalone. $C_{12}H_{15}ClNO_4PS_2$. (M_r 367.8). *1130200.* [2310-17-0].

mp: 45 °C to 48 °C

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Phosphomolybdic acid. $12MoO_3,H_3PO_4,xH_2O$. *1064900.* [51429-74-4].

Orange-yellow, fine crystals, freely soluble in water, soluble in alcohol.

Phosphomolybdic acid solution. *1064901.*

Dissolve 4 g of *phosphomolybdic acid R* in *water R* and dilute to 40 ml with the same solvent. Add cautiously and with cooling 60 ml of *sulphuric acid R*. Prepare immediately before use.

Phosphomolybdotungstic reagent. *1065000.*

Dissolve 100 g of *sodium tungstate R* and 25 g of *sodium molybdate R* in 700 ml of *water R*. Add 100 ml of *hydrochloric acid R* and 50 ml of *phosphoric acid R*. Heat the mixture under a reflux condenser in a glass apparatus for 10 h. Add 150 g of *lithium sulphate R*, 50 ml of *water R* and a few drops of *bromine R*. Boil to remove the excess of bromine (15 min), allow to cool, dilute to 1000 ml with *water R* and filter. The reagent should be yellow in colour. If it acquires a greenish tint, it is unsatisfactory for use but may be regenerated by boiling with a few drops of *bromine R*. Care must be taken to remove the excess of bromine by boiling.

Storage: at 2 °C to 8 °C.

Phosphomolybdotungstic reagent, dilute. *1065001.*

To 1 volume of *phosphomolybdotungstic reagent R* add 2 volumes of *water R*.

Phosphoric acid. *1065100.* [7664-38-2].

See *Concentrated phosphoric acid (0004).*

Phosphoric acid, dilute. *1065101.*

See *Dilute phosphoric acid (0005).*

Phosphoric acid, dilute R1. *1065102.*

Dilute 93 ml of *dilute phosphoric acid R* to 1000 ml with *water R*.

Phosphorous acid. H_3PO_3. (M_r 82.0). *1130600.* [13598-36-2].

White or almost white, very hygroscopic and deliquescent crystalline mass; slowly oxidised by oxygen (air) to H_3PO_4.

Unstable, orthorhombic crystals, soluble in water, in alcohol and in a mixture of 3 volumes of ether and 1 volume of alcohol.

d_4^{21}: 1.651.

mp: about 73 °C.

Phosphotungstic acid solution. *1065200.*

Heat under a reflux condenser for 3 h, 10 g of *sodium tungstate R* with 8 ml of *phosphoric acid R* and 75 ml of *water R*. Allow to cool and dilute to 100 ml with *water R*.

Phthalaldehyde. $C_8H_6O_2$. (M_r 134.1). *1065300.* [643-79-8]. Benzene-1,2-dicarboxaldehyde.

A yellow, crystalline powder.

mp: about 55 °C.

Storage: protected from light and air.

Phthalaldehyde reagent. *1065301.*

Dissolve 2.47 g of *boric acid R* in 75 ml of *water R*, adjust to pH 10.4 using a 450 g/l solution of *potassium hydroxide R* and dilute to 100 ml with *water R*. Dissolve 1.0 g of *phthalaldehyde R* in 5 ml of *methanol R*, add 95 ml of the boric acid solution and 2 ml of *thioglycollic acid R* and adjust to pH 10.4 with a 450 g/l solution of *potassium hydroxide R*.

Storage: protected from light; use within 3 days.

Phthalazine. $C_8H_6N_2$. (M_r 130.1). *1065400.* [253-52-1].

Pale yellow crystals, freely soluble in water, soluble in ethanol, in ethyl acetate and in methanol.

mp: 89 °C to 92 °C.

Phthalein purple. $C_{32}H_{32}N_2O_{12}.xH_2O$. ($M_r$ 637, anhydrous substance). *1065500.* [2411-89-4]. Metalphthalein. 2,2′,2″,2‴-[*o*-Cresolphthalein-3′,3″-bis(methylenenitrilo)]tetra-acetic acid. (1,3-Dihydro-3-oxo-isobenzofuran-1-ylidene)bis[(6-hydroxy-5-methyl-3,1-phenylene)bis(methyleneimino)diacetic acid].

A yellowish-white to brownish powder, practically insoluble in water, soluble in alcohol. The product may be found in commerce in the form of the sodium salt: a yellowish-white to pink powder, soluble in water, practically insoluble in alcohol.

Test for sensitivity. Dissolve 10 mg in 1 ml of *concentrated ammonia R* and dilute to 100 ml with *water R*. To 5 ml of the solution add 95 ml of *water R*, 4 ml of *concentrated ammonia R*, 50 ml of *alcohol R* and 0.1 ml of *0.1 M barium chloride*. The solution is blue-violet. Add 0.15 ml of *0.1 M sodium edetate*. The solution becomes colourless.

Phthalic acid. $C_8H_6O_4$. (M_r 166.1). *1065600.* [88-99-3]. Benzene-1,2-dicarboxylic acid.

A white or almost white, crystalline powder, soluble in hot water and in alcohol.

Phthalic anhydride. $C_8H_4O_3$. (M_r 148.1). *1065700.* [85-44-9]. Isobenzofuran-1,3-dione.

Content: minimum 99.0 per cent of $C_8H_4O_3$.

White or almost white flakes.

mp: 130 °C to 132 °C.

Assay. Dissolve 2.000 g in 100 ml of *water R* and boil under a reflux condenser for 30 min. Cool and titrate with *1 M sodium hydroxide*, using *phenolphthalein solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 74.05 mg of $C_8H_4O_3$.

Phthalic anhydride solution. *1065701.*

Dissolve 42 g of *phthalic anhydride R* in 300 ml of *anhydrous pyridine R*. Allow to stand for 16 h.

Storage: protected from light; use within 1 week.

Picein. $C_{14}H_{18}O_7$. (M_r 298.3). *1130700.* [530-14-3]. 1-[4-(β-D-Glucopyranosyloxy)phenyl]ethanone. *p*-(Acetylphenyl)-β-D-glucopyranoside.

mp: 194 °C to 195 °C.

Picric acid. $C_6H_3N_3O_7$. (M_r 229.1). *1065800.* [88-89-1]. 2,4,6-Trinitrophenol.

Yellow prisms or plates, soluble in water and in alcohol.

Storage: moistened with *water R*.

Picric acid solution. *1065801.*

A 10 g/l solution.

Picric acid solution R1. *1065802.*

Prepare 100 ml of a saturated solution of *picric acid R* and add 0.25 ml of *strong sodium hydroxide solution R*.

α-Pinene. $C_{10}H_{16}$. (M_r 136.2). *1130800.* [7785-70-8]. (1*R*,5*R*)-2,6,6-Trimethylbicyclo[3.1.1]hept-2-ene.

A liquid not miscible with water.

d_{20}^{20}: about 0.859.

n_D^{20}: about 1.466.

bp: 154 °C to 156 °C.

α-Pinene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 99.0 per cent of the total area of the peaks.

β-Pinene. $C_{10}H_{16}$. (M_r 136.2). *1109000.* [18172-67-3]. 6,6-Dimethyl-2-methylenebicyclo[*3.1.1*]heptane.

A colourless, oily liquid, odour reminiscent of turpentine, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: about 0.867.

n_D^{20}: about 1.474.

bp: 164 °C to 166 °C.

β-Pinene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution. The area of the principal peak is not less than 99.0 per cent of the total area of the peaks.

Piperazine hydrate. *1065900.* [142-63-2].

See *Piperazine hydrate (0425)*.

Piperidine. $C_5H_{11}N$. (M_r 85.2). *1066000.* [110-89-4]. Hexahydropyridine.

A colourless to slightly yellow, alkaline liquid, miscible with water, with alcohol and with light petroleum.

bp: about 106 °C.

Piperitone. $C_{10}H_{16}O$. (M_r 152.2). *1151200.* [89-81-6]. 6-Isopropyl-3-methyl-cyclohex-2-en-1-one.

Pirimiphos-ethyl. $C_{13}H_{24}N_3O_3PS$. (M_r 333.4). *1130300.* [23505-41-1].

mp: 15 °C to 18 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Plasma, platelet-poor. *1066100.*

Withdraw 45 ml of human blood into a 50 ml plastic syringe containing 5 ml of a sterile 38 g/l solution of *sodium citrate R*. Without delay, centrifuge at 1500 *g* at 4 °C for 30 min. Remove the upper two-thirds of the supernatant plasma using a plastic syringe and without delay centrifuge at 3500 *g* at 4 °C for 30 min. Remove the upper two-thirds of the liquid and freeze it rapidly in suitable amounts in plastic tubes at or below −40 °C. Use plastic or silicone-treated equipment.

Plasma substrate. *1066200.*

Separate the plasma from human or bovine blood collected into one-ninth its volume of a 38 g/l solution of *sodium citrate R*, or into two-sevenths its volume of a solution containing 20 g/l of *disodium hydrogen citrate R* and

25 g/l of *glucose R*. With the former, prepare the substrate on the day of collection of the blood. With the latter, prepare within two days of collection of the blood.

Storage: at – 20 °C.

Plasma substrate R1. *1066201.*

Use water-repellent equipment (made from materials such as suitable plastics or suitably silicone-treated glass) for taking and handling blood.

Collect a suitable volume of blood from each of at least five sheep; a 285 ml volume of blood collected into 15 ml of anticoagulant solution is suitable but smaller volumes may be collected, taking the blood, either from a live animal or at the time of slaughter, using a needle attached to a suitable cannula which is long enough to reach the bottom of the collecting vessel. Discarding the first few millilitres and collecting only free-flowing blood, collect the blood in a sufficient quantity of an anticoagulant solution containing 8.7 g of *sodium citrate R* and 4 mg of *aprotinin R* per 100 ml of *water R* to give a final ratio of blood to anticoagulant solution of 19 to 1. During and immediately after collection, swirl the flask gently to ensure mixing but do not allow frothing to occur. When collection is complete, close the flask and cool to 10 °C to 15 °C. When cold, pool the contents of all the flasks with the exception of any that show obvious haemolysis or clots and keep the pooled blood at 10 °C to 15 °C.

As soon as possible and within 4 h of collection, centrifuge the pooled blood at 1000 *g* to 2000 *g* at 10 °C to 15 °C for 30 min. Separate the supernatant liquid and centrifuge it at 5000 *g* for 30 min. (Faster centrifugation, for example 20 000 *g* for 30 min, may be used if necessary to clarify the plasma, but filtration procedures should not be used.) Separate the supernatant liquid and, without delay, mix thoroughly and distribute the plasma substrate into small stoppered containers in portions sufficient for a complete heparin assay (for example 10 ml to 30 ml). Without delay, rapidly cool to a temperature below – 70 °C (for example by immersing the containers into liquid nitrogen) and store at a temperature below – 30 °C.

The plasma is suitable for use as plasma substrate in the assay for heparin if, under the conditions of the assay, it gives a clotting time appropriate to the method of detection used and if it provides reproducible, steep log dose-response curves.

When required for use, thaw a portion of the plasma substrate in a water-bath at 37 °C, gently swirling until thawing is complete; once thawed it should be kept at 10 °C to 20 °C and used without delay. The thawed plasma substrate may be lightly centrifuged if necessary; filtration procedures should not be used.

Plasma substrate R2. *1066202.*

Prepare from human blood containing less than 1 per cent of the normal amount of factor IX. Collect the blood into one-ninth its volume of a 38 g/l solution of *sodium citrate R*.

Storage: in small amounts in plastic tubes at a temperature of – 30 °C or lower.

Plasma substrate R3. *1066203.*

Prepare from human blood containing less than 1 per cent of the normal amount of factor XI. Collect the blood into one-ninth its volume of a 38 g/l solution of *sodium citrate R*.

Storage: in small amounts in plastic tubes at a temperature of – 30 °C or lower.

Plasma substrate deficient in factor V. *1066300.*

Use preferably a plasma which is congenitally deficient, or prepare it as follows: separate the plasma from human blood collected into one tenth of its volume of a 13.4 g/l solution of *sodium oxalate R*. Incubate at 37 °C for 24 h to 36 h. The coagulation time determined by the method described for *coagulation factor V solution R* should be 70 s to 100 s. If the coagulation time is less than 70 s, incubate again for 12 h to 24 h.

Storage: in small quantities at a temperature of – 20 °C or lower.

Plasminogen, human. *1109100.* [9001-91-6].

A substance present in blood that may be activated to plasmin, an enzyme that lyses fibrin in blood clots.

Plutonium-242 spiking solution. *1167400.*

Contains 50 Bq/l ^{242}Pu and a 134 g/l solution of *lanthanum chloride heptahydrate R* in a 284 g/l solution of *nitric acid R*.

Poly[(cyanopropyl)methylphenylmethylsiloxane]. *1066500.*

See *poly[(cyanopropyl)(methyl)][(phenyl)(methyl)]siloxane R*.

Poly[(cyanopropyl)(methyl)][(phenyl)(methyl)]siloxane. *1066500.*

Contains 25 per cent of cyanopropyl groups, 25 per cent of phenyl groups and 50 per cent of methyl groups. (Average relative molecular mass 8000).

A very viscous liquid (viscosity about 9000 mPa·s).

d_{25}^{25}: about 1.10.

n_{D}^{25}: about 1.502.

Poly[(cyanopropyl)(phenyl)][dimethyl]siloxane. *1114800.*

Stationary phase for gas chromatography.

Contains 6 per cent of (cyanopropyl)(phenyl) groups and 94 per cent of dimethyl groups.

Poly(cyanopropyl)(phenylmethyl)siloxane. *1066600.*

Stationary phase for gas chromatography.

Contains 90 per cent of cyanopropylgroups and 10 per cent of phenylmethyl groups.

Poly(cyanopropyl)(7)(phenyl)(7)(methyl)(86)siloxane. *1109200.*

Stationary phase for gas chromatography.

Polysiloxane substituted with 7 per cent of cyanopropyl groups, 7 per cent of phenyl groups and 86 per cent of dimethyl groups.

Poly(cyanopropyl)siloxane. *1066700.*

Polysiloxane substituted with 100 per cent of cyanopropyl groups.

Poly(dimethyl)(diphenyl)(divinyl)siloxane. *1100000.*

Stationary phase for gas chromatography.

Contains 94 per cent of methyl groups, 5 per cent of phenyl groups and 1 per cent of vinyl groups. SE54.

Poly(dimethyl)(diphenyl)siloxane. *1066900.*

Stationary phase for gas chromatography.

Contains 95 per cent of methyl groups and 5 per cent of phenyl groups. DB-5, SE52.

Poly(dimethyl)(85)(diphenyl)(15)siloxane. *1154700.*

Stationary phase for chromatography.

Contains 85 per cent of methyl groups and 15 per cent of phenyl groups. PS086.

Poly(dimethyl)siloxane. *1066800.*

Silicone gum rubber (methyl). Organosilicon polymer with the appearance of a semi-liquid, colourless gum.

The intrinsic viscosity, determined as follows is about 115 ml·g^{-1}. Weigh 1.5 g, 1 g and 0.3 g of the substance to be examined to the nearest 0.1 mg, into 100 ml volumetric flasks. Add 40 ml to 50 ml of *toluene R*, shake until the substance is completely dissolved and dilute to 100.0 ml with the same solvent. Determine the viscosity (*2.2.9*) of each solution. Determine the viscosity of *toluene R* under the same conditions. Reduce the concentration of each solution by half by diluting with *toluene R*. Determine the viscosity of these solutions.

c = concentration in grams per 100 ml,

t_1 = flow time of the solution to be examined,

t_2 = flow time of toluene,

η_1 = viscosity of the solution to be examined in millipascal seconds,

η_2 = viscosity of toluene in millipascal seconds,

d_1 = relative density of the solution to be examined,

d_2 = relative density of toluene.

To obtain the relative densities use the following data.

Concentration (g/100 ml)	Relative density (d_1)
0 - 0.5	1.000
0.5 - 1.25	1.001
1.25 - 2.20	1.002
2.20 - 2.75	1.003
2.75 - 3.20	1.004
3.20 - 3.75	1.005
3.75 - 4.50	1.006

The specific viscosity is obtained from the equation:

$$\eta_{sp} = \frac{\eta_1 - \eta_2}{\eta_2} = \frac{t_1 d_1}{t_2 d_2} - 1$$

and the reduced viscosity from:

$$\eta_{red} = \frac{\eta_{sp}}{c}$$

The intrinsic viscosity (η) is obtained by extrapolating the preceding equation to $c = 0$. This is done by plotting the curve η_{sp}/c or $\log \eta_{sp}/c$ as a function of c. Extrapolation to $c = 0$ gives η. The intrinsic viscosity is expressed in millilitres per gram; the value obtained must therefore be multiplied by 100.

The infrared absorption spectrum (*2.2.24*) obtained by applying the substance, if necessary dispersed in a few drops of *carbon tetrachloride R*, to a sodium chloride plate, does not show absorption at 3053 cm^{-1}, corresponding to vinyl groups.

Loss on drying (*2.2.32*): maximum 2.0 per cent, determined on 1.000 g by drying *in vacuo* at 350 °C for 15 min; maximum 0.8 per cent, determined on 2.000 g by drying at 200 °C for 2 h.

Polyether hydroxylated gel for chromatography. *1067000.*

Gel with a small particle size having a hydrophilic surface with hydroxyl groups. It has an exclusion limit for dextran of relative molecular mass 2×10^5 to 2.5×10^6.

Polyethyleneglycol adipate. $(C_8H_{12}O_4)_n$. (M_r $(172.2)_n$). *1067700.*

A white or almost white, wax-like mass, practically insoluble in water.

mp: about 43 °C.

Polyethyleneglycol, base-deactivated. *1170300.*

Stationary phase for gas chromatography.

Cross-linked, base-deactivated polyethyleneglycol specially designed for amine analysis.

Polyethyleneglycol succinate. $(C_6H_8O_4)_n$. (M_r $(144.1)_n$). *1067800.*

A white or almost white, crystalline powder, practically insoluble in water.

mp: about 102 °C.

Polymethacrylate gel, hydroxylated. *1151300.*

Stationary phase for size-exclusion chromatography.

Gel based on hydroxylated methacrylic acid polymer.

Polymethylphenylsiloxane. *1067900.*

Stationary phase for gas chromatography.

Contains 50 per cent of methyl groups and 50 per cent of phenyl groups. (Average relative molecular mass 4000).

A very viscous liquid (viscosity about 1300 mPa·s).

d_{25}^{25}: about 1.09.

n_D^{25}: about 1.540.

Poly[methyl(95)phenyl(5)]siloxane. *1068000.*

See *Poly(dimethyl)(diphenyl)siloxane R*.

Poly[methyl(94)phenyl(5)vinyl(1)]siloxane. *1068100.*

See *Poly(dimethyl)(diphenyl)(divinyl)siloxane R*.

Polyoxyethylated castor oil. *1068200.*

A light yellow liquid. It becomes clear above 26 °C.

Polysorbate 20. *1068300.* [9005-64-5].

See *Polysorbate 20 (0426)*.

Polysorbate 80. *1068400.* [9005-65-6].

See *Polysorbate 80 (0428)*.

Polystyrene 900-1000. *1112200.* [9003-53-6].

Organic standard used for calibration in gas chromatography.

M_w: about 950.

M_w/M_n: 1.10.

Potassium bicarbonate. *1069900.* [298-14-6].

See *potassium hydrogen carbonate R*.

Potassium bicarbonate solution, saturated methanolic. *1069901.*

See *potassium hydrogen carbonate solution, saturated methanolic R*.

Potassium bromate. $KBrO_3$. (M_r 167.0). *1068700.* [7758-01-2].

White or almost white granular powder or crystals, soluble in water, slightly soluble in alcohol.

Potassium bromide. *1068800.* [7758-02-3]. See *Potassium bromide (0184).*

Potassium bromide used for infrared absorption spectrophotometry (2.2.24) also complies with the following requirement.

A disc 2 mm thick prepared from the substance previously dried at 250 °C for 1 h, has a substantially flat baseline over the range 4000 cm^{-1} to 620 cm^{-1}. It exhibits no maxima with absorbance greater than 0.02 above the baseline, except maxima for water at 3440 cm^{-1} and 1630 cm^{-1}.

Potassium carbonate. K_2CO_3. (M_r 138.2). *1068900.* [584-08-7]. Dipotassium carbonate.

A white or almost white, granular powder, hygroscopic, very soluble in water, practically insoluble in ethanol.

Storage: in an airtight container.

Potassium chlorate. $KClO_3$. (M_r 122.6). *1069000.* [3811-04-9].

A white or almost white powder, granules or crystals, soluble in water.

Potassium chloride. *1069100.* [7447-40-7]. See *Potassium chloride (0185).*

Potassium chloride used for infrared absorption spectrophotometry (2.2.24) also complies with the following requirement.

A disc 2 mm thick, prepared from the substance previously dried at 250 °C for 1 h, has a substantially flat baseline over the range 4000 cm^{-1} to 620 cm^{-1}. It exhibits no maxima with absorbance greater than 0.02 above the baseline, except maxima for water at 3440 cm^{-1} and 1630 cm^{-1}.

Potassium chloride, 0.1 M. *1069101.*

A solution of *potassium chloride R* containing the equivalent of 7.46 g of KCl in 1000.0 ml.

Potassium chromate. K_2CrO_4. (M_r 194.2). *1069200.* [7789-00-6]. Dipotassium chromate.

Yellow crystals, freely soluble in water.

Potassium chromate solution. *1069201.*

A 50 g/l solution.

Potassium citrate. *1069300.* [6100-05-6].

See *Potassium citrate (0400).*

Potassium cyanide. KCN. (M_r 65.1). *1069400.* [151-50-8].

A white or almost white, crystalline powder or white or almost white mass or granules, freely soluble in water, slightly soluble in alcohol.

Potassium cyanide solution. *1069401.*

A 100 g/l solution.

Potassium cyanide solution, lead-free. *1069402.*

Dissolve 10 g of *potassium cyanide R* in 90 ml of *water R*, add 2 ml of *strong hydrogen peroxide solution R* diluted 1 to 5. Allow to stand for 24 h, dilute to 100 ml with *water R* and filter.

The solution complies with the following test: take 10 ml of the solution, add 10 ml of *water R* and 10 ml of *hydrogen sulphide solution R*. No colour is evolved even after addition of 5 ml of *dilute hydrochloric acid R*.

Potassium dichromate. $K_2Cr_2O_7$. (M_r 294.2). *1069500.* [7778-50-9]. Dipotassium dichromate.

Potassium dichromate used for the calibration of spectrophotometers (*2.2.25*) contains not less than 99.9 per cent of $K_2Cr_2O_7$, calculated with reference to the substance dried at 130 °C.

Orange-red crystals, soluble in water, practically insoluble in alcohol.

Assay. Dissolve 1.000 g in *water R* and dilute to 250.0 ml with the same solvent. To 50.0 ml of this solution add a freshly prepared solution of 4 g of *potassium iodide R*, 2 g of *sodium hydrogen carbonate R* and 6 ml of *hydrochloric acid R* in 100 ml of *water R* in a 500 ml flask. Stopper the flask and allow to stand protected from light for 5 min. Titrate with *0.1 M sodium thiosulphate*, using 1 ml of *iodide-free starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 4.903 mg of $K_2Cr_2O_7$.

Potassium dichromate solution. *1069501.*

A 106 g/l solution.

Potassium dichromate solution R1. *1069502.*

A 5 g/l solution.

Potassium dihydrogen phosphate. *1069600.* [7778-77-0].

See *Potassium dihydrogen phosphate (0920).*

Potassium dihydrogen phosphate, 0.2 M. *1069601.*

A solution of *potassium dihydrogen phosphate R* containing the equivalent of 27.22 g of KH_2PO_4 in 1000.0 ml.

Potassium ferricyanide. $K_3[Fe(CN)_6]$. (M_r 329.3). *1069700.* [13746-66-2]. Potassium hexacyanoferrate(III).

Red crystals, freely soluble in water.

Potassium ferricyanide solution. *1069701.*

Wash 5 g of *potassium ferricyanide R* with a little *water R*, dissolve and dilute to 100 ml with *water R*. Prepare immediately before use.

Potassium ferrocyanide. $K_4[Fe(CN)_6],3H_2O$. (M_r 422.4). *1069800.* [14459-95-1]. Potassium hexacyanoferrate(II).

Transparent yellow crystals, freely soluble in water, practically insoluble in alcohol.

Potassium ferrocyanide solution. *1069801.*

A 53 g/l solution.

Potassium fluoride. KF. (M_r 58.1). *1137800.* [7789-23-3].

Colourless crystals or white or almost white crystalline powder, deliquescent, soluble in water, practically insoluble in alcohol.

Potassium hydrogen carbonate. $KHCO_3$. (M_r 100.1). *1069900.* [298-14-6]. Potassium bicarbonate.

Transparent, colourless crystals, freely soluble in water, practically insoluble in alcohol.

Potassium hydrogen carbonate solution, saturated methanolic. *1069901.*

Dissolve 0.1 g of *potassium hydrogen carbonate R* in 0.4 ml of *water R*, heating on water-bath. Add 25 ml of *methanol R* and swirl, keeping the solution on the water-bath until dissolution is complete. Use a freshly prepared solution.

Potassium hydrogen phthalate. $C_8H_5KO_4$. (M_r 204.2). *1070000.* [877-24-7]. Potassium hydrogen benzene-1,2-dicarboxylate.

White or almost white crystals, soluble in water, slightly soluble in alcohol.

Potassium hydrogen phthalate, 0.2 M. *1070001.*

A solution of *potassium hydrogen phthalate R* containing the equivalent of 40.84 g of $C_8H_5KO_4$ in 1000.0 ml.

Potassium hydrogen sulphate. $KHSO_4$. (M_r 136.2). *1070100.* [7646-93-7].

Colourless, transparent, hygroscopic crystals, freely soluble in water giving a strongly acid solution.

Storage: in an airtight container.

Potassium hydrogen tartrate. $C_4H_5KO_6$. (M_r 188.2). *1070200.* [868-14-4]. Potassium hydrogen (2*R*,3*R*)-2,3-dihydroxybutane-1,4-dioate.

A white or almost white, crystalline powder or colourless, slightly opaque crystals, slightly soluble in water, soluble in boiling water, practically insoluble in alcohol.

Potassium hydroxide. *1070300.* [1310-58-3].

See *Potassium hydroxide (0840).*

Potassium hydroxide, alcoholic, 2 M. *1070301.*

Dissolve 12 g of *potassium hydroxide R* in 10 ml of *water R* and dilute to 100 ml with *alcohol R*.

Potassium hydroxide in alcohol (10 per cent *V/V*), 0.5 M. *1070302.*

Dissolve 28 g of *potassium hydroxide R* in 100 ml of *alcohol R* and dilute to 1000 ml with *water R*.

Potassium hydroxide solution, alcoholic. *1070303.*

Dissolve 3 g of *potassium hydroxide R* in 5 ml of *water R* and dilute to 100 ml with *aldehyde-free alcohol R*. Decant the clear solution. The solution should be almost colourless.

Potassium hydroxide solution, alcoholic R1. *1070304.*

Dissolve 6.6 g of *potassium hydroxide R* in 50 ml of *water R* and dilute to 1000 ml with *ethanol R*.

Potassium iodate. KIO_3. (M_r 214.0). *1070400.* [7758-05-6].

A white or almost white, crystalline powder, soluble in water.

Potassium iodide. *1070500.* [7681-11-0].

See *Potassium iodide (0186).*

Potassium iodide and starch solution. *1070501.*

Dissolve 0.75 g of *potassium iodide R* in 100 ml of *water R*. Heat to boiling and add whilst stirring a solution of 0.5 g of *soluble starch R* in 35 ml of *water R*. Boil for 2 min and allow to cool.

Test for sensitivity. A mixture of 15 ml of the potassium iodide and starch solution, 0.05 ml of *glacial acetic acid R* and 0.3 ml of *iodine solution R2* is blue.

Potassium iodide solution. *1070502.*

A 166 g/l solution.

Potassium iodide solution, iodinated. *1070503.*

Dissolve 2 g of *iodine R* and 4 g of *potassium iodide R* in 10 ml of *water R*. When solution is complete dilute to 100 ml with *water R*.

Potassium iodide solution, iodinated R1. *1070505.*

Dissolve 500 mg of *iodine R* and 1.5 g of *potassium iodide R* in *water R* and dilute to 25 ml with the same solvent.

Potassium iodide solution, saturated. *1070504.*

A saturated solution of *potassium iodide R* in *carbon dioxide-free water R*. Make sure the solution remains saturated as indicated by the presence of undissolved crystals.

Test by adding to 0.5 ml of the saturated potassium iodide solution 30 ml of a mixture of 2 volumes of *chloroform R* and 3 volumes of *glacial acetic acid R*, as well as 0.1 ml of *starch solution R* . Any blue colour formed should be discharged by the addition of 0.05 ml of *0.1 M sodium thiosulphate*.

Storage: protected from light.

Potassium iodobismuthate solution. *1070600.*

To 0.85 g of *bismuth subnitrate R* add 40 ml of *water R*, 10 ml of *glacial acetic acid R* and 20 ml of a 400 g/l solution of *potassium iodide R*.

Potassium iodobismuthate solution R1. *1070601.*

Dissolve 100 g of *tartaric acid R* in 400 ml of *water R* and add 8.5 g of *bismuth subnitrate R*. Shake for 1 h, add 200 ml of a 400 g/l solution of *potassium iodide R* and shake well. Allow to stand for 24 h and filter.

Storage: protected from light.

Potassium iodobismuthate solution R2. *1070602.*

Stock solution. Suspend 1.7 g of *bismuth subnitrate R* and 20 g of *tartaric acid R* in 40 ml of *water R*. To the suspension add 40 ml of a 400 g/l solution of *potassium iodide R* and stir for 1 h. Filter. The solution may be kept for several days in brown bottles.

Spray solution. Mix immediately before use 5 ml of the stock solution with 15 ml of *water R*.

Potassium iodobismuthate solution R3. *1070604.*

Dissolve 0.17 g of *bismuth subnitrate R* in a mixture of 2 ml of *glacial acetic acid R* and 18 ml of *water R*. Add 4 g of *potassium iodide R*, 1 g of *iodine R* and dilute to 100 ml with *dilute sulphuric acid R*.

Potassium iodobismuthate solution R4. *1070605.*

Dissolve 1.7 g of *bismuth subnitrate R* in 20 ml of *glacial acetic acid R*. Add 80 ml of *distilled water R*, 100 ml of a 400 g/l solution of *potassium iodide R*, 200 ml of *glacial acetic acid R* and dilute to 1000 ml with *distilled water R*. Mix 2 volumes of this solution with 1 volume of a 200 g/l solution of *barium chloride R*.

Potassium iodobismuthate solution R5. *1070606.*

To 0.85 g of *bismuth subnitrate R* add 10 ml of *glacial acetic acid R* and gently heat until completely dissolved. Add 40 ml of *water R* and allow to cool. To 5 ml of this solution, add 5 ml of a 400 g/l solution of *potassium iodide R*, 20 ml of *glacial acetic acid R* and 70 ml of *water R*.

Potassium iodobismuthate solution, dilute. *1070603.*

Dissolve 100 g of *tartaric acid R* in 500 ml of *water R* and add 50 ml of *potassium iodobismuthate solution R1*.

Storage: protected from light.

Potassium nitrate. KNO_3. (M_r 101.1). *1070700.* [7757-79-1].

Colourless crystals, very soluble in water.

Potassium periodate. KIO_4. (M_r 230.0). *1070800.* [7790-21-8].

A white or almost white, crystalline powder or colourless crystals, soluble in water.

Potassium ferriperiodate solution. *1070801.*

Dissolve 1 g of *potassium periodate R* in 5 ml of a freshly prepared 120 g/l solution of *potassium hydroxide R*. Add 20 ml of *water R* and 1.5 ml of *ferric chloride solution R1*. Dilute to 50 ml with a freshly prepared 120 g/l solution of *potassium hydroxide R*.

Potassium permanganate. *1070900.* [7722-64-7].

See *Potassium permanganate (0121)*.

Potassium permanganate and phosphoric acid solution. *1070901.*

Dissolve 3 g of *potassium permanganate R* in a mixture of 15 ml of *phosphoric acid R* and 70 ml of *water R*. Dilute to 100 ml with *water R*.

Potassium permanganate solution. *1070902.*

A 30 g/l solution.

Potassium perrhenate. $KReO_4$. (M_r 289.3). *1071000.* [10466-65-6].

A white or almost white, crystalline powder, soluble in water, slightly soluble in alcohol, in methanol and in propylene glycol.

Potassium persulphate. $K_2S_2O_8$. (M_r 270.3). *1071100.* [7727-21-1]. Dipotassium peroxodisulphate.

Colourless crystals or a white or almost white, crystalline powder, sparingly soluble in water, practically insoluble in alcohol. Aqueous solutions decompose at room temperature and more rapidly on warming.

Potassium plumbite solution. *1071200.*

Dissolve 1.7 g of *lead acetate R*, 3.4 g of *potassium citrate R* and 50 g of *potassium hydroxide R* in *water R* and dilute to 100 ml with the same solvent.

Potassium pyroantimonate. $KSb(OH)_6$. (M_r 262.9). *1071300.* [12208-13-8]. Potassium hexahydroxoantimoniate.

White or almost white, crystals or crystalline powder, sparingly soluble in water.

Potassium pyroantimonate solution. *1071301.*

Dissolve 2 g of *potassium pyroantimonate R* in 95 ml of hot *water R*. Cool quickly and add a solution containing 2.5 g of *potassium hydroxide R* in 50 ml of *water R* and 1 ml of *dilute sodium hydroxide solution R*. Allow to stand for 24 h, filter and dilute to 150 ml with *water R*.

Potassium tartrate. $C_4H_4K_2O_6,{}^1/_2H_2O$. (M_r 235.3). *1071400.* [921-53-9]. Dipotassium (2*R*,3*R*)-2,3-dihydroxybutane-1,4-dioate hemihydrate.

White or almost white, granular powder or crystals, very soluble in water, very slightly soluble in alcohol.

Potassium tetraiodomercurate solution. *1071500.*

Dissolve 1.35 g of *mercuric chloride R* in 50 ml of *water R*. Add 5 g of *potassium iodide R* and dilute to 100 ml with *water R*.

Potassium tetraiodomercurate solution, alkaline. *1071600.*

Dissolve 11 g of *potassium iodide R* and 15 g of *mercuric iodide R* in *water R* and dilute to 100 ml with the same solvent. Immediately before use, mix 1 volume of this solution with an equal volume of a 250 g/l solution of *sodium hydroxide R*.

Potassium tetroxalate. $C_4H_3KO_8,2H_2O$. (M_r 254.2). *1071700.* [6100-20-5].

A white or almost white, crystalline powder, sparingly soluble in water, soluble in boiling water, slightly soluble in alcohol.

Potassium thiocyanate. KSCN. (M_r 97.2). *1071800.* [333-20-0].

Colourless crystals, deliquescent, very soluble in water and in alcohol.

Storage: in an airtight container.

Potassium thiocyanate solution. *1071801.*

A 97 g/l solution.

Povidone. *1068500.* [9003-39-8].

See *Povidone (0685)*.

Procaine hydrochloride. *1109400.*

See *Procaine hydrochloride (0050)*.

Proline. $C_5H_9NO_2$. (M_r 115.1). *1152200.* [147-85-3]. L-Proline. (*S*)-Pyrrolidine-2-carboxylic acid.

White or almost white, finely crystallised powder, freely soluble in water and in mineral acids, soluble in alcohol.

Content: minimum 99.0 per cent of $C_5H_9NO_2$.

$[\alpha]_D^{22}$: −51 to −53, determined on a 50 g/l solution in *1 M hydrochloric acid*.

Propanol. C_3H_8O. (M_r 60.1). *1072000.* [71-23-8]. 1-Propanol.

A clear colourless liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.802 to 0.806.

bp: about 97.2 °C.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 96 °C and 99 °C.

2-Propanol. C_3H_8O. (M_r 60.1). *1072100.* [67-63-0]. Isopropyl alcohol.

A clear, colourless, flammable liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.785.

bp: 81 °C to 83 °C.

2-Propanol R1. *1072101.*

Complies with the requirements prescribed for *2-propanol R* and with the following requirements:

n_D^{20}: about 1.378.

Water (*2.5.12*): maximum 0.05 per cent, determined on 10 g.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 25 per cent at 210 nm, 55 per cent at 220 nm, 75 per cent at 230 nm, 95 per cent at 250 nm, 98 per cent at 260 nm.

Propetamphos. $C_{10}H_{20}NO_4PS$. (M_r 281.3). *1130900.* [31218-83-4].

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

Propidium iodide. $C_{27}H_{34}I_2N_4$. (M_r 668.4). *1154200.* [25535-16-4]. 3,8-Diamino-5-[3(diethylmethylammonio)propyl]-6-phenylphenanthridinium diiodide.

Dark red solid.

Propionaldehyde. C_3H_6O. (M_r 58.1). *1072300.* [123-38-6]. Propanal.

A liquid freely soluble in water, miscible with alcohol.

d_{20}^{20}: about 0.81.

n_D^{20}: about 1.365.

bp: about 49 °C.

mp: about – 81 °C.

Propionic acid. $C_3H_6O_2$. (M_r 74.1). *1072400.* [79-09-4].

An oily liquid, soluble in alcohol, miscible with water.

d_{20}^{20}: about 0.993.

n_D^{20}: about 1.387.

bp: about 141 °C.

mp: about – 21 °C.

Propionic anhydride. $C_6H_{10}O_3$. (M_r 130.1). *1072500.* [123-62-6].

A clear, colourless liquid, soluble in alcohol.

d_{20}^{20}: about 1.01.

bp: about 167 °C.

Propionic anhydride reagent. *1072501.*

Dissolve 1 g of *toluenesulphonic acid R* in 30 ml of *glacial acetic acid R*, add 5 ml of *propionic anhydride R* and allow to stand for at least 15 min before use.

Storage: use within 24 h.

Propyl acetate. $C_5H_{10}O_2$. (M_r 102.1). *1072600.* [109-60-4].

d_{20}^{20}: about 0.888.

bp: about 102 °C.

mp: about – 95 °C.

Propyl parahydroxybenzoate. *1072700.* [94-13-3].

See *Propyl parahydroxybenzoate (0431).*

D-Prolyl-L-phenylalanyl-L-arginine 4-nitroanilide dihydrochloride. $C_{26}H_{36}Cl_2N_8O_5$. (M_r 612). *1072800.*

Propylene glycol. *1072900.* [57-55-6].

See *Propylene glycol (0430).*

Propylene oxide. C_3H_6O. (M_r 58.1). *1121800.* [75-56-9].

Colourless liquid, miscible with alcohol.

Protamine sulphate. *1073000.* [53597-25-4 (salmine) 9007-31-2 (clupeine)].

See *Protamine sulphate (0569).*

Protopine hydrochloride. $C_{20}H_{20}ClNO_5$. (M_r 389.8). *1163500.* [6164-47-2].

5-Methyl-4,6,7,14-tetrahydrobis[1,3]benzodioxolo[4,5-*c*:5′,6′-*g*]azecin-13(5*H*)-one hydrochloride.

Pteroic acid. $C_{14}H_{12}N_6O_3$. (M_r 312.3). *1144600.* [119-24-4]. 4-[[(2-Amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoic acid.

Crystals, soluble in solutions of alkali hydroxides.

Pulegone. $C_{10}H_{16}O$. (M_r 152.2). *1073100.* [89-82-7]. (*R*)-2-Isopropylidene-5-methylcyclohexanone. (+)-*p*-Menth-4-en-3-one.

An oily, colourless liquid, practically insoluble in water, miscible with alcohol.

d_{15}^{20}: about 0.936.

n_D^{20}: 1.485 to 1.489.

bp: 222 °C to 224 °C.

Pulegone used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Peppermint oil (0405)* using the substance to be examined as the test solution.

The area of the principal peak is not less than 98.0 per cent of the total area of the peaks.

Putrescine. $C_4H_{12}N_2$. (M_r 88.15). *1137900.* [110–60–1]. 1,4-Butanediamine. Tetramethylenediamine.

A colourless oily liquid, very soluble in water. Strong piperidine-like odour.

bp: about 159 °C.

mp: about 23 °C.

Pyridine. C_5H_5N. (M_r 79.1). *1073200.* [110-86-1].

A clear, colourless liquid, hygroscopic, miscible with water and with alcohol.

bp: about 115 °C.

Storage: in an airtight container.

Pyridine, anhydrous. *1073300.* [110-86-1].

Dry *pyridine R* over *anhydrous sodium carbonate R*. Filter and distil.

Water (*2.5.12*): maximum 0.01 per cent *m/m*.

Pyridinium hydrobromide perbromide. $C_5H_6Br_3N$. (M_r 319.8). *1166100.* [39416-48-3]. Pyridinium tribromide(1-).

Red crystals.

Pyrid-2-ylamine. $C_5H_6N_2$. (M_r 94.1). *1073400.* [504-29-0]. 2-Aminopyridine.

Large crystals soluble in water and in alcohol.

bp: about 210 °C.

mp: about 58 °C.

Pyridylazonaphthol. $C_{15}H_{11}N_3O$. (M_r 249.3). *1073500.* [85-85-8]. 1-(2-Pyridylazo)-2-naphthol.

A brick-red powder, practically insoluble in water, soluble in alcohol, in methanol and in hot dilute alkali solutions.

mp: about 138 °C.

Pyridylazonaphthol solution. *1073501.*

A 1 g/l solution in *ethanol R*.

Test for sensitivity. To 50 ml of *water R* add 10 ml of *acetate buffer solution pH 4.4 R*, 0.10 ml of *0.02 M sodium edetate* and 0.25 ml of the pyridylazonaphthol solution. After addition of 0.15 ml of a 5 g/l solution of *copper sulphate R*, the colour changes from light yellow to violet.

4-(2-Pyridylazo)resorcinol monosodium salt. $C_{11}H_8N_3NaO_2$, H_2O. (M_r 255.2). *1131500.* [16593-81-0].

Orange crystalline powder.

Pyrocatechol. $C_6H_6O_2$. (M_r 110.1). *1073600.* [120-80-9]. Benzene-1,2-diol.

Colourless or slightly yellow crystals, soluble in water, in acetone and in alcohol.

mp: about 102 °C.

Storage: protected from light.

Pyrogallol. $C_6H_6O_3$. (M_r 126.1). *1073700.* [87-66-1]. Benzene-1,2,3-triol.

White or almost white crystals, becoming brownish on exposure to air and light, very soluble in water and in alcohol, slightly soluble in carbon disulphide. On exposure to air, aqueous solutions, and more rapidly alkaline solutions, become brown owing to the absorption of oxygen.

mp: about 131 °C.

Storage: protected from light.

Pyrogallol solution, alkaline. *1073701.*

Dissolve 0.5 g of *pyrogallol R* in 2 ml of *carbon dioxide-free water R*. Dissolve 12 g of *potassium hydroxide R* in 8 ml of *carbon dioxide-free water R*. Mix the two solutions immediately before use.

Pyrrolidine. C_4H_9N. (M_r 71.1). *1165000.* [123-75-1].

Content: minimum 99 per cent of C_4H_9N.

bp: 87 °C to 88 °C.

2-Pyrrolidone. C_4H_7NO. (M_r 85.1). *1138000.* [616-45-5]. Pyrrolidin-2-one.

Liquid above 25 °C, miscible with water, with ethanol and with ethyl acetate.

d_4^{25}: 1.116.

Pyruvic acid. $C_3H_4O_3$. (M_r 88.1). *1109300.* [127-17-3]. 2-Oxopropanoic acid.

A yellowish liquid, miscible with water and with ethanol.

d_{20}^{20}: about 1.267.

n_D^{20}: about 1.413.

bp: about 165 °C.

Quercetin dihydrate. $C_{15}H_{10}O_7,2H_2O$. (M_r 338.2). *1138100.* 2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-4*H*-1-benzopyran-4-one.

Yellow crystals or yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Water (*2.5.12*): maximum 12.0 per cent, determined on 0.100 g.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Ginkgo leaf (1828)*.

The content is not less than 90 per cent (anhydrous substance) calculated by the normalisation procedure.

Storage: protected from light.

Quercitrin. $C_{21}H_{20}O_{11}$. (M_r 448.4). *1138200.* [522-12-3]. Quercetin 3-L-rhamnopyranoside. 3-[(6-Deoxy-α-L-mannopyranosyl)oxy]-2-(3,4-dihydroxyphenyl)-5,7-dihydroxy-4*H*-1-benzopyran-4-one. Quercitroside.

Yellow crystals, practically insoluble in cold water, soluble in alcohol.

mp: 176 °C to 179 °C.

Chromatography. Examine as prescribed in the monograph on *Goldenrod (1892)* applying 20 µl of the solution. After spraying, the chromatogram shows a yellowish-brown fluorescent zone with an R_F of about 0.6.

Storage: at a temperature of 2 °C to 8 °C.

Quinaldine red. $C_{21}H_{23}IN_2$. (M_r 430.3). *1073800.* [117-92-0]. 2-[2-[4-(Dimethylamino)phenyl]ethenyl]-1-ethylquinolinium iodide.

Dark bluish-black powder, sparingly soluble in water, freely soluble in alcohol.

Quinaldine red solution. *1073801.*

Dissolve 0.1 g of *quinaldine red R* in *methanol R* and dilute to 100 ml with the same solvent.

Colour change: pH 1.4 (colourless) to pH 3.2 (red).

Quinhydrone. $C_{12}H_{10}O_4$. (M_r 218.2). *1073900.* [106-34-3]. Equimolecular compound of 1,4-benzoquinone and hydroquinone.

Dark green, lustrous crystals or a crystalline powder, slightly soluble in water, sparingly soluble in hot water, soluble in alcohol and in concentrated ammonia.

mp: about 170 °C.

Quinidine. $C_{20}H_{24}N_2O_2$. (M_r 324.4). *1074000.* [56-54-2]. (*S*)-(6-Methoxyquinol-4-yl)[(2*R*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol.

White or almost white crystals, very slightly soluble in water, sparingly soluble in alcohol, slightly soluble in methanol.

$[\alpha]_D^{20}$: about + 260, determined on a 10 g/l solution in *ethanol R*.

mp: about 172 °C.

Storage: protected from light.

Quinidine sulphate. *1109500.* [6591-63-5].

See *Quinidine sulphate (0017)*.

Quinine. $C_{20}H_{24}N_2O_2$. (M_r 324.4). *1074100.* [130-95-0]. (*R*)-(6-Methoxyquinol-4-yl)[(2*S*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol.

A white or almost white, microcrystalline powder, very slightly soluble in water, slightly soluble in boiling water, very soluble in ethanol.

$[\alpha]_D^{20}$: about – 167, determined on a 10 g/l solution in *ethanol R*.

mp: about 175 °C.

Storage: protected from light.

Quinine hydrochloride. *1074200.* [6119-47-7].

See *Quinine hydrochloride (0018)*.

Quinine sulphate. *1074300.* [6119-70-6].

See *Quinine sulphate (0019)*.

Rabbit erythrocyte suspension. *1074500.*

Prepare a 1.6 per cent *V/V* suspension of rabbit erythrocytes as follows: defibrinate 15 ml of freshly drawn rabbit blood by shaking with glass beads, centrifuge at 2000 *g* for 10 min and wash the erythrocytes with three quantities, each of 30 ml, of a 9 g/l solution of *sodium chloride R*. Dilute 1.6 ml of the suspension of erythrocytes to 100 ml with a mixture of 1 volume of *phosphate buffer solution pH 7.2 R* and 9 volumes of a 9 g/l solution of *sodium chloride R*.

Raclopride tartrate. $C_{19}H_{26}Cl_2N_2O_9$. (M_r 497.3). *1144700.* [98185-20-7]. Raclopride L-tartrate.

A white or almost white solid, sensitive to light, soluble in water.

$[\alpha]_D^{25}$: + 0.3, determined on a 3 g/l solution.

mp: about 141 °C.

Rapeseed oil. *1074600.*

See *Rapeseed oil, refined (1369)*.

Reducing mixture. *1074700.*

Grind the substances added in the following order to obtain a homogeneous mixture: 20 mg of *potassium bromide R*, 0.5 g of *hydrazine sulphate R* and 5 g of *sodium chloride R*.

Resin for reversed-phase ion chromatography. *1131100.*

A neutral, macroporous, high specific surface area with a non-polar character resin consisting of polymer lattice of polystyrene cross-linked with divinylbenzene.

Resin, weak cationic. *1096000.*

See *weak cationic resin R*.

Resorcinol. *1074800.* [108-46-3].

See *Resorcinol (0290)*.

Resorcinol reagent. *1074801.*

To 80 ml of *hydrochloric acid R1* add 10 ml of a 20 g/l solution of *resorcinol R* and 0.25 ml of a 25 g/l solution of *copper sulphate R* and dilute to 100.0 ml with *water R*. Prepare the solution at least 4 h before use.

Storage: at 2 °C to 8 °C for 1 week.

Rhamnose. $C_6H_{12}O_5,H_2O$. (M_r 182.2). *1074900.* [6155-35-7]. L-(+)-Rhamnose. 6-Deoxy-L-mannose.

A white or almost white, crystalline powder, freely soluble in water.

$[\alpha]_D^{20}$: + 7.8 to + 8.3, determined on a 50 g/l solution in *water R* containing about 0.05 per cent of NH_3.

Rhaponticin. $C_{21}H_{24}O_9$. (M_r 420.4). *1075000.* [155-58-8]. 3-Hydroxy-5-[2-(3-hydroxy-4-methoxyphenyl)ethenyl]phenyl β-D-glucopyranoside.

A yellowish-grey, crystalline powder, soluble in alcohol and in methanol.

Chromatography. Examine as prescribed in the monograph on *Rhubarb (0291)*; the chromatogram shows only one principal spot.

Rhodamine 6 G. $C_{28}H_{31}ClN_2O_3$. (M_r 479.0). *1153300.* [989-38-8].

Colour Index No. 45160.

9-[2-(Ethoxycarbonyl)phenyl]-3,6-bis(ethylamino)-2,7-dimethylxanthenylium chloride.

Brownish-red powder.

Rhodamine B. $C_{28}H_{31}ClN_2O_3$. (M_r 479.0). *1075100.* [81-88-9].

Schultz No. 864.

Colour Index No. 45170.

[9-(2-Carboxyphen-yl)-6-(diethylamino)-3*H*-xanthen-3-ylidene]diethylammonium chloride.

Green crystals or reddish-violet powder, very soluble in water and in alcohol.

Ribose. $C_5H_{10}O_5$. (M_r 150.1). *1109600.* [50-69-1]. D-Ribose.

Soluble in water, slightly soluble in alcohol.

mp: 88 °C to 92 °C.

Ricinoleic acid. $C_{18}H_{34}O_3$. (M_r 298.5). *1100100.* [141-22-0]. 12-Hydroxyoleic acid.

A yellow or yellowish-brown viscous liquid, consisting of a mixture of fatty acids obtained by the hydrolysis of castor oil, practically insoluble in water, very soluble in ethanol.

d_{20}^{20}: about 0.942.

n_D^{20}: about 1.472.

mp: about 285 °C, with decomposition.

Rosmarinic acid. $C_{18}H_{16}O_8$. (M_r 360.3). *1138300.* [20283-92-5].

mp: 170 °C to 174 °C.

Ruthenium red. $[(NH_3)_5RuORu(NH_3)_4ORu(NH_3)_5]Cl_6,4H_2O$. ($M_r$ 858). *1075200.* [11103-72-3].

A brownish-red powder, soluble in water.

Ruthenium red solution. *1075201.*

A 0.8 g/l solution in *lead acetate solution R*.

Rutin. $C_{27}H_{30}O_{16},3H_2O$. (M_r 665). *1075300.* [153-18-4]. Rutoside. 3-(*O*-6-Deoxy-α-L-mannopyranosyl-(1→6)-β-D-glucopyranosyloxy)-2-(3,4-dihydroxyphenyl)-5,7-dihydroxy-4*H*-chromen-4-one.

A yellow, crystalline powder, darkening in light, very slightly soluble in water, soluble in about 400 parts of boiling water, slightly soluble in alcohol, soluble in solutions of the alkali hydroxides and in ammonia.

mp: about 210 °C, with decomposition.

A solution in *alcohol R* shows two absorption maxima (*2.2.25*), at 259 nm and 362 nm.

Storage: protected from light.

Sabinene. $C_{10}H_{16}$. (M_r 136.2). *1109700.* [3387-41-5]. Thuj-4(10)-ene. 4-Methylene-1-isopropylbicyclo[3.1.0]hexane.

A colourless, oily liquid.

Sabinene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Bitter-orange-flower oil (1175)*, using the substance to be examined as the test solution.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Saccharin sodium. *1131400.* [128-44-9].

See *Saccharin sodium (0787)*.

Safrole. $C_{10}H_{10}O_2$. (M_r 162.2). *1131200.* [94-59-7]. 5-(Prop-2-enyl)-1,3-benzodioxole. 4-Allyl-1,2-(methylenedioxy)benzene.

A colourless or slightly yellow, oily liquid, with the odour of sassafras, insoluble in water, very soluble in alcohol, miscible with hexane.

d_{20}^{20}: 1.095 to 1.096.

n_D^{20}: 1.537 to 1.538.

bp: 232 °C to 234 °C.

Freezing point: about 11 °C.

Safrole used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Cinnamon bark oil, Ceylon (1501)*.

The content is not less than 96.0 per cent, calculated by the normalisation procedure.

Salicin. $C_{13}H_{18}O_7$. (M_r 286.3). *1131300.* [138-52-3]. 2-(Hydroxymethyl)phenyl-β-D-glucopyranoside. Salicoside.

$[\alpha]_D^{20}$: – 62.5 ± 2.

mp: 199 °C to 201 °C.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Willow bark (1583)* at the concentration of the reference solution. The content is not less than 99.0 per cent calculated by the normalisation procedure.

Salicylaldehyde. $C_7H_6O_2$. (M_r 122.1). *1075400.* [90-02-8]. 2-Hydroxybenzaldehyde.

A clear, colourless, oily liquid.

d_{20}^{20}: about 1.167.

n_D^{20}: about 1.574.

bp: about 196 °C.

mp: about – 7 °C.

Salicylaldehyde azine. $C_{14}H_{12}N_2O_2$. (M_r 240.3). *1075500.* [959-36-4]. 2,2′-Azinodimethyldiphenol.

Dissolve 0.30 g of *hydrazine sulphate R* in 5 ml of *water R*, add 1 ml of *glacial acetic acid R* and 2 ml of a freshly prepared 20 per cent *V/V* solution of *salicylaldehyde R* in *2-propanol R*. Mix, allow to stand until a yellow precipate is formed. Shake with two quantities, each of 15 ml, of *methylene chloride R*. Combine the organic layers and dry over *anhydrous sodium sulphate R*. Decant or filter the solution and evaporate to dryness. Recrystallise from a mixture of 40 volumes of *methanol R* and 60 volumes of *toluene R* with cooling. Dry the crystals *in vacuo*.

mp: about 213 °C.

Chromatography. Examine as prescribed in the test for hydrazine in the monograph on *Povidone (0685)*; the chromatogram shows only one principal spot.

Salicylic acid. *1075600.* [69-72-7].

See *Salicylic acid (0366).*

Sand. *1075800.*

White or slightly greyish grains of silica with a particle size between 150 µm and 300 µm.

Santonin. $C_{15}H_{18}O_3$. (M_r 246.3). *1122000.* [481-06-1]. (–)-α-Santonin. 3,5a,9-Trimethyl-3a,5,5a,9b-tetrahydro-3*H*,4*H*-naphtho[1,2]furan-2,8-dione.

Colourless, shiny crystals colouring yellow in light, very slightly soluble in water, freely soluble in hot ethanol, sparingly soluble in ethanol.

$[\alpha]_D^{18}$: – 173 in ethanol.

mp: 174 °C to 176 °C.

Chromatography. Examine as prescribed in identification test C in the monograph on *Arnica flower (1391)*, the chromatogram obtained with 10 µl of the solution shows a quenching zone with an R_F value of about 0.5. Spray with *anisaldehyde solution R* and examine while heating at 105 °C for 5 min to 10 min. In daylight the quenching zone is at first a yellow zone that quickly changes to a violet-red zone.

Sclareol. $C_{20}H_{36}O_2$. (M_r 308.5). *1139900.* [515-03-7]. (1*R*,2*R*,4a*S*,8a*S*)-1-[(3*R*)-3-Hydroxy-3-methylpent-4-enyl]-2,5,5,8a-tetramethyldecahydronaphthalen-2-ol.

Odourless crystals.

$[\alpha]_D^{20}$: 6.7, in solution in ethanol.

$bp_{19\ mm}$: 218 °C to 220 °C.

mp: 96 °C to 98 °C.

Sclareol used in the chromatographic profile test in the monograph on Clary sage oil (1850) complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Clary sage oil (1850).*

The content of sclareol is not less than 97 per cent, calculated by the normalisation procedure.

Scopoletin. $C_{10}H_8O_4$. (M_r 192.2). *1158700.* [92-61-5]. 7-Hydroxy-6-methoxy-2*H*-1-benzopyran-2-one. 7-Hydroxy-6-methoxycoumarin.

Faintly beige, fine crystals.

mp: 202 °C to 208 °C.

SDS-PAGE running buffer. *1114900.*

Dissolve 151.4 g of *tris(hydroxymethyl)aminomethane R*, 721.0 g of *glycine R* and 50.0 g of *sodium lauryl sulphate R* in *water R* and dilute to 5000 ml with the same solvent. Immediately before use, dilute to 10 times its volume with *water R* and mix. Measure the pH (*2.2.3*) of the diluted solution. The pH is between 8.1 and 8.8.

SDS-PAGE sample buffer (concentrated). *1115000.*

Dissolve 1.89 g of *tris(hydroxymethyl)aminomethane R*, 5.0 g of *sodium lauryl sulphate R* and 50 mg of *bromophenol blue R* in *water R*. Add 25.0 ml of *glycerol R* and dilute to 100 ml with *water R*. Adjust the pH to 6.8 with *hydrochloric acid R*, and dilute to 125 ml with *water R*.

SDS-PAGE sample buffer for reducing conditions (concentrated). *1122100.*

Dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulphate R* and 100 mg of *bromophenol blue R* in *water R*. Add 50.0 ml of *glycerol R* and dilute to 200 ml with *water R*. Add 25.0 ml of *2-mercaptoethanol R*. Adjust to pH 6.8 (*2.2.3*) with *hydrochloric acid R*, and dilute to 250.0 ml with *water R*.

Alternatively, dithiothreitol may be used as reducing agent instead of 2-mercaptoethanol. In this case prepare the sample buffer as follows: dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulphate R* and 100 mg of *bromophenol blue R* in *water R*. Add 50.0 ml of *glycerol R* and dilute to 200 ml with *water R*. Adjust to pH 6.8 (*2.2.3*) with *hydrochloric acid R*, and dilute to 250.0 ml with *water R*. Immediately before use, add *dithiothreitol R* to a final concentration of 100 mM.

Selenious acid. H_2SeO_3. (M_r 129.0). *1100200.* [7783-00-8].

Deliquescent crystals, freely soluble in water.

Storage: in an airtight container.

Selenium. Se. (A_r 79.0). *1075900.* [7782-49-2].

A brown-red to black powder or granules, practically insoluble in water and in alcohol, soluble in nitric acid.

mp: about 220 °C.

Serine. *1076000.* [56-45-1].

See *Serine (0788).*

Sialic acid. *1001100.* [131-48-6].

See *N-acetylneuraminic acid R.*

Silibinin. $C_{25}H_{22}O_{10}$. (M_r 482.4). *1151400.* [22888-70-6]. Silybin. (2*R*,3*R*)-3,5,7-Trihydroxy-2-[(2*R*,3*R*)-3-(4-hydroxy-3-methoxyphenyl)-2-(hydroxymethyl)-2,3-dihydro-1,4-benzodioxin-6-yl]-2,3-dihydro-4*H*-1-benzopyran-4-one.

White to yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Silibinin used in the assay of Milk-thistle fruit (1860) complies with the following requirement.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Milk-thistle fruit (1860).*

Test solution. Dissolve 5.0 mg of silibinin, dried *in vacuo*, in *methanol R* and dilute to 50.0 ml with the same solvent.

The silibinin A and silibinin B content is not less than 95.0 per cent, calculated by the normalisation procedure.

Silica gel π-acceptor/π-donor for chiral separations. *1160100.*

A very finely divided silica gel for chromatography consisting of spherical particles to which 1-(3,5-dinitrobenzamido)-1,2,3,4-tetrahydrophenantrene has been covalently bound, showing both π-electron acceptor and π-electron donor characteristics. The particle size and the configuration are indicated after the name of the reagent in the tests where it is used.

Silica gel AGP for chiral chromatography. *1148700.*

A very finely divided silica gel for chromatography consisting of spherical particles coated with α1- acid glycoprotein. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica gel, anhydrous . *1076100* . [112926-00-8].

Partly dehydrated polymerised, amorphous silicic acid, absorbing at 20 °C about 30 per cent of its mass of water. Practically insoluble in water, partly soluble in solutions of sodium hydroxide. It contains a suitable indicator for detection of the humidity status, for which the colour change from the hydrated to anhydrous form is given on the label.

Silica gel BC for chiral chromatography. *1161300.*

A very finely divided silica gel for chromatography (5 µm) coated with β-cyclodextrin. Higher selectivity may be obtained when cyclodextrin has been derivatized with propylene oxide.

Silica gel for chromatography. *1076900.*

A very finely divided (3 µm-10 µm) silica gel. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, alkyl-bonded for use with highly aqueous mobile phases. *1160200.*

A very finely divided silica gel with bonded alkyl groups suitable for use with highly aqueous mobile phases.

Silica gel for chromatography, amidohexadecylsilyl. *1170400.*

A very finely divided silica gel with a fine particle size, chemically modified at the surface by the bonding of amidohexadecylsilyl groups. The particle size is indicated after the name of the reagent in the test where it is used.

Silica gel for chromatography, aminohexadecylsilyl. *1138400.*

A very finely divided (3-10 µm) silica gel with a fine particle size chemically modified at the surface by the bonding of aminohexadecylsilyl groups. The particle size is indicated after the name of the reagent in the test where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, aminopropylmethylsilyl. *1102400.*

Silica gel with a fine particle size (between 3 µm and 10 µm), chemically modified by bonding aminopropylmethylsilyl groups on the surface. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, aminopropylsilyl. *1077000.*

Silica gel with a fine particle size (between 3 µm and 10 µm), chemically modified by bonding aminopropylsilyl groups on the surface. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, amylose derivative of. *1109800.*

A very finely divided (10 µm) silica gel, chemically modified at the surface by the bonding of an amylose derivative. The particle size is indicated after the name of the reagent in the test where it is used.

A fine, white or almost white, homogenous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, butylsilyl. *1076200.*

A very finely divided silica gel (3 µm-10 µm), chemically modified at the surface by the bonding of butylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Spheroidal silica: 30 nm.

Pore volume: 0.6 cm^3/g.

Specific surface area: 80 m^2/g.

Silica gel for chromatography, butylsilyl, end-capped. *1170500.*

A very finely divided silica (3-10 µm), chemically modified at the surface by the bonding of butylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogenous powder, practically insoluble in water and in ethanol (96 per cent).

Silica gel for chromatography, cyanosilyl. *1109900.*

A very finely divided silica gel chemically modified at the surface by the bonding of cyanosilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, di-isobutyloctadecylsilyl. *1140000.*

A very finely divided silica gel chemically modified at the surface by the bonding of di-isobutyloctadecylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica gel for chromatography, diisopropylcyanopropylsilyl. *1168100.*

A very finely divided silica gel chemically modified at the surface by the bonding of diisopropylcyanopropylsilyl groups. The particle size is indicated after the name of the reagent in which the test is used.

Silica gel for chromatography, dimethyloctadecylsilyl. *1115100.*

A very finely divided silica gel (3 µm-10 µm), chemically modified at the surface by the bonding of dimethyloctadecylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol. Irregular particle size.

Specific surface area: 300 m^2/g.

Silica gel for chromatography, diol. *1110000.*

Spherical silica particles to which dihydroxypropyl groups are bonded. Pore size 10 nm.

Silica gel for chromatography, hexadecylamidylsilyl. *1162500.*

A very finely divided (5 µm) silica gel, chemically modified at the surface by the introduction of hexadecylcarboxamidopropyldimethylsilyl groups.

Silica gel for chromatography, hexylsilyl. *1077100.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of hexylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, human albumin coated. *1138500.*

A very finely divided (3 µm to 10 µm) silica gel, chemically modified at the surface by the bonding of human albumin. The particle size is indicated after the name of the reagent in the tests where it is used.

A white or almost white, fine, homogeneous powder.

Silica gel for chromatography, hydrophilic. *1077200.*

A very finely divided (3 µm-10 µm) silica gel whose surface has been modified to provide hydrophilic characteristics. The particle size may be stated after the name of the reagent in the tests where it is used.

Silica gel for chromatography, nitrile. *1077300.*

A very finely divided silica gel, chemically modified at the surface by the bonding of cyanopropylsilyl groups. The particle size is indicated after the name of the reagent in the test where it is used.

A fine white or almost white, homogenous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, nitrile R1. *1077400.*

A very finely divided silica gel consisting of porous, spherical particles with chemically bonded nitrile groups. The particle size is indicated after the name of the reagent in the test where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, nitrile R2. *1119500.*

Ultrapure silica gel, chemically modified at the surface by the introduction of cyanopropylsilyl groups. Less than 20 ppm of metals. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine white or almost white, homogenous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecanoylaminopropylsilyl. *1115200.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of aminopropylsilyl groups which are acylated with octadecanoyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecylsilyl. *1077500.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecylsilyl R1. *1110100.*

A very finely divided ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups. The particle size, the pore size and the carbon loading are indicated after the name of the reagent in the tests where it is used. Less than 20 ppm of metals.

Silica gel for chromatography, octadecylsilyl R2. *1115300.*

A very finely divided (15 nm pore size) ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups (20 per cent carbon load), optimised for the analysis of polycyclic aromatic hydrocarbons. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecylsilyl, base-deactivated. *1077600.*

A very finely divided (3 µm-10 µm) silica gel, pretreated before the bonding of octadecylsilyl groups by careful washing and hydrolysing most of the superficial siloxane bridges to minimise the interaction with basic components. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecylsilyl, end-capped. *1115400.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogenous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecylsilyl, end-capped R1. *1115401.*

A very finely divided (10 nm pore size) ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups (19 per cent carbon load). To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used. It contains less than 20 ppm of metals.

Silica gel for chromatography, octadecylsilyl, end-capped, base-deactivated. *1108600.*

A very finely divided (3 µm-10 µm) silica gel with a pore size of 10 nm and a carbon loading of 16 per cent, pre-treated before the bonding of octadecylsilyl groups by washing and hydrolysing most of the superficial siloxane bridges. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the test where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octadecylsilyl, end-capped, base-deactivated R1. *1162600.*

A very finely divided (3-10 µm) silica gel pre-treated before the bonding of octadecylsilyl groups by washing and hydrolysing most of the superficial siloxane bridges. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the test where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in ethanol (96 per cent).

Silica gel for chromatography, octadecylsilyl, monolithic. *1154500.*

Monolithic rods of highly porous (greater than 80 per cent) metal-free silica with a bimodal pore structure, modified at the surface by the bonding of octadecylsilyl groups.

Silica gel for chromatography, octadecylsilyl, with polar incorporated groups, end-capped. *1165100.*

A very finely divided silica gel (3-10 µm). The particles are based on silica, chemically modified with a reagent providing a surface with chains having polar incorporated groups and terminating octadecyl groups. Furthermore, the packing material is end-capped. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder.

Silica gel for chromatography, octylsilyl. *1077700.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of octylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octylsilyl R1. *1077701.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of octylsilyl and methyl groups (double bonded phase). The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octylsilyl R2. *1077702.*

Ultrapure very finely divided (10 nm pore size) silica gel, chemically modified at the surface by the bonding of octylsilyl groups (19 per cent carbon load). Less than 20 ppm of metals.

Silica gel for chromatography, octylsilyl R3. *1155200.*

A very finely divided ultrapure silica gel, chemically modified at the surface by the bonding of octylsilyl groups and sterically protected with branched hydrocarbons at the silanes. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica gel for chromatography, octylsilyl, base-deactivated. *1131600.*

A very finely divided (3 µm-10 µm) silica gel, pretreated before the bonding of octylsilyl groups by careful washing and hydrolysing most of the superficial siloxane bridges to minimise the interaction with basic components. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octylsilyl, end-capped. *1119600.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of octylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octylsilyl, end-capped, base-deactivated. *1148800.*

A very finely divided (3 µm-10 µm) silica gel, pre-treated before the bonding of octylsilyl groups by washing and hydrolysing most of the superficial siloxane bridges. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the test where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, octylsilyl, with polar incorporated groups, end-capped. *1152600.*

A very finely divided silica gel (3-10 µm). The particles are based on silica, chemically modified with a reagent providing a surface with chains having polar incorporated groups and terminating octyl groups. Furthermore, the packing material is end-capped. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder.

Silica gel for chromatography, palmitamidopropylsilyl, end-capped. *1161900.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of palmitamidopropyl groups and end-capped with acetamidopropyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for chromatography, phenylhexylsilyl. *1153900.*

A very finely divided silica gel, chemically modified at the surface by the bonding of phenylhexyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica gel for chromatography, phenylhexylsilyl, end-capped. *1170600.*

A very finely divided silica gel (3 µm), chemically modified at the surface by the bonding of phenylhexylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica gel for chromatography, phenylsilyl. *1110200.*

A very finely divided (5 µm-10 µm) silica gel, chemically modified at the surface by the bonding of phenyl groups.

Silica gel for chromatography, phenylsilyl R1. *1075700.*

A very finely divided silica gel (5 µm), chemically modified at the surface by the bonding of phenyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water, in alcohol and in methylene chloride.

Spheroidal silica: 8 nm.

Specific surface area: 180 m^2/g.

Carbon loading: 5.5 per cent.

Silica gel for chromatography, phenylsilyl, end-capped. *1154900.*

A very finely divided (5-10 µm) silica gel, chemically modified at the surface by the bounding of phenyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica gel for chromatography, propylsilyl. *1170700.*

A very finely divided silica gel (3-10 µm), chemically modified at the surface by the bonding of propylsilyl groups. The particle size is indicated after the name of the reagent in the test where it is used.

Silica gel for chromatography, strong-anion-exchange. *1077800.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of quaternary ammonium groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

pH limit of use: 2 to 8.

Silica gel for chromatography, strong cation-exchange. *1161400.*

A very finely divided (5-10 µm) silica gel, chemically modified at the surface by the bonding of sulphonic acid groups. The particle size is specified after the name of the reagent in the tests where it is used.

Silica gel for chromatography, trimethylsilyl. *1115500.*

A very finely divided (3 µm-10 µm) silica gel, chemically modified at the surface by the bonding of trimethylsilyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

A fine, white or almost white, homogeneous powder, practically insoluble in water and in alcohol.

Silica gel for size-exclusion chromatography. *1077900.*

A very finely divided silica gel (10 µm) with a very hydrophilic surface. The average diameter of the pores is about 30 nm. It is compatible with aqueous solutions between pH 2 and 8 and with organic solvents. It is suitable for the separation of proteins with relative molecular masses of 1×10^3 to 3×10^5.

Silica gel G. *1076300.* [112926-00-8].

Contains about 13 per cent of calcium sulphate hemihydrate.

A fine, white or almost white, homogeneous powder with a particle size of about 15 µm.

Calcium sulphate content. Place 0.25 g in a ground-glass stoppered flask, add 3 ml of *dilute hydrochloric acid R* and 100 ml of *water R* and shake vigorously for 30 min. Filter through a sintered-glass filter (*2.1.2*) and wash the residue. Carry out on the combined filtrate and washings the complexometric assay of calcium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 14.51 mg of $CaSO_4, {}^1/_2H_2O$.

pH (*2.2.3*). Shake 1 g for 5 min with 10 ml of *carbon dioxide-free water R*. The pH of the suspension is about 7.

Silica gel GF_{254}. *1076400.* [112926-00-8].

Contains about 13 per cent of calcium sulphate hemihydrate and about 1.5 per cent of a fluorescent indicator having an optimal intensity at 254 nm.

A fine, white or almost white, homogeneous powder with a particle size of about 15 µm.

Calcium sulphate content. Determine by the method prescribed for *silica gel G R*.

pH (2.2.3). Complies with the test prescribed for *silica gel G R*.

Fluorescence. Examine by thin-layer chromatography (*2.2.27*) using *silica gel GF_{254} R* as the coating substance. Apply separately to the plate at ten points increasing volumes from 1 µl to 10 µl of a 1 g/l solution of *benzoic acid R* in a mixture of 10 volumes of *anhydrous formic acid R* and 90 volumes of *2-propanol R*. Develop over a path of 10 cm with the same mixture of solvents. After evaporating the solvents examine the chromatogram in ultraviolet light at 254 nm. The benzoic acid appears as dark spots on a fluorescent background in the upper third of the chromatogram for quantities of 2 µg and greater.

Silica gel H. *1076500.* [112926-00-8].

A fine, white or almost white, homogeneous powder with a particle size of about 15 µm.

pH (2.2.3). Complies with the test prescribed for *silica gel G R*.

Silica gel H, silanised. *1076600.*

Preparation of a thin layer. See *silanised silica gel HF_{254} R*.

A fine, white or almost white homogeneous powder which, after being shaken with water, floats on the surface because of its water-repellent properties.

Chromatographic separation. Complies with the test prescribed for *silanised silica gel HF_{254} R*.

Silica gel HF_{254}. *1076700.*

Contains about 1.5 per cent of a fluorescent indicator having an optimal intensity at 254 nm.

A fine, white or almost white, homogeneous powder with a particle size of about 15 µm.

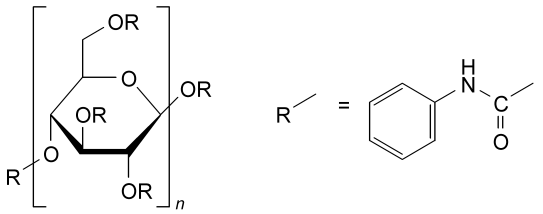
pH. Complies with the test prescribed for *silica gel G R*.

Fluorescence. Complies with the test prescribed for *silica gel GF_{254} R*.

Silica gel HF_{254}, silanised. *1076800.*

Contains about 1.5 per cent of a fluorescent indicator having an optimal intensity at 254 nm.

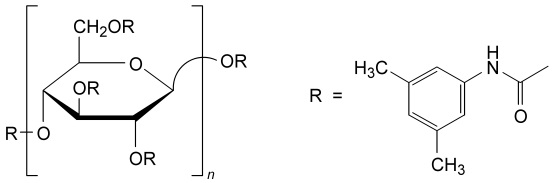
A fine, white or almost white, homogeneous powder which, after shaking with water, floats on the surface because of its water-repellent properties.



Preparation of a thin layer. Vigorously shake 30 g for 2 min with 60 ml of a mixture of 1 volume of *methanol R* and 2 volumes of *water R*. Coat carefully cleaned plates with a layer 0.25 mm thick using a spreading device. Allow the coated plates to dry in air and then heat in an oven at 100 °C to 105 °C for 30 min.

Chromatographic separation. Introduce 0.1 g each of *methyl laurate R, methyl myristate R, methyl palmitate R* and *methyl stearate R* into a 250 ml conical flask. Add 40 ml of *alcoholic potassium hydroxide solution R* and heat under a reflux condenser on a water-bath for 1 h. Allow to cool, transfer the solution to a separating funnel by means of 100 ml of *water R*, acidify (pH 2 to 3) with *dilute hydrochloric acid R* and shake with three quantities, each of 10 ml of *chloroform R*. Dry the combined chloroform extracts over *anhydrous sodium sulphate R*, filter and evaporate

to dryness on a water-bath. Dissolve the residue in 50 ml of *chloroform R*. Examine by thin-layer chromatography (*2.2.27*), using silanised silica gel HF_{254} as the coating substance. Apply to the plate at each of three separate points 10 µl of the chloroformic solution. Develop over a path of 14 cm with a mixture of 10 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 65 volumes of *dioxan R*. Dry the plate at 120 °C for 30 min. Allow to cool, spray with a 35 g/l solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 150 °C until the spots become visible. Treat the plate with ammonia vapour until the background is white. The chromatograms show four clearly separated, well-defined spots.



Silica gel OC for chiral separations. *1146800.*

A very finely divided silica gel for chromatography (5 µm) coated with the following derivative:

Silica gel OD for chiral separations. *1110300.*

A very finely divided silica gel for chromatography (5 µm) coated with the following derivative:

Silicotungstic acid. $H_4SiW_{12}O_{40}.xH_2O$. *1078000.* [11130-20-4].

White or yellowish-white crystals, deliquescent, very soluble in water and in alcohol.

Storage: in an airtight container.

Silicristin. $C_{25}H_{22}O_{10}$. (M_r 482.4). *1151500.* [33889-69-9]. (2*R*,3*R*)-3,5,7-Trihydroxy-2-[(2*R*,3*S*)-7-hydroxy-2-(4-hydroxy-3-methoxyphenyl)-3-hydroxymethyl-2,3-dihydro-1-benzofuran-5-yl]chroman-4-one.

White to yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Silidianin. $C_{25}H_{22}O_{10}$. (M_r 482.4). *1151600.* [29782-68-1]. (3*R*,3a*R*,6*R*,7a*R*,8*R*)-7a-Hydroxy-8-(4-hydroxy-3-methoxyphenyl)-4-[(2*R*, 3*R*)-3,5,7-trihydroxy-4-oxochroman-2-yl]-2,3,3a,7a-tetrahydro-3,6-methano-1-benzofuran-7(6a*H*)-one.

White to yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Silver diethyldithiocarbamate. $C_5H_{10}AgNS_2$. (M_r 256.1). *1110400.* [1470-61-7].

A pale-yellow or greyish-yellow powder, practically insoluble in water, soluble in pyridine.

It may be prepared as follows. Dissolve 1.7 g of *silver nitrate R* in 100 ml of *water R*. Separately dissolve 2.3 g of *sodium diethyldithiocarbamate R* in 100 ml of *water R*. Cool both solutions to 10 °C, then mix and while stirring collect the yellow precipitate on a sintered-glass filter (*2.1.2*) and wash with 200 ml of cold *water R*. Dry the precipitate *in vacuo* for 2-3 h.

Silver diethyldithiocarbamate may be used provided it has not changed in colour or developed a strong odour.

Silver manganese paper. *1078200.*

Immerse strips of slow filter paper into a solution containing 8.5 g/l of *manganese sulphate R* and 8.5 g/l of *silver nitrate R*. Maintain for a few minutes and allow to dry over *diphosphorus pentoxide R* protected from acid and alkaline vapours.

Silver nitrate. *1078300.* [7761-88-8].

See *Silver nitrate (0009)*.

Silver nitrate reagent. *1078305.*

To a mixture of 3 ml of *concentrated ammonia R* and 40 ml of *1 M sodium hydroxide*, add 8 ml of a 200 g/l solution of *silver nitrate R*, dropwise, with stirring. Dilute to 200 ml with *water R*.

Silver nitrate solution R1. *1078301.*

A 42.5 g/l solution.

Storage: protected from light.

Silver nitrate solution R2. *1078302.*

A 17 g/l solution.

Storage: protected from light.

Silver nitrate solution, ammoniacal. *1078303.*

Dissolve 2.5 g of *silver nitrate R* in 80 ml of *water R* and add *dilute ammonia R1* dropwise until the precipitate has dissolved. Dilute to 100 ml with *water R*. Prepare immediately before use.

Silver nitrate solution in pyridine. *1078304.*

An 85 g/l solution in *pyridine R*.

Storage: protected from light.

Silver oxide. Ag_2O. (M_r 231.7). *1078400.* [20667-12-3]. Disilver oxide.

A brownish-black powder, practically insoluble in water and in alcohol, freely soluble in dilute nitric acid and in ammonia.

Storage: protected from light.

Sinensetin. $C_{20}H_{20}O_7$. (M_r 372.4). *1110500.* [2306-27-6]. 3′,4′,5,6,7-Pentamethoxyflavone.

A white or almost white, crystalline powder, practically insoluble in water, soluble in alcohol.

mp: about 177 °C.

Absorbance (*2.2.25*). A solution in *methanol R* shows 3 absorption maxima, at 243 nm, 268 nm and 330 nm.

Assay. Examine by liquid chromatography (*2.2.29*) as prescribed in the monograph on *Java tea (1229)*.

The content is not less than 95 per cent, calculated by the normalisation procedure.

Sitostanol. $C_{29}H_{52}O$. (M_r 416.7). *1140100.* [19466-47-8]. Dihydro-β-sitosterol.

Content: minimum 95.0 per cent of $C_{29}H_{52}O$.

β-Sitosterol. $C_{29}H_{50}O$. (M_r 414.7). *1140200.* [83-46-5]. Stigmast-5-en-3β-ol. 22,23-Dihydrostigmasterol.

A white or almost white powder, practically insoluble in water, sparingly soluble in tetrahydrofuran.

Content: minimum 75.0 per cent *m/m* of $C_{29}H_{50}O$, calculated with reference to the dried substance.

Assay. Gas chromatography (*2.2.28*), as prescribed in the monograph on *Phytosterol (1911)*.

Test solution. Dissolve 0.100 g of the substance to be examined in *tetrahydrofuran R* and dilute to 10.0 ml with the same solvent. Introduce 100 µl of this solution into a suitable 3 ml flask and evaporate to dryness under *nitrogen R*. To the residue add 100 µl of a freshly prepared mixture of 50 µl of *1-methylimidazole R* and 1.0 ml of *heptafluoro-N-methyl-N-(trimethylsilyl)butanamide R*. Close the flask tightly and heat at 100 °C for 15 min. Allow to cool.

Inject 1 µl of the test solution.

Sodium. Na. (A_r 22.99). *1078500.* [7440-23-5].

A metal whose freshly cut surface is bright silver-grey. It rapidly tarnishes in contact with air and is oxidised completely to sodium hydroxide and converted to sodium carbonate. It reacts violently with water, yielding hydrogen and a solution of sodium hydroxide; soluble in anhydrous methanol, yielding hydrogen and a solution of sodium methoxide; practically insoluble in light petroleum.

Storage: under light petroleum or liquid paraffin.

Sodium acetate. *1078600.* [6131-90-4].

See *Sodium acetate (0411)*.

Sodium acetate, anhydrous. $C_2H_3NaO_2$. (M_r 82.0). *1078700.* [127-09-3].

Colourless crystals or granules, very soluble in water, sparingly soluble in alcohol.

Loss on drying (*2.2.32*). Not more than 2.0 per cent, determined by drying in an oven at 105 °C.

Sodium arsenite. $NaAsO_2$. (M_r 129.9). *1165900.* [7784-46-5].

Sodium arsenite solution. *1165901.*

Dissolve 5.0 g of *sodium arsenite R* in 30 ml of *1 M sodium hydroxide*. Cool to 0 °C and add, while stirring, 65 ml of *dilute hydrochloric acid R*.

Sodium ascorbate solution. *1078800.* [134-03-2].

Dissolve 3.5 g of *ascorbic acid R* in 20 ml of *1 M sodium hydroxide*. Prepare immediately before use.

Sodium azide. NaN_3. (M_r 65.0). *1078900.* [26628-22-8].

A white or almost white, crystalline powder or crystals, freely soluble in water, slightly soluble in alcohol.

Sodium bicarbonate. *1081300.* [144-55-8].

See *sodium hydrogen carbonate R*.

Sodium bismuthate. $NaBiO_3$. (M_r 280.0). *1079000.* [12232-99-4].

Content: minimum 85.0 per cent of $NaBiO_3$.

A yellow or yellowish-brown powder, slowly decomposing when moist or at a high temperature, practically insoluble in cold water.

Assay. Suspend 0.200 g in 10 ml of a 200 g/l solution of *potassium iodide R* and add 20 ml of *dilute sulphuric acid R*. Using 1 ml of *starch solution R* as indicator, titrate with *0.1 M sodium thiosulphate* until an orange colour is obtained.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 14.00 mg of $NaBiO_3$.

Sodium bromide. *1154300.* [7647-15-6].

See *Sodium bromide (0190)*.

Sodium butanesulphonate. $C_4H_9NaO_3S$. (M_r 160.2). *1115600.* [2386-54-1].

A white or almost white, crystalline powder, soluble in water.

mp: greater than 300 °C.

Sodium carbonate. *1079200.* [6132-02-1].

See *Sodium carbonate decahydrate (0191)*.

Sodium carbonate, anhydrous. Na_2CO_3. (M_r 106.0). *1079300.* [497-19-8]. Disodium carbonate.

A white or almost white powder, hygroscopic, freely soluble in water.

When heated to about 300 °C it loses not more than 1 per cent of its mass.

Storage: in an airtight container.

Sodium carbonate solution. *1079301.*

A 106 g/l solution of *anhydrous sodium carbonate R*.

Sodium carbonate solution R1. *1079302.*

A 20 g/l solution of *anhydrous sodium carbonate R* in *0.1 M sodium hydroxide*.

Sodium carbonate solution R2. *1079303.*

A 40 g/l solution of *anhydrous sodium carbonate R* in *0.2 M sodium hydroxide*.

Sodium carbonate monohydrate. Na_2CO_3,H_2O. *1131700.* [5968-11-6].

See *Sodium carbonate monohydrate (0192)*.

Sodium cetostearyl sulphate. *1079400.*

See *Sodium cetostearyl sulphate (0847)*.

Sodium chloride. *1079500.* [7647-14-5].

See *Sodium chloride (0193)*.

Sodium chloride solution. *1079502.*

A 20 per cent *m/m* solution.

Sodium chloride solution, saturated. *1079503.*

Mix 1 part of *sodium chloride R* with 2 parts of *water R*, shake from time to time and allow to stand. Before use, decant the solution from any undissolved substance and filter, if necessary.

Sodium citrate. *1079600.* [6132-04-3].

See *Sodium citrate (0412)*.

Sodium cobaltinitrite. $Na_3[Co(NO_2)_6]$. (M_r 403.9). *1079700.* [13600-98-1]. Trisodium hexanitrocobaltate(III).

Orange-yellow powder, freely soluble in water, slightly soluble in alcohol.

Sodium cobaltinitrite solution. *1079701.*

A 100 g/l solution. Prepare immediately before use.

Sodium decanesulphonate. $C_{10}H_{21}NaO_3S$. (M_r 244.3). *1079800.* [13419-61-9].

Crystalline powder or flakes, white or almost white, freely soluble in water, soluble in methanol.

Sodium decyl sulphate. $C_{10}H_{21}NaO_4S$. (M_r 260.3). *1138600.* [142-87-0].

Content: minimum 95.0 per cent of $C_{10}H_{21}NaO_4S$.

White or almost white powder, freely soluble in water.

Sodium deoxycholate. $C_{24}H_{39}NaO_4$. (M_r 414.6). *1131800.* [302-95-4]. Sodium 3α,12α-dihydroxy-5β-cholan-24-oate.

Sodium deoxyribonucleate. (About 85 per cent has a relative molecular mass of 2×10^7 or greater). *1079900.* [73049-39-5].

A white or almost white, fibrous preparation obtained from calf thymus.

Test for suitability. Dissolve 10 mg in *imidazole buffer solution pH 6.5 R* and dilute to 10.0 ml with the same buffer solution (solution a). Dilute 2.0 ml of solution (a) to 50.0 ml with *imidazole buffer solution pH 6.5 R*. The absorbance (*2.2.25*) of the solution, measured at 260 nm, is 0.4 to 0.8.

To 0.5 ml of solution (a) add 0.5 ml of *imidazole buffer solution pH 6.5 R* and 3 ml of perchloric acid (25 g/l $HClO_4$). A precipitate is formed. Centrifuge. The absorbance of the supernatant liquid, measured at 260 nm using a mixture of 1 ml of *imidazole buffer solution pH 6.5 R* and 3 ml of perchloric acid (25 g/l $HClO_4$) as compensation liquid, is not greater than 0.3.

In each of two tubes, place 0.5 ml of solution (a) and 0.5 ml of a solution of a reference preparation of streptodornase containing 10 IU/ml in *imidazole buffer solution pH 6.5 R*. To one tube add immediately 3 ml of perchloric acid (25 g/l $HClO_4$). A precipitate is formed. Centrifuge and collect the supernatant liquid (a). Heat the other tube at 37 °C for 15 min and add 3 ml of perchloric acid (25 g/l $HClO_4$). Centrifuge and collect the supernatant liquid (b). The absorbance of supernatant liquid (b), measured at 260 nm with reference to supernatant liquid (a) is not less than 0.15.

Sodium diethyldithiocarbamate. $C_5H_{10}NNaS_2,3H_2O$. (M_r 225.3). *1080000.* [20624-25-3].

white or almost white or colourless crystals, freely soluble in water, soluble in alcohol. The aqueous solution is colourless.

Sodium dihydrogen phosphate. *1080100.* [13472-35-0].

See *Sodium dihydrogen phosphate dihydrate (0194).*

Sodium dihydrogen phosphate, anhydrous. NaH_2PO_4. (M_r 120.0). *1080200.* [7558-80-7].

White or almost white powder, hygroscopic.

Storage: in an airtight container.

Sodium dihydrogen phosphate monohydrate. NaH_2PO4,H_2O. (M_r 138.0). *1080300.* [10049-21-5].

White or almost white, slightly deliquescent crystals or granules, freely soluble in water, practically insoluble in alcohol.

Storage: in an airtight container.

Sodium dioctyl sulfosuccinate. $C_{20}H_{37}NaO_7S$. (M_r 444.6). *1170800.* [577-11-7]. Sodium 1,4-bis[(2-ethylhexyl)oxy]-1,4-dioxobutane-2-sulfonate. 1,4-Bis(2-ethylhexyl) sulfobutanedioate sodium salt.

White or almost white, waxy solid.

Sodium dithionite. $Na_2S_2O_4$. (M_r 174.1). *1080400.* [7775-14-6].

White or greyish-white, crystalline powder, oxidises in air, very soluble in water, slightly soluble in alcohol.

Storage: in an airtight container.

Sodium dodecyl sulphate. *1080500.* [151-21-3].

See *Sodium laurilsulfate (0098)* except for the content which should be not less than 99.0 per cent.

Sodium edetate. *1080600.* [6381-92-6].

See *Disodium edetate (0232).*

Sodium fluoresceinate. $C_{20}H_{10}Na_2O_5$. (M_r 376.3). *1080700.* [518-47-8].

Schultz No. 880.

Colour Index No. 45350.
Fluorescein sodium. Disodium 2-(3-oxo-6-oxido-3H-xanthen-9-yl)benzoate.

An orange-red powder, freely soluble in water. Aqueous solutions display an intense yellowish-green fluorescence.

Sodium fluoride. *1080800.* [7681-49-4].

See *Sodium fluoride (0514).*

Sodium formate. $CHNaO_2$. (M_r 68.0). *1122200.* [141-53-7]. Sodium methanoate.

White or almost white, crystalline powder or deliquescent granules, soluble in water and in glycerol, slightly soluble in alcohol.

mp: about 253 °C.

Sodium glucuronate. $C_6H_9NaO_7,H_2O$. (M_r 234.1). *1080900.* Sodium D-glucuronate monohydrate.

$[\alpha]_D^{20}$: about + 21.5, determined on a 20 g/l solution.

Sodium glycocholate. $C_{26}H_{42}NNaO_6,2H_2O$. (M_r 523.6). *1155500.* [207300-80-9]. Sodium [(3,7,12-trihydroxy-5-cholan-24-oyl)amino]acetate dihydrate. *N*-[(3,5,7,12)-3,7,12-Trihydroxy-24-oxocholan-24-yl]glycine monosodium salt dihydrate.

Content: minimum 97 per cent of $C_{26}H_{42}NNaO_6,2H_2O$.

Sodium heptanesulphonate. $C_7H_{15}NaO_3S$. (M_r 202.3). *1081000.* [22767-50-6].

A white or almost white, crystalline mass, freely soluble in water, soluble in methanol.

Sodium heptanesulphonate monohydrate. $C_7H_{15}NaO_3S,H_2O$. (M_r 220.3). *1081100.*

Content: minimum 96 per cent of $C_7H_{15}NaO_3S$, calculated with reference to the anhydrous substance.

A white or almost white, crystalline powder, soluble in water, very slightly soluble in ethanol.

Water (*2.5.12*): maximum 8 per cent, determined on 0.300 g.

Assay. Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 20.22 mg of $C_7H_{15}NaO_3S$.

Sodium hexanesulphonate. $C_6H_{13}NaO_3S$. (M_r 188.2). *1081200.* [2832-45-3].

A white or almost white powder, freely soluble in water.

Sodium hexanesulphonate monohydrate. $C_6H_{13}NaO_3S,H_2O$. (M_r 206.2). *1161500.* [207300-91-2].

A white or almost white powder, soluble in water.

Sodium hydrogen carbonate. *1081300.* [144-55-8].

See *Sodium hydrogen carbonate (0195).*

Sodium hydrogen carbonate solution. *1081301.*

A 42 g/l solution.

Sodium hydrogen sulphate. $NaHSO_4$. (M_r 120.1). *1131900.* [7681-38-1]. Sodium bisulphate.

Freely soluble in water, very soluble in boiling water. It decomposes in alcohol into sodium sulphate and free sulphuric acid.

mp: about 315 °C.

Sodium hydrogensulphite. $NaHO_3S$. (M_r 104.1). *1115700.* [7631-90-5].

A white or almost white, crystalline powder, freely soluble in water, sparingly soluble in alcohol.

On exposure to air, some sulphur dioxide is lost and the substance is gradually oxidated to sulphate.

Sodium hydroxide. *1081400.* [1310-73-2].

See *Sodium hydroxide (0677).*

2 M Sodium hydroxide. *3009800.*

Dissolve 84 g of *sodium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 ml with the same solvent.

Sodium hydroxide solution. *1081401.*

Dissolve 20.0 g of *sodium hydroxide R* in *water R* and dilute to 100.0 ml with the same solvent. Verify the concentration by titration with *1 M hydrochloric acid,* using *methyl orange solution R* as indicator, and adjust if necessary to 200 g/l.

Sodium hydroxide solution, carbonate-free. *1081406.*

Dissolve *sodium hydroxide R* in *carbon dioxide-free water R* to give a concentration of 500 g/l and allow to stand. Decant the clear supernatant liquid, taking precautions to avoid the introduction of carbon dioxide.

Sodium hydroxide solution, dilute. *1081402.*

Dissolve 8.5 g of *sodium hydroxide R* in *water R* and dilute to 100 ml with the same solvent.

Sodium hydroxide solution, methanolic. *1081403.*

Dissolve 40 mg of *sodium hydroxide R* in 50 ml of *water R*. Cool and add 50 ml of *methanol R*.

Sodium hydroxide solution, methanolic R1. *1081405.*

Dissolve 200 mg of *sodium hydroxide R* in 50 ml of *water R*. Cool and add 50 ml of *methanol R*.

Sodium hydroxide solution, strong. *1081404.*

Dissolve 42 g of *sodium hydroxide R* in *water R* and dilute to 100 ml with the same solvent.

Sodium 2-hydroxybutyrate. $C_4H_7NaO_3$. (M_r 126.1). *1158800.* [19054-57-0]. Sodium (2*RS*)-2-hydroxybutanoate.

Sodium hypobromite solution. *1081500.*

In a bath of iced water mix 20 ml of *strong sodium hydroxide solution R* and 500 ml of *water R,* add 5 ml of *bromine solution R* and stir gently until solution is complete. Prepare immediately before use.

Sodium hypochlorite solution, strong. *1081600.*

Content: 25 g/l to 30 g/l of active chlorine.

A yellowish liquid with an alkaline reaction.

Assay. Introduce into a flask, successively, 50 ml of *water R,* 1 g of *potassium iodide R* and 12.5 ml of *dilute acetic acid R*. Dilute 10.0 ml of the substance to be examined to 100.0 ml with *water R*. Introduce 10.0 ml of this solution into the flask and titrate with *0.1 M sodium thiosulphate,* using 1 ml of *starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 3.546 mg of active chlorine.

Storage: protected from light.

Sodium hypophosphite. NaH_2PO_2,H_2O. (M_r 106.0). *1081700.* [10039-56-2]. Sodium phosphinate monohydrate.

A white or almost white, crystalline powder or colourless crystals, hygroscopic, freely soluble in water, soluble in alcohol.

Storage: in an airtight container.

Sodium iodide. *1081800.* [7681-82-5].

See *Sodium iodide (0196).*

Sodium laurilsulfate. *1081900.* [151-21-3].

See *Sodium laurilsulfate (0098).*

Sodium lauryl sulphate. *1081900.* [151-21-3].

See *Sodium laurilsulfate R.*

Sodium laurylsulphonate for chromatography. $C_{12}H_{25}NaO_3S$. (M_r 272.4). *1132000.* [2386-53-0].

White or almost white powder or crystals, freely soluble in water.

Absorbance $A_{1\text{ cm}}^{5\%}$ (*2.2.25*), determined in *water R*:

about 0.05 at 210 nm,

about 0.03 at 220 nm,

about 0.02 at 230 nm,

about 0.02 at 500 nm.

Sodium metabisulphite. *1082000.* [7681-57-4].

See *Sodium metabisulphite (0849).*

Sodium methanesulphonate. CH_3SO_3Na. (M_r 118.1). *1082100.* [2386-57-4].

A white or almost white, crystalline powder, hygroscopic.

Storage: in an airtight container.

Sodium molybdate. $Na_2MoO_4,2H_2O$. (M_r 242.0). *1082200.* [10102-40-6]. Disodium molybdate dihydrate.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water.

Sodium naphthoquinonesulphonate. $C_{10}H_5NaO_5S$. (M_r 260.2). *1082300.* [521-24-4]. Sodium 1,2-naphthoquinone-4-sulphonate.

A yellow to orange-yellow, crystalline powder, freely soluble in water, practically insoluble in alcohol.

Sodium nitrate. $NaNO_3$. (M_r 85.0). *1082400.* [7631-99-4].

White or almost white powder or granules or colourless, transparent crystals, deliquescent in moist air, freely soluble in water, slightly soluble in alcohol.

Storage: in an airtight container.

Sodium nitrite. $NaNO_2$. (M_r 69.0). *1082500.* [7632-00-0].

Content: minimum 97.0 per cent of $NaNO_2$.

A white or almost white, granular powder or a slightly yellow, crystalline powder, freely soluble in water.

Assay. Dissolve 0.100 g in 50 ml of *water R*. Add 50.0 ml of *0.02 M potassium permanganate* and 15 ml of *dilute sulphuric acid R*. Add 3 g of *potassium iodide R*. Titrate with *0.1 M sodium thiosulphate,* using 1.0 ml of *starch solution R* added towards the end of the titration as indicator.

1 ml of *0.02 M potassium permanganate* is equivalent to 3.450 mg of $NaNO_2$.

Sodium nitrite solution. *1082501.*

A 100 g/l solution. Prepare immediately before use.

Sodium nitroprusside. $Na_2[Fe(CN)_5(NO)],2H_2O$. (M_r 298.0). *1082600.* [13755-38-9]. Sodium pentacyano-nitrosylferrate(III) dihydrate.

Reddish-brown powder or crystals, freely soluble in water, slightly soluble in alcohol.

Sodium octanesulphonate. $C_8H_{17}NaO_3S$. (M_r 216.3). *1082700.* [5324-84-5].

Content: minimum 98.0 per cent of $C_8H_{17}NaO_3S$.

White or almost white, crystalline powder or flakes, freely soluble in water, soluble in methanol.

Absorbance. The absorbance (*2.2.25*) of a 54 g/l solution measured at 200 nm is not greater than 0.10 and that measured at 250 nm is not greater than 0.01.

Sodium octyl sulphate. $C_8H_{17}NaO_4S$. (M_r 232.3). *1082800.* [142-31-4].

White or almost white, crystalline powder or flakes, freely soluble in water, soluble in methanol.

Sodium oxalate. $C_2Na_2O_4$. (M_r 134.0). *1082900.* [62-76-0].

A white or almost white, crystalline powder, soluble in water, practically insoluble in alcohol.

Sodium pentanesulphonate. $C_5H_{11}NaO_3S$. (M_r 174.2). *1083000.* [22767-49-3].

A white or almost white, crystalline solid, soluble in water.

Sodium pentanesulphonate monohydrate. $C_5H_{11}NaO_3S,H_2O$. (M_r 192.2). *1132100.*

A white or almost white crystalline solid, soluble in water.

Sodium perchlorate. $NaClO_4,H_2O$. (M_r 140.5). *1083100.* [7791-07-3].

Content: minimum 99.0 per cent of $NaClO_4,H_2O$.

White or almost white, deliquescent crystals, very soluble in water.

Storage: in a well-closed container.

Sodium periodate. $NaIO_4$. (M_r 213.9). *1083200.* [7790-28-5]. Sodium metaperiodate.

Content: minimum 99.0 per cent of $NaIO_4$.

White or almost white, crystalline powder or crystals, soluble in water and in mineral acids.

Sodium periodate solution. *1083201.*

Dissolve 1.07 g of *sodium periodate R* in *water R*, add 5 ml of *dilute sulphuric acid R* and dilute to 100.0 ml with *water R*. Use a freshly prepared solution.

Sodium phosphite pentahydrate. $Na_2HPO_3,5H_2O$. (M_r 216.0). *1132200.* [13517-23-2].

A white or almost white, crystalline powder, hygroscopic, freely soluble in water.

Storage: in an airtight container.

Sodium picrate solution, alkaline. *1083300.*

Mix 20 ml of *picric acid solution R* and 10 ml of a 50 g/l solution of *sodium hydroxide R* and dilute to 100 ml with *water R*.

Storage: use within 2 days.

Sodium potassium tartrate. $C_4H_4KNaO_6,4H_2O$. (M_r 282.2). *1083500.* [6381-59-5].

Colourless, prismatic crystals, very soluble in water.

Sodium pyrophosphate. $Na_4P_2O_7,10H_2O$. (M_r 446.1). *1083600.* [13472-36-1]. Tetrasodium diphosphate decahydrate.

Colourless, slightly efflorescent crystals, freely soluble in water.

Sodium rhodizonate. $C_6Na_2O_6$. (M_r 214.0). *1122300.* [523-21-7]. [(3,4,5,6-Tetraoxocyclohex-1-en-1,2-ylene)dioxy]disodium.

Violet crystals, soluble in water with an orange-yellow colour.

Solutions are unstable and must be prepared on the day of use.

Sodium salicylate. *1083700.* [54-21-7].

See *Sodium salicylate (0413).*

Sodium sulphate, anhydrous. *1083800.* [7757-82-6].

Ignite at 600 °C to 700 °C anhydrous sodium sulphate complying with the requirements prescribed in the monograph on *Anhydrous sodium sulphate (0099).*

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined by drying in an oven at 130 °C.

Sodium sulphate decahydrate. $Na_2SO_4,10H_2O$. (M_r 322.2). *1132300.* [7727-73-3].

See *Sodium sulphate decahydrate (0100).*

Sodium sulphide. $Na_2S,9H_2O$. (M_r 240.2). *1083900.* [1313-84-4]. Disodium sulphide nonahydrate.

Colourless, rapidly yellowing crystals, deliquescent, very soluble in water.

Storage: in an airtight container.

Sodium sulphide solution. *1083901.*

Dissolve 12 g of *sodium sulphide R* with heating in 45 ml of a mixture of 10 volumes of *water R* and 29 volumes of *glycerol (85 per cent) R*, allow to cool and dilute to 100 ml with the same mixture of solvents.

The solution should be colourless.

Sodium sulphide solution R1. *1083902.*

Prepare by one of the following methods.

– Dissolve 5 g of *sodium sulphide R* in a mixture of 10 ml of *water R* and 30 ml of *glycerol R*.

– Dissolve 5 g of *sodium hydroxide R* in a mixture of 30 ml of *water R* and 90 ml of *glycerol R*. Divide the solution into 2 equal portions. Saturate 1 portion with *hydrogen sulphide R*, with cooling. Mix the 2 portions.

Storage: in a well-filled container, protected from light; use within 3 months.

Sodium sulphite. *1084000.* [10102-15-5].

See *Sodium sulphite heptahydrate (0776).*

Sodium sulphite, anhydrous. *1084100.* [7757-83-7].

See *Anhydrous sodium sulphite (0775).*

Sodium tartrate. $C_4H_4Na_2O_6,2H_2O$. (M_r 230.1). *1084200.* [6106-24-7]. Disodium (2*R*,3*R*)-2,3-dihydroxybutanedioate dihydrate.

White or almost white crystals or granules, very soluble in water, practically insoluble in alcohol.

Sodium taurodeoxycholate. $C_{26}H_{44}NNaO_6S,H_2O$. (M_r 539.7). *1155600.* [110026-03-4]. Sodium 2-[(3,12-dihydroxy-5-cholan-24-oyl)amino]ethanesulphonate

monohydrate. 2-[[(3,5,12)-3,12-Dihydroxy-24-oxocholan-24-yl]amino]ethanesulphonic acid monosodium salt monohydrate.

Content: minimum 94 per cent of $C_{26}H_{44}NNaO_6S,H_2O$.

Sodium tetradeuteriodimethylsilapentanoate. $C_6H_9{}^2H_4NaO_2Si$. (M_r 172.3). *1084300.* TSP. Sodium (2,2,3,3-tetradeuterio)-4,4-dimethyl-4-silapentanoate.

The degree of deuteration is not less than 99 per cent.

A white or almost white, crystalline powder, freely soluble in water, in ethanol and in methanol.

mp: about 300 °C.

Water and deuterium oxide: maximum 0.5 per cent.

Sodium tetrahydroborate. $NaBH_4$. (M_r 37.8). *1146900.* [16940-66-2]. Sodium borohydride.

Colourless, hygroscopic crystals, freely soluble in water, soluble in anhydrous ethanol, decomposing at higher temperature or in the presence of acids or certain metal salts forming borax and hydrogen.

Storage: in an airtight container.

Sodium tetrahydroborate reducing solution. *1146901.*

Introduce about 100 ml of *water R* into a 500 ml volumetric flask containing a stirring bar. Add 5.0 g of *sodium hydroxide R* in pellets and 2.5 g of *sodium tetrahydroborate R*. Stir until complete dissolution, dilute to 500.0 ml with *water R* and mix. Prepare immediately before use.

Sodium tetraphenylborate. $NaB(C_6H_5)_4$. (M_r 342.2). *1084400.* [143-66-8].

A white or slightly yellowish, bulky powder, freely soluble in water and in acetone.

Sodium tetraphenylborate solution. *1084401.*

Filter before use if necessary.

A 10 g/l solution.

Storage: use within 1 week.

Sodium thioglycollate. $C_2H_3NaO_2S$. (M_r 114.1). *1084500.* [367-51-1]. Sodium mercaptoacetate.

White or almost white, granular powder or crystals, hygroscopic, freely soluble in water and in methanol, slightly soluble in alcohol.

Storage: in an airtight container.

Sodium thiosulphate. *1084600.* [10102-17-7].

See *Sodium thiosulphate (0414)*.

Sodium tungstate. $Na_2WO_4,2H_2O$. (M_r 329.9). *1084700.* [10213-10-2]. Disodium tungstate dihydrate.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water forming a clear solution, practically insoluble in alcohol.

Sorbitol. *1084800.* [50-70-4].

See *Sorbitol (0435)*.

Squalane. $C_{30}H_{62}$. (M_r 422.8). *1084900.* [111-01-3]. 2,6,10,15,19,23-Hexamethyltetracosane.

A colourless, oily liquid, freely soluble in fatty oils, slightly soluble in acetone, in alcohol, in glacial acetic acid and in methanol.

d_{20}^{20}: 0.811 to 0.813.

n_D^{20}: 1.451 to 1.453.

Stannous chloride. $SnCl_2,2H_2O$. (M_r 225.6). *1085000.* [10025-69-1]. Tin dichloride dihydrate.

Content: minimum 97.0 per cent of $SnCl_2,2H_2O$.

Colourless crystals, very soluble in water, freely soluble in alcohol, in glacial acetic acid and in dilute and concentrated hydrochloric acid.

Assay. Dissolve 0.500 g in 15 ml of *hydrochloric acid R* in a ground-glass-stoppered flask. Add 10 ml of *water R* and 5 ml of *chloroform R*. Titrate rapidly with *0.05 M potassium iodate* until the chloroform layer is colourless.

1 ml of *0.05 M potassium iodate* is equivalent to 22.56 mg of $SnCl_2,2H_2O$.

Stannous chloride solution. *1085001.*

Heat 20 g of *tin R* with 85 ml of *hydrochloric acid R* until no more hydrogen is released. Allow to cool.

Storage: over an excess of *tin R*, protected from air.

Stannous chloride solution R1. *1085002.*

Immediately before use, dilute 1 volume of *stannous chloride solution R* with 10 volumes of *dilute hydrochloric acid R*.

Stannous chloride solution R2. *1085003.*

To 8 g of *stannous chloride R* add 100 ml of a 20 per cent *V/V* solution of *hydrochloric acid R*. Shake until dissolved, heating, if necessary, on a water-bath at 50 °C. Pass a current of *nitrogen R* for 15 min. Prepare immediately before use.

Stanolone. $C_{19}H_{30}O_2$. (M_r 290.4). *1154400.* [521-18-6]. 17β-Hydroxy-5α-androstan-3-one.

White or almost white powder.

mp: about 180 °C.

Standard solution for the micro determination of water. *1147300.*

Commercially available standard solution for the coulometric titration of water, containing a certified content of water in a suitable solvent.

***Staphylococcus aureus* strain V8 protease. Type XVII-B.** *1115800.* [66676-43-5].

Microbial extracellular proteolytic enzyme. A lyophilised powder containing 500 units to 1000 units per milligram of solid.

Starch, soluble. *1085100.* [9005-84-9].

A white or almost white powder.

Prepare a 20 g/l solution in hot *water R*. The solution is at most slightly opalescent and remains fluid on cooling.

Starch iodate paper. *1085101.*

Immerse strips of filter paper in 100 ml of *iodide-free starch solution R* containing 0.1 g of *potassium iodate R*. Drain and allow to dry protected from light.

Starch iodide paper. *1085106.*

Immerse strips of filter paper in 100 ml of *starch solution R* containing 0.5 g of *potassium iodide R*. Drain and allow to dry protected from light.

Test for sensitivity. Mix 0.05 ml of *0.1 M sodium nitrite* with 4 ml of *hydrochloric acid R* and dilute to 100 ml with *water R*. Apply one drop of the solution to starch iodide paper; a blue spot appears.

Starch solution. *1085103.*

Triturate 1.0 g of *soluble starch R* with 5 ml of *water R* and whilst stirring pour the mixture into 100 ml of boiling *water R* containing 10 mg of *mercuric iodide R*.

Carry out the test for sensitivity each time the reagent is used.

Test for sensitivity. To a mixture of 1 ml of the starch solution and 20 ml of *water R*, add about 50 mg of *potassium iodide R* and 0.05 ml of *iodine solution R1*. The solution is blue.

Starch solution, iodide-free. *1085104.*

Prepare the solution as prescribed for *starch solution R* omitting the mercuric iodide. Prepare immediately before use.

Starch solution R1. *1085105.*

Mix 1 g of *soluble starch R* and a small amount of cold *water R*. Add this mixture, while stirring, to 200 ml of boiling *water R*. Add 250 mg of *salicylic acid R* and boil for 3 min. Immediately remove from the heat and cool.

Storage: long storage is required, the solution shall be stored at 4 °C to 10 °C. A fresh starch solution shall be prepared when the end-point of the titration from blue to colourless fails to be sharp. If stored under refrigeration, the starch solution is stable for about 2 to 3 weeks.

Test for sensitivity. A mixture of 2 ml of *starch solution R1*, 20 ml of *water R*, about 50 mg of *potassium iodide R* and 0.05 ml of *iodine solution R1* is blue.

Starch solution R2. *1085107.*

Triturate 1.0 g of *soluble starch R* with 5 ml of *water R* and whilst stirring pour the mixture into 100 ml of boiling *water R*. Use a freshly prepared solution.

Test for sensitivity. To a mixture of 1 ml of the starch solution and 20 ml of *water R*, add about 50 mg of *potassium iodide R* and 0.05 ml of *iodine solution R1*. The solution is blue.

Stearic acid. $C_{18}H_{36}O_2$. (M_r 284.5). *1085200.* [57-11-4]. Octadecanoic acid.

White or almost white powder or flakes, greasy to the touch, practically insoluble in water, soluble in hot alcohol.

mp: about 70 °C.

Stearic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional requirement.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Saw palmetto fruit (1848)*.

The content of stearic acid is not less than 98 per cent, calculated by the normalisation procedure.

Stearyl alcohol. $C_{18}H_{38}O$. (M_r 270.5). *1156400.* [112-92-5]. 1-Octadecanol.

mp: about 60 °C.

Content: minimum 95 per cent of $C_{18}H_{38}O$.

Stigmasterol. $C_{29}H_{48}O$. (M_r 412.7). *1141400.* [83-48-7]. (22*E*)-Stigmasta-5,22-dien-3β-ol. (22*E*)-24-Ethylcholesta-5,22-dien-3β-ol.

White or almost white powder, insoluble in water.

mp: about 170 °C.

$[\alpha]_D^{22}$: about − 51 (*c* = 2 in chloroform).

Streptomycin sulphate. *1085300.* [3810-74-0].

See *Streptomycin sulphate (0053)*.

Strongly acidic ion-exchange resin. *1085400.*

See *ion-exchange resin, strongly acidic R*.

Strontium carbonate. $SrCO_3$. (M_r 147.6). *1122700.* [1633-05-2].

A white or almost white, crystalline powder.

Content: minimum 99.5 per cent of $SrCO_3$.

Strontium chloride hexahydrate. $SrCl_2,6H_2O$. (M_r 266.6). *1167000.* [10025-70-4].

White or almost white crystals, very soluble in water.

mp: about 115 °C (loss of water) and 872 °C.

Strontium selective extraction resin. *1167100.*

Commercially available resin prepared by loading a suspension of 4,4′(5′)-di-*tert*-butylcyclohexano-18-crown-6 (crown ether) in octanol onto an inert chromatographic support. The bed density of this resin is approximately 0.35 g/ml.

Strontium-85 spiking solution. *1166800.*

Dilute *strontium-85 standard solution R* to a radioactivity concentration of approximately 10 kBq/ml with a 0.27 g/l solution of *strontium chloride hexahydrate R* in a 1.03 g/l solution of *hydrochloric acid R*.

Strontium-85 standard solution. *1166900.*

A solution of strontium-85 in the form of Sr^{2+} ions in a 51.5 g/l solution of *hydrochloric acid R*.

Styrene. C_8H_8. (M_r 104.2). *1151700.* [100-42-5]. Ethenylbenzene.

bp: about 145 °C.

Colourless, oily liquid, very slightly soluble in water.

Styrene-divinylbenzene copolymer. *1085500.*

Porous, rigid, cross-linked polymer beads. Several grades are available with different sizes of beads. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Succinic acid. $C_4H_6O_4$. (M_r 118.1). *1085600.* [110-15-6]. Butanedioic acid.

A white or almost white, crystalline powder or colourless crystals, soluble in water and in alcohol.

mp: 184 °C to 187 °C.

Sucrose. *1085700.* [57-50-1].

See *Sucrose (0204)*.

Sudan orange. $C_{16}H_{12}N_2O$. (M_r 248.3). *1110700.* [842-07-9].

Colour Index No. 12055.
1-(Phenylazo)naphthalen-2-ol. Sudan I.

An orange-red powder, practically insoluble in water, soluble in methylene chloride.

mp: about 131 °C.

Sudan red G. $C_{17}H_{14}N_2O_2$. (M_r 278.3). *1085800.*

Schultz No. 149.

Colour Index No. 12150.
Solvent Red 1. 1-[(2-Methoxyphenyl)azo]naphtalen-2-ol.

A reddish-brown powder, practically insoluble in water.

Chromatography. Examine by thin-layer chromatography (*2.2.27*) using *silica gel G R* as the coating substance. Apply 10 µl of a 0.1 g/l solution in *methylene chloride R* and develop over a path of 10 cm with the same solvent. The chromatogram shows only one principal spot.

Sulfanilamide. $C_6H_8N_2O_2S$. (M_r 172.2). *1086100.* [63-74-1]. 4-Aminobenzenesulphonamide.

A white or almost white powder, slightly soluble in water, freely soluble in boiling water, in acetone, in dilute acids and in solutions of the alkali hydroxides, sparingly soluble in alcohol and in light petroleum.

mp: about 165 °C.

Sulphamic acid. H_3NO_3S. (M_r 97.1). *1085900.* [5329-14-6].

White or almost white crystalline powder or crystals, freely soluble in water, sparingly soluble in acetone, in alcohol and in methanol.

mp: about 205 °C, with decomposition.

Sulphan blue. $C_{27}H_{31}N_2NaO_6S_2$. (M_r 566.6). *1086000.* [129-17-9].

Schultz No. 769.

Colour Index No. 42045.
Acid Blue 1. Patent Blue VF. Disulphine blue.
Blue VS. Sodium [[[(4-diethylamino)phenyl](2,4-disulphonatophenyl)methylene]cyclohexa-2,5-dien-1-ylidene]diethylammonium.

A violet powder, soluble in water. Dilute solutions are blue and turn yellow on the addition of concentrated hydrochloric acid.

Sulphanilic acid. $C_6H_7NO_3S$. (M_r 173.2). *1086200.* [121-57-3]. 4-Aminobenzenesulphonic acid.

Colourless crystals, sparingly soluble in water, practically insoluble in alcohol.

Sulphanilic acid solution. *1086203.*

Dissolve 0.33 g of *sulphanilic acid R* in 75 ml of *water R* heating gently if necessary and dilute to 100 ml with *glacial acetic acid R*.

Sulphanilic acid solution R1. *1086201.*

Dissolve 0.5 g of *sulphanilic acid R* in a mixture of 75 ml of *dilute acetic acid R* and 75 ml of *water R*.

Sulphanilic acid solution, diazotised. *1086202.*

Dissolve, with warming, 0.9 g of *sulphanilic acid R* in 9 ml of *hydrochloric acid R*, and dilute to 100 ml with *water R*. Cool 10 ml of this solution in iced water and add 10 ml of an ice-cold 45 g/l solution of *sodium nitrite R*. Allow to stand at 0 °C for 15 min (if stored at this temperature, the solution is stable for 3 days) and immediately before use add 20 ml of a 100 g/l solution of *sodium carbonate R*.

Sulfathiazole. $C_9H_9N_3O_2S_2$. (M_r 255.3). *1086300.* [72-14-0]. 4-Amino-*N*-(thiazol-2-yl)benzenesulphonamide.

White or yellowish-white powder or crystals, very slightly soluble in water, soluble in acetone, slightly soluble in alcohol. It dissolves in dilute mineral acids and in solutions of alkali hydroxides and carbonates.

mp: about 200 °C.

Sulphomolybdic reagent R2. *1086400.*

Dissolve about 50 mg of *ammonium molybdate R* in 10 ml of *sulphuric acid R*.

Sulphomolybdic reagent R3. *1086500.*

Dissolve with heating 2.5 g of *ammonium molybdate R* in 20 ml of *water R*. Dilute 28 ml of *sulphuric acid R* in 50 ml of *water R*, then cool. Mix the two solutions and dilute to 100 ml with *water R*.

Storage: in a polyethylene container.

Sulphosalicylic acid. $C_7H_6O_6S,2H_2O$. (M_r 254.2). *1086600.* [5965-83-3]. 2-Hydroxy-5-sulphobenzoic acid.

A white or almost white, crystalline powder or crystals, very soluble in water and in alcohol.

mp: about 109 °C.

Sulphur. *1110800.* [7704-34-9].

See *Sulphur for external use (0953)*.

Sulphur dioxide. SO_2. (M_r 64.1). *1086700.* [7446-09-5]. Sulphurous anhydride.

A colourless gas. When compressed it is a colourless liquid.

Sulphur dioxide R1. SO_2. (M_r 64.1). *1110900.*

Content: minimum 99.9 per cent *V/V* of SO_2.

Sulphuric acid. H_2SO_4. (M_r 98.1). *1086800.* [7664-93-9].

Content: 95.0 per cent *m/m* to 97.0 per cent *m/m* of H_2SO_4.

A colourless, caustic liquid with an oily consistency, highly hygroscopic, miscible with water and with alcohol producing intense heat.

d_{20}^{20}: 1.834 to 1.837.

A 10 g/l solution is strongly acid and gives the reactions of sulphates (*2.3.1*).

Appearance. It is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Oxidisable substances. Pour 20 g cautiously, with cooling, into 40 ml of *water R*. Add 0.5 ml of *0.002 M potassium permanganate*. The violet colour persists for at least 5 min.

Chlorides. Pour 10 g, carefully and while cooling, into 10 ml of *water R* and after cooling dilute to 20 ml with the same solvent. Add 0.5 ml of *silver nitrate solution R2*. Allow to stand for 2 min protected from bright light. The solution is not more opalescent than a standard prepared at the same time using a mixture of 1 ml of *chloride standard solution (5 ppm Cl) R*, 19 ml of *water R* and 0.5 ml of *silver nitrate solution R2* (0.5 ppm).

Nitrates. Pour 50 g or 27.2 ml, carefully and while cooling, into 15 ml of *water R*. Add 0.2 ml of a freshly prepared 50 g/l solution of *brucine R* in *glacial acetic acid R*. After 5 min any colour is less intense than that of a reference mixture prepared in the same manner and containing 12.5 ml of *water R*, 50 g of *nitrogen-free sulphuric acid R*, 2.5 ml of *nitrate standard solution (10 ppm NO_3) R* and 0.2 ml of a 50 g/l solution of *brucine R* in *glacial acetic acid R* (0.5 ppm).

Ammonium. Pour 2.5 g, carefully and while cooling, into *water R* and dilute to 20 ml with the same solvent. Cool, and add dropwise 10 ml of a 200 g/l solution of *sodium hydroxide R*, followed by 1 ml of *alkaline potassium tetraiodomercurate solution R*. The colour of the solution is less intense than that of a mixture of 5 ml of *ammonium standard solution (1 ppm NH_4) R*, 15 ml of *water R*, 10 ml of a 200 g/l solution of *sodium hydroxide R* and 1 ml of *alkaline potassium tetraiodomercurate solution R* (2 ppm).

Arsenic (*2.4.2*). To 50 g add 3 ml of *nitric acid R* and evaporate carefully until the volume is reduced to about 10 ml. Cool, add to the residue 20 ml of *water R* and concentrate to 5 ml. The solution complies with limit test A for arsenic (0.02 ppm). Prepare the standard using 1.0 ml of *arsenic standard solution (1 ppm As) R*.

Heavy metals (*2.4.8*). Dilute 10 ml of the solution obtained in the test for iron to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (2 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Iron (*2.4.9*). Dissolve the residue on ignition with slight heating in 1 ml of *dilute hydrochloric acid R* and dilute to 50.0 ml with *water R*. 5 ml of the solution diluted to 10 ml with *water R* complies with the limit test for iron (1 ppm).

Residue on ignition: maximum 0.001 per cent, determined on 100 g by evaporating cautiously in a small crucible over a naked flame and igniting the residue to redness.

Assay. Weigh accurately a ground-glass-stoppered flask containing 30 ml of *water R*, introduce 0.8 ml of the sulphuric acid, cool and weigh again. Titrate with *1 M sodium hydroxide*, using 0.1 ml of *methyl red solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 49.04 mg of H_2SO_4.

Storage: in a ground-glass-stoppered container made of glass or other inert material.

Sulphuric acid, alcoholic, 2.5 M. *1086801.*

Carefully and with constant cooling, stir 14 ml of *sulphuric acid R* into 60 ml of *ethanol R*. Allow to cool and dilute to 100 ml with *ethanol R*. Prepare immediately before use.

Sulphuric acid, alcoholic, 0.25 M. *1086802.*

Dilute 10 ml of *2.5 M alcoholic sulphuric acid R* to 100 ml with *ethanol R*. Prepare immediately before use.

Sulphuric acid, alcoholic solution of. *1086803.*

Carefully and with constant cooling, stir 20 ml of *sulphuric acid R* into 60 ml of *alcohol R*. Allow to cool and dilute to 100 ml with *alcohol R*. Prepare immediately before use.

Sulphuric acid, dilute. *1086804.*

Contains 98 g/l of H_2SO_4.

Add 5.5 ml of *sulphuric acid R* to 60 ml of *water R*, allow to cool and dilute to 100 ml with the same solvent.

Assay. Into a ground-glass-stoppered flask containing 30 ml of *water R*, introduce 10.0 ml of the dilute sulphuric acid. Titrate with *1 M sodium hydroxide*, using 0.1 ml of *methyl red solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 49.04 mg of H_2SO_4.

Sulphuric acid-formaldehyde reagent. *1086805.*

Mix 2 ml of *formaldehyde solution R* with 100 ml of *sulphuric acid R*.

Sulphuric acid, heavy metal-free. *1086807.*

Complies with the requirements prescribed for *sulphuric acid R* and with the following maximum contents of heavy metals:

As: 0.005 ppm;

Cd: 0.002 ppm;

Cu: 0.001 ppm;

Fe: 0.05 ppm;

Hg: 0.005 ppm;

Ni: 0.002 ppm;

Pb: 0.001 ppm;

Zn: 0.005 ppm.

Sulphuric acid, nitrogen-free. *1086806.*

Complies with the requirements prescribed for *sulphuric acid R* and with the following additional test.

Nitrates. To 5 ml of *water R* add carefully 45 ml of the sulphuric acid, allow to cool to 40 °C and add 8 mg of *diphenylbenzidine R*. The solution is faint pink or very pale blue.

Sulphuric acid, nitrogen-free R1. *1086808.*

Nitrogen-free sulphuric acid R containing 95.0 per cent *m/m* to 95.5 per cent *m/m* of H_2SO_4.

Sunflower oil. *1086900.*

See *Sunflower oil, refined (1371)*.

Swertiamarin. $C_{16}H_{22}O_{10}$. (M_r 374.3). *1163600.* [17388-39-5]. Swertiamaroside. (4*R*,5*R*,6*S*)-5-Ethenyl-6-(β-D-glucopyranosyloxy)-4a-hydroxy-4,4a,5,6-tetrahydro-1*H*,3*H*-pyrano[3,4-*c*]pyran-1-one.

Tagatose. $C_6H_{12}O_6$. (M_r 180.16). *1111000.* [87-81-0]. D-*lyxo*-Hexulose.

White or almost white powder.

$[\alpha]_D^{20}$: – 2.3 (21.9 g/l solution in *water R*).

mp: 134 °C to 135 °C.

Talc. *1087000.* [14807-96-6].

See *Talc (0438)*.

Tannic acid. *1087100.* [1401-55-4].

Yellowish to light-brown, glistening scales or amorphous powder, very soluble in water, freely soluble in alcohol, soluble in acetone.

Storage: protected from light.

Tartaric acid. *1087200.* [87-69-4].

See *Tartaric acid (0460)*.

Taxifolin. $C_{15}H_{12}O_7$. (M_r 304.3). *1151800.* [480-18-2]. (2*R*,3*R*)-2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-2,3-dihydro-4*H*-1-benzopyran-4-one.

White or almost white powder, slightly soluble in ethanol.

A solution in *ethanol R* shows an absorption maximum (*2.2.25*) at 290 nm.

Tecnazene. $C_6HCl_4NO_2$. (M_r 260.9). *1132400.* [117-18-0].

bp: about 304 °C.

mp: 99 °C to 100 °C.

A suitable certified reference solution (10 ng/µl in cyclohexane) may be used.

α-Terpinene. $C_{10}H_{16}$. (M_r 136.2). *1140300.* [99-86-5]. 1-Isopropyl-4-methylcyclohexa-1,3-diene.

Clear, almost colourless liquid.

d_4^{20}: about 0.837.

n_D^{20}: about 1.478.

bp: about 174 °C.

α-Terpinene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Tea tree oil (1837)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

γ-Terpinene. $C_{10}H_{16}$. (M_r 136.2). *1115900.* [99-85-4]. 1-Isopropyl-4-methylcyclohexa-1,4-diene.

An oily liquid.

γ-Terpinene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405).*

Test solution. The substance to be examined.

The area of the principal peak is not less than 93.0 per cent of the area of all the peaks in the chromatogram obtained.

Terpinen-4-ol. $C_{10}H_{18}O$. (M_r 154.2). *1116000.* [562-74-3]. 4-Methyl-1-(1-methylethyl)cyclohex-3-en-1-ol. *p*-Menth-1-en-4-ol.

An oily, colourless liquid.

Terpinen-4-ol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Lavender oil (1338).*

Test solution. The substance to be examined.

The area of the principal peak is not less than 90.0 per cent of the area of all the peaks in the chromatogram obtained.

α-Terpineol. $C_{10}H_{18}O$. (M_r 154.2). *1087300.* [98-55-5]. (*RS*)-2-(4-Methylcyclohex-3-enyl)-2-propanol.

Colourless crystals, practically insoluble in water, soluble in alcohol.

d_{20}^{20}: about 0.935.

n_D^{20}: about 1.483.

$[\alpha]_D^{20}$: about 92.5.

mp: about 35 °C.

It may contain 1 to 3 per cent of β-terpineol.

α-Terpineol used in gas chromatography complies with the following test.

Assay. Examine by gas chromatography (*2.2.28*) under the conditions described in the monograph on *Anise oil (0804).*

Test solution. A 100 g/l solution in *hexane R.*

The area of the principal peak is not less than 97.0 per cent of the total area of the peaks. Disregard the peak due to hexane.

Terpinolene. $C_{10}H_{16}$. (M_r 136.2). *1140400.* [586-62-9]. *p*-Mentha-1,4(8)-diene. 4-Isopropylidene-1-methylcyclohexene.

Clear, almost colourless liquid.

d_4^{20}: about 0.863.

n_D^{20}: about 1.488.

bp: about 184 °C.

Terpinolene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Tea tree oil (1837).*

The content is not less than 90 per cent, calculated by the normalisation procedure.

Testosterone. *1116100.* [58-22-0].

See *Testosterone (1373).*

Testosterone propionate. *1087400.* [57-85-2].

See *Testosterone propionate (0297).*

Tetrabutylammonium bromide. $C_{16}H_{36}BrN$. (M_r 322.4). *1087500.* [1643-19-2].

White or almost white crystals.

mp: 102 °C to 104 °C.

Tetrabutylammonium dihydrogen phosphate. $C_{16}H_{38}NO_4P$. (M_r 339.5). *1087600.* [5574-97-0].

White or almost white powder, hygroscopic.

pH (*2.2.3*): about 7.5 for a 170 g/l solution.

Absorbance (*2.2.25*): about 0.10 determined at 210 nm using a 170 g/l solution.

Storage: in an airtight container.

Tetrabutylammonium hydrogen sulphate. $C_{16}H_{37}NO_4S$. (M_r 339.5). *1087700.* [32503-27-8].

A crystalline powder or colourless crystals, freely soluble in water and in methanol.

mp: 169 °C to 173 °C.

Absorbance (*2.2.25*). The absorbance of a 50 g/l solution, at wavelengths from 240 nm to 300 nm, is not greater than 0.05.

Tetrabutylammonium hydrogen sulphate R1. *1087701.*

Complies with the requirements prescribed for *tetrabutylammonium hydrogen sulphate R* and with the following additional requirement:

Absorbance (*2.2.25*). The absorbance of a 50 g/l solution, at wavelengths from 215 nm to 300 nm, is not greater than 0.02.

Tetrabutylammonium hydroxide. $C_{16}H_{37}NO,30H_2O$. (M_r 800). *1087800.* [2052-49-5].

Content: minimum 98.0 per cent of $C_{16}H_{37}NO,30H_2O$.

White or almost white crystals, soluble in water.

Assay. Dissolve 1.000 g in 100 ml of *water R.* Titrate immediately with *0.1 M hydrochloric acid* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M hydrochloric acid* is equivalent to 80.0 mg $C_{16}H_{37}NO,30H_2O$.

Tetrabutylammonium hydroxide solution (104 g/l). *1087801.* [2052-49-5].

A solution containing 104 g/l of $C_{16}H_{37}NO$ (M_r 259.5), prepared by dilution of a suitable reagent grade.

Tetrabutylammonium hydroxide solution (400 g/l). *1087802.* [2052-49-5].

A solution containing 400 g/l of $C_{16}H_{37}NO$ M_r 259.5) of a suitable grade.

Tetrabutylammonium iodide. $C_{16}H_{36}IN$. (M_r 369.4). *1087900.* [311-28-4].

Content: minimum 98.0 per cent of $C_{16}H_{36}IN$.

White or slightly coloured, crystalline powder or crystals, soluble in alcohol.

Sulphated ash (*2.4.14*): maximum 0.02 per cent.

Assay. Dissolve 1.200 g in 30 ml of *water R.* Add 50.0 ml of *0.1 M silver nitrate* and 5 ml of *dilute nitric acid R.* Titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate,* using 2 ml of *ferric ammonium sulphate solution R2* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 36.94 mg of $C_{16}H_{36}IN$.

Tetrachloroethane. $C_2H_2Cl_4$. (M_r 167.9). *1088000.* [79-34-5]. 1,1,2,2-Tetrachloroethane.

A clear, colourless liquid, slightly soluble in water, miscible with alcohol.

d_{20}^{20}: about 1.59.

n_D^{20}: about 1.495.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 145 °C and 147 °C.

Tetrachlorvinphos. $C_{10}H_9Cl_4O_4P$. (M_r 366.0). *1132500.* [22248-79-9].

mp: about 95 °C.

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Tetracos-15-enoic acid methyl ester. $C_{25}H_{48}O_2$. (M_r 380.7). *1144800.* [2733-88-2]. 15-Tetracosaenoic acid methyl ester. Methyl tetracos-15-enoate. Nervonic acid methyl ester.

Content: minimum 99.0 per cent of $C_{25}H_{48}O_2$, determined by gas chromatography.

Liquid.

Tetracycline hydrochloride. *1147000.*

See *Tetracycline hydrochloride (0210).*

Tetradecane. $C_{14}H_{30}$. (M_r 198.4). *1088200.* [629-59-4]. *n*-Tetradecane.

Content: minimum 99.5 per cent *m/m* of $C_{14}H_{30}$.

A colourless liquid.

d_{20}^{20}: about 0.76.

n_D^{20}: about 1.429.

bp: about 252 °C.

mp: about – 5 °C.

Tetradecylammonium bromide. $C_{40}H_{84}BrN$. (M_r 659). *1088300.* [14937-42-9]. Tetrakis(decyl)ammonium bromide.

A white or slightly coloured, crystalline powder or crystals.

mp: 88 °C to 89 °C.

Tetraethylammonium hydrogen sulphate. $C_8H_{21}NO_4S$. (M_r 227.3). *1116200.* [16873-13-5].

Hygroscopic powder.

mp: about 245 °C.

Tetraethylammonium hydroxide solution. $C_8H_{21}NO$. (M_r 147.3). *1100300.* [77-98-5].

A 200 g/l aqueous solution, colourless liquid, strongly alkaline.

d_{20}^{20}: about 1.01.

n_D^{20}: about 1.372.

HPLC grade.

Tetraethylene pentamine. $C_8H_{23}N_5$. (M_r 189.3). *1102000.* [112-57-2]. 3,6,9-Triazaundecan-1,11-diamine.

Colourless liquid, soluble in acetone.

n_D^{20}: about1.506.

Storage: protected from humidity and heat.

Tetraheptylammonium bromide. $C_{28}H_{60}BrN$. (M_r 490.7). *1088400.* [4368-51-8].

A white or slightly coloured, crystalline powder or crystals.

mp: 89 °C to 91 °C.

Tetrahexylammonium bromide. $C_{24}H_{52}BrN$. (M_r 434.6). *1152500.* [4328-13-6]. *N,N,N*-Trihexylhexan-1-aminium bromide.

White or almost white, crystalline powder, hygroscopic.

mp: about 100 °C.

Tetrahexylammonium hydrogen sulphate. $C_{24}H_{53}NO_4S$. (M_r 451.8). *1116300.* [32503-34-7]. *N,N,N*-Trihexylhexan-1-aminium hydrogen sulphate.

White or almost white crystals.

mp: 100 °C to 102 °C.

Tetrahydrofuran. C_4H_8O. (M_r 72.1). *1088500.* [109-99-9]. Tetramethylene oxide.

A clear, colourless, flammable liquid, miscible with water, with alcohol.

d_{20}^{20}: about 0.89.

Do not distil if the tetrahydrofuran does not comply with the test for peroxides.

Peroxides. Place 8 ml of *potassium iodide and starch solution R* in a 12 ml ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

Tetrahydrofuran used in spectrophotometry complies with the following additional requirement.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 20 per cent at 255 nm, 80 per cent at 270 nm, 98 per cent at 310 nm.

Tetrahydrofuran for chromatography R. *1147100.*

It complies with the requirements of *tetrahydrofuran R* and with the following requirements:

d_4^{20} = 0.8892.

bp: about 66 °C.

Content: minimum 99.8 per cent of C_4H_8O.

Tetramethylammonium bromide. $C_4H_{12}BrN$. (M_r 154.1). *1156600.* [64-20-0]. *N,N,N*-Trimethylmethanaminium bromide.

White or slightly yellow crystals, freely soluble in water.

mp: about 285 °C, with decomposition.

Tetramethylammonium chloride. $C_4H_{12}ClN$. (M_r 109.6). *1100400.* [75-57-0].

Colourless crystals, soluble in water and in alcohol.

mp: about 300 °C, with decomposition.

Tetramethylammonium hydrogen sulphate. $C_4H_{13}NO_4S$. (M_r 171.2). *1116400.* [80526-82-5].

Hygroscopic powder.

mp: about 295 °C.

Tetramethylammonium hydroxide. $C_4H_{13}NO,5H_2O$. (M_r 181.2). *1122800.* [10424-65-4]. Tetramethylammonium hydroxide pentahydrate.

Suitable grade for HPLC.

Tetramethylammonium hydroxide solution. *1088600.* [75-59-2].

Content: minimum 10.0 per cent *m/m* of $C_4H_{13}NO$. (M_r 91.2).

A clear, colourless or very pale yellow liquid, miscible with water and with alcohol.

Assay. To 1.000 g add 50 ml of *water R* and titrate with *0.05 M sulphuric acid*, using 0.1 ml of *methyl red solution R* as indicator.

1 ml of *0.05 M sulphuric acid* is equivalent to 9.12 mg of $C_4H_{13}NO$.

Tetramethylammonium hydroxide solution, dilute. *1088601.*

Dilute 10 ml of *tetramethylammonium hydroxide solution R* to 100 ml with *aldehyde-free alcohol R*. Prepare immediately before use.

Tetramethylbenzidine. $C_{16}H_{20}N_2$. (M_r 240.3). *1132600.* [54827-17-7]. 3,3′,5,5′-Tetramethylbiphenyl-4,4′-diamine.

A powder, practically insoluble in water, very soluble in methanol.

mp: about 169 °C.

1,1,3,3-Tetramethylbutylamine. $C_8H_{19}N$. (M_r 129.3). *1141500.* [107-45-9]. 2-Amino-2,4,4-trimethylpentane.

Clear, colourless liquid.

d_{20}^{20}: about 0.805.

n_D^{20}: about 1.424.

bp: about 140 °C.

Tetramethyldiaminodiphenylmethane. $C_{17}H_{22}N_2$. (M_r 254.4). *1088700.* [101-61-1]. 4,4′-Methylenebis-(*N,N*-dimethylaniline).

White to bluish-white crystals or leaflets, practically insoluble in water, slightly soluble in alcohol, soluble in mineral acids.

mp: about 90 °C.

Tetramethyldiaminodiphenylmethane reagent. *1088701.*

Solution A. Dissolve 2.5 g of *tetramethyldiaminodiphenylmethane R* in 10 ml of *glacial acetic acid R* and add 50 ml of *water R*.

Solution B. Dissolve 5 g of *potassium iodide R* in 100 ml of *water R*.

Solution C. Dissolve 0.30 g of *ninhydrin R* in 10 ml of *glacial acetic acid R* and add 90 ml of *water R*.

Mix solution A, solution B and 1.5 ml of solution C.

Tetramethylethylenediamine. $C_6H_{16}N_2$. (M_r 116.2). *1088800.* [110-18-9]. *N,N,N',N'*-Tetramethylethylenediamine.

A colourless liquid, miscible with water and with alcohol.

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.418.

bp: about 121 °C.

Tetramethylsilane. $C_4H_{12}Si$. (M_r 88.2). *1088900.* [75-76-3]. TMS.

A clear, colourless liquid, very slightly soluble in water, soluble in acetone and in alcohol.

d_{20}^{20}: about 0.64.

n_D^{20}: about 1.358.

bp: about 26 °C.

Tetramethylsilane used in nuclear magnetic resonance spectrometry complies with the following additional requirement.

In the nuclear magnetic resonance spectrum of an approximately 10 per cent *V/V* solution of the tetramethylsilane in *deuterated chloroform R*, the intensity of any foreign signal, excluding those due to spinning side bands and to chloroform, is not greater than the intensity of the C-13 satellite signals located at a distance of 59.1 Hz on each side of the principal signal of tetramethylsilane.

Tetrapropylammonium chloride. $C_{12}H_{28}ClN$. (M_r 221.8). *1151900.* [5810-42-4].

White or almost white, crystalline powder, sparingly soluble in water.

mp: about 241 °C.

Tetrazolium blue. $C_{40}H_{32}Cl_2N_8O_2$. (M_r 728). *1089000.* [1871-22-3]. 3,3′-(3,3′-Dimethoxy[1,1′-biphenyl]-4,4′-diyl)bis[2,5-diphenyl-2*H*-tetrazolium] dichloride.

Yellow crystals, slightly soluble in water, freely soluble in alcohol and in methanol, practically insoluble in acetone.

mp: about 245 °C, with decomposition.

Tetrazolium bromide. $C_{18}H_{16}BrN_5S$. (M_r 414.3). *1152700.* [298-93-1]. 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide. MTT.

Thallous sulphate. Tl_2SO_4. (M_r 504.8). *1089100.* [7446-18-6]. Dithallium sulphate.

White or almost white, rhomboid prisms, slightly soluble in water, practically insoluble in alcohol.

Thebaine. $C_{19}H_{21}NO_3$. (M_r 311.4). *1089200.* [115-37-7]. (5*R*,9*R*,13*S*)-4,5-Epoxy-3,6-dimethoxy-9a-methylmorphina-6,8-diene.

A white or pale yellow, crystalline powder, very slightly soluble in water, soluble in hot ethanol and in toluene.

mp: about 193 °C.

Chromatography (*2.2.27*). Examine as prescribed in identification test B in the monograph on *Raw opium (0777)*, applying to the plate as a band (20 mm × 3 mm) 20 µl of a 0.5 g/l solution. The chromatogram obtained shows an orange-red or red principal band with an R_F of about 0.5.

Theobromine. *1138800.* [83-67-0].

See *Theobromine (0298)*.

Theophylline. *1089300.* [58-55-9].

See *Theophylline (0299)*.

Thiamazole. $C_4H_6N_2S$. (M_r 114.2). *1089400.* [60-56-0]. Methimazole. 1-Methyl-1*H*-imidazole-2-thiol.

A white or almost white, crystalline powder, freely soluble in water, soluble in alcohol and in methylene chloride.

mp: about 145 °C.

2-(2-Thienyl)acetic acid. $C_6H_6O_2S$. (M_r 142.1). *1089500.* [1918-77-0].

A brown powder.

mp: about 65 °C.

Thioacetamide. C_2H_5NS. (M_r 75.1). *1089600.* [62-55-5].

A crystalline powder or colourless crystals, freely soluble in water and in alcohol.

mp: about 113 °C.

Thioacetamide reagent. *1089601.*

To 0.2 ml of *thioacetamide solution R* add 1 ml of a mixture of 5 ml of *water R*, 15 ml of *1 M sodium hydroxide* and 20 ml of *glycerol (85 per cent) R*. Heat in a water-bath for 20 s. Prepare immediately before use.

Thioacetamide solution. *1089602.*

A 40 g/l solution.

Thiobarbituric acid. $C_4H_4N_2O_2S$. (M_r 144.2). *1111200.* [504-17-6]. 4,6-Dihydroxy-2-sulfanylpyrimidine.

Thiodiethylene glycol. $C_4H_{10}O_2S$. (M_r 122.2). *1122900.* [111-48-8]. Di(2-hydroxyethyl) sulphide.

A colourless or yellow, viscous liquid. It contains at least 99.0 per cent of $C_4H_{10}O_2S$.

d_{20}^{20}: about 1.18.

Thioglycollic acid. $C_2H_4O_2S$. (M_r 92.1). *1089700.* [68-11-1]. 2-Mercaptoacetic acid.

A colourless liquid, miscible with water, soluble in alcohol.

Thiomalic acid. $C_4H_6O_4S$. (M_r 150.2). *1161600.* [70-49-5]. (2*RS*)-2-Sulphanylbutanedioic acid.

mp: 150 °C to 152 °C.

Thiomersal. $C_9H_9HgNaO_2S$. (M_r 404.8). *1089800.* [54-64-8]. Sodium mercurothiolate. Sodium 2-[(ethylmercurio)thio]benzoate.

A light, yellowish-white, crystalline powder, very soluble in water, freely soluble in alcohol.

Thiourea. CH_4N_2S. (M_r 76.1). *1089900.* [62-56-6].

White or almost white, crystalline powder or crystals, soluble in water and in alcohol.

mp: about 178 °C.

Threonine. *1090000.* [72-19-5].

See *Threonine (1049).*

Thrombin, bovine. *1090200.* [9002-04-4].

A preparation of the enzyme, obtained from bovine plasma, that converts fibrinogen into fibrin.

A yellowish-white powder.

Storage: at a temperature below 0 °C.

Thrombin, human. *1090100.* [9002-04-4].

Dried human thrombin. A preparation of the enzyme which converts human fibrinogen into fibrin. It is obtained from liquid human plasma and may be prepared by precipitation with suitable salts and organic solvents under controlled conditions of pH, ionic strength and temperature.

A yellowish-white powder, freely soluble in a 9 g/l solution of sodium chloride forming a cloudy, pale yellow solution.

Storage: in a sealed, sterile container under nitrogen, protected from light, at a temperature below 25 °C.

Thrombin solution, human. *1090101.*

Reconstitute *human thrombin R* as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* to 5 IU/ml.

Thrombin solution, human R1. *1090102.*

Reconstitute *human thrombin R* as directed by the manufacturer and dilute to 2.5 IU/ml with *phosphate buffer solution pH 6.5 R.*

Thromboplastin. *1090300.*

Extract 1.5 g of *acetone-dried ox brain R* with 60 ml of *water R* at 50 °C for 10 min to 15 min, centrifuge at 1500 r/min for 2 min and decant the supernatant liquid. The extract retains its activity for several days when stored in a refrigerator. It may contain 3 g/l of *cresol R* as an antimicrobial preservative.

Thujone. $C_{10}H_{16}O$. (M_r 152.2). *1116500.* [76231-76-0]. 4-Methyl-1-(1-methylethyl)bicyclo[3.1.0]hexan-3-one.

A colourless or almost colourless liquid, practically insoluble in water, soluble in alcohol and in many other organic solvents.

Thymidine. $C_{10}H_{14}N_2O_5$. (M_r 242.2). *1158900.* 1-(2-Deoxy-β-D-*erythro*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione.

Needles, soluble in water, in hot ethanol (96 per cent) and in glacial acetic acid.

Thymine. $C_5H_6N_2O_2$. (M_r 126.1). *1090400.* [65-71-4]. 5-Methylpyrimidine-2,4(1*H*,3*H*)-dione.

Short needles or plates, slightly soluble in cold water, soluble in hot water. It dissolves in dilute solution of alkali hydroxides.

Thymol. *1090500.* [89-83-8]. See *Thymol (0791).*

Thymol used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405).*

Test solution. Dissolve 0.1 g in about 10 ml of *acetone R.*

The area of the principal peak is not less than 95.0 per cent of the area of all the peaks in the chromatogram obtained. Disregard the peak due to acetone.

Thymol blue. $C_{27}H_{30}O_5S$. (M_r 466.6). *1090600.* [76-61-9]. Thymolsulphonphthalein. 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2-isopropyl-5-methylphenol) *S,S*-dioxide.

A brownish-green to greenish-blue, crystalline powder, slightly soluble in water, soluble in alcohol and in dilute solutions of alkali hydroxides.

Thymol blue solution. *1090601.*

Dissolve 0.1 g of *thymol blue R* in a mixture of 2.15 ml of *0.1 M sodium hydroxide* and 20 ml of *alcohol R* and dilute to 100 ml with *water R.*

Test for sensitivity. To 0.1 ml of the thymol blue solution add 100 ml of *carbon dioxide-free water R* and 0.2 ml of *0.02 M sodium hydroxide.* The solution is blue. Not more than 0.15 ml of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 1.2 (red) to pH 2.8 (yellow); pH 8.0 (olive-green) to pH 9.6 (blue).

Thymolphthalein. $C_{28}H_{30}O_4$. (M_r 430.5). *1090700.* [125-20-2]. 3,3-bis(4-Hydroxy-5-isopropyl-2-methylphenyl)-3*H*-isobenzo-furan-1-one.

A white or yellowish-white powder, practically insoluble in water, soluble in alcohol and in dilute solutions of alkali hydroxides.

Thymolphthalein solution. *1090701.*

A 1 g/l solution in *alcohol R.*

Test for sensitivity. To 0.2 ml of the thymolphthalein solution add 100 ml of *carbon dioxide-free water R.* The solution is colourless. Not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour to blue.

Colour change: pH 9.3 (colourless) to pH 10.5 (blue).

Tin. Sn. (A_r 118.7). *1090800.* [7440-31-5].

Silvery-white granules, soluble in hydrochloric acid with release of hydrogen.

Arsenic (*2.4.2*). 0.1 g complies with limit test A (10 ppm).

Titan yellow. $C_{28}H_{19}N_5Na_2O_6S_4$. ($M_r$ 696). *1090900.* [1829-00-1].

Schultz No. 280.

Colour Index No. 19540.

Thiazol yellow. Disodium 2,2′-[(1-triazene-1,3-diyl)di-4,1-phenylene]bis-[6-methylbenzothiazole-7-sulphonate].

A yellowish-brown powder, freely soluble in water and in alcohol.

Titan yellow paper. *1090901.*

Immerse strips of filter paper in *titan yellow solution R* and leave for a few minutes. Allow to dry at room temperature.

Titan yellow solution. *1090902.*

A 0.5 g/l solution.

Test for sensitivity. To 0.1 ml of the titan yellow solution add 10 ml of *water R*, 0.2 ml of *magnesium standard solution (10 ppm Mg) R* and 1.0 ml of *1 M sodium hydroxide*. A distinct pink colour is visible by comparison with a reference solution prepared in a similar manner omitting the magnesium.

Titanium. Ti. (A_r 47.88). *1091000.* [7440-32-6].

Content: minimum 99 per cent of Ti.

Metal powder, fine wire (diameter not more than 0.5 mm), sponge.

mp: about 1668 °C.

Density: about 4.507 g/cm^3.

Titanium dioxide. *1117900.* [13463-67-7].

See *Titanium dioxide (0150)*.

Titanium trichloride. $TiCl_3$. (M_r 154.3). *1091200.* [7705-07-9]. Titanium(III) chloride.

Reddish-violet crystals, deliquescent, soluble in water and in alcohol.

mp: about 440 °C.

Storage: in an airtight container.

Titanium trichloride solution. *1091201.*

d_{20}^{20}: about 1.19.

A 150 g/l solution in hydrochloric acid (100 g/l HCl).

Titanium trichloride-sulphuric acid reagent. *1091202.*

Carefully mix 20 ml of *titanium trichloride solution R* with 13 ml of *sulphuric acid R*. Add sufficient *strong hydrogen peroxide solution R* to give a yellow colour. Heat until white fumes are evolved. Allow to cool. Dilute with *water R* and repeat the evaporation and addition of *water R* until a colourless solution is obtained. Dilute to 100 ml with *water R*.

TLC aluminium oxide G plate. *1165200.*

Support of metal, glass or plastic, coated with a layer of aluminium oxide (particle size 5-40 µm) containing about 10 per cent of calcium sulphate hemihydrate as a binder.

TLC octadecylsilyl silica gel plate. *1148600.*

Support of glass, metal or plastic coated with a layer of octadecylsilyl silica gel. The plate may contain an organic binder.

TLC octadecylsilyl silica gel F_{254} plate R. *1146600.*

Support of glass, metal or plastic coated with a layer of octadecylsilyl silica gel.

It contains a fluorescent indicator having a maximum absorbance in ultraviolet light at 254 nm.

TLC performance test solution. *1116600.*

Prepare a mixture of 1.0 ml of each of the following solutions and dilute to 10.0 ml with *acetone R*: a 0.5 g/l solution of *Sudan red G R* in *toluene R*, a 0.5 g/l solution of *methyl orange R* in *ethanol R* prepared immediately before use, a 0.5 g/l solution of *bromocresol green R* in *acetone R* and a 0.25 g/l solution of *methyl red R* in *acetone R*.

TLC silica gel plate. *1116700.*

Support of glass, metal or plastic, coated with a layer of silica gel of a suitable thickness and particle size (usually 2 µm to 10 µm for fine particle size (High Performance Thin-Layer Chromatography, HPTLC) plates and 5 µm to 40 µm for normal TLC plates). If necessary, the particle size is indicated after the name of the reagent in the tests where it is used.

The plate may contain an organic binder.

Chromatographic separation. Apply to the plate an appropriate volume (10 µl for a normal TLC plate and 1 µl to 2 µl for a fine particle size plate) of *TLC performance test solution R*. Develop over a pathlength two-thirds of the plate height, using a mixture of 20 volumes of *methanol R* and 80 volumes of *toluene R*. The plate is not satisfactory, unless the chromatogram shows four clearly separated spots, the spot of bromocresol green with an R_F value less than 0.15, the spot of methyl orange with an R_F value in the range of 0.1 to 0.25, the spot of methyl red with an R_F value in the range of 0.35 to 0.55 and the spot of Sudan red G with an R_F value in the range of 0.75 to 0.98.

TLC silica gel F_{254} plate. *1116800.*

It complies with the requirements prescribed for *TLC silica gel plate R* with the following modification.

It contains a fluorescent indicator having a maximum absorbance at 254 nm.

Fluorescence suppression. Apply separately to the plate at five points increasing volumes (1 µl to 10 µl for normal TLC plates and 0.2 µl to 2 µl for fine particle size plates) of a 1 g/l solution of *benzoic acid R* in a mixture of 15 volumes of *ethanol R* and 85 volumes of *cyclohexane R*. Develop over a pathlength half of the plate height with the same mixture of solvents. After evaporating the solvents examine the chromatogram in ultraviolet light at 254 nm. For normal TLC plates the benzoic acid appears as dark spots on a fluorescent background approximately in the middle of the chromatogram for quantities of 2 µg and greater. For fine particle size plates the benzoic acid appears as dark spots on a fluorescent background approximately in the middle of the chromatogram for quantities of 0.2 µg and greater.

TLC silica gel F_{254}, silanised plate. *1117200.*

It complies with the requirements prescribed for *TLC silica gel silanised plate R* with the following modification.

It contains a fluorescent indicator having a maximum absorbance at 254 nm.

TLC silica gel G plate. *1116900.*

It complies with the requirements prescribed for *TLC silica gel plate R* with the following modification.

It contains calcium sulphate hemihydrate as binder.

TLC silica gel GF_{254} plate. *1117000.*

It complies with the requirements prescribed for *TLC silica gel plate R* with the following modifications.

It contains calcium sulphate hemihydrate as binder and a fluorescent indicator having a maximum absorbance at 254 nm.

Fluorescence suppression. Complies with the test prescribed for *TLC silica gel F_{254} plate R*.

TLC silica gel plate for chiral separations, octadecylsilyl. *1137700.*

Support of glass, metal or plastic, coated with a layer of octadecylsilyl silica gel, impregnated with Cu^{2+} ions and enantiomerically pure hydroxyproline. The plate may contain an organic binder.

TLC silica gel, silanised plate. *1117100.*

Support of glass, metal or plastic, coated with a layer of silanised silica gel of a suitable thickness and particle size (usually 2 µm to 10 µm for fine particle size (High Performance Thin-Layer Chromatography, HPTLC) plates and 5 µm to 40 µm for normal TLC plates). If necessary, the particle size is indicated after the name of the reagent in the tests where it is used.

The plate may contain an organic binder.

Chromatographic separation. Introduce 0.1 g each of *methyl laurate R, methyl myristate R, methyl palmitate R* and *methyl stearate R* into a 250 ml conical flask. Add 40 ml of *alcoholic potassium hydroxide solution R* and heat under a reflux condenser on a water-bath for 1 h. Allow to cool, transfer the solution to a separating funnel by means of 100 ml of *water R*, acidify (pH 2 to 3) with *dilute hydrochloric acid R* and shake with three quantitites each of 10 ml of *methylene chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 50 ml of *methylene chloride R*. Examine by thin-layer chromatography (*2.2.27*), using *silanised TLC silica gel plate R*. Apply an appropriate quantity (about 10 µl for normal TLC plates and about 1 µl to 2 µl for fine particle size plates) of the methylene chloride solution at each of three separate points. Develop over a pathlength two-thirds of the plate height with a mixture of 10 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 65 volumes of *dioxan R*. Dry the plate at 120 °C for 30 min. Allow to cool, spray with a 35 g/l solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 150 °C until the spots become visible. Treat the plate with ammonia vapour until the background is white. The chromatograms show four clearly separated, well-defined spots.

α-Tocopherol. *1152300.* [10191-41-0].

See *all-rac-α-Tocopherol (0692)*.

α-Tocopheryl acetate. *1152400.* [7695-91-2].

See *all-rac-α-Tocopheryl acetate (0439)*.

***o*-Tolidine.** $C_{14}H_{16}N_2$. (M_r 212.3). *1123000.* [119-93-7]. 3,3′-Dimethylbenzidine.

Content: minimum 97.0 per cent of $C_{14}H_{16}N_2$.

A light brownish, crystalline power.

mp: about 130 °C.

***o*-Tolidine solution.** *1123001.*

Dissolve 0.16 g of *o-tolidine R* in 30.0 ml of *glacial acetic acid R*, add 1.0 g of *potassium iodide R* and dilute to 500.0 ml with *water R*.

Toluene. C_7H_8. (M_r 92.1). *1091300.* [108-88-3]. Methylbenzene.

A clear, colourless, flammable liquid, very slightly soluble in water, miscible with alcohol.

d_{20}^{20}: 0.865 to 0.870.

bp: about 110 °C.

Toluene, sulphur-free. *1091301.*

Complies with the requirements prescribed for *toluene R* and with the following additional requirements:

Sulphur compounds. To 10 ml add 1 ml of *ethanol R* and 3 ml of *potassium plumbite solution R* and boil under a reflux condenser for 15 min. Allow to stand for 5 min. No darkening is produced in the aqueous layer.

Thiophen-related substances. Shake 2 ml with 5 ml of *isatin reagent R* for 5 min and allow to stand for 15 min. No blue colour is produced in the lower layer.

Toluenesulphonamide. $C_7H_9NO_2S$. (M_r 171.2). *1091500.* [70-55-3]. 4-Methylbenzenesulphonamide. *p*-Toluenesulphonamide.

A white or almost white, crystalline powder, slightly soluble in water, soluble in alcohol and in solutions of alkali hydroxides.

mp: about 136 °C.

Chromatography. Examine as prescribed in the monograph on *Tolbutamide (0304)*; the chromatogram shows only one principal spot.

***o*-Toluenesulphonamide.** $C_7H_9NO_2S$. (M_r 171.2). *1091400.* [88-19-7]. 2-Methylbenzenesulphonamide.

A white or almost white, crystalline powder, slightly soluble in water, soluble in alcohol and in solutions of alkali hydroxides.

mp: about 156 °C.

***p*-Toluenesulphonamide.** *1091500.* [70-55-3].

See *toluenesulphonamide R*.

Toluenesulphonic acid. $C_7H_8O_3S,H_2O$. (M_r 190.2). *1091600.* [6192-52-5]. 4-Methylbenzenesulphonic acid.

Content: minimum 87.0 per cent of $C_7H_8O_3S$.

A white or almost white, crystalline powder or crystals, freely soluble in water, soluble in alcohol.

***o*-Toluidine.** C_7H_9N. (M_r 107.2). *1091700.* [95-53-4]. 2-Methylaniline.

A pale-yellow liquid becoming reddish-brown on exposure to air and light, slightly soluble in water, soluble in alcohol and in dilute acids.

d_{20}^{20}: about 1.01.

n_D^{20}: about 1.569.

bp: about 200 °C.

Storage: in an airtight container, protected from light.

***o*-Toluidine hydrochloride.** $C_7H_{10}ClN$. (M_r 143.6). *1117300.* [636-21-5]. 2-Methylaniline hydrochloride. 2-Methylbenzenamine hydrochloride.

Content: minimum 98.0 per cent of $C_7H_{10}ClN$.

mp: 215 °C to 217 °C.

***p*-Toluidine.** C_7H_9N. (M_r 107.2). *1091800.* [106-49-0]. 4-Methylaniline.

Lustrous plates or flakes, slightly soluble in water, freely soluble in acetone and in alcohol.

mp: about 44 °C.

Toluidine blue. $C_{15}H_{16}ClN_3S$. (M_r 305.8). *1091900.* [92-31-9].

Schultz No. 1041.

Colour Index No. 52040.

Toluidine Blue O. 3-Amino-7-dimethylamino-2-methylphenothiazin-5-ium chloride.

A dark-green powder, soluble in water, slightly soluble in alcohol.

Tosylarginine methyl ester hydrochloride. $C_{14}H_{23}ClN_4O_4S$. (M_r 378.9). *1092000.* [1784-03-8]. *N*-Tosyl-L-arginine methyl ester hydrochloride. Methyl (*S*)-5-guanidino-2-(4-methylbenzenesulphonamido)valerate hydrochloride.

$[\alpha]_D^{20}$: – 12 to – 16, determined on a 40 g/l solution.

mp: about 145 °C.

Tosylarginine methyl ester hydrochloride solution. *1092001.*

To 98.5 mg of *tosylarginine methyl ester hydrochloride R* add 5 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 8.1 R* and shake to dissolve. Add 2.5 ml of *methyl red mixed solution R* and dilute to 25.0 ml with *water R*.

Tosyl-lysyl-chloromethane hydrochloride. $C_{14}H_{22}Cl_2N_2O_3S$. (M_r 369.3). *1092100.* [4238-41-9]. *N*-Tosyl-L-lysyl-chloromethane hydrochloride. (3*S*)-7-Amino-1-chloro-3-(4-methylbenzenesulphonamido)heptan-2-one hydrochloride.

$[\alpha]_D^{20}$: – 7 to – 9, determined on a 20 g/l solution.

mp: about 155 °C, with decomposition.

$A_{1\,cm}^{1\%}$: 310 to 340, determined at 230 nm in *water R*.

Tosylphenylalanylchloromethane. $C_{17}H_{18}ClNO_3S$. (M_r 351.9). *1092200.* [402-71-1]. *N*-Tosyl-L-phenylalanylchloromethane.

$[\alpha]_D^{20}$: – 85 to – 89, determined on a 10 g/l solution in *alcohol R*.

mp: about 105 °C.

$A_{1\,cm}^{1\%}$: 290 to 320, determined at 228.5 nm in *alcohol R*.

Toxaphene. *1132800.* [8001-35-2].

A mixture of polychloro derivatives.

mp: 65 °C to 90 °C.

A suitable certified reference solution (10 ng/µl in iso-octane) may be used.

Tragacanth. *1092300.* [9000-65-1].

See *Tragacanth (0532)*.

Triacetin. $C_9H_{14}O_6$. (M_r 218.2). *1092400.* [102-76-1]. Propane-1,2,3-triyl triacetate. Glycerol triacetate.

An almost clear, colourless to yellowish liquid, soluble in water, miscible with alcohol.

d_{20}^{20}: about 1.16.

n_D^{20}: about 1.43.

bp: about 260 °C.

Triamcinolone. $C_{21}H_{27}FO_6$. (M_r 394.4). *1111300.* [124-94-7]. 9-Fluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione.

A crystalline powder.

mp: 262 °C to 263 °C.

Triamcinolone acetonide. *1133100.* [76-25-5].

See *Triamcinolone acetonide (0533)*.

Tribromophenol. $C_6H_3Br_3O$. (M_r 330.8). *1165300.* [118-79-6]. 2,4,6-Tribromophenol.

Tributyl citrate. $C_{18}H_{32}O_7$. (M_r 360.4). *1152800.* [77-94-1]. Tributyl 2-hydroxypropane-1,2,3-tricarboxylate.

d_4^{20}: about 1.043.

n_D^{20}: about 1.445.

Trichlorethylene. *1102100.*

See *Trichloroethylene R*.

Trichloroacetic acid. $C_2HCl_3O_2$. (M_r 163.4). *1092500.* [76-03-9].

Colourless crystals or a crystalline mass, very deliquescent, very soluble in water and in alcohol.

Storage: in an airtight container.

Trichloroacetic acid solution. *1092501.*

Dissolve 40.0 g of *trichloroacetic acid R* in *water R* and dilute to 1000.0 ml with the same solvent. Verify the concentration by titration with *0.1 M sodium hydroxide* and adjust if necessary to 40 ± 1 g/l.

1,1,1-Trichloroethane. $C_2H_3Cl_3$. (M_r 133.4). *1092600.* [71-55-6]. Methylchloroform.

A non-flammable liquid, practically insoluble in water, soluble in acetone and in methanol.

d_{20}^{20}: about 1.34.

n_D^{20}: about 1.438.

bp: about 74 °C.

Trichloroethylene. C_2HCl_3. (M_r 131.4). *1102100.* [79-01-6].

A colourless liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: about 1.46.

n_D^{20}: about 1.477.

Trichlorotrifluoroethane. $C_2Cl_3F_3$. (M_r 187.4). *1092700.* [76-13-1]. 1,1,2-Trichloro-1,2,2-trifluoroethane.

A colourless, volatile liquid, practically insoluble in water, miscible with acetone.

d_{20}^{20}: about 1.58.

Distillation range (*2.2.11*). Not less than 98 per cent distils between 47 °C and 48 °C.

Tricine. $C_6H_{13}NO_5$. (M_r 179.2). *1138900.* [5704–04–1]. *N*-[2-Hydroxy-1,1-bis(hydroxymethyl)ethyl]glycine.

Use electrophoresis-grade reagent.

mp: about 183 °C.

Tricosane. $C_{23}H_{48}$. (M_r 324.6). *1092800.* [638-67-5].

White or almost white crystals, practically insoluble in water, soluble in hexane.

mp: about 48 °C.

Tridocosahexaenoin. $C_{69}H_{98}O_6$. (M_r 1023.5). *1144900.* [124596-98-1]. Triglyceride of docosahexaenoic acid (C22:6). Glycerol tridocosahexaenoate. Propane-1,2,3-triyl tri-(*all-Z*)-docosa-4,7,10,13,16,19-hexaenoate.

The reagent from Nu-Chek Prep, Inc. has been found suitable.

Triethanolamine. *1092900.* [102-71-6].

See *Trolamine (1577)*.

Triethylamine. $C_6H_{15}N$. (M_r 101.2). *1093000.* [121-44-8]. *N,N*-Diethylethanamine.

A colourless liquid, slightly soluble in water at a temperature below 18.7 °C, miscible with alcohol.

d_{20}^{20}: about 0.727.

n_D^{20}: about 1.401.

bp: about 90 °C.

Triethylamine R1. $C_6H_{15}N$. (M_r 101.2). *1093001.* [121-44-8]. *N,N*-Diethylethanamine.

Complies with the requirements prescribed for *triethylamine R* and with the following additional requirements.

Content: minimum 99.5 per cent of $C_6H_{15}N$, determined by gas chromatography.

Water: maximum 0.1 per cent.

Use freshly distilled or from a freshly opened container.

Triethylenediamine. $C_6H_{12}N_2$. (M_r 112.2). *1093100.* 1,4-Diazabicyclo[2.2.2]octane.

Crystals, very hygroscopic, sublimes readily at room temperature, freely soluble in water, in acetone and in ethanol.

bp: about 174 °C.

mp: about 158 °C.

Storage: in an airtight container.

Triethyl phosphonoformate. $C_7H_{15}O_5P$. (M_r 210.2). *1132900.* [1474-78-8]. Ethyl (diethoxyphosphoryl)formate.

Colourless liquid.

$bp_{12\ mm}$: about 135 °C.

Trifluoroacetic acid. $C_2HF_3O_2$. (M_r 114.0). *1093200.* [76-05-1].

Content: minimum 99 per cent of $C_2HF_3O_2$.

Liquid, miscible with acetone and with alcohol.

d_{20}^{20}: about 1.53.

bp: about 72 °C.

Use a grade suitable for protein sequencing.

Storage: in an airtight container.

Trifluoroacetic anhydride. $C_4F_6O_3$. (M_r 210.0). *1093300.* [407-25-0].

Colourless liquid.

d_{20}^{20}: about 1.5.

4-Trifluoromethylphenol. $C_7H_5F_3O$. (M_r 162.1). *1161700.* [402-45-9].

White or light yellow, crystalline solid or powder.

mp: about 46 °C.

Trigonelline hydrochloride. $C_7H_8ClNO_2$. (M_r 173.6). *1117400.* [6138-41-6]. 3-Carboxy-1-methylpyridinium chloride. Nicotinic acid *N*-methylbetaine hydrochloride.

A crystalline powder, very soluble in water, soluble in alcohol.

mp: about 258 °C.

Trimethylpentane. C_8H_{18}. (M_r 114.2). *1093400.* [540-84-1]. Iso-octane. 2,2,4-Trimethylpentane.

A colourless, flammable liquid, practically insoluble in water, soluble in ethanol.

d_{20}^{20}: 0.691 to 0.696.

n_D^{20}: 1.391 to 1.393.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 98 °C and 100 °C.

Trimethylpentane used in spectrophotometry complies with the following additional requirement.

Minimum transmittance (*2.2.25*), determined using *water R* as compensation liquid: 98 per cent from 250 nm to 420 nm.

Trimethylpentane R1. *1093401.*

Complies with the requirements prescribed for *trimethylpentane R* with the following modification.

Absorbance (2.2.25). Not more than 0.07 from 220 nm to 360 nm, determined using *water R* as the compensation liquid.

***N,O*-bis(Trimethylsilyl)acetamide.** $C_8H_{21}NOSi_2$. (M_r 203.4). *1093600.* [10416-59-8].

Colourless liquid.

d_{20}^{20}: about 0.83.

***N*-Trimethylsilylimidazole.** $C_6H_{12}N_2Si$. (M_r 140.3). *1100500.* [18156-74-6]. 1-Trimethylsilylimidazole.

A colourless, hygroscopic liquid.

d_{20}^{20}: about 0.96.

n_D^{20}: about 1.48.

Storage: in an airtight container.

***N,O*-bis(Trimethylsilyl)trifluoroacetamide.** $C_8H_{18}F_3NOSi_2$. (M_r 257.4). *1133200.* [25561-30-2]. BSTFA.

Colourless liquid.

d_{20}^{20}: about 0.97.

n_D^{20}: about 1.38.

bp_{12mm}: about 40 °C

Trimethylsulphonium hydroxide. $C_3H_{10}OS$. (M_r 94.2). *1145000.* [17287-03-5].

d_4^{20}: about 0.81.

Trimethyltin chloride. C_3H_9ClSn. (M_r 199.3). *1170900.* [1066-45-1]. Chlorotrimethylstannane.

2,4,6-Trinitrobenzene sulphonic acid. $C_6H_3N_3O_9S,3H_2O$. (M_r 347.2). *1117500.* [2508-19-2].

A white or almost white, crystalline powder, soluble in water.

mp: 190 °C to 195 °C.

Triolein. $C_{57}H_{104}O_6$. (M_r 885.4). *1168200.* [122-32-7]. Propane-1,2,3-triyl tris[(9*Z*)-octadec-9-enoate]. *sn*-Glyceryl trioleate. Glycerol trioleate. Oleyl triglyceride.

Content: minimum 99.0 per cent.

Triphenylmethanol. $C_{19}H_{16}O$. (M_r 260.3). *1093700.* [76-84-6]. Triphenylcarbinol.

Colourless crystals, practically insoluble in water, freely soluble in alcohol.

Triphenyltetrazolium chloride. $C_{19}H_{15}ClN_4$. (M_r 334.8). *1093800.* [298-96-4]. 2,3,5-Triphenyl-2*H*-tetrazolium chloride.

Content: minimum 98.0 per cent of $C_{19}H_{15}ClN_4$. A pale or dull-yellow powder, soluble in water, in acetone and in alcohol.

mp: about 240 °C, with decomposition.

Assay. Dissolve 1.000 g in a mixture of 5 ml of *dilute nitric acid R* and 45 ml of *water R*. Add 50.0 ml of *0.1 M silver nitrate* and heat to boiling. Allow to cool, add 3 ml of *dibutyl phthalate R*, shake vigorously and titrate with *0.1 M ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 33.48 mg of $C_{19}H_{15}ClN_4$.

Storage: protected from light.

Triphenyltetrazolium chloride solution. *1093801.*

A 5 g/l solution in *aldehyde-free alcohol R*.

Storage: protected from light.

Triscyanoethoxypropane. $C_{12}H_{17}N_3O_3$. (M_r 251.3). *1093900.* 1,2,3-Tris(2-cyanoethoxy)propane.

A viscous, brown-yellow liquid, soluble in methanol. Used as a stationary phase in gas chromatography.

d_{20}^{20}: about 1.11.

Viscosity (*2.2.9*): about 172 mPa·s.

1,3,5-Tris[3,5-di(1,1-dimethylethyl)-4-hydroxybenzyl]-1,3,5-triazine-2,4,6(1*H*,3*H*,5*H*)-trione. $C_{48}H_{69}O_6N_3$. (M_r 784.1). *1094000.* [27676-62-6].

A white or almost white, crystalline powder.

mp: 218 °C to 222 °C.

Tris[2,4-di(1,1-dimethylethyl)phenyl] phosphite. $C_{42}H_{63}O_3P$. (M_r 647). *1094100.* [31570-04-4].

White or almost white powder.

mp: 182 °C to 186 °C.

Tris(hydroxymethyl)aminomethane. *1094200.* [77-86-1].

See *Trometamol (1053)*.

Tris(hydroxymethyl)aminomethane solution. *1094201.*

A solution containing the equivalent of 24.22 g of $C_4H_{11}NO_3$ in 1000.0 ml.

Tris(hydroxymethyl)aminomethane solution R1. *1094202.*

Dissolve 60.6 mg of *tris(hydroxymethyl)aminomethane R* and 0.234 g of *sodium chloride R* in *water R* and dilute to 100 ml with the same solvent.

Storage: at 2 °C to 8 °C; use within 3 days.

Tripotassium phosphate trihydrate. $K_3PO_4,3H_2O$. (M_r 266.3). *1155300.* [22763-03-7].

White or almost white crystalline powder, freely soluble in water.

Trisodium phosphate dodecahydrate. $Na_3PO_4,12H_2O$. (M_r 380.1). *1094300.* [10101-89-0].

Colourless or white or almost white crystals, freely soluble in water.

Troxerutin. $C_{33}H_{42}O_{19}$. (M_r 743). *1160300.* [7085-55-4]. Trihydroxyethylrutin. 3′,4′,7-Tris[*O*-(2-hydroxyethyl)]rutin. 2-[3,4-Bis(2-hydroxyethoxy)phenyl]-3-[[6-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-7-(2-hydroxyethoxy)-4*H*-1-benzopyran-4-one.

mp: 168 °C to 176 °C.

Trypsin. *1094500.* [9002-07-7].

A proteolytic enzyme obtained by activation of trypsinogen extracted from the pancreas of beef (*Bos taurus* L.).

A white or almost white, crystalline or amorphous powder, sparingly soluble in water.

Trypsin for peptide mapping. *1094600.* [9002-07-7].

Trypsin of high purity treated to eliminate chymotryptic activity.

Tryptophan. $C_{11}H_{12}N_2O_2$. (M_r 204.2). *1094700.* [73-22-3].

A white or yellowish-white, crystalline powder or colourless crystals, slightly soluble in water, very slightly soluble in alcohol.

$[\alpha]_D^{20}$: about –30, determined on a 10 g/l solution.

Tyramine. $C_8H_{11}NO$. (M_r 137.2). *1117600.* [51-67-2]. 4-(2-Aminoethyl)phenol.

Crystals, sparingly soluble in water, soluble in boiling ethanol.

mp: 164 °C to 165 °C.

Tyrosine. $C_9H_{11}NO_3$. (M_r 181.2). *1094800.* [60-18-4]. 2-Amino-3-(4-hydroxyphenyl)propionic acid.

A white or almost white, crystalline powder, or colourless or white or almost white crystals, slightly soluble in water, practically insoluble in acetone and in ethanol, soluble in dilute hydrochloric acid and in solutions of alkali hydroxides.

Chromatography. Examine as prescribed in the monograph on *Levodopa (0038)*; the chromatogram shows only one principal spot.

Umbelliferone. $C_9H_6O_3$. (M_r 162.1). *1137500.* [93-35-6]. 7-Hydroxycoumarin. 7-Hydroxy-2*H*-1-benzopyran-2-one.

Needles from water.

mp: 225 °C to 228 °C.

Uracil. $C_4H_4N_2O_2$. (M_r 112.1). *1161800.* [66-22-8].

Content: minimum 95.0 per cent.

Urea. *1095000.* [57-13-6].

See *Urea (0743)*.

Uridine. $C_9H_{12}N_2O_6$. (M_r 244.2). *1095100.* [58-96-8]. 1-β-D-Ribofuranosyluracil.

A white or almost white, crystalline powder, soluble in water.

mp: about 165 °C.

Ursolic acid. $C_{30}H_{48}O_3$. (M_r 456.7). *1141600.* [77-52-1]. (3β)-3-Hydroxyurs-12-en-28-oic acid.

White or almost white powder, practically insoluble in water, sparingly soluble in methanol, slightly soluble in alcohol.

$[\alpha]_D^{21}$: about 67.50 (10 g/l solution in a 56.1 g/l solution of *potassium hydroxide R* in *alcohol R*).

mp: 285 °C to 288 °C.

Valencene. $C_{15}H_{24}$. (M_r 204.4). *1152100.* [4630-07-3]. 4β*H*,5α-Eremophila-1(10),11-diene. (1*R*,7*R*,8a*S*)-1,8a-Dimethyl-7-(1-methylethenyl)-1,2,3,5,6,7,8,8a-octahydronaphthalene.

Oily, colourless to pale yellow liquid, with a characteristic odour, practically insoluble in water, soluble in alcohol.

d_4^{20}: about 0.918.

n_D^{20}: about 1.508.

bp: about 123 °C.

Valencene used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Sweet orange oil (1811)*.

The content is not less than 80 per cent, calculated by the normalisation procedure.

Valerenic acid. $C_{15}H_{22}O_2$. (M_r 234.3). *1165700.* [3569-10-6]. (2*E*)-3-[(4*S*,7*R*,7a*R*)-3,7-Dimethyl-2,4,5,6,7,7a-hexahydro-1*H*-inden-4-yl]-2-methylprop-2-enoic acid.

mp: 134 °C to 138 °C.

Valeric acid. $C_5H_{10}O_2$. (M_r 102.1). *1095200.* [109-52-4]. Pentanoic acid.

A colourless liquid, soluble in water, freely soluble in alcohol.

d_{20}^{20}: about 0.94.

n_D^{20}: about 1.409.

bp: about 186 °C.

Vanillin. *1095300.* [121-33-5].

See *Vanillin (0747)*.

Vanillin reagent. *1095301.*

Carefully add, dropwise, 2 ml of *sulphuric acid R* to 100 ml of a 10 g/l solution of *vanillin R* in *alcohol R*.

Storage: use within 48 h.

Vanillin solution, phosphoric. *1095302.*

Dissolve 1.0 g of *vanillin R* in 25 ml of *alcohol R*. Add 25 ml of *water R* and 35 ml of *phosphoric acid R*.

Veratrole. $C_8H_{10}O_2$. (M_r 138.2). *1165400.* [91-16-7]. 1,2-Dimethoxybenzene.

d_4^{20}: 1.085.

n_D^{20}: 1.534.

bp: about 206 °C.

mp: about 22 °C.

Verbenone. $C_{10}H_{14}O$. (M_r 150.2). *1140500.* [1196-01-6]. (1*S*,5*S*)-4,6,6-Trimethylbicyclo[3.1.1]hept-3-en-2-one.

Oil with a characteristic odour, practically insoluble in water, miscible with organic solvents.

d_{20}^{20}: about 0.978.

n_D^{18}: about 1.49.

$[\alpha]_D^{18}$: about + 249.6.

bp: 227 °C to 228 °C.

mp: about 6.5 °C.

Verbenone used in gas chromatography complies with the following additional test.

Assay. Examine by gas chromatography (*2.2.28*) as prescribed in the monograph on *Rosemary oil (1846)*.

The content is not less than 99 per cent, calculated by the normalisation procedure.

Vinyl acetate. $C_4H_6O_2$. (M_r 86,10). *1111800.* [108-05-4]. Ethenyl acetate.

d_{20}^{20}: about 0.930.

bp: about 72 °C.

Vinyl chloride. C_2H_3Cl. (M_r 62.5). *1095400.* [75-01-4].

A colourless gas, slightly soluble in organic solvents.

Vinyl polymer for chromatography, octadecyl. *1155400.*

Spherical particles (5 µm) of a vinyl alcohol copolymer chemically modified by bonding of octadecyl groups on the hydroxyl groups.

Vinyl polymer for chromatography, octadecylsilyl. *1121600.*

Spherical particles (5 µm) of a vinyl alcohol copolymer bonded to an octadecylsilane. Carbon content of 17 per cent.

2-Vinylpyridine. C_7H_7N. (M_r 105.1). *1102200.* [100-69-6].

A yellow liquid, miscible in water.

d_{20}^{20}: about 0.97.

n_D^{20}: about 1.549.

1-Vinylpyrrolidin-2-one. C_6H_9NO. (M_r 111.1). *1111900.* [88-12-0]. 1-Ethenylpyrrolidin-2-one.

Content: minimum 99.0 per cent of C_6H_9NO.

A clear colourless liquid.

Water (*2.5.12*): maximum 0.1 per cent, determined on 2.5 g. Use as the solvent, a mixture of 50 ml of *anhydrous methanol R* and 10 ml of *butyrolactone R*.

Assay. Examine by gas chromatography (*2.2.28*).

The chromatography may be carried out using

- a fused-silica column 30 m long and 0.5 mm in internal diameter the inner wall of which is coated with a 1.0 µm layer of *macrogol 20 000 R*,
- *helium for chromatography R* as the carrier gas,
- a flame-ionisation detector,

maintaining the temperature of the injection port at 190 °C and programming the temperature of the column as follows: maintain the temperature at 80 °C for 1 min and then increase it to 190 °C at a rate of 10 °C per minute. Maintain at 190 °C for 15 min. Inject 0.3 µl of the substance to be examined and adjust the flow rate of the carrier gas so that the retention time of the peak corresponding to 1-vinylpyrrolidin-2-one is about 17 min. Determine the content of C_6H_9NO by internal normalisation.

Vitexin. $C_{21}H_{20}O_{10}$. (M_r 448.4). *1133300.* [3681-93-4]. Apigenin 8-glucoside.

Yellow powder.

Storage: in an airtight container, protected from light.

Water. *1095500.* [7732-18-5].

See *Purified water (0008)*.

Water R1. *1095509.*

Prepared from *distilled water R* by multiple distillation. Remove carbon dioxide by boiling for at least 15 min before use in a boiling flask of fused silica or borosilicate glass and cool. Any other suitable method may be used. The boiling flask has been already used for the test or has been filled with *water R* and kept in an autoclave at 121 °C for at least 1 h prior to first use. When tested immediately before use, *water R1* is neutral to *methyl red solution R*, i.e. it shall produce an orange-red (not a violet-red or yellow) colour corresponding to pH 5.5 ± 0.1 when 0.05 ml of *methyl red solution R* is added to 50 ml of the water to be examined.

Conductivity: maximum 1 $\mu S \cdot cm^{-1}$, determined at 25 °C by an in-line conductivity meter (see *Purified water (0008)*).

Water, ammonium-free. *1095501.* [7732-18-5].

To 100 ml of *water R* add 0.1 ml of *sulphuric acid R*. Distil using the apparatus described for the determination of *Distillation range* (*2.2.11*). Reject the first 10 ml and collect the following 50 ml.

Water, carbon dioxide-free. *1095502.* [7732-18-5].

Water R which has been boiled for a few minutes and protected from the atmosphere during cooling and storage.

Water for chromatography. *1095503.* [7732-18-5].

Deionised *water R* with a resistivity of not less than 0.18 Mohm·m.

Water, distilled. *1095504.* [7732-18-5].

Water R prepared by distillation.

Water, distilled, deionised. *1095508.*

Deionised *water R* prepared by distillation with a resistivity of not less than 18 Mohm·m.

Water for injections. *1095505.* [7732-18-5].

See *Water for injections (0169)*.

Water, nitrate-free. *1095506.* [7732-18-5].

To 100 ml of *water R* add a few milligrams of *potassium permanganate R* and of *barium hydroxide R*. Distil using the apparatus described for the determination of *Distillation range* (*2.2.11*). Reject the first 10 ml and collect the following 50 ml.

Water, particle-free. *1095507.* [7732-18-5].

Filter *water R* through a membrane with a pore size of 0.22 µm.

Weak cationic resin. *1096000.*

Polymethacrylic resin, slightly acid, with carboxyl groups present in a protonated form.

Particle size: 75 µm to 160 µm.

pH limits of use: 5 to 14.

Maximum temperature of use: 120 °C.

Xanthydrol. $C_{13}H_{10}O_2$. (M_r 198.2). *1096100.* [90-46-0]. 9-Xanthenol.

Content: minimum 90.0 per cent of $C_{13}H_{10}O_2$.

A white to pale-yellow powder, very slightly soluble in water, soluble in alcohol and in glacial acetic acid.

It is also available as a methanolic solution containing 90 g/l to 110 g/l of xanthydrol.

mp: about 123 °C.

Assay. In a 250 ml flask dissolve 0.300 g in 3 ml of *methanol R* or use 3.0 ml of solution. Add 50 ml of *glacial acetic acid R* and, dropwise with shaking, 25 ml of a 20 g/l solution of *urea R*. Allow to stand for 12 h, collect the precipitate on a sintered-glass filter (16) (*2.1.2*), wash with 20 ml of *alcohol R*, dry in an oven at 100 °C to 105 °C and weigh.

1 g of precipitate is equivalent to 0.9429 g of xanthydrol.

Storage: protected from light. If a methanolic solution is used, store in small sealed ampoules and filter before use if necessary.

Xanthydrol R1. *1096101.*

Complies with the requirements prescribed for *xanthydrol R* and with the following requirement.

Content: minimum 98.0 per cent of $C_{13}H_{10}O_2$.

Xanthydrol solution. *1096102.*

To 0.1 ml of a 100 g/l solution of *xanthydrol R* in *methanol R* add 100 ml of *anhydrous acetic acid R* and 1 ml of *hydrochloric acid R*. Allow to stand for 24 h before using.

Xylene. C_8H_{10}. (M_r 106.2). *1096200.* [1330-20-7].

Mixture of isomers. A clear, colourless, flammable liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: about 0.867.

n_D^{20}: about 1.497.

bp: about 138 °C.

***m*-Xylene.** C_8H_{10}. (M_r 106.2). *1117700.* [108-38-3]. 1,3-Dimethylbenzene.

A clear, colourless, flammable liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: about 0.884.

n_D^{20}: about 1.497.

bp: about 139 °C.

mp: about – 47 °C.

***o*-Xylene.** C_8H_{10}. (M_r 106.2). *1100600.* [95-47-6]. 1,2-Dimethylbenzene.

A clear, colourless, flammable liquid, practically insoluble in water, miscible with alcohol.

d_{20}^{20}: about 0.881.

n_D^{20}: about 1.505.

bp: about 144 °C.

mp: about – 25 °C.

Xylenol orange. $C_{31}H_{28}N_2Na_4O_{13}S$. ($M_r$ 761). *1096300.* [3618-43-7]. Tetrasodium 3,3′-(3*H*-2,1-benzoxathiol-3-ylidene)bis[(6-hydroxy-5-methyl-3,1-phenylene)methyleneiminobisacetate] *S,S*-dioxide.

A reddish-brown crystalline powder, soluble in water.

Xylenol orange triturate. *1096301.*

Triturate 1 part of *xylenol orange R* with 99 parts of *potassium nitrate R*.

Test for sensitivity. To 50 ml of *water R* add 1 ml of *dilute acetic acid R*, 50 mg of the xylenol orange triturate and 0.05 ml of *lead nitrate solution R*. Add *hexamethylenetetramine R* until the colour changes from yellow to violet-red. After addition of 0.1 ml of *0.1 M sodium edetate* the colour changes to yellow.

Xylose. *1096400.* [58-86-6].

See *Xylose (1278)*.

Zinc. Zn. (A_r 65.4). *1096500.* [7440-66-6].

Content: minimum 99.5 per cent of Zn.

Silver-white cylinders, granules, pellets or filings with a blue sheen.

Arsenic (*2.4.2*). 5.0 g complies with limit test A (0.2 ppm). Dissolve in a mixture of the 15 ml of *hydrochloric acid R* and 25 ml of *water R* prescribed.

Zinc, activated. *1096501.*

Place the zinc cylinders or pellets to be activated in a conical flask and add a sufficient quantity of a 50 ppm solution of *chloroplatinic acid R* to cover the metal. Allow the metal to remain in contact with the solution for 10 min, wash, drain and dry immediately.

Arsenic. To 5 g of the activated zinc add 15 ml of *hydrochloric acid R*, 25 ml of *water R*, 0.1 ml of *stannous chloride solution R* and 5 ml of *potassium iodide solution R*. Treat as described in limit test A for arsenic (*2.4.2*). No stain is produced on the *mercuric bromide paper R*.

Activity. Repeat the test for arsenic using the same reagents and adding a solution containing 1 µg of arsenic. An appreciable stain appears on the *mercuric bromide paper R*.

Zinc acetate. $(C_2H_3O_2)_2Zn,2H_2O$. (M_r 219.5). *1102300.* [5970-45-6]. Zinc acetate dihydrate.

Bright white or almost white crystals, slightly efflorescent, freely soluble in water, soluble in alcohol. It loses its crystallisation water at 100 °C.

d_{20}^{20}: about 1.735.

mp: about 237 °C.

Zinc acetate solution. *1102301.*

Mix 600 ml of *water R* with 150 ml of *glacial acetic acid R*, 54.9 g of *zinc acetate R* and stir to dissolve. Continue stirring while adding 150 ml of *concentrated ammonia R*. Cool to room temperature and adjust with *ammonia R* to pH 6.4. Dilute the mixture to 1 litre with *water R*.

Zinc chloride. *1096600.* [7646-85-7].

See *Zinc chloride (0110).*

Zinc chloride-formic acid solution. *1096601.*

Dissolve 20 g of *zinc chloride R* in 80 g of an 850 g/l solution of *anhydrous formic acid R.*

Zinc chloride solution, iodinated. *1096602.*

Dissolve 20 g of *zinc chloride R* and 6.5 g of *potassium iodide R* in 10.5 ml of *water R.* Add 0.5 g of *iodine R* and shake for 15 min. Filter if necessary.

Storage: protected from light.

Zinc iodide and starch solution. *1096502.*

To a solution of 2 g of *zinc chloride R* in 10 ml of *water R* add 0.4 g of *soluble starch R* and heat until the starch has dissolved. After cooling to room temperature add 1.0 ml of a colourless solution containing 0.10 g *zinc R* as filings and 0.2 g of *iodine R* in *water R.* Dilute the solution to 100 ml with *water R* and filter.

Storage: protected from light.

Test for sensitivity. Dilute 0.05 ml of *sodium nitrite solution R* to 50 ml with *water R.* To 5 ml of this solution add 0.1 ml of *dilute sulphuric acid R* and 0.05 ml of the zinc iodide and starch solution and mix. The solution becomes blue.

Zinc oxide. *1096700.* [1314-13-2].

See *Zinc oxide (0252).*

Zinc powder. Zn. (A_r 65.4). *1096800.* [7440-66-6].

Content: minimum 90.0 per cent of Zn (A_r 65.4).

A very fine, grey powder, soluble in *dilute hydrochloric acid R.*

Zinc sulphate. *1097000.* [7446-20-0].

See *Zinc sulphate (0111).*

Zirconyl chloride. A basic salt corresponding approximately to the formula $ZrCl_2O, 8H_2O$. *1097100.* [15461-27-5].

Content: minimum 96.0 per cent of $ZrCl_2O,8H_2O$.

White or almost white, crystalline powder or crystals, freely soluble in water and in alcohol.

Assay. Dissolve 0.600 g in a mixture of 5 ml of *nitric acid R* and 50 ml of *water R.* Add 50.0 ml of *0.1 M silver nitrate* and 3 ml of *dibutyl phthalate R* and shake. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 16.11 mg of $ZrCl_2O,8H_2O$.

Zirconyl nitrate. A basic salt corresponding approximately to the formula $ZrO(NO_3)_2,2H_2O$. *1097200.* [14985-18-3].

A white or almost white powder or crystals, hygroscopic, soluble in water. The aqueous solution is a clear or at most slightly opalescent liquid.

Storage: in an airtight container.

Zirconyl nitrate solution. *1097201.*

A 1 g/l solution in a mixture of 40 ml of *water R* and 60 ml of *hydrochloric acid R.*

01/2008:40102

4.1.2. STANDARD SOLUTIONS FOR LIMIT TESTS

Acetaldehyde standard solution (100 ppm C_2H_4O). *5000100.*

Dissolve 1.0 g of *acetaldehyde R* in *2-propanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 500.0 ml with *2-propanol R.* Prepare immediately before use.

Acetaldehyde standard solution (100 ppm C_2H_4O) R1. *5000101.*

Dissolve 1.0 g of *acetaldehyde R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 500.0 ml with *water R.* Prepare immediately before use.

Aluminium standard solution (200 ppm Al). *5000200.*

Dissolve in *water R* a quantity of *aluminium potassium sulphate R* equivalent to 0.352 g of $AlK(SO_4)_2,12H_2O$. Add 10 ml of *dilute sulphuric acid R* and dilute to 100.0 ml with *water R.*

Aluminium standard solution (100 ppm Al). *5000203.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing 8.947 g of *aluminium chloride R* in 1000.0 ml of *water R.*

Aluminium standard solution (10 ppm Al). *5000201.*

Immediately before use, dilute with *water R* to 100 times its volume in a solution containing *aluminium nitrate R* equivalent to 1.39 g of $Al(NO_3)_3,9H_2O$ in 100.0 ml.

Aluminium standard solution (2 ppm Al). *5000202.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *aluminium potassium sulphate R* equivalent to 0.352 g of $AlK(SO_4)_2,12H_2O$ and 10 ml of *dilute sulphuric acid R* in 100.0 ml.

Ammonium standard solution (100 ppm NH_4). *5000300.*

Immediately before use, dilute to 25 ml with *water R* 10 ml of a solution containing *ammonium chloride R* equivalent to 0.741 g of NH_4Cl in 1000 ml.

Ammonium standard solution (2.5 ppm NH_4). *5000301.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *ammonium chloride R* equivalent to 0.741 g of NH_4Cl in 1000.0 ml.

Ammonium standard solution (1 ppm NH_4). *5000302.*

Immediately before use, dilute *ammonium standard solution (2.5 ppm NH_4) R* to 2.5 times its volume with *water R.*

Antimony standard solution (100 ppm Sb). *5000401.*

Dissolve *antimony potassium tartrate R* equivalent to 0.274 g of $C_4H_4KO_7Sb,{}^1/_2H_2O$ in 500 ml of *1M hydrochloric acid* and dilute the clear solution to 1000 ml with *water R.*

Antimony standard solution (1 ppm Sb). *5000400.*

Dissolve *antimony potassium tartrate R* equivalent to 0.274 g of $C_4H_4KO_7Sb,{}^1/_2H_2O$ in 20 ml of *hydrochloric acid R1* and dilute the clear solution to 100.0 ml with *water R.* To 10.0 ml of this solution add 200 ml of *hydrochloric acid R1* and dilute to 1000.0 ml with *water R.* To 100.0 ml of this solution add 300 ml of *hydrochloric acid R1* and dilute to 1000.0 ml with *water R.* Prepare the dilute solutions immediately before use.

Arsenic standard solution (10 ppm As). *5000500.*

Immediately before use, dilute with *water R* to 100 times its volume a solution prepared by dissolving *arsenious trioxide R* equivalent to 0.330 g of As_2O_3 in 5 ml of *dilute sodium hydroxide solution R* and diluting to 250.0 ml with *water R*.

Arsenic standard solution (1 ppm As). *5000501.*

Immediately before use, dilute *arsenic standard solution (10 ppm As) R* to 10 times its volume with *water R*.

Arsenic standard solution (0.1 ppm As). *5000502.*

Immediately before use, dilute *arsenic standard solution (1 ppm As) R* to 10 times its volume with *water R*.

Barium standard solution (0.1 per cent Ba). *5000601.*

Dissolve *barium chloride R* equivalent to 0.178 g of $BaCl_2,2H_2O$ in *distilled water R* and dilute to 100.0 ml with the same solvent.

Barium standard solution (50 ppm Ba). *5000600.*

Immediately before use, dilute with *distilled water R* to 20 times its volume a solution in *distilled water R* containing *barium chloride R* equivalent to 0.178 g of $BaCl_2,2H_2O$ in 100.0 ml.

Barium standard solution (2 ppm Ba). *5005600.*

Immediately before use, dilute *barium standard solution (50 ppm Ba) R* to 25 times its volume with *distilled water R*.

Bismuth standard solution (100 ppm Bi). *5005300.*

Dissolve *bismuth R* equivalent to 0.500 g of Bi in 50 ml of *nitric acid R* and dilute to 500.0 ml with *water R*. Dilute the solution to 10 times its volume with *dilute nitric acid R* immediately before use.

Cadmium standard solution (0.1 per cent Cd). *5000700.*

Dissolve *cadmium R* equivalent to 0.100 g of Cd in the smallest necessary amount of a mixture of equal volumes of *hydrochloric acid R* and *water R* and dilute to 100.0 ml with a 1 per cent *V/V* solution of *hydrochloric acid R*.

Cadmium standard solution (10 ppm Cd) . *5000701.*

Immediately before use, dilute *cadmium standard solution (0.1 per cent Cd) R* to 100 times its volume with a 1 per cent *V/V* solution of *hydrochloric acid R*.

Calcium standard solution (400 ppm Ca). *5000800.*

Immediately before use, dilute with *distilled water R* to 10 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 1.000 g of $CaCO_3$ and 23 ml of *1 M hydrochloric acid* in 100.0 ml.

Calcium standard solution (100 ppm Ca). *5000801.*

Immediately before use, dilute with *distilled water R* to 10 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 0.624 g of $CaCO_3$ and 3 ml of *acetic acid R* in 250.0 ml.

Calcium standard solution (100 ppm Ca) R1. *5000804.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *anhydrous calcium chloride R* equivalent to 2.769 g of $CaCl_2$ in 1000.0 ml of *dilute hydrochloric acid R*.

Calcium standard solution (100 ppm Ca), alcoholic. *5000802.*

Immediately before use, dilute with *alcohol R* to 10 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 2.50 g of $CaCO_3$ and 12 ml of *acetic acid R* in 1000.0 ml.

Calcium standard solution (10 ppm Ca). *5000803.*

Immediately before use, dilute with *distilled water R* to 100 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 0.624 g of $CaCO_3$ and 3 ml of *acetic acid R* in 250.0 ml.

Chloride standard solution (50 ppm Cl). *5004100.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *sodium chloride R* equivalent to 0.824 g of NaCl in 1000.0 ml.

Chloride standard solution (8 ppm Cl). *5000900.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *sodium chloride R* equivalent to 1.32 g of NaCl in 1000.0 ml.

Chloride standard solution (5 ppm Cl). *5000901.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *sodium chloride R* equivalent to 0.824 g of NaCl in 1000.0 ml.

Chromium liposoluble standard solution (1000 ppm Cr). *5004600.*

A chromium (metal) organic compound in an oil.

Chromium standard solution (0.1 per cent Cr). *5001002.*

Dissolve *potassium dichromate R* equivalent to 2.83 g of $K_2Cr_2O_7$ in *water R* and dilute to 1000.0 ml with the same solvent.

Chromium standard solution (100 ppm Cr). *5001000.*

Dissolve *potassium dichromate R* equivalent to 0.283 g of $K_2Cr_2O_7$ in *water R* and dilute to 1000.0 ml with the same solvent.

Chromium standard solution (0.1 ppm Cr). *5001001.*

Immediately before use, dilute *chromium standard solution (100 ppm Cr) R* to 1000 times its volume with *water R*.

Cobalt standard solution (100 ppm Co). *5004300.*

Dissolve *cobalt nitrate R* equivalent to 0.494 g of $Co(NO_3)_2,6H_2O$ in 500 ml of *1M nitric acid* and dilute the clear solution to 1000 ml with *water R*.

Copper liposoluble standard solution (1000 ppm Cu). *5004700.*

A copper (metal) organic compound in an oil.

Copper standard solution (0.1 per cent Cu). *5001100.*

Dissolve *copper sulphate R* equivalent to 0.393 g of $CuSO_4,5H_2O$ in *water R* and dilute to 100.0 ml with the same solvent.

Copper standard solution (10 ppm Cu). *5001101.*

Immediately before use, dilute *copper standard solution (0.1 per cent Cu) R* to 100 times its volume with *water R*.

Copper standard solution (0.1 ppm Cu). *5001102.*

Immediately before use, dilute *copper standard solution (10 ppm Cu) R* to 100 times its volume with *water R*.

Ferrocyanide standard solution (100 ppm $Fe(CN)_6$). *5001200.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *potassium ferrocyanide R* equivalent to 0.20 g of $K_4Fe(CN)_6,3H_2O$ in 100.0 ml.

Ferricyanide standard solution (50 ppm $Fe(CN)_6$). *5001300.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *potassium ferricyanide R* equivalent to 0.78 g of $K_3Fe(CN)_6$ in 100.0 ml.

Fluoride standard solution (10 ppm F). *5001400.*

Dissolve in *water R sodium fluoride R* previously dried at 300 °C for 12 h, equivalent to 0.442 g of NaF, and dilute to 1000.0 ml with the same solvent (1 ml = 0.2 mg F). Store in a polyethylene container. Immediately before use, dilute the solution to 20 times its volume with *water R*.

Fluoride standard solution (1 ppm F). *5001401.*

Immediately before use, dilute *fluoride standard solution (10 ppm F) R* to 10 times its volume with *water R*.

Formaldehyde standard solution (5 ppm CH_2O). *5001500.*

Immediately before use, dilute with *water R* to 200 times its volume a solution containing 1.0 g of CH_2O per litre prepared from *formaldehyde solution R*.

Germanium standard solution (100 ppm Ge). *5004400.*

Dissolve *ammonium hexafluorogermanate (IV) R* equivalent to 0.307 g of $(NH_4)_2GeF_6$ in a 0.01 per cent *V/V* solution of *hydrofluoric acid R*. Dilute the clear solution to 1000 ml with *water R*.

Glyoxal standard solution (20 ppm $C_2H_2O_2$). *5003700.*

In a 100 ml graduated flask weigh a quantity of *glyoxal solution R* corresponding to 0.200 g of $C_2H_2O_2$ and make up to volume with *ethanol R*. Immediately before use dilute the solution to 100 times its volume with the same solvent.

Glyoxal standard solution (2 ppm $C_2H_2O_2$). *5003701.*

Immediately before use, dilute *glyoxal standard solution (20 ppm $C_2H_2O_2$) R* to 10 times its volume with *ethanol R*.

Hydrogen peroxide standard solution (10 ppm H_2O_2). *5005200.*

Dilute 10.0 ml of *dilute hydrogen peroxide solution R* to 300.0 ml with *water R*. Dilute 10.0 ml of this solution to 1000.0 ml with *water R*. Prepare immediately before use.

Iodide standard solution (10 ppm I). *5003800.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *potassium iodide R* equivalent to 0.131 g of KI in 100.0 ml.

Iron standard solution (0.1 per cent Fe). *5001605.*

Dissolve 0.100 g of Fe in the smallest amount necessary of a mixture of equal volumes of *hydrochloric acid R* and *water R* and dilute to 100.0 ml with *water R*.

Iron standard solution (250 ppm Fe). *5001606.*

Immediately before use, dilute with *water R* to 40 times its volume a solution containing 4.840 g of *ferric chloride R* in a 150 g/l solution of *hydrochloric acid R* diluted to 100.0 ml.

Iron standard solution (20 ppm Fe). *5001600.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *ferric ammonium sulphate R* equivalent to 0.863 g of $FeNH_4(SO_4)_2,12H_2O$ and 25 ml of *dilute sulphuric acid R* in 500.0 ml.

Iron standard solution (10 ppm Fe). *5001601.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *ferrous ammonium sulphate R* equivalent to 7.022 g of $Fe(NH_4)_2(SO_4)_2,6H_2O$ and 25 ml of *dilute sulphuric acid R* in 1000.0 ml.

Iron standard solution (8 ppm Fe). *5001602.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing 80 mg of *iron R* and 50 ml of *hydrochloric acid R* (220 g/l HCl) in 1000.0 ml.

Iron standard solution (2 ppm Fe). *5001603.*

Immediately before use, dilute *iron standard solution (20 ppm Fe) R* to 10 times its volume with *water R*.

Iron standard solution (1 ppm Fe). *5001604.*

Immediately before use, dilute *iron standard solution (20 ppm Fe) R* to 20 times its volume with *water R*.

Lead liposoluble standard solution (1000 ppm Pb). *5004800.*

A lead (metal) organic compound in an oil.

Lead standard solution (0.1 per cent Pb). *5001700.*

Dissolve *lead nitrate R* equivalent to 0.400 g of $Pb(NO_3)_2$ in *water R* and dilute to 250.0 ml with the same solvent.

Lead standard solution (0.1 per cent Pb) R1. *5005400.*

Dissolve in *dilute lead-free nitric acid R* a quantity of *lead nitrate R* equivalent to 0.400 g of $Pb(NO_3)_2$ and dilute to 250.0 ml with the same solvent.

Lead standard solution (100 ppm Pb). *5001701.*

Immediately before use, dilute *lead standard solution (0.1 per cent Pb) R* to 10 times its volume with *water R*.

Lead standard solution (10 ppm Pb). *5001702.*

Immediately before use, dilute *lead standard solution (100 ppm Pb) R* to 10 times its volume with *water R*.

Lead standard solution (10 ppm Pb) R1. *5001706.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing 0.160 g of *lead nitrate R* in 100 ml of *water R*, to which is added 1 ml of *lead-free nitric acid R* and dilute to 1000.0 ml.

Lead standard solution (10 ppm Pb) R2. *5005401.*

Dilute *lead standard solution (0.1 per cent Pb) R1* to 100 times its volume with *dilute lead-free nitric acid R*. Use within 1 week.

Lead standard solution (2 ppm Pb). *5001703.*

Immediately before use, dilute *lead standard solution (10 ppm Pb) R* to 5 times its volume with *water R*.

Lead standard solution (1 ppm Pb). *5001704.*

Immediately before use, dilute *lead standard solution (10 ppm Pb) R* to 10 times its volume with *water R*.

Lead standard solution (0.5 ppm Pb). *5005402.*

Dilute *lead standard solution (10 ppm Pb) R2* to 20 times its volume with *dilute lead-free nitric acid R*. Use within 1 day.

Lead standard solution (0.25 ppm Pb). *5006000.*

Immediately before use, dilute *lead standard solution (1 ppm Pb) R* to 4 times its volume with *water R*.

Lead standard solution (0.1 ppm Pb). *5001705.*

Immediately before use, dilute *lead standard solution (1 ppm Pb) R* to 10 times its volume with *water R*.

Magnesium standard solution (0.1 per cent Mg). *5001803.*

Dissolve *magnesium sulphate R* equivalent to 1.010 g of $MgSO_4,7H_2O$ in *distilled water R* and dilute to 100.0 ml with the same solvent.

Magnesium standard solution (100 ppm Mg). *5001800.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *magnesium sulphate R* equivalent to 1.010 g of $MgSO_4,7H_2O$ in 100.0 ml.

Magnesium standard solution (10 ppm Mg). *5001801.*

Immediately before use, dilute *magnesium standard solution (100 ppm Mg) R* to 10 times its volume with *water R*.

Magnesium standard solution (10 ppm Mg) R1. *5001802.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing 8.365 g of *magnesium chloride R* in 1000.0 ml of *dilute hydrochloric acid R*.

Manganese standard solution (1000 ppm Mn). *5005800.*

Dissolve *manganese sulphate R* equivalent to 3.08 g of $MnSO_4,H_2O$ in 500 ml of *1 M nitric acid* and dilute the solution to 1000 ml with *water R*.

Manganese standard solution (100 ppm Mn). *5004500.*

Dissolve *manganese sulphate R* equivalent to 0.308 g of $MnSO_4,H_2O$ in 500 ml of *1M nitric acid* and dilute the clear solution to 1000 ml with *water R*.

Mercury standard solution (1000 ppm Hg). *5001900.*

Dissolve *mercuric chloride R* equivalent to 1.354 g of $HgCl_2$ in 50 ml of *dilute nitric acid R* and dilute to 1000.0 ml with *water R*.

Mercury standard solution (10 ppm Hg). *5001901.*

Immediately before use, dilute with water to 100 times its volume a solution containing *mercuric chloride R* equivalent to 0.338 g of $HgCl_2$ in 250.0 ml.

Nickel liposoluble standard solution (1000 ppm Ni). *5004900.*

A nickel (metal) organic compound in an oil.

Nickel standard solution (10 ppm Ni). *5002000.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *nickel sulphate R* equivalent to 4.78 g of $NiSO_4,7H_2O$ in 1000.0 ml.

Nickel standard solution (5 ppm Ni). *5005900.*

Immediately before use dilute *nickel standard solution (10 ppm Ni) R* to twice its volume with *water for chromatography R*.

Nickel standard solution (0.2 ppm Ni). *5002002.*

Immediately before use, dilute *nickel standard solution (10 ppm Ni) R* to 50 times its volume with *water R*.

Nickel standard solution (0.1 ppm Ni). *5002001.*

Immediately before use, dilute *nickel standard solution (10 ppm Ni) R* to 100 times its volume with *water R*.

Nitrate standard solution (100 ppm NO_3). *5002100.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *potassium nitrate R* equivalent to 0.815 g of KNO_3 in 500.0 ml.

Nitrate standard solution (10 ppm NO_3). *5002101.*

Immediately before use, dilute *nitrate standard solution (100 ppm NO_3) R* to 10 times its volume with *water R*.

Nitrate standard solution (2 ppm NO_3). *5002102.*

Immediately before use, dilute *nitrate standard solution (10 ppm NO_3) R* to 5 times its volume with *water R*.

Palladium standard solution (500 ppm Pd). *5003600.*

Dissolve 50.0 mg of *palladium R* in 9 ml of *hydrochloric acid R* and dilute to 100.0 ml with *water R*.

Palladium standard solution (20 ppm Pd). *5003602.*

Dissolve 0.333 g of *palladium chloride R* in 2 ml of warm *hydrochloric acid R*. Dilute the solution to 1000.0 ml with a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. Immediately before use dilute to 10 times its volume with *water R*.

Palladium standard solution (0.5 ppm Pd). *5003601.*

Dilute 1 ml of *palladium standard solution (500 ppm Pd) R* to 1000 ml with a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R*.

Phosphate standard solution (200 ppm PO_4). *5004200.*

Dissolve *potassium dihydrogen phosphate R* equivalent to 0.286 g of KH_2PO_4 in *water R* and dilute to 1000.0 ml with the same solvent.

Phosphate standard solution (5 ppm PO_4). *5002200.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *potassium dihydrogen phosphate R* equivalent to 0.716 g of KH_2PO_4 in 1000.0 ml.

Platinum standard solution (30 ppm Pt). *5002300.*

Immediately before use, dilute with *1 M hydrochloric acid* to 10 times its volume a solution containing 80 mg of *chloroplatinic acid R* in 100.0 ml of *1 M hydrochloric acid*.

Potassium standard solution (0.2 per cent K). *5002402.*

Dissolve *dipotassium sulphate R* equivalent to 0.446 g of K_2SO_4 in *distilled water R* and dilute to 100.0 ml with the same solvent.

Potassium standard solution (600 ppm K). *5005100.*

Immediately before use, dilute with *water R* to 20 times its volume a solution containing *dipotassium sulphate R* equivalent to 2.676 g of K_2SO_4 in 100.0 ml.

Potassium standard solution (100 ppm K). *5002400.*

Immediately before use, dilute with *water R* to 20 times its volume a solution containing *dipotassium sulphate R* equivalent to 0.446 g of K_2SO_4 in 100.0 ml.

Potassium standard solution (20 ppm K). *5002401.*

Immediately before use, dilute *potassium standard solution (100 ppm K) R* to 5 times its volume with *water R*.

Selenium standard solution (100 ppm Se). *5002500.*

Dissolve 0.100 g of *selenium R* in 2 ml of *nitric acid R*. Evaporate to dryness. Take up the residue in 2 ml of *water R* and evaporate to dryness; carry out three times. Dissolve the residue in 50 ml of *dilute hydrochloric acid R* and dilute to 1000.0 ml with the same acid.

Selenium standard solution (1 ppm Se). *5002501.*

Immediately before use, dilute with *water R* to 40 times its volume a solution containing *selenious acid R* equivalent to 6.54 mg of H_2SeO_3 in 100.0 ml.

Silver standard solution (5 ppm Ag). *5002600.*

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *silver nitrate R* equivalent to 0.790 g of $AgNO_3$ in 1000.0 ml.

Sodium standard solution (1000 ppm Na). *5005700.*

Dissolve a quantity of *anhydrous sodium carbonate R* equivalent to 2.305 g of Na_2CO_3 in a mixture of 25 ml of *water R* and 25 ml of *nitric acid R* and dilute to 1000.0 ml with *water R*.

Sodium standard solution (200 ppm Na). *5002700.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *sodium chloride R* equivalent to 0.509 g of NaCl in 100.0 ml.

Sodium standard solution (50 ppm Na). *5002701.*

Dilute the *sodium standard solution (200 ppm Na) R* to four times its volume with *water R*.

Strontium standard solution (1.0 per cent Sr). *5003900.*

Cover with *water R*, *strontium carbonate R* equivalent to 1.6849 g of $SrCO_3$. Cautiously add *hydrochloric acid R* until all the solid has dissolved and there is no sign of further effervescence. Dilute to 100.0 ml with *water R*.

Sulphate standard solution (100 ppm SO_4). *5002802.*

Immediately before use, dilute with *distilled water R* to 10 times its volume a solution in *distilled water R* containing *dipotassium sulphate R* equivalent to 0.181 g of K_2SO_4 in 100.0 ml.

Sulphate standard solution (10 ppm SO_4). *5002800.*

Immediately before use, dilute with *distilled water R* to 100 times its volume a solution in *distilled water R* containing *dipotassium sulphate R* equivalent to 0.181 g of K_2SO_4 in 100.0 ml.

Sulphate standard solution (10 ppm SO_4) R1. *5002801.*

Immediately before use, dilute with *alcohol (30 per cent V/V) R* to 100 times its volume a solution containing *dipotassium sulphate R* equivalent to 0.181 g of K_2SO_4 in 100.0 ml of *alcohol (30 per cent V/V) R*.

Sulphite standard solution (80 ppm SO_2). *5005500.*

Dissolve 3.150 g of *anhydrous sodium sulphite R* in freshly prepared *distilled water R* and dilute to 100.0 ml with the same solvent. Dilute 0.5 ml to 100.0 ml with freshly prepared *distilled water R*.

Sulphite standard solution (1.5 ppm SO_2). *5002900.*

Dissolve *sodium metabisulphite R* equivalent to 0.152 g of $Na_2S_2O_5$ in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*. To 3.0 ml of the resulting solution, add 4.0 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *water R*.

Thallium standard solution (10 ppm Tl). *5003000.*

Dissolve *thallous sulphate R* equivalent to 0.1235 g of Tl_2SO_4 in a 9 g/l solution of *sodium chloride R* and dilute to 1000.0 ml with the same solution. Dilute 10.0 ml of the solution to 100.0 ml with the 9 g/l solution of *sodium chloride R*.

Tin liposoluble standard solution (1000 ppm Sn). *5005000.*

A tin (metal) organic compound in an oil.

Tin standard solution (5 ppm Sn). *5003100.*

Dissolve *tin R* equivalent to 0.500 g of Sn in a mixture of 5 ml of *water R* and 25 ml of *hydrochloric acid R* and dilute to 1000.0 ml with *water R*. Dilute the solution to 100 times its volume with a 2.5 per cent *V/V* solution of *hydrochloric acid R* immediately before use.

Tin standard solution (0.1 ppm Sn). *5003101.*

Immediately before use, dilute *tin standard solution (5 ppm Sn) R* to 50 times its volume with *water R*.

Titanium standard solution (100 ppm Ti). *5003200.*

Dissolve 100.0 mg of *titanium R* in 100 ml of *hydrochloric acid R* diluted to 150 ml with *water R*, heating if necessary. Allow to cool and dilute to 1000 ml with *water R*.

Vanadium standard solution (1 g/l V). *5003300.*

Dissolve in *water R ammonium vanadate R* equivalent to 0.230 g of NH_4VO_3 and dilute to 100.0 ml with the same solvent.

Zinc standard solution (5 mg/ml Zn). *5003400.*

Dissolve 3.15 g of *zinc oxide R* in 15 ml of *hydrochloric acid R* and dilute to 500.0 ml with *water R*.

Zinc standard solution (100 ppm Zn). *5003401.*

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *zinc sulphate R* equivalent to 0.440 g of $ZnSO_4,7H_2O$ and 1 ml of *acetic acid R* in 100.0 ml.

Zinc standard solution (10 ppm Zn). *5003402.*

Immediately before use, dilute *zinc standard solution (100 ppm Zn) R* to 10 times its volume with *water R*.

Zinc standard solution (5 ppm Zn). *5003403.*

Immediately before use, dilute *zinc standard solution (100 ppm Zn) R* to 20 times its volume with *water R*.

Zirconium standard solution (1 g/l Zr). *5003500.*

Dissolve *zirconyl nitrate R* equivalent to 0.293 g of $ZrO(NO_3)_2,2H_2O$ in a mixture of 2 volumes of *hydrochloric acid R* and 8 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

01/2008:40103

4.1.3. BUFFER SOLUTIONS

Buffered acetone solution. *4000100.*

Dissolve 8.15 g of *sodium acetate R* and 42 g of *sodium chloride R* in *water R*, add 68 ml of *0.1 M hydrochloric acid* and 150 ml of *acetone R* and dilute to 500 ml with *water R*.

Buffer solution pH 2.0. *4000200.*

Dissolve 6.57 g of *potassium chloride R* in *water R* and add 119.0 ml of *0.1 M hydrochloric acid*. Dilute to 1000.0 ml with *water R*.

Phosphate buffer solution pH 2.0. *4007900.*

Dissolve 8.95 g of *disodium hydrogen phosphate R* and 3.40 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent. If necessary adjust the pH (*2.2.3*) with *phosphoric acid R*.

Sulphate buffer solution pH 2.0. *4008900.*

Dissolve 132.1 g of *ammonium sulphate R* in *water R* and dilute to 500.0 ml with the same solvent (Solution I). Carefully and with constant cooling stir 14 ml of sulphuric acid R into about 400 ml of *water R*; allow to cool and dilute to 500.0 ml with *water R* (Solution II). Mix equal volumes of solutions I and II. Adjust the pH (*2.2.3*) if necessary.

Buffer solution pH 2.2. *4010500.*

Mix of 6.7 ml of *phosphoric acid R* with 50.0 ml of a 4 per cent solution of *dilute sodium hydroxide solution R* and dilute to 1000.0 ml with *water R*.

Buffer solution pH 2.5. *4000300.*

Dissolve 100 g of *potassium dihydrogen phosphate R* in 800 ml of *water R*; adjust to pH 2.5 (*2.2.3*) with *hydrochloric acid R* and dilute to 1000.0 ml with *water R*.

Buffer solution pH 2.5 R1. *4000400.*

To 4.9 g of *dilute phosphoric acid R* add 250 ml of *water R*. Adjust the pH (*2.2.3*) with *dilute sodium hydroxide solution R* and dilute to 500.0 ml with *water R*.

Phosphate buffer solution pH 2.8. *4010600.*

Dissolve 7.8 g of *sodium dihydrogen phosphate R* in 900 ml of *water R*, adjust to pH 2.8 (*2.2.3*) with *phosphoric acid R* and dilute to 1000 ml with the same solvent.

Buffer solution pH 3.0. *4008000.*

Dissolve 21.0 g of *citric acid R* in 200 ml of *1 M sodium hydroxide* and dilute to 1000 ml with *water R*. Dilute 40.3 ml of this solution to 100.0 ml with *0.1 M hydrochloric acid*.

0.25 M Citrate buffer solution pH 3.0. *4012600.*

Dissolve 4.8 g of *citric acid R* in 80 ml of *water R*. Adjust the pH (*2.2.3*) with *1 M sodium hydroxide* and dilute to 100.0 ml with *water R*.

0.1 M Phosphate buffer solution pH 3.0. *4011500.*

Dissolve 12.0 g of *anhydrous sodium dihydrogen phosphate R* in *water R*, adjust the pH (*2.2.3*) with *dilute phosphoric acid R1* and dilute to 1000 ml with *water R*.

Phosphate buffer solution pH 3.0. *4000500.*

Mix 0.7 ml of *phosphoric acid R* with 100 ml of *water R*. Dilute to 900 ml with the same solvent. Adjust to pH 3.0 (*2.2.3*) with *strong sodium hydroxide solution R* and dilute to 1000 ml with *water R*.

Phosphate buffer solution pH 3.0 R1. *4010000.*

Dissolve 3.40 g of *potassium dihydrogen phosphate R* in 900 ml of *water R*. Adjust to pH 3.0 (*2.2.3*) with *phosphoric acid R* and dilute to 1000.0 ml with *water R*.

Phosphate buffer solution pH 3.2. *4008100.*

To 900 ml of a 4 g/l solution of *sodium dihydrogen phosphate R*, add 100 ml of a 2.5 g/l solution of *phosphoric acid R*. Adjust the pH (*2.2.3*) if necessary.

Phosphate buffer solution pH 3.2 R1. *4008500.*

Adjust a 35.8 g/l solution of *disodium hydrogen phosphate R* to pH 3.2 (*2.2.3*) with *dilute phosphoric acid R*. Dilute 100.0 ml of the solution to 2000.0 ml with *water R*.

Buffer solution pH 3.5. *4000600.*

Dissolve 25.0 g of *ammonium acetate R* in 25 ml of *water R* and add 38.0 ml of *hydrochloric acid R1*. Adjust the pH (*2.2.3*) if necessary with *dilute hydrochloric acid R* or *dilute ammonia R1*. Dilute to 100.0 ml with *water R*.

Phosphate buffer solution pH 3.5. *4000700.*

Dissolve 68.0 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent. Adjust the pH (*2.2.3*) with *phosphoric acid R*.

Buffer solution pH 3.6. *4000800.*

To 250.0 ml of *0.2 M potassium hydrogen phthalate R* add 11.94 ml of *0.2 M hydrochloric acid*. Dilute to 1000.0 ml with *water R*.

Buffer solution pH 3.7. *4000900.*

To 15.0 ml of *acetic acid R* add 60 ml of *alcohol R* and 20 ml of *water R*. Adjust to pH 3.7 (*2.2.3*) by the addition of *ammonia R*. Dilute to 100.0 ml with *water R*.

Buffered copper sulphate solution pH 4.0. *4001000.*

Dissolve 0.25 g of *copper sulphate R* and 4.5 g of *ammonium acetate R* in *dilute acetic acid R* and dilute to 100.0 ml with the same solvent.

Acetate buffer solution pH 4.4. *4001100.*

Dissolve 136 g of *sodium acetate R* and 77 g of *ammonium acetate R* in *water R* and dilute to 1000.0 ml with the same solvent; add 250.0 ml of *glacial acetic acid R* and mix.

Phthalate buffer solution pH 4.4. *4001200.*

Dissolve 2.042 g of *potassium hydrogen phthalate R* in 50 ml of *water R*, add 7.5 ml of *0.2 M sodium hydroxide* and dilute to 200.0 ml with *water R*.

Acetate buffer solution pH 4.5. *4012500.*

Dissolve 77.1 g of *ammonium acetate R* in *water R*. Add 70 ml of *glacial acetic acid R* and dilute to 1000.0 ml with *water R*.

0.05 M Phosphate buffer solution pH 4.5. *4009000.*

Dissolve 6.80 g of *potassium dihydrogen phosphate R* in 1000.0 ml of *water R*. The pH (*2.2.3*) of the solution is 4.5.

Sodium acetate buffer solution pH 4.5. *4010100.*

Dissolve 63 g of *anhydrous sodium acetate R* in *water R*, add 90 ml *acetic acid R* and adjust to pH 4.5, and dilute to 1000 ml with *water R*.

Acetate buffer solution pH 4.6. *4001400.*

Dissolve 5.4 g of *sodium acetate R* in 50 ml of *water R*, add 2.4 g of *glacial acetic acid R* and dilute to 100.0 ml with *water R*. Adjust the pH (*2.2.3*) if necessary.

Succinate buffer solution pH 4.6. *4001500.*

Disssolve 11.8 g of *succinic acid R* in a mixture of 600 ml of *water R* and 82 ml of *1 M sodium hydroxide* and dilute to 1000.0 ml with *water R*.

Acetate buffer solution pH 4.7. *4001600.*

Dissolve 136.1 g of *sodium acetate R* in 500 ml of *water R*. Mix 250 ml of this solution with 250 ml of *dilute acetic acid R*. Shake twice with a freshly prepared, filtered, 0.1 g/l solution of *dithizone R* in *chloroform R*. Shake with *carbon tetrachloride R* until the extract is colourless. Filter the aqueous layer to remove traces of carbon tetrachloride.

Acetate buffer solution pH 5.0. *4009100.*

To 120 ml of a 6 g/l solution of *glacial acetic acid R* add 100 ml of *0.1 M potassium hydroxide* and about 250 ml of *water R*. Mix. Adjust the pH to 5.0 with a 6 g/l solution of *acetic acid R* or with *0.1 M potassium hydroxide* and dilute to 1000.0 ml with *water R*.

Citrate buffer solution pH 5.0. *4010700.*

Prepare a solution containing 20.1 g/l of *citric acid R* and 8.0 g/l of *sodium hydroxide R*. Adjust the pH with *dilute hydrochloric acid R*.

Phosphate buffer solution pH 5.0. *4011300.*

Dissolve 2.72 g of *potassium dihydrogen phosphate R* in 800 ml of *water R*. Adjust the pH (*2.2.3*) with *1 M potassium hydroxide* and dilute to 1000 ml with *water R*.

Buffer solution pH 5.2. *4001700.*

Dissolve 1.02 g of *potassium hydrogen phthalate R* in 30.0 ml of *0.1 M sodium hydroxide*. Dilute to 100.0 ml with *water R*.

0.067 M Phosphate buffer solution pH 5.4. *4012000.*

Mix appropriate volumes of a 23.99 g/l solution of *disodium hydrogen phosphate R* with a 9.12 g/l solution of *sodium dihydrogen phosphate monohydrate R* to obtain pH 5.4 (*2.2.3*).

Acetate-edetate buffer solution pH 5.5. *4001900.*

Dissolve 250 g of *ammonium acetate R* and 15 g *sodium edetate R* in 400 ml of *water R* and add 125 ml of *glacial acetic acid R*.

Buffer solution pH 5.5. *4001800.*

Dissolve 54.4 g of *sodium acetate R* in 50 ml of *water R*, heating to 35 °C if necessary. After cooling, slowly add 10 ml of *anhydrous acetic acid R*. Shake and dilute to 100.0 ml with *water R*.

Phosphate buffer solution pH 5.5. *4002000.*

Solution I. Dissolve 13.61 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Solution II. Dissolve 35.81 g of *disodium hydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Mix 96.4 ml of solution I and 3.6 ml of solution II.

Phosphate-citrate buffer solution pH 5.5. *4008700.*

Mix 56.85 ml of a 28.4 g/l solution of *anhydrous disodium hydrogen phosphate R* and 43.15 ml of a 21 g/l solution of *citric acid R*.

Phosphate buffer solution pH 5.6. *4011200.*

Solution I. Dissolve 0.908 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100.0 ml with the same solvent.

Solution II. Dissolve 1.161 g of *dipotassium hydrogen phosphate R* in *water R* and dilute to 100.0 ml with the same solvent.

Mix 94.4 ml of solution I and 5.6 ml of solution II. If necessary, adjust to pH 5.6 (*2.2.3*) using solution I or solution II.

Phosphate buffer solution pH 5.8. *4002100.*

Dissolve 1.19 g of *disodium hydrogen phosphate dihydrate R* and 8.25 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Acetate buffer solution pH 6.0. *4002200.*

Dissolve 100 g of *ammonium acetate R* in 300 ml of *water R*, add 4.1 ml of *glacial acetic acid R*, adjust the pH (*2.2.3*) if necessary using *ammonia R* or *acetic acid R* and dilute to 500.0 ml with *water R*.

Diethylammonium phosphate buffer solution pH 6.0. *4002300.*

Dilute 68 ml of *phosphoric acid R* to 500 ml with *water R*. To 25 ml of this solution add 450 ml of *water R* and 6 ml of *diethylamine R*, adjust to pH 6 ± 0.05 (*2.2.3*), if necessary, using *diethylamine R* or *phosphoric acid R* and dilute to 500.0 ml with *water R*.

Phosphate buffer solution pH 6.0. *4002400.*

Mix 63.2 ml of a 71.5 g/l solution of *disodium hydrogen phosphate R* and 36.8 ml of a 21 g/l solution of *citric acid R*.

Phosphate buffer solution pH 6.0 R1. *4002500.*

Dissolve 6.8 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with *water R*. Adjust the pH (*2.2.3*) with *strong sodium hydroxide solution R*.

Phosphate buffer solution pH 6.0 R2. *4002600.*

To 250.0 ml of *0.2 M potassium dihydrogen phosphate R* add 28.5 ml of *0.2 M sodium hydroxide* and dilute to 1000.0 ml with *water R*.

Phosphate buffer solution pH 6.4. *4002800.*

Dissolve 2.5 g of *disodium hydrogen phosphate R*, 2.5 g of *sodium dihydrogen phosphate R* and 8.2 g of *sodium chloride R* in 950 ml of *water R*. Adjust the pH (*2.2.3*) of the solution to 6.4 with *1 M sodium hydroxide* or *1 M hydrochloric acid*, if necessary. Dilute to 1000.0 ml with *water R*.

0.5 M Phthalate buffer solution pH 6.4. *4009200.*

Dissolve 100 g of *potassium hydrogen phthalate R* in *water R* and dilute to 1000.0 ml with the same solvent. Adjust the pH (*2.2.3*) if necessary, using *strong sodium hydroxide solution R*.

Buffer solution pH 6.5. *4002900.*

Dissolve 60.5 g of *disodium hydrogen phosphate R* and 46 g of *potassium dihydrogen phosphate R* in *water R*. Add 100 ml of *0.02 M sodium edetate* and 20 mg of *mercuric chloride R* and dilute to 1000.0 ml with *water R*.

Imidazole buffer solution pH 6.5. *4003000.*

Dissolve 6.81 g of *imidazole R*, 1.23 g of *magnesium sulphate R* and 0.73 g of *calcium sulphate R* in 752 ml of *0.1 M hydrochloric acid*. Adjust the pH (*2.2.3*) if necessary and dilute to 1000.0 ml with *water R*.

0.1 M phosphate buffer solution pH 6.5. *4010800.*

Dissolve 13.80 g of *sodium dihydrogen phosphate monohydrate R* in 900 ml of *distilled water R*. Adjust the pH (*2.2.3*) using a 400 g/l solution of *sodium hydroxide R*. Dilute to 1000 ml with *distilled water R*.

Phosphate buffer solution pH 6.5. *4012800.*

Dissolve 2.75 g of *sodium dihydrogen phosphate R* and 4.5 g of *sodium chloride R* in 500 ml of *water R*. Adjust the pH (*2.2.3*) with *phosphate buffer solution pH 8.5 R*.

Buffer solution pH 6.6. *4003100.*

To 250.0 ml of *0.2 M potassium dihydrogen phosphate R* add 89.0 ml of *0.2 M sodium hydroxide*. Dilute to 1000.0 ml with *water R*.

Phosphate buffered saline pH 6.8. *4003200.*

Dissolve 1.0 g of *potassium dihydrogen phosphate R*, 2.0 g of *dipotassium hydrogen phosphate R* and 8.5 g of *sodium chloride R* in 900 ml of *water R*, adjust the pH (*2.2.3*) if necessary and dilute to 1000.0 ml with the same solvent.

Phosphate buffer solution pH 6.8. *4003300.*

Mix 77.3 ml of a 71.5 g/l solution of *disodium hydrogen phosphate R* with 22.7 ml of a 21 g/l solution of *citric acid R*.

Phosphate buffer solution pH 6.8 R1. *4003400.*

To 51.0 ml of a 27.2 g/l solution of *potassium dihydrogen phosphate R* add 49.0 ml of a 71.6 g/l solution of *disodium hydrogen phosphate R*. Adjust the pH (*2.2.3*) if necessary.

Storage: at 2 °C to 8 °C.

1 M tris-hydrochloride buffer solution pH 6.8. *4009300.*

Dissolve 60.6 g of *tris(hydroxymethyl)aminomethane R* in 400 ml of *water R*. Adjust the pH (*2.2.3*) with *hydrochloric acid R* and dilute to 500.0 ml with *water R*.

Buffer solution pH 7.0. *4003500.*

To 1000 ml of a solution containing 18 g/l of *disodium hydrogen phosphate R* and 23 g/l of *sodium chloride R* add sufficient (about 280 ml) of a solution containing 7.8 g/l of *sodium dihydrogen phosphate R* and 23 g/l of *sodium chloride R* to adjust the pH (*2.2.3*). Dissolve in the solution sufficient *sodium azide R* to give a 0.2 g/l solution.

Maleate buffer solution pH 7.0. *4003600.*

Dissolve 10.0 g of *sodium chloride R*, 6.06 g of *tris(hydroxymethyl)aminomethane R* and 4.90 g of *maleic anhydride R* in 900 ml of *water R*. Adjust the pH (*2.2.3*) using a 170 g/l solution of *sodium hydroxide R*. Dilute to 1000.0 ml with *water R*.

Storage: at 2 °C to 8 °C; use within 3 days.

0.025 M Phosphate buffer solution pH 7.0. *4009400.*

Mix 1 volume of *0.063 M phosphate buffer solution pH 7.0 R* with 1.5 volumes of *water R*.

0.03 M Phosphate buffer solution pH 7.0. *4010300.*

Dissolve 5.2 g of *dipotassium hydrogen phosphate R* in 900 ml of *water for chromatography R*. Adjust the solution to pH 7.0 ± 0.1 using *phosphoric acid R* and dilute to 1000 ml with *water for chromatography R*.

0.05 M Phosphate buffer solution pH 7.0. *4012400.*

Mix 34 ml of *water R* and 100 ml of *0.067 M phosphate buffer solution pH 7.0 R*.

0.063 M Phosphate buffer solution pH 7.0. *4009500.*

Dissolve 5.18 g of *anhydrous disodium hydrogen phosphate R* and 3.65 g of *sodium dihydrogen phosphate monohydrate R* in 950 ml of *water R* and adjust the pH (*2.2.3*) with *phosphoric acid R*; dilute to 1000.0 ml with *water R*.

0.067 M Phosphate buffer solution pH 7.0. *4003800.*

Solution I. Dissolve 0.908 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100.0 ml with the same solvent.

Solution II. Dissolve 2.38 g of *disodium hydrogen phosphate R* in *water R* and dilute to 100.0 ml with the same solvent.

Mix 38.9 ml of solution I and 61.1 ml of solution II. Adjust the pH (*2.2.3*) if necessary.

0.1 M Phosphate buffer solution pH 7.0. *4008200.*

Dissolve 1.361 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100.0 ml with the same solvent. Adjust the pH (*2.2.3*) using a 35 g/l solution of *disodium hydrogen phosphate R*.

Phosphate buffer solution pH 7.0. *4003700.*

Mix 82.4 ml of a 71.5 g/l solution of *disodium hydrogen phosphate R* with 17.6 ml of a 21 g/l solution of *citric acid R*.

Phosphate buffer solution pH 7.0 R1. *4003900.*

Mix 250.0 ml of *0.2 M potassium dihydrogen phosphate R* and 148.2 ml of a 8 g/l solution of *sodium hydroxide R*, adjust the pH (*2.2.3*) if necessary. Dilute to 1000.0 ml with *water R*.

Phosphate buffer solution pH 7.0 R2. *4004000.*

Mix 50.0 ml of a 136 g/l solution of *potassium dihydrogen phosphate R* with 29.5 ml of *1 M sodium hydroxide* and dilute to 100.0 ml with *water R*. Adjust the pH (*2.2.3*) to 7.0 ± 0.1.

Phosphate buffer solution pH 7.0 R3. *4008600.*

Dissolve 5 g of *potassium dihydrogen phosphate R* and 11 g of *dipotassium hydrogen phosphate R* in 900 ml of *water R*. Adjust to pH 7.0 (*2.2.3*) with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*. Dilute to 1000 ml with *water R* and mix.

Phosphate buffer solution pH 7.0 R4. *4010200.*

Dissolve 28.4 g of *anhydrous disodium hydrogen phosphate R* and 18.2 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 500 ml with the same solvent.

Phosphate buffer solution pH 7.0 R5. *4011400.*

Dissolve 28.4 g of *anhydrous disodium hydrogen phosphate R* in 800 ml of *water R*. Adjust the pH (*2.2.3*) using a 30 per cent *m/m* solution of *phosphoric acid R* and dilute to 1000 ml with *water R*.

Tetrabutylammonium buffer solution pH 7.0. *4010900.*

Dissolve 6.16 g of *ammonium acetate R* in a mixture of 15 ml of *tetrabutylammonium hydroxide solution (400 g/l) R* and 185 ml of *water R*. Adjust the pH (*2.2.3*) with *nitric acid R*.

Buffered salt solution pH 7.2. *4004300.*

Dissolve in *water R* 8.0 g of *sodium chloride R*, 0.2 g of *potassium chloride R*, 0.1 g of *anhydrous calcium chloride R*, 0.1 g of *magnesium chloride R*, 3.18 g of *disodium hydrogen phosphate R* and 0.2 g of *potassium dihydrogen phosphate R* and dilute to 1000.0 ml with *water R*.

Buffer solution pH 7.2. *4004100.*

To 250.0 ml of *0.2 M potassium dihydrogen phosphate R* add 175.0 ml of *0.2 M sodium hydroxide*. Dilute to 1000.0 ml with *water R*. Adjust the pH (*2.2.3*) if necessary.

Phosphate-albumin buffered saline pH 7.2. *4004400.*

Dissolve 10.75 g of *disodium hydrogen phosphate R*, 7.6 g of *sodium chloride R* and 10 g of *bovine albumin R* in *water R* and dilute to 1000.0 ml with the same solvent. Immediately before use adjust the pH (*2.2.3*) using *dilute sodium hydroxide solution R* or *dilute phosphoric acid R*.

Phosphate-albumin buffered saline pH 7.2 R1. *4009600.*

Dissolve 10.75 g of *disodium hydrogen phosphate R*, 7.6 g of *sodium chloride R* and 1 g of *bovine albumin R* in *water R* and dilute to 1000.0 ml with the same solvent. Immediately before use adjust the pH (*2.2.3*) using *dilute sodium hydroxide solution R* or *dilute phosphoric acid R*.

Phosphate buffer solution pH 7.2. *4004200.*

Mix 87.0 ml of a 71.5 g/l solution of *disodium hydrogen phosphate R* with 13.0 ml of a 21 g/l solution of *citric acid R*.

Imidazole buffer solution pH 7.3. *4004500.*

Dissolve 3.4 g of *imidazole R* and 5.8 g of *sodium chloride R* in *water R*, add 18.6 ml of *1 M hydrochloric acid* and dilute to 1000.0 ml with *water R*. Adjust the pH (*2.2.3*) if necessary.

Barbital buffer solution pH 7.4. *4004700.*

Mix 50 ml of a solution in *water R* containing 19.44 g/l of *sodium acetate R* and 29.46 g/l of *barbital sodium R* with 50.5 ml of *0.1 M hydrochloric acid*, add 20 ml of an 85 g/l of *sodium chloride R* and dilute to 250 ml with *water R*.

Buffer solution pH 7.4. *4004600.*

Dissolve 0.6 g of *potassium dihydrogen phosphate R*, 6.4 g of *disodium hydrogen phosphate R* and 5.85 g of *sodium chloride R* in *water R*, and dilute to 1000.0 ml with the same solvent. Adjust the pH (*2.2.3*) if necessary.

Phosphate buffered saline pH 7.4. *4005000.*

Dissolve 2.38 g of *disodium hydrogen phosphate R,* 0.19 g of *potassium dihydrogen phosphate R* and 8.0 g of *sodium chloride R* in water. Dilute to 1000.0 ml with the same solvent. Adjust the pH (*2.2.3*) if necessary.

Phosphate buffer solution pH 7.4. *4004800.*

Add 250.0 ml of *0.2 M potassium dihydrogen phosphate R* to 393.4 ml of *0.1 M sodium hydroxide.*

Tris(hydroxymethyl)aminomethane buffer solution pH 7.4. *4012100.*

Dissolve 30.3 g of *tris(hydroxymethyl)aminomethane R* in approximately 200 ml of *water R.* Add 183 ml of *1 M hydrochloric acid.* Dilute to 500.0 ml with *water R. Note: the pH is 7.7-7.8 at room temperature and 7.4 at 37 °C. This solution is stable for several months at 4 °C.*

Tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4. *4004900.*

Dissolve 6.08 g of *tris(hydroxymethyl)aminomethane R,* 8.77 g of *sodium chloride R* in 500 ml of *distilled water R.* Add 10.0 g of *bovine albumin R.* Adjust the pH (*2.2.3*) using *hydrochloric acid R.* Dilute to 1000.0 ml with *distilled water R.*

Tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R1. *4012200.*

Dissolve 0.1 g of *bovine albumin R* in a mixture containing 2 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 7.4 R* and 50 ml of a 5.84 mg/ml solution of *sodium chloride R.* Dilute to 100.0 ml with *water R.*

Tris-sodium acetate buffer solution pH 7.4. *4012900.*

Dissolve 6.3 g of *tris(hydroxymethyl)aminomethane R* and 4.9 g of *anhydrous sodium acetate R* in 900 ml of *water R.* Adjust to pH 7.4 (*2.2.3*) with *sulphuric acid R* and dilute to 1000 ml with *water R.*

Tris-sodium acetate-sodium chloride buffer solution pH 7.4. *4013000.*

Dissolve 30.0 g of *tris(hydroxymethyl)aminomethane R,* 14.5 g of *anhydrous sodium acetate R* and 14.6 g of *sodium chloride R* in 900 ml of *water R.* Add 0.50 g of *bovine albumin R.* Adjust to pH 7.4 (*2.2.3*) with *sulphuric acid R* and dilute to 1000 ml with *water R.*

Borate buffer solution pH 7.5. *4005200.*

Dissolve 2.5 g of *sodium chloride R,* 2.85 g of *disodium tetraborate R* and 10.5 g of *boric acid R* in *water R* and dilute to 1000.0 ml with the same solvent. Adjust the pH (*2.2.3*) if necessary.

Storage: at 2 °C to 8 °C.

Buffer (HEPES) solution pH 7.5. *4009700.*

Dissolve 2.38 g of *2-[4-(2-hydroxyethyl)piperazin-1-yl]ethanesulphonic acid R* in about 90 ml of *water R.* Adjust the pH to 7.5 with *sodium hydroxide solution R.* Dilute to 100 ml with *water R.*

0.2 M Phosphate buffer solution pH 7.5. *4005400.*

Dissolve 27.22 g of *potassium dihydrogen phosphate R* in 930 ml of *water R,* adjust to pH 7.5 (*2.2.3*) with a 300 g/l solution of *potassium hydroxide R* and dilute to 1000.0 ml with *water R.*

0.33 M Phosphate buffer solution pH 7.5. *4005300.*

Solution I. Dissolve 119.31 g of *disodium hydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Solution II. Dissolve 45.36 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Mix 85 ml of solution I and 15 ml of solution II. Adjust the pH (*2.2.3*) if necessary.

0.05 M Tris-hydrochloride buffer solution pH 7.5. *4005600.*

Dissolve 6.057 g of *tris(hydroxymethyl)aminomethane R* in *water R* and adjust the pH (*2.2.3*) with *hydrochloric acid R.* Dilute to 1000.0 ml with *water R.*

Tris(hydroxymethyl)aminomethane buffer solution pH 7.5. *4005500.*

Dissolve 7.27 g of *tris(hydroxymethyl)aminomethane R* and 5.27 g of *sodium chloride R* in *water R,* and adjust the pH (*2.2.3*) if necessary. Dilute to 1000.0 ml with *water R.*

Sodium citrate buffer solution pH 7.8 (0.034 M sodium citrate, 0.101 M sodium chloride). *4009800.*

Dissolve 10.0 g of *sodium citrate R* and 5.90 g of *sodium chloride R* in 900 ml of *water R.* Adjust the pH (*2.2.3*) by addition of *hydrochloric acid R* and dilute to 1000 ml with *water R.*

0.0015 M Borate buffer solution pH 8.0. *4006000.*

Dissolve 0.572 g of *disodium tetraborate R* and 2.94 g of *calcium chloride R* in 800 ml of *water R.* Adjust the pH (*2.2.3*) with *1 M hydrochloric acid.* Dilute to 1000.0 ml with *water R.*

Buffer solution pH 8.0. *4005900.*

To 50.0 ml of *0.2 M potassium dihydrogen phosphate R* add 46.8 ml of *0.2 M sodium hydroxide.* Dilute to 200.0 ml with *water R.*

Buffer solution pH 8.0 R1. *4010400.*

Dissolve 20 g of *dipotassium hydrogen phosphate R* in 900 ml of *water R.* Adjust the pH (*2.2.3*) with *phosphoric acid R.* Dilute to 1000 ml with *water R.*

0.02 M Phosphate buffer solution pH 8.0. *4006100.*

To 50.0 ml of *0.2 M potassium dihydrogen phosphate R* add 46.8 ml of *0.2 M sodium hydroxide.* Dilute to 500.0 ml with *water R.*

0.1 M Phosphate buffer solution pH 8.0. *4008400.*

Dissolve 0.523 g of *potassium dihydrogen phosphate R* and 16.73 g of *dipotassium hydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

1 M Phosphate buffer solution pH 8.0. *4007800.*

Dissolve 136.1 g of *potassium dihydrogen phosphate R* in *water R,* adjust the pH (*2.2.3*) with *1 M sodium hydroxide.* Dilute to 1000.0 ml with *water R.*

1 M Tris-hydrochloride buffer solution pH 8.0. *4012700.*

Dissolve 121.1 g of *tris(hydroxymethyl)aminomethane R* and 1.47 g of *calcium chloride R* in 900 ml of *water R.* Adjust the pH (*2.2.3*) with *hydrochloric acid R* and dilute to 1000.0 ml with *water R.*

Tris-hydrochloride buffer solution pH 8.0. *4012300.*

Dissolve 1.21 g of *tris(hydroxymethyl)aminomethane R* and 29.4 mg of *calcium chloride R* in *water R.* Adjust the pH (*2.2.3*) with *1 M hydrochloric acid* and dilute to 100.0 ml with *water R.*

Tris-sodium acetate buffer solution pH 8.0. *4013100.*

Dissolve 6.3 g of *tris(hydroxymethyl)aminomethane R* and 4.9 g of *anhydrous sodium acetate R* in 900 ml of *water R*. Adjust to pH 8.0 (*2.2.3*) with *sulphuric acid R* and dilute to 1000 ml with *water R*.

Tris-sodium acetate-sodium chloride buffer solution pH 8.0. *4013200.*

Dissolve 30.0 g of *tris(hydroxymethyl)aminomethane R*, 14.5 g of *anhydrous sodium acetate R* and 14.6 g of *sodium chloride R* in 900 ml of *water R*. Add 0.50 g of *bovine albumin R*. Adjust to pH 8.0 (*2.2.3*) with *sulphuric acid R* and dilute to 1000 ml with *water R*.

Tris(hydroxymethyl)aminomethane buffer solution pH 8.1. *4006200.*

Dissolve 0.294 g of *calcium chloride R* in 40 ml of *tris(hydroxymethyl)aminomethane solution R* and adjust the pH (*2.2.3*) with *1 M hydrochloric acid*. Dilute to 100.0 ml with *water R*.

Tris-glycine buffer solution pH 8.3. *4006300.*

Dissolve 6.0 g of *tris(hydroxymethyl)aminomethane R* and 28.8 g of *glycine R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 1 volume to 10 volumes with *water R* immediately before use.

Tris-hydrochloride buffer solution pH 8.3. *4011800.*

Dissolve 9.0 g of *tris(hydroxymethyl)aminomethane R* in 2.9 litres of *water R*. Adjust the pH (*2.2.3*) with *1 M hydrochloric acid*. Adjust the volume to 3 litres with *water R*.

Barbital buffer solution pH 8.4. *4006400.*

Dissolve 8.25 g of *barbital sodium R* in *water R* and dilute to 1000.0 ml with the same solvent.

Tris-EDTA BSA buffer solution pH 8.4. *4006500.*

Dissolve 6.1 g of *tris(hydroxymethyl)aminomethane R*, 2.8 g of *sodium edetate R*, 10.2 g of *sodium chloride R* and 10 g of *bovine albumin R* in *water R*, adjust to pH 8.4 (*2.2.3*) using *1 M hydrochloric acid* and dilute to 1000.0 ml with *water R*.

Tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4. *4006600.*

Dissolve 5.12 g of *sodium chloride R*, 3.03 g of *tris(hydroxymethyl)aminomethane R* and 1.40 g of *sodium edetate R* in 250 ml of *distilled water R*. Adjust the pH (*2.2.3*) to 8.4 using *hydrochloric acid R*. Dilute to 500.0 ml with *distilled water R*.

Phosphate buffer solution pH 8.5. *4013300.*

Dissolve 3.5 g of *dipotassium hydrogen phosphate R* and 4.5 g of *sodium chloride R* in 500 ml of *water R*. Adjust the pH (*2.2.3*) with a mixture of equal volumes of *dilute phosphoric acid R* and *water R*.

Tris acetate buffer solution pH 8.5. *4006700.*

Dissolve 0.294 g of *calcium chloride R* and 12.11 g of *tris(hydroxymethyl)aminomethane R* in *water R*. Adjust the pH (*2.2.3*) with *acetic acid R*. Dilute to 1000.0 ml with *water R*.

Barbital buffer solution pH 8.6 R1. *4006900.*

Dissolve in *water R* 1.38 g of *barbital R*, 8.76 g of *barbital sodium R* and 0.38 g of *calcium lactate R* and dilute to 1000.0 ml with the same solvent.

1.5 M tris-hydrochloride buffer solution pH 8.8. *4009900.*

Dissolve 90.8 g of *tris(hydroxymethyl)aminomethane R* in 400 ml of *water R*. Adjust the pH (*2.2.3*) with *hydrochloric acid R* and dilute to 500.0 ml with *water R*.

Buffer (phosphate) solution pH 9.0. *4008300.*

Dissolve 1.74 g of *potassium dihydrogen phosphate R* in 80 ml of *water R*, adjust the pH (*2.2.3*) with *1 M potassium hydroxide* and dilute to 100.0 ml with *water R*.

Buffer solution pH 9.0. *4007000.*

Solution I. Dissolve 6.18 g of *boric acid R* in *0.1 M potassium chloride R* and dilute to 1000.0 ml with the same solvent.

Solution II. *0.1 M sodium hydroxide*.

Mix 1000.0 ml of solution I and 420.0 ml of solution II.

Buffer solution pH 9.0 R1. *4007100.*

Dissolve 6.20 g of *boric acid R* in 500 ml of *water R* and adjust the pH (*2.2.3*) with *1 M sodium hydroxide* (about 41.5 ml). Dilute to 1000.0 ml with *water R*.

Ammonium chloride buffer solution pH 9.5. *4007200.*

Dissolve 33.5 g of *ammonium chloride R* in 150 ml of *water R*, add 42.0 ml of *concentrated ammonia R* and dilute to 250.0 ml with *water R*.

Storage: in a polyethylene container.

Ammonium chloride buffer solution pH 10.0. *4007300.*

Dissolve 5.4 g of *ammonium chloride R* in 20 ml of *water R*, add 35.0 ml of *ammonia R* and dilute to 100.0 ml with *water R*.

Diethanolamine buffer solution pH 10.0. *4007500.*

Dissolve 96.4 g of *diethanolamine R* in *water R* and dilute to 400 ml with the same solvent. Add 0.5 ml of an 186 g/l solution of *magnesium chloride R* and adjust the pH (*2.2.3*) with *1 M hydrochloric acid*. Dilute to 500.0 ml with *water R*.

0.1 M Ammonium carbonate buffer solution pH 10.3. *4011900.*

Dissolve 7.91 g of *ammonium carbonate R* in 800 ml of *water R*. Adjust the pH (*2.2.3*) with *dilute sodium hydroxide solution R*. Dilute to 1000.0 ml with *water R*.

Ammonium chloride buffer solution pH 10.4. *4011000.*

Dissolve 70 g of *ammonium chloride R* in 200 ml of *water R*, add 330 ml of *concentrated ammonia R* and dilute to 1000.0 ml with *water R*. If necessary, adjust to pH 10.4 with *ammonia R*.

Borate buffer solution pH 10.4. *4011100.*

Dissolve 24.64 g of *boric acid R* in 900 ml of *distilled water R*. Adjust the pH (*2.2.3*) using a 400 g/l solution of *sodium hydroxide R*. Dilute to 1000 ml with *distilled water R*.

Ammonium chloride buffer solution pH 10.7. *4013400.*

Dissolve 67.5 g of *ammonium chloride R* in *water R*, add 570 ml of *concentrated ammonia R* and dilute to 1000.0 ml with *water R*.

Buffer solution pH 10.9. *4007600.*

Dissolve 6.75 g of *ammonium chloride R* in *ammonia R* and dilute to 100.0 ml with the same solvent.

Total-ionic-strength-adjustment buffer. *4007700.*

Dissolve 58.5 g of *sodium chloride R*, 57.0 ml of *glacial acetic acid R*, 61.5 g of *sodium acetate R* and 5.0 g of *cyclohexylene-dinitrilotetra-acetic acid R* in *water R* and

dilute to 500.0 ml with the same solvent. Adjust to pH 5.0 to 5.5 with a 335 g/l solution of *sodium hydroxide R* and dilute to 1000.0 ml with *distilled water R*.

Total-ionic-strength-adjustment buffer R1. *4008800.*

Solution (a). Dissolve 210 g of *citric acid R* in 400 ml of *distilled water R*. Adjust to pH 7.0 (*2.2.3*) with *concentrated ammonia R*. Dilute to 1000.0 ml with *distilled water R*.

Solution (b). Dissolve 132 g of *ammonium phosphate R* in *distilled water R* and dilute to 1000.0 ml with the same solvent.

Solution (c). To a suspension of 292 g of (ethylenedinitrilo)tetra-*acetic acid R* in about 500 ml of *distilled water R*, add about 200 ml of *concentrated ammonia R* to dissolve. Adjust the pH to 6 to 7 (*2.2.3*) with *concentrated ammonia R*. Dilute to 1000.0 ml with *distilled water R*.

Mix equal volumes of solution (a), (b), and (c) and adjust to pH 7.5 with *concentrated ammonia R*.

4.2. VOLUMETRIC ANALYSIS

01/2008:40201

4.2.1. PRIMARY STANDARDS FOR VOLUMETRIC SOLUTIONS

Primary standards for volumetric solutions are indicated by the suffix RV. Primary standards of suitable quality may be obtained from commercial sources or prepared by the following methods.

Arsenious trioxide. As_2O_3. (M_r 197.8). *2000100.* [1327-53-3].

Sublime *arsenious trioxide R* in a suitable apparatus.

Storage: over *anhydrous silica gel R*.

Benzoic acid. $C_7H_6O_2$. (M_r 122.1). *2000200.* [65-85-0].

Sublime *benzoic acid R* in a suitable apparatus.

Potassium bromate. $KBrO_3$. (M_r 167.0). *2000300.* [7758-01-2].

Crystallise *potassium bromate R* from boiling *water R*. Collect the crystals and dry to constant mass at 180 °C.

Potassium hydrogen phthalate. $C_8H_5KO_4$. (M_r 204.2). *2000400.* [877-24-7].

Recrystallise *potassium hydrogen phthalate R* from boiling *water R*, collect the crystals at a temperature above 35 °C and dry to constant mass at 110 °C.

Sodium carbonate. Na_2CO_3 . (M_r 106.0). *2000500.* [497-19-8].

Filter at room temperature a saturated solution of *sodium carbonate R*. Introduce slowly into the filtrate a stream of *carbon dioxide R* with constant cooling and stirring. After about 2 h, collect the precipitate on a sintered-glass filter (*2.1.2*). Wash the filter with iced *water R* containing carbon dioxide. After drying at 100 °C to 105 °C, heat to constant mass at 270 °C to 300 °C, stirring from time to time.

Sodium chloride. NaCl. (M_r 58.44). *2000600.* [7647-14-5].

To 1 volume of a saturated solution of *sodium chloride R* add 2 volumes of *hydrochloric acid R*. Collect the crystals formed and wash with *hydrochloric acid R1*. Remove the hydrochloric acid by heating on a water-bath and dry the crystals to constant mass at 300 °C.

Sulphanilic acid. $C_6H_7NO_3S$. (M_r 173.2). *2000700.* [121-57-3].

Recrystallise *sulphanilic acid R* from boiling *water R*. Filter and dry to constant mass at 100 °C to 105 °C.

Zinc. Zn. (M_r 65.4). *2000800.* [7440-66-6].

Use a quality containing not less than 99.9 per cent of Zn.

01/2008:40202

4.2.2. VOLUMETRIC SOLUTIONS

Volumetric solutions are prepared according to the usual chemical analytical methods. The accuracy of the apparatus used is verified to ensure that it is appropriate for the intended use.

The concentration of volumetric solutions is indicated in terms of molarity. Molarity expresses, as the number of moles, the amount of substance dissolved in 1 litre of solution. A solution which contains *x* moles of substance per litre is said to be *x* M.

Volumetric solutions do not differ from the prescribed strength by more than 10 per cent. The molarity of the volumetric solutions is determined by an appropriate number of titrations. The repeatability does not exceed 0.2 per cent (relative standard deviation).

Volumetric solutions are standardised by the methods described below. When a volumetric solution is to be used in an assay in which the end-point is determined by an electrochemical process (for example, amperometry or potentiometry) the solution is standardised by the same method. The composition of the medium in which a volumetric solution is standardised should be the same as that in which it is to be used.

Solutions more dilute than those described are obtained by dilution with *carbon dioxide-free water R* of the least-concentrated solution that describes a standardisation. The correction factors of these solutions are the same as those from which the dilutions were prepared.

0.1 M Acetic acid. *3008900.*

Dilute 6.0 g of *glacial acetic acid R* to 1000.0 ml with *water R*.

Standardisation. To 25.0 ml of acetic acid add 0.5 ml of *phenolphthalein solution R* and titrate with *0.1 M sodium hydroxide*.

0.1 M Ammonium and cerium nitrate. *3000100.*

Shake for 2 min a solution containing 56 ml of sulphuric acid R and 54.82 g of *ammonium and cerium nitrate R*, add five successive quantities, each of 100 ml, of *water R*, shaking after each addition. Dilute the clear solution to 1000.0 ml with *water R*. Standardise the solution after 10 days.

Standardisation. To 25.0 ml of the ammonium and cerium nitrate solution add 2.0 g of *potassium iodide R* and 150 ml of *water R*. Titrate immediately with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator.

Storage: protected from light.

0.01 M Ammonium and cerium nitrate. *3000200.*

To 100.0 ml of *0.1 M ammonium and cerium nitrate* add, with cooling, 30 ml of sulphuric acid R and dilute to 1000.0 ml with *water R*.

0.1 M Ammonium and cerium sulphate. *3000300.*

Dissolve 65.0 g of *ammonium and cerium sulphate R* in a mixture of 500 ml of *water R* and 30 ml of sulphuric acid R. Allow to cool and dilute to 1000.0 ml with *water R*.

Standardisation. To 25.0 ml of the ammonium and cerium sulphate solution add 2.0 g of *potassium iodide R* and 150 ml of *water R*. Titrate immediately with *0.1 M sodium thiosulphate,* using 1 ml of *starch solution R* as indicator.

0.01 M Ammonium and cerium sulphate. *3000400.*

To 100.0 ml of *0.1 M ammonium and cerium sulphate* add, with cooling, 30 ml of sulphuric acid R and dilute to 1000.0 ml with *water R*.

0.1 M Ammonium thiocyanate. *3000500.*

Dissolve 7.612 g of *ammonium thiocyanate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 20.0 ml of *0.1 M silver nitrate* add 25 ml of *water R,* 2 ml of *dilute nitric acid R* and 2 ml of *ferric ammonium sulphate solution R2.* Titrate with the ammonium thiocyanate solution until a reddish-yellow colour is obtained.

0.1 M Barium chloride. *3000600.*

Dissolve 24.4 g of *barium chloride R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 10.0 ml of the barium chloride solution add 60 ml of *water R,* 3 ml of *concentrated ammonia R* and 0.5 mg to 1 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate*. When the solution begins to decolorise, add 50 ml of *alcohol R* and continue the titration until the blue-violet colour disappears.

0.05 M Barium perchlorate. *3000700.*

Dissolve 15.8 g of *barium hydroxide R* in a mixture of 7.5 ml of *perchloric acid R* and 75 ml of *water R* , adjust the solution to pH 3 by adding *perchloric acid R* and filter if necessary. Add 150 ml of *alcohol R* and dilute to 250 ml with *water R*. Dilute to 1000.0 ml with *buffer solution pH 3.7 R*.

Standardisation. To 5.0 ml of *0.05 M sulphuric acid* add 5 ml of *water R,* 50 ml of *buffer solution pH 3.7 R* and 0.5 ml of *alizarin s solution R*. Titrate with the barium perchlorate solution until an orange-red colour appears. Standardise immediately before use.

0.025 M Barium perchlorate. *3009600.*

Dilute 500.0 ml of *0.05 M barium perchlorate* to 1000.0 ml with *buffer solution pH 3.7 R*.

0.004 M Benzethonium chloride. *3000900.*

Dissolve in *water R* 1.792 g of *benzethonium chloride R,* previously dried to constant mass at 100 °C to 105 °C, and dilute to 1000.0 ml with the same solvent.

Standardisation. Calculate the molarity of the solution from the content of $C_{27}H_{42}ClNO_2$ in the dried benzethonium chloride determined as follows. Dissolve 0.350 g of the dried substance in 30 ml of *anhydrous acetic acid R* and add 6 ml of *mercuric acetate solution R*. Titrate with *0.1 M perchloric acid,* using 0.05 ml of *crystal violet solution R* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 44.81 mg of $C_{27}H_{42}ClNO_2$.

0.01 M Bismuth nitrate. *3010000.*

Dissolve 4.86 g of *bismuth nitrate pentahydrate R* in 60 ml of *dilute nitric acid R* and dilute to 1000.0 ml with *water R*.

Standardisation. To 25.0 ml of the bismuth nitrate solution, add 50 ml of *water R* and titrate with *0.01 M sodium edetate* using 0.05 ml of a 1 g/l solution of *xylenol orange R* as indicator.

0.0167 M Bromide-bromate. *3001000.*

Dissolve 2.7835 g of *potassium bromate RV* and 13 g of *potassium bromide R* in *water R* and dilute to 1000.0 ml with the same solvent.

0.1 M Cerium sulphate. *3001100.*

Dissolve 40.4 g of *cerium sulphate R* in a mixture of 500 ml of *water R* and 50 ml of sulphuric acid R. Allow to cool and dilute to 1000.0 ml with *water R*.

Standardisation. To 20.0 ml of the cerium sulphate solution, add 1.6 g of *potassium iodide R,* 100 ml of *water R* and 40 ml of *dilute sulphuric acid R*. Titrate immediately with *0.1 M sodium thiosulphate* using 0.8 ml of *starch solution R* as indicator.

0.02 M Copper sulphate. *3001200.*

Dissolve 5.0 g of *copper sulphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 20.0 ml of the copper sulphate solution add 2 g of *sodium acetate R* and 0.1 ml of *pyridylazonaphthol solution R*. Titrate with *0.02 M sodium edetate* until the colour changes from violet-blue to bright green. Titrate slowly towards the end of the titration.

0.1 M Ferric ammonium sulphate. *3001300.*

Dissolve 50.0 g of *ferric ammonium sulphate R* in a mixture of 6 ml of sulphuric acid R and 300 ml of *water R* and dilute to 1000.0 ml with *water R*.

Standardisation. To 25.0 ml of the ferric ammonium sulphate solution, add 3 ml of *hydrochloric acid R* and 2 g of *potassium iodide R*. Allow to stand for 10 min. Titrate with *0.1 M sodium thiosulphate,* using 1 ml of *starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 48.22 mg of $FeNH_4(SO_4)_2,12H_2O$.

0.1 M Ferrous sulphate. *3001400.*

Dissolve 27.80 g of *ferrous sulphate R* in 500 ml of *dilute sulphuric acid R* and dilute to 1000.0 ml with *water R*.

Standardisation. To 25.0 ml of the ferrous sulphate solution add 3 ml of *phosphoric acid R* and titrate immediately with *0.02 M potassium permanganate*. Standardise immediately before use.

1 M Hydrochloric acid. *3001800.*

Dilute 103.0 g of *hydrochloric acid R* to 1000.0 ml with *water R*.

Standardisation. Dissolve 1.000 g of *sodium carbonate RV* in 50 ml of *water R,* add 0.1 ml of *methyl orange solution R* and titrate with the hydrochloric acid until the solution just becomes yellowish-red. Boil for 2 min. The solution reverts to yellow. Cool and continue the titration until a yellowish-red colour is obtained.

1 ml of *1 M hydrochloric acid* is equivalent to 53.00 mg of Na_2CO_3.

0.1 M Hydrochloric acid. *3002100.*

Dilute 100.0 ml of *1 M hydrochloric acid* to 1000.0 ml with *water R*.

Standardisation. Carry out the titration described for *1 M hydrochloric acid* using 0.100 g of *sodium carbonate RV* dissolved in 20 ml of *water R*.

1 ml of *0.1 M hydrochloric acid* is equivalent to 5.30 mg of Na_2CO_3.

0.1 M Hydrochloric acid, alcoholic. *3008800.*

Dilute 9.0 ml of *hydrochloric acid R* to 1000.0 ml with *aldehyde-free alcohol R*.

0.5 M Iodine. *3009400.*

Dissolve 127 g of *iodine R* and 200 g of *potassium iodide R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 2.0 ml of the iodine solution add 1 ml of *dilute acetic acid R* and 50 ml of *water R*. Titrate with *0.1 M sodium thiosulphate,* using *starch solution R* as indicator.

Storage: protected from light.

0.05 M Iodine. *3002700.*

Dissolve 12.7 g of *iodine R* and 20 g of *potassium iodide R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 20.0 ml of the iodine solution add 1 ml of *dilute acetic acid R* and 30 ml of *water R*. Titrate with *0.1 M sodium thiosulphate,* using *starch solution R* as indicator.

Storage: protected from light.

0.01 M Iodine. *3002900.*

Add 0.3 g of *potassium iodide R* to 20.0 ml of *0.05 M iodine* and dilute to 100.0 ml with *water R*.

0.1 M Lanthanum nitrate. *3010100.*

Dissolve 43.30 g of *lanthanum nitrate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 20 ml of the lanthanum nitrate solution, add 15 ml of *water R* and 25 ml of *0.1 M sodium edetate*. Add about 50 mg of *xylenol orange triturate R* and about 2 g of *hexamethylenetetramine R*. Titrate with *0.1 M zinc sulphate* until the colour changes from yellow to violet-pink.

0.1 M Lead nitrate. *3003100.*

Dissolve 33 g of *lead nitrate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Take 20.0 ml of the lead nitrate solution and carry out the determination of lead by complexometry (*2.5.11*).

0.05 M Lead nitrate. *3009700.*

Dilute 50.0 ml of *0.1 M Lead nitrate* to 100.0 ml with *water R*.

0.1 M Lithium methoxide. *3003300.*

Dissolve 0.694 g of *lithium R* in 150 ml of *anhydrous methanol R* and dilute to 1000.0 ml with *toluene R*.

Standardisation. To 10 ml of *dimethylformamide R* add 0.05 ml of a 3 g/l solution of *thymol blue R* in *methanol R* and titrate with the lithium methoxide solution until a pure blue colour is obtained. Immediately add 0.200 g of *benzoic acid RV*. Stir to effect solution and titrate with the lithium methoxide solution until the pure blue colour is again obtained. Protect the solution from atmospheric carbon dioxide throughout the titration. From the volume of titrant used in the second titration ascertain the exact strength of the lithium methoxide solution. Standardise immediately before use.

1 ml of *0.1 M lithium methoxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1 M Magnesium chloride. *3003400.*

Dissolve 20.33 g of *magnesium chloride R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Carry out the determination of magnesium by complexometry (*2.5.11*).

1 M Nitric acid. *3003600.*

Dilute 96.6 g of *nitric acid R* to 1000.0 ml with *water R*.

Standardisation. Dissolve 1.000 g of *sodium carbonate RV* in 50 ml of *water R*, add 0.1 ml of *methyl orange solution R* and titrate with the nitric acid until the solution just becomes reddish-yellow; boil for 2 min. The solution reverts to yellow. Cool and continue the titration until a reddish-yellow colour is obtained.

1 ml of *1 M nitric acid* is equivalent to 53.00 mg of Na_2CO_3.

0.1 M Perchloric acid. *3003900.*

Place 8.5 ml of *perchloric acid R* in a volumetric flask containing about 900 ml of *glacial acetic acid R* and mix. Add 30 ml of *acetic anhydride R*, dilute to 1000.0 ml with *glacial acetic acid R*, mix and allow to stand for 24 h. Determine the water content (*2.5.12*) without addition of methanol and, if necessary, adjust the water content to 0.1-0.2 per cent by adding either *acetic anhydride R* or *water R*. Allow to stand for 24 h.

Standardisation. Dissolve 0.350 g of *potassium hydrogen phthalate RV* in 50 ml of *anhydrous acetic acid R*, warming gently if necessary. Allow to cool protected from the air, and titrate with the perchloric acid solution, using 0.05 ml of *crystal violet solution R* as indicator. Note the temperature of the perchloric acid solution at the time of the titration. If the temperature at which an assay is carried out is different from that at which the *0.1 M perchloric acid* has been standardised, the volume used in the assay becomes:

$$V_c = V\,[1 + (t_1 - t_2)\,0.0011]$$

where t_1 is the temperature during standardisation, t_2 is the temperature during the assay, V_c is the corrected volume, and V is the observed volume.

1 ml of *0.1 M perchloric acid* is equivalent to 20.42 mg of $C_8H_5KO_4$.

0.05 M Perchloric acid. *3004000.*

Dilute 50.0 ml of *0.1 M perchloric acid* to 100.0 ml with *anhydrous acetic acid R*.

0.02 M Perchloric acid. *3009900.*

Dilute 20.0 ml of *0.1 M perchloric acid* to 100.0 ml with *anhydrous acetic acid R*.

0.033 M Potassium bromate. *3004200.*

Dissolve 5.5670 g of *potassium bromate RV* in *water R* and dilute to 1000.0 ml with the same solvent.

0.02 M Potassium bromate. *3004300.*

Dissolve 3.340 g of *potassium bromate RV* in *water R* and dilute to 1000.0 ml with the same solvent.

0.0167 M Potassium bromate. *3004400.*

Prepare by diluting *0.033 M Potassium bromate.*

0.0083 M Potassium bromate. *3004500.*

Prepare by diluting *0.033 M Potassium bromate.*

0.0167 M Potassium dichromate. *3004600.*

Dissolve 4.90 g of *potassium dichromate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 20.0 ml of the potassium dichromate solution add 1 g of *potassium iodide R* and 7 ml of *dilute hydrochloric acid R*. Add 250 ml of *water R* and titrate with *0.1 M sodium thiosulphate,* using 3 ml of *starch solution R* as indicator, until the colour changes from blue to light green.

0.1 M Potassium hydrogen phthalate. *3004700.*

In a conical flask containing about 800 ml of *anhydrous acetic acid R,* dissolve 20.42 g of *potassium hydrogen phthalate RV*. Heat on a water-bath until completely dissolved, protected from humidity. Cool to 20 °C and dilute to 1000.0 ml with *anhydrous acetic acid R*.

1 M Potassium hydroxide. *3009100.*

Dissolve 60 g of *potassium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Titrate 20.0 ml of the potassium hydroxide solution with *1 M hydrochloric acid,* using 0.5 ml of *phenolphthalein solution R* as indicator.

0.1 M Potassium hydroxide. *3004800.*

Dissolve 6 g of *potassium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Titrate 20.0 ml of the potassium hydroxide solution with *0.1 M hydrochloric acid,* using 0.5 ml of *phenolphthalein solution R* as indicator.

0.5 M Potassium hydroxide in alcohol (60 per cent *V/V*). *3004900.*

Dissolve 3 g of *potassium hydroxide R* in *aldehyde-free alcohol R* (60 per cent *V/V*) and dilute to 100.0 ml with the same solvent.

Standardisation. Titrate 20.0 ml of the alcoholic potassium hydroxide solution (60 per cent *V/V*) with *0.5 M hydrochloric acid,* using 0.5 ml of *phenolphthalein solution R* as indicator.

0.5 M Potassium hydroxide, alcoholic. *3005000.*

Dissolve 3 g of *potassium hydroxide R* in 5 ml of *water R* and dilute to 100.0 ml with *aldehyde-free alcohol R*.

Standardisation. Titrate 20.0 ml of the alcoholic potassium hydroxide solution with *0.5 M hydrochloric acid,* using 0.5 ml of *phenolphthalein solution R* as indicator.

0.1 M Potassium hydroxide, alcoholic. *3005100.*

Dilute 20.0 ml of *0.5 M alcoholic potassium hydroxide* to 100.0 ml with *aldehyde-free alcohol R*.

0.01 M Potassium hydroxide, alcoholic. *3009000.*

Dilute 2.0 ml of *0.5 M alcoholic potassium hydroxide* to 100.0 ml with *aldehyde-free alcohol R*.

0.05 M Potassium iodate. *3005200.*

Dissolve 10.70 g of *potassium iodate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Dilute 25.0 ml of the potassium iodate solution to 100.0 ml with *water R*. To 20.0 ml of this solution add 2 g of *potassium iodide R* and 10 ml of *dilute sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate,* using 1 ml of *starch solution R,* added towards the end of the titration, as indicator.

0.001 M Potassium iodide. *3009200.*

Dilute 10.0 ml of *potassium iodide solution R* (166 g/l) to 100.0 ml with *water R*. Dilute 5.0 ml of this solution to 500.0 ml with *water R*.

0.02 M Potassium permanganate. *3005300.*

Dissolve 3.2 g of *potassium permanganate R* in *water R* and dilute to 1000.0 ml with the same solvent. Heat the solution for 1 h on a water-bath, allow to cool and filter through a sintered-glass filter (*2.1.2*).

Standardisation. To 20.0 ml of the potassium permanganate solution, add 2 g of *potassium iodide R* and 10 ml of *dilute sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate,* using 1 ml of *starch solution R,* added towards the end of the titration, as indicator. Standardise immediately before use.

Storage: protected from light.

0.1 M Silver nitrate. *3005600.*

Dissolve 17.0 g of *silver nitrate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Dissolve 0.100 g of *sodium chloride RV* in 30 ml of *water R*. Titrate with the silver nitrate solution, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Storage: protected from light.

0.001 M Silver nitrate. *3009300.*

Dilute 5.0 ml of silver nitrate 0.1 M to 500.0 ml with *water R*.

0.1 M Sodium arsenite. *3005800.*

Dissolve *arsenious trioxide RV* equivalent to 4.946 g of As_2O_3 in a mixture of 20 ml of *strong sodium hydroxide solution R* and 20 ml of *water R,* dilute to 400 ml with *water R* and add *dilute hydrochloric acid R* until the solution is neutral to *litmus paper R*. Dissolve 2 g of *sodium hydrogen carbonate R* in the solution and dilute to 500.0 ml with *water R*.

0.1 M Sodium edetate. *3005900.*

Dissolve 37.5 g of *sodium edetate R* in 500 ml of *water R,* add 100 ml of *1 M sodium hydroxide* and dilute to 1000.0 ml with *water R*.

Standardisation. Dissolve 0.120 g of *zinc RV* in 4 ml of *hydrochloric acid R1* and add 0.1 ml of *bromine water R*. Drive off the excess of bromine by boiling, add *dilute sodium hydroxide solution R* until the solution is weakly acid or neutral and carry out the assay of zinc by complexometry (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 6.54 mg of Zn.

Storage: in a polyethylene container.

0.02 M Sodium edetate. *3006000.*

Dissolve 7.444 g of *sodium edetate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Dissolve 0.100 g of *zinc RV* in 4 ml of *hydrochloric acid R1* and add 0.1 ml of *bromine water R*. Drive off the excess of bromine by boiling. Transfer the solution to a volumetric flask and dilute to 100.0 ml with *water R*. Transfer 25.0 ml of the solution to a 500 ml conical flask and dilute to 200 ml with *water R*. Add about 50 mg of *xylenol orange triturate R* and *hexamethylenetetramine R* until the solution becomes violet-pink. Add 2 g of *hexamethylenetetramine R* in excess. Titrate with the sodium edetate solution until the violet-pink colour changes to yellow.

1 ml of *0.02 M sodium edetate* is equivalent to 1.308 mg of Zn.

1 M Sodium hydroxide. *3006300.*

Dissolve 42 g of *sodium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Titrate 20.0 ml of the sodium hydroxide solution with *1 M hydrochloric acid* using the indicator prescribed in the assay in which *1 M sodium hydroxide* is used.

If sodium hydroxide free from carbonate is prescribed, prepare it as follows. Dissolve *sodium hydroxide R* in *water R* to give a concentration of 400 g/l to 600 g/l and allow to stand. Decant the clear supernatant liquid, taking precautions to avoid the introduction of carbon dioxide, and dilute with *carbon dioxide-free water R* to the required molarity. The solution complies with the following test. Titrate 20.0 ml of hydrochloric acid of the same molarity with the solution of sodium hydroxide, using 0.5 ml of *phenolphthalein solution R* as indicator. At the end-point add just sufficient of the acid to discharge the pink colour and concentrate the solution to 20 ml by boiling. During boiling add just sufficient acid to discharge the pink colour, which should not reappear after prolonged boiling. The volume of acid used does not exceed 0.1 ml.

0.1 M Sodium hydroxide. *3006600.*

Dilute 100.0 ml of *1 M sodium hydroxide* to 1000.0 ml with *carbon dioxide-free water R*.

Standardisation. Titrate 20.0 ml of the sodium hydroxide solution with *0.1 M hydrochloric acid*, using the end-point detection prescribed for the assay in which the *0.1 M sodium hydroxide* is used.

Standardisation (for use in the assay of halide salts of organic bases). Dissolve 0.100 g of *benzoic acid RV* in a mixture of 5 ml of *0.01 M hydrochloric acid* and 50 ml of *alcohol R*. Carry out the titration (*2.2.20*), using the sodium hydroxide solution. Note the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1 M Sodium hydroxide, ethanolic. *3007000.*

To 250 ml of *ethanol R* add 3.3 g of *strong sodium hydroxide solution R*.

Standardisation. Dissolve 0.100 g of *benzoic acid RV* in 2 ml of *water R* and 10 ml of *alcohol R*. Titrate with the ethanolic sodium hydroxide solution, using 0.2 ml of *thymolphthalein solution R* as indicator. Standardise immediately before use.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1 M Sodium methoxide. *3007100.*

Cool 175 ml of *anhydrous methanol R* in iced *water R* and add, in small portions, about 2.5 g of freshly cut *sodium R*. When the metal has dissolved, dilute to 1000.0 ml with *toluene R*.

Standardisation. To 10 ml of *dimethylformamide R* add 0.05 ml of a 3 g/l solution of *thymol blue R* in *methanol R*, and titrate with the sodium methoxide solution until a pure blue colour is obtained. Immediately add 0.200 g of *benzoic acid RV*. Stir to effect solution and titrate with the sodium methoxide solution until the pure blue colour is again obtained. Protect the solution from atmospheric carbon dioxide throughout the titration. From the volume of titrant used in the second titration ascertain the exact strength of the sodium methoxide solution. Standardise immediately before use.

1 ml of *0.1 M sodium methoxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1 M Sodium nitrite. *3007200.*

Dissolve 7.5 g of *sodium nitrite R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Dissolve 0.300 g of *sulphanilic acid RV* in 50 ml of *dilute hydrochloric acid R* and carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using the sodium nitrite solution and determining the end-point electrometrically. Standardise immediately before use.

1 ml of *0.1 M sodium nitrite* is equivalent to 17.32 mg of $C_6H_7NO_3S$.

0.1 M Sodium periodate. *3009500.*

Dissolve 21.4 g of *sodium periodate R* in about 500 ml of *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. In a stoppered flask, introduce 20.0 ml of the sodium periodate solution and add 5 ml of *perchloric acid R*. Close the flask and shake. Adjust the solution to pH 6.4 (*2.2.3*) using a saturated solution of *sodium hydrogen carbonate R*. Add 10 ml of *potassium iodide solution R*, close, shake and allow to stand for 2 min. Titrate with *0.025 M sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and titrate slowly until the colour is completely discharged.

0.1 M Sodium thiosulphate. *3007300.*

Dissolve 25 g of *sodium thiosulphate R* and 0.2 g of *sodium carbonate R* in *carbon dioxide-free water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 10.0 ml of *0.033 M potassium bromate*, add 40 ml of *water R*, 10 ml of *potassium iodide solution R* and 5 ml of *hydrochloric acid R1*. Titrate with the sodium thiosulphate solution, using 1 ml of *starch solution R*, added towards the end of the titration, as indicator.

0.5 M Sulphuric acid. *3007800.*

Dissolve 28 ml of sulphuric acid R in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. Dissolve 1.000 g of *sodium carbonate RV* in 50 ml of *water R*, add 0.1 ml of *methyl orange solution R*, and titrate with the sulphuric acid until the solution begins to turn reddish-yellow. Boil for about 2 min. The colour of the solutions reverts to yellow. Cool and titrate again until the reddish-yellow colour reappears.

1 ml of *0.5 M sulphuric acid* is equivalent to 53.00 mg of Na_2CO_3.

0.05 M Sulphuric acid. *3008000.*

Dilute 100.0 ml of *0.5 M sulphuric acid* to 1000.0 ml with *water R*.

Standardisation. Carry out the titration described for *0.5 M sulphuric acid*, using 0.100 g of *sodium carbonate RV*, dissolved in 20 ml of *water R*.

1 ml of *0.05 M sulphuric acid* is equivalent to 5.30 mg of Na_2CO_3.

0.1 M Tetrabutylammonium hydroxide. *3008300.*

Dissolve 40 g of *tetrabutylammonium iodide R* in 90 ml of *anhydrous methanol R*, add 20 g of finely powdered *silver oxide R* and shake vigorously for 1 h. Centrifuge a few millilitres of the mixture and test the supernatant liquid for iodides. If a positive reaction is obtained, add an additional 2 g of *silver oxide R* and shake for a further 30 min. Repeat this procedure until the liquid is free from iodides, filter the mixture through a fine sintered-glass filter (*2.1.2*) and rinse the reaction vessel and filter with three quantities, each of 50 ml, of *toluene R*. Add the washings to the filtrate and dilute to 1000.0 ml with *toluene R*. Pass dry carbon dioxide-free nitrogen through the solution for 5 min.

Standardisation. To 10 ml of *dimethylformamide R* add 0.05 ml of a 3 g/l solution of *thymol blue R* in *methanol R* and titrate with the tetrabutylammonium hydroxide solution until a pure blue colour is obtained. Immediately add 0.200 g of *benzoic acid RV*. Stir to effect solution, and titrate with the tetrabutylammonium hydroxide solution until the pure

blue colour is again obtained. Protect the solution from atmospheric carbon dioxide throughout the titration. From the volume of titrant used in the second titration ascertain the exact strength of the tetrabutylammonium hydroxide solution. Standardise immediately before use.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1 M Tetrabutylammonium hydroxide in 2-propanol. *3008400.*

Prepare as described for *0.1 M tetrabutylammonium hydroxide* using *2-propanol R* instead of *toluene R* and standardise as described.

0.05 M Zinc chloride. *3008500.*

Dissolve 6.82 g of *zinc chloride R*, weighed with appropriate precautions, in *water R*. If necessary, add dropwise *dilute hydrochloric acid R* until the opalescence disappears. Dilute to 1000.0 ml with *water R*.

Standardisation. To 20.0 ml of the zinc chloride solution add 5 ml of *dilute acetic acid R* and carry out the determination of zinc by complexometry (*2.5.11*).

0.1 M Zinc sulphate. *3008600.*

Dissolve 29 g of *zinc sulphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Standardisation. To 20.0 ml of the zinc sulphate solution add 5 ml of *dilute acetic acid R* and carry out the determination of zinc by complexometry (*2.5.11*).

5.1. GENERAL TEXTS ON MICROBIOLOGY

01/2008:50101

5.1.1. METHODS OF PREPARATION OF STERILE PRODUCTS

Sterility is the absence of viable micro-organisms. The sterility of a product cannot be guaranteed by testing; it has to be assured by the application of a suitably validated production process. It is essential that the effect of the chosen sterilisation procedure on the product (including its final container or package) is investigated to ensure effectiveness and the integrity of the product and that the procedure is validated before being applied in practice. It is recommended that the choice of the container is such as to allow the optimum sterilisation to be applied. Failure to follow meticulously a validated process involves the risk of a non-sterile product or of a deteriorated product. Revalidation is carried out whenever major changes in the sterilisation procedure, including changes in the load, take place. It is expected that the principles of good manufacturing practice (as described in, for example, the European Community Guide to GMP) will have been observed in the design of the process including, in particular, the use of:

- qualified personnel with appropriate training,
- adequate premises,
- suitable production equipment, designed for easy cleaning and sterilisation,
- adequate precautions to minimise the bioburden prior to sterilisation,
- validated procedures for all critical production steps,
- environmental monitoring and in-process testing procedures.

The precautions necessary to minimise the pre-sterilisation bioburden include the use of components with an acceptable low degree of microbial contamination. Microbiological monitoring and setting of suitable action limits may be advisable for ingredients which are liable to be contaminated because of their origin, nature or method of preparation.

The methods described here apply mainly to the inactivation or removal of bacteria, yeasts and moulds. For biological products of animal or human origin or in cases where such material has been used in the production process, it is necessary during validation to demonstrate that the process is capable of the removal or inactivation of relevant viral contamination. Guidance on this aspect is provided in, for example, the appropriate European Community Notes for Guidance.

Wherever possible, a process in which the product is sterilised in its final container (terminal sterilisation) is chosen. When a fully validated terminal sterilisation method by steam, dry heat or ionising radiation is used, parametric release, that is the release of a batch of sterilised items based on process data rather than on the basis of submitting a sample of the items to sterility testing, may be carried out, subject to the approval of the competent authority.

If terminal sterilisation is not possible, filtration through a bacteria-retentative filter or aseptic processing is used; wherever possible, appropriate additional treatment of the product (for example, heating of the product) in its final container is applied. In all cases, the container and closure are required to maintain the sterility of the product throughout its shelf-life.

Sterility Assurance Level (SAL)

Where appropriate reference is made within the methods described below, to a “sterility assurance level” or “SAL”. The achievement of sterility within any one item in a population of items submitted to a sterilisation process cannot be guaranteed nor can it be demonstrated. The inactivation of micro-organisms by physical or chemical means follows an exponential law; thus there is always a finite statistical probability that a micro-organism may survive the sterilising process. For a given process, the probability of survival is determined by the number, types and resistance of the micro-organisms present and by the environment in which the organisms exist during treatment. The SAL of a sterilising process is the degree of assurance with which the process in question renders a population of items sterile. The SAL for a given process is expressed as the probability of a non-sterile item in that population. An SAL of 10^{-6}, for example, denotes a probability of not more than one viable micro-organism in 1×10^{6} sterilised items of the final product. The SAL of a process for a given product is established by appropriate validation studies.

METHODS AND CONDITIONS OF STERILISATION

Sterilisation may be carried out by one of the methods described below. Modifications to, or combinations of, these methods may be used provided that the chosen procedure is validated both with respect to its effectiveness and the integrity of the product including its container or package.

For all methods of sterilisation the critical conditions of the operation are monitored in order to confirm that the previously determined required conditions are achieved throughout the batch during the whole sterilisation process This applies in all cases including those where the reference conditions are used.

TERMINAL STERILISATION

For terminal sterilisation it is essential to take into account the non-uniformity of the physical and, where relevant, chemical conditions within the sterilising chamber. The location within the sterilising chamber that is least accessible to the sterilising agent is determined for each loading configuration of each type and size of container or package (for example, the coolest location in an autoclave). The minimum lethality delivered by the sterilising cycle and the reproducibility of the cycle are also determined in order to ensure that all loads will consistently receive the specified treatment.

Having established a terminal sterilisation process, knowledge of its performance in routine use is gained wherever possible, by monitoring and suitably recording the physical and, where relevant, chemical conditions achieved within the load in the chamber throughout each sterilising cycle.

Steam sterilisation (Heating in an autoclave). Sterilisation by saturated steam under pressure is preferred, wherever applicable, especially for aqueous preparations. For this method of terminal sterilisation the reference conditions for aqueous preparations are heating at a minimum of 121 °C for 15 min. Other combinations of time and temperature may be used provided that it has been satisfactorily demonstrated that the process chosen delivers an adequate and reproducible level of lethality when operating routinely within the established tolerances. The procedures and

precautions employed are such, as to give an SAL of 10^{-6} or better. Guidance concerning validation by means of the F_0 concept is provided below (*5.1.5*).

Knowledge of the physical conditions (temperature and pressure) within the autoclave chamber during the sterilisation procedure is obtained. The temperature is usually measured by means of temperature-sensing elements inserted into representative containers together with additional elements at the previously established coolest part of the loaded chamber. The conditions throughout each cycle are suitably recorded, for example, as a temperature-time chart, or by any other suitable means.

Where a biological assessment is carried out, this is obtained using a suitable biological indicator (*5.1.2*).

Dry heat sterilisation. For this method of terminal sterilisation the reference conditions are a minimum of 160 °C for at least 2 h. Other combinations of time and temperature may be used provided that it has been satisfactorily demonstrated that the process chosen delivers an adequate and reproducible level of lethality when operated routinely within the established tolerances. The procedures and precautions employed are such as to give an SAL of 10^{-6} or better.

Dry heat sterilisation is carried out in an oven equipped with forced air circulation or other equipment specially designed for the purpose. The steriliser is loaded in such a way that a uniform temperature is achieved throughout the load. Knowledge of the temperature within the steriliser during the sterilisation procedure is usually obtained by means of temperature-sensing elements inserted into representative containers together with additional elements at the previously established coolest part of the loaded steriliser. The temperature throughout each cycle is suitably recorded.

Where a biological assessment is carried out, this is obtained using a suitable biological indicator (*5.1.2*).

Dry heat at temperatures greater than 220 °C is frequently used for sterilisation and depyrogenation of glassware. In this case demonstration of a 3-log reduction in heat resistant endotoxin can be used as a replacement for biological indicators (*5.1.2*).

Ionising radiation sterilisation. Sterilisation by this method is achieved by exposure of the product to ionising radiation in the form of gamma radiation from a suitable radioisotopic source (such as cobalt 60) or of a beam of electrons energised by a suitable electron accelerator.

In some countries there are regulations that lay down rules for the use of ionising radiation for sterilisation purposes, for example, in the appropriate European Community Notes for Guidance.

For this method of terminal sterilisation the reference absorbed dose is 25 kGy. Other doses may be used provided that it has satisfactorily been demonstrated that the dose chosen delivers an adequate and reproducible level of lethality when the process is operated routinely within the established tolerances. The procedures and precautions employed are such as to give an SAL of 10^{-6} or better.

During the sterilisation procedure the radiation absorbed by the product is monitored regularly by means of established dosimetry procedures that are independent of dose rate. Dosimeters are calibrated against a standard source at a reference radiation plant on receipt from the supplier and at suitable intervals of not longer than one year thereafter.

Where a biological assessment is carried out, this is obtained using a suitable biological indicator (*5.1.2*).

Gas sterilisation. This method of sterilisation is only to be used where there is no suitable alternative. It is essential that penetration by gas and moisture into the material to be sterilised is ensured and that it is followed by a process of elimination of the gas under conditions that have been previously established to ensure that any residue of gas or its transformation products in the sterilised product is below the concentration that could give rise to toxic effects during use of the product. Guidance on this aspect with respect to the use of ethylene oxide is provided, for example, in the appropriate European Community Notes for Guidance.

Wherever possible, the gas concentration, relative humidity, temperature and duration of the process are measured and recorded. Measurements are made where sterilisation conditions are least likely to be achieved, as determined at validation.

The effectiveness of the process applied to each sterilisation load is checked using a suitable biological indicator (*5.1.2*).

A suitable sample of each batch is tested for sterility (*2.6.1*) before the batch is released.

FILTRATION

Certain active ingredients and products that cannot be terminally sterilised may be subjected to a filtration procedure using a filter of a type that has been demonstrated to be satisfactory by means of a microbial challenge test using a suitable test micro-organism. A suspension of *Pseudomonas diminuta* (ATCC 19146, NCIMB 11091 or CIP 103020) may be suitable. It is recommended that a challenge of at least 10^7 CFU per cm^2 of active filter surface is used and that the suspension is prepared in tryptone soya broth which, after passage throug the filter, is collected aseptically and incubated aerobically at 32 °C. Such products need special precautions. The production process and environment are designed to minimise microbial contamination and are regularly subjected to appropriate monitoring procedures. The equipment, containers and closures and, wherever possible, the ingredients are subjected to an appropriate sterilisation process. It is recommended that the filtration process is carried out as close as possible to the filling point. The operations following filtration are carried out under aseptic conditions.

Solutions are passed through a bacteria-retentive membrane with a nominal pore size of 0.22 μm or less or any other type of filter known to have equivalent properties of bacteria retention. Appropriate measures are taken to avoid loss of solute by adsorption on to the filter and to avoid the release of contaminants from the filter. Attention is given to the bioburden prior to filtration, filter capacity, batch size and duration of filtration. The filter is not used for a longer period than has been approved by validation of the combination of the filter and the product in question.

The integrity of an assembled sterilising filter is verified before use and confirmed after use by carrying out tests appropriate to the type of filter used and the stage of testing, for example bubble-point, pressure hold or diffusion rate tests.

Due to the potential additional risks of the filtration method as compared with other sterilisation processes, a prefiltration through a bacteria-retentative filter may be advisable in cases where a low bioburden cannot be ensured by other means.

ASEPTIC PREPARATION

The objective of aseptic processing is to maintain the sterility of a product that is assembled from components, each of which has been sterilised by one of the above methods. This is achieved by using conditions and facilities designed to prevent microbial contamination. Aseptic processing may

include aseptic filling of products into container/closure systems, aseptic blending of formulations followed by aseptic filling and aseptic packaging.

In order to maintain the sterility of the components and the product during processing, careful attention needs to be given to:

- environment,
- personnel,
- critical surfaces,
- container/closure sterilisation and transfer procedures,
- maximum holding period of the product before filling into the final container.

Process validation includes appropriate checks on all the above and checks on the process are regularly carried out by means of process simulation tests using microbial growth media which are then incubated and examined for microbial contamination (media fill tests). In addition, a suitable sample of each batch of any product that is sterilised by filtration and/or aseptically processed is tested for sterility (*2.6.1*) before the batch is released.

01/2008:50102

5.1.2. BIOLOGICAL INDICATORS OF STERILISATION

Biological indicators are standardised preparations of selected micro-organisms used to assess the effectiveness of a sterilisation procedure. They usually consist of a population of bacterial spores placed on an inert carrier, for example a strip of filter paper, a glass slide or a plastic tube. The inoculated carrier is covered in such a way that it is protected from any deterioration or contamination, while allowing the sterilising agent to enter into contact with the micro-organisms. Spore suspensions may be presented in sealed ampoules. Biological indicators are prepared in such a way that they can be stored under defined conditions; an expiry date is set.

Micro-organisms of the same bacterial species as the bacteria used to manufacture the biological indicators may be inoculated directly into a liquid product to be sterilised or into a liquid product similar to that to be sterilised. In this case, it must be demonstrated that the liquid product has no inhibiting effect on the spores used, especially as regards their germination.

A biological indicator is characterised by the name of the species of bacterium used as the reference micro-organism, the number of the strain in the original collection, the number of viable spores per carrier and the *D*-value. The *D*-value is the value of a parameter of sterilisation (duration or absorbed dose) required to reduce the number of viable organisms to 10 per cent of the original number. It is of significance only under precisely defined experimental conditions. Only the stated micro-organisms are present. Biological indicators consisting of more than one species of bacteria on the same carrier may be used. Information on the culture medium and the incubation conditions is supplied.

It is recommended that the indicator organisms are placed at the locations presumed, or wherever possible, found by previous physical measurement to be least accessible to the sterilising agent. After exposure to the sterilising agent, aseptic technique is used to transfer carriers of spores to the culture media, so that no contamination is present at the time of examination. Biological indicators that include an ampoule of culture medium placed directly in the packaging protecting the inoculated carrier may be used.

A choice of indicator organisms is made such that:

a) the resistance of the test strain to the particular sterilisation method is great compared to the resistance of all pathogenic micro-organisms and to that of micro-organisms potentially contaminating the product,

b) the test strain is non-pathogenic,

c) the test strain is easy to culture.

After incubation, growth of the reference micro-organisms subjected to a sterilisation procedure demonstrates that the procedure has been unsatisfactory.

Steam sterilisation. The use of biological indicators intended for steam sterilisation is recommended for the validation of sterilisation cycles. Spores of *Bacillus stearothermophilus* (for example, ATCC 7953, NCTC 10007, NCIMB 8157 or CIP 52.81) are recommended. The number of viable spores exceeds 5×10^5 per carrier. The *D*-value at 121 °C exceeds 1.5 min. It is verified that exposing the biological indicators to steam at 121 ± 1 °C for 6 min leaves revivable spores, and that there is no growth of the reference micro-organisms after the biological indicators have been exposed to steam at 121 ± 1 °C for 15 min.

Dry-heat sterilisation. Spores of *Bacillus subtilis* (for example, var. *niger* ATCC 9372, NCIMB 8058 or CIP 77.18) are recommended for the preparation of biological indicators. The number of viable spores exceeds 1×10^5 per carrier and the *D*-value at 160 °C is approximately 1 min to 3 min. Dry heat at temperatures greater than 220 °C is frequently used for sterilisation and depyrogenation of glassware. In this case, demonstration of a 3 log reduction in heat resistant bacterial endotoxin can be used as a replacement for biological indicators.

Ionising radiation sterilisation. Biological indicators may be used to monitor routine operations, as an additional possibility to assess the effectiveness of the set dose of radiation energy, especially in the case of accelerated electron sterilisation. The spores of *Bacillus pumilus* (for example, ATCC 27.142, NCTC 10327, NCIMB 10692 or CIP 77.25) are recommended. The number of viable spores exceeds 1×10^7 per carrier. The *D*-value exceeds 1.9 kGy. It is verified that there is no growth of the reference micro-organisms after the biological indicators have been exposed to 25 kGy (*minimum absorbed dose*).

Gas sterilisation. The use of biological indicators is necessary for all gas sterilisation procedures, both for the validation of the cycles and for routine operations. Gas sterilisation is widely used for medical devices, isolators, chambers, etc. Use for such purposes is outside the scope of the European Pharmacopoeia. The use of spores of *Bacillus subtilis* (for example, var. *niger* ATCC 9372, NCIMB 8058 or CIP 77.18) is recommended for ethylene oxide. The number of viable spores exceeds 5×10^5 per carrier. The parameters of resistance are the following: the *D*-value exceeds 2.5 min for a test cycle involving 600 mg/l of ethylene oxide, at 54 °C and at 60 per cent relative humidity. It is verified that there is no growth of the reference micro-organisms after the biological indicators have been exposed to the test cycle described above for 60 min and that exposing the indicators to a reduced temperature cycle (600 mg/l, 30 °C and 60 per cent relative humidity) for 15 min leaves revivable spores. Exposing the indicators to 600 mg/l of ethylene oxide at 54 °C for 60 min without humidification must leave revivable spores to ensure that the biological indicator is able to reveal insufficient humidification.

01/2008:50103

5.1.3. EFFICACY OF ANTIMICROBIAL PRESERVATION

If a pharmaceutical preparation does not itself have adequate antimicrobial activity, antimicrobial preservatives may be added, particularly to aqueous preparations, to prevent proliferation or to limit microbial contamination which, during normal conditions of storage and use, particularly for multidose containers, could occur in a product and present a hazard to the patient from infection and spoilage of the preparation. Antimicrobial preservatives must not be used as a substitute for good manufacturing practice.

The efficacy of an antimicrobial preservative may be enhanced or diminished by the active constituent of the preparation or by the formulation in which it is incorporated or by the container and closure used. The antimicrobial activity of the preparation in its final container is investigated over the period of validity to ensure that such activity has not been impaired by storage. Such investigations may be carried out on samples removed from the final container immediately prior to testing.

During development of a pharmaceutical preparation, it shall be demonstrated that the antimicrobial activity of the preparation as such or, if necessary, with the addition of a suitable preservative or preservatives provides adequate protection from adverse effects that may arise from microbial contamination or proliferation during storage and use of the preparation.

The efficacy of the antimicrobial activity may be demonstrated by the test described below. The test is not intended to be used for routine control purposes.

TEST FOR EFFICACY OF ANTIMICROBIAL PRESERVATION

The test consists of challenging the preparation, wherever possible in its final container, with a prescribed inoculum of suitable micro-organisms, storing the inoculated preparation at a prescribed temperature, withdrawing samples from the container at specified intervals of time and counting the organisms in the samples so removed.

The preservative properties of the preparation are adequate if, in the conditions of the test, there is a significant fall or no increase, as appropriate, in the number of micro-organisms in the inoculated preparation after the times and at the temperatures prescribed. The criteria of acceptance, in terms of decrease in the number of micro-organisms with time, vary for different types of preparations according to the degree of protection intended (see Tables 5.1.3.-1/2/3).

Test micro-organisms

Pseudomonas aeruginosa	ATCC 9027; NCIMB 8626; CIP 82.118.
Staphylococcus aureus	ATCC 6538; NCTC 10788; NCIMB 9518; CIP 4.83.
Candida albicans	ATCC 10231; NCPF 3179; IP 48.72.
Aspergillus niger	ATCC 16404; IMI 149007; IP 1431.83.

Single-strain challenges are used and the designated micro-organisms are supplemented, where appropriate, by other strains or species that may represent likely contaminants to the preparation. It is recommended, for example, that *Escherichia coli* (ATCC 8739; NCIMB 8545; CIP 53.126) is used for all oral preparations and *Zygosaccharomyces rouxii* (NCYC 381; IP 2021.92) for oral preparations containing a high concentration of sugar.

Preparation of inoculum

Preparatory to the test, inoculate the surface of agar medium B (*2.6.12*) for bacteria or agar medium C without the addition of antibiotics (*2.6.12*) for fungi, with the recently grown stock culture of each of the specified micro-organisms. Incubate the bacterial cultures at 30-35 °C for 18-24 h, the culture of *C. albicans* at 20-25 °C for 48 h, and the culture of *A. niger* at 20-25 °C for 1 week or until good sporulation is obtained. Subcultures may be needed after revival before the micro-organism is in its optimal state, but it is recommended that their number be kept to a minimum.

To harvest the bacterial and *C. albicans* cultures, use a sterile suspending fluid, containing 9 g/l of *sodium chloride R*, for dispersal and transfer of the surface growth into a suitable vessel. Add sufficient suspending fluid to reduce the microbial count to about 10^8 micro-organisms per millilitre. To harvest the *A. niger* culture, use a sterile suspending fluid containing 9 g/l of *sodium chloride R* and 0.5 g/l of *polysorbate 80 R* and adjust the spore count to about 10^8 per millilitre by adding the same solution.

Remove immediately a suitable sample from each suspension and determine the number of colony-forming units per millilitre in each suspension by plate count or membrane filtration (*2.6.12*). This value serves to determine the inoculum and the baseline to use in the test. The suspensions shall be used immediately.

METHOD

To count the viable micro-organisms in the inoculated products, use the agar medium used for the initial cultivation of the respective micro-organisms.

Inoculate a series of containers of the product to be examined, each with a suspension of one of the test organisms to give an inoculum of 10^5 to 10^6 micro-organisms per millilitre or per gram of the preparation. The volume of the suspension of inoculum does not exceed 1 per cent of the volume of the product. Mix thoroughly to ensure homogeneous distribution.

Maintain the inoculated product at 20-25 °C, protected from light. Remove a suitable sample from each container, typically 1 ml or 1 g, at zero hour and at appropriate intervals according to the type of the product and determine the number of viable micro-organisms by plate count or membrane filtration (*2.6.12*). Ensure that any residual antimicrobial activity of the product is eliminated by dilution, by filtration or by the use of a specific inactivator. When dilution procedures are used, due allowance is made for the reduced sensitivity in the recovery of small numbers of viable micro-organisms. When a specific inactivator is used, the ability of the system to support the growth of the test organisms is confirmed by the use of appropriate controls.

The procedure is validated to verify its ability to demonstrate the required reduction in count of viable micro-organisms.

CRITERIA OF ACCEPTANCE

The criteria for evaluation of antimicrobial activity are given in Tables 5.1.3.-1/2/3 in terms of the log reduction in the number of viable micro-organisms against the value obtained for the inoculum.

Table 5.1.3.-1. - *Parenteral and ophthalmic preparations*

		Log reduction				
		6 h	**24 h**	**7 d**	**14 d**	**28 d**
Bacteria	A	2	3	-	-	NR*
	B	-	1	3	-	NI**
Fungi	A	-	-	2	-	NI
	B	-	-	-	1	NI

*NR: no recover

**NI: no increase

The A criteria express the recommended efficacy to be achieved. In justified cases where the A criteria cannot be attained, for example for reasons of an increased risk of adverse reactions, the B criteria must be satisfied.

Table 5.1.3.-2. - *Topical preparations*

		Log reduction			
		2 d	**7 d**	**14 d**	**28 d**
Bacteria	A	2	3	-	NI
	B	-	-	3	NI
Fungi	A	-	-	2	NI
	B	-	-	1	NI

The A criteria express the recommended efficacy to be achieved. In justified cases where the A criteria cannot be attained, for example for reasons of an increased risk of adverse reactions, the B criteria must be satisfied.

Table 5.1.3.-3. - *Oral preparations*

	Log reduction	
	14 d	**28 d**
Bacteria	3	NI
Fungi	1	NI

The above criteria express the recommended efficacy to be achieved.

01/2008:50104

5.1.4. MICROBIOLOGICAL QUALITY OF PHARMACEUTICAL PREPARATIONS

The following chapter is published for information.

This general chapter presents 2 sets of recommended acceptance criteria for microbiological quality. The 1st set of criteria corresponds to the 1st sets of methods in general chapters 2.6.12 and 2.6.13. In the same way that the 1st sets of tests in chapters 2.6.12 and 2.6.13 are to be replaced in future by the 2nd sets, so the 1st set of criteria in this chapter will be replaced by the 2nd set. Where authorised, the 2nd set of criteria may be used instead of the 1st set before replacement of the latter. The 2nd set presents criteria developed in co-operation with the Japanese Pharmacopoeia and the United States Pharmacopeia to achieve harmonised requirements.

A. METHOD OF THE EUROPEAN PHARMACOPOEIA

In the manufacture, packaging, storage and distribution of pharmaceutical preparations, suitable measures must be taken to ensure their microbiological quality. The pharmaceutical preparations should comply with the criteria given below.

Category 1

Preparations required to be sterile by the relevant monograph on the dosage form and other preparations labelled sterile.

– Test for sterility (*2.6.1*).

Category 2

Preparations for topical use and for use in the respiratory tract, except where required to be sterile, and transdermal patches.

– Total viable aerobic count (*2.6.12*). Not more than 10^2 micro-organisms (aerobic bacteria plus fungi) per gram, per millilitre or per patch (including the adhesive and backing layer).

– Transdermal patches: absence of enterobacteria and certain other gram-negative bacteria, determined on 1 patch (including the adhesive and backing layer). Other preparations: not more than 10^1 enterobacteria and certain other gram-negative bacteria per gram or per millilitre (*2.6.13*).

– Absence of *Pseudomonas aeruginosa*, determined on 1 g, 1 ml or 1 patch (including the adhesive and backing layer) (*2.6.13*).

– Absence of *Staphylococcus aureus*, determined on 1 g, 1 ml or 1 patch (including the adhesive and backing layer) (*2.6.13*).

Category 3

A. *Preparations for oral and rectal administration.*

– Total viable aerobic count (*2.6.12*). Not more than 10^3 bacteria and not more than 10^2 fungi per gram or per millilitre.

– Absence of *Escherichia coli* (1 g or 1 ml) (*2.6.13*).

B. *Preparations for oral administration containing raw materials of natural (animal, vegetable or mineral) origin for which antimicrobial pretreatment is not feasible and for which the competent authority accepts microbial contamination of the raw material exceeding 10^3 viable micro-organisms per gram or per millilitre. Herbal medicinal products described in category 4 are excluded.*

– Total viable aerobic count (*2.6.12*). Not more than 10^4 bacteria and not more than 10^2 fungi per gram or per millilitre.

– Not more than 10^2 enterobacteria and certain other gram-negative bacteria per gram or per millilitre (*2.6.13*).

– Absence of *Salmonella* (10 g or 10 ml) (*2.6.13*).

– Absence of *Escherichia coli* (1 g or 1 ml) (*2.6.13*).

– Absence of *Staphylococcus aureus* (1 g or 1 ml) (*2.6.13*).

Category 4

Herbal medicinal products consisting solely of one or more herbal drugs (whole, reduced or powdered).

A. *Herbal medicinal products to which boiling water is added before use.*

– Total viable aerobic count (*2.6.12*). Not more than 10^7 bacteria and not more than 10^5 fungi per gram or per millilitre.

– Not more than 10^2 *Escherichia coli* per gram or per millilitre (see Appendix).

B. *Herbal medicinal products to which boiling water is not added before use.*

- Total viable aerobic count (*2.6.12*). Not more than 10^5 bacteria and not more than 10^4 fungi per gram or per millilitre.
- Not more than 10^3 enterobacteria and certain other gram-negative bacteria per gram or per millilitre (*2.6.13*).
- Absence of *Escherichia coli* (1 g or 1 ml) (*2.6.13*).
- Absence of *Salmonella* (10 g or 10 ml) (*2.6.13*).

B. HARMONISED METHOD: MICROBIOLOGICAL QUALITY OF NON-STERILE PHARMACEUTICAL PREPARATIONS AND SUBSTANCES FOR PHARMACEUTICAL USE

The presence of certain micro-organisms in non-sterile preparations may have the potential to reduce or even inactivate the therapeutic activity of the product and has a potential to adversely affect the health of the patient. Manufacturers therefore have to ensure a low bioburden of finished dosage forms by implementing current guidelines on Good Manufacturing Practice during the manufacture, storage and distribution of pharmaceutical preparations.

Microbial examination of non-sterile products is performed according to the methods given in general chapters *2.6.12* and *2.6.13 (B. Harmonised method)*. Acceptance criteria for non-sterile pharmaceutical products based upon the total aerobic microbial count (TAMC) and the total combined yeasts/moulds count (TYMC) are given in Tables 5.1.4.-1 and 5.1.4.-2. Acceptance criteria are based on individual results or on the average of replicate counts when replicate counts are performed (e.g. direct plating methods).

When an acceptance criterion for microbiological quality is prescribed it is interpreted as follows:

- 10^1 CFU: maximum acceptable count = 20;
- 10^2 CFU: maximum acceptable count = 200;
- 10^3 CFU: maximum acceptable count = 2000, and so forth.

Table 5.1.4.-1 includes a list of specified micro-organisms for which acceptance criteria are set. The list is not necessarily exhaustive and for a given preparation it may be necessary to test for other micro-organisms depending on the nature of the starting materials and the manufacturing process.

If it has been shown that none of the prescribed tests will allow valid enumeration of micro-organisms at the level prescribed, a validated method with a limit of detection as close as possible to the indicated acceptance criterion is used.

Table 5.1.4.-2. – *Acceptance criteria for microbiological quality of non-sterile substances for pharmaceutical use*

	TAMC (CFU/g or CFU/ml)	TYMC (CFU/g or CFU/ml)
Substances for pharmaceutical use	10^3	10^2

Table 5.1.4.-1. – *Acceptance criteria for microbiological quality of non-sterile dosage forms*

Route of administration	TAMC (CFU/g or CFU/ml)	TYMC (CFU/g or CFU/ml)	Specified micro-organisms
Non-aqueous preparations for oral use	10^3	10^2	Absence of *Escherichia coli* (1 g or 1 ml)
Aqueous preparations for oral use	10^2	10^1	Absence of *Escherichia coli* (1 g or 1 ml)
Rectal use	10^3	10^2	-
Oromucosal use Gingival use Cutaneous use Nasal use Auricular use	10^2	10^1	Absence of *Staphylococcus aureus* (1 g or 1 ml) Absence of *Pseudomonas aeruginosa* (1 g or 1 ml)
Vaginal use	10^2	10^1	Absence of *Pseudomonas aeruginosa* (1 g or 1 ml) Absence of *Staphylococcus aureus* (1 g or 1 ml) Absence of *Candida albicans* (1 g or 1 ml)
Transdermal patches (limits for one patch including adhesive layer and backing)	10^2	10^1	Absence of *Staphylococcus aureus* (1 patch) Absence of *Pseudomonas aeruginosa* (1 patch)
Inhalation use (special requirements apply to liquid preparations for nebulisation)	10^2	10^1	Absence of *Staphylococcus aureus* (1 g or 1 ml) Absence of *Pseudomonas aeruginosa* (1 g or 1 ml) Absence of bile-tolerant gram-negative bacteria (1 g or 1 ml)
Special Ph. Eur. provision for oral dosage forms containing raw materials of natural (animal, vegetal or mineral) origin for which antimicrobial pretreatment is not feasible and for which the competent authority accepts TAMC of the raw material exceeding 10^3 CFU per gram or per millilitre	10^4	10^2	Not more than 10^2 CFU of bile-tolerant gram-negative bacteria (1 g or 1 ml) Absence of *Salmonella* (10 g or 10 ml) Absence of *Escherichia coli* (1 g or 1 ml) Absence of *Staphylococcus aureus* (1 g or 1 ml)
Special Ph. Eur. provision for herbal medicinal products consisting solely of one or more herbal drugs (whole, reduced or powdered):			
– herbal medicinal products to which boiling water is added before use	10^7	10^5	Not more than 10^2 CFU of *Escherichia coli* (see Appendix) (1 g or 1 ml)
– herbal medicinal products to which boiling water is not added before use	10^5	10^4	Not more than 10^3 CFU of bile-tolerant gram-negative bacteria (1 g or 1 ml) Absence of *Escherichia coli* (1 g or 1 ml) Absence of *Salmonella* (10 g or 10 ml)

In addition to the micro-organisms listed in Table 5.1.4.-1, the significance of other micro-organisms recovered is evaluated in terms of:

- use of the product: hazard varies according to the route of administration (eye, nose, respiratory tract);
- nature of the product: its ability to support growth, the presence of adequate antimicrobial preservation;
- method of application;
- intended recipient: risk may differ for neonates, infants, the debilitated;
- use of immunosuppressive agents, corticosteroids;
- presence of disease, wounds, organ damage.

Where warranted, a risk-based assessment of the relevant factors is conducted by personnel with specialised training in microbiology and the interpretation of microbiological data. For raw materials, the assessment takes account of processing to which the product is subjected, the current technology of testing and the availability of materials of the desired quality.

Appendix: Special Ph. Eur. Provision for herbal medicinal products consisting solely of one or more herbal drugs (whole, reduced or powdered): quantificative test for *E. coli*

Use the following protocol.

Sample preparation and pre-incubation. Prepare a sample using a 10-fold dilution of not less than 1 g of the product to be examined as described in general chapter *2.6.12* (under section B, Harmonised method), and use the quantities corresponding respectively to 0.1 g, 0.01 g and 0.001 g (or 0.1 ml, 0.01 ml and 0.001 ml) to inoculate a suitable amount (determined as described under 3-4 of general chapter *2.6.13*, section B, Harmonised method) of casein soya bean digest broth, mix and incubate at 30-35 °C for 18-24 h.

Selection and subculture. Shake the container, transfer 1 ml of casein soya bean digest broth to 100 ml of MacConkey broth and incubate at 42-44 °C for 24-48 h. Subculture on a plate of MacConkey agar at 30-35 °C for 18-72 h.

Interpretation. Growth of colonies indicates the possible presence of *E. coli*. This is confirmed by identification tests.

Note the smallest quantity of the product that gives a positive result and the largest quantity that gives a negative result.

Determine from the following table the probable number of bacteria.

Results for each quantity of product			Probable number of bacteria per gram or millilitre of product
0.1 g or 0.1 ml	0.01 g or 0.01 ml	0.001 g or 0.001 ml	
+	+	+	> 10^3
+	+	-	< 10^3 and > 10^2
+	-	-	< 10^2 and > 10
-	-	-	< 10

5.1.5. APPLICATION OF THE F_0 CONCEPT TO STEAM STERILISATION OF AQUEOUS PREPARATIONS

The following chapter is published for information.

The F_0 value of a saturated steam sterilisation process is the lethality expressed in terms of the equivalent time in minutes at a temperature of 121 °C delivered by the process to the product in its final container with reference to micro-organisms possessing a *Z*-value of 10.

The total F_0 of a process takes account of the heating up and cooling down phases of the cycle and can be calculated by integration of lethal rates with respect to time at discrete temperature intervals.

When a steam sterilisation cycle is chosen on the basis of the F_0 concept, great care must be taken to ensure that an adequate assurance of sterility is consistently achieved. In addition to validating the process, it may also be necessary to perform continuous, rigorous microbiological monitoring during routine production to demonstrate that the microbiological parameters are within the established tolerances so as to give an SAL of 10^{-6} or better.

In connection with sterilisation by steam, the *Z*-value relates the heat resistance of a micro-organism to changes in temperature. The *Z*-value is the change in temperature required to alter the *D*-value by a factor of 10.

The *D*-value (or decimal reduction value) is the value of a parameter of sterilisation (duration or absorbed dose) required to reduce the number of viable organisms to 10 per cent of the original number. It is only of significance under precisely defined experimental conditions.

The following mathematical relationships apply:

$$F_0 = D_{121}\,(\log N_0 - \log N) = D_{121} \log IF$$

D_{121} = *D*-value of the reference spores (*5.1.2*) at 121 °C,
N_0 = initial number of viable micro-organisms,
N = final number of viable micro-organisms,
IF = inactivation factor.

$$Z = \frac{T_2 - T_1}{\log D_1 - \log D_2}$$

D_1 = *D*-value of the micro-organism at temperature T_1,
D_2 = *D*-value of the micro-organism at temperature T_2.

$$IF = \frac{N_0}{N} = 10^{t/D}$$

t = exposure time,
D = *D*-value of micro-organism in the exposure conditions.

5.1.6. ALTERNATIVE METHODS FOR CONTROL OF MICROBIOLOGICAL QUALITY

The following chapter is published for information.

1. GENERAL INTRODUCTION

The objective of this chapter is to facilitate the implementation and use of alternative microbiological methods where this can lead to cost-effective microbiological control and improved assurance for the quality of pharmaceutical products. These alternative methods may also find a place in environmental monitoring.

The microbiological methods described in the European Pharmacopoeia have been used for almost a century and these methods - for enumerating and identifying micro-organisms - still serve microbiologists well. Over the years, these methods have been invaluable to help control and secure the production of microbiologically-safe pharmaceutical products. Nevertheless conventional microbiological methods are slow, and results are not available before an incubation period of typically up to 14 days. Thus the results from the conventional microbiological methods seldom enable proactive, corrective action to be taken.

Alternative methods for control of microbiological quality have been introduced in recent years, and some of these methods have shown potential for real-time or near-real-time results with the possibility of earlier corrective action. These new methods can also offer significant improvements in the quality of testing.

In this informational chapter new microbiological methods offering pharmaceutical applications are described. For each method the basic principle is stated and the benefits and disadvantages of the method are then discussed. Potential uses describe applications that may be envisaged in view of the principles on which the method is based: it is not intended to suggest that actual application has been made. Finally, general considerations for the validation of the method are outlined. These are illustrated by specific examples for each type of method. A detailed validation protocol is given for information at the end of this chapter.

It is not the intention of this chapter to recommend one method over another, nor is it the intention to provide an exclusive or exhaustive list of alternative methods that can be used for pharmaceutical microbiological control. This informational chapter however may be used in the process of choosing an alternative microbiological method as a supplement or as an alternative to conventional microbiological approaches and to give guidance in the process of validating the chosen method. In this rapidly developing field, further methods are likely to appear. The guidance offered in this chapter may be equally applicable to these methods.

There are 3 major types of determinations specific to microbiological tests. These include:

- qualitative tests for the presence or absence of micro-organisms;
- quantitative tests for enumeration of micro-organisms;
- identification tests.

1-1. *QUALITATIVE TESTS FOR THE PRESENCE OR ABSENCE OF MICRO-ORGANISMS*

In conventional microbiological analysis this type of test is characterised by the use of turbidity or other growth-related changes in a culture medium as evidence of the presence of viable micro-organisms in the test sample. The most common example of this test is the sterility test. Other examples of this type of testing are those tests designed to evaluate the presence or absence of a particular type of viable micro-organism in a sample.

1-2. *QUANTITATIVE TESTS FOR ENUMERATION OF MICRO-ORGANISMS*

Membrane filtration and plate count methods are conventional methods used to estimate the number of viable micro-organisms present in a sample. The Most Probable Number (MPN) method is another example of these methods. MPN was developed as a means to estimate the number of viable micro-organisms present in a sample not amenable to direct plating.

1-3. *IDENTIFICATION TESTS*

Biochemical and morphological characterisation of an unknown micro-organism is the classical method of identification used in pharmacopoeial tests. Recently developed methods have streamlined and automated aspects of this identification, especially in the areas of data handling, analysis, and storage. Several new approaches that have been integrated into these methods include biochemical reactions, carbon substrate utilisation, characterisation of fatty acid composition, restriction endonuclease banding patterns and use of 16S rDNA sequence analysis.

2. GENERAL PRINCIPLES OF ALTERNATIVE METHODS

Alternative microbiological methods employ direct and indirect methods of detection; in some instances amplification of the signal is achieved by enrichment methods. In recognition of these differences, and for convenience within this chapter, alternative methods for the control of microbiological quality are divided into 3 categories:

- growth-based methods, where a detectable signal is usually achieved by a period of subculture;
- direct measurement, where individual cells are differentiated and visualised;
- cell component analysis, where the expression of specific cell components offers an indirect measure of microbial presence.

In some instances, these distinctions are artificial but they do enable a working classification to be created.

2-1. *GROWTH-BASED METHODS*

2-1-1. **Early detection of growth**

2-1-1-1. *General critical aspects of methods based on early detection of growth*

Such methods are critically dependent upon microbial growth in order to achieve a detectable number of micro-organisms. For the typically low levels of microbial contamination seen in pharmaceutical products, detection may take 24 h or even more, especially in the case of yeasts and moulds. Increased sensitivity can be achieved with filtered products. In this case, after filtration, the membrane is incubated in the medium and the result is expressed as presence or absence in the quantity corresponding to the filtered volume. These systems, because they use an incubation step in liquid media, do not offer quantitative information but a presence/absence determination in the quantity analysed. Analysis of more than one sample quantity may offer a semi-quantitative estimation (limit test). The major benefit of such methods compared to classical methods frequently resides in the capacity to process simultaneously a large number of samples and potentially to obtain a result in a shorter time.

2-1-1-2. *Electrochemical methods*

Principles of measurement. Micro-organisms multiplying and metabolising in appropriate growth media produce highly charged ionic metabolites from weakly charged organic nutrients leading to the modification of electrical properties in those media. These changes in impedance (measured by conductance or capacitance) are monitored with electrodes included in the culture vessels and in contact with the culture medium. The measurable end-point is the time taken to detect a pre-determined impedance change; the detection time is inversely proportional to the initial inoculum size. For yeasts and moulds, which produce only small changes in electrical impedance, an indirect measurement of conductance using a potassium hydroxide reservoir is commonly used. Direct measurement of capacitance can also be carried out.

Critical aspects. Automated detection with electronic data generation, mapping of the variation of impedance reflecting the growth curve of the micro-organisms, and reduction of the duration of the test to 48 h.

Potential uses. Microbiological assay of antibiotics, efficacy of antimicrobial preservation and presence/absence in the quantity of sample tested when performing total viable aerobic count.

2-1-1-3. *Measurement of consumption or production of gas*

Principles of measurement. Actively multiplying and metabolising organisms utilise appropriate growth media, leading to the production of metabolites or elimination of specific nutrients. In one approach, changes in gaseous head-space composition may be monitored in closed culture vessels by pressure transducers responding to gas production (e.g. CO_2) or gas consumption (e.g. O_2). Other indicators may be employed including colorimetric detection of CO_2.

Critical aspects. For slow-growing micro-organisms such as mycobacteria, the method offers more rapid detection. There is no direct relationship between original microbial burden and detectable end-point. The incubation temperature and the algorithm for data processing significantly affect the results.

Potential uses. Products where slow-growing micro-organisms may be present.

2-1-1-4. *Bioluminescence*

Principles of measurement. Adenosine triphosphate (ATP) is a well-documented marker of cell viability. In this method, ATP needs first to be released from micro-organisms using an appropriate extractant, followed by quantitative assay using the luciferin/luciferase enzyme system, which emits light in proportion to the ATP present. The emitted light is measured with a bioluminometer and is expressed in relative light units (RLU) for bioluminescence in liquid media. The RLU obtained from the sample is compared with a threshold value determined at 2 or 3 times the RLU of the medium used for cultivation or sample suspension. The result is positive if the RLU obtained with the analysed sample exceeds the threshold value. A modification to the method using growth of micro-organisms captured on a membrane by incubation on agar medium employs a charge coupled device (CCD) camera to detect the micro-colonies, and results are expressed as microCFU. This method is quantitative but has a narrow range of linearity.

Critical aspects. If the product sampled has a high level of bacterial contamination (about 500-1000 CFU per sample quantity tested), the detection is rapid (1 h). For low levels of contamination (less than 100 CFU per quantity of sample tested), it is necessary to increase the number of micro-organisms by an incubation step in culture media (liquid or solid agar) for 12-48 h according to the method employed. After this time, in liquid media, one single cell capable of growth will increase from 1 to 1000 and will be detected. The yield of ATP varies from one micro-organism to another, bacteria containing 1-10 fg per cell and fungi around 100 fg per cell and many other factors including the species, the growth phase of the cell, the nutritional status, the cellular stress or the cellular age could affect the ATP content of the cell. Therefore, it is not possible to obtain a count directly from the RLU value. In addition, turbidity and sample colour can affect the reaction by either enhancing the reaction and increasing the level of light output or acting as a quenching agent and lowering the level of light output. Since the reaction is enzymatically based, products which could inhibit or decrease the enzyme activity may interfere. In practice, such interference is rare but must be thoroughly investigated during the validation process. The reaction is also sensitive to the presence of phosphate nucleotides such as ADP or GTP, which interfere by producing ATP in the presence of adenylate kinase. This enzyme is used to increase the sensitivity of some bioluminescence methods: here a 3rd reagent is added containing ADP and new ATP is produced in the presence of adenylate kinase released from micro-organisms.

Potential uses. Testing for efficacy of antimicrobial preservation, presence/absence in the quantity of sample tested when performing total viable aerobic count (bioluminescence in tube or microtitre plate), total viable aerobic count (bioluminescence on membrane), environmental and water monitoring. The method finds applications in filterable and non-filterable products.

2-1-1-5. *Microcalorimetry*

Principles of measurement. Microbial catabolism generates heat which can be accurately measured by microcalorimetry. Heat production can be detected by placing the contaminated sample in a sealed ampoule containing a growth medium and enclosing within a calorimeter. Using sensitive instrumentation microbial growth curves can be established. High bioburdens may be detectable by flow calorimetry.

Critical aspects. Theoretically, this method does not require microbial growth but simply catabolic activity. Nevertheless, a minimum number of micro-organisms are required to give heat output measures above base-line and this is usually achieved by use of an enrichment method.

Potential uses. Test for efficacy of antimicrobial preservation.

2-1-1-6. *Turbidimetry*

Principles of measurement. Microbial growth will lead to detectable changes in medium opacity. This can be accurately quantified by optical density measurement at a specified wavelength. In its simplest form such measurements are performed in a standard spectrophotometer over a wavelength range generally of 420-615 nm. Alternative automated systems employ microtitre plate readers offering continuous readout with early detection of optical density change.

Critical aspects. Attempts have been made to extrapolate the initial bioburden from the time for detection but this may be limited to healthy micro-organisms with reproducible growth characteristics. The methods cannot distinguish between viable and non-viable micro-organisms.

Potential uses. By means of calibration graphs, determination of the inoculum size of microbial suspensions for use in pharmacopoeial tests. In automated mode, establishment of the preservative sensitivity of test micro-organisms recovered from formulated products.

2-1-1-7. *Phage-based methods*

Principles of measurement. Bacterial viruses (bacteriophage, phage) can infect host cells causing either lysis or incorporation of their genetic material and expression of novel proteins. Their high level of host specificity can be employed in detection methods which exploit the consequences of infection as an end-point. Such end-points include: plaque formation on a solid lawn of reporter bacteria; detection of intracellular contents released from lysed bacteria (possibly by colorimetric method); or phage-induced effects such as ice nucleation or bioluminescence following infection by genetically modified phage. Fluorescently labelled coliphages can be used for the selective detection of viable *E. coli* in combination with DEFT (see 2-3-3.).

Critical aspects. Phage-based detection can be used in both single and mixed cultures where host specificity allows both detection and identification. Detectable end-points often require a minimum number of target cells to ensure a measurable signal, necessitating enrichment in situations of low bioburden. The viral infection process can be adversely affected by sample composition. In most cases there is a narrow host range which makes it difficult to detect a broad spectrum of microbial contaminants.

Potential uses. These methods are used mainly for research purposes with commercial development aimed principally towards uses in clinical and food microbiology. These methods are likely to be employed for presence/absence determinations of specified micro-organisms.

2-1-2. **Media development to improve detection**

Principles of measurement. Culture media have existed for many years and have been constantly improved. A recent innovation is the appearance of chromogenic substrates which are increasingly used in clinical and food microbiology. The ability to detect the presence of specific enzymes using suitable substrates has led to the development of a large number of methods for the identification of micro-organisms employing manual or automated methods. The incorporation of such substrates into a selective or non-selective primary isolation medium can eliminate the need for further subculture and biochemical tests to identify certain micro-organisms. Consequently, chromogenic liquid or solid culture media are designed to produce specific enzymatic activities for detection and differentiation of micro-organisms. In these particular media, defined substrates are introduced into the formulation and are hydrolysed by the specific cell enzyme of a given bacteria or fungi during growth. These substrates are chosen according to the diagnostic enzymatic activity sought and are linked to coloured indicators.

Critical aspects. The use of innovative media presents several advantages: improved discrimination of colonies in mixed culture, ease of use and ease of interpretation. In addition, response times are shorter because growth and identification of the micro-organism are simultaneous. However, validation of the media must be undertaken carefully to ensure a combination of specificity, selectivity and robustness. The quality of the signal is based not only on the careful choice of the enzymes used as the basis of detection, as these enzymes may be present in different genera, but also on physico-chemical characteristics of the medium such as pH.

Potential uses. Detection of specified micro-organisms such as *E. coli*, coliforms, *Salmonella*, *Staphylococcus* and *Streptococcus* spp.; particular benefit may be found in presence/absence testing. Yeasts can also be detected using chromogenic culture media.

2-2. *DIRECT MEASUREMENT*

2-2-1. **Solid phase cytometry**

Principles of measurement. A membrane filter is used to retain microbial contaminants. Micro-organisms are stained by labelling using a fluorophore as a viability indicator, either before or after filtration. The fluorophore is initially a non-fluorogenic, conjugated substrate that requires intracellular enzymatic activity to cleave the substrate and release the fluorescent moiety. An intact cellular membrane is required to retain fluorophore within the cytoplasm. Laser excitation and automated scanning allows the detection of single, viable fluorescent micro-organisms. Appropriate software permits differentiation of viable micro-organisms from auto-fluorescent particles. The high sensitivity and rapidity of detection permits near-real-time detection of microbial contaminants. Total cell counts can be obtained using a permanently fluorescing stain.

Critical aspects. Metabolically active, fastidious and viable non-culturable micro-organisms can be detected. This may result in reappraisal of the microbial limits established for the samples under evaluation. Spores require initiation of germination to enable detection. Single cell detection may be achievable, but identification is not currently part of the routine test protocol. The use of fluorescent antibody may offer a route to selective detection. False positives may occur from auto-fluorescent particles, which can be difficult to differentiate from micro-organisms.

Potential uses. Rapid and sensitive method for the non-specific evaluation of bioburden. It has found applications in testing pharmaceutical-grade waters.

2-2-2. **Flow cytometry**

Principles of measurement. Fluorophore-labelled micro-organisms can be detected in suspension as they pass through a flow cell cytometer. Where a viability-indicating fluorophore substrate is employed, viable micro-organisms can be differentiated from non-viable particles (see 2-2-1.).

Critical aspects. Flow cytometry may be applied for the microbiological analysis of both filterable and non-filterable materials. Flow cytometric analysis gives near-real-time detection, but it is not as sensitive as solid phase cytometry. To increase sensitivity for use in the pharmaceutical field, it often becomes necessary to add an incubation step in culture media and in that case the method becomes a growth-based method. Analysis of non-filterable samples may require serial dilution to optimise performance, and particulate size can have a significant effect on performance. With the exception of filterability, similar considerations apply to those of solid phase cytometry. Clumping of bacteria can be a problem (e.g. *S. aureus*).

Potential uses. In contrast with solid phase cytometry, this method offers the potential to detect and enumerate the microbial bioburden in materials containing significant levels of particulate matter. If a pre-incubation step is needed, the method becomes a qualitative determination.

2-2-3. **Direct epifluorescent filtration technique (DEFT)**

Principles of measurement. This technique may be considered to be a forerunner of solid phase cytometry. Micro-organisms concentrated by filtration from the sample are stained with a fluorescent dye, formerly acridine orange and now more commonly 4′,6-diamidino-2-phenylindole (DAPI), that may be detected by epifluorescent illumination. Fluorescent vital staining techniques as employed in solid phase cytometry (see 2-2-1.) are amenable to DEFT and fluorescent redox dyes such as 5-cyano-2,3-ditolyltetrazolium chloride (CTC) can be used to highlight respiring cells. Coupled with microscopy, the method allows rapid detection of micro-organisms, the absolute sensitivity depending on

the volume of product filtered and the number of fields of view examined. Semi-automated auto-focusing systems coupled to image analysis have served to improve the utility of this method. A modification to the principle employs sampling using an adhesive sheet which permits collection of cells from surfaces, staining on the sheet and subsequent direct observation under the epifluorescence microscope.

Critical aspects. The distribution of micro-organisms on the membrane affects method robustness. The intensity of fluorescence can be influenced by the staining process and the metabolic status of the micro-organisms. A brief period of culture on the filter surface prior to staining allows microcolony formation; these microcolonies stain readily, can be easily enumerated and are demonstrable evidence of viability. Developments using fluorescence *in situ* hybridisation (FISH) arising from the complementary interaction of a fluorescently-labelled oligonucleotide probe with a specific rRNA sequence offer a route to selective detection.

Potential uses. DEFT is generally limited to low viscosity fluids although pre-dilution or pre-filtration has occasionally been applied to viscous or particulate products. Bioburden monitoring has been successfully achieved in aqueous pharmaceuticals.

2-3. *CELL COMPONENT ANALYSIS*

2-3-1. **Phenotypic**

2-3-1-1. *Immunological methods*

Principles of measurement. Antibody-antigen reactions can be employed to detect unique cellular determinants of specific organisms. These reactions can be linked to agglutination phenomena, colorimetric or fluorimetric end-points offering both quantitative and qualitative detection. Enzyme-linked immunosorbent assays (ELISA) offer simple solid phase methodologies.

Critical aspects. Immunological detection methods depend upon the unique expression of specific identifiers but do not necessarily demonstrate the presence of viable micro-organisms.

Potential uses. Detection and identification of specified micro-organisms.

2-3-1-2. *Fatty acid profiles*

Principles of measurement. The fatty acid composition of micro-organisms is stable, well conserved and shows a high degree of homogeneity within different taxonomic groups. The isolate is grown on a standard medium and harvested. The fatty acids are saponified, methylated and extracted and the occurrence and amount of the resulting fatty acid methyl esters are measured by high resolution gas chromatography. The fatty acid composition of an unknown isolate is compared with a database of known isolates for a possible match and identification.

Critical aspects. The use of fatty acid profiles for microbial identification requires a high degree of standardisation. It is critical for the fatty acid composition of microbial cells that isolates are grown using standard media and standard incubation conditions. Standard conditions for operation of the gas chromatograph must be employed, with frequent runs of calibration standards and known isolates being very important.

Potential uses. Identification or characterisation of environmental and product flora for contaminant tracing and detection of specified micro-organisms.

2-3-1-3. *Fourier transform infrared (FTIR) spectroscopy*

Principles of measurement. A Fourier transformation of the infrared spectrum of whole micro-organisms gives a stable, recognisable pattern typical of the taxonomic groups of micro-organisms. The analysis of the FTIR pattern can be performed in instruments available on the market. The isolate is grown on a standard medium and harvested. Cell mass is transferred to a carrier, and the infrared spectrum is recorded. The Fourier transformation is calculated and the pattern is compared with a database of known isolates for a possible match and identification.

Critical aspects. The use of FTIR-patterns for microbial identification requires a high degree of standardisation. It is critical for the FTIR-pattern of microbial cells that isolates are grown using standard media and standard incubation conditions. The cells must be in the same state of the growth cycle when analysed. Particular attention needs to be paid to the validation process.

Potential uses. Identification or characterisation of environmental and product flora for contaminant tracing and detection of specified micro-organisms.

2-3-1-4. *Mass spectrometry*

Principles of measurement. Gaseous breakdown products released by heating microbial isolates in a vacuum can be analysed by mass spectrometry, providing characteristic spectra. Similarly, intact microbial cells, when subject to intense ionisation under matrix-assisted laser desorption ionisation-time of flight (MALDI-TOF) mass spectrometry, release a distinctive pattern of charged species. Such spectra can be compared with known profiles as a rapid aid to identification.

Critical aspects. Isolates require culture prior to analysis.

Potential uses. Identification or characterisation of environmental and product flora for contaminant tracing and detection of specified micro-organisms.

2-3-1-5. *Biochemical assays based on physiological reactions*

Principles of measurement. These assays are usually preceded by a Gram stain or other early differentiation test to decide on the appropriate testing protocol. Microbial cell suspensions are tested using biochemical test kits. Micro-organisms are known to have particular reactions to these biochemical substances, e.g. utilisation of specific carbon sources. The identification of the culture is done by comparing the biochemical reaction profile with a database. These methods can be performed manually or by automated instruments.

Critical aspects. A pure colony is needed which must not be older than 3 days. The handling of the system is easy but the interpretation of the results can be subjective. Depending on the system used and the micro-organism under investigation, the results can be available quickly.

Potential uses. Identification of environmental and product flora for contaminant tracing and detection of specified micro-organisms.

2-3-2. **Genotypic**

2-3-2-1. *Nucleic acid amplification techniques (NAAT)*

General principles of measurement. NAAT rely on the reiteration of the process of DNA polymerisation, leading to an exponential increase of a specific fragment of the nucleic acid, i.e. the use of the polymerase chain reaction (PCR). In this thermophilic cyclic process a specific DNA fragment is amplified using oligonucleotide primers (see also general method *2.6.21*). RNA can also be amplified by PCR after transcription into cDNA using a reverse transcriptase. This technique is known as reverse transcriptase PCR (RT-PCR). Alternatively, specific RNA-based amplification techniques, for example nucleic acid sequence-based amplification (NASBA) or transcription-mediated amplification (TMA) are available to amplify multiple antisense copies of the RNA

target. Amplified nucleic acid fragments can be analysed by several methods: fragment size analysis; specific sequence analysis; reamplification with a second primer pair; or specific detection by hybridisation with a fluorescent labelled probe. Depending on the choice of analysis the amplification technique can be qualitative, semi-quantitative or quantitative. For identification/characterisation purposes sequence analysis of specific parts of the genome can be used (i.e. 16S or 23S rRNA targets).

General critical aspects. NAAT have many advantages over classical methods for the detection of micro-organisms:

- the methods are highly specific, provided that the primers chosen are specific for a particular micro-organism or group of micro-organisms;
- the procedures are rapid, overcoming the problem of prolonged incubation times;
- the methods are highly sensitive allowing ideally the detection and amplification of one single nucleic acid fragment in the reaction mix.

However, there are numerous practical restrictions to its use:

- the sensitivity of the methods is highly dependent on how successfully the target fragments can be concentrated in the sample;
- the presence of inhibitors of the enzymatic process result in false negative reactions;
- the starting volume of the sample tested is small;
- the procedures are prone to cross-contamination from previously amplified fragments resulting in false positive results.

Depending on the aim, a choice must be made for amplification of an RNA or DNA target. The target choice affects the correlation with viability. The use of DNA as a marker has the disadvantage that dead micro-organisms also contain DNA, whereas mRNA is rapidly degraded in dead bacteria and is considered a better marker for viability.

Critical aspects of RT-PCR. Reverse transcriptase-PCR is characterised by the synthesis of cDNA using RNA as a template. Reverse transcriptase is used for this step. A specific part of the cDNA is subsequently amplified by PCR. Depending on the quality of the RNA isolation, the cDNA synthesis efficiency can vary. RT-PCR can be used to specifically detect RNA if the DNA contamination of the RNA sample is minimal.

Critical aspects of RNA amplification techniques. These methods have proven to be very valuable for specific (quantitative) RNA detection. However, they may be more difficult to implement routinely.

Critical aspects of (semi-) quantitative detection (real-time PCR). Classical PCR techniques are based on end-point detection. In general fragment analysis is carried out using agarose gels and specific size markers. However, there is no correlation between the amount of PCR product at the end of the reaction and the original amount of target molecule. In contrast the amount of PCR product detected at the beginning of the exponential phase of the reaction correlates very well with the initial starting amount of nucleic acid. Modern real-time PCR techniques are developed to measure this exponential phase of the reaction. These techniques generate amplification data from which the original amount of target molecule can be deduced. A specific labelled probe detects in real time the PCR product formed, allowing direct visualisation of the exponential part of the PCR reaction. By comparison with amplification plots of a standard dilution series, a quantification of the target molecule can be obtained. Automated real-time PCR systems are available on the market. An additional advantage is that the chance of cross-contamination is minimised, as PCR products are scanned with a laser while the tubes remain closed. However, generation of standards will be difficult to accomplish.

Critical aspects of amplification of genes coding for 16S or 23S rRNA. A powerful application of PCR is the amplification and subsequent sequence analysis of specific parts of the genes coding for 16S or 23S rRNA. Analysis of these specific DNA sequences allows in most cases the identification of a micro-organism at species level. Selection of appropriate universal primers, or even species-specific primer pairs, from international databases allows a high specificity in fragment amplification. Modern systematic classification is based on comparative sequence analysis.

Potential uses. Owing to the high specificity of the amplification techniques, they are very suitable for identification purposes. NAAT are suitable for the detection of specified micro-organisms or certain groups such as mycoplasmas. Real-time quantitative PCR is needed for enumeration.

2-3-2-2. *Genetic fingerprinting*

Principles of measurement. This technique characterises and identifies micro-organisms using restriction fragments of nucleic acids from bacterial and fungal genomes. DNA is extracted from a pure microbial cell lysate and cut into fragments by restriction enzymes. DNA fragments are size-separated by electrophoresis, visualised, and the pattern is compared with other known patterns of microbial isolates. The genetic fingerprint is a stable marker that provides definitive species discrimination or even characterisation below species level. Ribotyping is a typical example of this technique. There are also fingerprinting methods based on PCR with primers that bind to several sites in the microbial genome, creating amplicons with a characteristic size distribution.

Critical aspects. There is a need for a pure colony, but no preliminary cultivation step is necessary. The growth conditions (temperature, type of media,) do not affect the outcome of the analysis. For the identification of bacteria semi-automated systems are on the market.

Potential uses. Genetic fingerprinting is more valuable for strain discrimination (characterisation below species level) than for identification of species.

3. GENERAL VALIDATION REQUIREMENTS

The purpose of this section is to provide guidance on the validation of methods for use as alternatives to microbiological methods of the Pharmacopoeia. For microbial recovery and identification, microbiological testing laboratories sometimes use alternative test methods to those described in the general chapters for a variety of reasons, such as economics, throughput, and convenience. Validation of these methods is required. Some guidance on validation is provided in the General Notices section 1.1 on the use of alternative methods.

Validation of alternative microbiological methods must take into account the large degree of variability associated with conventional methods. When conducting microbiological testing by conventional plate count, for example, one frequently encounters a range of results that is broader than ranges in commonly used chemical tests.

Where specific equipment is critical for the application of the alternative method, the equipment, including computer hardware and software, must be fully qualified as follows:

- design qualification (DQ) to provide documented evidence that the design of the equipment is suitable for correct performance of the method; to be provided by the supplier;

– installation qualification (IQ) to provide documented evidence that the equipment has been provided and installed in accordance with its specification;
– operational qualification (OQ) to provide documented evidence that the installed equipment operates within pre-determined limits when used in accordance with its operational procedures;
– performance qualification (PQ) to provide documented evidence that the equipment, as installed and operated in accordance with operational procedures, consistently performs in accordance with predetermined criteria and thereby yields correct results for the method. This is typically done with a 'model' system (with test micro-organisms) to make sure that the conditions used by the user laboratory make it possible to satisfy the criteria described by the supplier of the method in the laboratory.

Some alternative methods depend on the use of databases. The extent of coverage of the database with respect to the range of micro-organisms of interest must be taken into account for validation purposes.

The value of a new or modified method must be demonstrated in a comparative study between the official method and the alternative method. The characteristics defined in this chapter must be used to establish this comparison.

3-1. *TYPES OF MICROBIOLOGICAL TESTS*

It is critical to the validation effort to identify the portion of the test addressed by the alternative method. For example, there are a variety of methods available to detect the presence of viable cells. These methods may have applications in a variety of tests (e.g. bioburden, sterility tests,) but may not, in fact, replace the critical aspects of the test entirely. For example, a sterility test by membrane filtration may be performed according to the pharmacopoeial procedure up to the point of combining the processed filter with the recovery media, and after that the presence of viable cells might then be demonstrated by use of some of the available methods. Validation of this application would, therefore, require validation of the recovery system employed rather than the entire test.

General concerns. Validation of a microbiological method is the process by which it is experimentally established that the performance characteristics of the method meet the requirements for the intended application. Since microbiological tests have 3 basic applications, 3 separate sets of validation criteria are required. These concerns are described below.

3-2. *VALIDATION OF ALTERNATIVE QUALITATIVE TESTS FOR THE PRESENCE OR ABSENCE OF MICRO-ORGANISMS*

3-2-1. **Accuracy and precision**

A direct method to show the equivalence of 2 qualitative methods would be to run them side by side and determine the degree to which the method under evaluation shows equivalence to the pharmacopoeial method. An example of this could be the sterility test where this would translate into a comparison of the rate of positive and negative results produced by the alternative method versus the pharmacopoeial method for identical samples. However, in a case such as the sterility test, the low number of failures would required thousands of comparison tests to establish equivalency and thus would be problematic.

A more feasible method for evaluating the precision of an alternative qualitative method compared with a pharmacopoeial method might be to observe the degree of agreement between the two when the procedures are performed repeatedly on different lots of the same product. The accuracy and precision of the alternative method may be expressed as the relative rates of false positive and false negative results between the new method and the pharmacopoeial method using a standardised, low-level inoculum.

The rate of occurrence of false negative results in the presence of the sample for the 2 methods can be estimated using low levels of test micro-organisms. This design is similar to the standard bacteriostasis/fungistasis test; however, the level of micro-organisms inoculated must be very low, for example about 5 CFU per unit. The level of inoculum should ensure a frequency of failure rates high enough to provide a means to compare the 2 methods. The alternative method must provide at least as high a frequency of recovery as the pharmacopoeial method.

3-2-2. **Specificity**

The specificity of an alternative qualitative method is its ability to detect the required range of micro-organisms that may be present in the sample under test. This concern is adequately addressed by growth promotion of the media for qualitative methods that rely upon growth to demonstrate presence or absence of micro-organisms. For those methods that do not require growth as an indicator of microbial presence, the specificity assures that extraneous matter in the test system does not interfere with the test. Where relevant for the purpose of the test, mixtures of micro-organisms are used during validation.

3-2-3. **Limit of detection**

The limit of detection of an alternative qualitative method is the lowest number of micro-organisms in a sample that can be detected under the stated experimental conditions. A microbiological limit test determines the presence or absence of micro-organisms. Due to the nature of microbiology, the limit of detection refers to the number of micro-organisms present in the original sample before any dilution or incubation steps; it does not refer to the number of micro-organisms present at the time of testing.

The 2 methods (alternative and pharmacopoeial) must be assessed by using an inoculum containing a low number of test micro-organisms, for example about 5 CFU per unit, followed by a measurement of recovery. The level of inoculation must be adjusted until at least 50 per cent of the samples show growth in the pharmacopoeial method. It is necessary to repeat this determination several times, as the limit of detection of a test is determined from an appropriate number of replicates (for example not less than 5). The ability of the 2 methods to detect the presence of single organisms can be demonstrated using the χ^2 test.

3-2-4. **Robustness**

The robustness of an alternative qualitative method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters, and provides an indication of the method's reliability under a variety of normal test conditions, such as different analysts, instruments, batches of reagents and laboratories. Robustness can be defined as the intrinsic resistance to the influences exerted by operational and environmental variables on the results of the microbiological method. Robustness is a validation parameter best suited to determination by the supplier of the method, but if critical parameters are modified by the user their effects on robustness have to be evaluated. Robustness of a qualitative method is judged by its ability to detect the test micro-organisms under the deliberate variations to the method parameters.

3-3. *VALIDATION OF ALTERNATIVE QUANTITATIVE TESTS FOR ENUMERATION OF MICRO-ORGANISMS*

3-3-1. **Accuracy**

The accuracy of an alternative quantitative method is the closeness of the test results obtained by the alternative method to the value obtained by the pharmacopoeial method. Accuracy must be demonstrated across the practical range of the test. Accuracy is usually expressed as the percentage of recovery of micro-organisms by the method.

Accuracy may be shown by preparing a suspension of micro-organisms at the upper end of the range of the test, serially diluted down to the lower end of the range of the test. For example, if the alternative method is meant to replace the traditional plate count method for viable counts, then a reasonable range might be 10^0-10^6 CFU per ml. If it is, instead, a replacement for the MPN method, a much more narrow range may be used. At least 5 suspensions across the range of the test must be analysed for each test micro-organism. If the alternative method is meant to replace the conventional method, it must provide an estimate of viable micro-organisms of not less than 70 per cent of the estimate provided by the pharmacopoeial method.

The protocol used to check the linearity (see 3-3-5.) of the method may also be used to check the accuracy: the suspensions of micro-organisms prepared for the alternative method are counted at the same time using the pharmacopoeial method. Accuracy is demonstrated if the suitability tests show that the slope of the regression line does not differ significantly from 1 and if the y-intercept is not significantly different from 0.

3-3-2. **Precision**

The precision of an alternative quantitative method is the degree of agreement among individual test results when the procedure is applied repeatedly to multiple samplings of homogeneous suspensions of micro-organisms under the prescribed conditions. The precision is usually expressed as the variance, standard deviation or coefficient of variation of a series of measurements.

At the very least, a suspension of micro-organisms with a concentration usually in the middle of the range is counted several times. The number of replicates is chosen so that the entire test can be carried out during the same working session, i.e. under the same operating conditions and without any change in the suspension of micro-organisms. Other working sessions are then carried out under conditions of maximum variability (different reagents, different operators, different days, etc.). The variance of the results observed in each of the working sessions ('groups') is calculated. If the variances are homogeneous, the variance of the repeatability can be calculated. The inter-group variance of the results is calculated. The variance of the intermediate precision is the sum of the variance of the repeatability and the inter-group variance. The coefficients of variation are then calculated. Generally, a coefficient of variation in the 10-15 per cent range is acceptable. Irrespective of the specific results, the alternative method must have a coefficient of variation that is not larger than that of the pharmacopoeial method.

3-3-3. **Specificity**

The specificity of an alternative quantitative method is demonstrated using a range of appropriate micro-organisms. Where relevant for the purpose of the test, mixtures of micro-organisms are used during validation.

3-3-4. **Limit of quantification**

The limit of quantification of an alternative quantitative method is the lowest number of micro-organisms that can be accurately counted. As it is not possible to obtain a reliable sample containing a known number of micro-organisms, it is essential that the quantification limit is determined from a number of replicates, for example at least 5. The results of the linearity and accuracy studies can also be used. Here, the lowest concentration in the linear range is considered to be the limit of quantification of the method. The limit of quantification must not be a number greater than that of the pharmacopoeial method.

3-3-5. **Linearity**

The linearity of an alternative quantitative method is its ability to produce results that are proportional to the concentration of micro-organisms present in the sample within a given range. The linearity must be determined over the range corresponding to the purpose of the alternative method. A method to determine this would be to select different concentrations of each test micro-organism and conduct several replicates of each concentration. The number of replicates is chosen so that the entire test can be carried out during the same working session. 2 more working sessions are then completed under conditions of maximum variability (different reagents, different operators, different days, etc.). After checking the homogeneity of the variances of the results obtained for each concentration, the regression line is calculated. Linearity is demonstrated if the estimated slope is significant and if the test for deviation from linearity is non-significant.

3-3-6. **Range**

The range of an alternative quantitative method is the interval between the upper and lower levels of micro-organisms that have been determined with precision, accuracy, and linearity using the method as written. The range is determined from studies of precision, accuracy and linearity.

3-3-7. **Robustness**

The robustness of an alternative quantitative method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters and provides an indication of its reliability under a variety of normal test conditions, such as different analysts, instruments, batches of reagents and laboratories. Robustness can be defined as the intrinsic resistance to the influences exerted by operational and environmental variables on the results of the microbiological method. Robustness is a validation parameter best suited to determination by the supplier of the method, but if critical parameters are modified by the user their effects on robustness have to be evaluated. Robustness of a quantitative method is judged by its ability to enumerate with statistical relevance the test micro-organisms under the deliberate variations to the method parameters.

3-4. *VALIDATION OF ALTERNATIVE IDENTIFICATION TESTS*

There is a large body of evidence that different methods vary considerably in their ability to identify micro-organisms in pharmacopoeial products. It must be accepted that a method of systematics needs to be internally consistent, but may differ from others in identification of isolates. In other words, identification of an isolate based on biochemical activity may lead to one conclusion, identification by fatty acid analysis to another, identification by DNA analysis may lead to a third, and other methods may lead to alternative conclusions. Microbiological identifications by a particular system flow directly from previous experience with that system, and therefore may well differ from identifications by another system. It is critical that each system provides a consistent identification of isolates from pharmacopoeial products.

3-4-1. **Accuracy**

The accuracy of an alternative identification method is its ability to identify the desired micro-organism to the required taxonomic level and to differentiate it from other micro-organisms present in the sample. It must be demonstrated with a series of test micro-organisms or micro-organisms obtained from a typical sample previously identified by another method.

3-4-2. **Precision**

The precision of an alternative identification method is the degree of agreement among individual test results when the procedure is applied repeatedly to multiple samplings of suspensions of test micro-organisms across the range of the test.

3-4-3. **Robustness**

The robustness of an alternative identification method is a measure of its capacity to remain unaffected by small but deliberate variations in method parameters, and provides an indication of its reliability under a variety of normal test conditions such as different analysts, instruments, batches of reagents and laboratories. Robustness can be defined as the intrinsic resistance to the influences exerted by operational and environmental variables on the results of the microbiological method. Robustness is a validation parameter best suited to determination by the supplier of the method, but if critical parameters are modified by the user their effects on robustness have to be evaluated. Robustness of an identification method is judged by its ability to identify consistently the test micro-organisms under the deliberate variations to the method parameters.

4. SPECIFIC VALIDATION REQUIREMENTS

4-1. *BACKGROUND*

Validation is defined in various contexts with some differences, but a consensus definition is to establish documented evidence that a process will consistently achieve what it is intended to do. Hence, in order to perform correct validation of a new method it is critical to understand and define what the procedure is intended to achieve.

2 levels of validation must be envisaged for the application of conventional or alternative microbiological methods. Primary validation of a method is typically performed by the supplier of the new method, whereas validation for the actual intended use, which is a verification of the suitability or applicability of the method in a given situation, must be seen as the responsibility of the user. Before validation for the actual intended use, performance qualification is carried out by the user as described in 3. *General validation requirements*.

Typically, microbiological methods use specific characteristics of micro-organisms as indicators or detection principles for more general questions. The information needed is presence, number, viability, resistance or identity of micro-organisms in a given product or environment.

A given method will usually give an indirect and conditional answer to the questions. For example, the total number and viability of micro-organisms is indicated by the number of micro-organisms able to reproduce under a certain set of conditions for sample preparation, cultivation and incubation. Reproduction in classical microbiology is hence taken as the general indicator for viability. There are other parameters, however, that can be used as an indication of viability. The level of ATP or accumulation or metabolism of substrates in living cells can also be taken as an indicator for viability. The results of different indication methods for viability may not always be identical. Micro-organisms may not be able to reproduce on a given medium, but may still accumulate and metabolise a substrate. Micro-organisms may be unable at a given state of damage to accumulate a substrate, but may still be able to recover and to reproduce.

Another example is the various methods used for identification of micro-organisms. Characterisation of the metabolic pattern of micro-organisms is frequently used for species identification, whereas another method consists of the comparison of DNA sequences. Again, the answer obtained may not be fully coincident for the different identification methods, and while one answer may be appropriate for the construction of a correct phylogenetic correlation tree, another answer may be more useful in the context of pathogenicity or other properties of the differentiated micro-organisms.

4-1-1. **Primary validation**

In order to characterise a specific microbiological method, the principle of detection must be clearly described by the supplier. The method must be fully detailed with respect to the conditions required for application, the materials and equipment needed, and the expected signal. The application principle should be described in a peer-reviewed journal.

The principle of detection must be characterised in a model system and/or with a panel of test micro-organisms, by at least:

- prerequisite treatment of sample or micro-organisms;
- type of response;
- specificity of the response;
- limit of detection;
- range;
- linearity of the response;
- accuracy and precision of the response;
- robustness of the method in a model system;
- limits of suitability.

Once the method has been characterised in this way by the supplier, the principle of detection need not be verified by each user.

4-1-2. **Validation of alternative microbiological method**

4-1-2-1. *Risk-benefit analysis*

For validation of specific alternative microbiological methods it is critical that the purpose of the procedure is precisely outlined. Based on the purpose, the type and depth of information needed must be defined. The information obtained by, and the limitations of, the conventional method and the alternative method must be considered and compared in a risk-benefit analysis.

An alternative method can be justified as being applicable if the information obtained gives a scientifically sound answer to the questions asked in the procedure, and if the limitations of the method are not more severe than the limitations of the conventional method.

4-1-2-2. *Validation for the actual intended use*

The alternative method must be applied in the procedure used and with the samples to be analysed under the responsibility of the user, and must be shown to give comparable results as characterised in a model system by the supplier. Specific questions to be asked where applicable are:

- compatibility of the response with the sample preparation needed for product testing;
- limit and range of detection of the method with regard to sample size and sample availability;
- specificity of the response with regard to the influence of the ingredients of the product;
- linearity of the response with regard to all types of samples to be analysed;

– accuracy and precision of the response with regard to all types of samples to be analysed;
– robustness of the method with regard to all types of samples to be analysed.

Acceptance criteria for the method in routine use will need to be defined as a function of the application and of the validation data.

4-2. *BIOLUMINESCENCE FOR ENUMERATION OF MICRO-ORGANISMS*

4-2-1. **Risk-benefit analysis**

Extensive scientific evidence and use for years supports the capability of the ATP viability marker to detect the same range of micro-organisms as is encountered using standard plating methods. Since this method is growth-dependent, the improvement comparing to the plating methods is the rapidity to obtain a result (from 5 days with the plating methods to 24 h for bioluminescence). It is possible to identify the bioluminescence-detected micro-organisms from the incubation step medium, but it has to be remembered that in a mixed culture some micro-organisms may out-compete others during incubation. This method provides evaluation of samples within 24 h for filterable and non-filterable products (water, in-process control, environmental samples, solid and liquid raw materials, solid and liquid finished products, etc.) and for a large number of samples, when the detection step is automated.

4-2-2. **Validation for the actual intended use**

The method relies upon the detection of ATP from viable micro-organisms. Performance qualification is carried out with test micro-organisms to make sure that under the conditions applied by the user laboratory it is possible to satisfy the criteria described by the supplier for precision, accuracy and linearity (quantitative method), or limit of detection (qualitative and semi-quantitative method) over the range required for the intended use. Following this step, validation proceeds in 3 phases:

– *phase 1*: fertility of the medium in the presence of the product (if an incubation step is performed);
– *phase 2*: search for interferences that may increase or inhibit the ATP production (by addition of an ATP standard solution to the product to test);
– *phase 3*: comparative testing with the pharmacopoeial method.

A detailed example of validation of the bioluminescence method is given at the end of this chapter.

4-3. *CYTOMETRY (SOLID AND FLOW) FOR ENUMERATION OF MICRO-ORGANISMS*

4-3-1. **Risk-benefit analysis**

Extensive scientific evidence supports the capability of this fluorescence viability marker to detect and/or count a wider range of micro-organisms than are encountered using standard plating methods. Cytometry will detect all viable micro-organisms including some that may not be discernable by growth-based methods. Whilst being rapid, the recovery of micro-organisms post-analysis is limited. Thus the further processing of analysed samples for identification would require alternative fluorescent stains or an alternative method. Currently it is not possible to use this method for routine identification of micro-organisms, although basic morphology is readily discernable in solid phase cytometry under fluorescent microscopes. This method provides rapid evaluation of samples and hence allows for a proactive approach to pharmaceutical manufacturing, facilitating building quality into pharmaceutical operations. This method is not growth-dependent and hence all metabolically active micro-organisms will be detected. However, the limit of detection for flow cytometry is currently such that it cannot be used for enumeration by direct examination for most pharmaceutical samples. If pre-incubation is necessary, the estimation becomes semi-quantitative (limit test).

4-3-2. **Validation for the actual intended use**

The method relies upon the detection of a fluorescent signal from labelled micro-organisms.

Performance qualification is carried out to ensure that the instruments perform within their defined operational parameters. This involves the use of fluorescent standards of prescribed intensity and cultures of known type and number of micro-organisms. These tests challenge the quantitative detection system. Reagents and consumables (negative controls) must also be utilised to ensure that the routine test protocol is applicable, and that the quality of the materials used in the test do not contribute to the final result. Pure culture experiments involving test micro-organisms are used to challenge the detection system, and to compare test results with those obtained using standard plate count. Multiple replicates (at least 5) from overnight cultures diluted across a concentration range (e.g. 100 per cent, 75 per cent, 50 per cent, 25 per cent and 10 per cent) must be used to evaluate linearity, accuracy, precision, range, specificity, limit of quantification (quantitative method) and limit of detection (flow cytometry with pre-incubation step). Since cytometry has high sensitivity (solid phase cytometry can detect single cells, whereas flow cytometry is sensitive to a level of around 10-50 cells per millilitre), and detection is not growth based, the linearity of the instrumentation can be tested by comparison of the actual results with the expected value.

Following this step, validation proceeds in 2 phases: validation with respect to the product to be examined and comparative testing. Results of each phase must be evaluated against pre-determined acceptance criteria using positive and negative controls:

– *phase 1*: individual materials to be evaluated by cytometry must be 'spiked' with a defined level of micro-organisms to ensure that the sample preparation process and the samples themselves do not have an impact upon the performance of the detection system; specifically, the sample matrix must not affect detection (i.e. contain endogenous chromophores, auto-fluorescent particles), and in the case of flow cytometry, sample size/dilution and flow rate must be determined for optimal performance;
– *phase 2*: testing must be performed in which the results obtained by cytometry and the pharmacopoeial method are compared; the number of samples and the testing period must be defined in a comparability protocol; the number of samples required will vary, but must be representative of the material evaluation process (i.e. time/number), and must allow for statistical evaluation; all samples must be prepared according to defined procedures and evaluated against selected validation and acceptance criteria, similar to those used for pure culture evaluation.

4-4. *FATTY ACID PROFILES FOR IDENTIFICATION*

4-4-1. **Risk-benefit analysis**

Identification by fatty acid profiles may be more precise than the identification methods based on metabolic profiles in conventional microbiological culture methods. The database is broader than for conventional culture methods. Pre-incubation is needed, but extraction and identification is faster than in biochemical methods and hence, the result is obtained faster. Other modern methods, such as 16S rRNA sequence analysis or genetic fingerprinting, have a similar

broad differentiation range and give a result as fast as this method.

Separation of closely related micro-organisms (e.g. *E. coli* and *Salmonella* spp.) can be difficult by fatty acid profiles. Where the identification of closely related micro-organisms is especially important, other systems may give more precise results. For a given application it is important to specify which types of micro-organisms are most important to be identified. If it is most critical to characterise the correct phylogenetic species of the isolate, DNA sequence-based identification methods will give more reliable results.

Limitations of identification by fatty acid profiles are also seen in the necessity to grow micro-organisms on standardised media under standard temperature conditions and durations of incubation. Micro-organisms that cannot be cultivated on such media cannot be identified.

4-4-2. **Validation for the actual intended use**

Using a range of test micro-organisms and at least 3 replicate determinations in each case, it must be demonstrated that the method yields consistent results.

A significant number of isolates from typical samples to be analysed by the user must be identified, at least 3 times each. The results in each case should be consistent and in accord with those obtained using alternative identification methods. Where a different identification result is found in another identification system, the reason for the difference must be investigated. Where a scientifically plausible explanation exists for the recognition of a different species, a difference between identification systems may be acceptable. In such a case it must be assured that the recognition of the identified species is robust. It must also be assured that the system does not group poorly recognised isolates under one 'species' thereby simulating the repeated isolation of a single species.

4-5. *NUCLEIC ACID AMPLIFICATION TECHNIQUES*

4-5-1. **Risk-benefit analysis**

NAAT are widely used in diagnostics for their precision and rapidity at a relatively low cost (for the analysis, but not for the instruments,) when compared with the traditional methods. Provided that specific validations have been performed, when NAAT are appropriately used, they may offer advantages in some fields in comparison to classical methods; on the other hand classical methods are generally more easily standardisable, need a lower level of technical competence and may have lower costs. Even when NAAT are not more difficult to perform than traditional methods, the interpretation of the results generally needs a high degree of scientific competence.

When used for identification, DNA-based methods cannot discriminate between dead and live micro-organisms. That means that they cannot be directly used on the product but only after passage on a traditional culture medium, thereby losing part of the advantage in rapidity. Moreover, if used directly on the product at the end of the analysis, these methods do not result in a strain to be used in further experiments and may not give advantages when the micro-organisms to be detected are poorly cultivable or stressed. RNA amplification techniques (e.g. RT-PCR) may identify living micro-organisms (but not spores) directly in the products, but in comparison to traditional methods are much more difficult to use routinely. On the other hand, where specific primers are used, identification (or typing) by NAAT is more precise than the traditional methods and in some cases may have other advantages: for instance for the identification of some vaccines (e.g. cholera vaccine, whole cell pertussis vaccine,) their use may substitute for that of specific sera and contribute to reducing the use of animals, or may give a very specific identification where this is presently lacking (e.g. BCG vaccine).

These methods are in general non-quantitative (PCR) or semi-quantitative (real-time PCR), meaning that their results cannot be compared with those of a colony count where an exact enumeration of the micro-organisms present in the sample is requested, but even if colony count has a valence consolidated in time this dogma may not be verified for bacteria which have a tendency to clump (mycobacteria) or are organised in chains or in clusters (streptococci, staphylococci), therefore an accurate standardisation of the semi-quantitative methods may give results of comparable reliability.

4-5-2. **Validation for the actual intended use**

The method is validated according to chapter *2.6.21*. Comparison of conventional and PCR-based methodologies, which differ in sensitivity and specificity, is particularly difficult and may lead to divergent conclusions.

The following example is published for information and not for general application.

Example validation of an alternative method: detailed protocol followed by a laboratory for the implementation of bioluminescence

BACKGROUND

Methods using a pre-incubation step in liquid medium (bioluminescence in tube or microtitre plate) do not offer quantitative information but a presence/absence determination in the quantity analysed. Using more than a single sample quantity, the system may offer semi-quantitative determination (limit test). For example, the classical tested quantity for viable aerobic count on non-sterile products is 0.1 g or 0.1 ml leading to absence in 0.1 g or 0.1 ml, i.e. less than 10 micro-organisms in 1 g or 1 ml for a negative result and more than or equal to 10 micro-organisms in 1 g or 1 ml in case of a positive result. If 0.01 g or 0.01 ml is tested simultaneously, a negative result corresponds to a number of micro-organisms less than 100 in 1 g or 1 ml. The combination between negative for 0.01 g or 0.01 ml and positive for 0.1 g or 0.1 ml permits an estimate of the contamination level of the product to be less than 100 but more than or equal to 10 micro-organisms in 1 g or 1 ml.

As mentioned in section 2., bioluminescence can be used as a quantitative method if micro-organisms are captured on a filtration membrane and later incubated in culture medium (bioluminescence on membrane).

The protocol below describes validation aspects for qualitative, semi-quantitative and quantitative methods.

PERFORMANCE QUALIFICATION OF THE ALTERNATIVE METHOD

Specificity

Screen the method with test micro-organisms appropriate to the method. For example, for microbial aerobic viable count on non-sterile products, use at least the micro-organisms described in chapter *2.6.12* for the fertility of the media in the presence of product. This determination is performed at least 3 times with each micro-organism. Acceptance criterion: all test micro-organisms are successfully detected.

Limit of detection (only for semi-quantitative or qualitative methods)

Prepare a low inoculum (about 5 CFU in the initial sample) of each test micro-organism. Perform the analysis in at least 5 replicates with the pharmacopoeial method and with the bioluminescence method concerned. Acceptance criterion: the ability of the 2 methods to detect the presence of a single micro-organism can be demonstrated using the χ^2 test. Alternative procedure: prepare a series of dilutions of micro-organisms to have a count in the next dilution of about 5 CFU per inoculum (e.g.: 10 CFU/inoculum, 5 CFU/inoculum, 2.5 CFU/inoculum, 1.25 CFU/inoculum, 0.75 CFU/inoculum). Perform the test on 5 independent series of dilutions with the pharmacopoeial method and with the bioluminescence method concerned. Determine the limit of detection for each method. It corresponds to the last dilution where the result is positive for the 5 series. Acceptance criterion: the limit of detection of the bioluminescence method is equal to or lower than that of the pharmacopoeial method.

Limit of quantification (quantitative method)

This can be performed at the same time as the linearity determination. It corresponds to the lowest concentration of the chosen range that satisfies the criteria for linearity, accuracy and precision. Acceptance criterion: the limit of quantification of the bioluminescence method is equal to or lower than that of the pharmacopoeial method.

Precision

Quantitative evaluation. For each test micro-organism, perform at least 5 replicates during the same series including at least the concentration of micro-organisms corresponding to the middle of the range. Perform 3 independent tests. Carry out a statistical analysis to compare the precision of the 2 methods or calculate the coefficient of variation (CV). Acceptance criterion: CV 15 per cent to 30 per cent or precision not different with the risk alpha equal to 5 per cent between the 2 methods. If precision is different, the bioluminescence method is better than the pharmacopoeial method, indicated by a smaller standard deviation.

Qualitative or semi-quantitative evaluation. Use the alternative procedure described for setting the limit of detection and report the frequency of positive results in parallel with the pharmacopoeial method. Acceptance criterion: the frequency of positive results at the detection limit is 100 per cent and this frequency is better than or equal to the pharmacopoeial method.

Linearity

For each test micro-organism, prepare 5 concentrations in the range of the bioluminescence method (range is normally indicated by the supplier). Perform the pharmacopoeial and the bioluminescence methods in parallel. Repeat this test 2 further times to have results on 3 independent tests. Test for linear regression, presence of a slope, and lack of fit with the F test at alpha equal to 5 per cent. If statistical analysis is not possible, calculate the correlation coefficient (R^2) and the slope between the 2 methods. Acceptance criterion: statistical analysis may show linear regression, the presence of a slope and no lack of fit with a risk of 5 per cent. Equation $y = a + bx$ is determined where b is the slope and a the intercept. If no statistical analysis is available, R^2 is at least 0.9 and the slope does not diverge by more than 20 per cent from 1 (b between 0.8 and 1.2). If the linearity is not demonstrated in such a large range, the range can be decreased and linearity demonstrated with only 3 concentrations in place of 5.

Accuracy

Quantitative evaluation. Accuracy can be determined with data obtained in linearity. For each micro-organism use 3 to 5 concentrations within the linear range of the method. Perform statistical analysis (Student's t test at risk 5 per cent) to test the conformity of the estimated slope (value = 1) versus the obtained slope and to test the conformity of the estimated intercept (value = 0) versus the obtained intercept. For example, if the estimated slope is b with a standard deviation $s_{(b)}$ of 0.090 with 5 concentrations of micro-organisms, calculate $t = (b - 1)/s_{(b)}$. For intercept a, with standard deviation equal to $s_{(a)}$, $t = (a - 0)/s_{(a)}$. Compare these values to the Student's t at 5 per cent, for 13 degrees of freedom (3 tests, 5 concentrations). Acceptance criterion: if the t values obtained are less than the Student's t, the method is exact in the applied range. In the case that there is no conformity for the slope (slope different from 1) or for the intercept (intercept different from 0) the method is not exact over the applied range.

Qualitative or semi-quantitative evaluations. Use the alternative procedure described for setting the limit of detection. Calculate the proportion of false negatives for bioluminescence and for the pharmacopoeial method over all tested dilutions. Compare the extent of false negatives for the 2 or 3 concentrations of micro-organisms just under the detection limit (for example 5 CFU/inoculum, 2.5 CFU/inoculum or 1.25 CFU/inoculum) giving a positive result. By definition, the detection limit corresponds to 0 per cent of false negatives. Acceptance criterion: the percentage of false negatives for the bioluminescence method at sample concentrations below the detection limit must be equal to or lower than that of the pharmacopoeial method.

Range

This is the interval between the lowest and the highest concentrations of micro-organisms where linearity, precision and accuracy have been demonstrated.

Robustness

The information is given by the supplier.

VALIDATION FOR THE ACTUAL INTENDED USE

In the example given, there was no need to determine the accuracy and detection limit in the presence of the product. The validation consists of 3 parts, verifying:

- *phase 1*: the fertility of the medium in the presence of the product;
- *phase 2*: the absence of interference from the product that may increase or inhibit ATP production;
- *phase 3*: the testing of the product in parallel with the pharmacopoeial method.

These 3 parts of validation are performed on 3 independent tests using for example at least 2 different batches of product.

Phase 1: fertility of the medium in the presence of the product

If the product has a known high contamination level (more than 500 micro-organisms per gram or millilitre) the incubation step is unnecessary, the micro-organisms can be detected directly. In this case testing the fertility of the medium in the presence of the product is not necessary. However, pharmaceutical products are generally contaminated at a much lower level and growth of the micro-organism is necessary to obtain detection with bioluminescence. It must therefore be proven that the product does not inhibit the growth of micro-organisms under the conditions of the test. In order to do so, separately add inoculum at not more than 100 CFU for each test micro-organism into the portion of medium containing the

product. For bioluminescence in tube or microtitre plate, perform the bioluminescence test. For bioluminescence on membrane, incubate at 30-35 °C or 20-25 °C for 5 days and count the bioluminescent colonies on the membrane. Acceptance criterion: the test is positive (bioluminescence in tube or microtitre plate); the quantitative recovery of the micro-organism is at least 70 per cent (bioluminescence on membrane).

Phase 2: search for interference of the product

The objective is to show that the product does not add stray light or non-microbial ATP (does not lead to false positive result: criterion A) or does not decrease the ATP detection (does not lead to a false negative result: criterion B).

Bioluminescence in tube or microtitre plate

A. Perform the bioluminescence test with the culture broth alone and with the culture broth in the presence of the product. Determine the RLU value for culture broth alone and the RLU value for culture broth in the presence of product.

B. Perform the bioluminescence test with the culture broth alone and the culture broth in the presence of ATP. Determine the response coefficient for ATP concentration in per cent.

Acceptance criterion:

– *criterion A*: the RLU value of culture broth in the presence of product is less than twice the RLU value of culture broth alone (if criterion A is not satisfied, it is necessary to determine a specific threshold for this product);
– *criterion B*: the RLU value of culture broth in the presence of product and ATP is within the interval 25 per cent to 200 per cent of the RLU value of culture broth in the presence of ATP.

Bioluminescence on membrane: perform the complete bioluminescence test to search for interference. Acceptance criterion: the recovery of micro-organisms is greater than or equal to 70 per cent and not more than 200 per cent.

Phase 3: analysis of the product in parallel with the pharmacopoeial method

Perform the test according to the validated method for the product concerned in parallel with the pharmacopoeial method to show the relationship between the 2 methods for the product concerned, on 3 independent tests and using at least 2 different batches. Express the result as positive or negative in a certain quantity (bioluminescence in tube or microtitre plate) or express the count per filtered quantity (bioluminescence on membrane). Acceptance criterion: results must be correlated with the pharmacopoeial method.

5.1.7. VIRAL SAFETY

This chapter provides general requirements concerning the viral safety of medicinal products whose manufacture has involved the use of materials of human or animal origin. Since viral safety is a complex issue, it is important that a risk assessment is carried out. Requirements to be applied to a specific medicinal product are decided by the competent authority.

Where the risk of viral contamination exists, complementary measures are used as appropriate to assure the viral safety of medicinal products, based on:

– selection of source materials and testing for viral contaminants;
– testing the capacity of the production process to remove and/or inactivate viruses;
– testing for viral contamination at appropriate stages of production.

Where appropriate, one or more validated procedures for removal or inactivation of viruses are applied.

Further detailed recommendations on viral safety, including validation studies, are provided, in particular, by the *Note for guidance on virus validation studies: the design, contribution and interpretation of studies validating the inactivation and removal of viruses (CPMP/BWP/268/95)* of the Committee for Proprietary Medicinal Products, and the *ICH guideline Q5A: Viral safety evaluation of biotechnology products derived from cell lines of human or animal origin* (including any subsequent revisions of these documents).

Requirements concerning immunological products for veterinary use are dealt with in the monographs *Vaccines for veterinary use (0062)* and *Immunosera for veterinary use (0030)* and related general chapters.

Risk assessment

A risk assessment with respect to viral safety is carried out where materials of human or animal origin are used as ingredients of medicinal products or in the manufacture of active substances, excipients or medicinal products.

The principle of the risk assessment is to consider various factors that may influence the potential level of infectious particles in the medicinal product and factors related to the use of the medicinal product that determine or influence the viral risk to the recipients.

The risk assessment takes into consideration relevant factors, for example:

– the species of origin;
– the organ, tissue, fluid of origin;
– the potential contaminants in view of the origin of the raw material and the history of the donor(s), preferably including epidemiological data;
– the potential contaminants from the manufacturing process (for example, from risk materials used during manufacture);
– the infectivity and pathogenicity of the potential contaminants for the intended recipients of the medicinal product, taking account of the route of administration of the medicinal product;
– the amount of material used to produce a dose of medicinal product;
– controls carried out on the donor(s), on the raw material, during production and on the final product;
– the manufacturing process of the product and its capacity to remove and/or inactivate viruses.

The risk assessment can be based mainly on the manufacturing conditions if these include rigorous inactivation steps (for example, for gelatin etc., and products terminally sterilised by steam or dry heat as described in the general texts on sterility (*5.1*)).

5.2. GENERAL TEXTS ON BIOLOGICAL PRODUCTS

01/2008:50201 corrected 6.0

5.2.1. TERMINOLOGY USED IN MONOGRAPHS ON BIOLOGICAL PRODUCTS

For some items, alternative terms commonly used in connection with veterinary vaccines are shown in parenthesis.

Seed-lot system. A seed-lot system is a system according to which successive batches of a product are derived from the same master seed lot. For routine production, a working seed lot may be prepared from the master seed lot. The origin and the passage history of the master seed lot and the working seed lot are recorded.

Master seed lot. A culture of a micro-organism distributed from a single bulk into containers and processed together in a single operation in such a manner as to ensure uniformity and stability and to prevent contamination. A master seed lot in liquid form is usually stored at or below – 70 °C. A freeze-dried master seed lot is stored at a temperature known to ensure stability.

Working seed lot. A culture of a micro-organism derived from the master seed lot and intended for use in production. Working seed lots are distributed into containers and stored as described above for master seed lots.

Cell-bank system (Cell-seed system). A system whereby successive final lots (batches) of a product are manufactured by culture in cells derived from the same master cell bank (master cell seed). A number of containers from the master cell bank (master cell seed) are used to prepare a working cell bank (working cell seed). The cell-bank system (cell-seed system) is validated for the highest passage level achieved during routine production.

Master cell bank (Master cell seed). A culture of cells distributed into containers in a single operation, processed together and stored in such a manner as to ensure uniformity and stability and to prevent contamination. A master cell bank (master cell seed) is usually stored at – 70 °C or lower.

Working cell bank (Working cell seed). A culture of cells derived from the master cell bank (master cell seed) and intended for use in the preparation of production cell cultures. The working cell bank (working cell seed) is distributed into containers, processed and stored as described for the master cell bank (master cell seed).

Primary cell cultures. Cultures of cells obtained by trypsination of a suitable tissue or organ. The cells are essentially identical to those of the tissue of origin and are no more than 5 *in vitro* passages from the initial preparation from the animal tissue.

Cell lines. Cultures of cells that have a high capacity for multiplication *in vitro*. In diploid cell lines, the cells have essentially the same characteristics as those of the tissue of origin. In continuous cell lines, the cells are able to multiply indefinitely in culture and may be obtained from healthy or tumoral tissue. Some continuous cell lines have oncogenic potential under certain conditions.

Production cell culture. A culture of cells intended for use in production; it may be derived from one or more containers of the working cell bank (working cell seed) or it may be a primary cell culture.

Control cells. A quantity of cells set aside, at the time of virus inoculation, as uninfected cell cultures. The uninfected cells are incubated under similar conditions to those used for the production cell cultures.

Single harvest. Material derived on one or more occasions from a single production cell culture inoculated with the same working seed lot or a suspension derived from the working seed lot, incubated, and harvested in a single production run.

Monovalent pooled harvest. Pooled material containing a single strain or type of micro-organism or antigen and derived from a number of eggs, cell culture containers etc. that are processed at the same time.

Final bulk vaccine. Material that has undergone all the steps of production except for the final filling. It consists of one or more monovalent pooled harvests, from cultures of one or more species or types of micro-organism, after clarification, dilution or addition of any adjuvant or other auxiliary substance. It is treated to ensure its homogeneity and is used for filling the containers of one or more final lots (batches).

Final lot (Batch). A collection of closed, final containers or other final dosage units that are expected to be homogeneous and equivalent with respect to risk of contamination during filling or preparation of the final product. The dosage units are filled, or otherwise prepared, from the same final bulk vaccine, freeze-dried together (if applicable) and closed in one continuous working session. They bear a distinctive number or code identifying the final lot (batch). Where a final bulk vaccine is filled and/or freeze-dried on several separate sessions, there results a related set of final lots (batches) that are usually identified by the use of a common part in the distinctive number or code; these related final lots (batches) are sometimes referred to as sub-batches, sub-lots or filling lots.

Combined vaccine. A multicomponent preparation formulated so that different antigens are administered simultaneously. The different antigenic components are intended to protect against different strains or types of the same organism and/or different organisms. A combined vaccine may be supplied by the manufacturer either as a single liquid or freeze-dried preparation or as several constituents with directions for admixture before use.

01/2008:50202

5.2.2. CHICKEN FLOCKS FREE FROM SPECIFIED PATHOGENS FOR THE PRODUCTION AND QUALITY CONTROL OF VACCINES

Where specified, chickens, embryos or cell cultures used for the production or quality control of vaccines are derived from eggs produced by chicken flocks free from specified pathogens (SPF). The SPF status of a flock is ensured by means of the system described below. The list of micro-organisms given is based on current knowledge and will be updated as necessary.

A flock is defined as a group of birds sharing a common environment and having their own caretakers who have no contact with non-SPF flocks. Once a flock is defined, no non-SPF birds are added to it.

Each flock is housed so as to minimise the risk of contamination. The facility in which the flock is housed must not be sited near to any non-SPF flocks of birds with the exception of flocks that are in the process of being established as SPF flocks and that are housed in facilities and conditions appropriate to SPF flocks. The SPF flock is housed within an isolator or in a building with filtered air under positive pressure. Appropriate measures are taken to prevent entry of rodents, wild birds, insects and unauthorised personnel.

Personnel authorised to enter the facility must have no contact with other birds or with agents potentially capable of infecting the flock. It is advisable for personnel to shower and change clothing or to wear protective clothing before entering the controlled facility.

Wherever possible, items taken into the facility are sterilised. In particular it is recommended that the feed is suitably treated to avoid introduction of undesirable micro-organisms and that water is at least of potable quality, for example from a chlorinated supply. No medication is administered to birds within the flock that might interfere with detection of any disease.

A permanent record is kept of the general health of the flock and any abnormality is investigated. Factors to be monitored include morbidity, mortality, general physical condition, feed consumption, daily egg production and egg quality, fertility and hatchability. Records are maintained for a period of at least 5 years. Details of any deviation from normal in these performance parameters or detection of any infection are notified to the users of the eggs as soon as practicable.

The tests or combination of tests described below must have suitable specificity and sensitivity with respect to relevant serotypes of the viruses. Samples for testing are taken at random.

A positive result for chicken anaemia virus (CAV) does not necessarily exclude use of material derived from the flock, but live vaccines for use in birds less than 7 days old shall be produced using material from CAV-negative flocks. Inactivated vaccines for use in birds less than 7 days old may be produced using material from flocks that have not been shown to be free from CAV, provided it has been demonstrated that the inactivation process inactivates CAV.

ESTABLISHMENT OF AN SPF FLOCK

A designated SPF flock is derived from chickens shown to be free from vertically-transmissible agents listed in Table 5.2.2-1. This is achieved by testing of 2 generations prior to the designated SPF flock. A general scheme for the procedure to be followed in establishing and maintaining an SPF flock is shown diagrammatically in Table 5.2.2.-2. In order to establish a new SPF flock, a series of tests must be conducted on 3 generations of birds. All birds in the first generation must be tested at least once before the age of 20 weeks for freedom from avian leucosis group-antigen and tested by an enzyme immunoassay (EIA) for freedom of antibodies to avian leucosis virus subtypes A, B and J. All birds must also be tested for freedom from antibodies to the vertically-transmissible agents listed in Table 5.2.2-1. From the age of 8 weeks the flock is tested for freedom from *Salmonella*. Clinical examination is carried out on the flock from 8 weeks of age and the birds must not exhibit any signs of infectious disease. The test methods to be used for these tests are given in the table and further guidance is also given in the section below on routine testing of designated SPF flocks. From 20 weeks of age, the flock is tested as described under Routine testing of designated SPF flocks. All stages of this testing regime are also applied to the subsequent 2 generations, except the testing of every bird before lay for vertically-transmissible agents. All test results must indicate freedom from pathogens in all 3 generations for the flock consisting of the third generation to be designated as SPF.

SPF embryos derived from another designated SPF flock contained within a separate facility on the same site may be introduced. From 8 weeks of age, these replacement birds are regarded as a flock and are tested in accordance with test procedures described above.

INITIAL TESTING REQUIREMENTS FOR SUBSEQUENT GENERATIONS DERIVED FROM A DESIGNATED SPF FLOCK

Where a replacement flock is derived exclusively from a fully established SPF flock the new generation is tested prior to being designated as SPF. In addition to the tests for *Salmonella* and monitoring of the general health and performance of the flock, further specific testing from the age of 8 weeks is required. Tests are performed on two 5 per cent samples of the flock (minimum 10, maximum 200 birds) taken with an interval of at least 4 weeks between the ages of 12-16 weeks and 16-20 weeks.

All samples are collected and tested individually. Blood samples for antibody tests and suitable samples for testing for leucosis antigen are collected. The test methods to be used are as described under Routine testing of designated SPF flocks. Only when all tests have confirmed the absence of infection may the new generation be designated as SPF.

ROUTINE TESTING OF DESIGNATED SPF FLOCKS

General examination and necropsy. Clinical examination is carried out at least once per week throughout the life of the flock in order to verify that the birds are free from fowl-pox virus and signs of any other infection. In the event of mortality exceeding 0.1 per cent per week, necropsy is performed on all available carcasses to verify that there is no sign of infection. Where appropriate, histopathological and/or microbiological/virological studies are performed to confirm diagnosis. Specific examination for tuberculosis lesions is carried out and histological samples from any suspected lesions are specifically stained to verify freedom from *Mycobacterium avium*. Caecal contents of all available carcasses are examined microbiologically for the presence of *Salmonella spp.* using the techniques described below. Where appropriate, caecal samples from up to 5 birds may be pooled.

Cultural testing for Salmonella spp. Cultural testing for *Salmonella* spp. is performed either by testing samples of droppings or cloacal swabs or by testing of drag swabs. Where droppings or cloacal swabs are tested, a total of 60 samples within each 4-week period is tested throughout the entire life of the flock. Tests may be performed on pools of up to 10 samples. Where drag swabs are tested, a minimum of 2 drag swabs are tested during each 4-week period throughout the entire life of the flock. Detection of *Salmonella spp.* in these samples is performed by pre-enrichment of the samples followed by culture using *Salmonella*-selective media.

Tests for avian leucosis antigen. Prior to the commencement of laying, cloacal swabs or blood samples (using buffy coat cultivation) are tested for the presence of group-specific leucosis antigen. A total of 5 per cent (minimum 10, maximum 200) of the flock is sampled during each 4-week period. During lay, albumen samples from 5 per cent (minimum 10, maximum 200) of the eggs are tested in each 4-week period. Tests are performed by EIA for group-specific antigen using methods that are capable of detecting antigen from subgroups A, B and J.

Table 5.2.2.-1

Agent	Test to be used**	Vertical transmission	Rapid/slow spread
Avian adenoviruses, group 1	AGP, EIA	yes	slow
Avian encephalomyelitis virus	AGP, EIA	yes	rapid
Avian infectious bronchitis virus	HI, EIA	no	rapid
Avian infectious laryngotracheitis virus	VN, EIA	no	slow
Avian leucosis viruses	EIA for virus, VN for antibody	yes	slow
Avian nephritis virus	IS	no	slow
Avian orthoreoviruses	IS, EIA	yes	slow
Avian reticuloendotheliosis virus	AGP, IS, EIA	yes	slow
Chicken anaemia virus	IS, EIA, VN	yes	slow
Egg drop syndrome virus	HI, EIA	yes	slow
Infectious bursal disease virus	Serotype 1: AGP, EIA, VN Serotype 2: VN	no	rapid
Influenza A virus	AGP, EIA, HI	no	rapid
Marek's disease virus	AGP	no	rapid
Newcastle disease virus	HI, EIA	no	rapid
Turkey rhinotracheitis virus	EIA	no	slow
Mycoplasma gallisepticum	Agg and HI to confirm a positive test, EIA, HI	yes	slow
Mycoplasma synoviae	Agg and HI to confirm a positive test, EIA, HI	yes	rapid
Salmonella pullorum	Agg	yes	slow

Agg: agglutination
AGP: agar gel precipitation; the technique is suitable where testing is carried out weekly
EIA: enzyme immunoassay
HI: haemagglutination inhibition
IS: immunostaining
VN: virus neutralisation

**Subject to agreement by the competent authority, other types of test may be used provided they are at least as sensitive as those indicated and of appropriate specificity.

Table 5.2.2-2. – *Schematic description of the establishment and maintenance of SPF flocks*

NEW STOCK	Establish freedom from vertically-transmissible agents
	Test all birds for avian leucosis antigen and antibodies prior to 20 weeks of age
	Test for *Salmonella* spp. and perform general clinical observation from 8 weeks of age
	Carry out routine testing for specified agents from 20 weeks of age
2nd GENERATION	Test all birds for avian leucosis antigen and antibodies prior to 20 weeks of age
	Test for *Salmonella* spp. and perform general clinical observation from 8 weeks of age
	Carry out routine testing for specified agents from 20 weeks of age
3rd GENERATION	Test all birds for avian leucosis antigen and antibodies prior to 20 weeks of age
	Test for *Salmonella* spp. and perform general clinical observation from 8 weeks of age
DESIGNATE FLOCK AS SPF IF ALL TESTS ARE SATISFACTORY	
3rd GENERATION	Carry out routine testing for specified agents from 20 weeks of age
	Carry out post-lay testing for vertically-transmissible agents
SUBSEQUENT GENERATIONS	Test two 5 per cent samples for avian leucosis antigen and for antibodies against specified agents between 12 and 20 weeks of age
	Test for *Salmonella* spp. and perform general clinical observation from 8 weeks of age
	Carry out routine testing for specified agents from 20 weeks of age
	Carry out post-lay testing for vertically-transmissible agents

Test for antibodies to other agents. Tests for antibodies to all agents listed in Table 5.2.2.-1 are performed throughout the laying period of the flock. In each 4-week period, samples are taken from 5 per cent (minimum 10, maximum 200) of the flock. It is recommended that 1.25 per cent of the flock is sampled each week since some test methods for some agents must be conducted on a weekly basis. Table 5.2.2.-1 classifies the agents into those that spread rapidly through

the flock and those that spread slowly or may not infect the entire flock. For those agents listed as slowly spreading, each sample is tested individually. For those agents listed as rapidly spreading, at least 20 per cent of the samples collected in each 4-week period are tested individually or, where serum neutralisation or ELISA tests are employed, all of the samples may be tested individually or by preparing pools of 5 samples, collected at the same time.

Suitable methods to be used for detection of the agents are shown in Table 5.2.2.-1. Subject to agreement by the competent authority, other test methods may be used provided they are shown to be at least as sensitive as those indicated and of appropriate specificity.

TESTS TO BE CONDUCTED AT THE END OF THE LAYING PERIOD

Following the last egg collection, final testing to confirm the absence of vertically-transmissible agents indicated in Table 5.2.2.-1 is performed. After the last egg collection, a minimum of 5 per cent of the flock (minimum 10, maximum 200) is retained for at least 4 weeks. Blood samples are collected from every bird in the group during the 4-week period with at least 1.25 per cent of the birds (25 per cent of the sample) being bled not earlier than 4 weeks after the final egg collection. Serum samples are tested for vertically-transmissible agents (as defined by Table 5.2.2.-1) using the methods indicated. Where sampling is performed on a weekly basis, at least 1.25 per cent of the birds (25 per cent of the sample) are tested each week during this period. Alternatively, within 4 weeks of the final egg collection blood and/or other suitable sample materials are collected from at least 5 per cent of the flock and tested for the presence of vertically-transmissible agents using validated nucleic acid amplification techniques (*2.6.21*).

ACTION TO BE TAKEN IN THE EVENT OF DETECTION OF A SPECIFIED AGENT

If evidence is found of contamination of the flock by an agent listed as slowly spreading in Table 5.2.2.-1, all materials derived from the flock during the 4-week period immediately preceding the date on which the positive sample was collected are considered unsatisfactory. Similarly, if evidence is found of contamination of the flock by an agent listed as rapidly spreading in Table 5.2.2.-1, all materials derived from the flock during the 2-week period immediately preceding the date on which the positive sample was collected are considered unsatisfactory. Any product manufactured with such materials, and for which the use of SPF materials is required, is considered unsatisfactory and must be discarded; any quality control tests conducted using the materials are invalid.

Producers must notify users of all eggs of the evidence of contamination as soon as possible following the outbreak.

Any flock in which an outbreak of any specified agent is confirmed may not be redesignated as an SPF flock. Any progeny derived from that flock during or after the 4-week period prior to the last negative sample being collected may not be designated as SPF.

01/2008:50203

5.2.3. CELL SUBSTRATES FOR THE PRODUCTION OF VACCINES FOR HUMAN USE

This general chapter deals with diploid cell lines and continuous cell lines used for the production of vaccines for human use; specific issues relating to vaccines prepared by recombinant DNA technology are covered by the monograph on *Products of recombinant DNA technology (0784)*. Testing to be carried out at various stages (cell seed, master cell bank, working cell bank, cells at or beyond the maximum population doubling level used for production) is indicated in Table 5.2.3.-1. General provisions for the use of cell lines and test methods are given below. Where primary cells or cells that have undergone a few passages without constitution of a cell bank are used for vaccine production, requirements are given in the individual monograph for the vaccine concerned.

Diploid cell lines. A diploid cell line has a high but finite capacity for multiplication *in vitro*.

Continuous cell lines. A continuous cell line has the capacity to multiply indefinitely *in vitro*; the cells often have differences in karyotype compared to the original cells; they may be obtained from healthy or tumoral tissue.

For injectable vaccines produced in continuous cell lines, the purification process is validated to demonstrate removal of substrate-cell DNA to a level equivalent to not more than 10 ng per single human dose, unless otherwise prescribed.

Cell-bank system. Production of vaccines in diploid and continuous cell lines is based on a cell-bank system. The *in vitro* age of the cells is counted from the master cell bank. Each working cell bank is prepared from one or more containers of the master cell bank. The use, identity and inventory control of the containers is carefully documented.

Media and substances of animal and human origin. The composition of media used for isolation and all subsequent culture is recorded in detail and if substances of animal origin are used they must be free from extraneous agents.

If human albumin is used, it complies with the monograph on *Human albumin solution (0255)*.

Bovine serum used for the preparation and maintenance of cell cultures is tested and shown to be sterile and free from bovine viruses, notably bovine diarrhoea virus and mycoplasmas.

Trypsin used for the preparation of cell cultures is examined by suitable methods and shown to be sterile and free from mycoplasmas and viruses, notably pestiviruses and parvoviruses.

Cell seed. The data used to assess the suitability of the cell seed comprise information, where available, on source, history and characterisation.

Source of the cell seed. For human cell lines, the following information concerning the donor is recorded: ethnic and geographical origin, age, sex, general physiological condition, tissue or organ used, results of any tests for pathogens.

For animal cell lines, the following information is recorded concerning the source of the cells: species, strain, breeding conditions, geographical origin, age, sex, general physiological condition, tissue or organ used, results of any tests for pathogens.

Cells of neural origin, such as neuroblastoma and P12 cell lines, may contain substances that concentrate agents of spongiform encephalopathies and such cells are not used for vaccine production.

History of the cell seed. The following information is recorded: the method used to isolate the cell seed, culture methods and any other procedures used to establish the master cell bank, notably any that might expose the cells to extraneous agents.

Full information may not be available on the ingredients of media used in the past for cultivation of cells, for example on the source of substances of animal origin; where justified and authorised, cell banks already established using such media may be used for vaccine production.

Table 5.2.3.-1 – *Testing of cell lines*

Test	Cell seed	Master cell bank (MCB)	Working cell bank (WCB)	Cells at or beyond the maximum population doubling level used for production
		1. IDENTITY AND PURITY		
Morphology	+	+	+	+
Relevant selection of the following tests: biochemical (e.g. isoenzymes), immunological (e.g. histocompatibility), cytogenetic markers, nucleic acid fingerprinting	+	+	+	+
Karyotype (diploid cell lines)	+	+	+(1)	+(1)
Life span (diploid cell lines)	–	+	+	–
		2. EXTRANEOUS AGENTS		
Bacterial and fungal contamination	–	+	+	–
Mycoplasmas	–	+	+	–
Tests in cell cultures	–	–	+	–
Co-cultivation	–	–	+(2)	+(2)
Tests in animals and eggs	–	–	+(2)	+(2)
Specific tests for possible contaminants depending on the origin of the cells (see above under Infectious extraneous agents)	–	–	+(2)	+(2)
Retroviruses	–	+(3)	–	+(3)
		3. TUMORIGENICITY		
Tumorigenicity	–	–	–	+(4)

(1) The diploid character is established for each working cell bank but using cells at or beyond the maximum population doubling level used for production.

(2) Testing is carried out for each working cell bank, but using cells at or beyond the maximum population doubling level used for production.

(3) Testing is carried out for the master cell bank, but using cells at or beyond the maximum population doubling level used for production.

(4) The MRC-5 cell line, the WI-38 cell line and the FRhL-2 cell line are recognised as being non-tumorigenic and they need not be tested. Tests are not carried out on cell lines that are known or assumed to be tumorigenic.

Characterisation of the cell seed. The following properties are investigated:

(1) the identity of the cells (for example, isoenzymes, serology, nucleic acid fingerprinting);

(2) the growth characteristics of the cells and their morphological properties (light and electron microscopes);

(3) for diploid cell lines, karyotype;

(4) for diploid cell lines, the *in vitro* life span in terms of population doubling level.

Cell substrate stability. Suitable viability of the cell line in the intended storage conditions must be demonstrated. For a given product to be prepared in the cell line, it is necessary to demonstrate that consistent production can be obtained with cells at passage levels at the beginning and end of the intended span of use.

Infectious extraneous agents. Cell lines for vaccine production shall be free from infectious extraneous agents. Tests for extraneous agents are carried out as shown in Table 5.2.3.-1.

Depending on the origin and culture history of the cell line, it may be necessary to carry out tests for selected, specific potential contaminants, particularly those that are known to infect latently the species of origin, for example simian virus 40 in rhesus monkeys. For cell lines of rodent origin, antibody-production tests are carried out in mice, rats and hamsters to detect species-specific viruses.

Cell lines are examined for the presence of retroviruses as described below. Cell lines that show the presence of retroviruses capable of replication are not acceptable for production of vaccines.

Tumorigenicity. For the preparation of live vaccines, the cell line must not be tumorigenic at any population doubling level used for vaccine production. Where a tumorigenic cell line is used for the production of other types of vaccine, the purification process is validated to demonstrate that residual substrate-cell DNA is reduced to less than 10 ng per single human dose of the vaccine, unless otherwise prescribed, and that substrate-cell protein is reduced to an acceptable level.

A cell line which is known to have tumorigenic potential does not have to be tested further. If a cell line is of unknown tumorigenic potential, it is either regarded as being tumorigenic or it is tested for tumorigenicity using an *in vitro* test as described below; if the result of the *in vitro* test is negative or not clearly positive, an *in vivo* test as described below is carried out. The tests are carried out using cells at or beyond the maximum population doubling level that will be used for vaccine production.

The MRC-5, the WI-38 and the FRhL-2 cell lines are recognised as being non-tumorigenic and further testing is not necessary.

Chromosomal characterisation. Diploid cell lines shall be shown to be diploid. More extensive characterisation of a diploid cell line by karyotype analysis is required if the removal of intact cells during processing after harvest has not been validated. Samples from four passage levels evenly spaced over the life-span of the cell line are examined. A minimum of 200 cells in metaphase are examined for exact count of chromosomes and for frequency of hyperploidy, hypoploidy, polyploidy, breaks and structural abnormalities.

The MRC-5, the WI-38 and the FRhL-2 cell lines are recognised as being diploid and well characterised; where they are not genetically modified, further characterisation is not necessary.

TEST METHODS FOR CELL CULTURES

Identification. Nucleic-acid-fingerprint analysis and a relevant selection of the following are used to establish the identity of the cells:

(1) biochemical characteristics (isoenzyme analysis),

(2) immunological characteristics (histocompatibility antigens),

(3) cytogenetic markers.

Contaminating cells. The nucleic-acid-fingerprint analysis carried out for identification also serves to demonstrate freedom from contaminating cells.

Bacterial and fungal contamination. The master cell bank and each working cell bank comply with the test for sterility (*2.6.1*), carried out using for each medium 10 ml of supernatant fluid from cell cultures. Carry out the test on 1 per cent of the containers with a minimum of two containers.

Mycoplasmas (*2.6.7*). The master cell bank and each working cell bank comply with the test for mycoplasmas by the culture method and the indicator cell culture method. Use one or more containers for the test.

Test for extraneous agents in cell cultures. The cells comply with the test for haemadsorbing viruses and with the tests in cell cultures for other extraneous agents given in chapter *2.6.16* under Production cell culture: control cells. If the cells are of simian origin, they are also inoculated into rabbit kidney cell cultures to test for herpesvirus B (cercopithecid herpesvirus 1).

Co-cultivation. Co-cultivate intact and disrupted cells separately with other cell systems including human cells and simian cells. Carry out examinations to detect possible morphological changes. Carry out tests on the cell culture fluids to detect haemagglutinating viruses. The cells comply with the test if no evidence of any extraneous agent is found.

Retroviruses. Examine for the presence of retroviruses using:

(1) infectivity assays,

(2) transmission electron microscopy,

(3) if tests (1) and (2) give negative results, reverse transcriptase assays (in the presence of magnesium and manganese) carried out on pellets obtained by high-speed centrifugation.

Tests in animals. Inject intramuscularly (or, for suckling mice, subcutaneously) into each of the following groups of animals 10^7 viable cells divided equally between the animals in each group:

(1) two litters of suckling mice less than 24 h old, comprising not fewer than ten animals,

(2) ten adult mice.

Inject intracerebrally into each of ten adult mice 10^6 viable cells to detect the possible presence of lymphocytic choriomeningitis virus.

Observe the animals for at least 4 weeks. Investigate animals that become sick or show any abnormality to establish the cause of illness. The cells comply with the test if no evidence of any extraneous agent is found. The test is invalid if fewer than 80 per cent of the animals in each group remain healthy and survive to the end of the observation period.

For cells obtained from a rodent species (for example, Chinese hamster ovary cells or baby hamster kidney cells), tests for antibodies against likely viral contaminants of the species in question are carried out on animals that have received injections of the cells.

Tests in eggs. Using an inoculum of 10^6 viable cells per egg, inoculate the cells into the allantoic cavity of ten SPF embryonated hens' eggs (*5.2.2*) 9 to 11 days old and into the yolk sac of ten SPF embryonated hens' eggs 5 to 6 days old. Incubate for not less than 5 days. Test the allantoic fluids for the presence of haemagglutinins using mammalian and avian red blood cells; carry out the test at 5 ± 3 °C and 20-25 °C and read the results after 30 min and 60 min. The cells comply with the test if no evidence of any extraneous agent is found. The test is invalid if fewer than 80 per cent of the embryos remain healthy and survive to the end of the observation period.

Tests for tumorigenicity *in vitro*. The following test systems may be used:

(1) colony formation in soft agar gels,

(2) production of invasive cell growth following inoculation into organ cultures,

(3) study of transformation activity using, for example, the 3T3 assay system for active oncogenes.

Tests for tumorigenicity *in vivo*. The test consists in establishing a comparison between the cell line and a suitable positive control (for example, HeLa or Hep2 cells).

Animal systems that have been shown to be suitable for this test include:

(1) athymic mice (Nu/Nu genotype),

(2) newborn mice, rats or hamsters that have been treated with antithymocyte serum or globulin,

(3) thymectomised and irradiated mice that have been reconstituted (T^-, B^+) with bone marrow from healthy mice.

Whichever animal system is selected, the cell line and the reference cells are injected into separate groups of 10 animals each. In both cases, the inoculum for each animal is 10^7 cells suspended in a volume of 0.2 ml, and the injection may be by either the intramuscular or subcutaneous route. Newborn animals are treated with 0.1 ml of antithymocyte serum or globulin on days 0, 2, 7 and 14 after birth. A potent serum or globulin is one that suppresses the immune mechanisms of growing animals to the extent that the subsequent inoculum of 10^7 positive reference cells regularly produces tumours and metastases. Severely affected animals showing evident progressively growing tumours are euthanised before the end of the test to avoid unnecessary suffering.

At the end of the observation period all animals, including the reference group(s), are euthanised and examined for gross and microscopic evidence of the proliferation of inoculated cells at the site of injection and in other organs (for example lymph nodes, lungs, kidneys and liver).

In all test systems, the animals are observed and palpated at regular intervals for the formation of nodules at the sites of injection. Any nodules formed are measured in two perpendicular dimensions, the measurements being recorded regularly to determine whether there is progressive growth of the nodule. Animals showing nodules which begin to regress during the period of observation are euthanised before the nodules are no longer palpable, and processed for histological examination. Animals with progressively growing nodules are observed for 1-2 weeks. Among those without nodule formation, half are observed for 3 weeks and half for 12 weeks before they are euthanised and processed for histological examination. A necropsy is performed on each animal and includes examination for gross evidence of tumour formation at the site of injection and in other organs such as lymph nodes, lungs, brain, spleen, kidneys and liver. All tumour-like lesions and the site of injection are examined histologically. In addition, since some cell lines may give rise

to metastases without evidence of local tumour growth, any detectable regional lymph nodes and the lungs of all animals are examined histologically.

The test is invalid if fewer than nine of ten animals injected with the positive reference cells show progressively growing tumours.

01/2008:50204

5.2.4. CELL CULTURES FOR THE PRODUCTION OF VETERINARY VACCINES

Cell cultures for the production of vaccines for veterinary use comply with the requirements of this section. It may also be necessary that cell cultures used for testing of vaccines for veterinary use also comply with some or all of these requirements.

For most mammalian viruses, propagation in cell lines is possible and the use of primary cells is then not acceptable.

Permanently infected cells used for production of veterinary vaccines comply with the appropriate requirements described below. The cells shall be shown to be infected only with the agent stated.

CELL LINES

Cell lines are normally handled according to a cell-seed system. Each master cell seed is assigned a specific code for identification purposes. The master cell seed is stored in aliquots at − 70 °C or lower. Production of vaccine is not normally undertaken on cells more than twenty passages from the master cell seed. Where suspension cultures are used, an increase in cell numbers equivalent to approximately three population doublings is considered equivalent to one passage. If cells beyond twenty passage levels are to be used for production, it shall be demonstrated, by validation or further testing, that the production cell cultures are essentially similar to the master cell seed with regard to their biological characteristics and purity and that the use of such cells has no deleterious effect on vaccine production.

The history of the cell line shall be known and recorded in detail (for example, origin, number of passages and media used for multiplication, storage conditions).

The method of storing and using the cells, including details of how it is ensured that the maximum number of passages permitted is not exceeded during product manufacture, are recorded. A sufficient quantity of the master cell seed and each working cell seed are kept for analytical purposes.

The tests described below are carried out (as prescribed in Table 5.2.4.-1) on a culture of the master cell seed and the working cell seed or on cell cultures from the working cell seed at the highest passage level used for production and derived from a homogeneous sample demonstrated to be representative.

Characteristics of culture. The appearance of cell monolayers, before and after histological staining, is described. Information, if possible numerical data, is provided especially on the speed and rate of growth. Similarly, the presence or absence of contact inhibition, polynucleated cells and any other cellular abnormalities are specified.

Karyotype. A chromosomal examination is made of not fewer than fifty cells undergoing mitosis in the master cell seed and at a passage level at least as high as that to be used in production. Any chromosomal marker present in the master cell seed must also be found in the high passage cells and the modal number of chromosomes in these cells must not be more than 15 per cent higher than of cells of the master cell seed. The karyotypes must be identical. If the modal number exceeds the level stated, if the chromosomal markers are not found in the working cell seed at the highest level used for production or if the karyotype differs, the cell line shall not be used for manufacture.

Table 5.2.4.-1. – *Cell culture stage at which tests are carried out*

	Master cell seed	Working cell seed	Cell from working cell seed at highest passage level
General microscopy	+	+	+
Bacteria and fungi	+	+	–
Mycoplasmas	+	+	–
Viruses	+	+	–
Identification of species	+	–	+
Karyotype	+	–	+
Tumorigenicity	+	–	–

Identification of the species. It shall be shown, by one validated method, that the master cell seed and the cells from the working cell seed at the highest passage level used for production come from the species of origin specified. When a fluorescence test is carried out and the corresponding serum to the species of origin of cells is used and shows that all the tested cells are fluorescent, it is not necessary to carry out other tests with reagents able to detect contamination by cells of other species.

Bacterial and fungal contamination. The cells comply with the test for sterility (*2.6.1*). The sample of cells to be examined consists of not less than the number of cells in a monolayer with an area of 70 cm^2 or, for cells grown in suspension, an approximately equivalent number of cells. The cells are maintained in culture for at least 15 days without antibiotics before carrying out the test.

Mycoplasmas (*2.6.7*). The cells comply with the test for mycoplasmas. The cells are maintained in culture for at least 15 days without antibiotics before carrying out the test.

Absence of contaminating viruses. The cells must not be contaminated by viruses; suitably sensitive tests, including those prescribed below, are carried out.

The monolayers tested shall have an area of at least 70 cm^2, and shall be prepared and maintained using medium and additives, and grown under similar conditions to those used for the preparation of the vaccine. The monolayers are maintained in culture for a total of at least 28 days. Subcultures are made at 7-day intervals, unless the cells do not survive for this length of time, when the subcultures are made on the latest day possible. Sufficient cells, in suitable containers, are produced for the final subculture to carry out the tests specified below.

The monolayers are examined regularly throughout the incubation period for the possible presence of cytopathic effects and at the end of the observation period for cytopathic effects, haemadsorbent viruses and specific viruses by immuno-fluorescence and other suitable tests as indicated below.

Detection of cytopathic viruses. Two monolayers of at least 6 cm^2 each are stained with an appropriate cytological stain. The entire area of each stained monolayer is examined for any inclusion bodies, abnormal numbers of giant cells or any other lesion indicative of a cellular abnormality which might be attributable to a contaminant.

Detection of haemadsorbent viruses. Monolayers totalling at least 70 cm^2 are washed several times with an appropriate buffer and a sufficient volume of a suspension of suitable red blood cells added to cover the surface of the monolayer evenly. After different incubation times cells are examined for the presence of haemadsorption.

Detection of specified viruses. Tests are carried out for freedom from contaminants specific for the species of origin of the cell line and for the species for which the product is intended. Sufficient cells on suitable supports are prepared to carry out tests for the agents specified. Suitable positive controls are included in each test. The cells are subjected to suitable tests, for example using fluorescein-conjugated antibodies or similar reagents.

Tests in other cell cultures. Monolayers totalling at least 140 cm^2 are required. The cells are frozen and thawed at least three times and then centrifuged to remove cellular debris. Inoculate aliquots onto the following cells at any time up to 70 per cent confluency:

- primary cells of the source species;
- cells sensitive to viruses pathogenic for the species for which the vaccine is intended;
- cells sensitive to pestiviruses.

The inoculated cells are maintained in culture for at least 7 days, after which freeze-thawed extracts are prepared as above and inoculated onto sufficient fresh cultures of the same cell types to allow for the testing as described below. The cells are incubated for at least a further 7 days. The cultures are examined regularly for the presence of any cytopathic changes indicative of living organisms.

At the end of this period of 14 days, the inoculated cells are subjected to the following checks:

- freedom from cytopathic and haemadsorbent organisms, using the methods specified in the relevant paragraphs above,
- absence of pestiviruses and other specific contaminants by immunofluorescence or other validated methods as indicated in the paragraph above on Detection of Specified Viruses.

Tumorigenicity. The risk of a cell line for the target species must be evaluated and, if necessary, tests are carried out.

PRIMARY CELLS

For most mammalian vaccines, the use of primary cells is not acceptable for the manufacture of vaccines since cell lines can be used. If there is no alternative to the use of primary cells, the cells are obtained from a herd or flock free from specified pathogens, with complete protection from introduction of diseases (for example, disease barriers, filters on air inlets, suitable quarantine before introduction of animals). Chicken flocks comply with the requirements prescribed in general chapter *5.2.2. Chicken Flocks Free from Specified Pathogens for the Production and Quality Control of Vaccines*. For all other species, the herd or flock is shown to be free from relevant specified pathogens. All the breeding stock in the herd or flock intended to be used to produce primary cells for vaccine manufacture is subject to a suitable monitoring procedure including regular serological checks carried out at least twice a year and two supplementary serological examinations performed in 15 per cent of the breeding stock in the herd between the two checks mentioned above.

Wherever possible, particularly for mammalian cells, a seed-lot system is used with, for example, a master cell seed formed after less than five passages, the working cell seed being no more than five passages from the initial preparation of the cell suspension from the animal tissues.

Each master cell seed, working cell seed and cells of the highest passage of primary cells are checked in accordance with Table 5.2.4.-2 and the procedure described below. The sample tested shall cover all the sources of cells used for the manufacture of the batch. No batches of vaccine manufactured using the cells may be released if any one of the checks performed produces unsatisfactory results.

Table 5.2.4.-2. – *Cell culture stage at which tests are carried out*

	Master cell seed	Working cell seed	Highest passage level
General microscopy	+	+	+
Bacteria and fungi	+	+	–
Mycoplasmas	+	+	–
Viruses	+	+	–
Identification of species	+	–	–

Characteristics of cultures. The appearance of cell monolayers, before and after histological staining, is described. Information, if possible numerical data, is recorded, especially on the speed and rate of growth. Similarly, the presence or absence of contact inhibition, polynucleated cells and any other cellular abnormalities are specified.

Identification of species. It shall be demonstrated by one validated test that the master cell seed comes from the specified species of origin.

When a fluorescence test is carried out and the corresponding serum to the species of origin of cells is used and shows that all the tested cells are fluorescent, it is not necessary to carry out other tests with reagents able to detect contamination by cells of other species.

Bacterial and fungal sterility. The cells comply with the test for sterility (*2.6.1*). The sample of cells to be examined consists of not less than the number of cells in a monolayer with an area of 70 cm^2 or for cells grown in suspension an approximately equivalent number of cells. The cells are maintained in culture for at least 15 days without antibiotics before carrying out the test.

Mycoplasmas (*2.6.7*). The cells comply with the test for mycoplasmas. The cells are maintained in culture for at least 15 days without antibiotics before carrying out the test.

Absence of contaminating viruses. The cells must not be contaminated by viruses; suitably sensitive tests, including those prescribed below are carried out.

The monolayers tested shall be at least 70 cm^2, and shall be prepared and maintained in culture using the same medium and additives, and under similar conditions to those used for the preparation of the vaccine.

The monolayers are maintained in culture for a total of at least 28 days or for the longest period possible if culture for 28 days is impossible. Subcultures are made at 7-day intervals, unless the cells do not survive for this length of time when the subcultures are made on the latest day possible. Sufficient cells, in suitable containers are produced for the final subculture to carry out the tests specified below.

The monolayers are examined regularly throughout the incubation period for the possible presence of cytopathic effects and at the end of the observation period for cytopathic effects, haemadsorbent viruses and specific viruses by immunofluorescence and other suitable tests as indicated below.

Detection of cytopathic viruses. Two monolayers of at least 6 cm^2 each are stained with an appropriate cytological stain. Examine the entire area of each stained monolayer for any inclusion bodies, abnormal numbers of giant cells or any other lesion indicative of a cellular abnormality that might be attributable to a contaminant.

Detection of haemadsorbent viruses. Monolayers totalling at least 70 cm^2 are washed several times with a suitable buffer solution and a sufficient volume of a suspension of suitable red blood cells added to cover the surface of the monolayer evenly. After different incubation times, examine cells for the presence of haemadsorption.

Detection of specified viruses. Tests are be carried out for freedom of contaminants specific for the species of origin of the cells and for the species for which the product is intended.

Sufficient cells on suitable supports are prepared to carry out tests for the agents specified. Suitable positive controls are included in each test. The cells are subjected to suitable tests using fluorescein-conjugated antibodies or similar reagents.

Tests in other cell cultures. Monolayers totalling at least 140 cm^2 are required. The cells are frozen and thawed at least three times and then centrifuged to remove cellular debris. Aliquots are inoculated onto the following cells at any time up to 70 per cent confluency:

- primary cells of the source species;
- cells sensitive to viruses pathogenic for the species for which the vaccine is intended;
- cells sensitive to pestiviruses.

The inoculated cells are maintained in culture for at least 7 days, after which freeze-thawed extracts are prepared as above, and inoculated onto sufficient fresh cultures of the same cell types to allow for the testing as described below. The cells are incubated for at least a further 7 days. All cultures are regularly examined for the presence of any cytopathic changes indicative of living organisms.

At the end of this period of 14 days, the inoculated cells are subjected to the following checks:

- freedom from cytopathic and haemadsorbent organisms is demonstrated using the methods specified in the relevant paragraphs above;
- relevant substrates are tested for the absence of pestiviruses and other specific contaminants by immunofluorescence or other validated methods as indicated in the paragraph above on Detection of Specified Viruses.

01/2008:50205

5.2.5. SUBSTANCES OF ANIMAL ORIGIN FOR THE PRODUCTION OF VETERINARY VACCINES

Substances of animal origin (for example, serum, trypsin and serum albumin) may be used during the manufacture of veterinary immunological products, as ingredients of culture media etc. or as added constituents of vaccines or diluents. It is recommended to reduce, wherever practicable, the use of such substances.

Certain restrictions are placed upon the use of such substances to minimise the risk associated with pathogens that may be present in them.

- The use of substances of animal origin as constituents of vaccines or diluents is not generally acceptable except where such substances are sterilised by a suitable, validated method. Where the use of such substances has been shown to be essential and sterilisation is not possible, the criteria described under Requirements apply.
- Substances of animal origin used during production are either subjected to a suitable, validated sterilisation or inactivation procedure or the substance is tested for the absence of extraneous organisms in accordance with the Requirements below. For inactivated vaccines, the method used for inactivation of the vaccine strain may also be validated for inactivation of possible contaminants from substances of animal origin.

In addition to the restrictions described below, manufacturers must consider restrictions on the handling of substances of animal origin in the vaccine manufacturing premises.

The restrictions imposed by these sections may need to be varied in accordance with changes in the incidence of disease in the country of origin and in Europe.

REQUIREMENTS

Substances of animal origin comply with the requirements of the Pharmacopoeia (where a relevant monograph exists).

Source. The risk related to the animal diseases occurring in the country of origin of the substance and to the potential infectious diseases occurring in the source species, in relation to the proposed recipient species must be carefully evaluated. The strictest possible selection criteria must be applied, in particular for substances for use in products intended for the same species and for substances of bovine, caprine, ovine and porcine origin.

Preparation. Substances of animal origin are prepared from a homogeneous bulk designated with a batch number. A batch may contain substances derived from as many animals as desired but once defined and given a batch number, the batch is not added to or contaminated in any way.

All batches of substances shall be shown to be free from contaminants as described below and/or are subject to a validated inactivation procedure.

Inactivation. The inactivation procedure chosen shall have been shown to be capable of reducing the titre of certain potential contaminants in the substance concerned by at least 10^6. If this reduction in titre cannot be shown experimentally, kinetic studies for the inactivation procedure must be carried out and shown to be satisfactory, taking into account the possible level of contamination.

The list of potential contaminating organisms that the procedure must be shown to be capable of inactivating must be appropriate to the particular species of origin of the substance. The evidence for the efficacy of the procedure, which must relate to the current circumstances, may take the form of references to published literature or experimental data generated by the manufacturer.

Tests. For examination of the substance for freedom from contaminants, any solids are dissolved or suspended in a suitable medium in such a way as to create a solution or suspension containing at least 300 g/l of the substance to be examined. If the substance is not soluble or where cytotoxic reactions occur, a lower concentration may be used.

Any batch of substance found to contain living organisms of any kind is unsatisfactory and is either discarded or repro-cessed and shown to be satisfactory.

Freedom from extraneous viruses. The solution or suspension of the solid substance or the undiluted liquid substance is tested for contaminants by suitably sensitive methods. These methods shall include tests in suitably

sensitive cell cultures, including primary cells from the same species as the substances to be examined. A proportion of the cells is passaged at least twice.

The cells are observed regularly for 21 days for cytopathic effects. At the end of each 7 day period, a proportion of the original cultures is fixed, stained and examined for cytopathic effects; a proportion is tested for haemadsorbing agents; and a proportion is tested for specific agents by appropriate serodiagnostic tests.

Bacterial and fungal contamination. Before use, substances are tested for sterility (*2.6.1*) and freedom from mycoplasmas (*2.6.7*) or sterilised to inactivate any bacterial, fungal or mycoplasmal contaminants.

01/2008:50206

5.2.6. EVALUATION OF SAFETY OF VETERINARY VACCINES AND IMMUNOSERA

The term "product" means either a vaccine or an immunoserum throughout the text.

During development, safety tests are carried out in the target species to show the risks from use of the product.

Vaccines. In laboratory tests, "dose" means that quantity of the product to be recommended for use and containing the maximum titre or potency likely to be contained in production batches. Live vaccines are prepared only from strains of organisms that have been shown to be safe. For live vaccines, use a batch or batches of vaccine containing virus/bacteria at the least attenuated passage level that will be present in a batch of vaccine.

For combined vaccines, the safety shall be demonstrated; for live components of combined vaccines, compliance with the special requirements for live vaccines stated below shall be demonstrated separately for each vaccine strain.

For inactivated vaccines, safety tests carried out on the combined vaccine may be regarded as sufficient to demonstrate the safety of the individual components.

Immunosera. In the tests, "dose" means the maximum quantity of the product to be recommended for use and containing the maximum potency and maximum total protein likely to be contained in production batches. In addition, if appropriate, the dose tested also contains maximum quantities of immunoglobulin or gammaglobulin.

The tests described below, modified or supplemented by tests described in the Production section of a monograph, may be carried out as part of the tests necessary during development to demonstrate the safety of the product.

A. LABORATORY TESTS

Safety of the administration of 1 dose. For each of the recommended routes of administration, administer 1 dose of product to animals of each species and category for which use of the product is to be recommended. This must include animals of the youngest recommended age and pregnant animals, if appropriate. The animals are observed and examined at least daily for signs of abnormal local and systemic reactions. Where appropriate, these studies shall include detailed post-mortem macroscopic and microscopic examinations of the injection site. Other objective criteria are recorded, such as body temperature (for mammals) and performance measurements. The body temperatures are recorded on at least the day before and at the time of administration of the product, 4 h later and on the following 4 days. The animals are observed and examined until reactions may no longer be expected but, in all cases, the observation and examination period extends at least until 14 days after administration.

Examination of reproductive performance. As part of the studies, examination of reproductive performance must also be considered when data suggest that the starting material from which the product is derived may be a risk factor. Where prescribed in a monograph, reproductive performance of males and non-pregnant and pregnant females and harmful effects on the progeny, including teratogenic and abortifacient effects, are investigated by each of the recommended routes of administration.

Safety of 1 administration of an overdose. An overdose of the product is administered by each recommended route of administration to animals of the categories of the target species which are expected to be the most sensitive, such as animals of the youngest age and pregnant animals, if appropriate. The overdose normally consists of 10 doses of a live vaccine or 2 doses of an inactivated product or an immunoserum. For freeze-dried live vaccines, the 10 doses shall be reconstituted in a suitable volume of diluent for the test. The animals are observed and examined at least daily for signs of local and systemic reactions. Other objective criteria are recorded, such as body temperature (for mammals) and performance measurements. The animals are observed and examined for at least 14 days after administration. If the vaccine is intended for use in pregnant animals, carry out the test in these animals at the time for which use is not contra-indicated, and extend the observation period at least until parturition. The animals are observed and effects on gestation or the offspring are recorded. In exceptional circumstances, notably for immunosera, where there is evidence that an overdose is not appropriate and an overdose test is not performed, a clear warning of the potential dangers of overdosing must be contained in the product literature.

Safety of the repeated administration of 1 dose. Repeated administration of 1 dose may be required to reveal any adverse effects induced by such administration. These tests are particularly important where the product, notably an immunoserum, may be administered on several occasions over a relatively short space of time. These tests are carried out on the most sensitive categories of the target species, using each recommended route of administration. The number of administrations must be not less than the maximum number recommended; for vaccines, this shall take account of the number of administrations for primary vaccination and the 1st re-vaccination; for immunosera, it shall take account of the number of administrations required for treatment. The interval between administrations shall be suitable (e.g. period of risk or required for treatment) and appropriate to the recommendations of use. Although, for convenience, as far as vaccines are concerned, a shorter interval may be used in the study than that recommended in the field, an interval of at least 14 days must be allowed between administrations for the development of any hypersensitivity reaction. For immunosera, however, administration shall follow the recommended schedule. The animals are observed and examined at least daily for at least 14 days after the last administration for signs of systemic and local reactions. Other objective criteria are recorded, such as body temperature and performance measurements.

Residues. In the case of live vaccines for well-established zoonotic diseases, the determination of residual vaccine organisms at the injection site may be required, in addition to the studies of dissemination described below.

Adverse effects on immunological functions. Where the product might adversely affect the immune response of the animal to which the product is administered or of its progeny, suitable tests on the immunological functions are carried out.

Adverse effects from interactions. Studies are undertaken to show a lack of adverse effect on the safety of the product when simultaneous administration is recommended or where administration of the product is recommended as part of a schedule of administration of products within a short period of time.

Special requirements for live vaccines. The following laboratory tests must also be carried out with live vaccines.

a) Spread of the vaccine strain. Spread of the vaccine strain from vaccinated to unvaccinated target animals is investigated using the recommended route of administration most likely to result in spread. Moreover, it may be necessary to investigate the safety of spread to non-target species that could be highly susceptible to a live vaccine strain. An assessment must be made of how many animal-to-animal passages are likely to be sustainable under normal circumstances together with an assessment of the likely consequences.

b) Dissemination in vaccinated animal. Faeces, urine, milk, eggs, oral, nasal and other secretions shall be tested for the presence of the organism. Moreover, studies may be required of the dissemination of the vaccine strain in the body, with particular attention being paid to the predilection sites for replication of the organism. In the case of live vaccines for well-established zoonotic diseases for food-producing animals, these studies are obligatory.

c) Increase in virulence. Use material from the passage level that is likely to be most virulent for the target species between the master seed lot and the final product. The animals used are of an age suitable for recovery of the virus and the animals in all groups are of this age at the time of inoculation. The initial vaccination is carried out using the recommended route of administration most likely to lead to reversion to virulence. After this, not fewer than 5 further serial passages through animals of the target species are undertaken. The passages are undertaken by the route of administration most likely to lead to reversion to virulence. If the properties of the virus allow sequential passage to 5 groups via natural spreading, this method may be used, otherwise passage as described in each monograph is carried out and the maximally passaged virus that has been recovered is tested for increase in virulence. Not fewer than 2 animals are used for each passage. At each passage, the presence of living vaccine-derived organisms in the material used for passage is demonstrated. The safety of material from the highest successful passage is compared with that of unpassaged material.

For particular viruses, a monograph may require more passages in more animals if there is an indication from available data that this is relevant. At least the final passage is carried out using animals most appropriate to the potential risk being assessed.

d) Biological properties of the vaccine strain. Other tests may be necessary to determine as precisely as possible the intrinsic biological properties of the vaccine strain (for example, neurotropism). For vector vaccines, evaluation is made of the risk of changing the tropism or virulence of the strain and where necessary specific tests are carried out. Such tests are systematically carried out where the product of a foreign gene is incorporated into the strain as a structural protein.

e) Recombination or genomic reassortment of strain. The probability of recombination or genomic reassortment with field or other strains shall be considered.

B. FIELD STUDIES

Results from laboratory studies shall normally be supplemented with supportive data from field studies. Provided that laboratory tests have adequately assessed the safety and efficacy of a product under experimental conditions using vaccines of maximum and minimum titre or potency respectively, a single batch of product may be used to assess both safety and efficacy under field conditions. In these cases, a typical routine batch of intermediate titre or potency may be used.

For food-producing mammals, the studies include measurement of the body temperatures of a sufficient number of animals, before and after administration of the product; for other mammals, such measurements are carried out if the laboratory studies indicate that there might be a problem. The size and persistence of any local reaction and the proportion of animals showing local or systemic reactions are recorded. Performance measurements are made, where appropriate.

Performance measures for broilers include weekly mortality, feed conversion ratios, age at slaughter and weight, down grading and rejects at the processing plant. For vaccines for use in laying birds or in birds which may be maintained to lay, the effect of the vaccine on laying performance and hatchability is investigated, as appropriate.

C. ECOTOXICITY

An assessment is made of the potential harmful effects of the product for the environment and any necessary precautionary measures to reduce such risks are identified. The likely degree of exposure of the environment to the product is assessed taking into account: the target species and mode of administration; excretion of the product; disposal of unused product. If these factors indicate that there will be significant exposure of the environment to the product, the potential ecotoxicity is evaluated taking into account the properties of the product.

01/2008:50207

5.2.7. EVALUATION OF EFFICACY OF VETERINARY VACCINES AND IMMUNOSERA

The term “product” means either a vaccine or an immunoserum throughout the text.

During development of the product, tests are carried out to demonstrate that the product is efficacious when administered by each of the recommended routes and methods of administration and using the recommended schedule to animals of each species and category for which use of the product is to be recommended. The type of efficacy testing to be carried out varies considerably depending on the particular type of product.

As part of tests carried out during development to establish efficacy, the tests described in the Production section of a monograph may be carried out; the following must be taken into account.

The dose to be used is that quantity of the product to be recommended for use and containing the minimum titre or potency expected at the end of the period of validity.

For live vaccines, use vaccine containing virus/bacteria at the most attenuated passage level that will be present in a batch of vaccine.

For immunosera, if appropriate, the dose tested also contains minimum quantities of immunoglobulin or gammaglobulin and/or total protein.

The efficacy evidence must support all the claims being made. For example, claims for protection against respiratory disease must be supported by at least evidence of protection from clinical signs of respiratory disease. Where it is claimed that there is protection from infection this must be demonstrated using re-isolation techniques. If more than one claim is made, supporting evidence for each claim is required.

Vaccines. The influence of passively acquired and maternally derived antibodies on the efficacy of a vaccine is adequately evaluated. Any claims, stated or implied, regarding onset and duration of protection shall be supported by data from trials.

The efficacy of each of the components of multivalent and combined vaccines shall be demonstrated using the combined vaccine.

Immunosera. Particular attention must be paid to providing supporting data for the efficacy of the regime that is to be recommended. For example, if it is recommended that the immunoserum needs only to be administered once to achieve a prophylactic or therapeutic effect then this must be demonstrated. Any claims, stated or implied, regarding onset and duration of protection or therapeutic effect must be supported by data from trials. For example, the duration of the protection afforded by a prophylactic dose of an antiserum must be studied so that appropriate guidance for the user can be given on the label.

Studies of immunological compatibility are undertaken when simultaneous administration is recommended or where it is a part of a usual administration schedule. Wherever a product is recommended as part of an administration scheme, the priming or booster effect or the contribution of the product to the efficacy of the scheme as a whole is demonstrated.

LABORATORY TESTS

In principle, demonstration of efficacy is undertaken under well-controlled laboratory conditions by challenge of the target animal under the recommended conditions of use.

In so far as possible, the conditions under which the challenge is carried out shall mimic the natural conditions for infection, for example with regard to the amount of challenge organism and the route of administration of the challenge.

Vaccines. Unless otherwise justified, challenge is carried out using a strain different from the one used in the production of the vaccine.

If possible, the immune mechanism (cell-mediated/humoral, local/general, classes of immunoglobulin) that is initiated after the administration of the vaccine to target animals shall be determined.

Immunosera. Data are provided from measurements of the antibody levels achieved in the target species after administration of the product, as recommended. Where suitable published data exist, references are provided to relevant published literature on protective antibody levels and challenge studies are avoided.

Where challenges are required, these can be given before or after administration of the product, in accordance with the indications and specific claims to be made.

FIELD TRIALS

In general, results from laboratory tests are supplemented with data from field trials, carried out, unless otherwise justified, with untreated control animals. Provided that laboratory tests have adequately assessed the safety and efficacy of a product under experimental conditions using vaccines of maximum and minimum titre or potency respectively, a single batch of product could be used to assess both safety and efficacy under field conditions. In these cases, a typical routine batch of intermediate titre or potency may be used. Where laboratory trials cannot be supportive of efficacy, the performance of field trials alone may be acceptable.

1. INTRODUCTION

1-1. *SCIENTIFIC BACKGROUND*

Transmissible Spongiform Encephalopathies (TSEs) are chronic degenerative nervous diseases characterised by the accumulation of an abnormal isoform of a cellular

glycoprotein known as PrP (or prion protein). The abnormal isoform of PrP (PrP^{Sc}) differs from normal PrP (PrP^{c}) in being highly resistant to protease and heat denaturation treatments. PrP^{Sc} is considered to be the infective agent responsible for transmitting TSE disease.

TSE diseases in animals include:

- bovine spongiform encephalopathy (BSE) in cattle,
- scrapie in sheep and goats,
- chronic wasting disease (CWD) in cervids (deer and elk),
- transmissible mink encephalopathy (TME) in farmed mink,
- feline spongiform encephalopathy (FSE) in felidae (specifically domestic cats and captive large cats), and
- spongiform encephalopathy of exotic ungulates in zoos.

In humans, spongiform encephalopathies include different forms of Creutzfeldt-Jakob Disease (CJD), Kuru, Gerstmann-Sträussler-Scheinker Syndrome (GSS), and Fatal Familial Insomnia (FFI).

Iatrogenic transmission of spongiform encephalopathies has been reported. In sheep, scrapie has been accidentally transmitted by the use of Louping Ill vaccine prepared from pooled, formaldehyde treated ovine brain and spleen in which material from scrapie-infected sheep had been inadvertently incorporated. In man, cases of transmission of CJD have been reported which have been attributed to the parenteral administration of growth hormone and gonadotropin derived from human cadaveric pituitary glands. Cases of CJD have also been attributed to the use of contaminated instruments in brain surgery and with the transplantation of human dura mater and cornea.

Interspecies TSE transmission is restricted by a number of natural barriers, transmissibility being affected by the species of origin, the prion strain, dose, route of exposure and, in some species, the host allele of the PrP gene. Species barriers can be crossed under appropriate conditions.

Bovine spongiform encephalopathy (BSE) was first recognised in the United Kingdom in 1986 and a large number of cattle and individual herds have been affected. It is clear that BSE is a food borne disease associated with feeding meat and bone meal derived from TSE affected animals. Other countries have experienced cases of BSE, either in animals imported from the United Kingdom or in indigenous animals. There is convincing evidence to show that the variant form of CJD (vCJD) is caused by the agent which is responsible for BSE in cattle. Therefore, a cautious approach continues to be warranted if biological materials from species naturally affected by TSE diseases, especially bovine species, are used for the manufacture of medicinal products.

Scrapie occurs worldwide and has been reported in most European countries. It has the highest incidence in the United Kingdom. While humans have been exposed to naturally occurring scrapie for over 200 years, there is no epidemiological evidence directly linking scrapie to spongiform encephalopathies in humans. However, there remains a theoretical and currently unquantifiable risk that some BSE-contaminated protein supplement may have been fed to sheep. If such feed causes a recurrent BSE infection in sheep, it may be diagnosed as scrapie and might as such pose a risk of human TSEs. Further, it should also be assumed that any BSE agent introduced into the small ruminant population via contaminated feed is likely to be recycled and amplified.

1-2. *REGULATORY COMPLIANCE*

Risk assessment. Since the use of animal-derived materials is unavoidable for the production of some medicinal products and that complete elimination of risk at source is rarely possible, the measures taken to manage the risk of transmitting animal TSEs via medicinal products represent risk minimisation rather than risk elimination. Consequently, the basis for regulatory compliance should be based on a risk assessment, taking into consideration all pertinent factors as identified in this chapter (see below).

Legal Aspects. The note for guidance has been given the force of law by virtue of Annex I to European Parliament and Council Directives 2001/82/EC and 2001/83/EC (as amended by Commission Directive 2003/63/EC[(1)]), governing the veterinary and human medicinal products, respectively. These directives require that applicants for marketing authorisation for human and veterinary medicinal products must demonstrate that medicinal products are manufactured in accordance with the latest version of this note for guidance published in the *Official Journal of the European Union*. This is a continuing obligation after the marketing authorisation has been granted.

By definition, the principle of Specified Risk Materials as defined in Regulation (EC) No 999/2001 of the European Parliament and of the Council[(2)] does not apply to medicinal products. The use of substances derived from high infectivity tissues must be fully justified following an appropriate benefit/risk evaluation (see further below).

The note for guidance should be read in conjunction with the various European Community legal instruments including Commission decisions progressively implemented since 1991. Where appropriate, references to these decisions are given in the text. Position statements and explanatory notes made by the Committee for Proprietary Medicinal Products (CPMP) and Committee for Veterinary Medicinal Products (CVMP) are still applicable for the purpose of regulatory compliance unless otherwise superseded by the note for guidance.

The general monograph *Products with risk of transmitting agents of animal spongiform encephalopathies* of the European Pharmacopoeia refers to this chapter, which is identical with the note for guidance. The monograph forms the basis for issuing Certificates of Suitability as a procedure for demonstrating TSE compliance for substances and materials used in the manufacture of human and veterinary medicinal products.

Clarification of note for guidance. As the scientific understanding of TSEs, especially the pathogenesis of the diseases, is evolving, from time to time CPMP and its Biotechnology Working Party in collaboration with CVMP and its Immunologicals Working Party may be required in the future to develop supplementary guidance in the form of position statements or explanatory notes for the purpose of clarifying the note for guidance. The supplementary guidance shall be published by the Commission and on the website of the European Agency for the Evaluation of Medicinal Products (EMEA) and taken into consideration accordingly in the scope of the certification of the European Directorate for the Quality of Medicines (EDQM).

Implementation of the revised note for guidance. All authorised medicinal products in the European Union have demonstrated compliance with the note for guidance on minimising the risk of transmitting animal spongiform encephalopathy agents via human and veterinary medicinal products (EMEA/410/01-Rev.1) in line with the legal requirement as inscribed in Annex I to Directive 2001/82/EC

(1) O.J. L 159, 27.06.2003, p. 46
(2) O.J. L 147, 31.05.2001, p. 1

(veterinary medicines) or Directive 2001/83/EC as amended by Directive 2003/63/EC (medicines for human use). The revised note for guidance is to be applied prospectively, i.e. for all medicinal products that will be authorised or whose marketing authorisation will be renewed after the time of coming into operation of the revised note for guidance.

2. SCOPE OF THE CHAPTER

TSE-RELEVANT ANIMAL SPECIES

Cattle, sheep, goats and animals that are naturally susceptible to infection with transmissible spongiform encephalopathy agents or susceptible to infection through the oral route other than humans[3] and non-human primates are defined as "TSE-relevant animal species"[4].

MATERIALS

This chapter is concerned with materials derived from "TSE-relevant animal species" that are used for the preparation of:

- active substances,
- excipients and adjuvants,
- raw and starting materials and reagents used in production (e.g. bovine serum albumin; enzymes; culture media including those used to prepare working cell banks, or new master cell banks for medicinal products which are subject to a new marketing authorisation).

This chapter is also applicable to materials that come into direct contact with the equipment used in manufacture of the medicinal product or that come in contact with the medicinal product and therefore have the potential for contamination.

Materials used in the qualification of plant and equipment, such as culture media used in media fill experiments to validate the aseptic filling process, shall be considered in compliance with this chapter provided that the constituent or constituents are derived from tissues with no detectable infectivity (category C tissues), where the risk of cross-contamination with potentially infective tissues has been considered (see section 3-3) and where the materials are sourced from a GBR I/II country (see section 3-2). Such information shall be provided in the dossier for a marketing authorisation and verified during routine inspection for compliance with Good Manufacturing Practice (GMP).

Other materials such as cleaning agents, softeners and lubricants that come into contact with the medicinal product during its routine manufacture or in the finishing stage or in the primary packaging are considered in compliance with this chapter if they are derived from tallow under the conditions described in section 6.

SEED LOTS, CELL BANKS AND ROUTINE FERMENTATION/PRODUCTION[5]

For the purpose of regulatory compliance, master seeds or master cell banks in marketing authorisation applications lodged after 1 July 2000 (for human medicinal products) or 1 October 2000 (for veterinary medicinal products) are covered by the note for guidance.

Master seeds and master cell banks,

- for vaccine antigens;
- for a biotechnology-derived medicinal product within the meaning of Part A of the Annex to Council Regulation (EC) No 2309/93; and
- for other medicinal products using seed lots or cell banking systems in their manufacture,

that have already been approved for the manufacture of a constituent of an authorised medicinal product shall be considered in compliance with the note for guidance even if they are incorporated in marketing authorisation applications lodged after 1 July 2000 (for human medicinal products) or 1 October 2000 (for veterinary medicinal products).

Master cell banks and master seeds established before 1 July 2000 (for human medicinal products) or 1 October 2000 (for veterinary medicinal products), but not yet approved as a constituent of an authorised medicinal product shall demonstrate that they fulfil the requirements of the note for guidance. If, for some raw or starting materials or reagents used for the establishment of these cell banks or seeds, full documentary evidence is not/no longer available, the applicant should present a risk assessment as described in Section 4 of the note for guidance.

Established working seeds or cell banks used in the manufacture of medicinal products authorised before 1 July 2000 (human medicines) or 1 October 2000 (veterinary medicines), which have been subjected to a properly conducted risk assessment by a competent authority of the Member States or the EMEA and declared to be acceptable, shall also be considered compliant.

However, where materials derived from the "TSE-relevant animal species" are used in fermentation/routine production processes or in the establishment of working seeds and working cell banks, the applicant must demonstrate that they fulfil the requirements of the note for guidance.

3. GENERAL CONSIDERATIONS

3-1. *SCIENTIFIC PRINCIPLES FOR MINIMISING RISK*

When manufacturers have a choice, the use of materials from "non TSE-relevant animal species" or non-animal origin is preferred. The rationale for using materials derived from "TSE-relevant animal species" instead of materials from "non-TSE-relevant species" or of non-animal origin should be given. If materials from "TSE-relevant animal species" have to be used, consideration should be given to all the necessary measures to minimise the risk of transmission of TSE.

Readily applicable diagnostic tests for TSE infectivity *in vivo* are not yet available. Diagnosis is based on post-mortem confirmation of characteristic brain lesions by histopathology and/or detection of PrP^{Sc} by Western blot or immunoassay. The demonstration of infectivity by the inoculation of suspect tissue into target species or laboratory animals is also used for confirmation. However, due to the long incubation periods of all TSEs, results of *in vivo* tests are available only after months or years.

Several *in vitro* diagnostic tests capable of detecting PrP^{Sc} in brain samples from infected animals have been approved for use but in the main they are less sensitive than *in vivo* infectivity assays. Nonetheless, screening of source animals by *in vitro* tests may prevent the use of animals at late stages of incubation of the disease and may provide information about the epidemiological status of a given country or region.

Minimising the risks of transmission of TSE is based upon three complementary parameters:

- the source animals and their geographical origin,
- nature of animal material used in manufacture and any procedures in place to avoid cross-contamination with higher risk materials,

(3) Regulatory guidance and position papers have been issued by the Committee for Proprietary Medicinal Products and its Biotechnology Working Party on human tissue derived medicinal products in relation with CJD and vCJD. Such guidance can be found on http://www.emea.eu.int.

(4) Pigs and birds, which are animal species of particular interest for the production of medicinal products, are not naturally susceptible to infection via the oral route. Therefore they are not TSE-relevant animal species within the meaning of this chapter. Also dogs, rabbits and fish are non TSE-relevant animal species within the meaning of this chapter.

(5) See also: Position paper on the assessment of the risk of transmission of animal spongiform encephalopathy agents by master seed materials used in the production of veterinary vaccines (EMEA/CVMP/019/01-February 2001 adopted by the Committee for Veterinary Medicinal products (CVMP) in July 2001, Official Journal of the European Communities C 286 of 12 October 2001, p.12.

– production process(es) including the quality assurance system in place to ensure product consistency and traceability.

3-2. *SOURCE ANIMALS*

The source materials used for the production of materials for the manufacture of medicinal products shall be derived from animals fit for human consumption following ante- and post-mortem inspection in accordance with Community or equivalent (third country) conditions, except for materials derived from live animals, which should be found healthy after clinical examination.

3-2-1. **Geographical sourcing**

3-2-1-1. *Bovine materials*

There are currently two organisations involved in the assessment of the BSE status of a specified country or zone. Firstly, the Organisation Internationale des Epizooties (OIE)[6] lays down the criteria for the assessment of the status of countries in the chapter of the International Animal Health Code on bovine spongiform encephalopathy. OIE also provides a list of notified BSE cases worldwide. Secondly, the European Commission Scientific Steering Committee (SSC)[7] has established a system for classifying the countries according to their geographical BSE risk (GBR).

Regulation (EC) No 999/2001 of the European Parliament and of the Council laying down rules for the prevention, control and eradication of certain transmissible spongiform encephalopathies (TSE Regulation)[2] entered into force on 1 July 2001. While medicinal products, medical devices and cosmetics are excluded from the scope of this Regulation, the principles for the determination of BSE status should be taken into account in the categorisation of the BSE status of a given country or region.

For the purposes of this chapter, the SSC GBR classification should be used as the indicator of the status of a given country. However, when countries are categorised according to Regulation (EC) No 999/2001, this categorisation should be used.

European Commission Scientific Steering Committee Classification

The European Scientific Steering Committee classification for geographical BSE risk (GBR) gives an indication of the level of likelihood of the presence of one or more cattle clinically or pre-clinically infected with BSE in a given country or region. A definition of the four categories is provided in the following Table.

GBR level	Presence of one or more cattle clinically or pre-clinically infected with BSE in a geographical region/country
I	Highly unlikely
II	Unlikely but not excluded
III	Likely but not confirmed or confirmed at a lower level
IV	Confirmed at a higher level[1]

(1) ≥ 100 cases/1 Million adult cattle per year

Reports of the GBR assessment of the countries are available on the SSC website[8]. If the BSE status of a country has not been classified by the SSC, a risk assessment shall be submitted taking into account the SSC criteria for the GBR classification.

Where there is a choice, animals should be sourced from countries with the lowest possible GBR level unless the use of material from higher GBR countries is justified. Some of the materials identified in Section 6, "Specific Conditions" can be sourced from GBR category III and, in some cases, category IV countries, provided that the controls and requirements as specified in the relevant sections below are applied. Apart from these exceptions, animals must not be sourced from category IV countries, and justifications for the use of animals from category III countries must always be provided.

3-2-1-2. Sheep and goats (small ruminants)

Naturally occurring clinical scrapie cases have been reported in a number of countries worldwide. As BSE in sheep could possibly be mistaken for scrapie, as a precautionary measure, sourcing of materials derived from small ruminants shall take into account the prevalence of both BSE and scrapie in the country and the tissues from which the materials are derived.

The principles related to "BSE Negligible risk (closed) bovine herds" (see section 3-2-2) could equally be applied in the context of small ruminants in order to develop a framework to define the TSE status of a flock of small ruminants. For sheep, because of the concern over the possibility of BSE in sheep, the use of (a) genotype(s) shown to be resistant to BSE/scrapie infection shall be considered in establishing TSE free flocks. However, goats have not been studied sufficiently with regard to a genotype specific sensitivity.

Material of small ruminant origin should preferably be sourced from countries with a long history of absence of scrapie, such as New Zealand or Australia or from proven TSE-free flocks. Justification shall be required if the material is sourced from some other origin.

3-2-2. **BSE negligible risk (closed) bovine herds**. The safest sourcing is from countries where the presence of BSE is highly unlikely i.e. GBR I. Other countries may have or have had cases of BSE at some point in time and the practical concept of "Negligible risk (closed) bovine herds" has been developed by the SSC and endorsed by the CPMP and CVMP. Criteria for establishing and maintaining a "BSE negligible risk (closed) bovine herd" can be found in the SSC opinion of 22-23 July 1999[9].

For the time being it is not possible to quantify the reduction of the geographical BSE risk for cattle from BSE negligible risk (closed) bovine herds. However, it is expected that this risk reduction is substantial. Therefore, sourcing from such closed bovine herds shall be considered in the risk assessment in conjunction with the GBR classification of the country.

3-3. *ANIMAL PARTS, BODY FLUIDS AND SECRETIONS AS STARTING MATERIALS*

In a TSE infected animal, different organs and secretions have different levels of infectivity[10]. The tables in the Annex of this chapter[11] summarise current data about the distribution of infectivity and PrP^{Sc} in cattle with BSE, and in sheep and goats with scrapie.

(6) http://www.oie.int
(7) The Scientific Steering Committee established by Commission Decision 97/404/EC shall assist the Commission to obtain the best scientific advice available on matters relating to consumer health. Since May 2003, its tasks have been taken over by the European Food Safety Agency (EFSA): http://www.efsa.eu.int
(8) http://europa.eu.int/comm/food/fs/sc/ssc/outcome_en.html
(9) SSC Scientific Opinion on the conditions related to "BSE Negligible Risk (Closed) Bovine Herds" adopted at the meeting of 22-23 July 1999. http://europa.eu.int/comm/food/fs/sc/ssc/out56_en.html
(10) If materials from "TSE-relevant animal species" have to be used, consideration should be given to use of materials of the lowest category of risk.
(11) The tissue classification tables are based upon the most recent *WHO guidelines on transmissible spongiform encephalopathies in relation to biological and pharmaceutical products* (February 2003) WHO/BCT/QSD/03.01.

The information in the tables is based exclusively upon observations of naturally occurring disease or primary experimental infection by the oral route (in cattle) but does not include data on models using strains of TSE that have been adapted to experimental animals, because passaged strain phenotypes can differ significantly and unpredictably from those of naturally occurring disease. Because immunohistochemical and/or Western blot detection of misfolded host protein (PrP^{Sc}) have proven to be a surrogate marker of infectivity, PrP^{Sc} testing results have been presented in parallel with bioassay data. Tissues are grouped into three major infectivity categories, irrespective of the stage of disease:

Category A	**High-infectivity tissues** central nervous system (CNS) tissues that attain a high titre of infectivity in the later stages of all TSEs, and certain tissues that are anatomically associated with the CNS
Category B	**Lower-infectivity tissues** peripheral tissues that have tested positive for infectivity and/or PrP^{Sc} in at least one form of TSE
Category C	**Tissues with no detectable infectivity** tissues that have been examined for infectivity, without any infectivity detected, and/or PrP^{Sc}, with negative results

Category A tissues and substances derived from them shall not be used in the manufacture of medicinal products, unless justified (see Section 5).

Although the category of lower risk tissues (category B tissues) almost certainly includes some (e.g. blood) with a lower risk than others (e.g. lymphoreticular tissues), the data about infectivity levels in these tissues are too limited to subdivide the category into different levels of risk. It is also evident that the placement of a given tissue in one or another category can be disease and species specific, and subject to revision as new data emerges.

For the risk assessment (see section 4), manufacturers and/or marketing authorisation holders/applicants shall take into account the tissue classification tables in the Annex to this chapter[12].

The categories in the tables are only indicative and it is important to note the following points.

- In certain situations there could be cross-contamination of tissues of different categories of infectivity. The potential risk will be influenced by the circumstances in which tissues were removed, especially by contact of tissues with lower-infectivity tissues or no detectable infectivity (categories B and C tissues) with high-infectivity tissues (category A tissues). Thus, cross-contamination of some tissues may be increased if infected animals are slaughtered by penetrative brain stunning or if the brain and/or spinal cord is sawed. The risk of cross-contamination will be decreased if body fluids are collected with minimal damage to tissue and cellular components are removed, and if foetal blood is collected without contamination from other maternal or foetal tissues including placenta, amniotic and allantoic fluids. For certain tissues, it is very difficult or impossible to prevent cross-contamination with category A tissues (e.g. skull). This has to be considered in the risk assessment.
- For certain classes of substances the stunning/slaughtering techniques used may be important in minimising the potential risk[13] because of the likelihood of disseminating the brain particles into the peripheral organs, particularly to the lungs. Stunning/slaughtering techniques should be described as well as the procedures to remove high infectivity tissues. The procedures to collect the animal tissues/organs to be used and the measures in place to avoid cross-contamination with a higher risk material must also be described in detail.
- The risk of contamination of tissues and organs with BSE-infectivity potentially harboured in central nervous material as a consequence of the stunning method used for cattle slaughtering depends on the following factors:
  - the amount of BSE-infectivity in the brain of the slaughtered animal,
  - the extent of brain damage,
  - the dissemination of brain particles in the animal body.

  These factors must be considered in conjunction with the GBR classification of the source animals, the age of the animals in the case of cattle and the post-mortem testing of the cattle using a validated method.

  The underlying principles indicated above would be equally applicable to sheep and goats.

The risk posed by cross-contamination will be dependent on several complementary factors including:

- measures adopted to avoid contamination during collection of tissues (see above),
- level of contamination (amount of the contaminating tissue),
- amount and type of materials collected at the same time.

Manufacturers or the marketing authorisation holders/applicants should take into account the risk with respect to cross-contamination.

3-4. *AGE OF ANIMALS*

As the TSE infectivity accumulates in bovine animals over an incubation period of several years, it is prudent to source from young animals.

3-5. *MANUFACTURING PROCESS*

The assessment of the overall TSE risk reduction of a medicinal product shall take into account the control measures instituted with respect to:

- sourcing of the raw/starting materials, and
- the manufacturing process.

Controlled sourcing is a very important criterion in achieving acceptable safety of the product, due to the documented resistance of TSE agents to most inactivation procedures.

A quality assurance system, such as ISO 9000 certification, HACCP[14] or GMP, must be put in place for monitoring the production process and for batch delineation (i.e. definition of batch, separation of batches, cleaning between batches). Procedures shall be put in place to ensure traceability as well as self-auditing and to auditing suppliers of raw/starting materials.

Certain production procedures may contribute considerably to the reduction of the risk of TSE contamination, e.g. procedures used in the manufacture of tallow derivatives (see section 6). As such rigorous processing cannot be applied to many products, processes involving physical removal, such as precipitation and filtration to remove prion-rich material, are likely to be more appropriate than chemical treatments. A description of the manufacturing process, including in-process controls applied, shall be presented and the steps that might contribute to reduction or elimination of TSE

(12) The introduction of the 3-category tissue classification system does not invalidate the risk-assessments based on the previously used 4-category tissue classification, performed for authorised medicinal products.
(13) SSC opinion on stunning methods and BSE risk (the risk of dissemination of brain particles into the blood and carcass when applying certain stunning methods), adopted at the meeting of 10-11 January 2002. http://europa.eu.int/comm/food/fs/sc/ssc/out245_en.pdf
(14) Hazard Analysis Critical Control Point.

contamination should be discussed. Whenever different manufacturing sites are involved, the steps performed at each site shall be clearly identified. The measures in place in order to ensure traceability of every production batch to the source material should be described.

Cleaning process. Cleaning of process equipment may be difficult to validate for the elimination of TSE agents. It is reported that after exposure to high titre preparations of TSE agent, detectable infectivity can remain bound to the surface of stainless steel. The removal of all adsorbed protein by the use of sodium hydroxide or chlorine releasing disinfectants (e.g. 20 000 ppm chlorine for 1 h) have been considered acceptable approaches where equipment that cannot be replaced has been exposed to potentially contaminated material. In the case of using category A materials in the manufacture of a product, dedicated equipment shall be used, unless otherwise justified.

If risk materials are used in the manufacture of a product, cleaning procedures, including control measures, shall be put in place in order to minimise the risk of cross-contamination between production batches. This is especially important if materials from different risk categories are handled in the same plant with the same equipment.

Removal/Inactivation validation. Validation studies of removal/inactivation procedures for TSEs are difficult to interpret. It is necessary to take into consideration the nature of the spiked material and its relevance to the natural situation, the design of the study (including scaling-down of processes) and the method of detection of the agent (*in vitro* or *in vivo* assay). Further research is needed to develop an understanding of the most appropriate "spike preparation" for validation studies. Therefore, validation studies are currently not generally required. However, if claims are made for the safety of the product with respect to TSEs based on the ability of manufacturing processes to remove or inactivate TSE agents, they must be substantiated by appropriate validation studies.

In addition to appropriate sourcing, manufacturers are encouraged to continue their investigations into removal and inactivation methods to identify steps/processes that would have benefit in assuring the removal or inactivation of TSE agents. In any event, a production process wherever possible shall be designed taking account of available information on methods which are thought to inactivate or remove TSE agents.

4. RISK ASSESSMENT OF MATERIALS OR SUBSTANCES USED IN THE MANUFACTURE AND PREPARATION OF A MEDICINAL PRODUCT IN THE CONTEXT OF REGULATORY COMPLIANCE

The assessment of the risk associated with TSE needs careful consideration of all of the parameters as outlined in section 3-1 (Scientific Principles for Minimising Risk).

As indicated in the introduction to this chapter, regulatory compliance is based on a favourable outcome from a risk assessment. The risk assessments, conducted by the manufacturers and/or the marketing authorisation holders or applicants for the different materials or substances from "TSE-relevant animal species" used in the manufacture of a medicinal product shall show that all TSE risk factors have been taken into account and, where possible, risk has been minimised by application of the principles described in this chapter. TSE Certificates of suitability issued by the EDQM may be used by the marketing authorisation holders or applicants as the basis of the risk assessments.

An overall risk assessment for the medicinal product, conducted by the marketing authorisation holders or applicants, shall take into account the risk assessments for all the different materials from "TSE-relevant animal species" and, where appropriate, TSE reduction or inactivation by the manufacturing steps of the active substance and/or finished product.

The final determination of regulatory compliance rests with the competent authority.

It is incumbent upon the manufacturers and/or the marketing authorisation holders or applicants for both human and veterinary medicinal products to select and justify the control measures for a given "TSE-relevant animal species" derivative, taking into account the state of the art of science and technology.

5. BENEFIT/RISK EVALUATION

In addition to the parameters as mentioned in sections 3 and 4, the acceptability of a particular medicinal product containing materials derived from a "TSE-relevant animal species", or which as a result of manufacture could contain these materials, shall take into account the following factors:

- route of administration of the medicinal product,
- quantity of animal material used in the medicinal product,
- maximum therapeutic dosage (daily dose and duration of treatment),
- intended use of the medicinal product and its clinical benefit.

High-infectivity tissues (category A tissues) and substances derived thereof shall not be used in manufacture of medicinal products, their starting materials and intermediate products (including active substances, excipients and reagents), unless justified. A justification why no other materials can be used shall be provided. In these exceptional and justified circumstances, the use of high-infectivity tissues could be envisaged for the manufacture of active substances, when, after performing the risk assessment as described in Section 4 of this chapter, and taking into account the intended clinical use, a positive benefit/risk assessment can be presented by the marketing authorisation applicant. Substances from category A materials, if their use is justified, must be produced from animals of GBR I countries.

6. SPECIFIC CONSIDERATIONS

The following materials prepared from "TSE-relevant animal species" are considered in compliance with this chapter provided that they meet at least the conditions specified below. The relevant information or a certificate of suitability granted by the EDQM shall be provided by the marketing authorisation applicant/holder.

6-1. *COLLAGEN*

Collagen is a fibrous protein component of mammalian connective tissue.

For collagen, documentation to demonstrate compliance with this chapter needs to be provided taking into account the provisions listed in sections 3 to 5. In addition, consideration should be given to the following.

- For collagen produced from bones, the conditions specified for gelatin are applicable (see below).
- Collagen produced from tissues such as hides and skins do not usually present a measurable TSE risk provided that contamination with potentially infected materials, for example spillage of blood and/or central nervous tissues, is avoided during their procurement.

6-2. *GELATIN*

Gelatin is a natural, soluble protein, gelling or non-gelling, obtained by the partial hydrolysis of collagen produced from bones, hides and skins, tendons and sinews of animals.

For gelatin, documentation to demonstrate compliance with this chapter needs to be provided taking into account the provisions listed in sections 3 to 5. In addition, consideration should be given to the following.

The source material used

Gelatin used in medicinal products can be manufactured from bones or hides.

Hides as the starting material. On the basis of current knowledge, hides used for gelatin production represent a much safer source material as compared to bones. However, it is highly recommended that measures should be put in place to avoid cross-contamination with potentially infected materials during procurement.

Bones as the starting material. Where bones are used to manufacture gelatin, more stringent production conditions shall be applied (see below). In any case, the removal of skulls and spinal cords from the starting material is considered as a first precautionary measure which largely affects the safety of the product. As far as practicable, bones should be sourced from countries classified as GBR I and II. Bones from category GBR III countries can be used if the gelatin is manufactured under defined conditions as indicated below and if vertebrae from cattle over 12 months of age are removed from the raw/starting materials[15].

Manufacturing methods

No specific measures with regard to the processing conditions are required for gelatin produced from hides provided that control measures are put in place to avoid cross-contamination both during the procurement of the hides and during the manufacturing process.

However, the mode of manufacture must be taken into account where bones are used as the starting material.

– Bones (including vertebrae) for the production of gelatin using acid treatment shall be sourced only from GBR category I or II countries. An additional alkaline treatment (pH 13, 1 h) of the bones/ossein may further increase the TSE safety of acid-derived bone gelatin.

  For bones sourced from a GBR category III country, the alkaline process shall be applied. However, this manufacturing method is optional for bones coming from GBR category I and II countries.

– For a typical alkaline manufacturing process, bones are finely crushed, degreased with hot water and demineralised with dilute hydrochloric acid (at a minimum of 4 per cent and pH < 1.5) over a period of at least 2 days to produce the ossein. This is followed by an alkaline treatment with saturated lime solution (pH at least 12.5) for a period of at least 20 days. The gelatin is extracted, washed, filtered and concentrated. A “flash” heat treatment (sterilisation) step using 138-140 °C for 4 s is applied. Bovine hide gelatin can also be produced by the alkaline process. Bovine bones may also be treated by an acid process. The liming step is then replaced by an acid pre-treatment where the ossein is soaked overnight at pH < 4.

6-3. *BOVINE BLOOD DERIVATIVES*

Foetal bovine serum is commonly used in cell cultures. Foetal bovine serum should be obtained from foetuses harvested in abattoirs from healthy dams fit for human consumption and the womb should be completely removed and the foetal blood harvested in dedicated space or area by cardiac puncture into a closed collection system using aseptic technique.

New born calf serum is obtained from calves under 20 days old and calf serum from animals under the age of 12 months. In the case of donor bovine serum, given that it may be derived from animals less than 36 months old, the TSE status of the donor herd shall be well defined and documented. In all cases, serum shall be collected according to specified protocols by personnel trained in these procedures to avoid cross-contamination with higher risk tissues.

For bovine blood derivatives, documentation to demonstrate compliance with this chapter needs to be provided taking into account the provisions listed in sections 3 to 5. In addition, consideration should be given to the following.

Traceability

Traceability to the slaughterhouse must be assured for each batch of serum or plasma. Slaughterhouses must have available lists of farms from which the animals are originated. If serum is produced from living animals, records must be available for each serum batch which assures the traceability to the farms.

Geographical origin

Whilst tissue infectivity of BSE in cattle is more restricted than scrapie, as a precautionary measure bovine blood must be sourced from countries classified GBR I and II, unless otherwise justified.

Stunning methods

If it is sampled from slaughtered animals, the method of slaughter is of importance to assure the safety of the material. It has been demonstrated that stunning by captive bolt stunner with or without pithing as well as by pneumatic stunner, especially if it injects air, can destroy the brain and disseminate brain material into the blood stream. Negligible risk can be expected from a non-penetrative stunner and from electro-narcosis[16]. The stunning methods must therefore be described for the bovine blood collection process.

If sourcing is allowed from countries where cases of BSE have been detected (GBR III) a non-penetrative stunner shall be used for slaughter.

6-4. *TALLOW DERIVATIVES*

Tallow is fat obtained from tissues including subcutaneous, abdominal and inter-muscular areas and bones. Tallow used as the starting material for the manufacture of tallow derivatives shall be category 3 material or equivalent, as defined in Regulation (EC) No 1774/2002[17] of the European Parliament and of the Council of 3 October 2002 laying down health rules concerning animal by-products not intended for human consumption.

Tallow derivatives, such as glycerol and fatty acids, manufactured from tallow by rigorous processes are thought unlikely to be infectious and they have been the subject of specific consideration by CPMP and CVMP. For this reason, such materials manufactured under the conditions at least as rigorous as those given below shall be considered in compliance for this chapter, irrespective of the geographical origin and the nature of the tissues from which tallow derivatives are derived. Examples of rigorous processes are:

– trans-esterification or hydrolysis at not less than 200 °C for not less than 20 min under pressure (glycerol, fatty acids and fatty acid esters production),

(15) Regulation (EC) No 1774/2002 of the European Parliament and of the Council laying down health rules concerning animal by-products not intended for human consumption shall apply unless justified. Regarding the manufacturing of gelatin and collagen or import of raw material for such manufacturing for use in pharmaceutical products, only material from animals fit for human consumption shall be used. The use of vertebrae from such animals from category II countries, which according to the risk assessment is safe, shall continue to be allowed.
(16) SSC Opinion on stunning methods and BSE risk (The risk of dissemination of brain particles into the blood and carcass when applying certain stunning methods) adopted at the meeting on 10-11 January 2002. http://europa.eu.int/comm/food/fs/sc/ssc/out245_en.pdf
(17) OJ L 273, 10.10.2002, p. 1

- saponification with 12 M NaOH (glycerol and soap production):
  - batch process: at not less than 95 °C for not less than 3 h,
  - continuous process: at not less than 140 °C, under pressure for not less than 8 min, or equivalent,
- distillation at 200 °C.

Tallow derivatives manufactured according to these conditions are unlikely to present any TSE risk and shall therefore be considered compliant with this chapter.

Tallow derivatives produced using other conditions must demonstrate compliance with this chapter.

6-5. *ANIMAL CHARCOAL*

Animal charcoal is prepared by carbonisation of animal tissues, such as bones, using high temperature at > 800 °C. Unless otherwise justified, the starting material for the manufacture of animal charcoal shall be category 3 material or equivalent, as defined in Regulation (EC) No 1774/2002 of the European Parliament and of the Council of 3 October 2002 laying down health rules concerning animal by-products not intended for human consumption. Irrespective of the geographical origin and the nature of the tissue, for the purpose of regulatory compliance, animal charcoal shall be considered in compliance with this chapter.

Charcoal manufactured according to these conditions is unlikely to present any TSE risk and shall therefore be considered compliant with this chapter. Charcoal produced using other conditions must demonstrate compliance with this chapter.

6-6. *MILK AND MILK DERIVATIVES*

In the light of the current scientific knowledge and irrespective of the geographical origin, milk is unlikely to present any risk of TSE contamination.

Certain materials, including lactose, are extracted from whey, the spent liquid from cheese production following coagulation. Coagulation can involve the use of calf rennet, an extract from abomasum, or rennet derived from other ruminants. The CPMP/CVMP have performed a risk assessment for lactose and other whey derivatives produced using calf rennet and concluded that the TSE risk is negligible if the calf rennet is produced in accordance with the process described in the risk assessment report[18]. The conclusion was endorsed by the SSC[19] which has also performed an assessment of the TSE risk of rennet in general[20].

Milk derivatives manufactured according to the conditions below are unlikely to present any TSE risk and shall therefore be considered compliant with this chapter.

- The milk is sourced from healthy animals in the same conditions as milk collected for human consumption, and
- no other ruminant materials, with the exception of calf rennet, are used in the preparation of such derivatives (e.g. pancreatic enzyme digests of casein).

Milk derivatives produced using other processes or rennet derived from other ruminant species must demonstrate compliance with this chapter.

6-7. *WOOL DERIVATIVES*

Derivatives of wool and hair of ruminants, such as lanolin and wool alcohols derived from hair shall be considered in compliance with this chapter, provided the wool and hair are sourced from live animals.

Wool derivatives produced from wool which is sourced from slaughtered animals declared “fit for human consumption” and the manufacturing process in relation to pH, temperature and duration of treatment meets at least one of the stipulated processing conditions listed below are unlikely to present any TSE risk and shall therefore be considered compliant with this chapter.

- Treatment at pH ≥ 13 (initial; corresponding to a NaOH concentration of at least 0.1 M NaOH) at ≥ 60 °C for at least 1 h. This occurs normally during the reflux stage of the organic-alkaline treatment.
- Molecular distillation at ≥ 220 °C under reduced pressure.

Wool derivatives produced using other conditions must demonstrate compliance with this chapter.

6-8. *AMINO ACIDS*

Amino acids can be obtained by hydrolysis of materials from various sources.

Unless otherwise justified, the starting material for the manufacture of amino acids shall be category 3 material or equivalent, as defined in Regulation (EC) No 1774/2002 of the European Parliament and of the Council of 3 October 2002 laying down health rules concerning animal by-products not intended for human consumption.

Amino acids prepared using the following processing conditions, in accordance with Commission Decision 98/256/EC[21] and Commission Decision 2001/376/EC[22], are unlikely to present any TSE risk and shall be considered compliant with this chapter:

- amino acids produced from hides and skins by a process which involves exposure of the material to a pH of 1 to 2, followed by a pH of > 11, followed by heat treatment at 140 °C for 30 min at 3 bar,
- the resulting amino acids or peptides must be filtered after production, and
- analysis is performed using a validated and sensitive method to control any residual intact macromolecules, with an appropriate limit set.

Amino acids prepared using other conditions must demonstrate compliance with this chapter.

(18) Committee for Proprietary Medicinal Products and its Biotechnology Working Party conducted a risk and regulatory assessment of lactose prepared using calf rennet. The risk assessment included the source of the animals, the excision of the abomasums and the availability of well-defined quality assurance procedures. The quality of any milk replacers used as feed for the animals from which abomasums are obtained is particularly important. The report can be found on http://www.emea.eu.int

(19) Provisional statement on the safety of calf-derived rennet for the manufacture of lactose. Adopted by the SSC at its meeting of 4-5 April 2002. (http://europa.eu.int/comm/food/fs/sc/ssc/out255_en.pdf)

(20) The SSC issued an opinion on the safety of animal rennet in regard to risks from animal TSE and BSE in particular, adopted at its meeting of 16 May 2002. (http://europa.eu.int/comm/food/fs/sc/ssc/out265_en.pdf)

Annex: major categories of infectivity

The tables below are adapted from the *WHO Guideline on Transmissible Spongiform Encephalopathies in Relation to Biological and Pharmaceutical Products* (February 2003).

Data entries are shown as follows:

\+ = presence of infectivity or PrP^{TSE}[(23)],

− = absence of detectable infectivity or PrP^{TSE},

NT = not tested,

? = controversial or uncertain results.

Category A: High-infectivity tissues

Tissues	Cattle BSE		Sheep and goats Scrapie	
	Infectivity[1]	PrP^{TSE}	Infectivity[1]	PrP^{TSE}
Brain	+	+	+	+
Spinal cord	+	+	+	+
Retina, Optic nerve	+	NT	NT	+
Spinal ganglia	+	NT	NT	+
Trigeminal ganglia	+	NT	NT	+
Pituitary gland[2]	−	NT	+	NT
Dura mater[2]	NT	NT	NT	NT

1. Infectivity bioassays of cattle tissues have been conducted in either cattle or mice (or both); and most bioassays of sheep and/or goat tissues have been conducted only in mice. In regard to sheep and goats not all results are consistent for both species.

2. No experimental data about infectivity in human pituitary gland or dura mater have been reported, but cadaveric dura mater patches, and growth hormone derived from cadaveric pituitaries have transmitted disease to scores of people and therefore must be included in the category of high-risk tissues.

Category B: Lower-infectivity tissues

Tissues	Cattle BSE		Sheep and goats Scrapie	
	Infectivity	PrP^{TSE}	Infectivity	PrP^{TSE}
Peripheral Nervous system				
Peripheral nerves	−	NT	+	NT
Enteric plexuses[1]	NT	+	NT	+
Lymphoreticular tissues				
Spleen	−	−	+	+
Lymph nodes	−	−	+	+
Tonsil	+	NT	+	+
Nictitating membrane	NT	−	NT	+
Thymus	−	NT	+	NT
Alimentary tract				
Esophagus	−	NT	NT	+
Fore-stomach[2] (ruminants only)	−	NT	NT	+
Stomach/ abomasum[2]	−	NT	NT	+
Duodenum	−	NT	NT	+
Jejunum	−	NT	NT	+
Ileum[3]	+	+	+	+
Large intestine	−	NT	+	+
Reproductive tissues				
Placenta	−	NT	+	+
Other tissues				
Lung*	−	NT	−	NT
Liver	−	NT	+	NT
Kidney*	−	−	−	−
Adrenal	NT	NT	+	NT
Pancreas	−	NT	+	NT
Bone marrow	+	NT	+	NT
Blood vessels	−	NT	NT	+
Olfactory mucosa	−	NT	+	NT
Gingival tissue*	NT	NT	NT	NT
Salivary gland	−	NT	+	NT
Cornea[4]*	NT	NT	NT	NT
Body fluids				
CSF	−	NT	+	NT
Blood[5]	−	NT	+	−

1. In cattle, limited to the distal ileum.

2. Ruminant forestomachs (reticulum, rumen, and omasum) are widely consumed, as is the true stomach (abomasum). The abomasum of cattle (and sometimes sheep) is also a source of rennet.

3. In cattle and sheep, only the distal ileum has been bioassayed for infectivity.

4. Because only one or two cases of CJD have been plausibly attributed to corneal transplants among hundreds of thousands of recipients, cornea is categorised as a lower-risk tissue; other anterior chamber tissues (lens, aqueous humor, iris, conjunctiva) have been tested with a negative result both in vCJD and other human TSEs, and there is no epidemiological evidence that they have been associated with iatrogenic disease transmission.

5. Early reports on the transmission of disease to rodents from the blood of patients with sCJD have not been confirmed, and evaluation of the ensemble of experimental and epidemiological data relevant to TSE transmission through blood, blood components, and therapeutic plasma products fails to suggest transmission from blood of patients with any form of "classical" TSE. Not enough data has accumulated to be able to make the same statement about blood from patients with vCJD. Foetal calf blood contains no detectable infectivity, but in genotypically susceptible sheep with natural scrapie or experimentally induced BSE, transfusion of large blood volumes has transmitted disease to healthy sheep. Infectivity has also been demonstrated in studies of rodent-adapted strains of TSE.

* These tissues have been classified under category B: Lower-infectivity tissues, because infectivity and/or PrP^{TSE} have been found in human CJD (vCJD or other).

(23) In the main body of this chapter the abnormal isoform of the prion protein is referred to as PrP^{Sc}. However, as these tables are transcribed directly from the WHO guideline mentioned above, the WHO nomenclature for the abnormal prion protein (PrP^{TSE}) has been maintained.

Category C: Tissues with no detected infectivity

Tissues	Cattle BSE		Sheep and goats Scrapie	
	Infectivity	PrP^{TSE}	Infectivity	PrP^{TSE}
Reproductive tissues

Urine[4,5]	–	NT	NT	NT
Faeces	–	NT	–	NT

1. Embryos from BSE-affected cattle have not transmitted disease to mice, but no infectivity measurements have been made on foetal calf tissues other than blood (negative mouse bioassay). Calves born of dams that received embryos from BSE-affected cattle have survived for observations periods of up to seven years, and examination of the brains of both the unaffected dams and their calves revealed no spongiform encephalopathy or PrP^{TSE}.

2. Intracerebral inoculation of muscle homogenates has not transmitted disease to 1) primates from humans with sCJD; 2) mice or cattle from cattle with BSE; and 3) mice from sheep and goats with natural or experimentally-induced scrapie. However, older reports described single instances of transmission from goat and hamster muscle, and a more recent report described transmission from the muscle of wild type and transgenic mice, but as each of these studies were conducted with passaged strains of TSE, their relevance to natural disease remains undetermined. A recent human case report described a patient with CJD and inclusion body myositis with abundant PrP^{TSE} in diseased muscle. After much deliberation, the committee nevertheless elected to retain muscle in the 'no detected infectivity' tissue category until more information about uncomplicated natural infections becomes available.

3. Evidence that infectivity is not present in milk includes temporo-spatial epidemiologic observations failing to detect maternal transmission; clinical observations of over a hundred calves nursed by infected cows that have not developed BSE; and experimental observations that milk from infected cows has not transmitted disease when administered intracerebrally or orally to mice. Experiments are in progress in which large volumes of milk from experimentally infected cows are concentrated and tested for the presence of PrP^{TSE}.

4. Single reports of transmission of CJD infectivity from human cord blood, colostrum, and urine have never been confirmed and are considered improbable.

5. A previously unreported PrP type, termed PrP^{u}, has been identified in the urine of sporadic and familial CJD patients, but its significance for transmission risk remains to be determined.

5.2.9. EVALUATION OF SAFETY OF EACH BATCH OF VETERINARY VACCINES AND IMMUNOSERA

The term "product" means either a vaccine or an immunoserum throughout the text.

Definition of abnormal reactions. During development studies, the type and degree of reactions expected after administration of the product are defined in the light of safety testing. This definition of normal or abnormal local and systemic reactions is then used as part of the operation procedure for the batch safety test to evaluate acceptable and unacceptable reactions.

Amount to be administered in the test. In the tests, "dose" means the quantity of the product to be recommended for use and containing the titre or potency within the limits specified for production batches. The amount to be administered in the test is usually defined in a number of doses. For freeze-dried vaccines, the 10 doses are reconstituted in a suitable volume for the test. For products consisting of a container of freeze-dried live component(s) and a container of inactivated component(s) to be used as a diluent, it may be necessary to use further liquid for the reconstitution of the freeze-dried component(s). The contents of 2 containers of inactivated component mixed with the contents of a maximum number of freeze-dried live containers are to be injected in one site and the other live freeze dried components reconstituted using a suitable solvent may be given at a separate site, if necessary and justified. For combined vaccines, safety tests carried out on the combined vaccine may be regarded as sufficient to demonstrate the safety of the individual components.

Route of administration. The product is administered by a recommended route. In principle, preference should be given to the application route with the higher possibility to detect reactions.

Where it is known, for example from development studies, that there is a particular risk, a 2nd administration is performed using a suitable dose and time interval as determined during development.

Target animal species and category of animals. Use animals of the minimum age recommended for vaccination or administration of the product and of the most sensitive species, unless otherwise justified and authorised.

Animal numbers. The number of animals to be used for the test is prescribed in the monographs. Generally 2 animals are used for a mammalian species and 10 for birds and fish.

Identification of animals. Unless otherwise justified, all animals are marked in a suitable way to ensure individual documentation of data for the whole observation period.

Observation period. Where objective criteria such as body temperature are to be recorded as described below, the animals are examined and observed for at least 3 days prior to administration of the product. After administration of the product, the animals are observed and examined at least once every day for a period of at least 14 days for signs of local and systemic reactions. On the day of administration of the product, at least one additional inspection is necessary after 4 h or at intervals as specified in the monograph. Where there is a 2nd administration of the product the period usually ends 14 days after the 2nd administration.

Local and systemic reactions. Animals showing severe abnormal local or systemic reactions are euthanised. All dead animals undergo a post-mortem with macroscopic examination. Additional microscopic and microbiological investigations may be indicated.

The animals are observed and examined for signs of local and systemic reactions. Where it is known to be a useful indicator, other criteria are recorded, such as body temperature, body mass, other performance measurements and food intake.

Local reactions. As far as appropriate and possible, the size and persistence of any local reaction (including incidence of painful reactions) and the proportion of animals showing local reactions are recorded.

Systemic reactions. Body temperature and if appropriate, body mass are documented as general indicators of systemic effects of administration of the product. In addition, all clinical signs are recorded.

Body temperature. For mammals, the studies include measurement of body temperature during the observation period. The body temperatures are recorded beginning at least 3 days before administration of the product, at the time of administration, 4 h after and at suitable intervals. The body temperature before administration of the product has to be within the physiological range. At least for products where a significant increase in body temperature may be expected (e.g. endotoxin containing products or several live viral vaccines) or is specified in an individual monograph (e.g. not more than 2 °C for porcine actinobacillosis vaccine) it is recommended to use the mean temperature of the days before administration of the product (e.g. day – 3 to day 0) as the base line temperature to have clear guidance for evaluation of the test.

Body mass and food intake. Where it is known to be a reliable and useful indicator of safety, for example in young growing animals or in fish, the body mass is measured and documented shortly before administration and during the observation period. The food intake is monitored and documented as an indicator of the effect of administering the product. In most cases, it will be sufficient to record the daily ration has been consumed or partly or wholly rejected but, in some cases it may be necessary to record the actual weight of food consumed, if this is a relevant indicator of the safety of the product.

Clinical signs. All expected and unexpected clinical signs of a general nature are recorded, including changes in health status and behaviour changes.

Score sheets. The score sheets are prepared for each product in the light of expected signs. All parameters and data are recorded in score sheets. The score sheets contain general parameters but are also adapted for each kind of product to list clinical signs which might be more evident for a given product.

Criteria for repeating the test. If an abnormal sign occurs, the responsible veterinarian determines, based on post-mortem examination if necessary, whether this was due to the product or not. If it is not clear what caused the abnormal sign or where an animal is withdrawn for reasons unrelated to the product, the test may be repeated. If in the 2nd test, there is the same abnormal sign as in the 1st test, the product does not comply with the test. Any treatment administered to an animal during the observation period is recorded. If the treatment may interfere with the test, the test is not valid.

5.3. STATISTICAL ANALYSIS OF RESULTS OF BIOLOGICAL ASSAYS AND TESTS

1. INTRODUCTION

This chapter provides guidance for the design of bioassays prescribed in the European Pharmacopoeia (Ph. Eur.) and for analysis of their results. It is intended for use by those whose primary training and responsibilities are not in statistics, but who have responsibility for analysis or interpretation of the results of these assays, often without the help and advice of a statistician. The methods of calculation described in this annex are not mandatory for the bioassays which themselves constitute a mandatory part of the Ph. Eur. Alternative methods can be used and may be accepted by the competent authorities, provided that they are supported by relevant data and justified during the assay validation process. A wide range of computer software is available and may be useful depending on the facilities available to, and the expertise of, the analyst.

Professional advice should be obtained in situations where: a comprehensive treatment of design and analysis suitable for research or development of new products is required; the restrictions imposed on the assay design by this chapter are not satisfied, for example particular laboratory constraints may require customized assay designs, or equal numbers of equally spaced doses may not be suitable; analysis is required for extended non-linear dose-response curves, for example as may be encountered in immunoassays. An outline of extended dose-response curve analysis for one widely used model is nevertheless included in Section 3.4 and a simple example is given in Section 5.4.

1.1. GENERAL DESIGN AND PRECISION

Biological methods are described for the assay of certain substances and preparations whose potency cannot be adequately assured by chemical or physical analysis. The principle applied wherever possible throughout these assays is that of comparison with a standard preparation so as to determine how much of the substance to be examined produces the same biological effect as a given quantity, the *Unit*, of the standard preparation. It is an essential condition of such methods of biological assay that the tests on the standard preparation and on the substance to be examined be carried out at the same time and under identical conditions.

For certain assays (determination of virus titre for example) the potency of the test sample is not expressed relative to a standard. This type of assay is dealt with in Section 4.5.

Any estimate of potency derived from a biological assay is subject to random error due to the inherent variability of biological responses and calculations of error should be made, if possible, from the results of each assay, even when the official method of assay is used. Methods for the design of assays and the calculation of their errors are, therefore, described below. In every case, before a statistical method is adopted, a preliminary test is to be carried out with an appropriate number of assays, in order to ascertain the applicability of this method.

The confidence interval for the potency gives an indication of the precision with which the potency has been estimated in the assay. It is calculated with due regard to the experimental design and the sample size. The 95 per cent confidence interval is usually chosen in biological assays. Mathematical statistical methods are used to calculate these limits so as to warrant the statement that there is a 95 per cent probability that these limits include the true potency. Whether this precision is acceptable to the European Pharmacopoeia depends on the requirements set in the monograph for the preparation concerned.

The terms “mean” and “standard deviation” are used here as defined in most current textbooks of biometry.

The terms “stated potency” or “labelled potency”, “assigned potency”, “assumed potency”, “potency ratio” and “estimated potency” are used in this section to indicate the following concepts:

- “stated potency” or “labelled potency”: in the case of a formulated product a nominal value assigned from knowledge of the potency of the bulk material; in the case of bulk material the potency estimated by the manufacturer;
- “assigned potency”: the potency of the standard preparation;
- “assumed potency”: the provisionally assigned potency of a preparation to be examined which forms the basis of calculating the doses that would be equipotent with the doses to be used of the standard preparation;
- “potency ratio” of an unknown preparation; the ratio of equipotent doses of the standard preparation and the unknown preparation under the conditions of the assay;
- “estimated potency”: the potency calculated from assay data.

Section 9 (Glossary of symbols) is a tabulation of the more important uses of symbols throughout this annex. Where the text refers to a symbol not shown in this section or uses a symbol to denote a different concept, this is defined in that part of the text.

2. RANDOMISATION AND INDEPENDENCE OF INDIVIDUAL TREATMENTS

The allocation of the different treatments to different experimental units (animals, tubes, etc.) should be made by some strictly random process. Any other choice of experimental conditions that is not deliberately allowed for in the experimental design should also be made randomly. Examples are the choice of positions for cages in a laboratory and the order in which treatments are administered. In particular, a group of animals receiving the same dose of any preparation should not be treated together (at the same time or in the same position) unless there is strong evidence that the relevant source of variation (for example, between times, or between positions) is negligible. Random allocations may be obtained from computers by using the built-in randomisation function. The analyst must check whether a different series of numbers is produced every time the function is started.

The preparations allocated to each experimental unit should be as independent as possible. Within each experimental group, the dilutions allocated to each treatment are not normally divisions of the same dose, but should be prepared individually. Without this precaution, the variability inherent in the preparation will not be fully represented in the experimental error variance. The result will be an under-estimation of the residual error leading to:

1) an unjustified increase in the stringency of the test for the analysis of variance (see Sections 3.2.3 and 3.2.4),

2) an under-estimation of the true confidence limits for the test, which, as shown in Section 3.2.5, are calculated from the estimate of s^2, the residual error mean square.

3. ASSAYS DEPENDING UPON QUANTITATIVE RESPONSES

3.1. STATISTICAL MODELS

3.1.1. GENERAL PRINCIPLES

The bioassays included in the Ph. Eur. have been conceived as "dilution assays", which means that the unknown preparation to be assayed is supposed to contain the same active principle as the standard preparation, but in a different ratio of active and inert components. In such a case the unknown preparation may in theory be derived from the standard preparation by dilution with inert components. To check whether any particular assay may be regarded as a dilution assay, it is necessary to compare the dose-response relationships of the standard and unknown preparations. If these dose-response relationships differ significantly, then the theoretical dilution assay model is not valid. Significant differences in the dose-response relationships for the standard and unknown preparations may suggest that one of the preparations contains, in addition to the active principle, other components which are not inert but which influence the measured responses.

To make the effect of dilution in the theoretical model apparent, it is useful to transform the dose-response relationship to a linear function on the widest possible range of doses. 2 statistical models are of interest as models for the bioassays prescribed: the parallel-line model and the slope-ratio model.

The application of either is dependent on the fulfilment of the following conditions:

1) the different treatments have been randomly assigned to the experimental units,

2) the responses to each treatment are normally distributed,

3) the standard deviations of the responses within each treatment group of both standard and unknown preparations do not differ significantly from one another.

When an assay is being developed for use, the analyst has to determine that the data collected from many assays meet these theoretical conditions.

- Condition 1 can be fulfilled by an efficient use of Section 2.
- Condition 2 is an assumption which in practice is almost always fulfilled. Minor deviations from this assumption will in general not introduce serious flaws in the analysis as long as several replicates per treatment are included. In case of doubt, a test for deviations from normality (e.g. the Shapiro-Wilk[1] test) may be performed.
- Condition 3 can be checked with a test for homogeneity of variances (e.g. Bartlett's[2] test, Cochran's[3] test). Inspection of graphical representations of the data can also be very instructive for this purpose (see examples in Section 5).

When conditions 2 and/or 3 are not met, a transformation of the responses may bring a better fulfilment of these conditions. Examples are ln y, $\sqrt{y}$, y^2.

- Logarithmic transformation of the responses y to ln y can be useful when the homogeneity of variances is not satisfactory. It can also improve the normality if the distribution is skewed to the right.
- The transformation of y to $\sqrt{y}$ is useful when the observations follow a Poisson distribution i.e. when they are obtained by counting.
- The square transformation of y to y^2 can be useful if, for example, the dose is more likely to be proportional to the area of an inhibition zone rather than the measured diameter of that zone.

For some assays depending on quantitative responses, such as immunoassays or cell-based *in vitro* assays, a large number of doses is used. These doses give responses that completely span the possible response range and produce an extended non-linear dose-response curve. Such curves are typical for all bioassays, but for many assays the use of a large number of doses is not ethical (for example, *in vivo* assays) or practical, and the aims of the assay may be achieved with a limited number of doses. It is therefore customary to restrict doses to that part of the dose-response range which is linear under suitable transformation, so that the methods of Sections 3.2 or 3.3 apply. However, in some cases analysis of extended dose-response curves may be desirable. An outline of one model which may be used for such analysis is given in Section 3.4 and a simple example is shown in Section 5.4.

There is another category of assays in which the response cannot be measured in each experimental unit, but in which only the fraction of units responding to each treatment can be counted. This category is dealt with in Section 4.

3.1.2. ROUTINE ASSAYS

When an assay is in routine use, it is seldom possible to check systematically for conditions 1 to 3, because the limited number of observations per assay is likely to influence the sensitivity of the statistical tests. Fortunately, statisticians have shown that, in symmetrical balanced assays, small deviations from homogeneity of variance and normality do not seriously affect the assay results. The applicability of the statistical model needs to be questioned only if a series of assays shows doubtful validity. It may then be necessary to perform a new series of preliminary investigations as discussed in Section 3.1.1.

2 other necessary conditions depend on the statistical model to be used:

- for the parallel-line model:

  4A) the relationship between the logarithm of the dose and the response can be represented by a straight line over the range of doses used,

  5A) for any unknown preparation in the assay the straight line is parallel to that for the standard.

- for the slope-ratio model:

  4B) the relationship between the dose and the response can be represented by a straight line for each preparation in the assay over the range of doses used,

  5B) for any unknown preparation in the assay the straight line intersects the y-axis (at zero dose) at the same point as the straight line of the standard preparation (i.e. the response functions of all preparations in the assay must have the same intercept as the response function of the standard).

(1) Wilk, M.B. and Shapiro, S.S. (1968). The joint assessment of normality of several independent samples, *Technometrics* 10, 825-839.
(2) Bartlett, M.S. (1937). Properties of sufficiency and statistical tests, *Proc. Roy. Soc. London*, Series A 160, 280-282.
(3) Cochran, W.G. (1951). Testing a linear relation among variances, *Biometrics* 7, 17-32.

Conditions 4A and 4B can be verified only in assays in which at least 3 dilutions of each preparation have been tested. The use of an assay with only 1 or 2 dilutions may be justified when experience has shown that linearity and parallelism or equal intercept are regularly fulfilled.

After having collected the results of an assay, and before calculating the relative potency of each test sample, an analysis of variance is performed, in order to check whether conditions 4A and 5A (or 4B and 5B) are fulfilled. For this, the total sum of squares is subdivided into a certain number of sum of squares corresponding to each condition which has to be fulfilled. The remaining sum of squares represents the residual experimental error to which the absence or existence of the relevant sources of variation can be compared by a series of *F*-ratios.

When validity is established, the potency of each unknown relative to the standard may be calculated and expressed as a potency ratio or converted to some unit relevant to the preparation under test e.g. an International Unit. Confidence limits may also be estimated from each set of assay data.

Assays based on the parallel-line model are discussed in Section 3.2 and those based on the slope-ratio model in Section 3.3.

If any of the 5 conditions (1, 2, 3, 4A, 5A or 1, 2, 3, 4B, 5B) are not fulfilled, the methods of calculation described here are invalid and an investigation of the assay technique should be made.

The analyst should not adopt another transformation unless it is shown that non-fulfilment of the requirements is not incidental but is due to a systematic change in the experimental conditions. In this case, testing as described in Section 3.1.1 should be repeated before a new transformation is adopted for the routine assays.

Excess numbers of invalid assays due to non-parallelism or non-linearity, in a routine assay carried out to compare similar materials, are likely to reflect assay designs with inadequate replication. This inadequacy commonly results from incomplete recognition of all sources of variability affecting the assay, which can result in underestimation of the residual error leading to large *F*-ratios.

It is not always feasible to take account of all possible sources of variation within one single assay (e.g. day-to-day variation). In such a case, the confidence intervals from repeated assays on the same sample may not satisfactorily overlap, and care should be exercised in the interpretation of the individual confidence intervals. In order to obtain a more reliable estimate of the confidence interval it may be necessary to perform several independent assays and to combine these into one single potency estimate and confidence interval (see Section 6).

For the purpose of quality control of routine assays it is recommended to keep record of the estimates of the slope of regression and of the estimate of the residual error in control charts.

– An exceptionally high residual error may indicate some technical problem. This should be investigated and, if it can be made evident that something went wrong during the assay procedure, the assay should be repeated. An unusually high residual error may also indicate the presence of an occasional outlying or aberrant observation. A response that is questionable because of failure to comply with the procedure during the course of an assay is rejected. If an aberrant value is discovered after the responses have been recorded, but can then be traced to assay irregularities, omission may be justified. The arbitrary rejection or retention of an apparently aberrant response can be a serious source of bias. In general, the rejection of observations solely because a test for outliers is significant, is discouraged.
– An exceptionally low residual error may once in a while occur and cause the *F*-ratios to exceed the critical values. In such a case it may be justified to replace the residual error estimated from the individual assay, by an average residual error based on historical data recorded in the control charts.

3.1.3. CALCULATIONS AND RESTRICTIONS

According to general principles of good design the following 3 restrictions are normally imposed on the assay design. They have advantages both for ease of computation and for precision.

a) Each preparation in the assay must be tested with the same number of dilutions.

b) In the parallel-line model, the ratio of adjacent doses must be constant for all treatments in the assay; in the slope-ratio model, the interval between adjacent doses must be constant for all treatments in the assay.

c) There must be an equal number of experimental units to each treatment.

If a design is used which meets these restrictions, the calculations are simple. The formulae are given in Sections 3.2 and 3.3. It is recommended to use software which has been developed for this special purpose. There are several programs in existence which can easily deal with all assay-designs described in the monographs. Not all programs may use the same formulae and algorithms, but they should all lead to the same results.

Assay designs not meeting the above mentioned restrictions may be both possible and correct, but the necessary formulae are too complicated to describe in this text. A brief description of methods for calculation is given in Section 7.1. These methods can also be used for the restricted designs, in which case they are equivalent with the simple formulae.

The formulae for the restricted designs given in this text may be used, for example, to create *ad hoc* programs in a spreadsheet. The examples in Section 5 can be used to clarify the statistics and to check whether such a program gives correct results.

3.2. THE PARALLEL-LINE MODEL

3.2.1. INTRODUCTION

The parallel-line model is illustrated in Figure 3.2.1.-I. The logarithm of the doses are represented on the horizontal axis with the lowest concentration on the left and the highest concentration on the right. The responses are indicated on the vertical axis. The individual responses to each treatment are indicated with black dots. The 2 lines are the calculated ln(dose)-response relationship for the standard and the unknown.

Note: the natural logarithm (ln or $\log_e$) is used throughout this text. Wherever the term “antilogarithm” is used, the quantity e^x is meant. However, the Briggs or “common” logarithm (log or $\log_{10}$) can equally well be used. In this case the corresponding antilogarithm is 10^x.

For a satisfactory assay the assumed potency of the test sample must be close to the true potency. On the basis of this assumed potency and the assigned potency of the standard, equipotent dilutions (if feasible) are prepared, i.e. corresponding doses of standard and unknown are expected to give the same response. If no information on the assumed potency is available, preliminary assays are carried out over a wide range of doses to determine the range where the curve is linear.

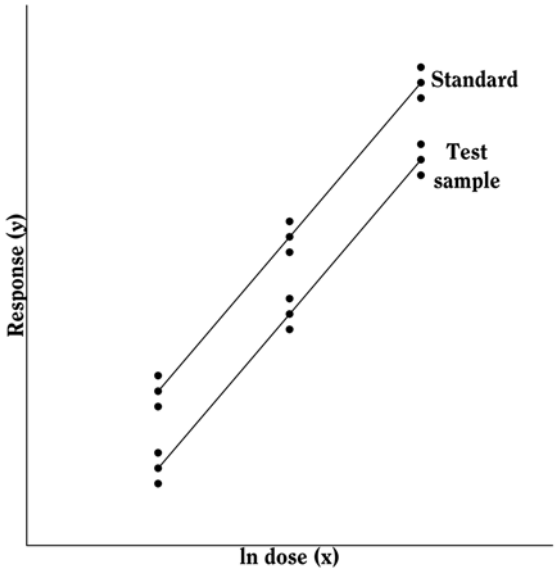

Figure 3.2.1.-I. – *The parallel-line model for a 3 + 3 assay*

The more nearly correct the assumed potency of the unknown, the closer the 2 lines will be together, for they should give equal responses at equal doses. The horizontal distance between the lines represents the "true" potency of the unknown, relative to its assumed potency. The greater the distance between the 2 lines, the poorer the assumed potency of the unknown. If the line of the unknown is situated to the right of the standard, the assumed potency was overestimated, and the calculations will indicate an estimated potency lower than the assumed potency. Similarly, if the line of the unknown is situated to the left of the standard, the assumed potency was underestimated, and the calculations will indicate an estimated potency higher than the assumed potency.

3.2.2. ASSAY DESIGN

The following considerations will be useful in optimising the precision of the assay design:

1) the ratio between the slope and the residual error should be as large as possible,

2) the range of doses should be as large as possible,

3) the lines should be as close together as possible, i.e. the assumed potency should be a good estimate of the true potency.

The allocation of experimental units (animals, tubes, etc.) to different treatments may be made in various ways.

3.2.2.1. Completely randomised design

If the totality of experimental units appears to be reasonably homogeneous with no indication that variability in response will be smaller within certain recognisable sub-groups, the allocation of the units to the different treatments should be made randomly.

If units in sub-groups such as physical positions or experimental days are likely to be more homogeneous than the totality of the units, the precision of the assay may be increased by introducing one or more restrictions into the design. A careful distribution of the units over these restrictions permits irrelevant sources of variation to be eliminated.

3.2.2.2. Randomised block design

In this design it is possible to segregate an identifiable source of variation, such as the sensitivity variation between litters of experimental animals or the variation between Petri dishes in a diffusion microbiological assay. The design requires that every treatment be applied an equal number of times in every block (litter or Petri dish) and is suitable only when the block is large enough to accommodate all treatments once. This is illustrated in Section 5.1.3. It is also possible to use a randomised design with repetitions. The treatments should be allocated randomly within each block. An algorithm to obtain random permutations is given in Section 8.5.

3.2.2.3. Latin square design

This design is appropriate when the response may be affected by two different sources of variation each of which can assume k different levels or positions. For example, in a plate assay of an antibiotic the treatments may be arranged in a $k \times k$ array on a large plate, each treatment occurring once in each row and each column. The design is suitable when the number of rows, the number of columns and the number of treatments are equal. Responses are recorded in a square format known as a Latin square. Variations due to differences in response among the k rows and among the k columns may be segregated, thus reducing the error. An example of a Latin square design is given in Section 5.1.2. An algorithm to obtain Latin squares is given in Section 8.6. More complex designs in which one or more treatments are replicated within the Latin square may be useful in some circumstances. The simplified formulae given in this Chapter are not appropriate for such designs, and professional advice should be obtained.

3.2.2.4. Cross-over design

This design is useful when the experiment can be sub-divided into blocks but it is possible to apply only 2 treatments to each block. For example, a block may be a single unit that can be tested on 2 occasions. The design is intended to increase precision by eliminating the effects of differences between units while balancing the effect of any difference between general levels of response at the 2 occasions. If 2 doses of a standard and of an unknown preparation are tested, this is known as a twin cross-over test.

The experiment is divided into 2 parts separated by a suitable time interval. Units are divided into 4 groups and each group receives 1 of the 4 treatments in the first part of the test. Units that received one preparation in the first part of the test receive the other preparation on the second occasion, and units receiving small doses in one part of the test receive large doses in the other. The arrangement of doses is shown in Table 3.2.2.-I. An example can be found in Section 5.1.5.

Table 3.2.2.-I. – *Arrangement of doses in cross-over design*

Group of units	Time I	Time II
1	S_1	T_2
2	S_2	T_1
3	T_1	S_2
4	T_2	S_1

3.2.3. ANALYSIS OF VARIANCE

This section gives formulae that are required to carry out the analysis of variance and will be more easily understood by reference to the worked examples in Section 5.1. Reference should also be made to the glossary of symbols (Section 9).

The formulae are appropriate for symmetrical assays where one or more preparations to be examined (*T*, *U*, etc.) are compared with a standard preparation (*S*). It is stressed that the formulae can only be used if the doses are equally spaced, if equal numbers of treatments per preparation are applied, and each treatment is applied an equal number of times. It should not be attempted to use the formulae in any other situation.

Apart from some adjustments to the error term, the basic analysis of data derived from an assay is the same for completely randomised, randomised block and Latin square designs. The formulae for cross-over tests do not entirely fit this scheme and these are incorporated into Example 5.1.5.

Having considered the points discussed in Section 3.1 and transformed the responses, if necessary, the values should be averaged over each treatment and each preparation, as shown in Table 3.2.3.-I. The linear contrasts, which relate to the slopes of the ln(dose)-response lines, should also be formed. 3 additional formulae, which are necessary for the construction of the analysis of variance, are shown in Table 3.2.3.-II.

The total variation in response caused by the different treatments is now partitioned as shown in Table 3.2.3.-III the sums of squares being derived from the values obtained in Tables 3.2.3.-I and 3.2.3.-II. The sum of squares due to non-linearity can only be calculated if at least 3 doses per preparation are included in the assay.

The residual error of the assay is obtained by subtracting the variations allowed for in the design from the total variation in response (Table 3.2.3.-IV). In this table $\overline{y}$ represents the mean

Table 3.2.3.-I. – *Formulae for parallel-line assays with d doses of each preparation*

	Standard (*S*)	**1st Test sample (*T*)**	**2nd Test sample (*U*, etc.)**
Mean response lowest dose	S_1	T_1	U_1
Mean response 2nd dose	S_2	T_2	U_2
...	...	...	...
Mean response highest dose	S_d	T_d	U_d
Total preparation	$P_S = S_1 + S_2 + ... + S_d$	$P_T = T_1 + T_2 + ... + T_d$	$P_U = ...\text{etc.}$
Linear contrast	$L_S = 1S_1 + 2S_2 + ... + dS_d - \frac{1}{2}(d+1)P_S$	$L_T = 1T_1 + 2T_2 + ... + dT_d - \frac{1}{2}(d+1)P_T$	$L_U = ...\text{etc.}$

Table 3.2.3.-II. – *Additional formulae for the construction of the analysis of variance*

$H_P = \frac{n}{d}$	$H_L = \frac{12n}{d^3 - d}$	$K = \frac{n(P_S + P_T + ...)^2}{hd}$

Table 3.2.3.-III. – *Formulae to calculate the sum of squares and degrees of freedom*

Source of variation	**Degrees of freedom (*f*)**	**Sum of squares**
Preparations	$h - 1$	$SS_{\text{prep}} = H_P(P_S^2 + P_T^2 + ...) - K$
Linear regression	1	$SS_{\text{reg}} = \frac{1}{h}H_L(L_S + L_T + ...)^2$
Non-parallelism	$h - 1$	$SS_{\text{par}} = H_L(L_S^2 + L_T^2 + ...) - SS_{\text{reg}}$
Non-linearity(*)	$h(d-2)$	$SS_{\text{lin}} = SS_{\text{treat}} - SS_{\text{prep}} - SS_{\text{reg}} - SS_{\text{par}}$
Treatments	$hd - 1$	$SS_{\text{treat}} = n(S_1^2 + ... + S_d^2 + T_1^2 + ... + T_d^2 + ...) - K$

(*) Not calculated for two-dose assays

Table 3.2.3.-IV. – *Estimation of the residual error*

Source of variation		**Degrees of freedom**	**Sum of squares**
Blocks (rows)(*)		$n - 1$	$SS_{\text{block}} = hd(R_1^2 + ... + R_n^2) - K$
Columns(**)		$n - 1$	$SS_{\text{col}} = hd(C_1^2 + ... + C_n^2) - K$
Residual error(***)	**Completely randomised**	$hd(n-1)$	$SS_{\text{res}} = SS_{\text{tot}} - SS_{\text{treat}}$
	Randomised block	$(hd-1)(n-1)$	$SS_{\text{res}} = SS_{\text{tot}} - SS_{\text{treat}} - SS_{\text{block}}$
	Latin square	$(hd-2)(n-1)$	$SS_{\text{res}} = SS_{\text{tot}} - SS_{\text{treat}} - SS_{\text{block}} - SS_{\text{col}}$
Total		$nhd - 1$	$SS_{\text{tot}} = \sum(y - \overline{y})^2$

For Latin square designs, these formulae are only applicable if $n = hd$

(*) Not calculated for completely randomised designs

(**) Only calculated for Latin square designs

(***) Depends on the type of design

of all responses recorded in the assay. It should be noted that for a Latin square the number of replicate responses (n) is equal to the number of rows, columns or treatments (dh).

The analysis of variance is now completed as follows. Each sum of squares is divided by the corresponding number of degrees of freedom to give mean squares. The mean square for each variable to be tested is now expressed as a ratio to the residual error (s^2) and the significance of these values (known as F-ratios) are assessed by use of Table 8.1 or a suitable sub-routine of a computer program.

3.2.4. TESTS OF VALIDITY

Assay results are said to be "statistically valid" if the outcome of the analysis of variance is as follows.

1) The linear regression term is significant, i.e. the calculated probability is less than 0.05. If this criterion is not met, it is not possible to calculate 95 per cent confidence limits.

2) The term for non-parallelism is not significant, i.e. the calculated probability is not less than 0.05. This indicates that condition 5A, Section 3.1, is satisfied;

3) The term for non-linearity is not significant, i.e. the calculated probability is not less than 0.05. This indicates that condition 4A, Section 3.1, is satisfied.

A significant deviation from parallelism in a multiple assay may be due to the inclusion in the assay-design of a preparation to be examined that gives an ln(dose)-response line with a slope different from those for the other preparations. Instead of declaring the whole assay invalid, it may then be decided to eliminate all data relating to that preparation and to restart the analysis from the beginning.

When statistical validity is established, potencies and confidence limits may be estimated by the methods described in the next section.

3.2.5. ESTIMATION OF POTENCY AND CONFIDENCE LIMITS

If I is the ln of the ratio between adjacent doses of any preparation, the common slope (b) for assays with d doses of each preparation is obtained from:

$$b = \frac{H_L\,(L_S + L_T + \ldots)}{Inh} \qquad (3.2.5.\text{-}1)$$

and the logarithm of the potency ratio of a test preparation, for example T, is:

$$M'_T = \frac{P_T - P_S}{db} \qquad (3.2.5.\text{-}2)$$

The calculated potency is an estimate of the "true potency" of each unknown. Confidence limits may be calculated as the antilogarithms of:

$$CM'_T \pm \sqrt{(C-1)\,(CM'^2_T + 2V)} \qquad (3.2.5.\text{-}3)$$

$$\text{where } C = \frac{SS_{\text{reg}}}{SS_{\text{reg}} - s^2t^2} \text{ and } V = \frac{SS_{\text{reg}}}{b^2dn}$$

The value of t may be obtained from Table 8.2 for p = 0.05 and degrees of freedom equal to the number of the degrees of freedom of the residual error. The estimated potency (R_T) and associated confidence limits are obtained by multiplying the values obtained by A_T after antilogarithms have been taken. If the stock solutions are not exactly equipotent on the basis of assigned and assumed potencies, a correction factor is necessary (See Examples 5.1.2 and 5.1.3).

3.2.6. MISSING VALUES

In a balanced assay, an accident totally unconnected with the applied treatments may lead to the loss of one or more responses, for example because an animal dies. If it is considered that the accident is in no way connected with the composition of the preparation administered, the exact calculations can still be performed but the formulae are necessarily more complicated and can only be given within the framework of general linear models (see Section 7.1). However, there exists an approximate method which keeps the simplicity of the balanced design by replacing the missing response by a calculated value. The loss of information is taken into account by diminishing the degrees of freedom for the total sum of squares and for the residual error by the number of missing values and using one of the formulae below for the missing values. It should be borne in mind that this is only an approximate method, and that the exact method is to be preferred.

If more than one observation is missing, the same formulae can be used. The procedure is to make a rough guess at all the missing values except one, and to use the proper formula for this one, using all the remaining values including the rough guesses. Fill in the calculated value. Continue by similarly calculating a value for the first rough guess. After calculating all the missing values in this way the whole cycle is repeated from the beginning, each calculation using the most recent guessed or calculated value for every response to which the formula is being applied. This continues until 2 consecutive cycles give the same values; convergence is usually rapid.

Provided that the number of values replaced is small relative to the total number of observations in the full experiment (say less than 5 per cent), the approximation implied in this replacement and reduction of degrees of freedom by the number of missing values so replaced is usually fairly satisfactory. The analysis should be interpreted with great care however, especially if there is a preponderance of missing values in one treatment or block, and a biometrician should be consulted if any unusual features are encountered. Replacing missing values in a test without replication is a particularly delicate operation.

Completely randomised design

In a completely randomised assay the missing value can be replaced by the arithmetic mean of the other responses to the same treatment.

Randomised block design

The missing value is obtained using the equation:

$$y' = \frac{nB' + kT' - G'}{(n-1)\,(k-1)} \qquad (3.2.6.\text{-}1)$$

where B' is the sum of the responses in the block containing the missing value, T' the corresponding treatment total and G' is the sum of all responses recorded in the assay.

Latin square design

The missing value y' is obtained from:

$$y' = \frac{k\,(B' + C' + T') - 2G'}{(k-1)\,(k-2)} \qquad (3.2.6.\text{-}2)$$

where B' and C' are the sums of the responses in the row and column containing the missing value. In this case $k = n$.

Cross-over design

If an accident leading to loss of values occurs in a cross-over design, a book on statistics should be consulted (e.g. D.J. Finney, see Section 10), because the appropriate formulae depend upon the particular treatment combinations.

3.3. THE SLOPE-RATIO MODEL

3.3.1. INTRODUCTION

This model is suitable, for example, for some microbiological assays when the independent variable is the concentration of an essential growth factor below the optimal concentration of the medium. The slope-ratio model is illustrated in Figure 3.3.1.-I.

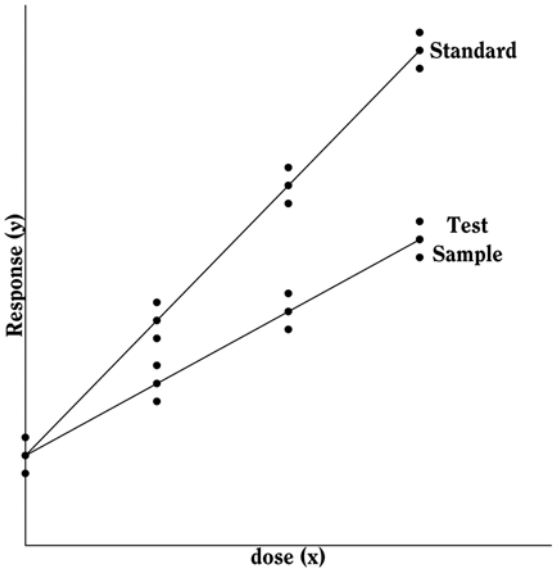

Figure 3.3.1.-I. – *The slope-ratio model for a 2 × 3 + 1 assay*

The doses are represented on the horizontal axis with zero concentration on the left and the highest concentration on the right. The responses are indicated on the vertical axis. The individual responses to each treatment are indicated with black dots. The 2 lines are the calculated dose-response relationship for the standard and the unknown under the assumption that they intersect each other at zero-dose. Unlike the parallel-line model, the doses are not transformed to logarithms.

Just as in the case of an assay based on the parallel-line model, it is important that the assumed potency is close to the true potency, and to prepare equipotent dilutions of the test preparations and the standard (if feasible). The more nearly correct the assumed potency, the closer the 2 lines will be together. The ratio of the slopes represents the "true" potency of the unknown, relative to its assumed potency. If the slope of the unknown preparation is steeper than that of the standard, the potency was underestimated and the calculations will indicate an estimated potency higher than the assumed potency. Similarly, if the slope of the unknown is less steep than that of the standard, the potency was overestimated and the calculations will result in an estimated potency lower than the assumed potency.

In setting up an experiment, all responses should be examined for the fulfilment of the conditions 1, 2 and 3 in Section 3.1. The analysis of variance to be performed in routine is described in Section 3.3.3 so that compliance with conditions 4B and 5B of Section 3.1 may be examined.

3.3.2. ASSAY DESIGN

The use of the statistical analysis presented below imposes the following restrictions on the assay:

a) the standard and the test preparations must be tested with the same number of equally spaced dilutions,

b) an extra group of experimental units receiving no treatment may be tested (the blanks),

c) there must be an equal number of experimental units to each treatment.

As already remarked in Section 3.1.3, assay designs not meeting these restrictions may be both possible and correct, but the simple statistical analyses presented here are no longer applicable and either expert advice should be sought or suitable software should be used.

A design with 2 doses per preparation and 1 blank, the "common zero ($2h$ + 1)-design", is usually preferred, since it gives the highest precision combined with the possibility to check validity within the constraints mentioned above. However, a linear relationship cannot always be assumed to be valid down to zero-dose. With a slight loss of precision a design without blanks may be adopted. In this case 3 doses per preparation, the "common zero ($3h$)-design", are preferred to 2 doses per preparation. The doses are thus given as follows:

1) the standard is given in a high dose, near to but not exceeding the highest dose giving a mean response on the straight portion of the dose-response line,

2) the other doses are uniformly spaced between the highest dose and zero dose,

3) the test preparations are given in corresponding doses based on the assumed potency of the material.

A completely randomised, a randomised block or a Latin square design may be used, such as described in Section 3.2.2. The use of any of these designs necessitates an adjustment to the error sum of squares as described for assays based on the parallel-line model. The analysis of an assay of one or more test preparations against a standard is described below.

3.3.3. ANALYSIS OF VARIANCE

3.3.3.1. The (*hd* + 1)-design

The responses are verified as described in Section 3.1 and, if necessary, transformed. The responses are then averaged over each treatment and each preparation as shown in Table 3.3.3.1.-I. Additionally, the mean response for blanks (B) is calculated.

The sums of squares in the analysis of variance are calculated as shown in Tables 3.3.3.1.-I to 3.3.3.1.-III. The sum of squares due to non-linearity can only be calculated if at least 3 doses of each preparation have been included in the assay. The residual error is obtained by subtracting the variations allowed for in the design from the total variation in response (Table 3.3.3.1.-IV).

The analysis of variance is now completed as follows. Each sum of squares is divided by the corresponding number of degrees of freedom to give mean squares. The mean square for each variable to be tested is now expressed as a ratio to the residual error (s^2) and the significance of these values (known as F-ratios) are assessed by use of Table 8.1 or a suitable sub-routine of a computer program.

3.3.3.2. The (*hd*)-design

The formulae are basically the same as those for the (hd + 1)-design, but there are some slight differences.

- B is discarded from all formulae.
- $K = \dfrac{n\,(P_S + P_T + \ldots)^2}{hd}$
- SS_{blank} is removed from the analysis of variance.
- The number of degrees of freedom for treatments becomes $hd - 1$.
- The number of degrees of freedom of the residual error and the total variance is calculated as described for the parallel-line model (see Table 3.2.3.-IV).

Validity of the assay, potency and confidence interval are found as described in Sections 3.3.4 and 3.3.5.

Table 3.3.3.1.-I. – *Formulae for slope-ratio assays with d doses of each preparation and a blank*

	Standard (*S*)	**1st Test sample (*T*)**	**2nd Test sample (*U*, etc.)**
Mean response lowest dose	S_1	T_1	U_1
Mean response 2nd dose	S_2	T_2	U_2
...	...	...	...
Mean response highest dose	S_d	T_d	U_d
Total preparation	$P_S = S_1 + S_2 + ... + S_d$	$P_T = T_1 + T_2 + ... + T_d$	$P_U = ...$
Linear product	$L_S = 1S_1 + 2S_2 + ... + dS_d$	$L_T = 1T_1 + 2T_2 + ... + dT_d$	$L_U = ...$
Intercept value	$a_S = (4d+2)P_S - 6L_S$	$a_T = (4d+2)P_T - 6L_T$	$a_U = ...$
Slope value	$b_S = 2L_S - (d+1)P_S$	$b_T = 2L_T - (d+1)P_T$	$b_U = ...$
Treatment value	$G_S = S_1^2 + ... + S_d^2$	$G_T = T_1^2 + ... + T_d^2$	$G_U = ...$
Non-linearity(*)	$J_S = G_S - \frac{P_S^2}{d} - \frac{3b_S^2}{d^3 - d}$	$J_T = G_T - \frac{P_T^2}{d} - \frac{3b_T^2}{d^3 - d}$	$J_U = ...$

(*) Not calculated for two-dose assays

Table 3.3.3.1.-II. – *Additional formulae for the construction of the analysis of variance*

$H_B = \frac{nhd^2 - nhd}{hd^2 - hd + 4d + 2}$	$H_I = \frac{n}{4d^3 - 2d^2 - 2d}$	$a = \frac{a_S + a_T + ...}{h(d^2 - d)}$	$K = \frac{n(B + P_S + P_T + ...)^2}{hd + 1}$

Table 3.3.3.1.-III. – *Formulae to calculate the sum of squares and degrees of freedom*

Source of variation	**Degrees of freedom (*f*)**	**Sum of squares**
Regression	h	$SS_{\text{reg}} = SS_{\text{treat}} - SS_{\text{blank}} - SS_{\text{int}} - SS_{\text{lin}}$
Blanks	1	$SS_{\text{blank}} = H_B(B - a)^2$
Intersection	$h - 1$	$SS_{\text{int}} = H_I\left((a_S^2 + a_T^2 + ...) - h(d^2 - d)^2 a^2\right)$
Non-linearity(*)	$h(d - 2)$	$SS_{\text{lin}} = n(J_S + J_T + ...)$
Treatments	hd	$SS_{\text{treat}} = n(B^2 + G_S + G_T + ...) - K$

(*) Not calculated for two-dose assays

3.3.4. TESTS OF VALIDITY

Assay results are said to be "statistically valid" if the outcome of the analysis of variance is as follows:

1) the variation due to blanks in (*hd* + 1)-designs is not significant, i.e. the calculated probability is not smaller than 0.05. This indicates that the responses of the blanks do not significantly differ from the common intercept and the linear relationship is valid down to zero dose;

2) the variation due to intersection is not significant, i.e. the calculated probability is not less than 0.05. This indicates that condition 5B, Section 3.1 is satisfied;

3) in assays including at least 3 doses per preparation, the variation due to non-linearity is not significant, i.e. the calculated probability is not less than 0.05. This indicates that condition 4B, Section 3.1 is satisfied.

A significant variation due to blanks indicates that the hypothesis of linearity is not valid near zero dose. If this is likely to be systematic rather than incidental for the type of assay, the (*hd*-design) is more appropriate. Any response to blanks should then be disregarded.

When these tests indicate that the assay is valid, the potency is calculated with its confidence limits as described in Section 3.3.5.

3.3.5. ESTIMATION OF POTENCY AND CONFIDENCE LIMITS

3.3.5.1. The (*hd* + 1)-design

The common intersection a' of the preparations can be calculated from:

$$a' = \frac{(2d+1)B + (2d-3)ha}{h(2d-3) + 2d + 1} \qquad (3.3.5.1.\text{-}1)$$

The slope of the standard, and similarly for each of the other preparations, is calculated from:

$$b'_S = \frac{6L_S - 3d(d+1)a'}{2d^3 + 3d^2 + d} \qquad (3.3.5.1.\text{-}2)$$

The potency ratio of each of the test preparations can now be calculated from:

$$R'_T = \frac{b'_T}{b'_S} \qquad (3.3.5.1.\text{-}3)$$

which has to be multiplied by A_T, the assumed potency of the test preparation, in order to find the estimated potency R_T. If the step between adjacent doses was not identical

Table 3.3.3.1.-IV. – *Estimation of the residual error*

Source of variation		Degrees of freedom	Sum of squares
Blocks (rows)(*)		$n-1$	$SS_{block} = hd\,(R_1^2 + ... + R_n^2) - K$
Columns(**)		$n-1$	$SS_{col} = hd\,(C_1^2 + ... + C_n^2) - K$
Residual error(***)	**Completely randomised**	$(hd+1)\,(n-1)$	$SS_{res} = SS_{tot} - SS_{treat}$
	Randomised block	$hd\,(n-1)$	$SS_{res} = SS_{tot} - SS_{treat} - SS_{block}$
	Latin square	$(hd-1)\,(n-1)$	$SS_{res} = SS_{tot} - SS_{treat} - SS_{block} - SS_{col}$
Total		$nhd + n - 1$	$SS_{tot} = \sum (y - \overline{y})^2$

For Latin square designs, these formulae are only applicable if $n = hd$

(*) Not calculated for completely randomised designs

(**) Only calculated for Latin square designs

(***) Depends on the type of design

for the standard and the test preparation, the potency has to be multiplied by I_S/I_T. Note that, unlike the parallel-line analysis, no antilogarithms are calculated.

The confidence interval for R_T' is calculated from:

$$CR_T' - K' \pm \sqrt{(C-1)\,(CR_T'^2 + 1) + K'\,(K' - 2CR_T')} \qquad (3.3.5.1.\text{-}4)$$

$$\text{where } C = \frac{b_S'^2}{b_S'^2 - s^2 t^2 V_1} \text{ and } K' = (C-1)\,V_2$$

V_1 are V_2 are related to the variance and covariance of the numerator and denominator of R_T. They can be obtained from:

$$V_1 = \frac{6}{n\,(2d+1)}\left(\frac{1}{d\,(d+1)} + \frac{3}{2\,(2d+1) + hd\,(d-1)}\right) \qquad (3.3.5.1.\text{-}5)$$

$$V_2 = \frac{3d\,(d+1)}{(3d+1)\,(d+2) + hd\,(d-1)} \qquad (3.3.5.1.\text{-}6)$$

The confidence limits are multiplied by A_T, and if necessary by I_S/I_T.

3.3.5.2. The (*hd*)-design

The formulae are the same as for the (*hd* + 1)-design, with the following modifications:

$$a' = a \qquad (3.3.5.2.\text{-}1)$$

$$V_1 = \frac{6}{nd\,(2d+1)}\left(\frac{1}{d+1} + \frac{3}{h\,(d-1)}\right) \qquad (3.3.5.2.\text{-}2)$$

$$V_2 = \frac{3\,(d+1)}{3\,(d+1) + h\,(d-1)} \qquad (3.3.5.2.\text{-}3)$$

3.4. EXTENDED SIGMOID DOSE-RESPONSE CURVES

This model is suitable, for example, for some immunoassays when analysis is required of extended sigmoid dose-response curves. This model is illustrated in Figure 3.4.-I.

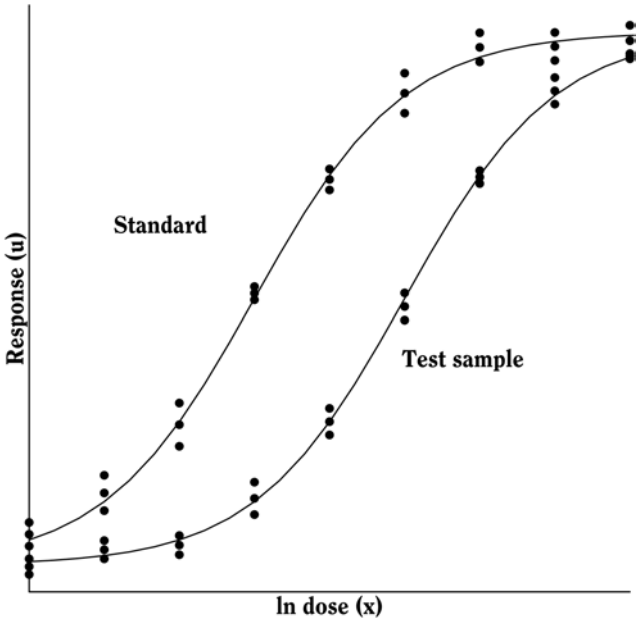

Figure 3.4.-I. – *The four-parameter logistic curve model*

The logarithms of the doses are represented on the horizontal axis with the lowest concentration on the left and the highest concentration on the right. The responses are indicated on the vertical axis. The individual responses to each treatment are indicated with black dots. The 2 curves are the calculated ln(dose)-response relationship for the standard and the test preparation.

The general shape of the curves can usually be described by a logistic function but other shapes are also possible. Each curve can be characterised by 4 parameters: The upper asymptote (α), the lower asymptote (δ), the slope-factor (β), and the horizontal location (γ). This model is therefore often referred to as a four-parameter model. A mathematical representation of the ln(dose)-response curve is:

$$u = \delta + \frac{\alpha - \delta}{1 + e^{-\beta(x-\gamma)}}$$

For a valid assay it is necessary that the curves of the standard and the test preparations have the same slope-factor, and the same maximum and minimum response level at the extreme parts. Only the horizontal location (γ) of the curves may be different. The horizontal distance between the curves is related to the "true" potency of the unknown. If the assay is used routinely, it may be sufficient to test the condition of equal upper and lower response levels when the assay is

developed, and then to retest this condition directly only at suitable intervals or when there are changes in materials or assay conditions.

The maximum-likelihood estimates of the parameters and their confidence intervals can be obtained with suitable computer programs. These computer programs may include some statistical tests reflecting validity. For example, if the maximum likelihood estimation shows significant deviations from the fitted model under the assumed conditions of equal upper and lower asymptotes and slopes, then one or all of these conditions may not be satisfied.

The logistic model raises a number of statistical problems which may require different solutions for different types of assays, and no simple summary is possible. A wide variety of possible approaches is described in the relevant literature. Professional advice is therefore recommended for this type of analysis. A simple example is nevertheless included in Section 5.4 to illustrate a "possible" way to analyse the data presented. A short discussion of alternative approaches and other statistical considerations is given in Section 7.5.

If professional advice or suitable software is not available, alternative approaches are possible: 1) if "reasonable" estimates of the upper limit (α) and lower limit (δ) are available, select for all preparations the doses with mean of the responses (u) falling between approximately 20 per cent and 80 per cent of the limits, transform responses of the selected doses to $y = \ln\left(\frac{u-\delta}{\alpha-u}\right)$ and use the parallel line model (Section 3.2) for the analysis; 2) select a range of doses for which the responses (u) or suitably transformed responses, for example ln(u), are approximately linear when plotted against ln(dose); the parallel line model (Section 3.2) may then be used for analysis.

4. ASSAYS DEPENDING UPON QUANTAL RESPONSES

4.1. INTRODUCTION

In certain assays it is impossible or excessively laborious to measure the effect on each experimental unit on a quantitative scale. Instead, an effect such as death or hypoglycaemic symptoms may be observed as either occurring or not occurring in each unit, and the result depends on the number of units in which it occurs. Such assays are called quantal or all-or-none.

The situation is very similar to that described for quantitative assays in Section 3.1, but in place of n separate responses to each treatment a single value is recorded, i.e. the fraction of units in each treatment group showing a response. When these fractions are plotted against the logarithms of the doses the resulting curve will tend to be sigmoid (S-shaped) rather than linear. A mathematical function that represents this sigmoid curvature is used to estimate the dose-response curve. The most commonly used function is the cumulative normal distribution function. This function has some theoretical merit, and is perhaps the best choice if the response is a reflection of the tolerance of the units. If the response is more likely to depend upon a process of growth, the logistic distribution model is preferred, although the difference in outcome between the 2 models is usually very small.

The maximum likelihood estimators of the slope and location of the curves can be found only by applying an iterative procedure. There are many procedures which lead to the same outcome, but they differ in efficiency due to the speed of convergence. One of the most rapid methods is direct optimisation of the maximum-likelihood function (see Section 7.1), which can easily be performed with computer programs having a built-in procedure for this purpose. Unfortunately, most of these procedures do not yield an estimate of the confidence interval, and the technique to obtain it is too complicated to describe here. The technique described below is not the most rapid, but has been chosen for its simplicity compared to the alternatives. It can be used for assays in which one or more test preparations are compared to a standard. Furthermore, the following conditions must be fulfilled:

1) the relationship between the logarithm of the dose and the response can be represented by a cumulative normal distribution curve,

2) the curves for the standard and the test preparation are parallel, i.e. they are identically shaped and may only differ in their horizontal location,

3) in theory, there is no natural response to extremely low doses and no natural non-response to extremely high doses.

4.2. THE PROBIT METHOD

The sigmoid curve can be made linear by replacing each response, i.e. the fraction of positive responses per group, by the corresponding value of the cumulative standard normal distribution. This value, often referred to as "normit", ranges theoretically from $-\infty$ to $+\infty$. In the past it was proposed to add 5 to each normit to obtain "probits". This facilitated the hand-performed calculations because negative values were avoided. With the arrival of computers the need to add 5 to the normits has disappeared. The term "normit method" would therefore be better for the method described below. However, since the term "probit analysis" is so widely spread, the term will, for historical reasons, be maintained in this text.

Once the responses have been linearised, it should be possible to apply the parallel-line analysis as described in Section 3.2. Unfortunately, the validity condition of homogeneity of variance for each dose is not fulfilled. The variance is minimal at normit = 0 and increases for positive and negative values of the normit. It is therefore necessary to give more weight to responses in the middle part of the curve, and less weight to the more extreme parts of the curve. This method, the analysis of variance, and the estimation of the potency and confidence interval are described below.

4.2.1. TABULATION OF THE RESULTS

Table 4.2.1.-I is used to enter the data into the columns indicated by numbers:

(1) the dose of the standard or the test preparation,

(2) the number n of units submitted to that treatment,

(3) the number of units r giving a positive response to the treatment,

(4) the logarithm x of the dose,

(5) the fraction $p = r/n$ of positive responses per group.

The first cycle starts here.

(6) column Y is filled with zeros at the first iteration,

(7) the corresponding value $\Phi = \Phi(Y)$ of the cumulative standard normal distribution function (see also Table 8.4).

The columns (8) to (10) are calculated with the following formulae:

(8) $$Z = \frac{e^{-Y^2/2}}{\sqrt{2\pi}} \qquad (4.2.1.\text{-}1)$$

(9) $$y = Y + \frac{p - \Phi}{Z} \qquad (4.2.1.\text{-}2)$$

(10) $$w = \frac{nZ^2}{\Phi - \Phi^2} \qquad (4.2.1.\text{-}3)$$

The columns (11) to (15) can easily be calculated from columns (4), (9) and (10) as *wx*, *wy*, wx^2, wy^2 and *wxy* respectively, and the sum (Σ) of each of the columns (10) to (15) is calculated separately for each of the preparations.

The sums calculated in Table 4.2.1.-I are transferred to columns (1) to (6) of Table 4.2.1.-II and 6 additional columns (7) to (12) are calculated as follows:

(7) $$S_{xx} = \sum wx^2 - \frac{(\sum wx)^2}{\sum w} \qquad (4.2.1.\text{-}4)$$

(8) $$S_{xy} = \sum wxy - \frac{(\sum wx)(\sum wy)}{\sum w} \qquad (4.2.1.\text{-}5)$$

(9) $$S_{yy} = \sum wy^2 - \frac{(\sum wy)^2}{\sum w} \qquad (4.2.1.\text{-}6)$$

(10) $$\overline{x} = \frac{\sum wx}{\sum w} \qquad (4.2.1.\text{-}7)$$

(11) $$\overline{y} = \frac{\sum wy}{\sum w} \qquad (4.2.1.\text{-}8)$$

The common slope *b* can now be obtained as:

$$b = \frac{\sum S_{xy}}{\sum S_{xx}} \qquad (4.2.1.\text{-}9)$$

and the intercept *a* of the standard, and similarly for the test preparations is obtained as:

(12) $$a = \overline{y} - b\overline{x} \qquad (4.2.1.\text{-}10)$$

Column (6) of the first working table can now be replaced by $Y = a + bx$ and the cycle is repeated until the difference between 2 cycles has become small (e.g. the maximum difference of *Y* between 2 consecutive cycles is smaller than 10^{-8}).

4.2.2. TESTS OF VALIDITY

Before calculating the potencies and confidence intervals, validity of the assay must be assessed. If at least 3 doses for each preparation have been included, the deviations from linearity can be measured as follows: add a 13th column to Table 4.2.1.-II and fill it with:

$$S_{yy} - \frac{S_{xy}^2}{S_{xx}} \qquad (4.2.2.\text{-}1)$$

The column total is a measure of deviations from linearity and is approximately χ^2 distributed with degrees of freedom equal to $N - 2h$. Significance of this value may be assessed with the aid of Table 8.3 or a suitable sub-routine in a computer program. If the value is significant at the 0.05 probability level, the assay must probably be rejected (see Section 4.2.4).

When the above test gives no indication of significant deviations from linear regression, the deviations from parallelism are tested at the 0.05 significance level with:

$$\chi^2 = \sum \frac{S_{xy}^2}{S_{xx}} - \frac{(\sum S_{xy})^2}{\sum S_{xx}} \qquad (4.2.2.\text{-}2)$$

with $h - 1$ degrees of freedom.

4.2.3. ESTIMATION OF POTENCY AND CONFIDENCE LIMITS

When there are no indications for a significant departure from parallelism and linearity the ln(potency ratio) M'_T is calculated as:

$$M'_T = \frac{a_T - a_S}{b} \qquad (4.2.3.\text{-}1)$$

Table 4.2.1.-I. – *First working table*

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)	(15)

							Σ =	Σ =				

and the antilogarithm is taken. Now let t = 1.96 and s = 1. Confidence limits are calculated as the antilogarithms of:

$$CM'_T-(C-1)(\overline{x}_S-\overline{x}_T)\pm\sqrt{(C-1)\left(V\sum S_{xx}+C\left(M'_T-\overline{x}_S+\overline{x}_T\right)^2\right)} \qquad (4.2.3.\text{-}2)$$

where $C=\dfrac{b^2\sum S_{xx}}{b^2\sum S_{xx}-s^2t^2}$ and $V=\dfrac{1}{\sum\limits_S w}+\dfrac{1}{\sum\limits_T w}$

4.2.4. INVALID ASSAYS

If the test for deviations from linearity described in Section 4.2.2 is significant, the assay should normally be rejected. If there are reasons to retain the assay, the formulae are slightly modified. t becomes the t-value (p = 0.05) with the same number of degrees of freedom as used in the check for linearity and s^2 becomes the χ^2 value divided by the same number of degrees of freedom (and thus typically is greater than 1).

The test for parallelism is also slightly modified. The χ^2 value for non-parallelism is divided by its number of degrees of freedom. The resulting value is divided by s^2 calculated above to obtain an F-ratio with h - 1 and N - 2h degrees of freedom, which is evaluated in the usual way at the 0.05 significance level.

4.3. THE LOGIT METHOD

As indicated in Section 4.1 the logit method may sometimes be more appropriate. The name of the method is derived from the logit function which is the inverse of the logistic distribution. The procedure is similar to that described for the probit method with the following modifications in the formulae for Φ and Z.

$$\Phi = \frac{1}{1+e^{-Y}} \qquad (4.3.\text{-}1)$$

$$Z = \frac{e^{-Y}}{\left(1+e^{-Y}\right)^2} \qquad (4.3.\text{-}2)$$

4.4. OTHER SHAPES OF THE CURVE

The probit and logit method are almost always adequate for the analysis of quantal responses called for in the European Pharmacopoeia. However, if it can be made evident that the ln(dose)-response curve has another shape than the 2 curves described above, another curve Φ may be adopted. Z is then taken to be the first derivative of Φ.

For example, if it can be shown that the curve is not symmetric, the Gompertz distribution may be appropriate (the gompit method) in which case $\Phi = 1 - e^{-e^{Y}}$ and $Z = e^{Y-e^{Y}}$.

4.5. THE MEDIAN EFFECTIVE DOSE

In some types of assay it is desirable to determine a median effective dose which is the dose that produces a response in 50 per cent of the units. The probit method can be used to determine this median effective dose (ED_{50}), but since there is no need to express this dose relative to a standard, the formulae are slightly different.

Note: a standard can optionally be included in order to validate the assay. Usually the assay is considered valid if the calculated ED_{50} of the standard is close enough to the assigned ED_{50}. What "close enough" in this context means depends on the requirements specified in the monograph.

The tabulation of the responses to the test samples, and optionally a standard, is as described in Section 4.2.1. The test for linearity is as described in Section 4.2.2. A test for parallelism is not necessary for this type of assay. The ED_{50} of test sample T, and similarly for the other samples, is obtained as described in Section 4.2.3, with the following modifications in formulae 4.2.3.-1 and 4.2.3.-2).

$$M'_T = \frac{-a_T}{b} \qquad (4.5.\text{-}1)$$

$$CM'_T-(C-1)\overline{x}_T\pm\sqrt{(C-1)\left(V\sum S_{xx}+C\left(M'_T-\overline{x}_T\right)^2\right)} \qquad (4.5.\text{-}2)$$

where $V=\dfrac{1}{\sum\limits_T w}$ and C is left unchanged

5. EXAMPLES

This section consists of worked examples illustrating the application of the formulae. The examples have been selected primarily to illustrate the statistical method of calculation. They are not intended to reflect the most suitable method of assay, if alternatives are permitted in the individual monographs. To increase their value as program checks, more decimal places are given than would usually be necessary. It should also be noted that other, but equivalent methods of calculation exist. These methods should lead to exactly the same final results as those given in the examples.

5.1. PARALLEL-LINE MODEL

5.1.1. TWO-DOSE MULTIPLE ASSAY WITH COMPLETELY RANDOMISED DESIGN

An assay of corticotrophin by subcutaneous injection in rats

The standard preparation is administered at 0.25 and 1.0 units per 100 g of body mass. 2 preparations to be examined are both assumed to have a potency of 1 unit per milligram and they are administered in the same quantities as the standard. The individual responses and means per treatment are given in Table 5.1.1.-I. A graphical presentation (Figure 5.1.1.-I) gives no rise to doubt the homogeneity of variance and normality of the data, but suggests problems with parallelism for preparation U.

Table 5.1.1.-I. – *Response metameter y: mass of ascorbic acid (mg) per 100 g of adrenal gland*

	Standard *S*		**Preparation *T***		**Preparation *U***	
	S_1	S_2	T_1	T_2	U_1	U_2
	300	289	310	230	250	236
	310	221	290	210	268	213
	330	267	360	280	273	283
	290	236	341	261	240	269
	364	250	321	241	307	251
	328	231	370	290	270	294
	390	229	303	223	317	223
	360	269	334	254	312	250
	342	233	295	216	320	216
	306	259	315	235	265	265
Mean	332.0	248.4	323.9	244.0	282.2	250.0

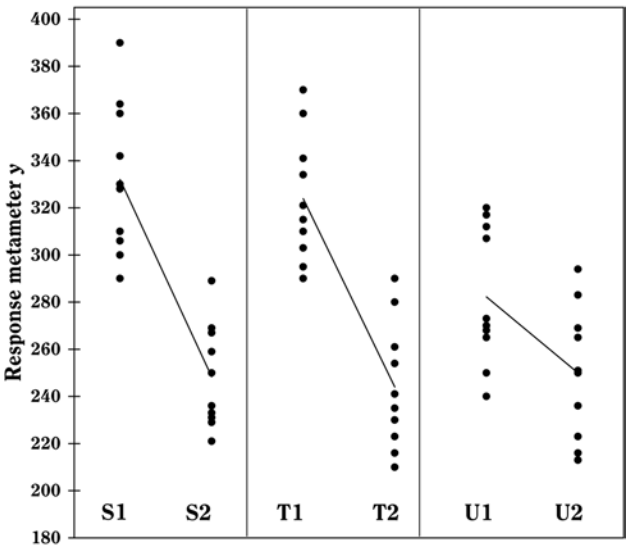

Figure 5.1.1.-I.

The formulae in Tables 3.2.3.-I and 3.2.3.-II lead to:

$P_S = 580.4$ $L_S = -41.8$

$P_T = 567.9$ $L_T = -39.95$

$P_U = 532.2$ $L_U = -16.1$

$H_P = \frac{10}{2} = 5$ $H_L = \frac{120}{6} = 20$

The analysis of variance can now be completed with the formulae in Tables 3.2.3-III and 3.2.3.-IV. This is shown in Table 5.1.1.-II.

Table 5.1.1.-II. – *Analysis of variance*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability
Preparations	2	6256.6	3128.3		
Regression	1	63 830.8	63 830.8	83.38	0.000
Non-parallelism	2	8218.2	4109.1	5.37	0.007
Treatments	5	78 305.7			
Residual error	54	41 340.9	765.57		
Total	59	119 646.6			

The analysis confirms a highly significant linear regression. Departure from parallelism, however, is also significant ($p = 0.0075$) which was to be expected from the graphical observation that preparation *U* is not parallel to the standard. This preparation is therefore rejected and the analysis repeated using only preparation *T* and the standard (Table 5.1.1.-III).

Table 5.1.1.-III. – *Analysis of variance without sample U*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability
Preparations	1	390.6	390.6		
Regression	1	66 830.6	66 830.6	90.5	0.000
Non-parallelism	1	34.2	34.2	0.05	0.831
Treatments	3	67 255.5			
Residual error	36	26 587.3	738.54		
Total	39	93 842.8			

The analysis without preparation *U* results in compliance with the requirements with respect to both regression and parallelism and so the potency can be calculated. The formulae in Section 3.2.5 give:

– for the common slope:

$$b = \frac{20\,(-41.8 - 39.95)}{\ln 4 \times 10 \times 2} = -58.970$$

– the ln(potency ratio) is:

$$M'_T = \frac{567.9 - 580.4}{2 \times (-58.970)} = 0.1060$$

$$C = \frac{66\,830.6}{66\,830.6 - 738.54 \times 2.028^2} = 1.0476$$

$$V = \frac{66\,830.6}{(-58.970)^2 \times 2 \times 10} = 0.9609$$

– and ln(confidence limits) are:

$$1.0476 \times 0.1060 \pm \sqrt{0.0476 \times (1.0476 \times 0.1060^2 + 2 \times 0.9609)}$$
$$= 0.1110 \pm 0.3034$$

By taking the antilogarithms we find a potency ratio of 1.11 with 95 per cent confidence limits from 0.82-1.51.

Multiplying by the assumed potency of preparation *T* yields a potency of 1.11 units/mg with 95 per cent confidence limits from 0.82 to 1.51 units/mg.

5.1.2. THREE-DOSE LATIN SQUARE DESIGN

Antibiotic agar diffusion assay using a rectangular tray

The standard has an assigned potency of 4855 IU/mg. The test preparation has an assumed potency of 5600 IU/mg. For the stock solutions 25.2 mg of the standard is dissolved in 24.5 ml of solvent and 21.4 mg of the test preparation is dissolved in 23.95 ml of solvent. The final solutions are prepared by first diluting both stock solutions to 1/20 and further using a dilution ratio of 1.5.

A Latin square is generated with the method described in Section 8.6 (see Table 5.1.2.-I). The responses of this routine assay are shown in Table 5.1.2.-II (inhibition zones in mm × 10). The treatment mean values are shown in Table 5.1.2.-III. A graphical representation of the data (see Figure 5.1.2.-I) gives no rise to doubt the normality or homogeneity of variance of the data.

The formulae in Tables 3.2.3.-I and 3.2.3.-II lead to:

$P_S = 529.667$ $L_S = 35.833$

$P_T = 526.333$ $L_T = 39.333$

$H_P = \frac{6}{3} = 2$ $H_L = \frac{72}{24} = 3$

The analysis of variance can now be completed with the formulae in Tables 3.2.3.-III and 3.2.3.-IV. The result is shown in Table 5.1.2.-IV.

The analysis shows significant differences between the rows. This indicates the increased precision achieved by using a Latin square design rather than a completely randomised design. A highly significant regression and no significant departure of the individual regression lines from parallelism and linearity confirms that the assay is satisfactory for potency calculations.

Table 5.1.2.-I. – *Distribution of treatments over the plate*

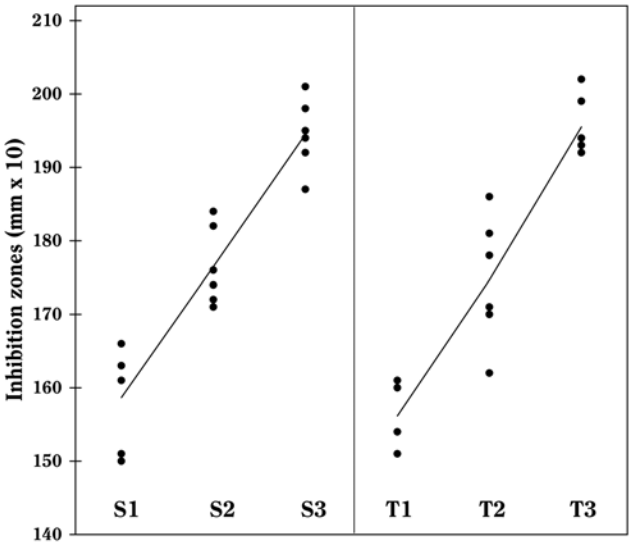

Figure 5.1.2.-I.

Table 5.1.2.-IV. – *Analysis of variance*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability
Preparations	1	11.1111	11.1111		
Regression	1	8475.0417	8475.0417	408.1	0.000
Non-parallelism	1	18.3750	18.3750	0.885	0.358
Non-linearity	2	5.4722	2.7361	0.132	0.877
Treatments	5	8510			
Rows	5	412	82.40	3.968	0.012
Columns	5	218.6667	43.73	2.106	0.107
Residual error	20	415.3333	20.7667		
Total	35	9556			

The formulae in Section 3.2.5 give:

– for the common slope:

$$b = \frac{3 \times (35.833 + 39.333)}{\ln(1.5) \times 6 \times 2} = 46.346$$

– the ln(potency ratio) is:

$$M'_T = \frac{526.333 - 529.667}{3 \times 46.346} = -0.023974$$

$$C = \frac{8475.0417}{8475.0417 - 20.7667 \times 2.086^2} = 1.0108$$

$$V = \frac{8475.0417}{46.346^2 \times 3 \times 6} = 0.2192$$

– and ln(confidence limits) are:

$$\frac{1.0108 \times (-0.0240) \pm \sqrt{0.0108 \times \left(1.0108 \times (-0.0240)^2 + 2 \times 0.2192\right)}}{= -0.02423 \pm 0.06878}$$

The potency ratio is found by taking the antilogarithms, resulting in 0.9763 with 95 per cent confidence limits from 0.9112-1.0456.

A correction factor of $\frac{4855 \times 25.2/24.5}{5600 \times 21.4/23.95} = 0.99799$ is necessary because the dilutions were not exactly equipotent on the basis of the assumed potency. Multiplying by this correction factor and the assumed potency of 5600 IU/mg yields a potency of 5456 IU/mg with 95 per cent confidence limits from 5092 to 5843 IU/mg.

5.1.3. FOUR-DOSE RANDOMISED BLOCK DESIGN

Antibiotic turbidimetric assay

This assay is designed to assign a potency in international units per vial. The standard has an assigned potency of 670 IU/mg. The test preparation has an assumed potency of 20 000 IU/vial. On the basis of this information the stock solutions are prepared as follows. 16.7 mg of the standard is dissolved in 25 ml solvent and the contents of one vial of the test preparation are dissolved in 40 ml solvent. The final solutions are prepared by first diluting to 1/40 and further using a dilution ratio of 1.5. The tubes are placed in a water-bath in a randomised block arrangement (see Section 8.5). The responses are listed in Table 5.1.3.-I.

Inspection of Figure 5.1.3.-I gives no rise to doubt the validity of the assumptions of normality and homogeneity of variance of the data. The standard deviation of S_3 is somewhat high but is no reason for concern.

Table 5.1.3.-I. – *Absorbances of the suspensions (× 1000)*

	Standard *S*				Preparation *T*				
Block	S_1	S_2	S_3	S_4	T_1	T_2	T_3	T_4	Mean
1	252	207	168	113	242	206	146	115	181.1
2	249	201	187	107	236	197	153	102	179.0
3	247	193	162	111	246	197	148	104	176.0
4	250	207	155	108	231	191	159	106	175.9
5	235	207	140	98	232	186	146	95	167.4
Mean	246.6	203.0	162.4	107.4	237.4	195.4	150.4	104.4	

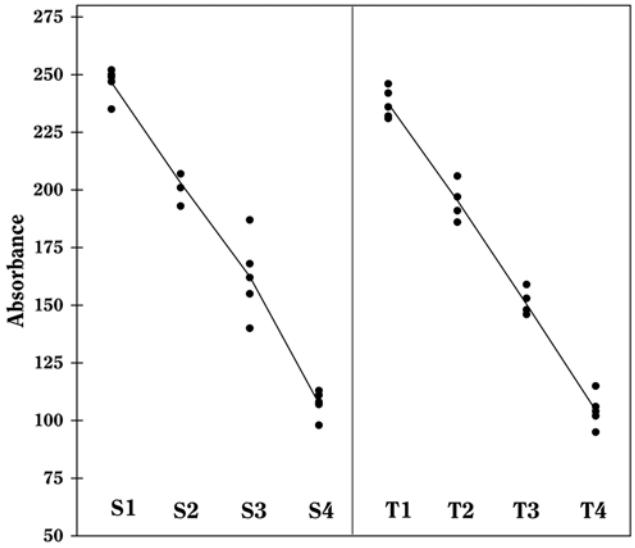

Figure 5.1.3.-I.

The formulae in Tables 3.2.3.-I and 3.2.3.-II lead to:

$P_S = 719.4$ $L_S = -229.1$

$P_T = 687.6$ $L_T = -222$

$H_P = \frac{5}{4} = 1.25$ $H_L = \frac{60}{60} = 1$

The analysis of variance is constructed with the formulae in Tables 3.2.3.-III and 3.2.3.-IV. The result is shown in Table 5.1.3.-II.

Table 5.1.3.-II. – *Analysis of variance*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability
Preparations	1	632.025	632.025		
Regression	1	101 745.6	101 745.6	1887.1	0.000
Non-parallelism	1	25.205	25.205	0.467	0.500
Non-linearity	4	259.14	64.785	1.202	0.332
Treatments	7	102 662			
Blocks	4	876.75	219.188	4.065	0.010
Residual error	28	1509.65	53.916		
Total	39	105 048.4			

A significant difference is found between the blocks. This indicates the increased precision achieved by using a randomised block design. A highly significant regression and no significant departure from parallelism and linearity confirms that the assay is satisfactory for potency calculations. The formulae in Section 3.2.5 give:

– for the common slope:

$$b = \frac{1 \times (-229.1 - 222)}{\ln(1.5) \times 5 \times 2} = -111.255$$

– the ln(potency ratio) is:

$$M'_T = \frac{687.6 - 719.4}{4 \times (-111.255)} = 0.071457$$

$$C = \frac{101\,745.6}{101\,745.6 - 53.916 \times 2.048^2} = 1.00223$$

$$V = \frac{101\,745.6}{(-111.255)^2 \times 4 \times 5} = 0.4110$$

– and ln(confidence limits) are:

$$1.00223 \times 0.0715 \pm \sqrt{0.00223 \times (1.00223 \times 0.0715^2 + 2 \times 0.4110)} = 0.07162 \pm 0.04293$$

The potency ratio is found by taking the antilogarithms, resulting in 1.0741 with 95 per cent confidence limits from 1.0291 to 1.1214. A correction factor of $\frac{670 \times 16.7/25}{20\,000 \times 1/40} = 0.89512$ is necessary because the dilutions were not exactly equipotent on the basis of the assumed potency. Multiplying by this correction factor and the assumed potency of 20 000 IU/vial yields a potency of 19 228 IU/vial with 95 per cent confidence limits from 18 423-20 075 IU/vial.

5.1.4. FIVE-DOSE MULTIPLE ASSAY WITH COMPLETELY RANDOMISED DESIGN

An in-vitro assay of three hepatitis B vaccines against a standard

3 independent two-fold dilution series of 5 dilutions were prepared from each of the vaccines. After some additional steps in the assay procedure, absorbances were measured. They are shown in Table 5.1.4.-I.

Table 5.1.4.-I. – *Optical densities*

Dilution	Standard *S*			Preparation *T*		
1:16 000	0.043	0.045	0.051	0.097	0.097	0.094
1:8000	0.093	0.099	0.082	0.167	0.157	0.178
1:4000	0.159	0.154	0.166	0.327	0.355	0.345
1:2000	0.283	0.295	0.362	0.501	0.665	0.576
1:1000	0.514	0.531	0.545	1.140	1.386	1.051

Dilution	Preparation *U*			Preparation *V*		
1:16 000	0.086	0.071	0.073	0.082	0.082	0.086
1:8000	0.127	0.146	0.133	0.145	0.144	0.173
1:4000	0.277	0.268	0.269	0.318	0.306	0.316
1:2000	0.586	0.489	0.546	0.552	0.551	0.624
1:1000	0.957	0.866	1.045	1.037	1.039	1.068

The logarithms of the optical densities are known to have a linear relationship with the logarithms of the doses. The mean responses of the ln-transformed optical densities are listed in Table 5.1.4.-II. No unusual features are discovered in a graphical presentation of the data (Figure 5.1.4.-I).

Table 5.1.4.-II. – *Means of the ln-transformed absorbances*

S_3	−1.835	T_3	−1.073	U_3	−1.305	V_3	−1.161
S_4	−1.166	T_4	−0.550	U_4	−0.618	V_4	−0.554
S_5	−0.635	T_5	0.169	U_5	−0.048	V_5	0.047

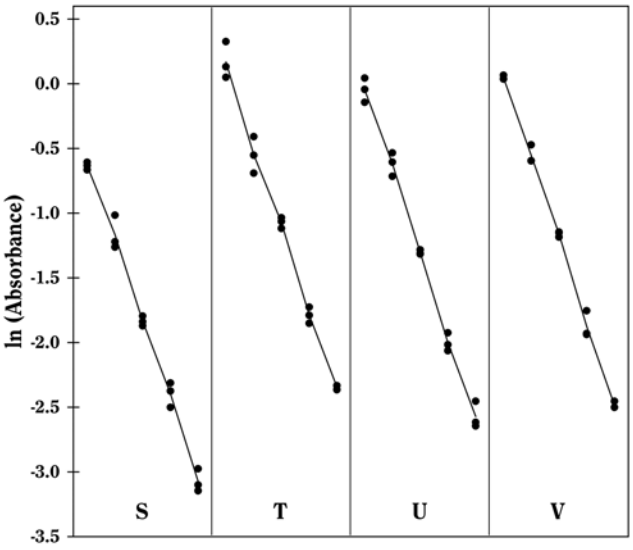

Figure 5.1.4.-I.

The formulae in Tables 3.2.3.-I and 3.2.3.-II give:

$P_S = -9.108$ $L_S = 6.109$

$P_T = -5.586$ $L_T = 6.264$

$P_U = -6.544$ $L_U = 6.431$

$P_V = -6.027$ $L_V = 6.384$

$H_P = \frac{3}{5} = 0.6$ $H_L = \frac{36}{120} = 0.3$

The analysis of variance is completed with the formulae in Tables 3.2.3.-III and 3.2.3.-IV. This is shown in Table 5.1.4.-III.

Table 5.1.4.-III. – *Analysis of variance*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability
Preparations	3	4.475	1.492		
Regression	1	47.58	47.58	7126	0.000
Non-parallelism	3	0.0187	0.006	0.933	0.434
Non-linearity	12	0.0742	0.006	0.926	0.531
Treatments	19	52.152			
Residual error	40	0.267	0.0067		
Total	59	52.42			

A highly significant regression and a non-significant departure from parallelism and linearity confirm that the potencies can be safely calculated. The formulae in Section 3.2.5 give:

– for the common slope:

$$b = \frac{0.3 \times (6.109 + 6.264 + 6.431 + 6.384)}{\ln 2 \times 3 \times 4} = 0.90848$$

– the ln(potency ratio) for preparation *T* is:

$$M'_T = \frac{-5.586 - (-9.108)}{5 \times 0.90848} = 0.7752$$

$$C = \frac{47.58}{47.58 - 0.0067 \times 2.021^2} = 1.00057$$

$$V = \frac{47.58}{0.9085^2 \times 5 \times 3} = 3.8436$$

– and ln(confidence limits) for preparation *T* are:

$$1.00057 \times 0.7752 \pm \sqrt{0.00057 \times (1.00057 \times 0.7752^2 + 2 \times 3.8436)}$$

$$= 0.7756 \pm 0.0689$$

By taking the antilogarithms a potency ratio of 2.171 is found with 95 per cent confidence limits from 2.027 to 2.327. All samples have an assigned potency of 20 µg protein/ml and so a potency of 43.4 µg protein/ml is found for test preparation *T* with 95 per cent confidence limits from 40.5-46.5 µg protein/ml.

The same procedure is followed to estimate the potency and confidence interval of the other test preparations. The results are listed in Table 5.1.4.-IV.

Table 5.1.4.-IV. – *Final potency estimates and 95 per cent confidence intervals of the test vaccines (in µg protein/ml)*

	Lower limit	Estimate	Upper limit
Vaccine *T*	40.5	43.4	46.5
Vaccine *U*	32.9	35.2	37.6
Vaccine *V*	36.8	39.4	42.2

5.1.5. TWIN CROSS-OVER DESIGN

Assay of insulin by subcutaneous injection in rabbits

The standard preparation was administered at 1 unit and 2 units per millilitre. Equivalent doses of the unknown preparation were used based on an assumed potency of 40 units per millilitre. The rabbits received subcutaneously 0.5 ml of the appropriate solutions according to the design in Table 5.1.5.-I and responses obtained are shown in Table 5.1.5.-II and Figure 5.1.5.-I. The large variance illustrates the variation between rabbits and the need to employ a cross-over design.

Table 5.1.5.-I. – *Arrangements of treatments*

	Group of rabbits			
	1	**2**	**3**	**4**
Day 1	S_1	S_2	T_1	T_2
Day 2	T_2	T_1	S_2	S_1

Table 5.1.5.-II. – *Response y: sum of blood glucose readings (mg/100 ml) at 1 hour and $2\frac{1}{2}$ hours*

	Group 1		Group 2		Group 3		Group 4	
	S_1	T_2	S_2	T_1	T_1	S_2	T_2	S_1
	112	104	65	72	105	91	118	144

	116	91	50	65	66	55	39	87
	101	68	55	100	91	68	31	71
Mean	95.6	82.8	69.6	93.3	89.9	66.6	72.4	106.8

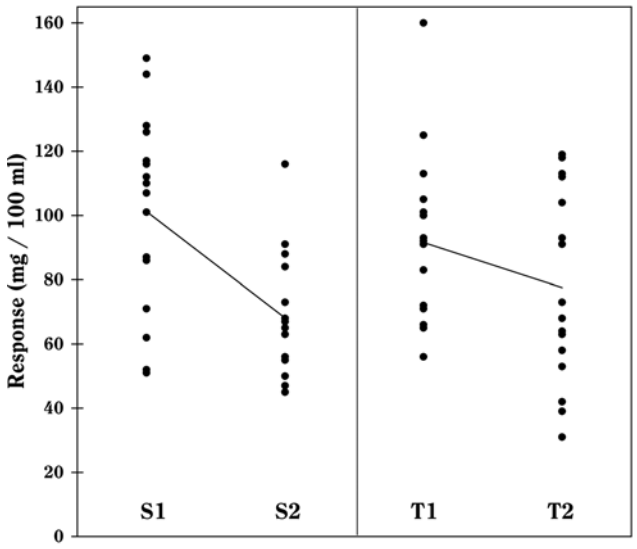

Figure 5.1.5.-I.

The analysis of variance is more complicated for this assay than for the other designs given because the component of the sum of squares due to parallelism is not independent of the component due to rabbit differences. Testing of the parallelism of the regression lines involves a second error-mean-square term obtained by subtracting the parallelism component and 2 "interaction" components from the component due to rabbit differences.

3 "interaction" components are present in the analysis of variance due to replication within each group:

days × preparation; days × regression; days × parallelism.

These terms indicate the tendency for the components (preparations, regression and parallelism) to vary from day to day. The corresponding *F*-ratios thus provide checks on these aspects of assay validity. If the values of *F* obtained are significantly high, care should be exercised in interpreting the results of the assay and, if possible, the assay should be repeated.

The analysis of variance is constructed by applying the formulae given in Tables 3.2.3.-I to 3.2.3.-III separately for both days and for the pooled set of data. The formulae in Tables 3.2.3.-I and 3.2.3.-II give:

Day 1: $P_S = 165.25$ $L_S = -13$

$P_T = 162.25$ $L_T = -8.75$

$H_P = \frac{8}{2} = 4$ $H_L = \frac{96}{6} = 16$

Day 2: $P_S = 173.38$ $L_S = -20.06$

$P_T = 176.00$ $L_T = -5.25$

$H_P = \frac{8}{2} = 4$ $H_L = \frac{96}{6} = 16$

Pooled: $P_S = 169.31$ $L_S = -16.53$

$P_T = 169.13$ $L_T = -7.00$

$H_P = \frac{16}{2} = 8$ $H_L = \frac{192}{6} = 32$

and with the formulae in Table 3.2.3.-III this leads to:

Day 1	Day 2	Pooled
$SS_{prep} = 18.000$	$SS_{prep} = 13.781$	$SS_{prep} = 0.141$
$SS_{reg} = 3784.5$	$SS_{reg} = 5125.8$	$SS_{reg} = 8859.5$
$SS_{par} = 144.5$	$SS_{par} = 1755.3$	$SS_{par} = 1453.5$

The interaction terms are found as Day 1 + Day 2 - Pooled.

$$SS_{\text{days}\times\text{prep}} = 31.64$$

$$SS_{\text{days}\times\text{reg}} = 50.77$$

$$SS_{\text{days}\times\text{par}} = 446.27$$

In addition the sum of squares due to day-to-day variation is calculated as:

$$SS_{\text{days}} = \frac{1}{2}N\left(D_1^2 + D_2^2\right) - K = 478.52$$

and the sum of squares due to blocks (the variation between rabbits) as:

$$SS_{\text{block}} = 2\sum B_i^2 - K = 39\,794.7$$

where B_i is the mean response per rabbit.

The analysis of variance can now be completed as shown in Table 5.1.5.-III.

Table 5.1.5.-III. – *Analysis of variance*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability
Non-parallelism	1	1453.5	1453.5	1.064	0.311
Days × Prep.	1	31.6	31.6	0.023	0.880
Days × Regr.	1	50.8	50.8	0.037	0.849
Residual error between rabbits	28	38 258.8	1366.4		
Rabbits	31	39 794.7	1283.7		
Preparations	1	0.14	0.14	0.001	0.975
Regression	1	8859.5	8859.5	64.532	0.000
Days	1	478.5	478.5	3.485	0.072
Days × non-par.	1	446.3	446.3	3.251	0.082
Residual error within rabbits	28	3844.1	137.3		
Total	63	53 423.2			

The analysis of variance confirms that the data fulfil the necessary conditions for a satisfactory assay: a highly significant regression, no significant departures from parallelism, and none of the three interaction components is significant.

The formulae in Section 3.2.5 give:

– for the common slope:

$$b = \frac{32 \times (-16.53 - 7)}{\ln 2 \times 16 \times 2} = -33.95$$

– the ln(potency ratio) is:

$$M_T' = \frac{169.13 - 169.31}{2 \times (-33.95)} = 0.00276$$

$$C = \frac{8859.5}{8859.5 - 137.3 \times 2.048^2} = 1.0695$$

$$V = \frac{8859.5}{(-33.95)^2 \times 2 \times 16} = 0.2402$$

– and ln(confidence limits) are:

$$1.0695 \times 0.00276 \pm \sqrt{0.0695 \times (1.0695 \times 0.00276^2 + 2 \times 0.2402)} = 0.00295 \pm 0.18279$$

By taking the antilogarithms a potency ratio of 1.003 with 95 per cent confidence limits from 0.835 to 1.204 is found. Multiplying by A_T = 40 yields a potency of 40.1 units per millilitre with 95 per cent confidence limits from 33.4-48.2 units per millilitre.

5.2. SLOPE-RATIO MODEL

5.2.1. A COMPLETELY RANDOMISED (0,3,3)-DESIGN

An assay of factor VIII

A laboratory carries out a chromogenic assay of factor VIII activity in concentrates. The laboratory has no experience with the type of assay but is trying to make it operational. 3 equivalent dilutions are prepared of both the standard and the test preparation. In addition a blank is prepared, although a linear dose-response relationship is not expected for low doses. 8 replicates of each dilution are prepared, which is more than would be done in a routine assay.

A graphical presentation of the data shows clearly that the dose-response relationship is indeed not linear at low doses. The responses to blanks will therefore not be used in the calculations (further assays are of course needed to justify this decision). The formulae in Tables 3.3.3.1.-I and 3.3.3.1.-II yield

$P_S = 0.6524$ $P_T = 0.5651$

$L_S = 1.4693$ $L_T = 1.2656$

$a_S = 0.318$ $a_T = 0.318$

$b_S = 0.329$ $b_T = 0.271$

$G_S = 0.1554$ $G_T = 0.1156$

$J_S = 4.17 \cdot 10^{-8}$ $J_T = 2.84 \cdot 10^{-6}$

and

$H_1 = 0.09524$ $a' = 0.05298$ $K = 1.9764$

and the analysis of variance is completed with the formulae in Tables 3.3.3.1.-III and 3.3.3.1.-IV.

A highly significant regression and no significant deviations from linearity and intersection indicate that the potency can be calculated.

Slope of standard:

$$b'_S = \frac{6 \times 1.469 - 36 \times 0.0530}{84} = 0.0822$$

Slope of test sample:

$$b'_T = \frac{6 \times 1.266 - 36 \times 0.0530}{84} = 0.0677$$

Formula 3.3.5.1.-3 gives:

$$R = \frac{0.0677}{0.0822} = 0.823$$

$$C = \frac{0.0822^2}{0.0822^2 - 3.86 \cdot 10^{-6} \times 2.018^2 \times 0.0357} = 1.000083$$

$$K' = 0.000083 \times 0.75 = 0.000062$$

and the 95 per cent confidence limits are:

$$0.823 \pm \sqrt{0.000083 \times 1.678 + 0.000062 \times (-1.646)} = 0.823 \pm 0.006$$

The potency ratio is thus estimated as 0.823 with 95 per cent confidence limits from 0.817 to 0.829.

Table 5.2.1.-I. – *Absorbances*

	Blank	Standard *S* (in IU/ml)			Preparation *T* (in IU/ml)

5.2.2. A COMPLETELY RANDOMISED (0,4,4,4)-DESIGN

An in-vitro assay of influenza vaccines

The haemagglutinin antigen (HA) content of 2 influenza vaccines is determined by single radial immunodiffusion. Both have a labelled potency of 15 µg HA per dose, which is equivalent with a content of 30 µg HA/ml. The standard has an assigned content of 39 µg HA/ml.

Standard and test vaccines are applied in 4 duplicate concentrations which are prepared on the basis of the assigned and the labelled contents. When the equilibrium between the external and the internal reactant is established, the zone of the annulus precipitation area is measured. The results are shown in Table 5.2.2.-I.

Table 5.2.2.-I. – *Zone of precipitation area (mm^2)*

Conc.	Standard *S*		Preparation *T*		Preparation *U*	
(µg/ml)	I	II	I	II	I	II
7.5	18.0	18.0	15.1	16.8	15.4	15.7
15.0	22.8	24.5	23.1	24.2	20.2	18.6
22.5	30.4	30.4	28.9	27.4	24.2	23.1
30.0	35.7	36.6	34.4	37.8	27.4	27.0

A graphical presentation of the data shows no unusual features (see Figure 5.2.2.-I). The formulae in Tables 3.3.3.1.-I and 3.3.3.1.-II yield

$P_S = 108.2$ $P_T = 103.85$ $P_U = 85.8$

$L_S = 301.1$ $L_T = 292.1$ $L_U = 234.1$

$a_S = 141.0$ $a_T = 116.7$ $a_U = 139.8$

$b_S = 61.2$ $b_T = 64.95$ $b_U = 39.2$

$G_S = 3114.3$ $G_T = 2909.4$ $G_U = 1917.3$

$J_S = 0.223$ $J_T = 2.227$ $J_U = 0.083$

and

$H_I = 0.0093$ $a' = 11.04$ $K = 14\,785.8$

and the analysis of variance is completed with the formulae in Tables 3.3.3.1.-III and 3.3.3.1.-IV. This is shown in Table 5.2.2.-II.

A highly significant regression and no significant deviations from linearity and intersection indicate that the potency can be calculated.

Slope of standard:

$$b'_S = \frac{6 \times 301.1 - 60 \times 11.04}{180} = 6.356$$

Slope of *T* is:

$$b'_T = \frac{6 \times 292.1 - 60 \times 11.04}{180} = 6.056$$

Slope of *U* is:

$$b'_U = \frac{6 \times 234.1 - 60 \times 11.04}{180} = 4.123$$

This leads to a potency ratio of 6.056/6.356 = 0.953 for vaccine *T* and 4.123/6.356 = 0.649 for vaccine *U*.

$$C = \frac{6.356^2}{6.356^2 - 1.068 \times 2.179^2 \times 0.0444} = 1.0056$$

$$K' = 0.0056 \times 0.625 = 0.0035$$

And the confidence limits are found with formula 3.3.5.1.-4.

For vaccine *T*:

$$0.955 \pm \sqrt{0.0056 \times 1.913 + 0.0035 \times (-1.913)} = 0.955 \pm 0.063$$

For vaccine *U*:

$$0.649 \pm \sqrt{0.0056 \times 1.423 + 0.0035 \times (-1.301)} = 0.649 \pm 0.058$$

The HA content in µg/dose can be found by multiplying the potency ratios and confidence limits by the assumed content of 15 µg/dose. The results are given in Table 5.2.2.-III.

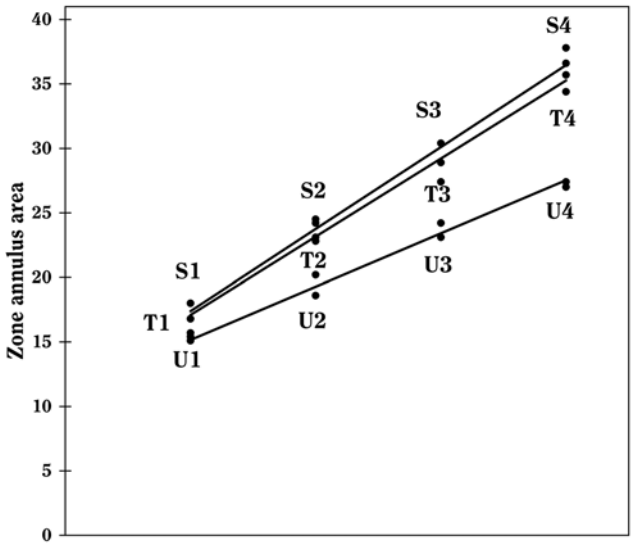

Figure 5.2.2.-I.

Table 5.2.2.-II. – *Analysis of variance*

Source of variation	Degrees of freedom	Sum of squares	Mean square	*F*-ratio	Probability

Vaccin *U*	8.9	9.7	10.6

5.3. QUANTAL RESPONSES

5.3.1. PROBIT ANALYSIS OF A TEST PREPARATION AGAINST A REFERENCE

An in-vivo assay of a diphtheria vaccine

A diphtheria vaccine (assumed potency 140 IU/vial) is assayed against a standard (assigned potency 132 IU/vial). On the basis of this information, equivalent doses are prepared and randomly administered to groups of guinea-pigs. After a given period, the animals are challenged with diphtheria toxin and the number of surviving animals recorded as shown in Table 5.3.1.-I.

Table 5.3.1.-I. – *Raw data from a diphtheria assay in guinea-pigs*

Standard (*S*) Assigned potency 132 IU/vial			Test preparation (*T*) Assumed potency 140 IU/vial		
dose (IU/ml)	challenged	protected	dose (I.U./ml)	challenged	protected
1.0	12	0	1.0	11	0
1.6	12	3	1.6	12	4
2.5	12	6	2.5	11	8
4.0	11	10	4.0	11	10

The observations are transferred to the first working table and the subsequent columns are computed as described in Section 4.2.1. Table 5.3.1.-II shows the first cycle of this procedure.

The sums of the last 6 columns are then calculated per preparation and transferred to the second working table (see Table 5.3.1.-III). The results in the other columns are found with formulae 4.2.1.-4 to 4.2.1.-10. This yields a common slope *b* of 1.655.

The values for *Y* in the first working table are now replaced by *a* + *bx* and a second cycle is carried out (see Table 5.3.1.-IV).

The cycle is repeated until the difference between 2 consecutive cycles has become small. The second working table should then appear as shown in Table 5.3.1.-V.

Linearity is tested as described in Section 4.2.2. The χ^2-value with 4 degrees of freedom is 0.851 + 1.070 = 1.921 representing a *p*-value of 0.750 which is not significant.

Since there are no significant deviations from linearity, the test for parallelism can be carried out as described in the same section. The χ^2-value with 1 degree of freedom is $(16.71 + 17.27) - \frac{14.15^2}{5.89} = 0.001$ representing a *p*-value of 0.974 which is not significant.

The ln(potency ratio) can now be estimated as described in Section 4.2.3.

$$M'_T = \frac{-1.721 - (-2.050)}{2.401} = 0.137$$

Further:

$$C = \frac{2.401^2 \times 5.893}{2.401^2 \times 5.893 - 1^2 \times 1.960^2} = 1.127$$

$$V = \frac{1}{18.37} + \frac{1}{17.96} = 0.110$$

So ln confidence limits are:

$$0.155 - 0.013 \pm \sqrt{0.127\,(0.649 + 1.127 \times 0.036^2)} = 0.142 \pm 0.288$$

The potency and confidence limits can now be found by taking the antilogarithms and multiplying these by the assumed potency of 140 IU/vial. This yields an estimate of 160.6 IU/vial with 95 per cent confidence limits from 121.0-215.2 IU/vial.

Table 5.3.1.-II. – *First working table in the first cycle*

5.3.2. LOGIT ANALYSIS AND OTHER TYPES OF ANALYSES OF A TEST PREPARATION AGAINST A REFERENCE

Results will be given for the situation where the logit method and other "classical" methods of this family are applied to the data in Section 5.3.1. This should be regarded as an exercise rather than an alternative to the probit method in this specific case. Another shape of the curve may be adopted only if this is supported by experimental or theoretical evidence. See Table 5.3.2.-I.

Table 5.3.2.-I. – *Results by using alternative curves*

	Logit	Gompit	Angle(*)
Φ	$\frac{1}{1+e^{-Y}}$	$1-e^{-e^{Y}}$	$\frac{1}{2}\sin Y+\frac{1}{2}$
Z	$\frac{e^{-Y}}{(1+e^{-Y})^2}$	$e^{Y-e^{Y}}$	$\frac{1}{2}\cos Y$
slope b	4.101	2.590	1.717
χ^2 lin	2.15	3.56	1.50
χ^2 par	0.0066	0.168	0.0010
Potency	162.9	158.3	155.8
Lower limit	121.1	118.7	122.6
Upper limit	221.1	213.3	200.7

(*) If $Y < -\frac{1}{2}\pi$ then $\Phi = 0$ and $Z = 0$

If $Y > \frac{1}{2}\pi$ then $\Phi = 1$ and $Z = 0$

5.3.3. THE ED_{50} DETERMINATION OF A SUBSTANCE USING THE PROBIT METHOD

An in-vitro assay of oral poliomyelitis vaccine

In an ED_{50} assay of oral poliomyelitis vaccine with 10 different dilutions in 8 replicates of 50 µl on an ELISA-plate, results were obtained as shown in Table 5.3.3.-I.

The observations are transferred to the first working table and the subsequent columns are computed as described in Section 4.2.1. Table 5.3.3.-II shows the first cycle of this procedure.

Table 5.3.3.-I. – *Dilutions (10^x µl of the undiluted vaccine)*

–3.5	–4.0	–4.5	–5.0	–5.5	–6.0	–6.5	–7.0	–7.5	–8.0
+	+	+	+	–	–	–	–	–	–
+	+	+	+	–	–	–	–	–	–
+	+	–	–	–	–	–	–	–	–
+	+	+	+	–	–	–	–	–	–
+	+	+	–	–	–	–	–	–	–
+	+	+	+	+	–	–	–	–	–
+	+	+	+	+	–	+	–	–	–
+	+	+	+	–	+	–	–	–	–

The sums of the last 6 columns are calculated and transferred to the second working table (see Table 5.3.3.-III). The results in the other columns are found with formulae 4.2.1.-4 to 4.2.1.-10. This yields a common slope *b* of – 0.295.

The values for *Y* in the first working table are now replaced by *a* + *bx* and a second cycle is carried out. The cycle is repeated until the difference between 2 consecutive cycles has become small. The second working table should then appear as shown in Table 5.3.3.-IV.

Linearity is tested as described in Section 4.2.2. The χ^2-value with 8 degrees of freedom is 2.711 representing a *p*-value of 0.951 which is not significant.

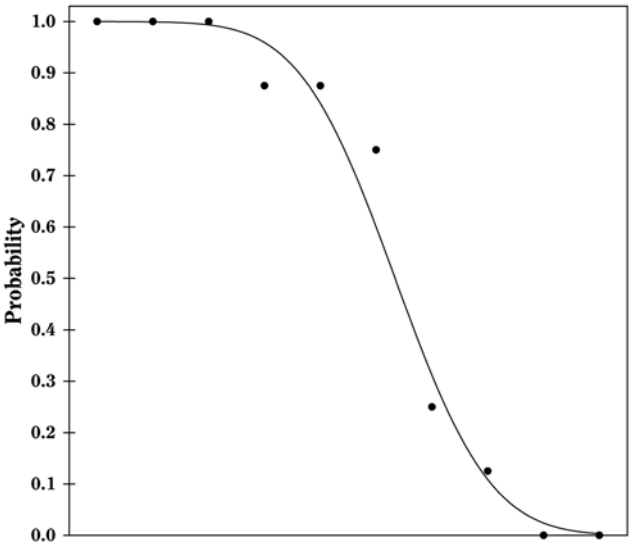

Figure 5.3.3.-I.

The potency ratio can now be estimated as described in Section 4.5.

$$M'_T = \frac{-(-7.931)}{-0.646} = -12.273$$

Further:

$$C = \frac{(-0.646)^2 \times 55.883}{(-0.646)^2 \times 55.883 - 1^2 \times 1.960^2} = 1.197$$

$$V = \frac{1}{19.39} = 0.052$$

So ln confidence limits are:

$$-14.692-(-2.420)\pm\sqrt{0.197\times(2.882+1.197\times0.009^2)}$$

$$=-12.272\pm0.754$$

This estimate is still expressed in terms of the ln(dilutions). In order to obtain estimates expressed in $\ln(ED_{50})$/ml the values are transformed to $-M'_T+\ln\left(\frac{1000}{50}\right)$.

Table 5.3.3.-III. – *Second working table in the first cycle*

Vaccine	Σw	Σwx	Σwy	Σwx^2	Σwy^2	Σwxy	S_{xx}	S_{xy}	S_{yy}	$\overline{x}$	$\overline{y}$	*a*
T	50.93	– 674.3	11.17	9484.6	57.50	– 312.32	556.92	– 164.43	55.05	– 13.24	0.219	– 3.690

Table 5.3.3.-IV. – *Second working table after sufficient cycles*

Vaccine	Σw	Σwx	Σwy	Σwx^2	Σwy^2	Σwxy	S_{xx}	S_{xy}	S_{yy}	$\overline{x}$	$\overline{y}$	*a*
T	19.39	– 238.2	0.11	2981.1	26.05	– 37.45	55.88	– 36.11	26.05	– 12.28	0.006	– 7.931

Since it has become common use to express the potency of this type of vaccine in terms of $\log_{10}(ED_{50})$/ml, the results have to be divided by ln(10). The potency is thus estimated as 6.63 $\log_{10}(ED_{50})$/ml with 95 per cent confidence limits from 6.30 to 6.96 $\log_{10}(ED_{50})$/ml.

5.4. EXTENDED SIGMOID DOSE-RESPONSE CURVES

5.4.1. FOUR-PARAMETER LOGISTIC CURVE ANALYSIS

A serological assay of tetanus sera

As already stated in Section 3.4, this example is intended to illustrate a "possible" way to analyse the data presented, but not necessarily to reflect the "only" or the "most appropriate" way. Many other approaches can be found in the literature, but in most cases they should not yield dramatically different outcomes. A short discussion of alternative approaches and other statistical considerations is given in Section 7.5.

A guinea-pig antiserum is assayed against a standard serum (0.4 IU/ml) using an enzyme-linked immunosorbent assay technique (ELISA). 10 two-fold dilutions of each serum were applied on a 96-well ELISA plate. Each dilution was applied twice. The observed responses are listed in Table 5.4.1.-I.

Table 5.4.1.-I. – *Observed responses*

Standard *S*			Preparation to be examined *T*		
Dil.	Obs. 1	Obs. 2	Dil.	Obs. 1	Obs. 2
1/10	2.912	2.917	1/10	3.017	2.987
1/20	2.579	2.654	1/20	2.801	2.808
1/40	2.130	2.212	1/40	2.401	2.450
1/80	1.651	1.638	1/80	1.918	1.963
1/160	1.073	0.973	1/160	1.364	1.299
1/320	0.585	0.666	1/320	0.861	0.854
1/640	0.463	0.356	1/640	0.497	0.496
1/1280	0.266	0.234	1/1280	0.340	0.344
1/2560	0.228	0.197	1/2560	0.242	0.217
1/5120	0.176	0.215	1/5120	0.178	0.125

For this example, it will be assumed that the laboratory has validated conditions 1 to 3 in Section 3.1.1 when the assay was being developed for routine use. In addition, the laboratory has validated that the upper limit and lower limit of the samples can be assumed to be equal.

No unusual features are discovered in a graphical representation. A least squares method of a suitable computer program is used to fit the parameters of the logistic function, assuming that the residual error terms are independent and identically distributed normal random variables. In this case, 3 parameters (α, β and δ) are needed to describe the common slope-factor and the common lower and upper asymptotes. 2 additional parameters (γ_S and γ_T) are needed to describe the horizontal location of the 2 curves.

The following estimates of the parameters are returned by the program:

$$\alpha = 3.196 \qquad \gamma_S = -4.307$$

$$\beta = 1.125 \qquad \gamma_T = -4.684$$

$$\delta = 0.145$$

In addition, the estimated residual variance (s^2) is returned as 0.001429 with 20 degrees of freedom (within-treatments variation).

In order to obtain confidence limits, and also to check for parallelism and linearity, the observed responses (*u*) are linearised and submitted to a weighted parallel-line analysis by the program. This procedure is very similar to that described in Section 4.2 for probit analysis with the following modifications:

$$Y = \beta(x - \gamma) \qquad y = Y + \frac{\left(\frac{u-\delta}{\alpha-\delta}\right) - \Phi}{Z}$$

$$\Phi = \frac{1}{1+e^{-Y}} \qquad w = \frac{Z^2(\alpha-\delta)^2}{s^2}$$

$$Z = \frac{e^{-Y}}{(1+e^{-Y})^2}$$

The resulting weighted analysis of variance of the transformed responses (*y*) using weights (*w*) is shown in Table 5.4.1.-II.

Table 5.4.1.-II – *Weighted analysis of variance*

Source of variation	Degrees of freedom	Chi-square	Probability
Preparations	1	0.529653	0.467
Regression	1	6599.51	0.000
Non-parallelism	1	0.0458738	0.830
Non-linearity	16	8.89337	0.918
Treatments	19	6608.98	0.000
Residual error	20	20.0000	
Total	39	6628.98	

There are no significant deviations from parallelism and linearity and thus the assay is satisfactory for potency calculations. If the condition of equal upper and lower asymptotes is not fulfilled, significant deviations from linearity and/or parallelism are likely to occur because the tests for linearity and parallelism reflect the goodness of fit of the complete four-parameter model. The residual error in the analysis of variance is always equal to 1 as a result of the transformation. However, a heterogeneity factor (analogous to that for the probit model) can be computed.

The relative potency of the test preparation can be obtained as the antilogarithm of $\gamma_S - \gamma_T$. Multiplying by the assigned potency of the standard yields an estimate of 1.459 × 0.4 = 0.584 IU/ml. Formula 4.2.3.-2 gives 95 per cent confidence limits from 0.557-0.612 IU/ml.

6. COMBINATION OF ASSAY RESULTS

6.1. INTRODUCTION

Replication of independent assays and combination of their results is often needed to fulfil the requirements of the European Pharmacopoeia. The question then arises as to whether it is appropriate to combine the results of such assays and if so in what way.

2 assays may be regarded as mutually independent when the execution of either does not affect the probabilities of the possible outcomes of the other. This implies that the random errors in all essential factors influencing the result (for example, dilutions of the standard and of the preparation to be examined, the sensitivity of the biological indicator) in one assay must be independent of the corresponding random errors in the other one. Assays on successive days using the original and retained dilutions of the standard therefore are not independent assays.

There are several methods for combining the results of independent assays, the most theoretically acceptable being the most difficult to apply. 3 simple, approximate methods are described below; others may be used provided the necessary conditions are fulfilled.

Before potencies from assays based on the parallel-line or probit model are combined they must be expressed in logarithms; potencies derived from assays based on the slope-ratio model are used as such. As the former models are more common than those based on the slope-ratio model, the symbol *M* denoting ln potency is used in the formulae in this section; by reading *R* (slope-ratio) for *M*, the analyst may use the same formulae for potencies derived from assays based on the slope-ratio model. All estimates of potency must be corrected for the potency assigned to each preparation to be examined before they are combined.

6.2. WEIGHTED COMBINATION OF ASSAY RESULTS

This method can be used provided the following conditions are fulfilled:

1) the potency estimates are derived from independent assays;

2) for each assay *C* is close to 1 (say less than 1.1);

3) the number of degrees of freedom of the individual residual errors is not smaller than 6, but preferably larger than 15;

4) the individual potency estimates form a homogeneous set (see Section 6.2.2).

When these conditions are not fulfilled this method cannot be applied. The method described in Section 6.3 may then be used to obtain the best estimate of the mean potency to be adopted in further assays as an assumed potency.

6.2.1. CALCULATION OF WEIGHTING COEFFICIENTS

It is assumed that the results of each of the n' assays have been analysed to give n' values of *M* with associated confidence limits. For each assay the logarithmic confidence interval *L* is obtained by subtracting the lower limit from the upper. A weight *W* for each value of *M* is calculated from equation 6.2.1.-1, where *t* has the same value as that used in the calculation of confidence limits.

$$W = \frac{4t^2}{L^2} \qquad (6.2.1.\text{-}1)$$

6.2.2. HOMOGENEITY OF POTENCY ESTIMATES

By squaring the deviation of each value of *M* from the weighted mean, multiplying by the appropriate weight and summing over all assays, a statistic is obtained which is approximately distributed as χ^2 (see Table 8.3) and which may be used to test the homogeneity of a set of ln potency estimates:

$$\chi^2 \approx \sum_{n'} W\left(M - \overline{M}\right)^2 \quad \text{where} \quad \overline{M} = \frac{\sum WM}{\sum W} \qquad (6.2.2.\text{-}1)$$

If the calculated χ^2 is smaller than the tabulated value corresponding to $(n' - 1)$ degrees of freedom the potencies are homogeneous and the mean potency and limits obtained in Section 6.2.3 will be meaningful.

If the calculated value of this statistic is greater than the tabulated value, the potencies are heterogeneous. This means that the variation between individual estimates of *M* is greater than would have been predicted from the estimates of the confidence limits, i.e. that there is a significant variability between the assays. Under these circumstances condition 4 is not fulfilled and the equations in Section 6.2.3 are no longer applicable. Instead, the formulae in Section 6.2.4 may be used.

6.2.3. CALCULATION OF THE WEIGHTED MEAN AND CONFIDENCE LIMITS

The products *WM* are formed for each assay and their sum divided by the total weight for all assays to give the logarithm of the weighted mean potency.

$$\overline{M} = \frac{\sum WM}{\sum W} \qquad (6.2.3.\text{-}1)$$

The standard error of the ln (mean potency) is taken to be the square root of the reciprocal of the total weight:

$$s_{\overline{M}} = \sqrt{\frac{1}{\sum W}} \qquad (6.2.3.\text{-}2)$$

and approximate confidence limits are obtained from the antilogarithms of the value given by

$$\overline{M} \pm t \times s_{\overline{M}} \qquad (6.2.3.\text{-}3)$$

where the number of degrees of freedom of t equals the sum of the number of degrees of freedom for the error mean squares in the individual assays.

6.2.4. WEIGHTED MEAN AND CONFIDENCE LIMITS BASED ON THE INTRA- AND INTER-ASSAY VARIATION

When results of several repeated assays are combined, the (χ^2-value may be significant. The observed variation is then considered to have two components:

– the intra-assay variation $s_M^2 = 1/W$,

– the inter-assay variation $s_{\overline{M}}^2 = \dfrac{\sum \left(M - \overline{M}\right)^2}{n'\left(n' - 1\right)}$

where $\overline{M}$ is the unweighted mean. The former varies from assay to assay whereas the latter is common to all M.

For each M a weighting coefficient is then calculated as:

$$W' = \frac{1}{s_M^2 + s_{\overline{M}}^2}$$

which replaces W in Section 6.2.3. where t is taken to be approximately 2.

6.3. UNWEIGHTED COMBINATION OF ASSAY RESULTS

To combine the n' estimates of M from n' assays in the simplest way, the mean is calculated and an estimate of its standard deviation is obtained by calculating:

$$s_{\overline{M}}^2 = \frac{\sum \left(M - \overline{M}\right)^2}{n'\left(n' - 1\right)} \qquad (6.3.\text{-}1)$$

and the limits are:

$$\overline{M} \pm t s_{\overline{M}} \qquad (6.3.\text{-}2)$$

where t has (n' – 1) degrees of freedom. The number n' of estimates of M is usually small, and hence the value of t is quite large.

6.4. EXAMPLE OF A WEIGHTED MEAN POTENCY WITH CONFIDENCE LIMITS

Table 6.4.-I lists 6 independent potency estimates of the same preparation together with their 95 per cent confidence limits and the number of degrees of freedom of their error variances. Conditions 1, 2 and 3 in Section 6.2. are met. The ln potencies and the weights are calculated as described in Section 6.2.

Table 6.4.-I. – *Potency estimates and confidence intervals of 6 independent assays*

Potency estimate (I.U./vial)	Lower limit (I.U./vial)	Upper limit (I.U./vial)	Degrees of freedom	ln potency *M*	Weight *W*
18 367	17 755	19 002	20	9.8183	3777.7
18 003	17 415	18 610	20	9.7983	3951.5
18 064	17 319	18 838	20	9.8017	2462.5
17 832	17 253	18 429	20	9.7887	4003.0
18 635	17 959	19 339	20	9.8328	3175.6
18 269	17 722	18 834	20	9.8130	4699.5

Homogeneity of potency estimates is assessed with formula 6.2.2.-1 which gives a χ^2 of 4.42 with 5 degrees of freedom. This is not significant (p = 0.49) and thus all conditions are met.

A weighted mean potency is calculated with formula 6.2.3.-1 which yields 9.8085.

Formula 6.2.3.-2 gives a standard deviation of 0.00673 and approximate 95 per cent confidence limits of 9.7951 and 9.8218 are calculated with formula 6.2.3.-3 where t has 120 degrees of freedom.

By taking the antilogarithms a potency of 18 187 IU/vial is found with 95 per cent confidence limits from 17 946-18 431 IU/vial.

7. BEYOND THIS ANNEX

It is impossible to give a comprehensive treatise of statistical methods in a pharmacopoeial text. However, the methods described in this annex should suffice for most pharmacopoeial purposes. This section tries to give a more abstract survey of alternative or more general methods that have been developed. The interested reader is encouraged to further explore the existing literature in this area. The use of more specialised statistical methods should, in any case, be left to qualified personnel.

7.1. GENERAL LINEAR MODELS

The methods given in this annex can be described in terms of general linear models (or generalised linear models to include the probit and logit methods). The principle is to define a linear structure matrix X (or design matrix) in which each row represents an observation and each column a linear effect (preparation, block, column, dose). For example: the Latin square design in example 5.1.2 would involve a matrix with 36 rows and 13 columns. 1 column for each of the preparations, 1 column for the doses, 5 columns for each block except the first, and 5 columns for each row except the first. All columns, except the one for doses, are filled with 0 or 1 depending on whether or not the observation relates to the effect. A vector Y is filled with the (transformed) observations. The effects are estimated with the formula $(X^tX)^{-1}X^tY$ from which the potency estimate m can easily be derived as a ratio of relevant effects. Confidence intervals are calculated from Fieller's theorem:

$$m_L, m_U = \frac{\left[m - \frac{gv_{12}}{v_{22}} \pm \frac{ts}{b}\sqrt{v_{11} - 2mv_{12} + m^2v_{22} - g\left(v_{11} - \frac{v_{12}^2}{v_{22}}\right)}\right]}{(1-g)}$$

where $g = \dfrac{t^2s^2v_{22}}{b^2}$

and v_{11}, v_{22}, v_{12} represent the variance multipliers for the numerator, the denominator and their covariance multiplier respectively. These are taken directly from $(X^tX)^{-1}$ or indirectly by noting that:

$$\mathrm{Var}(a_1 - a_2) = \mathrm{Var}(a_1) + \mathrm{Var}(a_2) - 2\mathrm{Cov}(a_1, a_2)$$

$$\text{and } \mathrm{Cov}(a_1 - a_2, b) = \mathrm{Cov}(a_1, b) - \mathrm{Cov}(a_2, b)$$

A full analysis of variance in which all components are partitioned is slightly more complicated as it involves a renewed definition of X with more columns to relax the assumptions of parallelism and linearity, after which the linear hypotheses can be tested. For assays depending upon quantal responses the linear effects (intercepts a_S, a_T etc. and the common slope b are found by maximising the sum over treatments of $n\ln\Phi(a_i + bx) + (n - r)\ln(1 - \Phi(a_i + bx))$ where x is the ln(dose), Φ denotes the shape of the distribution and $i \in \{S, T, \ldots\}$.

7.2. HETEROGENEITY OF VARIANCE

Heterogeneity of variance cannot always be solved by simply transforming the responses. A possible way to cope with this problem is to perform a weighted linear regression. In order to obtain an unbiased estimate, the weight of the observations is taken to be proportional to the reciprocal of the error variances. Since the true error variance is not always known, an iterative reweighted linear procedure may be followed. However, the calculation of the confidence interval involves new problems.

7.3. OUTLIERS AND ROBUST METHODS

The method of least squares described in this annex has the disadvantage of being very sensitive to outliers. A clear outlier may completely corrupt the calculations. This problem is often remedied by discarding the outlying result from the dataset. This policy can lead to arbitrary rejection of data and is not always without danger. It is not easy to give a general guideline on how to decide whether or not a specific observation is an outlier and it is for this reason that many robust methods have been developed. These methods are less sensitive to outliers because they give less weight to observations that are far away from the predicted value. New problems usually arise in computing confidence intervals or defining a satisfactory function to be minimised.

7.4. CORRELATED ERRORS

Absolute randomisation is not always feasible or very undesirable from a practical point of view. Thus, subsequent doses within a dilution series often exhibit correlated errors leading to confidence limits that are far too narrow. Some methods have been developed that take account of this autocorrelation effect.

7.5. EXTENDED NON-LINEAR DOSE-RESPONSE CURVES

Analysis of extended non-linear dose-response curves raises a number of statistical questions which require consideration, and for which professional advice is recommended. Some of these are indicated below.

1) An example using the four-parameter logistic function has been shown. However, models based on functions giving other sigmoid curves may also be used. Models incorporating additional asymmetry parameters have been suggested.

2) Heterogeneity of variance is common when responses cover a wide range. If the analysis ignores the heterogeneity, interpretation of results may not be correct and estimates may be biased. Use of the reciprocal of the error variances as weights is unlikely to be reliable with limited numbers of replicates. It may be appropriate to estimate a function which relates variance to mean response.

3) The statistical curve-fitting procedures may give different estimates depending on assumptions made about the homogeneity of the variance and on the range of responses used.

4) In principle, equality of upper and lower response limits for the different preparations included in an assay can be directly tested in each assay. However, interpretation of the results of these tests may not be straightforward. The tests for linearity and parallelism given by the simplified method of analysis (Example 5.4.1) indirectly incorporate tests for equality and accuracy of upper and lower limits.

5) Many assays include “controls” which are intended to identify the upper and/or lower response limits. However, these values may not be consistent with the statistically fitted upper and lower response limits based on the extended dose-response curve.

6) The simplified method of analysis given in Example 5.4.1 provides approximate confidence intervals. Other methods may also be used, for example intervals based on lack-of-fit of the completely specified model. For typical assay data, with responses covering the complete range for each preparation tested, all methods give similar results.

7.6. NON-PARALLELISM OF DOSE-RESPONSE CURVES

Similarity of dose-response relationships is a fundamental criterion for assessing whether an assay may be regarded as a dilution assay and hence whether the estimation of relative potency is valid (see Section 3.1.1). This criterion is frequently met by showing that dose-response curves for standard and test samples do not deviate significantly from parallelism. Underestimation of the residual error can lead to excess rejection of assays due to significant deviations from parallelism and/or linearity. This is often an artefact of inappropriate assay design or analysis. Minor modifications to assay designs might in many cases substantially improve the estimation of the residual error. Analysis allowing for the actual level of replication may also improve the situation. If estimation of the relevant residual error is not feasible for individual assays, for example because it is impractical to create independent doses and/or replicates, it might be possible to obtain a more correct estimate of the residual error during the assay validation process. There may also be cases where the assay system is sufficiently precise to detect slight but genuine non-parallelism. If there is true non-parallelism this needs to be recognised and a suitable solution adopted. A solution might, for example, require a suitable standard that is similar in composition to, and therefore parallel to, the test samples. If the assay system is responding in a non-specific manner to extraneous components of the standard or test samples, then a more specific assay system that does not respond to the irrelevant components may be the solution. No simple, generally applicable statistical solution exists to overcome these fundamental problems. The appropriate action has to be decided on a case-by-case basis with the help of statistical expertise.

8. TABLES AND GENERATING PROCEDURES

The tables in this section list the critical values for the most frequently occurring numbers of degrees of freedom. If a critical value is not listed, reference should be made to more extensive tables. Many computer programs include statistical functions and their use is recommended instead

of the tables in this section. Alternatively, the generating procedures given below each table can be used to compute the probability corresponding to a given statistic and number of degrees of freedom.

8.1. THE *F*-DISTRIBUTION

If an observed value is higher than the value in Table 8.1.-I, it is considered to be significant (upper lines, $p = 0.05$) or highly significant (lower lines, $p = 0.01$). *df*1 is the number of degrees of freedom of the numerator and *df*2 is the number of degrees of freedom of the denominator.

Generating procedure. Let `F` be the *F*-ratio and `df1` and `df2` as described above. Let `pi` = π = 3.14159265358979... The procedure in Table 8.1.-II will then generate the *p*-value.

8.2. THE *t*-DISTRIBUTION

If an observed value is higher than the value in Table 8.2.-I, it is considered to be significant ($p = 0.05$) or highly significant ($p = 0.01$).

Generating procedures. The *p*-value for a given *t* with df degrees of freedom can be found with the procedures in Section 8.1 where `F` = t^2, `df1` = 1 and `df2` = df.

Table 8.1.-I — *Critical values of the F-distribution*

df1 → / **df2 ↓**	**1**	**2**	**3**	**4**	**5**	**6**	**8**	**10**	**12**	**15**	**20**	**∞**

Table 8.1.-II — *Generating procedure for the F-distribution*

If df1 is even	**If df1 is odd and df2 is even**	**If df1 and df2 are odd**
`x=df1/(df1+df2/F)`	`x=df2/(df2+df1*F)`	`x=atn(sqr(df1*F/df2))`
`s=1`	`s=1`	`cs=cos(x)`
`t=1`	`t=1`	`sn=sin(x)`
`for i=2 to (df1-2) step 2`	`for i=2 to (df2-2) step 2`	`x=x/2`
`t=t*x*(df2+i-2)/i`	`t=t*x*(df1+i-2)/i`	`s=0`
`s=s+t`	`s=s+t`	`t=sn*cs/2`
`next i`	`next i`	`v=0`
`p=s*(1-x)^(df2/2)`	`p=1-s*(1-x)^(df1/2)`	`w=1`
		`for i=2 to (df2-1) step 2`
		`s=s+t`
		`t=t*i/(i+1)*cs*cs`
		`next i`
		`for i=1 to (df1-2) step 2`
		`v=v+w`
		`w=w*(df2+i)/(i+2)*sn*sn`
		`next i`
		`p=1+(t*df2*v-x-s)/pi*4`

The *t*-value ($p = 0.05$) for a given number of degrees of freedom df can be found with the procedure in Table 8.2.-II, which should be accurate up to 6 decimal places.

Table 8.2.-I — *Critical values of the t-distribution*

df	$p = 0.05$	$p = 0.01$	df	$p = 0.05$	$p = 0.01$

    2.56449/df^3+
    1.51956/df^4+
    1.02579/df^5+
    0.44210/df^7
```

8.3. THE χ^2-DISTRIBUTION

Table 8.3.-I — *Critical values of the χ^2-distribution*

df	$p = 0.05$	$p = 0.01$	df	$p = 0.05$	$p = 0.01$
1	3.841	6.635	11	19.675	24.725
2	5.991	9.210	12	21.026	26.217
3	7.815	11.345	13	22.362	27.688
4	9.488	13.277	14	23.685	29.141
5	11.070	15.086	15	24.996	30.578
6	12.592	16.812	16	26.296	32.000
7	14.067	18.475	20	31.410	37.566
8	15.507	20.090	25	37.652	44.314
9	16.919	21.666	30	43.773	50.892
10	18.307	23.209	40	55.758	63.691

If an observed value is higher than the value in Table 8.3.-I, it is considered to be significant ($p = 0.05$) or highly significant ($p = 0.01$).

Generating procedure. Let `X2` be the χ^2-value and `df` as described above. The procedure in Table 8.3.-II will then generate the *p*-value.

Table 8.3.-II — *Generating procedure for the χ^2-distribution*

If df is even	If df is odd
`s=0`	`x=sqr(x2)`
`t=exp(-x2/2)`	`s=0`
`for i=2 to df step 2`	`t=x*exp(-x2/2)/sqr(pi/2)`
`s=s+t`	`for i=3 to df step 2`
`t=t*x2/i`	`s=s+t`
`next i`	`t=t*x2/i`
`p=1-s`	`next i`
	`p=1-s-2*phi(x)`

In this procedure `phi` is the cumulative standard normal distribution function Φ (see Section 8.4).

8.4. THE Φ-DISTRIBUTION (THE CUMULATIVE STANDARD NORMAL DISTRIBUTION)

Table 8.4.-I — *Values of the Φ-distribution*

x	Φ	x	Φ	x	Φ
0.00	0.500	1.00	0.841	2.00	0.977
0.05	0.520	1.05	0.853	2.05	0.980
0.10	0.540	1.10	0.864	2.10	0.982
0.15	0.560	1.15	0.875	2.15	0.984
0.20	0.579	1.20	0.885	2.20	0.986
0.25	0.599	1.25	0.894	2.25	0.988
0.30	0.618	1.30	0.903	2.30	0.989
0.35	0.637	1.35	0.911	2.35	0.991
0.40	0.655	1.40	0.919	2.40	0.992
0.45	0.674	1.45	0.926	2.45	0.993
0.50	0.691	1.50	0.933	2.50	0.994
0.55	0.709	1.55	0.939	2.55	0.995
0.60	0.726	1.60	0.945	2.60	0.995
0.65	0.742	1.65	0.951	2.65	0.996
0.70	0.758	1.70	0.955	2.70	0.997
0.75	0.773	1.75	0.960	2.75	0.997
0.80	0.788	1.80	0.964	2.80	0.997
0.85	0.802	1.85	0.968	2.85	0.998
0.90	0.816	1.90	0.971	2.90	0.998
0.95	0.829	1.95	0.974	2.95	0.998

The Φ-value for negative *x* is found from Table 8.4.-I as $1 - \Phi(-x)$.

Generating procedure: Let x be the *x*-value. The procedure in Table 8.4.-II will generate the corresponding Φ-value if $0 \leq x \leq 8.15$. If *x* is greater than 8.15 the Φ-value can be set to 1. If *x* is negative, the formula given above can be used. This procedure assumes that the computer can represent about 15 decimal places. If less digits or more digits can be represented, the procedure needs some trivial modifications.

Table 8.4.-II – *Generating procedure for the Φ-distribution*

```
s=0
t=x
i=1
repeat
s=s+t
i=i+2
t=t*x*x/i
until t<1E-16
phi=0.5+s*exp(-x*x/2)/sqr(2*pi)
```

8.5. RANDOM PERMUTATIONS

Random permutations are needed in randomised block designs. The following algorithm shows how the built-in random generator of a computer can be used to create random permutations of *N* treatments.

Step 1. Write the *N* possible treatments down in a row.

Step 2. Obtain a random integer *r* such that $1 \leq r \leq N$.

Step 3. Exchange the *r*-th treatment with the *N*-th treatment in the row.

Step 4. Let $N = N - 1$ and repeat steps 2 to 4 until $N = 1$.

An example with 6 treatments will illustrate this algorithm.

1.	$N = 6$	S_1	S_2	S_3	T_1	T_2	T_3
2.	$r = 2$		→				←
3.		S_1	T_3	S_3	T_1	T_2	S_2
4.	$N = 5$						
2.	$r = 4$				→	←	
3.		S_1	T_3	S_3	T_2	T_1	S_2
4.	$N = 4$						
2.	$r = 4$				↓		
3.		S_1	T_3	S_3	T_2	T_1	S_2
4.	$N = 3$						
2.	$r = 1$	→		←			
3.		S_3	T_3	S_1	T_2	T_1	S_2
4.	$N = 2$						
2.	$r = 1$	→	←				
3.		T_3	S_3	S_1	T_2	T_1	S_2
4.	$N = 1$						

8.6. LATIN SQUARES

The following example shows how 3 independent permutations can be used to obtain a Latin square.

1) Generate a random permutation of the *N* possible treatments (see Section 8.5):

T_3	S_3	S_1	T_2	T_1	S_2

2) A simple Latin square can now be constructed by "rotating" this permutation to the right. This can be done as follows. Write the permutation found in step 1 down on the first row. The second row consists of the same permutation, but with all treatments shifted to the right. The rightmost treatment is put on the empty place at the left. This is repeated for all the rows until all the treatments appear once in each column:

T_3	S_3	S_1	T_2	T_1	S_2
S_2	T_3	S_3	S_1	T_2	T_1
T_1	S_2	T_3	S_3	S_1	T_2
T_2	T_1	S_2	T_3	S_3	S_1
S_1	T_2	T_1	S_2	T_3	S_3
S_3	S_1	T_2	T_1	S_2	T_3

3) Generate 2 independent random permutations of the figures 1 to *N*:

– one for the rows:

2	**3**	**6**	**1**	**4**	**5**

– and one for the columns:

3	**4**	**6**	**2**	**5**	**1**

4) The Latin square can now be found by sorting the rows and columns of the simple Latin square according to the 2 permutations for the rows and columns:

	3	4	6	2	5	1
2	T_3	S_3	S_1	T_2	T_1	S_2
3	S_2	T_3	S_3	S_1	T_2	T_1
6	T_1	S_2	T_3	S_3	S_1	T_2
1	T_2	T_1	S_2	T_3	S_3	S_1
4	S_1	T_2	T_1	S_2	T_3	S_3
5	S_3	S_1	T_2	T_1	S_2	T_3
			↓			
	1	2	3	4	5	6
1	S_1	T_3	T_2	T_1	S_3	S_2
2	S_2	T_2	T_3	S_3	T_1	S_1
3	T_1	S_1	S_2	T_3	T_2	S_3
4	S_3	S_2	S_1	T_2	T_3	T_1
5	T_3	T_1	S_3	S_1	S_2	T_2
6	T_2	S_3	T_1	S_2	S_1	T_3

9. GLOSSARY OF SYMBOLS

Symbol	Definition
a	Intersection of linear regression of responses on dose or ln(dose)
b	Slope of linear regression of responses on dose or on ln(dose)

Symbol	Definition
d	Number of dose levels for each preparation (excluding the blank in slope-ratio assays)
e	Base of natural logarithms (= 2.71828182845905...)
g	Statistic used in Fieller's theorem: $g = \frac{C-1}{C}$
h	Number of preparations in an assay, including the standard preparation
m	Potency estimate obtained as a ratio of effects in general linear models
n	Number of replicates for each treatment
p	Probability of a given statistic being larger than the observed value. Also used as the ratio r/n in probit analysis
r	The number of responding units per treatment group in assays depending upon quantal responses
s	Estimate of standard deviation ($= \sqrt{s^2}$)
s^2	Estimate of residual variance given by error mean square in analysis of variance
t	Student's statistic (Table 8.2.)
u	Observed response in four-parameter analysis
v_{11}, v_{12}, v_{22}	(Co)variance multipliers for numerator and denominator of ratio m in Fieller's theorem
w	Weighting coefficient
x	The ln(dose)
y	Individual response or transformed response
A	Assumed potencies of test preparations when making up doses
B	Mean response to blanks in slope-ratio assays
C	Statistic used in the calculation of confidence intervals: $C = \frac{1}{1-g}$
$C_1, \ldots, C_n$	Mean response to each column of a Latin square design
D_1, D_2	Mean response on time 1 or time 2 in the twin cross-over design
F	Ratio of 2 independent estimates of variance following an F-distribution (Table 8.1.)
$G_S, G_T, \ldots$	Treatment values used in the analysis of variance for slope-ratio assays
H_P, H_L	Multipliers used in the analysis of variance for parallel-line assays
H_B, H_I	Multipliers used in the analysis of variance for slope-ratio assays
I	In parallel-line assays, the ln of the ratio between adjacent doses. In slope-ratio assays, the interval between adjacent doses
$J_S, J_T, \ldots$	Linearity values used in the analysis of variance for slope-ratio assays
K	Correction term used in the calculation of sums of squares in the analysis of variance
L	Width of confidence interval in logarithms
$L_S, L_T, \ldots$	Linear contrasts of standard and test preparations
M'	ln potency ratio of a given test preparation
N	Total number of treatments in the assay (= dh)
$P_S, P_T, \ldots$	Sum of standard and test preparations
R	Estimated potency of a given test preparation
R'	Potency ratio of a given test preparation
$R_1, \ldots, R_n$	Mean response in each of rows 1 to n of a Latin square design, or in each block of a randomised block design
S	Standard preparation
$S_1, \ldots, S_d$	Mean response to the lowest dose 1 up to the highest dose d of the standard preparation S
SS	Sum of squares due to a given source of variation
$T, U, V, \ldots$	Test preparations
$T_1, \ldots, T_d$	Mean response to the lowest dose 1 up to the highest dose d of test preparation T
V	Variance coefficient in the calculation of confidence limits
W	Weighting factor in combination of assay results
X	Linear structure or design matrix used in general linear models
Y	Vector representing the (transformed) responses in general linear models
Z	The first derivative of Φ
α	Upper asymptote of the ln(dose)-response curve in four-parameter analysis

Symbol	Definition
β	Slope-factor of the ln(dose)-response curve in four-parameter analysis
γ	The ln(dose) giving 50 per cent response in the four-parameter analysis
δ	Lower asymptote of the ln(dose)-response curve in four-parameter analysis
π	3.141592653589793238...
Φ	Cumulative standard normal distribution function (Table 8.4.)
χ^2	Chi-square statistic (Table 8.3.)

5.4. RESIDUAL SOLVENTS

5.4. Residual solvents.. 603

01/2008:50400

5.4. RESIDUAL SOLVENTS

LIMITING RESIDUAL SOLVENT LEVELS IN ACTIVE SUBSTANCES, EXCIPIENTS AND MEDICINAL PRODUCTS

The International Conference on Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH) has adopted Impurities Guidelines for Residual Solvents which prescribes limits for the content of solvents which may remain in active substances, excipients and medicinal products after processing. This guideline, the text of which is reproduced below, excludes existing marketed products. The European Pharmacopoeia is, however, applying the same principles enshrined in the guideline to existing active substances, excipients and medicinal products whether or not they are the subject of a monograph of the Pharmacopoeia. All substances and products are to be tested for the content of solvents likely to be present in a substance or product.

Where the limits to be applied comply with those given below, tests for residual solvents are not generally mentioned in specific monographs since the solvents employed may vary from one manufacturer to another and the requirements of this general chapter are applied via the general monograph on *Substances for Pharmaceutical Use (2034)*. The competent authority is to be informed of the solvents employed during the production process. This information is also given in the dossier submitted for a certificate of suitability of the monographs of the European Pharmacopoeia and is mentioned on the certificate.

Where only Class 3 solvents are used, a test for loss on drying may be applied or a specific determination of the solvent may be made. If for a Class 3 solvent a justified and authorised limit higher than 0.5 per cent is applied, a specific determination of the solvent is required.

When Class 1 residual solvents or Class 2 residual solvents (or Class 3 residual solvents which exceed the 0.5 per cent) are used, the methodology described in the general method (*2.4.24*) is to be applied wherever possible. Otherwise an appropriate validated method is to be employed.

When a quantitative determination of a residual solvent is carried out, the result is taken into account for the calculation of the content of the substance except where a test for drying is carried out.

APPENDIX 3. METHODS FOR ESTABLISHING EXPOSURE LIMITS

1. INTRODUCTION

The objective of this guideline is to recommend acceptable amounts of residual solvents in pharmaceuticals for the safety of the patient. The guideline recommends the use of less toxic solvents and describes levels considered to be toxicologically acceptable for some residual solvents.

Residual solvents in pharmaceuticals are defined here as organic volatile chemicals that are used or produced in the manufacture of active substances or excipients, or in the preparation of medicinal products. The solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of active substance may enhance the yield, or determine characteristics such as crystal form, purity, and solubility. Therefore, the solvent may sometimes be a critical parameter in the synthetic process. This guideline does not address solvents deliberately used as excipients nor does it address solvates. However, the content of solvents in such products should be evaluated and justified.

Since there is no therapeutic benefit from residual solvents, all residual solvents should be removed to the extent possible to meet product specifications, good manufacturing practices, or other quality-based requirements. Medicinal products should contain no higher levels of residual solvents than can be supported by safety data. Some solvents that are known to cause unacceptable toxicities (Class 1, Table 1) should be avoided in the production of active substances, excipients, or medicinal products unless their use can be strongly justified in a risk-benefit assessment. Some solvents associated with less severe toxicity (Class 2, Table 2) should be limited in order to protect patients from potential adverse effects. Ideally, less toxic solvents (Class 3, Table 3) should be used where practical. The complete list of solvents included in this guideline is given in Appendix 1.

The lists are not exhaustive and other solvents can be used and later added to the lists. Recommended limits of Class 1 and 2 solvents or classification of solvents may change as new safety data becomes available. Supporting safety data in a marketing application for a new medicinal product containing a new solvent may be based on concepts in this guideline or the concept of qualification of impurities as expressed in the guideline for active substances (*Q3A*, Impurities in New Active Substances) or medicinal products (*Q3B*, Impurities in New Medicinal Products), or all three guidelines.

2. SCOPE OF THE GUIDELINE

Residual solvents in active substances, excipients, and in medicinal products are within the scope of this guideline. Therefore, testing should be performed for residual solvents when production or purification processes are known to result in the presence of such solvents. It is only necessary to test for solvents that are used or produced in the manufacture or purification of active substances, excipients, or medicinal product. Although manufacturers may choose to test the medicinal product, a cumulative method may be used to calculate the residual solvent levels in the medicinal product from the levels in the ingredients used to produce the medicinal product. If the calculation results in a level equal to or below that recommended in this guideline, no testing of the medicinal product for residual solvents need be considered. If however, the calculated level is above the recommended level, the medicinal product should be tested to ascertain whether the formulation process has reduced the relevant solvent level to within the acceptable amount. Medicinal product should also be tested if a solvent is used during its manufacture.

This guideline does not apply to potential new active substances, excipients, or medicinal products used during the clinical research stages of development, nor does it apply to existing marketed medicinal products.

The guideline applies to all dosage forms and routes of administration. Higher levels of residual solvents may be acceptable in certain cases such as short term (30 days or less) or topical application. Justification for these levels should be made on a case by case basis.

See Appendix 2 for additional background information related to residual solvents.

3. GENERAL PRINCIPLES

3.1. CLASSIFICATION OF RESIDUAL SOLVENTS BY RISK ASSESSMENT

The term “tolerable daily intake” (TDI) is used by the International Program on Chemical Safety (IPCS) to describe exposure limits of toxic chemicals and “acceptable daily intake” (ADI) is used by the World Health Organisation (WHO) and other national and international health authorities and institutes. The new term “permitted daily exposure” (PDE) is defined in the present guideline as a pharmaceutically acceptable intake of residual solvents to avoid confusion of differing values for ADI’s of the same substance.

Residual solvents assessed in this guideline are listed in Appendix 1 by common names and structures. They were evaluated for their possible risk to human health and placed into one of three classes as follows:

Class 1 solvents: Solvents to be avoided

Known human carcinogens, strongly suspected human carcinogens, and environmental hazards.

Class 2 solvents: Solvents to be limited

Non-genotoxic animal carcinogens or possible causative agents of other irreversible toxicity such as neurotoxicity or teratogenicity.

Solvents suspected of other significant but reversible toxicities.

Class 3 solvents: Solvents with low toxic potential

Solvents with low toxic potential to man; no health-based exposure limit is needed. Class 3 solvents have PDEs of 50 mg or more per day.

3.2. METHODS FOR ESTABLISHING EXPOSURE LIMITS

The method used to establish permitted daily exposures for residual solvents is presented in Appendix 3. Summaries of the toxicity data that were used to establish limits are published in *Pharmeuropa*, Vol. 9, No. 1, Supplement April 1997.

3.3. OPTIONS FOR DESCRIBING LIMITS OF CLASS 2 SOLVENTS

Two options are available when setting limits for Class 2 solvents.

Option 1: The concentration limits in ppm stated in Table 2 can be used. They were calculated using equation (1) below by assuming a product mass of 10 g administered daily.

$$\text{Concentration (ppm)} = \frac{1000 \times \text{PDE}}{\text{dose}} \qquad (1)$$

Here, PDE is given in terms of mg/day and dose is given in g/day.

These limits are considered acceptable for all substances, excipients, or products. Therefore this option may be applied if the daily dose is not known or fixed. If all excipients and active substances in a formulation meet the limits given in Option 1, then these components may be used in any proportion. No further calculation is necessary provided the daily dose does not exceed 10 g. Products that are administered in doses greater than 10 g per day should be considered under Option 2.

Option 2: It is not considered necessary for each component of the medicinal product to comply with the limits given in Option 1. The PDE in terms of mg/day as stated in Table 2 can be used with the known maximum daily dose and equation (1) above to determine the concentration of residual solvent allowed in a medicinal product. Such limits are considered acceptable provided that is has been demonstrated that the residual solvent has been reduced to the practical minimum. The limits should be realistic in relation to analytical precision, manufacturing capability, reasonable variation in the manufacturing process, and the limits should reflect contemporary manufacturing standards.

Option 2 may be applied by adding the amounts of a residual solvent present in each of the components of the medicinal product. The sum of the amounts of solvent per day should be less than that given by the PDE.

Consider an example of the use of Option l and Option 2 applied to acetonitrile in a medicinal product. The permitted daily exposure to acetonitrile is 4.1 mg per day; thus, the Option 1 limit is 410 ppm. The maximum administered daily mass of a medicinal product is 5.0 g, and the medicinal product contains two excipients. The composition of the medicinal product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in formulation	Acetonitrile content	Daily exposure
Active substance	0.3 g	800 ppm	0.24 mg
Excipient 1	0.9 g	400 ppm	0.36 mg
Excipient 2	3.8 g	800 ppm	3.04 mg
Medicinal product	5.0 g	728 ppm	3.64 mg

Excipient l meets the Option l limit, but the drug substance, excipient 2, and medicinal product do not meet the Option l limit. Nevertheless, the product meets the Option 2 limit of 4.l mg per day and thus conforms to the recommendations in this guideline.

Consider another example using acetonitrile as residual solvent. The maximum administered daily mass of a medicinal product is 5.0 g, and the medicinal product contains two excipients. The composition of the medicinal product and the calculated maximum content of residual acetonitrile is given in the following table.

Component	Amount in formulation	Acetonitrile content	Daily exposure
Active substance	0.3 g	800 ppm	0.24 mg
Excipient 1	0.9 g	2000 ppm	1.80 mg
Excipient 2	3.8 g	800 ppm	3.04 mg
Medicinal product	5.0 g	1016 ppm	5.08 mg

In this example, the product meets neither the Option 1 nor the Option 2 limit according to this summation. The manufacturer could test the medicinal product to determine if the formulation process reduced the level of acetonitrile. If the level of acetonitrile was not reduced during formulation to the allowed limit, then the manufacturer of the medicinal product should take other steps to reduce the amount of acetonitrile in the medicinal product. If all of these steps fail to reduce the level of residual solvent, in exceptional cases the manufacturer could provide a summary of efforts made to reduce the solvent level to meet the guideline value, and provide a risk-benefit analysis to support allowing the product to be utilised containing residual solvent at a higher level.

3.4. ANALYTICAL PROCEDURES

Residual solvents are typically determined using chromatographic techniques such as gas chromatography. Any harmonised procedures for determining levels of residual solvents as described in the pharmacopoeias should be used, if feasible. Otherwise, manufacturers would be free to select the most appropriate validated analytical procedure for a particular application. If only Class 3 solvents are present, a non-specific method such as loss on drying may be used.

Validation of methods for residual solvents should conform to ICH guidelines “Text on Validation of Analytical Procedures” and “Extension of the ICH Text on Validation of Analytical Procedures”.

3.5. REPORTING LEVELS OF RESIDUAL SOLVENTS

Manufacturers of pharmaceutical products need certain information about the content of residual solvents in excipients or active substances in order to meet the criteria of this guideline. The following statements are given as acceptable examples of the information that could be provided from a supplier of excipients or active substances to a pharmaceutical manufacturer. The supplier might choose one of the following as appropriate:

– Only Class 3 solvents are likely to be present. Loss on drying is less than 0.5 per cent.
– Only Class 2 solvents X, Y, ... are likely to be present. All are below the Option 1 limit

  (Here the supplier would name the Class 2 solvents represented by X, Y, ...)
– Only Class 2 solvents X, Y, ... and Class 3 solvents are likely to be present. Residual Class 2 solvents are below the Option 1 limit and residual Class 3 solvents are below 0.5 per cent.

If Class 1 solvents are likely to be present, they should be identified and quantified. “Likely to be present” refers to the solvent used in the final manufacturing step and to solvents that are used in earlier manufacturing steps and not removed consistently by a validated process.

If solvents of Class 2 or Class 3 are present at greater than their Option 1 limits or 0.5 per cent, respectively, they should be identified and quantified.

4. LIMITS OF RESIDUAL SOLVENTS

4.1. SOLVENTS TO BE AVOIDED

Solvents in Class 1 should not be employed in the manufacture of active substances, excipients, and medicinal products because of their unacceptable toxicity or their deleterious environmental effect. However, if their use is unavoidable in order to produce a medicinal product with a significant therapeutic advance, then their levels should be restricted as shown in Table 1, unless otherwise justified. 1,1,1-Trichloroethane is included in Table 1 because it is an environmental hazard. The stated limit of 1500 ppm is based on a review of the safety data.

Table 1. – *Class 1 solvents in pharmaceutical products (solvents that should be avoided)*

Solvent	Concentration limit (ppm)	Concern
Benzene	2	Carcinogen
Carbon tetrachloride	4	Toxic and environmental hazard
1,2-Dichloroethane	5	Toxic
1,1-Dichloroethene	8	Toxic
1,1,1-Trichloroethane	1500	Environmental hazard

4.2. SOLVENTS TO BE LIMITED

Solvents in Table 2 should be limited in pharmaceutical products because of their inherent toxicity. PDEs are given to the nearest 0.1 mg/day, and concentrations are given to the nearest 10 ppm. The stated values do not reflect the necessary analytical precision of determination. Precision should be determined as part of the validation of the method.

Table 2. – *Class 2 solvents in pharmaceutical products*

Solvent	PDE (mg/day)	Concentration limit (ppm)
Acetonitrile	4.1	410
Chlorobenzene	3.6	360
Chloroform	0.6	60
Cyclohexane	38.8	3880
1,2-Dichloroethene	18.7	1870
Dichloromethane	6.0	600
1,2-Dimethoxyethane	1.0	100
N,N-Dimethylacetamide	10.9	1090
N,N-Dimethylformamide	8.8	880
1,4-Dioxane	3.8	380
2-Ethoxyethanol	1.6	160
Ethyleneglycol	6.2	620

Solvent	PDE (mg/day)	Concentration limit (ppm)
Formamide	2.2	220
Hexane	2.9	290
Methanol	30.0	3000
2-Methoxyethanol	0.5	50
Methylbutylketone	0.5	50
Methylcyclohexane	11.8	1180
N-Methylpyrrolidone	5.3	530
Nitromethane	0.5	50
Pyridine	2.0	200
Sulfolane	1.6	160
Tetrahydrofuran	7.2	720
Tetralin	1.0	100
Toluene	8.9	890
1,1,2-Trichloroethene	0.8	80
Xylene*	21.7	2170

*usually 60 per cent *m*-xylene, 14 per cent *p*-xylene,9 per cent *o*-xylene with 17 per cent ethyl benzene

4.3. SOLVENTS WITH LOW TOXIC POTENTIAL

Solvents in Class 3 (shown in Table 3) may be regarded as less toxic and of lower risk to human health. Class 3 includes no solvent known as a human health hazard at levels normally accepted in pharmaceuticals. However, there are no long-term toxicity or carcinogenicity studies for many of the solvents in Class 3. Available data indicate that they are less toxic in acute or short-term studies and negative in genotoxicity studies. It is considered that amounts of these residual solvents of 50 mg per day or less (corresponding to 5000 ppm or 0.5 per cent under Option l) would be acceptable without justification. Higher amounts may also be acceptable provided they are realistic in relation to manufacturing capability and good manufacturing practice.

Table 3. – *Class 3 solvents which should be limited by GMP or other quality-based requirements*

Acetic acid	Heptane
Acetone	Isobutyl acetate
Anisole	Isopropyl acetate
1-Butanol	Methyl acetate
2-Butanol	3-Methyl-1-butanol
Butyl acetate	Methylethylketone
tert-Butylmethyl ether	Methylisobutylketone
Cumene	2-Methyl-l-propanol
Dimethyl sulphoxide	Pentane
Ethanol	1-Pentanol
Ethyl acetate	1-Propanol
Ethyl ether	2-Propanol
Ethyl formate	Propyl acetate
Formic acid	

4.4. SOLVENTS FOR WHICH NO ADEQUATE TOXICOLOGICAL DATA WAS FOUND

The following solvents (Table 4) may also be of interest to manufacturers of excipients, active substances, or medicinal products. However, no adequate toxicological data on which to base a PDE was found. Manufacturers should supply justification for residual levels of these solvents in pharmaceutical products.

Table 4. – *Solvents for which no adequate toxicological data was found*

1,1-Diethoxypropane	Methylisopropylketone
1,1-Dimethoxymethane	Methyltetrahydrofuran
2,2-Dimethoxypropane	Petroleum ether
Isooctane	Trichloroacetic acid
Isopropyl ether	Trifluoroacetic acid

GLOSSARY

Genotoxic carcinogens: Carcinogens which produce cancer by affecting genes or chromosomes.

LOEL: Abbreviation for lowest-observed effect level.

Lowest-observed effect level: The lowest dose of substance in a study or group of studies that produces biologically significant increases in frequency or severity of any effects in the exposed humans or animals.

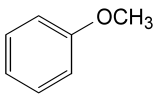
Modifying factor: A factor determined by professional judgement of a toxicologist and applied to bioassay data to relate that data safely to humans.

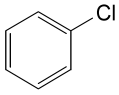
Neurotoxicity: The ability of a substance to cause adverse effects on the nervous system.

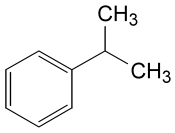
NOEL: Abbreviation for *no-observed-effect level.*

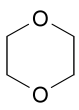
No-observed-effect level: The highest dose of substance at which there are no biologically significant increases in frequency or severity of any effects in the exposed humans or animals.

PDE: Abbreviation for *permitted daily exposure.*

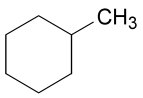


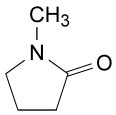


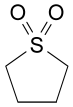




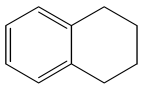
Permitted daily exposure: The maximum acceptable intake per day of residual solvent in pharmaceutical products.

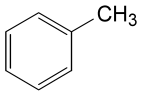


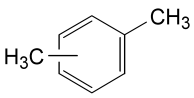




Reversible toxicity: The occurrence of harmful effects that are caused by a substance and which disappear after exposure to the substance ends.







Strongly suspected human carcinogen: A substance for which there is no epidemiological evidence of carcinogenesis but there are positive genotoxicity data and clear evidence of carcinogenesis in rodents.

Teratogenicity: The occurrence of structural malformations in a developing foetus when a substance is administered during pregnancy.

APPENDIX 1. LIST OF SOLVENTS INCLUDED IN THE GUIDELINE

Solvent	Other Names	Structure	Class
Acetic acid	Ethanoic acid	CH_3COOH	Class 3
Acetone	2-Propanone Propan-2-one	CH_3COCH_3	Class 3
Acetonitrile		CH_3CN	Class 2
Anisole	Methoxybenzene		Class 3
Benzene	Benzol		Class 1
1-Butanol	*n*-Butyl alcohol Butan-1-ol	$CH_3[CH_2]_3OH$	Class 3
2-Butanol	*sec*-Butyl alcohol Butan-2-ol	$CH_3CH_2CH(OH)CH_3$	Class 3
Butyl acetate	Acetic acid butyl ester	$CH_3COO[CH_2]_3CH_3$	Class 3
tert-Butylmethyl ether	2-Methoxy-2-methylpropane	$(CH_3)_3COCH_3$	Class 3
Carbon tetrachloride	Tetrachloromethane	CCl_4	Class 1
Chlorobenzene			Class 2
Chloroform	Trichloromethane	$CHCl_3$	Class 2
Cumene	Isopropylbenzene (1-Methylethyl)benzene		Class 3
Cyclohexane	Hexamethylene		Class 2
1,2-Dichloroethane	*sym*-Dichloroethane Ethylene dichloride Ethylene chloride	CH_2ClCH_2Cl	Class 1
1,1-Dichloroethene	1,1-Dichloroethylene Vinylidene chloride	$H_2C=CCl_2$	Class 1
1,2-Dichloroethene	1,2-Dichloroethylene Acetylene dichloride	$ClHC=CHCl$	Class 2
Dichloromethane	Methylene chloride	CH_2Cl_2	Class 2
1,2-Dimethoxyethane	Ethyleneglycol dimethyl ether Monoglyme Dimethyl cellosolve	$H_3COCH_2CH_2OCH_3$	Class 2
N,N-Dimethylacetamide	DMA	$CH_3CON(CH_3)_2$	Class 2
N,N-Dimethylformamide	DMF	$HCON(CH_3)_2$	Class 2
Dimethyl sulphoxide	Methylsulphinylmethane Methyl sulphoxide DMSO	$(CH_3)_2SO$	Class 3
1,4-Dioxane	*p*-Dioxane [1,4]Dioxane		Class 2
Ethanol	Ethyl alcohol	CH_3CH_2OH	Class 3
2-Ethoxyethanol	Cellosolve	$CH_3CH_2OCH_2CH_2OH$	Class 2
Ethyl acetate	Acetic acid ethyl ester	$CH_3COOCH_2CH_3$	Class 3
Ethyleneglycol	1,2-Dihydroxyethane 1,2-Ethanediol	$HOCH_2CH_2OH$	Class 2

Solvent	Other Names	Structure	Class
Ethyl ether	Diethyl ether Ethoxyethane 1,1′-Oxybisethane	$CH_3CH_2OCH_2CH_3$	Class 3
Ethyl formate	Formic acid ethyl ester	$HCOOCH_2CH_3$	Class 3
Formamide	Methanamide	$HCONH_2$	Class 2
Formic acid		$HCOOH$	Class 3
Heptane	*n*-Heptane	$CH_3[CH_2]_5CH_3$	Class 3
Hexane	*n*-Hexane	$CH_3[CH_2]_4CH_3$	Class 2
Isobutyl acetate	Acetic acid isobutyl ester	$CH_3COOCH_2CH(CH_3)_2$	Class 3
Isopropyl acetate	Acetic acid isopropyl ester	$CH_3COOCH(CH_3)_2$	Class 3
Methanol	Methyl alcohol	CH_3OH	Class 2
2-Methoxyethanol	Methyl cellosolve	$CH_3OCH_2CH_2OH$	Class 2
Methyl acetate	Acetic acid methyl ester	CH_3COOCH_3	Class 3
3-Methyl-1-butanol	Isoamyl alcohol Isopentyl alcohol 3-Methylbutan-1-ol	$(CH_3)_2CHCH_2CH_2OH$	Class 3
Methylbutylketone	2-Hexanone Hexan-2-one	$CH_3[CH_2]_3COCH_3$	Class 2
Methylcyclohexane	Cyclohexylmethane		Class 2
Methylethylketone	2-Butanone MEK Butan-2-one	$CH_3CH_2COCH_3$	Class 3
Methylisobutylketone	4-Methylpentan-2-one 4-Methyl-2-pentanone MIBK	$CH_3COCH_2CH(CH_3)_2$	Class 3
2-Methyl-1-propanol	Isobutyl alcohol 2-Methylpropan-1-ol	$(CH_3)_2CHCH_2OH$	Class 3
N-Methylpyrrolidone	1-Methylpyrrolidin-2-one 1-Methyl-2-pyrrolidinone		Class 2
Nitromethane		CH_3NO_2	Class 2
Pentane	*n*-Pentane	$CH_3[CH_2]_3CH_3$	Class 3
1-Pentanol	Amyl alcohol Pentan-1-ol Pentyl alcohol	$CH_3[CH_2]_3CH_2OH$	Class 3
1-Propanol	Propan-1-ol Propyl alcohol	$CH_3CH_2CH_2OH$	Class 3
2-Propanol	Propan-2-ol Isopropyl alcohol	$(CH_3)_2CHOH$	Class 3
Propyl acetate	Acetic acid propyl ester	$CH_3COOCH_2CH_2CH_3$	Class 3
Pyridine			Class 2
Sulfonane	Tetrahydrothiophene 1,1-dioxide		Class 2
Tetrahydrofuran	Tetramethylene oxide Oxacyclopentane		Class 2

Solvent	Other Names	Structure	Class
Tetralin	1,2,3,4-Tetrahydronaphthalene		Class 2
Toluene	Methylbenzene		Class 2
1,1,1-Trichloroethane	Methylchloroform	CH_3CCl_3	Class 1
1,1,2-Trichloroethene	Trichloroethene	$HClC{=}CCl_2$	Class 2
Xylene*	Dimethybenzene Xylol		Class 2

*usually 60 per cent *m*-xylene, 14 per cent *p*-xylene, 9 per cent *o*-xylene with 17 per cent ethyl benzene.

APPENDIX 2. ADDITIONAL BACKGROUND

A2.1. ENVIRONMENTAL REGULATION OF ORGANIC VOLATILE SOLVENTS

Several of the residual solvents frequently used in the production of pharmaceuticals are listed as toxic chemicals in Environmental Health Criteria (EHC) monographs and the Integrated Risk Information System (IRIS). The objectives of such groups as the International Programme on Chemical Safety (IPCS), the United States Environmental Protection Agency (USEPA) and the United States Food and Drug Administration (USFDA) include the determination of acceptable exposure levels. The goal is protection of human health and maintenance of environmental integrity against the possible deleterious effects of chemicals resulting from long-term environmental exposure. The methods involved in the estimation of maximum safe exposure limits are usually based on long-term studies. When long-term study data are unavailable, shorter term study data can be used with modification of the approach such as use of larger safety factors. The approach described therein relates primarily to long-term or life-time exposure of the general population in the ambient environment, i.e. ambient air, food, drinking water and other media.

A2.2. RESIDUAL SOLVENTS IN PHARMACEUTICALS

Exposure limits in this guideline are established by referring to methodologies and toxicity data described in EHC and IRIS monographs. However, some specific assumptions about residual solvents to be used in the synthesis and formulation of pharmaceutical products should be taken into account in establishing exposure limits. They are:

1) Patients (not the general population) use pharmaceuticals to treat their diseases or for prophylaxis to prevent infection or disease.

2) The assumption of life-time patient exposure is not necessary for most pharmaceutical products but may be appropriate as a working hypothesis to reduce risk to human health.

3) Residual solvents are unavoidable components in pharmaceutical production and will often be a part of medicinal products.

4) Residual solvents should not exceed recommended levels except in exceptional circumstances.

5) Data from toxicological studies that are used to determine acceptable levels for residual solvents should have been generated using appropriate protocols such as those described for example, by OECD and the FDA Red Book.

APPENDIX 3. METHODS FOR ESTABLISHING EXPOSURE LIMITS

The Gaylor-Kodell method of risk assessment (Gaylor, D. W. and Kodell, R. L. Linear Interpolation algorithm for low dose assessment of toxic substance. J. Environ. Pathology, 4, 305, 1980) is appropriate for Class 1 carcinogenic solvents. Only in cases where reliable carcinogenicity data are available should extrapolation by the use of mathematical models be applied to setting exposure limits. Exposure limits for Class 1 solvents could be determined with the use of a large safety factor (i.e., 10 000 to 100 000) with respect to the no-observed-effect level (NOEL). Detection and quantification of these solvents should be by state-of-the-art analytical techniques.

Acceptable exposure levels in this guideline for Class 2 solvents were established by calculation of PDE values according to the procedures for setting exposure limits in pharmaceuticals (*Pharmacopeial Forum*, Nov-Dec 1989), and the method adopted by IPCS for Assessing Human Health Risk of Chemicals (*Environmental Health Criteria 170*, WHO, 1994). These methods are similar to those used by the USEPA (IRIS) and the USFDA (*Red Book*) and others. The method is outlined here to give a better understanding of the origin of the PDE values. It is not necessary to perform these calculations in order to use the PDE values tabulated in Section 4 of this document.

PDE is derived from the no-observed-effect level (NOEL), or the lowest-observed effect level (LOEL), in the most relevant animal study as follows:

$$\mathrm{PDE} = \frac{\mathrm{NOEL} \times \mathrm{Weight\ Adjustment}}{\mathrm{F1} \times \mathrm{F2} \times \mathrm{F3} \times \mathrm{F4} \times \mathrm{F5}}$$

The PDE is derived preferably from a NOEL. If no NOEL is obtained, the LOEL may be used. Modifying factors proposed here, for relating the data to humans, are the same kind of "uncertainty factors" used in Environmental Health Criteria (*Environmental Health Criteria* 170, World Health Organisation, Geneva, 1994), and "modifying factors" or "safety factors" in *Pharmacopoeial Forum*. The assumption of 100 per cent systemic exposure is used in all calculations regardless of route of administration.

The modifying factors are as follows:

F1 = A factor to account for extrapolation between species

- F1 = 2 for extrapolation from dogs to humans
- F1 = 2.5 for extrapolation from rabbits to humans
- F1 = 3 for extrapolation from monkeys to humans

F1 = 5 for extrapolation from rats to humans

F1 = 10 for extrapolation from other animals to humans

F1 = 12 for extrapolation from mice to humans

F1 takes into account the comparative surface area: body weight ratios for the species concerned and for man. Surface area (*S*) is calculated as:

$$S = km^{0.67}$$

in which *m* = body mass, and the constant *k* has been taken to be 10. The body weight used in the equation are those shown below in Table A3.-1.

Table A3.-1. – *Values used in the calculations in this document*

Rat body weight	425 g
Pregnant rat body weight	330 g
Mouse body weight	28 g
Pregnant mouse body weight	30 g
Guinea-pig body weight	500 g
Rhesus monkey body weight	2.5 kg
Rabbit body weight (pregnant or not)	4 kg
Beagle dog body weight	11.5 kg
Rat respiratory volume	290 l/day
Mouse respiratory volume	43 l/day
Rabbit respiratory volume	1440 l/day
Guinea-pig respiratory volume	430 l/day
Human respiratory volume	28800 l/day
Dog respiratory volume	9000 l/day
Monkey respiratory volume	1150 l/day
Mouse water consumption	5 ml/day
Rat water consumption	30 ml/day
Rat food consumption	30 g/day

F2 = A factor of 10 to account for variability between individuals. A factor of 10 is generally given for all organic solvents, and 10 is used consistently in this guideline.

F3 = A variable factor to account for toxicity studies of short-term exposure.

F3 = 1 for studies that last at least one half-lifetime (1 year for rodents or rabbits; 7 years for cats, dogs and monkeys).

F3 = 1 for reproductive studies in which the whole period of organogenesis is covered.

F3 = 2 for a 6 month study in rodents, or a 3.5 year study in non-rodents.

F3 = 5 for a 3 month study in rodents, or a 2 year study in non-rodents.

F3 = 10 for studies of a shorter duration.

In all cases, the higher factor has been used for study durations between the time points, e.g. a factor of 2 for a 9 month rodent study.

F4 = A factor that may be applied in cases of severe toxicity, e.g. non-genotoxic carcinogenicity, neurotoxicity or teratogenicity. In studies of reproductive toxicity, the following factors are used:

F4 = 1 for foetal toxicity associated with maternal toxicity

F4 = 5 for foetal toxicity without maternal toxicity

F4 = 5 for a teratogenic effect with maternal toxicity

F4 = 10 for a teratogenic effect without maternal toxicity

F5 = A variable factor that may be applied if the no-effect level was not established.

When only a LOEL is available, a factor of up to 10 can be used depending on the severity of the toxicity.

The weight adjustment assumes an arbitrary adult human body weight for either sex of 50 kg. This relatively low weight provides an additional safety factor against the standard weights of 60 kg or 70 kg that are often used in this type of calculation. It is recognised that some adult patients weigh less than 50 kg; these patients are considered to be accommodated by the built-in safety factors used to determine a PDE. If the solvent was present in a formulation specifically intended for paediatric use, an adjustment for a lower body weight would be appropriate.

As an example of the application of this equation, consider the toxicity study of acetonitrile in mice that is summarised in *Pharmeuropa*, Vol. 9. No. 1, Supplement, April 1997, page S24. The NOEL is calculated to be 50.7 mg kg^{-1} day^{-1}. The PDE for acetonitrile in this study is calculated as follows:

$$\mathrm{PDE} = \frac{50.7\mathrm{mg\ kg^{-1}\ day^{-1}} \times 50\ \mathrm{kg}}{12 \times 10 \times 5 \times 1 \times 1} = 4.22\ \mathrm{mg\ day^{-1}}$$

In this example,

F1 = 12 to account for the extrapolation from mice to humans

F2 = 10 to account for differences between individual humans

F3 = 5 because the duration of the study was only 13 weeks

F4 = 1 because no severe toxicity was encountered

F5 = 1 because the no-effect level was determined

The equation for an ideal gas, $PV = nRT$, is used to convert concentrations of gases used in inhalation studies from units of ppm to units of mg/l or mg/m^3. Consider as an example the rat reproductive toxicity study by inhalation of carbon tetrachloride (molecular weight 153.84) summarised in *Pharmeuropa*, Vol. 9, No. 1, Supplement, April 1997, page S9.

$$\frac{n}{V} = \frac{P}{RT} = \frac{300 \times 10^{-6}\ \mathrm{atm} \times 153\,840\ \mathrm{mg\ mol^{-1}}}{0.082\ \mathrm{l\ atm\ K^{-1} mol^{-1}} \times 298\ \mathrm{K}}$$

$$= \frac{46.15\ \mathrm{mg}}{24.45\ \mathrm{l}} = 1.89\ \mathrm{mg/l}$$

The relationship 1000 litres = 1 m^3 is used to convert to mg/m^3.

5.5. ALCOHOLIMETRIC TABLES

5.5. Alcoholimetric tables.. 613

01/2008:50500

5.5. ALCOHOLIMETRIC TABLES

The general formula agreed by the Council of the European Communities in its Directive of 27 July 1976 on alcoholimetry served as the basis for establishing the following tables.

% *V/V*	% *m/m*	ρ_{20} (kg/m^3)

5.6. ASSAY OF INTERFERONS

5.6. Assay of interferons..... 627

01/2008:50600

5.6. ASSAY OF INTERFERONS

The following chapter is published for information.

1. INTRODUCTION

Monographs on human interferons generally contain a bioassay based on the inhibitory activity of the interferon on the cytopathic action of a virus on a cell line in culture. In most cases, however, the virus, cell line and the assay details are not specified, in order to allow the appropriate flexibility, where the monograph covers more than one sub-class of interferon.

The present text is intended to provide outline information for the analyst on how to design, optimise and validate such an assay once an appropriate combination of cell line and cytopathic virus has been identified. A detailed procedure for a particular cytopathic antiviral assay is described as an example of a suitable method, together with information on other virus-cell line combinations and guidance on how to adapt and validate the procedure for these other combinations.

2. ANTIVIRAL (CYTOPATHIC EFFECT REDUCTION) ASSAYS

The antiviral assay of human interferons is based on the induction of a cellular response in human cells, which prevents or reduces the cytopathic effect of an infectious virus. The potency of interferon is estimated by comparing its protective effect against a viral cytopathic effect with the same effect of the appropriate reference preparation calibrated in International Units.

3. INTERFERON ASSAY USING Hep2c CELLS AND INFECTIOUS ENCEPHALOMYOCARDITIS VIRUS

The antiviral assay of human interferons described is of the cytopathic effect reduction type. It uses human Hep2c cells infected by encephalomyocarditis virus (EMCV) to measure the potencies of different human interferon test preparations. This assay has been used in three World Health Organisation (WHO) international collaborative studies of candidate International Standards for human interferon alpha, human interferon beta and human interferon gamma and has repeatedly been demonstrated to be sensitive, reliable and reproducible for potency estimations of the different types of human interferon.

For the culture of mammalian cells, all procedures are carried out using standard operating procedures for the maintenance of such cell lines in culture. Volumes of reagents are indicated for cell cultures carried out in 75 cm^2 flasks. Other types of containers (flasks or plates) may be used but volumes must be adapted accordingly.

3.1. MAINTENANCE AND PREPARATION OF Hep2c CELLS

Hep2c cells are maintained and passaged in culture medium A.

Cells are stored as frozen stocks using standard operating procedures. Growing cells may be maintained in culture up to a permitted passage number of 30, after which new cultures are established from frozen stocks.

At the beginning of the assay procedure, harvest the cells from the flasks showing 90 per cent confluent monolayers using the trypsin-treatment procedure described below.

– Remove the culture medium from the flasks.
– To each flask, add 5 ml of trypsin solution heated at 37 °C (a trypsin stock solution contains 4 mg/ml of *trypsin R* and 4 mg/ml of *sodium edetate R*; immediately before use, dilute 50 times with phosphate buffered saline). Swirl the capped flask to wash the cell monolayer. Remove the excess of trypsin solution.
– Incubate the flasks for 5 min to 10 min at 37 °C. Microscopically or visually observe the cells for signs of detachment. When viewed microscopically, the cells appear rounded up or detached and free-floating. Shake the flask vigorously to detach all the cells, add approximately 5 ml of culture medium A. Shake vigorously to yield a suspension of single cells.
– To prepare the cell suspensions for the assay procedure, carefully disperse the cells by pipetting up and down to disrupt cell aggregates, count the cells and resuspend at a concentration of 6×10^5 cells/ml.

3.2. PROPAGATION OF ENCEPHALOMYOCARDITIS VIRUS

Encephalomyocarditis virus is propagated in mouse L-929 cells in order to produce a stock of progeny virus. L-929 cells are maintained by trypsin treatment and passage as described for Hep2c cells (*NOTE: it may be necessary to substitute neonatal calf serum with foetal bovine serum if the cells show poor growth*).

Take several flasks containing confluent cultures of L-929 cells. Pour off the medium from the flasks. Inoculate with 2 ml of the EMCV suspension appropriately diluted in culture medium B so that it contains approximately 2.5×10^8 plaque forming units (PFU) per millilitre. Each flask will contain 4-6 $\times 10^7$ L-929 cells and therefore the multiplicity of infection (m.o.i.) will be approximately 10 PFU/cell. Carefully swirl the virus suspension over the entire cell monolayer and return the flasks to the incubator for approximately 1 h. Maintain the medium at pH 7.4 to 7.8.

After adsorption of the EMCV, add approximately 40 ml of culture medium B to each flask and return the flasks to the incubator at 37 °C for about 30 h. Maintain the medium at pH 7.4 to 7.8 to obtain a maximum virus yield. Remove the culture fluid and store at approximately 4 °C.

Place the flasks at – 20 °C to freeze the cell monolayer. Then thaw to room temperature. Add approximately 5 ml of culture medium and shake the flask to disrupt the cell walls. Transfer the contents of each flask to the container of culture fluid. Transfer the culture fluid containing the EMCV to 50 ml plastic centrifuge tubes and centrifuge at approximately 500 *g* for about 10 min to remove cell debris. Dispense the clarified culture fluid into glass screw-capped bottles, in quantities of 20 ml, 10 ml, 5 ml, 1 ml, 0.5 ml or 0.2 ml, as appropriate. Store at – 70 °C. Larger volumes can be thawed, dispensed into smaller quantities and re-frozen when required. The EMCV stock will retain its original titre if stored permanently at approximately – 70 °C, but repeated freeze-thaw cycles or storage at higher temperatures, e.g. at approximately – 20 °C, results in progressive loss of titre.

3.3. ASSAY PROCEDURE

3.3.1. Determination of the dose-response range

Preparation of the solutions

Dilute the appropriate standard for interferon (for example a specific WHO sub-type interferon standard) in culture medium A, in 10-fold dose increments, to give doses covering the range of 1000 - 0.001 IU/ml. Carry out the assay procedure in 96-well microtitre plates. To each well add 100 µl of culture medium A. Add approximately 100 µl of each dilution of the reference preparation to each well except for those intended for virus controls. Using a multichannel pipette set at 100 µl, mix the contents of the wells.

Dispensing of the cell suspension

Pour the cell suspension of Hep2c cells, which has been adjusted to contain approximately 6×10^5 cells/ml of culture medium A, into a plastic Petri-dish. Dispense the cell suspension from the Petri-dish into each well of the microtitre plates, using a multichannel pipette set at 100 µl.

Incubate the plates for about 24 h in an incubator set at 37 °C and 5 per cent CO_2.

Viral infection

At this stage, using an inverted microscope, check that the monolayers of Hep2c cells are confluent, that they show a relatively even distribution of cells, that they have correct morphology and that they are healthy.

Remove most of the culture medium from the wells by inverting the plate and shaking it and blotting on a paper towel (proceed in an identical way when discarding fluids from micro-titre plates as described later). Dilute the EMCV stock with fresh culture medium A to a titre of approximately 3×10^7 PFU/ml (*NOTE: each plate requires approximately 20 ml of diluted virus, plus 5 per cent to 10 per cent of extra volume*). Dispense the diluted suspension from a 9 cm sterile Petri-dish using a multichannel pipette set at 200 µl to all wells including virus controls, but excluding cell controls. Add approximately 200 µl of culture medium A without virus to each of the cell control wells.

Return the plates to the incubator set at 37 °C and 5 per cent CO_2 for approximately 24 h.

Staining

Examine the plates microscopically to check that the EMCV has caused a cytopathic effect (c.p.e.) in the virus controls. The time interval for maximum c.p.e. may vary from one assay to the next because of inherent variation of Hep2c cells to virus challenge over a given period of continuous cultivation.

Remove most of the culture medium from the wells by discarding into an appropriate decontaminating solution (sodium hypochlorite is suitable). Dispense *phosphate buffered saline pH 7.4 R* into each well. Discard the *phosphate buffered saline pH 7.4 R* into a decontaminating solution. Dispense into each well 150 µl of staining solution. Stain the cells for approximately 30 min at room temperature. Discard the staining solution into a decontaminating solution. Dispense approximately 150 µl of fixing solution. Fix for 10 min at room temperature. Discard the fixing solution into a decontaminating solution and wash the cell monolayers by immersing the assay plates in a plastic box containing running water. Discard the water and superficially dry the plates with paper towels. Dry the assay plates at 20 °C to 37 °C until all moisture has evaporated.

Add 150 µl of *0.1 M sodium hydroxide* to each well. Elute the stain by gentle agitation of the plates or by hitting them against the palm of the hand. Make sure that the stain is evenly distributed in all wells before making spectrophotometric readings.

Read the absorbance at 610 nm to 620 nm, using a microtitre plate reader, taking as a blank a well or a column of wells containing no cells and approximately 150 µl of *0.1 M sodium hydroxide*.

Estimate the concentrations of interferon standard that give the maximum and minimum reduction of cytopathic effect. This is the dose response corresponding to the working range of the assay.

3.3.2. Assay procedure

Carry out the assay as described above, using:

– as test solutions, the substance to be examined, diluted in two-fold increments with culture medium A to give nominal concentrations covering the working range of the assay,

– as reference solutions, the appropriate standard for interferon (for example, a specific WHO sub-type interferon) in culture medium A, diluted in two-fold increments to give nominal concentrations covering the working range of the assay.

3.3.3. Data analysis

Results of the cytopathic effect reduction assay generally fit a sigmoidal dose-response curve, when the interferon concentration (the log of the reciprocal of the interferon dilution) is plotted versus stain absorbance.

Plot the interferon concentration (log reciprocal of dilution) versus the stain absorbance for the interferon reference preparation and for the interferon test solutions. Using the linear portion of the curve, calculate the concentration of interferon in the sample by comparing the responses for test and reference solutions, using the usual statistical methods for a parallel line assay.

4. VALIDATION OF OTHER PROCEDURES

4.1. CHOICE OF CELL LINE AND VIRUS

A number of other combinations of cell line and virus have been used in anti-viral assays for interferons. For example, EMCV has been used in combination with the A549 epithelial lung carcinoma cell line, Semliki Forest virus or Sindbis virus have been used with human fibroblasts, and vesicular stomatitis virus has been used with either human diploid fibroblasts, the human amnion WISH cell line or the Madin-Darby bovine kidney cell line. In each case the choice of the cell line/virus combination is usually based on that which gives the most sensitive response to the interferon preparation to be assayed, and gives parallel responses when comparing the test preparation and interferon standard.

4.2. CHOICE OF RESPONSE

The staining procedure described above measures remaining viable cells. A number of other responses have been used, including methyl violet or crystal violet staining, or the thiazolyl blue (MTT) conversion procedure. In each case, the method is selected on the basis of producing a suitably linear and sensitive relationship between response colour and viable cell count.

4.3. STATISTICAL VALIDATION

As with all parallel line bioassays, the assay must satisfy the usual statistical criteria of linearity of response, parallelism and variance.

4.4. VALIDATION OF ASSAY LAYOUT

As with all microtitre plate assay procedures, attention must be given to validating the assay layout. In particular, bias due to non-random pipetting order or plate edge effects must be investigated and eliminated, by randomising the assay layout, or by avoiding the use of edge wells.

REAGENTS AND CULTURE MEDIA

Culture medium A (10 per cent neonatal calf serum)

RPMI 1640 culture medium, supplemented with antibiotics if necessary (penicillin 10 000 IU/ml; streptomycin 10 ng/ml)	450 ml
L-Glutamine, 200 mM, sterile	5 ml
Neonatal calf serum	50 ml

Culture medium B (2 per cent foetal bovine serum)

RPMI 1640 culture medium, supplemented with antibiotics if necessary (penicillin 10 000 IU/ml; streptomycin 10 ng/ml)	490 ml
L-Glutamine, 200 mM, sterile	5 ml
Foetal bovine serum	10 ml

Staining solution

Naphthalene black	0.5 g
Acetic acid, glacial	90 ml
Sodium acetate, anhydrous	8.2 g
Water to produce	1000 ml

Fixing solution

Formaldehyde, 40 per cent	100 ml
Acetic acid, glacial	90 ml
Sodium acetate, anhydrous	8.2 g
Water to produce	1000 ml

5.7. TABLE OF PHYSICAL CHARACTERISTICS OF RADIONUCLIDES MENTIONED IN THE EUROPEAN PHARMACOPOEIA

5.7. Table of physical characteristics of radionuclides mentioned in the European Pharmacopoeia..... 633

01/2008:50700

5.7. TABLE OF PHYSICAL CHARACTERISTICS OF RADIONUCLIDES MENTIONED IN THE EUROPEAN PHARMACOPOEIA

The following table is given to complete the general monograph *Radiopharmaceutical preparations (0125)*.

The values are obtained from the database of the National Nuclear Data Center (NNDC) at Brookhaven National Laboratory, Upton. N.Y., USA, directly accessible via Internet at the address: 'http://www.nndc.bnl.gov/nndc/nudat/radform.html'.

In case another source of information is preferred (more recent values), this source is explicitly mentioned.

Other data sources:

* DAMRI (Département des Applications et de la Métrologie des Rayonnements Ionisants, CEA Gif-sur-Yvette, France),

** PTB (Physikalisch-Technische Bundesanstalt, Braunschweig, Germany),

*** NPL (National Physical Laboratory, Teddington, Middlesex, UK).

The uncertainty of the half-lives are given in parentheses. In principle the digits in parentheses are the standard uncertainty of the corresponding last digits of the indicated numerical value ('Guide to the Expression of Uncertainty in Measurement', International Organisation for Standardisation (ISO), 1993, ISBN 92-67-10188-9).

The following abbreviations are used:

e_A = Auger electrons,

ce = conversion electrons,

β^- = electrons,

β^+ = positrons,

γ = gamma rays,

X = X-rays.

Radionuclide	Half-life	Electronic emission			Photon emission

5.8. PHARMACOPOEIAL HARMONISATION

5.8. Pharmacopoeial harmonisation.. 645

01/2008:50800

5.8. PHARMACOPOEIAL HARMONISATION

This general chapter is included for guidance of users. It provides information on the degree of harmonisation and consequently interchangeability of various general chapters and monographs of the European Pharmacopoeia and those of the Japanese Pharmacopoeia and United States Pharmacopoeia. The chapter does not affect in any way the status of the monographs and general chapters as the authoritative reference in any case of doubt or dispute where compliance with the European Pharmacopoeia is required.

The European Pharmacopoeia Commission recognises the utility of working with other pharmacopoeial bodies to develop harmonised monographs and general chapters. Such harmonisation is fully compatible with the declared aims of the Commission and has benefits of different kinds, notably the simplification and rationalisation of quality control methods and licensing procedures. Such harmonisation also enhances the benefits of the work of the International Conference on Harmonisation (ICH) and the Veterinary International Co-operation on Harmonisation (VICH) since some of the guidelines developed depend on pharmacopoeial general chapters for their application.

Work on harmonisation is carried out by a well-defined but informal process in the Pharmacopoeial Discussion Group (PDG), in which the European Pharmacopoeia, the Japanese Pharmacopoeia and the United States Pharmacopoeia are associated. Information will be given in subsequent revised versions of this general chapter on items that have been dealt with by the PDG.

Where harmonisation of general chapters is carried out, the aim is to arrive at interchangeable methods or requirements so that demonstration of compliance using a general chapter from one of the three pharmacopoeias implies that the same result would be obtained using the general chapter of either of the other pharmacopoeias. If residual differences remain in harmonised general chapters, information will be given in subsequent versions of this general chapter.

Where harmonisation of monographs is carried out, the aim is to arrive at identical requirements for all attributes of a product. For some products, it can be extremely difficult to achieve complete harmonisation, for example because of differences in legal status and interpretation. It has therefore appeared to the PDG worthwhile to approve and publish monographs in which as many attributes as possible are harmonised. Information on any non-harmonised attributes will be included in subsequent versions of this general chapter.

The three Pharmacopoeias have undertaken not to make unilateral changes to harmonised monographs and general chapters but rather to apply the agreed revision procedure whereby all partners adopt a revision simultaneously.

5.9. POLYMORPHISM

5.9. Polymorphism..... 649

01/2008:50900

5.9. POLYMORPHISM

Polymorphism (or crystal polymorphism) is a phenomenon related to the solid state; it is the ability of a compound in the solid state to exist in different crystalline forms having the same chemical composition. Substances that exist in a non-crystalline solid state are said to be amorphous.

When this phenomenon is observed for a chemical element (for example, sulphur), the term allotropy is used instead of polymorphism.

The term pseudopolymorphism is used to describe solvates (including hydrates), where a solvent is present in the crystal matrix in stoichiometric proportions; the term may also be extended to include compounds where the solvent is trapped in the matrix in variable proportions. However the term pseudopolymorphism is ambiguous because of its use in different circumstances. It is therefore preferable to use only the terms “solvates” and “hydrates”.

Where a monograph indicates that a substance shows polymorphism, this may be true crystal polymorphism, occurrence of solvates, allotropy or occurrence of the amorphous form.

The identity of chemical composition implies that all crystalline and amorphous forms of a given species have the same chemical behaviour in solution or as a melt; in contrast, their physico-chemical and physical characteristics (solubility, hardness, compressibility, density, melting point, etc.), and therefore their reactivity and bioavailability may be different at the solid state.

When a compound shows polymorphism, the form for which the free enthalpy is lowest at a given temperature and pressure is the most thermodynamically stable. The other forms are said to be in a metastable state. At normal temperature and pressure, a metastable form may remain unchanged or may change to a thermodynamically more stable form.

If there are several crystalline forms, one form is thermodynamically more stable at a given temperature and pressure. A given crystalline form may constitute a phase that can reach equilibrium with other solid phases and with the liquid and gas phases.

If each crystalline form is the more stable within a given temperature range, the change from one form to another is reversible and is said to be enantiotropic. The change from one phase to another is a univariate equilibrium, so that at a given pressure this state is characterised by a transition temperature. However, if only one of the forms is stable over the entire temperature range, the change is irreversible or monotropic.

Different crystalline forms or solvates may be produced by varying the crystallisation conditions (temperature, pressure, solvent, concentration, rate of crystallisation, seeding of the crystallisation medium, presence and concentration of impurities, etc.).

The following techniques may be used to study polymorphism:

- X-ray diffraction of powders (*2.9.33*),
- X-ray diffraction of single crystals,
- thermal analysis (*2.2.34*) (differential scanning calorimetry, thermogravimetry, thermomicroscopy),
- microcalorimetry,
- moisture absorption analysis,
- optical and electronic microscopy,
- solid-state nuclear magnetic resonance,
- infrared absorption spectrophotometry (*2.2.24*),
- Raman spectrometry (*2.2.48*),
- measurement of solubility and intrinsic dissolution rate,
- density measurement.

These techniques are often complementary and it is indispensable to use several of them.

Pressure/temperature and energy/temperature diagrams based on analytical data are valuable tools for fully understanding the energetic relationship (enantiotropism, monotropism) and the thermodynamic stability of the individual modifications of a polymorphic compound.

For solvates, differential scanning calorimetry and thermogravimetry are preferable, combined with measurements of solubility, intrinsic dissolution rate and X-ray diffraction.

For hydrates, water sorption/desorption isotherms are determined to demonstrate the zones of relative stability.

In general, hydrates are less soluble in water than anhydrous forms, and likewise solvates are less soluble in their solvent than unsolvated forms.

5.10. CONTROL OF IMPURITIES IN SUBSTANCES FOR PHARMACEUTICAL USE

5.10. Control of impurities in substances for pharmaceutical use..... 653

01/2008:51000

5.10. CONTROL OF IMPURITIES IN SUBSTANCES FOR PHARMACEUTICAL USE

Preamble

The monographs of the European Pharmacopoeia on substances for pharmaceutical use are designed to ensure acceptable quality for users. The role of the Pharmacopoeia in public health protection requires that adequate control of impurities be provided by monographs. The quality required is based on scientific, technical and regulatory considerations.

Requirements concerning impurities are given in specific monographs and in the general monograph *Substances for pharmaceutical use (2034)*. Specific monographs and the general monograph are complementary: specific monographs prescribe acceptance criteria for impurities whereas the general monograph deals with the need for qualification, identification and reporting of any organic impurities that occur in *active substances*.

The thresholds for reporting, identification and qualification contained in the general monograph *Substances for pharmaceutical use (2034)* apply to all related substances. However, if a monograph does not contain a related substances test based on a quantitative method, any new impurities occurring above a threshold may be overlooked since the test is not capable to detect those impurities.

The provisions of the Related substances section of the general monograph *Substances for pharmaceutical use (2034)*, notably those concerning thresholds, do not apply to excipients; also excluded from the provisions of this section are: biological and biotechnological products; peptides; oligonucleotides; radiopharmaceuticals; fermentation products and semisynthetic products derived therefrom; herbal products and crude products of animal and plant origin. Although the thresholds stated in the general monograph do not apply, the general concepts of reporting, identification (wherever possible) and qualification of impurities are equally valid for these classes.

Basis for the elaboration of monographs of the European Pharmacopoeia

European Pharmacopoeia monographs are elaborated on substances that are present in medicinal products that have been authorised by the competent authorities of Parties to the *European Pharmacopoeia Convention*. Consequently, these monographs do not necessarily cover all sources of substances for pharmaceutical use on the world market.

Organic and inorganic impurities present in those substances that have been evaluated by the competent authorities are qualified with respect to safety at the maximum authorised content (at the maximum daily dose) unless new safety data that become available following evaluation justify lower limits.

European Pharmacopoeia monographs on substances for pharmaceutical use are elaborated by groups of experts and working parties collaborating with national pharmacopoeia authorities, the competent authorities for marketing authorisation, national control laboratories and the European Pharmacopoeia laboratory; they are also assisted by the producers of the substances and/or the pharmaceutical manufacturers that use these substances.

Control of impurities in substances for pharmaceutical use

The quality with respect to impurities is controlled by a set of tests within a monograph. These tests are intended to cover organic and inorganic impurities that are relevant in view of the sources of active substances in authorised medicinal products.

Control of residual solvents is provided by the general monograph *Substances for pharmaceutical use (2034)* and general chapter *5.4. Residual solvents*. The certificate of suitability of a monograph of the European Pharmacopoeia for a given source of a substance indicates the residual solvents that are controlled together with the specified acceptance criteria and the validated control method where this differs from those described in general chapter *2.4.24. Identification and control of residual solvents*.

Monographs on organic chemicals usually have a test entitled “Related substances” that covers relevant organic impurities. This test may be supplemented by specific tests where the general test does not control a given impurity or where there are particular reasons (for example, safety reasons) for requiring special control.

Where a monograph has no Related substances (or equivalent) test but only specific tests, the user of a substance must nevertheless ensure that there is suitable control of organic impurities; those occurring above the identification threshold are to be identified (wherever possible) and, unless justified, those occurring above the qualification threshold are to be qualified (see also under Recommendations to users of monographs of active substances).

Where the monograph covers substances with different impurity profiles, it may have a single related substances test to cover all impurities mentioned in the Impurities section or several tests may be necessary to give control of all known profiles. Compliance may be established by carrying out only the tests relevant to the known impurity profile for the source of the substance.

Instructions for control of impurities may be included in the Production section of a monograph, for example where the only analytical method appropriate for the control of a given impurity is to be performed by the manufacturer since the method is too technically complex for general use or cannot be applied to the final drug substance and/or where validation of the production process (including the purification step) will give sufficient control.

Impurities section in monographs on active substances

The Impurities section in a monograph includes impurities (chemical structure and name wherever possible), which are usually organic, that are known to be detected by the tests prescribed in the monograph. It is based on information available at the time of elaboration or revision of the monograph and is not necessarily exhaustive. The section includes specified impurities and, where so indicated, other detectable impurities.

Specified impurities have an acceptance criterion not greater than that authorised by the competent authorities.

Other detectable impurities are potential impurities with a defined structure but not known to be normally present above the identification threshold in substances used in medicinal products that have been authorised by the competent authorities of Parties to the Convention. They are given in the Impurities section for information.

Where an impurity other than a specified impurity is found in an active substance it is the responsibility of the user of the substance to check whether it has to be identified/qualified, depending on its content, nature, maximum daily dose and relevant identification/qualification threshold, in accordance with the general monograph on *Substances for pharmaceutical use (2034)*, Related substances section.

It should be noted that specific thresholds are applied to substances exclusively for veterinary use.

Interpretation of the test for related substances in the monographs on active substances

A specific monograph on a substance for pharmaceutical use is to be read and interpreted in conjunction with the general monograph on *Substances for pharmaceutical use (2034)*.

Where a general acceptance criterion for impurities ("any other impurity", "other impurities", "any impurity") equivalent to a nominal content greater than the applicable identification threshold (see the general monograph on *Substances for pharmaceutical use (2034)*) is prescribed, this is valid only for specified impurities mentioned in the Impurities section. The need for identification (wherever possible), reporting, specification and qualification of other impurities that occur must be considered according to the requirements of the general monograph. It is the responsibility of the user of the substance to determine the validity of the acceptance criteria for impurities not mentioned in the Impurities section and for those indicated as other detectable impurities.

Acceptance criteria for the related substances test are presented in different ways in existing monographs; the decision tree (Figure 5.10.-1) may be used as an aid in the interpretation of general acceptance criteria and their relation with the Impurities section of the monograph.

General acceptance criteria for "other" impurities are expressed in various ways in the monographs: "any other impurity", "other impurities", "any impurity", "any spot", "any band", etc. The general acceptance criteria may apply to certain specified impurities only or to unspecified impurities and certain specified impurities, depending on the nature of the active substance and the applicable identification threshold. Pending editorial adaptation of already published monographs using unequivocal terminology, the decision tree (Figure 5.10.-1) may be used to determine the acceptance criterion to be applied.

Recommendations to users of monographs of active substances

Monographs give a specification for suitable quality of substances with impurity profiles corresponding to those taken into account during elaboration and/or revision of the monograph. It is the responsibility of the user of the substance to check that the monograph provides adequate control of impurities for a substance for pharmaceutical use from a given source, notably by using the procedure for certification of suitability of the monographs of the European Pharmacopoeia.

A monograph with a related substances test based on a quantitative method (such as liquid chromatography, gas chromatography and capillary electrophoresis) provides adequate control of impurities for a substance from a given source if impurities present in amounts above the applicable identification threshold are specified impurities mentioned in the Impurities section.

If the substance contains impurities other than those mentioned in the Impurities section, it has to be verified that these impurities are detectable by the method described in the monograph, otherwise a new method must be developed and revision of the monograph must be requested. Depending on the contents found and the limits proposed, the identification and/or the qualification of these impurities must be considered.

Where a single related substances test covers different impurity profiles, only impurities for the known profile from a single source need to be reported in the certificate of analysis unless the marketing authorisation holder uses active substances with different impurity profiles.

Identification of impurities (peak assignment)

Where a monograph has an individual limit for an impurity, it is often necessary to define means of identification, for example using a reference substance, a representative chromatogram or relative retention. The user of the substance may find it necessary to identify impurities other than those for which the monograph provides a means of identification, for example to check the suitability of the specification for a given impurity profile by comparison with the Impurities section. The European Pharmacopoeia does not provide reference substances, representative chromatograms or information on relative retentions for this purpose, unless prescribed in the monograph. Users will therefore have to apply the available scientific techniques for identification.

New impurities/Specified impurities above the specified limit

Where a new manufacturing process or change in an established process leads to the occurrence of a new impurity, it is necessary to apply the provisions of the general monograph on *Substances for pharmaceutical use (2034)* regarding identification and qualification and to verify the suitability of the monograph for control of the impurity. A certificate of suitability is a means for confirming for a substance from a given source that the new impurity is adequately controlled or the certificate contains a method for control with a defined acceptance criterion. In the latter case revision of the monograph will be initiated.

Where a new manufacturing process or change in an established process leads to the occurrence of a specified impurity above the specified limit, it is necessary to apply the provisions of the general monograph on *Substances for pharmaceutical use (2034)* regarding qualification.

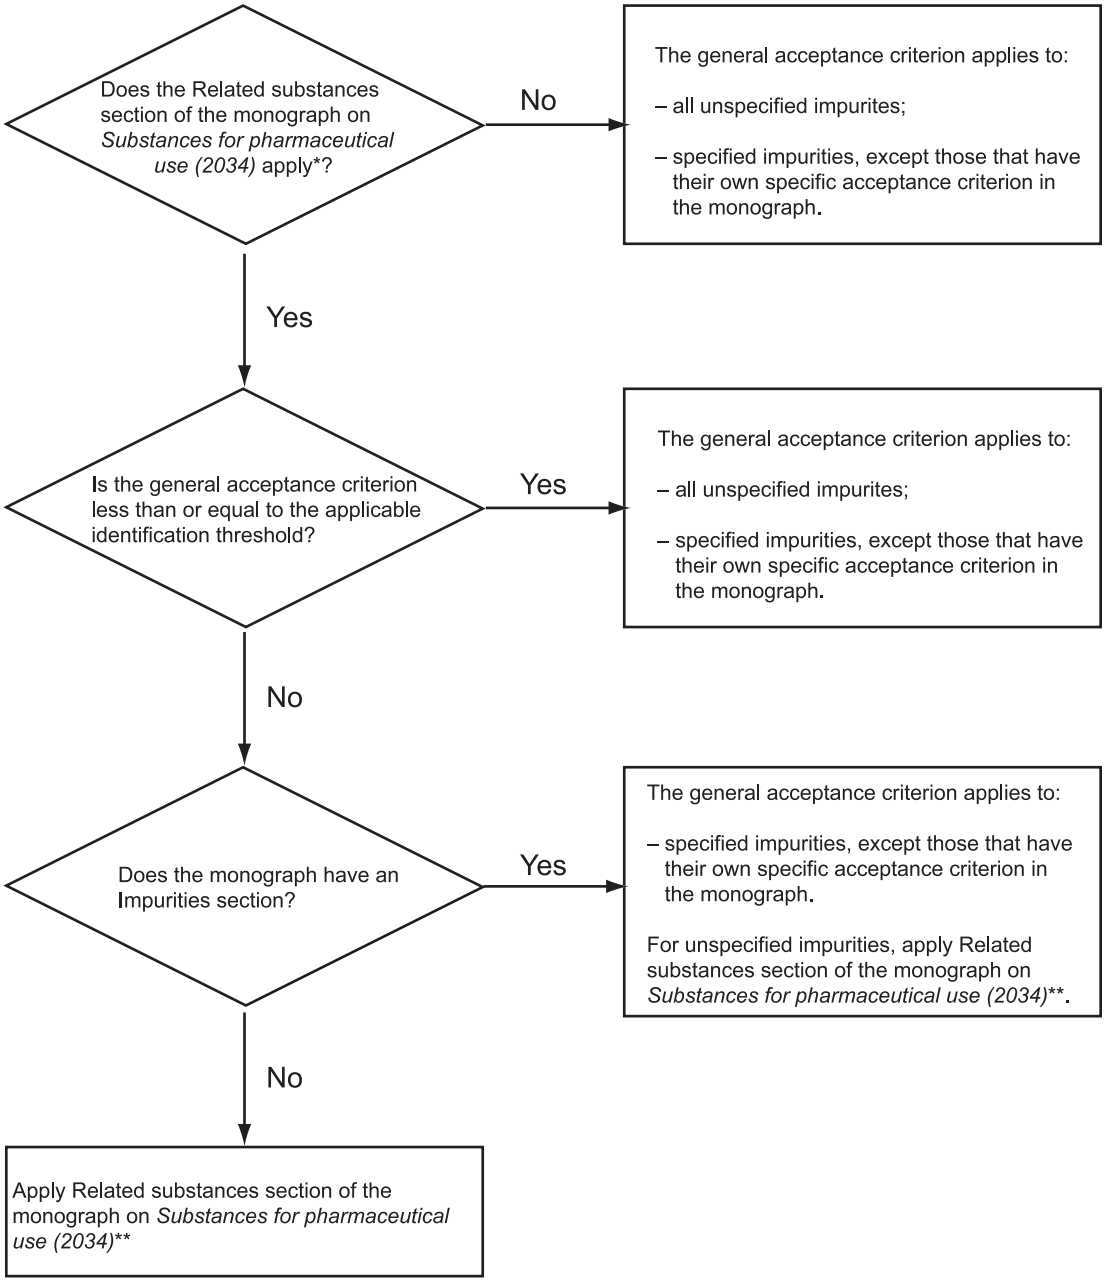
Chromatographic methods

General chapter *2.2.46. Chromatographic separation techniques* deals with various aspects of impurities control.

Information is available via the EDQM website on commercial names for columns and other reagents and equipment found suitable during monograph development, where this is considered useful.

GLOSSARY

Disregard limit: in chromatographic tests, the nominal content at or below which peaks/signals are not taken into account for calculating a sum of impurities. The numerical values for the disregard limit and the reporting threshold are usually the same.



Identification threshold: a limit above which an impurity is to be identified.

Identified impurity: an impurity for which structural characterisation has been achieved.

Impurity: any component of a substance for pharmaceutical use that is not the chemical entity defined as the substance.

Nominal concentration: concentration calculated on the basis of the concentration of the prescribed reference and taking account of the prescribed correction factor.

Other detectable impurities: potential impurities with a defined structure that are known to be detected by the tests in a monograph but not known to be normally present above the identification threshold in substances used

* The requirements of this section apply to active substances, with the exception of: biological and biotechnological products; peptides; oligonucleotides; radiopharmaceuticals; products of fermentation and semi-synthetic products derived therefrom; crude products of animal or plant origin; herbal products.

** To apply the Related substances section of the monograph on *Substances for pharmaceutical use (2034)*:
- an individual acceptance criterion must be defined for any impurity that may be present above the identification threshold;
- any impurity with an acceptance criterion above the identification threshold must wherever possible be identified;
- any impurity with an acceptance criterion above the qualification threshold must be qualified.

Figure 5.10.-1. – *Decision tree for interpretation of general acceptance criteria for "other" impurities in monographs*

in medicinal products that have been authorised by the competent authorities of Parties to the Convention. They are unspecified impurities and are thus limited by a general acceptance criterion.

Potential impurity: an impurity that theoretically can arise during manufacture or storage. It may or may not actually appear in the substance. Where a potential impurity is known to be detected by the tests in a monograph but not known to be normally present in substances used in medicinal products that have been authorised by the competent authorities of Parties to the Convention, it will be included in the Impurities section under *Other detectable impurities* for information.

Qualification: the process of acquiring and evaluating data that establishes the biological safety of an individual impurity or a given impurity profile at the level(s) specified.

Qualification threshold: a limit above which an impurity is to be qualified.

Related substances: title used in monographs for general tests for organic impurities.

Reporting threshold: a limit above which an impurity is to be reported. Synonym: reporting level.

Specified impurity: an impurity that is individually listed and limited with a specific acceptance criterion in a monograph. A specified impurity can be either identified or unidentified.

Unidentified impurity: an impurity for which a structural characterisation has not been achieved and that is defined solely by qualitative analytical properties (for example, relative retention).

Unspecified impurity: an impurity that is limited by a general acceptance criterion and not individually listed with its own specific acceptance criterion.

5.11. CHARACTERS SECTION IN MONOGRAPHS

5.11. Characters section in monographs.. 659

01/2008:51100

5.11. CHARACTERS SECTION IN MONOGRAPHS

The General Notices indicate that the statements included in the Characters section are not to be interpreted in a strict sense and are not requirements. For information of users, the methods recommended to authors of monographs as the basis for statements concerning hygroscopicity, crystallinity and solubility are given below.

HYGROSCOPICITY

This method is to be carried out on a substance that complies with the test for loss on drying or water content of the monograph. The method gives an indication of the degree of hygroscopicity rather than a true determination.

Use a glass weighing vessel 50 mm in external diameter and 15 mm high. Weigh the vessel and stopper (m_1). Place the amount of substance prescribed for the test for loss on drying or water in the vessel and weigh (m_2). Place the unstoppered vessel in a desiccator at 25 °C containing a saturated solution of ammonium chloride or ammonium sulphate or place it in a climatic cabinet set at 25 ± 1 °C and 80 ± 2 per cent relative humidity. Allow to stand for 24 h. Stopper the weighing vessel and weigh (m_3).

Calculate the percentage increase in mass using the expression:

$$\frac{m_3 - m_2}{m_2 - m_1} \times 100$$

The result is interpreted as follows:

- *deliquescent*: sufficient water is absorbed to form a liquid,
- *very hygroscopic*: increase in mass is equal to or greater than 15 per cent,
- *hygroscopic*: increase in mass is less than 15 per cent and equal to or greater than 2 per cent,
- *slightly hygroscopic*: increase in mass is less than 2 per cent and equal to or greater than 0.2 per cent.

CRYSTALLINITY

This method is employed to establish the crystalline or amorphous nature of a substance.

Mount a few particles of the substance to be examined in mineral oil on a clean glass slide. Examine under a polarising microscope. Crystalline particles exhibit birefringence and extinction positions when the microscope stage is revolved.

SOLUBILITY

For this test a maximum of 111 mg of substance (for each solvent) and a maximum of 30 ml of each solvent are necessary.

Dissolving procedure

Shake vigorously for 1 min and place in a constant temperature device, maintained at a temperature of 25.0 ± 0.5 °C for 15 min. If the substance is not completely dissolved, repeat the shaking for 1 min and place the tube in the constant temperature device for 15 min.

Method

Weigh 100 mg of finely powdered substance (90) (*2.9.12*) in a stoppered tube (16 mm in internal diameter and 160 mm long), add 0.1 ml of the solvent and proceed as described under Dissolving Procedure. If the substance is completely dissolved, it is *very soluble*.

If the substance is not completely dissolved, add 0.9 ml of the solvent and proceed as described under Dissolving Procedure. If the substance is completely dissolved, it is *freely soluble*.

If the substance is not completely dissolved, add 2.0 ml of the solvent and proceed as described under Dissolving Procedure. If the substance is completely dissolved, it is *soluble*.

If the substance is not completely dissolved, add 7.0 ml of the solvent and proceed as described under Dissolving Procedure. If the substance is completely dissolved, it is *sparingly soluble*.

If the substance is not completely dissolved, weigh 10 mg of finely powdered substance (90) (*2.9.12*) in a stoppered tube, add 10.0 ml of the solvent and proceed as described under Dissolving Procedure. If the substance is completely dissolved, it is *slightly soluble*.

If the substance is not completely dissolved, weigh 1 mg of finely powdered substance (90) (*2.9.12*) in a stoppered tube, add 10.0 ml of the solvent and proceed as described under Dissolving Procedure. If the substance is completely dissolved, it is *very slightly soluble*.

5.12. REFERENCE STANDARDS

5.12. Reference standards..... 663

01/2008:51200

5.12. REFERENCE STANDARDS

This chapter is published for information.

1. INTRODUCTION

'Reference standard' is used in this chapter as a general term covering reference substances, reference preparations and reference spectra.

Reference standards are frequently necessary to achieve adequate quality control of substances for pharmaceutical use and pharmaceutical preparations.

Reference standards are established using suitable procedures and their continued suitability for use is monitored according to a predefined programme. Where a reference standard is needed, it is an integral part of the pharmacopoeial monograph or the manufacturer's specification. Where a European Pharmacopoeia reference standard is referred to in a monograph or general chapter, it represents the official standard that is alone authoritative in case of doubt or dispute.

Reference materials and certified reference materials are defined below but are not otherwise dealt with in this chapter.

In several parts of the chapter, detailed information is given for chemical reference substances but not for biological reference preparations. The general principles given apply to the latter, but in view of their heterogeneous nature and frequently their complexity compared to chemical reference substances, detailed information on their use, establishment and the re-test programmes applied is not included. For peptide and protein reference standards, a specific approach is used for certain aspects, notably the establishment of an assigned content; this chapter does not deal with that approach.

2. TERMINOLOGY

Primary standard. A standard shown to have suitable properties for the intended use, the demonstration of suitability being made without comparison to an existing standard.

Secondary standard. A standard established by comparison with a primary standard.

International standard. An international standard is a primary standard that defines an International Unit. The equivalence in International Units of an international standard is stated by the World Health Organisation.

European Pharmacopoeia reference standard. A reference standard established under the aegis of and approved by the European Pharmacopoeia Commission.

European Pharmacopoeia Chemical Reference Substance (CRS). A substance or mixture of substances intended for use as stated in a monograph or general chapter of the European Pharmacopoeia. European Pharmacopoeia Chemical Reference Substances are primary standards, except for those (notably antibiotics) that are calibrated in International Units. The latter are secondary standards traceable to the international standard.

European Pharmacopoeia Biological Reference Preparation (BRP). A substance or mixture of substances intended for use as stated in a monograph or general chapter of the European Pharmacopoeia. European Pharmacopoeia Biological Reference Preparations are either secondary standards calibrated in International Units or primary standards, which may be used to define a European Pharmacopoeia Unit. Other assigned values may also be used, for example, virus titre, or number of bacteria.

Reference Material (RM). A material or substance, one or more of whose property values are sufficiently homogeneous and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials.

Certified Reference Material (CRM). A reference material, accompanied by a certificate, one or more of whose property values are certified by a procedure that establishes its traceability to an accurate realisation of the unit in which the property values are expressed, and for which each certified value is accompanied by an uncertainty at a stated level of confidence.

NOTE: pharmacopoeial reference standards are to be distinguished from reference materials and certified reference materials, which may be used in several contexts using a variety of analytical techniques for quantitative purposes. The use of reference materials is required or recommended in a number of monographs and general chapters of the pharmacopoeia, notably for calibration or verification of satisfactory performance of instruments.

The specificity of pharmacopoeial reference standards has been officially recognised in the introduction of ISO Guide 34 - *General requirements for the competence of reference material producers - (Second Edition 2000)*: "Pharmacopoeia standards and substances are established and distributed by pharmacopoeia authorities following the general principle of this guide. It should be noted, however, that a different approach is used by the pharmacopoeia authorities to give the user the information provided by the certificate of analysis and the expiration dates. Also, the uncertainty of their assigned values is not stated since it is negligible in relation to the defined limits of the method-specific assays of the pharmacopoeias for which they are used."

3. USE OF REFERENCE STANDARDS

Reference standards are employed in the identification, purity testing and assay of substances for pharmaceutical use and pharmaceutical preparations. Reference standards are shown to be suitable for their intended purpose; they are not necessarily suitable for other purposes. If a reference standard is to be used for any purpose other than that for which it has been established, its suitability for the new use has to be fully demonstrated. Any value assigned to a reference standard is valid for the intended use and not necessarily for other uses.

A European Pharmacopoeia reference standard with an assigned content/potency for use in the assay of a substance for pharmaceutical use may be suitable to determine the content of that substance in a pharmaceutical preparation where all the following conditions are fulfilled:

- the chromatographic assay method described in the active substance monograph is employed;
- the user verifies the applicability of the method to the particular pharmaceutical preparation (absence of interference);
- any pre-treatment of the sample (e.g. extraction) is validated for the particular pharmaceutical preparation;
- the use is approved by the competent authority.

Reference standards are also established for the determination of the content of components of herbal drugs and herbal drug preparations. These may be: the active principles themselves; marker constituents used for quantification; or extracts. Reference standards consisting of extracts are established using well-characterised samples of active principles or marker constituents.

It is the policy of the European Pharmacopoeia to supply reference standards in adequate quantities for immediate use after opening of the container. Use in other conditions is the responsibility of the analyst. If an unopened container is stored in the recommended conditions, it remains suitable for use as long as it is of the current batch. Information on current batch numbers is provided in the reference standards catalogue available from the European Directorate for the Quality of Medicines (Council of Europe). Storage of solutions of reference standards is not recommended unless suitability has been demonstrated by the user.

Secondary standards. A secondary standard may be used for routine quality control purposes for any of the uses described above for primary standards, provided that it is established with reference to the primary standard. A secondary standard is established and employed to reduce the use of the primary standard, which requires more extensive characterisation and evaluation and may be available only in a limited quantity. A secondary standard is used only for the same purpose as the primary standard with reference to which it has been established.

4. ESTABLISHMENT OF REFERENCE STANDARDS

4-1. *PRIMARY STANDARD*

A substance or preparation to be established as a primary standard is characterised by a variety of analytical techniques chosen to demonstrate its suitability for use.

For substances for pharmaceutical use and their impurities, relevant parts of the following test programme are usually applied.

- Characterisation of the substance (structural elucidation) by appropriate chemical attributes such as structural formula, empirical formula and molecular weight. A number of techniques may be used including:
  - nuclear magnetic resonance spectrometry;
  - mass spectrometry;
  - infrared spectrophotometry;
  - elemental analysis.
- Determination of the purity:
  - determination of the content of organic impurities by an appropriate separation technique or spectrometric method, where applicable;
  - quantitative determination of water;
  - determination of the content of residual solvents;
  - determination of loss on drying, which may in certain circumstances replace the determinations of water and residual solvents;
  - determination of inorganic impurities (test for heavy metals, sulphated ash, atomic spectrometry, inductively coupled plasma spectrometry, X-ray fluorescence); the results are not used in determining an assigned content, except where they would have an appreciable impact upon it;
  - determination of the purity by an absolute method (e.g. differential scanning calorimetry or phase solubility analysis where appropriate; the results of these determinations are used to support and confirm the results obtained from separation techniques; they are not used in the calculation of the assigned value).

For a primary chemical reference substance to be established for assay purposes, the assigned content is generally calculated from the values obtained from the analyses performed for the determination of impurities (organic, inorganic, water and solvents) by applying the principle of mass balance; other suitable methods are also used.

An establishment report for the reference standard is prepared and approved by the qualified person.

4-2. *EUROPEAN PHARMACOPOEIA REFERENCE STANDARDS*

The candidate standards are tested against a wide variety of analytical methods. The extent of testing and the number of laboratories involved depends on the use of the reference standard. Compliance with the relevant monograph is usually required, unless otherwise justified.

Where a collaborative trial is carried out during establishment, a protocol is provided for each participant and only valid results derived according to the protocol are used for establishing an assigned value or otherwise confirming suitability.

For chemical reference substances, relevant parts of the following programme are typically applied.

4-2-1. **Identification**. In general, a batch selected from the normal production of the substance is satisfactory. It is shown to comply with the requirements of the monograph; full structural elucidation is carried out for the first batch.

4-2-2. **Related substances test**. A reference standard corresponding to an impurity is characterised for identity and purity. Where a reference standard is used to determine the content of a given impurity, the preferred minimum content is 95.0 per cent; where this is achieved no assigned value is given, the content being considered as 100.0 per cent; this approximation is acceptable since there will be no appreciable effect on the determination of impurities. When this minimum content cannot be obtained, the standard has an assigned content.

If an impurity is not available in a sufficient quantity to establish a reference standard, a number of other options exist:

- preparation of a reference standard that contains a mixture of the compound(s) and the impurity or impurities;
- preparation of a reference standard containing a mixture of specified impurities.

Where such a mixture is also used to determine the content of a given impurity, the content of the impurity in the reference standard is determined by appropriate separation methods and a value assigned to the reference standard.

4-2-3. **Assay**

4-2-3-1. *Chemical assay.* When a reference standard is to be used for quantitative determination of an active substance or an excipient (assay standard), the extent of testing is greater. In general, several collaborating laboratories examine the proposed substance, following a detailed protocol that describes the procedures to be followed. The results obtained are used to assign a content. It is particularly important to quantify the impurities if a selective assay is employed. In such a case, it is best to examine the proposed substance by additional analytical procedures that are scientifically justified, including, where possible, absolute methods.

If a reference standard is required for a non-chromatographic assay method (e.g. colorimetry or ultraviolet spectrophotometry), the relative reactivity or relative absorbance of the impurities present in a substance must be checked to ensure that they are not markedly different from those of the substance.

A protocol is prepared and must be strictly followed by the participants of the collaborative trial to assign the content. The protocol usually requires:

- determination of water (or loss on drying);

– estimation of the organic impurities (including residual solvents when appropriate) using the prescribed separation techniques;
– and possibly, determination of the content of the substance by an absolute method; this would be a confirmatory determination not necessarily performed by all participants and the results would not be used in the calculation of the assigned value.

The protocol also indicates the system suitability tests and acceptance criteria for each of the tests performed.

Unless otherwise stated, an assigned value is given for the substance or preparation as presented in the container ('as is'), and the contents are not to be dried before use. For assay standards prepared by lyophilisation the content of the pure substance is indicated in milligrams or International Units per vial.

4-2-3-2. *Microbiological assay.* A reference standard for the microbiological assay is first shown to comply with the monograph. If the results are satisfactory a collaborative microbiological assay is carried out, using the international standard. The potency is expressed in International Units. If an international standard does not exist, European Pharmacopoeia Units are used. The assigned potency is calculated from the results of a collaborative trial. Various validity criteria are applied including parallelism, linearity, and quadratic fit, according to the usual statistical procedures (*5.3*). The assigned potency with the confidence limits is calculated from statistically valid results.

4-2-3-3. *Assay of components of herbal drugs and herbal drug preparations.* Reference standards used in monographs of herbal drugs vary in the extent of testing depending on the type of reference standard.

– An active component or marker constituent is characterised and evaluated for identity and purity; a value for content is assigned irrespective of the purity.
– An extract is used as a reference standard when insufficient active principle or marker constituent is available. The assigned content of the extract is established by means of a collaborative trial using a well-characterised sample of the active principle or marker component for which a value is to be assigned.

4-2-4. **Establishment report**. A report containing the results of the establishment study as well as information concerning the use of the reference standard is prepared. The report for a chemical assay standard has a value assigned to the substance with the rationale for attributing that value. The estimated uncertainty of the assigned value is calculated, and where it is less than a predefined value, which is considered to be negligible in relation to the acceptance criteria for the assay, then the study is accepted. Otherwise, the trial may be repeated, in whole or in part, or the limits defined for the pharmaceutical substance may be widened. The uncertainty of the assigned value is not given as part of the information provided with the reference standard, since the precision of the method and the uncertainty of the value attributed to the reference standard are taken into account when setting the limit(s) in a monograph.

4-3. *SECONDARY STANDARD*

A secondary standard should exhibit the same property or properties as the primary standard, relevant for the test(s) for which it is established. The extent of testing is not so great as is required for the establishment of a primary standard. The secondary standard is established by comparison with the primary standard to which it is traceable. An official primary standard is used wherever possible for establishment of secondary standards.

Identification

– For use in infrared spectrophotometry: the absorbance bands correspond in position and relative size to the absorbance bands of the primary standard.
– For use in separation techniques: the migration distance, migration time and retention time of the secondary standard are the same as those of the primary standard for thin-layer chromatography or electrophoresis, capillary electrophoresis and gas or liquid chromatography respectively.

Purity test. For use in separation techniques: as for identification but when used for quantification, a content relative to the signal from the primary standard is to be established.

Assay. Secondary standards are assayed against a primary standard with an assigned content or potency. The property for which a value is to be assigned for the secondary standard is similar in magnitude to that of the primary reference standard with which it is compared. Both the number of independent replicate determinations to be performed and the acceptance criteria to be applied are predefined.

5. PRODUCTION, LABELLING, STORAGE AND DISTRIBUTION

5-1. *PRODUCTION*

All operations are carried out according to the relevant norms of best practice to ensure the traceability and integrity of the reference standard. The production record includes information regarding filling, labelling and storage. Reference standards are dispensed into containers under appropriate filling and closure conditions, to ensure the integrity of the reference standard. The containers employed may be multi-use or single use, but the latter is preferred to minimise the risk of decomposition, contamination, or water uptake.

5-2. *LABELLING*

The labelling bears the name of the reference standard, the name of the supplier, the batch number, and any other information necessary to the proper use of the reference standard. If used as an assay standard the following information is also given:

– the assigned percentage content;
– or, the content in milligrams or millilitres of the chemical entity in the container;
– or, the assigned potency (for biological assays or microbiological assays) in units either per milligram or per vial.

For a manufacturer's reference standard, the label indicates a re-test or expiry date. For European Pharmacopoeia reference standards, no re-test or expiry date is given since the re-test programme (see below) monitors continued fitness for use.

Leaflets. An accompanying explanatory leaflet may also be provided giving information needed for correct use of the reference standard. An explanatory leaflet is considered as part of the labelling. Where stated in a monograph, a chromatogram is included in the leaflet.

5-3. *STORAGE AND DISTRIBUTION*

Reference standards are to be stored and distributed in conditions suitable to ensure optimal stability.

European Pharmacopoeia reference standards. European Pharmacopoeia reference standards are mostly stored in temperature-controlled rooms at 5 ± 3 °C. However, a number of reference standards that are relatively unstable

are stored at – 20 ± 5 °C or, in a few cases (e.g. live virus preparations), at – 80 ± 10 °C, and for cell cultures, under liquid nitrogen (– 180 °C).

Special packaging is employed to minimise the risk of damage during transport.

Reference standards that are normally stored at 5 ± 3 °C are dispatched by normal mail since short excursions from the long-term storage temperature are not deleterious to the reference standard. Reference standards stored at – 20 °C are packed on ice and dispatched by express courier. Reference standards stored at – 80 °C or stored under liquid nitrogen are packed on solid carbon dioxide and dispatched by express courier.

6. RE-TEST PROGRAMME

A system is established and implemented to ensure the continued fitness-for-use of the reference standards. Normally, a re-test programme is applied, taking account of the known physico-chemical properties and stability data for the reference standard. Reference standards are periodically tested for stability during storage. A monitoring programme is applied that is designed to detect at an early stage any sign of decomposition using appropriate analytical techniques. The methods employed should be chosen from amongst those performed during establishment so that baseline data are available.

The periodicity and extent of re-testing reference standards depends on a number of factors including:

- stability;
- container and closure system;
- storage conditions;
- hygroscopicity;
- physical form;
- intended use;
- presentation (single use/multiple use).

Most reference standards are presented in powder form but some are prepared as solutions. Preferably, reference standards are presented as single-use units. However, if the standard is presented in multi-use containers then re-testing may be more frequent for hygroscopic or oxygen-sensitive substances. The testing methods include the determination of water and decomposition products (where known). The re-test period may be lengthened with the support of sufficient data. The maximum permitted variation from the assigned value should be pre-defined, and if exceeded, the batch should be re-established or replaced.

European Pharmacopoeia reference standards. The monitoring programme of the EDQM includes a selection of the following tests, chosen for their rapidity, sensitivity and applicability to small quantities:

- determination of water, loss on drying and/or thermogravimetric analysis;
- estimation of impurities by stability-indicating separation techniques;
- where appropriate, determination of the molar purity by differential scanning calorimetry;
- application of other specific tests for detecting impurities.

Any significant differences observed compared with the last examination will lead to more extensive examination of the batch and, if necessary, to the establishment of a replacement batch.

5.14. GENE TRANSFER MEDICINAL PRODUCTS FOR HUMAN USE

This general chapter is published for information.

This general chapter contains a series of texts on gene transfer medicinal products for human use. The texts provide a framework of requirements applicable to the production and control of these products. For a specific medicinal product, application of these requirements and the need for any further texts is decided by the competent authority. The texts are designed to be applicable to approved products; the need for application of part or all of the texts to products used during the different phases of clinical trials is decided by the competent authority. The provisions of the chapter do not exclude the use of alternative production and control methods that are acceptable to the competent authority.

Further detailed recommendations on gene transfer medicinal products for human use are provided by the Note for Guidance on the Quality, Preclinical and Clinical Aspects of Gene Transfer Medicinal Products (CPMP/BWP/3088/99) and the Guideline on Development and Manufacture of Lentiviral Vectors (CHMP/BWP/2458/03) of the Committee for Medicinal Products for Human Use (including any subsequent revisions of these documents).

DEFINITION

For the purposes of this general chapter, gene transfer medicinal product (GTMP) shall mean a product obtained through a set of manufacturing processes aimed at the transfer, to be performed either *in vivo* or *ex vivo*, of a prophylactic, diagnostic or therapeutic gene (i.e. a piece of nucleic acid) to human/animal cells, and its subsequent expression *in vivo*. The gene transfer involves an expression system known as a vector, which can be of viral as well as non-viral origin. The vector can also be included in a human or animal cell.

Recombinant vectors, such as viral vectors and plasmids. Recombinant vectors are either injected directly into the patient's body (*in vivo* gene transfer) or transferred into host cells before administration of these genetically modified cells to the patient (*ex vivo* gene transfer). Viral vectors are derived from various viruses (for example, adenoviruses, poxviruses, retroviruses, lentiviruses, adeno-associated-viruses, herpesviruses). These vectors can be replicative, non-replicative or conditionally replicative. Plasmid vectors include nucleic acids in a simple formulation (for example, naked DNA) or complexed to various molecules (synthetic vectors such as lipids or polymers). Genetic material transferred by GTMPs consists of nucleotide sequences, which may encode gene products, antisense transcripts or ribozymes. Chemically synthesised oligonucleotides are not within the scope of this general chapter. After transfer, the genetic material may remain either cytoplasmic or episomal, or may be integrated into the host cell genome, depending on the integrating or non-integrating status of the vector.

Genetically modified cells. Genetically modified eukaryotic or bacterial cells are modified by vectors to express a product of interest.

PRODUCTION

Substances used in production. The raw materials used during the manufacturing process, including viral seed lot and cell bank establishment, where applicable, are qualified. Unless otherwise justified, all substances used are produced within a recognised quality assurance system using suitable production facilities. Suitable specifications are established to control notably their identity, potency (where applicable), purity and safety in terms of microbiological quality and bacterial endotoxin contamination. The quality of water used complies with the relevant corresponding monographs (*Purified water (0008), Highly purified water (1927), Water for injections (0169)*). The use of antibiotics is avoided wherever possible during production.

Viral safety. The requirements of chapter *5.1.7* apply.

Transmissible spongiform encephalopathies (*5.2.8*). A risk assessment of the product with respect to transmissible spongiform encephalopathies is carried out and suitable measures are taken to minimise such risk.

Recombinant vectors

PRODUCTION

GENERAL PROVISIONS

For viral vectors, production is based on a cell bank system and a virus seed-lot system, wherever possible.

For plasmid vectors, production is based on a bacterial cell bank system.

The production method shall have been shown to yield a vector of consistent quality in order to guarantee efficacy and safety in man. Unless otherwise justified and authorised, the vector in the final product shall have undergone no more passages or subcultures from the master seed lot than were used to prepare the vector shown in clinical trials to be satisfactory with respect to safety and efficacy.

SUBSTRATE FOR VECTOR PROPAGATION

The substrates used comply with relevant requirements of the European Pharmacopoeia (*5.2.2, 5.2.3*, and the section at the end of this general chapter: Bacterial cells used for the manufacture of plasmid vectors for human use).

CHARACTERISATION OF THE VECTOR

Historical records of vector construction are documented, including the origin of the vector and its subsequent manipulation, notably deleted or modified regions.

The vector is characterised using suitable and validated methods.

The genetic stability of the vector at or beyond the maximum passage level used for production is assessed by suitable methods.

PROPAGATION AND HARVEST

All processing of the cell banks and subsequent cell cultures is done in an area where no other cells or vectors are handled at the same time. Any material of human or animal origin used in the preparation of cell suspensions and culture media is qualified. The purity of the harvest is verified by suitable tests as defined in the corresponding specific sections.

PURIFIED HARVEST

The bulk of active substance is defined as a lot of purified recombinant vectors (viral vectors, or naked or complexed plasmids).

FINAL LOT

Unless otherwise justified and authorised, formulation and distribution of the final bulk is carried out under aseptic conditions using sterile containers (*3.2*).

The stability of the final lot is assessed using stability protocols including the duration, storage conditions, number of lots to be tested, test schedule and assays to be performed.

ASSAYS AND TESTS

The GTMPs comply with assays and tests described in the corresponding specific sections.

Genetically modified cells

For cells to be modified with a recombinant vector, the data related to the recombinant vector are documented above, under Recombinant vectors.

PRODUCTION

CELL SUBSTRATE

For xenogeneic cell lines, including bacterial cells, a cell bank system comprising a master cell bank and working cell banks is established.

For autologous and allogeneic cells, a cell banking system comprising a master cell bank and working cell banks is established wherever possible.

TRANSFECTION / TRANSDUCTION

Cells are transduced or transfected using a recombinant vector (plasmid or viral vector) qualified as described under Recombinant vectors; the process is validated. They are handled under aseptic conditions in an area where no other cells or vectors are handled at the same time. All reagents used during cell manipulation steps are fully qualified. Antibiotics are avoided unless otherwise justified and authorised. Transfection or transduction is carried out under aseptic conditions.

FINAL LOT

In the case of frozen storage, the viability of genetically modified cells is assessed before freezing and after thawing.

If the cells are not used within a short period, stability is determined by verifying cell viability and expression of the genetic insert.

In the case of genetically modified cells encapsulated before implantation in man, any encapsulating component used is considered as part of the final product, and is therefore quality-controlled and fully characterised (for example, physical integrity, selective permeability, sterility).

ASSAYS AND TESTS

Controls of xenogeneic, allogeneic or autologous cells include the following:

– identity, counting and viability of cells;

– overall integrity, functionality, copies per cell, transfer and expression efficiency of the genetic insert;

– microbiological controls (*2.6.1* or *2.6.27*), endotoxin content, mycoplasma contamination (*2.6.7*), adventitious virus contamination and, where applicable, replicative vector generation.

The competent authority may approve a reduced testing programme where necessary because of limited availability of cells. Where necessary because of time constraints, the product may be released for use before the completion of certain tests.

ADENOVIRUS VECTORS FOR HUMAN USE

DEFINITION

Adenovirus vectors for human use are freeze-dried or liquid preparations of recombinant adenoviruses, genetically modified to transfer genetic material to human somatic cells *in vivo* or *ex vivo*.

PRODUCTION

VECTOR CONSTRUCTION

There are different approaches for the design and construction of an adenovirus vector. The purpose of clinical use determines which approach is optimal. A method is chosen that minimises the risk of generating replication-competent adenovirus vectors or that effectively eliminates potential helper viruses during production.

VECTOR PRODUCTION

The production method shall have been shown to yield a vector of consistent quality in order to guarantee efficacy and safety in man. Unless otherwise justified and authorised, the vector in the final product shall have undergone no more passages from the master seed lot than were used to prepare the vector shown in clinical trials to be satisfactory with respect to safety and efficacy.

The genetic and phenotypic stability of the vector construct at or beyond the maximum passage level used for production is assessed by suitable methods.

SUBSTRATE FOR VECTOR PROPAGATION

The vector is propagated in continuous cell lines (*5.2.3*) based on a cell bank system. The occurrence of replication-competent adenoviruses (RCAs) may be significant when large regions of homology exist between the viral genome and the genome of the complementation cells. This occurrence may be minimised by minimising the homology between both genomes. The use of cells with no sequence homology with the vector is recommended for production.

VECTOR SEED LOT

Production of the vector is based on a seed-lot system.

The strain of adenovirus used is identified by historical records that include information on its origin and its subsequent manipulation, notably deleted or modified regions. A detailed description of the genetic insert(s) and the flanking control regions is established, including the nucleotide sequence. The method by which the genetic insert is introduced into the vector is documented.

Only a seed lot that complies with the following requirements may be used for vector production.

Identification. The vector is identified in the master seed lot and each working seed lot by immunochemical methods (*2.7.1*) or nucleic acid amplification techniques (NATs) (*2.6.21*).

Genetic and phenotypic characterisation. The following tests are carried out.

– The entire genome of the vector is sequenced at a passage level comparable to a production batch and the analytically determined sequence is compared to the

theoretical sequence based on vector construction and available databases.

– Restriction analysis is performed on the vector DNA of the master seed lot, each working seed lot and a production batch. The viral DNA is extracted, purified and digested with sufficient resolution. The digested fragments are separated by gel electrophoresis or capillary electrophoresis and the observed restriction pattern is compared to the theoretical restriction pattern based on vector construction.
– A suitable number of isolated sub-clones are tested for expression of the genetic insert product(s) and biological activity at a passage level comparable to a production batch. Sub-clones giving lower levels of expression or biological activity need further characterisation.

Vector concentration. The titre of infectious vector or the concentration of vector particles in the master seed lot and each working seed lot are determined.

Extraneous agents (*2.6.16*). The master seed lot and each working seed lot comply with the tests for extraneous agents.

Replication-competent adenoviruses (RCAs). RCAs are generated by homologous recombination between the recombinant viral DNA and the adenovirus sequences integrated into the genome of the complementation cells.

Detection of RCAs is performed by a suitable method approved by the competent authority. It is generally performed by an infectivity assay on sensitive detector cell lines, which are not able to complement for the genes deleted from the vector. Other indicators of viral replication may be used as appropriate.

When RCAs are not supposed to be present in the test sample, considering vector construction and cell lines used, at least 2, but preferably 3 or 4 successive passages are performed on the detector cell line, where applicable. Detection of a cytopathic effect at the end of the passages reveals the presence of RCAs in the preparation. Positive controls are included in each assay to monitor its sensitivity.

When RCAs are expected to be present in the test sample, plaque-assays or limit dilution assays on a detector cell line may be performed.

PROPAGATION AND HARVEST

All processing of the cell bank and subsequent cell cultures is done in an area with a suitable containment level where no other cells or vectors are handled at the same time. Any material of human or animal origin used in the preparation of cell suspensions and culture media is qualified. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration, but it is preferable to have a substrate free from antibiotics during production. Unless otherwise justified and authorised, at no stage during production is penicillin or streptomycin used. A portion of the production cell cultures is set aside as uninfected cell cultures (control cells).

Each single harvest that complies with the following requirements may be used in the preparation of the purified harvest.

Identification. The vector is identified by immunochemical methods (*2.7.1*) or NATs (*2.6.21*).

Vector concentration. The titre of infectious vector and the concentration of vector particles in single harvests are determined.

Extraneous agents (*2.6.16*). The single harvest complies with the tests for extraneous agents.

Control cells. Control cells comply with a test for identification (*5.2.3*) and a test for extraneous agents (*2.6.16*).

PURIFIED HARVEST

Several single harvests may be pooled before the purification process. The purification process is validated to demonstrate the satisfactory removal of impurities.

Purified harvests that comply with the following requirements may be used in the preparation of the final bulk.

Vector concentration. The titre of infectious vector and the concentration of vector particles in purified harvests are determined.

Identification. The vector is identified by immunochemical methods (*2.7.1*) or NATs (*2.6.21*).

Genomic integrity. Genomic integrity of the vector is verified by suitable methods such as restriction analysis.

Residual host-cell protein. The concentration of residual host-cell protein is determined by a suitable immunochemical method (*2.7.1*), unless the process has been validated to demonstrate suitable clearance.

Residual host-cell DNA. The content of residual host-cell DNA is determined using a suitable method, unless the process has been validated to demonstrate suitable clearance. Quantitative polymerase chain reaction (PCR) is recommended for its sensitivity and specificity, but other suitable techniques may also be used.

Residual reagents. Where reagents are used during the purification process, tests (for example, liquid chromatography or atomic absorption spectrometry) for these substances are carried out on the purified harvest, unless the process has been validated to demonstrate suitable clearance.

Residual antibiotics. Where antibiotics are used during the production process, their residual concentration is determined by a microbiological assay (adapted from *2.7.2*) or by other suitable methods (for example, liquid chromatography), unless the process has been validated to demonstrate suitable clearance.

FINAL BULK

Several purified harvests may be pooled during preparation of the final bulk. A stabiliser and other excipients may be added. The formulated product is filtered through a bacteria-retentive filter.

Only a final bulk that complies with the following requirement may be used in the preparation of the final lot.

Sterility (*2.6.1*). It complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the tests for bovine serum albumin (when bovine serum is used to manufacture the vector) and RCAs have been carried out with satisfactory results on the final bulk, they may be omitted on the final lot.

IDENTIFICATION

The vector is identified by immunochemical methods (*2.7.1*) or NATs (*2.6.21*) or restriction analysis.

TESTS

Osmolality (*2.2.35*): within the limits approved for the particular preparation.

pH (*2.2.3*): within the limits approved for the particular preparation.

Extractable volume (*2.9.17*). It complies with the test for extractable volume.

Residual moisture (*2.5.12*): within the limits approved for the particular freeze-dried preparation.

Bovine serum albumin: not more than the limit approved for the particular preparation, determined by a suitable immunochemical method (*2.7.1*), where bovine serum has been used during production.

Replication-competent adenovirus (RCA) concentration: within the limits approved for the particular preparation.

Vector aggregates. Vector aggregates are determined by suitable methods (for example, light scattering).

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than the limit approved for the particular preparation.

Thermal stability. Maintain samples of the vector final lot at a temperature and for a length of time that are adapted and authorised for the particular preparation. Determine the total infectious vector concentration after heating, as described below under Assay. Determine in parallel the vector concentration of a non-heated sample. The estimation of the difference between the total vector concentration without heating and after heating is within the limits approved for the particular preparation.

ASSAY

Vector particle concentration. Physical titration is performed by a suitable technique (for example, liquid chromatography, absorbance measurement or NATs (*2.6.21*)). Use an appropriate vector reference standard to validate each assay.

The vector particle concentration of the preparation to be examined is not less than the concentration stated on the label.

Infectious vector titre. Titrate the preparation to be examined by inoculation into cell cultures. Titrate an appropriate vector reference standard to validate each assay.

The assay is invalid if:

- the confidence interval (P = 0.95) of the logarithm of the vector concentration is greater than a value authorised by the competent authority;
- the infectious vector titre of the reference standard is outside limit values defined by a control chart.

Ratio of vector particle concentration to infectious vector titre: within the limits approved for the particular preparation.

Expression of the genetic insert product. The expression of the genetic insert product(s) is determined wherever possible, following inoculation of cell cultures with the particular preparation at a predetermined multiplicity of infection, by suitable immunochemical (*2.7.1*) or biochemical assays or by flow cytometry (*2.7.24*).

Biological activity. Unless otherwise justified and authorised, biological activity is determined by a suitable *in vitro* or *in vivo* test.

LABELLING

The label states:

- the content of active substance;
- the recommended human dose, expressed in vector particle concentration;
- for freeze-dried preparations:
  - the name or composition and the volume of the reconstituting liquid to be added;
  - the time within which the product is to be used after reconstitution.

POXVIRUS VECTORS FOR HUMAN USE

DEFINITION

Poxvirus vectors for human use are freeze-dried or liquid preparations of recombinant poxviruses, genetically modified to transfer genetic material to human somatic cells *in vivo* or *ex vivo*.

PRODUCTION

VECTOR CONSTRUCTION

The general design of a poxvirus vector is currently as follows: the genetic insert is inserted downstream of a poxvirus promoter. This expression cassette is inserted into the poxvirus genome in such a manner that it interrupts a viral gene non-essential for replication or is positioned between 2 virus open reading frames.

In most strategies used so far for the construction of the vector, the expression cassette is first inserted within the target site of a virus DNA fragment cloned into a bacterial plasmid. The plasmid is then introduced into host cells, cultured *in vitro*, which are simultaneously infected with the parental poxvirus. DNA recombination occurs within the infected cells, between homologous sequences in the viral genome and viral sequences in the plasmid so as to transfer the genetic insert into the targeted site of the viral genome. The correct targeting of the inserted DNA is checked by restriction-enzyme mapping, NATs (*2.6.21*) and sequencing. Successive plaque-cloning steps are performed to purify the recombinant poxvirus from the mixture of parental and recombinant poxviruses. A variety of methods (for example, foreign marker genes, DNA hybridisation, immunological detection, phenotypic changes in the virus) are employed to facilitate recognition and/or selection of the recombinant poxvirus from the background of parental virus. Where foreign marker genes have been transiently employed, they are removed by appropriate methods from the final recombinant poxvirus.

An alternative strategy for creating poxvirus vectors begins with the *in vitro* construction of a full-length virus genome harbouring the expression cassette within a chosen target site. This recombinant genome is then introduced into host cells simultaneously infected with a helper poxvirus that is unable to multiply. The helper virus may be a poxvirus of the same species whose ability to multiply has been inactivated, or another poxvirus species that does not multiply in the host cells.

The construction of non-replicative poxvirus vectors relies on specific host cell lines or primary cells that are naturally permissive, or on host cell lines that have been modified to express an essential poxvirus gene. These cells fulfill the general requirements for the production of medicinal products (*5.2.3*) and do not allow the generation of replicative vectors.

VECTOR PRODUCTION

The production method shall have been shown to yield a vector of consistent quality in order to guarantee efficacy and safety in man. Unless otherwise justified and authorised, the vector in the final product shall have undergone no more passages from the master seed lot than were used to prepare the vector shown in clinical trials to be satisfactory with respect to safety and efficacy.

The genetic and phenotypic stability of the vector construct at or beyond the maximum passage level used for production is assessed by suitable methods.

SUBSTRATE FOR VECTOR PROPAGATION

The vector is propagated under aseptic conditions in human diploid cells (*5.2.3*), in continuous cell lines (*5.2.3*) or in cultures of chick-embryo cells derived from a chicken flock free from specified pathogens (*5.2.2*). When the vector is propagated in a continuous cell line or in human diploid cells, a cell-bank system is established.

VECTOR SEED LOT

Production of the vector is based on a seed-lot system.

The strain of poxvirus used is identified by historical records that include information on its origin and its subsequent manipulation, notably deleted or modified regions. A detailed description of the genetic insert(s) and the flanking control regions is established, including the nucleotide sequence. The method by which the genetic insert is introduced into the vector is documented.

Only a seed lot that complies with the following requirements may be used for vector production.

Identification. The vector is identified in the master seed lot and each working seed lot by immunochemical methods (*2.7.1*) or NATs (*2.6.21*).

Genetic and phenotypic characterisation. The following tests are carried out.

- The entire genome of the vector is sequenced at a passage level comparable to a production batch and the analytically determined sequence is compared to the theoretical sequence based on vector construction and available databases.
- Restriction analysis is performed on the vector DNA of the master seed lot, each working seed lot and a production batch. The viral DNA is extracted, purified and digested with sufficient resolution. The digested fragments are separated by gel electrophoresis or capillary electrophoresis and the observed restriction pattern is compared to the theoretical restriction pattern based on vector construction.
- A suitable number of isolated sub-clones are tested for expression of the genetic insert product(s) and biological activity at a passage level comparable to a production batch. Sub-clones giving lower levels of expression or biological activity need further characterisation.
- The host range is verified by determining the replication properties of the vector and comparing them with that of the parental virus, at a passage level comparable to a production batch.

Infectious vector titre. The titre of infectious vector in the master seed lot and each working seed lot is determined.

Extraneous agents (*2.6.16*). The master seed lot and each working seed lot comply with the tests for extraneous agents, except where cytopathic strains cannot be neutralised and the vector causes interference. Where a test cannot be performed, carry out a suitable validated alternative.

PROPAGATION AND HARVEST

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area with a suitable containment level where no other cells or vectors are handled at the same time. Any material of human or animal origin used in the preparation of cell suspensions and culture media is qualified. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration, but it is preferable to have a substrate free from antibiotics during production. Unless otherwise justified and authorised, at no stage during production is penicillin or streptomycin used. A portion of the production cell culture is set aside as uninfected cell cultures (control cells).

Each single harvest that complies with the following requirements may be used in the preparation of the purified harvest.

Identification. The vector is identified by immunochemical methods (*2.7.1*) or NATs (*2.6.21*).

Infectious vector titre. The titre of infectious vector in single harvests is determined.

Extraneous agents (*2.6.16*). The single harvest complies with the tests for extraneous agents, except where cytopathic strains cannot be neutralised and the vector causes interference. Where a test cannot be performed, carry out a suitable validated alternative.

Control cells. If human diploid cells or a continuous cell line are used for production, the control cells comply with a test for identification (*5.2.3*). They comply with the tests for extraneous agents (*2.6.16*).

PURIFIED HARVEST

Processing is carried out under aseptic conditions. Several single harvests may be pooled before the purification process. The harvest is first clarified to remove cells and then, where applicable, purified by validated methods. Purified harvests that comply with the following requirements may be used in the preparation of the final bulk.

Infectious vector titre. The titre of infectious vector in purified harvests is determined.

Identification. The vector is identified by immunochemical methods (*2.7.1*) or NATs (*2.6.21*).

Genomic integrity. Genomic integrity of the vector is verified by suitable methods such as restriction analysis.

Ratio of infectious vector titre to total protein concentration. The total protein concentration is determined by a suitable method (*2.5.33*). The ratio between infectious vector titre and total protein concentration is calculated.

Residual host-cell protein. The concentration of residual host-cell protein is determined by a suitable immunochemical method (*2.7.1*), unless the process has been validated to demonstrate suitable clearance.

Residual host-cell DNA. The content of residual host-cell DNA is determined using a suitable method, unless the process has been validated to demonstrate suitable clearance. Quantitative PCR is recommended for its sensitivity and specificity, but other suitable techniques may also be used.

Residual reagents. Where reagents are used during the purification process, tests (for example, liquid chromatography or atomic absorption spectrometry) for these substances are carried out on the purified harvest, unless the process has been validated to demonstrate suitable clearance.

Residual antibiotics. Where antibiotics are used during the production process, their residual concentration is determined by a microbiological assay (adapted from *2.7.2*) or by other suitable methods (for example, liquid chromatography), unless the process has been validated to demonstrate suitable clearance.

FINAL BULK

Several purified harvests may be pooled during preparation of the final bulk. A stabiliser and other excipients may be added.

Only a final bulk that complies with the following requirement may be used in the preparation of the final lot.

Sterility (*2.6.1*). It complies with the test for sterility carried out using 10 ml for each medium.

FINAL LOT

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the test for bovine serum albumin (when bovine serum is used to manufacture the vector) has been carried out with satisfactory results on the final bulk, it may be omitted on the final lot.

IDENTIFICATION

The vector is identified by immunochemical methods (*2.7.1*) or NATs (*2.6.21*).

TESTS

Osmolality (*2.2.35*): within the limits approved for the particular preparation.

pH (*2.2.3*): within the limits approved for the particular preparation.

Extractable volume (*2.9.17*). It complies with the test for extractable volume.

Residual moisture (*2.5.12*): within the limits approved for the particular freeze-dried preparation.

Bovine serum albumin: not more than the limit approved for the particular preparation, determined by a suitable immunochemical method (*2.7.1*), where bovine serum has been used during production.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than the limit approved for the particular preparation.

Thermal stability. Maintain samples of the vector final lot at a temperature and for a length of time that are adapted and authorised for the particular preparation. Determine the total infectious vector concentration after heating, as described below under Assay. Determine in parallel the vector concentration of a non-heated sample. The estimation of the difference between the total vector concentration without heating and after heating is within the limits approved for the particular preparation.

ASSAY

Infectious vector titre. Titrate at least 3 vials of the preparation to be examined by inoculation into cell cultures. Titrate a vial of an appropriate vector reference standard to validate each assay.

The vector titre of the preparation to be examined is not less than the minimum amount stated on the label.

The assay is invalid if:

- the confidence interval (P = 0.95) of the logarithm of the vector concentration is greater than a value authorised by the competent authority;
- the infectious vector titre of the reference standard is outside limit values defined by a control chart.

Expression of the genetic insert product. The expression of the genetic insert product(s) is determined, wherever possible, following inoculation of cell cultures with the particular preparation at a predetermined multiplicity of infection, by suitable immunochemical (*2.7.1*) or biochemical assays or by flow cytometry (*2.7.24*).

Biological activity. Unless otherwise justifed and authorised, biological activity is determined by a suitable *in vitro* or *in vivo* test.

LABELLING

The label states:

- the minimum vector titre per human dose;
- the recommended human dose;
- for freeze-dried preparations:
  - the name or composition and the volume of the reconstituting liquid to be added;
  - the time within which the product is to be used after reconstitution.

PLASMID VECTORS FOR HUMAN USE

DEFINITION

Plasmid vectors for human use are double-stranded circular forms of bacterial DNA that carry a gene of interest or a nucleotide sequence encoding antisense sequences or ribozymes and its expression cassette; they are amplified in bacteria at an extrachromosomal location. They are used to transfer genetic material into human somatic cells *in vivo* or to genetically modify autologous, allogeneic, xenogeneic or bacterial cells before administration to humans. Plasmid vectors may be presented as naked DNA or may be formulated with synthetic delivery systems such as lipids (lipoplexes), polymers (polyplexes) and/or peptide ligands that facilitate transfer across the cell membrane and delivery to the cell, or that target delivery via specific receptors.

Plasmids formulated with synthetic delivery systems are not within the scope of this section.

PRODUCTION

PLASMID CONSTRUCTION

A typical plasmid vector is composed of:

- the plasmid vector backbone that contains multiple restriction endonuclease recognition sites for insertion of the genetic insert and the bacterial elements necessary for plasmid production, such as selectable genetic markers for the identification of cells that carry the recombinant vector;
- the required regulatory genetic elements to facilitate expression of the genetic insert;
- the genetic insert;
- a polyadenylation signal.

A complete description of the plasmid DNA, including its nucleotide sequence, is established with the identification, source, means of isolation and nucleotide sequence of the genetic insert. The source and function of component parts of the plasmid, such as the origin of replication, viral and eukaryotic promoters and genes encoding selection markers, are documented.

GENERAL PROVISIONS

Cell banks. Production of plasmid vectors is based on a bacterial cell-bank system with generation and characterisation of a master cell bank (MCB), working cell banks (WCBs) and end-of-production cells (EOPCs), which comply with the section at the end of this general chapter: Bacterial cells used for the manufacture of plasmid vectors for human use. The raw materials used during the manufacturing process, including cell bank establishment, are qualified.

Selection techniques. Unless otherwise justified and authorised, antibiotic-resistance genes used as selectable genetic markers, particularly for clinically useful antibiotics, are not included in the vector construct. Other selection techniques for the recombinant plasmid are preferred.

Reference standards. A suitable batch of the formulated plasmid, preferably one that has been clinically evaluated, is fully characterised and retained for use as a reference standard as necessary in routine control tests.

PROPAGATION AND HARVEST

Plasmid DNA is transferred to host strain bacterial cells and a single clone of transformed bacteria is expanded to create the MCB. The WCB is then derived from the MCB. The EOPCs are obtained from the WCB by fermentation in production conditions.

Plasmid DNA is isolated from harvested cells using an extraction step and is purified to obtain the bulk product.

Unless otherwise justified and authorised, caesium chloride-ethidium bromide density gradients are not used for production.

PURIFIED PLASMID

The production process is optimised to remove impurities consistently while retaining product activity. The requirement to test for a particular impurity depends on the following:

- the demonstrated capability of the manufacture and purification processes to remove or inactivate the impurity through process validation, using specific quantification methods;
- the potential toxicity associated with the impurity;
- the potential decrease of the efficacy of the genetic insert product associated with the impurity.

If selective resistance to specific antibiotics has been used for selection, data from validation studies of purification procedures are required to demonstrate the clearance capability for residual antibiotics.

Relevant in-process controls are performed to ensure that the process is continuously under control, for example, amount and form of plasmid after the extraction steps and amount of endotoxins after the extraction steps.

Only a batch of purified plasmid that complies with the following requirements may be used.

Identity and integrity of the purified plasmid. Identity and integrity of the purified plasmid are established by suitable methods such as sequencing or nucleic acid amplification techniques (*2.6.21*); restriction-digest analysis may be used where it is sufficient to detect potential critical modifications in the plasmid and confirm the plasmid identity.

Plasmid DNA. The following indications are given as examples.

DNA concentrations greater than 500 ng/ml may be determined using absorbance measurement at 260 nm. A 50 µg/ml double-stranded DNA solution has an absorbance of 1 (specific absorbance 200).

DNA concentrations less than 500 ng/ml are determined following incubation with fluorescent dyes that bind specifically to double-stranded DNA, using a reference standard of DNA to establish a calibration curve.

Liquid chromatography may also be used to determine the concentration of plasmid DNA using a reference standard. In some cases, capillary electrophoresis is also acceptable.

DNA forms. Plasmid DNA is characterised in terms of the proportions of supercoiled, multimeric, relaxed monomer and linear forms, using suitable analytical methods, examples of which are given below. For quantification of supercoiled forms, anion-exchange high performance liquid chromatography (HPLC) or capillary electrophoresis may be used. Capillary electrophoresis is also suitable for the quantification of other forms.

Residual host-cell DNA. The content of residual host-cell DNA is determined using a suitable method, unless the process has been validated to demonstrate suitable clearance. Quantitative PCR is recommended for its sensitivity and specificity, but other suitable techniques may also be used.

Residual RNA. The content of residual RNA is determined, unless the process has been validated to demonstrate suitable clearance. Reverse-phase HPLC (RP-HPLC) may be used, or quantitative reverse-transcriptase polymerase chain reaction (RT-PCR) (*2.6.21*) when a lower limit of detection is required.

Residual host-cell protein. The concentration of residual host-cell protein is determined using standard protein assays (*2.5.33*), SDS-PAGE followed by silver staining, or specific immuno-assays such as western blot or ELISA, unless the process has been validated to demonstrate suitable clearance.

Microbiological control. Depending on the preparation concerned, it complies with the test for sterility (*2.6.1*) or the bioburden is determined (*2.6.12*).

Bacterial endotoxins (*2.6.14*): less than the limit approved for the particular preparation.

FINAL BULK

Several purified harvests may be pooled during preparation of the final bulk. A stabiliser and other excipients may be added. The formulated product is filtered through a bacteria-retentive filter.

Only a final bulk that complies with the following requirement may be used in the preparation of the final lot.

Sterility (*2.6.1*). It complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use.

IDENTIFICATION

The plasmid vector is identified by restriction-digest analysis or by sequencing. The test for biological activity also serves to identify the product.

TESTS

Tests carried out on the final lot include the following.

Appearance.

pH (*2.2.3*): within the limits approved for the particular preparation.

Extractable volume (*2.9.17*). It complies with the test for extractable volume.

Residual moisture (*2.5.12*): within the limits approved for the particular freeze-dried preparation.

DNA forms. The percentage of the specific monomeric supercoiled form is determined as described for the purified plasmid.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than the limit approved for the particular preparation.

ASSAY

Plasmid DNA: not less than the quantity stated on the label, determined, for example, by one of the following methods.

DNA concentrations greater than 500 ng/ml may be determined using absorbance measurement at 260 nm. A 50 µg/ml double-stranded DNA solution has an absorbance of 1 (specific absorbance 200).

DNA concentrations less than 500 ng/ml are determined following incubation with fluorescent dyes that bind specifically to double-stranded DNA, using a reference standard of DNA to establish a calibration curve.

Liquid chromatography may also be used to determine the concentration of plasmid DNA using a reference standard. In some cases, capillary electrophoresis is also acceptable.

Biological activity. Wherever possible, biological activity is assessed through *in vitro* or *in vivo* bioassays. A well-defined, representative reference standard is required as a positive control for the assay. Bioassays employed to assay plasmid vectors generally involve transfection of a relevant cell line *in vitro*, followed by some functional measure of the expressed genetic insert. Such functional assays provide information about the activity of the product encoded by the genetic insert instead of the expression level of the genetic insert itself.

It may be necessary to supplement the bioassay with western-blot and ELISA assays to assess the integrity and quantity of the expressed product.

LABELLING

The label states:

- the plasmid DNA concentration;
- the recommended human dose;
- for freeze-dried preparations:
  - the name and volume of the liquid to be added;
  - the time within which the product is to be used after reconstitution.

BACTERIAL CELLS USED FOR THE MANUFACTURE OF PLASMID VECTORS FOR HUMAN USE

Production of plasmid vectors for human use is based on the use of a bacterial cell-bank system with generation and characterisation of a master cell bank (MCB), working cell banks (WCBs) and end-of-production cells (EOPCs). A bacterial cell bank for the manufacture of plasmid vectors is a collection of vials containing bacterial cells stored under defined conditions, with uniform composition, and obtained from pooled cells derived from a single clone of a transformed host strain. The MCB has a known, documented history; it is preferably derived from a qualified repository source. The WCB is produced by expanding one or more vials of the MCB. Methods and reagents used to produce the bank and storage conditions are documented.

MCBs and WCBs are qualified by testing an aliquot of the banked material or testing a subculture of the cell bank.

The following table indicates the tests required at each stage of production.

Assay	Host strain	MCB	WCB	EOPCs*
Identity and purity				
Viability	+	+	+	+
Bacterial strain characterisation	+	+	–	+
Genotyping / phenotyping	+	+	–	+
Presence of the plasmid				
– Sequence of the DNA plasmid	–	+	–	+
– Copy number	–	+	+	+
– Restriction map	–	+	+	+
– Percentage of cells retaining the plasmid	–	+	+	+
Adventitious agents				
Purity by plating	+	+	+	+
Presence of bacteriophage	+	+	–	+

* EOPCs are cells with a passage number at least equivalent to that used for production. The analysis has to be done once to validate each new WCB, except for purity, which has to be tested for each fermentation.

IDENTITY AND PURITY TESTING

Viability. The number of viable cells is determined by plating a diluted aliquot of bacterial cells on an appropriate medium and counting individual colonies.

Biochemical and physiological bacterial strain characterisation. Depending on the bacterial strain used for production, relevant biochemical and physiological characterisation is performed to confirm cell identity at the species level.

Genotyping / phenotyping. The genotype of bacterial cells is verified by determination of the suitable specific phenotypic markers or by appropriate genetic analysis.

Presence of the plasmid

Sequencing. The whole nucleotide sequence of the plasmid is verified.

Copy number. The plasmid DNA is isolated and purified from a known number of bacteria and the copy number determined by a validated method such as quantitative PCR (*2.6.21*).

Restriction map. Restriction endonuclease digestion is performed with sufficient resolution to verify that the structure of the plasmid is unaltered in bacterial cells.

Percentage of cells retaining the plasmid. Bacterial elements present in the plasmid, such as selectable genetic markers, are used to define the percentage of bacteria retaining the plasmid.

ADVENTITIOUS AGENTS AND ENDOGENOUS VIRUSES

Purity by plating. Bacterial cells are streaked out onto suitable media and incubated in the required conditions in order to detect potential bacterial contaminants. In order to test for inhibition of the growth of contaminating organisms, additional tests in the presence of a definite amount of relevant positive control bacteria are carried out. A suitable number of colonies is examined; no contamination is detected.

Presence of bacteriophage. Bacterial cells are plated and incubated in a medium allowing proliferation of bacteriophages, to test for bacteriophage presence. The test is validated by the use of a reference bacteriophage strain and permissive cells as positive controls. A suitable number of colonies is examined; no contamination is detected.

ALLERGEN PRODUCTS

Producta allergenica

DEFINITION

Allergen products are pharmaceutical preparations derived from extracts of naturally occurring source materials containing allergens, which are substances that cause or provoke allergic (hypersensitivity) disease. The allergenic components are most often of a proteinaceous nature. Allergen products are intended for *in vivo* diagnosis or treatment of allergic (hypersensitivity) diseases attributed to these allergens.

Allergen products are available as finished products, as bulk preparations in dried form, solutions or suspensions intended to be further concentrated or diluted prior to use or as final preparations in solutions, suspensions or freeze-dried. Allergen products intended for parenteral, bronchial and conjunctival administration are sterile.

For *diagnostic use*, allergen products are usually prepared as unmodified extracts in a 50 per cent *V/V* solution of glycerol for skin-prick testing. For intradermal diagnosis or for provocation tests by nasal, ocular or bronchial routes, suitable dilutions of allergen products may be prepared by dilution of aqueous or glycerinated extracts, or by reconstitution immediately before use of unmodified freeze-dried extracts.

For *immunotherapy*, allergen products may be either unmodified extracts or extracts modified chemically and/or by adsorption onto different carriers (for example, aluminium hydroxide, calcium phosphate or tyrosine).

This monograph does not apply to: chemicals that are used solely for diagnosis of contact dermatitis; chemically synthesised products; allergens derived by rDNA technology; finished products used on a named-patient basis. It does not necessarily apply to allergen products for veterinary use.

PRODUCTION

Allergen products are derived from a wide range of allergenic source materials. They are often prepared as bulk products intended to be further diluted or concentrated prior to use. They may be treated to modify or reduce the allergenic activity or remain unmodified.

Where allergen products are manufactured using materials of human or animal origin, the requirements of chapter *5.1.7. Viral safety* apply.

SOURCE MATERIALS

Source materials for the preparation of allergen products are mostly pollens, moulds, mites, animal epithelia, hymenoptera venoms and certain foods.

They are described by their origin, nature, method of collection or production and pretreatment, and are stored under defined conditions that minimise deterioration.

The collection or production, as well as the handling of the source materials are such that uniform qualitative and quantitative composition is ensured as far as possible from batch to batch.

Pollens. Potential chemical contaminants, such as pesticides and heavy metals, must be minimised. Pollens contain not more than 1 per cent of foreign pollens as determined by microscopic examination. Pollens contain not more than 1 per cent of mould spores as determined by microscopic examination.

Mites and moulds. Biologically active contaminants such as mycotoxins in moulds must be minimised and any presence justified. Care must be taken to minimise any allergenic constituents of the media used for the cultivation of mites and moulds as source materials. Culture media that contain substances of human or animal origin must be justified and, when required must be suitably treated to ensure the inactivation or elimination of possible transmissible agents of disease.

Animal epithelia. Animal epithelia must be obtained from healthy animals selected to avoid possible transmissible agents of disease.

MANUFACTURING PROCESS

Allergen products are generally obtained by extraction, and may be purified, from the source materials using appropriate methods shown to preserve the biological properties of the allergenic components. Allergen products are manufactured under conditions designed to minimise microbial growth and enzymatic degradation.

A purification procedure, if any, is designed to minimise the content of any potential irritant low-molecular-mass components or other non-allergenic components.

Allergen products may contain a suitable antimicrobial preservative. The nature and the concentration of the antimicrobial preservative have to be justified.

The manufacturing process comprises various stages.

Native allergen extracts result after separation from the extracted source materials.

Intermediate allergen products are obtained by further processing or modification of the native allergen extracts. The modification may be achieved by chemical processes (chemical conjugation) or physical processes (physical adsorption onto different carriers, for example, aluminium hydroxide, calcium phosphate or tyrosine). They may also be modified by inclusion into such vehicles as liposomes or microspheres, or by the addition of other biologically active agents to enhance efficacy or safety. Intermediate allergen products may be freeze-dried.

Bulk allergen preparations consist of products in solution or suspension which will not be further processed or modified, and are ready for dilution or filling into final containers.

IN-HOUSE REFERENCE PREPARATION

An appropriate representative preparation is selected as the In-House Reference Preparation (IHRP), characterised and used to verify batch-to-batch consistency. The IHRP is stored in suitably sized aliquots under conditions ensuring its stability, usually freeze-dried.

Characterisation of the In-House Reference Preparation. *The extent of characterisation of the IHRP depends on the nature of the allergenic source material, knowledge of the allergenic components and availability of suitable reagents, as well as the intended use. The characterised IHRP is used as reference in the batch control of native allergen extracts or intermediate allergen products and, if possible, in the batch control of final allergen preparations.*

The In-House Reference Preparation (IHRP) is characterised by the protein content determination and a protein profile using relevant methods (such as isoelectric focusing, polyacrylamide gel electrophoresis, immunoelectrophoresis or molecular-mass profiling). Allergenic components may be detected by appropriate methods (for example, immunoblotting or crossed radio-immunoelectrophoresis). Characterisation of the allergenic components may include identification of relevant allergens based on serological or other techniques using a pool or individual sera from allergic patients, or allergen-specific polyclonal or monoclonal

antibodies. When allergen reference substances are available, determination of the content of individual allergens may be performed. Individual allergens are identified according to internationally established nomenclature whenever possible.

Where possible, the biological potency of the IHRP is established by *in vivo* techniques such as skin testing, and expressed in units of biological activity. If not, for certain extracts, potency may be established by suitable immunoassays (for example, those based on the inhibition of the binding capacity of specific immunoglobulin E antibodies) or by quantitative techniques for a single major component.

IDENTIFICATION

Identity is confirmed at the intermediate or other applicable stage by comparison with the IHRP using protein profiling by appropriate methods (for example, isoelectric focusing, sodium dodecyl sulphate-polyacrylamide gel electrophoresis or immunoelectrophoresis).

TESTS

Various biochemical and immunological tests have been developed in order to characterise allergens qualitatively and quantitatively. However, some of the methods, particularly for the determination of allergenic activity and allergen profile, are not applicable to all products at present. This is because knowledge of the allergenic components or the required reagents is not available. Accordingly, allergen products have been classified in different categories with increasing test requirements, according to quality and intended use.

Where possible the following tests are applied to the final preparations. If not, they must be performed on the extracts as late as possible in the manufacturing process, for example, at the stage immediately prior to that stage (modification, dilution etc.) which renders the test not feasible on the final preparation.

Water (*2.5.12*). Not more than 5 per cent for freeze-dried products.

Sterility (*2.6.1*). Allergen products intended for parenteral, bronchial and conjunctival administration comply with the test for sterility.

Protein content: 80 per cent to 120 per cent of the stated content of a given batch. If the biological potency can be determined then the test for protein content may be omitted.

Protein profile. The protein composition determined by suitable methods corresponds to that of the IHRP.

Abnormal toxicity (*2.6.9*). Allergen products obtained from moulds and intended for parenteral administration (except skin-prick tests) comply with the test for abnormal toxicity for immunosera and vaccines for human use.

Various additional tests, some with increasing selectivity, depending on the allergen product concerned can be applied, but in any case for allergen products intended for therapeutic use, a validated test measuring the potency (total allergenic activity, determination of individual allergens or any other justified tests) must be applied.

Aluminium (*2.5.13*). Not less than 80 per cent and not more than 120 per cent of the stated amount but in any case not more than 1.25 mg per human dose unless otherwise justified and authorised, when aluminium hydroxide or aluminium phosphate is used as adsorbent.

Calcium (*2.5.14*). Not less than 80 per cent and not more than 120 per cent of the stated amount when calcium phosphate is used as adsorbent.

Antigen profile. The antigens are identified by means of suitable techniques using antigen-specific animal antibodies.

Allergen profile. Relevant allergenic components are identified by means of suitable techniques using allergen-specific human antibodies.

Total allergenic activity. The activity is 50 per cent to 200 per cent of the stated amount as assayed by inhibition of the binding capacity of specific immunoglobulin E antibodies or a suitable equivalent *in vitro* method.

Individual allergens: 50 per cent to 200 per cent of the stated amount, determined by a suitable method.

STORAGE

Adsorbed allergen products should not be frozen.

LABELLING

The label states:

- the biological potency and/or the protein content and/or the extraction concentration;
- the route of administration and the intended use;
- the storage conditions;
- where applicable, the name and amount of added antimicrobial preservative;
- for freeze-dried preparations:
  - the name, composition and volume of the reconstituting liquid to be added
  - the period of time within which the preparation is to be used after reconstitution;
- where applicable, that the preparation is sterile;
- where applicable, the name and amount of adsorbent.

ESSENTIAL OILS

Aetherolea

The statements in this monograph are intended to be read in conjunction with individual monographs on essential oils in the European Pharmacopoeia. Application of the monograph to other essential oils may be decided by the competent authority.

DEFINITION

Odorous product, usually of complex composition, obtained from a botanically defined plant raw material by steam distillation, dry distillation, or a suitable mechanical process without heating. Essential oils are usually separated from the aqueous phase by a physical process that does not significantly affect their composition.

Essential oils may be subjected to a suitable subsequent treatment. Thus an essential oil may be commercially known as being deterpenated, desesquiterpenated, rectified or 'x'-free.

- A *deterpenated essential oil* is an essential oil from which monoterpene hydrocarbons have been removed, partially or totally.
- A *deterpenated and desesquiterpenated essential oil* is an essential oil from which mono- and sesquiterpene hydrocarbons have been removed, partially or totally.
- A *rectified essential oil* is an essential oil that has been subjected to fractional distillation to remove certain constituents or modify the content.

– An *'x'-free essential oil* is an essential oil that has been subjected to partial or complete removal of one or more constituents.

PRODUCTION

Depending on the monograph, the plant raw material may be fresh, wilted, dried, whole, broken or ground.

Steam distillation. The essential oil is produced by the passage of steam through the plant raw material in a suitable apparatus. The steam may be introduced from an external source or generated by boiling water below the raw material or by boiling water in which the raw material is immersed. The steam and oil vapours are condensed. The water and essential oil are separated by decantation.

Dry distillation. The essential oil is produced by high-temperature heating of stems or barks in a suitable apparatus without the addition of water or steam.

Mechanical process. The essential oil, usually known as 'cold-pressed', is produced by a mechanical process without any heating. It is mainly applied to *Citrus* fruit and involves expression of the oil from the pericarp and subsequent separation by physical means.

In certain cases, a suitable antioxidant may be added to the essential oil.

CHARACTERS

The appearance and the odour of the essential oil is determined.

IDENTIFICATION

Essential oils are identified by their gas chromatographic profile, or failing this, by any other test that may be required (for example, a test by thin-layer chromatography).

TESTS

GENERAL TESTS

The essential oil complies with the prescribed limits for the following tests.

Relative density (*2.2.5*).

Refractive index (*2.2.6*).

Optical rotation (*2.2.7*).

Fatty oils and resinified essential oils (*2.8.7*).

SUPPLEMENTARY TESTS

If necessary, the essential oil complies with the prescribed limits for the following tests.

Freezing point (*2.2.18*).

Acid value (*2.5.1*).

Peroxide value (*2.5.5*).

Foreign esters (*2.8.6*).

Residue on evaporation (*2.8.9*).

Water (*2.8.5*).

Solubility in alcohol (*2.8.10*).

Falsification. If appropriate, a test for one or more falsifications may be carried out by thin-layer chromatography (*2.2.27*), by gas chromatography (*2.2.28*) using a chiral column if necessary, or by any other suitable method.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

In addition to the system suitability test given in the specific monograph, it is necessary to check the suitability of the chromatographic system using the following test, which is to be carried out periodically within the framework of performance qualification.

The chromatogram shown in Figure 2098.-1 is given as an example.

Reference solution: *essential oil CRS*. If necessary, the reference solution can be diluted with *heptane R*.

Column:

– *material*: fused silica;

– *size*: *l* = 60 m, Ø = 0.25 mm;

– *stationary phase*: *macrogol 20 000 R* (0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.5 ml/min.

Split ratio: 1:500. The split ratio/injection volume can be adjusted in order to fit the specific equipment used, provided that the column load stays the same.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 100	70 → 240
	100 - 105	240
Injection port		250
Detector		270

Detection: flame ionisation.

Injection: 1 µl.

Identification of components: use the chromatogram supplied with *essential oil CRS*.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to linalol and linalyl acetate;

– *signal-to-noise ratio*: minimum 100 for the peak due to decanal;

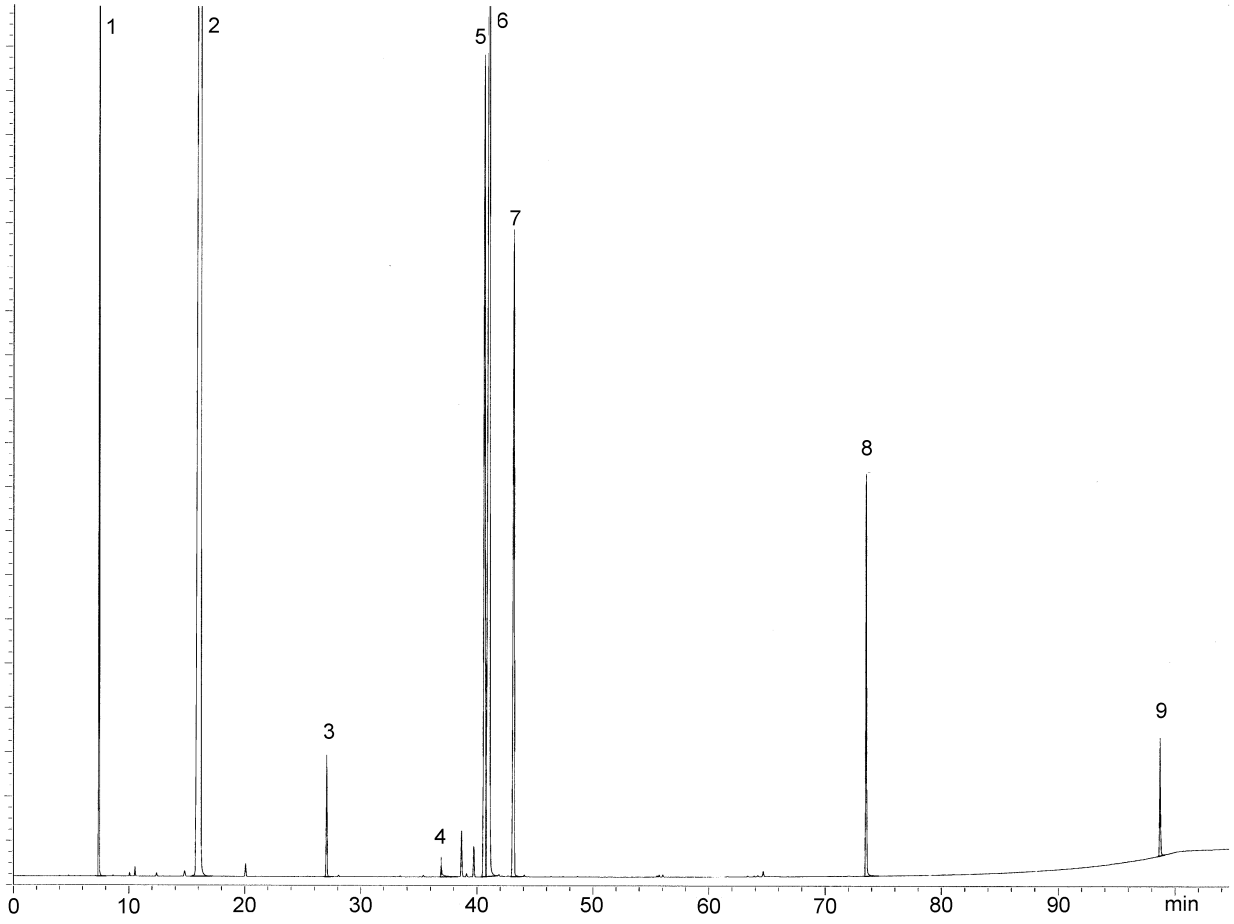
– *limits*: the percentage content of each of the 9 components is within the limits stated on the leaflet provided with *essential oil CRS*.

STORAGE

In a well-filled, airtight container, protected from light.

LABELLING

The label states:



– the scientific name of the plant raw material used;

– where applicable, the type and/or the chemotype of the essential oil;

– where applicable, the method of production;

– where applicable, the name and concentration of any added antioxidant;

– where applicable, additional processing steps that are not specified under Definition.

1. α-pinene
2. cineole
3. hexanol
4. decanal
5. linalol
6. linalyl acetate
7. β-caryophyllene
8. eugenol
9. benzyl salicylate

EXTRACTS

Extracta

DEFINITION

Extracts are preparations of liquid (liquid extracts and tinctures), semi-solid (soft extracts) or solid (dry extracts) consistency, obtained from herbal drugs or animal matter, which are usually in a dry state.

Where medicinal products are manufactured using extracts of animal origin, the requirements of chapter *5.1.7. Viral safety* apply.

Different types of extract may be distinguished. Standardised extracts are adjusted within an acceptable tolerance to a given content of constituents with known therapeutic activity; standardisation is achieved by adjustment of the extract with inert material or by blending batches of extracts. Quantified extracts are adjusted to a defined range of constituents; adjustments are made by blending batches of extracts. Other extracts are essentially defined by their production process (state of the herbal drug or animal matter to be extracted, solvent, extraction conditions) and their specifications.

PRODUCTION

Extracts are prepared by suitable methods using ethanol or other suitable solvents. Different batches of the herbal drug or animal matter may be blended prior to extraction. The herbal drug or animal matter to be extracted may undergo a preliminary treatment, for example, inactivation of enzymes, grinding or defatting. In addition, unwanted matter may be removed after extraction.

Herbal drugs, animal matter and organic solvents used for the preparation of extracts comply with any relevant monograph of the Pharmacopoeia. For soft and dry extracts where the organic solvent is removed by evaporation, recovered or recycled solvent may be used, provided that the recovery procedures are controlled and monitored to ensure that solvents meet appropriate standards before re-use or admixture with other approved materials. Water used for the preparation of extracts is of a suitable quality. Except for the test for bacterial endotoxins, water complying with the section on Purified water in bulk in the monograph on *Purified water (0008)* is suitable. Potable water may be suitable if it complies with a defined specification that allows the consistent production of a suitable extract.

Where applicable, concentration to the intended consistency is carried out using suitable methods, usually under reduced pressure and at a temperature at which deterioration of the constituents is reduced to a minimum. Essential oils that have been separated during processing may be restored to the extracts at an appropriate stage in the manufacturing process. Suitable excipients may be added at various stages of the manufacturing process, for example to improve technological qualities such as homogeneity or consistency. Suitable stabilisers and antimicrobial preservatives may also be added.

Extraction with a given solvent leads to typical proportions of characterised constituents in the extractable matter; during production of standardised and quantified extracts, purification procedures may be applied that increase these proportions with respect to the expected values; such extracts are referred to as 'refined'.

IDENTIFICATION

Extracts are identified using a suitable method.

TESTS

Where applicable, as a result of analysis of the herbal drug or animal matter used for production and in view of the production process, tests for microbiological quality (*5.1.4*), heavy metals, aflatoxins and pesticide residues (*2.8.13*) in the extracts may be necessary.

ASSAY

Wherever possible, extracts are assayed by a suitable method.

LABELLING

The label states:

- the herbal drug or animal matter used;
- whether the extract is liquid, soft or dry, or whether it is a tincture;
- for standardised extracts, the content of constituents with known therapeutic activity;
- for quantified extracts, the content of constituents (markers) used for quantification;
- the ratio of the starting material to the genuine extract (DER);
- the solvent or solvents used for extraction;
- where applicable, that a fresh herbal drug or fresh animal matter has been used;
- where applicable, that the extract is 'refined';
- the name and amount of any excipient used including stabilisers and antimicrobial preservatives;
- where applicable, the percentage of dry residue.

Liquid extracts — extracta fluida

DEFINITION

Liquid extracts are liquid preparations of which, in general, 1 part by mass or volume is equivalent to 1 part by mass of the dried herbal drug or animal matter. These preparations are adjusted, if necessary, so that they satisfy the requirements for content of solvent, and, where applicable, for constituents.

PRODUCTION

Liquid extracts are prepared by using ethanol of a suitable concentration or water to extract the herbal drug or animal matter, or by dissolving a soft or dry extract (which has been produced using the same strength of extraction solvent as is used in preparing the liquid extract by direct extraction) of the herbal drug or animal matter in either ethanol of a suitable concentration or water. Liquid extracts may be filtered, if necessary.

A slight sediment may form on standing, which is acceptable as long as the composition of the liquid extract is not changed significantly.

TESTS

Relative density (*2.2.5*). Where applicable, the liquid extract complies with the limits prescribed in the monograph.

Ethanol (*2.9.10*). For alcoholic liquid extracts, carry out the determination of ethanol content. The ethanol content complies with that prescribed.

Methanol and 2-propanol (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol for alcoholic liquid extracts, unless otherwise prescribed.

Dry residue (*2.8.16*). Where applicable, the liquid extract complies with the limits prescribed in the monograph, corrected if necessary, taking into account any excipient used.

STORAGE

Protected from light.

LABELLING

The label states in addition to the requirements listed above:

- where applicable, the ethanol content in per cent *V/V* in the final extract.

Tinctures — tincturae

DEFINITION

Tinctures are liquid preparations that are usually obtained using either 1 part of herbal drug or animal matter and 10 parts of extraction solvent, or 1 part of herbal drug or animal matter and 5 parts of extraction solvent.

PRODUCTION

Tinctures are prepared by maceration or percolation (outline methodology is given below) using only ethanol of a suitable concentration for extraction of the herbal drug or animal matter, or by dissolving a soft or dry extract (which has been produced using the same strength of extraction solvent as is used in preparing the tincture by direct extraction) of the herbal drug or animal matter in ethanol of a suitable concentration. Tinctures are filtered, if necessary.

Tinctures are usually clear. A slight sediment may form on standing, which is acceptable as long as the composition of the tincture is not changed significantly.

Production by maceration. Unless otherwise prescribed, reduce the herbal drug or animal matter to be extracted to pieces of suitable size, mix thoroughly with the prescribed extraction solvent and allow to stand in a closed container for an appropriate time. The residue is separated from the extraction solvent and, if necessary, pressed out. In the latter case, the 2 liquids obtained are combined.

Production by percolation. If necessary, reduce the herbal drug or animal matter to be extracted to pieces of suitable size. Mix thoroughly with a portion of the prescribed extraction solvent and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow at room temperature slowly making sure that the herbal drug or animal matter to be extracted is always covered with the remaining extraction solvent. The residue may be pressed out and the expressed liquid combined with the percolate.

TESTS

Relative density (*2.2.5*). Where applicable, the tincture complies with the limits prescribed in the monograph.

Ethanol (*2.9.10*). The ethanol content complies with that prescribed.

Methanol and 2-propanol (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol, unless otherwise prescribed.

Dry residue (*2.8.16*). Where applicable, the tincture complies with the limits prescribed in the monograph, corrected if necessary, taking into account any excipient used.

STORAGE

Protected from light.

LABELLING

The label states in addition to the requirements listed above:

– for tinctures other than standardised and quantified tinctures, the ratio of starting material to extraction liquid or of starting material to final tincture;
– the ethanol content in per cent *V/V* in the final tincture.

Soft extracts – extracta spissa

DEFINITION

Soft extracts are semi-solid preparations obtained by evaporation or partial evaporation of the solvent used for extraction.

TESTS

Dry residue (*2.8.16*). The soft extract complies with the limits prescribed in the monograph.

Solvents. Where applicable, a monograph on a soft extract prescribes a limit test for the solvent used for extraction.

STORAGE

Protected from light.

Dry extracts – extracta sicca

DEFINITION

Dry extracts are solid preparations obtained by evaporation of the solvent used for their production. Dry extracts usually have a loss on drying or a water content of not greater than 5 per cent *m/m*.

TESTS

Water (*2.2.13*). Where applicable, the dry extract complies with the limits prescribed in the monograph.

Loss on drying (*2.8.17*). Where applicable, the dry extract complies with the limits prescribed in the monograph.

Solvents. Where applicable, a monograph on a dry extract prescribes a limit test for the solvent used for extraction.

STORAGE

In an airtight container, protected from light.

01/2008:1434

HERBAL DRUG PREPARATIONS

Plantae medicinales praeparatae

DEFINITION

Herbal drug preparations are obtained by subjecting herbal drugs to treatments such as extraction, distillation, expression, fractionation, purification, concentration or fermentation. These include comminuted or powdered herbal drugs, tinctures, extracts, essential oils, expressed juices and processed exudates.

Herbal teas comply with the monograph on *Herbal teas (1435)*.

Instant herbal teas consist of powder or granules of one or more herbal drug preparation(s) intended for the preparation of an oral solution immediately before use.

01/2008:1433
corrected 6.0

HERBAL DRUGS

Plantae medicinales

DEFINITION

Herbal drugs are mainly whole, fragmented, or cut plants, parts of plants, algae, fungi or lichen, in an unprocessed state, usually in dried form but sometimes fresh. Certain exudates that have not been subjected to a specific treatment are also considered to be herbal drugs. Herbal drugs are precisely defined by the botanical scientific name according to the binominal system (genus, species, variety and author).

PRODUCTION

Herbal drugs are obtained from cultivated or wild plants. Suitable collection, cultivation, harvesting, drying, fragmentation and storage conditions are essential to guarantee the quality of herbal drugs.

Herbal drugs are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminations. They are not rotten.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the plant are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs.

IDENTIFICATION

Herbal drugs are identified using their macroscopic and microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

TESTS

Foreign matter (*2.8.2*). Carry out a test for foreign matter, unless otherwise prescribed or justified and authorised. The content of foreign matter is not more than 2 per cent *m/m*, unless otherwise prescribed or justified and authorised. A specific appropriate test may apply to herbal drugs liable to be adulterated.

Loss on drying (*2.2.32*). Carry out a test for loss on drying, unless otherwise prescribed or justified and authorised.

Water (*2.2.13*). A determination of water may be carried out instead of a test for loss on drying for herbal drugs with a high essential-oil content.

Pesticides (*2.8.13*). Herbal drugs comply with the requirements for pesticide residues. The requirements take into account the nature of the plant, where necessary the preparation in which the plant might be used, and where available the knowledge of the complete record of treatment of the batch of the plant.

Microbial contamination. Recommendations on the microbiological quality of herbal medicinal products consisting solely of one or more herbal drugs are given in the text *5.1.4. Microbiological quality of pharmaceutical preparations*.

Where necessary, herbal drugs comply with other tests, such as the following, for example.

Total ash (*2.4.16*).

Ash insoluble in hydrochloric acid (*2.8.1*).

Extractable matter.

Swelling index (*2.8.4*).

Bitterness value (*2.8.15*).

Heavy metals. The risk of contamination of herbal drugs by heavy metals must be considered. If an individual monograph does not prescribe a test for heavy metals or specific elements, such a test or tests may be required if justified.

Aflatoxins (*2.8.18*). Where necessary, limits for aflatoxins may be required.

Radioactive contamination. In some specific circumstances, the risk of radioactive contamination is to be considered.

ASSAY

Unless otherwise prescribed or justified and authorised, herbal drugs are assayed by an appropriate method.

STORAGE

Protected from light.

01/2008:1435

HERBAL TEAS

Plantae ad ptisanam

DEFINITION

Herbal teas consist exclusively of one or more herbal drugs intended for oral aqueous preparations by means of decoction, infusion or maceration. The preparation is prepared immediately before use.

Herbal teas are usually supplied in bulk form or in sachets.

The herbal drugs used comply with the appropriate individual European Pharmacopoeia monographs or in their absence to the general monograph on *Herbal drugs (1433)*.

Recommendations on the microbiological quality of herbal teas (*5.1.4. – Category 4*) take into account the prescribed preparation method (use of boiling or non-boiling water).

IDENTIFICATION

The identity of herbal drugs present in herbal teas is checked by botanical examinations.

TESTS

The proportion of herbal drugs present in herbal teas is checked by appropriate methods.

Herbal teas in sachets comply with the following test:

Uniformity of mass. Determine the average mass of twenty randomly chosen units as follows: weigh a single full sachet of herbal tea, open it without losing any fragments. Empty it completely using a brush. Weigh the empty sachet and calculate the mass of the contents by subtraction. Repeat the operation on the nineteen remaining sachets. Unless otherwise justified not more than two of the twenty individual masses of the contents deviate from the average mass of the contents by more than the percentage deviation shown in the table below and none deviates by more than twice that percentage.

Average mass	Percentage deviation
less than 1.5 g	15 per cent
1.5 g to 2.0 g included	10 per cent
more than 2.0 g	7.5 per cent

STORAGE

Store protected from light.

01/2008:0084

IMMUNOSERA FOR HUMAN USE, ANIMAL

Immunosera ex animali ad usum humanum

DEFINITION

Animal immunosera for human use are liquid or freeze-dried preparations containing purified immunoglobulins or immunoglobulin fragments obtained from serum or plasma of immunised animals of different species.

The immunoglobulins or immunoglobulin fragments have the power of specifically neutralising or binding to the antigen used for immunisation. The antigens include microbial or other toxins, human antigens, suspensions of bacterial and viral antigens and venoms of snakes, scorpions and spiders. The preparation is intended for intravenous or intramuscular administration, after dilution where applicable.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently immunosera of acceptable safety, potency in man and stability.

Any reagent of biological origin used in the production of immunosera shall be free of contamination with bacteria, fungi and viruses. The general requirements of chapter *5.1.7. Viral safety* apply to the manufacture of animal immunosera for human use, in conjunction with the more specific requirements relating to viral safety in this monograph. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

Methods used for production are validated, effective, reproducible and do not impair the biological activity of the product.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

Reference preparation. A batch shown to be suitable in clinical trials, or a batch representative thereof, is used as the reference preparation for the tests for high molecular mass proteins and purity.

ANIMALS

The animals used are of a species approved by the competent authority, are healthy and are exclusively reserved for production of immunoserum. They are tested and shown to be free from a defined list of infectious agents. The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoserum production.

IMMUNISATION

The antigens used are identified and characterised, where appropriate; where relevant, they are shown to be free from extraneous infectious agents. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule, with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

COLLECTION OF BLOOD OR PLASMA

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product. Unless otherwise prescribed, an antimicrobial preservative may be added. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoserum is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

Tests for contaminating viruses. If an antimicrobial preservative is added, it must be neutralised before carrying out the tests, or the tests are carried out on a sample taken before addition of the antimicrobial preservative. Each pool is tested for contaminating viruses by suitable *in vitro* tests.

Each pool is tested for viruses by inoculation to cell cultures capable of detecting a wide range of viruses relevant for the particular product.

Potency. Carry out a biological assay as indicated in the monograph and express the result in International Units per millilitre, where applicable. A validated *in vitro* method may also be used.

Protein content. Dilute the product to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying by 6.25. The protein content is within approved limits.

PURIFICATION AND VIRAL INACTIVATION

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immunoadsorption or by other chemical or physical methods. They may be processed further by enzyme treatment. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that affect the immunobiological characteristics of the product. For products intended to consist of immunoglobulin fragments, the methods are validated to guarantee total fragmentation. The methods of purification used are such that they do not generate additional components that compromise the quality and the safety of the product. Unless otherwise justified and authorised, validated procedures are applied for removal and/or inactivation of viruses. The procedures are selected to avoid the formation of polymers or aggregates and, unless the product is intended to consist of Fab′ fragments, to minimise the splitting of F(ab′)2 into Fab′ fragments.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

Purity. Examine by non-reducing polyacrylamide gel electrophoresis (*2.2.31*), by comparison with the reference preparation. The bands are compared in intensity and no additional bands are found.

FINAL BULK

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. Intermediate products with different specificities may be pooled.

An antimicrobial preservative and a stabiliser may be added. If an antimicrobial preservative has been added to the blood or plasma, the same substance is used as the antimicrobial preservative in the final bulk.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable physico-chemical method. It contains not less than 85 per cent and not more than 115 per cent of the amount stated on the label.

Sterility (*2.6.1*). It complies with the test for sterility.

FINAL LOT

The final bulk of immunoserum is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use. Provided that the tests for osmolality, protein content, molecular-size distribution, antimicrobial preservative, stabiliser, purity, foreign proteins and albumin and the assay have been carried out with satisfactory results on the final bulk, they may be omitted on the final lot.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

The identity is established by immunological tests and, where necessary, by determination of biological activity. The assay may also serve for identification.

CHARACTERS

Immunosera are clear to opalescent and colourless to very faintly yellow liquids. They are free from turbidity. Freeze-dried products are white or slightly yellow powders or solid friable masses. After reconstitution they show the same characteristics as liquid preparations.

TESTS

Solubility. To a container of the preparation to be examined, add the volume of the liquid for reconstitution stated on the label. The preparation dissolves completely within the time stated on the label.

Extractable volume (*2.9.17*). It complies with the requirement for extractable volume.

pH (*2.2.3*). The pH is within the limits approved for the particular product.

Osmolality (*2.2.35*): minimum 240 mosmol/kg after dilution, where applicable.

Protein content: 90 per cent to 110 per cent of the amount stated on the label, and, unless otherwise justified and authorised, not more than 100 g/l.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying by 6.25.

Molecular-size distribution. Examine by liquid chromatography (*2.2.29* or *2.2.30*). It complies with the specification approved for the particular product.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable physicochemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Phenol (*2.5.15*): maximum 2.5 g/l for preparations containing phenol.

Stabiliser. Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

Purity. Examine by non-reducing polyacrylamide gel electrophoresis (*2.2.31*), by comparison with the reference preparation. No additional bands are found for the preparation to be examined.

Foreign proteins. When examined by precipitation tests with specific antisera, only protein from the declared animal species is shown to be present, unless otherwise prescribed, for example where material of human origin is used during production.

Albumin. Unless otherwise prescribed in the monograph, when examined electrophoretically, the content of albumin is not greater than the limit approved for the particular product and, in any case, is not greater than 3 per cent.

Water (*2.5.12*): maximum 3 per cent.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 ml per kilogram of the rabbit's body mass.

ASSAY

Carry out a biological assay as indicated in the monograph and express the result in International Units per millilitre, where appropriate. A validated *in vitro* method may also be used.

STORAGE

Protected from light, at the temperature stated on the label. Do not allow liquid preparations to freeze.

Expiry date. The expiry date is calculated from the beginning of the assay.

LABELLING

The label states:

- the number of International Units per millilitre, where applicable;
- the amount of protein per container;
- for freeze-dried preparations:
  - the name and volume of the reconstituting liquid to be added;
  - that the immunoserum is to be used immediately after reconstitution;
  - the time required for complete dissolution;
- the route of administration;
- the storage conditions;
- the expiry date, except for containers of less than 1 ml which are individually packed; the expiry date may be omitted from the label on the container, provided it is shown on the package and the label on the package states that the container must be kept in the package until required for use;
- the animal species of origin;
- the name and amount of any antimicrobial preservative, any stabiliser and any other substance added to the immunoserum.

01/2008:0030

IMMUNOSERA FOR VETERINARY USE

Immunosera ad usum veterinarium

DEFINITION

Immunosera for veterinary use are preparations containing immunoglobulins, purified immunoglobulins or immunoglobulin fragments obtained from serum or plasma of immunised animals. They may be preparations of crude polyclonal antisera or purified preparations.

The immunoglobulins or immunoglobulin fragments have the power of specifically neutralising the antigen used for immunisation. The antigens include microbial or other toxins, bacterial and viral antigens, venoms of snakes and hormones. The preparation is intended for parenteral administration to provide passive immunity.

PRODUCTION

GENERAL PROVISIONS

Immunosera are obtained from the serum or plasma of healthy animals immunised by administration of one or more suitable antigens.

The production method shall have been shown to yield consistently batches of immunosera of acceptable safety (*5.2.6*) and efficacy (*5.2.7*).

DONOR ANIMALS

The animals used are exclusively reserved for production of immunoserum. They are maintained under conditions protecting them from the introduction of disease, as far as possible. The donor animals, and any animals in contact with them, are tested and shown to be free from a defined list of infectious agents and re-tested at suitable intervals.

The list of agents for testing includes not only those agents that are relevant to the donor animal, but also those that are relevant to the recipient target species for the product. Where the donor animals have not been demonstrated to be free from a relevant pathogen, a justification must be provided and a validated inactivation or purification procedure must be included in the manufacturing procedure. The feed originates from a controlled source. Where the donor animals are chickens, use chickens from a flock free from specified pathogens (*5.2.2*). Where applicable for the species used, measures are taken to avoid contamination with agents of transmissible spongiform encephalopathies.

As far as possible, animals being introduced into the herd are from a known source and have a known breeding and rearing history. The introduction of animals into the herd follows specified procedures, including defined quarantine measures. During the quarantine period the animals are observed and tested to establish that they are free from the list of agents relevant for the donor animals. It may be necessary to test the animals in quarantine for freedom from additional agents, depending on their known breeding and rearing history or any lack of information on their source.

Any routine or therapeutic medicinal treatment administered to the animals in quarantine or thereafter must be recorded.

IMMUNISING ANTIGEN

The principles described in the Production section of *Vaccines for veterinary use (0062)* are applied to the production of the immunogen. The antigen used is identified and characterised. The starting materials used for antigen preparation must be controlled to minimise the risk of contamination with extraneous agents. The antigen may be blended with a suitable adjuvant. The immunogen is produced on a batch basis. The batches must be prepared and tested in such a manner that assures that each batch will be equally safe and free from extraneous agents and will produce a satisfactory, consistent immune response.

IMMUNISATION

The donor animals are immunised according to a defined schedule. For each animal, the details of the dose of immunising antigen, route of administration and dates of administration are recorded. Animals are kept under general health surveillance and the development of specific antibodies are monitored at appropriate stages of the immunisation process.

COLLECTION OF BLOOD OR PLASMA

Animals are thoroughly examined before each collection. Only healthy animals may be used as a donor animal. Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The method of collection and the volume to be collected on each occasion are specified. The blood or plasma is collected in such a manner as to maintain sterility of the product. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoserum is further processed.

Clear criteria are established for determining the time between immunisation and first collection of blood or plasma as well as the time between subsequent collections and the length of time over which collections are made. The criteria applied must take into account the effect of the collections on the health and welfare of the animal as well as the effect on the consistency of production of batches of the finished product, over time.

The rate of clearance of any residues that may arise from the immunising antigen or medication given needs to be taken into account. In the case of the risk of residues from chemical substances, consideration could be given to the inclusion of a withdrawal period for the finished product. If the immunising agent consists of a live organism, the time between immunisation and collection may need to take into account the time required for the donor to eliminate the immunogen, particularly if any residual live organisms might be harmful to the recipient.

PREPARATION OF THE FINISHED PRODUCT

Several single plasma or serum collections from one or more animals may be pooled to form a bulk for preparation of a batch. The number of collections that may be used to produce a bulk and the size of the bulk are defined. Where pooling is not undertaken, the production procedure must be very carefully controlled to ensure that the consistency of the product is satisfactory.

The active substance is subjected to a purification and/or inactivation procedure unless omission of such a step has been justifed and agreed with the competent authority. The procedure applied must have been validated and be shown not to adversely impair the biological activity of the product. The validation studies must address the ability of the procedure to inactivate or remove any potential contaminants such as pathogens that could be transmitted from the donor to the recipient target species and infectious agents such as those that cause ubiquitous infections in the donor animals and cannot be readily eliminated from these donor animals.

For purified immunosera, the globulins containing the immune substances may be obtained from the crude immunoserum by enzyme treatment and fractional precipitation or by other suitable chemical or physical methods

Antimicrobial preservatives. Antimicrobial preservatives are used to prevent spoilage or adverse effects caused by microbial contamination occurring during use of a product. Antimicrobial preservatives are not included in freeze-dried products but, if justified, taking into account the maximum recommended period of use after reconstitution, they may be included in the diluent for multidose freeze-dried products. For single-dose liquid preparations, inclusion of antimicrobial preservatives is not normally acceptable, but may be acceptable, for example where the same product is filled in single-dose and multidose containers and is for use in non-food producing species. For multidose liquid preparations, the need for effective antimicrobial preservation is evaluated taking into account likely contamination during use and the maximum recommended period of use after broaching of the container.

During development studies the effectiveness of the antimicrobial preservative throughout the period of validity shall be demonstrated to the satisfaction of the competent authority.

The efficacy of the antimicrobial preservative is evaluated as described in chapter *5.1.3*; for a multidose preparation, additional samples are taken, to monitor the effect of the antimicrobial preservative over the proposed in-use shelf-life. If neither the A criteria nor the B criteria can be met, then in justified cases the following criteria are applied to antisera for veterinary use: bacteria, no increase at 24 h and 7 days, 3 log reduction at 14 days, no increase at 28 days; fungi, no increase at 14 days and 28 days.

Addition of antibiotics as antimicrobial preservative is not acceptable.

Unless otherwise prescribed in the monograph, the final bulk is distributed aseptically into sterile, tamper-proof containers which are then closed so as to exclude contamination.

The preparation may be freeze-dried.

In-process tests. Suitable tests are carried out in-process, such as on samples from collections before pooling to form a bulk.

BATCH TESTS

The tests that are necessary to demonstrate the suitability of a batch of a product will vary and are influenced by a number of factors, including the detailed method of production. The tests to be conducted by the manufacturer on a particular product are agreed with the competent authority. If a product is treated by a validated procedure for inactivation of extraneous agents, the test for extraneous agents can be omitted on that product with the agreement of the competent authority. If a product is treated by a validated procedure for inactivation of mycoplasmas, the test for mycoplasmas can be omitted on that product with the agreement of the competent authority.

Only a batch that complies with each of the relevant requirements given below under Identification, Tests and Potency and/or in the relevant specific monograph may be released for use. With the agreement of the competent authority, certain tests may be omitted where in-process tests give an equal or better guarantee that the batch would comply or where alternative tests validated with respect to the Pharmacopoeia method have been carried out.

Certain tests, e.g. for antimicrobial preservatives, for foreign proteins and for albumin, may be carried out by the manufacturer on the final bulk rather than on the batch, batches or sub-batches of finished product prepared from it. In some circumstances, e.g. when collections are made into plasmapheresis bags and each one is, essentially, a batch, pools of samples may be tested, with the agreement of the competent authority.

It is recognised that, in accordance with General Notices (section 1.1. General statements), for an established antiserum the routine application of the safety test will be waived by the competent authority in the interests of animal welfare when a sufficient number of consecutive batches have been produced and found to comply with this test, thus demonstrating consistency of the manufacturing process. Significant changes to the manufacturing process may require resumption of routine testing to re-establish consistency. The number of consecutive batches to be tested depends on a number of factors such as the type of antiserum, the frequency of production of batches, and experience with the immunoserum during developmental safety testing and during application of the batch safety test. Without prejudice to the decision of the competent authority in the light of information available for a given antiserum, testing of 10 consecutive batches is likely to be sufficient for the majority of products. For products with an inherent safety risk, it may be necessary to continue to conduct the safety test on each batch.

Animal tests. In accordance with the provisions of the European Convention for the Protection of Vertebrate Animals Used for Experimental and Other Scientific Purposes, tests must be carried out in such a way as to use the minimum number of animals and to cause the least pain, suffering, distress or lasting harm. The criteria for judging tests in monographs must be applied in the light of this. For example, if it is indicated that an animal is considered to show positive, infected etc. when typical clinical signs occur then as soon as sufficient indication of a positive result is obtained the animal in question shall be either euthanised or given suitable treatment to prevent unnecessary suffering. In accordance with the General Notices, alternative test methods may be used to demonstrate compliance with the monograph and the use of such tests is particularly encouraged when this leads to replacement or reduction of animal use or reduction of suffering.

pH (*2.2.3*). The pH of crude and purified immunosera is shown to be within the limits set for the products.

Formaldehyde. If formaldehyde is used for production of immunoserum, a test for free formaldehyde is carried out as prescribed under Tests.

Other inactivating agents. When other inactivation methods are used, appropriate tests are carried out to demonstrate that the inactivating agent has been removed or reduced to an acceptable residual level.

Batch potency test. If a specific monograph exists for the product, the test described under Potency is not necessarily carried out for routine testing of batches of antiserum. The type of batch potency test to be carried out will depend on the claims being made for the product. Wherever possible, *in vitro* tests must be used. The type of test required may include measurement of antibodies against specific infectious organisms, determination of the type of antibody (e.g. neutralising or opsonising). All tests must be validated. The criteria for acceptance must be set with reference to a batch that has been shown to comply with the requirements specified under Potency if a specific monograph exists for the product, and which has been shown to have satisfactory efficacy, in accordance with the claims being made for the product.

Total immunoglobulins. A test for the quantities of total immunoglobulins and/or total gammaglobulins and/or specific immunoglobulin classes is carried out. The results obtained must be within the limits set for the product and agreed with the competent authority. The batch contains not more than the level shown to be safe in the safety studies and, unless the batch potency test specifically covers all appropriate immunoglobulins, the level in the batch is not less than that in the batch or batches shown to be effective in the efficacy studies.

Total protein. For products where claims are being made which relate to the protein content, as well as demonstrating that the batch contains not more than the stated upper limit, the batch shall be shown to contain not less than that in the batch or batches shown to be effective in the efficacy studies.

Extraneous agents. In addition to the test described under Tests, specific tests may be required depending on the nature of the preparation, its risk of contamination and the use of the product. In particular, specific tests for important potential pathogens may be required when the donor and recipient species are the same and when these agents would not be detected reliably by the general screening test described under Tests.

Water. Where applicable, the freeze-drying process is checked by a determination of water and shown to be within the limits set for the product.

IDENTIFICATION

The identity of the product is established by immunological tests and, where necessary, by determination of biological activity. The potency test may also serve for identification.

TESTS

The following requirements refer to liquid immunosera and reconstituted freeze-dried immunosera.

Foreign proteins. When examined by precipitation tests with specific antisera against plasma proteins of a suitable range of species, only protein from the declared animal species is shown to be present.

Albumin. Purified immunosera comply with a test for albumin. Unless otherwise prescribed in the monograph, when examined electrophoretically, purified immunosera show not more than a trace of albumin, and the content of albumin is in any case not greater than 30 g/l of the reconstituted preparation, where applicable.

Total protein. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, discard the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying by 6.25. The results obtained are not greater than the upper limit stated on the label.

Antimicrobial preservative. Determine the amount of antimicrobial preservative by a suitable physicochemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Formaldehyde (*2.4.18*). Where formaldehyde has been used in the preparation, the concentration of free formaldehyde is not greater than 0.5 g/l, unless a higher amount has been shown to be safe.

Sterility (*2.6.1*). Immunosera for veterinary use comply with the test for sterility. When the volume of liquid in a container is greater than 100 ml, the method of membrane filtration is used wherever possible. If this method is used, incubate the media for not less than 14 days. Where the method of membrane filtration cannot be employed, the method of direct inoculation may be used. Where the volume of liquid in each container is at least 20 ml, the minimum volume to be used for each culture medium is 10 per cent of the contents of the container or 5 ml, whichever is the least. The appropriate number of items to be tested (*2.6.1*) is 1 per cent of the batch with a minimum of 4 and a maximum of 10.

Mycoplasmas (*2.6.7*). Immunosera for veterinary use comply with the test for mycoplasmas.

Safety. A test is conducted in one of the species for which the product is recommended. Unless an overdose is specifically contraindicated on the label, twice the maximum recommended dose for the species used is administered by a recommended route. If there is a warning against administration of an overdose, a single dose is administered. For products to be used in mammals, use 2 animals of the minimum age for which the product is recommended. For avian products, use not fewer than 10 birds of the minimum age recommended. The birds are observed for 21 days. The other species are observed for 14 days. No abnormal local or systemic reaction occurs.

Extraneous agents. A test for extraneous agents is conducted by inoculation of cell cultures sensitive to pathogens of the species of the donor animal and into cells sensitive to pathogens of each of the recipient target species stated on the label (*2.6.25*). Observe the cells for 14 days. During this time, carry out at least one passage. The cells are checked daily for cytopathic effect and are checked at the end of 14 days for the presence of a haemadsorbing agent. The batch complies with the test if there is no evidence of the presence of an extraneous agent.

For immunosera of avian origin, if a test in cell culture is insufficient to detect potential extraneous agents, a test is conducted by inoculation of embryonated eggs from flocks free from specified pathogens (*5.2.2*) or by some other suitable method (polymerase chain reaction (PCR) for example).

POTENCY

Carry out a suitable test for potency.

Where a specific monograph exists, carry out the biological assay prescribed in the monograph and express the result in International Units per millilitre when such exist.

STORAGE

Protected from light, at a temperature of 5 ± 3 °C. Liquid immunosera must not be allowed to freeze.

LABELLING

The label states:

- that the preparation is for veterinary use;
- whether or not the preparation is purified;
- the minimum number of International Units per millilitre, where such exist;
- the volume of the preparation in the container;
- the indications for the product;
- the instructions for use including the interval between any repeat administrations and the maximum number of administrations that is recommended;
- the recipient target species for the immunoserum;
- the dose recommended for different species;
- the route(s) of administration;
- the name of the species of the donor animal;
- the maximum quantity of total protein;
- the name and amount of any antimicrobial preservative or other substance added to the immunoserum;
- any contra-indications to the use of the product including any required warning on the dangers of administration of an overdose;
- for freeze-dried immunosera:
  - the name or composition and the volume of the reconstituting liquid to be added;
  - the period within which the immunoserum is to be used after reconstitution.

01/2008:2031

MONOCLONAL ANTIBODIES FOR HUMAN USE

Anticorpora monoclonalia ad usum humanum

DEFINITION

Monoclonal antibodies for human use are preparations of an immunoglobulin or a fragment of an immunoglobulin, for example, F(ab')2, with defined specificity, produced by a single clone of cells. They may be conjugated to other substances, including for radiolabelling.

They can be obtained from immortalised B lymphocytes that are cloned and expanded as continuous cell lines or from rDNA-engineered cell lines.

Currently available rDNA-engineered antibodies include the following antibodies.

Chimeric monoclonal antibodies: the variable heavy and light chain domains of a human antibody are replaced by those of a non-human species, which possess the desired antigen specificity.

Humanised monoclonal antibodies: the 3 short hypervariable sequences (the complementarity determining regions) of non-human variable domains for each chain are engineered into the variable domain framework of a human antibody; other sequence changes may be made to improve antigen binding.

Recombinant human monoclonal antibodies: the variable heavy and light chain domain of a human antibody are combined with the constant region of a human antibody.

Monoclonal antibodies obtained from cell lines modified by recombinant DNA technology also comply with the requirements of the monograph *Products of recombinant DNA technology (0784)*.

This monograph applies to monoclonal antibodies for therapeutic and prophylactic use and for use as *in vivo* diagnostics. It does not apply to monoclonal antibodies used as reagents in the manufacture of medicinal products. Nor does it apply to monoclonal antibodies produced in ascites, for which requirements are decided by the competent authority.

PRODUCTION

GENERAL PROVISIONS

Production is based on a seed-lot system using a master cell bank and, if applicable, a working cell bank derived from the cloned cells. The production method is validated during development studies in order to prevent transmission of infectious agents by the final product. All biological materials and cells used in the production are characterised and are in compliance with chapter *5.2.8. Minimising the risk of transmitting animal spongiform encephalopathy agents via human and veterinary medicinal products*. Where monoclonal antibodies for human use are manufactured using materials of human or animal origin, the requirements of chapter *5.1.7. Viral safety* also apply. Where an immunogen is used it is characterised and the method of immunisation is documented.

Process validation. During development studies, the production method is validated for the following aspects:

- consistency of the production process including fermentation, purification and, where applicable, fragmentation method;
- removal or inactivation of infectious agents;
- adequate removal of product- and process-related impurities (for example, host-cell protein and DNA, protein A, antibiotics, cell-culture components);
- specificity and specific activity of the monoclonal antibody;
- absence of non-endotoxin pyrogens;
- reusability of purification components (for example, column material), limits or acceptance criteria being set as a function of the validation;
- methods used for conjugation, where applicable.

Product characterisation. The product is characterised to obtain adequate information including: structural integrity, isotype, amino-acid sequence, secondary structure, carbohydrate moiety, disulphide bridges, conformation, specificity, affinity, specific biological activity and heterogeneity (characterisation of isoforms).

A battery of suitable analytical techniques is used including chemical, physical, immunochemical and biological tests (for example, peptide mapping, *N*- and *C*-terminal amino-acid sequencing, mass spectrometry, chromatographic, electrophoretic and spectroscopic techniques). Additional tests are performed to obtain information on cross-reactivity with human tissues.

For those products that are modified by fragmentation or conjugation, the influence of the methods used on the antibody is characterised.

Process intermediates. Where process intermediates are stored, an expiry date or a storage period justified by stability data is established for each.

Biological assay. The biological assay is chosen in terms of its correlation with the intended mode of action of the monoclonal antibody.

Reference preparation. A batch shown to be stable and shown to be suitable in clinical trials, or a batch representative thereof, is used as a reference preparation for the identification, tests and assay. The reference preparation is appropriately characterised as defined under Product characterisation, except that it is not necessary to examine cross-reactivity for each batch of reference preparation.

Definition of a batch. Definition of a batch (including batch size) is required throughout the process.

SOURCE CELLS

Source cells include fusion partners, lymphocytes, myeloma cells, feeder cells and host cells for the expression of the recombinant monoclonal antibody.

The origin and characteristics of the parental cell are documented, including information on the health of the donors, and on the fusion partner used (for example, myeloma cell line, human lymphoblastoid B-cell line).

Wherever possible, source cells undergo suitable screening for extraneous agents and endogenous agents. The choice of viruses for the tests is dependent on the species and tissue of origin.

CELL LINE PRODUCING THE MONOCLONAL ANTIBODY

The suitability of the cell line producing the monoclonal antibody is demonstrated by:

- documentation on the history of the cell line including description of the cell fusion, immortalisation or transfection and cloning procedure;
- characterisation of the cell line (for example, phenotype, isoenzyme analysis, immunochemical markers and cytogenetic markers);
- characterisation of relevant features of the antibody;
- stability of antibody secretion with respect to the characteristics of the antibody and level of expression and glycosylation up to or beyond the population doubling level or generation number used for routine production;
- for recombinant DNA products, stability of the host/vector genetic and phenotypic characteristics up to or beyond the population doubling level or generation number used for routine production.

CELL BANKS

The master cell bank is a homogeneous suspension of the cell line producing the monoclonal antibody, distributed in equal volumes in a single operation into individual containers for storage.

A working cell bank is a homogeneous suspension of the cell material derived from the master cell bank at a finite passage level, distributed in equal volumes in a single operation into individual containers for storage.

Post-production cells are cells cultured up to or beyond the population doubling level or generation number used for routine production.

The following tests are performed on the master cell bank: viability, identity, sterility (bacteria, fungi, mycoplasmas), characterisation of the monoclonal antibody produced. Non-endogenous viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. Retrovirus and other endogenous viral contamination is tested using a suitable range of *in vitro* tests.

The following tests are performed on the working cell bank: viability, identity, sterility (bacteria, fungi, mycoplasmas). Adventitious viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. For the first working cell bank, these tests are performed on post-production cells, generated from that working cell bank; for working cell banks subsequent to the first working cell bank, a single *in vitro* and *in vivo* test can be done either directly on the working cell bank or on post-production cells.

For the master cell bank and working cell bank, tests for specific viruses are carried out when potentially contaminated biological material has been used during preparation of the cell banks, taking into account the species of origin of this material. This may not be necessary when this material is inactivated using validated procedures.

The following tests are performed on the post-production cells: sterility (bacteria, fungi, mycoplasmas). Virus tests are performed on cells or cell culture supernatants. For this, non-endogenous viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. Retrovirus and other endogenous viral contamination is tested using a suitable range of *in vitro* tests.

CULTURE AND HARVEST

Production at finite passage level (single harvest). Cells are cultivated up to a defined maximum number of passages or population doublings (in accordance with the stability of the cell line). Product is harvested in a single operation.

Continuous-culture production (multiple harvest). Cells are continuously cultivated for a defined period (in accordance with the stability of the system and production consistency). Monitoring is necessary throughout the life of the culture; the required frequency and type of monitoring will depend on the nature of the production system.

Each harvest is tested for antibody content, bioburden, endotoxin and mycoplasmas. Routine general or specific tests for adventitious viruses are carried out at a suitable stage depending on the nature of the manufacturing process and the materials used. For processes using production at finite passage level (single harvest), at least 3 harvests are tested for adventitious viruses using a suitable range of *in vitro* methods.

The acceptance criteria for harvests for further processing are clearly defined and linked to the schedule of monitoring applied. If any adventitious viruses are detected, the process is carefully investigated to determine the cause of the contamination and the harvest is not further processed. Harvests in which an endogenous virus has been detected are not used for purification unless an appropriate action plan has been defined to prevent transmission of infectious agents by the final product.

PURIFICATION

Harvests may be pooled before further processing. The purification process includes steps that remove and/or inactivate non-enveloped and enveloped viruses. A validated purification process, for which removal and/or inactivation of infectious agents and removal of product- and process-related impurities has been demonstrated is used. Defined steps of the process lead to a purified antibody of constant quality and biological activity.

The test programme on the purified monoclonal antibody depends on the validation of the process, on demonstration of consistency and on the expected level of product- and process-related impurities. The purified monoclonal antibody is tested for bioburden and bacterial endotoxins, purity, integrity and potency by suitable analytical methods, comparing with the reference preparation where necessary.

If storage of intermediates is intended, adequate stability of these preparations and its impact on quality or shelf-life of the finished product are evaluated.

FINAL BULK

The final bulk is prepared from one or more batches of purified monoclonal antibody. Suitable stabilisers and other excipients may be added during preparation of the final bulk.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

Sterility (*2.6.1*). Carry out the test using 10 ml for each medium.

Bacterial endotoxins (*2.6.14*). It complies with the limit approved for the particular product.

Process-related impurities. Suitable tests for host-cell-derived proteins, host-cell- and vector-derived DNA and other process-related impurities are carried out on a suitable number of final bulks or batches of purified monoclonal antibodies. The final bulk complies with the limits approved for the particular product. When consistency of the purification process has been demonstrated, the tests may subsequently be omitted.

FINAL LOT

The final bulk is distributed aseptically into sterile containers, which are then closed so as to prevent contamination.

CHARACTERS

Liquid preparations are clear or slightly opalescent, colourless or slightly yellow liquids, without visible particles. Freeze-dried products are white or slightly yellow powders or solid friable masses. After reconstitution they show the same characteristics as liquid preparations.

IDENTIFICATION

The identity is established by suitable validated methods comparing the product with the reference preparation. The assay also contributes to identification.

TESTS

Appearance. Liquid or reconstituted freeze-dried preparations are clear or slightly opalescent and colourless or slightly yellow, without visible particles.

Solubility. Freeze-dried preparations dissolve completely in the prescribed volume of reconstituting liquid, within a defined time, giving a clear or slightly opalescent solution without visible particles.

pH (*2.2.3*). It complies with the limits approved for the particular product.

Osmolality (*2.2.35*): minimum 240 mosmol/kg, diluted for use where applicable.

Extractable volume (*2.9.17*). It complies with the test for extractable volume.

Total protein (*2.5.33*). It complies with the limits approved for the particular product.

Molecular-size distribution. Molecular-size distribution is determined by a suitable method, for example, size-exclusion chromatography (*2.2.30*). It complies with the limits approved for the particular product.

Molecular identity and structural integrity. Depending on the nature of the monoclonal antibody, its microheterogeneity and isoforms, a number of different tests can be used to demonstrate molecular identity and structural integrity. These tests may include peptide mapping, isoelectric focusing, ion-exchange chromatography, hydrophobic interaction chromatography, oligosaccharide mapping, monosaccharide content and mass spectrometry.

Purity. Examine by a suitable validated method, such as SDS-polyacrylamide gel electrophoresis (*2.2.31*) under non-reducing and reducing conditions or capillary electrophoresis (*2.2.47*). Suitable tests for process-related and product-related impurities are carried out.

Stabiliser. Where applicable, it complies with the limits approved for the particular product.

Water (*2.5.12*). Freeze-dried products comply with the limits approved for the particular product.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*). It complies with the limits approved for the particular product.

Tests applied to modified antibodies. Suitable tests are carried out depending on the type of modification.

ASSAY

Carry out a suitable assay against the reference preparation. Design of the assay and calculation of the results are made according to the usual principles (for example, *5.3*).

STORAGE

As stated on the label.

Expiry date. The expiry date is calculated from the date of sterile filtration, the date of filling (for liquid preparations) or the date of freeze-drying (where applicable).

LABEL

The label states:

- the number of International Units per millilitre, where applicable;
- the quantity of protein per container;
- the quantity of monoclonal antibody in the container;
- for liquid preparations, the volume of the preparation in the container;
- for freeze-dried preparations:
  - the name and the volume of the reconstitution liquid to be added;
  - the period of time within which the monoclonal antibody is to be used after reconstitution;
- the dilution to be made before use of the product, where applicable.

01/2008:1468

PRODUCTS OF FERMENTATION

Producta ab fermentatione

This monograph applies to indirect gene products obtained by fermentation. It is not applicable to:

- *monographs in the Pharmacopoeia concerning vaccines for human or veterinary use*;
- *products derived from continuous cell lines of human or animal origin*;
- *direct gene products that result from the transcription and translation from nucleic acid to protein, whether or not subject to post-translational modification*;
- *products obtained by semi-synthesis from a product of fermentation and those obtained by biocatalytic transformation*;
- *whole broth concentrates or raw fermentation products.*

This monograph provides general requirements for the development and manufacture of products of fermentation. These requirements are not necessarily comprehensive in a given case and requirements complementary or additional to those prescribed in this monograph may be imposed in an individual monograph or by the competent authority.

DEFINITION

For the purposes of this monograph, products of fermentation are active or inactive pharmaceutical substances produced by controlled fermentation as indirect gene products. They are primary or secondary metabolites of micro-organisms such as bacteria, yeasts, fungi and micro-algae, whether or not modified by traditional procedures or recombinant DNA (rDNA) technology. Such metabolites include vitamins, amino acids, antibiotics, alkaloids and polysaccharides.

They may be obtained by batch or continuous fermentation processes followed by procedures such as extraction, concentration, purification and isolation.

PRODUCTION

Production is based on a process that has been validated and shown to be suitable. The extent of validation depends on the critical nature of the respective process step.

CHARACTERISATION OF THE PRODUCER MICRO-ORGANISM

The history of the micro-organism used for production is documented. The micro-organism is adequately characterised. This may include determination of the phenotype of the micro-organism, macroscopic and microscopic methods and biochemical tests and, if appropriate, determination of the genotype of the micro-organism and molecular genetic tests.

PROCESSES USING A SEED-LOT SYSTEM

The *master cell bank* is a homogeneous suspension or lyophilisate of the original cells distributed into individual containers for storage. The viability and productivity of the cells under the selected storage conditions and their suitability for initiating a satisfactory production process after storage must be demonstrated.

Propagation of the master cell bank may take place through a seed-lot system that uses a working cell bank.

The *working cell bank* is a homogeneous suspension or lyophilisate of the cell material derived from the master cell bank, distributed in equal volumes into individual containers for storage (for example, in liquid nitrogen).

Production may take place by batch or continuous culture and may be terminated under defined conditions.

All containers in a cell bank are stored under identical conditions. Once removed from storage, the individual ampoules, vials or culture straws are not returned to the cell bank.

PROCESSES USING STAGED GROWTH IN CULTURES

The contents of a container of the working cell bank are used, if necessary after resuspension, to prepare an inoculum in a suitable medium. After a suitable period of growth, the cultures are used to initiate the fermentation process, if necessary following preculture in a prefermentor. The conditions to be used at each stage of the process are defined and must be met with each production run.

CHANGE CONTROL

If the production process is altered in a way that causes a significant change in the impurity profile of the product, the critical steps associated with this change in impurity profile are revalidated.

If a significant change has taken place in the micro-organism used for production that causes a significant change in the impurity profile of the product, the critical steps of the production process associated with this change, particularly the procedure for purification and isolation, are revalidated.

Revalidation includes demonstration that new impurities present in the product as a result of the change are adequately controlled by the test procedures. If necessary, additional or alternative tests must be introduced with appropriate limits. If the change in the process or in the micro-organism results in an increase in the level of an impurity already present, the acceptability of such an increase is addressed.

When a master cell bank is replaced, the critical steps of the production process must be revalidated to the extent necessary to demonstrate that no adverse change has occurred in the quality and safety of the product. Particular attention must be given to possible changes in the impurity profile of the product if a modified or new micro-organism is introduced into the process.

RAW MATERIALS

The raw materials employed in the fermentation and/or down-stream processing are of suitable quality for the intended purpose. They are tested to ensure that they comply with written specifications.

Levels of bioburden in media or in the inlet air for aeration are reduced to an adequately low level to ensure that if microbiological contamination occurs, it does not adversely affect the quality, purity and safety of the product. Addition of components such as nutrients, precursors, and substrates during fermentation takes place aseptically.

IN-PROCESS CONTROLS

In-process controls are in place to ensure the consistency of the conditions during fermentation and down-stream processing and of the quality of the isolated product. Particular attention must be paid to ensure that any microbial contamination that adversely affects the quality, purity and safety of the product is detected by the controls applied.

Production conditions may be monitored, as appropriate, by suitable procedures for example to control and check:

– temperature,
– pH,
– rate of aeration,
– rate of agitation,
– pressure,

and to monitor the concentration of the required product.

DOWN-STREAM PROCESSING

At the end of fermentation, the producer micro-organism is inactivated or removed. Further processing is designed to reduce residues originating from the culture medium to an acceptable level and to ensure that the desired product is recovered with consistent quality.

Various purification processes may be used, for example, charcoal treatment, ultrafiltration and solvent extraction. It must be demonstrated that the process or processes chosen reduce to a minimum or remove:

– residues from the producer micro-organism, culture media, substrates and precursors,
– unwanted transformation products of substrates and precursors.

If necessary, suitable tests are performed either as in-process controls or on the isolated product of fermentation.

IDENTIFICATION, TESTS AND ASSAY

The requirements with which the product must comply throughout its period of validity, as well as specific test methods, are stated in the individual monographs.

01/2008:1483

PRODUCTS WITH RISK OF TRANSMITTING AGENTS OF ANIMAL SPONGIFORM ENCEPHALOPATHIES

Producta cum possibili transmissione vectorium enkephalopathiarum spongiformium animalium

DEFINITION

Products with risk of transmitting agents of animal spongiform encephalopathies are those derived from tissues or secretions of animals susceptible to transmissible spongiform encephalopathies other than by experimental challenge. This monograph applies to all substances or preparations obtained from such animals and to all substances or preparations where products obtained from such animals are included as active substances or excipients or have been used during production, for example as raw or source materials, starting materials or reagents.

PRODUCTION

Production complies with chapter *5.2.8. Minimising the risk of transmitting animal spongiform encephalophathy agents via human and veterinary medicinal products.*

01/2008:0125

RADIOPHARMACEUTICAL PREPARATIONS

Radiopharmaceutica

DEFINITION

For the purposes of this general monograph, radiopharmaceutical preparations cover:

- radiopharmaceutical: any medicinal product which, when ready for use, contains one or more radionuclides (radioactive isotopes) included for a medicinal purpose,
- radionuclide generator: any system incorporating a fixed parent radionuclide from which is produced a daughter radionuclide which is to be removed by elution or by any other method and used in a radiopharmaceutical preparation,
- kit for radiopharmaceutical preparation: any preparation to be reconstituted and/or combined with radionuclides in the final radiopharmaceutical preparation, usually prior to its administration,
- radiopharmaceutical precursor: any other radionuclide produced for the radio-labelling of another substance prior to administration.

A nuclide is a species of atom characterised by the number of protons and neutrons in its nucleus (and hence by its atomic number Z, and mass number A) and also by its nuclear energy state. Isotopes of an element are nuclides with the same atomic number but different mass numbers. Nuclides containing an unstable arrangement of protons and neutrons will transform spontaneously to either a stable or another unstable combination of protons and neutrons with a constant statistical probability. Such nuclides are said to be radioactive and are called radionuclides. The initial unstable nuclide is referred to as the parent radionuclide and the resulting nuclide as the daughter nuclide.

The radioactive decay or transformation may involve the emission of charged particles, electron capture (EC) or isomeric transition (IT). The charged particles emitted from the nucleus may be alpha particles (helium nucleus of mass number 4) or beta particles (negatively charged, generally called electrons or positively charged, generally called positrons). The emission of charged particles from the nucleus may be accompanied by the emission of gamma rays. Gamma rays are also emitted in the process of isomeric transition. These emissions of gamma rays may be partly replaced by the ejection of electrons known as internal conversion electrons. This phenomenon, like the process of electron capture, causes a secondary emission of X-rays (due to the reorganisation of the electrons in the atom). This secondary emission may itself be partly replaced by the ejection of electrons known as Auger electrons. Radionuclides with a deficit of neutrons may decay by emitting positrons. These radionuclides are called positron emitters. Positrons are annihilated on contact with electrons, the process being accompanied by the emission of usually two gamma photons, each with an energy of 511 keV, generally emitted at 180° to each other, termed annihilation radiation.

The decay of a radionuclide is governed by the laws of probability with a characteristic decay constant and follows an exponential law. The time in which a given quantity of a radionuclide decays to half its initial value is termed the half-life ($T_{1/2}$).

The penetrating power of each radiation varies considerably according to its nature and its energy. Alpha particles are completely absorbed in a thickness of a few micrometers to some tens of micrometers of matter. Beta particles are completely absorbed in a thickness of several millimetres to several centimetres of matter. Gamma rays are not completely absorbed but only attenuated and a tenfold reduction may require, for example, several centimetres of lead. For most absorbents, the denser the absorbent, the shorter the range of alpha and beta particles and the greater the attenuation of gamma rays.

Each radionuclide is characterised by an invariable half-life, expressed in units of time and by the nature and energy of its radiation or radiations. The energy is expressed in electronvolts (eV), kilo-electronvolts (keV) or mega-electronvolts (MeV).

Generally the term “radioactivity” is used to describe the phenomenon of radioactive decay and to express the physical quantity (activity) of this phenomenon. The radioactivity of a preparation is the number of nuclear disintegrations or transformations per unit time.

In the International System (SI), radioactivity is expressed in becquerel (Bq) which is one nuclear transformation per second. Absolute radioactivity measurements require a specialised laboratory but identification and measurement of radiation can be carried out relatively by comparing with standardised preparations provided by laboratories recognised by the competent authority.

Radionuclidic purity: the ratio, expressed as a percentage, of the radioactivity of the radionuclide concerned to the total radioactivity of the radiopharmaceutical preparation. The relevant radionuclidic impurities are listed with their limits in the individual monographs.

Radiochemical purity: the ratio, expressed as a percentage, of the radioactivity of the radionuclide concerned which is present in the radiopharmaceutical preparation in the stated chemical form, to the total radioactivity of that radionuclide present in the radiopharmaceutical preparation. The relevant radiochemical impurities are listed with their limits in the individual monographs.

Chemical purity: in monographs on radiopharmaceutical preparations chemical purity is controlled by specifying limits on chemical impurities.

Isotopic carrier: a stable isotope of the element concerned either present or added to the radioactive preparation in the same chemical form as that in which the radionuclide is present.

Specific radioactivity: the radioactivity of a radionuclide per unit mass of the element or of the chemical form concerned.

Radioactive concentration: the radioactivity of a radionuclide per unit volume.

Total radioactivity: the radioactivity of the radionuclide, expressed per unit (vial, capsule, ampoule, generator, etc).

Starting materials: all the constituents which make up the radiopharmaceutical preparations.

Period of validity: the time during which specifications described in the monograph must be fulfilled. Expiry date and, if necessary, time must be clearly stated.

PRODUCTION

A radiopharmaceutical preparation monograph describes as precisely as possible the method of production of the radionuclide. A radiopharmaceutical preparation contains its radionuclide:

- as an element in atomic or molecular form, e.g. [^{133}Xe], [^{15}O]O_2,
- as an ion, e.g. [^{131}I]iodide, [^{99m}Tc]pertechnetate,
- included in or attached to organic molecules by chelation, e.g. [^{111}In]oxine or by covalent bonding, e.g. 2-[^{18}F]fluoro-2-deoxy-D-glucose.

The practical ways of producing radionuclides for use in, or as radiopharmaceutical preparations are:

- neutron bombardment of target materials (generally in nuclear reactors),
- charged particles bombardment of target materials (in accelerators such as cyclotrons),
- nuclear fission of heavy nuclides of target materials (generally after neutron or particle bombardment),
- from a radionuclide generator.

NEUTRON OR CHARGED PARTICLE BOMBARDMENT

The nuclear reaction and the probability of its occurrence in unit time are dependent on the nature and physical properties of the target material and the nature, energy and quantity of the incident particles.

The nuclear transformation occurring through particle bombardment may be written in the form:

target nucleus (bombarding particle, emitted particle or radiation) produced nucleus.

Examples: $^{58}Fe(n,\gamma)^{59}Fe$

$^{18}O(p,n)^{18}F$

In addition to the desired nuclear reaction adventitious transformations may occur. These will be influenced by the energy of the incident particle and the purity of the target material. Such adventitious transformations may give rise to radionuclidic impurities.

NUCLEAR FISSION

A small number of nuclides with a high atomic number are fissionable and the most frequently used reaction is the fission of uranium-235 by neutrons in a nuclear reactor. Iodine-131, molybdenum-99 and xenon-133 may be produced by nuclear fission of uranium-235. Their extraction from a mixture of more than 200 other radionuclides must be carefully controlled in order to minimise the radionuclidic impurities.

RADIONUCLIDE GENERATORS

Radionuclide generator systems use a relatively long-lived parent radionuclide which decays to a daughter radionuclide, usually with a shorter half-life.

By separating the daughter radionuclide from the parent radionuclide by a chemical or physical process, it is possible to use the daughter at a considerable distance from the production site of the generators despite its short half-life.

TARGET MATERIALS

The isotopic composition and purity of the target material will determine the relative percentages of the principal radionuclide and radionuclidic impurities. The use of isotopically enriched target material in which the abundance of the required target nuclide has been artificially increased, can improve the production yield and the purity of the desired radionuclide.

The chemical form, the purity, the physical state and the chemical additives, as well as the bombardment conditions and the direct physical and chemical environment will determine the chemical state and chemical purity of the radionuclides which are produced.

In the production of radionuclides and particularly of short-lived radionuclides it may not be possible to determine any of these quality criteria before further processing and manufacture of radiopharmaceutical preparations. Therefore each batch of target material must be tested in test production runs before its use in routine radionuclide production and manufacture of the radiopharmaceutical preparations, to ensure that under specified conditions, the target yields the radionuclide in the desired quantity and quality specified.

The target material is contained in a holder in gaseous, liquid or solid state, in order to be irradiated by a beam of particles. For neutron bombardment, the target material is commonly contained in quartz ampoules or high purity aluminium or titanium containers. It is necessary to ascertain that no interaction can occur between the container and its contents under the irradiation conditions (temperature, pressure, time).

For charged particle bombardment, the holder for target material is usually built of aluminium or another appropriate metal, with inlet and outlet ports, a surrounding cooling system and usually a thin metal foil target window. The nature and thickness of the target window have a particular influence on the yield of the nuclear reaction and may also affect the radionuclidic purity.

The production procedure clearly describes:

- target material,
- construction of the holder for target material,
- loading of target material into the irradiation system,
- method of irradiation (bombardment),
- separation of the desired radionuclide,

and evaluates all effects on the efficiency of the production in terms of quality and quantity of the produced radionuclide.

The chemical state of the isolated radionuclide may play a major role in all further processing.

PRECURSORS FOR SYNTHESIS

Generally, these precursors are not produced on a large scale. Some precursors are synthesised by the radiopharmaceutical production laboratory, others are supplied by specialised producers or laboratories.

Tests for identity, for chemical purity and the assay must be performed by validated procedures.

When batches of precursors are accepted using data from the certificates of analysis, suitable evidence has to be established to demonstrate the consistent reliability of the supplier's analyses and at least one identity test must be conducted. It is recommended to test precursor materials in production runs before their use for the manufacture of radiopharmaceutical preparations, to ensure that under specified production conditions, the precursor yields the radiopharmaceutical preparation in the desired quantity and quality specified.

PERFORMANCE OF THE PRODUCTION SYSTEM

All operations, from the preparation of the target to the dispensing of the final radiopharmaceutical preparation, must be clearly documented including their impact on the purity of the final product and the efficiency of the procedure. Where possible, in-process controls are performed and the

results recorded at each production step to identify at which level a possible discrepancy from the normal production pathway may have occurred.

a) The production of radiopharmaceutical preparations may make use of mechanical and automated processes that are used in the pharmaceutical industry, subject to adapting these to the specificity of the radioactive starting material and to the requirements of radioprotection.

b) For radiopharmaceutical preparations containing shortlived radionuclides, such as certain positron emitters, remotely controlled production and automated radiosynthesis are generally used. For radionuclides with a very short half-life (less than 20 min) the control of the performance of the production system is an important measure to assure the quality of the radiopharmaceutical preparation before its release.

c) Any production procedure must be validated in test production runs before its use in routine manufacture of radiopharmaceutical preparations, to ensure that under specified production conditions, the production system yields the radiopharmaceutical preparation in the desired quantity and specified quality.

d) The preparation of the dosage form of the final radiopharmaceutical preparation in the practice of nuclear medicine generally involves limited radioactivity starting from ready-to-use radiopharmaceutical preparations, generators, kits and radioactive precursors. All conditions which may affect the quality of the product (e.g. radiochemical purity and sterility) must be clearly defined and must include appropriate measures for radiation protection.

IDENTIFICATION

Radioactive decay: radioactivity decays at an exponential rate with a decay constant characteristic of each radionuclide.

The curve of exponential decay (decay curve) is described by the equation:

$$A_t = A_o e^{-\lambda t}$$

A_t = the radioactivity at time t,

A_o = the radioactivity at time $t = 0$,

λ = the decay constant characteristic of each radionuclide,

e = the base of Napierian logarithms.

The half-life ($T_{1/2}$) is related to the decay constant (λ) by the equation:

$$T_{1/2} = \frac{\ln 2}{\lambda} \qquad (\ln 2 \approx 0.693)$$

The radionuclide is generally identified by its half-life or by the nature and energy of its radiation or radiations or by both, as prescribed in the monograph.

Measurement of half-life. The half-life is measured with a suitable detection apparatus such as an ionisation chamber, a Geiger-Müller counter, a scintillation counter (solid crystal, liquid) or a semiconductor detector. The preparation to be tested is used as such or diluted or dried in a capsule after appropriate dilution. The radioactivity chosen, having regard to experimental conditions, must be of a sufficiently high level to allow detection during several estimated half-lives, but not too high to minimise count rate losses, for example due to dead time.

The radioactive source is prepared in a manner that will avoid loss of material during handling. If it is a liquid (solution), it is contained in bottles or sealed tubes. If it is a solid (residue from drying in a capsule), it is protected by a cover consisting of a sheet of adhesive cellulose acetate or of some other material.

The same source is measured in the same geometrical conditions and at intervals usually corresponding to half of the estimated half-life throughout a time equal to about three half-lives. The correct functioning of the apparatus is checked using a source of long half-life and, if necessary, corrections for any changes of the count rate have to be applied (see Measurement of Radioactivity).

A graph can be drawn with time as the abscissa and the logarithm of the relative instrument reading (e.g. count rate) as the ordinate. The calculated half-life differs by not more than 5 per cent from the half-life stated in the Pharmacopoeia, unless otherwise stated.

Determination of the nature and energy of the radiation. The nature and energy of the radiation emitted may be determined by several procedures including the construction of an attenuation curve and the use of spectrometry. The attenuation curve can be used for analysis of electron radiation; spectrometry is mostly used for identification of gamma rays and detectable X-rays.

The *attenuation curve* is drawn for pure electron emitters when no spectrometer for beta rays is available or for beta/gamma emitters when no spectrometer for gamma rays is available. This method of estimating the maximum energy of beta radiation gives only an approximate value. The source, suitably mounted to give constant geometrical conditions, is placed in front of the thin window of a Geiger-Müller counter or a proportional counter. The source is protected as described above. The count rate of the source is then measured. Between the source and the counter are placed, in succession, at least six aluminium screens of increasing mass per unit area within such limits that with a pure beta emitter this count rate is not affected by the addition of further screens. The screens are inserted in such a manner that constant geometrical conditions are maintained. A graph is drawn showing, as the abscissa, the mass per unit area of the screen expressed in milligrams per square centimetre and, as the ordinate, the logarithm of the count rate for each screen examined. A graph is drawn in the same manner for a standardised preparation. The mass attenuation coefficients are calculated from the median parts of the curves, which are practically rectilinear.

The *mass attenuation coefficient* μ_m, expressed in square centimetres per milligram, depends on the energy spectrum of the beta radiation and on the nature and the physical properties of the screen. It therefore allows beta emitters to be identified. It is calculated using the equation:

$$\mu_m = \frac{\ln A_1 - \ln A_2}{m_2 - m_1}$$

m_1 = mass per unit area of the lightest screen,

m_2 = mass per unit area of the heaviest screen, m_1 and m_2 being within the rectilinear part of the curve,

A_1 = count rate for mass per unit area m_1,

A_2 = count rate for mass per unit area m_2.

The mass attenuation coefficient μ_m thus calculated does not differ by more than 10 per cent from the coefficient obtained under identical conditions using a standardised preparation of the same radionuclide.

The range of beta particles is a further parameter which can be used for the determination of the beta energy. It is obtained from the graph described above as the mass per unit

area corresponding to the intersection of the extrapolations of the descending rectilinear part of the attenuation curve and the horizontal line of background radioactivity.

Liquid scintillation counting may be used to obtain spectra of α and β^- emitters (see measurement of radioactivity).

Gamma spectrometry is used to identify radionuclides by the energy and intensity of their gamma rays and X-rays.

The preferred detector for gamma and X-ray spectrometry is a germanium semiconductor detector. A thallium-activated sodium iodide scintillation detector is also used but this has a much lower energy resolution.

The gamma detector has to be calibrated using standard sources because the detection efficiency is a function of the energy of the gamma and X-rays as well as the form of the source and the source-to-detector distance. The detection efficiency may be measured using a calibrated source of the radionuclide to be measured or, for more general work, a graph of efficiency against gamma and X-ray energy may be constructed from a series of calibrated sources of various radionuclides.

The gamma and X-ray spectrum of a radionuclide which emits gamma and X-rays is unique to that nuclide and is characterised by the energies and the number of photons of particular energies emitted per transformation from one energy level to another energy level. This property contributes to the identification of radionuclides present in a source and to their quantification. It allows the estimation of the degree of radionuclidic impurity by detecting peaks other than those expected.

It is possible to establish the rate of the decay of radioactivity using gamma spectrometry since the peaks diminish in amplitude as a function of the half-life. If, in such a source, a radioactive impurity with a different half-life is present, it is possible to detect the latter by identification of the characteristic peak or peaks whose amplitudes decrease at a different rate from that expected for the particular radionuclide. A determination of the half-life of the additional peaks by repeated measurements of the sample will help to identify the impurity.

The *Table of physical characteristics of radionuclides mentioned in the European Pharmacopoeia* (*5.7*) summarises the most commonly accepted physical characteristics of radionuclides used in preparations which are the subject of monographs in the European Pharmacopoeia. In addition, the Table states the physical characteristics of the main potential impurities of the radionuclides mentioned in the monographs.

By "transition probability" is meant the probability of the transformation of a nucleus in a given energy state, via the transition concerned. Instead of "probability" the terms "intensity" and "abundance" are frequently used.

By "emission probability" is meant the probability of an atom of a radionuclide giving rise to the emission of the particles or radiation concerned.

Irrespective of whether the one or the other meaning is intended, probability is usually measured in terms of 100 disintegrations.

MEASUREMENT OF RADIOACTIVITY

The radioactivity of a preparation is stated at a given date and, if necessary, time.

The absolute measurement of the radioactivity of a given sample may be carried out if the decay scheme of the radionuclide is known, but in practice many corrections are required to obtain accurate results. For this reason it is common to carry out the measurement with the aid of a primary standard source. Primary standards may not be available for short-lived radionuclides e.g. positron emitters. Measuring instruments are calibrated using suitable standards for the particular radionuclides. Standards are available from the laboratories recognised by the competent authority. Ionisation chambers and Geiger-Müller counters may be used to measure beta and beta/gamma emitters; scintillation or semiconductor counters or ionisation chambers may be used for measuring gamma emitters; low-energy beta emitters require a liquid-scintillation counter. For the detection and measurement of alpha emitters, specialised equipment and techniques are required. For an accurate comparison of radioactive sources, it is essential for samples and standards to be measured under similar conditions.

Low-energy beta emitters may be measured by liquid-scintillation counting. The sample is dissolved in a solution containing one or more often two organic fluorescent substances (primary and secondary scintillators), which convert part of the energy of disintegration into photons of light, which are detected by a photomultiplier and converted into electrical impulses. When using a liquid-scintillation counter, comparative measurements are corrected for light-quenching effects. Direct measurements are made, wherever possible, under similar conditions, (e.g. volumes and type of solutions) for the source to be examined and the standard source.

All measurements of radioactivity must be corrected by subtracting the background due to radioactivity in the environment and to spurious signals generated in the equipment itself.

With some equipment, when measurements are made at high levels of radioactivity, it may be necessary to correct for loss by coincidence due to the finite resolving time of the detector and its associated electronic equipment. For a counting system with a fixed dead time τ following each count, the correction is:

$$N = \frac{N_{obs}}{1 - N_{obs}\tau}$$

N = the true count rate per second,

N_{obs} = the observed count rate per second,

τ = the dead time, in seconds.

With some equipment this correction is made automatically. Corrections for loss by coincidence must be made before the correction for background radiation.

If the time of an individual measurement, t_m is not negligible short compared with the half-life, $T_{1/2}$, the decay during this measurement time must be taken into account. After having corrected the instrument reading (count rate, ionisation current, etc.) for background and, if necessary, for losses due to electronic effects, the decay correction during measurement time is:

$$R_{corr} = \frac{R\frac{t_m \ln 2}{T_{1/2}}}{1 - \exp\left(-\frac{t_m \ln 2}{T_{1/2}}\right)}$$

R_{corr} = instrument reading corrected to the beginning of the individual measurement,

R = instrument reading before decay correction, but already corrected for background, etc.

The results of determinations of radioactivity show variations which derive mainly from the random nature of nuclear transformation. A sufficient number of counts must be

registered in order to compensate for variations in the number of transformations per unit of time. The standard deviation is the square root of the counts, so at least 10 000 counts are necessary to obtain a relative standard deviation of not more than 1 per cent (confidence interval: 1 sigma).

All statements of radioactive content are accompanied by a statement of the date and, if necessary, the time at which the measurement was made. This statement of the radioactive content must be made with reference to a time zone (GMT, CET). The radioactivity at other times may be calculated from the exponential equation or from tables.

The radioactivity of a solution is expressed per unit volume to give the radioactive concentration.

RADIONUCLIDIC PURITY

In most of the cases, to state the radionuclidic purity of a radiopharmaceutical preparation, the identity of every radionuclide present and their radioactivity must be known. The most generally useful method for examination of radionuclidic purity is that of gamma spectrometry. It is not a completely reliable method because alpha- and beta-emitting impurities are not usually easily detectable and, when sodium iodide detectors are employed, the peaks due to gamma emitting impurities are often obscured by the spectrum of the principal radionuclide.

The individual monographs prescribe the radionuclidic purity required (for example, the gamma-ray spectrum does not significantly differ from that of a standardised preparation) and may set limits for specific radionuclidic impurities (for example, cobalt-60 in cobalt-57). While these requirements are necessary, they are not in themselves sufficient to ensure that the radionuclidic purity of a preparation is sufficient for human use. The manufacturer must examine the product in detail and especially must examine preparations of radionuclides of short half-life for impurities of long half-life after a suitable period of decay. In this way, information on the suitability of the manufacturing processes and the adequacy of the testing procedures may be obtained. In cases where two or more positron emitting radionuclides need to be identified and/or differentiated, as e.g. 18F-impurities in 13N-preparations, half-life determinations need to be carried out in addition to gamma spectrometry.

Due to differences in the half-lives of the different radionuclides present in a radiopharmaceutical preparation, the radionuclidic purity changes with time. The requirement of the radionuclidic purity must be fulfilled throughout the period of validity. It is sometimes difficult to carry out these tests before authorising the release for use of the batch when the half-life of the radionuclide in the preparation is short. The test then constitutes a control of the quality of production.

RADIOCHEMICAL PURITY

The determination of radiochemical purity requires separation of the different chemical substances containing the radionuclide and estimating the percentage of radioactivity associated with the declared chemical substance. Radiochemical impurities may originate from:

- radionuclide production,
- subsequent chemical procedures,
- incomplete preparative separation,
- chemical changes during storage.

The requirement of the radiochemical purity must be fulfilled throughout the period of validity.

In principle, any method of analytical separation may be used in the determination of radiochemical purity. For example, the monographs for radiopharmaceutical products may include paper chromatography (*2.2.26*), thin-layer chromatography (*2.2.27*), electrophoresis (*2.2.31*), size-exclusion chromatography (*2.2.30*), gas chromatography (*2.2.28*) and liquid chromatography (*2.2.29*). The technical description of these analytical methods is set out in the monographs. Moreover certain precautions special to radioactivity must also be taken for radiation protection.

In a hospital environment thin-layer and paper chromatography are mostly used. In paper and thin-layer chromatography, a volume equal to that described in the monograph is deposited on the starting-line as prescribed in the general methods for chromatography. It is preferable not to dilute the preparation to be examined but it is important to avoid depositing such a quantity of radioactivity that counting losses by coincidence occur during measurement of the radioactivity. On account of the very small quantities of the radioactive material applied, a carrier may be added when specified in a particular monograph. After development, the support is dried and the positions of the radioactive areas are detected by autoradiography or by measurement of radioactivity over the length of the chromatogram, using suitable collimated counters or by cutting the strips and counting each portion. The positions of the spots or areas permit chemical identification by comparison with solutions of the same chemical substances (non-radioactive) using a suitable detection method.

Radioactivity may be measured by integration using an automatic-plotting instrument or a digital counter. The ratios of the areas under the peaks give the ratios of the radioactive concentration of the chemical substances. When the strips are cut into portions, the ratios of the quantities of radioactivity measured give the ratio of concentrations of the radioactive chemical species.

SPECIFIC RADIOACTIVITY

Specific radioactivity is usually calculated taking into account the radioactive concentration (radioactivity per unit volume) and the concentration of the chemical substance being studied, after verification that the radioactivity is attributable only to the radionuclide (radionuclidic purity) and the chemical species (radiochemical purity) concerned.

Specific radioactivity changes with time. The statement of the specific radioactivity therefore includes reference to a date and, if necessary, time. The requirement of the specific radioactivity must be fulfilled throughout the period of validity.

CHEMICAL PURITY

The determination of chemical purity requires quantification of the individual chemical impurities specified in the monograph.

ENANTIOMERIC PURITY

Where appropriate, the stereoisomeric purity has to be verified.

PHYSIOLOGICAL DISTRIBUTION

A physiological distribution test is prescribed, if necessary, for certain radiopharmaceutical preparations. The distribution pattern of radioactivity observed in specified organs, tissues or other body compartments of an appropriate animal species (usually rats or mice) can be a reliable indication of the expected distribution in humans and thus of the suitability for the intended purpose.

The individual monograph prescribes the details concerning the performance of the test and the physiological distribution requirements which must be met for the radiopharmaceutical preparation. A physiological distribution conforming to the requirements will assure appropriate distribution of the radioactive compounds to the intended biological target in humans and limits its distribution to non-target areas.

In general, the test is performed as follows.

Each of three animals is injected intravenously with the preparation to be tested. If relevant, the species, sex, strain and weight and/or age of the animals is specified in the monograph. The test injection is the radiopharmaceutical preparation as it is intended for human use. Where applicable, products are reconstituted according to the manufacturer's instructions. In some cases, dilution immediately before injection may be necessary.

The administration will normally be made via the intravenous route for which purpose the caudal vein is used. Other veins such as the saphenous, femoral, jugular or penile veins may be used in special cases. Animals showing evidence of extravasation of the injection (observed at the time of injection or revealed by subsequent assay of tissue radioactivity) are rejected from the test.

Immediately after injection each animal is placed in a separate cage which will allow collection of excreta and prevent contamination of the body surface of the animal.

At the specified time after injection, the animals are euthanised by an appropriate method and dissected. Selected organs and tissues are assayed for their radioactivity using a suitable instrument as described elsewhere in this monograph. The physiological distribution is then calculated and expressed in terms of the percentage of the radioactivity which is found in each of the selected organs or tissues. For this purpose the radioactivity in an organ may be related to the injected radioactivity calculated from the radioactive content of the syringe measured before and after injection. For some radiopharmaceutical preparations it may be appropriate to determine the ratio of the radioactivity in weighed samples of selected tissues (radioactivity/mass).

For a preparation to meet the requirements of the test, the distribution of radioactivity in at least two of the three animals must comply with all the specified criteria.

STERILITY

Radiopharmaceutical preparations for parenteral administration must be prepared using precautions designed to exclude microbial contamination and to ensure sterility. The test for sterility is carried out as described in the general method for sterility (*2.6.1*). Special difficulties arise with radiopharmaceutical preparations because of the short half-life of some radionuclides small size of batches and the radiation hazards. It is not always possible to await the results of the test for sterility before authorisation of the release for use of the batch concerned. Parametric release (*5.1.1)* of the product manufactured by a fully validated process is the method of choice in such cases. When aseptic manufacturing is used, the test for sterility has to be executed as a control of the quality of production.

When the size of a batch of the radiopharmaceutical preparation is limited to one or a few samples (e.g. therapeutic or very short-lived radiopharmaceutical preparation), sampling the batch for sterility testing may not be applicable. If the radiopharmaceutical preparation is sterilised by filtration and/or aseptically processed (*5.1.1*) process validation is critical.

When the half-life of the radionuclide is very short (e.g. less than 20 min), the administration of the radiopharmaceutical preparation to the patient is generally on-line with a validated production system.

For safety reasons (high level of radioactivity) it is not possible to use the quantity of the radiopharmaceutical preparations as required in the test for sterility (*2.6.1*). The method by membrane filtration is to be preferred to limit irradiation of personnel.

Notwithstanding the requirements concerning the use of antimicrobial preservatives in *Parenteral preparations (0520)*, their addition to radiopharmaceutical preparations in multidose containers is not obligatory, unless prescribed in the monograph.

BACTERIAL ENDOTOXINS - PYROGENS

For certain radiopharmaceutical preparations a test for bacterial endotoxins is prescribed. The test is carried out as described in the general method (*2.6.14*), taking the necessary precautions to limit irradiation of the personnel carrying out the test.

The limit for bacterial endotoxins is indicated in the individual monograph.

When the nature of the radiopharmaceutical preparation results in an interference by inhibition or activation and it is not possible to eliminate the interfering factor(s), the test for pyrogens (*2.6.8*) may be specifically prescribed.

It is sometimes difficult to carry out these tests before releasing the batch for use when the half-life of the radionuclide in the preparation is short. The test then constitutes a control of the quality of production.

STORAGE

Store in an airtight container in a place that is sufficiently shielded to protect personnel from irradiation by primary or secondary emissions and that complies with national and international regulations concerning the storage of radioactive substances. During storage, containers may darken due to irradiation. Such darkening does not necessarily involve deterioration of the preparations.

Radiopharmaceutical preparations are intended for use within a short time and the end of the period of validity must be clearly stated.

LABELLING

The labelling of radiopharmaceutical preparations complies with the relevant national and European legislation.

The label on the direct container states:

- the name of the preparation and/or its reference,
- the name of the manufacturer,
- an identification number,
- for liquid and gaseous preparations: the total radioactivity in the container, or the radioactive concentration per millilitre at a stated date and, if necessary, time, and the volume of liquid in the container,
- for solid preparations (such as freeze-dried preparations): the total radioactivity at a stated date and, if necessary, time. After reconstitution with the appropriate solution, the preparation is considered as a liquid preparation,
- for capsules: the radioactivity per capsule at a stated date and, if necessary, time and the number of capsules in the container.

The labelling can be adapted in certain cases (e.g. radiopharmaceutical preparations containing short-lived radionuclides).

In addition, the label on the outer package states:
- the route of administration,
- the period of validity or the expiry date,
- the name and concentration of any added antimicrobial preservative,
- where applicable, any special storage conditions.

01/2008:0784

RECOMBINANT DNA TECHNOLOGY, PRODUCTS OF

Producta ab arte ADN recombinandorum

This monograph provides general requirements for the development and manufacture of products of recombinant DNA technology. These requirements are not necessarily comprehensive in a given case and requirements complementary or additional to those prescribed in this monograph may be imposed in an individual monograph or by the competent authority.

The monograph is not applicable to modified live organisms that are intended to be used directly in man and animals, for example as live vaccines.

DEFINITION

Products of rDNA technology are produced by genetic modification in which DNA coding for the required product is introduced, usually by means of a plasmid or a viral vector, into a suitable micro-organism or cell line, in which that DNA is expressed and translated into protein. The desired product is then recovered by extraction and purification. The cell or micro-organism before harbouring the vector is referred to as the host cell, and the stable association of the two used in the manufacturing process is referred to as the host-vector system.

PRODUCTION

Production is based on a validated seed-lot system using a host-vector combination that has been shown to be suitable to the satisfaction of the competent authority. The seed-lot system uses a master cell bank and a working cell bank derived from the master seed lot of the host-vector combination. A detailed description of cultivation, extraction and purification steps and a definition of the production batch shall be established.

Where products of rDNA technology are manufactured using materials of human or animal origin, the requirements of chapter *5.1.7. Viral safety* apply.

The determination of the suitability of the host-vector combination and the validation of the seed-lot system include the following elements.

CLONING AND EXPRESSION

The suitability of the host-vector system, particularly as regards microbiological purity, is demonstrated by:

Characterisation of the host cell, including source, phenotype and genotype, and of the cell-culture media;

Documentation of the strategy for the cloning of the gene and characterisation of the recombinant vector, including:

i. the origin and characterisation of the gene;

ii. nucleotide-sequence analysis of the cloned gene and the flanking control regions of the expression vector; the cloned sequences are kept to a minimum and all relevant expressed sequences are clearly identified and confirmed at the RNA level; the DNA sequence of the cloned gene is normally confirmed at the seed-lot stage, up to and beyond the normal level of population doubling for full-scale fermentation; in certain systems, for example, where multiple copies of the gene are inserted into the genome of a continuous cell line, it may be inappropriate to sequence the cloned gene at the production level; under these circumstances, Southern blot analysis of total cellular DNA or sequence analysis of the messenger RNA (mRNA) may be helpful, particular attention being paid to the characterisation of the expressed protein;

iii. the construction, genetics and structure of the complete expression vector;

Characterisation of the host-vector system, including:

i. mechanism of transfer of the vector into the host cells;

ii. copy number, physical state and stability of the vector inside the host cell;

iii. measures used to promote and control the expression.

CELL-BANK SYSTEM

The master cell bank is a homogeneous suspension of the original cells already transformed by the expression vector containing the desired gene, distributed in equal volumes into individual containers for storage (for example, in liquid nitrogen). In some cases it may be necessary to establish separate master cell banks for the expression vector and the host cells.

The working cell bank is a homogeneous suspension of the cell material derived from the master cell bank(s) at a finite passage level, distributed in equal volumes into individual containers for storage (for example, in liquid nitrogen).

In both cell banks, all containers are treated identically during storage and, once removed from storage, the containers are not returned to the cell stock.

The cell bank may be used for production at a finite passage level or for continuous-culture production.

Production at a finite passage level

This cultivation method is defined by a limited number of passages or population doublings which must not be exceeded during production. The maximum number of cell doublings, or passage levels, during which the manufacturing process routinely meets the criteria described below must be stated.

Continuous-culture production

By this cultivation method the number of passages or population doublings is not restricted from the beginning of production. Criteria for the harvesting as well as for the termination of production have to be defined by the manufacturer. Monitoring is necessary throughout the life of the culture; the required frequency and type of monitoring will depend on the nature of the production system and the product.

Information is required on the molecular integrity of the gene being expressed and on the phenotypic and genotypic characteristics of the host cell after long-term cultivation. The acceptance of harvests for further processing must be clearly linked to the schedule of monitoring applied and a clear definition of a 'batch' of product for further processing is required.

VALIDATION OF THE CELL BANKS

Validation of the cell banks includes:

i. stability by measuring viability and the retention of the vector;

ii. identity of the cells by phenotypic features;

iii. where appropriate, evidence that the cell banks are free from potentially oncogenic or infective adventitious agents (viral, bacterial, fungal or mycoplasmal); special attention

has to be given to viruses that can commonly contaminate the species from which the cell line has been derived; certain cell lines contain endogenous viruses, for example, retroviruses, which may not readily be eliminated; the expression of these organisms, under a variety of conditions known to cause their induction, shall be tested for;

iv. for mammalian cells, details of the tumorigenic potential of the cell bank shall be obtained.

CONTROL OF THE CELLS

The origin, form, storage, use and stability at the anticipated rate of use must be documented in full for all cell banks under conditions of storage and recovery. New cell banks must be fully validated.

VALIDATION OF THE PRODUCTION PROCESS

Extraction and purification

The capacity of each step of the extraction and purification procedure to remove and/or inactivate contaminating substances derived from the host cell or culture medium, including, in particular, virus particles, proteins, nucleic acids and added substances, must be validated.

Validation studies are carried out to demonstrate that the production process routinely meets the following criteria:

- exclusion of extraneous agents from the product; studies including, for example, viruses with relevant physico-chemical features are undertaken, and a reduction capacity for such contaminants at each relevant stage of purification is established;
- adequate removal of vector, host-cell, culture medium and reagent-derived contaminants from the product; the reduction capacity for DNA is established by spiking; the reduction of proteins of animal origin can be determined by immunochemical methods;
- maintenance within stated limits of the yield of product from the culture;
- adequate stability of any intermediate of production and/or manufacturing when it is intended to use intermediate storage during the process.

Characterisation of the substance

The identity, purity, potency and stability of the final bulk product are established initially by carrying out a wide range of chemical, physical, immunochemical and biological tests. Prior to release, each batch of the product is tested by the manufacturer for identity and purity and an appropriate assay is carried out.

Production consistency

Suitable tests for demonstrating the consistency of the production and purification are performed. In particular, the tests include characterisation tests, in-process controls and final-product tests as exemplified below.

AMINO-ACID COMPOSITION

Partial amino-acid sequence analysis. The sequence data permit confirmation of the correct *N*-terminal processing and detection of loss of the *C*-terminal amino acids.

Peptide mapping. Peptide mapping using chemical and/or enzymatic cleavage of the protein product and analysis by a suitable method such as two-dimensional gel electrophoresis, capillary electrophoresis or liquid chromatography must show no significant difference between the test protein and the reference preparation. Peptide mapping can also be used to demonstrate correct disulphide bonding.

DETERMINATION OF MOLECULAR MASS

Cloned-gene retention. The minimum percentage of cells containing the vector or the cloned gene after cultivation is approved by the relevant authority.

Total protein. The yield of protein is determined.

Chemical purity. The purity of the protein product is analysed in comparison with a reference preparation by a suitable method such as liquid chromatography, capillary electrophoresis or sodium dodecyl sulphate polyacrylamide gel electrophoresis.

Host-cell-derived proteins. Host-cell-derived proteins are detected by immunochemical methods, using, for example, polyclonal antisera raised against protein components of the host-vector system used to manufacture the product, unless otherwise prescribed. The following types of procedure may be used: liquid-phase displacement assays (for example, radio-immunoassay), liquid-phase direct-binding assays and direct-binding assays using antigens immobilised on nitrocellulose (or similar) membranes (for example, dot-immunoblot assays, Western blots). General requirements for the validation of immunoassay procedures are given under *2.7.1. Immunochemical Methods.* In addition, immunoassay methods for host-cell contaminants meet the following criteria.

- *Antigen preparations.* Antisera are raised against a preparation of antigens derived from the host organism, into which has been inserted the vector used in the manufacturing process that lacks the specific gene coding for the product. This host cell is cultured, and proteins are extracted, using conditions identical to those used for culture and extraction in the manufacturing process. Partly purified preparations of antigens, using some of the purification steps in the manufacturing process, may also be used for the preparation of antisera.
- *Calibration and standardisation.* Quantitative data are obtained by comparison with dose-response curves obtained using standard preparations of host-derived protein antigens. Since these preparations are mixtures of poorly defined proteins, a standard preparation is prepared and calibrated by a suitable protein determination method. This preparation is stored in a stable state suitable for use over an extended period of time.
- *Antisera.* Antisera contain high-avidity antibodies recognising as many different proteins in the antigen mixture as possible, and do not cross-react with the product.

Host-cell- and vector-derived DNA. Residual DNA is detected by hybridisation analysis, using suitably sensitive, sequence-independent analytical techniques or other suitably sensitive analytical techniques.

Hybridisation analysis

DNA in the test sample is denatured to give single-stranded DNA, immobilised on a nitrocellulose or other suitable filter and hybridised with labelled DNA prepared from the host-vector manufacturing system (DNA probes). Although a wide variety of experimental approaches is available, hybridisation methods for measurement of host-vector DNA meet the following criteria.

- *DNA probes.* Purified DNA is obtained from the host-vector system grown under the same conditions as those used in the manufacturing process. Host chromosomal DNA and vector DNA may be separately prepared and used as probes.
- *Calibration and standardisation.* Quantitative data are obtained by comparison with responses obtained using standard preparations. Chromosomal DNA probes and vector DNA probes are used with chromosomal DNA and vector DNA standards, respectively.

Standard preparations are calibrated by spectroscopic measurements and stored in a state suitable for use over an extended period of time.

– *Hybridisation conditions.* The stringency of hybridisation conditions is such as to ensure specific hybridisation between probes and standard DNA preparations and the drug substances must not interfere with hybridisation at the concentrations used.

Sequence-independent techniques

Suitable procedures include: detection of sulphonated cytosine residues in single-stranded DNA (where DNA is immobilised on a filter and cytosines are derivatised *in situ*, before detection and quantitation using an antibody directed against the sulphonated group); detection of single-stranded DNA using a fragment of single-stranded DNA bound to a protein and an antibody of this protein. Neither procedure requires the use of specific host or vector DNA as an assay standard. However, the method used must be validated to ensure parallelism with the DNA standard used, linearity of response and non-interference of either the drug substance or excipients of the formulation at the dilutions used in the assay.

IDENTIFICATION, TESTS AND ASSAY

The requirements with which the final product (bulk material or dose form) must comply throughout its period of validity, as well as specific test methods, are stated in the individual monograph.

01/2008:2034

SUBSTANCES FOR PHARMACEUTICAL USE

Corpora ad usum pharmaceuticum

The statements in this monograph are intended to be read in conjunction with individual monographs on substances in the Pharmacopoeia. Application of the monograph to other substances may be decided by the competent authority.

DEFINITION

Substances for pharmaceutical use are any organic or inorganic substances that are used as active substances or excipients for the production of medicinal products for human or veterinary use. They may be obtained from natural sources or produced by extraction from raw materials, fermentation or synthesis.

This monograph does not apply to herbal drugs, herbal drug preparations or extracts, which are the subject of separate general monographs [*Herbal drugs (1433), Herbal drug preparations (1434), Extracts (0765)*].

Where medicinal products are manufactured using substances for pharmaceutical use of human or animal origin, the requirements of chapter *5.1.7. Viral safety* apply.

Substances for pharmaceutical use may be used as such or as starting materials for subsequent formulation to prepare medicinal products. Depending on the formulation, certain substances may be used either as active substances or as excipients. Solid substances may be compacted, coated, granulated, powdered to a certain fineness or processed in other ways. Processing with addition of excipients is permitted only where this is specifically stated in the Definition of the individual monograph.

Substance for pharmaceutical use of special grade. Unless otherwise indicated or restricted in the individual monographs, a substance for pharmaceutical use is intended for human and veterinary use, and is of appropriate quality for the manufacture of all dosage forms in which it can be used.

Polymorphism. Individual monographs do not usually specify crystalline or amorphous forms, unless bioavailability is affected. All forms of a substance for pharmaceutical use comply with the requirements of the monograph, unless otherwise indicated.

PRODUCTION

Substances for pharmaceutical use are manufactured by procedures that are designed to ensure a consistent quality and comply with the requirements of the individual monograph or approved specification.

The provisions of general chapter *5.10* apply to the control of impurities in substances for pharmaceutical use.

Whether or not it is specifically stated in the individual monograph that the substance for pharmaceutical use:

– is a recombinant protein or another substance obtained as a direct gene product based on genetic modification, where applicable, the substance also complies with the requirements of the general monograph on *Products of recombinant DNA technology (0784)*;

– is obtained from animals susceptible to transmissible spongiform encephalopathies other than by experimental challenge, where applicable, the substance also complies with the requirements of the general monograph on *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)*;

– is a substance derived from a fermentation process, whether or not the micro-organisms involved are modified by traditional procedures or recombinant DNA (rDNA) technology, where applicable, the substance complies with the requirements of the general monograph on *Products of fermentation (1468)*.

If solvents are used during production, they are of suitable quality. In addition, their toxicity and their residual level are taken into consideration (*5.4*). If water is used during production, it is of suitable quality.

If substances are produced or processed to yield a certain form or grade, that specific form or grade of the substance complies with the requirements of the monograph. Certain functionality-related tests may be described to control properties that may influence the suitability of the substance and subsequently the properties of dosage forms prepared from it.

Powdered substances may be processed to obtain a certain degree of fineness (*2.9.12*).

Compacted substances are processed to increase the particle size or to obtain particles of a specific form and/or to obtain a substance with a higher bulk density.

Coated active substances consist of particles of the active substance coated with one or more suitable excipients.

Granulated active substances are particles of a specified size and/or form produced from the active substance by granulation directly or with one or more suitable excipients.

If substances are processed with excipients, these excipients comply with the requirements of the relevant monograph or, where no such monograph exists, the approved specification.

CHARACTERS

The statements under the heading Characters (e.g. statements about the solubility or a decomposition point) are not to be interpreted in a strict sense and are not requirements. They are given for information.

Where a substance may show polymorphism, this may be stated under Characters in order to draw this to the attention of the user who may have to take this characteristic into consideration during formulation of a preparation.

IDENTIFICATION

Where under Identification an individual monograph contains subdivisions entitled *First identification* and *Second identification*, the test or tests that constitute the *First identification* may be used in all circumstances. The test or tests that constitute the *Second identification* may be used for identification, provided it can be demonstrated that the substance is fully traceable to a batch certified to comply with all the other requirements of the monograph.

TESTS

Polymorphism (*5.9*). If the nature of a crystalline or amorphous form imposes restrictions on its use in preparations, the nature of the specific crystalline or amorphous form is identified, its morphology is adequately controlled and its identity is stated on the label.

Related substances. Unless otherwise prescribed or justified and authorised, organic impurities in active substances are to be reported, identified wherever possible, and qualified as indicated in Table 2034.-1.

Specific thresholds may be applied for impurities known to be unusually potent or to produce toxic or unexpected pharmacological effects.

If the individual monograph does not provide suitable control for a new impurity, a suitable test for control must be developed and included in the specification for the substance.

The requirements above do not apply to biological and biotechnological products, peptides, oligonucleotides, radiopharmaceuticals, products of fermentation and semi-synthetic products derived therefrom, to crude products of animal or plant origin or herbal products.

Residual solvents are limited according to the principles defined in chapter *5.4*, using general method *2.4.24* or another suitable method. Where a quantitative determination of a residual solvent is carried out and a test for loss on drying is not carried out, the content of residual solvent is taken into account for calculation of the assay content of the substance, the specific optical rotation and the specific absorbance.

Microbiological quality. Individual monographs give acceptance criteria for microbiological quality wherever such control is necessary. Table 5.1.4.-2. – *Acceptance criteria for microbiological quality of non-sterile substances for pharmaceutical use* in chapter *5.1.4. Microbiological quality of pharmaceutical preparations* gives recommendations on microbiological quality that are of general relevance for substances subject to microbial contamination. Depending on the nature of the substance and its intended use, different acceptance criteria may be justified.

Sterility (*2.6.1*). If intended for use in the manufacture of sterile dosage forms without a further appropriate sterilisation procedure, or if offered as sterile grade, the substance for pharmaceutical use complies with the test for sterility.

Bacterial endotoxins (*2.6.14*). If offered as bacterial endotoxin-free grade, the substance for pharmaceutical use complies with the test for bacterial endotoxins. The limit and test method (if not gelation method A) are stated in the individual monograph. The limit is calculated in accordance with *Test for bacterial endotoxins: guidelines* (*2.6.14*), unless a lower limit is justified from results from production batches or is required by the competent authority. Where a test for bacterial endotoxins is prescribed, a test for pyrogens is not required.

Pyrogens (*2.6.8*). If the test for pyrogens is justified rather than the test for bacterial endotoxins and if a pyrogen-free grade is offered, the substance for pharmaceutical use complies with the test for pyrogens. The limit and test method are stated in the individual monograph or approved by the competent authority. Based on appropriate test validation for bacterial endotoxins and pyrogens, the test for bacterial endotoxins may replace the test for pyrogens.

Additional properties. Control of additional properties (e.g. physical characteristics, functionality-related characteristics) may be necessary for individual manufacturing processes or formulations. Grades (such as sterile, endotoxin-free, pyrogen-free) may be produced with a view to manufacture of preparations for parenteral administration or other dosage forms and appropriate requirements may be specified in an individual monograph.

ASSAY

Unless justified and authorised, contents of substances for pharmaceutical use are determined. Suitable methods are used.

LABELLING

In general, labelling is subject to supranational and national regulation and to international agreements. The statements under the heading Labelling therefore are not comprehensive and, moreover, for the purposes of the Pharmacopoeia only those statements that are necessary to demonstrate compliance or non-compliance with the monograph are mandatory. Any other labelling statements are included as recommendations. When the term 'label' is used in the Pharmacopoeia, the labelling statements may appear on the container, the package, a leaflet accompanying the package or a certificate of analysis accompanying the article, as decided by the competent authority.

Where appropriate, the label states that the substance is:

– intended for a specific use;

– of a distinct crystalline form;

Table 2034.-1. – *Reporting, identification and qualification of organic impurities in active substances*

Use	Maximum daily dose	Reporting threshold	Identification threshold	Qualification threshold
Human use or human and veterinary use	≤ 2 g/day	> 0.05 per cent	> 0.10 per cent or a daily intake of > 1.0 mg (whichever is the lower)	> 0.15 per cent or a daily intake of > 1.0 mg (whichever is the lower)
Human use or human and veterinary use	> 2 g/day	> 0.03 per cent	> 0.05 per cent	> 0.05 per cent
Veterinary use only	Not applicable	> 0.1 per cent	> 0.2 per cent	> 0.5 per cent

– of a specific degree of fineness;
– compacted;
– coated;
– granulated;
– sterile;
– free from bacterial endotoxins;
– free from pyrogens;
– containing gliding agents.

Where applicable, the label states:
– the degree of hydration,
– the name and concentration of any added substance (for example, an antimicrobial preservative or an antioxidant).

Where an active substance is processed with addition of an excipient or excipients, the label states the excipient(s) used and the content of active substance and excipient(s).

01/2008:0153

VACCINES FOR HUMAN USE

Vaccina ad usum humanum

For a combined vaccine, where there is no monograph to cover a particular combination, the vaccine complies with the monograph for each individual component, with any necessary modifications approved by the competent authority.

DEFINITION

Vaccines for human use are preparations containing substances capable of inducing a specific and active immunity in man against an infecting agent or the toxin or the antigen elaborated by it. They shall have been shown to have acceptable immunogenic activity in man with the intended vaccination schedule. They may contain an adjuvant.

Vaccines for human use may contain: organisms inactivated by chemical or physical means that maintain adequate immunogenic properties; living organisms that are naturally avirulent or that have been treated to attenuate their virulence whilst retaining adequate immunogenic properties; antigens extracted from the organisms or secreted by them or produced by genetic engineering; the antigens may be used in their native state or may be detoxified by chemical or physical means and may be aggregated, polymerised or conjugated to a carrier to increase their immunogenicity.

Terminology used in monographs on vaccines for human use is defined in chapter *5.2.1*.

Bacterial vaccines are suspensions of various degrees of opacity in colourless or almost colourless liquids, or may be freeze-dried. The concentration of living or inactivated bacteria is expressed in terms of International Units of opacity or, where appropriate, is determined by direct cell count or, for living bacteria, by viable count.

Bacterial toxoids are prepared from toxins by diminishing their toxicity to a non-detectable level or by completely eliminating it by physical or chemical procedures whilst retaining adequate immunogenic properties. The toxins are obtained from selected strains of micro-organisms. The method of production is such that the toxoid does not revert to toxin. Toxoids may be liquid or freeze-dried. They may be purified and adsorbed. Adsorbed toxoids are suspensions of white or grey particles dispersed in colourless or pale yellow liquids and may form a sediment at the bottom of the container.

Viral vaccines are prepared from viruses grown in animals, in fertilised eggs, in suitable cell cultures or in suitable tissues or by culture of genetically engineered cells. They are liquids that vary in opacity according to the type of preparation or may be freeze-dried. Liquid preparations and freeze-dried preparations after reconstitution may be coloured if a pH indicator such as phenol red has been used in the culture medium.

PRODUCTION

General provisions. The production method for a given product must have been shown to yield consistently batches comparable with the batch of proven clinical efficacy and safety in man. Requirements for production including in-process testing are included in individual monographs. Where justified and authorised, certain tests may be omitted where it can be demonstrated, for example by validation studies, that the production process consistently ensures compliance with the test.

Unless otherwise justified and authorised, vaccines are produced using a seed-lot system. The methods of preparation are designed to maintain adequate immunogenic properties, to render the preparation harmless and to prevent contamination with extraneous agents.

Where vaccines for human use are manufactured using materials of human or animal origin, the general requirements of chapter *5.1.7. Viral safety* apply in conjunction with the more specific requirements relating to viral safety in this monograph, in chapters *5.2.2. Chicken flocks free from specified pathogens for the production and quality control of vaccines*, *5.2.3. Cell substrates for the production of vaccines for human use* and *2.6.16. Tests for extraneous agents in viral vaccines for human use*, and in individual monographs.

Unless otherwise justified and authorised, in the production of a final lot of vaccine, the number of passages of a virus, or the number of subcultures of a bacterium, from the master seed lot shall not exceed that used for production of the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

Vaccines are as far as possible free from ingredients known to cause toxic, allergic or other undesirable reactions in man. Suitable additives, including stabilisers and adjuvants may be incorporated. Penicillin and streptomycin are not used at any stage of production nor added to the final product; however, master seed lots prepared with media containing penicillin or streptomycin may, where justified and authorised, be used for production.

Consistency of production is an important feature of vaccine production. Monographs on vaccines for human use give limits for various tests carried out during production and on the final lot. These limits may be in the form of maximum values, minimum values or minimum and maximum tolerances around a given value. While compliance with these limits is required, it is not necessarily sufficient to ensure consistency of production for a given vaccine. For relevant tests, the manufacturer must therefore define for each product a suitable action or release limit or limits to be applied in view of the results found for batches tested clinically and those used to demonstrate consistency of production. These limits may be subsequently refined on a statistical basis in the light of production data.

Substrates for propagation. Substrates for propagation comply with the relevant requirements of the Pharmacopoeia (*5.2.2, 5.2.3*) or in the absence of such requirements with those of the competent authority. Processing of cell banks and subsequent cell cultures is done under aseptic conditions

in an area where no other cells are being handled. Serum and trypsin used in the preparation of cell suspensions shall be shown to be free from extraneous agents.

Seed lots. The strain of bacterium or virus used in a master seed lot is identified by historical records that include information on the origin of the strain and its subsequent manipulation. Suitable measures are taken to ensure that no micro-organism other than the seed strain is present in a seed lot.

Culture media. Culture media are as far as possible free from ingredients known to cause toxic, allergic or other undesirable reactions in man; if inclusion of such ingredients is necessary, it shall be demonstrated that the amount present in the final lot is reduced to such a level as to render the product safe. Approved animal (but not human) serum may be used in the growth medium for cell cultures but the medium used for maintaining cell growth during virus multiplication shall not contain serum, unless otherwise stated. Cell culture media may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration although it is preferable to have a medium free from antibiotics during production.

Propagation and harvest. The seed cultures are propagated and harvested under defined conditions. The purity of the harvest is verified by suitable tests as defined in the monograph.

Control cells. For vaccines produced in cell cultures, control cells are maintained and tested as prescribed. In order to provide a valid control, these cells must be maintained in conditions that are essentially equivalent to those used for the production cell cultures, including use of the same batches of media and media changes.

Control eggs. For live vaccines produced in eggs, control eggs are incubated and tested as prescribed in the monograph.

Purification. Where applicable, validated purification procedures may be applied.

Inactivation. Inactivated vaccines are produced using a validated inactivation process whose effectiveness and consistency have been demonstrated. Where there are recognised potential contaminants of a harvest, for example in vaccines produced in eggs from healthy, non-SPF flocks, the inactivation process is also validated with respect to the potential contaminants. A test for effectiveness of the inactivation process is carried out as soon as possible after the inactivation process, unless otherwise justified and authorised.

Stability of intermediates. During production of vaccines, intermediates are obtained at various stages and are stored, sometimes for long periods. Such intermediates include:

- seed lots;
- live or inactivated harvests from bacterial or viral cultures;
- purified harvests that may consist of toxins or toxoids, polysaccharides, bacterial or viral suspensions;
- purified antigens;
- adsorbed antigens;
- conjugated polysaccharides;
- final bulk vaccine;
- vaccine in the final closed container stored at a temperature lower than that used for stability studies and intended for release without re-assay.

Except where they are used within a short period of time, stability studies are carried out on the intermediates in the intended storage conditions to establish the expected extent of degradation. For final bulk vaccine, stability studies may be carried out on representative samples in conditions equivalent to those intended to be used for storage. For each intermediate (except for seed lots), a period of validity applicable for the intended storage conditions is established, where appropriate in the light of stability studies.

Final bulk. The final bulk is prepared by aseptically blending the ingredients of the vaccine.

Adsorbents. Vaccines may be adsorbed on aluminium hydroxide, aluminium phosphate, calcium phosphate or other suitable adsorbent; the adsorbents are prepared in special conditions which confer the appropriate physical form and adsorptive properties.

Antimicrobial preservatives. Antimicrobial preservatives are used to prevent spoilage or adverse effects caused by microbial contamination occurring during the use of a vaccine. Antimicrobial preservatives are not included in freeze-dried products. For single-dose liquid preparations, inclusion of antimicrobial preservatives is not normally acceptable. For multidose liquid preparations, the need for effective antimicrobial preservation is evaluated taking into account likely contamination during use and the maximum recommended period of use after broaching of the container. If an antimicrobial preservative is used, it shall be shown that it does not impair the safety or efficacy of the vaccine. Addition of antibiotics as antimicrobial preservatives is not normally acceptable.

During development studies, the effectiveness of the antimicrobial preservative throughout the period of validity shall be demonstrated to the satisfaction of the competent authority.

The efficacy of the antimicrobial preservative is evaluated as described in chapter *5.1.3.* If neither the A criteria nor the B criteria can be met, then in justified cases the following criteria are applied to vaccines for human use: bacteria, no increase at 24 h and 7 days, 3 log reduction at 14 days, no increase at 28 days; fungi, no increase at 14 days and 28 days.

Final lot. For vaccines for parenteral administration, the final lot is prepared by aseptically distributing the final bulk into sterile tamper-proof containers which, after freeze-drying where applicable, are closed so as to exclude contamination. For vaccines for administration by a non-parenteral route, the final lot is prepared by distributing the final bulk under suitable conditions into sterile, tamper-proof containers.

Appearance. Each container (vial, syringe or ampoule) in each final lot is inspected visually or mechanically for acceptable appearance.

Degree of adsorption. During development of an adsorbed vaccine, the degree of adsorption is evaluated as part of the consistency testing. A release specification for the degree of adsorption is established in the light of results found for batches used in clinical testing. From the stability data generated for the vaccine it must be shown that at the end of the period of validity the degree of adsorption will not be less than for batches used in clinical testing.

Stability. During development studies, maintenance of potency of the final lot throughout the period of validity shall be demonstrated; the loss of potency in the recommended storage conditions is assessed and excessive loss even within the limits of acceptable potency may indicate that the vaccine is unacceptable.

Expiry date. Unless otherwise stated, the expiry date is calculated from the beginning of the assay or from the beginning of the first assay for a combined vaccine. For vaccines stored at a temperature lower than that used for stability studies and intended for release without re-assay, the expiry date is calculated from the date of removal from cold storage. If, for a given vaccine, an assay is not carried

out, the expiry date for the final lot is calculated from the date of an approved stability-indicating test or failing this from the date of freeze-drying or the date of filling into the final containers. For a combined vaccine where components are presented in separate containers, the expiry date is that of the component which expires first.

The expiry date applies to vaccines stored in the prescribed conditions.

Animal tests. In accordance with the provisions of the European Convention for the Protection of Vertebrate Animals Used for Experimental and Other Scientific Purposes, tests must be carried out in such a way as to use the minimum number of animals and to cause the least pain, suffering, distress or lasting harm. The criteria for judging tests in monographs must be applied in the light of this. For example, if it is indicated that an animal is considered to show positive, infected etc. when typical clinical signs or death occur then as soon as sufficient indication of a positive result is obtained the animal in question shall be either humanely destroyed or given suitable treatment to prevent unnecessary suffering. In accordance with the General Notices, alternative test methods may be used to demonstrate compliance with the monograph and the use of such tests is particularly encouraged when this leads to replacement or reduction of animal use or reduction of suffering.

TESTS

Vaccines comply with the tests prescribed in individual monographs including, where applicable, the following:

pH (*2.2.3*). Liquid vaccines, after reconstitution where applicable, comply with the limits for pH approved for the particular preparation.

Adjuvant. If the vaccine contains an adjuvant, the amount is determined and shown to be within acceptable limits with respect to the expected amount (see also the tests for aluminium and calcium below).

Aluminium (*2.5.13*): maximum 1.25 mg of aluminium (Al) per single human dose where an aluminium adsorbent has been used in the vaccine, unless otherwise stated.

Calcium (*2.5.14*): maximum 1.3 mg of calcium (Ca) per single human dose where a calcium adsorbent has been used in the vaccine, unless otherwise stated.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l of free formaldehyde is present in the final product where formaldehyde has been used in the preparation of the vaccine, unless otherwise stated.

Phenol (*2.5.15*): maximum 2.5 g/l is present in the final product where phenol has been used in the preparation of the vaccine, unless otherwise stated.

Water (*2.5.12*): maximum 3.0 per cent *m/m* for freeze-dried vaccines, unless otherwise stated.

Extractable volume (*2.9.17*). Unless otherwise justified and authorised, it complies with the requirement for extractable volume.

STORAGE

Store protected from light. Unless otherwise stated, the storage temperature is 5 ± 3 °C; liquid adsorbed vaccines must not be allowed to freeze.

LABELLING

The label states:

- the name of the preparation;
- a reference identifying the final lot;
- the recommended human dose and route of administration;
- the storage conditions;
- the expiry date;
- the name and amount of any antimicrobial preservative;
- the name of any antibiotic, adjuvant, flavour or stabiliser present in the vaccine;
- the name of any constituent that may cause adverse reactions and any contra-indications to the use of the vaccine;
- for freeze-dried vaccines:
  - the name or composition and the volume of the reconstituting liquid to be added;
  - the time within which the vaccine is to be used after reconstitution.

01/2008:0062

VACCINES FOR VETERINARY USE

Vaccina ad usum veterinarium

In the case of combined vaccines, for each component that is the subject of a monograph in the Pharmacopoeia, the provisions of that monograph apply to that component, modified where necessary as indicated (see Tests (Safety) below, Evaluation of safety of veterinary vaccines (5.2.6) and Evaluation of efficacy of veterinary vaccines (5.2.7)).

1. DEFINITION

Vaccines for veterinary use are preparations containing antigenic substances and are administered for the purpose of inducing a specific and active immunity against disease provoked by bacteria, toxins, viruses, fungi or parasites. The vaccines, live or inactivated, confer active immunity that may be transferred passively via maternal antibodies against the immunogens they contain and sometimes also against antigenically related organisms. Vaccines may contain bacteria, toxins, viruses or fungi, living or inactivated, parasites, or antigenic fractions or substances produced by these organisms and rendered harmless whilst retaining all or part of their antigenic properties; vaccines may also contain combinations of these constituents. The antigens may be produced by recombinant DNA technology. Suitable adjuvants may be included to enhance the immunising properties of the vaccines.

Terminology used in monographs on vaccines for veterinary use is defined in chapter *5.2.1*.

1-1. *BACTERIAL VACCINES AND BACTERIAL TOXOIDS*

Bacterial vaccines and bacterial toxoids are prepared from cultures grown on suitable solid or liquid media, or by other suitable means; the requirements of this section do not apply to bacterial vaccines prepared in cell cultures or in live animals. The strain of bacterium used may have been modified by genetic engineering. The identity, antigenic potency and purity of each bacterial culture used is carefully controlled.

Bacterial vaccines contain inactivated or live bacteria or their antigenic components; they are liquid preparations of various degrees of opacity or they may be freeze-dried.

Bacterial toxoids are prepared from toxins by diminishing their toxicity to a very low level or by completely eliminating it by physical or chemical means whilst retaining adequate immunising potency. The toxins are obtained from selected

strains of specified micro-organisms grown in suitable media or are obtained by other suitable means, for example, chemical synthesis.

The toxoids may be:

- liquid,
- precipitated with alum or another suitable agent,
- purified and/or adsorbed on aluminium phosphate, aluminium hydroxide, calcium phosphate or another adsorbent prescribed in the monograph.

Bacterial toxoids are clear or slightly opalescent liquids. Adsorbed toxoids are suspensions or emulsions. Certain toxoids may be freeze-dried.

Unless otherwise indicated, statements and requirements given below for bacterial vaccines apply equally to bacterial vaccines, bacterial toxoids and products containing a combination of bacterial cells and toxoid.

1-2. *VIRAL VACCINES*

Viral vaccines are prepared by growth in suitable cell cultures (*5.2.4*), in tissues, in micro-organisms, in fertilised eggs or, where no other possibility is available, in live animals, or by other suitable means. The strain of virus used may have been modified by genetic engineering. They are liquid or freeze-dried preparations of one or more viruses or viral subunits or peptides.

Live viral vaccines are prepared from viruses of attenuated virulence or of natural low virulence for the target species.

Inactivated viral vaccines are treated by a validated procedure for inactivation of the virus and may be purified and concentrated.

1-3. *VECTOR VACCINES*

Vector vaccines are liquid or freeze-dried preparations of one or more types of live micro-organisms (bacteria or viruses) that are non-pathogenic or have low pathogenicity for the target species and in which have been inserted one or more genes encoding antigens that stimulate an immune response protective against other microorganisms.

2. PRODUCTION

2-1. *PREPARATION OF THE VACCINE*

The methods of preparation, which vary according to the type of vaccine, are such as to maintain the identity and immunogenicity of the antigen and to ensure freedom from contamination with extraneous agents.

Substances of animal origin used in the production of vaccines for veterinary use comply with the requirements of chapter *5.2.5*. Other substances used in the preparation of vaccines for veterinary use comply with requirements of the Pharmacopoeia (where a relevant monograph exists) and are prepared in a manner that avoids contamination of the vaccine.

2-1-1. **Substrates for production**. Cell cultures used in the production of vaccines for veterinary use comply with the requirements of chapter *5.2.4*.

Where a monograph refers to chicken flocks free from specified pathogens (SPF), these flocks comply with the requirements prescribed in chapter *5.2.2*.

For production of inactivated vaccines, where vaccine organisms are grown in poultry embryos, such embryos are derived either from SPF flocks (*5.2.2*) or from healthy non-SPF flocks free from the presence of certain agents and their antibodies, as specified in the monograph. It may be necessary to demonstrate that the inactivation process is effective against specified potential contaminants. For the production of a master seed lot and for all passages of a micro-organism up to and including the working seed lot, eggs from SPF flocks (*5.2.2*) are used.

Where it is unavoidable to use animals or animal tissues in the production of veterinary vaccines, such animals shall be free from specified pathogens, as appropriate to the source species and the target animal for the vaccine.

2-1-2. **Media used for seed culture preparation and for production**. At least the qualitative composition must be recorded of media used for seed culture preparation and for production. The grade of each named ingredient is specified. Where media or ingredients are claimed as proprietary, this is indicated and an appropriate description recorded. Ingredients that are derived from animals are specified as to the source species and country of origin, and must comply with the criteria described in chapter *5.2.5*. Preparation processes for media used, including sterilisation procedures, are documented.

The addition of antibiotics during the manufacturing process is normally restricted to cell culture fluids and other media, egg inocula and material harvested from skin or other tissues.

2-1-3. **Seed lots**

2-1-3-1. *Bacterial seed lots*

2-1-3-1-1. General requirements. The genus and species (and varieties where appropriate) of the bacteria used in the vaccine are stated. Bacteria used in manufacture are handled in a seed-lot system wherever possible. Each master seed lot is tested as described below. A record of the origin, date of isolation, passage history (including purification and characterisation procedures) and storage conditions is maintained for each master seed lot. Each master seed lot is assigned a specific code for identification purposes.

2-1-3-1-2. Propagation. The minimum and maximum number of subcultures of each master seed lot prior to the production stage are specified. The methods used for the preparation of seed cultures, preparation of suspensions for seeding, techniques for inoculation of seeds, titre and concentration of inocula and the media used, are documented. It shall be demonstrated that the characteristics of the seed material (for example, dissociation or antigenicity) are not changed by these subcultures. The conditions under which each seed lot is stored are documented.

2-1-3-1-3. Identity and purity. Each master seed lot is shown to contain only the species and strain of bacterium stated. A brief description of the method of identifying each strain by biochemical, serological and morphological characteristics and distinguishing it as far as possible from related strains is recorded, as is also the method of determining the purity of the strain. If the master seed lot is shown to contain living organisms of any kind other than the species and strain stated, then it is unsuitable for vaccine production.

2-1-3-2. *Virus seed lots*

2-1-3-2-1. General requirements. Viruses used in manufacture are handled in a seed-lot system. Each master seed lot is tested as described below. A record of the origin, date of isolation, passage history (including purification and characterisation procedures) and storage conditions is maintained for each seed lot. Each master seed lot is assigned a specific code for identification purposes. Production of vaccine is not normally undertaken using virus more than 5 passages from the master seed lot. In the tests on the master seed lot described below, the organisms used are not normally more than 5 passages from the master seed lot at the start of the tests, unless otherwise indicated.

Where the master seed lot is contained within a permanently infected master cell seed, the following tests are carried out on an appropriate volume of virus from disrupted master

cell seed. Where relevant tests have been carried out on disrupted cells to validate the suitability of the master cell seed, these tests need not be repeated.

2-1-3-2-2. Propagation. The master seed lot and all subsequent passages are propagated on cells, on embryonated eggs or in animals that have been shown to be suitable for vaccine production (see above), and, where applicable, using substances of animal origin that meet the requirements prescribed in chapter *5.2.5*.

2-1-3-2-3. Identification. A suitable method to identify the vaccine strain and to distinguish it as far as possible from related strains must be used.

2-1-3-2-4. Bacteria and fungi. The master seed lot complies with the test for sterility (*2.6.1*).

2-1-3-2-5. Mycoplasmas (*2.6.7*). The master seed lot complies with the test for mycoplasmas (culture method and indicator cell culture method).

2-1-3-2-6. Absence of extraneous viruses. Monographs may contain requirements for freedom from extraneous agents, otherwise the requirements stated below apply.

Preparations of monoclonal or polyclonal antibodies containing high levels of neutralising antibody to the virus of the seed lot are made on a batch basis, using antigen that is not derived from any passage level of the virus isolate giving rise to the master seed virus. Each batch of serum is maintained at 56 °C for 30 min to inactivate complement. Each batch is shown to be free of antibodies to potential contaminants of the seed virus and is shown to be free of any non-specific inhibiting effects on the ability of viruses to infect and propagate within cells (or eggs, where applicable). If such a serum cannot be obtained, other methods are used to remove or neutralise the seed virus specifically.

If the seed lot virus would interfere with the conduct and sensitivity of a test for extraneous viruses, a sample of the master seed lot is treated with a minimum amount of the monoclonal or polyclonal antibody so that the vaccine virus is neutralised as far as possible or removed. The final virus-serum mixture shall, if possible, contain at least the virus content of 10 doses of vaccine per 0.1 ml for avian vaccines and per millilitre for other vaccines. For avian vaccines, the testing to be carried out on seed lots is given in chapter *2.6.24*. For mammalian vaccines, the seed lot or the mixture of seed lot and antiserum is tested for freedom from extraneous agents as follows.

The mixture is inoculated onto cultures of at least 70 cm^2 of the required cell types. The cultures may be inoculated at any suitable stage of growth up to 70 per cent confluency. At least 1 monolayer of each type must be retained as a control. The cultures must be monitored daily for a week. At the end of this period the cultures are freeze thawed 3 times, centrifuged to remove cell debris and re-inoculated onto the same cell type as above. This is repeated twice. The final passage must produce sufficient cells in appropriate vessels to carry out the tests below.

Cytopathic and haemadsorbing agents are tested for using the methods described in the relevant sections on testing cell cultures (*5.2.4*) and techniques such as immuno-fluorescence are used for detection of specific contaminants for the tests in cell cultures. The master seed lot is inoculated onto:

- primary cells of the species of origin of the virus,
- cells sensitive to viruses pathogenic for the species for which the vaccine is intended,
- cells sensitive to pestiviruses.

If the master seed lot is shown to contain living organisms of any kind, other than the virus of the species and strain stated, or foreign viral antigens, then it is unsuitable for vaccine production.

2-1-4. **Inactivation**. Inactivated vaccines are subjected to a validated inactivation procedure. The testing of the inactivation kinetics described below is carried out once for a given production process. The rest of this section applies to each production run. When conducting tests for inactivation, it is essential to take account of the possibility that under the conditions of manufacture, organisms may be physically protected from inactivant.

2-1-4-1. *Inactivation kinetics.* The inactivating agent and the inactivation procedure shall be shown, under conditions of manufacture, to inactivate the vaccine micro-organism. Adequate data on inactivation kinetics shall be obtained. Normally, the time required for inactivation shall be not more than 67 per cent of the duration of the inactivation process.

2-1-4-2. *Aziridine.* If an aziridine compound is used as the inactivating agent then it shall be shown that no inactivating agent remains at the end of the inactivation procedure. This may be accomplished by neutralising the inactivating agent with thiosulphate and demonstrating residual thiosulphate in the inactivated harvest at the completion of the inactivation procedure.

2-1-4-3. *Formaldehyde.* If formaldehyde is used as the inactivating agent, then a test for free formaldehyde is carried out as prescribed under Tests.

2-1-4-4. *Other inactivating agents.* When other inactivation methods are used, appropriate tests are carried out to demonstrate that the inactivating agent has been removed or reduced to an acceptable residual level.

2-1-4-5. *Residual live virus/bacteria and/or detoxification testing.* A test for complete inactivation and/or detoxification is performed immediately after the inactivation and/or detoxification procedure and, if applicable, the neutralisation or removal of the inactivating or detoxifying agent.

2-1-4-5-1. Bacterial vaccines. The test selected shall be appropriate to the vaccine bacteria being used and shall consist of at least 2 passages in production medium or, if solid medium has been used for production, in a suitable liquid medium or in the medium prescribed in the monograph. The product complies with the test if no evidence of any live micro-organism is observed.

2-1-4-5-2. Bacterial toxoids. The test selected shall be appropriate to the toxin or toxins present and shall be the most sensitive available.

2-1-4-5-3. Viral vaccines. The test selected shall be appropriate to the vaccine virus being used and must consist of at least 2 passages in cells, embryonated eggs or, where no other suitably sensitive method is available, in animals. The quantity of cell samples, eggs or animals shall be sufficient to ensure appropriate sensitivity of the test. For tests in cell cultures, not less than 150 cm^2 of cell culture monolayer is inoculated with 1.0 ml of inactivated harvest. The product complies with the test if no evidence of the presence of any live virus or other micro-organism is observed.

The final bulk vaccine is prepared by combining one or more batches of antigen that comply with all the relevant requirements with any auxiliary substances, such as adjuvants, stabilisers, antimicrobial preservatives and diluents.

2-2. *CHOICE OF VACCINE COMPOSITION AND CHOICE OF VACCINE STRAIN*

For the choice of vaccine composition and choice of vaccine strain, important aspects to be evaluated include safety, efficacy and stability. General requirements for evaluation of safety and efficacy are given in chapter *5.2.6* and chapter *5.2.7*. These requirements may be made more explicit or supplemented by the requirements of specific monographs.

For live vaccines, a maximum virus titre or bacterial count acceptable from the point of view of safety is established during development studies. This is then used as the maximum acceptable titre for each batch of vaccine at release.

2-2-1. **Potency and immunogenicity**. The tests given under the headings Potency and Immunogenicity in monographs serve 2 purposes:

- the Potency section establishes by a well-controlled test in experimental conditions, the minimum acceptable vaccinating capacity for all vaccines within the scope of the definition, which must be guaranteed throughout the period of validity;
- well-controlled experimental studies are normally a part of the overall demonstration of efficacy of a vaccine (see chapter *5.2.7*); the test referred to in the section 'Immunogenicity' (it usually cross-refers to the Immunogenicity section) is suitable as a part of this testing.

2-2-2. **Route of administration**. During development of a vaccine, safety and immunogenicity are demonstrated for each route of administration to be recommended. The following is a non-exhaustive list of such routes of administration:

- intramuscular,
- subcutaneous,
- intravenous,
- ocular,
- oral,
- nasal,
- foot-stab,
- wing web,
- intradermal,
- intraperitoneal,
- *in ovo*.

2-2-3. **Methods of administration**. During development of a vaccine, safety and immunogenicity are demonstrated for each method of administration to be recommended. The following is a non-exhaustive list of such methods of administration:

- injection,
- drinking water,
- spray,
- eye-drop,
- scarification,
- implantation,
- immersion.

2-2-4. **Categories of animal**. Monographs may indicate that a given test is to be carried out for each category of animal of the target species for which the product is recommended or is to be recommended. The following is a non-exhaustive list of categories that are to be taken into account.

- *Mammals*:
  - pregnant animals/non-pregnant animals,
  - animals raised primarily for breeding/animals raised primarily for food production,
  - animals of the minimum age or size recommended for vaccination.
- *Avian species*:
  - birds raised primarily for egg production/birds raised primarily for production of meat,
  - birds before point of lay/birds after onset of lay.
- *Fish*:
  - broodstock fish/fish raised primarily for food production.

2-2-5. **Antimicrobial preservatives**. Antimicrobial preservatives are used to prevent spoilage or adverse effects caused by microbial contamination occurring during use of a vaccine which is expected to be no longer than 10 h after first broaching. Antimicrobial preservatives are not included in freeze-dried products but, if justified, taking into account the maximum recommended period of use after reconstitution, they may be included in the diluent for multi-dose freeze-dried products. For single-dose liquid preparations, inclusion of antimicrobial preservatives is not acceptable unless justified and authorised, but may be acceptable, for example where the same vaccine is filled in single-dose and multidose containers and is used in non-food-producing species. For multidose liquid preparations, the need for effective antimicrobial preservation is evaluated taking into account likely contamination during use and the maximum recommended period of use after broaching of the container.

During development studies the effectiveness of the antimicrobial preservative throughout the period of validity shall be demonstrated to the satisfaction of the competent authority.

The efficacy of the antimicrobial preservative is evaluated as described in chapter *5.1.3* and in addition samples are tested at suitable intervals over the proposed in use shelf-life. If neither the A criteria nor the B criteria can be met, then in justified cases the following criteria are applied to vaccines for veterinary use: bacteria, no increase from 24 h to 7 days, 3 log reduction at 14 days, no increase at 28 days; fungi, no increase at 14 days and 28 days.

Addition of antibiotics as antimicrobial preservative is generally not acceptable.

2-2-6. **Stability**. Evidence of stability is obtained to justify the proposed period of validity. This evidence takes the form of the results of virus titrations, bacterial counts or potency tests carried out at regular intervals until 3 months beyond the end of the shelf life on not fewer than 3 representative consecutive batches of vaccine kept under recommended storage conditions together with results from studies of moisture content (for freeze-dried products), physical tests on the adjuvant, chemical tests on substances such as the adjuvant constituents and preservatives and pH, as appropriate.

Where applicable, studies on the stability of the reconstituted vaccine are carried out, using the product reconstituted in accordance with the proposed recommendations.

2-3. *MANUFACTURER'S TESTS*

Certain tests may be carried out on the final bulk vaccine rather than on the batch or batches prepared from it; such tests include those for antimicrobial preservatives, free formaldehyde and the potency determination for inactivated vaccines.

2-3-1. **Residual live virus/bacteria and/or detoxification testing**. For inactivated vaccines, where the auxiliary substances would interfere with a test for inactivation and/or detoxification, a test for inactivation or detoxification is carried out during preparation of the final bulk, after the different batches of antigen have been combined but before addition of auxiliary substances; the test for inactivation or detoxification may then be omitted on the final bulk and the batch.

Where there is a risk of reversion to toxicity, the test for detoxification performed at the latest stage of the production process at which the sensitivity of the test is not

compromised (e.g. after the different batches of antigen have been combined but before the addition of auxiliary substances) is important to demonstrate a lack of reversion to toxicity.

2-3-2. **Batch potency test**. For most vaccines, the tests cited under Potency or Immunogenicity are not suitable for the routine testing of batches.

For live vaccines, the minimum acceptable virus titre or bacterial count that gives satisfactory results in the Potency test and other efficacy studies is established during development. For routine testing it must be demonstrated for each batch that the titre or count at release is such that at the end of the period of validity, in the light of stability studies, the vaccine, stored in the recommended conditions, will contain not less than the minimum acceptable virus titre or bacterial count determined during development studies.

For inactivated vaccines, if the test described under Potency is not used for routine testing, a batch potency test is established during development. The aim of the batch potency test is to ensure that each batch of vaccine would, if tested, comply with the test described under Potency and Immunogenicity. The acceptance criteria for the batch potency test are therefore established by correlation with the test described under Potency. Where a batch potency test is described in a monograph, this is given as an example of a test that is considered suitable, after establishment of correlation with the potency test; other test models can also be used.

2-3-3. **Batch**. Unless otherwise prescribed in the monograph, the final bulk vaccine is distributed aseptically into sterile, tamper-proof containers which are then closed so as to exclude contamination.

Only a batch that complies with each of the requirements given below under 3. Batch tests or in the relevant individual monograph may be released for use. With the agreement of the competent authority, certain of the batch tests may be omitted where in-process tests give an equal or better guarantee that the batch would comply or where alternative tests validated with respect to the Pharmacopoeia method have been carried out.

The identification test can often be conveniently combined with the batch potency test to avoid unnecessary use of animals. For a given vaccine, a validated *in vitro* test can be used to avoid the unnecessary use of animals.

It is recognised that, in accordance with General Notices (section 1.1. General statements), for an established vaccine the routine application of the safety test will be waived by the competent authority in the interests of animal welfare when a sufficient number of consecutive production batches have been produced and found to comply with the test, thus demonstrating consistency of the manufacturing process. Significant changes to the manufacturing process may require resumption of routine testing to re-establish consistency. The number of consecutive batches to be tested depends on a number of factors such as the type of vaccine, the frequency of production of batches and experience with the vaccine during development safety testing and during application of the batch safety test. Without prejudice to the decision of the competent authority in the light of information available for a given vaccine, testing of 10 consecutive batches is likely to be sufficient for most products. For products with an inherent safety risk, it may be necessary to continue to conduct the safety test on each batch.

Animal tests. In accordance with the provisions of the European Convention for the Protection of Vertebrate Animals Used for Experimental and Other Scientific Purposes, tests must be carried out in such a way as to use the minimum number of animals and to cause the least pain, suffering, distress or lasting harm. The criteria for judging tests in monographs must be applied in the light of this. For example, if it is indicated that an animal is considered to be positive, infected etc. when typical clinical signs occur then as soon as it is clear that the result will not be affected the animal in question shall be either euthanised or given suitable treatment to prevent unnecessary suffering. In accordance with the General Notices, alternative test methods may be used to demonstrate compliance with the monograph and the use of such tests is particularly encouraged when this leads to replacement or reduction of animal use or reduction of suffering.

2-3-4-1. *Physical tests.* A vaccine with an oily adjuvant is tested for viscosity by a suitable method and shown to be within the limits set for the product. The stability of the emulsion shall be demonstrated.

2-3-4-2. *Chemical tests.* Tests for the concentrations of appropriate substances such as aluminium and preservatives are carried out to show that these are within the limits set for the product.

2-3-4-3. *pH.* The pH of liquid products and diluents is measured and shown to be within the limits set for the product.

2-3-4-4. *Water.* Where applicable, the freeze-drying process is checked by a determination of water and shown to be within the limits set for the product.

3. BATCH TESTS

The monographs also indicate tests to be carried out on each particular vaccine.

All hen eggs, chickens and chicken cell cultures for use in quality control tests shall be derived from an SPF flock (*5.2.2*).

3-1. **Identification**. For inactivated vaccines, the identification prescribed in monographs is usually an antibody induction test since this is applicable to all vaccines.

3-2. **Formaldehyde** (*2.4.18*; use Method B if sodium metabisulphite has been used to neutralise excess formaldehyde). Where formaldehyde has been used in the preparation, the concentration of free formaldehyde is not greater than 0.5 g/l, unless a higher amount has been shown to be safe.

3-3. **Phenol** (*2.5.15*). When the vaccine contains phenol, the concentration is not greater than 5 g/l.

3-4. **Sterility** (*2.6.1*). Where prescribed in the monograph, vaccines comply with the test for sterility. Where the volume of liquid in a container is greater than 100 ml, the method of membrane filtration is used wherever possible. Where the method of membrane filtration cannot be used, the method of direct inoculation may be used. Where the volume of liquid in each container is at least 20 ml, the minimum volume to be used for each culture medium is 10 per cent of the contents or 5 ml, whichever is less. The appropriate number of items to be tested (*2.6.1*) is 1 per cent of the batch with a minimum of 4 and a maximum of 10.

For avian live viral vaccines, for non-parenteral use only, the requirement for sterility is usually replaced by requirements for absence of pathogenic micro-organisms and for a maximum of 1 non-pathogenic micro-organism per dose.

3-5. **Extraneous agents**. Monographs prescribe a set of measures that taken together give an acceptable degree of assurance that the final product does not contain infectious extraneous agents. These measures include:

1) production within a seed-lot system and a cell-seed system, wherever possible;

2) extensive testing of seed lots and cell seed for extraneous agents;

3) requirements for SPF flocks used for providing substrates for vaccine production;

4) testing of substances of animal origin, which must, wherever possible, undergo an inactivation procedure;

5) for live vaccines, testing of the final product for infectious extraneous agents; such tests are less extensive than those carried out at earlier stages because of the guarantees given by in-process testing.

In cases of doubt, the tests intended for the seed lot of a live vaccine may also be applied to the final product. If an extraneous agent is found in such a test, the vaccine does not comply the monograph.

Avian live viral vaccines comply with the tests for extraneous agents in batches of finished products (*2.6.25*).

3-6. **Mycoplasmas** (*2.6.7*). Where prescribed in a monograph, the vaccine complies with the test for mycoplasmas (culture method).

3-7. **Safety**. In general, 2 doses of an inactivated vaccine and/or 10 doses of a live vaccine are injected by a recommended route. It may be necessary to reduce the prescribed number of doses under certain circumstances or amend the method of re-constitution and injection, for example for a combined vaccine, where it is difficult to reconstitute 10 doses of the live component in 2 doses of the inactivated component. The animals are observed for the longest period stated in the monographs. No abnormal local or systemic reaction occurs. Where several batches are prepared from the same final bulk, the safety test is carried out on the first batch and then omitted for further batches prepared from the same final bulk.

During development studies, the type and degree of reactions expected with the vaccine are defined in the light of safety testing. This definition is then used as part of the operating procedure for the batch safety test to evaluate acceptable and unacceptable reactions.

The immune status of animals to be used for the safety test is specified in the individual monograph. For most monographs, one of the 3 following categories is specified:

1) the animals must be free from antibodies against the virus/bacterium/toxin etc. contained in the vaccine,

2) the animals are preferably free from antibodies but animals with a low level of antibody may be used as long as the animals have not been vaccinated and the administration of the vaccine does not cause an anamnestic response,

3) the animals must not have been vaccinated against the disease the vaccine is intended to prevent.

As a general rule, category 1 is specified for live vaccines. For other vaccines, category 2 is usually specified but where most animals available for use in tests would comply with category 1, this may be specified for inactivated vaccines also. Category 3 is specified for some inactivated vaccines where determination of antibodies prior to testing is unnecessary or impractical. For poultry vaccines, as a general rule the use of SPF birds is specified.

For avian vaccines, the safety test is generally carried out using 10 SPF chickens (*5.2.2*), except that for vaccines not recommended for use in chickens it is carried out using 10 birds of one of the species for which the vaccine is recommended, the birds being free from antibodies against the disease agent for which the vaccine is intended to provide protection.

3-8. **Potency**. The vaccine complies with the requirements of the test mentioned under Immunogenicity (section 2-3-1) when administered by a recommended route and method.

4. STORAGE

Store protected from light at a temperature of 5 ± 3 °C, unless otherwise indicated. Liquid preparations are not to be allowed to freeze, unless otherwise indicated.

5. LABELLING

The label states:

- that the preparation is for veterinary use,
- the volume of the preparation and the number of doses in the container,
- the route of administration,
- the type or types of bacteria or viruses used and for live vaccines the minimum and the maximum number of live bacteria or the minimum and the maximum virus titre,
- where applicable, for inactivated vaccines, the minimum potency in International Units,
- where applicable, the name and amount of antimicrobial preservative or other substance added to the vaccine,
- the name of any substance that may cause an adverse reaction,
- for freeze-dried vaccines:
  - the name or composition and the volume of the reconstituting liquid to be added,
  - the period within which the vaccine is to be used after reconstitution,
- for vaccines with an oily adjuvant, that if the vaccine is accidentally injected into man, urgent medical attention is necessary,
- the animal species for which the vaccine is intended,
- the indications for the vaccine,
- the instructions for use,
- any contra-indications to the use of the product including any required warning on the dangers of administration of an overdose,
- the doses recommended for different species.

01/2008:1579

VEGETABLE FATTY OILS

Olea herbaria

DEFINITION

Vegetable fatty oils are mainly solid or liquid triglycerides of fatty acids. They may contain small amounts of other lipids such as waxes, free fatty acids, partial glycerides or unsaponifiable matters. Vegetable fatty oils are obtained from the seeds, the fruit or the pit/stone/kernel of various plants by expression and/or solvent extraction, then possibly refined and hydrogenated. A suitable antioxidant may be added if necessary.

Virgin oil: an oil obtained from raw materials of special quality by mechanical procedures (e.g. by cold expression or centrifugation).

Refined oil: an oil obtained by expression and/or solvent extraction, and subsequently either alkali refining (followed by bleaching and any deodorisation) or physical refining.

Hydrogenated oil: an oil obtained by expression and/or solvent extraction, and subsequently either alkali refining or physical refining, then possible bleaching, followed by drying, hydrogenation and subsequent bleaching and deodorisation.

Only alkali-refined oils are used in the preparation of parenteral dosage forms.

PRODUCTION

Measures are taken to ensure that the oil complies with the limit for benzo[a]pyrene decided by the competent authority. A limit of 2.0 ppb is set in Commission Regulation (EC) No. 208/2005.

OBTENTION OF A CRUDE OIL

Where the plant has a high oil content, the oil is generally obtained by expression under heating followed by an extraction; where the plant has a low oil content, the oil is generally obtained by direct extraction.

Mechanical procedures

A. Expression

High-pressure screw-pressing. It consists of some or all of the following steps: cleaning, drying, dehulling or decorticating, grinding, cooking and flaking.

During *cleaning* the foreign matter is eliminated. *Drying* may be necessary if the seed moisture content is higher than desirable for downstream processing. *Decorticating* is useful to obtain a high-protein meal by reduction of fibre and to reduce impurities in the oil. *Cooking* serves various purposes: completion of the breakdown of oil cells, lowering of the viscosity of the oil, coagulation of the protein in the meal, adjustment of the moisture level, sterilisation of the seed, detoxifying undesirable seed constituents (gossypol for cottonseed) and fixing certain phosphatides in the cake thus lowering subsequent refining losses. The efficacy of the expression process is such that only 3 per cent to 6 per cent of the oil is left in the cake.

Wet screw-pressing. The bunches are loaded into cages (for palm fruit) and moved into a horizontal steriliser with application of live steam and heating. The purposes of this steriliser are inactivation of enzymes, loosening of the fruit on the bunch, coagulation of proteins, etc. After heating in a digester, the pulp is fed to a screw-press. The oil is centrifugally clarified and vacuum-dried.

Pre-pressing followed by solvent extraction. The same sequence of steps is performed as above. The main function of pre-pressing is to obtain a cake of excellent permeability for the following solvent extraction stage. The extraction is performed either in a percolation-type or in an immersion-type apparatus. The efficacy of the solvent extraction process is such that residual oil levels in meal are generally below 1 per cent.

B. Centrifugation

Centrifugation separates the oily phase from the aqueous phase, which contains water-soluble components and residual solid particles. This operation can be carried out using:

- self-cleaning bowl or disc centrifuges;
- super-decanters, which are horizontal turbines equipped with a cylindrical bowl that tapers slightly at one end and which contains a continuously turning screw that scrapes the sides of the bowl; the screw and the bowl rotate at different speeds; the solid particles are discarded from the tapered end of the bowl and the oil flows out from the other end.

Solvent extraction. Prior to extraction, the following steps are carried out: the seeds are tempered for about a week at a temperature below 24 °C in order to loosen the hull from the seed and allow the seed moisture to attain equilibrium, then the seeds are cleaned, ground, dehulled and flaked. The most widely used solvent is a mixture of mainly *n*-hexane and methylpentanes (bp: 65-70 °C) commonly referred to as 'hexane'. Due to the major fire and explosive risks of this mixture, liquified gases and supercritical gases may also be used.

REFINING

The objective of refining is to remove impurities and contaminants of the oil with the least possible damage to the triglycerides and with minimal loss of oil. The contents of the following substances are reduced:

- free fatty acids, which may cause deterioration of the oil by oxidation, a smoked taste when heated and a sharp flavour (by alkali refining);
- water, which favours the enzymatic hydrolysis reactions (by alkali refining, drying);
- partial glycerides, which may cause foaming and a bitter taste (by neutralisation, washing);
- phosphatides and phosphorous compounds, which have emulsifying properties and may cause deposits, a darkening of the oil when heated, a cloudy appearance and bad organoleptic stability (by alkali refining);
- colouring matters such as chlorophyll (by alkali refining) and carotenoids (by bleaching);
- glycolipids, which may form colloidal solutions with water;
- free hydrocarbons, paraffin, waxes and resinous materials;
- metals (Fe, Cu, Pb, Sn, Pt, Pd, etc.), which are strong oxidation catalysts;
- pigments such as gossypol (in cottonseed oil) or mycotoxins such as aflatoxin (mainly in arachis seeds);
- pesticides;
- oxidation products (aldehydes, peroxides);
- proteins having possible allergic reactions;
- unsaponifiable matters (sterols, tocopherols and other vitamins);
- polycyclic aromatic hydrocarbons.

Alkali refining. It involves the following steps: degumming if necessary, neutralisation using alkali, washing and drying.

Degumming. During this step of the refining, i.e. treatment with water and/or phosphoric acid and/or sodium chloride, the phosphatides, phosphorous compounds and metals are eliminated. The use of this step depends on the nature of the oil.

Neutralisation with alkali. This step reduces the free-fatty-acid content below 0.1 per cent; the fatty acids are converted into oil-insoluble soaps, also called 'soapstocks'. Other substances may be removed by adsorption on these soaps: mucilaginous substances, phosphatides, oxidation products, colouring matters, etc. All substances that become insoluble in the oil on hydration are removed. Neutralisation with alkali has the disadvantage of saponifying a portion of neutral oil if the neutralisation is not well conducted.

Washing. This operation consists in removing the excess of soaps and alkali as well as the remaining traces of metals, phosphatides and other impurities, using hot water.

Drying. The remaining water is eliminated under vacuum before any further steps, such as bleaching.

Physical refining. It involves a steam treatment of the oil under high vacuum at a temperature greater than 235 °C. This technique must be applied to oils naturally low in phosphatides and metals (palm, coconut, olive) or from which phosphatides and metals have been removed by an acid treatment using concentrated phosphoric acid followed by an adsorptive treatment with activated bleaching earth (for sunflower, rapeseed, soya-bean). Moreover, it cannot be used for heat-sensitive oils (cottonseed oil), which darken.

Bleaching. The common method of bleaching is by adsorption treatment of the oil, which is generally heated at 90 °C for 30 min under vacuum, with bleaching earth (natural or activated) or carbon (activated or not); synthetic silica adsorbents may also be added. Substances that have not been totally removed during refining are eliminated, for example carotenoids and chlorophyll.

Deodorisation. Deodorisation eliminates odours, volatile substances and any residual extraction solvents; it involves injecting dry vapour into the oil, which is kept under vacuum at a high temperature. Different temperatures are used according to the oil: 200-235 °C for 1.5-3 h or greater than 240 °C for 30 min.

One of the main side reactions is thermic decolourisation due to the destruction of carotenoids when the temperature is greater than 150 °C. This technique provokes a loss of substances that may be distilled (free fatty acids, sterols, tocopherols, part of the refined oil), and may cause *cis-trans* isomerisation of the unsaturated fatty-acid double bonds.

WINTERISATION

Elimination of solids and waxes by filtration at low temperature (also called dewaxing). These solids and waxes could affect the appearance of the oil and cause deposits.

HYDROGENATION

The hydrogenation of the dried and/or bleached oil is performed using a catalyst (e.g. Ni, Pt, Pd), at a temperature of about 100-200 °C under hydrogen pressure. The catalyst is then removed by filtration at 90 °C. The hydrogen must be pure: free of poisons for the catalyst, water-free, and low in carbon dioxide, methane and nitrogen contents. Small amounts of polymers may be obtained. *Trans*-fatty acids are formed during partial hydrogenation.

CHROMATOGRAPHIC PURIFICATION

In high-purity applications, mainly for parenteral uses, the oil may be further purified by passing the oil through a column containing an activated earth. A solvent may sometimes be used to improve the efficiency. High-polarity molecules, such as oxidised materials, acids, alcohols, partial glycerides and free sterols, are preferentially removed.

When the oil is used in the preparation of parenteral dosage forms, the limits set in the monograph for the acid value, the peroxide value and the water content may be different.

LABELLING

The label states:

- where applicable, that the oil was obtained by expression or extraction;
- where applicable, that the oil is suitable for use in the manufacture of parenteral dosage forms.

GLOSSARY

The following introductory text provides definitions and/or explanations of terms that may be found in, or used in association with, the general monographs on dosage forms, but that are not defined within them. Where relevant, reference is made to other equivalent terms that may be found in other publications or contexts.

This glossary is published for information.

Standard Term

Standard Terms for describing the pharmaceutical form of a medicinal product, the routes of administration and the containers used have been established by the European Pharmacopoeia Commission and are provided in a separate publication on Standard Terms.

Active substance

Equivalent terms: active ingredient, drug substance, medicinal substance, active pharmaceutical ingredient.

Vehicle

A vehicle is the carrier, composed of one or more excipients, for the active substance(s) in a liquid preparation.

Basis

A basis is the carrier, composed of one or more excipients, for the active substance(s) in semi-solid and solid preparations.

Conventional-release dosage forms

Conventional-release dosage forms are preparations showing a release of the active substance(s) which is not deliberately modified by a special formulation design and/or manufacturing method. In the case of a solid dosage form, the dissolution profile of the active substance depends essentially on its intrinsic properties. Equivalent term: immediate-release dosage form.

Modified-release dosage forms

Modified-release dosage forms are preparations where the rate and/or place of release of the active substance(s) is different from that of a conventional-release dosage form administered by the same route. This deliberate modification is achieved by a special formulation design and/or manufacturing method. Modified-release dosage forms include prolonged-release, delayed-release and pulsatile-release dosage forms.

Prolonged-release dosage forms

Prolonged-release dosage forms are modified-release dosage forms showing a slower release of the active substance(s) than that of a conventional-release dosage form administered by the same route. Prolonged-release is achieved by a special formulation design and/or manufacturing method. Equivalent term: extended-release dosage form.

Delayed-release dosage forms

Delayed-release dosage forms are modified-release dosage forms showing a release of the active substance(s) which is delayed. Delayed release is achieved by a special formulation design and/or manufacturing method. Delayed-release dosage forms include gastro-resistant preparations as defined in the general monographs on solid oral dosage forms.

Pulsatile-release dosage forms

Pulsatile-release dosage forms are modified-release dosage forms showing a sequential release of the active substance(s). Sequential release is achieved by a special formulation design and/or manufacturing method.

Large-volume parenterals

Infusions and injections supplied in containers with a nominal content of more than 100 ml.

Small-volume parenterals

Infusions and injections supplied in containers with a nominal content of 100 ml or less.

01/2008:0016

CAPSULES

Capsulae

The requirements of this monograph do not necessarily apply to preparations that are presented as capsules intended for use other than by oral administration. Requirements for such preparations may be found, where appropriate, in other general monographs, for example Rectal preparations (1145) and Vaginal preparations (1164).

DEFINITION

Capsules are solid preparations with hard or soft shells of various shapes and capacities, usually containing a single dose of active substance(s). They are intended for oral administration.

The capsule shells are made of gelatin or other substances, the consistency of which may be adjusted by the addition of substances such as glycerol or sorbitol. Excipients such as surface-active agents, opaque fillers, antimicrobial preservatives, sweeteners, colouring matter authorised by the competent authority and flavouring substances may be added. The capsules may bear surface markings.

The contents of capsules may be solid, liquid or of a paste-like consistency. They consist of one or more active substances with or without excipients such as solvents, diluents, lubricants and disintegrating agents. The contents do not cause deterioration of the shell. The shell, however, is attacked by the digestive fluids and the contents are released.

Where applicable, containers for capsules comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of capsules may be distinguished:

- hard capsules;
- soft capsules;
- gastro-resistant capsules;
- modified-release capsules;
- cachets.

PRODUCTION

In the manufacture, packaging, storage and distribution of capsules, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

TESTS

Uniformity of dosage units. Capsules comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, capsules with a content of active substance less than 2 mg or less than 2 per cent of the fill mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those ingredients which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Capsules comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Dissolution. A suitable test may be carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in *Dissolution test for solid dosage forms* (*2.9.3*).

Where a dissolution test is prescribed, a disintegration test may not be required.

STORAGE

Store at a temperature not exceeding 30 °C.

LABELLING

The label states the name of any added antimicrobial preservative.

Hard capsules

DEFINITION

Hard capsules have shells consisting of 2 prefabricated, cylindrical sections, each of which has one rounded, closed end and one open end.

PRODUCTION

The active substance(s), usually in solid form (powder or granules), are filled into one of the sections that is then closed by slipping the other section over it. The security of the closure may be strengthened by suitable means.

TESTS

Disintegration. Hard capsules comply with the test for disintegration of tablets and capsules (*2.9.1*). Use *water R* as the liquid medium. When justified and authorised, *0.1 M hydrochloric acid* or *artificial gastric juice R* may be used as the liquid medium. If the capsules float on the surface of the water, a disc may be added. Operate the apparatus for 30 min, unless otherwise justified and authorised.

Soft capsules

DEFINITION

Soft capsules have thicker shells than those of hard capsules. The shells consist of a single part and are of various shapes.

PRODUCTION

Soft capsules are usually formed, filled and sealed in one operation, but for extemporaneous use the shell may be prefabricated. The shell material may contain an active substance.

Liquids may be enclosed directly; solids are usually dissolved or dispersed in a suitable vehicle to give a solution or dispersion of a paste-like consistency.

There may be partial migration of the constituents from the capsule contents into the shell and vice versa because of the nature of the materials and the surfaces in contact.

TESTS

Disintegration. Soft capsules comply with the test for disintegration of tablets and capsules (*2.9.1*). Use *water R* as the liquid medium. When justified and authorised, *0.1 M hydrochloric acid* or *artificial gastric juice R* may be used as the liquid medium. Add a disc to each tube. Liquid active substances dispensed in soft capsules may attack the disc; in such circumstances and where authorised, the disc may be omitted. Operate the apparatus for 30 min, unless otherwise justified and authorised. If the capsules fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 capsules omitting the discs.

Modified-release capsules

DEFINITION

Modified-release capsules are hard or soft capsules in which the contents or the shell or both contain special excipients or are prepared by a special process designed to modify the rate, the place or the time at which the active substance(s) are released.

Modified-release capsules include prolonged-release capsules and delayed-release capsules.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Gastro-resistant capsules

DEFINITION

Gastro-resistant capsules are delayed-release capsules that are intended to resist the gastric fluid and to release their active substance or substances in the intestinal fluid. Usually they are prepared by filling capsules with granules or with particles covered with a gastro-resistant coating, or in certain cases, by providing hard or soft capsules with a gastro-resistant shell (enteric capsules).

PRODUCTION

For capsules filled with granules or filled with particles covered with a gastro-resistant coating, a suitable test is carried out to demonstrate the appropriate release of the active substance(s).

TESTS

Disintegration. For capsules with a gastro-resistant shell carry out the test for disintegration (*2.9.1*) with the following modifications. Use *0.1 M hydrochloric acid* as the liquid medium and operate the apparatus for 2 h, or other such time as may be authorised, without the discs. Examine the state of the capsules. The time of resistance to the acid medium varies according to the formulation of the capsules to be examined. It is typically 2 h to 3 h but even with authorised deviations it must not be less than 1 h. No capsule shows signs of disintegration or rupture permitting the escape of the contents. Replace the acid by *phosphate buffer solution pH 6.8 R*. When justified and authorised, a buffer solution of pH 6.8 with added pancreas powder (for example, 0.35 g of *pancreas powder R* per 100 ml of buffer solution) may be used. Add a disc to each tube. Operate the apparatus for 60 min. If the capsules fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 capsules omitting the discs.

Dissolution. For capsules prepared from granules or particles already covered with a gastro-resistant coating, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example the test described in *Dissolution test for solid dosage forms* (*2.9.3*).

Cachets

DEFINITION

Cachets are solid preparations consisting of a hard shell containing a single dose of one or more active substances. The cachet shell is made of unleavened bread usually from rice flour and consists of 2 prefabricated flat cylindrical sections. Before administration, the cachets are immersed in water for a few seconds, placed on the tongue and swallowed with a draught of water.

LABELLING

The label states the method of administration of the cachets.

01/2008:1239

CHEWING GUMS, MEDICATED

Masticabilia gummis medicata

DEFINITION

Medicated chewing gums are solid, single-dose preparations with a base consisting mainly of gum that are intended to be chewed but not swallowed.

They contain one or more active substances which are released by chewing. After dissolution or dispersion of the active substances in saliva, chewing gums are intended to be used for:

– local treatment of mouth diseases,
– systemic delivery after absorption through the buccal mucosa or from the gastrointestinal tract.

PRODUCTION

Medicated chewing gums are made with a tasteless masticatory gum base that consists of natural or synthetic elastomers. They may contain other excipients such as fillers, softeners, sweetening agents, flavouring substances, stabilisers and plasticisers and authorised colouring matter.

Medicated chewing gums are manufactured by compression or by softening or melting the gum bases and adding successively the other substances. In the latter case, chewing gums are then further processed to obtain the desired gum presentation. The medicated chewing gums may be coated, for example, if necessary to protect from humidity and light.

Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s). The method *Dissolution test for medicated chewing gums* (*2.9.25*) may be used to that purpose.

In the manufacture, packaging, storage and distribution of medicated chewing gums, suitable means must be taken to ensure their microbial quality; recommendations related to this aspect are provided in the general chapter on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

TESTS

Uniformity of dosage units. Medicated chewing gums comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, medicated chewing gums with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A for uniformity of content of single-dose preparations. If the preparation contains more than one active substance, the requirement applies only to those active substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Uncoated medicated chewing gums and, unless otherwise justified and authorised, coated medicated chewing gums comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

STORAGE

Store uncoated medicated chewing gums protected from humidity and light.

01/2008:0652

EAR PREPARATIONS

Auricularia

DEFINITION

Ear preparations are liquid, semi-solid or solid preparations intended for instillation, for spraying, for insufflation, for application to the auditory meatus or as an ear wash.

Ear preparations usually contain 1 or more active substances in a suitable vehicle. They may contain excipients, for example, to adjust tonicity or viscosity, to adjust or stabilise the pH, to increase the solubility of the active substances, to stabilise the preparation or to provide adequate antimicrobial properties. The excipients do not adversely affect the intended medicinal action of the preparation or, at the concentrations used, cause toxicity or undue local irritation.

Preparations for application to the injured ear, particularly where the eardrum is perforated, or prior to surgery are sterile, free from antimicrobial preservatives and supplied in single-dose containers.

Ear preparations are supplied in multi-dose or single-dose containers, provided, if necessary, with a suitable administration device which may be designed to avoid the introduction of contaminants.

Unless otherwise justified and authorised, aqueous ear preparations supplied in multidose containers contain a suitable antimicrobial preservative at a suitable concentration, except where the preparation itself has adequate antimicrobial properties.

Where applicable, containers for ear preparations comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of ear preparations may be distinguished:

– ear drops and sprays;
– semi-solid ear preparations;
– ear powders;
– ear washes;
– ear tampons.

PRODUCTION

During development of an ear preparation whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

During development of ear washes, it must be demonstrated that the nominal content can be withdrawn from the container of preparations presented in single-dose containers.

In the manufacture, packaging, storage and distribution of ear preparations, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

Sterile ear preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

In the manufacture of ear preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units. Single-dose ear preparations comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose ear preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those ingredients that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose ear preparations comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Sterility (*2.6.1*). Where the label indicates that the ear preparation is sterile, it complies with the test for sterility.

STORAGE

If the preparation is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the name of any added antimicrobial preservative;
- where applicable, that the preparation is sterile;
- for multidose containers, the period after opening the container after which the contents must not be used. This period does not exceed 4 weeks, unless otherwise justified and authorised.

Ear drops and ear sprays

DEFINITION

Ear drops and ear sprays are solutions, emulsions or suspensions of one or more active substances in liquids suitable for application to the auditory meatus without exerting harmful pressure on the eardrum (for example, water, glycols or fatty oils). They may also be placed in the auditory meatus by means of a tampon impregnated with the liquid.

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment which is readily dispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered.

Ear drops are usually supplied in multidose containers of glass or suitable plastic material that are fitted with an integral dropper or with a screw cap of suitable materials incorporating a dropper and rubber or plastic teat. Alternatively, such a cap assembly is supplied separately. Ear sprays are usually supplied in multi-dose containers fitted with an appropriate applicator. When ear sprays are supplied in pressurised containers, these comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

Semi-solid ear preparations

DEFINITION

Semi-solid ear preparations are intended for application to the external auditory meatus, if necessary by means of a tampon impregnated with the preparation.

Semi-solid ear preparations comply with the requirements of the monograph on *Semi-solid preparations for cutaneous application (0132)*.

They are supplied in containers fitted with a suitable applicator.

Ear powders

DEFINITION

Ear powders comply with the requirements of the monograph on *Powders for cutaneous application (1166)*.

They are supplied in containers fitted with a suitable device for application or insufflation.

Ear washes

DEFINITION

Ear washes are preparations intended to cleanse the external auditory meatus. They are usually aqueous solutions with a pH within physiological limits.

Ear washes intended for application to injured parts or prior to a surgical operation are sterile.

Ear tampons

DEFINITION

Ear tampons are intended to be inserted into the external auditory meatus. They comply with the requirements of the monograph on *Medicated tampons (1155)*.

01/2008:1163

EYE PREPARATIONS

Ophthalmica

DEFINITION

Eye preparations are sterile liquid, semi-solid or solid preparations intended for administration upon the eyeball and/or to the conjunctiva, or for insertion in the conjunctival sac.

Where applicable, containers for eye preparations comply with the requirements of materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of eye preparations may be distinguished:

- eye drops;
- eye lotions;
- powders for eye drops and powders for eye lotions;
- semi-solid eye preparations;
- ophthalmic inserts.

PRODUCTION

During the development of an eye preparation whose formulation contains an antimicrobial preservative, the necessity for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in chapter *5.1.3. Efficacy of antimicrobial preservation*.

Eye preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in chapter *5.1.1. Methods of preparation of sterile products*.

In the manufacture of eye preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

During development, it must be demonstrated that the nominal contents can be withdrawn from the container of liquid and semi-solid eye preparations supplied in single-dose containers.

TESTS

Sterility (*2.6.1*). Eye preparations comply with the test. Applicators supplied separately also comply with the test. Remove the applicator with aseptic precautions from its package and transfer it to a tube of culture medium so that it is completely immersed. Incubate and interpret the results as described in the test.

STORAGE

Unless otherwise justified and authorised, store in a sterile, tamper-proof container.

LABELLING

The label states the name of any added antimicrobial preservative.

Eye drops

DEFINITION

Eye drops are sterile aqueous or oily solutions, emulsions or suspensions of one or more active substances intended for instillation into the eye.

Eye drops may contain excipients, for example, to adjust the tonicity or the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance, or to stabilise the preparation. These substances do not adversely affect the intended medicinal action or, at the concentrations used, cause undue local irritation.

Aqueous preparations supplied in multidose containers contain a suitable antimicrobial preservative in appropriate concentration except when the preparation itself has adequate antimicrobial properties. The antimicrobial preservative chosen must be compatible with the other ingredients of the preparation and must remain effective throughout the period of time during which eye drops are in use.

If eye drops do not contain antimicrobial preservatives they are supplied in single-dose containers or in multidose containers preventing microbial contamination of the contents after opening.

Eye drops intended for use in surgical procedures do not contain antimicrobial preservatives.

Eye drops that are solutions, examined under suitable conditions of visibility, are practically clear and practically free from particles.

Eye drops that are suspensions may show a sediment that is readily redispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered.

Multidose preparations are supplied in containers that allow successive drops of the preparation to be administered. The containers contain at most 10 ml of the preparation, unless otherwise justified and authorised.

TESTS

Particle size. Unless otherwise justified and authorised, eye drops in the form of a suspension comply with the following test: introduce a suitable quantity of the suspension into a counting cell or with a micropipette onto a slide, as appropriate, and scan under a microscope an area corresponding to 10 µg of the solid phase. For practical reasons, it is recommended that the whole sample is first scanned at low magnification (e.g. × 50) and particles greater than 25 µm are identified. These larger particles can then be measured at a larger magnification (e.g. × 200 to × 500). For each 10 µg of solid active substance, not more than 20 particles have a maximum dimension greater than 25 µm, and not more than 2 of these particles have a maximum dimension greater than 50 µm. None of the particles has a maximum dimension greater than 90 µm.

LABELLING

The label states, for multidose containers, the period after opening the container after which the contents must not be used. This period does not exceed 4 weeks, unless otherwise justified and authorised.

Eye lotions

DEFINITION

Eye lotions are sterile aqueous solutions intended for use in rinsing or bathing the eye or for impregnating eye dressings.

Eye lotions may contain excipients, for example to adjust the tonicity or the viscosity of the preparation or to adjust or stabilise the pH. These substances do not adversely affect the intended action or, at the concentrations used, cause undue local irritation.

Eye lotions supplied in multidose containers contain a suitable antimicrobial preservative in appropriate concentration except when the preparation itself has

adequate antimicrobial properties. The antimicrobial preservative chosen is compatible with the other ingredients of the preparation and remains effective throughout the period of time during which the eye lotions are in use.

If eye lotions do not contain antimicrobial preservatives, they are supplied in single-dose containers. Eye lotions intended for use in surgical procedures or in first-aid treatment do not contain an antimicrobial preservative and are supplied in single-dose containers.

Eye lotions, examined under suitable conditions of visibility, are practically clear and practically free from particles.

The containers for multidose preparations do not contain more than 200 ml of eye lotion, unless otherwise justified and authorised.

LABELLING

The label states:

- where applicable, that the contents are to be used on one occasion only;
- for multidose containers, the period after opening the container after which the contents must not be used; this period does not exceed 4 weeks, unless otherwise justified and authorised.

Powders for eye drops and powders for eye lotions

DEFINITION

Powders for the preparation of eye drops and eye lotions are supplied in a dry, sterile form to be dissolved or suspended in an appropriate liquid vehicle at the time of administration. They may contain excipients to facilitate dissolution or dispersion, to prevent caking, to adjust the tonicity, to adjust or stabilise the pH or to stabilise the preparation.

After dissolution or suspension in the prescribed liquid, they comply with the requirements for eye drops or eye lotions, as appropriate.

TESTS

Uniformity of dosage units (*2.9.40*). Single-dose powders for eye drops and eye lotions comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose powders for eye drops and eye lotions with a content of active substance less then 2 mg or less than 2 per cent of the total mass comply with test B. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above condition.

Uniformity of mass (*2.9.5*). Single-dose powders for eye drops and eye lotions comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Semi-solid eye preparations

DEFINITION

Semi-solid eye preparations are sterile ointments, creams or gels intended for application to the conjunctiva or to the eyelids. They contain one or more active substances dissolved or dispersed in a suitable basis. They have a homogeneous appearance.

Semi-solid eye preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*. The basis is non-irritant to the conjunctiva.

Semi-solid eye preparations are packed in small, sterilised collapsible tubes fitted or provided with a sterilised cannula. The containers contain at most 10 g of the preparation, unless otherwise justified and authorised. The tubes must be well-closed to prevent microbial contamination. Semi-solid eye preparations may also be packed in suitably designed single-dose containers. The containers, or the nozzles of tubes, are of such a shape as to facilitate administration without contamination.

TESTS

Particle size. Semi-solid eye preparations containing dispersed solid particles comply with the following test: spread gently a quantity of the preparation corresponding to at least 10 µg of solid active substance as a thin layer. Scan under a microscope the whole area of the sample. For practical reasons, it is recommended that the whole sample is first scanned at a small magnification (e.g. × 50) and particles greater than 25 µm are identified. These larger particles can then be measured at a larger magnification (e.g. × 200 to × 500). For each 10 µg of solid active substance, not more than 20 particles have a maximum dimension greater than 25 µm, and not more than 2 of these particles have a maximum dimension greater than 50 µm. None of the particles has a maximum dimension greater than 90 µm.

LABELLING

The label states, for multidose containers, the period after opening the container after which the contents must not be used. This period does not exceed 4 weeks, unless otherwise justified and authorised.

Ophthalmic inserts

DEFINITION

Ophthalmic inserts are sterile, solid or semi-solid preparations of suitable size and shape, designed to be inserted in the conjunctival sac, to produce an ocular effect. They generally consist of a reservoir of active substance embedded in a matrix or bounded by a rate-controlling membrane. The active substance, which is more or less soluble in lacrymal liquid, is released over a determined period of time.

Ophthalmic inserts are individually distributed into sterile containers.

PRODUCTION

In the manufacture of ophthalmic inserts, measures are taken to ensure a suitable dissolution behaviour.

TESTS

Uniformity of dosage units (*2.9.40*). Ophthalmic inserts comply with the test or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Ophthalmic inserts comply, where applicable, with test A.

LABELLING

The label states:

- where applicable, the total quantity of active substance per insert;
- where applicable, the dose released per unit time.

01/2008:1105

FOAMS, MEDICATED

Musci medicati

Additional requirements for medicated foams may be found, where appropriate, in other general monographs, for example on Rectal preparations (1145), Vaginal preparations (1164) and Liquid preparations for cutaneous application (0927).

DEFINITION

Medicated foams are preparations consisting of large volumes of gas dispersed in a liquid generally containing one or more active substances, a surfactant ensuring their formation and various other excipients. Medicated foams are usually intended for application to the skin or mucous membranes.

Medicated foams are usually formed at the time of administration from a liquid preparation in a pressurised container. The container is equipped with a device consisting of a valve and a push button suitable for the delivery of the foam.

Medicated foams intended for use on severely injured skin and on large open wounds are sterile.

Medicated foams supplied in pressurised containers comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

PRODUCTION

Sterile medicated foams are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

TESTS

Relative foam density. Maintain the container at about 25 °C for at least 24 h. Taking care not to warm the container, fit a rigid tube 70 mm to 100 mm long and about 1 mm in internal diameter onto the push button. Shake the container to homogenise the liquid phase of the contents and dispense 5 ml to 10 ml of foam to waste. Tare a flat-bottomed dish with a volume of about 60 ml and about 35 mm high. Place the end of the rigid tube attached to the push button in the corner of the dish, press the push button and fill the dish uniformly, using a circular motion. After the foam has completely expanded, level off by removing the excess foam with a slide. Weigh. Determine the mass of the same volume of *water R* by filling the same dish with *water R*.

The relative foam density is equivalent to the ratio:

$$\frac{m}{e}$$

m = mass of the test sample of foam, in grams,

e = mass of same volume of *water R*, in grams.

Carry out three measurements. None of the individual values deviate by more than 20 per cent from the mean value.

Duration of expansion. The apparatus (Figure 1105.-1) consists of a 50 ml burette, 15 mm in internal diameter, with 0.1 ml graduations and fitted with a 4 mm single bore stopcock. The graduation corresponding to 30 ml is at least 210 mm from the axis of the stopcock. The lower part of the burette is connected by means of a plastic tube not longer than 50 mm and 4 mm in internal diameter to the foam-generating container equipped with a push button fitted to this connection. Maintain the container at about 25 °C for at least 24 h. Shake the container, taking care not to warm it, to homogenise the liquid phase of the contents and dispense 5 ml to 10 ml of the foam to waste. Connect the push button to the outlet of the burette. Press the button and introduce about 30 ml of foam in a single delivery. Close the stopcock and at the same time start the chronometer and read the volume of foam in the burette. Every 10 s read the growing volume until the maximum volume is reached.

Carry out three measurements. None of the times needed to obtain the maximum volume is more than 5 min.

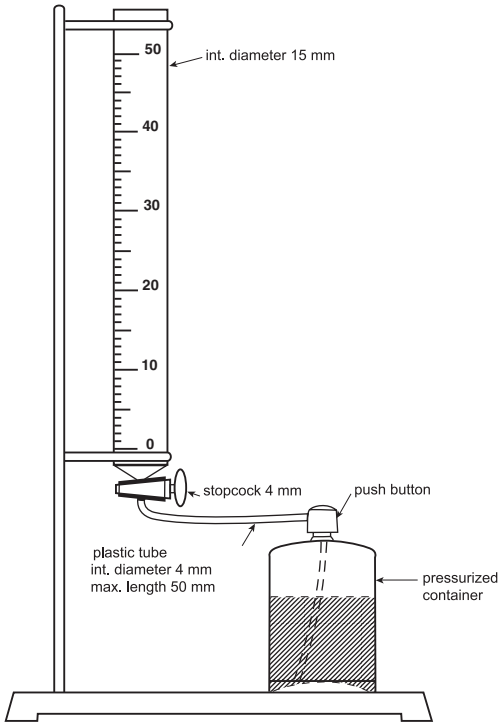

Figure 1105.-1. – *Apparatus for the determination of the duration of expansion*

Sterility (*2.6.1*). When the label indicates that the preparation is sterile, it complies with the test for sterility.

LABELLING

The label states, where applicable, that the preparation is sterile.

01/2008:0499

GRANULES

Granulata

Requirements for granules to be used for the preparation of oral solutions or suspensions are given in the monograph on Liquid preparations for oral use (0672). Where justified and authorised, the requirements of this monograph do not apply to granules for veterinary use.

DEFINITION

Granules are preparations consisting of solid, dry aggregates of powder particles sufficiently resistant to withstand handling. They are intended for oral administration. Some are swallowed as such, some are chewed and some are dissolved or dispersed in water or another suitable liquid before being administered.

Granules contain one or more active substances with or without excipients and, if necessary, colouring matter authorised by the competent authority and flavouring substances.

Granules are presented as single-dose or multidose preparations. Each dose of a multidose preparation is administered by means of a device suitable for measuring the quantity prescribed. For single-dose granules, each dose is enclosed in an individual container, for example a sachet or a vial.

Where applicable, containers for granules comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of granules may be distinguished:

– effervescent granules,
– coated granules,
– gastro-resistant granules,
– modified-release granules.

PRODUCTION

In the manufacture, packaging, storage and distribution of granules, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

TESTS

Uniformity of dosage units. Single-dose granules comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose granules with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose granules except for coated granules comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Uniformity of mass of delivered doses from multidose containers (*2.9.27*). Granules supplied in multidose containers comply with the test.

STORAGE

If the preparation contains volatile ingredients or the contents have to be protected, store in an airtight container.

Effervescent granules

DEFINITION

Effervescent granules are uncoated granules generally containing acid substances and carbonates or hydrogen carbonates which react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

TESTS

Disintegration. Place one dose of the effervescent granules in a beaker containing 200 ml of *water R* at 15-25 °C; numerous bubbles of gas are evolved. When the evolution of gas around the individual grains ceases, the granules have disintegrated, being either dissolved or dispersed in the water. Repeat the operation on 5 other doses. The preparation complies with the test if each of the 6 doses used disintegrates within 5 min.

STORAGE

In an airtight container.

Coated granules

DEFINITION

Coated granules are usually multidose preparations and consist of granules coated with one or more layers of mixtures of various excipients.

PRODUCTION

The substances used as coatings are usually applied as a solution or suspension in conditions in which evaporation of the vehicle occurs.

TESTS

Dissolution. A suitable test may be carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in *Dissolution test for solid dosage forms* (*2.9.3*).

Modified-release granules

DEFINITION

Modified-release granules are coated or uncoated granules which contain special excipients or which are prepared by special procedures, or both, designed to modify the rate, the place or the time at which the active substance or substances are released.

Modified-release granules include prolonged-release granules and delayed-release granules.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

TESTS

Dissolution. Carry out a suitable test to demonstrate the appropriate release of the active substance(s), for example the test described in *Dissolution test for solid dosage forms* (*2.9.3*).

Gastro-resistant granules

DEFINITION

Gastro-resistant granules are delayed-release granules that are intended to resist the gastric fluid and to release the active substance(s) in the intestinal fluid. These properties are achieved by covering the granules with a gastro-resistant material (enteric-coated granules) or by other suitable means.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

TESTS

Dissolution. Carry out a suitable test to demonstrate the appropriate release of the active substance(s), for example the test described in *Dissolution test for solid dosage forms* (*2.9.3*).

01/2008:0945

INTRAMAMMARY PREPARATIONS FOR VETERINARY USE

Praeparationes intramammariae ad usum veterinarium

DEFINITION

Intramammary preparations for veterinary use are sterile preparations intended for introduction into the mammary gland via the teat canal. There are two main categories: those intended for administration to lactating animals, and those intended for administration to animals at the end of lactation or to non-lactating animals for the treatment or prevention of infection.

Intramammary preparations for veterinary use are solutions, emulsions or suspensions or semi-solid preparations containing one or more active substances in a suitable vehicle. They may contain excipients such as stabilising, emulsifying, suspending and thickening agents. Suspensions may show a sediment which is readily dispersed on shaking. Emulsions may show evidence of phase separation but are readily redispersed on shaking.

Unless otherwise justified and authorised, intramammary preparations for veterinary use are supplied in containers for use on one occasion only for introduction in a single teat canal of an animal.

If supplied in multidose containers, aqueous preparations contain a suitable antimicrobial preservative at a suitable concentration, except where the preparation itself has adequate antimicrobial properties. Precautions for administration and for storage between administrations must be taken.

Where applicable, containers for intramammary preparations for veterinary use comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

PRODUCTION

During the development of a intramammary preparation for veterinary use, the formulation for which contains an antimicrobial preservative, the effectiveness of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

Intramammary preparations for veterinary use are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

In the manufacture of intramammary preparations for veterinary use containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Deliverable mass or volume. Squeeze out as much as possible of the contents of ten containers according to the instructions on the label. The mean mass or volume does not differ by more than 10 per cent from the nominal mass or volume.

Sterility (*2.6.1*). Intramammary preparations for veterinary use comply with the test for sterility; use the technique of membrane filtration or, in justified cases, direct inoculation of the culture media. Squeeze out the contents of ten containers and mix thoroughly. For each medium, use 0.5 g to 1 g (or 0.5 ml to 1 ml as appropriate) taken from the mixed sample.

STORAGE

Store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the name of the active substance(s) and the mass or number of International Units of the active substance(s) that may be delivered from the container using normal technique,
– whether the preparation is intended for use in a lactating animal or a non-lactating animal,
– in the case of multidose containers, the name of any added antimicrobial preservative.

01/2008:1228

INTRARUMINAL DEVICES

Praeparationes intraruminales

The requirements of this monograph do not apply to preparations (sometimes known as boluses), such as large conventional tablets, capsules or moulded dosage forms which give immediate or prolonged release of the active substance(s). Such preparations comply with the relevant parts of the monographs on Capsules (0016) or Tablets (0478).

DEFINITION

Intraruminal devices are solid preparations each containing one or more active substances. They are intended for oral administration to ruminant animals and are designed to be retained in the rumen to deliver the active substance(s) in a continuous or pulsatile manner. The period of release of the active substance(s) may vary from days to weeks according to the nature of the formulation and/or the delivery device.

Intraruminal devices may be administered using a balling gun. Some intraruminal devices are intended to float on the surface of the ruminal fluid while others are intended to remain on the floor of the rumen or reticulum. Each device has a density appropriate for its intended purpose.

PRODUCTION

For continuous release, the intraruminal device is designed to release the active substance(s) at a defined rate over a defined period of time. This may be achieved by erosion, corrosion, diffusion, osmotic pressure or any other suitable chemical, physical or physico-chemical means.

For pulsatile-release, the intraruminal device is designed to release a specific quantity of active substance(s) at one or several defined intermediate times. This may be achieved by corrosion by ruminal fluids of the metallic elements of the intraruminal device which leads to sequential release of the constituent units which are usually in the form of tablets.

In the manufacture of intraruminal devices, means are taken to ensure an appropriate release of the active substance(s).

In the manufacture, packaging, storage and distribution of intraruminal devices, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

TESTS

Uniformity of dosage units. Constituent tablet units of intraruminal devices comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise justified and authorised, constituent tablet units of intraruminal devices in which the active substances are present at levels less than 2 mg or less than 2 per cent of the total mass comply with test A for uniformity of content of single-dose preparations. If the preparation contains more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Unless otherwise justified and authorised, the constituent tablet units of intraruminal devices comply with the test for uniformity of mass. If the test for uniformity of content is prescribed for all active substances, the test for uniformity of mass is not required.

LABELLING

The label states:

- for continuous-release devices, the dose released per unit time,
- for pulsatile-release devices, the dose released at specified times.

01/2008:1806

INTRAUTERINE PREPARATIONS FOR VETERINARY USE

Praeparationes intra-uterinae ad usum veterinarium

DEFINITION

Intrauterine preparations for veterinary use are liquid, semi-solid or solid preparations intended for the direct administration to the uterus (cervix, cavity or fundus), usually in order to obtain a local effect. They contain 1 or more active substances in a suitable basis.

Where appropriate, containers for intrauterine preparations for veterinary use comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of intrauterine preparations for veterinary use may be distinguished:

- intrauterine tablets,
- intrauterine capsules,
- intrauterine solutions, emulsions and suspensions, concentrates for intrauterine solutions,
- tablets for intrauterine solutions and suspensions,
- semi-solid intrauterine preparations,
- intrauterine foams,
- intrauterine sticks.

PRODUCTION

During the development of an intrauterine preparation for veterinary use, the effectiveness of any added antimicrobial preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided under *Efficacy of antimicrobial preservation* (*5.1.3*).

In the manufacture, packaging, storage and distribution of intrauterine preparations for veterinary use, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*, Category 2).

Sterile intrauterine preparations for veterinary use are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of microorganisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

During development, it must be demonstrated that the nominal content can be withdrawn from the container of liquid and semi-solid intrauterine preparations for veterinary use presented in single-dose containers.

TESTS

Uniformity of dosage units. Single-dose intrauterine preparations for veterinary use comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, solid single-dose preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A (intrauterine tablets) or test B (intrauterine capsules) for uniformity of content of single-dose preparations. If the preparation has more than 1 active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Solid single-dose intrauterine preparations for veterinary use comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed or justified and authorised for all the active substances, the test for uniformity of mass is not required.

Dissolution. A suitable test may be carried out to demonstrate the appropriate release of the active substance(s) from solid single-dose intrauterine preparations for veterinary use, for example one of the tests described in *Dissolution test for solid dosage forms* (*2.9.3*).

When a dissolution test is prescribed, a disintegration test may not be required.

Sterility (*2.6.1*). Sterile intrauterine preparations for veterinary use comply with the test for sterility. Applicators supplied with the preparation also comply with the test for sterility. Remove the applicator with aseptic precautions from its package and transfer it to a tube of culture medium so that it is completely immersed. Incubate and interpret the results as described in the test for sterility.

LABELLING

The label states:

– the name of any added antimicrobial preservative,
– where applicable, that the preparation is sterile.

Intrauterine tablets

DEFINITION

Intrauterine tablets are solid preparations each containing a single dose of 1 or more active substances. They generally conform to the definition given in the monograph on *Tablets (0478)*.

A suitable applicator may be used for application into the uterus.

TESTS

Disintegration. Unless intended for prolonged local action, they comply with the test for disintegration of suppositories and pessaries (*2.9.2*). Examine the state of the tablets after 30 min, unless otherwise justified and authorised.

Intrauterine capsules

DEFINITION

Intrauterine capsules are solid, single-dose preparations. They are generally similar to soft capsules, differing only in their shape and size. Intrauterine capsules have various shapes, usually ovoid. They are smooth and have a uniform external appearance.

A suitable applicator may be used for application into the uterus.

TESTS

Disintegration. Unless intended for prolonged local action, they comply with the test for disintegration of suppositories and pessaries (*2.9.2*). Examine the state of the capsules after 30 min, unless otherwise justified and authorised.

Intrauterine solutions, suspensions and emulsions Concentrates for intrauterine solutions

DEFINITION

Intrauterine solutions, suspensions and emulsions are liquid preparations. Concentrates for intrauterine solutions are intended for administration after dilution.

They may contain excipients, for example to adjust the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance(s) or to stabilise the preparation. The excipients do not adversely affect the intended medical action, or, at the concentrations used, cause undue local irritation.

Intrauterine emulsions may show evidence of phase separation, but are readily redispersed on shaking. Intrauterine suspensions may show a sediment that is readily dispersed on shaking to give a suspension which remains sufficiently stable to enable a homogeneous preparation to be delivered.

They may be supplied in single-dose containers. The container is adapted to deliver the preparation to the uterus or it may be accompanied by a suitable applicator.

PRODUCTION

In the manufacture of intrauterine suspensions, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

Tablets for intrauterine solutions and suspensions

DEFINITION

Tablets intended for the preparation of intrauterine solutions and suspensions are single-dose preparations which are dissolved or dispersed in water at the time of administration. They may contain excipients to facilitate dissolution or dispersion or to prevent caking.

Tablets for intrauterine solutions or suspensions conform with the definition given in the monograph on *Tablets (0478)*.

After dissolution or dispersion, they comply with the requirements for intrauterine solutions or intrauterine suspensions, as appropriate.

TESTS

Disintegration. Tablets for intrauterine solutions or suspensions disintegrate within 3 min when tested according to the test for disintegration of tablets and capsules (*2.9.1*), but using *water R* at 15-25 °C.

LABELLING

The label states:

– the method of preparation of the intrauterine solution or suspension,
– the conditions and duration of storage of the solution or suspension after reconstitution.

Semi-solid intrauterine preparations

DEFINITION

Semi-solid preparations for intrauterine use are ointments, creams or gels.

Semi-solid preparations for intrauterine use comply with the requirements of the monograph on *Semi-solid preparations for cutaneous application (0132)*.

They are often supplied in single-dose containers. The container is adapted to deliver the preparation to the uterus or it may be accompanied by a suitable applicator.

Intrauterine foams

DEFINITION

Intrauterine foams comply with the requirements of the monograph on *Medicated foams (1105)*.

They are supplied in multi-dose containers. The container is adapted to deliver the preparation to the uterus or it may be accompanied by a suitable applicator.

Intrauterine sticks

DEFINITION

Intrauterine sticks comply with the requirements of the monograph on *Sticks (1154)*. They often produce a foam when coming into contact with physiological fluids.

01/2008:0927

LIQUID PREPARATIONS FOR CUTANEOUS APPLICATION

Praeparationes liquidae ad usum dermicum

Where justified and authorised, the requirements of this monograph do not apply to preparations intended for systemic and veterinary use.

DEFINITION

Liquid preparations for cutaneous application are preparations of a variety of viscosities intended for local or transdermal delivery of active ingredients. They are solutions, emulsions or suspensions that may contain 1 or more active substances in a suitable vehicle. They may contain suitable antimicrobial preservatives, antioxidants and other excipients such as stabilisers, emulsifiers and thickeners.

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment that is readily dispersed on shaking to give a suspension that is sufficiently stable to enable a homogeneous preparation to be delivered.

Where applicable, containers for liquid preparations for cutaneous application comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

When liquid preparations for cutaneous application are dispensed in pressurised containers, the containers comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

Preparations specifically intended for use on severely injured skin are sterile.

Several categories of liquid preparations for cutaneous application may be distinguished, for example:

– shampoos;
– cutaneous foams.

PRODUCTION

During development of a liquid preparation for cutaneous application whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

During development, it must be demonstrated that the nominal content can be withdrawn from the container of liquid preparations for cutaneous application presented in single-dose containers.

In the manufacture, packaging, storage and distribution of liquid preparations for cutaneous application, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations (5.1.4)*.

Sterile liquid preparations for cutaneous application are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

In the manufacture of liquid preparations for cutaneous application containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Sterility (*2.6.1*). Where the label indicates that the preparation is sterile, it complies with the test for sterility.

STORAGE

If the preparation is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the name of any added antimicrobial preservative;
– where applicable, that the preparation is sterile.

Shampoos

DEFINITION

Shampoos are liquid or, occasionally, semi-solid preparations intended for application to the scalp and subsequent washing away with water. Upon rubbing with water they usually form a foam.

They are emulsions, suspensions or solutions. Shampoos normally contain surface active agents.

Cutaneous foams

DEFINITION

Cutaneous foams comply with the requirements of the monograph on *Medicated foams (1105)*.

01/2008:0672

LIQUID PREPARATIONS FOR ORAL USE

Praeparationes liquidae peroraliae

Where justified and authorised, the requirements of this monograph do not apply to liquid preparations for oral use intended for veterinary use.

DEFINITION

Liquid preparations for oral use are usually solutions, emulsions or suspensions containing one or more active substances in a suitable vehicle; they may, however, consist of liquid active substances used as such (oral liquids).

Some preparations for oral use are prepared by dilution of concentrated liquid preparations, or from powders or granules for the preparation of oral solutions or suspensions, for oral drops or for syrups, using a suitable vehicle.

The vehicle for any preparations for oral use is chosen having regard to the nature of the active substance(s) and to provide organoleptic characteristics appropriate to the intended use of the preparation.

Liquid preparations for oral use may contain suitable antimicrobial preservatives, antioxidants and other excipients such as dispersing, suspending, thickening, emulsifying, buffering, wetting, solubilising, stabilising, flavouring and sweetening agents and colouring matter, authorised by the competent authority.

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment, which is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Where applicable, containers for liquid preparations for oral use comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of preparations may be distinguished;

- oral solutions, emulsions and suspensions;
- powders and granules for oral solutions and suspensions;
- oral drops;
- powders for oral drops;
- syrups;
- powders and granules for syrups.

PRODUCTION

During development of a preparation for oral use whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

During development, it must be demonstrated that the nominal content can be withdrawn from the container, for liquid preparations for oral use presented in single-dose containers.

In the manufacturing, packaging, storage and distribution of liquid preparations for oral use, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

In the manufacture of liquid preparations for oral use containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units. Solutions, suspensions and emulsions in single-dose containers comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of content or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose preparations that are suspensions comply with the following test. After shaking, empty each container as completely as possible and carry out the test on the individual contents. They comply with test B for uniformity of content of single-dose preparations.

Uniformity of mass. Single-dose preparations that are solutions or emulsions comply with the following test: weigh individually the contents of 20 containers, emptied as completely as possible, and determine the average mass. Not more than 2 of the individual masses deviate by more than 10 per cent from the average mass and none deviate by more than 20 per cent.

Dose and uniformity of dose of oral drops. Into a suitable graduated cylinder, introduce by means of the dropping device the number of drops usually prescribed for one dose, or introduce by means of the measuring device the usually prescribed quantity. The dropping speed does not exceed 2 drops per second. Weigh the liquid, repeat the addition, weigh again and carry on repeating the addition and weighing until a total of 10 masses are obtained. No single mass deviates by more than 10 per cent from the average mass. The total of 10 masses does not differ by more than 15 per cent from the nominal mass of 10 doses. If necessary, measure the total volume of 10 doses. The volume does not differ by more than 15 per cent from the nominal volume of 10 doses.

Uniformity of mass of delivered doses from multidose containers (*2.9.27*). Liquid preparations for oral use supplied in multidose containers comply with the test. Oral drops are not subject to the provisions of this test.

LABELLING

The label states the name of any added antimicrobial preservative.

Oral solutions, emulsions and suspensions

DEFINITION

Oral solutions, emulsions and suspensions are supplied in single-dose or multidose containers. Each dose from a multidose container is administered by means of a device suitable for measuring the prescribed volume. The device is usually a spoon or a cup for volumes of 5 ml or multiples thereof or an oral syringe for other volumes.

Powders and granules for oral solutions and suspensions

DEFINITION

Powders and granules for the preparation of oral solutions or suspensions generally conform to the definitions in the monographs on *Oral powders (1165)* or *Granules (0499)* as appropriate. They may contain excipients, in particular to facilitate dispersion or dissolution and to prevent caking.

After dissolution or suspension, they comply with the requirements for oral solutions or oral suspensions, as appropriate.

TESTS

Uniformity of dosage units. Single-dose powders and single-dose granules comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose powders and single-dose granules with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose powders and single-dose granules comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

LABELLING

The label states:

- the method of preparation of the solution or suspension;
- the conditions and the duration of storage after reconstitution.

Oral drops

DEFINITION

Oral drops are solutions, emulsions or suspensions that are administered in small volumes such as drops by the means of a suitable device.

LABELLING

The label states the number of drops per millilitre of preparation or per gram of preparation if the dose is measured in drops.

Powders for oral drops

DEFINITION

Powders for the preparation of oral drops generally conform to the definition of *Oral powders (1165)*. They may contain excipients to facilitate dissolution or suspension in the prescribed liquid or to prevent caking.

After dissolution or suspension, they comply with the requirements for oral drops.

TESTS

Uniformity of dosage units. Single-dose powders for oral drops comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose powders for oral drops with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose powders for oral drops comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Syrups

DEFINITION

Syrups are aqueous preparations characterised by a sweet taste and a viscous consistency. They may contain sucrose at a concentration of at least 45 per cent *m/m*. The sweet taste can also be obtained by using other polyols or sweetening agents. Syrups usually contain aromatic or other flavouring agents. Each dose from a multidose container is administered by means of a device suitable for measuring the prescribed volume. The device is usually a spoon or a cup for volumes of 5 ml or multiples thereof.

LABELLING

The label states the name and concentration of the polyol or sweetening agent.

Powders and granules for syrups

DEFINITION

Powders and granules for syrups generally conform to the definitions in the monograph on *Oral powders (1165)* or *Granules (0499)*. They may contain excipients to facilitate dissolution.

After dissolution, they comply with the requirements for syrups.

TESTS

Uniformity of dosage units. Single-dose powders and granules for syrups comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose powders and granules for syrups with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose powders and granules for syrups comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

01/2008:0676

NASAL PREPARATIONS

Nasalia

DEFINITION

Nasal preparations are liquid, semi-solid or solid preparations intended for administration to the nasal cavities to obtain a systemic or local effect. They contain one or more active substances. Nasal preparations are as far as possible non-irritating and do not adversely affect the functions of the nasal mucosa and its cilia. Aqueous nasal preparations are usually isotonic and may contain excipients, for example, to adjust the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance, or to stabilise the preparation.

Nasal preparations are supplied in multidose or single-dose containers, provided, if necessary, with a suitable administration device, which may be designed to avoid the introduction of contaminants.

Unless otherwise justified and authorised, aqueous nasal preparations supplied in multidose containers contain a suitable antimicrobial preservative in an appropriate concentration, except where the preparation itself has adequate antimicrobial properties.

Where applicable, the containers comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of nasal preparations may be distinguished:

- nasal drops and liquid nasal sprays;
- nasal powders;
- semi-solid nasal preparations;
- nasal washes;
- nasal sticks.

PRODUCTION

During the development of a nasal preparation whose formulation contains an antimicrobial preservative, the efficacy of the chosen preservative shall be demonstrated to

the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

In the manufacture, packaging, storage and distribution of nasal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

Sterile nasal preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

In the manufacture of nasal preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Sterility (*2.6.1*). Where the label states that the preparation is sterile, it complies with the test for sterility.

STORAGE

If the preparation is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the name of any added antimicrobial preservative;
– where applicable, that the preparation is sterile.

Nasal drops and liquid nasal sprays

DEFINITION

Nasal drops and liquid nasal sprays are solutions, emulsions or suspensions intended for instillation or spraying into the nasal cavities.

Emulsions may show evidence of phase separation but are easily redispersed on shaking. Suspensions may show a sediment, which is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Nasal drops are usually supplied in multidose containers provided with a suitable applicator.

Liquid nasal sprays are supplied in containers with atomising devices or in pressurised containers fitted with a suitable adapter and with or without a metering dose valve, which comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

The size of droplets of the spray is such as to localise their deposition in the nasal cavity.

TESTS

Unless otherwise prescribed or justified and authorised, nasal drops supplied in single-dose containers and single doses of metered-dose nasal sprays, both intended for systemic action, comply with the following tests.

NASAL DROPS IN SINGLE-DOSE CONTAINERS

Uniformity of dosage units. Nasal drops in single-dose containers comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of mass or uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of mass. *Nasal drops that are solutions comply with the following test.* Weigh individually the contents of 10 containers emptied as completely as possible, and determine the average mass. Not more than 2 of the individual masses deviate by more than 10 per cent from the average mass, and none deviate by more than 20 per cent.

Uniformity of content (*2.9.6*). *Nasal drops that are suspensions or emulsions comply with the following test.* Empty each container as completely as possible and carry out the test on the individual contents. They comply with test B for uniformity of content.

METERED-DOSE NASAL SPRAYS

Uniformity of dosage units. Metered-dose nasal sprays comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of mass or the test for uniformity of delivered dose shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

In the case of metered-dose nasal sprays that are solutions, proceed as follows. Discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. Weigh the container, discharge once to waste and weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers. Determine the mass variation (*2.9.40*).

In the case of metered-dose nasal sprays that are suspensions or emulsions, proceed as follows. Use an apparatus capable of quantitatively retaining the dose leaving the actuator of the atomising device. Shake the container for 5 s and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. After 2 s, fire 1 dose of the metered-dose nasal spray into the collecting vessel by actuating the atomising device. Collect the contents of the collecting vessel by successive rinses. Determine the content of active substance in the combined rinses. Repeat the procedure for a further 9 containers. Determine the content uniformity (*2.9.40*).

Uniformity of mass. *Metered-dose nasal sprays that are solutions comply with the following test.* Discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. Weigh the container, discharge once to waste and weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers.

The preparation complies with the test if not more than 2 of the individual values deviate by more than 25 per cent from the average value and none deviate by more than 35 per cent.

Uniformity of delivered dose. *Metered-dose nasal sprays that are suspensions or emulsions comply with the following test.* Use an apparatus capable of quantitatively retaining the dose leaving the actuator of the atomising device. Shake the container for 5 s and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. After 2 s, fire 1 dose of the metered-dose nasal spray into the collecting vessel by actuating the atomising device. Collect the contents of the collecting vessel by successive rinses. Determine the content of active substance in the combined rinses. Repeat the procedure for a further 9 containers.

Unless otherwise justified and authorised, the preparation complies with the test if not more than 1 of the individual contents is outside the limits of 75 per cent to 125 per cent

and none are outside the limits of 65 per cent to 135 per cent of the average content.

If 2 or at most 3 individual contents are outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 20 more containers. The preparation complies with the test if not more than 3 individual contents of the 30 individual contents are outside the limits of 75 per cent to 125 per cent and none are outside the limits of 65 per cent to 135 per cent of the average content.

Nasal powders

DEFINITION

Nasal powders are powders intended for insufflation into the nasal cavity by means of a suitable device.

They comply with the requirements of the monograph on *Powders for cutaneous application (1166)*.

The size of the particles is such as to localise their deposition in the nasal cavity and is verified by adequate methods of particle-size determination.

Semi-solid nasal preparations

DEFINITION

Semi-solid nasal preparations comply with the requirements of the monograph on *Semi-solid preparations for cutaneous application (0132)*.

The containers are adapted to deliver the product to the site of application.

Nasal washes

DEFINITION

Nasal washes are generally aqueous isotonic solutions intended to cleanse the nasal cavities.

Nasal washes intended for application to injured parts or prior to a surgical operation are sterile.

PRODUCTION

During development, it must be demonstrated that the nominal content can be withdrawn from the container, for nasal washes presented in single-dose containers.

Nasal sticks

DEFINITION

Nasal sticks comply with the monograph on *Sticks (1154)*.

01/2008:1807

OROMUCOSAL PREPARATIONS

Praeparationes buccales

This monograph does not apply to dental preparations or to preparations such as chewable tablets (0478), medicated chewing gums (1239), oral lyophilisates and other solid or semi-solid preparations that are intended to be chewed or dispersed in the saliva before being swallowed. Where justified and authorised, this monograph does not apply to preparations for veterinary use.

DEFINITION

Oromucosal preparations are solid, semi-solid or liquid preparations, containing one or more active substances intended for administration to the oral cavity and/or the throat to obtain a local or systemic effect. Preparations intended for a local effect may be designed for application to a specific site within the oral cavity such as the gums (gingival preparations) or the throat (oropharyngeal preparations). Preparations intended for a systemic effect are designed to be absorbed primarily at one or more sites on the oral mucosa (e.g. sublingual preparations). Mucoadhesive preparations are intended to be retained in the oral cavity by adhesion to the mucosal epithelium and may modify systemic drug absorption at the site of application. For many oromucosal preparations, it is likely that some proportion of the active substance(s) will be swallowed and may be absorbed via the gastrointestinal tract.

Oromucosal preparations may contain suitable antimicrobial preservatives and other excipients such as dispersing, suspending, thickening, emulsifying, buffering, wetting, solubilising, stabilising, flavouring and sweetening agents. Solid preparations may in addition contain glidants, lubricants and excipients capable of modifying the release of the active substance(s).
Where applicable, containers for oromucosal preparations comply with the requirements for *Materials used for the manufacture of containers* (*3.1 and subsections*) and *Containers* (*3.2 and subsections*).

Several categories of preparations for oromucosal use may be distinguished:

- gargles;
- mouthwashes;
- gingival solutions;
- oromucosal solutions and oromucosal suspensions;
- semi-solid oromucosal preparations (including for example gingival gel, gingival paste, oromucosal gel, oromucosal paste);
- oromucosal drops, oromucosal sprays and sublingual sprays (including oropharyngeal sprays);
- lozenges and pastilles;
- compressed lozenges;
- sublingual tablets and buccal tablets;
- oromucosal capsules;
- mucoadhesive preparations.

PRODUCTION

During the development of an oromucosal preparation containing an antimicrobial preservative, the effectiveness of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with the criteria for judging the preservative properties of the formulation are provided in *5.1.3 Efficacy of antimicrobial preservation*.

In the manufacture, packaging, storage and distribution of oromucosal preparations, suitable means are taken to ensure their microbiological quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

In the manufacture of semi-solid and liquid oromucosal preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units. Single-dose oromucosal preparations comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose oromucosal preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A (compressed and moulded dosage forms) or test B (capsules) for the uniformity of content of single-dose preparations. If the preparation contains more than one active substance, this requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Solid single-dose oromucosal preparations comply with the test for uniformity of mass. If the test for the uniformity of content is prescribed, or justified and authorised, for all active substances, the test for uniformity of mass is not required.

LABELLING

The label states the name of any added antimicrobial preservative.

Gargles

DEFINITION

Gargles are aqueous solutions intended for gargling to obtain a local effect. They are not to be swallowed. They are supplied as ready-to-use solutions or concentrated solutions to be diluted. They may also be prepared from powders or tablets to be dissolved in water before use.

Gargles may contain excipients to adjust the pH which, as far as possible, is neutral.

Mouthwashes

DEFINITION

Mouthwashes are aqueous solutions intended for use in contact with the mucous membrane of the oral cavity. They are not to be swallowed. They are supplied as ready-to-use solutions or concentrated solutions to be diluted. They may also be prepared from powders or tablets to be dissolved in water before use.

Mouthwashes may contain excipients to adjust the pH which, as far as possible, is neutral.

Gingival solutions

DEFINITION

Gingival solutions are intended for administration to the gingivae by means of a suitable applicator.

Oromucosal solutions and oromucosal suspensions

DEFINITION

Oromucosal solutions and oromucosal suspensions are liquid preparations intended for administration to the oral cavity by means of a suitable applicator.

Oromucosal suspensions may show a sediment which is readily dispersible on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered.

Semi-solid oromucosal preparations

DEFINITION

Semi-solid oromucosal preparations are hydrophilic gels or pastes intended for administration to the oral cavity or to a specific part of the oral cavity such as the gingivae (gingival gel, gingival paste). They may be provided as single-dose preparations.

Semi-solid oromucosal preparations comply with the requirements of the monograph on *Semi-solid preparations for cutaneous use (0132)*.

Oromucosal drops, oromucosal sprays and sublingual sprays

DEFINITION

Oromucosal drops, oromucosal sprays and sublingual sprays are solutions, emulsions or suspensions intended for local or systemic effect. They are applied by instillation or spraying into the oral cavity or onto a specific part of the oral cavity such as spraying under the tongue (sublingual spray) or into the throat (oropharyngeal spray).

Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment which is readily dispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be delivered.

Liquid oromucosal sprays are supplied in containers with atomising devices or in pressurised containers having a suitable adaptor, with or without a metering dose valve, which comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

The size of the droplets of the spray is such as to localise their deposition in the oral cavity or the throat as intended.

TESTS

Unless otherwise prescribed or justified and authorised, oromucosal drops supplied in single-dose containers, single doses of metered-dose oromucosal sprays and sublingual sprays, all intended for systemic action, comply with the following tests.

OROMUCOSAL DROPS IN SINGLE-DOSE CONTAINERS

Uniformity of dosage units. Oromucosal drops in single-dose containers comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of mass or uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of mass. *Oromucosal drops that are solutions comply with the following test.* Weigh individually the contents of 10 containers emptied as completely as possible, and determine the average mass. Maximum 2 of the individual masses deviate by more than 10 per cent from the average mass and none deviates by more than 20 per cent.

Uniformity of content (*2.9.6*). *Oromucosal drops that are suspensions or emulsions comply with the following test.* Empty each container as completely as possible and carry out the test on the individual contents. They comply with test B of uniformity of content.

METERED-DOSE OROMUCOSAL SPRAYS AND SUBLINGUAL SPRAYS

Uniformity of dosage units. Metered-dose oromucosal sprays and sublingual sprays comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of mass or the test for uniformity of

delivered dose shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

In the case of metered-dose oromucosal sprays and sublingual sprays that are solutions, proceed as follows. Discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. Weigh the container, discharge once to waste and weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers. Determine the mass variation (*2.9.40*).

In the case of metered-dose oromucosal sprays and sublingual sprays that are suspensions or emulsions proceed as follows. Use an apparatus capable of quantitatively retaining the dose leaving the actuator of the atomising device.

Shake the container for 5 s and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. After 2 s, fire 1 dose of the metered-dose spray into the collecting vessel by actuating the atomising device. Collect the contents of the collecting vessel by successive rinses. Determine the content of active substance in the combined rinses. Repeat the procedure for a further 9 containers. Determine the content uniformity (*2.9.40*).

Uniformity of mass. *Metered-dose oromucosal sprays and sublingual sprays that are solutions comply with the following test.* Discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. Weigh the container, discharge once to waste and weigh the container again. Calculate the difference between the 2 masses. Repeat the procedure for a further 9 containers.

The preparation complies with the test if maximum 2 of the individual values deviate by more than 25 per cent from the average value and none deviates by more than 35 per cent.

Uniformity of delivered dose. *Metered-dose oromucosal sprays and sublingual sprays that are suspensions or emulsions comply with the following test.* Use an apparatus capable of quantitatively retaining the dose leaving the actuator of the atomising device.

Shake the container for 5 s and discharge once to waste. Wait for a minimum of 5 s, shake for 5 s and discharge again to waste. Repeat this procedure for a further 3 actuations. After 2 s, fire 1 dose of the metered-dose spray into the collecting vessel by actuating the atomising device. Collect the contents of the collecting vessel by successive rinses. Determine the content of active substance in the combined rinses. Repeat the procedure for a further 9 containers.

Unless otherwise justified and authorised, the preparation complies with the test if maximum 1 of the individual contents is outside the limits of 75 per cent to 125 per cent and none is outside the limits of 65 per cent to 135 per cent of the average content.

If 2 or maximum 3 individual contents are outside the limits of 75 per cent to 125 per cent but within the limits of 65 per cent to 135 per cent, repeat the test for 20 more containers. The preparation complies with the test if maximum 3 individual contents of the 30 individual contents are outside the limits of 75 per cent to 125 per cent and none is outside the limits of 65 per cent to 135 per cent of the average content.

Lozenges and pastilles

DEFINITION

Lozenges and pastilles are solid, single-dose preparations intended to be sucked to obtain, usually, a local effect in the oral cavity and the throat. They contain one or more active substances, usually in a flavoured and sweetened base, and are intended to dissolve or disintegrate slowly in the mouth when sucked.

Lozenges are hard preparations prepared by moulding. Pastilles are soft, flexible preparations prepared by moulding of mixtures containing natural or synthetic polymers or gums and sweeteners.

Compressed lozenges

DEFINITION

Compressed lozenges are solid, single-dose preparations intended to be sucked to obtain a local or systemic effect. They are prepared by compression and are often rhomboid in shape.

Compressed lozenges conform with the general definition of tablets.

PRODUCTION

In the manufacture of compressed lozenges, measures are taken to ensure that they possess suitable mechanical strength to resist handling without crumbling or breaking. This may be demonstrated by examining the *Friability of uncoated tablets* (*2.9.7*) and the *Resistance to crushing of tablets* (*2.9.8*).

TESTS

Dissolution. For compressed lozenges intended for a systemic effect, a suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Sublingual tablets and buccal tablets

DEFINITION

Sublingual tablets and buccal tablets are solid, single-dose preparations to be applied under the tongue or to the buccal cavity, respectively, to obtain a systemic effect. They are prepared by compression of mixtures of powders or granulations into tablets with a shape suited for the intended use.

Sublingual tablets and buccal tablets conform to the general definition of tablets.

PRODUCTION

In the manufacture of sublingual tablets and buccal tablets, measures are taken to ensure that they possess suitable mechanical strength to resist handling without crumbling or breaking. This may be demonstrated by examining the *Friability of uncoated tablets* (*2.9.7*) and the *Resistance to crushing of tablets* (*2.9.8*).

TESTS

Dissolution. Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Oromucosal capsules

DEFINITION

Oromucosal capsules are soft capsules to be chewed or sucked.

Mucoadhesive preparations

DEFINITION

Mucoadhesive preparations contain one or more active substances intended for systemic absorption through the buccal mucosa over a prolonged period of time. They may be supplied as mucoadhesive buccal tablets or as other mucoadhesive solid or semi-solid preparations.

Mucoadhesive buccal tablets are prepared by compression of mono- or multi-layered tablets. They usually contain hydrophilic polymers, which on wetting with the saliva produce a flexible hydrogel that adheres to the buccal mucosa.

PRODUCTION

In the manufacture of mucoadhesive buccal tablets, measures are taken to ensure that they possess suitable mechanical strength to resist handling without crumbling or breaking. This may be demonstrated by examining the *Friability of uncoated tablets* (*2.9.7*) and the *Resistance to crushing of tablets* (*2.9.8*).

TESTS

Dissolution. Unless otherwise justified and authorised, a suitable test is carried out to demonstrate the appropriate release of the active substance(s).

01/2008:0520

PARENTERAL PREPARATIONS

Parenteralia

The requirements of this monograph do not necessarily apply to products derived from human blood, to immunological preparations, or radiopharmaceutical preparations. Special requirements may apply to preparations for veterinary use depending on the species of animal for which the preparation is intended.

DEFINITION

Parenteral preparations are sterile preparations intended for administration by injection, infusion or implantation into the human or animal body.

Parenteral preparations may require the use of excipients, for example to make the preparation isotonic with respect to blood, to adjust the pH, to increase solubility, to prevent deterioration of the active substances or to provide adequate antimicrobial properties, but not to adversely affect the intended medicinal action of the preparation or, at the concentrations used, to cause toxicity or undue local irritation.

Containers for parenteral preparations are made as far as possible from materials that are sufficiently transparent to permit the visual inspection of the contents, except for implants and in other justified and authorised cases.

Where applicable, the containers for parenteral preparations comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Parenteral preparations are supplied in glass containers (*3.2.1*) or in other containers such as plastic containers (*3.2.2*, *3.2.2.1* and *3.2.9*) and prefilled syringes. The tightness of the container is ensured by suitable means. Closures ensure a good seal, prevent the access of micro-organisms and other contaminants and usually permit the withdrawal of a part or the whole of the contents without removal of the closure. The plastic materials or elastomers (*3.2.9*) used to manufacture the closures are sufficiently firm and elastic to allow the passage of a needle with the least possible shedding of particles. Closures for multidose containers are sufficiently elastic to ensure that the puncture is resealed when the needle is withdrawn.

Several categories of parenteral preparations may be distinguished:

- injections,
- infusions,
- concentrates for injections or infusions,
- powders for injections or infusions,
- gels for injections,
- implants.

PRODUCTION

During the development of a parenteral preparation, the formulation for which contains an antimicrobial preservative, the effectiveness of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided under *Efficacy of antimicrobial preservation* (*5.1.3*).

Parenteral preparations are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms. Recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

Water used in the manufacture of parenteral preparations complies with the requirements of water for injections in bulk stated in the monograph on *Water for injections (0169)*.

TESTS

Particulate contamination: sub-visible particles (*2.9.19*). For preparations for human use, solutions for infusion or solutions for injection comply with the test.

In the case of preparations for subcutaneous or intramuscular injection, higher limits may be appropriate. Radiopharmaceutical preparations are exempt from these requirements. Preparations for which the label states that the product is to be used with a final filter are exempt from these requirements, providing it has been demonstrated that the filter delivers a solution that complies with the test.

For preparations for veterinary use, when supplied in containers with a nominal content of more than 100 ml and when the content is equivalent to a dose of more than 1.4 ml per kilogram of body mass, solutions for infusion or solutions for injection comply with the test for particulate contamination: sub-visible particles.

Sterility (*2.6.1*). Parenteral preparations comply with the test for sterility.

STORAGE

In a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the name and concentration of any added antimicrobial preservative,
- where applicable, that the solution is to be used in conjunction with a final filter,
- where applicable, that the preparation is free from bacterial endotoxins or that it is apyrogenic.

Injections

DEFINITION

Injections are sterile solutions, emulsions or suspensions. They are prepared by dissolving, emulsifying or suspending the active substance(s) and any added excipients in water, in a suitable non-aqueous liquid, that may be non-sterile where justified, or in a mixture of these vehicles.

Solutions for injection, examined under suitable conditions of visibility, are clear and practically free from particles.

Emulsions for injection do not show any evidence of phase separation. Suspensions for injection may show a sediment which is readily dispersed on shaking to give a suspension which remains sufficiently stable to enable the correct dose to be withdrawn.

Multidose preparations. Multidose aqueous injections contain a suitable antimicrobial preservative at an appropriate concentration except when the preparation itself has adequate antimicrobial properties. When a preparation for parenteral use is presented in a multidose container, the precautions to be taken for its administration and more particularly for its storage between successive withdrawals are given.

Antimicrobial preservatives. Aqueous preparations which are prepared using aseptic precautions and which cannot be terminally sterilised may contain a suitable antimicrobial preservative in an appropriate concentration.

No antimicrobial preservative is added when:

- the volume to be injected in a single dose exceeds 15 ml, unless otherwise justified,
- the preparation is intended for administration by routes where, for medical reasons, an antimicrobial preservative is not acceptable, such as intracisternally, epidurally, intrathecally or by any route giving access to the cerebrospinal fluid, or intra- or retro-ocularly.

Such preparations are presented in single-dose containers.

PRODUCTION

In the manufacture of injections containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

Single-dose preparations. The volume of the injection in a single-dose container is sufficient to permit the withdrawal and administration of the nominal dose using a normal technique (*2.9.17*).

TESTS

Uniformity of dosage units. Single-dose suspensions for injection comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose suspensions for injection with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A for uniformity of content of single-dose preparations. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Bacterial endotoxins - pyrogens. A test for bacterial endotoxins (*2.6.14*) is carried out or, where justified and authorised, the test for pyrogens (*2.6.8*). Recommendations on the limits for bacterial endotoxins are given in chapter *2.6.14*.

Preparations for human use. The preparation complies with a test for bacterial endotoxins (*2.6.14*) or with the test for pyrogens (*2.6.8*).

Preparations for veterinary use. When the volume to be injected in a single dose is 15 ml or more and is equivalent to a dose of 0.2 ml or more per kilogram of body mass, the preparation complies with a test for bacterial endotoxins (*2.6.14*) or with the test for pyrogens (*2.6.8*).

Any preparation. Where the label states that the preparation is free from bacterial endotoxins or apyrogenic, respectively, the preparation complies with a test for bacterial endotoxins (*2.6.14*) or with the test for pyrogens (*2.6.8*), respectively.

Infusions

DEFINITION

Infusions are sterile, aqueous solutions or emulsions with water as the continuous phase. They are usually made isotonic with respect to blood. They are principally intended for administration in large volume. Infusions do not contain any added antimicrobial preservative.

Solutions for infusion, examined under suitable conditions of visibility are clear and practically free from particles.

Emulsions for infusion do not show any evidence of phase separation.

PRODUCTION

In the manufacture of infusions containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

The volume of the infusion in the container is sufficient to permit the withdrawal and administration of the nominal dose using a normal technique (*2.9.17*).

TESTS

Bacterial endotoxins - pyrogens. They comply with a test for bacterial endotoxins (*2.6.14*) or, where justified and authorised, with the test for pyrogens (*2.6.8*). For the latter test inject 10 ml per kilogram of body mass into each rabbit, unless otherwise justified and authorised.

Concentrates for injections or infusions

DEFINITION

Concentrates for injections or infusions are sterile solutions intended for injection or infusion after dilution. They are diluted to a prescribed volume with a prescribed liquid before administration. After dilution, they comply with the requirements for injections or for infusions.

TESTS

Bacterial endotoxins - pyrogens. They comply with the requirements prescribed for injections or for infusions, after dilution to a suitable volume.

Powders for injections or infusions

DEFINITION

Powders for injections or infusions are solid, sterile substances distributed in their final containers and which, when shaken with the prescribed volume of a prescribed sterile liquid rapidly form either clear and

practically particle-free solutions or uniform suspensions. After dissolution or suspension, they comply with the requirements for injections or for infusions.

Freeze-dried products for parenteral use are considered as powders for injections or infusions.

PRODUCTION

The uniformity of content and uniformity of mass of freeze-dried products for parenteral use are ensured by the in-process control of the amount of the solution prior to freeze-drying.

TESTS

Uniformity of dosage units. Powders for injections or infusions comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, powders for injections or infusions with a content of active substance less than 2 mg or less than 2 per cent of the total mass, or with a unit mass equal to or less than 40 mg comply with test A for uniformity of content of single-dose preparations. If the preparation contains more than one active substance, the requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Powders for injections or infusions comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Bacterial endotoxins - pyrogens. They comply with the requirements prescribed for injections or for infusions, after dissolution or suspension in a suitable volume of liquid.

LABELLING

The label states the instructions for the preparation of injections and infusions.

Gels for injections

DEFINITION

Gels for injections are sterile gels with a viscosity suitable to guarantee a modified release of the active substance(s) at the site of injection.

Implants

DEFINITION

Implants are sterile, solid preparations of a size and shape suitable for parenteral implantation and release of the active substance(s) over an extended period of time. Each dose is provided in a sterile container.

01/2008:1011

PATCHES, TRANSDERMAL

Emplastra transcutanea

DEFINITION

Transdermal patches are flexible pharmaceutical preparations of varying sizes, containing one or more active substances. They are intended to be applied to the unbroken skin in order to deliver the active substance(s) to the systemic circulation after passing through the skin barrier.

Transdermal patches normally consist of an outer covering which supports a preparation which contains the active substance(s). The transdermal patches are covered on the site of the release surface of the preparation by a protective liner, which is removed before applying the patch to the skin.

The outer covering is a backing sheet impermeable to the active substance(s) and normally impermeable to water, designed to support and protect the preparation. The outer covering may have the same dimensions as the preparation or it may be larger. In the latter case the overlapping border of the outer covering is covered by pressure-sensitive adhesive substances which assure the adhesion of the patch to the skin.

The preparation contains the active substance(s) together with excipients such as stabilisers, solubilisers or substances intended to modify the release rate or to enhance transdermal absorption. It may be a single layer or multi-layer solid or semi-solid matrix, and in this case it is the composition and structure of the matrix which determines the diffusion pattern of the active substance(s) to the skin. The matrix may contain pressure-sensitive adhesives which assure the adhesion of the preparation to the skin. The preparation may exist as a semi-solid reservoir one side of which is a membrane which may control the release and the diffusion of the active substance(s) from the preparation. The pressure-sensitive adhesive substances may, in this case, be applied to some or all parts of the membrane, or only around the border of the membrane of the outer covering.

When applied to the dried, clean and unbroken skin, the transdermal patch adheres firmly to the skin by gentle pressure of the hand or the fingers and can be peeled off without causing appreciable injury to the skin or detachment of the preparation from the outer covering. The patch must not be irritant or sensitising to the skin, even after repeated applications.

The protective liner generally consists of a sheet of plastic or metal material. When removed, the protective liner does not detach the preparation (matrix or reservoir) or the adhesive from the patch.

Transdermal patches are normally individually enclosed in sealed sachets.

PRODUCTION

In the manufacture, packaging, storage and distribution of transdermal patches suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

TESTS

Uniformity of dosage units. Transdermal patches comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the test for uniformity

of content shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, transdermal patches comply with test C for uniformity of content of single-dose preparations.

Dissolution. A suitable test may be required to demonstrate the appropriate release of the active substance(s), for example one of the tests described in *Dissolution test for transdermal patches* (*2.9.4*). The disc assembly method, the cell method or the rotating cylinder method may be used, as suitable, according to the composition, dimensions and shape of the patch.

A membrane may be used. It can be of various materials, such as inert porous cellulose or silicones, and must not affect the release kinetics of the active substance(s) from the patch. Furthermore, it must be free of substances that may interfere with its performance (for example grease). The membrane may be suitably treated before the tests, for example, by maintaining it in the medium to be used in the test for 24 h. Apply the membrane above the releasing surface of the patch, avoiding the formation of air bubbles.

The test conditions and the requirements are to be authorised by the competent authority.

STORAGE

Store at room temperature, unless otherwise indicated.

LABELLING

The label states, where applicable, the total quantity of active substance(s) per patch, the dose released per unit time and the area of the releasing surface.

01/2008:1166

POWDERS FOR CUTANEOUS APPLICATION

Pulveres ad usum dermicum

Where justified and authorised, the requirements of this monograph do not apply to powders for cutaneous application intended for veterinary use.

DEFINITION

Powders for cutaneous application are preparations consisting of solid, loose, dry particles of varying degrees of fineness. They contain one or more active substances, with or without excipients and, if necessary, colouring matter authorised by the competent authority.

Powders for cutaneous application are presented as single-dose powders or multidose powders. They are free from grittiness. Powders specifically intended for use on large open wounds or on severely injured skin are sterile.

Multidose powders for cutaneous application may be dispensed in sifter-top containers, containers equipped with a mechanical spraying device or in pressurised containers.

Powders dispensed in pressurised containers comply with the requirements of *Pressurised pharmaceutical preparations (0523)*.

Where applicable, containers for powders comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

PRODUCTION

In the manufacture of powders for cutaneous application, measures are taken to ensure a suitable particle size with regard to the intended use.

In the manufacture, packaging, storage and distribution of powders for cutaneous application, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

Sterile powders for cutaneous application are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

TESTS

Fineness. If prescribed, the fineness of a powder is determined by the sieve test (*2.9.12*) or another appropriate method.

Uniformity of dosage units. Single-dose powders for cutaneous application comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose powders for cutaneous application with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose powders for cutaneous application comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Sterility (*2.6.1*). Where the label indicates that the preparation is sterile, it complies with the test for sterility.

LABELLING

The label states:

– that the preparation is for external use,
– where applicable, that the preparation is sterile.

01/2008:1165

POWDERS, ORAL

Pulveres perorales

Requirements for powders to be used for the preparation of oral solutions or suspensions are given in the monograph for Liquid preparations for oral use (0672). Where justified and authorised, the requirements of this monograph do not apply to oral powders intended for veterinary use.

DEFINITION

Oral powders are preparations consisting of solid, loose, dry particles of varying degrees of fineness. They contain one or more active substances, with or without excipients and, if necessary, colouring matter authorised by the competent authority and flavouring substances. They are generally

administered in or with water or another suitable liquid. They may also be swallowed directly. They are presented as single-dose or multidose preparations.

Where applicable, containers for oral powders comply with the requirements of *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Multidose oral powders require the provision of a measuring device capable of delivering the quantity prescribed. Each dose of a single-dose powder is enclosed in an individual container, for example a sachet or a vial.

PRODUCTION

In the manufacture of oral powders, means are taken to ensure a suitable particle size with regard to the intended use.

In the manufacture, packaging, storage and distribution of oral powders, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

TESTS

Uniformity of dosage units. Single-dose oral powders comply with the test for uniformity of dosage units (*2.9.40*) or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, single-dose oral powders with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test B for uniformity of content of single-dose preparations. If the preparation has more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Single-dose oral powders comply with the test for uniformity of mass of single-dose preparations. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Uniformity of mass of delivered doses from multidose containers (*2.9.27*). Oral powders supplied in multidose containers comply with the test.

STORAGE

If the preparation contains volatile ingredients, or the contents have to be protected, store in an airtight container.

Effervescent powders

Effervescent powders are presented as single-dose or multidose preparations and generally contain acid substances and carbonates or hydrogen carbonates which react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

STORAGE

In an airtight container.

01/2008:1037

PREMIXES FOR MEDICATED FEEDING STUFFS FOR VETERINARY USE

Praeadmixta ad alimenta medicata ad usum veterinarium

DEFINITION

Mixtures of one or more active substances, usually in suitable bases, that are prepared to facilitate feeding the active substances to animals. They are used exclusively in the preparation of medicated feeding stuffs.

Premixes occur in granulated, powdered, semi-solid or liquid form. Used as powders or granules, they are free-flowing and homogeneous; any aggregates break apart during normal handling. Used in liquid form, they are homogeneous suspensions or solutions which may be obtained from thixotropic gels or structured liquids. The particle size and other properties are such as to ensure uniform distribution of the active substance(s) in the final feed. Unless otherwise justified and authorised, the instructions for use state that the concentration of a premix in granulated or powdered form is at least 0.5 per cent in the medicated feeding stuff.

PRODUCTION

Active substance. An active substance intended for incorporation into a medicated premix complies with the requirements of the relevant monograph of the European Pharmacopoeia, unless already otherwise justified and authorised for existing premixes.

TESTS

Loss on drying (*2.2.32*). Unless otherwise justified and authorised, for premixes occurring in granulated or powdered form, maximum 15.0 per cent, determined on 3.000 g by drying in an oven at 100-105 °C for 2 h.

LABELLING

The label states:

- the category of animal for which the premix is intended,
- the instructions for the preparation of the medicated feeding stuffs from the premix and the basic feed,
- where applicable, the time that must elapse between the cessation of feeding of the medicated feeding stuff and collection of the material intended for human consumption.

01/2008:0671

PREPARATIONS FOR INHALATION

Inhalanda

DEFINITION

Preparations for inhalation are liquid or solid preparations intended for administration as vapours or aerosols to the lung in order to obtain a local or systemic effect. They contain one or more active substances which may be dissolved or dispersed in a suitable vehicle.

Preparations for inhalation may, depending on the type of preparation, contain propellants, cosolvents, diluents, antimicrobial preservatives, solubilising and stabilising agents, etc. These excipients do not adversely affect the functions of the mucosa of the respiratory tract or its cilia.

Preparations for inhalation are supplied in multidose or single-dose containers. When supplied in pressurised containers, they comply with the requirements of the monograph on *Pressurised pharmaceutical preparations (0523)*.

Preparations intended to be administered as aerosols (dispersions of solid or liquid particles in a gas) are administered by one of the following devices:

– nebuliser,
– pressurised metered-dose inhaler,
– powder inhaler.

PRODUCTION

During the development of a preparation for inhalation which contains an antimicrobial preservative, the effectiveness of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with the criteria for judging the preservative properties of the formulation are described in the text on *Efficacy of antimicrobial preservation* (*5.1.3*).

The size of aerosol particles to be inhaled is controlled so that a significant fraction is deposited in the lung. The fine-particle characteristics of preparations for inhalation are determined by the method for *Aerodynamic assessment of fine particles* (*2.9.18*).

In assessing the uniformity of delivered dose of a multidose inhaler, it is not sufficient to test a single inhaler. Manufacturers must substitute procedures which take both inter- and intra-inhaler dose uniformity into account. A suitable procedure based on the intra-inhaler test would be to collect each of the specified doses at the beginning, middle and end of the number of doses stated on the label from separate inhalers.

Pressurised metered-dose inhalers are tested for leakage. All inhalers are tested for extraneous particulate contamination.

LABELLING

For metered-dose preparations the label states:

– the delivered dose, except for preparations for which the dose has been established as a metered-dose or as a predispensed-dose,
– where applicable, the number of deliveries from the inhaler to provide the minimum recommended dose,
– the number of deliveries per inhaler.

The label states, where applicable, the name of any added antimicrobial preservative.

Liquid preparations for inhalation

3 categories of liquid preparations for inhalation may be distinguished:

A. preparations intended to be converted into vapour,

B. liquid preparations for nebulisation,

C. pressurised metered-dose preparations for inhalation.

Liquid preparations for inhalation are solutions or dispersions.

Dispersions are readily dispersible on shaking and they remain sufficiently stable to enable the correct dose to be delivered. Suitable excipients may be used.

A. PREPARATIONS INTENDED TO BE CONVERTED INTO VAPOUR

DEFINITION

Preparations intended to be converted into vapour are solutions, dispersions or solid preparations. They are usually added to hot water and the vapour generated is inhaled.

B. LIQUID PREPARATIONS FOR NEBULISATION

DEFINITION

Liquid preparations for inhalation intended to be converted into aerosols by continuously operating nebulisers or metered-dose nebulisers are solutions, suspensions or emulsions. Suitable cosolvents or solubilisers may be used to increase the solubility of the active substances.

Liquid preparations for nebulisation in concentrated form for use in continuously operating nebulisers are diluted to the prescribed volume with the prescribed liquid before use. Liquids for nebulisation may also be prepared from powders.

The pH of the liquid preparations for use in continuously operating nebulisers is not lower than 3 and not higher than 8.5.

Suspensions and emulsions are readily dispersible on shaking and they remain sufficiently stable to enable the correct dose to be delivered.

Aqueous preparations for nebulisation supplied in multidose containers may contain a suitable antimicrobial preservative at a suitable concentration except where the preparation itself has adequate antimicrobial properties.

Continuously operating nebulisers are devices that convert liquids into aerosols by high-pressure gases, ultrasonic vibration or other methods. They allow the dose to be inhaled at an appropriate rate and particle size which ensures deposition of the preparation in the lungs.

Metered-dose nebulisers are devices that convert liquids into aerosols by high-pressure gases, ultrasonic vibration or other methods. The volume of liquid to be nebulised is metered so that the aerosol dose can be inhaled with one breath.

C. PRESSURISED METERED-DOSE PREPARATIONS FOR INHALATION

DEFINITION

Pressurised metered-dose preparations for inhalation are solutions, suspensions or emulsions supplied in containers equipped with a metering valve and which are held under pressure with suitable propellants or suitable mixtures of liquefied propellants, which can act also as solvents. Suitable cosolvents, solubilisers and stabilisers may be added.

The delivered dose is the dose delivered from the inhaler to the patient. For some preparations, the dose has been established as a metered dose. The metered dose is determined by adding the amount deposited on the inhaler to the delivered dose. It may also be determined directly.

TESTS

For breath-operated pressurised metered-dose inhalers, the test conditions described below may need to be modified to ensure that breath actuation occurs for the inhaler under test.

Uniformity of delivered dose. Containers usually operate in a valve-down position. For containers that operate in a valve-up position, an equivalent test is applied using methods that ensure the complete collection of the delivered dose. In all cases, prepare the inhaler as directed in the instructions to the patient.

The dose collection apparatus must be capable of quantitatively capturing the delivered dose.

The following apparatus (Figure 0671.-1) and procedure may be used.

The apparatus consists of a filter-support base with an open-mesh filter-support, such as a stainless steel screen, a collection tube that is clamped or screwed to the filter-support base, and a mouthpiece adapter to ensure an airtight seal between the collection tube and the mouthpiece. Use a mouthpiece adapter which ensures that the front face of the inhaler mouthpiece is flush with the front face or the 2.5 mm indented shoulder of the sample collection tube, as appropriate. The vacuum connector is connected to a system comprising a vacuum source and a flow regulator. The source should be adjusted to draw air through the complete assembly, including the filter and the inhaler to be tested, at 28.3 litres/min (± 5 per cent). Air should be drawn continuously through the apparatus to avoid loss of the active substance into the atmosphere. The filter-support base is designed to accommodate 25 mm diameter filter disks. The filter disk and other materials used in the construction of the apparatus must be compatible with the active substance and solvents that are used to extract the active substance from the filter. One end of the collection tube is designed to hold the filter disk tightly against the filter-support base. When assembled, the joints between the components of the apparatus are airtight so that when a vacuum is applied to the base of the filter, all of the air drawn through the collection tube passes through the inhaler.

Unless otherwise prescribed in the instructions to the patient, shake the inhaler for 5 s and discharge one delivery to waste. Fire the inverted inhaler into the apparatus, depressing the valve for a sufficient time to ensure complete discharge. Repeat the procedure until the number of

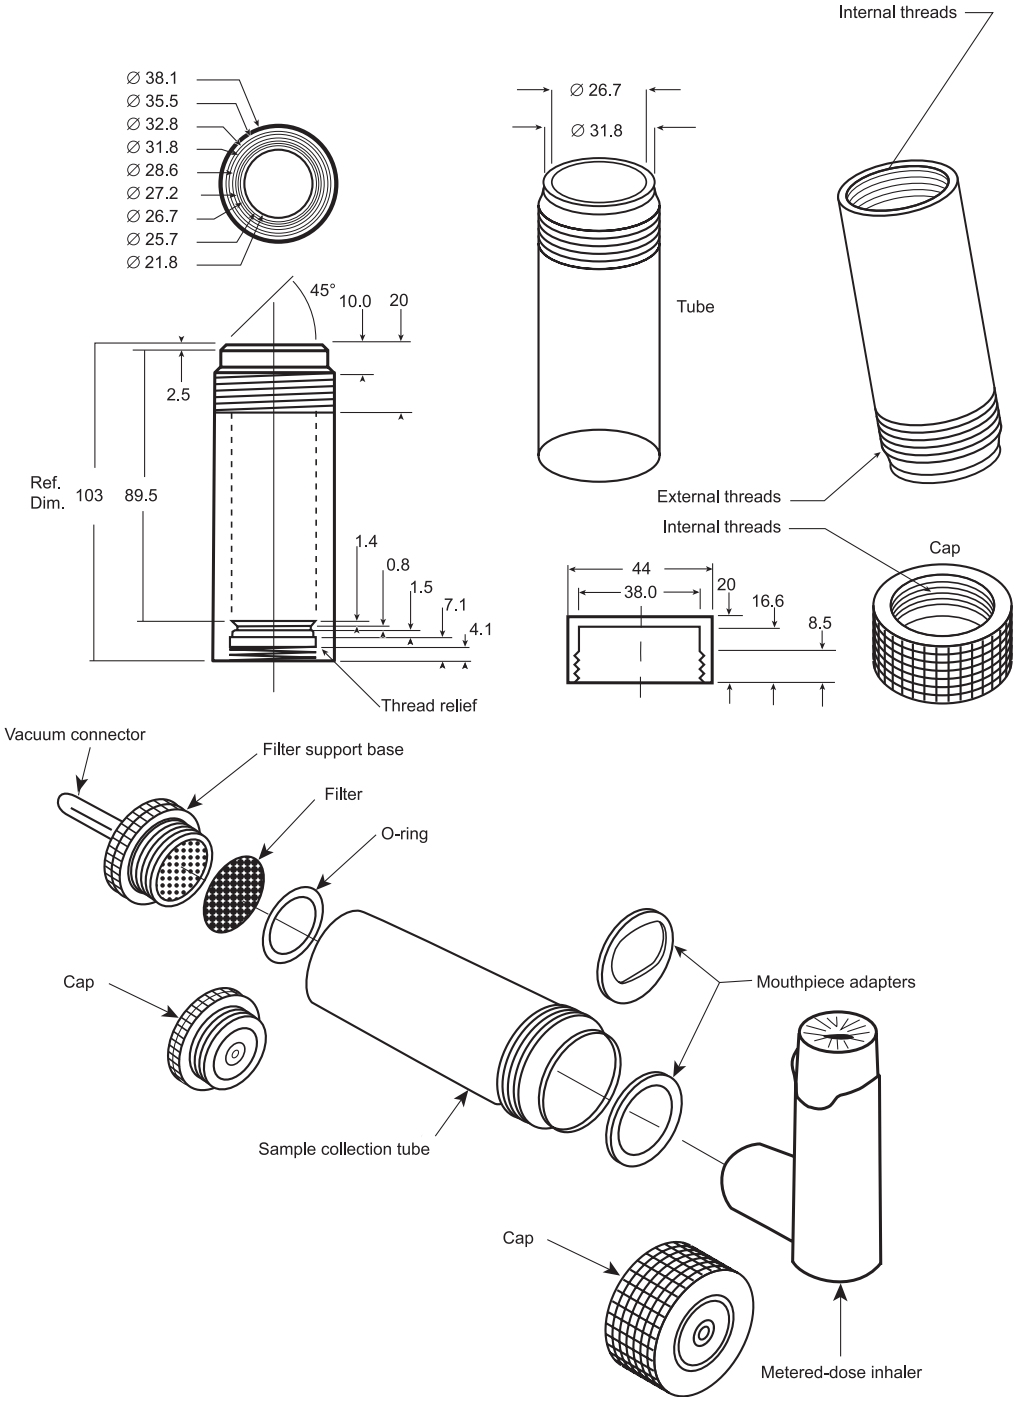

Figure 0671.-1. – *Dose collection apparatus for pressurised metered-dose inhalers*
Dimensions in millimetres

deliveries that constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the device to waste, waiting not less than 5 s between actuations until $(n/2)+1$ deliveries remain, where n is the number of deliveries stated on the label. Collect 4 doses using the procedure described above.

Discharge the device to waste, waiting not less than 5 s between actuations until 3 doses remain. Collect these 3 doses using the procedure described above.

For preparations containing more than one active substance, carry out the test for uniformity of delivered dose for each active substance.

Unless otherwise justified and authorised, the preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the average value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent.

Fine particle dose. Using an apparatus and procedure described in *Aerodynamic assessment of fine particles* (*2.9.18 - Apparatus C, D or E*), calculate the fine particle dose.

Number of deliveries per inhaler. Take one inhaler and discharge the contents to waste, actuating the valve at intervals of not less than 5 s. The total number of deliveries so discharged from the inhaler is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

Powders for inhalation

DEFINITION

Powders for inhalation are presented as single-dose powders or multidose powders. To facilitate their use, active substances may be combined with a suitable carrier. They are generally administered by powder inhalers. For pre-metered inhalers, the inhaler is loaded with powders pre-dispensed in capsules or other suitable pharmaceutical forms. For inhalers using a powder reservoir, the dose is created by a metering mechanism within the inhaler.

The delivered dose is the dose delivered from the inhaler. For some preparations, the dose has been established as a metered dose or as a predispensed dose. The metered dose is determined by adding the amount deposited on the inhaler to the delivered dose. It may also be determined directly.

TESTS

Uniformity of delivered dose. In all cases, prepare the inhaler as directed in the instructions to the patient. The dose collection apparatus must be capable of quantitatively capturing the delivered dose. A dose collection apparatus similar to that described for the evaluation of pressurised metered-dose inhalers may be used provided that the dimensions of the tube and the filter can accommodate the measured flow rate. A suitable tube is defined in Table 0671.-1. Connect the tube to a flow system according to the scheme specified in Figure 0671.-2 and Table 0671.-1.

Unless otherwise stated, determine the test flow rate and duration using the dose collection tube, the associated flow system, a suitable differential pressure meter and a suitable volumetric flowmeter, calibrated for the flow leaving the meter, according to the following procedure.

Prepare the inhaler for use and connect it to the inlet of the apparatus using a mouthpiece adapter to ensure an airtight seal. Use a mouthpiece adapter which ensures that the front face of the inhaler mouthpiece is flush with the front face of the sample collection tube. Connect one port of a differential pressure meter to the pressure reading point, P1, in Figure 0671.-2 and let the other be open to the atmosphere. Switch on the pump, open the 2-way solenoid valve and adjust the flow control valve until the pressure drop across the inhaler is 4.0 kPa (40.8 cm H_2O) as indicated by the differential pressure meter. Remove the inhaler from the mouthpiece adapter and without touching the flow control valve, connect a flowmeter to the inlet of the sampling apparatus. Use a flowmeter calibrated for the volumetric flow leaving the meter, or calculate the volumetric flow leaving the meter (Q_{out}) using the ideal gas law. For a meter calibrated for the entering volumetric flow (Q_{in}), use the following expression:

$$Q_{out} = \frac{Q_{in} \times P_0}{P_0 - \Delta P}$$

P_0 = atmospheric pressure,

ΔP = pressure drop over the meter.

If the flow rate is above 100 litres/min adjust the flow control valve to obtain a flow rate of 100 litres/min (± 5 per cent). Note the volumetric airflow rate exiting the meter and define this as the test flow rate, Q_{out}, in litres per minute. Define the test flow duration, T, in seconds so that a volume of 4 litres of air is drawn from the mouthpiece of the inhaler at the test flow rate, Q_{out}.

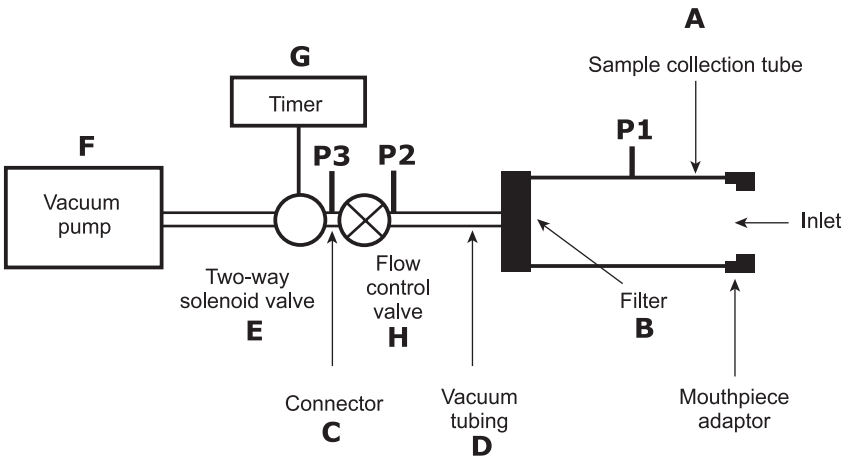

Figure 0671.-2. – *Apparatus suitable for measuring the uniformity of delivered dose for powder inhalers*

Ensure that critical flow occurs in the flow control valve by the following procedure; with the inhaler in place and the test flow rate Q_{out}, measure the absolute pressure on both sides of the control valve (pressure reading points P2 and P3 in Figure 0671.-2). A ratio P3/P2 of less than or equal to 0.5 indicates critical flow. Switch to a more powerful pump and re-measure the test flow rate if critical flow is not indicated.

Table 0671.-1. – *Specifications of the apparatus used for powder inhalers described in Figure 0671.-2*

Code	Item	Description
A	Sample collection tube	Capable of quantitatively capturing the delivered dose, e.g. dose collection tube similar to that described in Figure 0671.-1 with dimensions of 34.85 mm ID × 12 cm length (e.g. product number XX40 047 00, Millipore Corporation, Bedford, MA 01732 with modified exit tube, ID ≥ 8 mm, fitted with Gelman product number 61631), or equivalent.
B	Filter	47 mm filter, e.g. A/E glass fibre filter (Gelman Sciences, Ann Arbor, MI 48106), or equivalent.
C	Connector	ID ≥ 8 mm, e.g., short metal coupling, with low-diameter branch to P3.
D	Vacuum tubing	A length of suitable tubing having an ID ≥ 8 mm and an internal volume of 25 ± 5 ml.
E	2-way solenoid valve	A 2-way, 2-port solenoid valve having a minimum airflow resistance orifice with ID ≥ 8 mm and an opening time ≤ 100 ms (e.g. type 256-A08, Bürkert GmbH, D-74653 Ingelfingen), or equivalent.
F	Vacuum pump	Pump must be capable of drawing the required flow rate through the assembled apparatus with the powder inhaler in the mouthpiece adapter (e.g. product type 1023, 1423 or 2565, Gast Manufacturing Inc., Benton Harbor, MI 49022), or equivalent. Connect the pump to the 2-way solenoid valve using short and/or wide (≥ 10 mm ID) vacuum tubing and connectors to minimise pump capacity requirements.
G	Timer	Timer capable of driving the 2-way solenoid valve for the required time period (e.g. type G814, RS Components International, Corby, NN17 9RS, UK), or equivalent.
P1	Pressure tap	2.2 mm ID, 3.1 mm OD, flush with internal surface of the sample collection tube, centred and burr-free, 59 mm from its inlet. The pressure tap P1 must never be open to the atmosphere.
P1 P2 P3	Pressure measurements	Differential pressure to atmosphere (P1) or absolute pressure (P2 and P3).
H	Flow control valve	Adjustable regulating valve with maximum C*v* ≥ 1, (e.g. type 8FV12LNSS, Parker Hannifin plc., Barnstaple, EX31 1NP, UK), or equivalent.

Predispensed systems. Prepare the inhaler as directed in the instructions to the patient and connect it to the apparatus using an adapter which ensures a good seal. Draw air through the inhaler using the predetermined conditions. Repeat the procedure until the number of deliveries which constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 9 doses.

Reservoir systems. Prepare the inhaler as directed in the instructions to the patient and connect it to the apparatus using an adapter which ensures a good seal. Draw air through the inhaler under the predetermined conditions. Repeat the procedure until the number of deliveries which constitute the minimum recommended dose have been sampled. Quantitatively collect the contents of the apparatus and determine the amount of active substance.

Repeat the procedure for a further 2 doses.

Discharge the device to waste until $(n/2)+1$ deliveries remain, where n is the number of deliveries stated on the label. If necessary, store the inhaler to discharge electrostatic charges. Collect 4 doses using the procedure described above.

Discharge the device to waste until 3 doses remain. If necessary, store the inhaler to discharge electrostatic charges. Collect 3 doses using the procedure described above.

For preparations containing more than one active substance, carry out the test for uniformity of delivered dose for each active substance.

Results. The preparation complies with the test if 9 out of 10 results lie between 75 per cent and 125 per cent of the average value and all lie between 65 per cent and 135 per cent. If 2 or 3 values lie outside the limits of 75 per cent to 125 per cent, repeat the test for 2 more inhalers. Not more than 3 of the 30 values lie outside the limits of 75 per cent to 125 per cent and no value lies outside the limits of 65 per cent to 135 per cent.

In justified and authorised cases, these ranges may be extended but no value should be greater than 150 per cent or less than 50 per cent of the average value.

Fine particle dose. Using the apparatus and procedure described in *Aerodynamic assessment of fine particles* (*2.9.18 - Apparatus C, D or E*), calculate the fine particle dose.

Number of deliveries per inhaler for multidose inhalers. Discharge doses from the inhaler until empty, at the predetermined flow rate. Record the deliveries discharged. The total number of doses delivered is not less than the number stated on the label (this test may be combined with the test for uniformity of delivered dose).

01/2008:1116

PREPARATIONS FOR IRRIGATION

Praeparationes ad irrigationem

DEFINITION

Preparations for irrigation are sterile, aqueous, large-volume preparations intended to be used for irrigation of body cavities, wounds and surfaces, for example during surgical procedures.

Preparations for irrigation are either solutions prepared by dissolving one or more active substances, electrolytes or osmotically active substances in water complying with the requirements for *Water for injections (0169)* or they consist of such water alone. In the latter case, the preparation may be labelled as 'water for irrigation'. Irrigation solutions are usually adjusted to make the preparation isotonic with respect to blood.

Examined in suitable conditions of visibility, preparations for irrigation are clear and practically free from particles.

Preparations for irrigation are supplied in single-dose containers. The containers and closures comply with the requirements for containers for preparations for parenteral use (*3.2.1* and *3.2.2*), but the administration port of the container is incompatible with intravenous administration equipment and does not allow the preparation for irrigation to be administered with such equipment.

PRODUCTION

Preparations for irrigation are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of

micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

During development, it must be demonstrated that the nominal content can be withdrawn from the container.

TESTS

Sterility (*2.6.1*). Preparations for irrigation comply with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 0.5 IU/ml.

Pyrogens (*2.6.8*). Preparations for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the preparation, unless otherwise justified and authorised.

LABELLING

The label states:

– that the preparation is not to be used for injection;
– that the preparation is to be used on one occasion only and that any unused portion of the preparation is to be discarded.

01/2008:0523

PRESSURISED PHARMACEUTICAL PREPARATIONS

Praeparationes pharmaceuticae in vasis cum pressu

Additional requirements for preparations presented in pressurised containers may be found, where appropriate, in other general monographs, for example Preparations for inhalation (0671), Liquid preparations for cutaneous application (0927), Powders for cutaneous application (1166), Nasal preparations (0676) and Ear preparations (0652).

DEFINITION

Pressurised pharmaceutical preparations are presented in special containers under pressure of a gas and contain one or more active substances. The preparations are released from the container, upon actuation of an appropriate valve, in the form of an aerosol (dispersion of solid or liquid particles in a gas, the size of the particles being adapted to the intended use) or of a liquid or semisolid jet such as a foam. The pressure for the release is generated by suitable propellants.

The preparations consist of a solution, an emulsion or a suspension and are intended for local application to the skin or to mucous membranes of various body orifices, or for inhalation. Suitable excipients may also be used, for example solvents, solubilisers, emulsifying agents, suspending agents and lubricants for the valve to prevent clogging.

Propellants. The propellants are either gases liquefied under pressure or compressed gases or low-boiling liquids. Liquefied gases are, for example, fluorinated hydrocarbons and low-molecular-mass hydrocarbons (such as propane and butane). Compressed gases are, for example, carbon dioxide, nitrogen and nitrous oxide.

Mixtures of these propellants may be used to obtain optimal solution properties and desirable pressure, delivery and spray characteristics.

Containers. The containers are tight and resistant to the internal pressure and may be made of metal, glass, plastic or combinations of these materials. They are compatible with their contents. Glass containers are protected with a plastic coating.

Spraying device. The valve keeps the container tightly closed when not in use and regulates the delivery of the contents during use. The spray characteristics are influenced by the type of spraying device, in particular by the dimensions, number and location of orifices. Some valves provide a continuous release, others ("metering dose valves") deliver a defined quantity of product upon each valve actuation.

The various valve materials in contact with the contents are compatible with them.

Requirements for pressurised pharmaceutical preparations. Pressurised preparations are provided with a delivery device appropriate for the intended application.

Special requirements may be necessary for the selection of propellants, for particle size and the single-dose delivered by the metering valves.

LABELLING

The label states:

– the method of use,
– any precautions to be taken,
– for a container with a metering dose valve, the amount of active substance in a unit-spray.

01/2008:1145

RECTAL PREPARATIONS

Rectalia

DEFINITION

Rectal preparations are intended for rectal use in order to obtain a systemic or local effect, or they may be intended for diagnostic purposes.

Where applicable, containers for rectal preparations comply with the requirements for materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of rectal preparations may be distinguished:

– suppositories;
– rectal capsules;
– rectal solutions, emulsions and suspensions;
– powders and tablets for rectal solutions and suspensions;
– semi-solid rectal preparations;
– rectal foams;
– rectal tampons.

PRODUCTION

During the development of a rectal preparation whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in chapter *5.1.3 Efficacy of antimicrobial preservation*.

During development, it must be demonstrated that the nominal contents can be withdrawn from the container of liquid and semi-solid rectal preparations presented in single-dose containers.

In the manufacture, packaging, storage and distribution of rectal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in chapter *5.1.4 Microbiological quality of pharmaceutical preparations*.

In the manufacture of semi-solid and liquid rectal preparations containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Uniformity of dosage units (*2.9.40*). Liquid and semi-solid single-dose rectal preparations comply with the test. Solid single-dose rectal preparations comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, solid single-dose rectal preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A (tablets) or test B (suppositories, rectal capsules). If the preparation contains more than one active substance, this requirement applies only to those substances that correspond to the above conditions.

Uniformity of mass (*2.9.5*). Solid single-dose rectal preparations comply with the test. If the test for uniformity of content is prescribed for all active substances, the test for uniformity of mass is not required.

Dissolution. A suitable test may be required to demonstrate the appropriate release of the active substance(s) from solid single-dose rectal preparations, for example *2.9.42 Dissolution test for lipophilic solid dosage forms*.

Where a dissolution test is prescribed, a disintegration test may not be required.

LABELLING

The label states the name of any added antimicrobial preservative.

Suppositories

DEFINITION

Suppositories are solid, single-dose preparations. The shape, volume and consistency of suppositories are suitable for rectal administration.

They contain 1 or more active substances dispersed or dissolved in a suitable basis that may be soluble or dispersible in water or may melt at body temperature. Excipients such as diluents, adsorbents, surface-active agents, lubricants, antimicrobial preservatives and colouring matter, authorised by the competent authority, may be added if necessary.

PRODUCTION

Suppositories are prepared by compression or moulding. If necessary, the active substance(s) are previously ground and sieved through a suitable sieve. When prepared by moulding, the medicated mass, sufficiently liquefied by heating, is poured into suitable moulds. The suppository solidifies on cooling. Various excipients are available for this process, such as hard fat, macrogols, cocoa butter, and various gelatinous mixtures consisting of, for example, gelatin, water and glycerol. The determination of the softening time of lipophilic suppositories (*2.9.22*) is carried out.

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from suppositories intended for modified release or for prolonged local action.

In the manufacture of suppositories containing dispersed active substances, measures are taken to ensure a suitable and controlled particle size.

TESTS

Disintegration (*2.9.2*). Unless intended for modified release or for prolonged local action, they comply with the test. For suppositories with a fatty base, examine after 30 min, and for suppositories with a water-soluble base, examine after 60 min, unless otherwise justified and authorised.

Rectal capsules

DEFINITION

Rectal capsules (shell suppositories) are solid, single-dose preparations generally similar to soft capsules as defined in the monograph *Capsules (0016)* except that they may have lubricating coatings. They are of elongated shape, are smooth and have a uniform external appearance.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from rectal capsules intended for modified release or for prolonged local action.

TESTS

Disintegration (*2.9.2*). Unless intended for modified release or for prolonged local action, they comply with the test. Examine the state of the capsules after 30 min, unless otherwise justified and authorised.

Rectal solutions, emulsions and suspensions

DEFINITION

Rectal solutions, emulsions and suspensions are liquid preparations intended for rectal use in order to obtain a systemic or local effect, or they may be intended for diagnostic purposes.

Rectal solutions, emulsions and suspensions are supplied in single-dose containers and contain 1 or more active substances dissolved or dispersed in water, glycerol or macrogols or other suitable solvents. Emulsions may show evidence of phase separation but are readily redispersed on shaking. Suspensions may show a sediment that is readily dispersible on shaking to give a suspension that remains sufficiently stable to enable the correct dose to be delivered.

Rectal solutions, emulsions and suspensions may contain excipients, for example to adjust the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance(s) or to stabilise the preparation. These substances do not adversely affect the intended medical action or, at the concentrations used, cause undue local irritation.

Rectal solutions, emulsions and suspensions are supplied in containers containing a volume in the range of 2.5 ml to 2000 ml. The container is adapted to deliver the preparation to the rectum or is accompanied by a suitable applicator.

Powders and tablets for rectal solutions and suspensions

DEFINITION

Powders and tablets intended for the preparation of rectal solutions or suspensions are single-dose preparations that are dissolved or dispersed in water or other suitable solvents at the time of administration. They may contain excipients to facilitate dissolution or dispersion or to prevent aggregation of the particles.

After dissolution or suspension, they comply with the requirements for rectal solutions or rectal suspensions, as appropriate.

TESTS

Disintegration (*2.9.1*). Tablets for rectal solutions or suspensions comply with the test, but using *water R* at 15-25 °C and 6 tablets. Examine the state of the tablets after 3 min. The tablets comply with the test if all 6 have disintegrated.

LABELLING

The label states:

– the method of preparation of the rectal solution or suspension;

– the conditions and duration of storage of the solution or suspension after constitution.

Semi-solid rectal preparations

DEFINITION

Semi-solid rectal preparations are ointments, creams or gels.

They are often supplied as single-dose preparations in containers provided with a suitable applicator.

Semi-solid rectal preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*.

Rectal foams

DEFINITION

Rectal foams comply with the requirements of the monograph *Medicated foams (1105)*.

Rectal tampons

DEFINITION

Rectal tampons are solid, single-dose preparations intended to be inserted into the lower part of the rectum for a limited time.

They comply with the requirements of the monograph *Medicated tampons (1155)*.

01/2008:0132

SEMI-SOLID PREPARATIONS FOR CUTANEOUS APPLICATION

Praeparationes molles ad usum dermicum

The requirements of this monograph apply to all semi-solid preparations for cutaneous application. Where appropriate, additional requirements specific to semi-solid preparations intended to be applied to particular surfaces or mucous membranes may be found in other general monographs, for example Ear preparations (0652), Nasal preparations (0676), Rectal preparations (1145), Eye preparations (1163) and Vaginal preparations (1164).

DEFINITION

Semi-solid preparations for cutaneous application are intended for local or transdermal delivery of active substances, or for their emollient or protective action. They are of homogeneous appearance.

Semi-solid preparations for cutaneous application consist of a simple or compound basis in which, usually, 1 or more active substances are dissolved or dispersed. According to its composition, the basis may influence the activity of the preparation.

The basis may consist of natural or synthetic substances and may be single phase or multiphase. According to the nature of the basis, the preparation may have hydrophilic or hydrophobic properties; it may contain suitable excipients such as antimicrobial preservatives, antioxidants, stabilisers, emulsifiers, thickeners and penetration enhancers.

Semi-solid preparations for cutaneous application intended for use on severely injured skin are sterile.

Where applicable, containers for semi-solid preparations for cutaneous application comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections).

Several categories of semi-solid preparations for cutaneous application may be distinguished:

– ointments;
– creams;
– gels;
– pastes;
– poultices;
– medicated plasters.

According to their structure, ointments, creams and gels generally show viscoelastic behaviour and are non-Newtonian in character e.g. plastic, pseudoplastic or thixotropic type flow at high shear rates. Pastes frequently exhibit dilatancy.

PRODUCTION

During development of semi-solid preparations for cutaneous application whose formulation contains an antimicrobial preservative, the need for and the efficacy of the chosen preservative shall be demonstrated to the satisfaction of the competent authority. A suitable test method together with criteria for judging the preservative properties of the formulation are provided in *Efficacy of antimicrobial preservation* (*5.1.3*). In the manufacture, packaging, storage and distribution of semi-solid preparations for cutaneous application, suitable steps are taken to ensure their microbiological quality; recommendations on this are provided in *Microbiological Quality of Pharmaceutical Preparations* (*5.1.4*). Sterile semi-solid preparations for cutaneous application are prepared using materials

and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this are provided in *Methods of Preparation of Sterile Products* (*5.1.1*).

During development, it must be demonstrated that the nominal content can be withdrawn from the container of semi-solid preparations for cutaneous application presented in single-dose containers.

In the manufacture of semi-solid preparations for cutaneous application, suitable measures are taken to ensure that the defined rheological properties are fulfilled. Where appropriate, the following non-mandatory tests may be carried out: measurement of consistency by penetrometry (*2.9.9*), viscosity (apparent viscosity) (*2.2.10*) and a suitable test to demonstrate the appropriate release of the active substance(s).

In the manufacture of semi-solid preparations for cutaneous application containing 1 or more active substances that are not dissolved in the basis (e.g. emulsions or suspensions), measures are taken to ensure appropriate homogeneity of the preparation to be delivered.

In the manufacture of semi-solid preparations for cutaneous application containing dispersed particles, measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

TESTS

Sterility (*2.6.1*). Where the label indicates that the preparation is sterile, it complies with the test for sterility.

STORAGE

If the preparation contains water or other volatile ingredients, store in an airtight container. If the preparation is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the name of any added antimicrobial preservative;
– where applicable, that the preparation is sterile.

Ointments

DEFINITION

An ointment consists of a single-phase basis in which solids or liquids may be dispersed.

Hydrophobic Ointments

Hydrophobic ointments can absorb only small amounts of water. Typical bases used for their formulation are hard, liquid and light liquid paraffins, vegetable oils, animal fats, synthetic glycerides, waxes and liquid polyalkylsiloxanes.

Water-emulsifying Ointments

Water-emulsifying ointments can absorb larger amounts of water and thereby produce water-in-oil or oil-in-water emulsions depending on the nature of the emulsifiers: water-in-oil emulsifying agents such as wool alcohols, sorbitan esters, monoglycerides and fatty alcohols, or oil-in-water emulsifying agents such as sulphated fatty alcohols, polysorbates, macrogol cetostearyl ether or esters of fatty acids with macrogols may be used for this purpose. Their bases are those of the hydrophobic ointments.

Hydrophilic Ointments

Hydrophilic ointments are preparations having bases that are miscible with water. The bases usually consist of mixtures of liquid and solid macrogols (polyethylene glycols). They may contain appropriate amounts of water.

Creams

DEFINITION

Creams are multiphase preparations consisting of a lipophilic phase and an aqueous phase.

Lipophilic Creams

Lipophilic creams have as the continuous phase the lipophilic phase. They contain water-in-oil emulsifying agents such as wool alcohols, sorbitan esters and monoglycerides.

Hydrophilic Creams

Hydrophilic creams have as the continuous phase the aqueous phase. They contain oil-in-water emulsifying agents such as sodium or trolamine soaps, sulphated fatty alcohols, polysorbates and polyoxyl fatty acid and fatty alcohol esters combined, if necessary, with water-in-oil emulsifying agents.

Gels

DEFINITION

Gels consist of liquids gelled by means of suitable gelling agents.

Lipophilic Gels

Lipophilic gels (oleogels) are preparations whose bases usually consist of liquid paraffin with polyethylene or fatty oils gelled with colloidal silica or aluminium or zinc soaps.

Hydrophilic Gels

Hydrophilic gels (hydrogels) are preparations whose bases usually consist of water, glycerol or propylene glycol gelled with suitable gelling agents such as starch, cellulose derivatives, carbomers and magnesium-aluminium silicates.

Pastes

DEFINITION

Pastes are semi-solid preparations for cutaneous application containing large proportions of solids finely dispersed in the basis.

Poultices

DEFINITION

Poultices consist of a hydrophilic heat-retentive basis in which solid or liquid active substances are dispersed. They are usually spread thickly on a suitable dressing and heated before application to the skin.

Medicated plasters

DEFINITION

Medicated plasters are flexible preparations containing 1 or more active substances. They are intended to be applied to the skin. They are designed to maintain the active substance(s) in close contact with the skin such that these may be absorbed slowly, or act as protective or keratolytic agents.

Medicated plasters consist of an adhesive basis, which may be coloured, containing 1 or more active substances, spread as a uniform layer on an appropriate support made of natural or synthetic material. It is not irritant or sensitising to the skin. The adhesive layer is covered by a suitable protective liner, which is removed before applying the plaster to the skin. When removed, the protective liner does not detach the preparation from the outer, supporting layer.

Medicated plasters are presented in a range of sizes directly adapted to their intended use or as larger sheets to be cut before use. Medicated plasters adhere firmly to the skin

when gentle pressure is applied and can be peeled off without causing appreciable injury to the skin or detachment of the preparation from the outer, supporting layer.

TESTS

Dissolution. A suitable test may be required to demonstrate the appropriate release of the active substance(s), for example one of the tests described in *Dissolution test for transdermal patches* (*2.9.4*).

01/2008:1154

STICKS

Styli

Additional requirements for sticks may be found, where appropriate, in other general monographs, for example Nasal preparations (0676).

DEFINITION

Sticks are solid preparations intended for local application. They are rod-shaped or conical preparations consisting of one or more active substances alone or which are dissolved or dispersed in a suitable basis which may dissolve or melt at body temperature.

Urethral sticks and sticks for insertion into wounds are sterile.

PRODUCTION

In the manufacture, packaging, storage and distribution of sticks, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

Urethral sticks and other sterile sticks are prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

In the manufacture of sticks means are taken to ensure that the preparation complies with a test for mass uniformity or, where appropriate, a test for uniformity of content.

TESTS

Sterility (*2.6.1*). Urethral sticks and sticks for insertion into wounds comply with the test for sterility.

LABELLING

The label states:

- the quantity of active substance(s) per stick,
- for urethral sticks and sticks to be inserted into wounds that they are sterile.

01/2008:0478

TABLETS

Compressi

The requirements of this monograph do not necessarily apply to preparations that are presented as tablets intended for use other than by oral administration. Requirements for such preparations may be found, where appropriate, in other general monographs; for example Rectal preparations (1145), Vaginal preparations (1164) and Oromucosal preparations (1807). This monograph does not apply to lozenges, oral pastes and oral gums. Where justified and authorised, the requirements of this monograph do not apply to tablets for veterinary use.

DEFINITION

Tablets are solid preparations each containing a single dose of one or more active substances. They are obtained by compressing uniform volumes of particles or by another suitable manufacturing technique, such as extrusion, moulding or freeze-drying (lyophilisation). Tablets are intended for oral administration. Some are swallowed whole, some after being chewed, some are dissolved or dispersed in water before being administered and some are retained in the mouth where the active substance is liberated.

The particles consist of one or more active substances with or without excipients such as diluents, binders, disintegrating agents, glidants, lubricants, substances capable of modifying the behaviour of the preparation in the digestive tract, colouring matter authorised by the competent authority and flavouring substances.

Tablets are usually straight, circular solid cylinders, the end surfaces of which are flat or convex and the edges of which may be bevelled. They may have break-marks and may bear a symbol or other markings. Tablets may be coated.

Where applicable, containers for tablets comply with the requirements for materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of tablets for oral use may be distinguished:

- uncoated tablets;
- coated tablets;
- effervescent tablets;
- soluble tablets;
- dispersible tablets;
- orodispersible tablets;
- gastro-resistant tablets;
- modified-release tablets;
- tablets for use in the mouth;
- oral lyophilisates.

PRODUCTION

Tablets are usually prepared by compressing uniform volumes of particles or particle aggregates produced by granulation methods. In the manufacture of tablets, means are taken to ensure that they possess a suitable mechanical strength to avoid crumbling or breaking on handling or subsequent processing. This may be demonstrated using the tests described in chapters *2.9.7. Friability of uncoated tablets* and *2.9.8. Resistance to crushing of tablets*. Chewable tablets are prepared to ensure that they are easily crushed by chewing.

Subdivision of tablets. Tablets may bear a break-mark or break-marks and may be subdivided in parts, either to ease the intake of the medicinal product or to comply with the posology. In the latter case, subdivision must be assessed and authorised by the competent authority. In order to ensure that the patient will receive the intended dose, the efficacy of the break-mark(s) must be assessed during the development of the product, in respect of uniformity of mass of the subdivided parts. Each authorised dose must be tested using the following test.

Take 30 tablets at random, break them by hand and, from all the parts obtained from 1 tablet, take 1 part for the test and reject the other part(s). Weigh each of the 30 parts individually and calculate the average mass. The tablets comply with the test if not more than 1 individual mass is outside the limits of 85 per cent to 115 per cent of the average mass. The tablets fail to comply with the test if more than 1 individual mass is outside these limits, or if 1 individual mass is outside the limits of 75 per cent to 125 per cent of the average mass.

In the manufacture, packaging, storage and distribution of tablets, suitable means are taken to ensure their microbiological quality; recommendations on this aspect are provided in chapter *5.1.4. Microbiological quality of pharmaceutical preparations*.

TESTS

Uniformity of dosage units (*2.9.40*). Tablets comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, tablets with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A. If the preparation has more than 1 active substance, the requirement applies only to those substances that correspond to the above conditions.

Unless otherwise justified and authorised, coated tablets other than film-coated tablets comply with test A irrespective of their content of active substance(s).

Uniformity of mass (*2.9.5*). Uncoated tablets and, unless otherwise justified and authorised, film-coated tablets comply with the test. If the test for uniformity of content is prescribed or justified and authorised for all the active substances, the test for uniformity of mass is not required.

Dissolution. A suitable test may be carried out to demonstrate the appropriate release of the active substance(s), for example one of the tests described in chapter *2.9.3. Dissolution test for solid dosage forms*.

Where a dissolution test is prescribed, a disintegration test may not be required.

Uncoated tablets

DEFINITION

Uncoated tablets include single-layer tablets resulting from a single compression of particles and multi-layer tablets consisting of concentric or parallel layers obtained by successive compression of particles of different composition. The excipients used are not specifically intended to modify the release of the active substance in the digestive fluids.

Uncoated tablets conform to the general definition of tablets. A broken section, when examined under a lens, shows either a relatively uniform texture (single-layer tablets) or a stratified texture (multi-layer tablets) but no signs of coating.

TESTS

Disintegration (*2.9.1*). Uncoated tablets comply with the test. Use *water R* as the liquid. Add a disc to each tube. Operate the apparatus for 15 min, unless otherwise justified and authorised, and examine the state of the tablets. If the tablets fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 tablets omitting the discs.

Chewable tablets are not required to comply with the test.

Coated tablets

DEFINITION

Coated tablets are tablets covered with one or more layers of mixtures of various substances such as natural or synthetic resins, gums, gelatin, inactive and insoluble fillers, sugars, plasticisers, polyols, waxes, colouring matter authorised by the competent authority and sometimes flavouring substances and active substances. The substances used as coatings are usually applied as a solution or suspension in conditions in which evaporation of the vehicle occurs. When the coating is a very thin polymeric coating, the tablets are known as film-coated tablets.

Coated tablets have a smooth surface, which is often coloured and may be polished; a broken section, when examined under a lens, shows a core surrounded by one or more continuous layers with a different texture.

PRODUCTION

Where justified, uniformity of mass or uniformity of content of coated tablets other than film-coated tablets may be ensured by control of the cores.

TESTS

Disintegration (*2.9.1*). Coated tablets other than film-coated tablets comply with the test. Use *water R* as the liquid. Add a disc to each tube. Operate the apparatus for 60 min, unless otherwise justified and authorised, and examine the state of the tablets. If any of the tablets has not disintegrated, repeat the test on a further 6 tablets, replacing *water R* with *0.1 M hydrochloric acid*.

Film-coated tablets comply with the disintegration test prescribed above except that the apparatus is operated for 30 min, unless otherwise justified and authorised.

If coated tablets or film-coated tablets fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 tablets omitting the discs.

Chewable coated tablets are not required to comply with the test.

Effervescent tablets

DEFINITION

Effervescent tablets are uncoated tablets generally containing acid substances and carbonates or hydrogen carbonates, which react rapidly in the presence of water to release carbon dioxide. They are intended to be dissolved or dispersed in water before administration.

TESTS

Disintegration. Place 1 tablet in a beaker containing 200 ml of *water R* at 15-25 °C; numerous bubbles of gas are evolved. When the evolution of gas around the tablet or its fragments ceases the tablet has disintegrated, being either dissolved or dispersed in the water so that no agglomerates of particles remain. Repeat the operation on 5 other tablets.

The tablets comply with the test if each of the 6 tablets used disintegrates in the manner prescribed within 5 min, unless otherwise justified and authorised.

Soluble tablets

DEFINITION

Soluble tablets are uncoated or film-coated tablets. They are intended to be dissolved in water before administration. The solution produced may be slightly opalescent due to the added excipients used in the manufacture of the tablets.

TESTS

Disintegration (*2.9.1*). Soluble tablets disintegrate within 3 min, using *water R* at 15-25 °C.

Dispersible tablets

DEFINITION

Dispersible tablets are uncoated or film-coated tablets intended to be dispersed in water before administration, giving a homogeneous dispersion.

TESTS

Disintegration (*2.9.1*). Dispersible tablets disintegrate within 3 min, using *water R* at 15-25 °C.

Fineness of dispersion. Place 2 tablets in 100 ml of *water R* and stir until completely dispersed. A smooth dispersion is produced, which passes through a sieve screen with a nominal mesh aperture of 710 µm.

Orodispersible tablets

DEFINITION

Orodispersible tablets are uncoated tablets intended to be placed in the mouth where they disperse rapidly before being swallowed.

TESTS

Disintegration (*2.9.1*). Orodispersible tablets disintegrate within 3 min.

Modified-release tablets

DEFINITION

Modified-release tablets are coated or uncoated tablets that contain special excipients or are prepared by special procedures, or both, designed to modify the rate, the place or the time at which the active substance(s) are released.

Modified-release tablets include prolonged-release tablets, delayed-release tablets and pulsatile-release tablets.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s).

Gastro-resistant tablets

DEFINITION

Gastro-resistant tablets are delayed-release tablets that are intended to resist the gastric fluid and to release their active substance(s) in the intestinal fluid. Usually they are prepared from granules or particles already covered with a gastro-resistant coating or in certain cases by covering tablets with a gastro-resistant coating (enteric-coated tablets).

Tablets covered with a gastro-resistant coating conform to the definition of coated tablets.

PRODUCTION

For tablets prepared from granules or particles already covered with a gastro-resistant coating, a suitable test is carried out to demonstrate the appropriate release of the active substance(s).

TESTS

Disintegration (*2.9.1*). For tablets covered with a gastro-resistant coating, carry out the test with the following modifications. Use *0.1 M hydrochloric acid* as the liquid. Operate the apparatus for 2 h, or another such time as may be justified and authorised, without the discs and examine the state of the tablets. The time of resistance to the acid medium varies according to the formulation of the tablets to be examined. It is typically 2 h to 3 h but even with authorised deviations is not less than 1 h. No tablet shows signs of either disintegration (apart from fragments of coating) or cracks that would allow the escape of the contents. Replace the acid by *phosphate buffer solution pH 6.8 R* and add a disc to each tube. Operate the apparatus for 60 min and examine the state of the tablets. If the tablets fail to comply because of adherence to the discs, the results are invalid. Repeat the test on a further 6 tablets omitting the discs.

Dissolution. For tablets prepared from granules or particles already covered with a gastro-resistant coating, a suitable test is carried out to demonstrate the appropriate release of the active substance(s), for example the test described in chapter *2.9.3. Dissolution test for solid dosage forms*.

Tablets for use in the mouth

DEFINITION

Tablets for use in the mouth are usually uncoated tablets. They are formulated to effect a slow release and local action of the active substance(s) or the release and absorption of the active substance(s) at a defined part of the mouth. They comply with the requirements of the monograph *Oromucosal preparations (1807)*.

Oral lyophilisates

DEFINITION

Oral lyophilisates are solid preparations intended either to be placed in the mouth or to be dispersed (or dissolved) in water before administration.

PRODUCTION

Oral lyophilisates are obtained by freeze-drying (lyophilisation), involving division into single doses, freezing, sublimation and drying of usually aqueous, liquid or semi-solid preparations.

TESTS

Disintegration. Place 1 oral lyophilisate in a beaker containing 200 ml of *water R* at 15-25 °C. It disintegrates within 3 min. Repeat the test on 5 other oral lyophilisates. They comply with the test if all 6 have disintegrated.

Water (*2.5.12*). Oral lyophilisates comply with the test; the limits are approved by the competent authority.

01/2008:1155

TAMPONS, MEDICATED

Tamponae medicatae

Additional requirements for medicated tampons may be found, where appropriate, in other general monographs, for example Rectal preparations (1145), Vaginal preparations (1164) and Ear preparations (0652).

DEFINITION

Medicated tampons are solid, single-dose preparations intended to be inserted into the body cavities for a limited period of time. They consist of a suitable material such as cellulose, collagen or silicone impregnated with one or more active substances.

PRODUCTION

In the manufacture, packaging, storage and distribution of medicated tampons, suitable means are taken to ensure their microbial quality; recommendations on this aspect are provided in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

LABELLING

The label states the quantity of active substance(s) per tampon.

01/2008:1164

VAGINAL PREPARATIONS

Vaginalia

DEFINITION

Vaginal preparations are liquid, semi-solid or solid preparations intended for administration to the vagina usually in order to obtain a local effect. They contain 1 or more active substances in a suitable basis.

Where appropriate, containers for vaginal preparations comply with the requirements for materials used for the manufacture of containers (*3.1* and subsections) and containers (*3.2* and subsections).

Several categories of vaginal preparations may be distinguished:

- pessaries;
- vaginal tablets;
- vaginal capsules;
- vaginal solutions, emulsions and suspensions;
- tablets for vaginal solutions and suspensions;
- semi-solid vaginal preparations;
- vaginal foams;
- medicated vaginal tampons.

PRODUCTION

During development, it must be demonstrated that the nominal contents can be withdrawn from the container of liquid and semi-solid vaginal preparations presented in single-dose containers.

In the manufacturing, packaging, storage and distribution of vaginal preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in chapter *5.1.4. Microbiological quality of pharmaceutical preparations.*

TESTS

Uniformity of dosage units (*2.9.40*). Liquid and semi-solid single-dose vaginal preparations comply with the test. Solid single-dose vaginal preparations comply with the test or, where justified and authorised, with the tests for uniformity of content and/or uniformity of mass shown below. Herbal drugs and herbal drug preparations present in the dosage form are not subject to the provisions of this paragraph.

Uniformity of content (*2.9.6*). Unless otherwise prescribed or justified and authorised, solid single-dose vaginal preparations with a content of active substance less than 2 mg or less than 2 per cent of the total mass comply with test A (vaginal tablets) or test B (pessaries, vaginal capsules). If the preparation has more than one active substance, the requirement applies only to those substances which correspond to the above conditions.

Uniformity of mass (*2.9.5*). Solid single-dose vaginal preparations comply with the test. If the test for uniformity of content is prescribed for all the active substances, the test for uniformity of mass is not required.

Dissolution. A suitable test may be carried out to demonstrate the appropriate release of the active substance(s) from solid single-dose vaginal preparations, for example one of the tests described in chapter *2.9.3. Dissolution test for solid dosage forms* or in *2.9.42. Dissolution test for lipophilic solid dosage forms.*

When a dissolution test is prescribed, a disintegration test may not be required.

Pessaries

DEFINITION

Pessaries are solid, single-dose preparations. They have various shapes, usually ovoid, with a volume and consistency suitable for insertion into the vagina. They contain 1 or more active substances dispersed or dissolved in a suitable basis that may be soluble or dispersible in water or may melt at body temperature. Excipients such as diluents, adsorbents, surface-active agents, lubricants, antimicrobial preservatives and colouring matter authorised by the competent authority may be added, if necessary.

PRODUCTION

Pessaries are usually prepared by moulding. Where appropriate in the manufacture of pessaries, measures are taken to ensure a suitable and controlled particle size of the active substance(s). If necessary, the active substance(s) are previously ground and sieved through a suitable sieve.

When prepared by moulding, the medicated mass, sufficiently liquefied by heating, is poured into suitable moulds. The pessary solidifies on cooling. Various excipients are available for this process, such as hard fat, macrogols, cocoa butter, and various gelatinous mixtures consisting, for example, of gelatin, water and glycerol.

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from pessaries intended for prolonged local action.

TESTS

Disintegration (*2.9.2*). Unless intended for prolonged local action, they comply with the test. Examine the state of the pessaries after 60 min, unless otherwise justified and authorised.

Vaginal tablets

DEFINITION

Vaginal tablets are solid, single-dose preparations. They generally conform to the definitions of uncoated or film-coated tablets given in the monograph *Tablets (0478)*.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from vaginal tablets intended for prolonged local action.

TESTS

Disintegration (*2.9.2*). Unless intended for prolonged local action, they comply with the test (special method for vaginal tablets). Examine the state of the tablets after 30 min, unless otherwise justified and authorised.

Vaginal capsules

DEFINITION

Vaginal capsules (shell pessaries) are solid, single-dose preparations. They are generally similar to soft capsules as defined in the monograph *Capsules (0016)*, differing only in their shape and size. Vaginal capsules have various shapes, usually ovoid. They are smooth and have a uniform external appearance.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of the active substance(s) from vaginal capsules intended for prolonged local action.

TESTS

Disintegration (*2.9.2*). Unless intended for prolonged local action, they comply with the test. Examine the state of the capsules after 30 min, unless otherwise justified and authorised.

Vaginal solutions, emulsions and suspensions

DEFINITION

Vaginal solutions, emulsions and suspensions are liquid preparations intended for a local effect, for irrigation or for diagnostic purposes. They may contain excipients, for example to adjust the viscosity of the preparation, to adjust or stabilise the pH, to increase the solubility of the active substance(s) or to stabilise the preparation. The excipients do not adversely affect the intended medical action or, at the concentrations used, cause undue local irritation.

Vaginal emulsions may show evidence of phase separation but are readily redispersed on shaking. Vaginal suspensions may show a sediment that is readily dispersed on shaking to give a suspension that remains sufficiently stable to enable a homogeneous preparation to be delivered.

They are supplied in single-dose containers. The container is adapted to deliver the preparation to the vagina or it is accompanied by a suitable applicator.

PRODUCTION

In the manufacture of vaginal suspensions measures are taken to ensure a suitable and controlled particle size with regard to the intended use.

Tablets for vaginal solutions and suspensions

DEFINITION

Tablets intended for the preparation of vaginal solutions and suspensions are single-dose preparations that are dissolved or dispersed in water at the time of administration. They may contain excipients to facilitate dissolution or dispersion or to prevent caking.

Apart from the test for disintegration, tablets for vaginal solutions or suspensions conform with the definition for *Tablets (0478)*.

After dissolution or dispersion, they comply with the requirements for vaginal solutions or vaginal suspensions, as appropriate.

TESTS

Disintegration (*2.9.1*). Tablets for vaginal solutions or suspensions comply with the test, but using *water R* at 15-25 °C and 6 tablets. Examine the state of the tablets after 3 min. The tablets comply with the test if all 6 have disintegrated.

LABELLING

The label states:

- the method of preparation of the vaginal solution or suspension;
- the conditions and duration of storage of the solution or suspension after constitution.

Semi-solid vaginal preparations

DEFINITION

Semi-solid vaginal preparations are ointments, creams or gels.

They are often supplied in single-dose containers. The container is provided with a suitable applicator.

Semi-solid vaginal preparations comply with the requirements of the monograph *Semi-solid preparations for cutaneous application (0132)*.

Vaginal foams

DEFINITION

Vaginal foams comply with the requirements of the monograph *Medicated foams (1105)*.

Medicated vaginal tampons

DEFINITION

Medicated vaginal tampons are solid, single-dose preparations intended to be inserted in the vagina for a limited time.

They comply with the requirements of the monograph *Medicated tampons (1155)*.

01/2008:1808

VETERINARY LIQUID PREPARATIONS FOR CUTANEOUS APPLICATION

Praeparationes liquidae veterinariae ad usum dermicum

Unless otherwise justified and authorised, veterinary liquid preparations for cutaneous application comply with the requirements of the monograph on Liquid preparations

for cutaneous application (0927). In addition to these requirements, the following statements apply to veterinary liquid preparations for cutaneous application.

DEFINITION

Veterinary liquid preparations for cutaneous application are liquid preparations intended to be applied to the skin to obtain a local and/or systemic effect. They are solutions, suspensions or emulsions which may contain one or more active substances in a suitable vehicle. They may be presented as concentrates in the form of wettable powders, pastes, solutions or suspensions, which are used to prepare diluted suspensions or emulsions of active substances. They may contain suitable antimicrobial preservatives, antioxidants and other excipients such as stabilisers, emulsifiers and thickeners.

Several categories of veterinary liquid preparations for cutaneous application may be distinguished:

- cutaneous foams (see *Liquid preparations for cutaneous application (0927)*),
- dip concentrates,
- pour-on preparations,
- shampoos (see *Liquid preparations for cutaneous application (0927)*),
- spot-on preparations,
- sprays,
- teat dips,
- teat sprays,
- udder-washes.

Dip concentrates

DEFINITION

Dip concentrates are preparations containing one or more active substances, usually in the form of wettable powders, pastes, solutions or suspensions, which are used to prepare diluted solutions, suspensions or emulsions of active substances. The diluted preparations are applied by complete immersion of the animal.

Pour-on preparations

DEFINITION

Pour-on preparations contain one or more active substances for the prevention and treatment of ectoparasitic and/or endoparasitic infestations of animals. They are applied in volumes which are usually greater than 5 ml by pouring along the animal's dorsal midline.

Spot-on preparations

DEFINITION

Spot-on preparations contain one or more active substances for the prevention and treatment of ectoparasitic and/or endoparasitic infestations of animals. They are applied in volumes which are usually less than 10 ml, to a small area on the head or back, as appropriate, of the animal.

Sprays

DEFINITION

Sprays contain one or more active substances that are intended to be applied externally for therapeutic or prophylactic purposes. They are delivered in the form of an aerosol by the actuation of an appropriate valve or by means of a suitable atomising device that is either an integral part of the container or is supplied separately.

Sprays may be presented in pressurised containers (see *Pressurised pharmaceutical preparations (0523)*). When so presented, sprays usually consist of one or more active substances in a suitable vehicle held under pressure with suitable propellants or suitable mixtures of propellants. When otherwise presented, sprays are supplied in well-closed containers.

PRODUCTION

During the development and manufacture of a spray, measures are taken to ensure that the assembled product conforms to a defined spray rate and spray pattern.

Teat dips

DEFINITION

Teat dips contain one or more disinfectant active substances, usually in the form of solutions into which the teats of an animal are dipped pre- and, where necessary, post-milking to reduce the population of pathogenic micro-organisms on the surfaces. Teat dips may be supplied/presented as ready-to-use preparations or they may be prepared by dilution of teat dip concentrates. Pre- and post-milking teat dips often differ in formulation. Teat dips usually contain emollients to promote skin hydration, to soften the skin and allow healing of lesions that would otherwise harbour bacteria.

Teat sprays

DEFINITION

Teat sprays contain one or more disinfectant active substances, usually in the form of solutions which are sprayed onto the teats of an animal pre- and, where necessary, post-milking to reduce the population of pathogenic micro-organisms on the surfaces. Teat sprays may be supplied/presented as ready-to-use preparations or they may be prepared by dilution of teat spray concentrates. Pre- and post-milking sprays often differ in formulation. Teat sprays usually contain emollients to promote skin hydration, to soften the skin and allow healing of lesions that would otherwise harbour bacteria.

Udder-washes

DEFINITION

Udder-washes contain one or more disinfectant active substances, usually in the form of solutions which are sprayed onto the udder and teats of an animal to remove mud and faecal contamination before the application of teat dips or sprays. Udder-washes are usually prepared by the dilution either of concentrated preparations or of ready-to-use teat dips or teat sprays.

VACCINES FOR HUMAN USE

Anthrax vaccine for human use (adsorbed, prepared from culture filtrates).. 757

ANTHRAX VACCINE FOR HUMAN USE (ADSORBED, PREPARED FROM CULTURE FILTRATES)

Vaccinum anthracis adsorbatum ab colato culturarum ad usum humanum

DEFINITION

Anthrax vaccine for human use (adsorbed, prepared from culture filtrates) is a preparation of *Bacillus anthracis* antigens precipitated by aluminium potassium sulphate. The antigens are prepared from a sterile culture filtrate produced by a non-encapsulated strain, either avirulent or attenuated, of *B. anthracis*.

The main virulence components of *B. anthracis* are the polyglutamic aicd capsule and 2 binary anthrax toxins, namely lethal toxin and œdema toxin, formed from the respective combination of protective antigen (PA) with either lethal factor (LF) or œdema factor (EF).

LF is a zinc-dependent endopeptidase and EF is a potent calmodulin and calcium-dependent adenylate cyclase. Cell-free cultures of *B. anthracis* contain PA and because expression of the 3 toxin-component genes is co-ordinately regulated, LF and EF are also present. In addition, the vaccine is likely to contain many other *B. anthracis* antigens, including membrane proteins, secreted proteins, cytoplasmic proteins, peptidoglycans, nucleic acids and carbohydrates.

PRODUCTION

GENERAL PROVISIONS

Cultures are managed in a seed-lot system. The vaccine strain is toxigenic but lacks the plasmid with the necessary genes for synthesis of the capsule, an important virulence factor.

The production method must be shown to yield a consistent and active product with a safety and efficacy profile that is adequate or equivalent to previous lots. The vaccine must show a level of protection against a virulent strain of *B. anthracis*, in a suitable animal infection model, that is equal to or greater than that of a reference vaccine. The vaccine must not show a level of toxicity that exceeds that of a reference vaccine.

The production method and stability of the final lot and relevant intermediates are evaluated using one or more indicator tests. Such tests include potency and specific toxicity, and may be supported by tests confirming the presence of relevant antigens and associated proteins. Release and shelf-life specifications are established based upon the results of stability testing so as to ensure satisfactory product performance during the approved period of validity.

SEED LOTS

The attenuated non-encapsulated strain of *B. anthracis* used is identified by historical records that include information on its origin and subsequent manipulation and the tests used to characterise the strain. These include morphological, cultural, biochemical and genetic properties of the strain. Only a master seed lot or, where applicable, working seed lots, that comply with the following requirements may be used.

Identification. Each seed lot is identified as containing *B. anthracis*.

Phenotypic parameters. Each seed lot must have a known biochemical and enzymatic profile and have a known history of absence of antibiotic resistance.

Microbial purity. Each seed lot complies with the requirements for absence of contaminating organisms. Purity of bacterial cultures is verified by methods of suitable sensitivity.

Virulence test. The absence of bacterial capsule is demonstrated for each seed lot by McFadyean stain and the specific toxicity (oedema) test.

REFERENCE PREPARATION

The potency and toxicity of the vaccine bulk are verified using reference standards derived from representative vaccine batches. These batches are extensively characterised for their intended purpose and are stored in suitably sized aliquots under conditions ensuring their stability.

PROPAGATION AND HARVEST

The attenuated strain is grown using suitable liquid media. At the end of cultivation, the purity of the culture is tested. The culture medium is separated from the bacterial mass by filtration. The pH of the filtrate is determined after dilution with a 0.9 g/l solution of *sodium chloride R* and is shown to be within limits suitable for stability. A suitable test for absence of live *B. anthracis*, including spores, is carried out. Aluminium potassium sulphate or an alternative adjuvant may be added at this stage. An antimicrobial preservative may be added to the suspension to form the purified harvest.

Only a purified harvest that complies with the following requirements may be used in the preparation of the final lot.

Immunological identity. Confirm the presence of *B. anthracis* protective antigen by a suitable immunochemical method (*2.7.1*).

Antimicrobial preservative. Determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

FINAL BULK VACCINE

The purified harvest is diluted aseptically with sterile saline solution to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof glass ampoules and heat-sealed to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the potency assay, the specific toxicity (oedema) test and the test for antimicrobial preservative have been carried out with satisfactory results on the purified harvest, they may be omitted on the final lot.

IDENTIFICATION

The presence of *B. anthracis* protective antigen is confirmed by a suitable immunochemical method (*2.7.1*).

TESTS

Abnormal toxicity. Inject intraperitoneally up to 4 human doses of vaccine into each of at least 10 healthy mice, each weighing 17-22 g. Observe the mice daily for 7 days. The vaccine complies with the test if none of the animals shows signs of ill health.

Specific toxicity (oedema) test. Use not fewer than 2 rabbits per test. Prepare serial two-fold dilutions of vaccine with normal saline, corresponding to 4, 2, 1, 0.5 and 0.25 human doses. Inject intradermally 0.1 ml of each dilution of the test and of the reference vaccine into the shaved flanks of 2 rabbits. Each rabbit receives the 10 previously prepared injections (5 dilutions of the test vaccine and 5 dilutions of the reference vaccine). In one of the rabbits, the lower concentrations are injected at the anterior end and the higher concentrations at the posterior end. The reverse is used for the 2nd rabbit. The rabbits are monitored for 24 h for signs of oedema at the injection site. The vaccine complies with the test if the oedematous reaction is not greater than that observed with the reference vaccine.

Alternatively, specific *in vitro* assays for lethal factor and adenylate cyclase activity may be used, subject to validation.

Antimicrobial preservative. Determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the intended content.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

The potency of the anthrax vaccine is determined by comparing the dose required to protect guinea-pigs against intradermal challenge by a virulent strain of *B. anthracis* with the dose of a suitable reference preparation that gives the same protection. Use 9 groups of not fewer than 16 female guinea-pigs, each weighing 250-350 g. Prepare 4 dilutions of the vaccine and of the reference preparation containing 1.5, 0.5, 0.17 and 0.05 human doses in 0.5 ml. Allocate each dilution to a separate group. The remaining group receives 0.5 ml of saline and is used to verify the challenge dose. Inject subcutaneously into each guinea-pig 0.5 ml of the dilution allocated to its group on each of 2 occasions, 1 week apart. 7 days after the 2nd injection, inject intradermally into each guinea-pig 2000 spores of a virulent strain of *B. anthracis* (Vollum) in 0.1 ml. Observe the animals for 10 days and record the number of deaths per group. The test is not valid unless all the control animals die within 5 days of challenge. Using the proportions of animals that survive in each of the vaccinated groups, calculate the potency of the vaccine relative to the reference preparation using the usual statistical methods (*5.3*). The vaccine complies with the test if:

– the relative potency estimate exceeds 1.0, or;
– the 95 per cent confidence interval for the relative potency includes 1.0, and the lower 95 per cent confidence limit is not less than 50 per cent of the relative potency estimate.

LABELLING

The label states that the vaccine is not to be frozen.

01/2008:1929

BCG FOR IMMUNOTHERAPY

BCG ad immunocurationem

DEFINITION

BCG for immunotherapy is a freeze-dried preparation of live bacteria derived from a culture of the bacillus of Calmette and Guérin (*Mycobacterium bovis* BCG) whose capacity for treatment has been established.

It complies with the monograph *Vaccines for human use (0153)*.

PRODUCTION

GENERAL PROVISIONS

BCG for immunotherapy shall be produced by a staff consisting of healthy persons who do not work with other infectious agents; in particular they shall not work with virulent strains of *Mycobacterium tuberculosis*, nor shall they be exposed to a known risk of tuberculosis infection. Staff are examined periodically for tuberculosis. BCG for immunotherapy is susceptible to sunlight: the procedures for production shall be so designed that all products are protected from direct sunlight and from ultraviolet light at all stages of manufacture, testing and storage.

Production is based on a seed-lot system. The production method shall have been shown to yield consistently BCG products that can be used for treatment of superficial bladder cancer and are safe. The product is prepared from cultures which are separated from the master seed lot by as few subcultures as possible and in any case not more than 8 subcultures. During the course of these subcultures the preparation is not freeze-dried more than once.

If a bioluminescence test or other biochemical method is used instead of viable count, the method is validated against the viable count for each stage of the process at which it is used.

SEED LOTS

The strain used to establish the master seed lot is chosen for and maintained to preserve its characteristics, its capacity to treat and prevent superficial bladder cancer, and its relative absence of pathogenicity for man and laboratory animals. The strain used shall be identified by historical records that include information on its origin and subsequent manipulation.

Before establishment of a working seed lot a batch is prepared and reserved for use as the comparison product. When a new working seed lot is established, a suitable test for delayed hypersensitivity in guinea-pigs is carried out on a batch of product prepared from the new working seed lot; the product is shown to be not significantly different in activity from the comparison product. Antimicrobial agent sensitivity testing is also carried out.

Only a working seed lot that complies with the following requirements may be used for propagation.

Identification. The bacteria in the working seed lot are identified as *Mycobacterium bovis* BCG using microbiological techniques, which may be supplemented by molecular biology techniques (for example, nucleic acid amplification and restriction-fragment-length polymorphism).

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium. The working seed lot complies with the test for sterility, except for the presence of mycobacteria.

Virulent mycobacteria. Examine the working seed lot as prescribed under Tests, using 10 guinea-pigs.

PROPAGATION AND HARVEST

The bacteria are grown in a suitable medium for not more than 21 days by surface or submerged culture. The culture medium does not contain substances known to cause toxic or allergic reactions in human beings or to cause the bacteria to become virulent for guinea-pigs. The culture is harvested and suspended in a sterile liquid medium that protects the viability of the culture as determined by a suitable method of viable count.

FINAL BULK

The final bulk is prepared from a single harvest or by pooling a number of single harvests. A stabiliser may be added; if the stabiliser interferes with the determination of bacterial concentration on the final bulk, the determination is carried out before addition of the stabiliser.

Only final bulk that complies with the following requirements may be used in the preparation of the final lot.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml of final bulk for each medium. The final bulk complies with the test for sterility, except for the presence of mycobacteria.

Count of viable units. Determine the number of viable units per millilitre by viable count on solid medium using a method suitable for the product to be examined or by a suitable biochemical method. Carry out the test in parallel on a reference preparation of the same strain.

Bacterial concentration. Determine the total bacterial concentration by a suitable method, either directly by determining the mass of the micro-organisms, or indirectly by an opacity method that has been calibrated in relation to the mass of the micro-organisms; if the bacterial concentration is determined before addition of a stabiliser, the concentration in the final bulk is established by calculation. The total bacterial concentration is within the limits approved for the particular product.

The ratio of the count of viable units to the total bacterial concentration is not less than that approved for the particular product.

FINAL LOT

The final bulk is distributed into sterile containers and freeze-dried to a moisture content favourable to the stability of the product; the containers are closed either under vacuum or under an inert gas.

Except where the filled and closed containers are stored at a temperature of – 20 °C or lower, the expiry date is not later than 4 years from the date of harvest.

Only a final lot that complies with the following requirement for count of viable units and with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for virulent mycobacteria has been carried out with satisfactory results on the final bulk, it may be omitted on the final lot.

Count of viable units. Determine the number of viable units per millilitre of the reconstituted product by viable count on solid medium using a method suitable for the product to be examined, or by a suitable biochemical method. The ratio of the count of viable units after freeze-drying to that before is not less than that approved for the particular product.

IDENTIFICATION

BCG for immunotherapy is identified by microscopic examination of the bacilli in stained smears demonstrating their acid-fast property and by the characteristic appearance of colonies grown on solid medium. Alternatively, molecular biology techniques (for example, nucleic acid amplification) may be used.

TESTS

Virulent mycobacteria. Inject subcutaneously or intramuscularly into each of 6 guinea-pigs, each weighing 250-400 g and having received no treatment likely to interfere with the test, a quantity of the product to be examined equivalent to at least 1/25 of 1 human dose. Observe the animals for at least 42 days. At the end of this period, euthanise the guinea-pigs and examine by autopsy for signs of infection with tuberculosis, ignoring any minor reactions at the site of injection. Animals that die during the observation period are also examined for signs of tuberculosis. The product complies with the test if none of the guinea-pigs shows signs of tuberculosis and if not more than 1 animal dies during the observation period. If 2 animals die during this period and autopsy does not reveal signs of tuberculosis, repeat the test on 6 other guinea-pigs. The product complies with the test if not more than 1 animal dies during the 42 days following the injection and autopsy does not reveal any sign of tuberculosis.

Bacterial and fungal contamination. The reconstituted product complies with the test for sterility (*2.6.1*) except for the presence of mycobacteria.

Temperature stability. Maintain samples of the freeze-dried product at 37 °C for 4 weeks. Determine the number of viable units in the heated product and in unheated product as described below. The number of viable units in the heated product is within the limits approved for the particular product but in any case not less than 20 per cent of that in unheated product.

Water. Not more than the limit approved for the particular product, determined by a suitable method.

ASSAY

Determine the number of viable units in the reconstituted product by viable count on solid medium using a method suitable for the product to be examined or by a suitable validated biochemical method. The number is within the range stated on the label. Determine the number of viable units in the comparison control in parallel.

LABELLING

The label states:

– the minimum and the maximum number of viable units per dose in the reconstituted product,
– that the product must be protected from direct sunlight.

01/2008:0163

BCG VACCINE, FREEZE-DRIED

Vaccinum tuberculosis (BCG) cryodesiccatum

DEFINITION

Freeze-dried BCG vaccine is a preparation of live bacteria derived from a culture of the bacillus of Calmette and Guérin (*Mycobacterium bovis* BCG) whose capacity to protect against tuberculosis has been established.

PRODUCTION

GENERAL PROVISIONS

BCG vaccine shall be produced by a staff consisting of healthy persons who do not work with other infectious agents; in particular they shall not work with virulent strains of *Mycobacterium tuberculosis*, nor shall they be exposed to a known risk of tuberculosis infection. Staff are examined periodically for tuberculosis. BCG vaccine is susceptible to sunlight: the procedures for the preparation of the vaccine shall be designed so that all cultures and vaccines are protected from direct sunlight and from ultraviolet light at all stages of manufacture, testing and storage.

Production of the vaccine is based on a seed-lot system. The production method shall have been shown to yield consistently BCG vaccines that induce adequate sensitivity to tuberculin in man, that have acceptable protective potency in animals and are safe. The vaccine is prepared from

cultures which are derived from the master seed lot by as few subcultures as possible and in any case not more than 8 subcultures. During the course of these subcultures the preparation is not freeze-dried more than once.

If a bioluminescence test or other biochemical method is used instead of viable count, the method is validated against the viable count for each stage of the process at which it is used.

BACTERIAL SEED LOTS

The strain used to establish the master seed lot is chosen for and maintained to preserve its characteristics, its capacity to sensitise man to tuberculin and to protect animals against tuberculosis, and its relative absence of pathogenicity for man and laboratory animals. The strain used shall be identified by historical records that include information on its origin and subsequent manipulation.

A suitable batch of vaccine is prepared from the first working seed lot and is reserved for use as the comparison vaccine. When a new working seed lot is established, a suitable test for delayed hypersensitivity in guinea-pigs is carried out on a batch of vaccine prepared from the new working seed lot; the vaccine is shown to be not significantly different in activity from the comparison vaccine. Antimicrobial agent sensitivity testing is also carried out.

Only a working seed lot that complies with the following requirements may be used for propagation.

Identification. The bacteria in the working seed lot are identified as *Mycobacterium bovis* BCG using microbiological techniques, which may be supplemented by molecular biology techniques (for example, nucleic acid amplification and restriction-fragment-length polymorphism).

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

Virulent mycobacteria. Examine the working seed lot as prescribed under Tests, using 10 guinea-pigs.

PROPAGATION AND HARVEST

The bacteria are grown in a suitable medium for not more than 21 days by surface or submerged culture. The culture medium does not contain substances known to cause toxic or allergic reactions in humans or to cause the bacteria to become virulent for guinea-pigs. The culture is harvested and suspended in a sterile liquid medium that protects the viability of the vaccine as determined by a suitable method of viable count.

FINAL BULK VACCINE

The final bulk vaccine is prepared from a single harvest or by pooling a number of single harvests. A stabiliser may be added; if the stabiliser interferes with the determination of bacterial concentration in the final bulk vaccine, the determination is carried out before addition of the stabiliser.

Only final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium. The final bulk vaccine complies with the test for sterility except for the presence of mycobacteria.

Count of viable units. Determine the number of viable units per millilitre by viable count on solid medium using a method suitable for the vaccine to be examined or by a suitable biochemical method. Carry out the test in parallel on a reference preparation of the same strain.

Bacterial concentration. Determine the total bacterial concentration by a suitable method, either directly by determining the mass of the micro-organisms, or indirectly by an opacity method that has been calibrated in relation to the mass of the organisms; if the bacterial concentration is determined before addition of a stabiliser, the concentration in the final bulk vaccine is established by calculation. The total bacterial concentration is within the limits approved for the particular product.

The ratio of the count of viable units to the total bacterial concentration is not less than that approved for the particular product.

FINAL LOT

The final bulk vaccine is distributed into sterile containers and freeze-dried to a moisture content favourable to the stability of the vaccine; the containers are closed either under vacuum or under an inert gas.

Except where the filled and closed containers are stored at a temperature of – 20 °C or lower, the expiry date is not later than 4 years from the date of harvest.

Only a final lot that complies with the following requirement for count of viable units and with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for virulent mycobacteria has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot. Provided the test for excessive dermal reactivity has been carried out with satisfactory results on the working seed lot and on 5 consecutive final lots produced from it, the test may be omitted on the final lot.

Count of viable units. Determine the number of viable units per millilitre of the reconstituted vaccine by viable count on solid medium using a method suitable for the vaccine to be examined or by a suitable biochemical method. The ratio of the count of viable units after freeze-drying to that before is not less than that approved for the particular product.

IDENTIFICATION

BCG vaccine is identified by microscopic examination of the bacilli in stained smears demonstrating their acid-fast property and by the characteristic appearance of colonies grown on solid medium. Alternatively, molecular biology techniques (for example nucleic acid amplification) may be used.

TESTS

Virulent mycobacteria. Inject subcutaneously or intramuscularly into each of 6 guinea-pigs, each weighing 250-400 g and having received no treatment likely to interfere with the test, a quantity of vaccine equivalent to at least 50 human doses. Observe the animals for at least 42 days. At the end of this period, euthanise the guinea-pigs and examine by autopsy for signs of infection with tuberculosis, ignoring any minor reactions at the site of injection. Animals that die during the observation period are also examined for signs of tuberculosis. The vaccine complies with the test if none of the guinea-pigs shows signs of tuberculosis and if not more than 1 animal dies during the observation period. If 2 animals die during this period and autopsy does not reveal signs of tuberculosis repeat the test on 6 other guinea-pigs. The vaccine complies with the test if not more than 1 animal dies during the 42 days following the injection and autopsy does not reveal any sign of tuberculosis.

Bacterial and fungal contamination. The reconstituted vaccine complies with the test for sterility (*2.6.1*) except for the presence of mycobacteria.

Excessive dermal reactivity. Use 6 healthy, white or pale-coloured guinea-pigs, each weighing not less than 250 g and having received no treatment likely to interfere with the test. Inject intradermally into each guinea-pig, according to a randomised plan, 0.1 ml of the reconstituted vaccine and of 2 tenfold serial dilutions of the vaccine and identical doses of the comparison vaccine. Observe the lesions formed at the site of the injection for 4 weeks. The vaccine complies with the test if the reaction it produces is not markedly different from that produced by the comparison vaccine.

Temperature stability. Maintain samples of the freeze-dried vaccine at 37 °C for 4 weeks. Determine the number of viable units in the heated vaccine and in unheated vaccine as described below. The number of viable units in the heated vaccine is not less than 20 per cent that in unheated vaccine.

Water. Not more than the limit approved for the particular product, determined by a suitable method.

ASSAY

Determine the number of viable units in the reconstituted vaccine by viable count on solid medium using a method suitable for the vaccine to be examined or by a suitable validated biochemical method. The number is within the range stated on the label. Determine the number of viable units in the comparison vaccine in parallel.

LABELLING

The label states:

- the minimum and maximum number of viable units per millilitre in the reconstituted vaccine,
- that the vaccine must be protected from direct sunlight.

01/2008:0154

CHOLERA VACCINE

Vaccinum cholerae

DEFINITION

Cholera vaccine is a homogeneous suspension of a suitable strain or strains of *Vibrio cholerae* containing not less than 8×10^9 bacteria in each human dose. The human dose does not exceed 1.0 ml.

PRODUCTION

The vaccine is prepared using a seed-lot system. The vaccine consists of a mixture of equal parts of vaccines prepared from smooth strains of the 2 main serological types, Inaba and Ogawa. These may be of the classical biotype with or without the El-Tor biotype. A single strain or several strains of each type may be included. All strains must contain, in addition to their type O antigens, the heat-stable O antigen common to Inaba and Ogawa. If more than one strain each of Inaba and Ogawa are used, these may be selected so as to contain other O antigens in addition. The World Health Organisation recommends new strains which may be used if necessary, in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia. In order to comply with the requirements for vaccination certificates required for international travel, the vaccine must contain not less than 8×10^9 organisms of the classical biotype. Each strain is grown separately. The bacteria are inactivated either by heating the suspensions (for example, at 56 °C for 1 h) or by treatment with formaldehyde or phenol or by a combination of the physical and chemical methods.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*) modified as follows: inject 0.5 ml of the vaccine into each mouse and 1.0 ml into each guinea pig.

IDENTIFICATION

It is identified by specific agglutination tests.

TESTS

Phenol (*2.5.15*). If phenol has been used in the preparation, the concentration is not more than 5 g/l.

Antibody production. Test the ability of the vaccine to induce antibodies (such as agglutinating, vibriocidal or haemagglutinating antibodies) in the guinea-pig, the rabbit or the mouse. Administer the vaccine to a group of at least 6 animals. At the end of the interval of time necessary for maximum antibody formation, determined in preliminary tests, collect sera from the animals and titrate them individually for the appropriate antibody using a suitable method. The vaccine to be examined passes the test if each serotype has elicited a significant antibody response.

Sterility (*2.6.1*). It complies with the test for sterility.

LABELLING

The label states:

- the method used to inactivate the bacteria,
- the number of bacteria in each human dose.

01/2008:0155

CHOLERA VACCINE, FREEZE-DRIED

Vaccinum cholerae cryodesiccatum

DEFINITION

Freeze-dried cholera vaccine is a preparation of a suitable strain or strains of *Vibrio cholerae*. The vaccine is reconstituted as stated on the label to give a uniform suspension containing not less than 8×10^9 bacteria in each human dose. The human dose does not exceed 1.0 ml of the reconstituted vaccine.

PRODUCTION

The vaccine is prepared using a seed-lot system. The vaccine consists of a mixture of equal parts of vaccines prepared from smooth strains of the 2 main serological types, Inaba and Ogawa. These may be of the classical biotype with or without the El-Tor biotype. A single strain or several strains of each type may be included. All strains must contain, in addition to their type O antigens, the heat-stable O antigen common to Inaba and Ogawa. If more than one strain each of Inaba and Ogawa are used, these may be selected so as to contain other O antigens in addition. The World Health Organisation recommends new strains which may be used if necessary in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia. In order to comply with the requirements for vaccination certificates required for international travel, the vaccine must contain not less than 8×10^9 organisms of the classical biotype. Each strain is grown separately. The bacteria are inactivated either by heating the suspensions (for example, at 56 °C for 1 h) or by treatment with formaldehyde or by a combination of the physical and chemical methods. Phenol is not used in the preparation. The vaccine is distributed into sterile containers

and freeze-dried to a moisture content favourable to the stability of the vaccine. The containers are then closed so as to exclude contamination.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*) modified as follows: inject 0.5 ml of the vaccine into each mouse and 1.0 ml into each guinea pig.

IDENTIFICATION

The vaccine reconstituted as stated on the label is identified by specific agglutination tests.

TESTS

Phenol (*2.5.15*). If phenol has been used in the preparation, the concentration is not more than 5 g/l.

Antibody production. Test the ability of the vaccine to induce antibodies (such as agglutinating, vibriocidal or haemagglutinating antibodies) in the guinea-pig, the rabbit or the mouse. Administer the reconstituted vaccine to a group of at least 6 animals. At the end of the interval of time necessary for maximum antibody formation, determined in preliminary tests, collect sera from the animals and titrate them individually for the appropriate antibody using a suitable method. The vaccine to be examined passes the test if each serotype has elicited a significant antibody response.

Sterility (*2.6.1*). The reconstituted vaccine complies with the test for sterility.

LABELLING

The label states:

– the method used to inactivate the bacteria,

– the number of bacteria in each human dose.

01/2008:2327

CHOLERA VACCINE (INACTIVATED, ORAL)

Vaccinum cholerae perorale inactivatum

DEFINITION

Cholera vaccine (inactivated, oral) is a homogeneous suspension of inactivated suitable strains of *Vibrio cholerae* serogroup O1, representing serotypes and biotypes of epidemic strains. The vaccine may contain the B subunit of cholera toxin (CTB). Just prior to ingestion, one dose of vaccine suspension is mixed with a suitable buffer as stated on the label.

PRODUCTION

GENERAL PROVISIONS

The production method must be validated to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

The production process must be validated to show that no clinically significant quantities of active toxin are present in the product.

CHOICE OF VACCINE STRAIN

The vaccine consists of a mixture of epidemic *V. cholerae* strains inactivated by a suitable method such as heat or formalin inactivation. All strains express smooth lipopolysaccharide (LPS). The CTB is produced by recombinant DNA technology in a strain that lacks the gene for cholera toxin subunit A (*ctxA*$^-$). Selected *V. cholerae* strains are low cholera-toxin producers.

The World Health Organisation (WHO) can recommend new vaccine strains or antigens that may be used if necessary, in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia.

SEED LOTS

The strains of *V. cholerae* used shall be identified by historical records that include information on the origin of the strains and their subsequent manipulation. Characterisation and maintenance of the recombinant strains and plasmids used for production of the recombinant B subunit of cholera toxin (rCTB) and the origin of the gene for cholera toxin subunit B (*ctxB*) are documented. The stability of the rCTB plasmid in the recombinant strain during storage and beyond the passage level used in production is confirmed.

Characterisation of the rCTB is undertaken using a variety of analytical techniques including determination of molecular size, charge and amino acid composition. Techniques suitable for such purposes include sodium dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) and different liquid chromatographies. The identity of the product is confirmed by at least partial *N*-terminal and *C*-terminal amino acid sequencing.

Master seed lots are grown on agar plates, which may contain appropriate antibiotics. Colonies are used to produce working seed lots in liquid media that are free from antibiotics. Cultures derived from the working seed lot must have the same characteristics as the cultures of the strain from which the master seed lot was derived.

Only a seed lot that complies with the following requirements may be used in the preparation of the monovalent cell harvest.

Identification. Master seed lots are identified by colony morphology, and by biochemical characterisation, using suitable molecular assays or immunoassays. Working seed lots are identified by colony morphology and by molecular assays or immunoassays.

Purity. Purity of master seed lots and working seed lots is verified by methods of suitable sensitivity.

PROPAGATION AND HARVEST

Each strain is grown separately from the working seed lot.

Cultures are checked at different stages of fermentation (subcultures and main culture) for purity, identity, cell opacity, pH and biochemical characteristics. Unsatisfactory cultures must be discarded.

Production cultures are shown to be consistent in respect of growth rate, pH and yield of cells or cell products.

MONOVALENT CELL HARVEST

Only a monovalent harvest that complies with established specifications for the following tests may be used.

pH (*2.2.3*): within the range approved for the particular product.

Identification. Relevant antigenic characteristics are verified by suitable immunological or biochemical assays.

Purity. Samples of culture are examined by microscopy of Gram-stained smears, by inoculation of appropriate culture media or by another suitable procedure.

Opacity. The absorbance at 600 nm (*2.2.25*) is within the range approved for the particular product.

INACTIVATED MONOVALENT CELL BULK

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. Bacteria are inactivated after washing, either by treatment with formaldehyde or by heating under conditions that ensure inactivation.

Only an inactivated monovalent cell bulk that complies with established specifications for the following tests may be used in the preparation of the final bulk.

pH (*2.2.3*): within the range approved for the particular product.

Identification: verified by slide agglutination.

Inactivation. Complete inactivation is verified by a suitable culture method.

Sterility (*2.6.1*). It complies with the test for sterility, carried out using 10 ml for each medium.

Opacity. The inactivation process may affect the accuracy of opacity measurements.

Purity. Samples of culture are examined by microscopy of Gram-stained smears, by inoculation of appropriate culture media or by another suitable procedure.

Smooth LPS content: verified by a suitable immunoassay (*2.7.1*).

Residual cholera toxin. The absence of residual cholera toxin is verified by a suitable immunoassay (*2.7.1*) or biochemical assay.

Free formaldehyde (*2.4.18*): content to be determined where formaldehyde is used for inactivation.

PURIFIED rCTB

Production of the rCTB follows the guidelines for assuring the quality of pharmaceutical and biological products prepared by recombinant technology and is covered by the monograph *Products of recombinant DNA technology (0784)*. Prior to harvest, the cell culture is checked for purity and opacity. rCTB is harvested by suitable filtration, concentrated by diafiltration, purified by chromatography, filter-sterilised and stored under suitable conditions. The pH of the pooled eluate is adjusted prior to buffer exchange.

Only purified rCTB that complies with established specifications for the following tests may be used in the preparation of the final bulk.

pH (*2.2.3*): within the range approved for the particular product.

Purity: verified by SDS-PAGE (*2.2.31*) and an appropriate liquid chromatography method (*2.2.29*).

Sterility (*2.6.1*). It complies with the test for sterility, carried out using 10 ml for each medium.

rCTB. The amount of rCTB is determined by a suitable immunoassay (*2.7.1*).

FINAL BULK

The final bulk vaccine is prepared by aseptically mixing a suitable buffer with monovalent cell bulks. Where used, the rCTB bulk is added in appropriate amounts. Preservatives, if used, may be added at this stage.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

Sterility (*2.6.1*). It complies with the test for sterility, carried out using 10 ml for each medium.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

FINAL LOT

The final bulk is mixed to homogeneity and filled aseptically into suitable containers.

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

IDENTIFICATION

Serotypes are detected by a suitable immunoassay (*2.7.1*) or molecular assay. rCTB is detected by a suitable immunoassay (*2.7.1*). The antigen-content assays may also serve as an identity test.

TESTS

pH (*2.2.3*): within the range approved for the particular product.

Sterility (*2.6.1*). It complies with the test for sterility.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l, where applicable.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

ASSAY

Antigen content. The amount of smooth LPS, and where applicable, the amount of rCTB, are within the limits approved for the particular product, determined by a suitable immunoassay (*2.7.1*).

LABELLING

The label states:

- the method of inactivation;
- the serogroup, serotypes and biotypes of vaccine strains;
- the number of bacteria per human dose;
- the amount of rCTB.

01/2008:0444

DIPHTHERIA AND TETANUS VACCINE (ADSORBED)

Vaccinum diphtheriae et tetani adsorbatum

DEFINITION

Diphtheria and tetanus vaccine (adsorbed) is a preparation of diphtheria formol toxoid and tetanus formol toxoid with a mineral adsorbent. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

PRODUCTION

GENERAL PROVISIONS

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing

250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

BULK PURIFIED DIPHTHERIA AND TETANUS TOXOIDS

The bulk purified diphtheria and tetanus toxoids are prepared as described in the monographs on *Diphtheria vaccine (adsorbed) (0443)* and *Tetanus vaccine (adsorbed) (0452)* and comply with the requirements prescribed therein.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used. Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

LABELLING

The label states:

- the minimum number of International Units of each component per single human dose,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- the name and the amount of the adsorbent,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

01/2008:0647

DIPHTHERIA AND TETANUS VACCINE (ADSORBED, REDUCED ANTIGEN(S) CONTENT)

Vaccinum diphtheriae et tetani, antigeni-o(-is) minutum, adsorbatum

DEFINITION

Diphtheria and tetanus vaccine (adsorbed, reduced antigen(s) content) is a preparation of diphtheria formol toxoid and tetanus formol toxoid with a mineral adsorbent. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively. It shall have been demonstrated to the competent authority that the quantity of diphtheria toxoid used does not produce adverse reactions in subjects from the age groups for which the vaccine is intended.

PRODUCTION

GENERAL PROVISIONS

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

BULK PURIFIED DIPHTHERIA TOXOID AND TETANUS TOXOIDS

The bulk purified diphtheria and tetanus toxoids are prepared as described in the monographs on *Diphtheria vaccine (adsorbed) (0443)* and *Tetanus vaccine (adsorbed) (0452)* and comply with the requirements prescribed therein.

FINAL BULK VACCINE

The vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified toxoids or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 ml of the vaccine to be examined and suspend the residue in 5 ml of a freshly prepared mixture of 1 volume of a 56 g/l solution of *sodium edetate R* and 49 volumes of a 90 g/l solution of *disodium hydrogen phosphate R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 20 IU per single human dose.

LABELLING

The label states:

– the minimum number of International Units of each component per single human dose;
– the name and the amount of the adsorbent;
– that the vaccine must be shaken before use;
– that the vaccine is not to be frozen.

01/2008:2062

DIPHTHERIA, TETANUS AND HEPATITIS B (rDNA) VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani et hepatitidis B (ADNr) adsorbatum

DEFINITION

Diphtheria, tetanus and hepatitis B (rDNA) vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; hepatitis B surface antigen (HBsAg); a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

HBsAg is a component protein of hepatitis B virus; the antigen is obtained by recombinant DNA technology.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

The content of bacterial endotoxins (*2.6.14*) in the bulk purified diphtheria toxoid and tetanus toxoid is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved

for the particular vaccine and in any case the contents are such that the final vaccine contains less than 100 IU per single human dose.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443), Tetanus vaccine (adsorbed) (0452)* and *Hepatitis B vaccine (rDNA) (1056).*

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and HBsAg onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria and tetanus components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the content of free formaldehyde has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

If an *in vivo* assay is used for the hepatitis B component, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The assay or, where applicable, the electrophoretic profile, serves also to identify the hepatitis B component of the vaccine.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject the equivalent of 1 human dose into each rabbit.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Hepatitis B component. It complies with the assay of hepatitis B vaccine (*2.7.15*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose,
- the amount of HBsAg per single human dose,
- the type of cells used for production of the HBsAg component,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- the name and the amount of the adsorbent,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

corrected 6.0

DIPHTHERIA, TETANUS AND PERTUSSIS (ACELLULAR, COMPONENT) VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani et pertussis sine cellulis ex elementis praeparatum adsorbatum

DEFINITION

Diphtheria, tetanus and pertussis (acellular, component) vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties, produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the latter harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be copurified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in the bulk purified diphtheria toxoid, tetanus toxoid and pertussis components is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)* and *Pertussis vaccine (acellular, component, adsorbed) (1356)*.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and pertussis components separately or together onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the tests for absence of residual pertussis toxin, irreversibility of pertussis toxoid, free formaldehyde and antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example.

The clear supernatant liquid obtained as described in identification test A reacts with specific antisera to the pertussis components of the vaccine.

TESTS

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification*. Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject into each mouse 2 mg of histamine base intraperitoneally in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if 1 or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If 1 mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Pertussis component. The vaccine complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification.

01/2008:0445

DIPHTHERIA, TETANUS AND PERTUSSIS VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani et pertussis adsorbatum

DEFINITION

Diphtheria, tetanus and pertussis vaccine (adsorbed) is a preparation of diphtheria formol toxoid and tetanus formol toxoid with a mineral adsorbent to which a suspension of inactivated *Bordetella pertussis* has been added. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

PRODUCTION

GENERAL PROVISIONS

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

BULK PURIFIED DIPHTHERIA AND TETANUS TOXOIDS, BULK INACTIVATED B. PERTUSSIS SUSPENSION

The bulk purified diphtheria and tetanus toxoids and the inactivated *B. pertussis* suspension are prepared as described in the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)* and *Pertussis vaccine (adsorbed) (0161)*, respectively, and comply with the requirements prescribed therein.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide and admixture of an appropriate quantity of a suspension of inactivated *B. pertussis*; the resulting mixture is approximately isotonic with blood. The *B. pertussis* concentration of the final bulk vaccine does not exceed that corresponding to an opacity of 20 IU per single human dose. If 2 or more strains of *B.*

pertussis are used, the composition of consecutive lots of the final bulk vaccine shall be consistent with respect to the proportion of each strain as measured in opacity units. Suitable antimicrobial preservatives may be added to the bulk vaccine. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the tests for specific toxicity of the pertussis component, antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained; reserve the precipitate for identification test C. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge to obtain a bacterial precipitate. Other suitable methods for separating the bacteria from the adsorbent may also be used. Identify pertussis vaccine by agglutination of the bacteria from the resuspended precipitate by antisera specific to *B. pertussis* or by the assay.

TESTS

Specific toxicity of the pertussis component. Use not fewer than 5 mice each weighing 14 g to 16 g for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Allow the animals access to food and water for at least 2 h before injection and during the test. Inject each mouse of the vaccine group intraperitoneally with 0.5 ml, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 ml of a 9 g/l sterile solution of *sodium chloride R*, preferably containing the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the total mass of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test. The test may be repeated and the results of the tests combined.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

If the test is carried out in guinea-pigs, the lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose; if the test is carried out in mice, the lower confidence limit (P = 0.95) of the estimated potency is not less than 60 IU per single human dose.

Pertussis component. Carry out the assay of pertussis vaccine (*2.7.7*).

The estimated potency is not less than 4 IU per single human dose and the lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

LABELLING

The label states:

- the minimum number of International Units of each component per single human dose,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- the name and the amount of the adsorbent,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

01/2008:2328

DIPHTHERIA, TETANUS AND POLIOMYELITIS (INACTIVATED) VACCINE (ADSORBED, REDUCED ANTIGEN(S) CONTENT)

Vaccinum diphtheriae, tetani et poliomyelitidis inactivatum, antigeni-o(-is) minutum, adsorbatum

DEFINITION

Diphtheria, tetanus and poliomyelitis (inactivated) vaccine (adsorbed, reduced antigen(s) content) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination; the amount of tetanus toxoid may also be reduced.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in bulk purified diphtheria toxoid, tetanus toxoid and inactivated monovalent poliovirus harvests is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)* and *Poliomyelitis vaccine (inactivated) (0214)*.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid, and an admixture of suitable quantities of purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) after virus harvest and before addition of the adsorbent in the preparation of the final bulk vaccine, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria and tetanus components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided the determination of D-antigen content cannot be carried out on the final lot, it is carried out during preparation of the final bulk before addition of the adsorbent.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given vaccine and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 ml of the vaccine to be examined and suspend the residue in 5 ml of a freshly prepared mixture of 1 volume of a 56 g/l solution of *sodium edetate R* and 49 volumes of a 90 g/l solution of *disodium hydrogen phosphate R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 20 IU per single human dose.

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

– the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
– the types of poliovirus contained in the vaccine;
– the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
– the type of cells used for production of the poliomyelitis component;
– the name and the amount of the adsorbent;
– that the vaccine must be shaken before use;
– that the vaccine is not to be frozen.

DIPHTHERIA, TETANUS, PERTUSSIS (ACELLULAR, COMPONENT) AND HAEMOPHILUS TYPE b CONJUGATE VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum cumque haemophili stirpi b coniugatum adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein; a mineral absorbent such as aluminium hydroxide or hydrated aluminium phosphate. The product may be presented with the haemophilus type b component in a separate container, the contents of which are mixed with the other components immediately before use.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the toxin harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The acellular pertussis component may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be copurified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate $[(C_{10}H_{19}O_{12}P)_n]$, with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

If the vaccine is presented with the haemophilus component in a separate vial, as part of consistency studies the assays of the diphtheria, tetanus and pertussis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components and bulk PRP conjugate is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine; if the vaccine is presented with the haemophilus component in a separate container, the contents of the diphtheria, tetanus and pertussis antigens are in any case such that the final vial for these components contains less than 100 IU per single human dose.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

During development studies and wherever revalidation is necessary, it shall be demonstrated by tests in animals that the vaccine induces a T-cell dependent B-cell immune response to PRP.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (acellular, component, adsorbed) (1356)* and *Haemophilus type b conjugate vaccine (1219)*.

FINAL BULK VACCINE

Different methods of preparation may be used: a final bulk vaccine may be prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and PRP conjugate onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate; or 2 final bulks may be prepared and filled separately, one containing the diphtheria, tetanus and pertussis components, the other the haemophilus component, which may be freeze-dried. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the tests for absence of residual pertussis toxin, irreversibility of pertussis toxoid and antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Osmolality. (*2.2.35*). The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

pH (*2.2.3*). The pH of the vaccine, reconstituted if necessary, is within the range approved for the particular product.

Free PRP. Unbound PRP is determined after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

IDENTIFICATION

If the vaccine is presented with the haemophilus component in a separate vial: identification tests A, B and C are carried out using the vial containing the diphtheria, tetanus and pertussis components; identification test D is carried out on the vial containing the haemophilus components.

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a specific antisera to the pertussis components of the vaccine.

D. The haemophilus component is identified by a suitable immunochemical method (*2.7.1*) for PRP.

TESTS

If the product is presented with the haemophilus component in a separate container: the tests for absence of residual pertussis toxin, irreversibility of pertussis toxoid, aluminium, free formaldehyde, antimicrobial preservative and sterility are carried out on the container with the diphtheria, tetanus and pertussis components; the tests for PRP content, water (where applicable), sterility and pyrogens are carried out on the container with the haemophilus component.

If the haemophilus component is freeze-dried, some tests may be carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification.* Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject intraperitoneally into each mouse 2 mg of histamine base in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if 1 or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If 1 mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

PRP: minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (*2.5.31*) or phosphorus (*2.5.18*), by an immunochemical method (*2.7.1*) or by anion-exchange liquid chromatography (*2.2.29*) with pulsed-amperometric detection.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Water (*2.5.12*): maximum 3.0 per cent for the freeze-dried haemophilus component.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP as carrier.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Pertussis component. The vaccine complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification.

DIPHTHERIA, TETANUS, PERTUSSIS (ACELLULAR, COMPONENT) AND HEPATITIS B (rDNA) VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum et hepatitidis B (ADNr) adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and hepatitis B (rDNA) vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordella pertussis*; hepatitis B surface antigen; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties, produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the latter harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be copurified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

Hepatitis B surface antigen is a component protein of hepatitis B virus; the antigen is obtained by recombinant DNA technology.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in the bulk purified diphtheria toxoid, tetanus toxoid and pertussis components is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (acellular, component, adsorbed) (1356)* and *Hepatitis B vaccine (rDNA) (1056)*.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and hepatitis B surface antigen onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the tests for absence of residual pertussis toxin, irreversibility of pertussis toxoid and antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the content of free formaldehyde has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

If an *in vivo* assay is used for the hepatitis B component, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a specific antisera to the pertussis components of the vaccine.

D. The assay or, where applicable, the electrophoretic profile, serves also to identify the hepatitis B component of the vaccine.

TESTS

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification*. Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject intraperitoneally into each mouse 2 mg of histamine base in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if 1 or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If 1 mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

Pyrogens (*2.6.8*). The vaccine complies with the test for pyrogens. Inject the equivalent of 1 human dose into each rabbit.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Pertussis component. The vaccine complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

Hepatitis B component. The vaccine complies with the assay of hepatitis B vaccine (*2.7.15*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- the amount of HBsAg per single human dose;
- the type of cells used for production of the hepatitis B component;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification.

DIPHTHERIA, TETANUS, PERTUSSIS (ACELLULAR, COMPONENT) AND POLIOMYELITIS (INACTIVATED) VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum et poliomyelitidis inactivatum adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine (adsorbed) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the toxin harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be copurified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components and purified, inactivated monovalent poliovirus harvests is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443), Tetanus vaccine (adsorbed) (0452), Pertussis vaccine (acellular, component, adsorbed) (1356)* and *Poliomyelitis vaccine (inactivated) (0214).*

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and admixture of suitable quantities of purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) after virus harvest and before addition of the adsorbent in the preparation of the final bulk vaccine, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for absence of residual pertussis toxin and irreversibility of pertussis toxoid, antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided that the determination of D-antigen content has been carried out with satisfactory results during preparation of the final bulk before addition of the adsorbent, it may be omitted on the final lot.

Provided that the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a specific antisera to the pertussis components of the vaccine.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

TESTS

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification.* Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject intraperitoneally into each mouse 2 mg of histamine base in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if 1 or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If 1 mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Pertussis component. The vaccine complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- the types of poliovirus contained in the vaccine;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification.

01/2008:2329

DIPHTHERIA, TETANUS, PERTUSSIS (ACELLULAR, COMPONENT) AND POLIOMYELITIS (INACTIVATED) VACCINE (ADSORBED, REDUCED ANTIGEN(S) CONTENT)

Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum et poliomyelitidis inactivatum, antigeni-o(-is) minutum, adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine (adsorbed, reduced antigen(s) content) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination; the amounts of tetanus toxoid and pertussis components may also be reduced.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the toxin harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be copurified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components and inactivated monovalent poliovirus harvests is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (acellular, component, adsorbed) (1356)* and *Poliomyelitis vaccine (inactivated) (0214)*.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and acellular pertussis components, and an admixture of suitable quantities of purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) after virus harvest and before addition of the adsorbent in the preparation of the final bulk vaccine, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for absence of residual pertussis toxin and irreversibility of pertussis toxoid, the test for antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided the determination of D-antigen content cannot be carried out on the final lot, it is carried out during preparation of the final bulk before addition of the adsorbent.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given vaccine and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 ml of the vaccine to be examined and suspend the residue in 5 ml of a freshly prepared mixture of 1 volume of a 56 g/l solution of *sodium edetate R* and 49 volumes of a 90 g/l solution of *disodium hydrogen phosphate R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.
B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.
C. The pertussis components are identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained as described in identification test A reacts with a specific antisera to the pertussis components of the vaccine.
D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

TESTS

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification.* Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject intraperitoneally into each mouse 2 mg of histamine base in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if one or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If one mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 20 IU per single human dose.

Pertussis component. The vaccine complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the types of poliovirus contained in the vaccine;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

DIPHTHERIA, TETANUS, PERTUSSIS (ACELLULAR, COMPONENT), HEPATITIS B (rDNA), POLIOMYELITIS (INACTIVATED) AND HAEMOPHILUS TYPE b CONJUGATE VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum, hepatitidis B (ADNr), poliomyelitidis inactivatum et haemophili stirpi b coniugatum adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; hepatitis B surface antigen (HBsAg); human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a suitable method; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein. The antigens in the vaccine may be adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. The product may be presented with the haemophilus component in a separate container, the contents of which are mixed with the other components immediately before or during use.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the toxin harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The acellular pertussis component may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be copurified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

Hepatitis B surface antigen is a component protein of hepatitis B virus; the antigen is obtained by recombinant DNA technology.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1 → 1)-ribitol-5-phosphate $[(C_{10}H_{19}O_{12}P)_n]$, with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

If the vaccine is presented with the haemophilus component in a separate vial, as part of consistency studies the assays of the diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria, toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in bulk purified diphtheria toxoid, bulk purified tetanus toxoid, bulk purified pertussis components, the hepatitis B surface antigen, the purified, inactivated monovalent poliovirus harvests and bulk PRP conjugate is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is not greater than the limit approved.

During development studies and wherever revalidation is necessary a test for pyrogens in rabbits (*2.6.8*) is carried out by injection of a suitable dose of the final lot. The vaccine is shown to be acceptable with respect to absence of pyrogenic activity.

During development studies and wherever revalidation is necessary, it shall be demonstrated by tests in animals that the vaccine induces a T-cell-dependent B-cell immune response to PRP.

The stability of the final lot and relevant intermediates is evaluated using one or more indicator tests. For the haemophilus component, such tests may include determination of molecular size, determination of free PRP in the conjugate and kinetics of depolymerisation. Taking account of the results of the stability testing, release

requirements are set for these indicator tests to ensure that the vaccine will be satisfactory at the end of the period of validity.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443), Tetanus vaccine (adsorbed) (0452), Pertussis vaccine (acellular, component, adsorbed) (1356), Hepatitis B vaccine (rDNA) (1056), Poliomyelitis vaccine (inactivated) (0214)* and *Haemophilus type b conjugate vaccine (1219).*

FINAL BULKS

Vaccine with all components in the same container. The final bulk is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, bulk purified tetanus toxoid, bulk purified acellular pertussis components and bulk purified hepatitis B surface antigen onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of a suitable quantity of PRP conjugate and suitable quantities of purified and inactivated, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such monovalent harvests. Suitable antimicrobial preservatives may be added.

Vaccine with the haemophilus component in a separate container. The final bulk of diphtheria, tetanus, pertussis, hepatitis B and poliovirus component is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, bulk purified tetanus toxoid, bulk purified acellular pertussis components and bulk purified hepatitis B surface antigen onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of suitable quantities of purified and inactivated, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable pool of such monovalent harvests This final bulk is filled separately. Suitable antimicrobial preservatives may be added. The final bulk of the haemophilus component is prepared by dilution of the bulk conjugate to the final concentration with a suitable diluent. A stabiliser may be added.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) after purification of the harvests and before preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Where the haemophilus component is in a separate container, the final bulk of the haemophilus component is freeze-dried. Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the tests for osmolality, for absence of residual pertussis toxin and irreversibility of pertussis toxoid and for antimicrobial preservative and the diphtheria, tetanus and pertussis component assays have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens and the purified monovalent harvests or the trivalent pool of polioviruses or the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided that the test for bovine serum albumin has been carried out with satisfactory results on the trivalent pool of inactivated monovalent harvests of polioviruses or on the final bulk vaccine, it may be omitted on the final lot.

If an *in vivo* assay is used for the hepatitis B component, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Free PRP. For vaccines with all components in the same container, the free PRP content is determined on the non-absorbed fraction. Unbound PRP is determined on the haemophilus component after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

Bacterial endotoxins (*2.6.14*): less than the limit approved for the product concerned.

Osmolality (*2.2.35*). The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

IDENTIFICATION

If the vaccine is presented with the haemophilus component in a separate vial: identification tests A, B, C, D and E are carried out using the vial containing the diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis components; identification test F is carried out on the vial containing the haemophilus components.

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The clear supernatant liquid obtained during identification test A reacts with a specific antisera to the pertussis components of the vaccine when examined by suitable immunochemical methods (*2.7.1*).

D. The hepatitis B component is identified by a suitable immunochemical method (*2.7.1*), for example the *in vitro* assay or by a suitable electrophoretic method (*2.2.31*).

E. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*), such as determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

F. The PRP and its carrier protein are identified by a suitable immunochemical method (*2.7.1*).

TESTS

If the product is presented with the haemophilus component in a separate container: the tests for absence of residual pertussis toxin and irreversibility of pertussis toxoid, free formaldehyde, aluminium, antimicrobial preservative and sterility are carried out on the container with the diphtheria, tetanus, pertussis, poliomyelitis and hepatitis B components; the tests for PRP, water, antimicrobial preservative (where applicable), aluminium (where applicable) and sterility are carried out on the container with the haemophilus component.

Some tests for the haemophilus component are carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification.* Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject intraperitoneally into each mouse 2 mg of histamine base in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if 1 or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If 1 mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

PRP: minimum 80 per cent of the amount of PRP stated on the label, for a vaccine with the haemophilus component in a separate container.

For a vaccine with all components in the same container: the PRP content determined on the non-absorbed fraction is not less than that approved for the product.

PRP is determined either by assay of ribose (*2.5.31*) or phosphorus (*2.5. 18*), by an immunochemical method (*2.7.1*) or by anion-exchange liquid chromatography (*2.2.29*) with pulsed-amperometric detection.

Aluminium (*2.5.13*): maximum 1.25 mg of aluminium (Al) per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l of free formaldehyde per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Water (*2.5.12*): maximum 3.0 per cent for the freeze-dried haemophilus component.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Pertussis component. The vaccine complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

Hepatitis B component. The vaccine complies with the assay of hepatitis B vaccine (*2.7.15*).

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- the amount of HBsAg per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the types of cells used for production of the poliomyelitis and the hepatitis B components;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification.

DIPHTHERIA, TETANUS, PERTUSSIS (ACELLULAR, COMPONENT), POLIOMYELITIS (INACTIVATED) AND HAEMOPHILUS TYPE b CONJUGATE VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum, poliomyelitidis inactivatum et haemophili stirpi b coniugatum adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a suitable method; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate. The product is presented with the haemophilus component in a separate container, the contents of which are mixed with the other components immediately before use.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid or a pertussis-toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. Pertussis toxoid is prepared from pertussis toxin by a method that renders the toxin harmless while maintaining adequate immunogenic properties and avoiding reversion to toxin. The acellular pertussis component may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate $[(C_{10}H_{19}O_{12}P)_n]$, with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria, toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (*2.6.14*) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components, purified, inactivated monovalent poliovirus harvests and bulk PRP conjugate is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

During development studies and wherever revalidation is necessary, it shall be demonstrated by tests in animals that the vaccine induces a T-cell dependent B-cell immune response to PRP.

As part of consistency studies the assays of the diphtheria, tetanus, pertussis and poliomyelitis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (acellular, component, adsorbed) (1356)*, *Poliomyelitis vaccine (inactivated) (0214)* and *Haemophilus type b conjugate vaccine (1219)*.

FINAL BULKS

The final bulk of the diphtheria, tetanus, pertussis and poliomyelitis components is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, bulk purified tetanus toxoid and bulk purified acellular pertussis components onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of suitable quantities of purified, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such monovalent harvests. Suitable antimicrobial preservatives may be added.

The final bulk of the haemophilus component is prepared by dilution of the bulk conjugate to the final concentration with a suitable diluent. A stabiliser may be added.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) during preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk of the haemophilus component is freeze-dried.

Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the test for absence of residual pertussis toxin and irreversibility of pertussis toxoid, the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided that the free formaldehyde content has been determined on the bulk purified antigens and the purified monovalent harvests or the trivalent pool of polioviruses or the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided that the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Osmolality (*2.2.35*). The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

Free PRP. Unbound PRP is determined on the haemophilus component after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

IDENTIFICATION

Identification tests A, B, C and D are carried out using the vial containing the diphtheria, tetanus, pertussis and poliomyelitis components; identification test E is carried out on the vial containing the haemophilus component.

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by suitable immunochemical methods (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with specific antisera to the pertussis components of the vaccine.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*), such as determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

E. The haemophilus component is identified by a suitable immunochemical method (*2.7.1*) for PRP.

TESTS

The tests for absence of residual pertussis toxin and irreversibility of pertussis toxoid, aluminium, free formaldehyde, antimicrobial preservative and sterility are carried out on the container with the diphtheria, tetanus, pertussis and poliomyelitis components; the tests for PRP, water, sterility and pyrogens are carried out on the container with the haemophilus component.

Some tests for the haemophilus component may be carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.

Absence of residual pertussis toxin and irreversibility of pertussis toxoid. *This test is not necessary for the product obtained by genetic modification*. Use 3 groups each of not fewer than 5 histamine-sensitive mice. Inject intraperitoneally into the first group twice the single human dose of the vaccine stored at 2-8 °C. Inject intraperitoneally into the second group twice the single human dose of the vaccine incubated at 37 °C for 4 weeks. Inject diluent intraperitoneally into the third group of mice. After 5 days, inject into each mouse 2 mg of histamine base

intraperitoneally in a volume not exceeding 0.5 ml and observe for 24 h. The test is invalid if 1 or more control mice die following histamine challenge. The vaccine complies with the test if no animal in the first or second group dies following histamine challenge. If 1 mouse dies in either or both of the first and second groups, the test may be repeated with the same number of mice or with a greater number and the results of valid tests combined; the vaccine complies with the test if, in both of the groups given the vaccine, not more than 5 per cent of the total number of mice die following histamine challenge.

The histamine sensitivity of the strain of mice used is verified at suitable intervals as follows: inject intravenously threefold dilutions of a reference pertussis toxin preparation in phosphate-buffered saline solution containing 2 g/l of gelatin and challenge with histamine as above; the strain is suitable if more than 50 per cent of the animals are sensitised by 50 ng of pertussis toxin and none of the control animals injected with only diluent and challenged similarly with histamine show symptoms of sensitisation.

Pertussis toxin BRP is suitable for use as a reference pertussis toxin.

PRP: minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (*2.5.31*) or phosphorus (*2.5.18*), by an immunochemical method (*2.7.1*) or by anion-exchange liquid chromatography (*2.2.29*) with pulsed-amperometric detection.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Water (*2.5.12*): maximum 3.0 per cent for the haemophilus component.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP as a carrier.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

Unless otherwise justified and authorised, the lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose.

Pertussis component. It complies with the assay of pertussis vaccine (acellular) (*2.7.16*).

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification.

01/2008:2061

DIPHTHERIA, TETANUS, PERTUSSIS AND POLIOMYELITIS (INACTIVATED) VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis et poliomyelitidis inactivatum adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis and poliomyelitis (inactivated) vaccine (adsorbed) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; an inactivated suspension of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition

between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (adsorbed) (0161)* and *Poliomyelitis vaccine (inactivated) (0214)*.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid and bulk purified tetanus toxoid and admixture of suitable quantities of an inactivated suspension of *B. pertussis* and purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) during preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the tests for specific toxicity of the pertussis component and antimicrobial preservative, and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided that the free formaldehyde content has been determined on the bulk purified antigens, the inactivated *B. pertussis* suspension and the purified monovalent harvests or the trivalent pool of polioviruses or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided that the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Osmolality (*2.2.35*). The osmolality of the vaccine is within the limits approved for the particular preparation.

IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The centrifugation residue obtained in identification A may be used. Other suitable methods for separating the bacteria from the adsorbent may also be used. Identify pertussis vaccine by agglutination of the bacteria from the resuspended precipitate by antisera specific to *B. pertussis* or by the assay of the pertussis component prescribed under Assay.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

TESTS

Specific toxicity of the pertussis component. Use not fewer than 5 healthy mice each weighing 14-16 g for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Allow the animals access to food and water for at least 2 h before injection and during the test. Inject each mouse of the vaccine group intraperitoneally with 0.5 ml, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 ml of a 9 g/l sterile solution of *sodium chloride R*, preferably containing the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the total mass of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per

control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test. The test may be repeated and the results of the tests combined.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

If the test is carried out in guinea pigs, the lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose; if the test is carried out in mice, the lower confidence limit (P = 0.95) of the estimated potency is not less than 60 IU per single human dose.

Pertussis component. Carry out the assay of pertussis vaccine (*2.7.7*).

The estimated potency is not less than 4 IU per single human dose and the lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the minimum number of International Units of pertussis vaccine per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

01/2008:2066

DIPHTHERIA, TETANUS, PERTUSSIS, POLIOMYELITIS (INACTIVATED) AND HAEMOPHILUS TYPE b CONJUGATE VACCINE (ADSORBED)

Vaccinum diphtheriae, tetani, pertussis, poliomyelitidis inactivatum et haemophili stirpi b coniugatum adsorbatum

DEFINITION

Diphtheria, tetanus, pertussis, poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; an inactivated suspension of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a suitable method; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate. The product is presented with the haemophilus component in a separate container, the contents of which are mixed with the other components immediately before use.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate $[(C_{10}H_{19}O_{12}P)_n]$, with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

During development studies and wherever revalidation is necessary, it shall be demonstrated by tests in animals that the vaccine induces a T-cell dependent B-cell immune response to PRP.

As part of consistency studies the assays of the diphtheria, tetanus, pertussis and poliomyelitis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

Reference vaccine(s). Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for

the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

Specific toxicity of the diphtheria and tetanus components. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia or tetanus, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs on *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (adsorbed) (0161)*, *Poliomyelitis vaccine (inactivated) (0214)* and *Haemophilus type b conjugate vaccine (1219)*.

FINAL BULKS

The final bulk of the diphtheria, tetanus, pertussis and poliomyelitis components is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, and bulk purified tetanus toxoid onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of suitable quantities of an inactivated suspension of *B. pertussis* and of purified, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such monovalent harvests. Suitable antimicrobial preservatives may be added.

The final bulk of the haemophilus component is prepared by dilution of the bulk conjugate to the final concentration with a suitable diluent. A stabiliser may be added.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

Bovine serum albumin. Determined on the poliomyelitis components by a suitable immunochemical method (*2.7.1*) during preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk of the haemophilus component is freeze-dried.

Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the tests for specific toxicity of the pertussis component and antimicrobial preservative, and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided that the free formaldehyde content has been determined on the bulk purified antigens, the inactivated *B. pertussis* suspension and the purified monovalent harvests or the trivalent pool of polioviruses or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

Provided that the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Osmolality (*2.2.35*). The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

Free PRP. Unbound PRP is determined on the haemophilus component after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

IDENTIFICATION

Identification tests A, B, C and D are carried out using the vial containing the diphtheria, tetanus, pertussis and poliomyelitis components; identification test E is carried out on the vial containing the haemophilus component.

A. Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. The clear supernatant liquid obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The centrifugation residue obtained in identification A may be used. Other suitable methods for separating the bacteria from the adsorbent may also be used. Identify pertussis vaccine by agglutination of the bacteria from the resuspended precipitate by antisera specific to *B. pertussis* or by the assay of the pertussis component prescribed under Assay.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*), such as determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

E. The haemophilus component is identified by a suitable immunochemical method (*2.7.1*) for PRP.

TESTS

The tests for specific toxicity of the pertussis component, aluminium, free formaldehyde, antimicrobial preservative and sterility are carried out on the container with diphtheria, tetanus, pertussis and poliomyelitis

components; the tests for PRP, water, sterility and pyrogens are carried out on the container with the haemophilus component.

Some tests for the haemophilus component may be carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.

Specific toxicity of the pertussis component. Use not fewer than 5 healthy mice each weighing 14-16 g, for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Allow the animals access to food and water for at least 2 h before injection and during the test. Inject each mouse of the vaccine group intraperitoneally with 0.5 ml, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 ml of a 9 g/l sterile solution of *sodium chloride R*, preferably containing the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the total mass of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test. The test may be repeated and the results of the tests combined.

PRP: minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (*2.5.31*) or phosphorus (*2.5.18*), by an immunochemical method (*2.7.1*) or by anion-exchange liquid chromatography (*2.2.29*) with pulsed-amperometric detection.

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Water (*2.5.12*): maximum 3.0 per cent for the haemophilus component.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP as carrier.

ASSAY

Diphtheria component. Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

Tetanus component. Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (*2.7.8*).

If the test is carried out in guinea-pigs, the lower confidence limit (P = 0.95) of the estimated potency is not less than 40 IU per single human dose; if the test is carried out in mice, the lower confidence limit (P = 0.95) of the estimated potency is not less than 60 IU per single human dose.

Pertussis component. Carry out the assay of pertussis vaccine (*2.7.7*).

The estimated potency is not less than 4 IU per single human dose and the lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

Poliomyelitis component

D-antigen content. As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (*2.7.1*) following desorption using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

In vivo test. The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (*2.7.20*).

LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the minimum number of International Units of pertussis vaccine per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

corrected 6.0

DIPHTHERIA VACCINE (ADSORBED)

Vaccinum diphtheriae adsorbatum

DEFINITION

Diphtheria vaccine (adsorbed) is a preparation of diphtheria formol toxoid with a mineral adsorbent. The formol toxoid is prepared from the toxin produced by the growth of *Corynebacterium diphtheriae*.

PRODUCTION

GENERAL PROVISIONS

Specific toxicity. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5

healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

BULK PURIFIED TOXOID

For the production of diphtheria toxin, from which toxoid is prepared, seed cultures are managed in a defined seed-lot system in which toxinogenicity is conserved and, where necessary, restored by deliberate reselection. A highly toxinogenic strain of *Corynebacterium diphtheriae* with known origin and history is grown in a suitable liquid medium. At the end of cultivation, the purity of each culture is tested and contaminated cultures are discarded. Toxin-containing culture medium is separated aseptically from the bacterial mass as soon as possible. The toxin content (Lf per millilitre) is checked (*2.7.27*) to monitor consistency of production. Single harvests may be pooled to prepare the bulk purified toxoid. The toxin is purified to remove components likely to cause adverse reactions in humans. The purified toxin is detoxified with formaldehyde by a method that avoids destruction of the immunogenic potency of the toxoid and reversion of the toxoid to toxin, particularly on exposure to heat. Alternatively, purification may be carried out after detoxification.

Only bulk purified toxoid that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

Absence of toxin and irreversibility of toxoid. Using the same buffer solution as for the final vaccine, without adsorbent, prepare a solution of bulk purified toxoid at 100 Lf/ml. Divide the solution into 2 equal parts. Maintain 1 part at 5 ± 3 °C and the other at 37 °C for 6 weeks. Carry out a test in Vero cells for active diphtheria toxin using 50 µl/well of both samples. The sample should not contain antimicrobial preservatives and detoxifying agents should be determined to be below the concentration toxic to Vero cells. Non-specific toxicity may be eliminated by dialysis.

Use freshly trypsinised Vero cells at a suitable concentration, for example 2.5×10^5 ml^{-1} and a reference diphtheria toxin diluted in 100 Lf/ml diphtheria toxoid. A suitable reference diphtheria toxin will contain either not less than 100 LD_{50}/ml or 67 to 133 lr/100 in 1 Lf and 25 000 to 50 000 minimal reacting doses for guinea-pig skin in 1 Lf (*diphtheria toxin BRP* is suitable for use as the reference toxin). Dilute the toxin in 100 Lf/ml diphtheria toxoid to a suitable concentration, for example 2×10^{-4} Lf/ml. Prepare serial twofold dilutions of the diluted diphtheria toxin and use undiluted test samples (50 µl/well). Distribute them in the wells of a sterile tissue culture plate containing a medium suitable for Vero cells. To ascertain that any cytotoxic effect noted is specific to diphtheria toxin, prepare in parallel dilutions where the toxin is neutralised by a suitable concentration of diphtheria antitoxin, for example 100 IU/ml. Include control wells without toxoid or toxin and with non-toxic toxoid at 100 Lf/ml on each plate to verify normal cell growth. Add cell suspension to each well, seal the plates and incubate at 37 °C for 5-6 days. Cytotoxic effect is judged to be present where there is complete metabolic inhibition of the Vero cells, indicated by the pH indicator of the medium. Confirm cytopathic effect by microscopic examination or suitable staining such as MTT dye. The test is invalid if 5×10^{-5} Lf/ml of reference diphtheria toxin in 100 Lf/ml toxoid has no cytotoxic effect on Vero cells or if the cytotoxic effect of this amount of toxin is not neutralised in the wells containing diphtheria antitoxin. The bulk purified toxoid complies with the test if no toxicity neutralisable by antitoxin is found in either sample.

Antigenic purity (*2.7.27*). Not less than 1500 Lf per milligram of protein nitrogen.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of a suitable quantity of bulk purified toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

IDENTIFICATION

Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the absorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 30 IU per single human dose.

LABELLING

The label states:

- the minimum number of International Units per single human dose,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- the name and the amount of the adsorbent,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

01/2008:0646

DIPHTHERIA VACCINE (ADSORBED, REDUCED ANTIGEN CONTENT)

Vaccinum diphtheriae, antigeniis minutum, adsorbatum

DEFINITION

Diphtheria vaccine (adsorbed, reduced antigen content) is a preparation of diphtheria formol toxoid with a mineral adsorbent. The formol toxoid is prepared from the toxin produced by the growth of *Corynebacterium diphtheriae*. It shall have been demonstrated to the competent authority that the quantity of diphtheria toxoid used does not produce adverse reactions in subjects from the age groups for which the vaccine is intended.

PRODUCTION

GENERAL PROVISIONS

Specific toxicity. The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxaemia, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

BULK PURIFIED TOXOID

The bulk purified toxoid is prepared as described in the monograph on *Diphtheria vaccine (adsorbed) (0443)* and complies with the requirements prescribed therein.

FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of a suitable quantity of bulk purified toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified toxoid or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/l, the test for free formaldehyde may be omitted on the final lot.

IDENTIFICATION

Diphtheria toxoid is identified by a suitable immunochemical method (*2.7.1*). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/l solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant liquid is obtained. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 ml of the vaccine to be examined and suspend the residue in 5 ml of a freshly prepared mixture of 1 volume of a 56 g/l solution of *sodium edetate R* and 49 volumes of a 90 g/l solution of *disodium hydrogen phosphate R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant liquid reacts with a suitable diphtheria antitoxin, giving a precipitate.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (*2.7.6*).

The lower confidence limit (P = 0.95) of the estimated potency is not less than 2 IU per single human dose.

LABELLING

The label states:

- the minimum number of International Units per single human dose;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

corrected 6.0

HAEMOPHILUS TYPE b CONJUGATE VACCINE

Vaccinum haemophili stirpi b coniugatum

DEFINITION

Haemophilus type b conjugate vaccine is a liquid or freeze-dried preparation of a polysaccharide, derived from a suitable strain of *Haemophilus influenzae* type b, covalently bound to a carrier protein. The polysaccharide, polyribosylribitol phosphate, referred to as PRP, is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate $[(C_{10}H_{19}O_{12}P)_n]$, with a defined molecular size. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently haemophilus type b conjugate vaccines of adequate safety and immunogenicity in man. The production of PRP and of the carrier are based on seed-lot systems.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

During development studies and wherever revalidation of the manufacturing process is necessary, it shall be demonstrated by tests in animals that the vaccine consistently induces a T-cell-dependent B-cell immune response.

The stability of the final lot and relevant intermediates is evaluated using one or more indicator tests. Such tests may include determination of molecular size, determination of free PRP in the conjugate and the immunogenicity test in mice. Taking account of the results of the stability testing, release requirements are set for these indicator tests to ensure that the vaccine will be satisfactory at the end of the period of validity.

BACTERIAL SEED LOTS

The seed lots of *H. influenzae* type b are shown to be free from contamination by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

No complex products of animal origin are included in the menstruum used for preservation of strain viability, either for freeze-drying or for frozen storage.

It is recommended that PRP produced by the seed lot be characterised using nuclear magnetic resonance spectrometry (*2.2.33*).

H. INFLUENZAE TYPE b POLYSACCHARIDE (PRP)

H. influenzae type b is grown in a liquid medium that does not contain high-molecular-mass polysaccharides; if any ingredient of the medium contains blood-group substances, the process shall be validated to demonstrate that after the purification step they are no longer detectable. The bacterial purity of the culture is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera. The culture may be inactivated. PRP is separated from the culture medium and purified by a suitable method. Volatile matter, including water, in the purified polysaccharide is determined by a suitable method such as thermogravimetry (*2.2.34*); the result is used to calculate the results of certain tests with reference to the dried substance, as prescribed below.

Only PRP that complies with the following requirements may be used in the preparation of the conjugate.

Identification. PRP is identified by an immunochemical method (*2.7.1*) or other suitable method, for example ^{1}H nuclear magnetic resonance spectrometry (*2.2.33*).

Molecular-size distribution. The percentage of PRP eluted before a given K_0 value or within a range of K_0 values is determined by size-exclusion chromatography (*2.2.30*); an acceptable value is established for the particular product and each batch of PRP must be shown to comply with this limit. Limits for currently approved products, using the indicated stationary phases, are shown for information in Table 1219.-1. Where applicable, the molecular-size distribution is also determined after chemical modification of the polysaccharide.

Liquid chromatography (*2.2.29*) with multiple-angle laser light-scattering detection may also be used for determination of molecular-size distribution.

A validated determination of the degree of polymerisation or of the weight-average molecular weight and the dispersion of molecular masses may be used instead of the determination of molecular size distribution.

Ribose (*2.5.31*). Not less than 32 per cent, calculated with reference to the dried substance.

Phosphorus (*2.5.18*): 6.8 per cent to 9.0 per cent, calculated with reference to the dried substance.

Protein (*2.5.16*). Not more than 1.0 per cent, calculated with reference to the dried substance. Use sufficient PRP to allow detection of proteins at concentrations of 1 per cent or greater.

Nucleic acid (*2.5.17*). Not more than 1.0 per cent, calculated with reference to the dried substance.

Bacterial endotoxins (*2.6.14*): less than 25 IU per microgram of PRP.

Residual reagents. Where applicable, tests are carried out to determine residues of reagents used during inactivation and purification. An acceptable value for each reagent is established for the particular product and each batch of PRP must be shown to comply with this limit. Where validation studies have demonstrated removal of a residual reagent, the test on PRP may be omitted.

CARRIER PROTEIN

The carrier protein is chosen so that when the PRP is conjugated it is able to induce a T-cell-dependent B-cell immune response. Currently approved carrier proteins and coupling methods are listed for information in Table 1219.-1. The carrier proteins are produced by culture of suitable micro-organisms; the bacterial purity of the culture is verified; the culture may be inactivated; the carrier protein is purified by a suitable method.

Only a carrier protein that complies with the following requirements may be used in the preparation of the conjugate.

Identification. The carrier protein is identified by a suitable immunochemical method (*2.7.1*).

Sterility (*2.6.1*). Carry out the test using for each medium 10 ml or the equivalent of one-hundred doses, whichever is less.

Table 1219.-1. – *Product characteristics and specifications for PRP and carrier protein in currently approved products*

Carrier			Haemophilus polysaccharide		Conjugation	
Type	**Purity**	**Nominal amount per dose**	**Type of PRP**	**Nominal amount per dose**	**Coupling method**	**Procedure**
Diphtheria toxoid	> 1500 Lf per milligram of nitrogen	18 µg	Size-reduced PRP K_0: 0.6-0.7, using *cross-linked agarose for chromatography R*	25 µg	cyanogen bromide activation of PRP	activated diphtheria toxoid (D-AH⁺), cyanogen bromide-activated PRP
Tetanus toxoid	> 1500 Lf per milligram of nitrogen	20 µg	PRP ≥ 50 % ≤ K_0: 0.30, using *cross-linked agarose for chromatography R*	10 µg	carbodi-imide mediated	ADH-activated PRP (PRP-cov.-AH) + tetanus toxoid + EDAC
CRM 197 diphtheria protein	> 90 % of diphtheria protein	25 µg	Size-reduced PRP Dp = 15-35 or 10-35	10 µg	reductive amination (1-step method) or *N*-hydroxysuccinimide activation	direct coupling of PRP to CRM 197 (cyanoborohydride activated)
Meningococcal group B outer membrane protein (OMP)	outer membrane protein vesicles: ≤ 8 % of lipopolysaccharide	125 µg or 250 µg	Size-reduced PRP K_0 < 0.6, using *cross-linked agarose for chromatography R* or $M_w > 50 \times 10^3$	7.5 µg or 15 µg	thioether bond	PRP activation by CDI PRP-IM + BuA2 + BrAc = PRP-BuA2-BrAc + thioactivated OMP

ADH = adipic acid dihydrazide
BrAc = bromoacetyl chloride
BuA2 = butane-1,4-diamide
CDI = carbonyldiimidazole
Dp = degree of polymerisation
EDAC = 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide
IM = imidazolium
M_w = weight-average molecular weight

Diphtheria toxoid. Diphtheria toxoid is produced as described in *Diphtheria vaccine (adsorbed) (0443)* and complies with the requirements prescribed therein for bulk purified toxoid.

Tetanus toxoid. Tetanus toxoid is produced as described in *Tetanus vaccine (adsorbed) (0452)* and complies with the requirements prescribed therein for bulk purified toxoid, except that the antigenic purity (*2.7.27*) is not less than 1500 Lf per milligram of protein nitrogen.

Diphtheria protein CRM 197. It contains not less than 90 per cent of diphtheria CRM 197 protein, determined by a suitable method. Suitable tests are carried out, for validation or routinely, to demonstrate that the product is nontoxic.

OMP (meningococcal group B Outer Membrane Protein complex). OMP complies with the following requirements for lipopolysaccharide and pyrogens.

Lipopolysaccharide. Not more than 8 per cent of lipopolysaccharide, determined by a suitable method.

Pyrogens (*2.6.8*). Inject into each rabbit 0.25 µg of OMP per kilogram of body mass.

BULK PRP CONJUGATE

PRP is chemically modified to enable conjugation; it is usually partly depolymerised either before or during this procedure. Reactive functional groups or spacers may be introduced into the carrier protein or PRP prior to conjugation. As a measure of consistency, the extent of derivatisation is monitored. The conjugate is obtained by the covalent binding of PRP and carrier protein. Where applicable, unreacted but potentially reactogenic functional groups are made unreactive by means of capping agents; the conjugate is purified to remove reagents.

Only a bulk conjugate that complies with the following requirements may be used in the preparation of the final bulk vaccine. For each test and for each particular product, limits of acceptance are established and each batch of conjugate must be shown to comply with these limits. Limits applied to currently approved products for some of these tests are listed for information in Table 1219.-2. For a freeze-dried vaccine, some of the tests may be carried out on the final lot rather than on the bulk conjugate where the freeze-drying process may affect the component being tested.

PRP. The PRP content is determined by assay of phosphorus (*2.5.18*) or by assay of ribose (*2.5.31*) or by an immunochemical method (*2.7.1*).

Protein. The protein content is determined by a suitable chemical method (for example, *2.5.16*).

PRP to protein ratio. Determine the ratio by calculation.

Table 1219.-2. – *Bulk conjugate requirements for currently approved products*

Test	Protein carrier			
	Diphtheria toxoid	**Tetanus toxoid**	**CRM 197**	**OMP**
Free PRP	< 37 %	< 20 %	< 25 %	< 15 %
Free protein	< 4 %	< 1 %, where applicable	< 1 % or < 2 %, depending on the coupling method	not applicable
PRP to protein ratio	1.25 - 1.8	0.30 - 0.55	0.3 - 0.7	0.05 - 0.1
Molecular size (K_0):				
cross-linked agarose for chromatography R	95 % < 0.75	60 % < 0.2	50 % 0.3 - 0.6	85 % < 0.3
cross-linked agarose for chromatography R1	0.6-0.7	85 % < 0.5		

Molecular-size distribution. Molecular-size distribution is determined by size-exclusion chromatography (*2.2.30*).

Free PRP. Unbound PRP is determined after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods.

Free carrier protein. Determine the content by a suitable method, either directly or by deriving the content by calculation from the results of other tests. The amount is within the limits approved for the particular product.

Unreacted functional groups. No unreacted functional groups are detectable in the bulk conjugate unless process validation has shown that unreacted functional groups detectable at this stage are removed during the subsequent manufacturing process (for example, owing to short half-life).

Residual reagents. Removal of residual reagents such as cyanide, EDAC (ethyldimethylaminopropylcarbodi-imide) and phenol is confirmed by suitable tests or by validation of the process.

Sterility (*2.6.1*). Carry out the test using for each medium 10 ml or the equivalent of 100 doses, whichever is less.

FINAL BULK VACCINE

An adjuvant, an antimicrobial preservative and a stabiliser may be added to the bulk conjugate before dilution to the final concentration with a suitable diluent.

Only a final bulk vaccine that complies with the following requirements may be used in preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). It complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification and Tests may be released for use. Provided the test for antimicrobial preservative has been carried out on the final bulk vaccine, it may be omitted on the final lot.

pH (*2.2.3*). The pH of the vaccine, reconstituted if necessary, is within the range approved for the particular product.

Free PRP. Unbound PRP is determined after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

IDENTIFICATION

The vaccine is identified by a suitable immunochemical method (*2.7.1*) for PRP.

TESTS

PRP. Not less than 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (*2.5.31*) or phosphorus (*2.5.18*), by an immunochemical method (*2.7.1*) or by anion-exchange liquid chromatography with pulsed amperometric detection (*2.2.29*).

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not greater than 115 per cent of the quantity stated on the label.

Water (*2.5.12*): maximum 3.0 per cent for freeze-dried vaccines.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP as carrier.

LABELLING

The label states:

– the number of micrograms of PRP per human dose,

– the type and nominal amount of carrier protein per single human dose.

01/2008:1526

HEPATITIS A (INACTIVATED) AND HEPATITIS B (rDNA) VACCINE (ADSORBED)

Vaccinum hepatitidis A inactivatum et hepatitidis B (ADNr) adsorbatum

DEFINITION

Hepatitis A (inactivated) and hepatitis B (rDNA) vaccine (adsorbed) is a suspension consisting of a suitable strain of hepatitis A virus, grown in cell cultures and inactivated by a validated method, and of hepatitis B surface antigen (HBsAg), a component protein of hepatitis B virus obtained by recombinant DNA technology; the antigens are adsorbed on a mineral carrier, such as aluminium hydroxide or hydrated aluminium phosphate.

PRODUCTION

GENERAL PROVISIONS

The two components are prepared as described in the monographs on *Hepatitis A vaccine (inactivated, adsorbed) (1107)* and *Hepatitis B vaccine (rDNA) (1056)* and comply with the requirements prescribed therein.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

Reference preparation. The reference preparation is part of a representative batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising antibody recognised to be protective, after a full-course primary immunisation. For hepatitis A, an antibody level not less than 20 mIU/ml determined by enzyme-linked immunosorbent assay is recognised as being protective. For hepatitis B, an antibody level not less than 10 mIU/ml against HBsAg is recognised as being protective.

FINAL BULK VACCINE

The final bulk vaccine is prepared from one or more inactivated harvests of hepatitis A virus and one or more batches of purified antigen.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). The final bulk vaccine complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, they may be omitted on the final lot. If the assay of the hepatitis A and/or the hepatitis B component is carried out *in vivo*, then provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

IDENTIFICATION

The vaccine is shown to contain hepatitis A virus antigen and hepatitis B surface antigen by suitable immunochemical methods (*2.7.1*), using specific antibodies or by the mouse immunogenicity tests described under Assay.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 2 IU per human dose.

ASSAY

Hepatitis A component. The vaccine complies with the assay of hepatitis A vaccine (*2.7.14*).

Hepatitis B component. The vaccine complies with the assay of hepatitis B vaccine (rDNA) (*2.7.15*).

LABELLING

The label states:

- the amount of hepatitis A virus antigen and hepatitis B surface antigen per container,
- the type of cells used for production of the vaccine,
- the name and amount of the adsorbent used,
- that the vaccine must be shaken before use,
- that the vaccine must not be frozen.

01/2008:1107

HEPATITIS A VACCINE (INACTIVATED, ADSORBED)

Vaccinum hepatitidis A inactivatum adsorbatum

DEFINITION

Hepatitis A vaccine (inactivated, adsorbed) is a suspension consisting of a suitable strain of hepatitis A virus grown in cell cultures, inactivated by a validated method and adsorbed on a mineral carrier.

PRODUCTION

Production of the vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity, safety and stability.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

Reference preparation. A part of a batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising antibody accepted to be protective, after a full-course primary immunisation is used as a reference preparation. An antibody level of 20 mIU/ml determined by enzyme-linked immunosorbent assay is recognised as being protective.

SUBSTRATE FOR VIRUS PROPAGATION

The virus is propagated in a human diploid cell line (*5.2.3*) or in a continuous cell line approved by the competent authority.

SEED LOTS

The strain of hepatitis A virus used to prepare the master seed lot shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation.

Only a seed lot that complies with the following requirements may be used for virus propagation.

Identification. Each master and working seed lot is identified as hepatitis A virus using specific antibodies.

Virus concentration. The virus concentration of each master and working seed lot is determined to monitor consistency of production.

Extraneous agents. The master and working seed lots comply with the requirements for seed lots for virus vaccines (*2.6.16*). In addition, if primary monkey cells have been used for isolation of the strain, measures are taken to ensure that the strain is not contaminated with simian viruses such as simian immunodeficiency virus and filoviruses.

VIRUS PROPAGATION AND HARVEST

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled. Animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator, such as phenol

red, and antibiotics at the lowest effective concentration. Not less than 500 ml of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells). Multiple harvests from the same production cell culture may be pooled and considered as a single harvest.

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine. When the determination of the ratio of virus concentration to antigen content has been carried out on a suitable number of single harvests to demonstrate production consistency, it may subsequently be omitted as a routine test.

Identification. The test for antigen content also serves to identify the single harvest.

Bacterial and fungal contamination (*2.6.1*). The single harvest complies with the test for sterility, carried out using 10 ml for each medium.

Mycoplasmas (*2.6.7*). The single harvest complies with the test for mycoplasmas, carried out using 1 ml for each medium.

Control cells. The control cells of the production cell culture comply with a test for identification and the requirements for extraneous agents (*2.6.16*).

Antigen content. Determine the hepatitis A antigen content by a suitable immunochemical method (*2.7.1*) to monitor production consistency; the content is within the limits approved for the particular product.

Ratio of virus concentration to antigen content. The consistency of the ratio of the concentration of infectious virus, determined by a suitable cell culture method, to antigen content is established by validation on a suitable number of single harvests.

PURIFICATION AND PURIFIED HARVEST

The harvest, which may be a pool of several single harvests, is purified by validated methods. If continuous cell lines are used for production, the purification process shall have been shown to reduce consistently the level of host-cell DNA.

Only a purified harvest that complies with the following requirements may be used in the preparation of the inactivated harvest.

Virus concentration. The concentration of infectious virus in the purified harvest is determined by a suitable cell culture method to monitor production consistency and as a starting point for monitoring the inactivation curve.

Antigen:total protein ratio. Determine the hepatitis A virus antigen content by a suitable immunochemical method (*2.7.1*). Determine the total protein by a validated method. The ratio of hepatitis A virus antigen content to total protein content is within the limits approved for the particular product.

Bovine serum albumin. Not more than 50 ng in the equivalent of a single human dose, determined by a suitable immunochemical method (*2.7.1*). Where appropriate in view of the manufacturing process, other suitable protein markers may be used to demonstrate effective purification.

Residual host-cell DNA. If a continuous cell line is used for virus propagation, the content of residual host-cell DNA, determined using a suitable method, is not greater than 100 pg in the equivalent of a single human dose.

Residual chemicals. If chemical substances are used during the purification process, tests for these substances are carried out on the purified harvest (or on the inactivated harvest), unless validation of the process has demonstrated total clearance. The concentration must not exceed the limits approved for the particular product.

INACTIVATION AND INACTIVATED HARVEST

Several purified harvests may be pooled before inactivation. In order to avoid interference with the inactivation process, virus aggregation must be prevented or aggregates must be removed immediately before and/or during the inactivation process. The virus suspension is inactivated by a validated method; the method shall have been shown to be consistently capable of inactivating hepatitis A virus without destroying the antigenic and immunogenic activity; for each inactivation procedure, an inactivation curve is plotted representing residual live virus concentration measured at not fewer than three points in time (for example, on days 0, 1 and 2 of the inactivation process). If formaldehyde is used for inactivation, the presence of excess free formaldehyde is verified at the end of the inactivation process.

Only an inactivated harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Inactivation. Carry out an amplification test for residual infectious hepatitis A virus by inoculating a quantity of the inactivated harvest equivalent to 5 per cent of the batch or, if the harvest contains the equivalent of 30 000 doses or more, not less than 1500 doses of vaccine into cell cultures of the same type as those used for production of the vaccine; incubate for a total of not less than 70 days making not fewer than one passage of cells within that period. At the end of the incubation period, carry out a test of suitable sensitivity for residual infectious virus. No evidence of hepatitis A virus multiplication is found in the samples taken at the end of the inactivation process. Use infectious virus inocula concurrently as positive controls to demonstrate cellular susceptibility and absence of interference. Incubate for a total of not less than 70 days, making not fewer than one passage of cells within that period.

Sterility (*2.6.1*). The inactivated viral harvest complies with the test for sterility, carried out using 10 ml for each medium.

Bacterial endotoxins (*2.6.14*): less than 2 IU in the equivalent of a single human dose.

Antigen content. Determine the hepatitis A virus antigen content by a suitable immunochemical method (*2.7.1*).

Residual chemicals. See under Purification and purified harvest.

FINAL BULK VACCINE

The final bulk vaccine is prepared from one or more inactivated harvests. Approved adjuvants, stabilisers and antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Sterility (*2.6.1*). The final bulk vaccine complies with the test for sterility, carried out using 10 ml for each medium.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile containers. The containers are then closed so as to avoid contamination.

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, these tests may be omitted

on the final lot. If the assay is carried out using mice or other animals, then provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

IDENTIFICATION

The vaccine is shown to contain hepatitis A virus antigen by a suitable immunochemical method (*2.7.1*) using specific antibodies or by the *in vivo* assay (*2.7.14*).

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

ASSAY

The vaccine complies with the assay of hepatitis A vaccine (*2.7.14*).

LABELLING

The label states the biological origin of the cells used for the preparation of the vaccine.

01/2008:1935

HEPATITIS A VACCINE (INACTIVATED, VIROSOME)

Vaccinum hepatitidis A inactivatum virosomale

DEFINITION

Hepatitis A vaccine (inactivated, virosome) is a suspension of a suitable strain of hepatitis A virus grown in cell cultures and inactivated by a validated method. Virosomes composed of influenza proteins of a strain approved for the particular product and phospholipids are used as adjuvants.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

Reference preparation. A reference preparation of inactivated hepatitis A antigen is calibrated against a batch of hepatitis A vaccine (inactivated, virosome) that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising antibody accepted to be protective, after a full-course primary immunisation. An antibody level not less than 20 mIU/ml determined by enzyme-linked immunosorbent assay is recognised as being protective.

PREPARATION OF HEPATITIS A ANTIGEN

Production of the hepatitis A antigen is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity, safety and stability.

Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

SUBSTRATE FOR PROPAGATION OF HEPATITIS A VIRUS

The virus is propagated in a human diploid cell line (*5.2.3*).

SEED LOTS OF HEPATITIS A VIRUS

The strain of hepatitis A virus used to prepare the master seed lot shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation.

Only a seed lot that complies with the following requirements may be used for virus propagation.

Identification. Each master and working seed lot is identified as hepatitis A virus using specific antibodies.

Virus concentration. The virus concentration of each master and working seed lot is determined to monitor consistency of production.

Extraneous agents. The master and working seed lots comply with the requirements for seed lots for virus vaccines (*2.6.16*).

PROPAGATION AND HARVEST OF HEPATITIS A VIRUS

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled. Animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator such as phenol red and antibiotics at the lowest effective concentration. Not less than 500 ml of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells). Multiple harvests from the same production cell culture may be pooled and considered as a single harvest.

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine. When the determination of the ratio of virus concentration to antigen content has been carried out on a suitable number of single harvests to demonstrate consistency, it may subsequently be omitted as a routine test.

Identification. The test for antigen content also serves to identify the single harvest.

Bacterial and fungal contamination (*2.6.1*). The single harvest complies with the test for sterility, carried out using 10 ml for each medium.

Mycoplasmas (*2.6.7*). The single harvest complies with the test for mycoplasmas.

Control cells. The control cells of the production cell culture comply with a test for identity and the requirements for extraneous agents (*2.6.16*).

Antigen content. Determine the hepatitis A antigen content by a suitable immunochemical method (*2.7.1*) to monitor production consistency; the content is within the limits approved for the particular product.

Ratio of virus concentration to antigen content. The consistency of the ratio of the concentration of infectious virus, as determined by a suitable cell culture method, to antigen content is established by validation on a suitable number of single harvests.

PURIFICATION AND PURIFIED HARVEST OF HEPATITIS A VIRUS

The harvest, which may be a pool of several single harvests, is purified by validated methods. If continuous cell lines are used for production, the purification process shall have been shown to reduce consistently the level of host-cell DNA.

Only a purified harvest that complies with the following requirements may be used in the preparation of the inactivated harvest.

Virus concentration. The concentration of infective virus in the purified harvest is determined by a suitable cell culture method to monitor production consistency and as a starting point for monitoring the inactivation curve.

Ratio of antigen to total protein. Determine the hepatitis A virus antigen content by a suitable immunochemical method (*2.7.1*). Determine the total protein by a validated method. The ratio of hepatitis A virus antigen content to total protein content is within the limits approved for the particular product.

Bovine serum albumin: maximum 50 ng per single human dose if foetal bovine serum is used, determined by a suitable immunochemical method (*2.7.1*). Where appropriate in view of the manufacturing process, other suitable protein markers may be used to demonstrate effective purification.

Residual chemicals. If chemical substances are used during the purification process, tests for these substances are carried out on the purified harvest (or on the inactivated harvest), unless validation of the process has demonstrated total clearance. The concentration must not exceed the limits approved for the particular product.

INACTIVATION AND INACTIVATED HARVEST OF HEPATITIS A VIRUS

Several purified harvests may be pooled before inactivation. In order to avoid interference with the inactivation process, virus aggregation must be prevented or aggregates must be removed immediately before and/or during the inactivation process. The virus suspension is inactivated by a validated method; the method shall have been shown to be consistently capable of inactivating hepatitis A virus without destroying the antigenic and immunogenic activity; for each inactivation procedure, an inactivation curve is plotted representing residual live virus concentration measured on at least 3 occasions (for example, on days 0, 1 and 2 of the inactivation process). If formaldehyde is used for inactivation, the presence of excess free formaldehyde is verified at the end of the inactivation process.

Only an inactivated harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Inactivation. Carry out an amplification test for residual infectious hepatitis A virus by inoculating a quantity of the inactivated harvest equivalent to 5 per cent of the batch or, if the harvest contains the equivalent of 30 000 doses or more, not less than 1500 doses of vaccine into cell cultures of the same type as those used for production of the vaccine; incubate for a total of not less than 70 days making not fewer than 1 passage of cells within that period. At the end of the incubation period, carry out a test of suitable sensitivity for residual infectious virus. No evidence of hepatitis A virus multiplication is found in the samples taken at the end of the inactivation process. Use infective virus inocula concurrently as positive controls to demonstrate cellular susceptibility and absence of interference.

Sterility (*2.6.1*). The inactivated viral harvest complies with the test for sterility, carried out using 10 ml for each medium.

Bacterial endotoxins (*2.6.14*): less than 2 IU of endotoxin in the equivalent of a single human dose.

Antigen content. Determine the hepatitis A virus antigen content by a suitable immunochemical method (*2.7.1*).

Residual chemicals. See under Purification and purified harvest.

PREPARATION OF INACTIVATED INFLUENZA VIRUS

The production of influenza viruses is based on a seed-lot system. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final production represents 1 passage from the working seed lot. The strain of influenza virus to be used is approved by the competent authority.

SUBSTRATE FOR PROPAGATION OF INFLUENZA VIRUS

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (*5.2.2*) or in suitable cell cultures (*5.2.4*), such as chick-embryo fibroblasts or chick kidney cells obtained from chicken flocks free from specified pathogens (*5.2.2*). For production, the virus is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

SEED LOTS OF INFLUENZA VIRUS

The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium.

Mycoplasmas (*2.6.7*). Carry out the test for mycoplasmas, using 10 ml.

PROPAGATION AND HARVEST OF INFLUENZA VIRUS

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form the monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

POOLED HARVEST OF INFLUENZA VIRUS

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying antigenicity of haemagglutinin. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at a temperature of 5 ± 3 °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/l of CH_2O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Only a pooled harvest that complies with the following requirements may be used in the preparation of the virosomes.

Haemagglutinin antigen. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Viral inactivation. Inoculate 0.2 ml of the harvest into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 ml of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 ml of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 ml of the allantoic fluid from each surviving embryo and examine each individual harvest by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

Ovalbumin: maximum 1 µg of ovalbumin in the equivalent of 1 human dose, determined by a suitable technique using a suitable reference preparation of ovalbumin.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Residual chemicals. Tests are carried out on the monovalent pooled harvest for the chemicals used for inactivation, the limits being approved by the competent authority.

PREPARATION OF VIROSOMES

Inactivated influenza virions are solubilised using a suitable detergent and are purified by high-speed centrifugation in order to obtain supernatants containing mainly influenza antigens. After the addition of suitable phospholipids, virosomes are formed by removal of the detergent either by adsorption chromatography or another suitable technique

Only virosomes that comply with the following requirements may be used in the preparation of the final bulk vaccine.

Haemagglutinin content. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it.

Phospholipids. The content and identity of the phospholipids are determined by suitable immunochemical or physico-chemical methods.

Ratio of phospholipid to haemagglutinin. The ratio of phospholipid content to haemagglutinin content is within the limits approved for the particular product.

Residual chemicals. Tests are carried out for the chemicals used during the process. The concentration of each residual chemical is within the limits approved for the particular product.

FINAL BULK VACCINE

The bulk vaccine is prepared by adding virosomes to inactivated hepatitis A viruses to yield an approved hepatitis A antigen:haemagglutinin ratio. Several bulks may be pooled, and approved stabilisers and antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Protein content. The amount of protein is determined using a suitable technique, the limits being approved by the competent authority.

Phospholipids. The content and identity of the phospholipids are determined by suitable immunochemical or physico-chemical methods. The amount of phospholipids complies with the limits approved for the particular product.

Haemagglutinin content. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*). The amount of haemagglutinin must not exceed the limits approved for the particular product.

Hepatitis A antigen content. Determine the hepatitis A antigen content by a suitable immunochemical method. The amount of antigen must not exceed the limits approved for the particular product.

Ratio of hepatitis A antigen to haemagglutinin. The ratio of hepatitis A antigen content to haemagglutinin content is within the limits approved for the particular product.

Ovalbumin: maximum 1 µg of ovalbumin per human dose, determined by a suitable technique using a suitable reference preparation of ovalbumin.

Virosome size. The size distribution of the virosome-hepatitis A virus mixture is within the limits approved for the particular product.

Sterility (*2.6.1*). The final bulk vaccine complies with the test for sterility, carried out using 10 ml for each medium.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Residual chemicals. If chemical substances are used during the formulation process, tests for these substances are carried out, the limits being approved by the competent authority.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile containers. The containers are then closed so as to avoid contamination.

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, these tests may be omitted on the final lot. If the assay is carried out *in vivo*, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

IDENTIFICATION

The vaccine is shown to contain hepatitis A virus antigen by a suitable immunochemical method (*2.7.1*) using specific antibodies.

TESTS

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 2 IU of endotoxin per human dose.

ASSAY

Determine the antigen content of the vaccine using a suitable immunochemical method (*2.7.1*) by comparison with the reference preparation. The acceptance criteria are approved for a given reference preparation by the competent authority.

LABELLING

The label states:

- the biological origin of the cells used for the preparation of the vaccine,
- that the carrier contains influenza proteins prepared in eggs,
- that the vaccine is not to be frozen,
- that the vaccine is to be shaken before use.

01/2008:1056

HEPATITIS B VACCINE (rDNA)

Vaccinum hepatitidis B (ADNr)

DEFINITION

Hepatitis B vaccine (rDNA) is a preparation of hepatitis B surface antigen (HBsAg), a component protein of hepatitis B virus; the antigen may be adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. The antigen is obtained by recombinant DNA technology.

PRODUCTION

GENERAL PROVISIONS

The vaccine shall have been shown to induce specific, protective antibodies in man. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity and safety.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

Hepatitis B vaccine (rDNA) is produced by the expression of the viral gene coding for HBsAg in yeast (*Saccharomyces cerevisiae*) or mammalian cells (Chinese hamster ovary (CHO) cells or other suitable cell lines), purification of the resulting HBsAg and the rendering of this antigen into an immunogenic preparation. The suitability and safety of the cells are approved by the competent authority.

The vaccine may contain the product of the S gene (major protein), a combination of the S gene and pre-S2 gene products (middle protein) or a combination of the S gene, the pre-S2 gene and pre-S1 gene products (large protein).

Reference preparation. The reference preparation is part of a representative batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young, healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of HBsAg neutralising antibody recognised to be protective, after a full-course primary immunisation. An antibody level not less than 10 mIU/ml is recognised as being protective.

CHARACTERISATION OF THE SUBSTANCE

Development studies are carried out to characterise the antigen. The complete protein, lipid and carbohydrate structure of the antigen is established. The morphological characteristics of the antigen particles are established by electron microscopy. The mean buoyant density of the antigen particles is determined by a physico-chemical method, such as gradient centrifugation. The antigenic epitopes are characterised. The protein fraction of the antigen is characterised in terms of the primary structure (for example, by determination of the amino-acid composition, by partial amino-acid sequence analysis and by peptide mapping).

CULTURE AND HARVEST

Identity, microbial purity, plasmid retention and consistency of yield are determined at suitable production stages. If mammalian cells are used, tests for extraneous agents and mycoplasmas are performed in accordance with *Tests for extraneous agents in viral vaccines for human use* (*2.6.16*), but using 200 ml of harvest in the test in cell culture for other extraneous agents.

PURIFIED ANTIGEN

Only a purified antigen that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Total protein. The total protein is determined by a validated method. The content is within the limits approved for the specific product.

Antigen content and identification. The quantity and specificity of HBsAg is determined in comparison with the International Standard for HBsAg subtype *ad* or an in-house reference, by a suitable immunochemical method (*2.7.1*) such as radio-immunoassay (RIA), enzyme-linked immunosorbent assay (ELISA), immunoblot (preferably using a monoclonal antibody directed against a protective epitope) or single radial diffusion. The antigen/protein ratio is within the limits approved for the specific product.

The molecular weight of the major band revealed following sodium dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) performed under reducing conditions corresponds to the value expected from the known nucleic acid and polypeptide sequences and possible glycosylation.

Antigenic purity. The purity of the antigen is determined by comparison with a reference preparation using liquid chromatography or other suitable methods such as SDS-PAGE with staining by acid blue 92 and silver. A suitable method is sensitive enough to detect a potential contaminant at a concentration of 1 per cent of total protein. Not less than 95 per cent of the total protein consists of hepatitis B surface antigen.

Composition. The content of proteins, lipids, nucleic acids and carbohydrates is determined.

Host-cell- and vector-derived DNA. If mammalian cells are used for production, not more than 10 pg of DNA in the quantity of purified antigen equivalent to a single human dose of vaccine.

Caesium. If a caesium salt is used during production, a test for residual caesium is carried out on the purified antigen. The content is within the limits approved for the specific product.

Sterility (*2.6.1*). The purified antigen complies with the test for sterility, carried out using 10 ml for each medium.

Additional tests on the purified antigen may be required depending on the production method used: for example, a test for residual animal serum where mammalian cells are used for production or tests for residual chemicals used during extraction and purification.

FINAL BULK VACCINE

An antimicrobial preservative and an adjuvant may be included in the vaccine.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). The final bulk vaccine complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, they may be omitted on the final lot. If the assay is carried out *in vivo*, then provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

IDENTIFICATION

The assay or, where applicable, the electrophoretic profile, serves also to identify the vaccine.

TESTS

Aluminium (*2.5.13*): maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Sterility (*2.6.1*). The vaccine complies with the test for sterility.

Pyrogens (*2.6.8*). The vaccine complies with the test for pyrogens. Inject the equivalent of one human dose into each rabbit.

ASSAY

The vaccine complies with the assay of hepatitis B vaccine (rDNA) (*2.7.15*).

LABELLING

The label states:

– the amount of HBsAg per container,
– the type of cells used for production of the vaccine,
– the name and amount of the adsorbent used,
– that the vaccine must be shaken before use,
– that the vaccine must not be frozen.

01/2008:0158

INFLUENZA VACCINE (SPLIT VIRION, INACTIVATED)

Vaccinum influenzae inactivatum ex virorum fragmentis praeparatum

DEFINITION

Influenza vaccine (split virion, inactivated) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs, inactivated and treated so that the integrity of the virus particles has been disrupted without diminishing the antigenic properties of the haemagglutinin and neuraminidase antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount.

The vaccine is a slightly opalescent liquid.

PRODUCTION

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

CHOICE OF VACCINE STRAIN

The World Health Organisation reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (*5.2.2*) or in suitable cell cultures (*5.2.4*), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (*5.2.2*). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

VIRUS SEED LOT

The production of vaccine is based on a seed-lot system. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium.

Mycoplasmas (*2.6.7*). Carry out the test for mycoplasmas, using 10 ml.

VIRUS PROPAGATION AND HARVEST

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

MONOVALENT POOLED HARVEST

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process should cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled

harvest is stored after inactivation, it is held at 5 ± 3 °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/l of CH_2O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation procedure, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or other suitable method and the virus particles are disrupted into component subunits by the use of approved procedures. For each new strain, a validation test is carried out to show that the monovalent bulk consists predominantly of disrupted virus particles.

Only a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Haemagglutinin antigen. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it[(1)]. Carry out the test at 20-25 °C.

For some vaccines, the physical form of the haemagglutinin particles prevents quantitative determination by immunodiffusion after inactivation of the virus. For these vaccines, a determination of haemagglutinin antigen is made on the monovalent pooled harvest before inactivation. The production process is validated to demonstrate suitable conservation of haemagglutinin antigen and a suitable tracer is used for formulation, for example, protein content.

Neuraminidase antigen. The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Residual infectious virus. Carry out the test described below under Tests.

Chemicals used for disruption. Tests are carried out on the monovalent pooled harvest for the chemicals used for disruption, the limits being approved by the competent authority.

FINAL BULK VACCINE

Appropriate quantities of the monovalent pooled harvests are blended to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest and that the tests for free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.

TESTS

Residual infectious virus. Inoculate 0.2 ml of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 ml of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 ml of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 ml of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l, where applicable.

Ovalbumin. Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (*2.7.1*) using a suitable reference preparation of ovalbumin.

Total protein. Not more than 6 times the total haemagglutinin content of the vaccine as determined in the assay, but in any case, not more than 100 µg of protein per virus strain per human dose and not more than a total of 300 µg of protein per human dose.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 100 IU per human dose.

ASSAY

Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it[(1)]. Carry out the test at 20-25 °C. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated haemagglutinin antigen content. The lower confidence limit (P = 0.95) is not less than 80 per cent of the amount stated on the label for each strain.

For some vaccines, quantitative determination of haemagglutinin antigen with respect to available reference preparations is not possible. An immunological identification of the haemagglutinin antigen and a semi-quantitative determination are carried out instead by suitable methods.

LABELLING

The label states:

– that the vaccine has been prepared on eggs,
– the strain or strains of influenza virus used to prepare the vaccine,

(1) Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

– the method of inactivation,
– the haemagglutinin content in micrograms per virus strain per dose,
– the maximum amount of ovalbumin,
– the season during which the vaccine is intended to protect.

01/2008:0869

INFLUENZA VACCINE (SURFACE ANTIGEN, INACTIVATED)

Vaccinum influenzae inactivatum ex corticis antigeniis praeparatum

DEFINITION

Influenza vaccine (surface antigen, inactivated) is a sterile suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs, inactivated and treated so that the preparation consists predominantly of haemagglutinin and neuraminidase antigens, without diminishing the antigenic properties of these antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount. The vaccine may contain an adjuvant.

PRODUCTION

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

CHOICE OF VACCINE STRAIN

The World Health Organisation reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (*5.2.2*) or in suitable cell cultures (*5.2.4*), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (*5.2.2*). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

VIRUS SEED LOT

The production of vaccine is based on a seed-lot system. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final vaccine represents one passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium.

Mycoplasmas (*2.6.7*). Carry out the test for mycoplasmas, using 10 ml.

VIRUS PROPAGATION AND HARVEST

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

MONOVALENT POOLED HARVEST

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process should cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at 5 ± 3 °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/l of CH_2O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation process, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or other suitable method. Virus particles are disrupted into component subunits by approved procedures and further purified so that the monovalent bulk consists mainly of haemagglutinin and neuraminidase antigens.

Only a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Haemagglutinin antigen. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it[(2)]. Carry out the test at 20-25 °C.

Neuraminidase antigen. The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Residual infectious virus. Carry out the test described below under Tests.

Purity. The purity of the monovalent pooled harvest is examined by polyacrylamide gel electrophoresis or by other approved techniques. Mainly haemagglutinin and neuraminidase antigens shall be present.

Chemicals used for disruption and purification. Tests are carried out on the monovalent pooled harvest for the chemicals used for disruption and purification, the limits being approved by the competent authority.

FINAL BULK VACCINE

Appropriate quantities of the monovalent pooled harvests are blended to make the final bulk vaccine. An adjuvant may be added.

(2) Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest and that the tests for free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

If the ovalbumin and formaldehyde content cannot be determined on the final lot, owing to interference from the adjuvant, they are determined on the monovalent pooled harvest, the acceptance limits being set to ensure that the limits for the final product will not be exceeded.

If the vaccine contains an adjuvant, suitable tests for identity and other relevant quality criteria are carried out on the final lot. These tests may include chemical and physical analysis, determination of particle size and determination of the number of particles per unit volume.

IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.

TESTS

Residual infectious virus. Inoculate 0.2 ml of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 ml of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 ml of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 ml of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l, where applicable.

Ovalbumin. Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (*2.7.1*) using a suitable reference preparation of ovalbumin.

Total protein. Not more than 40 µg of protein other than haemagglutinin per virus strain per human dose and not more than a total of 120 µg of protein other than haemagglutinin per human dose.

Sterility. It complies with the test for sterility (*2.6.1*).

Bacterial endotoxins (*2.6.14*): less than 100 IU per human dose.

ASSAY

Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it[(2)]. Carry out the test at 20-25 °C. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated content. The lower confidence limit (P = 0.95) haemagglutinin antigen is not less than 80 per cent of the amount stated on the label for each strain.

LABELLING

The label states:

- that the vaccine has been prepared on eggs,
- the strain or strains of influenza virus used to prepare the vaccine,
- the method of inactivation,
- the haemagglutinin content in micrograms per virus strain per dose,
- the season during which the vaccine is intended to protect,
- the maximum amount of ovalbumin,
- where applicable, the name and the quantity of adjuvant used.

01/2008:2149

INFLUENZA VACCINE (SURFACE ANTIGEN, INACTIVATED, PREPARED IN CELL CULTURES)

Vaccinum influenzae inactivatum ex cellulis corticisque antigeniis praeparatum

DEFINITION

Influenza vaccine (surface antigen, inactivated, prepared in cell cultures) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in cell cultures, inactivated and treated so that the preparation consists predominantly of haemagglutinin and neuraminidase antigens, preserving adequate antigenic properties of these antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount. The vaccine is a clear or slightly opalescent liquid. The vaccine may contain an adjuvant. This monograph applies to vaccines produced in diploid or continuous cell lines of mammalian origin.

PRODUCTION

GENERAL PROVISIONS

Production of the vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity, safety and stability.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

The production method is validated to demonstrate suitable reduction of residual host-cell protein. With the agreement of the competent authority and for each specific product, routine testing for residual host-cell proteins may be omitted based on the results of validation studies for the product. Guidance on the principles of such validation studies is given, for example, in the monograph on *Products of recombinant DNA technology (0784)*, in particular in the chapters on "Validation of the production process - extraction and purification" and "Production consistency - Host-cell-derived proteins".

CHOICE OF VACCINE STRAIN

The World Health Organisation reviews the world epidemiological situation annually and if necessary recommends new strains corresponding to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus used in the preparation of seed lots is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (*5.2.2*) or in suitable cell cultures (*5.2.3*), such as chick-embryo fibroblasts, chick kidney cells obtained from SPF chicken flocks (*5.2.2*), or a diploid or continuous cell line. The final passage for establishment of the working seed lot is prepared in the cell line used for routine production. For this production, the virus of each strain is propagated in a diploid or continuous cell line (*5.2.3*).

VIRUS SEED LOT

The production of vaccine is based on a seed-lot system. Each of the strains of influenza virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final vaccine represents 1 passage from the working seed lot.

Only a seed lot that complies with the following requirements may be used for virus propagation.

Identification. The haemagglutinin and neuraminidase antigens of each master and working seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Virus concentration. The virus concentration of each working seed lot is determined. Where applicable, the virus concentration of each master seed lot is determined.

Extraneous agents (*2.6.16*). The working seed lots comply with the requirements for seed lots. It is recognised that when a vaccine strain changes, there may be time constraints that make testing a virus seed for extraneous agents problematic, and the results of such testing may not be completely available before further processing. Rapid assays (e.g. multiplex PCR) are applied in parallel wherever possible.

If an agent is detected in a virus seed and the mammalian cells used for production are shown to be susceptible to this agent, the virus seed is not used for vaccine production.

If an agent is detected in a virus seed and the mammalian cells are not susceptible to the agent, validation of the production process to demonstrate removal or inactivation of the agent is carried out. If removal or inactivation cannot be demonstrated, the inactivated monovalent harvest is tested to demonstrate absence of any contaminant identified in the virus seed.

PROPAGATION AND SINGLE HARVEST

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled at the same time. Animal serum (but no human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions or media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator, such as phenol red, and antibiotics at the lowest effective concentration. Not less than 500 ml of the cell cultures employed for vaccine production are set aside as uninfected cell cultures (control cells).

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine.

Identification. The test for antigen content also serves to identify the single harvest.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium.

Mycoplasmas (*2.6.7*). Carry out the test for mycoplasmas, using 10 ml for each medium.

Control cells. The control cells of the production cell culture comply with a test for identification and the requirements for extraneous agents (*2.6.16*).

Haemagglutinin antigen. Determine the haemagglutinin antigen content by a suitable immunochemical method (*2.7.1*).

INACTIVATED AND PURIFIED MONOVALENT HARVEST

The harvest, which may be a pool of several single harvests of the same strain, is inactivated and purified by validated methods. Before or after the inactivation process, the monovalent harvest is concentrated and purified by high-speed centrifugation or another suitable method. The influenza virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process is designed so as to cause minimum alteration of the haemagglutinin and neuraminidase antigens.

Virus particles are disrupted into component subunits by approved procedures and further purified so that the monovalent bulk consists mainly of haemagglutinin and neuraminidase antigens.

If continuous cell lines are used for production, the purification process shall have been validated to reduce consistently host-cell DNA to a suitable level.

Only an inactivated, purified monovalent harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Haemagglutinin antigen. Determine the haemagglutinin antigen content by a suitable immunochemical method (*2.7.1*).

Antigen: total protein ratio. Determine the haemagglutinin antigen content by a suitable immunodiffusion test. Determine the total protein by a validated method. The ratio of haemagglutinin antigen content to total protein content is within the limits approved for the particular product.

Neuraminidase antigen. The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent harvests from each working seed lot.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Residual infectious virus. Carry out the test described below under Tests.

Purity. The purity of the monovalent harvest is examined by polyacrylamide gel electrophoresis or by other approved techniques. Mainly haemagglutinin and neuraminidase antigens are present.

Chemicals used for disruption and purification. Tests are carried out on the monovalent harvest for the chemicals used for disruption and purification, unless validation of the process has demonstrated total clearance. The concentration must not exceed the limits approved by the competent authority for the particular product.

FINAL BULK VACCINE

Appropriate quantities of the inactivated purified monovalent pooled harvests are blended to make the final bulk vaccine. An adjuvant may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Residual host-cell DNA. If a continuous cell line is used for virus propagation, the content of residual host-cell DNA, determined using a suitable method, is not greater than 10 ng in the equivalent of a single human dose.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each inactivated and purified monovalent harvest and that the tests for free formaldehyde, bovine serum albumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

If the vaccine contains an adjuvant, suitable tests for identity and other relevant quality criteria are carried out on the final lot. These tests may include chemical and physical analysis, determination of particle size and determination of the number of particles per unit volume.

IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.

TESTS

Residual infectious virus. Carry out an amplification test for residual infectious influenza virus by inoculating not less than 0.2 ml of the vaccine into cell cultures of the same type as used for production of the vaccine; incubate for not less than 4 days at 37 °C. Inoculate not less than 0.2 ml of the cell culture harvested medium into a new semiconfluent cell culture and incubate as before. At the end of the incubation period, examine for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage on cell cultures and test for haemagglutination; no haemagglutination occurs.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l, where applicable.

Bovine serum albumin: maximum 50 ng per human dose, determined by a suitable immunochemical method (*2.7.1*).

Total protein: maximum 40 µg of protein other than haemagglutinin per virus strain per human dose.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 25 IU per human dose.

ASSAY

Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation[3] or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated content. The lower confidence limit ($P = 0.95$) is not less than 80 per cent of the amount stated on the label for each strain.

LABELLING

The label states:

- the biological origin of the cells used for the preparation of the vaccine;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin antigen content in micrograms per virus strain per dose;
- the season during which the vaccine is intended to protect;
- where applicable, the name and the quantity of adjuvant used.

INFLUENZA VACCINE (SURFACE ANTIGEN, INACTIVATED, VIROSOME)

Vaccinum influenzae inactivatum ex corticis antigeniis praeparatum virosomale

DEFINITION

Influenza vaccine (surface antigen, inactivated, virosome) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs, inactivated and treated so that the preparation consists predominantly of haemagglutinin and neuraminidase antigens reconstituted to virosomes and without diminishing the antigenic properties of the antigens. The stated amount of haemagglutinin

(3) Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount.

The vaccine is a slightly opalescent liquid.

PRODUCTION

GENERAL PROVISIONS

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

CHOICE OF VACCINE STRAIN

The World Health Organisation reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (*5.2.2*) or in suitable cell cultures (*5.2.4*), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (*5.2.2*). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

VIRUS SEED LOT

The production of vaccine is based on a seed lot system. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium.

Mycoplasmas (*2.6.7*). Carry out the test for mycoplasmas, using 10 ml.

VIRUS PROPAGATION AND HARVEST

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest.

MONOVALENT POOLED HARVEST

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process is designed so as to cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at a temperature of 5 ± 3 °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/l of CH_2O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation process, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or another suitable method.

Only a monovalent pooled harvest that complies with the following requirements may be used for the preparation of virosomes.

Provided the tests for haemagglutinin antigen, neuraminidase antigen and residual infectious virus have been carried out with satisfactory results on the monovalent virosomal preparation, they may be omitted on the monovalent pooled harvest when the manufacturing process is continuous between the monovalent pooled harvest and the monovalent virosomal preparation.

Haemagglutinin antigen. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation[4] or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C.

Neuraminidase antigen. The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

Residual infectious virus. Carry out the test described under Tests.

PREPARATION OF MONOVALENT VIROSOMES

Virus particles are disrupted into component subunits by approved procedures and further purified so that the monovalent bulk consists mainly of haemagglutinin and neuraminidase antigens. Additional phospholipids may be added and virosomes may be formed by removal of the detergent either by adsorption chromatography or another suitable technique. Several monovalent virosomal preparations may be pooled.

Only a monovalent virosomal preparation that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Haemagglutinin antigen. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation[4] or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C.

Neuraminidase antigen. The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 virosomal preparations from each working seed lot.

Residual infectious virus. Carry out the test described under Tests. Provided this test has been carried out with satisfactory results on the monovalent pooled harvest, it may be omitted on the preparation of monovalent virosomes.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Purity. The purity of the monovalent virosomal preparation is examined by polyacrylamide gel electrophoresis (*2.2.31*) or by other approved techniques. Mainly haemagglutinin and neuraminidase antigens are present.

(4) Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control (NIBSC), Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, United Kingdom.

Chemicals used for disruption and purification. Tests for the chemicals used for disruption and purification are carried out on the monovalent virosomal preparation, the limits being approved by the competent authority.

Phospholipids. The content and identity of the phospholipids are determined by suitable immunochemical or physico-chemical methods.

Ratio of haemagglutinin to phospholipid. The ratio of haemagglutinin content to phospholipid content is within the limits approved for the particular product.

Virosome size. The average virosome diameter, determined by a suitable method such as photon-correlation spectroscopy, is not less than 100 nm and not greater than 300 nm. The polydispersity index is not greater than 0.4.

FINAL BULK VACCINE

Appropriate quantities of the monovalent virosomal preparations are blended to make the final bulk vaccine. Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest or, where appropriate, on the monovalent virosomal preparations, and that the tests for phospholipids, ratio of haemagglutinin to phospholipid, free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.

TESTS

Residual infectious virus. Inoculate 0.2 ml of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 ml of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 ml of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 ml of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

pH (*2.2.3*): 6.5 to 7.8

Phospholipids. The content and identity of the phospholipids is determined by a suitable immunochemical or physico-chemical method.

Ratio of haemagglutinin to phospholipid. The ratio of haemagglutinin content to phospholipid content is within the limits approved for the particular product.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

Free formaldehyde (*2.4.18*): maximum 0.2 g/l, where applicable.

Ovalbumin. Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (*2.7.1*) using a suitable reference preparation of ovalbumin.

Total protein. Not more than 40 µg of protein other than haemagglutinin per virus strain per human dose, and not more than a total of 120 µg of protein other than hemagglutinin per human dose.

Sterility (*2.6.1*). It complies with the test for sterility.

Virosome size. The average virosome diameter, determined by a suitable method such as photon-correlation spectroscopy, is not less than 100 nm and not greater than 300 nm. The polydispersity index is not greater than 0.4.

Bacterial endotoxins (*2.6.14*): less than 100 IU per human dose.

ASSAY

Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation[4] or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated haemagglutinin antigen content. The lower confidence limit (P = 0.95) is not less than 80 per cent of the amount stated on the label for each strain.

LABELLING

The label states:

- that the vaccine has been prepared on eggs;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin content, in micrograms per virus strain per dose;
- the maximum amount of ovalbumin;
- the season during which the vaccine is intended to protect.

INFLUENZA VACCINE (WHOLE VIRION, INACTIVATED)

Vaccinum influenzae inactivatum ex viris integris praeparatum

DEFINITION

Influenza vaccine (whole virion, inactivated) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs and inactivated in such a manner that their antigenic properties are retained. The

stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount.

The vaccine is a slightly opalescent liquid.

PRODUCTION

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use (*2.6.9*).

CHOICE OF VACCINE STRAIN

The World Health Organisation reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (*5.2.2*) or in suitable cell cultures (*5.2.4*), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (*5.2.2*). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

VIRUS SEED LOT

The production of vaccine is based on a seed-lot system. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium.

Mycoplasmas (*2.6.7*). Carry out the test for mycoplasmas, using 10 ml.

VIRUS PROPAGATION AND HARVEST

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

MONOVALENT POOLED HARVEST

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process should cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at 5 ± 3 °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/l of CH_2O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation process, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or other suitable method.

Only a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

Haemagglutinin antigen. Determine the content of haemagglutinin antigen by an immunodiffusion test (*2.7.1*), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it[(5)]. Carry out the test at 20-25 °C.

Neuraminidase antigen. The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

Sterility (*2.6.1*). Carry out the test for sterility, using 10 ml for each medium.

Residual infectious virus. Carry out the test described below under Tests.

FINAL BULK VACCINE

Appropriate quantities of the monovalent pooled harvests are blended to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

Sterility (*2.6.1*). Carry out the test for sterility using 10 ml for each medium.

FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest and that the tests for free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.
